

THE ECONOMIST

"Were all nations to follow the liberal system of free exportation and free importation, the different States into which a great continent was divided would so far resemble the different provinces of a great Empire. As among the different provinces of a great Empire the freedom of the inland trade appears, both from reason and experience, not only the best palliative of a dearth, but the most effectual preventative of a famine, so would the freedom of the exportation and importation trade be among the different States into which a great continent was divided."—ADAM SMITH.

MAY 1939

INDEX TO VOLUME CXXXIV

BEING FROM JANUARY TO MARCH, 1939, INCLUSIVE

Agenda for Rome

AS forecasts come in from Rome of the Italian official plans for the visit which Mr Chamberlain and Lord Halifax are to pay to Signor Mussolini next week, we get the impression that very little time is being allotted to the serious diplomatic work that is the ostensible purpose of the meeting; and we will confess that, for our part, we view this feature of the programme with some relief. For we have been told by the Italian newspapers that the conversations are expected to be conducted in the spirit of Munich, and there is always a risk that this might turn out to be true. The spirit of Munich, at least as it is interpreted in Berlin and Rome, might be rendered as the spirit of give and take, the democracies doing all the giving and the dictatorships all the taking. It is true that there is little prospect of any British territory, or even any British money, being handed over at Rome. It seems no more likely now than it was found to be when the question was ventilated in Parliament last June that Italy could apply with any hope of success for that British Government guarantee, in default of which the state of Italian finances and economy would prohibit the raising of a loan in London. As for territory, Mr MacDonald's recent dictum that the colonial question is not now a practical issue as far as Great Britain is concerned may be presumed to apply to any Italian claims as well as to those of Germany. Indeed, Italy has always recognised that our cession of Jubaland to her after the war was a full settlement of her claims on us under that London Treaty of 1915 which she is still invoking against France.

The identity of Signor Mussolini's intended victim was made perfectly clear by the famous shouts which echoed, with Fascist spontaneity, in the Chamber at Rome on November 30th. The next victim to be anaesthetised by the spirit of Munich was to be France, and the limbs of which she was to be relieved were Tunis, Corsica, Nice, Savoy and Jibuti. Signor Mussolini does not often miscalculate; but this time he did. The General Strike that was to paralyse M. Daladier immensely strengthened him. France has not buried her head in another financial crisis; on the contrary, she has begun to make a remarkable financial and economic recovery. The Italian demands have helped by their sheer outrageousness to close French political ranks. Until the other day it had not occurred to the Corsicans to proclaim the truism that they were patriotic Frenchmen. The Arabo-Berber nation of Tunisia is too conscious of its ripeness for self-government, and too well aware of the nature of Italian rule next door to them in Libya, to be willing to change the French for the Italians. The clumsily-staged scene in the Italian Chamber has stung both peoples into vociferation, and M. Daladier's reception this week, both in Corsica and in Tunis, has convincingly demonstrated the loyalty of these two territories. The net effect of claiming that Tunis and Corsica are Italian has been to make them more French than ever. The French Government, however, have left nothing to chance; they have publicly declared that they desire, and will accept, no mediation between themselves and Signor Mussolini; and the view in London is that, if Mr Chamberlain

mentions the subject at all, it will be to point out that the Italian "aspirations" in the Mediterranean are contrary to the Anglo-Italian Agreement.

Any cession of French territory to Italy, in the Mediterranean or elsewhere, can, therefore, it would seem, be ruled out, even as a topic for discussion. Territorial cessions do not, of course, exhaust the possibilities of Italian demands upon France. There is the claim for a regularisation of the status of Italians in Tunisia, which rests at present on the precarious basis of an old agreement which has to be renewed every three months. But the French are fully entitled to retort that, if Signor Mussolini desires such a regularisation, he should not have denounced, last month, the Agreement he reached with M. Laval in 1935 on precisely this matter (among others). There is the claim for reduction in the Suez Canal dues, with or without representation on the Board of the Company. There is the claim for a free port at Jibuti and possession of the railway to Addis Ababa, on the ground that most of the trade of Jibuti is with the new Italian Empire of Abyssinia. (This, incidentally, is, of all the Italian claims, the one that should excite the most sincere support from Herr Hitler, since what is sauce for Jibuti is clearly sauce for other ports, such as Trieste, whose hinterlands have also recently changed hands.) All these non-territorial demands of Signor Mussolini's have a certain element of justice in them. But the manner of their presentation has made it impossible for either the French or the British Governments to pay attention to the justice or to anything but the power politics of the claims.

If Tunis, Corsica, Nice, Savoy, Suez and Jibuti are all removed from the agenda, what remains? Spain we have always with us. If Signor Mussolini cannot be paid in French coin, may he not have some Spanish small change thrown to him instead, in return for all those bombs dropped from aeroplanes of Italian design on British merchant ships plying on their lawful occasions in Spanish waters? The sudden and furious offensive that General Franco and his Italian allies have launched shows how prominently the question of Spain stands on Signor Mussolini's agenda for the Rome talks, since it is clearly political rather than military considerations that lead to an attack in midwinter. Last April, a successful Franco offensive played quite a part in bringing the Anglo-Italian negotiations for an agreement to a conclusion; for, clearly, if General Franco is on the point of winning, there is an

added argument for Britain's standing in well with him and his friends. The new offensive has not yet secured any striking success; but the pressure on the Catalanian front is no more severe than will be put on Mr Chamberlain in Rome to grant belligerent rights to General Franco.

On the face of it, any such grant can be excluded—for two reasons. In the first place, no British Government can relish the prospect of wholesale attacks on British shipping by "volunteer" aircraft, destroyers and submarines of Italian manufacture—for that is the real meaning of "belligerent rights." And, secondly, Mr Chamberlain declared in the House of Commons on December 19th that "so long as there are foreign troops in Spain, and so long as no other solution has been found for the Spanish question but that which is involved in the Non-Intervention Plan, His Majesty's Government do not propose to grant belligerent rights to the parties in Spain other than in accordance with the Non-Intervention Plan itself." In ordinary times this would be decisive. But the Spanish affair has been marked by the use of so many misleading euphemisms—some of them by His Majesty's Ministers—that it is impossible not to be suspicious. For example, although the most furious battle of the war is raging on the Ebro and the Segre, the British Government's official view is that the Spanish question has been settled, for such a settlement was to be a prerequisite of the ratification of the Anglo-Italian Agreement. If a "settlement" can be so defined, why not a "solution"? But we hope that Mr Chamberlain meant not merely what he said, but what the words he used would ordinarily convey. There have been, in the last few days, the usual rumours to the effect that Signor Mussolini might, at comparatively small cost, be persuaded to order a complete withdrawal from Spain. There is no reason to believe that they are less than usually mendacious. We would hesitate to say that there is no prospect of a Chamberlain-Mussolini agreement on Spain; but there is no apparent possibility of any such agreement as would contribute to genuine appeasement.

We trust that Mr Chamberlain and Lord Halifax will have a pleasant journey and that their tour of the sights of Ancient and Modern Rome will afford them both pleasure and instruction. But, since there is no sign of any readiness on Signor Mussolini's part to agree to the conditions of an equal peace, and plenty of signs to the contrary, we pray that the Prime Minister and the Foreign Secretary will resist all temptations to bring home an agreement.

Secondary Education For All

NO public service is so well provided with blue-prints for its due development as education. The permanent Consultative Committee of unpaid experts given to the Board of Education forty years ago has done outstanding work. Their reports have served as landmarks in the progress of pedagogy. Since the war four reports have outlined plans for a new model education. Three, made under the chairmanship of Sir Henry Hadow, on the education of the adolescent (1926), the primary school (1931) and infant and nursery schools (1933), set out the new pattern. The fourth, on secondary education, drawn up under the chairmanship of Mr Will Spens (whose merited knighthood was included in the New Year Honours) and published a week ago, completes the design.

"The existing arrangements for the whole-time education of boys and girls above the age of 11 + have ceased to correspond with the actual structure of society and the economic facts of the situation." This is the considered conclusion of a survey whose 477 pages constitute an exhaustive record, not only of present post-primary education and its historical development, but also of the principles of philosophy, biology and psychology involved

in the training and instruction of young people. The Committee's finding is that the tradition of academic teaching handed down by the ancient public and endowed schools has lain too heavy upon the State-aided secondary schools set up in the dawn of this century; and the grip of that tradition has been tightened since 1917 by the demands of the School Certificate examination. Pupils are forced into the mould of a curriculum intended as a preparation for matriculation and undergraduate studies, and the provision of "post-primary education of high educative value on non-academic lines with a certain bearing, direct or indirect, on industry, agriculture and commerce" has been neglected.

The goal proposed by the Committee a dozen years ago in *The Education of the Adolescent* was "a secondary system enlarged to include a variety of institutions differing in curricula and educational methods but equal in educational opportunity and social status." And it is in this spirit that their latest recommendations are made. All children over 11 years of age should be entitled to secondary education, which, to provide a niche for every child, should comprise, not only "grammar" schools of the academic

type, but also "modern" schools and "technical high" schools. Modern schools will be a development of the central or senior schools at present anomalously administered under the elementary code, to provide more advanced instruction than in primary schools proper; their curriculum will come midway between those of grammar and technical schools. Technical high schools, like modern schools, will offer the same breadth of curriculum as other secondary schools, but, working closely in association with technical colleges, factories and farms, they will include such subjects as engineering, drawing, practical crafts and husbandry. Together the triad of schools is designed to turn out the professional men and technicians which modern society needs in growing numbers—while at the same time providing every child with a training suited to his bent.

Hitherto a prime obstacle to the provision of realistic and practical courses for boys and girls between the ages of 11 and 16 has been social prejudice. The old endowed schools have been held in high esteem, and the academic training they gave has been prized as a badge of social status. The Committee propose to remove the stigma of inferiority from technical and quasi-vocational training by insisting on absolute parity between the three types of secondary school they envisage, in quality, cost, accommodation, staffing and status.

Some critics will be wary of these proposals. There will be a lingering suspicion that the practical consequence of these reforms may be the relegation of most working-class children to technical institutions to prepare for the proletarian lot which destiny has given them; a fear that, instead of secondary education for all, the tri-furcation of post-primary schools may mean secondary education for only a select few.

Such apprehensions are *prima facie* groundless. The Committee's scheme is based upon equality of opportunity; upon 100 per cent. special places (i.e. free places or places at reduced fees) in all kinds of secondary schools as soon as possible; upon the entire abolition of fees immediately it can be afforded; and upon the freest possible transfer at 13 and subsequent ages from one type of school to another, if proved capacities seem to merit it.

Most important of all, perhaps, are the proposals relating to teaching and curriculum, as distinct from organisation. Thus the basic items of the curriculum will be the same in all the three proposed types of school. Studies in all will be grouped round English, Scripture, History and Geography; in all, foreign languages and physical and æsthetic training will be much more encouraged than has been the case in the past. Differentiation is, rightly and wisely, the keynote of the Committee's scheme; but in no kind of school will undue or premature specialisation be permitted. The intention of the reforms is to cater for the ascertained needs of adolescents; to provide them with freedom of choice; to foster the free growth of individuality; to liberate the teacher from examination trammels; to present pupils with problems in place of cramming them with undigested knowledge; and to eliminate what is dead and abstract from the teaching of such subjects as Latin, mathematics and science.

It may well prove that, in the event, the widely differing circumstances of the families from which the pupils come will weight the scales of opportunity against the poorer children without outstanding ability. There is no mention in the report of family allowances or maintenance grants. Yet there is a strong recommendation to raise the school leaving age all-round and effectively to 16; and there can be no doubt that the Committee's intention is to frame a secondary education suited in its diversity to all children and designed to furnish the stream of skilled and intelligent citizens of varied interests and attainments by which alone a modern industrial society can survive in health and wealth.

The real question now is how much of this welcome

advice will remain piously on paper and how much will be put into effect. The Hadow reports on infants, primary schools and adolescents have done something to make English education more adaptable and sympathetic. At secondary schools there were 484,676 children, or 12 per cent. of children between 11 and 17, in attendance last year, compared with 187,647 in 1913. The number of secondary school places has trebled since 1910, and the average length of stay in secondary schools has increased by two years. But, at no stage of public education has pedagogic enlightenment prevailed over administrative and financial obstacles. Despite the Hadow reports, only a quarter of the children between one and five come under the public health services; only one-seventh of the same group are yet in nursery schools or nursery classes; one-fifth of education authorities still provide no milk or school meals for pupils; one-third of elementary classes still number over forty, despite the Board's limit of thirty or thirty-five; one-third of the elementary schools blacklisted twelve years ago as unfit for use are still occupied; and, despite the raising of the school-leaving age, some critics estimate that as many as four-fifths of school children leave at or near fourteen. Of the juveniles who go to work thus early, only about one-fifth secure other than dead-end jobs and, as Professor Tawney eloquently argued in this year's Hobhouse Lecture, the majority of young people are no better qualified at eighteen to serve themselves and the State than they were four years before. In height, weight and nutrition there are marked differences between children from different social classes, despite the admirable thirty-years record of the school medical services. The better-paid professions are still manned by a small minority educated at costly schools; and, although one-fifth of the male undergraduates at Oxford and Cambridge and two-fifths at all universities are ex-elementary school boys, the number of such boys passing to universities is still less than one-half per cent. of the total output of primary schools. In spite of special places and State scholarships, "the educational ladder is an ideal rather than a fact"; and, over the whole field of education, performance still falls far short of the mark set by the Consultative Committee.

The obstacles to progress are economic. Educational advance is costly in two ways: already, on the one hand, something like one-seventh of the population is withheld from gainful employment for nine years; and, on the other hand, the yearly price of public education has risen since 1913 from £13 millions to £95 millions. If the Hadow and Spens schemes were fully implemented public funds would be called upon to supply from £120 millions to £150 millions annually. The current claims of defence reinforce calls for a halt in outlay.

There is some substance in these anxieties, short-sighted though they are. Yet it is for Parliament and the people to make up their minds. On the one hand, expensive reforms are officially elaborated; they are widely recognised as necessary and desirable. On the other hand, economy is officially claimed and practised. The time is ripe for decision. To the economist the outcome cannot be in doubt. It is as true to-day as it was when Lord Macaulay excited Parliament by his defence of the Ten Hours Act that the falsest of false economy is to exploit and wear out juvenile labour. Cheeseparing in education is waste; it is especially so to-day when gainful activities call for new skills and greater intelligence.

Education is a positive service. It is the casting of bread upon the waters to gain a manifold return. It is remunerative investment. It increases the economic yield of the people and swells the national income. As we stand at the parting of the ways in a troubled world economy, we need more than ever mental resource and technical knowledge. Youth is our capital and, in the wise words of Professor Tawney once more "society must not eat its seed-corn or harness its wagons with colts."

Unemployment in Great Britain—II

Inner and Outer Britain

LAST week, the first of these articles discussed some of the fundamental movements that have been going on throughout boom and slump over the last ten years in the distribution of our resources between different industries. These changes have been accompanied by others equally far-reaching in the growth of our employed population between different areas. Since the war a realignment of industrial growth has been taking place at a rate comparable with the movement to the Midlands and North in the Industrial Revolution a hundred and thirty years ago. The graph below illustrates the course of insured employment in Great Britain as a whole over the last fifteen years, compared with the growth of its two halves, Inner Britain or the South of England and Midlands, and Outer Britain or the North of England, Scotland and Wales. The different movements are extremely striking. Between July, 1923, and July, 1938, the number of insured employed in Great Britain increased by 23 per cent. In the same period the numbers in what we have called Inner Britain increased by no less than 40 per cent., while the numbers in Outer Britain increased by only 6 per cent. In July, 1923, there were roughly 5,000,000 insured employed in Outer Britain, and in July, 1938, 5,250,000. In Inner Britain at the first date there were just over 4,500,000, and at the second nearly 6,500,000. These figures give some idea of the relative numerical importance of the change. In 1923 the South and Midlands contained 48 per cent. of the insured employed, in 1938 56 per cent., while the proportion held by the North of England, Scotland and Wales shrank from 52 per cent. to 44 per cent. These recent changes in regional growth have been accompanied by social and economic reactions reaching every quarter of our national life.

The movements become clearer if we look at the two charts shown on the opposite page. One shows the regions we have included in Inner Britain, the other those we have included in Outer Britain. The contrast could scarcely be more marked. If the figures of July, 1923, are compared with the average of July, 1937, and July, 1938 (the average being taken to avoid comparisons with the peak of the boom in 1937, or with the low of a year later), it will be found that employment in the South-East, where expansion has been most rapid, has grown by the astonishing figure of 63 per cent. The effect of the Great Depression in this area was merely to cause a temporary cessation of growth. London in the same period grew by 37 per cent., rather more than half as fast, and the South-West by 35 per cent. In these two areas the slump caused a small and temporary relapse. The Midlands grew by only 26 per cent., and the slump was much more marked. Nevertheless, nowhere in the South did the growth of employment fall below 25 per cent. over the fifteen years under consideration, and in no case did the duration of the slump, as reckoned by the interval elapsing between the boom levels of 1929 and the surpassing of those levels in the upswing of recovery, reach as long as four years. The explanation of this resilience lies in the localisation of British industry. The economy of Inner Britain is based predominantly on supplying the growing home market, which barely felt the depression, and none of these regions is a centre of heavy industry. The Midlands, which, of these areas, has the largest export connections, felt the slump most severely. Building, one of the few investment goods industries which is fully represented in Inner Britain, is also one of the very few to have had a really prosperous history since the war. The great bulk of post-war construction, whether of houses or other buildings, was undertaken

in these localities, and the expansion of the building trade is strongly reflected in the employment figures.

The chart for the regions of Outer Britain tells a very different story. If 1923 is once again compared with the average of July, 1937-38, the North-East and Scotland show the best records; but, even so, insured employment in the North-East grew by only 6 per cent., and in Scotland by the same proportion. In the North-West, the increase has been 5 per cent., and practically all the growth was between 1923 and 1929. The curve for Wales shows to what a degree the changed post-war conditions have been met. Employment has decreased by 18 per cent. since 1923, and here, in contrast to the North-West, the decline was proceeding rapidly before 1929.

The gap between the lowest percentage increase in Inner Britain, 26 per cent., and the highest in Outer Britain, 6 per cent., is impressive, but that between the highest in Inner Britain, plus 63 per cent., and the lowest in Outer Britain, minus 18 per cent., is enormous. The duration of the slump in Outer Britain was also much longer than in the South and Midlands. The North-East took six years to regain the 1929 level, Scotland took six and a half years, the North-West took seven years, and Wales seven and a half years, compared with a maximum of four years in the South and Midlands. The loss of employment at the bottom of the slump in Inner Britain averaged 5 per cent. only, and never reached 9 per cent. In Outer Britain it averaged over 15 per cent. and reached 20 per cent. The explanation is again to be found in the location of British industry. In the years since the war Great Britain has had to make a readjustment away from the export areas with their declining volume of export trade towards the growing home market. Hence Scotland with engineering,

REGIONAL EMPLOYMENT CHANGES

EMPLOYMENT 1923-38

All the curves in the above diagrams have been reduced to a comparable basis by using figures for the regions as they were before the changes made in 1936, the chief of which was the establishment of a new Northern region. The figures for the "old" regions in the later years have been obtained partly from the Local Unemployment Index, partly through the courtesy of the Ministry of Labour. Normal seasonal variations have in every case been removed.

shipbuilding and textiles, the North-East with steel and shipbuilding, Wales with coal and steel, and the North-West with cotton, wool and engineering, have grown slowly and have at the same time tended to lose by migration to more prosperous regions. The brunt of the slump was borne by the export trades and the regions of Outer Britain.

In the last year both home market and export market have experienced sharp reductions, which have had different effects on the different areas. The North, despite the stimulus of re-armament to the heavy industries, has lost ground relatively to the South, largely because of the vulnerability of the export trades to trade depression. The South, supported by the demand of the home market and its strong upward trend, has declined much less, despite the slow drag exercised by shrinking building activity. Only the South-West and South-East have been sufficiently strong to improve their positions. London and Scotland have found the home market and re-armament enough to prevent an appreciable decline, but the Midlands and North-East have not been so fortunate, and the North-West (textiles) and Wales (tinplate and coal) have reacted severely.

The facts presented in last week's article demonstrated that great industrial shifts have been going on, and that to these labour, while still mobile, can only adapt itself relatively slowly. To dislocation caused by unequal industrial growth, we must now add the dislocation caused by unequal regional growth. Although both conditions inflame each other the latter may be the more distressing. If a whole area is severely hit, as South Wales, for example, has been, any adjustment, apart from wholesale movement of the population, may be difficult to find. In Lancashire, which has many industries, on the other hand, distressed cotton workers have been able to move into the new light

industries which have arisen amid the old trades' ruins.

A recent study by the Oxford Institute of Statistics on the mobility of Labour* has some interesting conclusions bearing on this point. The investigators show that mobility is determined primarily by relative unemployment percentages. During the period we are considering, the incentive to move from Outer Britain on account of unemployment has been ample. If we take the years 1927 onwards (to avoid the influence of the Coal Strike), and look at the lowest recorded unemployment percentages for all the areas, we find that the biggest spread between the different lows—3.9 per cent. in the South-East, and 14.7 per cent. in Wales—is over 10 per cent., with the other regions in between, those of Inner Britain grouped at one end, those of Outer Britain at the other. The spread between the highest figures of unemployment recorded, 39.9 per cent. in Wales, and 15 per cent. in London, is even greater, nearly 25 per cent.

It is possible, therefore, to conclude as follows. The great diversity of growth between Inner and Outer Britain since 1923, the trend of which appears still to persist, argues a great elasticity of labour supply and economic resilience. Yet the comparative regional figures for unemployment show that, great though the realignment has been, it has fallen very far short of completeness, and that maladjustment between the areas is persistent. Great Britain has responded to a surprising extent to the great economic strains that the post-war era has brought, but, nevertheless, readjustment, left to the free play of economic forces hampered by natural frictions of distance and poverty, has been very far from sufficient.

* Oxford Economic Papers. No. 1. Paper 5. "Studies in the Mobility of Labour."

Who Lost the Peace?

NINETEEN years ago next Tuesday the Treaty of Versailles came into effect, and four days later the Council of the League of Nations held its first meeting in Paris. As we embark on this twentieth year of the Great Peace, the moment is appropriate to inquire why the world system set up in 1919 has failed. Were the principles of the Paris Treaties fundamentally unsound and, if so, in what respects, or is it that these principles have been betrayed by those who should have carried them out? In the main, it is the second answer that Mr Lloyd George gives in his recently published volumes on the making of the treaties.* This work has not quite the same quality of exposition as his War Memoirs; for he is so often concerned to show that criticisms directed against himself should have been addressed elsewhere, that the work is loaded with unduly long quotations and summaries. The subject matter is immensely complicated and covers an enormous field; and Mr Lloyd George assumes a rather wider knowledge of the history of other nations than many general readers possess. Nevertheless, Mr Lloyd George's work is an essential contribution to the understanding of the Peace Treaties; the new documents which he quotes must be taken into account by anyone who hereafter attempts to form an opinion; and it is immensely valuable to have on record the personal impressions of the only survivor of the chief actors in that greatest of diplomatic dramas.

On the whole, Mr Lloyd George makes out a strong case for his main thesis. With all its defects, the Conference of 1919 released and gave ordered scope to forces which might have redeemed the world. Consider some of its fundamental issues. "The Treaties of Paris," says Mr Lloyd George, "constitute the greatest measure of national liberation of subject nations ever achieved by any war settlement on record." In 1914 there were, in the belligerent countries, 100 million men and women the denial of whose claim to free nationhood constituted a crime by the States which governed them. Secondly, the Peace Treaties made the attempt to vindicate international right, not merely by a return of territories occupied by force of arms, but by inflicting heavy compensation for the damage done and by summoning for trial those who were guilty of aggression or who had transgressed the laws of war. Thirdly, the huge armaments that had been piled up in anticipation of war were to be done away with, first by the defeated, and subsequently by the victorious nations. In the fourth place, the German colonies were not to be returned, but were to be administered as an international trust for the benefit of the inhabitants. Finally, the League of Nations was set up to promote conciliation when disputes arose between nations, to provide in suitable cases for arbitration, to furnish collective support for victims of aggression, to watch over the treatment of the minorities which were inevitably created in the new States of Europe and to negotiate the revision of treaties that experience proved to be unjust or unworkable. A special organ of the League was designed to standardise and raise the conditions of labour throughout the world.

Here are five principles that must unquestionably be applied if humanity is ever to create a peaceful world. Yet in respect of every one of them the work done by the treaty makers has been subjected to damaging criticism and in greater or less degree has been, or is being, undone.

Take first the aim of liberation. The nations of Europe are so inextricably mixed that it is not possible to draw boundaries which will give complete effect to the principle of racial or national unity. But the bias of Paris was so

strongly in favour of the victors that new difficulties were created which might have been avoided. One of these cases, namely the prohibition of the union of Austria and Germany, is to be reckoned among the major causes of the desire of the German people to destroy the dictate of Versailles. The case of the Sudeten Germans is rather different; for the result of the Munich settlement has shown how impossible it is in such a case to draw a satisfactory boundary on purely ethnographic principles; in any attempt to do so, the remedying of one set of defects only creates others. It is a pity that in discussing this question Mr Lloyd George should have allowed himself to betray his personal animus against Dr Benes, which has undoubtedly led him to belittle the character and achievement of that distinguished democrat. Mr Lloyd George, however, fully realises that the way to deal with these boundary problems is not perpetually to draw and redraw them but to make them unimportant by a liberal regime of international trade and by a proper treatment of minorities.

The vindication of international right by assigning "war guilt," by seeking to bring the guilty to trial and by exacting reparations may be justified on abstract grounds; but in practice it has proved the greatest failure of all. The reparation provisions, which were drafted in defiance of the opinion of British experts, but relieved the feelings of an incensed and heavily overburdened world, collapsed of their own weight; while the attempt to bring the Kaiser to justice faded away as soon as passions cooled. Mr Lloyd George defends the assigning of war guilt to Germany and rejects the argument that the people of a country may be differentiated from their rulers; but it is not surprising that a new generation should resent condemnation pronounced not by any tribunal but by victors on the field.

As to disarmament, it would undoubtedly have been better if a specific timetable and some rudimentary principles of general application had been laid down in Paris. But in the then atmosphere, it is not surprising that the Allied and Associated Powers limited themselves to general promises which in the sequel were dishonoured.

In many of these matters the settlements reached were compromises containing evident defects. But the defence of the Treaty makers is that, in the abnormal conditions of public opinion that then prevailed, it was impossible to attain perfection. They therefore resorted to the device of the clause in the Covenant providing for the revision of Treaties which prove to be in need of amendment. The clause has not been used, and events have confirmed the critics who complained that the League was a concealed alliance of victorious Powers designed to preserve the *status quo*. And so, for want of timely remedying, the sore places have festered until the whole body has become rotten and diseased.

As in the War Memoirs, the documents in the volumes reveal Mr Lloyd George's remarkable insight into the future, as well as his great gifts of persuasion at the conference table. His doubts about adding to the colonial responsibilities of Great Britain, his anticipation of the effects of a prolonged occupation of the Rhineland, his stand for the abolition of conscription in Germany (which was intended as a prelude to its general abolition), his fight for early and general disarmament, and his desire to discuss peace terms with Russia are examples of his wisdom that are of special interest to-day. With splendid support from the British Civil Service (who come out of the story with flying colours), he had a vision of the peace that the world needed.

That he faltered in the face of public opinion on certain points is evident from his book—notably in the matter of

reparations. He and Bonar Law, he says, regarded the conclusions of the notorious Hughes report, with its suggestion that Germany could pay £1,200 millions a year as interest on the direct cost of the war to the Allies, which was estimated at £24,000 millions, as "a wild and fantastic chimera." Again, in describing the discussion with Colonel House at an Allied Conference on October 29th, he explains that all were satisfied by the Lansing declaration, since "the Allies had no intention of putting forward any demand which would include the costs of the war." It is also true that in the famous election speech at Bristol he repeated what he said in every statement on the subject, namely, that Germany must be made to pay "up to the limit of her capacity," and that he would not be giving the whole of the facts if he told the country that we could expect every penny, for the financial experts in the Government departments were "doubtful" in view of the estimates of the wealth of Germany. But he summed up by saying (1) that we are entitled to demand the whole cost of the war, (2) that we intend to demand it, and (3) that "you will be glad to hear that the Committee of the Imperial British Cabinet believe that it can be done." At a time when wildly exaggerated ideas were rife among the general public in every country, Mr Lloyd George was one of the few who knew the truth. If he had more boldly challenged the popular sentiment of the day at the moment of victory, as he alone could have done, the course of history might have been changed.

Yet, in spite of these blemishes, Mr. Lloyd George's

defence of the Treaties, and of the personal part which he played in them, is an impressive one. The picture of the British delegation is that of a body of men who, on the whole, kept their heads relatively well in a world suffering from a stupendous emotional reaction; men who wished to be generous and long-sighted, but when up against insurmountable obstacles left it to Providence—and the League of Nations.

The Treaties are far better than they are popularly supposed to be; and they could undoubtedly have been made the basis of a durable peace if . . . And the most significant of the "ifs" raises the only point on which Mr Lloyd George admits that he has changed his mind. In December, 1918, he welcomed the decision of the American President to come to Europe in person. If Wilson had stayed at home his influence on the Conference would have been no less powerful, but the Treaty would not have been repudiated by the Senate. And if America had not pulled out of Europe, but had continued on the Reparation Commission and on the Council of the League, there is a strong probability that the hopes of the Treaty makers would have been fulfilled. And so the moral. It is as true to-day as in 1919 that, without America, the world is not ripe for a system that will eradicate aggression and vindicate the rule of justice in international affairs. Peace cannot be created out of war or out of crisis. It can grow only with careful nurture and constant and eternal vigilance. Its cultivation needs, not the tolerant acquiescence, but the active co-operation of the greatest single country in the world.

Nine Months' Revenue

THE return of revenue and expenditure issued each year on December 31st is the starting gun of the Budget season. It does not give the first glimpse of the coming Budget so much as set the field for the annual race of revenue to overtake expenditure before March 31st. The taxpayer, facing his January 1st demand note, knows against what handicap he is expected to run. This year the handicap is extremely heavy. The deficit with which the financial year enters its last quarter is £249.4 millions (excluding from expenditure the £17 millions that has already been debited to defence borrowing); this is £76.8 millions more than the deficit on January 1, 1938.

To speak of deficits, in these days of defence borrowing, is, however, to speak in euphemisms. When defence borrowing began, in 1937, the principle was laid down that the recurrent or maintenance cost of enlarged defences should be met out of revenue and only the non-recurrent cost out of borrowing. The distinction was never more than a rough and general one, since the grants-in-aid from

Defence Loan were never allocated to specific items or even sections of the estimates. The pretence was completely abandoned in 1938, when the need for a further speed-up, involving Supplementary Estimates, emerged as the Budget was being drafted. It was then provided that the whole cost of the Supplementaries should be met out of additional borrowing. What, in effect, occurs is that the revenue is charged in the Budget with such amount as the Chancellor of the Exchequer deems proper, and this figure is not thereafter subject to more than slight variations. If, as happened last year, less is spent on re-armament than was anticipated at the time of the Budget, it is the part that is borrowed, and not the part that is paid for out of revenue, that obtains the benefit of the short-fall. And if, as has happened this year, the requirements are more than was expected in the original Budget Estimates, the excess is borrowed. The effect is that, from one Budget to the next, the course of expenditure on defence is a subject of great fiscal interest, but largely divorced from the equally

* "The Truth about the Peace Treaties," by D. Lloyd George. (London) Gollancz. 2 Vols. 18/- each Vol.

* Exclusive of amounts spent under the Defence Loans Act as follows:—1937-38, £64,867,000 actual; 1938-39, £112,900,000 estimate; nine months to December 31, 1938, £17,000,000.

interesting question of the outcome of the Budget. With this introduction, the following figures of total defence expenditure (including borrowings) may be inserted almost parenthetically:—

	DEFENCE EXPENDITURE (£ millions)			
	1935-36	1936-37	1937-38	1938-39
First quarter	27.5	37.5	46.3	65.8
Second quarter ...	30.3	41.2	58.3	86.4
Third quarter	37.3	48.0	68.3	102.9
Fourth quarter	41.8	59.4	89.3	—

The last quarter, it will be noticed, shows much the largest increase in comparison with the corresponding quarter of the preceding year of any figure in the table. It is very nearly three times as much as was being spent three years ago and actually more, in a single quarter, than was spent in twelve months six years ago. The estimated total defence expenditure for 1938-39 is £368.6 millions. If the estimate were exactly realised, there would accordingly be £113.6 millions still to come. Estimates, being maximum permissible figures, are never fully realised. But the pace at which defence expenditure has been accelerating would seem to require considerably more than £113.6 millions to be spent between now and March 31st. If the increase is proportionately the same as last year, the expenditure in the final quarter will be something like £134 millions and further Supplementaries of over £20 millions will be required.

Whether this is so or not, it will presumably not affect the total inserted for the defence services in the table of expenditure to be met out of revenue—which is all that comes into question in determining whether there is what is still formally called a surplus or a deficit. Similarly, the expenditure on the National Debt is fixed, any sum not required for interest and management going automatically to the sinking fund. The total under this head on March 31st will be the £230 millions provided in the Budget (unless, indeed, interest and management require more than £230 millions, which does not appear in the least likely). The only possibility of a serious divergence of the formal total of expenditure from that estimated in the Budget lies, therefore, in the cost of the civil supply services and revenue departments. These (excluding the Post Office) were estimated to cost £39 millions more this

year than last. With nine months gone, the increase has been £22.2 millions, which is less than three-quarters of the amount estimated. The last quarter's expenditure, however, is always the heaviest of the four, and the final saving is not likely to be more than about £6 millions. The taxpayer's task is lightened by only this comparatively small amount.

The Budget estimates of revenue foresaw an increase of £72.1 millions over last year's yield. The £6 millions expected short-fall of expenditure would make it possible to balance the Budget on an increase of £66 millions. This, on a total revenue of £872.6 millions, represents an increase of 7.6 per cent. In the first three quarters the actual realised increase has been by less than 2.5 per cent. This is not, of course, a fair basis of comparison, as the increases in income tax imposed in the 1938 Budget can hardly affect any receipts before January 1st. In point of fact, however, the inflow of income tax has not been unsatisfactory; the deficits are shown in those taxes which are collected fairly regularly throughout the year. Thus death duties (of which, last year, nearly 77 per cent. were collected before the end of December) were estimated to bring in £1 million more over this year as a whole, but have actually brought in £11.4 millions less in nine months. There is clearly going to be a short-fall of actual receipts below the estimate of at least £10 millions, and possibly more, in this item. Customs and Excise, expected to produce £8.8 millions more, have increased by only £1.4 millions; there is another prospective deficit of £6 or £7 millions here. Stamps, expected to fall by £200,000 in the year, are £900,000 down in nine months. The motor duties may also not yield the full increase expected.

Prophecy at this stage of the financial year is dangerous because of the predominant influence of direct taxation payments in the March quarter. But these receipts will have to be unexpectedly heavy if a deficit of more than £10 millions is to be avoided. This, in itself, is an unpleasant conclusion. But it has even less bearing this year than usual on the shape of next April's Budget. That will be determined by the size of the increase in defence expenditure and by the sum that the Chancellor decides to raise by borrowing. Both these amounts are likely to be so very large that a mere formal deficit of £10 millions or so becomes almost unimportant.

Topics of the Week

Opposition Grows.—It would be a rash rendering of present trends in politics to forecast the early downfall or disintegration of the Government. Yet it cannot be gainsaid that Mr Chamberlain will set out for Rome with uneasy recollections of the past few months in the domestic as well as the diplomatic arena. The maintenance of peace has been received with heartfelt gratitude; but the particular means chosen to preserve peace, the Munich settlement, has fallen flat at home no less than abroad; and within the ranks of the Government's own supporters unrest has risen on three counts: foreign policy, defence and agriculture. No leader has appeared to weld the dissentients within and without the Conservative fold into an active opposition group; Mr Eden, for excess of scruple or absence of resolution, or subtlety of calculation, has confined his criticisms to the realms of general discourse and social philosophy; Mr Churchill has reserved his sharpest and most polished darts for Herr Hitler; and the much publicised private meeting on Wednesday, organised by Mr Duncan Sandys, and some others, and attended by persons of all parties alarmed by defects in defence and maladroit diplomacy, reveals no more than a hand-sized cloud on the horizon. Nevertheless, a large part of the public is unconvinced that the country's defences are in fact being decisively improved; and in farming areas dis-

content, skilfully manipulated by organised agricultural interests, has become a ferment. At the recent Kinross election Tory loyalty and inclement weather foiled the gallant attempt of the Duchess of Atholl to ride back to Parliament on an anti-appeasement policy. It is not so certain that Mr Chamberlain will score over the farmers at the forthcoming East Norfolk election. There local farmers and Conservatives have decided to back Mr Wright, an independent Conservative. But the Government are sponsoring Mr Medicott, a Simonite Liberal; and there will be a Labour candidate in the field. Should mischance befall the Government in a constituency which is by nature theirs, they will have the consolation of knowing that they have fallen down in the field in which, of all the criticised items in their programme, they are least culpable.

Air Defence Doubts.—The time is now near when the indignation felt by members of all parties about the Government's laggardly progress in civilian defence may become a political menace to Mr Chamberlain and his colleagues. Sir John Anderson was called in to organise air raid precautions and home defence because he had deservedly won fame for strong and forthright action in

varied fields. It may yet prove that Sir John has a plan which will allay anxiety and the determination to implement it with speed and decision. The publication of the new Home Office handbook on defence is eagerly waited. But so far the new Minister's efforts have earned no more lustre than the sad failures of the two Home Secretaries, Sir John Simon and Sir Samuel Hoare, who have tried unsuccessfully to grapple with air raid precautions. Public uneasiness is on the increase, and it is the more serious because a full three months have passed since the September crisis showed England and, above all, London open to marauding attack from the air. It is true that the output of airplanes and the supply of anti-aircraft artillery have markedly increased since then. It is true, too, that the Government have consented to add plans for shelters and evacuation to the anti-gas and anti-fire policy upon which previously they stubbornly relied. But in no case do they seem ready to do the job thoroughly and with expedition.

Sir John's intention to spend £20 millions on basement and lean-to shelters is condemned by a majority of experts as inadequate and, by Spanish experience, actually dangerous; even the Government's greatest well-wishers describe it as an interim measure; and this is most emphatically no time for provisional steps. The plan that has been approved whereby the Central Electricity Board is to organise a reserve of essential switchgear and transformer equipment was imperatively needed; but its scale (the cost is to be £3 millions, with 50 per cent. from public funds) is woefully inadequate. And in the earlier-established fields of home defence action is no more positive and public confidence no more pronounced. In London the auxiliary fire services are starved for lack of accommodation and equipment; they have a bare tenth of the stations needed and a mere fifteenth of the trailer pumps required; and, although just over half the firemen needed have been enrolled, training conditions in the main fire stations are seriously congested. The Home Office and the London County Council are at loggerheads about anti-fire policy as well as shelters; employers up and down the country are restive about the cost of protecting their workmen; and 40 million gas masks are becoming useless in private homes. Local authorities are looking for a lead. The whole community wants prompt action and a plan for real security; and, as the weeks pass without decisive steps being taken, the enthusiasm of volunteers is dimmed. No Cabinet can seem to gamble with the people's safety and survive.

German Submarines.—According to an announcement published on December 30th, the German Government has recently notified the British Government, in accordance with the procedure laid down in the Anglo-German Naval Agreements of June 18, 1935, and July 17, 1937, of its intention to exercise its rights of naval expansion under those agreements. Representatives of the Admiralty flew to Berlin and returned after two days' discussion, and a written explanation of the German motives is to follow. But there seems little expectation on the British side that Germany will be induced to modify her intentions—which are, apparently, to build up to the maximum strength allowed her in submarines by the Agreement of 1935, and in "A class" cruisers by that of 1937. Under the 1935 Agreement Germany agreed to limit her total tonnage to 35 per cent. of the total British tonnage, and for the most part the same ratio applies to each category of ship within the total; but (at the expense of other categories) Germany may, if she wishes, have parity in submarines. For the time, she consented not to go beyond 45 per cent.; to-day, apparently, she wants her full 100 per cent. In cruisers, Germany is entitled under the 1935 Agreement to five "A" class cruisers (of 10,000 tons, mounting 8-in. guns), but in 1937 she agreed to content herself with three unless "special circumstances" arose. It is these "special circumstances" (in the form of Russian construction) that have now arisen. The legality of Germany's present step is not in question; its technical

effect is discussed below; but its psychological and political effect cannot be left out of account, and in this intangible coin the material advantages of the new German move, however great in themselves, will be dearly bought. "Submarines," and *a fortiori* "German submarines," are words that still make English ears tingle.

Are the additional German submarines and cruisers aimed primarily against Great Britain or against Russia? It is here that the technical considerations come in. Germany at present can dispose of 54 completed submarines, of 20,263 tons, and 17 under construction, of 11,019 tons. Of those that are complete 32 are vessels of 250 tons, of limited radius of action, ostensibly intended for service in coastal waters and the Baltic, though some have been as far as the Mediterranean. British strength in under-water craft includes 54 completed craft of 57,349 tons, of which ten are old vessels of war design; and 15 under construction, of 16,780 tons. Taking the totals for each country, the German figure is 31,282 tons against the British 74,129 tons. Thus Germany is at present 2,000 tons below the 45 per cent. ratio to which she has hitherto restricted herself, though in number of units she has already drawn level. The Soviet Navy, ostensibly the excuse for the German desire to expand her allowance to 100 per cent., undoubtedly possesses more submarines than any other. Though no official figures are available, a careful estimate places Russia's strength to-day at 134 submarines in service and about 30 building. Not more than eight of these are of obsolete design, but about 40 are small vessels comparable with the German 250-tonners. There is thus some justification for the German increase—were it not for the fact that the answer to submarines is not submarines but destroyers. The Russian submarines may be the occasion for Germany's new programme, but it is British merchant shipping that is, inevitably, most directly threatened.

President and Congress.—The Congress to which Mr Roosevelt delivered (in person, as is his, and was Wilson's, custom) his annual Message on the State of the Union on Wednesday is far less likely to be amenable to his control than any of its three predecessors during his term of office. Mr Roosevelt, however, neither speaks nor acts as if he were prepared to compromise with his domestic critics. His nominations to the two vacancies in his Cabinet are eloquent of the continued firmness of his views. The Secretaryship of Commerce has been awarded to Mr Harry Hopkins, the New Dealer *par excellence*, and the head of the Works Progress Administration which, whether because of its enormous expenditure on providing work relief or because of its alleged excursions into local politics, has been more criticised than any other New Deal agency. The nomination for the Attorney-Generalship has gone to Mr

Frank Murphy, who as Governor of Michigan (he was defeated for re-election in November) gained the support of the unions and the suspicion of many other people by his lenient attitude toward "sit-down" strikes in the motor industry. Both these appointments have to be confirmed by the Senate, although for sixty years no President has been refused a free hand in appointing his executive assistants. But the confirmation will come with a bad grace, and what will be said before it is granted will not improve the relations between the Capitol and the White House.

* * *

These domestic disputes lend an added impressiveness to the general approval with which those passages of the President's Message which dealt with foreign affairs were received by his Congressional audience. The keynote of the Message was one of earnest warning—both to the American people lest they take with insufficient seriousness the threat to their liberties inherent in the advance of autocratic regimes, and to these regimes themselves lest they assume that the American democracy would not ultimately exert all its resources "to defend, not their homes alone, but the tenets of faith and humanity on which their Churches, their Governments and their very civilisation are founded." Although the President did not of course commit himself or the American people to deliberate intervention in the affairs of the world, still less of Europe, he did point out that, by her neutrality legislation, the United States was not merely not playing an adequate part in combating aggression, but through these laws "may actually give aid to an aggressor and deny it to a victim," and that "the instinct of self-preservation should warn us that we ought not to allow that to happen any more." America must be prepared for external action, more than ever now that "the world has grown so small and the weapons of attack so swift." There must be armed forces and defences, organisation of key facilities, and above all an "underlying strength of citizenship, the self-confidence, ability, imagination and devotion that give a State power to see things through." Already important Americans such as Senator Pittman have chimed in with agreement of the views expressed in the Message; and if Senator Nye, for instance, has made reservations on intervening against aggressors, he too has declared for amendment of the neutrality Acts. Details of the President's special message on defence recommendations and of other points in the Message will appear in *The Economist* for next week. But these brief references may serve to emphasise the fact that the President, who in the past has to his loss run ahead of American public opinion, is doing so no longer, and to make clear that the great changes going on at home and abroad will neither weaken President Roosevelt's domestic position nor the cause of democracy in the world.

* * *

The American Note to Japan.—If the Japanese really expected either China or the West to fall in with Japanese plans for a Japanese ascendancy in Eastern Asia, they have been sharply rebuffed on both fronts. Mr Wang Ching-wei, having issued a manifesto in favour of peace negotiations, has now been expelled from the Kuomintang for life; his own former supporters in the Government at Chungking have ranged themselves behind President Chiang Kai-shek; and the plot, if there really was a plot, to suborn the Governor of Yunnan, and so to close China's back door into Burma, seems to have miscarried. That is China's answer to Japan, and the answer of the West has been delivered, almost simultaneously, by the United States Ambassador at Tokyo in a Note which expresses the sentiments not only of America, but of all the Western democracies. The American Note explicitly and emphatically rejects the suggestion that the rights of third parties in China can be affected by Japanese claims based on the results of Japanese aggression. It rejects Japan's claim "to constitute herself the repository of authority and the arbiter of destiny in the creation of a 'new order' in

areas not under Japanese sovereignty." It further argues that the measures that Japan has been taking, on the strength of this claim, which the United States refuses to accept, constitute an unfair discrimination against American nationals and arbitrarily deprives them of their long-established rights of equal opportunity in China. The note includes an offer to negotiate with both China and Japan on the questions raised by the action that the Japanese have taken. This offer, however, is apparently not expected to lead to any very fruitful results; and the Note is written under the shadow of the reprisals which the United States has it in her power to take if Japan does not show herself amenable to courtesy and reason. The President has the power, under existing legislation, either to exclude Japan from most-favoured-nation benefits (as has already been done to Germany) or, if the discrimination continues, to exclude Japanese goods altogether; and, if Japan bought a trade monopoly of Eastern Asia at either price, she would be making a disastrously bad bargain. It is inconceivable that Japanese business men do not know this: all the same, Prince Konoe's Government has fallen, and what was thought to be the last defence of moderation has gone down before the coming of the fiercely nationalist Mr Hiranuma. Japan evidently means to spare herself no more than she will spare China.

* * *

France and Finance.—A casual observer of the course of the French Budget through Parliament might be excused for thinking that it was debated largely during the hours of darkness; and a more careful examination does not quite remove the feeling of nightmare. Back and forth between the Chamber and the Senate went the mutilated text, with the clocks ticking remorselessly toward the New Year until, on December 31st, Time had to stand still for twenty-four hours, with one Finance Committee doggedly cancelling out the other's work, with exasperation and exhaustion racking everyone except, it seems, the Minister of Finance himself—until at last M. Daladier pushed the Senate's amendments through the Chamber's Committee by making them questions of confidence. The main troubles were two: M. Reynaud's "axe" committee and the provision compelling banks to report on dividends collected for their clients. The first was the Senate's fancy, the second the Chamber's. Appointed to do precisely what its name implies, the Reynaud Economy Committee actually comes out little scathed. In its final form, after both Chamber and Senate had done battle over it, the clause relating to dividend reports obliges bankers to make a return, on February 1, 1940, of all dividends collected for customers in 1938 and in 1939, instead of making it, as its promoters desired, in the first quarter of 1939; but practical difficulties may be a bigger obstacle to the measure's effectiveness than the Senate's intervention. On Tuesday, as noted in our financial columns, the Bank Rate was reduced from 2½ to 2 per cent., and new financial proposals may be expected to benefit accordingly. With the Budget and two successful conversions launched, and with M. Reynaud's further ideas being considered by a public more disposed to be cheerful than for a good time past, the Government's position, and with it M. Reynaud's, is stronger than when they were appointed. But there can be no respite in determination. Much remains to be done. The working-classes have made and are making their contribution; it is now M. Daladier's duty and, indeed, supreme necessity to prove to them that they are not alone in their sacrifices.

* * *

New Year Honours.—The New Year Honours list is a routine roster, and it is seldom that the tradition of rewarding party services and administrative merit is appreciably departed from. Last Monday's list was only remarkable because the awards reflected to some degree the diplomatic dangers and excitements of the autumn—sufficiently so to secure the suppression of the list in the Prague press. Mr. F. T. A. Ashton-Gwatkin, who went with Viscount Runciman to mediate in Bohemia, was

made a Companion of the Bath, as was Mr Strang, who squired the Prime Minister on his aerial trips to Germany. Other awards were given to Sir Alexander Cadogan, Permanent Under-Secretary for Foreign Affairs; Sir Nevile Henderson, Ambassador in Berlin; Mr B. C. Newton, Minister in Prague; Mr F. R. H. Millar, assistant private secretary to the Foreign Secretary; and Mr J. M. Troutbeck, secretary at the Prague Legation. And the full list of 900 names included several A.R.P. and home defence workers. Apart from crisis credits, the outstanding items were the conferring of a Barony on Sir Maurice Hankey, until recently secretary to the Cabinet and repository of a generation's State secrets; the award of the Order of Merit to Sir James Jeans, the philosopher scientist, and, confirming the fighting services' strength in the Order, to Admiral of the Fleet Lord Chatfield; the conferring of the G.C.M.G. on Lord Hailey, whose monumental "African Survey" was a high-light of last year; and the appointment as Privy Counsellors of Mr R. A. Butler who has made a name (even under the shadow of Mr Chamberlain) as Under-Secretary for Foreign Affairs during the past ten months, and of Captain Crookshank, whose thankless task it was as Minister of Mines to ferry the battered Coal Bill wearily to port. On the whole 1939 was greeted with the honours list 1938 deserved.

* * *

Naval Changes.—No news is proverbially good news, and the silence of the senior fighting service has been comforting during months of hot debate about the progress of other arms. The smooth efficiency of the navy's mobilisation last September was welcome, but not unexpected, and not even the excitement lately caused by Germany's plans to increase her underwater and cruiser strength has brought to light any tales of naval deficiencies, though more medium-size anti-submarine destroyers will now be needed. Recent information suggests that the reorganisation occasioned in the fleet by the rapid development of air and artillery technique is proceeding according to plan. Eighteen months ago it was decided to transfer the Fleet Air Arm to the sole control of the Navy. Now it is announced that the personnel of the Air Arm will be increased from 3,000 to 10,000 by 1942, and that a new repair base is to be built for planes and aircraft carriers. The Navy has already seven aircraft carriers, and five more are being built, and since it is planned to furnish the Fleet with over 700 ship-borne planes, still more carriers will be needed, in addition to equipping all battleships and cruisers to carry aircraft. From next Monday the Admiralty's Air Material Department is to be strengthened to cope with repairs and maintenance and to co-ordinate the supply of equipment. It is the magnitude of these tasks and the recruitment of skilled maintenance personnel which makes the transfer of the Air Arm from the Air Ministry a long drawn-out job; when the four-year plan is completed, something like one-third of the fleet's man-power will be in the air or on the air ground staff; and, with its planes and anti-aircraft gunnery equipment, the British navy, which is reputed to have increased its fire-power by 33 per cent. in the last three years, will still be supreme in European waters.

* * *

Labour's Claims.—1938 can be written off in trade union annals as a much more satisfactory year than might have been expected in view of the sharp and steep recession which beset British industry and commerce. Wages continued to climb until after the middle of the year; there were no appreciable inroads into established pay and conditions; and the trade unions entered the New Year with a swollen membership of 5,000,000. The testing time is now due, for claims involving over 2,000,000 workers in the engineering, railway, hosiery and distributive trades are still pending. In engineering and on the railways the workers' demands have already been declared financially impossible by the employers. In the former case, where the claims would cost an extra £30 millions or so annually, the booming state of defence branches and the size of arms profits lend some force to the unions' case,

though it is evident that, over the whole of the industry, depression rather than prosperity is the keynote. If facts rule out large-scale concessions to the engineers, still more does the parlous state of railway traffics provide a cogent answer—in the negative—to the railwaymen's claims for an addition of some £6,750,000 to the companies' wages bills: the National Tribunal could scarcely reconcile these concessions with the "square deal" thesis. In hosiery, too, the employers have said no to a request for a 5 per cent. advance in wages; while the serious background of bad trade will hardly support the campaign of the Shop Assistants' Union to bring unregulated workers within the grocery, tailoring and footwear agreements won last year for 220,000 employees. The fact is that a period of depression is no time to seek higher wages. The tactics of the claims, however, may be, from the unions' viewpoint, sound. They are at the moment on the offensive; and proposals to reduce wages are surprisingly rare. Not even the railways, whose sufferings have been so widely bruited abroad, are likely to gain much support for cutting their labour costs; and the strength of the unions in 1939 may be seen, not in their power to secure higher wages, but in the employers' inability to obtain lower wages.

* * *

No Change in Palestine.—The proposed Round Table Conference of Jews and Arabs in London has not yet met, and the shooting in Palestine goes grimly on. The sensational events of the last few days have been the kidnapping of Mr Le Bouvier and the ambushing of Sir Charles Tegart. The kidnapping seems to have been an act of straight economic brigandage without political complications, and it has had, if not a happy, at least a non-tragic ending in the release of the prisoner in exchange for a ransom. The assault on the formidable Inspector-General of Police in Palestine was more audacious; and, while Sir Charles Tegart himself escaped with his life, his staff officer, Mr J. D. Sanderson, was shot dead while trying to remove the obstacle that had been placed across the road to hold up the car. The total casualties in Palestine, on both sides, like the social and political conditions which they reflect, approximate to those in Macedonia under Turkish rule during the decade immediately preceding the Balkan Wars; and it is impossible to understand the Government's delay in calling the Round Table Conference which they have substituted as a stop-gap in lieu of partition, after having sat on the Peel Commission's Report for a whole year before that. The one thing certain about the situation in Palestine is that time has told, is telling, and will continue to tell heavily against us. The Government ought to concentrate on getting, as rapidly as possible, a settlement which would safeguard the Jews already established in Palestine. For the creation of a new Jewish community on the grand scale, they must find some quite different territory, of large extent and with a sparse native population.

No Decision in Catalonia.—Fifteen days of battle have brought General Franco a good deal of success: they have carried his troops, it is reported, into Artesa, across the plain of Urgel, and in the southern sector to the outskirts of Borjas Blancas. His casualties are unknown, but must be large; his advance useful, but far from decisive. Once again there is emphasis on the power of the defence, of men sitting behind machine guns in strong positions, to hold up the advance even of mechanised troops. Where the defence has given way, various factors are responsible:

BRITANNIC ASSURANCE COMPANY LIMITED

(Established 1866)

Annual Income : : : : £6,700,000
Assets : : : : £30,000,000
All classes of Life, Fire, Accident,
Motor and General Insurances transacted

Chief Office: BROAD STREET CORNER, BIRMINGHAM

first, the initial violence of the attack, developed with great energy at a number of different points, would in any case have gained ground; and, secondly, it appears that the pocketing tactics, which the Insurgents have practised elsewhere, were favoured by the broken nature of the country. The Italians found an exception to this when they ran their heads against Colonel Lister's brigade in the Urgel sector: here it was a case of successful "defence in depth," and for days the Navarrese under General Solchaga, operating to the south of the Italians, were forced to mark time in case their left wing lost contact. Perhaps the most important factor in the battle is the state of Republican morale: this would seem to be undaunted, and now that the first rush of attack has passed, the defenders will be fortified by the knowledge that time is on their side, and that with every day they hold out General Franco's force grows weaker.

* * *

A Roumanian Richard II.—The "Front of National Renaissance" in Roumania continues to receive daily additions to its party roll; and this now includes many of the country's leading politicians, although important names are absent—those, for instance, of MM. Dinu and Jorge Bratianu, of M. Maniu and of Professor Jorga. The new single party, Fascist in appearance, merely puts into theory King Carol's political practice since the meteoric rise and fall of M. Goga last winter; and it is a tribute to the King's perseverance and political talent that, after years of compromise and intrigue with and against Liberals, National Peasants, factions like the Cuzists and the Roumanian Front, and latterly the Iron Guard, he should at last bring into being his own ideas on what Roumanian government ought to be. The general lines of the new party, if not the finished constitution, are now available. Membership will be open to Roumanian citizens over 21 (except soldiers, certain civil servants, and Jews; but including Magyars and Ukrainians): and in elections only candidates nominated by the party will be permitted to stand. The hierarchy will graduate downwards from the King, who is now supreme executive head of the State in name and in fact. With ministers under him such as MM. Calinescu and Gafencu, he may in time be able to "clean up" Roumanian politics. His task now is to sit securely in the seat of power. It remains to be seen whether the peasants will stand for losing what small political liberty was left to them; whether the King will be able to carry on a totalitarian economy without the co-operation of those members of the old Liberal Party who have not yet "made their peace with him"; and, again, whether he is capable of evolving a "corporative" system which will neither strangle those it seeks to govern nor itself be strangled by sheer pressure of events. If he fails, it will be largely his own fault; and if he succeeds, democrats may be consoled by the reflection that, so far, the King has shown himself a wise tyrant who, if not up to Platonic standards, at least is incomparably better than a Goga or a Codreanu.

The Italian Budget.—The following tables show the course of Italian public finance in recent years, and the new Budget estimates:—

	Years to June 30					
	1935	1936	1937	1938	1939	1940
	Estimates					
Revenue	18,817	20,371	24,702	20,597	25,072	24,561
Ordinary expenditure	14,670	16,142	23,413	23,770	25,035	29,316
Surplus (+) or Deficit (-)	+ 4,147	+ 4,229	+ 1,289	- 3,173	+ 37	- 4,755
Extraordinary expenditure	6,177	16,915	17,519	9,000*	?	?
Net Deficit	2,030	12,686	16,230	12,173	?	?

* Estimate made by Minister of Finance on May 18th.

EXPENDITURE ON DEFENCE AND AFRICA
(Million lire)
Years to June 30

	1935		1936		1937		1938	1939	1940
	Ordinary	Ordinary and Extraordinary	Ordinary	Ordinary and Extraordinary	Ordinary	Ordinary and Extraordinary	Ordinary	Ordinary	Ordinary
Army	2,476	3,014	2,371	7,452	2,627	9,439	2,491	2,591	3,406†
Navy	1,164	1,314	1,612	2,852	1,767	3,424	1,793	1,943	2,704†
Air Force	725	886	849	2,319	1,046	3,708	1,250	1,265	2,165†
Africa	8	945		4,136	13	7,182	1,614	1,785	1,897
Total	4,373	6,159	4,840	16,759	5,453	23,755	7,148	7,584	10,172

† Total ordinary defence expenditure is estimated at 8,275 million lire, but another 1,750 millions have been allotted, if required.

Conclusions which legitimately may be drawn from figures that always require careful handling reveal a rather dark picture, and point to the drastic consequences on poor countries of the international arms race. The figures for 1938-39, the third "post-war" year, when expenditure in Spain was still high though definitely falling, show a paper surplus of 37 millions; and reckoned against the unannounced extraordinary Budget, this means a deficit of perhaps 6 to 8 milliards. It was thought earlier that extraordinary expenditure would be less than in 1937-38, but this calculation may have been thrown out by the additional 1.2 milliards allocated recently for new armaments. The estimates for 1939-40, when actual war expenditure may be put very low, show a paper deficit of 4.7 milliards (about £52 millions at par). This deficit may be attributed to three main factors: increased defence estimates, new capital expenditure related to self-sufficiency plans, and, less certainly, an inclusion of at least part of the extraordinary Budget in the ordinary Budget. The latter assumption rests on the decision to show a paper deficit after years of paper surpluses in times of high extraordinary expenditure, and, if true, may mean either that expenditure is really being cut down or that the extraordinary estimates are being kept low in anticipation of a possible emergency. Signor Mussolini's root problem, now that his series of capital levies has been completed with the levy on private businesses of last November 7th, is to find sources of revenue with which to cover this extraordinary expenditure. Balancing the Budget on paper may cause him small worry: finding hard cash is another matter. That search for hard cash must at bottom depend for success on increased production and on improved foreign trade. And for neither of these desirable things are the signs very favourable.

* * *

Economies at Geneva.—The world is re-arming: and the League of Nations, by a natural contrast, is cutting down expenses. The diplomats have gone home: now it is the turn of the officials; and at least some of the lights Mr Churchill has spoken of will now go out. Count Carton de Wiart's special committee on League expenditure, which met recently in Brussels, recommended last Friday that salaries and charges be reduced by 6,750,000 Swiss francs (at present rates about £335,000), thus bringing down the 1940 Budget to 25,500,000 francs; and it is unlikely that the Assembly, when it discusses these recommendations, will do more than comment on them. The cuts will be made partly by combining some of the League's fifteen sections into three administrative groups. The political, disarmament, minorities, and mandates sections, in which the highest mortality among officials may be expected to fall, will form the first group; the economic, financial, and transit sections the second; and the opium, social questions, and health sections the third. A number of special expenses planned for 1940, including exhibition at the New York World Fair, anti-epidemic work in China, and a sum for settling Assyrians in Iraq, will be cut down or cut

out to save 3,685,000 francs. The I.L.O. will suffer by a reduction of 1,065,000 francs, or about one-tenth of its revenue, but it is not yet clear how this will affect its work. It is to be hoped that the economies will not be undertaken with any unnecessary rigidity of application. Some of the League's functions are clearly in abeyance; but the usefulness of others, especially those performed by the economic and financial sections, has in no way been reduced by recent events, and it would be false economy to limit their sphere of work.

* * *

Road Haulage Vehicles.—In view of the railway claim for a "square deal" as between road and rail freight carriage, the following figures, which have recently become available, are of interest. They show the number of goods vehicles operating under each type of licence, the "A" licence being for full-time public hauliers, the "B" licence for part-time public hauliers and the "C" licence for traders' own vehicles: the "A" contract licence covers vehicles reserved exclusively for one particular hirer, and such vehicles operate under conditions more closely approaching the "C" licence than the "A" licence.

	No. of Licence Holders			No. of Vehicles		
	April, 1936	June, 1937	June, 1938	April, 1936	June, 1937	June, 1938
"A" licences	25,648	23,750	22,999	85,337	83,626	83,749
"A" contract licences	2,084	3,267	3,967	5,156	7,475	9,467
"B" licences	34,100	34,061	34,120	52,809	53,775	54,906
"C" licences	161,221	186,481	178,298	316,714	362,380	365,025
Total	223,053	247,559	239,384	460,016	507,256	513,147

The number of "A" (public haulage) licence-holders has fallen by 751, but there has been an increase of 123 in the number of vehicles under "A" licence. This would appear to be due to the fact that the number of vehicles owned by the railway companies, practically the whole of which are operated under "A" licences, have increased from 9,709 in June, 1937, to 10,257 in June, 1938. This means that, for the second year in succession, there has actually been a fall in the number of public goods haulage vehicles which may be competitive with the railways.

* * *

Births, Deaths and Diseases in 1936.—The Registrar-General's annual statistical review of England and Wales for 1936, which has just been published (not before its time), provides no striking new information bearing on the course of fertility and the future of the population. For that we shall have to await the new statistics, which have been collected since July 1st last under the recent Population (Statistics) Act. But it contains a wealth of varied facts about births, deaths and marriages. Particularly interesting is a special examination of the connection between occupation and mortality. The inquiry, which relates to the years 1931-34, reveals that "the effects of the older and heavier industries upon the health of towns, which grew up around them, though less than in 1911-14, are still apparent." Tyneside, the coastal towns of Durham and the county boroughs, a considerable proportion of whose population is engaged in the textile industry, seem to be among the least healthy parts of the country. The most healthy towns, as one would expect, are at the sea-side; next to these come inland towns in which there is little mining or manufacturing, and London's outer ring. Maternal mortality showed a welcome, though not necessarily significant, drop in 1936. But the risk of death in child-birth is still little lower than before the war and there are striking variations from region to region. The risk is highest in South Wales, where it is between two and three times as great as in Greater London. The infant mortality rate (ratio of deaths of children under a year to total live births) moved in an opposite direction to maternal

DEATHS FROM INFLUENZA PER MILLION
POPULATION (ENGLAND AND WALES)

deaths, rising slightly in 1936 as compared with the preceding year, but it is still about half what it was before the war. The decline in infant deaths has been progressively greater throughout the first year of life. Infant mortality is still lowest in rural areas, but the handicap of the urban child has diminished and is diminishing. Among causes of death, at all ages, it is interesting that, while measles and other infectious diseases take a larger toll of life in the urban areas, the death rate from influenza is much greater in the countryside. It is also a curious feature of influenza that in January, February and March it has a high death rate, which varies tremendously from year to year, but in the remaining months the death rate is low and fairly stable.

* * *

New Laws.—Preoccupied by defence, foreign policy and crises overseas, Parliament found little time last year to add outstandingly to the Statutes of the Realm. The major achievements were won away from Westminster; in the agreement with Eire, which went a long way towards ending more than a century of strife; and in the trade treaty with the United States, which shone like a good deed in a naughty world of autarky and economic warfare. Yet the King's Government went on and, measured by the Acts which came into force with the New Year, last year's legislation was not inconsiderable. Once more the chief item owed its passage to the pertinacity of a private member. On January 1, 1938, it was Mr Herbert's Matrimonial Causes Act which took pride of place. Last Sunday it was Miss Ellen Wilkinson's Hire Purchase Act, which will regulate activities turning over more than £100 millions a year and affecting something like 50 per cent. of the population. The Act's aim is to prevent abuses and not to restrain trade, and reputable hire-purchase firms, as well as hirers, will be the gainers. The man or woman in the street will also benefit from the Administration of Justice (Miscellaneous Provisions) Act, which, while it effects none of the radical reforms in judicial procedure for which some critics call, will improve the competence of Quarter Sessions by encouraging the appointment of paid chairmen, simplify procedure in the King's Bench Division of the High Court, and extend the jurisdiction of county courts. Still more clearly will widespread gain be derived from the Widows', Orphans' and Old-age Contributory Pensions (Voluntary Contributors) Act, actually a legislative legacy from 1937, which alters the age limit for voluntary entrants into the scheme and increases contributions, and under which specially advantageous terms were given to entrants on or before last Monday. The Young Persons (Employment) Act will fill an important gap in factory and workshop legislation by fixing a maximum working week, meal-times and half-holidays for some 60,000 errand boys, page boys and cinema operatives under the age of 18. In all, the New Year list of new laws, which also includes Acts to regulate nursing homes and the registration of still-births in Scotland, if scarcely exciting, at least epitomises the detailed day-to-day provision which the care of a modern community imposes upon its representatives.

United States

Anglo-American Comparisons

NEW YORK, December 24.—At the end of 1936, the Dow-Jones average of industrial share prices was about 190, and the Federal Reserve Board's index of production stood at about 120. At the end of 1937 the Dow-Jones average was about 125 and the index of production about 80. At the end of 1938 the Dow-Jones average was about 150 and the index of production about 100. During this period of two years, long-term Government bonds were unusually stable, with a general tendency to rise. At the end of 1936 an issue of long term 2½ per cent. bonds was made; while at the end of 1938 an issue of long-term bonds was made at 2½ per cent. But the period of maturity had lengthened, and the type that commanded 2½ per cent. at the end of 1936 enjoyed a market two years later in the vicinity of 2 per cent.

The past two years have witnessed certain interesting cyclical phenomena. While the downward trend of production was not decisive until the autumn of 1937, there were certain ominous warnings that came before—in particular, the fall in commodity prices and building activity in the second quarter of 1937. In the same way, while the upward trend did not appear until the third quarter of 1938, it came after an upward trend in building in the second quarter.

It is possible to draw certain parallels and contrasts between the British and American economies during this period. Between August, 1937 (when the market touched a figure only a little under the winter high-point), and June, 1938, our share market fell almost exactly 50 per cent., but the recovery has left it at the end of 1938 about 25 per cent. below the general level of the winter of 1936-37. Indices of British share values show a current level of about 30 per cent. below the level of two years ago. Thus the net change in the two markets in two years has been almost identical; but while our market has undergone a 50 per cent. collapse, followed by a 50 per cent. recovery, British shares sagged gradually until about March, 1938, and then flattened out. Oddly enough, the three distinct breaks in the British share market in 1938 (the slumps in March, May and September) had counterparts in the American market; one difference is that in London each of the slumps was associated with international political crises, while in America the March and May declines were attributed to the state of domestic business.

Contrasted Economic Trends

In production, it appears that the American decline came before the British. It was sharply reflected in the index for the third quarter of 1937; and although there was some setback in England at about the same time, recession was not thought to have really set in until the end of the first quarter of 1938. The improvement in British industry in the closing months of 1938 could not be compared to the meteoric uprush across the Atlantic. Yet just as the end of 1938 finds American economic activity about 15 per cent. below the peak of the previous comparable period, so the end of 1938 finds activity in Britain below its usual seasonal level by a somewhat similar figure. In production as in the share market, we arrived at our goal by a dizzy collapse and sharp rebound; in England it was reached by a slow sag and a subsequent levelling-out.

In the case of the long-term interest rate in the two countries, there would appear to be a real divergence. Thus, in the past two years, the rate on long-term Government securities in England has risen by something like ½ per cent., while in the United States it has fallen by a somewhat smaller fraction. This leaves British War Loan close to a 3½ per cent. current yield, while the longest-term United States Government bonds currently yield 2½ per cent.—an apparent difference of about ½ per cent. In 1937 and 1938 a perceptible hardening of the long-term rate in London, and a softening of it here, has been evident. But one could as readily argue that the net effect of the two movements has

been rather to bring the two rates into closer alignment than to make them diverge. This is the more remarkable in the absence of much direct communication between the two markets. There is, of course, a good deal of communication between the share markets of New York and London; and for some time it has been believed in New York that, on current dividend, the London market was the lower of the two. But as share prices are commonly affected by thoughts for the future as well as for the present, and as earnings and dividends here are supposed to be rising, this belief is not carried beyond the point where the difference between the two markets does not of itself portend a flow of capital from London to New York. This is quite a different situation from that prevailing, say, in the last half of 1936.

New York and London

Beginning at the end of 1936, there has been one rather distinct change in relations between New York and London; that is that the sterling exchange is about 30 cents, or about 5 or 6 per cent., lower now than it was then. This may be ephemeral; but all the items considered in this retrospect—share prices, bond prices, production indices—are subject to change; and the argument is that only relatively long swings in these items can afford any basis for considered conclusions, and then only after they have for the most part receded a little into the past.

A retrospect such as this should not entirely omit reference to commodity prices. But commodity prices, once one of the stock items of international comparison, are now of dubious comparative value. Even where true international markets still exist, the forces which control them largely vitiate attempts at comparison. If the Board of Trade index is compared with that of the Bureau of Labour Statistics, it will be seen that our price rise started later in 1936, advanced less, began to decline a little sooner, and in 1938 was apparently stabilised earlier. The net result is that our index (78 in October) is firm, or 6 per cent. below November, 1936, while the Board of Trade index in October was almost the same as in November, 1936. The two indices are not at all comparable in structure; but their general movement has been distinctly similar.

It would seem that in the broad swings the American and British economies move together; but that in the shorter swings they are capable of independent movements probably of greater amplitude and disparity than formerly. In the past decade both countries have made great strides in the direction of economic self-sufficiency; but they seem still fated to share a good deal of common economic experience.

In London one often hears the expression that British recovery or depression "depends" upon America. The record does not give much evidence of this. Rather it shows that the two economies interact on each other; that, at any given time, either of them may be exerting the decisive influence; and that the two still have a certain tendency to move in the same general direction without the leadership ever being very clear.

France

The Government's Strength

PARIS, January 5.—The latest speeches of M. Paul Reynaud threw new light on his methods. His objective is to increase industrial production in order to meet the huge public expenditure as well as to face totalitarian re-armament. The means is the granting of credits. Newly-created francs, however, might be used for speculation against the franc; the right course, therefore, is to anchor capital in the country; and this can only be done by a firm and strong policy at home the same as in foreign affairs.

So far, the Daladier-Reynaud Government has shown a firm attitude, and political developments have given them opportune, if unexpected, help. Thus the Italian claims

Incorporated with Limited Liability under the Laws of the U.S.A.

welded the French people in unanimity because of their overweening audacity, and enabled the Prime Minister, two months after Munich, to answer them in a way which again inspired confidence.

Firmness in the foreign field must be backed by firm decisions in internal affairs. Here, too, the Government received unexpected help: the Socialists made a resurrection of the Popular Front impossible by allying themselves with the Communists in a policy of meaningless obstruction, so that, after the fiasco of the general strike, M. Daladier was able to get a temporary majority without serious difficulties, the Left wing of the Radical Socialist party being powerless.

Many observers now say that the Cabinet should be able to remain in power until the Presidential election in April at least. However that may be, the Budget was passed in due time—by an augmented majority in the Chamber. The decree-laws have been passed, including even the setting up of the now notorious Economy Committee, which is a most significant victory in the eyes of those who appreciate the part played by civil servants in electoral contests.

The political influence of State employees has been one factor in the recent development of French étatism—mainly under a Socialist Government. Public expenditure rose from 44,000 million francs to 64,000 millions between 1935 and 1938, and there was a rise of 6,000 million francs in expenditure on local undertakings, at the same time as the cost of re-armament was increasing by 19,000 millions. Road expenditure amounted to 279 millions in 1938 against 74 millions in 1928, and school building charges were 544 millions against 80 millions. All these charges added to the cost of social services and labour reforms, explain why “a ton of submarine costs 55,000 francs in Great Britain and 90,000 francs in France.” Economy is essential, urges the Minister of Finance, in a country which has just been called upon to bear an extra tax-burden of 35,000 million francs. The Economy Committee has been authorised to make recommendations which will be put into effect by decrees issued by the Council of Ministers before September 30, 1939.

Fresh Steps to Revival

The comparative calm in foreign affairs, the temporary stability of the Government and the reorganisation of State administration which is proceeding, make possible new efforts to revive business. These operate in three directions. First, the Bank of France has again lowered its rediscount rate, this time to 2 per cent., the lowest for two years and the same as the English bank rate. Secondly, fresh regulations have been issued about the application of the 40-hour week; these virtually introduce a 42-hour week in retail trade, a 42 to 44-hour week in the chemical industry, a 45-hour week in catering, and a 50-hour week in other provision businesses. The five-day week is abolished in every case where business is in direct contact with the public, but it is retained wherever its retention presents no obstacle to increased production. Thirdly, three decrees will be published which will tend to lessen the burden of taxation, with a view to developing private investment and fostering exports. Thus, the tax on industrial debentures issued before August 15, 1939, for 20 years will be lowered by 50 per cent.; and bonds issued by banks to finance export trade will be exempted from income tax altogether.

Germany

Trade Discussions

BERLIN, January 2.—At the end of this week, Herr Funk, Minister of Economics, will go to Rome. At the same time, trade discussions will take place between German and Italian delegations which will cover technical questions about the current trade agreement and also the possibilities of further development of mutual trade. Herr Funk's visit has no special political significance, and it certainly has no connection with Mr Chamberlain's trip to Rome next week. According to reports, Herr Funk will discuss the possibility of permitting increased numbers of Italian building and agricultural workers to come to Germany in the New Year. Last year Germany temporarily employed some 30,000 Italian farm labourers.

Germany has concluded a new trade agreement with Czecho-Slovakia which is expected to be the first step towards an entirely new orientation of Czecho-Slovakia's foreign trade. In the new agreement Czecho-Slovakia has made several concessions in Customs duties in favour of the Reich akin to those formerly given to Austria, and the outlook

for German sales in Czecho-Slovakia has been accordingly improved. Czech exports to Greater Germany will be limited to goods to a value of Rm. 150 millions in all, and will mainly consist of raw materials, semi-manufactured goods and foodstuffs, though a limited amount of metal goods and machinery will be included. The total of Rm. 150 millions is 30 per cent. less than the average value of Czech exports to the Reich in the past, which is due to the transfer of the Sudeten districts. Czecho-Slovakia will export 6,000 wagons of wheat, 3,000 wagons of barley, 7,000 wagons of oats, 4,500 wagons of wheat-flour and 1,500 wagons of beans, to a total value for agricultural products of Rm. 35 millions. The quantity of Czech exports to Germany of beer, spirits and timber is also fixed. On the other side, German deliveries of coal to Czecho-Slovakia are limited to a value of between 800 and 900 million Czech crowns.

The trade agreement concluded last March between Germany and Russia has now been extended to the end of 1939 without amendment. In spite of the provision of an export credit of Rm. 200 millions (which has not yet been fully used), German exports to Russia between January and September have further fallen, and at the same time Russian sales to Germany have been severely reduced. The following table shows the course of Russian foreign trade with her most important customers. The values are in millions of roubles (one rouble to 47 pfennigs):—

	JANUARY TO SEPTEMBER			
	Imports		Exports	
	1937	1938	1937	1938
(Million roubles)				
Germany	180.3	43.9	84.1	67.5
Great Britain	145.3	158.8	376.2	167.6
British Colonies and Dominions	53.5	81.4	24.4	7.6
U.S.A.	184.2	312.9	107.6	67.2
France.....	19.6	31.3	58.9	44.3
Netherlands (including Netherlands East Indies)	74.7	73.8	72.0	63.8
Belgium-Luxemburg	49.2	47.9	82.0	96.8
Iran (Persia).....	59.8	61.9	70.6	54.1

(Figures from Russian statistics)

German-American Relations

Although the German Press campaign against the American Government and the speeches of leading American statesmen is still couched in the strongest terms, seeking to represent the United States rejection of the German protest as the result of Jewish intrigues, there is no intention, according to reports from official circles, of breaking off diplomatic relations. It is not thought in Berlin that the United States would take steps to bring about a rupture on her own responsibility. On the other hand, it is not expected that the Ambassadors of the two countries will return to their posts in the near future.

It is pointed out officially that in the first half of 1938 Germany took American goods to the value of Rm. 185.4 millions, while she exported to the United States only Rm. 67.5 millions of goods. According to an official estimate, in the whole of the year 1938, Germany imported North American goods, chiefly raw materials, to the value of about Rm. 400 millions, paying in gold or free exchange; and it would accordingly not be to the interest of the United States to break off diplomatic relations, interrupt trade and lose eighty million German customers.

It must be mentioned that all the resources of German propaganda are being used to represent the outcome of the Lima Conference (which undoubtedly fell short of the United States' expectations) as negligible, and thus to split the unity of the American Republics. These tactics show how very uneasy Germany is about South American markets for her goods and about the prospects of obtaining raw materials and foodstuffs from South America.

Tasks Ahead

Herr Hitler outlined in his New Year message the future tasks of the Third Reich. First stands the education of the people in the idea of the National Socialist community. The second task is more concrete; it is the further strengthening of Germany's defensive power. It is not to be expected that Germany would reduce the *tempo* of her armaments and at the moment this is still rising. In this connection the British-German naval discussions are important. It is more than probable that Germany will develop her fleet to a greater extent in the future than in the past and, in particular, will try to secure parity with Great Britain in submarines.

Herr Hitler also mentioned the Four Year Plan, which is to be extended. Press comments and New Year articles by important people consistently emphasise the need for

strengthening the Reich's business and financial position. The labour shortage must be ended by utilising all reserves and rationalising methods of work. Productivity must be increased by more efficient organisation and by the regulation of investment according to national needs. Capacity and supplies must be rationed according to State requirements, export needs and the needs of domestic consumption.

Last Sunday, a new ordinance dealing with hours of labour came into force. It applies to all workers over eighteen years of age and to all types of undertaking. It retains the principle of the eight-hour day, but permits the working of a maximum of ten hours per working day. It will be possible under the ordinance for working time lost on account of holidays to be made up by overtime on other days, and extra pay will be given for such overtime.

Also on January 1st, a new Exchange Law came into force which was largely a codification of the numerous regulations already existing. The exchange laws have now been fully extended to include Austria and the Sudetenland. In general, no material alterations have been made. The liability to hand over foreign exchange to the authorities has been tightened up, and penalties for evasion have been made more severe all round. Similarly, the regulations to prevent the export of capital have been supplemented by more severe penalties. Business men and others who want to use cash abroad for the purchase of goods, to pay hotel, travelling or maintenance expenses, will have to apply for a formal permit before setting out on their journey.

Belgium

A Troubled Year-End

LOUVAIN, January 3.—Belgium did not finish the year 1938 very brilliantly. The Government emerged much weakened from its difficulties; and one wonders whether a big change will not be necessary in the near future. One of its ablest members, M. Max Leo-Gérard, Minister of Finance, has gone, and has been replaced by M. A.-E. Janssen, who has declared that he will carry on his predecessor's policy. Like M. Gérard, he is a partisan of the strictly balanced Budget and of a policy of economy; and this being so, it is not clear why M. Gérard ever left the Cabinet.

The Government has tried to balance the ordinary Budget and to reduce extraordinary expenditure to a strict minimum—and this, according to Belgian custom, is to be covered by a loan. Thus the amount of the 1939 extraordinary Budget has been brought from 2,500 to 1,600 million francs, a sum which includes about 500 million francs for extraordinary expenditure on re-armament. It appears, however, that anti-aircraft defence will need some additional hundreds of millions. The mobilisation in September cost Belgium 125 million francs (about £800,000), and this charge is to be covered by temporary taxation.

During the international crisis in September the Belgian Government found itself short of funds. But after the Munich Agreement the Government was able to issue successfully a loan of one milliard francs, thanks to which the Treasury's cash balance have been converted into bullion bought from the National Bank of Belgium; and nevertheless the Government ends the year with a liquid cash balance of 600 millions.

From the monetary point of view the position of Belgium has improved during the last six months; and the National Bank has got back the whole of the gold that was lost through the panic of May, 1938, when the French franc fell. At that time, Belgium had to export gold to the value of four milliard francs. More recently, when the pound sterling fell against the dollar, it was debated in Belgium whether to abandon the gold-standard and attach the Belgian franc to the pound sterling at its present-day value, that is, without any appreciable devaluation. This view is often found out amongst exporters, particularly those in the textile industry, who suffer a good deal from the fall of the pound. Politicians and the public in general, on the contrary, remember previous falls and energetically reject this suggestion. The Minister of Finance has recently declared that no action in this direction need be taken at present. Business circles realise, though, that attachment to the pound sterling would bring many advantages, and that sooner or later it may be inevitable.

Coal Trade Depressed

As well as the textile industry, which is suffering a slackening of exports, the coal industry is in difficulties; and these have been accentuated by Government intervention. At the time of the strike movement in France in 1936, the Belgian Government accepted the principle of the forty-hour week for those industries in which the work is hard. A first step in January, 1937, brought working hours in the coal industry down to forty-five. Decreasing production was thus added to working difficulties which already existed. The Government also made statutory certain voluntary wage increases previously granted to miners in prosperous times. By reducing imports and establishing an import tax, the Government has kept the price of coal at an artificial level; but in spite of this, the situation of a number of mines remains precarious. Meanwhile, the coal-consuming industries complain loudly of enhanced fuel prices; and in that respect the situation in Belgium is clearly abnormal. From time to time the Government has had to face the menace of labour trouble in the coal mines, and concessions made on that account have meant the imposition of uneconomic conditions.

The iron industry has a brighter outlook and for several months has noticeably revived.

It is rather surprising to find signs of revival in the statistics of the export trade, which, for the last two months, October and November, 1938, reveal an increase in almost all sections. Notwithstanding that improvement, unemployment shows an increase which was not expected. The effect of that increase on Budget prospects is not to be neglected; and the Government is accordingly anxious.

Spain

(From a Correspondent recently in Barcelona)

The Morale on Both Fronts

PARIS, January 3.—While the food question is acute in Republican Spain, I find no evidence that it is undermining the morale of the civil population. The report that the United States would send quantities of food has had a cheering effect; the new Franco push is taken with the same stoicism that has marked other military operations; and everybody realises that the Insurgents are still far from Barcelona. There is a general feeling of optimism that they will never get there.

The recent reports of dissensions on the Insurgent side seem to confirm news which has appeared in Barcelona: The view is taken there that the war is still a political rather than a military problem; and the military plan is rather to frustrate the enemy than to gain spectacular victories—on the assumption that if General Franco can be fought to a standstill, it will mean his ultimate defeat. Unable to compose differences within his own ranks, it is argued, General Franco will meet with resentment on several grounds: on his failure to win the war, for instance, and on the presence of foreign troops.

Moreover, a great many of General Franco's "followers" have a revolutionary spirit not much less warm than that of the hated "Reds." Lukewarm in their acceptance of Monarchism and the Church, they perfunctorily accepted them as part of the war formula. The Loyalist Government, so one of their Ministers has told me, have "friends" working on the other side trying to convince "well-meaning Spaniards," particularly of the revolutionary type, that there is little difference between their aspirations and those of Republican Spain, as embodied in Dr Negrin's thirteen points.

The most important of Dr Negrin's points are the absolute independence and integrity of Spain; a popular Republic and a vigorous State; full guarantees for civil and

The OCEAN

Accident & Guarantee Corporation, Limited
Head Office: 36-44 Moorgate, London, E.C.

FOR ALL CLASSES OF INSURANCE

religious rights; a plebiscite after the war; protection for property and producers, and especially for small property holders; thorough agrarian reform and advanced social legislation; and finally, "an ample amnesty for all Spaniards who desire to co-operate in the work of reconstruction," together with "renunciation of vengeance and reprisal."

While Government supporters are hopeful of results, they have no illusion that the reconciliation, if it comes, will be easy. The reactionary, or at best the ultra-conservative wing of General Franco's followers, may be expected to resist to the last. Like the General himself, they realise that only a complete military victory will yield them the high stakes for which they are playing. Spain is a land of surprises; no one can foretell what will come out of the peace gestures.

National Pride

On both sides Spanish pride has been deeply wounded by the foreign invasion. This is even true of many on General Franco's side, who feel that, having gone so far, they cannot now draw back. This pride, always to be reckoned with in Spanish psychology, is a real factor in explaining the tenacious resistance of the Republicans. At Barcelona, where it is felt that Spanish pride may in the end help to unite all "well-meaning" Spaniards, the Government is trying to make the war a question of Spanish honour; and, as President Azaña remarked in his latest public pronouncement, "in no nation in the world does one so roundly repeat 'a question of honour' as in Spain."

On the important question of morale, looked at from both sides, one finds that while the wear and tear of thirty months' campaigning has taken the freshness from those Insurgents who have done most of the fighting, the Government's army, recently reorganised, is in fairly good condition. To one who has rubbed elbows with the Government's forces, it seems that their morale is high. From the beginning the Government has insisted that the army should be well fed and clothed, while the effects of discipline and unification, as demonstrated in increased powers of resistance and even of attack, such as were witnessed in the Ebro crossing last summer, have raised the men's confidence. They no longer feel that they are fighting for a lost cause.

Civilian Discontent

Among the civilian population the Government have to cope with indifference and even disaffection, side by side with full-hearted enthusiasm. Small shopkeepers and their kind, although usually Republican and liberal, see their businesses reduced to nothing by the fortunes of war. Thousands of small grocers find that the co-operatives and the Government's rationing regulations are taking away all their trade. Unable to obtain foodstuffs on any terms, they, of course, have none to sell. In many cases they suffer for their own misdeeds, for the Government have found it necessary to cut off all supplies during the war period as the only way of stopping hoarding and profiteering.

The rich man's pesetas buy no more food than the poor man's in Republican Spain these days, although people with friends beyond the frontier can have food sent to them, and great quantities of food do reach Spain in this way. But those whose trade suffers from the war with difficulty conceal their indifference or even their wish that the war should end with a Franco victory. The Government seeks to reassure them by pointing out that their difficulty is only temporary and that under more normal conditions they will be amply protected.

Thousands of sympathisers with General Franco who remain in Government territory incur repeated accusations that they are engaged in espionage and in attempts to undermine civilian morale. Just after the successful Franco push on the Aragon and Catalan fronts last March, when it seemed that the Insurgents might soon be in Barcelona, many of their sympathisers came virtually into the open and began organising a "Fifth column." Their boldness went to the length of making covert threats against those with whom they had been in daily and friendly business relations. The authorities retorted by wholesale arrests, and, as is usual in such cases, police activity threatened to become an epidemic. There are many authenticated cases of needless imprisonment and suffering inflicted upon perfectly innocent persons, but happily this period is past, and the military police, known as the SIM (*Servicio de Investigación Militar*), is now becoming more moderate.

This varying civilian morale should not be taken as threatening disintegration; the parties supporting the Government, from Syndicalist and Socialist to Catalan and Basque, are still united and loyal. Such opposition as there may be does not play an obtrusive rôle, but rather one of imposing a salutary check upon the Ministry.

Among supplies for war manufacture the cotton supply is

of prime importance. At the outbreak of the war the Government had in hand about 125,000 bales, of which 60,000 were American, 35,000 were Egyptian and 30,000 Indian, the whole being worth about £170,000. This sufficed for the first year's needs, with perhaps some surplus. The Government has since been able to import Russian and Indian cotton in moderate quantities. Some months ago some 20,000 bales of such cotton were seized at sea by General Franco.

Here in Paris I learn that the Franco Government, which has been buying cotton as a Governmental activity, is restoring this trade to private hands, which is expected to stimulate purchases.

Japan

War Aims

TOKYO, December 7.—During the first months of the Sino-Japanese war it was fashionable for Japanese to express concern to foreign friends and acquaintances lest Japan's "real intentions" might be misunderstood abroad. Since that time a good deal of new light has been cast by the course of events on Japan's actual designs in China. And the position has been further clarified by the recent exchange of Notes between the United States and Japan on the subject of the Open Door. The American Note was a detailed statement of grievances and handicaps which American nationals had experienced in China as a result of Japanese military and administrative policies. It ended with three firmly worded requests: Discontinuance of discriminatory exchange control; stoppage of monopolies and preferences which would place Japanese in a favoured position relative to Americans; and cessation of interference with American property and American rights—

including such forms of interference as censorship of American mail and telegrams and restrictions upon residence and travel by Americans and upon American trade and shipping.

Although the American Note had requested an early reply, there was an interval of six weeks between its receipt and the presentation of the Japanese reply. This reply, while worded for the most part in conciliatory terms, was quite unyielding about the more important American requests. Perhaps its most significant phrase, a repudiation by implication, both of the Nine Power Treaty, which guarantees the territorial integrity of China, and of the traditional American policy of the Open Door, reads as follows:—

Any attempt to apply to the conditions of to-day and tomorrow inapplicable ideas and principles of the past would neither contribute to the establishment of a real peace in East Asia nor solve the immediate issues.

Several developments between the receipt of the American Note and the despatch of the reply showed that there was no intention on Japan's part to accede to the American contentions. The American Note had mentioned exchange control in Manchukuo as a means of trade discrimination in favour of Japan and against other nationalities, since the control does not apply to transactions in yen; and Manchukuo trade control has, in fact, been strengthened. The American Note objected to monopolies; and two Japanese semi-Government companies, in structure much like that of the South Manchurian Railway, have been formally organised for the purpose of developing North and Central China. It is easy to foresee the prospects of a foreign business firm in competition with either of these companies in an area under Japanese military control.

Simultaneous British, American and French Notes, requesting the reopening of the Yangtse river to the merchant shipping of the three Powers elicited a firm refusal from the new Minister of Foreign Affairs, Mr Hachiro Arita—one of the reasons alleged for the refusal being that Japanese merchant vessels are also excluded from the river. The validity of this excuse was promptly challenged by *The North China Daily News*, a sober and reliable British newspaper in Shanghai, which offered the following somewhat acid comment:—

Tens of thousands of tons of produce for export and of imported goods are passing up and down the Yangtse under Japanese auspices and for Japanese account. The cargoes are not war supplies, unless, of course, dried lilies, melon seeds, sandalwood, silk waste, piece goods and feathers come within that category. Tobacco leaf may not be munitions of war, though possibly the three thousand packages of general cargo, consisting of soap, candles, sugar, cigarettes, etc., landed by one vessel at Wuhu, would come under that heading, the candles being undoubtedly used to light the troops to their slumbers.

Japan's Task

No matter what minor concessions and adjustments may be made from time to time, there would now seem to be little reason for misunderstanding Japan's "real intention" to turn the occupied parts of China gradually into an extension of Manchukuo. The task is difficult and complicated, to be sure, both because of the much larger territory and population involved and because of the greater size of the foreign interests. Yet, as experience has shown, there are many ways of sapping and undermining foreign interests without proceeding to open violence.

With this prospect in view, what will the foreign Powers with interests in China do to protect their interests? The Japanese army, never more powerful in the direction of policy in general and policy in China in particular, is proceeding on the assumption that the Powers can and will do little or nothing. Theoretically a British-American-French-Soviet front against Japan in the Far East would seem formidable. But Japan's leaders reckon that Great Britain and France are too much threatened in Europe to take any serious risks in the Far East. The Munich Agreement has been generally interpreted here as a sign of the impotence of the democratic Powers in the face of vigorous aggression. And America is not expected to take positive action alone, especially as its invested stake in China is little in excess of £40 millions, while its export trade to China before the outbreak of the war amounted to only about 1.5 per cent. of its sales abroad.

Whether Japan will break her neck economically on the gigantic problems of pacifying and exploiting China remains to be seen. There is no sign at present of unrest or bitter discontent, and the deprivations which have been imposed on the population are thus far vastly less than those which the Russians endured during the first five-year plan. It is recognised here that Japan lacks capital for expensive large-scale development of China; but Nationalist economists contend that much can be done with the combination of Japanese organising ability and Chinese cheap labour. And the dream of an ultimate *Pax Japonica* in the Far East, of a Japan made both great and rich by the systematic exploitation of Chinese mineral and agricultural wealth is held up as compensation for the sacrifices of the present time.

New Zealand

Exchange Control

CHRISTCHURCH, December 8.—For some time past overseas funds held for exchange purposes by the New Zealand banks have been falling heavily. At the end of October these funds amounted to £NZ41.64 millions in 1934, £NZ28.03 millions in 1937 and £NZ11.86 millions in 1938. During the past year, therefore, they have fallen by more than £NZ16 millions. Whilst trading bank figures are not yet available for November, the decline in the Reserve Bank's sterling funds has continued. The chief causes of the decline are, first, the fall in the value of exports, principally of wool, during the past year and the consequent passive balance of payments; second, a normal seasonal excess of imports during the second half of the year; and third, an export of capital which has proceeded slowly over the last three years, and been accelerated in recent months. As the export season is now well under way and the balance of payments is decidedly active from November to May, it is expected that these overseas funds will quickly be built up again.

To conserve the funds that remain, the Government has now made regulations which permit complete control of all overseas payments. The Reserve Bank's obligation to provide sterling at its quoted rates in exchange for New Zealand currency has been suspended. All exports are to be licensed; and a condition of the licence is that receipts for exports shall be paid into the trading banks and transferred by them to the Reserve Bank. All imports, too, are to be licensed and necessary exchange funds cannot otherwise be secured.

The new regulations suspend the convertibility of New Zealand's currency with sterling and at the same time effectively control foreign trade and the movement of capital. The exchange is pegged at its present level, and, while no export restriction is intended, the Government will control the direction of the import trade. The both the nature and the direction of the import trade. The Minister of Finance has explained that overseas funds will be used, first, for the service abroad of public debt, and, secondly, for the extension of trade with the United Kingdom; while "facilities will be provided for the purchase of capital equipment and raw material for the extension of manufacture within the Dominion."

New Zealand has had one previous experience of this type of exchange control. At the end of 1931, when sterling funds were very short, a system of export licensing and exchange pooling was imposed. When, early in 1932, imports fell heavily, and sterling funds increased, the necessity for the scheme quickly passed; and after being widely condemned by traders as an unnecessary and troublesome interference with trade it was officially abandoned in June, 1932.

An Internal Loan

There is no certainty, as yet, whether the present control is to be regarded as a temporary and emergency measure, to be abandoned as soon as possible, or whether it will take a permanent place in the Government's policy for the general reshaping of economic affairs. Probably it will prove an experiment which will be modified as conditions change and its measure of success appears. It will undoubtedly prove troublesome and difficult for traders; and the restriction on capital movements involved will be unpopular and may have far-reaching effects. Already there has been a sharp rise in local prices of Australian securities.

The imposition of exchange control and its immediate cause in the shortage of London funds, are both direct results of the Government's policy during the last three years.

Under this policy the Government became committed to a scale of expenditure which, after the fall in wool prices in the 1937-38 season, went beyond the powers of the national income. Heavy borrowing from the Reserve Bank marked its continuance; and this borrowing created claims on the Bank which were met by the purchase and consequent depletion of its sterling exchange funds. The steps now taken to conserve these funds, though drastic, do provide an opportunity for the Government to revise its general policy and to place its financial and monetary operations on a sounder working basis. The announcement is already public that an internal loan will be shortly floated to finance public works expenditure, and possibly to repay the Government advances from the Reserve Bank. If this is done, and provided the Government lives within its means, there need be no fear of excess imports. The seasonal swing of trade will restore sterling funds to safe levels, and the necessity for conserving those funds will quickly pass.

**your new
factory
BUILT TO YOUR
REQUIREMENTS**

with coal, iron and steel on the spot

CAPITAL ASSISTANCE

WEST CUMBERLAND offers you the following exceptional advantages if you select it as a location for your new factory: plentiful labour, skilled and unskilled, male, female and juvenile. Foundries working the purest hæmatite in the Empire, producing pig iron and steel of all grades, and forgings. Manganese deposits in the area. Coal of all grades for engineering. Abundant lime. Water—soft water—in plenty: waterside factory sites. Good ports—good transport facilities. Magnificent country—mild climate—sporting amenities.

ADD TO THESE the unique facilities now offered by the Government. Your factory planned and built for you to your requirements, and rent only (on a non-profit basis) charged. Substantial assistance with capital. Contributions towards Rent, Rates, Income Tax and N.D.C.

Letters to the Editor

F.B.I. and New Zealand

TO THE EDITOR OF THE ECONOMIST

SIR,—In your issue of December 24th you stated, with regard to the above subject, that

If it appeared that the F.B.I. was allowing itself to be influenced by political rather than commercial considerations, its intervention would rightly meet with the hottest resentment in New Zealand and the severest condemnation here.

I entirely agree. Since, however, you have seen fit to infer that the attitude of the Federation of British Industries towards New Zealand might be due to the fact that a Labour Government is in power there, I trust you will allow me this opportunity of stating categorically that the policy of the F.B.I. with regard to New Zealand is based entirely upon commercial considerations. The political complexion of the New Zealand Government, or indeed of the Government of any part of the Empire, is no concern of the F.B.I., which is a non-political organisation, whose policy is based upon business considerations alone.

Yours very truly,

GUY LOCOCK,

Director, Federation of British Industries.

London, S.W.1.

Road and Rail

TO THE EDITOR OF THE ECONOMIST

SIR,—In your issue of December 31, 1938, Mr Sherrington rejects my point that the release of railways from regulation should be accompanied by a removal of restrictions at present laid on road transport. He states that

There is nothing to prevent a road haulier quoting a low rate per ton-mile where railway competition exists, and to quote a much higher rate per ton-mile to another trader who has not the benefit of competitive rail services.

Admitted. But any trader who is aggrieved by the rate charged by his haulage contractor is perfectly free to take his custom to some competing haulier, who will be ready to offer him the lower rate to get his business. There is no competition in rate of this sort between railways.

Mr Sherrington considers that the concentration of operators on services where there is already railway competition tells against the view that restriction has created an artificial scarcity of public vehicles. But those services where rail competition has depressed ton-mile rates are also those services which are the cheapest to work, and that is why the road hauliers are found there as well as the railways. This circumstance arises from a disability imposed on the railways by existing legislation. Railway companies are required to charge rates on a mileage scale, which is applied to all railways and lines of railway, regardless of any variations there may be between the costs of working traffic generally over one line and another. Railway rates are therefore relatively high where costs generally are low, and low where costs are high. The haulier, of course, concentrates on the first class of services, and these are also the services for which rail competition is likely to be keenest. The unfortunate railway is left to operate the second class of services alone; but only because the railway rates are too low to make the traffic attractive to hauliers, and *not* because of any difference in their status as carriers.

I am, Sir, your obedient servant,

GILBERT WALKER.

Eire's Economy

TO THE EDITOR OF THE ECONOMIST

SIR,—Your Irish Correspondent, in his letter of December 23rd, hardly goes far enough. The root of all our difficulties in Eire is the plight of agriculture. Recent statistics show that, in the last ten years, the value of industrial output has risen by almost exactly the same amount that the value of agricultural output has declined. This result was predictable from basic economic principles; as there is practically no export other than agricultural produce, the establishment of industrial undertakings can obviously have no result other than the transfer of labour from agriculture to industry: the net output of wealth is unchanged.

There are other factors at work depressing agriculture. The whole history of the rise of the standard of living in modern times is one of continual mechanisation and rationalisation of agriculture with a consequent increase in the output of foodstuffs per man year. This rise in productivity of foodstuffs has also been due to discoveries of extensive new territories offering special facilities for large production with a minimum of labour. The labour thus released from agriculture has gone to provide labour for industrial undertakings, so that, whereas in the U.S.A. seventy years ago 80 per cent. of the population were engaged in agriculture, to-day 80 per cent. are engaged in industry.

Thus, development of agriculture always has preceded and must precede the development of industry unless the economic unit is prepared to accept a lower standard of living as the price of industrialisation. In Eire an attempt has been, and is being, made to reverse this process with easily predictable results.

With a huge market for bacon, eggs and poultry at the door dominated by the Danes, successive Governments of Eire have made but the feeblest of attempts to educate their people to standards which would enable them to wrest at least a proportion of this trade from Denmark. Butter-making competitions and a few exhibits at agricultural shows and an agricultural college which teaches a few farmers' sons to become stewards and bailiffs on a soil and in a climate which has no reference to the conditions prevailing in the rest of Eire comprise the sum total of Government efforts in this direction. The splitting up of large farms into smaller and less economic units is another policy that has been actively pursued regardless of the fact that the reverse process is characteristic of every progressive country in the world, and also of the fact that the wealthiest economic units are those with the largest farms and the smallest percentage of their population engaged in agriculture.

If some notice is taken of your Correspondent's very correct views on the personnel and ambit of enquiry of the proposed Agricultural Commission, and if its findings are promptly and intelligently implemented, we may well hope to see Eire entering an era of prosperity hitherto unimagined.

Yours faithfully,

E. O'BRIEN.

Home Market versus Exports

TO THE EDITOR OF THE ECONOMIST

SIR,—We have read with interest the letter from Mr MacDougall on our estimate of output for the home market.

We quite agree that, if output for the home market is taken as a proportion of total and not merely industrial activity, its increase between 1929 and 1937 was probably in the neighbourhood of 30 per cent. It is unfortunate that we should have given the impression that this figure was greater than 50 per cent., when all that we intended to convey was that the inclusion of "services" would have increased the share of home activity in total activity, and would therefore have made the home market all the more important.

Yours faithfully,

THE COMPILERS OF THE ESTIMATE.

Books and Publications

An Orthodox Economist

PROFESSOR HANSEN of Harvard University is a sane and critical guide to recent literature on controlling the trade cycle. He has an agreeable style and an aversion from extreme *a priori* reasoning. His book* leaves the reader with the impression of having spent an hour or two in the company of an expert who is not too remote from the world, of having enjoyed a pleasant chat with an intelligent observer of monetary affairs. Such a book is of great value, but it would be an exaggeration to pretend that, with all its merits, it provides an original answer to the problem posed by its title.

The first part of the book consists of what are in effect penetrating reviews of the work of Messrs Keynes, Harrod, Hayek, Douglas, etc. Professor Hansen has some excuse for covering this old ground again in that he is able to draw attention to some over-emphasis and over-simplification in the reasoning of the Keynesian school. In the second part the author discusses the weapons of monetary control available to governments by the use of reserves accumulated in Unemployment and Old Age insurance funds, etc.

Finally, he draws the moral of the somewhat disconnected, but not unduly discursive, chapters of the earlier parts.

It is perhaps true to say that inflation is feared more than stagnation. Yet if the analysis [made in the preceding chapter] is not wide of the mark, the reverse ought to be the case. . . . The fact is that no price inflation is possible so long as vast unemployed resources of men and machines can be drawn upon to produce an ever-increasing output of goods and services.

Professor Hansen fully recognises that inflation is a possible danger; but he thinks that it is liable to be most dangerous if fear of it drives us into stagnation, and

thereby creates the conditions out of which will arise an uncontrollable drive of inflationary action.

Professor Hansen understands the key part that Government investment must play in recovery.

We ought to have a Board of Public Investment whose duty it is to originate novel self-liquidating public works.

Yet, short of Utopia, he realises that it is much more probable that

the expansion of public investment is likely to come . . . not in the form of a systematic programme to maintain full employment, but intermittently and piecemeal as one emergency after another compels action.

But, though well versed in the Swedish economists and ready to furnish a rational basis for the main principles of Rooseveltian economics (in respect of recovery expenditure), Professor Hansen is fully alive to the qualifications to be put upon his reasoning.

The great danger in an enlarged programme of public investment is that we are likely to rely too exclusively upon it. He concludes optimistically:—

It is . . . a mistake to assume, as some have, that public investment necessarily foreshadows the doom of private enterprise. Indeed, if reasonably full employment can, by these and other measures, be maintained, private investment outlets, while relatively smaller in relation to the total economy, may well grow absolutely.

This well-read, moderate and sensible author must earn especial gratitude in this age of extremism, and his lack of original thought may be considered almost a merit in itself when attempts to break new ground so often result merely in the spreading of false scents. The orthodoxy of the modern school has a solid champion in Professor Hansen.

A GOVERNMENT SERVICE for BUSINESS MEN throughout 1939

"THE BOARD of TRADE JOURNAL" The authoritative weekly journal of the Board of Trade contains essential news for exporters. It includes news of trade openings, exchange regulations, commercial treaties, Customs regulations, &c. The text of the Anglo-American Trade Agreement, was printed in full in the issues of 24 November and 22 December, 1938. Annual subscription 30s. post free.

MINISTRY OF LABOUR GAZETTE An invaluable monthly news service on very many aspects of industrial labour and employment, including employment and unemployment, wages and hours, cost of living, strikes and lock-outs, legal cases, etc. 6d. per copy. Annual subscription, 7s. post free.

THE LOCAL UNEMPLOYMENT INDEX, a monthly statistical return for over 600 towns. £3 3s. 0d. per annum.

ACCOUNTS relating to TRADE and NAVIGATION

These monthly returns give the volume and value of imports and exports for the current month with aggregate figures for the previous months of the year. Similar totals for the corresponding periods in the previous two years are given for purposes of comparison. Summary tables of imports and exports preface the detailed statistical analysis. In the return for December, preliminary figures are given for the past year. Each monthly return is adequately indexed. Annual subscription, £2 17s. 0d.

ANNUAL STATEMENT of the TRADE of the UNITED KINGDOM

This work, appearing in four volumes, contains the final figures for each year's trade analysed in considerable detail with comparative figures for the previous four years. The division is as follows:

Vol. I.—Summary of imports and exports.
Vol. II.—Detailed Statements of imports; exports of imported merchandise, bullion and coin and free goods in transit.
Vol. III.—Detailed Statements showing exports of produce and manufactures of the United Kingdom.
Vol. IV.—Detailed statement of the trade at each port or place, etc.

Prices for the volumes relating to the year 1937 are as follows: Vol. I, 15s. (15s. 6d.); Vol. II, 32s. 6d. (33s. 2d.); Vol. III, 20s. (20s. 6d.); Vol. IV, 25s., in the press. Post-free prices in brackets.

OVERSEAS TRADE REPORTS

Concise and informative accounts of the commercial and economic conditions prevailing in the principal countries throughout the world are presented in the series of reports by H.M. Trade Commissioners; Commercial Diplomatic and Consular Officers. Some thirty to forty reports are issued annually at a subscription price of 40s. post free. Reports on individual countries may be obtained separately at various prices.

All prices are net

THE BUSINESS WORLD

The Gold Reserve

THE latest half-yearly statement of the Exchange Equalisation Account's gold holdings, referring to the position on September 30, 1938, was published on December 31st. The figures, together with those of previous statements, are given in the following table:—

BRITISH GOLD HOLDINGS*				
(£ millions)				
	Mar. 31, 1937	Sept. 30, 1937	Mar. 31, 1938	Sept. 30, 1938
Bank of England ...	516.6	537.6	537.6	537.6
Exchange Equalisation Account	186.9	279.3	297.8	151.8
Total	703.5	816.9	835.4	689.4

* Valued at 140s. per ounce.

While the Bank of England's reserves remained intact, the Exchange Equalisation Account thus lost £146 millions of gold during the six months from April to September. The amount of the loss, though very large, was far from unexpected. Indeed, in *The Economist* of October 22, 1938, it was estimated that the Exchange Account had lost £65 millions of gold up to the end of May, as the result of the French repatriation at that time; and that that drain had been followed by a further outflow of £100 millions during the crisis months of August and September. This led to the tentative estimate that on September 30th the Exchange Account held no more than £130 millions of gold valued at 140s. per ounce.

The official return makes it clear that our estimate erred somewhat on the side of pessimism, although in view of the magnitude of both the figures involved and the imponderable forces at work, to have come within £22 millions of the correct figure is perhaps excusable. In retrospect, however, over the past four months it can be seen that there is one new factor of some importance, which had only begun to emerge last October, when we made our estimate. Earlier in the year gold arrivals from South Africa averaged about £1½ millions a week. Between the weeks ended September 8th and 15th they suddenly dropped from £1,054,000 to £353,000; and they have never recovered since. Now, South Africa has not ceased producing gold, and, apart from other indications, the inference is that instead of being shipped the gold is being retained in South Africa under the earmark of the British authorities. It takes nearly a fortnight for gold to travel from South Africa to London, and so the last big shipment must have left South Africa by August 25th. An examination of the returns suggests that between then and September 30th the short-fall in shipments amounted to about £6,000,000. The presumption is, therefore, that on September 30th the Exchange Equalisation Account held £6,000,000 of gold in South Africa, which was not allowed for in our October calculations. This, if correct, reduces the discrepancy between our calculations and the recent official return from £22 millions to £16 millions. It is of some importance to realise that, for reasons of greater safety in the event of war, some of the gold reserves are being held in the Dominions, where they are as available for shipment to New York as if they were in London.

This latest official return of our gold holdings is already three months out of date. Much water has since flowed

under London Bridge, and some more of our gold has also travelled across the Atlantic Ocean since September 30th. With the Exchange Equalisation Account's September 30th gold holdings of £152 millions taken as a starting point, it is time to make a fresh estimate of what has happened to them since. There is no doubt that during the past three months the Account has sustained further heavy gold losses. Is it possible to estimate how great they are?

The first approach to this question lies in the following table, prepared from the weekly returns of British imports and exports of gold bullion:—

OCTOBER–DECEMBER, 1938			
Imports		Exports	
From—		To—	
France.....	14,028	United States	102,984
Belgium	8,340	Canada	3,280
Holland	3,752	Belgium	1,910
Germany	2,570	Eire	1,010
South Africa	1,856	Sweden	978
West Africa	1,668	Switzerland	608
Switzerland	1,610	Other countries ...	386
India	1,469		
Other countries.....	2,304		
Total	37,597	Total	111,156

This table shows a net gold export of £73,559,000, but this figure must now be subjected to several qualifications. First, £7,661,000 of the gold imported from Belgium came here during the week ended October 6th. This gold was transferred here by the Belgian authorities, in search of greater safety, and its movement did not involve any change of ownership. It is doubtful if any of the £1,910,000 of gold shown as exported to Belgium represented the return home of this refugee gold. It is much more likely to represent the arbitrage operations against the belga, which took place from time to time during the late autumn. Therefore £7,661,000 ought to come off the import total.

On the other hand, imports from South Africa were a mere £1,856,000, whereas at the rate of £1½ millions a week they should have been £19,500,000. This suggests that about £17,600,000 was added during the quarter to British earmarkings in South Africa. There is the further suggestion that some of the gold shipped to Canada during and since the crisis was gold transferred there by the British authorities for motives of safety, but it is doubtful if the quantity involved was large.

The export returns can therefore be reconstructed as follows:—

Net exports, as shown in the returns	£ millions
Add imports of Belgian refugee gold.....	7.7
	81.3
Deduct estimated ear markings in Canada and South Africa, say	18.3
Exchange Account's net losses, as so far determined..	63.0

Even this preliminary figure of £63 millions does not necessarily tell the whole story. Arbitrage purchases in the London bullion market are automatically covered by this figure, for arbitrage involves a shipment of gold. Hoarding purchases, however, are a different story, and an examination of the course of the bullion market during the last

quarter suggests that, after allowing for re-sales, the Exchange Account may have supplied hoarders with anything up to £5,000,000. Finally, there are the reactions of the recent French repatriation movement. It is several weeks since M. Reynaud estimated that at £34 millions, and by the end of the year it may well have amounted to £50 millions or £60 millions. Not all this money came from London, but London's share may be tentatively put at £30 millions.

Now the French Control bought sterling to cover this movement, but there is no record of any consequent gold transfer from London to Paris. On the contrary, it is known that much of this sterling was converted into dollars, and if this operation caused gold to move from London to New York, this gold is already accounted for in the calculations. There may have been some transfer of gold from British to French earmark, but here again £5,000,000 would probably be an outside estimate. Adding on hoarders' purchases and possible French earmarkings, we get a final estimate of about £73 millions for the Exchange Account's gold losses during the quarter. This figure is so tentative that it is best reduced to the round figure of £70 millions. Again adopting a round figure, this suggests that on December 31, 1938, the Exchange Equalisation Account held only £80 millions of gold.

This last figure is less alarming than it appears. In the first place, everything has been worked out on a basis of 140s. per ounce. The Account always expresses its gold return in ounces, and if we take this week's price of 150s. per ounce, our estimate of £80 millions is written up to £86

millions. Then the technical position of sterling is far stronger than it was. The autumn pressure is at an end, most of the hot money formerly in London has already departed, and there must be a very big bull position in dollars. Everything, of course, depends on sentiment, but a sudden turn for the better might quickly create a big demand for sterling from bulls of dollars or bears of sterling anxious to cover. Also the liquidation of dollar positions towards the close of the year probably helped the Exchange Account, which may as a result be to-day holding either dollars or earmarked gold in the United States. This would be equivalent to a hidden reserve. Finally, there is still the possibility of recovering from the Bank of England some of the gold sold by it to the Account at the end of 1936. Very shortly the fiduciary note issue is due to undergo its seasonal contraction of £30 millions. It would be equally practicable to leave the fiduciary note issue at its present level of £230 millions and instead to take £30 millions of gold out of the issue department of the Bank. The Reserve would drop by £30 millions, but the Account would give the banking department £30 millions of securities instead. When, however, this gold reached the Account it would be automatically written up to £53 millions (at 150s. an ounce). This would bring the Exchange Account's total gold reserves back to £139 millions. In view of the present technical position of the pound, this should be adequate unless further political disturbances take place. If, on the other hand, 1939 proved a worse year politically than 1938, then the question of our gold reserves will be far from the most important problem with which we shall be faced.

The Market Outlook

NEW Year optimism is the least venial of human failings. Reading the usual messages from the Chancellor of the Exchequer and from industrial leaders, and observing the firm behaviour of the Stock Exchange at the year-end, the investor may well feel that, if the prophets' words are honeyed, 1939 at least can hardly be worse than 1938. A holder of the thirty leading equities included in *The Financial Times* index lost 16 per cent. of his capital last year, after a fall of 23 per cent. in the preceding year. The fall in 2½ per cent. Consols from 74½ to 70½ in 1938 reflected a rise in the price of long-term British Government credit from 3.36 per cent. to 3.56 per cent. And for any investor unfortunate enough to be heavily committed in home rails, the fall in the market valuation of the twelve equity and preference stocks of the four main line companies from £260 millions to £139 millions dramatically sums up a distressing year.

Some degree of optimism can thus be explained, if not necessarily justified, as a natural reaction from the bitter experience of the past year. To decide whether it is justified is only practicable if political factors are ruled out of discussion from the outset. The Stock Exchange, it is true, is not a laboratory bench where economic reactions occur in isolation from the rude world of politics. It is unnecessary to remind investors that security prices were driven to their lowest point last year in the September crisis. But to their lowest point last year in the September crisis. But if economic forecasting is rudimentary, it is at least more reliable than political soothsaying. We must judge the investment case in terms of economic probabilities, leaving the individual investor to weight the political risk according to his own opinion. On this assumption, we can divide the investment problem into three main parts—the prospect for gilt-edged stocks; the outlook for domestic equities after a 35½ per cent. fall over the past two years; and the scope for improvement in commodity prices and shares.

The Funds finished the Old Year as firmly as any section of the market. But before Christmas they had exhibited some nervousness on the extreme interpretation of year-end some nervousness on Lombard Street as a threat to "cheap money." The intrinsic logic of the inference is weak, but the ready response of long-dated stocks to a short-term

movement in money rates is significant. A display of sensitivity in gilt-edged when a major part of the defence borrowing has to be raised is not a reassuring symptom—particularly to those who believe that the decision to raise the existing borrowing limit beyond £400 millions "at the appropriate time this year" indicates a greater bias towards increased borrowing rather than increased taxation. It is essential for the gilt-edged market first to measure the scope which defence finance may play in the coming year, and secondly to consider the general trend of banking policy. Estimates published in *The Economist* of November 19, 1938, suggested that defence borrowing during the forthcoming financial year might range between £200 and £250 millions. With a volume of national savings of £400 millions or more, and a sub-normal demand for new industrial capital (either natural or induced) it should be possible to cover the total without stepping over the threshold of inflationary borrowing. But the fit of supply to demand threatens to be tight enough, and in such circumstances it may be the lender, rather than the borrower, who wields the greater power over the price.

There is a further point—the nature of the borrowing. The money market may be called upon to provide its share of defence finance by an expansion of the tender issues. There is good reason to suppose that the market would welcome this step in its own interests, and it would certainly play an important part in improving the banking system's liquidity ratios, and thus contribute towards the support of a larger volume of investments by the banks. If it is true that £100 millions represents about the *maximum sensible* for one operation in the long-term market, the money market would have little difficulty in carrying the greater share. Further, the question of timing is all-important. Considered from the aspect of pure need, it may not be necessary to raise further money until the end of this year, for out of total issues authorised under the Defence Loans Act, amounting to £180 millions (towards which £178 millions has been raised by loan) only £82 millions has so far been expended. But the bills for re-armament will be flowing in more quickly during the coming year, and the Treasury's tactic, both in 1937 and

1938, was to wait until the Budget had been presented and then to satisfy its requirements without delay. This year's Budget will not be a palatable dish for the market. But, once it is out of the way, the Treasury may have as good an opportunity to obtain its long-term finance as six or nine months later—particularly if a General Election should occur in the meantime. The outlook for gilt-edged stocks, clouded though it is, depends on the exercise of extreme tact by our monetary authorities.

What of industrial shares? Some observers argue that the recent firmness of the equity markets is an earnest of an early recovery, citing the behaviour of *The Financial News* ordinary share index in support of their view. It is true that, if the crisis "low" of September last is smoothed out, the index has displayed remarkable powers of resistance around the 80 level (July 1, 1935 = 100) on three occasions last year. But the process of "saucer-ing-out" (to borrow the jargon of the chartists) is proving lengthy. If the course of ordinary share values is compared with *The Economist* index of business activity since 1933, as on the accompanying chart, it is clear that the Stock Exchange has anticipated major trade changes in the trade trend at least six months before their appearance in statistics. It began to discount the fall in trade activity after September, 1937, nine months before it occurred. And it is surely significant that while the index of business activity, until November last, provided some ground for expecting industrial recovery, leading equity shares were not disposed to discount any improvement.

As a result, the yield differential between long-term interest rates (measured by the yield on Old Consols) and the return on industrial ordinary shares (measured by the Actuaries' Index) is 2.57 per cent. The average yield on industrials, at 6.13 per cent., is unparalleled since the early days of 1932, and one has to delve back to 1931 to find so large a differential between gilt-edged and ordinary share yields. The margin itself creates a presumption that corrective influences will sooner or later begin to operate. In part, this will take the form of lower dividends to come, which are already discounted in current share prices. But while the industrial scales are swinging so indecisively, there will be little prospect of increased earnings to encourage the market for some months ahead. If the conclusions in last week's special survey of economic prospects in 1939 are valid, neither re-armament expenditure nor recovery in America will suffice to offset a decline in activity during the early months of this year. If, from the summer onwards, they begin to exert a stronger influence, equity prices may begin to show decisive rallying powers when the uncertainties of the Budget have been removed. But re-armament as a particular, rather than a general, factor, will obviously continue to play a leading part, as it did in 1938, in determining the prices of aircraft, naval shipbuilding, and special engineering shares.

The stage of recovery reached in America, however, is the major factor in the economic field, and one on which the investor can place most reliance amid a welter of uncertainty. The purposeful course of the Federal Reserve Board's index of production from the low level of 76 last May to 103 in November shows that recovery in Wall Street (which is illustrated on page 29 in our usual

monthly chart) is well founded on economic fact. But those facts did not transmit their influence to British equities and world commodity prices last year, and to guess that a time lag of at least twelve months intervenes between incipient recovery in the United States and its reflection in the British indices does not seem unreasonable, for rising industrial activity must first reduce stocks to normal dimensions (as it has partly done in 1938) before a positive impetus is given to commodity prices. And while the fall in commodity prices has been stayed, tight control of production is still in operation for many commodities. There are signs that the promise of better prices is beginning to assist oil and rubber shares. And if a moderate degree of recovery later in 1939 is actually realised, commodity shares will not lag behind when higher earnings come into sight. It is well to follow the market promptly,

BUSINESS ACTIVITY AND ORDINARY SHARE VALUES

The Economist Index of Business Activity. 1935 = 100
The Financial News Index of 30 Ordinary Shares. July 1, 1935 = 100

but not prematurely; and it cannot be said with assurance that the economic indicators have touched bottom—though they may not fall greatly if politics do not interfere.

The conclusion, for the first part of 1939 at least, is that lively markets are improbable, even disregarding (as we have done throughout) the political risk. An enormous peace-time Budget alone would limit buying enterprise. What will follow in the second half of the year, when company reports will show the fuller effect of recession on profits, is still unsure. But there is a mild presumption that, after two and a half years of falling equity prices, the normal cyclical forces of recession will be near exhaustion. In short, the present time is not the best time to buy. But if all goes well politically, 1939 may present the investor with opportunities for a more definite investment policy than at any time since 1936.

Bricks and Houses

THE brick is the oldest manufactured building material. It was the basis of Roman architecture, and became the principal building material in England after the Great Fire of London. With the increase in the size of buildings, the steel frame and reinforced concrete have displaced the brick to some extent. Experiments have also been made with alternative materials in the construction of small houses. The coming of the small steel house, mass-produced in the factory and assembled where required, has long been predicted, but the brick still remains the principal building material for British dwelling houses.

The demand for bricks, consequently, is largely a func-

tion of the demand for dwelling-houses. The number of houses with a rateable value not exceeding £78 (£105 in Greater London) built in England and Wales was 202,060 in the year ended March, 1930. The subsequent depression scarcely affected building activity. After a decline to 183,807 (i.e. by less than 10 per cent.) in the year ended March, 1931, the number of houses built showed an almost uninterrupted expansion, reaching 346,053 in the year ended March, 1937. Since then activity has tended to decline, but the extent of the recession has so far been comparatively small.

The unprecedented expansion in building activity has

been accompanied by a corresponding increase in the demand for bricks. Between 1924 and 1930 the increase in the output of bricks, from 4,066 million units to 4,744 millions, was comparatively small. In 1935, however, the output was 7,220 million units and in 1937 production reached 8,250 millions. The growth of the brick industry is also reflected in the Census of Production returns. The following table shows the spectacular increase in the value of the output of building bricks and in the net output per person employed in the industry since 1907. The net output per person employed is based on the total production of the brick and fireclay trades, whose activities include the manufacture of bricks other than building bricks as well as of tiles, refractory materials, sanitary-ware, etc.

	VALUE OF OUT- PUT OF BRICKS (£'000)	Net Output per person employed in brick and fire- clay trades £
1907	6,373*	78
1912	5,172*	82
1924	11,160	207
1930	11,449	203
1933	12,918	209
1934	14,912	214
1935	15,613	216

* Includes silica bricks and firebricks.

While the size of the brick industry has grown appreciably, it has also undergone considerable changes in structure, organisation, and production methods. Apart from sand-lime or calcium-silicate bricks, made from a mixture of sand and hydrated lime, bricks are generally manufactured from clay. The location and varying composition of clay in different parts of the country largely dictates the methods of manufacture and costs of production. Thus, a large proportion of the output of common bricks is made from Fletton clay, which is found in the neighbourhood of Peterborough and Bedford. Owing to the special properties of Fletton clay, the brick industry may be roughly divided into flettons and other varieties.

Bricks other than flettons are made by a number of small scattered brickworks, probably nearly a thousand, catering for local demand. These include, at the one end, works producing bricks partly from colliery and other waste and, at the other, producers of high-quality, and often hand-made, facing bricks. There is a correspondingly wide local variation in prices, even for bricks serving the same purpose, for these small concerns are protected from the competition of brickworks in other areas by the comparatively high transport charges on such heavy and bulky products as bricks. More recently, however, technical developments and the growth of road transport have tended to increase the radius of distribution. Moreover, there has been a movement towards financial concentration, although, as a rule, the acquisition of works in different localities by one company has not been followed by concentration of production.

On the other hand, there has been a marked tendency towards concentration of production in the section of the industry based on Fletton clay. In contrast to the other raw materials, Fletton clay lends itself to mass-production methods; moreover, flettons can be produced without the costly drying process necessary for other varieties, and fuel costs are also appreciably lower, owing to the carbonaceous matter contained in this type of clay. The coal consumption per thousand flettons is little more than one hundredweight, compared with seven hundredweights for other common bricks. It is the special properties of Fletton clay which have been largely responsible for the concentration of production and the enormous expansion of the output of flettons. In 1922, the year before the amalgamation of Forders with the London Brick Company, the aggregate output of the works included in the merger was about 300 million units. In the intervening period the fletton industry has been reorganised into large mass-production units, and the capacity of The London Brick Company is now about six times that of 1922.

The mechanisation of output in the Peterborough and Bedford districts has led to an appreciable reduction in

costs. Between 1924 and 1930, when total demand showed a comparatively small increase, the reduction in price was slight, but as the following table shows, the tendency of prices since 1930 has been downwards. Moreover, in contrast to the producers of many other building materials, manufacturers of flettons did not increase their prices in 1937 or 1938:—

AVERAGE PRICE OF FLETTON BRICKS

(Shillings per thousand at King's Cross)

1924	53.25	1934	51.25
1929	52.25	1935	48.44
1930	52.25	1936	46.58
1931	51.42	1937	46.25
1932	51.25	1938	46.25
1933	51.25		

As a result of the progressive reduction of prices, the radius of the market for flettons widened considerably, and The London Brick Company now controls more than one-quarter of the industry's total capacity. Nevertheless, The London Brick Company has not achieved the same dominance in the industry as Associated Portland Cement in the cement industry, which was discussed in *The Economist* of December 10, 1938, on page 544. This is due mainly to the protection given to the more distant local producers by the high transport charges. In spite of the fact that special rates are quoted by the railways from Peterborough to London, transport costs still represent more than 30 per cent. of the total price paid by the London consumer. While cement is mixed with three times its weight of local sand and aggregate, bricks have to be transported in the finished state. But if the displacement of local brickworks by the introduction of flettons has

COMMERCIAL SERVICE

The Bank has over 380 Branches in Africa, and Agents and Correspondents throughout the world. The closest touch with Trade and Industrial conditions is maintained, with special attention to Commercial and Credit Intelligence. This service is available to Exporters, Importers and others wishing to develop trade with South, East and Central Africa.

THE STANDARD BANK MONTHLY REVIEW, which is sent post free on application, gives the latest information on all South, East and Central African matters of Trade and Commercial Interest.

made less headway in the more distant markets, the expansion of the area of supply has by no means been arrested. For example, brickmakers in the north have been much perturbed by the fact that the railways have granted preferential rates for the transport of bricks from Peterborough to the north of England. They fear that the fall in the demand for bricks in the south of England will tempt The London Brick Company to liquidate some of its apparently large stocks in the north at prices which would put many of them out of business. The Northern Brick Federation has even taken steps to contest an application by the railways for a further reduction in freight rates from Peterborough to Halifax. In the long run, the area of supply of the comparatively cheap mass-produced fletton brick is bound to widen further at the expense of the smaller brickworks.

But while the fletton brick will continue to displace other varieties serving the same purpose, the brick industry as a whole is now faced with an appreciable reduction in

demand, after many years of almost uninterrupted expansion. The course of building activity, on which the brick industry depends, is now on the downgrade, and there are no indications that this tendency will be arrested in the current year, especially as the absence of facilities for insuring buildings against damage or destruction from high explosives is rendering property less attractive as a means of investment. Moreover, the proportion of the total volume of building consisting of flats and tenements, which require fewer bricks per unit of accommodation, is growing, while framed construction, capable of taking lateral stresses and offering greater protection against air raids than brick-built houses, may come into favour. The total consumption of bricks may, therefore, be expected to decline in the current year. And, owing to their higher overhead costs, due to mechanisation, it would not be surprising if the fletton manufacturers intensified their drive to obtain a still larger share of the total, but dwindling, market.

Finance and Banking

The Turn of the Year.—The credit stringency accompanying the turn of the year continued almost up to the very last moment of the old year. When the discount market took loans for periods up to ten days on Friday, December 30th, it was widely assumed that all the necessary borrowing at the Bank of England had been made, and that Saturday morning, the last day of the year, would provide something in the nature of an anti-climax. In fact, the market had to go to the Bank for a further moderate amount on Saturday and, of course, had to take its accommodation for nine days. The total borrowed from the Bank over the turn of the year can be approximately estimated from the Bank return published this week. This shows discounts and advances to have risen by £20,367,000. This figure, plus the previous week's increase of £13,600,000, represents the amounts repayable to the Bank on January 5, 6, 7 and 9. This year, therefore, the Bank appears to have made its loans to the discount market on the basis of a total quota of daily maturities of about £8,000,000. One full quota of £8,000,000 was repaid on Wednesday of this week, and about £3,000,000 which had been borrowed by the market on Christmas Eve was repaid on Monday. These two amounts must be added to the increase in discounts and advances shown in the Bank return. The resulting total of about £45 millions may be taken as the amount which the market was on this occasion forced to borrow from the Bank of England. There can have been very few precedents for a "squeeze" of this severity.

With the turn of the year and the reflux of currency from circulation, the inflation of the credit basis due to temporary borrowing at the Bank made itself felt in full force. The clearing banks immediately became keen buyers of bills at their minimum rate of $\frac{1}{2}$ per cent. and money on Monday and Tuesday became almost unobtainable. The position is, however, changing rapidly. As Bank of England loans are being repaid, the superabundance of credit is disappearing. Bond money which found few takers at $\frac{3}{8}$ per cent. on Monday was keenly bid up to $\frac{1}{2}$ per cent. towards the end of the week. The growing scarcity of Treasury bills of which this week's tender is a token (£25,000,000 offered against £50,000,000 maturing) must tend to exert a powerful downward pull on discount rates. On the other hand the speculation against sterling and the maintenance of an abnormally high premium on forward dollars provides a less apparent but equally powerful pull towards higher money rates here. The one month dollar is quoted at a premium equal to $2\frac{1}{2}$ per cent. per annum. The three months rate equals $1\frac{1}{2}$ per cent. per annum.

Unless these rates are appreciably reduced the swap transactions to which they give rise must provide a serious threat to the cheap money policy of this country. This position needs careful watching.

Restoration of Gold Embargo.—At the request of the Treasury the Bank of England has asked the banks and the bullion market to refrain from transactions in forward gold and also not to facilitate loans against gold. A similar request was made in the summer of 1935, when the banks also agreed to scrutinise all foreign exchange operations, particularly those in the forward market. Last May these requests were withdrawn, in so far as they applied to gold, and there has since been a considerable amount of business in forward gold, while arbitrage and other purchases of spot gold have to some extent been financed with borrowed money. In view of the present weakness of sterling, which has proved the occasion for speculative operators, the gold embargo has now been restored in full force. The request to scrutinise foreign exchange operations, which once was withdrawn, has also been repeated. These announcements were made as *The Economist* was going to press, and so further comment must be reserved. We estimate, however, in a leading article the extent of the gold losses during the past three months.

French Bank Rate Reduction.—The return of funds to France continues unabated. It has provided by far the most potent single factor in the foreign exchange market this week, and has made possible a further step in the cheap money policy which M. Reynaud rightly regards as an essential part of his programme of financial reconstruction. This week the Bank of France reduced its discount rate from $2\frac{1}{2}$ per cent. to 2 per cent., and emphasised the significance of the move by choosing to make it on Tuesday, i.e. on the first possible opportunity after the year-end holidays, rather than waiting until Thursday the customary day on which Bank rate changes are announced in France. This reduction is on this occasion a genuine reflection of the trend in market rates. The day to day money rate in the Paris market has fallen to around $1\frac{1}{2}$ per cent., and the open market discount rate at $2\frac{1}{2}$ per cent. is fully in line with the level to which the official rate was lowered this week. Keeping pace with the fall in money rates in France the discounts on forward francs have been steadily narrowing. The one month rate is now

quoted around par while the discount on three months francs is a mere 40 centimes. In their control of the spot market for francs the French authorities have continued to avoid a policy of rigid pegging either against sterling or dollars. Their experience has suggested that the repatriation of capital tended to slow down whenever they let the franc depreciate *pari passu* with sterling in the latter's recent fall against the dollar. They have consequently allowed the franc to appreciate to some extent against sterling, the rate this week moving from 176 $\frac{1}{2}$ to 176 $\frac{3}{4}$. This movement may proceed further. It need not, as has been suggested recently, find an immovable barrier at the rate of 170 francs to the £—the rate on the basis of which the gold stock of the Bank of France was revalued last November. That revaluation was effected at the gold parity indicated by the then current sterling rate of 170 francs and the sterling gold price of 146s. 9d. per ounce. If the sterling price of gold is to soar above 150 shillings, there is no reason why the franc should not appreciate below 170 francs to the £, unlikely though such a movement would be. It is significant, however, that a fairly vocal and by no means unimportant body of financial opinion in France should lately have pleaded for a policy of closer attachment between the franc and the dollar, in view of the falling trend of sterling *vis-à-vis* the latter.

The Silver Squeeze.—A fair number of bears were caught in London by the decision of the United States authorities to leave the American prices for both domestic-mined and foreign silver unchanged after the New Year at 64.64 cents and 43 cents per ounce, respectively. Many operators had been confident that there would be a reduction, and so had sold forward for near delivery dates in January. The moment the American news was received they rushed to cover, and in doing so drove the London

cash price at Tuesday's fixing up from 20 $\frac{1}{8}$ d. to 21 $\frac{1}{8}$ d. per ounce. The forward market was not directly affected, and so the forward price only rose from 19 $\frac{1}{8}$ d. to 20 $\frac{1}{8}$ d. per ounce. This bear squeeze raised the cash price to a point where it actually paid American producers to ship to London, and a fair amount of this silver came on offer, with the result that on Tuesday afternoon the cash price eased by $\frac{1}{8}$ d. per ounce. On Wednesday morning, however, the American producers fixed higher limits, with the result that the price at the fixing was 20 $\frac{1}{8}$ d., or only $\frac{1}{8}$ d. higher than the price current on the previous afternoon. The forward price was unchanged. Profit-taking by bulls has also brought some silver on to the market. There is still a certain amount of bear covering to be effected, but once this is complete it is felt in the market that current prices will be found to be too high. Unlike previous years, when the American prices have been fixed for twelve months ahead, on this occasion the current price for domestic silver only holds good until June 30, 1939. The reason is that the silver legislation is due next summer to be reviewed by Congress.

A Year's Bank Clearings.—The total of bankers' clearings for 1938 gives clear evidence of the influence of the recession upon general spending, even if allowance is made for the fact that certain modern forms of payment do not pass directly through the Clearing House. Town clearings show a decrease of 7.7 per cent. since 1937, while metropolitan, country and provincial clearings have shrunk respectively by 3.9, 3.4 and 14.5 per cent. The decrease in town clearings largely reflects the recent inactivity on the Stock Exchange, for clearings on settling days alone show a drop of 13.8 per cent. The decline in provincial clearings represents the depression in the textile areas, which

Stock Exchange Turnover.—We present below our customary comparative table showing the average excess of Bank Clearings on Settlement days over non-Settlement days during the past three years, as a guide to movements in Stock Exchange turnover. The "non-settling day" average figures are obtained by deducting the total clearings on Settlement days from the total clearings for the year, and dividing the difference by the number of non-Settlement working days—counting Saturday as three-quarters of a full working day. The proportion of the total clearing directly connected with Stock Exchange business is, of course, higher than the percentage increase shown on Settlement days, since there is a substantial Stock Exchange clearing turnover on all working days and especially those immediately following the Settlement:—

(£ millions)		1936	1937	1938
Grand total of clearings on non-Settlement days		36,463	38,442	35,951
Daily average		134.4	142.9	133.3
Daily average on Settlement days		173.0	176.8	152.4
Increase on Settlement days:—				
Amount	38.6	33.9	19.1	
Per cent.	28.6	23.7	14.3	

This latest year's figures show some striking changes. The average increase in the clearing on Settlement days at £19.1 millions is little more than half of the increase on Settlement days in 1937 and less than half of the increase shown in 1936. In fact, the increase in 1938 is approximately back to the level of 1932.

The significance of this drop is even greater when the effect of Gilt-edged clearings is taken into consideration. Since Gilt-edged dealings are for cash, the clearing in respect of such transactions is fairly evenly distributed and is not to any important extent concentrated upon Account days. From the condition of the market it is tolerably clear that turnover was very low last year and certainly much lower than in 1932. Hence the clearing figures would support the two propositions that the volume of Stock Exchange business in 1938 was not more than half that of 1937 and at a lower ebb than in 1932. It is possible, indeed, that these figures give a rather rosy impression of the relative state of market activity, for the clearing totals do not, of course, reflect to any extent the drop in dealings closed within the Account

or to any appropriate extent the decline in Contango business. Under normally active conditions, the average broker does not retain more than a quarter of his gross takings as net profit, after allowing for rebate of commissions and expenses, and about half of the expenses are proportionate to turnover. Last year was indeed a lean time for members of the Stock Exchange.

First Banking Results.—If the first banking dividends prove a representative sample, shareholders will have no reasonable complaint against the outcome of 1938. Indeed, the first of the clearing bank announcements came as an agreeable surprise to the market, Martins Bank's dividend being raised from 14 per cent. to 14½ per cent. In the previous year the total distribution was increased to 16 per cent. by a delayed centenary bonus of 2 per cent., but there was no suggestion that this special distribution would be repeated. Barclays Bank has maintained its dividend, alone among the clearing banks, throughout depression and recovery, and its 14 per cent. payment, announced on Tuesday, has come to be regarded almost as an institution. On a superficial comparison, Martins Bank's earnings show a further increase of £19,363 to £872,929, but the comparison is invalidated by the fact that in 1937 profits were struck after payment of a centenary bonus to staff, which may well account for the whole of the year's apparent increase, or more. Whatever the real trend of earnings may have been last year, however, there can be no doubt that this bank has made substantial progress since 1936, when profits were only £769,988. Pension fund again receives £100,000, the allocation to premises account is increased from £75,000 to £100,000, and £50,000 is transferred to reserve (which now amounts to £3,550,000 against a paid-up capital of £4,160,042), leaving the carry-forward £19,723 higher at £328,730.

For the banks as a whole, actual earnings last year (before provisions) may have been somewhat higher than in 1937, since advances (despite their downward trend since March) have averaged £25.6 millions more, while investments have run only £15.0 millions lower. On the other hand, increased provisions have probably been required for doubtful debts and contingencies, especially since the depreciation in securities must have encroached to some extent upon hidden reserves. Hence the decrease of £207,367 to £1,926,458 shown by Barclays Bank profits is not altogether surprising, particularly since the increase of £6.8 millions in this bank's average advances from January to November last year has been appreciably lower than the reduction of £9.7 millions in the average investments portfolio. The presumption that very conservative accountancy has been employed is, however, suggested by the substantial allocation of £250,000 to contingency account. Total allocations amount to only £400,000, against £700,000 in the preceding year, when £500,000 was placed to general reserve. In 1937, however, the carry-forward was reduced by £128,377, whereas this year it is increased by £16,329 to £527,720. The Midland Bank's net profit of £2,445,671 shows a decrease on the year of only £62,338, while the reduction of the gross profit appears to have been even less. Provision for contingencies has been raised from £300,000 to £500,000, which, together with a transfer of £150,000 to premises account (against £400,000), makes total allocations of £650,000, against £700,000, the carry-forward after payment of the 16 per cent. dividend is £37,271 higher at £628,315. It may be noted that the favourable movement with Barclays Bank results last year is largely an apparent one, since this bank showed a large increase in profits for 1937 and last year earned more than in 1936. As was expected, the District Bank distribution for the year was raised to 18½ per cent. (against 17½ per cent.). Net profits of £508,808, against £519,255, indicate rather higher gross earnings. Williams Deacon's dividend is unchanged at 12½ per cent., and profits show only a trifling decline at £301,418. Since the dividend (shown gross) absorbs £234,375, allocations of £130,000 leave the carry-forward £62,957 lower at £85,635.

Discount Dividends.—Again last year the discount market demonstrated its ability to earn very satisfactory profits under apparently adverse conditions. Since the crisis, bill rates have admittedly shown a satisfactory margin over the cost of short money, but the average level for the first eight months of the year was even lower than in 1937. Moreover, the disappearance of outside bond money associated with the removal of foreign balances from this country must have occasioned some reduction in the bond portfolios even of those houses which were able, thanks to their abundant hidden reserves, to avoid any liquidation of securities at the unfavourable prices ruling during the crisis. In the event, none of the three large public companies has found it necessary to alter its distributions. Alexander's Discount dividend is maintained at 17½ per cent., to which level it was reduced last year from 19 per cent. The National Discount maintains, for the fourth successive year, a total distribution on the "B" shares of 26 per cent., including a bonus of 4 per cent.; and the Union Discount's dividend is unchanged at 10 per cent. on the capital as increased by the 1936 bonus issue. The preliminary announcements suggest that current earnings have been well maintained. Alexander's Discount carry-forward is raised by £2,500 to £131,000, indicating that net profits were fractionally higher at about £154,500. To meet the depreciation of investments, however, it was necessary to utilise the whole of the £300,000 transferred to investment reserve in 1934 and 1935. Since last year's balance sheet showed that investments accounted for over 48 per cent. of the balance-sheet total, excluding rediscounts, this provision occasioned no surprise. The corresponding percentages were 31 per cent. for the National and, for the Union, according to the balance-sheet classification of assets, less than 16 per cent. The Union Discount's preliminary figures indicate an increase of some £10,600 in net profits to about £261,000, while those of the National showed a rise of £6,000 to £195,000. Whether the increased earnings in this case are at all attributable to the acquisition of Reeves, Whitburn and Company last July will only be indicated by the balance-sheet figures, though it would be surprising if these showed any expansion. Some £50,000 is again put to reserve, though pensions receive £5,000 against £10,000. The carry-forward is little changed at about £217,000.

Home Railway Earnings.—With a further fall of £274,000 in the fifty-second week of the year the four home railways have completed 1938 with a gross traffic loss of £7,056,000. The fall of 4.29 per cent. is more favourable, at first sight, than the average fall of 6¼ per cent. in *The Economist* index of business activity, but it must be remembered that the railways had the benefit of the basic 5 per cent. increase in the charges throughout the year, and when comparison is made with 1929 (*The Economist* index is still running above the level of that year) the plight of the railways is immediately obvious. The companies were comparatively successful in maintaining passenger receipts within £140,000 of the 1937 level, but coal and coke receipts fell by £1,482,500 and merchandise by no less than £5,433,500. It is evident, indeed, that road competition is skimming even more of the cream from railway business. In the following table we bring up to date the estimates published in *The Economist* of August 13th and November 12th (when the basis of the calculations was fully explained) of a reduction in railways earnings during the whole of 1938. It should be emphasised that no allowance is made in these figures for increases in ancillary receipts during the second half of the year:—

RAILWAY EARNINGS ESTIMATES (Amounts in £'000's)					
	Second half-year			Reduction in net revenue first half-year	Total estimated reduction, full year
	Fall in traffic	Increased costs	Reduction in direct costs due to lower traffic volume		
L.M.S.	2,423	520	800	1,496	3,639
L. & N.E.	1,812	525	600	1,780	3,517
G.W.	926	260	300	818	1,704
S.R.	54	225	20	574	833

The estimated reductions in net receipts shown above suggest that L.M.S. first preference may have earned 3½ per cent. last year, G.W.R. ordinary approximately ¾ of 1 per cent., and Southern preferred approximately 3¼ per cent. The L.N.E.R. figure suggests that the second guaranteed stock dividend has been short-earned by at least ½ per cent. By the time this Note is read the market will probably know whether its anxieties regarding the dividend have proved justified.

Chinese Customs Revenue.—The Japanese "incident" has made no difference to the invariably prompt publication of the Chinese Customs Revenue figures for 1938, amounting to \$254,570,000. For a state of war the total compares very favourably with \$342,899,739 for 1937. But the figure appears to be a purely notional one so far as the bondholders are concerned, for the Inspector-General of Customs, Sir Frederick Maze, reports that no quota towards the loan and indemnity services has been received from areas under Japanese control except for a single remittance from the Shanghai Customs last June. Hence the services of the Customs loans was only maintained because the Chinese Government provided the balance from its own attenuated revenues. Bondholders may well ask what the point of the Chinese Customs agreement, negotiated between the British and Japanese authorities last May, really amounts to in practice. It was then understood that all Customs revenues from ports under Japanese armed control would be remitted to the Yokohama Specie Bank and that foreign loan quotas would then be remitted to the Inspector-General of Customs sufficient to meet in full foreign loans and indemnities secured on the Customs revenue. It would seem, indeed, that the agreement has never been given practical effect, and it has certainly lacked the consent of the Chinese Government itself, whose anxiety to maintain its debt payments under extreme stress cannot be too highly commended.

Foreign Bond Movements.—The course of quotations during December sets the seal upon a thoroughly unsatisfactory year for the foreign bondholder. Further falls to new low levels have occurred, and for all groups comprised in the foreign bond index calculated by Municipal and General Securities Company the December index is the lowest of the year. Movements over the past year are shown in the following table:—

AVERAGE JANUARY-JUNE, 1934=100.										
End of Month	Europe	Near & Far East	Egypt	South and Central America			Complete Index	Under-quoted Bonds	Defaulted Bonds	
				States	Provinces	Total				
1937 December	(28) 98.4	(31) 81.6	(4) 98.6	(35) 82.6	(11) 75.0	(46) 60.7	(109) 85.8	(54) 86.6	(55) 85.0	
1938 March	83.4	73.9	97.2	61.3	49.4	58.2	69.6	74.9	64.8	
June	(27) 89.0	68.5	98.0	65.9	51.2	62.0	(108) 71.1	(48) 76.5	(60) 67.0	
September ..	(26) 88.5	66.2	96.1	57.7	44.4	54.2	(107) 66.1	(47) 72.3	61.7	
October	86.7	70.8	95.2	59.4	45.3	55.7	67.8	74.1	63.2	
November	85.0	65.0	91.7	56.3	40.9	52.1	63.9	70.7	59.0	
December	78.1	64.2	87.0	53.7	40.7	50.2	61.3	68.7	56.0

issues occurred on fears for the future of the Mediterranean and the Suez Canal. The 28 per cent. fall in the complete index for 1938 is almost wholly due to political factors. Concern for the future has, in fact, played a larger part than actual infringements of service during the past year. This point is illustrated by the 35 per cent. fall in South and Central American State issues, although the few actual changes have been in favour of the bondholder—such as the increase in the Chilean and the Peru Guano loan services. In Europe, again, the Bulgarian payments were increased. But it is still impossible to secure acceptable terms for the resumption of Greek and Brazilian payments.

Lancashire Cotton Results.—The Lancashire Cotton Corporation's year runs to October 31st. Its latest accounts therefore cover a period of almost continuous recession from the prosperity of 1937. November, 1937, saw 90 per cent. of Lancashire's spindles still in full production, a level of activity only just below the peak of 92 per cent. maintained from February to October of that year, and close enough to practical capacity. From November, the first month of the Corporation's year, the fall was steep and continuous to 50 per cent., which persisted from May to August, 1938, giving way in the last two months of the company's year to a very slight recovery to 58 per cent. But rates were already being cut by that time. The effects, as reflected in the Lancashire Cotton profits, are shown below:—

	Years to October 31,		
	1936	1937	1938
Trading profit	127,899	593,194	289,208
Interest, etc., received	8,566	15,636	18,992
Total profit	136,465	608,830	308,200
Directors' fees, etc.	13,932	3,960	3,775
Depreciation	Nil	155,000	155,000
Debt interest	43,750*	75,000	75,000
Earned for pref.	78,783	374,870	74,425
Pref. div.	Nil	68,875	68,875
Earned for ord.	...	305,995	5,550
Earned % for ord.†	...	18.4	0.3
To reserve	Nil	150,000	Nil
Carried forward	78,783	234,778	240,328

* April 1–October 31 only.
† No ord. div. has been paid.

In the circumstances of 1937–38, a fall in gross trading profit from £593,194 to £289,208 is not surprising. Indeed, it is probable that old contracts carried in from 1937 cushioned the fall, and that part of the benefit which they contributed to the 1937–38 profits has been put to an internal reserve against the harsh prospect for 1939. At any rate, the directors record that, "in view of the uncertain position of the trade, certain reserves had to be made after fixing stock values, in order to prevent the current year's accounts being adversely affected when deliveries are made against contracts booked in the period ended October 31, 1938. These reserves also provide for the sales of certain stocks, should this be found necessary or desirable, at prices which may be even lower than stock values." Since stocks are valued "at cost or market price, whichever was lower," this last comment is no doubt intended to convey that the Corporation is quite prepared to sell below cost if other concerns begin a price-cutting race.

* * *

That being so, it is well to observe that the 1937–38 profits only cover the preference dividend with a small margin, and that the dividend is non-cumulative. On the other hand, the balance sheet shows that, if a hard time lies ahead, the Corporation has been able during 1938 to make financial preparations. Though a rise in stock has not

been avoided (from £1,096,469 to £1,140,411), it has been possible to withdraw from debtors and bills more than enough to finance the bigger stock, and cash reserves retained for depreciation (which is maintained at the full £155,000) are free to swell cash and investments, cash rising from £398,292 to £564,228 and investments from £95,566 to £146,329. The importance of cash reserves in a period of rate-cutting is obvious. In general, it is difficult to draw long-term conclusions from so disturbed a period as 1937–38. What does seem clear, however, is that the 1937 experiment of rather sharply increased margins was a failure. Quite apart from the misfortune of trade recession following rapidly after the rise in margins, the rise in exports of spinning machinery to foreign countries, combined with the relatively greater degree of the recession in cotton textiles, suggests that in the present world textile situation it would be imprudent to count on any but a very small permanent increase in spinning margins over the 1936 level. That being so, it remains for still greater efficiency and improved organisation to increase the profits of the trade, in which Lancashire Cotton Corporation enjoys the advantage of a considerable degree of rationalisation.

* * *

Turner and Newall Prospects.—The preliminary profits figures of Turner and Newall (discussed in *The Economist* of December 17th last) showed that although net trading profits had slightly increased, actual equity earnings had been reduced from £1,182,391 to £1,166,596 owing to an increased charge for N.D.C. These figures are confirmed by the full report, whose main interest consequently lies in the statutory and consolidated balance sheets and in Sir Samuel Turner's speech, which accompanies them. It may, perhaps, be pointed out that the profits disclosed by the parent company include the net profits of the subsidiary companies as shown by their audited accounts; they therefore represent, in effect, the consolidated profits of the whole group. The results of the past three years are analysed in the following table:—

	Years ended September 30th		
	1936	1937	1938
Profit	1,343,527	1,543,876	1,650,386
Depreciation	120,418	122,117	130,693
Taxation	56,756	125,164	238,749
Fees, and staff fund	13,045	13,106	13,250
Preference dividend	101,098	101,098	101,098
Ordinary stock:—			
Earned	1,052,210	1,182,391	1,166,596
Paid	847,689	1,065,690	1,065,756
Earned %	23.0	22.9	22.6
Paid %	17½	20	20
General reserve	200,000	100,000	100,000
Carry forward	99,069	115,770	116,610

Our chart below demonstrates the spectacular progress which the group has made in the past eight years:—

TURNER & NEWALL PROFITS—1929–38

Since 1932, in fact, distributable profits have jumped from £300,671 to £1,267,694, while the amount of the ordinary dividend has increased from £181,647 to £1,065,756, on an equity capital increased from £4,843,933 to £5,328,777.

* * *

If it is fair to single out any one branch of the undertaking which has contributed most to this expansion, it is probable that the asbestos cement section best fills the part. It is significant that although asbestos textiles were affected both in home and export markets last year, the turnover of Turner's Asbestos Cement reached a record. The chairman points out that new products have more than compensated for the decline in certain asbestos cement products—an illustration of the secular expansion of this branch of the business, which is now supplied by new factories, while another factory is building at Erith. The progress of the Keasbey and Mattison plants towards "the standard of efficiency to which Turner and Newall are accustomed . . . in the United Kingdom" is of long-range importance for the group. As for its asbestos mining interests, the Havelock Mine should be in production this year, and a new shaft is to be sunk at the Bell Mine in Canada. The group's financial resources should be fully adequate to deal with the remainder of the 1936 extension programme, for its net current assets amount to £3,919,000, while cash holdings exceed £2½ millions. As for the future, the chairman's speech refers to a "distinct falling off in sales during the last few months in certain sections," and recovery depends on the restoration of stable political conditions. For the current year, therefore, profits are unlikely to show expansion. But the £1 ordinary stock units, at 7½s., to yield £5 4s. per cent., constitute a valuable long-term holding.

* * *

Oil Dividends and Profits.—This week's announcements of maintained interim dividends by Royal Dutch and "Shell" Transport (the former at 6 per cent. and the latter at 7½ per cent. tax free) have considerably encouraged the oil share market. Both London and Amsterdam had feared that falling crude prices in the United States might even involve some reduction in the dividends, but their maintenance suggests that the American oil position has not proved so great a burden as was feared in 1938. A maintained interim dividend (of 5 per cent.) is also announced by Lobitos Oilfields, whose interim last year was followed by a 10 per cent. final payment. The Apex (Trinidad) full report shows that the 5 per cent. cut in the dividend overstates the actual change which has occurred in the trading position. The company's output of crude oil (which is sold to Trinidad Leaseholds) reached a new record of 562,942 tons in 1937–38, against 550,026 tons in 1936–37. But the average price per ton obtained fell from 17s. 6d. to 16s. 10d., and total profits were reduced by about 1 per cent. to £486,149. Well amortisation, however, is provided for at an even more generous level than in previous years; the normal provision has been increased by nearly £20,000 to £158,604, and in addition, a special allocation of £10,000 is made. As a result, the amount earned for dividend is approximately £31,000 lower at £229,814, representing earnings of 42.4 per cent., against 48.3 per cent. in the previous year, so that the dividend is covered by about the same margin as in 1936–37. In accordance with recent practice, no allocation is made to general reserve, but the carry forward is increased, by £9,815 to £128,371. General reserve now stands at £370,000, owing to the transfer of £150,000 share premiums arising from the share issue made two years ago. The board's strict depreciation policy has produced a strong balance sheet, in which fixed capital now amounts to £703,966 net, against £673,126, although a gross amount of £233,356, against £204,927, was spent on capital purposes during the year. At the current price of 27s. 4½d. cum dividend, the 5s. shares yield £7 14s. per cent.

Jute Industries Setback.—Jute Industries' trading experience in the year ended September 30, 1938, resembled that of the previous year, for conditions were not uniform throughout the period. The latter part of 1936–37 saw a decline in demand from the U.S.A., and it was only at the end of 1937–38 that some revival occurred in this trade. But British Government orders for sandbags, which represented but a fraction of the 1936–37 turnover, were more important in the latest period, and helped to reduce overheads by recalling idle machinery into use. These factors, however, have been unavailing against continued competition from Indian-produced jute goods, for the company's total profits are down from £123,451 to £89,304. In 1936–37, strikes in Indian mills lasting several months assisted the Dundee manufacturers to maintain their position, but last year the full force of competition was felt. But the drop in profits is, perhaps, more severe than might be expected from the state of trade described in the report, though it does not indicate that revenue has been charged with any special provision against stocks. In 1936–37, however, raw material prices rose sharply, and stocks increased from £463,533 to £580,960; thus, the fall to £493,562 last September suggests that inventory values may have played some part in the year's setback. Meanwhile, shareholders are spared the full force of the 28 per cent. decline in total profits, for depreciation and obsolescence (provided for at an exceptionally high rate in 1936–37) receive £15,000 less at £55,000. But even with this saving, the amount available for dividends, at £32,363 against £53,451, barely covers the 3 per cent. distribution on the 8 per cent. non-cumulative participating preference shares. The maximum rate of preferential dividend has not been paid since the capital reorganisation in 1929, and no ordinary dividend has been declared since the company was formed in 1920. The company's difficulties, indeed, are of a secular character, and are only affected incidentally by changes in the trade cycle.

* * *

The Week's Company Profits.—The first week of 1939 has produced only a small number of company reports, among which Turner and Newall is by far the largest. Our usual analysis of profit and loss accounts appears on page 54, and comprises 23 companies, apart from two for which comparable figures are not available. Their net profits amount to £3,104,000, compared with £3,876,000 earned in their previous years. The results are discussed in preceding Notes, and on page 36, under the heading "Shorter Comments."

* * *

Company Meetings of the Week.—In this issue, reports of company meetings begin on page 42. Sir Charles Gordon's survey of conditions in Canada, made at the *Bank of Montreal* meeting, was discussed in a Note on page 720 of last week's *Economist*. At the *Burma Corporation* meeting, Mr P. E. Marmion pointed out that the combined contribution of lead and silver to total revenue had again risen, this time to the high level of 80 per cent., and in reviewing the position of the ore reserves, he repeated an estimate made a year ago that the ultimate recovery of excess ore might reach 750,000 to 1,000,000 tons, of which only 124,021 tons had actually been absorbed into reserve calculations. Mr Marmion then reviewed the trend of metal markets and consumption in 1937 and 1938, and drew attention to the recovery in prices that had occurred since the end of the financial year. Addressing *Bullin's Ltd.* members, Colonel Sir Thomas A. Polson revealed that owing largely to increased accommodation, the trading profit of the Skegness holiday camp had risen by 50 per cent. At the *British Vacuum Cleaner and Engineering* meeting, Mr H. Cecil Booth stressed that while most of the business was concerned with domestic-type cleaners, good progress was being made in the development of new lines.

Industry and Trade

Self-Help for Farmers.—The attendance at the Oxford Farming Conference, which has now become an annual event, is a convincing proof that British farmers have still some time to spare, in the intervals of their political activities, for the practical work of modernising farming methods. The papers and the keen discussions which followed them gave clear proof of the energy and success with which many farmers have tackled the problems of widely fluctuating prices and steadily rising labour costs. The growing of a higher proportion of cash crops, the elimination of the green or bare fallow, the substitution of dairy herds for the bullock-fattening yards, and the greater emphasis on pigs and poultry have involved radical breaks with old traditions, but such changes have increased the output and the profits of many British farms. It was generally recognised that the rise in agricultural wages had stimulated the adoption of labour-saving methods and the better organisation of the farm's labour supply; many

speakers emphasised the importance of special bonuses or piece-rates in giving the agricultural worker a financial interest in his daily tasks. Still further mechanisation, a weekly or fortnightly free day and a week's holiday with pay were regarded by many speakers as essential if able men were to be retained on the land; one speaker put in a plea for an agricultural training school for agricultural workers, financed by farmers themselves, on the lines of the apprentice schools set up in other industries. More than one speaker pointed out, however, that the increased leisure demanded by farm workers was difficult to arrange on the small farm employing perhaps only one or two men, and it is on these farms also that further mechanisation is impeded by the high cost, both of purchase and of depreciation, of modern machinery relative to the small area. The future in this country of the large farm, of, say, 300 acres or more, is assured, and there will always be a certain number of the small family farms round about 50 acres

SHORTER COMMENTS

Company Results of the Week.—The movement in profits of NEW ZEALAND AND RIVER PLATE LAND MORTGAGE, though small, is in the right direction. Net profits amount to £32,565 against £30,451, and the dividend is increased from 3½ per cent. to 3¾ per cent. One of the more satisfactory reports of the week is that presented by HOULDER LINE, whose net earnings amount to £151,663 against £140,193, despite poor crop conditions in the Argentine. In addition to the unchanged 7½ per cent. dividend a special tax-free bonus of 2½ per cent. is being distributed from a surplus on the sale of vessels. The total profits of ASSOCIATED PAPER MILLS have fallen from £116,720 to £110,022, and the fall in wood pulp prices during the year necessitated the writing down of stocks. PHARAOH GANE AND COMPANY, the timber merchants, have experienced a drop in net profits of some £22,500 to £23,757, owing to the large fall in timber imports last year. The report stresses, however, that 1937 was a boom year, and that the comparison of last year's profits with a five-year average is favourable. Profits of CLEVELAND PETROLEUM COMPANY show a sharp contraction from £572,566 to £314,639, though it is reported that the sales of the company's motor spirits have been well maintained. ENGLISH CLAYS, LOVERING POCHIN AND COMPANY have been affected, both in the home and export markets, by the year's disturbed political conditions, and both turnover and profits have declined. The ordinary dividend is reduced from 4½ per cent. to 2 per cent.

BANKING PROFITS & DIVIDENDS

Barclays Bank, Ltd.—Net profit for year to December 31, 1938, £1,926,458, compared with £2,133,825 in 1937. Dividends maintained at 14 per cent. on "B" and "C," and at 10 per cent. on "A" shares. To premises, £150,000 (£200,000). To contingency account, £250,000, against £500,000 to reserves. Carry-forward raised from £511,391 to £527,720.

Midland Bank, Ltd.—Net profit year 1938, £2,445,671, against £2,508,009. Dividend 16 per cent., as before, absorbing £1,758,400, against £1,764,049. To reduction of bank premises, £150,000 (£400,000). To contingencies reserve, £500,000 (£300,000). Carry forward raised from £591,044 to £628,315.

Martins Bank, Ltd.—Net profit year 1938, £872,929, an increase of £19,363 on 1937. This profit is struck after expenses, income tax, N.D.C., contingency account, and bad debts. The 1937 profit was struck after a centenary staff bonus also. Dividend

raised from 14 to 14½ per cent. For 1937, a 2 per cent. bonus was added in respect of the centenary, which took place in 1931. To reserve, £50,000 (nil). To premises, £100,000 (£75,000). To pensions, £100,000 (same). Carry-forward raised from £309,007 to £328,730.

Clydesdale Bank Ltd.—Net profit for year 1938, £316,941, against £320,250. Dividend 16 per cent. (same), absorbing £208,000. To reduction of bank buildings, £20,000 (same). Superannuation, etc., fund, £35,000 (same). Reserved surplus fund, £50,000 (same). Carry forward raised from £91,173 to £95,114.

District Bank Ltd.—Profit for 1938, £508,808, against £519,255. Dividend on "A" and "C" shares 18½ per cent. for year and on "B" shares 10 per cent. as before, absorbing £376,525, against £372,881. To pensions, etc., fund, £70,000 (same). To bank property, £60,000 (same). Carry forward raised from £285,610 to £287,893.

Williams Deacon's Bank Ltd.—Dividend for half-year on "A" and "B" shares is at rate of 12½ per cent. p.a. Net profits for 1938 (after expenses including £45,000 to staff funds, and contingencies), £301,418. Dividend absorbs £234,375; to bank premises £30,000; to reserve fund, £100,000. Carry forward, £85,635 (£148,592).

DISCOUNT COMPANY RESULTS

Alexanders Discount Company.—Ordinary dividend for final half-year at rate of 20 per cent. p.a., making 17½ per cent. for 1938 (as before). Carry-forward, £131,000 (£128,000). The directors have transferred £300,000 from investment reserve to write down investments to under market price.

National Discount Company.—Dividend on "A" shares 10 per cent.; and on "B" shares, final of 13 per cent. plus cash bonus of 4 per cent., making 26 per cent. for 1938 (the same). To reserve, £50,000. To staff pension fund, £5,000. Provisional net profits are £195,000 (£188,962). For 1937 the reserve allocation was £50,000 and £10,000 was set aside for staff pensions. The carry-forward was £216,762. It is announced that Mr Ronald Lambart Basset has been appointed to a seat on the board.

U.S. BANKING RESULTS

Bank of America.—Balance sheet total, December 31, 1938, \$1,574,721,670 against \$1,493,373,095 a year earlier. Surplus and profits, \$64,058,600 (\$59,104,964). Deposits, \$1,437,027,491 (\$1,357,378,756). Loans, discounts, etc., \$673,828,309 (\$630,668,811).

Central Hanover Bank and Trust Company.—Total assets, December 31,

1938, \$1,042,703,016 against \$934,774,000 at end of 1937. Cash, \$639,591,438 (\$342,481,000). Undivided profits, \$11,537,028 (\$10,476,000). Deposits, \$939,260,373 (\$831,259,000).

Chase National Bank of the City of New York.—Statement as at December 31, 1938, shows: Deposits, \$2,234,333,000, against \$2,069,990,000 a year ago. Total resources, \$2,523,167,000 (\$2,375,379,000); cash, \$861,439,000 (\$708,040,000); U.S. Government securities, \$639,878,000 (\$603,362,000); loans and discounts, \$638,734,000 (\$728,522,000). Capital, \$100,270,000 (same); surplus, \$100,270,000 (same). Undivided profits, \$35,247,000 (\$31,121,000).

Bankers Trust Company of New York.—Deposits on December 31, 1938, were \$890,465,428 (against \$819,473,017 at the end of 1937); cheques, \$21,833,118 (\$33,323,824). Surplus fund, \$50,000,000; undivided profits, \$29,464,115 (\$26,932,372); total assets, \$1,043,469,941 (\$975,069,368).

Guaranty Trust Company of New York.—Statement dated December 31, 1938, shows: Deposits, \$1,619,978,420 (against \$1,449,807,512 a year ago), and total resources, \$1,941,765,660 (\$1,781,934,937). Capital, \$90,000,000; surplus fund, \$170,000,000; undivided profits, \$12,808,420; cash, \$788,474,638; United States Government obligations, \$486,310,848; loans and bills, \$528,846,450.

Manufacturers Trust Company.—Balance sheet dated December 31, 1938, compared with September 30, 1938, shows: Deposits, \$655,486,078 (\$645,093,134); resources, \$769,305,594 (\$763,349,641); cash, \$197,452,981 (\$206,617,807); U.S. Government stocks, \$229,471,899 (\$183,374,045).

Brown Brothers, Harriman and Company.—The statement, dated December 31, 1938, shows total assets \$95,171,745 (against \$89,431,555 on December 31, 1937). Deposits, \$69,082,071 (\$58,799,155). Loans and advances, \$19,562,900 (\$19,521,678).

MISCELLANEOUS

Fanti Consolidated Investment.—Profit for 1938, £44,615 (against £76,539), including net profit on sale of investments, £7,156 (£35,917). From balance brought in, £32,427 transferred to reserve, making it £39,419, of which £34,419 used for year's investment depreciation. Dividend, 9½ against 12½ per cent. Forward (subject to directors' share of profit), £11,901 (£4,510 net).

Vorarlberger Illwerke.—Holders of 6 per cent. first mortgage sterling bonds have approved of a reduction in interest rate.

(Continued on page 50)

in size, whose occupiers consider themselves paid for their long hours of work by their independence. But modern methods of farming and the higher standard of working conditions demanded by farm workers put at a discount the medium-sized arable farm, which is too large to be independent of hired labour and too small to make the best use of recent technical progress.

Employment Marking Time.—Owing to the proportionately much smaller decline in employment than in business activity since the autumn of 1937, due, in part, to the reduction in average weekly working hours, the monthly employment and unemployment returns are not so sensitive an index of changes in industrial production as formerly. Thus, between November, 1937, and November, 1938, when *The Economist* index of business activity fell by 10 per cent., employment showed a decline of less than 2 per cent. Between November 14th and December 12th, the number of registered unemployed in Great Britain (inclusive of agriculture) rose by 3,000, compared with an increase of 166,000 during the same period in 1937. Although the increase was much less marked than a year earlier, our index of unemployment, which is corrected for seasonal variations, shows a further increase in December. The increase of 24,000 in the number of insured persons aged 16 to 64 in employment in Great Britain (exclusive of agriculture) between

Dec. 12	1,831	91.9	1,474	...	11,452	110

November and December compares with a decrease of 136,000 during the same period in 1937. The increase last month, however, was not sufficient to alter our seasonally adjusted index of employment. A geographical analysis of changes in unemployment between November and December shows increases in the South Eastern, North Eastern and Northern divisions, as well as in Scotland and Wales; but there were decreases in London, in the South Western and North Western divisions and in the Midlands. Industrial changes are reflected in a rise in unemployment in building, public works contracting, the pottery and hosiery trades, but a fall in the distributive trades, in coal-mining, and in the cotton, silk and rayon, motor and aircraft, metal goods and engineering industries. In general, the returns for December give the impression that business activity has been marking time.

Steel and A.R.P. Shelters.—The tonnage of steel which will be required for air-raid shelters is exercising the minds of many people. Estimates ranging from 500,000

to 1,500,000 tons have been given, but probably a half-way figure would be nearer the mark. The subsidy of £20 millions announced by Sir John Anderson is expected to provide splinter- and blast-proof shelters for 10 million people, and these shelters will probably be chiefly of the small household type, capable of holding four or five people. The exact design of shelter which will qualify for the subsidy has not yet been announced, but it is probable that the Home Office will approve of a design utilising 14-gauge sheets with five-inch corrugations, curved in semi-circular fashion to fit a light 4 in. by 2½ in. joist arch. Such a shelter would weigh about 10 cwt., the cost of sheets, joists and erection would be about £10, and therefore 2,000,000 of such shelters could be erected for the £20 millions. On these assumptions the quantity of steel required would be 1,000,000 tons, of which approximately 50 per cent. would be joists and 50 per cent. corrugated sheets. If a lighter gauge sheet should be adopted, the tonnage of sheets would be reduced, and if a heavier or lighter joist than 4 in. by 2½ in. were approved, the ratio of joists to sheets would be altered. However, the probability is that the shelters will be on the lines indicated; but there is just the possibility that the Home Office may approve a design of "elephant" shelters (i.e. with 5-in. corrugations) for small private houses, without the use of joists at all. The difficulty at the moment appears to be to obtain the capacity for producing "elephant" sheets in the curved form desired; but no doubt, if necessary, the additional plant will be quickly provided. If the "elephant" shelter type, consisting of sheets only, is not adopted, the most probable alternative is the 4 in. by 2½ in. or 5 in. by 3 in. joist framework curved in semi-circular fashion and covered with galvanised corrugated sheets. In the lighter form of shelter, the tonnage of steel required would be about 8 per cent. of the annual ingot capacity of this country, and the sheet tonnage needed would be equivalent to about 20 per cent. of the capacity of the sheet-producing plant. This will prove a welcome filip to the industry.

Cotton Yarn Price-Fixing.—At the end of last week the members of the Egyptian-type mule yarn price agreement decided to give three months' notice to customers to terminate the 5 per cent. rebate on prices, which came into operation last August. The rebate was originally instituted in order to enable the members of the agreement to counter the competition of outside firms, and the 5 per cent. concession was granted to buyers who agreed to purchase yarn only from spinners adhering to the price convention. This action has been prompted by the fact that there will be no necessity for rebates or concessions of any kind when the proposed Enabling Bill becomes law. Meanwhile, further progress is being made with regard to the formation of a comprehensive price-fixing scheme for all American yarns. Meetings are being held in

Manchester almost daily, and it is expected that a definite scheme will be sent to all spinners concerned within the next week or two.

* * *

Trouble with Bacon Contracts.—The revival in December last of the system of long-term contracts for bacon pigs meant that the bacon curers, after an interval of two years during which they obtained their pigs by purchase in the open market, are again dependent for their raw material on the contracts arranged through the Pigs Marketing Board. Since one of the reasons for the breakdown of the previous contract was the inability of some curers to obtain sufficient pigs, while neighbouring factories were working to capacity, the Pigs Marketing Board offered, under the terms of the new contract, a bonus of 2s. per pig to producers who left to the Board the choice of the factory to which the pigs were to be sent. At the same time, the Pigs Marketing Board reserved the right to reallocate, if necessary to secure equitable distribution of supplies among the curers, any pigs allocated to a particular curer. It may be remembered that the total number of pigs contracted for in 1939 amounted to only 1.4 millions, while the curers estimate that at least 2.2 millions are necessary to secure the most economical throughput. In order to spread the deficiency as equally as possible over all the numerous curers, the Pigs Marketing Board have had to divert large numbers of pigs from the curers to whom they were allocated. For this necessity the Board can hardly be blamed, but judging from the complaints that have inundated both the Board and the National Farmers' Union, the reallocation has been an extraordinarily haphazard affair. Pigs from Scotland have been ordered to Birmingham, and shareholders near co-operative factories have been told to send their pigs 50 miles or more to other factories, with consequently increased charges for transport to be paid by the Board. The trouble, of course, arises from the need to give all curers an equal share in what trade there is, a principle which, however just in theory, prevents the most economical conversion of the pigs into bacon when the supply of bacon pigs is less than the curing capacity. The remedy lies either in reducing this capacity, which no doubt the rationalisation schemes proposed in the Bacon Act will partly achieve, or in increasing the supply of bacon pigs.

* * *

Further Fall in Freight Rates.—The past year opened with tramp shipping freight rates in the midst of a sharp downward movement. The decline was temporarily arrested in August and September, but in October the index resumed its decline, which continued to the end of the year. The extent of the fall in freight rates since December, 1937, is shown below:—

The Economist INDEX OF FREIGHT RATES
(1898 — 1913 = 100)

	Average, 1913	Dec., 1937	Sept., 1938	Oct., 1938	Nov., 1938	Dec., 1938
European waters	110.0	140.8	107.7	110.5	108.0	109.1
North America	113.1	118.0	110.2	110.8	111.0	110.3
South America	123.4	109.4	121.3	117.2	116.0	113.2
India	106.3	141.2	113.7	112.7	108.1	106.4
Far East and Pacific	117.4	127.1	112.8	104.5	101.3	97.0
Australia	127.9	121.7	112.2	111.6	112.2	111.3
Total	116.3	126.4	113.0	111.2	109.4	107.9
1913 = 100	100.0	108.6	97.2	95.6	94.1	92.8

Moreover, as the next table shows, the downward move-

ment between November and December was noticeable on the majority of shipping routes:—

	Index No.	Inc. or Dec. Points		Index No.	Inc. or Dec. Points
Home trade	98.8	+ 3.6	South America:—		
Bay—outwards.....	121.1	— 5.5	Outwards	73.0	— 5.6
Bay—homewards.....	130.6	— 1.6	Homewards	158.4	...
Mediterranean:—			India—outwards	94.7	...
Outwards	75.6	+ 0.2	India—homewards	118.1	— 3.4
Homewards	129.8	+ 6.5	Far East, etc.	97.0	— 4.3
North America.....	110.3	— 0.7	Australia	111.3	— 0.9

The firmer trend of commodity prices on the world market, if maintained, should tend to arrest the downward movement in freight rates. The plight of the shipping and shipbuilding industries has been accentuated by the intensification of subsidised foreign competition. A Fact-Finding Committee, representative of the various sections of the shipping industry, has been examining the position. As the Government has already expressed its willingness to assist shipping the industry's recommendations are awaited with interest.

* * *

Co-operators and Bazaars.—The trade of the Co-operative Wholesale Society for the first nine months of 1938 increased by 3½ per cent. over that of the same period in 1937 to £89,024,875. This moderate advance was secured by an increase of £2,998,614 in grocery and provisions, of £280,236 in coal, and of £269,369 in the building and engineering departments. There were decreases in drapery, clothing, and boots and shoes, reflecting the reduced spending power of co-operators in the industrial areas and also the competition of the departmental stores and multiple shops of rival concerns. That co-operative societies are feeling the effects of these and the "increasing activities of the limited-price bazaar stores" is shown by a resolution to be moved at the quarterly meeting of the C.W.S. at the end of the month by the Hull society. This resolution calls upon the directors to examine the question in all its aspects and to submit "recommendations for the establishment of a chain of bazaar stores throughout the country, to be controlled and financed by the C.W.S." The Hull society further declares that "national operation and control is essential" to compete successfully with the bazaar stores. Thus the matter, which has been under review by many other societies, is to be determined in July. Meanwhile the supplies from the C.W.S. productive works have decreased by 2½ per cent. to £29,534,590 in the nine months ended October 8, 1938. Much of the decrease was due to the fall of £978,727 in the output of the nine flour mills, which had a production of £7,269,770, representing 8,340,302 sacks of flour and offals. There were also reductions in the biscuit and margarine works; while the turnover of the export department decreased by £31,168 to £340,308. Apart from foodstuffs, the smaller output of the flannel and woollen mills, the weaving sheds, clothing factories, cycle works, and fellmongering and tannery departments contributed to the lessening of the optimism with which the year started. On the other hand, the higher price of butter raised the production of the three factories to £2,173,086, although the weight of butter sent out was 359,748 cwt., a decrease of 9,163 cwt. Good improvement was recorded in the supplies from the hosiery, corset, shirt, mantle and furniture departments, suggestive of the intensive campaign now in operation to reduce the dependence on outside makers for supplies. The highest advance in any section of the C.W.S. for the nine months was in the milk business, whose turnover was increased by over £1,000,000, or 33 per cent., to £3,946,842.

* * *

Strong Tin Position.—The tin market has entered the New Year in an unusually strong statistical and technical position. The December statistics published by Messrs A. Strauss and Company, Ltd., on Tuesday, showed hardly any change in stocks. At 29,377 tons (representing less than two months' consumption at the present level) they were

6 tons higher on the month, although the market had anticipated a considerable decline. The difference between the actual changes and the market's expectations was due to the fact that world deliveries, at 5,778 tons, showed an unexpectedly sharp drop of 1,650 tons and reached the lowest monthly level for several years. The December deliveries were thus again well below actual consumption, so that consumers' stocks have declined further. After the continuous drain in recent months these "invisible" stocks must now have fallen to or even below the safety level. On the other hand, since the above total of the visible supply includes at least 8,500 tons of tin held by the buffer pool, the total of visible stocks has declined by some 5,000 to 6,000 tons on the year. This contraction in stocks will naturally force consumers to return to the market before long, particularly as consumption is on the increase. The world's apparent consumption figure for the first quarter of this year will almost certainly reach and possibly exceed 45,000 tons, while the present free market quota of 35 per cent. of the standard tonnages will keep world supplies (including outside supplies) in the same period below 30,000 tons. The tin market will thus become dependent on buffer pool releases within the next few weeks, so that the prospects for tin prices are exceedingly strong. It is to be hoped that the authorities will not allow another "squeeze" to develop as in the years 1933 to 1935.

* * *

Falling Platinum Prices.—The price of platinum, unlike those of other precious metals, has been decidedly weak of late. After rising from £6 12s. 6d. per fine ounce in May to £8 in August, the price fell in November to £7 10s. Even this level can hardly be defended for much longer. World consumption of platinum has decreased substantially this year and will hardly reach 400,000 fine ounces, while supplies will probably exceed their previous record level of 435,000 oz. by a small margin. As the leading producers of platinum, and in particular the International Nickel Company of Canada, are anxious to extend the market for their product, it is not likely that they will attempt to raise the price by the restriction of supplies. A further reduction in the platinum price, bringing it beneath the present high price for gold, could by no means be regarded as regrettable, since it would stimulate the use of platinum in the jewellery trade and in industry, and thus help to close the gap between the available supplies and prospective demand.

* * *

Wholesale Prices Rally.—The New Year has opened with a moderate recovery in wholesale prices. For Great Britain, the complete *Economist* index number has risen by 0.9 per cent. and the primary products index number by 1.8 per cent.; and these increases have occurred in spite of the New Year's reductions in iron and steel prices. In

the United States, the complete Irving-Fisher index number has risen by 0.7 per cent., and *The Economist's* primary products index number by 0.8 per cent.

Details of changes in the component series of the complete index are given below:—

The Economist INDEX

(1927 = 100)

	Sept. 18, 1931	Jan. 5, 1938	Dec. 21, 1938	Jan. 4, 1939
Cereals and meat...	64.5	93.1	67.7	69.6
Other foods	62.2	63.7	57.1	57.6
Textiles	43.7	58.8	52.7	53.4
Minerals	67.4	95.6	94.4	91.8
Miscellaneous	65.8	79.6	75.0	76.2
Complete index	60.4	77.8	68.6	69.2
1913 = 100	83.1	107.1	94.5	95.3
1924 = 100	52.2	67.3	59.4	59.9

Grain prices are again higher, and their low point was apparently touched over a month ago. Among other foods, tea and sugar are firmer. In the textiles group, there were advances in cotton, flax and jute. The fall in the minerals group index reflects the reduction in iron and steel prices. In the miscellaneous materials group there was a moderate advance in rubber and a sharp increase in linseed oil.

INDUSTRIAL REPORTS

THE pulse of industry is gradually quickening again, though the volume of new business was still comparatively small this week. The demand for coal has been slack in South Wales, but the cold weather has stimulated purchases in other districts. The iron and steel markets opened on a note of confidence, and the volume of transactions is expected to expand in the near future. The Government's decision to create a national reserve of machinery for the electricity supply industry at a cost of £3,000,000 should benefit the electrical equipment industry at a time when other orders are not coming in so well as previously. Business in cotton goods has been small, and spinners have found difficulty in selling the reduced output. The tone of the market, how-

ever, has been better as a result of the firmer trend of raw cotton prices. The wool textile trade is fairly active and the demand for warm clothing has increased owing to the onset of cold weather.

Coal

Sheffield.—There is a strong demand generally for coal, and both industrial and household requirements are heavy. Locomotive hards are still in full request, and heavy deliveries of smalls are being made to electricity works. Gas coal is active and firm.

While blast-furnace coke continues dull, all other qualities show an improved demand. Graded qualities for

central heating are quoted higher at 27s. per ton on rail at ovens.

There is very little new export business, but prices are steady. A moderate demand exists for large coals, but smaller grades are in abundant supply. Prices are unchanged.

*

Newcastle-on-Tyne.—The North-East coal market is steady with collieries comfortably stemmed for the next two or three weeks. The cold weather and transport difficulties on the Continent has brought more inquiry for Durham coking coal. Northumberland screened steam coals remain firm, but collieries still experience difficulty in disposing of their smalls. Durham prime gas coal is readily sold, but second classes as well

SITES FOR WORKS Apply to above address for particulars

as bunkers are fairly plentiful. There has been an improved inquiry for coke from the Scandinavian countries, but the home section shows little change.

★

Glasgow.—The coal market has opened on a strong note after the holiday. Just as before the stoppage, weather influences have been the dominant factor, for the renewed severity of conditions has increased demand perceptibly, and on a market bare of stocks the effect has been a definite firmness of prices. This tendency may become less marked as supplies come forward, for the miners have as usual made a slow resumption of work. Demand is mainly on home account, and reflected therefore chiefly in Lanarkshire and Ayrshire, but Fife and the Lothians appear also to have sufficient business to absorb outputs.

Shipments last week showed a marked improvement at 289,000 tons, reducing the deficit on the year to 1,428,000 tons.

★

Cardiff.—The New Year has not brought any improvement in the state of business on the Cardiff coal market. Output and supply quotas for the first quarter of the year are considerably lower than those for the corresponding period last year, but they are more than adequate to meet current demand. Cases are reported of the recovery of contracts which were lost last year to Germany, and although they do not represent a considerable volume of trade, hopes are entertained that they will be followed by others covering business of larger proportions. Shipowners are concluding contracts with depot owners covering the whole of 1939 and are endeavouring to obtain the advantage of a "fall" clause.

Prices are nominally unchanged, and supplies are plentiful except of dry grains and sized classes. Shipments in the foreign and coastwise trades last week totalled only 212,600 tons, compared with 267,739 tons in the corresponding week of 1937, and the provisional total shipments for 1938 from the ports of Cardiff, Newport, Swansea, and Port Talbot are 19,252,500 tons, compared with 21,034,347 tons in 1937. The Brazilian Railways have invited tenders for 350,000 tons for delivery over the first six months of the New Year.

Iron and Steel

Sheffield.—The iron and steel market has opened the year on a firm note; the volume of business this week, however, was limited, as holiday influences were still operating. Consumers of forge and foundry pig iron have for some time been buying from hand to mouth awaiting a decision on prices. They are now coming into the market, and some contracts have been arranged over the first half of the year. Hematites continue quiet, and the re-

duction in prices for finished iron has so far brought no increase in business.

The revised quotations for steel have brought out more inquiries, and the market is in a confident mood. Buying of billets, both basic and acid, is regarded as satisfactory, steel bars and wire rods are in fair request, while business in stainless steel sheets is substantial.

The iron and steel scrap market has not been active this week. Interest is mainly in materials the prices of which are not stabilised, but it will probably be a week or two before demand shows much increase.

★

Middlesbrough.—The market has opened with a confidence tone after the holidays, and, whilst extensive orders have not yet been placed, it is expected that during the next two or three weeks foundry owners and users who have been waiting for the reduced prices to come into operation will be covering their requirements.

Foreign iron is practically shut out by the Import Duty and the operation of the rebate to buyers who use only pig iron produced by British works. The price of No. 3 Cleveland foundry pig iron is 99s. per ton delivered locally, less 5s. per ton rebate. Makers of East Coast hematite are expecting increased requisitions for iron under existing contracts; whilst stocks in makers' yards are substantial, it is believed that actual requirements will exceed the present output. A shipment of 1,100 tons was made last week to South Wales, which is the first parcel to be shipped to that area for a period of two years. Export business is, however, quiet, although small parcels continue to change hands. No. 1 quality East Coast hematite is at 120s. 6d. per ton delivered in the North-East area, less 5s. per ton rebate. Basic iron is in increased supply owing to the additional furnaces in operation, but none of it is available for the market, as it is used in producers' own steelworks.

Semi-finished steel makers are experiencing a better demand, as re-rollers have almost cleared their stocks of the Continental material imported some time ago. Finished steel producers are looking forward to extensive orders for arches and sheets as a result of the Government's A.R.P. programme. Further rail orders are expected when the annual contracts are placed by the railway companies. In the meantime, increased orders for shipbuilding material would be welcome.

Good Durham blast-furnace coke is in good supply at 24s. 3d. per ton at the ovens, whilst imports of foreign ore continue on a reduced scale. Heavy steel scrap is moving rather more freely at the reduced price. The total shipments of pig iron and steel from the Tees in December amounted to 30,738 tons.

★

Glasgow.—Work will not be resumed at the steel plants until next week, but in some of the lighter

branches a restart has now been made. The year opens with order books fairly well filled. Boiler-makers, locomotive builders, engineering firms generally, tool makers and machinery makers in the West of Scotland have many months' work on hand and will consume considerable tonnages of steel. The demand for shipbuilding material is still unsatisfactory. Clyde shipbuilders who are engaged on mercantile vessels are somewhat anxious concerning the future, as the new work placed is not keeping pace with the tonnage launched. Work on Admiralty contracts is providing employment at a number of Clyde yards and orders on hand will ensure steady work for many months at least. Sheet makers anticipate a busy spell and have a considerable tonnage booked for January delivery. The market for high-grade sheets continues to expand and sheet makers in Glasgow and district are supplying large quantities for the motor car trade, steel furniture manufacture, stove making, etc. Tube makers have sufficient work on hand to give steady employment for some time at their Lanarkshire plants.

★

Cardiff.—The reduced tinplate prices for the inland and export trades have not yet had any appreciable effect on demand, and the current rate of production is appreciably lower than the average weekly output during 1938. Work has not yet been resumed at some of the mills which were closed down for the Christmas holidays. There is a better inquiry for steel sheets for the home market, but the recent improvement in the market for galvanised sheets has not been maintained.

Textiles

Cotton (Manchester).—Business has been affected by the New Year holidays, negotiations between buyers and sellers being impeded by mail and cable delays. The tone of the market, however, has been rather firmer, in sympathy with the firmer tendency of raw cotton prices. Much uncertainty still exists concerning crop control in the United States next season. Still more material is going into the Government loan, and the consumption of American cotton continues to decline compared with a year ago.

In the yarn market buying has been of a hand-to-mouth character and most spinners have found difficulty in selling and clearing the reduced output. Further progress is being made with regard to the comprehensive price-fixing schemes for all American yarns, and Egyptian mule spinners have cancelled the 5 per cent. rebate on prices.

There have been few serious attempts at business of importance in piece-goods for abroad. Miscellaneous sales have been arranged for several outlets, but buyers and sellers have experienced difficulty in bridging differences between prices and offers. Necessary buying has occurred in home trade fabrics.

★

Wool (Bradford).—Another chapter opens in the wool textile industry with the reopening of the sales in Australia, and interest now largely centres on overseas markets. All cabled reports state that there is a continued healthy demand for the raw material,

with prices ruling at the level at which they closed before the Christmas recess. One of the most satisfactory features is that practically all trades are liberal buyers, although Japan in particular could purchase on a much larger scale than is the case.

Turning to manufacturing centres, most mills are running, but there is still plenty of room for improvement, while all sections complain very bitterly at the pronounced absence of profits, everything being cut to the very minimum. There are serious complaints at the business methods which are being adopted by the large multiple tailors; they seem to be in a position to dictate prices. The general public, however, is benefiting from the low level of prices. One of the most pleasing features is the briskness of the hosiery section, the present cold spell having led to very big sales of underwear fabrics, the like of which have not obtained for a long time. All this is contributing an important quota towards the running of machinery, not only in the West Riding, but also in the making-up factories.

THE COMMODITY MARKETS

A FORTNIGHT ago we indicated that the outlook for prices was more favourable than for some time. This view has since been confirmed by the course of prices of the principal primary products, both in this country and in the United States. Moody's index of the prices of staple commodities in the United States (December 31, 1931 = 100) rose from 141.3 to 143.6 during the fortnight ended last Wednesday. As *The Economist* index of the prices of primary products, given on page 39, shows, the upward movement was not confined to the United States. During the past few days the rise in the prices of a number of commodities in London has been accentuated by the renewed depreciation of the pound in terms of dollars.

The rise in prices was fairly general, including wheat, raw sugar, cotton, flax, jute, rubber, linseed oil, copper and tin. Moreover, as many consumers frequently replenish their stocks early in the year, the rise in prices may go further.

Metals

Copper.—In spite of the holiday season and the wish of most consumers to keep their cash resources liquid over the end of the year, the price of copper was fairly firm this week and standard cash closed on Wednesday at £44 6s. 3d. per ton, a net gain of 5s. The demand was fairly quiet, but at the same time sellers were very reserved in anticipation of better prices in the immediate future. Stocks of copper in official warehouses of the L.M.E. were given on December 31st at 29,605 tons, a decline of nearly 2,000 tons on the year. This level is at least 10,000 tons below normal and as there will be hardly an increase but quite possibly a further reduction in the near future, the technical position of the market is very strong.

Tin.—The tin market was very firm this week and the standard cash price closed on Wednesday £1 12s. 6d. higher at £217 per ton. This level equals the highest price for nearly 15 months. The December tin statistics published this week showed almost no change in stocks. At 29,377 tons the total visible supply was only six tons up on the month, according to A. Strauss and Company, Limited. New supplies at 6,439 tons showed the expected decline of 616 tons on the month, but simultaneously deliveries fell to the record low level of 5,778 tons, thus showing the remarkably sharp drop of 1,650 tons on November. The low level of deliveries, however, had a reassuring rather than a depressing influence on the price level, as it convinced the market that consumers' stocks must have fallen considerably in December and thus make substantial purchases more likely in the near future. In fact a considerable demand was encountered this week, mainly from the United States.

★

Lead and Spelter.—The price of lead closed on Wednesday 1s. 3d. down at £14 16s. 3d. per ton, while the price of spelter lost 3s. 9d. to close at £13 15s. per ton. There have been no new features in these markets and oversupply was again in evidence. It was reported from Brussels that negotiations for a closer co-operation amongst the Belgian customs smelters of zinc have been started. A successful outcome of these discussions would provide a suitable step towards a comprehensive international scheme, so that the Belgian discussions are of considerable interest.

★

Nickel.—Nickel remained steady this week, although some observers had expected a change in the price at the beginning of the year. According to Mr Robert C. Stanley, President of the International Nickel Company of Canada, the world's consumption of nickel amounted to 168 million lbs. in the first ten months of 1938. This figure represents a decline of 16 per cent. on the record figure of the preceding year and constituted the first interruption of the steep upward movement in progress since 1933. The decline was chiefly due to the low rate of consumption in the United States in the first half of 1938 and was smaller than the simultaneous decline in the consumption of most other metals. Consequently, it appears that the setback has not changed the strong basic position of nickel compared with that of the other base metals.

Grains

MARKETS have been firm during the past week, and both wheat and maize prices are higher than a week ago. In spite of the import duty recently imposed, there have again been inquiries from India for Australian wheat, while there has been a revival of interest in the United Kingdom and Belgium for American hard winter wheat. Prices in North America are also slowly improv-

ing; the prospects for the winter wheat are poor, as there has been a deficiency of moisture in the wheat belt and sharp variations in temperature in recent weeks. The premium of Plate maize continues and consequently more interest has been shown in supplies from America. Though the volume of business has not been large, barley prices are firmly held.

Other Foods

Provisions.—With smaller supplies of bacon, prices were advanced shortly after Christmas. Egg prices have also been improved by the reduction in home supplies, the consequence of the sudden onset of cold weather shortly before Christmas. There has been a steady trade in chilled meat, but the demand for home killed meat has been slow, except for veal. Dominion butter prices also improved in the past week.

★

Colonial Produce.—The market for raw sugar has been firm, although business has been limited by the holidays. At the resumption of the tea auctions, there was a good demand for Indian teas, but prices for Ceylon were irregular. Since the holidays, the market in cocoa has been steady, with some improvement in the price of Accra.

★

Fruit and Vegetables.—Immediately after Christmas, trade was quiet but improved over the week-end. Early in the week there was a shortage in London of green vegetables and English apples, but supplies have since become more normal and prices have again declined.

Miscellaneous Commodities

Oils and Oilseeds.—The volume of business in these markets has not been large, but prices are firm. The exportable surplus of linseed from the Argentine is now placed at about 1½ million tons for the new crop. There have recently been heavy shipments from the Plate both for Europe and the United States. Prices of cottonseed are steadier, but the export demand for cottonseed oil has been disappointing and prices have tended to fall. The demand for oilcakes has improved during the last few weeks of cold weather.

★

Rubber.—The Christmas and New Year holidays have limited the amount of business transacted, but prices have been maintained; compared with a week ago, the buyers' price of standard sheet shows an improvement of ½d. per lb. for positions up to April. Stocks outside the producing countries were estimated to total 487,322 tons at the end of November, a fall of 31,522 tons during the month and one of 36,346 tons compared with the close of 1937. Reports from the American automobile industry continue encouraging.

COMMODITY PRICES AND STATISTICS

Beginning with this issue the tables of Wholesale Prices and Commodity Statistics have been transferred to the "Current Statistics" section. The tables will be found this week on pages 55 & 56.

COMPANY MEETINGS

BANK OF MONTREAL

TRADE CONDITIONS IN CANADA

SIR CHARLES GORDON'S REVIEW

The 121st annual general meeting of the shareholders of the Bank of Montreal was held on December 5th last in Montreal.

Sir Charles Gordon, G.B.E. (president of the bank), who presided, in the course of his address said: By and large I think it can be said, having in view the conditions which have prevailed in other countries, that business throughout the Dominion during the past year has not been unsatisfactory. Most of our industries have maintained a fair rate of production, and although there has been recession in some lines this has been offset largely in other directions, with the marked activity of mining contributing in increasingly important measure to the welfare of many subsidiary enterprises from coast to coast.

Among the more immediate factors destined to have a stimulating effect upon certain of our manufacturing industries is the prospect of this country contributing to the armament requirements of Great Britain. I may say that early last spring when I was in London there seemed to be a desire in official quarters to place orders for munitions and airplanes in Canada, and I had a number of interviews with important people in this regard. Later, Sir Hardman Lever came here with a mission to look into the possibility. I think the result of these conversations and investigations will be satisfactory, as already contracts have been negotiated, and we may hope that additional business will follow.

MINING

In the stressful times through which we have been passing it may well be said that mining has been the sheet-anchor of our economic life. Here is an industry which over a period of years has measurably offset contraction in other lines of activity by increasing its production and extending its frontiers. Canada is now a recognised source of world supply for many of the base metals. During the present year a new record has been set up in gold mining by the production for the first time of more than 400,000 fine ounces of gold in one month, and as the year closes we see total production of gold on the basis of \$180 millions annually.

Despite the further progress which has been made in consolidating the position of mining and of its corollary, metallurgy, I think the most outstanding step which has been made in the development of our national resources has been in the results attained in the Alberta oilfields. Oil production there has now reached such a stage that it has commanded not only national but international attention, with the result that problems as to the best methods of transportation to distant markets are already being discussed.

These are matters that await determination as to the regular volume of production which can reasonably be counted upon, although the growth of production to date has been such as to indicate that possibly it may bring Canada to a place second only to Trinidad in the British Empire as a source of oil. Meanwhile, proration of production has been put into effect pending the development of markets and of facilities for refining and distribution. What already is assured is production of such a volume as will prove of marked benefit to the economic life of the whole prairie country, and a major asset in developing the great mining regions which lie north of the grain growing areas.

TRADE AGREEMENTS

An important factor bearing on the economic situation comes from the tripartite trade treaties just signed by the representatives of the United Kingdom, the United States and Canada. These treaties will affect in more or less degree every industrial and commercial enterprise in this country. The situation has been a peculiar one for Canada, inasmuch as it has provided the most dramatic demonstration yet given of Canada's position as the natural liaison between Great Britain and the United States.

Without Canada's co-operation the agreement making for closer commercial co-operation between the two largest English-speaking nations, so important at this juncture in world affairs, would not have been possible. Canada has given that co-operation, not without sacrifices and not without some misgivings as to what these sacrifices may portend.

THE ROYAL VISIT

We are promised in the coming year an honour unique in our history—namely, an official visit from the reigning sovereign and

his gracious consort. I am one of many who look upon this coming of the King and Queen to our Dominion—coupled with the further news of the appointment of H.R.H. the Duke of Kent to the Governor-Generalship of Australia—as the symbol of a new vision of Empire: a vision in which are seen the genius and the capital resources of the Empire concentrated as never before upon the upbuilding of the Empire itself and the upbuilding of the welfare of its own peoples.

If that belief is true, then it may well be that Canada will begin in full measure to fulfil the destiny marked out for her by her territorial domain, by her geographical position, by her great pioneering achievements, and, above all, by the quality of her racial stocks and racial traditions.

THE GENERAL MANAGERS' ADDRESS

Mr G. W. Spinney, as joint general manager, read the address of the joint general managers, in part, as follows:—

Important changes in the balance sheet figures are as follows: Our total assets amount to \$874,300,000, compared with \$829,600,000 a year ago. Quick assets, including securities, total \$620,300,000, representing 77.80 per cent. of all liabilities to the public. Deposits by the public amount to \$725,800,000, an increase of \$44,800,000. The increase in our Canadian deposits has been \$39,100,000.

Current loans and discounts in Canada amount to \$178,700,000, an increase of \$27,800,000 over last year, and \$47,900,000 over two years ago. There has been a substantial increase in the number of commercial borrowers who are using our facilities and to an extent we have obtained more profitable employment of money than could be found in short-term, high-grade securities.

This is a highly satisfactory development.

INVESTMENTS AND INTEREST RATES

Coming now to the largest item of our assets, investments, not exceeding market value at \$440,900,000, show an increase of \$3,200,000. There are included in this total Dominion and Provincial Government obligations amounting to \$362,200,000, of which \$172,600,000 mature within two years.

The very size of the Federal debt, direct and indirect, amounting to \$4,401,000,000, and the cost of servicing it, are reasons for assuming that monetary ease will be maintained in so far as it is feasible. Such a statement would be applicable also to the United States and Great Britain.

As a safeguard to the shrinkage in values which would ensue should a marked stiffening in interest rates occur, we have consistently adhered to the policy of restricting investments to securities within the short-term orbit. While this has narrowed our earning capacity, any other investment policy would be fraught with risk which we would not care to face.

At the present time 45.92 per cent. of our entire portfolio of securities will mature within two years, while 95.18 per cent. of our total holdings will fall due before the end of 1944.

BUSINESS OUTLOOK

Business as a whole in Canada during the year under review can be said to have fared very well, especially when viewed in the light of conditions prevailing in the rest of the world. Because of geographical and trade relations, our economic welfare must be under the special influence of conditions in the United States, and it is therefore reassuring to observe an upturn in business in that country. It is difficult, of course, to determine the extent to which their apparent betterment evolves from Government spending, but general sentiment has improved, and this is a prerequisite to industrial recovery.

Any marked improvement in our building trades, which have been lagging, will produce widespread benefit, and it is gratifying that the Ottawa Government, with the co-operation of the banks and various lending agencies in the country, has opened the way to building construction and improvement at low interest and amortisation cost, thus providing a marked impetus to the trade on a thoroughly sound basis.

In the complicated conditions which now beset us any general forecast would be risky, but, given peace in our time and prudent management of our affairs, there is every reason why Canada should face the future with confidence.

BURMA CORPORATION LIMITED

EFFECT OF FALL IN METAL PRICES

ORE RESERVE POSITION

MR P. E. MARMION'S REVIEW

The annual general meeting of the Burma Corporation, Limited, was held on the 20th ultimo, in Rangoon.

Mr P. E. Marmion (vice-chairman and joint managing director), in the course of his speech, said: Many of you may remember that I ended my address in December last year upon a note of caution since, in spite of the excellence of the results I was then reviewing, I could but remind you of the fall in metal prices that had already been in progress for several months, and which must have its inevitable reaction upon our earnings. Such indeed has been the course of events, and our report clearly shows both the extent and the direction of the decline, together with the influence of these movements upon our profits. These at Rs. 87,59,404 are sadly diminished relatively to the record set up last year, but, even so, they permitted the declaration of dividends aggregating 10 annas per share, a return of some 7 per cent., tax free, upon our capital.

IMPROVEMENT IN METAL PRICES

Happily since the close of our financial year there has been a welcome reversal in the trend of metal prices, which took them to a considerably higher level than they were in the month of June. The prices set out in the quarterly report for the period ended September 30th reflect the improvement, which was more than maintained to the end of November, since when there has been some recession.

The contribution of lead to our total revenue again rose from 54 to 58½ per cent. and silver also increased from 18½ to 21½ per cent., so that their combined contribution reached the high total of 80 per cent.

The total of operating expenditure is almost the same as last year. Freight, shipping and realisation charges have again increased, and amount to more than 60 per cent. of the total cost of production at Namtu. For the current period I am hopeful that the total of these charges and the relation it bears to our costs of production will revert to more normal proportions.

The Chairman then dealt with the tonnage and grade of the ore mined, emphasising the importance of the policy of grade reduction pursued since 1933, and passed on to review the production figures for the year as set out in the report. He then traced the movements of metal prices during the year, commenting upon the improvement which had taken place since the close of the financial year and which had been maintained until the end of November.

Turning to silver, the second most important of the Corporation's products, the Chairman stressed the complete dependence of the metal upon the United States buying policy as laid down by the Silver Purchase Act of 1934.

In commenting upon the importance of the improvements in production economy which were continuously in progress, the Chairman drew attention to the major influence in profits of metal prices, the cost of stores ancillary to production, and of ocean freight, over all of which no direct control could be exercised. He went on to emphasise that the most conspicuous feature in the accounts was the decline in revenue of £746,411, due to the fall in metal prices.

DEVELOPMENT WORK

The Chairman continued: Development work added 249,891 tons of ore to the reserves, of which 227,895 tons came from lateral exploration in the upper levels of the Chinaman Section and 21,996 from the current work on No. 11 level, and further work in the upper levels of the Meingtha Lode. Payable ore in the Meingtha extended just down to the horizon of No. 11 level, as in the Chinaman and Shan sections, but its length was much reduced. With the exception of a small area in the upper levels the development of the Meingtha lode is now complete.

Further investigation was initiated towards the end of the year at the south end of the Shan lode on No. 6 level to ascertain if there were any isolated blocks of ore that had been carried to the west by the main mass by the movement caused by the Yunnan Fault, and which would have been missed in the original plan of development. I am glad to state that our suspicions were well founded and that some disconnected blocks of ore have been located between the several fault planes which represent the direction of the movements

of the Yunnan Fault over a considerable period of time when it thrust the major portion of the original massive Bawdwin deposit some 700 ft. to the west. Although the individual blocks of ore in themselves do not represent a large tonnage, yet, in the aggregate, they will provide a useful addition to the reserve, and we shall no doubt locate similar faulted blocks on other levels as work proceeds.

SIGNIFICANCE OF RECENT DISCOVERIES

This discovery definitely establishes the geological sequence of the lateral fault movements by which the original homogeneous mass of ore, representing the Bawdwin deposit, was dislocated and separated into its three component parts, the Shan, Chinaman and Meingtha ore bodies. The location of the original massive deposit on the main north and south Bawdwin Fault shear was on the strike of the present Shan Lode. Earth movements subsequently caused the major portion of the mass represented by the present Chinaman and Meingtha Lodes to be moved, by what we call the Yunnan Fault, some 700 ft. to the south-west to the plane of the present Chinaman ore body. Later earth movements again dislocated this faulted major portion and thrust that part of it now known as the Meingtha Lode some 1,100 ft. to the south-east.

The original homogeneous ore body was thus finally broken into the three distinct but complementary lodes which we have to-day. Had it been possible to interpret the sequence, direction and extent of these tremendous earth movements at the beginning of operations at Bawdwin, the work of development would have been greatly simplified and cheapened, but the knowledge, even at this late date in the Corporation's history, is at least a source of satisfaction, inasmuch as it confirms that our diagnosis of the geological structure of the deposit has been correct and reassures us that the whole of the original mass of ore in its present widely faulted and separated portions will ultimately be fully explored and no portion left undiscovered.

ORE RESERVES

On the last two occasions on which I have addressed you I dealt at length with the ore reserve position. I explained the reasons why we felt confident that the ultimate tonnage of ore extracted would exceed very considerably the original estimate. Many of you will no doubt already have noticed that the familiar table in the general manager's report, setting out the estimated tonnages and values of the ore reserve, this year incorporated a new feature—the assessment of the excess tonnage that has already been extracted from those sections of the mine in which stoping has been completed. A start has thus been made in taking into account a definite tonnage of this ore and, from the further evidence accumulated during the year at the mine, I see no reason to modify the guess I made last December that the ultimate recovery of excess ore might reach a total of 750,000 to 1,000,000 tons, except perhaps that I might venture to state that indications favour the larger rather than the smaller figure.

So far only 124,021 tons of this large potential tonnage have actually been absorbed into our reserve calculations, so there remains the expectancy of a very large balance to supplement the normal accretions from current development work in future years. After allowing for 472,802 tons extracted during the year, the estimated total of our ore reserves at June 30th was 3,764,658 tons, just 100,000 tons less than 12 months previously.

TREND OF METAL MARKETS

In my review of metal markets last December I drew your attention to the short-lived spectacular rise in prices during the first quarter of 1937 and to the violent reaction that followed in the second quarter, causing our financial year ended June 30, 1937, to close with a trend pointing decidedly downwards.

This downward trend persisted throughout the second half of 1937 and continued without relief during the first half of 1938. Happily, in the month of June there were signs that the headlong decline had at last been arrested, and prices for the opening quarter of our current financial year show a welcome tendency to improve.

Notwithstanding this persistent decline in metal prices since the first quarter of 1937 and the recession in general business activity, particularly in the second half of 1937, it is remarkable that the demand for non-ferrous metals, outside the United States, remained at an exceptionally high level, with the result that the apparent world consumption for that year—again excluding the United States—reached higher levels than ever before; 1938, however, opened with the demand for metals somewhat subdued, particularly in the United States, but with the tide of armaments rising rapidly in all countries, with hostilities in Spain and China showing no signs of abatement, and with prospects of a sustained industrial revival in the United

States, the call for supplies of copper, lead and spelter again reached high levels and halted the rising tendency of stocks in the hands of producers.

CONSUMPTION IN THE UNITED STATES

Recovery in the United States lags so far behind the rest of the world that statistical surveys of world conditions are apt to be misleading unless they are divided into two groups. This applies with particular emphasis to a survey of world statistics of non-ferrous metals for 1937. These show, for example, that the world consumption of copper reached the record total of 2,163,000 tons, which is 116 per cent. of the highest total attained previously in 1929. The world total of 2,163,000 tons was, however, made up of 1,379,000 tons consumed by the rest of the world and 784,000 tons consumed in the United States, showing that, whilst the rest of the world consumed 161 per cent. of its 1929 total, the United States consumed only 78 per cent. of its 1929 figure. Similarly, consumption of lead in the United States for 1937 was only 76 per cent. of its 1929 figure and for spelter it was 102 per cent.

In the present state of political tension and uncertainty, I am sure you will not expect me to make any prophecy on the outlook for international trade in general and for non-ferrous metals in particular. The necessity for rigid monetary control in so many countries automatically encourages the policy of self-sufficiency, with its concomitant barriers and impediments to the flow of trade. These restrictions are, unfortunately, tending to increase, while the intensification of re-armament, already on a prodigious scale, must continue to retard the development of pacific industry, particularly as the financial stress increases.

The manufacture of all the implements of war has become an industry of the first magnitude in almost every country and calls for a major share in the available supply of metals, and in these circumstances it seems that we may anticipate the maintenance, or indeed some extension, of the present activity of demand.

LEAD

Demand for lead throughout 1937 continued to expand in almost every country, and the world total was greater than ever before. In the United States consumption increased by almost 60,000 tons beyond the figure for the previous year and exceeded production by 75,000 tons. Even with this substantial improvement, consumption was only 76 per cent. of its 1929 peak.

Consumption in the rest of the world expanded by more than 100,000 tons and established a new high record at 115 per cent. of the 1929 peak. Europe consumed 1,000,000 tons for the first time, and Japan exceeded her previous record by a substantial margin, while Germany, for the first time, exceeded her 1929 peak.

At the end of October stocks in the hands of the principal producers were 43,368 tons greater than in 1937, when they were particularly low. About half of these stocks comprised metal still on refinery floors far removed from the world's consuming markets.

SOUND STATISTICAL POSITION

The statistical position of the metal continues sound, having undergone little change, and the principal producers outside the United States are co-operating to keep production reasonably in accord with consumption.

World production of lead for 1937 was 1,684,227 tons, or 214,265 tons more than for the previous year. World production of lead for 1938 is estimated at 1,635,000 tons, or about 50,000 tons less than for 1937. The tendency for consumption to decline appears to have been halted in June, since when it has been somewhat in advance of production, with benefit to the stock position.

World production of spelter for 1937 was 1,634,228 tons, thus exceeding the record established in the previous year by no less than 170,000 tons. World consumption of spelter for 1937 was 1,600,000 tons, almost 100,000 tons more than for the previous year and constituting a new record. The estimated production of spelter for 1938 is 1,530,000 tons, or about 100,000 tons less than for the previous year.

World production of copper for 1937 reached the remarkable total of 2,237,000 tons, nearly 590,000 tons in excess of the previous year and 345,000 tons greater than in 1929. World consumption at 2,163,000 tons advanced by 300,000 tons.

World production of silver for 1937 reached the record total of over 273,000,000 ounces, or 20,000,000 ounces greater than for the previous year. World production of silver continues more or less at the level of the previous year, with Mexico showing signs of greater activity.

The report and accounts were unanimously adopted.

BUTLIN'S LIMITED

ALL-ROUND PROGRESS

The second ordinary annual general meeting of Butlin's, Limited, was held, on the 30th ultimo, in London.

Colonel Sir Thomas A. Polson, K.B.E., C.M.G., T.D. (the chairman), said that the gross profits of the business amounted this year to £121,795, as against £70,259 for the preceding year, an increase of over £50,000. The net profit amounted to £88,393 and, after deducting the preference dividend and making provision for taxation, the balance available, including the amount brought forward, was £53,607, which compared with £31,011 for 1937 and showed an increase of over 65 per cent.

The Skegness holiday camp went from strength to strength, the trading profit being approximately 50 per cent. greater than last year, very largely due to the fact that the accommodation at that camp was greatly increased, as, in fact, the actual profit per head was slightly lower. Their important new camp at Clacton had had a most successful season and a satisfactory profit was earned.

Their amusement park at the Empire Exhibition, Glasgow, had been one of the most successful features of that Exhibition. The directors had been approached with regard to the extensive International Exhibition to take place this coming summer at Liège, Belgium, and there was very little doubt that the company would have the sole concession for the amusement park.

Owing to the great demand for accommodation at the Clacton Camp—on which, up to October 2, 1938, the company had expended approximately £170,000—the full scheme of development was now proceeding as expeditiously as possible, and they would therefore be able to accommodate a greatly increased number of guests at Clacton during the coming season.

They had entered into a contract to purchase a freehold property of approximately 200 acres near Scarborough. The expansion to which he had referred would necessitate the obtaining of further capital, and in that connection negotiations had now reached an advanced stage and he anticipated that they would be able to announce full details in the course of the next week or two.

The directors were confident that the year 1939 would be an excellent year for the company and that they would meet shareholders again next year with eminently satisfactory results.

The report was unanimously adopted and a dividend of 20 per cent. on the ordinary shares approved.

BRITISH VACUUM CLEANER AND ENGINEERING COMPANY, LIMITED

CONTINUED SUCCESS OF "GOBLIN" PRODUCTS

The 35th ordinary general meeting of The British Vacuum Cleaner and Engineering Company, Limited, was held, on the 30th ultimo, in London.

Mr H. Cecil Booth, F.C.G.I., M.Inst.C.E., the chairman, said that the directors were glad to report that the turnover of the company during the year had again been substantially increased and the profits had been well maintained and stood at a new high level of £77,513. Having regard to the difficult conditions of trade, and bearing in mind the dislocation which was involved by the removal of the works and administrative offices from London to Leatherhead, the expenses of which had been charged in the accounts before arriving at the profits, the shareholders would agree with him in congratulating themselves on the year's trading. Their new works were well equipped and provided facilities for a considerably increased volume of production, with ample area for expansion whilst providing ideal conditions of employment.

The company's products marketed under the trade name "Goblin" had achieved increased public acceptance and "Goblin Cleaners" held a dominating position in the market. Whilst by far the greater proportion of their business was centred round the manufacture and sale of domestic-type vacuum cleaners, it would be of interest to them to know that during the year they had carried out a considerable number of important central cleaning installations. The company were developing new lines of manufacture and substantial progress was being made.

The directors recommended a final dividend of 30 per cent., making 40 per cent. for the year. In order to provide further working capital required to meet the continued expansion of the business, the directors had decided to issue a further 200,000 ordinary shares of 5s. each at the price of 20s. per share.

The chairman then read a copy of the circular letter to the ordinary shareholders announcing the terms on which shareholders would be entitled to subscribe for the new shares.

The report and accounts were unanimously adopted.

The estimates of Libyan and Tunisian trade are approximate only. The 1938 figures of shipping passing through the Suez Canal are estimates based on returns for nine months.

Finance

GOVERNMENT RETURNS

For the week ended December 31, 1938, total ordinary revenue was £7,976,000, against ordinary expenditure of £14,925,000. Thus, excluding sinking fund allocations, the deficit accrued since April 1st last is £249,447,000, against a deficit of £172,603,000 a year ago. The detailed Return for the quarter and nine months ended December 31, 1938, is printed in full on page 47.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On December 30th applications at £99 16s. 7d. per cent. for bills to be paid for on Tuesday, Wednesday, Thursday and Friday of the following week were accepted as to about 37 per cent. of the amount applied for. Applications at higher prices were accepted in full. Applications at £99 16s. 8d. per cent. for bills to be paid for on Monday and Saturday were accepted in full. £25.0 millions of Treasury bills are being offered on January 6th.

* All rates (Australia and New Zealand) now based on £100—London.
† Intermediate rates will be calculated on the basis of 2s. 6d. for every seven days.

Houlder Line, Ltd.—Credit balance for 1938, £173,000 (against £159,650), after transfer to Insurance Fund £5,000 and preference dividend. To depreciation, £100,000 (£90,000). Ordinary dividend maintained at 7 1/2 per cent., absorbing £29,906. Carry-forward raised from £38,712 to £43,094. Out of realised surplus on sale of vessels (£21,607), a special bonus distribution is recommended of 2 1/2 per cent. tax free, absorbing £13,750 and leaving a balance in the fund of £7,857.

De Havilland Aircraft Company.—Profit for year to September 30, 1938, £152,812, an increase of £30,628. A dividend of 10 per cent. and cash bonus of 2 1/2 per cent. are again recommended, but on £800,000 against £600,000.

Rio Claro Investment Trust.—Net revenue year to November 30, 1938, £94,052,

compared with £106,248. Ordinary dividend 6 1/2 per cent. for year, against 7 per cent., plus a special anniversary bonus of 1 per cent. Carry-forward raised from £77,893 to £90,507.

Stock Exchange Rules.—On January 3, 1939, the Committee for General Purposes confirmed rules concerning bargains with non-members. Rules 88a, and 88 (formerly 90) require that such bargains must be justified to the Committee if called upon, must be marked on a special form, and must be undertaken only if to the principal's greater advantage. Other rules, Nos. 200a and 204, were confirmed, and rules 96 and 16 were amended.

Province of Alberta.—At a recent meeting of the Province of Alberta Bond and Stock Holders Protective Committee, it was resolved that the decision be reaffirmed to

CENTRAL AND SOUTH AMERICA

THE BANK OF LONDON AND SOUTH AMERICA, LTD., issues the following details relative to quotations for certain of the South and Central American exchanges. All these exchanges, with the exception of Bolivia and Paraguay, are related to the United States dollar, and the approximate sterling rates may be obtained by applying the dollar-sterling exchange rate.

Bolivia.* Sight selling rate on London was 141.40 bolivianos per £ (nominal) on December 20, 1938.

Colombia.* Sight selling rate on New York was 175.50 pesos per 100 U.S. dollars on December 12, 1938. This rate applies to holders of permits buying in the "open" market.

Ecuador. Sight selling rate on New York was 14.45 sucres per U.S. dollar on December 9, 1938.

Guatemala. Sight selling rate on New York is maintained at one quetzal per U.S. dollar, but a commission of 1 per cent. is charged by the Central Bank for the sale of drafts.

Nicaragua.* Sight selling rate on New York for payment of imports was fixed by the National Bank at 5.52 1/2 cordobas per U.S. dollar (including 10 per cent. tax and 1/2 per cent. commission) on December 13, 1938.

Paraguay. Exchange is quoted on Buenos Aires; the sight selling rate was 72.50 Paraguayan pesos per Argentine "free" paper peso on December 7, 1938.

El Salvador. Sight selling rate on New York was 2.50 1/4 colones per U.S. dollar on December 14, 1938.

Venezuela. Sight selling rate on New York has been maintained at 3.19 bolivares per U.S. dollar since April 27, 1937.

* Exchange controls are operative in these countries.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest securities allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

the sit-down strike too tolerantly for the bulk of public opinion, is the new Attorney-General. And, to cap the list, Mr Felix Frankfurter, the Austrian-born Jewish Harvard professor who has been the legal teacher and political inspirer of almost all those clever young New Dealers most feared by the businessmen, has been nominated for the vacancy on the Supreme Court itself. All three of these are men of ability and merit—Mr Frankfurter consummately so—but all three are men who arouse bitter prejudice on personal, political or religious grounds. To send their names forward to the Senate for confirmation at this precise juncture is a challenge, almost an act of defiance.

The same note of unrepentance was struck last week in the first of the series of Messages with which the President has outlined the agenda for Congress. True, Mr Roosevelt, like a skilful general, concentrated his forces by withdrawing on less vital fronts. In the field of foreign policy, he sought, and found, the greatest common measure of agreement with his eloquent restatement of America's attachment to the cause of democracy. Even within the more controversial field of domestic economic policy, he hinted that the period of conflict between the Administration and the business world was at an end. But on the subject which is at once the main stem of his current policy and the chief target of the attacks upon him he showed no weakening. This is the policy of spending for relief and recovery. In his eyes, the existence of a Federal deficit at the present moment is a necessity that is not even painful.

The Budget Message on Thursday of last week was inspired with the same doctrine. The astronomical figures of the Federal Budget are worth quoting:—

	Receipts	Expenditure* (\$ millions)	Deficit
1933-34 ...	3,116	6,746	3,630
1934-35 ...	3,800	6,802	3,002
1935-36 ...	4,116	8,477	4,361
1936-37 ...	5,294	8,001	2,707
1937-38 ...	6,242	7,701	1,459
1938-39 (est.)	5,520	9,492	3,972
1939-40 (est.)	5,669	8,996	3,326

* Excluding debt retirement

The picture presented is one of surprising consistency. Both receipts and expenditure have shown a rising tendency, and the deficit has remained, except for one year, between a third and a half of the total expenditure. For 1939-40 the President proposes no change in the general outlines of the Budget. "Moderate additional taxation" is suggested (with the strong hint that it should be imposed on the rich or on business) to pay for additional expenditure on agriculture and on national defence, and recovery in business conditions is counted on to effect a small reduction in the deficit. But the President specifically defended the existence of a large deficit as an element in economic policy.

His reasoning is logical. If the national income were to return to its "normal" level of \$80,000 millions, he argues, tax revenue would be sufficient, without any increase in the rates of taxation, to cover expenditure. And, in the meantime, any attempt to balance the Budget would impede the return to a normal income. It is possible to have some theoretical sympathy for the doctrine of an eight-year, instead of a twelve-month, Budget, but still to find no resemblance to the theory in a Budget which by July, 1940, will not have been balanced for ten years, a decade during which the revenue has been less on the average than 60 per cent. of the expenses. On the other hand, it is difficult to have patience with those of Mr Roosevelt's opponents who think of balancing the Budget solely in terms of cutting expenditure almost in half—which would certainly cause social misery and probably economic calamity as well. If the American Budget is to be balanced, it can be done only by facing the necessity to which the whole body of American politicians (with a few notable exceptions, such as Senator La Follette) has

hitherto turned a blind eye—namely, the necessity for higher taxation on the middle incomes.

In one form of expenditure, that on national defence, Mr Roosevelt was more moderate than had been expected. The total expenditure for 1939-40 on national defence is put at \$1,320 millions. Of the increase of \$309 millions included in this figure, \$99 millions is for the continuation of existing programmes and \$210 millions is the first instalment of a new \$500 million programme. As a device for fostering recovery, armament expenditures on this scale are negligible. The figures seem, indeed, to dispose of the belief that the President is deliberately exaggerating international dangers in order to provide himself with a form of spending more popular than the much-criticised W.P.A.—a belief that might have been confirmed by what appears to have been the excessive alarmism of the reports given to a Congressional Committee by the Ambassadors in London and Paris. The evidence seems to show that Mr Roosevelt does no more than accurately reflect the prevailing sentiment of the American people in the attitude he takes towards the policies of the dictators and the practical conclusions of foreign policy he draws. There is, in fact, an astonishing revolution in American thought in progress. One of the recent "polls" of public opinion asked the question, "Should the democratic Powers, including the United States, now stand firm together, at any cost, to prevent Hitler or Mussolini from taking any more territory at the expense of other nations?" and received the astonishing response of 56.3 per cent. of affirmative replies. The significance of these "polls" lies not so much in any precise accuracy they may have as a reflection of public opinion as in the fact that they are generally believed, in America, to be accurate. Such a result would have been utterly inconceivable a few short months ago. It does not, of course, mean that there are not still several conflicting schools of thought on the matter—those who deplore the policy of democratic defiance, those who begrudge the millions to be spent on armaments, and those who dislike both features of the President's policy impartially. But the main body of opinion is moving with astonishing rapidity along the road on which Mr Roosevelt is leading it.

It may be assumed that the President will do what he can to capitalise the fact that the nation stands with him in his abhorrence of the dictators and in his fears of their intentions. Much will therefore be heard of foreign affairs in the coming months. But unless war itself should break out, Mr Roosevelt will stand or fall on domestic issues. The chief of these, so far at least as the world of politicians is concerned, is whether Mr Roosevelt will be a candidate for the Presidency a third time in 1940. He could still beyond question collect at the polls many more millions of votes than any of his nominees, so that the fate of his "purge" last summer may be no guide to that of his own candidacy in 1940. But the tradition against a third term is so strong that he may well decide not to defy it. If so, he has to make the further decision whether to put all his weight behind a New Dealer (Mr Hopkins might be his choice) and run the risk of defeat in the Convention, or to agree with the Conservatives on a safe compromise candidate who would bury the New Deal. Behind all these Democratic calculations there is the uneasy awareness that perhaps, after all, the tide has turned and that 1940 will be a Republican year. And there is always the grand confusing factor of the mere passage of time and all that it may bring. It is in the nature of the Presidential system that American politics should resemble the struggle of a political Gulliver in Lilliput. This has never seemed more true than in the last six years. But though the difference in political stature between Mr Roosevelt and his opponents is as great as ever, the odds in political fighting power are more level than they have been for many years past.

Civilian Defence

THE oldest duty of governments is to furnish their citizens with safety. Three months ago the challenge of impending war showed that two years of preparation had failed to provide the crowded and vulnerable cities of Britain with any adequate protection against air raids. Today, when the post-Munich promise of peace in our time has worn sadly thin, there is a growing clamour in the country for effective and forthright measures of civilian defence. We have it on the authority of Sir John Anderson himself, Lord Privy Seal and Minister for Civil Defence, that "there is risk of war within a comparatively short time"; and the surest way to counter diplomatic blackmail or to deter military aggression is to couple a clear foreign policy with stout defences.

That anxiety about the state of our defences is growing is undoubted. When Sir John Anderson returned from his merited holiday last week-end he found a *crescendo* of criticism awaiting him. In September, London lacked anti-aircraft guns of modern design, trained personnel for the balloon barrage, defences against explosive bombs, men and equipment for fighting bomb-born fires and, above all, a central plan and organisation. In addition, Britain's strength in bomber and fighter planes was too inferior to the reputed power of Germany to offer safeguards in the air. The current indictment is that, apart from the marked acceleration of anti-aircraft gun production, which should absolve the War Minister from the rebukes which are somewhat mysteriously heaped upon him, and the increased output of airplanes, very little has been done in the last three months to remove these vital disadvantages.

Sir John Anderson speaks no more than common sense when he says that war cannot be made safe for the civilian. But, three months after Munich, it is alleged that we have neither taken nor decided upon any proper precautions against the devastating power of high explosives; that, in our safeguards against the consequences of incendiary bombs, we have failed to furnish the necessary equipment and training facilities; and that plans for the evacuation of part of the civilian population from crowded areas are still confused and incomplete. Up to a few short weeks before the September crisis, the Government were seemingly satisfied that the instructions contained in the Home Office handbook for the protection of houses against gas attacks and fire were sufficient. Then, after having previously repudiated the need for evacuating children or adults from crowded towns in emergency, they accepted the Anderson plan and hurriedly ordered local authorities, with no time to prepare properly, to improvise transfer and billeting schemes. Since the crisis, they have made more concessions. They have elaborated their evacuation schemes and, for the first time, they have recognised the overriding danger of high-explosive bombing. Even so, they have not stilled complaint. Many of the trenches hastily dug in September, in which no more than 5 per cent. of the population ostensibly served could be crowded, have filled with water or subsided. The steel basement or lean-to shelters on which the Government propose to spend £20 millions to guard against splinters and blast will admittedly protect only against those by-products of high explosives which are explosive itself. There is no serious dispute about the shortage of fire-fighting apparatus and about the accommodation for the training of auxiliary firemen.

Sir John Anderson himself is optimistic. On Monday he told the Press that fire-fighting and other A.R.P. equipment would be fully supplied by the end of this year. He expressed complete confidence that his forthcoming recruitment campaign, on the basis of the National Service

Guide to be circulated to all households on January 25th, would sufficiently fill all gaps in personnel. He pointed out, and here he would find all his critics in full agreement, that the *sine qua non* of policy was to shore up our defences "as speedily as possible." The need for rapidity of action, he argued, precluded the Government from concentrating on long-term policies, such as the costly provision of deep bomb-proof shelters. In effect, he is planning to make Britain as safe as possible from air attack this year.

Considerations of urgency are indeed important, and Sir John had, owing to previous negligence and bungling, to start almost from scratch; and, despite official denials, it seems likely that he has had to contend with some Treasury intransigence. There is clearly a necessary distinction to be drawn between the short-term measures which are possible of achievement in a single year and the long-term measures which might occupy two years or more. It took Barcelona eighteen months to provide deep bomb-proof shelters for half the city's population. To set up properly organised rural camps for evacuated school children, where they might pursue health and their studies in safety, would patently take longer than to earmark paid lodging in private houses (which is at present being done on the basis of the census plan made public on January 6th). If the assumption behind the Government's policy is that an early war is likely, swift provisional measures are imperative.

Nevertheless, it remains incumbent upon the Government, on the one hand, to satisfy public sentiment that their provisional programme is efficient, and, on the other hand, to furnish proof that, at the same time, more thorough steps are being taken to provide the more complete protection which only a long-term policy can give. Actually, on both counts there is ground for doubt. In Barcelona the basement and lean-to shelters we are to build have been condemned, not simply as less efficient than underground refuges, but even as ineffective protection. Sir John's assurance that fire-fighting equipment and training facilities will presently leap to sufficiency lacks corroborative evidence. It is by no means certain that the voluntary register, whose trial period ends in March, will not then be proved a failure; and no one yet knows what to do or where to go in an emergency. The latest evacuation plans reveal yet another change of policy: provisionally, only children are listed for transfer, and "most people will and should stay where they are." The choice of areas for evacuation seems to be somewhat arbitrary. Birmingham and Smethwick are to send their children away; West Bromwich and Wolverhampton will not. Newcastle and Gateshead are evacuation areas; Wallsend, Felling, Jarrow and Hebburn are not. Manchester is; Preston, Warrington, Blackburn and Oldham are not. The London metropolitan boroughs are; Brentford, Chiswick, Ealing, Hendon, Heston, Barnes and Croydon are not; nor are the great steel-smelting towns. And, under the voluntary regime, the spontaneous evacuation of adults, who are not yet covered by official plans, may throw transport into chaos and disrupt billeting arrangements.

Nevertheless, the cause of criticism does not lie so much in the steps the Government have taken or propose to take as in their omissions and their general attitude to the problem. There is ample justification for an *ad hoc* short-term policy; but only if it promises to be, within its limits, efficient, and if, at the same time, it is coupled with a more adequate long-term plan. According to Sir John Anderson, the Government have relented so far as to have

an "open mind" about deep bomb-proof shelters, though it is now reported that such shelters have, apart from possible local exceptions, been ruled out as too costly. If "most people are to stay where they are" the provision of such shelters is imperative.

The root trouble is the Government's disinclination to realise, or admit, that they have perforce been called upon to carry through a revolution in the nation's economy. Britain's defence does not end with the old-style fighting services; it comprehends the whole life of the country. The mobilisation of men, mind and materials in the defence of peace is inescapable, and no device of organisation to achieve this end can be neglected. It is the prejudice which causes the Cabinet to look askance at proposals for a Ministry of Supply and a compulsory register that has led them to starve civilian defence of its greatest need: a comprehensive central plan, with a competent central staff with ample powers of command and supervision and a *cadre* of trained and able regional experts.

A New Index of Profits

THE review of industrial profits which appeared in *The Economist* of July 16, 1938, was justly entitled "Profits at the Peak." The net profits of 374 companies reporting in the September quarter showed a fall of 1.4 per cent., while the 564 companies whose reports were received last quarter show a fall of 4.4 per cent. And the latest evidence is the more conclusive, for while the "third quarter" sample is not wholly representative of industrial earnings at home, the "fourth quarter" figures include the profits of a large number of important British industrial concerns whose financial year ends on September 30th.

The Economist's profits figures for the three decades during which they have been collected were analysed in the special survey included in the issue of December 17th last. It was then announced that it is proposed in future to publish a quarterly index of British company profits. Before the construction of this index is explained, however, the results both of the December quarter and of the year 1938 must be passed in brief review. For 1938 as a whole, industrial

The local authorities are clamouring for a lead that does not come: every step forward in A.R.P. has to be forced upon the Government; in London, for instance, the boroughs are calling for the regional authority that is obviously necessary to resolve the differences due to the present multiple division of control and responsibility; and, all over the country, eagerness to serve is sinking as time slips barrenly away. No critic can condemn the Government out of hand for having wholly failed. But no one can claim that they are yet in clear sight of success. What is most urgently needed is general public confidence that the Government are doing all that is possible. And it will be difficult to create that confidence until the Government have, once at least, adopted some policy without first deriding those laymen who suggest it, then insisting that it is too costly or difficult and finally sponsoring some half-hearted version of it under severe pressure from Parliament and public. It is neither money nor men that are lacking, but leadership.

profits showed a rise of 6½ per cent., and, when calculated back by means of a "chain" index, the level of company earnings last year was one-fifth higher than in 1928. The trend of profits reported in each of the last ten calendar years is shown in Table I.

The profits of the December quarter and their distribution in dividends and reserves are set out in Tables II and III, while the usual industrial analyses will be found on page 102. Compared with the headlong fall in the profits of "fourth quarter" companies in 1930, a decline of 4.4 per cent. for the last quarter of 1938 must be accounted distinctly moderate, for the average accounting period of the 564 companies concerned covered practically a whole year of industrial recession. Directors, however, have not overlooked the possibility of a further fall in earnings during the current year. From a slightly smaller cake they have cut thinner slices for both preference and ordinary dividends, and have retained 37.3 per cent. of the distributable profits in reserves, compared with 32.7 per cent. for a similar (though not identical) sample of 549 companies which reported during the fourth quarter of 1937. The latest results, again, owe much to the substantial increase of 11½ per cent. in the profits of 37 coal and steel companies reporting last quarter, while shipping earnings (thanks mainly to the excellent P. and O. results) show a rise of practically 18 per cent. These groups, together with tobacco, which shows a small rise, contributed more than one-third of the total profits reported last quarter. On the other hand, the groups which show a substantial percentage decline in profits—including financial, land and investment, oil, tea and rubber companies, and the textile group

TABLE I.—PROFITS IN CALENDAR YEARS

Reports received during Calendar Years	Number of Companies	Profits (after debenture interest)	Profits, same Companies, preceding year	Increase or Decrease on preceding year

TABLE II.—PROFITS OF "FOURTH QUARTER" COMPANIES, 1929-38

Reports Issued during Fourth Quarter	No. of Companies	Total Profits (after deb. interest)	Change since preceding year (same companies)	Total Preference and Ordinary Capital	Ratio of Profits to Capital
1929	420	£ 33,404,593	+ 1.4	£ 323,129,955	10.3
1930	509	32,174,677	- 18.1	392,547,000	8.2
1931	474	12,292,859	- 53.9	383,451,625	3.2
1932	472	17,443,106	- 2.9	425,066,882	4.1
1933	464	21,116,780	+ 30.3	410,816,381	5.1
1934	468	28,611,449	+ 32.9	401,504,146	7.1
1935	485	33,561,979	+ 16.9	377,470,062	8.9
1936	496	42,134,767	+ 15.2	395,408,899	10.6
1937	549	57,436,059	+ 20.2	434,822,726	13.2
1938	564	57,113,768	- 4.4	421,863,955	13.5

TABLE III.—DIVISION OF PROFITS (FOURTH QUARTER COMPANIES)

Reports issued during Fourth Quarter	Proportion of Total Profits* (= 100)			Rate of Payment on Each Class of Capital			
	Paid in Pref. Div.	Paid in Ord. Div.	Put to Reserve or "Carried Forward"	Debtenture	Preference	Earned for Ordinary	Paid on Ordinary
1929	16.0	66.0	18.0	5.29	4.7	13.5	10.6
1930	21.9	60.2	17.9	5.19	4.5	10.3	8.4
1931	43.1	76.9	Dr. 20.0	5.18	3.8	2.9	3.9
1932	32.4	75.4	Dr. 7.8	5.16	3.6	4.4	4.9
1933	19.6	64.3	12.3	5.04	3.2	6.2	5.2
1934	19.6	59.9	20.5	4.95	3.7	9.9	6.8
1935	19.0	55.2	25.8	4.84	4.5	11.6	7.9
1936	17.5	53.5	29.0	4.75	4.9	14.2	9.2
1937	15.7	51.6	32.7	4.59	5.4	16.2	11.2
1938	13.9	48.8	37.3	4.47	5.0	16.7	10.6

* After debenture interest.

—provide a relatively small quota towards the quarter's profits. There is, in short, a good deal of dispersion in the quarter's results, whose net effect has been to cushion the fall in total profits for the 22 industrial groups.

Hence, it would not be surprising if the important company reports which will be published during the next month or two were to show a more significant fall in earning power than those of the past quarter. The investor, in fact, has been enjoying the advantage of the time-lag between falling industrial activity and its reflection in reported industrial profits. It is this time-lag which dogs every attempt to give an up-to-date measure of current industrial earning power. Until companies issue their annual reports on the same date each year, and, secondly, supply quarterly earnings figures on the American style, no profits index can be made statistically perfect. Irregular publication of a given company's results from year to year compels the adoption of the chain index method, since the sample of companies varies from month to month, and, indeed, from quarter to quarter. Moreover, the total profits reported in any one quarter may have been earned, on the average, ten to eleven months earlier. Hence there is a considerably increased time-lag to be taken into account when considering the profits of any twelve consecutive months. *The Economist* has for some time published four quarterly indices in which the profits reported in each quarter are compared, by the chain method, with those reported in the same quarter of 1928. While these quarterly index numbers are more up to date, they separate the profits experience of any twelve months into four arbitrary parts, each of which tends to have its own idiosyncrasies. These are necessary imperfections in the material, and they prevent the compilation of a simple index number like that of wholesale prices or security values.

To provide a comprehensive index which would be available more often than once a year, a new index has been calculated. This takes, every three months, the four latest quarterly indices and combines them with weights proportionate to the amount of profits involved. At the same time, the base has been altered to the period July, 1935-June, 1936; hence the base period roughly covers profits reported in respect of accounting periods falling in the calendar year 1935. Thus each quarterly index number embraces the profits reported in the latest quarter; but it is not confined to them, and also includes the profits of the three preceding quarters. Statistically, it is undesirable that profits reported a year earlier should have to be incorporated in an up-to-date index—it cannot be claimed, in other words, that the twelve-monthly index provides a wholly accurate

THE ECONOMIST INDEX OF INDUSTRIAL PROFITS

impression of the rate at which profits are currently moving. But it does claim to show the proportion in which the profits reported in the last twelve months compare with the profits of similar periods in past years; and this gives a more reliable indication of the trend of earning power of industrial companies as a whole than the sectional quarterly indices, hitherto published in *The Economist*, have permitted.

Two principal points may be made regarding our new index, which is plotted on the accompanying chart. First, it indicates, quite accurately, the cyclical swing of industrial profits. The decisive bottom established in the first three quarters of 1933 is in complete accord with the movement of the quarterly index numbers, for the fourth quarter's index for 1933 was the first to show a significant improvement after the depression. Conversely, the continued rise in profits in the first and second quarters of 1938, and the subsequent check in the third and fourth quarters is also faithfully reflected in the twelve months' index.

The second point that it is necessary to emphasise is that profits cannot be included in the index until they have been reported and that no attempt has been made to "date them back" to the period in which they were earned (though the selection of the period July, 1935-June, 1936, as the base is a rough-and-ready attempt to make the new index comparable, in its proportions if not in its timing, with the large number of other economic series that are based on the calendar year 1935). For those who wish to have a clearer impression of the economic timing of changes in earning capacity (as contrasted with the timing of the published results) the following summary may be of some service:—

Twelve months' Index to	Average date on which accounts of cos. included were closed	Middle date of average year in which profits earned
March	July 7*	Jan. 7*
June	Nov. 8*	May 8*
Sept.	Jan. 3	July 3*
Dec.	Mar. 30	Sept. 30*

* Previous year.

The third column in the table above is a striking reflection of the deficiencies in the reporting of British company profits. On the average, our twelve-monthly index will be based on company reports published eight or nine months earlier, while the average date on which profits were earned involves a further time-lag of six months. For those who are interested in the economic aspects of industrial profits (as opposed to their investment importance) the application of these time-lags to our published index is essential.

It is too early to base any estimate of the course of future earnings on the decline in our new index from 131.7 to 130.3 during the last two quarters. It is worth noting, however, that the rate of decline from the peak has so far been quite moderate compared with the fall in the second half of 1930. And if a decline in profits is in prospect, it is fortunate both for the investor and for the Chancellor of the Exchequer that the absolute level of industrial earning power, as measured by the index, was 12 per cent. higher in June last than at the beginning of 1930, when the index reached its cyclical peak of 116.5. The rise in profits from the middle of 1933 to the middle of 1938 was, of course, both steep and extensive. Lest any false conclusions be drawn from this fact, it is worth mentioning that the increase of about 12 per cent. from peak to peak is less than the simultaneous increases in either the Index of Business Activity or in Mr Colin Clark's estimates of the national income. The new index of profits, in short, provides no *prima facie* evidence, despite the steep rise in the recovery years, that profits are taking a larger share of the national income than in the past.

The Carpathians and Roumanian Oil

IN the situation created in Eastern Europe by the downfall of Czechoslovakia the mountain system of the Carpathians is a strategic factor of paramount importance. The Carpathians cannot compare with the Alps in elevation—they nowhere pass the height of 9,000 feet—but they are broad and extremely rugged; and they have been much less broken in by engineering. Economically they form no serious barrier, for there is no longer any obstruction of shipping on the Danube at the Iron Gates, and there are several railways through the passes. But for the operations of a big modern army in a major war the range would be a most formidable impediment, and even for a force with free passage through its defiles it would pose a difficult problem of communications. Any power engaging in large-scale warfare on the other side of such a mountain range from its bases of supply would be at a serious disadvantage.

In effect this means that Germany, having absorbed Austria and obtained a stranglehold on Czechoslovakia, has now a strategic ascendancy over the lands within the Carpathian arc—that is to say, the territories of the old Kingdom of Hungary, including Transylvania—but that the Soviet Union retains a corresponding strategic ascendancy over Old Roumania (Wallachia and Moldavia), which lies outside the arc and far away from the Silesian frontier of Germany. This natural partition of spheres of power might form a basis for a mutually satisfactory compromise between Germany and Russia were it not for the fact that the great Roumanian oilfield, the only big source of natural oil supply in Europe to the west of the Soviet Union, is in Old Roumania, which is on the wrong side of the Carpathians from Germany's point of view. The oil-bearing belt stretches round the most easterly corner of the range with its centre at Ploesti to the north of Bukarest.

It is clear that in war-time this oilfield would be of vital importance to Germany, unless she were assured of supplies either from Russia or from outside Europe. It

appears to be the general opinion of experts that Germany's own production of oil from coal could not suffice for her needs in a major war of any duration. Thus the alignment of Roumania in the event of a European war might be decisive in its effect, but her very capacity for granting or withholding vital supplies to Germany would involve her in grave dangers. If she withheld oil, she would risk a German invasion; if she supplied it and if Russia were a belligerent against Germany, she would have to reckon with a Russian attempt to cut off the traffic. In either case, Roumania would become a storm centre, and in either case, because of the orographical factor, the strategic position would be unfavourable to Germany.

If Roumania were hostile to Germany and it became a necessity for Germany to seize the Roumanian oil wells, the campaign would be one of great difficulty. Assuming that the Germans were given passage through Hungary and were assisted by a Hungarian army, they would doubtless succeed in over-running Transylvania, but they would then be faced with the task of forcing the Carpathian passes into Wallachia, and it is very unlikely that they would be able to repeat the enveloping movement by which they won their victories over Roumania in 1916. Then both Turkey and Bulgaria were allies of the Central Powers, and thus it was possible for Germany to attack Roumania from the South; Mackensen, with a mixed army of Germans and Bulgars, crossed the Danube from Bulgaria while Falkenhayn pressed on the Carpathian passes from the side of Transylvania. Of the passes, only one, the Vulkan, was forced by the Germans coming from Transylvania; the rest were rendered untenable by Mackensen's drive against their defenders' rear. Such strategy, however, requires an alliance with Bulgaria, and it is improbable that Germany will in future be able to obtain this alliance—except after very decisive victories in the opening stages of a war—because of the new conditions created by the Balkan Pact. Bulgaria might be only too willing

to join Germany in an attack on Roumania in order to recover her irredenta in the Dobrudja, but she would almost certainly be deterred by the superior military power of Turkey. Turkey, resolved to maintain an absolute independence in world affairs and to resist a German hegemony in the Balkans, could make a most important intervention in a European war merely by securing Roumania against attack from Bulgaria, and in the circumstances here contemplated there is good reason for believing that she would act in this way.

Without the possibility of an offensive from the south the Germans would have to force the Carpathian passes by frontal attack, and if they succeeded in this they would then have to occupy a large territory on the further side of the mountains and hold it against the counter-offensives of a Russian army based on Odessa. The forcing of the passes would certainly be no easy matter if the Roumanians were supported by Russian artillery and aircraft. But even if the passes were lost, the invaders would be at a great disadvantage for fighting in the Wallachian plain, for the Russian mechanised columns could operate without any obstruction except that presented by the rivers, whereas every German tank, lorry and big gun must come over the hairpin bends of the few Carpathian mountain roads and railways.

The same considerations would apply, though, of course, in a lesser degree, if Roumania were not hostile but friendly to Germany and were resolved to resist any coercion from Russia. The bottle necks of the Carpathian passes would make it very difficult for Germany to deploy a large army in Moldavia and Bessarabia to defend Roumania against a Russian invasion across the Dniester. If the Russians chose to concentrate their main strength on this front, they would have good prospects of capturing the oil wells area, and large German forces would be pinned down to battle under most unfavourable conditions.

The most effective way for Germany to reinforce a pro-German Roumania against a Russian invasion would be by use of the Danube. The warship flotilla which the Germans are building on the Danube, together with the Breslau-Vienna highway and the Oder-Danube canal now to be constructed through Czecho-Slovakia, will certainly give Germany a great capacity for utilising the river for strategic

purposes. However, part of the course of the Danube lies within the borders of Yugoslavia, and even if that country could be induced to grant passage to German gunboats and transports, such an encroachment on Yugoslav independence might put a severe strain on the Rome-Berlin Axis. So far the Axis has shown an impressive solidity, chiefly on account of the Spanish issue; but in the long run Italo-German partnership is conditional on Germany's willingness to keep away from the Adriatic, and if this *sine qua non* is to be observed, Yugoslavia must be left as a buffer state.

Apart from complications over Yugoslavia, Germany runs the risk of alienating Hungary by friendship with Roumania. Politically the Nazis have two great assets for their relations with Roumania—anti-Semitism and the fear of Bolshevism in the Roumanian ruling class. But neither of these assets is quite what it was; the glamour of Jew-baiting has been considerably diminished by the disastrous Goga experiment and many Roumanians in high places are convinced by now that Stalin does not desire to rekindle the fires of the October revolution either in Roumania or elsewhere. The shooting of Codreanu and the other Iron Guard leaders by their guards while they were trying to escape led to an outburst of abuse in the German Press against the present Roumanian regime which reveals all too clearly what hopes Germany was banking on an Iron Guard revolution. The attractions of a pro-German orientation being thus on the decline, Germany can only bring Roumania into her orbit by giving her a guarantee of her frontiers against Hungarian revisionism. But this means disappointing Hungary, and the resentment of Hungary is not a matter which Germany can lightly ignore. Hungarian revisionism wrecked all the attempts of France to construct a Danubian Federation to replace the former Empire of the Habsburgs, and now that Germany has taken over the inheritance of the "French system," its thorniest problem remains to plague her too with its incompatible nationalist obsessions. A frustrated Hungary might not dare to resist Germany or deny passage to German troops in a crisis, but she could not be an enthusiastic ally, and her discontent would be a serious factor of weakness in Germany's position. *Mittleuropa* is not going to be all beer and skittles even for the Third Reich.

Topics of the Week

Mr Chamberlain in Rome.—*Roma veduta, fede perduta* is a saying sometimes heard in Italy which we sincerely hope will not be true of Mr Chamberlain when the full glory of the Eternal City, with its wonders old and new, strikes upon his eye. For he goes, if we can believe the commentators, with a high heart and an open mind, anxious only to explore. He goes a believer in appeasement coupled with no surrender of vital interests; we wish that he may return with unbroken faith. On the Italian side Mr Chamberlain's visit means a great diplomatic triumph (to the ordinary Italian, steeped in the right opinions, almost a miracle; and a miracle not entirely of the Duce's doing): how great can be measured by the toasts exchanged on Mr Chamberlain's first day in Rome. "The Anglo-Italian Agreement," said Signor Mussolini, "takes account of the new position in the Mediterranean and in Africa . . ."; and, in his reply, the British Prime Minister referred to a "new Italy, powerful and progressive," and drank to the honour of the King of Italy, Emperor of Ethiopia. These words do, indeed, mark the opening of a new phase, in which no one will want to go on harping over past differences; but if Mr Chamberlain wishes to act as the British people and Parliament would have him act, then he will find a means of bringing home to the Italian dictator the conviction that a gesture

must now be made on his side too. No settlement in the Mediterranean can be regarded as final or satisfactory from the British point of view while the policy of Rome is manifested by military intervention in Spain and that sort of diplomatic aggression against France which, apart from being aimed at our nearest ally, could at need be turned against ourselves. Assurances are no longer enough: we need some firmer proof of Italian friendship. If Mr Chamberlain's visit paves the way for such a proof, it will have been more than worth while. So far, no indication of its results can be gleaned, save perhaps from the notable reticence of Signor Mussolini's words, the unexpected brevity of the talks, and the fact that their progress was reported by Signor Mussolini to the German and Japanese Ambassadors. Mr Chamberlain's visit may, after all, be a miracle; but it does not yet look like one.

* * *

Farmers in Revolt.—Once again Ironsides are up in arms in East Anglia. The latter-day Independents are the farmers of Norfolk and Suffolk. In the by-election in East Norfolk they have chosen their own candidate to fight the candidate sponsored by the Conservative and Liberal National central organisations and personally backed by the Prime Minister and the Chancellor of the Exchequer. At a mass meeting on Tuesday last at Ipswich,

attended by over 5,000 farmers, landowners, business men and Members of Parliament, it was decided to form a united front to put pressure on the Government to alter their agricultural policy, and the threat was made by a large majority of those present that, unless farm prices were brought into a fairer relation to farm costs the farmers' organisations would definitely go into political opposition. A farmers' meeting at York has taken the same line. Further, the Suffolk farmers plan to march in protest on London on February 1st, 5,000 strong and accompanied by thousands more farmers from all parts of the country. In a sense, this furore in East Anglia is no more than a squabble within the Conservative ranks for the spoils of political power, and just another attempt by an organised interest, this time the National Farmers' Union, to win concessions from the Conservative leaders by blackmail. In East Norfolk, the Liberal National candidate relies on the argument that there is no feasible alternative to the present Government and that Labour and the N.F.U. would be impossible bedfellows. Yet, it would be unfair to pass over the clear fact that farm prices are now lower than they have been for two years, and that sheep, barley and beet in the Eastern counties have lately felt a depressing draught. Nor can it be denied that the remarkable and ill-suited collection of aids which the National Government has given to agriculture (and which the N.F.U. seem to regard with some ingratitude) is inefficient in its eleemosynary aims as well as unduly costly, because it is irrational and piecemeal. The Government have shown signs of bowing before the storm; they have promised to review their policy, and the N.F.U. are to meet the Minister of Agriculture to discuss price insurance schemes for a wide range of products. If the consequence of the East Anglian rising were to be what the Prime Minister described in his New Year Message as "a long-term, comprehensive and well-balanced agricultural policy," defence, public health and the national interest might be well served. But that desirable consummation is by no means indicated in the farmers' extremer claims.

* * *

The Hitler-Beck Conversations.—Colonel Beck did not see any member of the French Government when he was in France, but on his way back from the Riviera to Warsaw he visited Herr Hitler at Berchtesgaden on the 5th and Herr von Ribbentrop at Munich next day. The scope and outcome of these German-Polish conversations are more than usually obscure. One Polish version of one German version is that "there are no insuperable obstacles on the road of Polish-German co-operation," and that nothing emerged in the discussions to disturb those relations between the two countries that have existed since 1934. The possible issues between Poland and Germany extend over questions of both general policy and local detail. As far as details go, Colonel Beck may have shown himself accommodating towards German desire to Nazify Memel as completely as Danzig has been Nazified already, without the formal incorporation of either city in the Reich. He may even have entertained some suggestion for the construction of a German motor-road across the Polish Corridor between Pomerania and East Prussia, on the precedent of the road already conceded to Germany across the Czech corridor between Silesia and Austria. If Poland could really secure a final settlement of the Corridor question with Germany at this price, she would be buying security cheap. On the Polish side there are also suggestions that Germany may have consented to a revision of the frontiers of the Carpatho-Ukraine to the further disadvantage of that small but important member of the Czecho-Slovak Confederation; but all that is now known of German policy tells against the likelihood of any German concessions to Poland in the direction of establishing a common frontier between Poland and Hungary.

* * *

But all these local questions—even the Ukraine—are subordinate to the general question of the alignment of forces

in Europe and in the world. Herr Hitler wants the buffer states between Germany and the Soviet Union to leave the League of Nations and join the anti-Comintern front, and he is said to have suggested to Colonel Beck that Poland might conveniently take the lead in this move. The Poles are, perhaps, more likely to follow the negative than the positive part of this recommendation. If they lent themselves to German designs against the Soviet Union they would be almost as likely to see the post-war Greater Poland liquidated (like Greater Czechoslovakia) as they would be if they took sides with the Soviet Union against Germany. As between the two giants on either side of her, Poland will assuredly cling to her neutrality as long as she can; and her persistence in this policy (which is the only conceivable Polish substitute for collective security fortified by a French alliance) is indicated by the recent rapprochement between the Polish and Russian Governments. The Russians have just done the Poles the courtesy of reopening the Polish Church in Moscow; simultaneously, the Poles have deprived some thousands of Polish Jews, resident in Germany, of their Polish passports before the Germans have had time to deport them; and this is a Polish rebuff to Germany. So Poland still oscillates precariously in the ever-narrowing space between the upper and the nether millstone.

* * *

The Czecho-Hungarian Affray.—The last few days have witnessed two bursts of local fighting on the Czecho-Hungarian (or, rather, the Ukraino-Hungarian) frontier as this was re-drawn in the joint Italo-German award of Vienna. In the small hours of the morning of January 6th the outskirts of the town of Munkacs, which the award has transferred from Czecho-Slovakia to Hungary, were attacked by Czecho-Slovak forces, and it seems to be beyond doubt that the fighting took place in what has now again become Hungarian territory, though it is uncertain whether the local Czech offensive was or was not provoked. On the 7th there was another clash at a frontier post near Ungvar. At one moment there was talk of a Hungarian ultimatum; but the Hungarians afterwards agreed to a Czecho-Slovak proposal for a joint investigation, and it has now been arranged between the Hungarian and Czecho-Slovak military representatives that a neutral zone shall be set up in the hope of preventing a recurrence of such incidents. In the present tense and menacing state of Europe there was at first some fear that the fighting might have been instigated from some greater capital than either Prague or Budapest, as the first move in some wider and more dangerous power-game. It now looks, however, as though the two incidents genuinely originated in the indiscretion of local commanders, with nothing more sinister in the background. The Germans have frowned upon Czechs and Hungarians alike for falling into a conflict which might seem to call in question the finality of the Vienna award. And though we still cannot be sure that somebody may not deliberately drop a spark into the powder magazine, it already seems reasonably clear that these alarming events on the Ukraino-Hungarian border were not, after all, the lighting of the fatal train. If M. Imredy has his way the spark will not come, as it has threatened to do, from fanatical Hungarian nationalists. This week he has initiated (following King Carol) a "Hungarian Life Movement," whose immediate aim is clearly to absorb and silence these fanatics; and in the end, perhaps, to develop into a major Parliamentary party.

* * *

The New Government in Japan.—The resignation of Prince Konoe's Government on the 4th, which we recorded last week, has been followed by the formation of a new Cabinet headed by Baron Hironuma. The change is in part no more than a reshuffle, since six out of eleven of Prince Konoe's former Ministers are still in office; the two significant changes are in the Premiership and in the Ministry of Finance. Baron Hironuma—an old man who seems to have nothing but his chauvinism to set off against his tale of years—is a poor substitute for his predecessor,

and the new Finance Minister, Mr Ishiwatari, is no substitute at all for Mr Ikeda; for, though he is reported to be a competent civil servant, it would appear that he has neither the character nor the prestige to carry out a policy of his own in his department. Indeed, the merit of the new Cabinet, in the eyes of its military makers, is, no doubt, its docility. Its business is to provide the Army with the necessary civilian assistance for pursuing its totalitarian war aims in China, and to find, somehow or other, the immediate ways and means, even at a risk of placing in jeopardy the whole future of the Japanese national economy. At the same time, even Baron Hironuma is showing a reluctance to break completely either with a sense of realities or with a show of constitutional propriety. He has not openly set aside the Parliamentary parties, and in his inaugural statement to the public he has admitted the gravity of the position in which Japan now finds herself. One is reminded of the political atmosphere in Germany under the shadow Chancellors of the latter years of the war of 1914-18. Japan to-day is still an old-fashioned military State of the pre-war Prussian and Russian kind. It remains to be seen whether she will be able to extricate herself from her vast Chinese adventure without falling into a post-war totalitarianism of either the Russian or the Prussian variety.

* * *

The War Minister Protests.—Mr Hore-Belisha is no believer in the maxim "never explain, never apologise." In the House of Commons, after the September crisis, he testified with all the fervour of a converted sinner to the defects disclosed by the emergency in his sector of Home Defence. When he came back a week ago from a much-photographed holiday, he faced his critics again, this time with confidence in his righteousness. In an impressive speech at Devonport, he outlined his nineteen months' record at the War Office: when he took over, the rate of recruiting for the Army threatened a shortage of 40,000 men on the establishment by March, 1939; in the event, the shortage will be less than 20,000. The position and prospects of every officer and man have been improved by far-reaching reforms; the formation and units of the Regular Army, 30 years old when Mr Hore-Belisha took office, have been radically overhauled to suit modern and mechanical uses, and the Territorial Army has been similarly adapted. On the question of anti-aircraft personnel and artillery, the War Minister claimed that their full complement was now in sight, and, significantly, he emphasised that to obtain supplies on a war-scale under the conditions of a voluntary and peace-time economy was not easy. Mr Hore-Belisha may perhaps be blamed for painting the defence picture too brightly in the past; he is uncommonly apprehensive of the damage undue pessimism may do and excessively blind to the dangers of optimism which is subsequently disproved. But more than once he has frankly pointed

the obvious moral that, without some special organisation of supplies and output such as a Ministry of Munitions gives in war-time, swift re-armament is an obdurate task; and it is hard to see why he has become the special target of criticism. On the information available to the public—even after mere "publicity" has been discounted—he would appear one of the most energetic and effective of Ministers. But his drastic reforms have clearly ruffled many susceptibilities; and, it must be said, the feast of unreason which is anti-Semitism is not without its celebrations even in England. On these two grounds alone, the good faith of the whispering campaign against the War Minister must be strongly suspect.

* * *

Aid for Shipping.—If there is any industry which can rightly be supported out of public funds, it is shipping. The justification is two-fold: on the one hand, no industry is more vital to the existence of the nation in time of war; and on the other hand, no industry can make out a more complete proof of the unfairness of the subsidised competition it has to face. British shipping, after a brief period of comparative prosperity in 1937, is now back in the doldrums and the Chamber of Shipping have this week published the proposals for assistance which they have drawn up on the Government's invitation. They are startling in their scope and size:—

For Deep Sea Tramps the restoration of the subsidy is proposed, in the enhanced amount of £2,500,000 a year for a minimum of five years.

Deep Sea and Near Trades Liners. It is suggested that £5 millions a year should be voted by Parliament for five years for a Liner Defence Fund. This, it is stated, would be distinct from a subsidy, though the distinction is not clearly drawn in the proposals. The Fund would be administered by the Treasury on the advice of an independent Commission, who would also be competent to propose other than financial measures.

Near Continental Trades. It is proposed that the Government insist on a greater proportion of timber imports from Russia being carried in British ships. The greater employment of British shipping in the timber trade from other countries and in the coal export trade is also recommended (the comment may be made that it is questionable how far Great Britain can dictate the nationality of the ships that carry her exports, whatever she may do about imports). Finally, a subsidy of £500,000 per annum is requested for this category.

Coasting Tramps. A further subsidy of £500,000 a year is suggested here, together with Government action to ensure fair terms of competition both with the railways and with foreign coasting vessels.

Coasting Liners. This section also stresses the necessity of protection against intensified railway competition and requests a subsidy of undefined amount.

Tankers. No proposals are made here pending discussions with the Government, but mention of the need for "financial incentives" seems to foreshadow another subsidy.

The total amount of financial assistance requested is thus at least £8,500,000 a year, and almost certainly more, in addition to the use by the State on behalf of the industry of the bargaining power that our enormous imports bestow. The proposals will need very careful examination both by the Government and by the public and they will receive more detailed treatment in a subsequent issue of *The Economist*. But this preliminary comment may be made: when a sick industry is invited by the Government to write its own prescription and counters with a request for nearly £10 millions a year of the public's money, it is only natural to express doubts about the efficacy of the method adopted. For no industry, however sincere, is likely to under-rate the extent of the assistance it requires and an independent assessment of needs will sooner or later be required. For the Government to have undertaken the initiative from the start and to have appointed an independent body to investigate, take evidence and prepare proposals would have involved a larger draught upon Governmental decision (a commodity that seems to be very scarce in Whitehall to-day), but it would certainly have saved time and might well save money.

* * *

Refugees.—The better part of a year has gone by since the annexation of Austria served as a prelude to a fresh threat to the property and citizenship of over half a million German Jews; and no practical plan has yet been devised by the nations who avow sympathy for the victims of Nazi persecution to finance the growing exodus and to find new homes for the fugitives. Germany's present economic difficulties have caused the speeding up of the policy of despoil and expel, and this week Mr George Rublee, Director of the London office of the Evian Conference on Refugees, has gone to Berlin to discuss ways and means of solving the problem in concert with the persecuting Government. *Faute de mieux*, Dr Schacht's recent proposal that an orderly dispersal of the emigrants should be financed by a loan of £500 millions raised by Jews outside Germany and covered by extra German exports admitted by other countries under special facilities, is to be the basis for negotiation; and there is a grave risk that, since the plan is unacceptable in principle and in detail, even its discussion may encourage the Germans to intensify their pressure. It is rumoured that, in due accord with the familiar policy of blackmail, the Reich may promise to suspend anti-Semitic measures for a time if this scheme, which has obvious economic advantages for Germany and corresponding disadvantages for her trade competitors, is accepted. It seems unlikely that the nations will consent to reward the Germans for their rapacity; yet it is undeniable, first, that the Reich ought to play an important part in tackling the problem created by Nazi policy, and, secondly, that so long as Germany's economic straits

persist, so long will her minorities be exposed to desperate persecution. Meanwhile, the Lord Baldwin Fund for Refugees is nearing the £400,000 mark; and some decision of the Powers on the character and sites of refugee settlement is imperative. Half the potential refugees from Germany are too old to settle easily; and openings for agricultural settlement are shrinking and precarious, while urban settlement is less costly and economically more defensible. The Amur Basin, British Guiana, Tanganyika, Kenya, Northern Rhodesia, Malaya, Borneo, Madagascar, Cyprus and Uruguay have been mentioned as possible refuges. In most of these there is, or could be, a market for cheap consumption goods; and the time is ripe to translate world sympathy into planned world action, in the light of the economic facts of the case—before the half-million German Jews are swamped by the five million Jews from other troubled European lands.

* * *

Australian Aircraft Production.—A further step has been taken to enlist the industrial capacity of the Dominions in the military defence of the British Commonwealth. A strong mission, headed by Sir Hardman Lever and consisting of Colonel Sir Donald Banks and Air-Marshal Sir Arthur Longmore, is to leave shortly for Australia to examine, in consultation with the Australian Government, the possibility of enlarging the Dominion's capacity for aircraft production. The mission, which is to prepare a scheme for consideration by the United Kingdom and Australian Governments, is being sent at the latter's request. Australia at present possesses a single factory turning out military aircraft, these being of an American type. Since its output is inadequate for all the requirements of the Australian Air Force, the first question before the mission will be whether Australia can attain or approach self-sufficiency in this vital material of war. For even if communications with Great Britain (or alternatively with Canada and the United States) could be kept open in time of war, Australia might well find those countries' productive capacity wholly pledged to their own needs. But beyond the question of self-reliance looms another: is Australia in a position to contribute through her capacity for manufacturing aircraft to the defence of zones beyond her shores, on whose security her own depends—Singapore and the Suez Canal area? In the event of a world war this reinforcement of munition supplies might be the most effective and valuable aid that the overseas Dominions could give, at least in the early phases, to their more vulnerable fellow-members of the British Commonwealth.

* * *

New Zealand's Imports.—The gradual unfolding of the new policy of import restriction adopted by the New Zealand Government is posing some pretty problems in the ethics of international commercial relations. The first reports of the goods for which import licences are to be refused show that quite a number of British products are affected. Boots and shoes and artificers' tools are the most important items on the prohibited list, and steel products and electrical goods are to be severely restricted. There is also a long list of goods from other countries whose import is to be prohibited, the United States, Australia, Canada and Czecho-Slovakia being the chief sufferers. There is very little doubt that the financial difficulties in which the Dominion now finds itself are the direct result of the prodigal policies of the Labour Government. But other countries, in the past, have had financial crises as the result of Labour policies and have imposed import restrictions without the objection—indeed with the enthusiastic support—of British manufacturers. New Zealand is thus not to be singled out for condemnation on that score. The convention of these matters is, in general, that a country can restrict its imports as much as it wishes without giving any other country the right to protest, so long as it restricts all imports equitably and does not discriminate against any of its suppliers. New Zealand appears to be restricting other countries' goods

at least as severely as the produce of the United Kingdom; once again we have no ground for complaint. But at Ottawa, New Zealand, together with the other Dominions, signed an undertaking in general terms to give British manufactures the opportunity of competition on equal terms with the products of her own domestic secondary industries. The new regulations would certainly seem to infringe the spirit if not the letter of this undertaking. But even then, New Zealand has consistently been, and even now will remain, a better field, relative to its size, for British manufactures than most of the other Dominions. It is a little inconsistent to mete out to the first offender rebukes far more severe than any that are addressed to the hardened sinners. In last week's *Economist* the Director of the Federation of British Industries disclaimed any political motive behind the unusually violent protests that his organisation is making against the actions of the New Zealand Government. His assurance is gratifying. But it is still difficult to see why, in a very foolish world, this particular New Zealand piece of foolishness should receive more than routine reprobation.

* * *

Palestine, the British Army, and "Atrocities."—The War Office has issued a statement this week describing the situation in Palestine and the measures taken by the British Army to deal with it. By implication the statement provides a denial of charges made in Germany and, at one time, in Italy, that the Army and the police have committed "atrocities" or connived at a "reign of terror." But it is clear that the War Office's action is inspired more by a wish to explain the measures of collective punishment—fines, demolitions, curfews—made necessary by the present state of Palestine, to a British public anxious to comprehend the very real difficulties which exist, than to refute charges which are as malicious as they are unfounded in fact. There is no need to refute such charges. The public trial and sentence of four British police constables for the manslaughter of an Arab in Jaffa, full details of which were available in Thursday's papers, must be one of the very few cases on record, in any country, of retribution being exacted for the shooting of a prisoner "while attempting to escape," and it is sufficient evidence that the British Administration has nothing to fear from publicity: nobody in this country, and few outside it, believed for a moment that they had. The fact that the charges come from a country in which no man is safe from summary imprisonment, or worse, without formality or trial or even proved offence, in which, as all the world knows, unoffending citizens have lately undergone more bodily and mental suffering than has been seen for long decades in Europe under peace conditions, is enough to set us at our ease. What the German newspapers say of the British administration in Palestine is important only as a guide to the minds of those who rule Germany; and in as much as they set out to rebuke, they do it only to themselves.

* * *

Two Battles in Spain.—The main feature of this week's fighting, in which General Franco continued to make important gains in Catalonia, was an offensive by the Army of the Levante under General Miaja into Estremadura. As with the Ebro counter-offensive last July, the Insurgents were taken by surprise and rolled back in a deep salient before they were able to make serious resistance, and by that time the Republicans were only a few miles from the Seville-Salamanca railway. From there they could cut off, or at least seriously dislocate, communications between General Queipo de Llano and G.H.Q. at Burgos. That is their long-range objective: for the moment they are content to play on General Franco's well-known cautious ways by forcing him to draw off guns, aeroplanes, and possibly men, from the northern push. The question is whether this will be enough to stop the advance in Catalonia; present reports suggest that it will not. And if the Insurgents take Tarragona, can they be prevented from taking Barcelona?

And if Barcelona falls, can the southern provinces hold out? The outlook is dark for the Republicans, but not, perhaps, entirely black. With good luck they may halt the Insurgent advance short of the coast, or pin it down at

Tarragona; while General Miaja may be able to put a dent in the southern front deep enough to demand a big effort from Burgos. And in any case the Republicans may congratulate themselves on having upset Signor Mussolini's Roman timetable.

* * *

The Defence of the Aland Islands.—*The Economist* of September 17, 1938, recorded the reopening between Finland and Sweden of the question of the status of the Aland Islands, as this had been determined by the international convention of 1921. The Aland Islands lie in the Baltic, across the mouth of the Gulf of Bothnia, between Sweden and Finland. They are nearer to the Swedish than to the Finnish coast, and their inhabitants are Swedish-speaking; but Finland inherited the sovereignty over them from Czarist Russia, who took them from Sweden, when she took Finland itself, in 1809. After the break-up of the Russian Empire the islanders wanted to return to Sweden, but Finland's title to sovereignty was upheld by an international award, and the question was settled—with some heart-searching on the Swedish side—by an agreement confirming Finnish sovereignty subject to the islands being neutralised, demilitarised, and granted political and cultural autonomy. As between the islands, Finland and Sweden this settlement was, and is, the best that could have been devised; but a demilitarisation that in 1921 gave Sweden military security and the islanders

Also in Piccadilly, Bristol, Liverpool, and Manchester

exemption from military burdens is no longer in the interests of any of the parties directly concerned in times when defencelessness is a sheer invitation to an aggressor. If the German Navy were to swoop down upon the Aland Islands, Germany would be thenceforth the undisputed mistress of the Baltic. Accordingly, the Finnish and Swedish Governments have now agreed to recommend to the other parties to the convention of 1921 that Finland shall be allowed to take defensive military measures in the southernmost part of the neutral zone, and that the islanders shall become subject to conscription. It has been agreed that the Alander troops shall be commanded by their own officers, and that the words of command shall be in Swedish; and the conscription Bill will have to be passed by the local parliament as well as by the Finnish Diet. It remains to be seen what line will be taken by the other signatories to the 1921 Convention. These include all the coastal States of the Baltic except the Soviet Union, and also Great Britain, France and Italy. What, in particular, will Germany say?

* * *

Official Secrets.—On December 19th the Home Secretary received a deputation from the National Union of Journalists, the National Council for Civil Liberties and other bodies, who demanded amendment of the Official Secrets Acts in order to prevent their use in restraint of the legitimate activities of politicians, authors, journalists,

printers, publishers and citizens in general. Sir Samuel Hoare has promised to proceed with such changes if they can be proved feasible; and this week the December deputation submitted a memorandum elaborating this case for reform. The case seems clear. The Acts were intended to cover only information the disclosure of which might be prejudicial to the safety of the State; power is accordingly given (in the 1920 Act) to require persons in certain circumstances to give on demand information relating to a suspected offence on pain of prosecution. Outside of cases where *raison d'état* must necessarily override all other considerations, this marked departure from the traditions of British justice is "a gross interference with the liberty of the subject and the right of the subject to refuse to answer questions of an incriminating character." The right of search in the 1911 Act, too, ought reasonably to be applicable only to exceptional cases where the safety of the State is endangered. It should surely not pass the wit of the Home Office and the Government lawyers to draft amendments which would confine the operation of the Acts to the cases of espionage and similar offences to deal with which they were contrived. It is not enough for the Home Secretary to promise that the Acts will, in executive fact, be confined to official secrets as they are generally and properly understood. Repeatedly they have been interpreted to comprehend information which had no military or State significance whatsoever, and so long as their scope remains vague and comprehensive the ordinary process of political discussion and news-gathering will be hobbled by fears of dire consequences.

Building and Business Revival

NEW YORK, January 1.—For November, the production index of the Federal Reserve Board was 103. Changes in industrial activity in December were small, and largely seasonal, so that the December figures will not be greatly different. The recovery in this index since June, when it was 77, is a full 33 per cent.

The outstanding feature is the doubling of non-residential building contracts. This is primarily evidence of the spending programme. While contracts of this sort are translated only gradually into actual industrial activity, they are probably by now a considerable effective influence. If the employment figures are used to measure industrial activity, it will be noted that, even in June, the non-durable goods industries were relatively lightly depressed; that they recovered sharply in July; and, since then, have made little headway.

BUSINESS INDICES (1923-25 = 100: Adjusted for Seasonal)				
	Nov., 1937	Oct., 1938	Nov., 1938	Nov., 1938
Industrial production (total) ...	88	96	103	
Manufactures	85	95	103	
Minerals	109	99	103	
Construction contracts (total)...	56	82	89	
Residential	32	57	57	
All other	76	102	117	
Factory employment	100.6	87.5	90.1	
Durable goods	99.8	79.1	81.3	
Non-durable goods	101.3	99.3	98.5	
Factory payrolls	92.9	83.9	84.1	
Durable goods	94.8	75.4	78.3	
Non-durable goods	90.8	93.5	90.6	
Freight car loadings (total)	71	68	69	
Of which, miscellaneous	76	72	74	
Department store sales	91	84	89	
Department store stocks	75	67	67	
* Preliminary				

The following table traces the movement of various indices since June:—

	Production	Construction		Employment		Dept. Store Sales
		Residential	Other	Durable Goods	Non-Durable Goods	
1938—						
June	77	42	64	65	88	82
July	83	49	68	71	95	83
August	88	53	77	72	97	83
September	90	56	96	76	98	86
October	96	57	102	78	97	84
November	103	54	117	81	99	89

The Influence of Steel and Motors

The real gain in employment has been in the durable goods industries, where the percentage increase (25) is comparatively little less than that of the production index as a whole. This gain has been largely concentrated in two industries—automobiles and steel. Steel has been a direct beneficiary of the Spending Programme, and of the automobile industry's revival; and the busier output of automobiles has been seasonal. That is, the first three months of an automobile year are largely devoted to stocking dealers with new models. The real test of public demand comes

later. As a matter of record, however, the public demand for the 1939 models is said to be very good.

These data suggest that the recovery so far has not been a general advance on a broad economic front, so much as a number of particular and sharp thrusts—steel, automobiles,

and building, especially Government projects. This view is supported by reference to the index of payrolls, which is more broadly based than the index of production. Payrolls rose from 67 in June to 84 in November, or almost 25 per cent.—about the same as the employment index, but a little less than the production index.

The inference seems justified that the production index, or the index of manufactures, has somewhat exaggerated the extent of the recovery, owing to the heavy influence of the steel and automobile industries, which have led the movement. This consideration helps to explain the generally rather tepid character of oral business comment. While most industrialists have felt a marked betterment in their own businesses since June, the extent of the improvement scarcely seems as great as might be expected from the statistics.

A comparison between the indices for last November and the figures recorded in June, 1936, is interesting. June, 1936, saw the recovery, after the depression of the early thirties, reach (in terms of the production index) the figure of 104—almost identical with the figure for November, 1938. The following table compares a number of the indices at the two dates:—

	June 1936	Nov., 1938
Industrial production (total)	104	103
Manufactures	105	103
Minerals	100	102
Construction contracts (total)	52	89
Residential	36	54
All other	65	117
Factory employment	97	90.1
Factory payrolls	84	84.1
Freight car loadings	73	69
Department store sales	87	89

They are two sharp contrasts. Building is playing a larger part in the current cycle than in 1936; and building is not only the beneficiary of the Spending Programme, but also of the Federal Housing Administration. Equally striking is the fact that payrolls are now the same as in June, 1936, but employment is materially lower.

More Recovery to Come?

As the New Year opens, therefore, comments on the outlook take the form of questions rather than statements and reflect an appreciable diversity of opinion. Optimists recognise that the recovery to date has been rather limited in impact, but expect to see it broaden out soon and become more comprehensive. They hold that automobiles and building are "cyclical leaders," and that in a recovery six months or more the leaders can be expected to show marked gain. This opinion is widely enough held to have developed its distinctive *cliché*—the term used to describe the broadening of the recovery is "fanning out"—a self-descriptive phrase, not to be confused with the baseball term of diametrically opposite meaning.

The pessimists' opinion, on the other hand, is that the movement that started last June is essentially unsubstantial; that it was stimulated by a number of economic "shots in the air"; that the sweeping advance of the cyclical leaders

is not representative of any fundamental vigour or even vitality in the economy; that the movement will not "fan out"; but that the industries that have rushed forward will presently fall back into closer alignment with the more sluggish path of the economy.

Both these views start from a common premise—that the recovery to date has been a curiously lopsided and limping sort of affair. It would be only a little exaggerated to say that half our economy is in a boom and half of it in a depression. The average opinion is a compromise. That is, there is a general recognition that the upturn of the cycle in mid-year was less an assertion of "natural force of recovery" than of powerful stimulants applied by the Government—such as the Spending Programme, the monetisation of the Inactive Gold Fund, and the reform of the tax laws. It is recognised that stimulants, however effective as initiating forces, from their very character lack sustaining motive power; and it is considered that the effect of last spring's stimulants has now been largely felt.

A good many people believe that the initial thrust of recovery has spent its force, but practically no one believes that the forces of recovery are in fact exhausted. The result is that there is a disposition to look for little marked change in the economy, either for better or worse, in the immediate future. When economic opinion reaches a stalemate of this sort, it always turns political. The proximate economic future having been disposed of with a barometric reading of "steady to unchanged," attention is now focused on the opening of the 76th Congress.

France

M. Daladier's Backing

PARIS, January 12.—On September 30th came the Munich Agreement; on November 30th the fiasco of the general strike; and on December 30th the enthusiastic "plebiscite" for France in Corsica and Tunisia. M. Daladier's return from his tour was applauded like his homecoming from Munich three months ago; but the gratitude expressed was evoked by rather different sentiments. This time the Prime Minister had spoken strong words as the nation expected him to, and the country's wish for some restoration of the dignity and prestige shaken by the Munich blow was satisfied.

Parliament now resumes its work, and the question of the day is: where is M. Daladier's majority? Actually, his majority is to be found less in Parliament than in the country, though Parliament, faithful though it always is to old controversies, can scarcely ignore the Prime Minister's public popularity without becoming itself unpopular.

M. Reynaud, the Minister of Finance, on the other hand, has to face critics of two kinds. First, there are his enemies, who reproach him for the taxes he has imposed; and then there are his friends who argue that a "boom" on the Stock Exchange is much easier to bring about than a genuine business revival. In actual fact, business is still improving as the current statistics for heavy industry, the motor trade and retail sales show.

The point is that this country is unfamiliar with the nervous ups and downs of the great industrial countries. It is a farmer and middle class country, a country of moderate unemployment and moderate luxury industries, a country

with a low birth-rate and large savings—a country, in short, which could not (even if it wished to do so) suddenly push its production to the British or German level. These facts explain why the idea of an Imperial economy to furnish France with the soldiers and raw materials it needs gains new supporters every day.

The idea of Empire is making sensational progress, which is an unforeseen consequence of the Italian colonial claims. But there are practical problems to be solved. Will the French public administration find it possible to establish and foster fresh productive developments in the colonies? There is still no certainty of this, though the value of trade between France and her colonies is steadily expanding.

Improved Trade and Revenue

The figures of foreign trade in 1938 show important movements compared with those of 1937, as the following table shows:—

Imports	1937	1938	Increase (+) or Decrease (—)	
			Increase (+) or Decrease (—) in value (in thousands of francs)	
Foodstuffs	10.7	12.4	+1.7	21
Raw materials	25.1	26.7	+1.6	9,911
Manufactured goods ...	6.4	6.6	+ 2	317
Totals	42.3	45.9	+3.5	10,249
Exports	1937	1938	Increase (+) or Decrease (—)	
			Increase (+) or Decrease (—) in value (in thousands of francs)	
Foodstuffs	3.3	4.3	+1.0	218
Raw materials	8.4	9.9	+1.4	3,606
Manufactured goods ...	12.1	16.3	+4.2	6
Totals	23.9	30.5	+6.6	3,382

The import surplus has fallen from 18,452 million francs in 1937 to 15,396 millions in 1938; and, of this decrease, 11,300 millions came in trade with foreign countries and 4,000 millions in trade with the colonies. Expressed in gold francs, the import surplus was 7,000 million francs in 1936, 9,000 millions in 1937 and 5,000 millions in 1938.

Imports have risen in value by only 3,500 million francs while exports rose by 6,600 millions. The volume of imports from the colonies was unchanged; and the volume of imports from foreign countries was markedly affected by the decline in coal imports from 37 million tons to 30 millions.

The volume of exports to the colonies was also unchanged. While some exports to foreign countries have fallen off, notably iron ore, many others have increased, principally manufactured goods. The figures show that exports were maintained while imports only fell to their normal level after the speculative buying which characterised the devaluation period. These are encouraging results, and trade should be further improved by the latest decrees of the Government, especially those which increase working hours and furnish credit facilities for producers.

Revenue receipts in November amounted to 4,958 million francs of which 4,550 millions were ordinary receipts. The month's receipts were 214 millions higher than the revised estimates which had not been reached in the four preceding months; and total revenue for eleven months of 1938 was now nearly 46,000 million francs, or 8,500 millions more than in the same months of 1937. Indirect taxes have fallen 500 millions below the estimates but they are 6,700 millions higher than the actual receipts of 1937. This favourable trend coupled with an improvement in production should afford timely support to the Stock Exchange, the confidence of which has been rather shaken lately by gloomy forecasts about coming foreign events.

Increased Output

The Statistique Générale de la France has published its monthly figures of industrial production in France; and they run as follows:—

(1928 = 100)	Nov., 1937	Sept., 1938	Oct., 1938	Nov., 1938
Index for eight groups (Groups Nos. IV and V excluded) ...	92	79	80	86
I. Mines	100	90	93	99
II. Chemical industries	103	98	94	103
III. Paper	189	157	157	171
VI. Iron and steel	90	61	66	74
VII. Engineering	89	70	72	79
Automobile	85	99	99	110
VIII. Building	58	62	62	62
IX. Gas and electricity	130	123	124	125
X. Miscellaneous	111	101	...	...

In the motor industry, 16,505 vehicles were put on the road in November compared with 13,892 in October and 11,246 in September. The figures for the cotton industry were as follows:—

	Aug. 1938	Sept.	Oct.	Nov.
Spinning (averages per spindle in kilograms):—				
Production	1,158	1,846	1,917	2,040
Deliveries	1,118	1,968	1,917	2,092
Stocks	2,178	2,114	2,168	2,136
Unfulfilled orders	5,591	5,612	6,427	6,842
Weaving (averages per loom in pieces of 100 metres):—				
Production	2.83	4.53	4.53	4.69
Deliveries	3.16	4.47	4.67	4.69
Stocks	8.32	8.72	8.34	8.46
Unfulfilled orders	15.79	15.30	16.17	17.64

Prices are still rising, the advance being most marked in the case of domestic products and foodstuffs:—

Prices	1937 Dec.	1938 Oct.	1938 Nov.	1939 Dec.	1939 Jan. 7
Wholesale prices (1914 = 100)					
General index.....	601	654	658	666	669
Domestic products	650	670	678	692	696

The number of bankruptcies in December was 468, against 455 in November and 358 in October; and, in the week ended December 31st, the number of persons returned as unemployed was 404,730, against 387,832 in the previous week and 365,452 a year ago.

Germany

Mr Norman in Berlin

BERLIN, January 9.—Mr Montagu Norman, Governor of the Bank of England, spent a day in Berlin to return the recent visit of Dr Schacht, President of the Reichsbank, to London. Officially, Mr Norman's trip was purely private; actually, it is likely that his visit had some more positive purpose. It is reasonable to suppose that, as in London, the two bankers discussed Jewish migration, foreign trade, standstill and debt questions. The complete reserve which has been maintained in Berlin about these discussions suggests that no tangible result worth mentioning can be recorded.

In essentials, the views of the two bankers can differ very little and, in quarters in touch with the Reichsbank, it is reported that Mr Norman and Dr Schacht are agreed that some working business agreement between their two countries should be concluded, and that all outstanding questions should be settled, so far as political factors will permit. Questions of clearing and foreign debts will be discussed at a conference of Mr Norman, Dr Schacht and the Reichsbank directors. In Berlin, some people are afraid of the introduction of a compulsory clearing by the United States and even the possibility of a similar step by Britain. Any interruption of American-German trade, or any fresh

impediments to commerce with England and the Dominions, would involve Germany in very serious difficulties, in view of her need for raw materials and food. The present atmosphere has endangered the settlement of the question of a new international coal cartel; the course of Anglo-German industrial discussions about markets has been hampered; and it is doubtful whether the visit of Mr Rublee, of the Evian Committee, to Berlin is, at the moment, either opportune or likely to succeed.

The Institute for Business Research has submitted the foreign trade situation to a searching inquiry. It has reached the conclusions that the over-riding principle of policy should be to cover import requirements. It is clear from the way in which in recent years Germany has conscripted, to finance imports, gold stocks, foreign debts, and foreign securities, as well as the gold and exchange reserves of Austria and Sudetenland, how overwhelming is the extent to which imports depend on export outlets. The amount of the proceeds derived from exports depends on world business conditions, and the Business Institute emphasises that, in the present state of world and German trade, export development can no longer be left to private initiative, but must be determined by each State according to its national needs. The report concludes that, in the future still more than in the past, German foreign trade must be monopolised and brought under social control and it is urged that the advantages in price at present possessed by foreign competitors could not be met by the unaided efforts of individual German exporters.

Production, Investment and Finance

In 1938, production of capital goods in Germany increased about 10 per cent. and has now reached 3½ times that of 1932. Compared with 1928-29, it is about 40 per cent. higher. In consequence of the armament and building programmes, output has greatly increased, particularly in building, iron, metal, machinery and motor car industries. The output of capital goods in 1938 amounted to between Rm. 18 and Rm. 19 milliards, compared with Rm. 16 milliards in 1937 and Rs. 13.8 milliards in 1928.

Total investment in 1938 is estimated at Rm. 10.2 milliards compared with only Rm. 6.3 milliards in 1937. Of this, bank loans accounted for Rm. 8.1 milliards and public issues for Rm. 2.1 milliards. Long-term investment totalled Rm. 6.9 milliards; short-term investment Rm. 3.3 milliards. In this connection, the Institute of Business Research announces that the special bills issued by the Reich, for armament purposes, have now been withdrawn from the credit structure, and their place has been taken by Treasury delivery certificates and Reich loans. In fact, however, large sums of special bills are still to be found in the possession of the banks; and the Reichsbank has, to simplify the position, taken over the special bills and in exchange has placed what are called "block bills" (*Blockwechsel*) at the disposal of the banks. The block bill is, in effect, a certificate stating that, in respect of it, a certain volume of bills is lying in the Reichsbank or its subsidiaries; and, like the original special bill, the block bill can be rediscounted and negotiated. The block bill is shown by the banks in their stock of bills, which has, therefore, fallen only a little since the early part of 1938, when new issues of special bills ceased and were replaced by Treasury delivery certificates.

Of last year's investment, some three-quarters (compared with one-half in the previous year) was absorbed by Reich loans. For private business only Rm. 2.6 milliards were available. It follows that by far the greater part of industrial development must be financed out of industry's own resources.

Problems of Industry

The development of German industry in the last six years has been dominated by the enormous volume of work for the State, which now absorbs the greater part of industrial capacity. At the beginning, the stocks of raw materials imposed no limits on the increase of production, while the better employment of plant led to falling costs and increasing revenues. The index of production in 1938 (1928 = 100) was 125, against 107 in 1936 and 117 in 1937. The value of production, however, did not increase in the same proportion, as export prices are still considerably below the level of 1938 and costs of production have increased continuously in the last few years. Domestic prices rose until the autumn of 1937, when the fall of raw material prices on the world market and the declines in the prices of pulp goods, cement and fertilisers produced a certain weakness. But this slight fall has since been arrested.

	Gross Value of Production All Trades (In Rm. milliards)	Industry alone (1935 = 100)	Gross Value of Production of Industry (1935 = 100)
1935	59	44½	100
1936	67½	51½	116
1937	77½	60	135
1938	85-90	c. 70	155-160

(Figures of the Institute for Business Research)

The productivity of industry is extensively influenced by the level of wages. In the absence of complete statistics, this influence can only be estimated. According to the Statistical Bureau of the Reich (Statistisches Reichsamt), labour expenses of a number of companies selected for investigation rose from Rm. 2.7 milliards in 1932 to Rm. 5.1 milliards in 1936. According to the Institut für Konjunkturforschung, labour expenses rose by 110 per cent. from 1932 to 1937 and by a further 14 per cent. in 1938. The total of wages paid in industry (omitting small workshops) rose between 1932 and 1938 from Rm. 5.4 to 13.4 milliards. At the same time contributions to social services have steadily increased under the pressure of moral compulsion; they are estimated at from 8 to 10 per cent. of all labour costs.

The system adopted by the State to finance its needs has led to numerous tax increases, but, on the other hand, industry has been enabled by better profits and by the liquidation of inventories to repay bank credits and loan debts and consequently to reduce its interest payments.

	Interest Payments (1932 = 100)	Property Taxes (in % of turnover)	Interest Payments (in % of turnover)	Property Taxes (in % of turnover)	Other Taxes
1932	100	100	3.3	3.2	1.0
1935	44	166	0.9	3.3	1.6
1936	45	209	0.8	3.5	1.8
1937	30	327	0.4	4.7	2.2

The Institute for Business Research has calculated that taxes and interest will absorb about 9 per cent. of the turnover of industry in 1938-39, since the collection of taxes has been intensified, the corporation tax has been increased and allowances have been suspended.

Depreciation expenses are increasing, since industry is engaging in extensive new investment in plant, on account of the complete employment of existing plant, as well as to provide for the new forms of substitute production. On the other hand, the writing-off of depression losses has slackened.

	Depreciation of Plant (In percentage of turnover)	Other writing-off (In percentage of turnover)	Total
1932	3.2	6.9	10.1
1935	3.1	1.2	4.4
1936	5.3	2.1	7.5
1937	4.4	0.4	4.8

In 1938 the total may be from 4.1 to 4.2 per cent. of turnover.

Higher costs and taxes have been responsible for the fact that industrial profits have risen considerably less than might have been supposed from the rise in the turnover of industrial companies.

	Turnover (1935 = 100)	Profits per cent. of turnover	Profits as per cent. of turnover
1932	—	—	4.1*
1935	100	100	3.3
1936	119	111	3.1
1937	138	117	2.8

* Loss.

In 1938 turnover increased by about 18 per cent. but profits

only by 3 per cent., so that the ratio will be no higher than 2.4 per cent.

As figures of industrial stocks do not exist, their volume can only be estimated. The Business Research Institute puts them in 1937 at Rm. 12½-13½ milliards, which would be equal to the level of 1928-29. This optimistic estimate stands in strange contrast to the various signs of shortage, although it must not be forgotten that considerable war reserves may well have been accumulated. German industry is especially short of iron and steel, wood and all imported materials. The domestic production of raw materials, however, has increased by 11 per cent.

Industrial Disorganisation

The enormous activities of the State and the priority given to exports have combined with limited capacity of production and lack of raw materials to produce a real struggle to secure the products of industry. The General Commissioner for the iron and steel industry has stated in a circular that high Government authorities are attempting to secure quicker deliveries from the engineering industry by issuing certificates of urgency, by telegrams, by threats that orders will be withdrawn and the like. Industrial firms are compelled to alter their plans of production, and as a result (according to the results of an investigation) materials sometimes take three or four times as long to be worked up. Some machines stand idle because bottlenecks have arisen in other departments. It has accordingly been decided that the Reichsstelle für Wirtschaftsausbau (State Office for the Development of Production) shall lay down production plans which are to be binding on the producer and his customer alike and can be modified only after permission has been granted.

Lack of Raw Materials

Germany imported about 500,000 tons of scrap metal in the first half of 1938. With the object of reducing these imports and economising foreign exchange, the leader of the Labour Front has ordered a complete collection of scrap in all business firms. It will be remembered that a similar collection was made from private families last year, in the course of which even the railings of parks and gardens were removed.

Architects have also been instructed not to provide mantel-pieces in future in order to save wood.

SAFETY FOR SAVINGS

In financial strength, the Temperance Permanent Building Society believes itself to occupy the premier position among Building Societies throughout the country. Reserves now represent nearly 19% of the combined share and deposit capital and are greatly in excess of those of any large Building Society with assets of £2,000,000 or over.

Liberal Party Feud

OTTAWA, December 24.—The Ministry continues to be subjected to very strong pressure by domestic manufacturing interests, notably the textile companies, to denounce the existing trade treaties with Germany and Japan to prevent these two countries from securing, through most-favoured-nation treatment, the benefit of the tariff concessions recently accorded to the United States. The Nazi persecution of the Jews has aroused a substantial measure of public support for measures to check any additional inflow of German goods. So far the Government has refused to respond to this pressure.

Meanwhile the Ministry has now come to a state of open war with Mr Hepburn, the Liberal Premier of Ontario. Two Federal Ministers have alleged that Mr Hepburn and his ally, Mr Duplessis, the Union Nationale Premier of Quebec, have been engaged in a disgraceful conspiracy to oust Mr Mackenzie King, the Dominion Premier, from the leadership of the Liberal Party. Mr Hepburn has denied this. He cited cases of the hostile or apathetic attitude of Ottawa towards proposals for co-operation on the part of his Ministry, and said he was ready to take this issue of co-operation with Ottawa to the people. Mr Mackenzie King then issued a statement declaring that he agreed with everything that his two Ministers had said; that the restraint which he had exercised for a year and a half about the attitude of Mr Hepburn towards his Government must now be ended, because the latter had raised an issue involving the decencies of public life and national unity; and that he proposed to face it squarely after discussing it with his followers in the Federal Parliament.

Financial and Farming Difficulties

The Federal Government's Budget prospects are not improving. Revenue receipts in November reached a total of \$36,534,480, compared with \$40,573,587 in November, 1937, while total expenditure for the month was \$49,270,220, compared with \$47,556,318 twelve months before. In the first eight months of the current fiscal year total receipts were \$358½ millions, compared with \$360½ millions in the corresponding period of the previous financial year; and, in the same period, expenditure was \$335½ millions, compared with \$321½ millions. The position at the end of November was, therefore, roughly \$15½ millions worse than a year before. The deficit on the Canadian National Railway will be heavier at the end of the year. The reduction in relief expenditure in the West will be far more than offset by the cost of the wheat guarantee. And the outlook for a cheerful balance sheet at the end of the fiscal year is not rosy.

An important conference about wheat marketing problems has been held in Winnipeg under the auspices of the Government of Manitoba, and was attended by leading experts from both Canada and the United States. The spokesmen for the prairie provinces agreed that a disastrous collapse of their economy had only been averted by the Federal Government's guarantee of a minimum price of 80 cents per bushel (No. 1 Northern) for wheat. An enormous carry-over of wheat was likely at the end of the current crop year. Further curtailments of overseas markets were possible; and the immediate outlook for Western agriculture was very dark. The view was strongly expressed that, as long as the Eastern provinces insisted upon maintaining a policy of industrial protectionism, which increased the costs of production of the prairie grain-growers and rendered it more difficult for them to compete with the producers of other wheat-exporting countries, Easterners could scarcely criticise the price guarantee policy which, in the eyes of Westerners, only assures a bare living to farmers.

The year 1938 ends with Canadian business showing no improvement. The general level of activity is about the same as it was at the close of 1937. The general index of the Bureau of Statistics on December 17th was slightly above the figure for the corresponding date in 1937.

Week Ending	Car loadings	Wholesale Prices	Bank Clearings	General Index
December 18, 1937	71.8	82.8	90.0	104.9
December 3, 1938	66.6	73.4	90.6	106.1
December 10, 1938	68.3	73.3	79.2	104.6
December 17, 1938	65.5	73.4	82.0	104.5

The public has lately been making its postponed purchases of winter goods, and, as a result, retail business has picked up considerably, although the special Christmas trade has not been so large in volume as it was a year ago. There has been no serious decline in the national income, as there have been few reductions in wages, and it is estimated that the total amount of dividends which Canadian companies will have paid by the end of the year will be \$322½ millions—which is very little short of the figure recorded for 1937, \$323½ millions.

No Real Revival Yet

It is becoming clear, however, that hopes of a real revival of prosperity for basic industries in consequence of the new Canadian-American Treaty will not be realised until there is a recovery of prices. This in turn depends upon an enlargement of general export trade which can hardly be hoped for as long as the present acute international tension continues. The foreign trade returns for November were again disappointing:—

	November, 1937	October, 1938	November, 1938
	\$	\$	\$
Imports	80,640,504	63,908,940	63,303,669
Exports (domestic)	106,662,684	101,633,805	93,223,909

Activity in mining is well sustained. The asbestos industry, too, is faring particularly well, asbestos exports in November amounting to 30,012 tons, compared with 20,741 tons in November, 1937. Newsprint exports in November were 264,421 tons, the largest monthly volume for the year and roughly 19,000 tons above the output for the month. The demand for pulp wood is slow and new contract prices have been reduced by \$1 per cord.

The winter's logging operations are now under way. Prices are firm, and the volume of lumber exports is as large as a year ago; but the lumber mills on the Pacific Coast are only operating at about 75 per cent. of their capacity. Also on the Pacific Coast, however, the salmon pack has been good, amounting to 1,690,000 cases, or 12 per cent. more than a year ago. In the prairie provinces a substantial proportion of the wheat crop has now been marketed, and, as export demand has been disappointing, visible stocks of Canadian wheat have been piling up, until on December 16th they amounted to 170,668,970 bushels, compared with 60,349,518 bushels twelve months before.

Mixed Industrial Outlook

In manufacturing, conditions vary. Motor manufacturers have increased their scale of operations, and their orders are helping the iron and steel industries. The industries which cater for mining are still busy, and farm implement plants are more active than a year ago. But boot and shoe manufacturers and tanneries are facing seasonal slackness, and furniture factories are just holding their own.

In the textile field the usual autumn enlargement of operations in the hosiery, silk and knitting mills has been maintained, but other branches complain of insufficient orders. Flourmilling continues to fare better; domestic orders are good and export trade has improved.

The tariff changes consequent upon the new Canadian-American trade agreement come into provisional effect on January 1st. Many manufacturers fear that more intensive competition from the United States will hurt their business, although the elimination of the 3 per cent. import excise tax will not take place until Parliament actually repeals it. Exporters to the British market are suffering somewhat from the decline in sterling.

Letters to the Editor

Decentralisation

TO THE EDITOR OF THE ECONOMIST

SIR,—The recent crisis has again turned our attention to the consequences of the impractical size of many of our towns. More and more people are coming to realise that London and other great cities are too large, and that their continued growth is making almost insoluble their problems of overcrowding, traffic congestion and inadequacy of open spaces. For many years it has been clear to town-planners that the only satisfactory policy, in the interests alike of industrial and business efficiency and of a good environment for family life, is one of decentralisation. To these sociological reasons has now been added the additional reason of safety from aerial attack. It is manifest folly to add further rings of development to towns already demonstrably too large, or to maintain or even increase their density.

For many years the Garden Cities and Town Planning Association has been advocating a practical policy of decentralisation of the great cities, coupled with the preservation of the countryside from sprawling or scattered development. On the technical and administrative side of the subject the Association, which has, of course, special advantages through its personnel and connections, has been making a constant and detailed study of all the relative problems and has put forward and tried to popularise constructive proposals.

Now that immediate attention must be paid to the problem in the interests of safety as well as welfare, the need for the work of the Association is very great, and it is necessary to supplement it by more complete data as to the financial, statistical and technical aspects of the subject, as well as to maintain an effective propaganda for Planning and Decentralisation.

A few hundreds subscribed now may help to save the country very large sums in the future. Subscriptions will gladly be received by any of us at 13 Suffolk Street, Pall Mall, London, S.W.1.

Yours, etc.,
LYTTON.
CECIL HARMSWORTH.

F.B.I. and New Zealand

TO THE EDITOR OF THE ECONOMIST

SIR,—Arising out of the statements made by the Director and the Empire Director of the Federation of British Industries in regard to New Zealand, it would be of important value to English traders in overseas markets if you would record when, where and how the Federation of British Industries has been, or could be, of service to the British manufacturer and the British exporter who sells and distributes the products in New Zealand.

We have been in New Zealand trade, handling produce from that country and acting for English manufacturers in New Zealand for over half a century, but we have no knowledge of any action of the Federation of British Industries that has been of benefit either to one or the other as regards the New Zealand trade.

Yours faithfully,
JOSEPH NATHAN AND COMPANY, LTD.,
ALEC NATHAN, Director.

London, E.C.3.

Scottish Government

TO THE EDITOR OF THE ECONOMIST

SIR,—Your editorial comment on December 17th about the inefficiency of Scottish government is refreshingly frank, but you will pardon one of your readers, I hope, for suggesting that in it you make two gravely wrong assumptions.

The first is that "Scotland is too poor to stand comfortably on its own (sic) feet." No one in possession of the facts could accept such a statement. It is quite untrue.

Financial statements about Scottish revenue are only issued at rare intervals, but the last available figures published by the Treasury revealed that Scotland contributed £67 millions towards a total United Kingdom revenue of £783 millions. That was in 1931 and is 8½ per cent. of the total. Actually that figure of £67 millions does not present a true picture of Scotland's wealth since it excludes the revenue derived from the taxation of chain stores and other concerns whose headquarters are in England but who function in Scotland. But for the sake of argument let us accept it.

Is £67 millions a lot of money—or is it a mere pittance? £67 millions was greater than the national revenues (for that year) of Belgium, of Holland, of Denmark, greater than the national revenues of Norway and Sweden put together. Yet no one, so far as I know, has ever suggested that any one of these countries is "too poor to stand on its own feet."

The second wrong assumption is that "Scotland is too closely related to the rest of Britain . . . to withdraw its (sic) troops from Westminster." Merely because two flats occur in the same building, sharing a roof, a party wall and some of the same services, it does not follow that each housewife has not perfect freedom to run her own ménage in her own way. Obviously Scotland must play her part as an area of Britain, but she has a duty towards herself which she is shirking to-day and has shirked for over two hundred years, with dire results. We certainly need a "planned policy" for Scotland, as you suggest. The Scottish people know their own needs and have the resources to meet them, but it is our business to plan for ourselves and to act for ourselves, and the only way we can do this is through our own legislative machinery—which we have not got.

You suggest that the Scottish people blame their bureaucracy for the decay of their country. We do not: we blame Parliament. Bureaucracy alone cannot help. Control of policy and control of finance for domestic affairs is essential. Even if 100 per cent. of civil servants concerned with Scottish affairs—covering, be it remembered, a far wider sphere than that included in the Reorganisation of Offices Bill you mentioned—were to be moved bodily to Scotland, it would not alleviate the two main evils: namely, the hopeless congestion at Westminster and the lack of a Scottish cabinet to formulate and prosecute a "planned policy" for the "Highlands, the fisheries, the housing, health and staple industries," whose condition you rightly label "lamentable." Governing Scotland is, after all, a full-time job for Cabinet and Parliament. At the moment it is the impossible occupation of one Cabinet Minister who can only command Parliament's attention for two days in the year.

We in Scotland may well ask ourselves, as we do in increasing numbers, whether we can afford to continue a system whereby tens of millions of pounds of Scottish money are taken away every year to London to be spent there—or from there; or whether we can afford to remain in this literally "absorbing" association with a richer country which compels us to follow her standards irrespective of our circumstances, and which is, at the same time, making grave inroads on our economic fabric.

I am, yours faithfully,
ROBERT HURD.

Edinburgh.

French Financial Policy

TO THE EDITOR OF THE ECONOMIST

SIR,—M. Reynaud's economy decrees should not be allowed to pass without attention being drawn to the striking and alarming resemblance they bear to the emergency decrees of Brüning which, seven years ago, intensified Germany's economic crisis and thus materially contributed to Hitler's rise to power. The large scale cut in public works (except for purposes of National Defence and for relieving the economic situation in Alsace) cannot fail to make the unemployment situation worse.

By intensifying the slump when the world economic outlook is not very favourable, the Reynaud decrees play directly into the hands of the extremists.

Yours, etc.,
P. T. BAUER.

Cambridge.

Books and Publications

Another Critic of the Soviets

THE battle of the books about Russia still goes on, but more books are now being written against the Soviet regime than for it. The power of the Red Army and Air Force is widely questioned, though on scarcely convincing grounds, and many erstwhile supporters of the Communist "experiment" have become convinced that the dictatorship of Stalin is too ruthless and the standard of life of the Russian people too low for believers in freedom and equality to lend the regime their backing. The friends of Soviet Russia are more loyal than ever, but they have declined in number. Treason trials, purges, food shortages and famines have bred disillusionment.

M. de Basily* is not disappointed. A pre-war Russian Liberal; he never had high hopes of the outcome of the Revolution after the Bolsheviks had triumphed over the Moderates. He holds no brief for Tsarist government. He admits the folly and iniquity of its rule. But he contends that the course of events was changing for the better when the world war and the Bolsheviks broke the trend with violence. Industry was growing rapidly, and material standards were rising. Liberalism was making headway, and autocracy was in retreat. Education and social services were being extended. M. de Basily contrasts what has actually happened with the elusive might-have-been.

Thus he has little praise even for the apparently conspicuous achievements of Lenin and Stalin. He argues that, compared with the industrialisation which was gathering pace immediately before the war, the Five-Year Plans represent no striking advance, while Soviet schools are poor in quality and Soviet social welfare a mere façade.

The crux of the question lies in two places: the standard of living and the extent of personal liberty. M. de Basily mobilises statistics, largely from official sources, to demonstrate, to his own satisfaction, the "debilitating poverty" of the Russian people to-day. Great mines, factories and plants have indeed been constructed; and vast quantities of war material have been produced. But farming has suffered sorely; the citizens of the first "Socialist" State lack many of the necessities of life; and only a few selected skilled artisans are well paid, well fed, well clothed and well housed.

In politics, as in economics, M. de Basily sees Soviet Russia as a great pretence masking a great failure. There is a formally democratic constitution, but, in his view, the people are, in fact, ruled by fear. Technical training is encouraged, but culture, free thought and true education are denied. And, though regimentation is complete, a liberal opposition is growing in bitterness and strength.

This is a grim picture, and at every point it is documented in detail and pointed by statistics. Yet, although it is the great merit of M. de Basily's book that it collects and analyses large quantities of figures about Russia's economy, mainly indisputable, his thesis is never at all convincing as the whole and final truth. Once more an advocate has written about Russia; and the Russian riddle remains unsolved.

We have hosts of statistics about Russia nowadays, but little genuine information, and the difference between figures and facts was never more complete. Writers like the Webbs have been blind to the progress achieved in pre-war Russia; M. de Basily sees scarcely any of the advantages of Soviet life; and the ordinary reader will still be bewildered. Shrewdly, he will suspect that the truth is a mean between the debaters' shrill contentions. He will not allow political prejudice to discount Russia's power for war and diplomacy, or her rôle as a pioneer in invention and social welfare and an innovator in ways of living. Nor, on the other hand, will he permit mere partisanship to hold up the Soviets as a model for other nations with dictatorship as the oddly-chosen exemplar of excited democrats. Meanwhile, he will learn a great deal from M. de Basily, but he is not likely to be converted.

Shorter Notices

"Wirtschaftskräfte und Wirtschaftspolitik der Tschechoslowakei." By Kurt Witt. Felix Weiner, Leipzig. 272 pages, 27 maps. Rm. 13.50 paper, Rm. 15.50 cloth.

Two years of study have gone to the making of this economic and political study, and although many of the matters with which the book deals have quite changed their nature since the author wrote it, those who want a factual survey of Czecho-Slovakia on the eve of Munich will find in it compendious material. The first part describes with a fair amount of detail the economic structure of the "first" Republic and of its more important industries; and in the latter part the author makes an excursion into politics and policies. Here he sticks less closely to the statistical point, and at times is superficial; but on the whole his text is carefully objective. He contrives a valuable perspective by frequent references to pre-war conditions, though allowance must be made for his determination to regard Czecho-Slovakia as first and foremost a political mistake.

"The Rise of Midland Industries. 1600-1838." W. H. B. Court. Oxford University Press. 271 pages. 15s.

This is not merely a history of events in the development of Midland industries, but a survey of the underlying causes which have made the area an industrial one. Beginning with the period when the Severn was a principal focus for trade, Mr Court gives an interesting—if perhaps over-detailed—account of the change from agriculture to industry as the main occupation of a rapidly increasing population, dealing on the way with such varied and important matters as markets, communications, the beginning of capitalistic enterprise, the intervention of the State and the development of the use of machinery and power.

"The Monetary Aspect of the Raw Materials Problem and the revival of International Trade." By M. A. Heilperin. International Institute of Intellectual Co-operation. 41 pages.

The view here expounded is that Germany's shortage of exchange for the purpose of purchasing materials derives from the search for self-sufficiency and the creation of a war economy. The widespread pursuit of similar policies has accentuated the lopsided distribution of gold and capital and choked trade channels; and the only way out of the present difficulties is the widest international co-operation to reanimate trade and investment and outlaw autarky.

THE BUSINESS WORLD

Sterling and Gold

ON the evening of January 6th, the Bank of England issued as part of its normal routine the simple statement that it had sold £200,001,571 of gold. It quickly transpired that this gold had been sold to the Exchange Equalisation Account, and it was soon calculated that if this gold was written up from the Bank's statutory price to the current market price it meant that the Exchange Equalisation Account's gold reserves had been reinforced to the extent of nearly £350 millions. It was further announced that the fiduciary note issue was to be increased forthwith from £230 millions to £400 millions. As Parliamentary sanction is required for any permanent increase above £260 millions, a Bill will be introduced when Parliament meets to amend the Currency and Bank Notes Act, 1928, so as to establish the new fiduciary issue of £400 millions. It will be recalled that a seasonal increase of £30 millions was made in the fiduciary note issue last December. The new increase of £170 millions falls £30 millions short of the Bank's gold sale. The net result, therefore, is to bring to an end the recent seasonal increase, and this week's Bank return shows a reduction of £17.5 millions in the reserve, which is mainly due to this cause.

In view of the past year's gold losses of the Exchange Equalisation Account, it is only the magnitude of the transfer which causes any surprise. The suggestion of a transfer was made in *The Economist* as long ago as October 22, 1938, and was repeated on November 12th. On both occasions, however, a far more modest transfer was contemplated, for we suggested £65 millions of gold (at 85s. per ounce) last October and £40 millions in November. It was also suggested that this transfer should be combined with the pre-Christmas increase in the fiduciary note issue, though it is, of course, equally appropriate to combine it with the post-Christmas decrease. It is safe, however, to say that few of those who have been urging on the authorities the step they have now taken expected the bold step of such an enormous transfer.

Yet once the shock of its magnitude has passed off, it is difficult to resist the conclusion that it is justified. Rightly or wrongly, sterling had come under suspicion, and a demonstration in force of this character was the swiftest and most certain way of discouraging purely speculative attacks. The Bank's gold reserve has now shrunk to £126 millions (at 85s. per ounce), or nearly to the level at which it stood when the Exchange Equalisation Account was established in 1932. Conversely, if our last week's estimate is correct, the Exchange Account now holds £410 millions of gold (at 140s. per ounce). Taking, however, the price of gold at 150s. per ounce, the Bank's holding is worth £220 millions, and the Exchange Account's £440 millions. The Exchange Account, therefore, now holds two-thirds of our gold reserves, leaving one-third to the Bank of England. It would be interesting to know if the establishment of this ratio was accidental or deliberate, but in any case it makes it clear once and for all that the main function of our gold is the settlement of our external differences; and two-thirds of our gold has now been mobilised with that end in view.

There is a tendency abroad to regard this gold transfer as inflationary. To show the utter absurdity of any such suggestion it is only necessary to quote the statistics in the table at the head of the following column.

The gold transfer has involved no like increase in the note circulation, in the credit base, in bankers' deposits or in joint-stock bank cash. This week's drop in

	Nov. 23, 1938	Jan. 4, 1939	Jan. 11, 1939
		(£ millions)	
Note issue	526.4	556.4	526.4
Note circulation	476.1	488.1	475.6
Reserve	51.6	68.3	50.8
Proportion	32.4%	35.6%	29.5%
Bankers' deposits	92.2	136.0	118.1

the Reserve and Proportion is solely the consequence of the seasonal contraction in the fiduciary note issue, with which this gold transfer has been combined, and this only restores the *status quo* of the return of November 23rd. The Bank of England is still able to meet its customers' demands in currency, and for years past it has not been required to do more. A measure, therefore, which simply mobilises our gold where it is really required, and does not in itself create any fresh credit, is not inflationary.

The implications of the transfer for the currency policy to be pursued by the British authorities have also been the subject of a certain amount of misconception. The reinforcement of the Exchange Account would make it possible to "peg" the pound at its present level for an indefinite period, and it has been somewhat hastily assumed in some quarters that this is the intention. But any such procedure would involve a change in the often-proclaimed principles of the Government's policy. The purpose of the Account is to iron out temporary and arbitrary fluctuations in the exchanges, but not to resist fundamental changes in the relative values of the different currencies. It is believed in this country—though in the nature of things it cannot be precisely determined—that the pound is still over-valued, although possibly not by as much as it was a year ago. If so, to attempt to maintain the present level against the "drag" of the market would involve imposing on British industry, though perhaps in minor degree, the dislocations that were experienced between 1925 and 1931 and would ensure that the newly-reinforced gold reserve of the Account would gradually drain away. No change in the declared policy of the Government has been announced, and it is greatly to be hoped that no change is to be anticipated.

The transfer of gold from the Bank to the Account has been paid for by the transfer of securities from the Account to the Bank. The Bank thus acquires £200 millions of "tap" Treasury bills, and since the total "tap" issue is only about £500 millions, nearly half the present issue is held by the Bank. Since there will be no means of telling, in the course of the next three months, whether these bills are replaced at maturity by "tap" or by tender bills, even the present very approximate indications of the authorities' transactions will now disappear. This is unfortunate; but the acquisition by the Bank of England of this large total of bills suggests a more constructive possibility. The recent forecast in *The Economist* of a coming dearth of bills was based on the fact that the outflow of foreign money had caused the Exchange Account to sell gold and take over Treasury bills previously held by the banking system. There has, in fact, developed to-day a definite lack of balance. The outflow of foreign money, which caused our gold losses, had other consequences as well as the foreign realisations of Treasury bills. These were foreign sales of British securities, foreign withdrawals of deposits from the British banks, and even foreign dishoarding of British currency. So far, all that there is to be set on the

other side of the equation, as the consequence of our gold losses, is the Exchange Account's absorption of Treasury bills. It is not surprising that there is already a lack of balance, the main symptoms of which are the coming dearth of bills and also last year's progressive weakness in the gilt-edged market.

This big exchange of gold and Treasury bills between the Exchange Equalisation Account and the Bank of England opens the door to a remedy. The issue department of the Bank has always been accustomed to hold all kinds of British Government securities and not merely Treasury bills. We urge, therefore, that it should gradually replace part of its £200 millions of Treasury bills acquired from the Exchange Account by long-term and medium-term securities, which it would purchase in the open market. Such purchases would be made from time to time in replacement of maturities of Treasury bills. In this way it would kill several birds with one stone. It would release to the banking system and the money market the Treasury bills which both urgently need if the banks are to maintain their liquidity and also avoid a deflationary contraction of credit; for, as we have repeatedly explained in the past, the banks must hold against their deposits an adequate volume of bills and short loans as well as a sufficiency of cash. The gilt-edged market would receive

new and powerful support, of a magnitude which would be gauged exactly to counteract the weakness caused by last year's foreign realisations. As indirect consequences, the rising trend of the long-term interest rate would be checked, and future defence borrowing would be facilitated. Nor would these be inflationary moves. Their sole significance and purpose would be the better balancing of the causes and consequence of our recent gold losses, or, more specifically, the neutralisation of the deflationary influences of last year's withdrawals of foreign funds. So far these have only been scotched and not killed by the compensatory action of the Exchange Equalisation Account.

Developments since 1931 have already rendered our monetary system far more elastic than anyone could have envisaged at that date. Looking back, however, over the past year, which was the first year during which our modern monetary system had to cope with a major and prolonged outflow of funds, it is clear that there is still need for even greater elasticity if the two declared objects of British currency policy—the maintenance of cheap money at home and the control of arbitrary fluctuations on the exchanges—are to be successfully combined. This transfer of gold to the Exchange Account provides an opportunity which the authorities ought to seize.

A Century of Indian Tea

A HUNDRED years ago, on January 10, 1839, the first consignment of tea grown and prepared in India, consisting of eight chests, totalling in all 350 lbs., was put up by the East India Company for public sale in the Commercial Sale Rooms, Mincing Lane. Since then British capital and enterprise have created an important industry covering over two million acres, employing about 1,250,000 people and representing a capital investment of upwards of £36 millions. As a result, largely, of the growth of the tea industry in India, London became the centre of the world's tea trade. To-day, India has one-third of the world's area under tea (exclusive of China) and produces over two-fifths of the world's output of the commodity (exclusive of China and French Indo-China). Her exports of tea represent 40 per cent. of the total quantity entering international trade. Tea accounted for 13 per cent., by value, of India's total exports of merchandise in 1937-38, thus ranking in importance after only jute and cotton.

To Major Robert Bruce, an army officer attached to the East India Company, goes the credit for finding native tea trees growing in the hilly tract of the Rangpur district, Assam, in 1823. Two years later the English Society of Arts offered a gold medal or fifty guineas "to the person who shall grow and prepare the greatest quantity of tea of good quality, not being less than 20 lbs. in weight, in the East or West Indies or any other British Colony." The East India Company, then enjoying a monopoly of the China tea trade, did all it could to discourage tea cultivation in India. But in 1834, the year following the abolition of the company's China tea trade monopoly, the special committee appointed to inquire into the possibility of introducing China tea plants into India reported that "the tea shrub is beyond all doubt indigenous to Upper Assam... where the shrub is cultivated for the sake of its leaf... We have no hesitation in declaring this discovery to be by far the most important and valuable ever made in matters connected with the agricultural or commercial resources of this Empire."

The annexation of Upper Assam by the East India Company in 1839 made private enterprise possible and safe. In January, 1840, the Assam Tea Company was formed to take over the private tea gardens of the East India Company. It paid the first earned dividend of 2½ per cent. in 1852, and four years later the dividend was raised to 9 per cent. Between 1856 and 1861 tea gardens and estates were opened up at Darjeeling and South India, by then there were fifty companies cultivating and manufacturing tea. The "tea mania" was running riot in 1862-63;

all and sundry holding a few acres of waste land in Assam, on which were planted a few maunds of tea seed, believed that they possessed a veritable El Dorado. Confidence in the future stability and prosperity of the tea plantation industry returned only after 1870. Since then the Indian tea industry has made steady progress, punctuated by occasional set-backs:

The Indian tea of commerce consists of the cured young

What is your
Capitalised Value
to your family?

If you listed all your personal assets and converted them into cash what would be the total? Now assuming from a safe investment interest on this amount could be obtained at the rate of 3½ per annum tax free, what income would this produce?

This is the test which you should apply to your own resources, so that you will know exactly what the financial position of your wife and family would be in the event of your death—a contingency which it is unwise to ignore. Most men are disappointed and not a little perturbed after this self examination.

THE "SAFEGUARD" POLICY
is specially designed to augment personal assets by providing an income (tax free and payable monthly) for your dependants in the event of death. If you survive the period of your family responsibilities the policy provides capital for your own retirement.

You are invited to make an enquiry for full details and for an illustration suited to your own circumstances. Rest assured you will incur no obligation by doing so.

leaves and tender tips of *Camellia thea*, variety *Viridis* (China tea comes from *Camellia thea*, variety *Bohea*). The plant is generally propagated from seed. The nurseries are put out in the early part of the year, and at six months to two years the seedling is lifted with a clod of earth carefully cut so as to avoid root damage. The young tea bush reaches maturity in three or four years, but is not in full bearing till the seventh or eighth year. The useful life of the bush is about fifty years. Neither the very young nor the very old bush yields the best tea, and the planter must wait for his return and pursue a systematic policy of replacement. The bush is kept down to 3 or 4 feet to facilitate plucking and ensure a steady supply of young and tender shoots. The work is carried out by women, who with quick eyes and deft fingers rapidly choose and pluck the leaves, right and left hand operating simultaneously. In respect of labour supply, the most fortunate area is South India, whence the surplus labour emigrates, not only to Assam but also to Ceylon and Malaya. In North India the crop is seasonal and the plucking season extends from April to November. More than half the crop is gathered during the months of July, August, and September. In South India and in Ceylon and Java, the crop is distributed throughout the year, though the advent of the rains produces a more abundant but inferior "flush" of leaf, which severely tests both labour supply and factory accommodation. The quality of the tea made varies closely with the fineness of the leaf and, although not so markedly, with the closeness of the plucking. The finest flavoured teas come from gardens in which the rate of growth of the young leaf is slow, as in Darjeeling. But quality also depends on soil conditions, methods of cultivation and, above all, the processing of the tea.

The gathered leaf is taken as quickly as possible to the factory, where it successively passes through the processes of withering, rolling, fermentation, firing, sorting and packing. Withering the leaf takes from 12 to 20 hours and plays an important part in determining the quality of the tea. Rolling twists the leaf and breaks open the cells containing properties that confer strength and flavour on the final product. The fermenting room is a cool, humid place where the rolled leaf is spread thinly and allowed to oxidise to develop the tea aroma. By the time the fermented tea is fired or dried the leaf has lost 75 per cent. of its weight and is termed "made" tea. Then follows sorting into grades, and the sorted tea is packed by machinery into air-tight chests (containing 118 lbs. on the average) and half-chests lined with lead or aluminium foil. Methods of cultivation and processing are being steadily improved by co-ordinated research in India, Ceylon and the Dutch East Indies, the three leading tea-exporting countries.

The growth of the tea plantation industry in India is revealed by the rapid increase in exports, from 250,000 lbs. in 1854 to nearly 2,500,000 lbs. in 1886 and 384,000,000 lbs. in 1929. The United Kingdom is by far the most important consumer of tea, absorbing, in 1937,

about one-half of the world's total exports. The East India Company, anxious to foster its sales of China tea, did much to prevent Britain from becoming a coffee drinking nation like most other countries. But while Britain's predilection for tea was fostered on China teas, the taste has gradually changed in favour of Indian and Ceylon teas. A great part of the credit for this development is due to the London tea blenders for select blending from the early days of the industry, the British public having been led on by gentle steps to appreciate a good "body" in its tea.

During the past ten years, however, the growth in the demand for tea has slowed down perceptibly, and the average price of all teas realised at the London auctions fell from 19.01 pence per lb. in 1927 to 9.45 pence per lb. in 1932. The three chief exporting countries—India, Ceylon and the Dutch East Indies—therefore decided in 1933 to regulate exports in order to assure tea growers a reasonably remunerative price. Regulation was at first introduced for a period of five years from April, 1933, but, owing to its success, the scheme has been prolonged for a further period of five years. Under the influence of the restriction of exports, average prices rose from 9.45 pence per lb. in 1932 to 15.18 pence per lb. in 1937. In the past year average prices fell slightly to 14.39 pence per lb.

In contrast to the sharp curtailment enforced by other regulation schemes, a comparatively small reduction in exports was sufficient to bring about a recovery in the price of tea. In no year were exports reduced below 82½ per cent. of the "standard tonnages" which

were based on maximum exports during any one of the three years 1929-31. But the rise in prices due to the curtailment of exports from India, Ceylon and the Dutch East Indies has led to some decrease in the exports of non-restricting countries. Thus, the restricting countries' share in world exports fell from 85½ per cent. in 1932 to 78½ per cent. in 1937. The tendency of exports from non-restricting countries to increase above a certain level of prices compels the International Tea Committee to pursue a reasonable price policy and safeguards the consumer against having to pay an extortionate price for his tea.

The relatively steady and inelastic demand for tea over a number of years precludes violent or frequent variations in the profitability of production. Booms and slumps notwithstanding, the tea plantation industry has rightly come to be regarded as one of the most stable industries, and tea shares are bought as an investment rather than for speculation. They deserve to enjoy a high rank among commodity shares, for not only does Indian tea enjoy a favoured place in the British market, partly because of the preferential tariff enjoyed by the Empire, but both demand and supply are far less fluctuating than they are for other commodities which are more affected by crop variations, the erratic requirements of the capital goods industries or the vagaries of the American market.

Bank Share Prospects

BANK profits may be broadly said to be the resultant of two factors, both of which are largely outside the banks' direct control. These factors are the amount of the banks' resources and the employment to which they are put. The amount of their resources is fundamentally governed, under present-day conditions, by the monetary policy of the authorities, while their allocation between different methods of employment depends to a considerable extent on national industrial and financial activity. The final magnitude of the banks' profits in any year will, of course, be affected by such matters as changes in the margin between money loaned to and by the banks, together with the policy of the managements in such matters as the observance of the unwritten rules regarding "ratios" between certain assets and liabilities, and the making of adjustments to and from internal reserves before the disclosed "net profits" figures are struck. From the investor's viewpoint, however, it is true to say that banking practice, as such, may influence the waves, but monetary policy and trade activity determine the main set of the tides of bank share earnings.

So far as the past year is concerned, the trend of monetary policy was on the whole favourable to the banks, though less so in the latter than in the earlier part of the year. The trend of the second basic factor—industrial and financial activity—was on the whole adverse, though less, if anything, in the latter than in the earlier months. The effect from the banks' viewpoint is epitomised in the accompanying table for the "Big Five" institutions.

In this table, the main banking assets have been arranged in order of remunerativeness. As a rough indication of the return in each category, it may be said that the banks earn from 4 to 5 per cent. on their advances, around 3 per cent.

on their investments, from ½ to 1 per cent. on discounts and call money, and nothing on their cash. During the first eleven months of 1938, the "Big Five" had on the average 39 per cent. of their total assets in advances, 24 per cent. in investments, 12½ per cent. in discounts, 5½ per cent. in money at call and short notice, and around 10 per cent. in cash. As between different banks, these proportions varied

CHANGES IN BANK ASSETS (1938 COMPARED WITH 1937)

[Note.—The figures, in each case, show percentage rise or fall in average weekly balances for first eleven months of each year]

	Barclays	Lloyds	Midland	National Provincial	West-minster	Total, "Big Five"
Total Assets	+ 1.4	- 2.0	+ 1.9	+ 1.8	- 2.4	+ 0.2
Advances	+ 3.6	+ 3.0	+ 1.5	+ 8.5	- 1.6	+ 2.8
Investments	- 8.8	- 5.3	+ 4.0	- 4.2	+ 0.1	+ 2.7
Discounts	+ 8.6	- 20.0	+ 5.8	+ 0.8	- 5.0	- 1.7
Call Money	+ 1.8	- 15.2	- 19.4	- 8.0	- 10.3	- 9.2
Cash	+ 5.2	+ 2.2	+ 6.8	+ 2.5	- 1.8	+ 3.2

appreciably, and the extent of such variations is a legitimate study for investors who are considering the prospects of individual bank shares. Taking the figures for the clearing banks as a whole, however, it will be seen that the total assets showed very little change, on the average, in 1938 as compared with 1937. Significant variations occurred, however, in their distribution. Average advances rose by nearly 3 per cent., but whereas the trend of total advances was rising consistently during 1937, it tended to fall perceptibly in the latter months of 1938. Investments were reduced on the average by 2½ per cent., but in the latter part of 1938 their trend, which had been falling for several

AUDITORS' CERTIFICATE AND REPORT.

We report that we have examined the above Balance Sheet with the Books of the Bank, and have obtained all the information and explanations we have required, and we are of opinion that such Balance Sheet is properly drawn up so as to exhibit a true and correct view of the state of the Bank's affairs according to the best of our information and the explanations given to us, and as shown by the Books.

KEMP, CHATTERIS, NICHOLS, SENDELL & CO.

HOLT & CO., Kirkland House, Whitehall, London, S.W.1.

months, began to rise again. Discounts showed a slight reduction on balance, while call money, as a result of the stagnation of Stock Exchange and City operations generally, declined by 9 per cent. On the whole, profits were unlikely to differ widely last year from those of 1937, since the various movements among the assets tended largely to cancel each other out. For a year in which economic activity was on the downtrend, such a result was not unencouraging. Some of the year's more favourable features, however (such as the rise in average advances), were in part an overflow from the period of economic prosperity which culminated in 1937.

Bank shares have their own distinct *clientèle* among investors, who look upon them as combining many of the virtues of a gilt-edged security and an equity share. How far does experience bear out that view? The table of banking dividends and profits, at the foot of this page, throws some light on the answer.

Only one of the "Big Five" banks—the Midland—has maintained its profits over the last nine years. Only one—Barclays—is paying the same dividend for 1938 as for 1929, the year of peak earnings in the period before the profound financial changes which followed Britain's departure from the gold standard in 1931. The actual figures of disclosed profits, as shown in the table, are affected to some extent, not only by internal reserve adjustments, but by deductions for taxation and (in 1937 and 1938) for National Defence Contribution. If estimated tax deductions are added back, it may be computed that the total profits of the "Big Five" were about £14.4 millions in 1929, £13.5 millions in 1937 and £13.1 millions in 1938. The decline last year incidentally suggests that internal reserve allocations, made before striking disclosed profits, may well have been rather larger than a year earlier. The net result is that bank profits remain something like 10 per cent. below the level of 1929, although *The Economist's* Index of Business Activity last year was 6 per cent. above the 1929 level. Thus, although bank profits and dividends have shown a fairly high degree of stability over this period, their dynamic qualities have not been strongly in evidence. The banks, from an earnings viewpoint, have been largely on the defensive.

The banks' "working capital" has increased appreciably during the period covered by these figures, partly through monetary expansion and partly by accretions from annual earnings "ploughed back" into reserves. As the next table shows, however, present-day profits bear a perceptibly lower relationship to paid-up capital and visible reserves than did those of 1929. The same applies to the relationship between profits and total assets. But the decline in the ratio between profits and average advances is, on the whole, nothing like so great.

NET PROFITS EXPRESSED AS PERCENTAGE OF JANUARY-NOVEMBER AVERAGES IN EACH YEAR

Item and Years	Barclays	Lloyds	Midland	National Provincial	Westminster
Total paid-up capital, and reserve fund—					
1929	8.94	8.76	9.10	11.55	11.60
1937	8.18	7.39	9.75	10.71	9.38
1938	7.24	6.74	8.89	9.85	8.35
Total assets—					
1929	0.61	0.52	0.52	0.72	0.66
1937	0.47	0.40	0.47	0.56	0.43
1938	0.42	0.38	0.45	0.52	0.40
Advances—					
1929	1.36	1.12	1.11	1.44	1.47
1937	1.11	1.13	1.20	1.42	1.31
1938	0.97	1.01	1.16	1.25	1.18

Owing to the varying incidence of taxation, etc., alluded to above, comparisons of single years in individual instances should not be pressed too closely. Two significant features, however, emerge from even a cursory inspection of the table. First, the experience of the different banks tends rather more towards uniformity to-day than in 1929. Secondly, the fall in profits cannot be attributed to any spectacular reduction in the rate of return on each £100 advanced. The considerable drop in profits per £100 of total assets must thus be traced to changes which have increased the proportion of lower yielding assets.

This, indeed, is an aspect of the general position which bears directly on the "equity" prospects of bank shares to-day. Since 1929 a considerable increase has occurred in the banks' holdings of investments, while their advances have failed to regain the 1929 level. The fact that, during recent years of industrial revival, the recovery in bank advances has not been wholly proportionate to the rise in trade activity suggests that competition from other sources—insurance companies and other non-banking institutions, together with the tendency of industry to finance itself from its own retained earnings—has presented the banks with a problem somewhat akin to that which has given rise to the railways' "square deal" proposals, though it is, of course, far less acute.

If, however, industrial demand for banking accommodation were to fall off to any significant extent this year (for cyclical reasons outside the banks' control), and if outside competition were not merely a temporary phenomenon, the question of defending the banks' most remunerative "traffic," by changes in "rates" or otherwise, might well arise. And although one possible effect of the financing of the Government's defence borrowing programme in 1939 may be a certain broadening of the credit basis—with a rising tendency, consequently, both in interest rates and total bank assets—the consummation of Government policy

may well involve an increase in the total of the lower-yielding types of banking assets—i.e. Treasury bills and investments. For this reason, although the relative stability of bank earnings is not threatened, an upward trend in the near future would appear unlikely.

Certainly, holders of bank shares have fared well in recent years. As our final table shows, the prices of typical variable dividend bank shares are still higher (with one exception) now than nine years ago, and the fall during the last twelve months has been extremely moderate. For this showing, the gilt-edged rather than the equity characteristics of bank shares, are largely responsible. The lower average level of interest rates to-day, as compared with 1929, is fully reflected in the lower yield of bank shares, which has more than compensated for dividend reductions in the interim. The slight, but perceptible, rise in interest rates during the past year is similarly paralleled

by a rising tendency in bank share yields. The general conclusion would seem to be that the course of bank share prices in the near future is more likely to follow that of gilt-edged stocks than of equities in general, but that no considerable fall in prices seems to be indicated.

Finance and Banking

The Defence of Sterling.—Recourse has been made to the Tripartite Agreement, to reinforce the various measures taken over the past ten days in the defence of sterling. The central banks of the various countries adhering to the Tripartite Agreement—and especially the United States, France, Holland, Belgium and Switzerland—have been invited to co-operate in the steps taken to discourage bear speculation against sterling, whether by banning forward operations in gold or by subjecting the character of forward exchange operations to more critical scrutiny. These institutions in their turn have forwarded this request to their domestic banks together with their own strong recommendation for compliance. The whole defensive edifice which is thus being built up is essentially voluntary in character, and it will have to be tested over a fairly extended period before any judgment on its efficacy can be passed. During the past week the experience of the market has suggested the existence of loopholes of considerable size—as indeed there must be as long as the exchange markets in the countries concerned remain free. The Dutch banks, for example, have been asked to refrain from forward gold operations with a sterling counterpart and are meticulously complying with this request. But they appear to be quite prepared to arrange forward gold purchases against French francs or, even more conveniently, against Swedish crowns, a currency which is almost certain to fluctuate with sterling in terms of gold. The existence of such facilities has already resulted in the transfer to Amsterdam of an appreciable volume of forward gold business. Scrutiny of forward exchange contracts is another matter in which absolute identity of judgment can hardly be expected, and deals which may appear sufficiently speculative to come under the ban of one bank have already been welcomed with open arms by less exacting institutions. Such elasticity of judgment has been apparent this week not only among Continental banks but also in London. The volume of business in the forward exchange market has consequently suffered very little from the official discouragement of speculative operations. The premium on forward dollars has at times shown signs of widening, and the Exchange Equalisation Account has had to intervene on a moderate scale in this market in order to prevent the premium on dollars from going appreciably beyond 2 cents for three months.

* * *

U.S. Silver Policy.—In their annual review of the silver market, Messrs Handy and Harman, the leading American firm of bullion dealers and brokers, write down the U.S. Government's silver programme as a complete and expensive failure. They even predict the radical amendment of that programme by Congress and the abrogation of the Silver Purchase Act of 1934. The facts of the situation as set out in the review certainly provide strong support for the case against the silver programme. During 1938 the silver market was almost wholly dependent on official American absorption of the metal, and United

States purchases accounted for 403,200,000 ounces, compared with 312,200,000 ounces in 1937. The 1938 figure was made up of 60,300,000 ounces of domestic silver and of 342,900,000 ounces bought in the open market. World production of new silver last year amounted to 264,800,000 ounces as compared with 274,700,000 ounces for 1937, but world supplies were augmented to 598,800,000 ounces, mainly by sales of demonetised silver by China (234,300,000 ounces), Mexico (35,000,000 ounces), Spain (40,000,000 ounces) and Siam (22,000,000 ounces). Of the world supply, the United States thus acquired over 67 per cent., while its purchases represented more than one and a half times the world output of new silver. Despite these enormous purchases, the United States Treasury at the end of the year was still as far as ever from the goal of a 1:3 ratio between silver and gold. On December 31st it would still have needed an additional 1,165,000,000 ounces of silver to bring the silver reserve up to the re-

quired level. During the five years of its existence, the United States' silver programme has cost over \$1,000,000,000, of which 82 per cent. was paid for foreign silver and 18 per cent. for domestic metal. On pure logic the case for the abrogation of the Silver Purchase Act is convincing enough. Some regard must, however, be had for the extent to which the United States has become committed to a maintenance of the price for silver—however artificial it may be. The United States Treasury would be by far the principal loser—on capital and not on income account—from a suspension of their official purchases of imported silver. The position, however, is sufficiently precarious and uncertain to justify Messrs Handy and Harman's prediction that the silver market is in for a period of troubled conditions.

* * *

Crisis Capital Movements.—Cabled summaries of the United States Treasury's report on the flow of foreign capital into and out of the United States for the third quarter of 1938 reveal movements of unprecedented magnitude. During this period the net inflow of capital into the United States amounted to \$407,166,000—despite net sales of securities by foreign holders amounting to \$29,886,000—an influx prompted by the international crisis. In the single week ended September 14 the influx amounted to as much as \$151,540,000. The greater part of the inflow of capital was in the form of bank balances, the net total in this form amounting to \$448,893,000. As the "crisis rush" into dollars was part of a world-wide rush into liquidity, it is not surprising that it should have taken this predominant form. Great Britain provided the largest source of this influx of funds into dollars. The net movement from sterling into dollar bank balances amounted to \$110,669,000 for the quarter, and taking all forms of capital the net movement from Great Britain was \$93,479,000. It may be assumed from the experience of the market at the time that the bulk of this movement from sterling into dollars represented the transfer of Continental rather than British capital. The figures for the final quarter of the year are likely to show a further large flow of foreign capital into the United States, for the flight into dollars continued for some weeks after the climax of the September crisis.

* * *

American Banking Trends.—During 1938 the Federal Reserve Banks acquired \$2,718 millions of gold certificates, this being due both to the year's influx of gold and also to the new policy of desterilisation adopted by President Roosevelt in the early part of 1938. The main consequence of this increase was a growth during the year of \$2,080 millions in member bank reserves and one of \$2,030 millions in excess reserves. These movements are reflected in the year-end statements of some of the leading New York City banks, which are summarised in the following table:—

NEW YORK CITY BANK STATEMENTS
(\$ millions)

	Deposits		Cash		Government Securities		Loans	
December 31	1937	1938	1937	1938	1937	1938	1937	1938
National City	1,712	1,835	517	532	483	669	609	522
Guaranty Trust	1,424	1,597	478	788	541	486	623	529
Chase	2,070	2,234	708	861	603	640	729	639
Bank of Manhattan	470	508	208	166	81	111	168	146

All the banks show increases in deposits and three of them in cash reserves. As regards the principal earning assets there is a general decrease in loans, but their investment policy has apparently varied. Still, the broad fact remains that the supply of credit has been increased, while the demand has contracted since a year ago. The result is that the American banks have become much more liquid. Indeed, their direct problem to-day is to find employment for the swollen resources placed at their disposal as the consequence of the reversion of Washington to a policy of deflation.

Jugoslavia's Exchange Policy.—The decision of the Yugoslav Government—reported by our correspondent in *The Economist* of December 24—to increase the sterling rate for the benefit of Yugoslav exporters is a welcome event from more than one point of view. It will tend to increase Yugoslav exports to Great Britain. What is more important, it indicates that despite all German efforts to acquire economic control, Yugoslavia has retained her independence in matters of foreign exchange policy. The decision to increase the sterling rate was taken in defiance of strong German opposition. The German policy in Yugoslavia, as in other countries of South-Eastern Europe, aims at maintaining the national currency undervalued in terms of Reichsmarks and overvalued in terms of sterling and other free exchanges. At first sight this policy may appear to be against the interests of German export trade. In reality, however, it helps German exporters by diverting Yugoslav exports to Germany and thus compelling Yugoslavia to buy more German goods. It was with this object in mind that Germany spared no diplomatic effort in 1936 to dissuade the Governments of South-Eastern Europe from following the French example by devaluing their currencies. It was with the same object that, during the recent negotiations with Yugoslavia, Roumania and other countries, Germany insisted upon fixing a higher Reichsmark rate. The result of this policy was that German importers could afford to pay abnormally high prices for the products of South-Eastern European countries in terms of the currencies of these countries, and thus drive a wedge between their prices and the world price level. The obvious remedy against this state of affairs would be a devaluation of national currencies in relation to the free exchanges. This end was partly achieved by Roumania in the recently concluded Anglo-Roumanian payments agreement, and by Yugoslavia through the present increase of the sterling rate. Even though this increase is only temporary, and does not amount to devaluation, in practice it is unlikely to be reversed.

* Record.

arrested last year. In view of the political and trade conditions which were experienced in 1938, however, some

moderate recession was only to be anticipated, and there is little doubt that improvement in these conditions would encourage the resumption of the upward movement of 1931-37. Despite the aggregate fall in new business, no less than 11 of the 44 offices whose figures are given above recorded new high levels. The effect of the trade recession doubtless explains the decreases shown by each of the industrial-cum-ordinary offices, namely, the Prudential, Pearl, Refuge, Britannic and Co-operative. Group assurances have been excluded from the table where the published information permits. The Eagle Star, however, which is known to transact a large volume of group business, gives only its total figure of new business. In group assurances, the Standard showed a large increase from £789,000 to a new record of £1,817,000, but the Legal and General's new business in decreasing

term and group assurances fell from £11,279,000 to £9,268,000. The published statement of the Prudential mentions a "considerable" increase in group business. New group pension results are of special interest; last year's uncertainties must have deterred the enlistment of interest in schemes covering the retirement of employees up to remote dates in the future. Nevertheless, the efforts of the Standard in this branch also have been highly successful, for this office issued contracts guaranteeing future pension payments of £646,000 per annum against £280,000 in 1937. The Legal and General, dealing with a much larger volume of business than the Standard, apparently suffered a moderate reduction in the amount of new pension contracts. Consideration moneys for immediate annuities showed some further decline from the exceptionally high levels of recent years.

MONEY MARKET NOTES

Foreign Exchanges

THERE has been a very narrow market this week, as the reinforcement of the Exchange Equalisation Account's gold reserves is at present deterring speculators from taking a view. Immediately after the news of the gold transfer, sterling rose from \$4.64½ to \$4.68½. A few nervous operators were realising dollars, but the main influence was official intervention. This week the New York rate gradually eased to \$4.65½ on Thursday morning, with the Control losing dollars every day, but it stiffened to \$4.67½ on Thursday afternoon. Three months' dollars were then at 2 cents premium, compared with 2½ cents premium a week before. Rather significantly, the spot Paris rate has followed the New York rate, thus showing that the franc may be acquiring a greater affinity for the dollar. At the week-end sterling rose to Frs. 177½, but has since slipped back to Frs. 177½. Forward francs have weakened slightly, the one month's rate going from a slight premium to Frs. ½ discount and the three months' rate from par to Frs. ½ discount. There was very little intervention by the French Control in the spot market and none at all in the forward market. Belgas followed the dollar, but were bid rather than offered all the week. It is believed that there was a big buying order in the market. One month's belgas are quoted at par and three months' at 4 cents discount. Guilders and Swiss francs also followed the dollar, which now seems to be setting the tone for the market.

The Bank Return

THIS week's return reflects the transfer of gold from the Bank of England to the Exchange Equalisation Account, discussed in a leading article on page 76. The issue department's gold reserve is reduced by £200 millions, while the fiduciary note issue is raised by £170 millions. The net result is a reduction of £30 millions in the total note issue, this being the normal post-Christmas contraction. The balance of the Christmas currency returned to the Bank this week, reducing the note circulation by £12.5 millions. The notes in Reserve, therefore, are only £17.5 millions less than a week ago.

The reduction in the note issue meant that £30 millions of the securities taken over from the Exchange Account were lodged in the banking department. Government securities,

however, are only £24.8 millions higher than last week, as there has since been

some repayment of Ways and Means advances. Market repayments have reduced discounts and advances by £26.8 millions, but they are still £7.2 millions higher than just before Christmas, so that part of the recent borrowing did not emanate from the discount market. Bankers' deposits are £17.9 millions lower than last week. The banks have gained the benefit of the return of Christmas currency, but their cash has been depleted by the discount market's repayments, which were made out of money borrowed from the banks. Looking back to November 23rd, before the Christmas withdrawal of currency, the note circulation is back to its level of that date, but bankers' deposits are higher. This is partly due to an intervening reduction in public deposits and partly to increases in Government securities and discounts and advances. Last week's return shows that bankers' deposits were not affected by the gold transfer.

The Money Market

MONEY has been comfortable, although up to last Monday the market was still repaying the Bank. This week's Bank return suggests that part of the New

Treasury bonds and other gilt-edged stocks within six months of maturity. 1 per cent. for loans against other collateral.

Year increase in discounts and advances was due to outside borrowing, and so the market's total loans may have been less than was previously estimated. The banks are also again lending freely, while this week's maturities

of tender Treasury bills were £14 millions in excess of payments. This all helps to explain the comparative ease; but, on the other hand, the banks are now beginning to pay over revenue in large amounts.

The banks have also resumed buying bills. They are ready buyers of February and March Treasuries at ½ per cent., and are taking a few early Aprils at the same rate. Three months' bank bills are quoted at ½ per cent. There is no sign yet that the Bank is buying dated securities in replacement of some of the Treasury bills taken over last week from the Exchange Equalisation Account.

The Bullion Market

BUSINESS in gold has contracted as the result of the new regulations. There has been a certain amount of reselling, mainly of maturing forward contracts.

* Above or below American shipping parity. This week's calculations are based on a "temporary parity," in which the war risk rate is taken as 1s. 3d. per cent.

† At fixing. The New York price of silver remained at 43 cents per ounce '999 fine during the week.

This has been balanced by fresh Continental buying, by interests strong enough to finance their own purchases. There was only a limited amount of arbitrage. The Control had to supply some gold on one or two days, but it bought a little on Saturday, and did not intervene either way on Monday or Thursday.

In the silver market the demand for cash has become easier, as there was less bear covering in evidence. There has also been some Indian forward buying, mainly to replace silver previously sold at a profit. The margin between cash and forward therefore narrowed on January 6th from ½d. to ¼d. This week has witnessed a little Continental selling and some American hedge-selling, offset by American trade buying. The latest cash price lies between the American buying and selling parities, but it is not regarded as stable.

Investment

New Southern Railway Capital.—The issue of £7,500,000 of Southern Railway 4 per cent. debenture stock, redeemable 1970-80, at 98½, was fully subscribed on Wednesday. Its terms were so attractive that the market lowered the two existing 4 per cent. debentures by three points on Monday, but the new stock opened at ½ premium and rose further to 1½ premium on Thursday. The funds will be devoted to reimbursing the company for certain capital expenditure already incurred on electrification and other works, and also to meet the cost of further additions and improvements. Thus the issue represents a complete break from the financial facilities made available since 1936 by the Railway Finance Corporation. The Southern Railway's full quota of borrowing from the Corporation is £5,929,811, of which £2,500,000 had been borrowed up to the end of 1937; by the beginning of next year, therefore, the company will have only £929,811 still available from that source, assuming that the past rate of borrowing is maintained. The 1937 balance sheet showed that the company had overspent on capital account the sum of £10,718,000, a position which would not in itself involve urgent rectification, though it does indicate that use has been made of the non-capital funds of the company, including the Railway Finance Corporation advances, to meet the large-scale capital expenditure of recent years. The cost of the new loan, to latest redemption, is £4 1s. 6d. per cent., compared with an effective rate of £2 14s. 8d. per cent. on the Railway Finance Corporation 2½ per cent. loan. The latter, however, is of a short-term character, for it is redeemable 1951-52, while borrowing under guarantee could not be arranged to-day on such favourable terms. The fact that the Southern Railway obtains as much as one-third of its passenger revenues from the London Transport Area suggests that it will be the principal main-line beneficiary if the forthcoming application for a basic 5 per cent. increase in charges in the area is granted by the Railway Rates Tribunal. Preferred ordinary stockholders will note that the chairman states in the offer for sale that the annual sum of £2,243,167 required to meet annuities and debenture interest in future has been covered "more than 2½ times" by net revenue for 1938. On this basis, last year's earnings would amount to at least 3½ per cent. for the preferred ordinary stock.

L. and N.E. Guaranteed Payment.—After *The Economist* had gone to press last week the London and North Eastern Railway announced that full dividend payments would be made on the first and second guaranteed stocks. Thus, a major doubt which had exercised the minds of second guaranteed stockholders since last July (when the interim dividend statement stated that

the half-year's payments involved a transfer from general reserve "for the time being") has been dispelled. Last Friday's statement, however, made no reference to the earnings position. Estimates submitted on page 31 of last week's issue suggested that the 4 per cent. dividend might be short-earned to the extent of one-third per cent. Any calculation of earnings is particularly difficult for this company, however, and it may happen that the estimate of working economies during the past half-year was too conservative. Alternatively (though this is perhaps less likely in view of the absence of any explicit reference, such as appeared in the interim statement) the directors may have made up some slight short-fall in earnings on the stock from general reserve. The second guaranteed stock has improved this week to from 60 to 61½ on the full payment.

Further Bank Results.—The bank dividend season has closed on a rather less cheerful note than it opened. For while the market was agreeably surprised by the increase in Martins Bank dividend announced last week, it was definitely disappointed by the reduction from 20 per cent. to 18 per cent. in the distribution of the Westminster Bank, the last of the "Big Five" to make its announcement. Shareholders were explicitly warned not to expect a repetition of last year's 2 per cent. bonus, and the yields ruling on Westminster Bank shares clearly showed that no such repetition was expected. At the same time, some hopes had been entertained of partial compensation by an increase in the dividend (as in the case of Martins) and the £4 shares, £1 paid, fell sharply on the announcement to 87s., but subsequently recovered to 90s. 6d. to give a slightly lower return (£4 1s. 3d. per cent.) than Lloyds Bank partly-paid shares. The profit figures show that the directors' decision was not due merely to conservatism, unless, of course, this had been given full rein before the figures were struck. The dividend is, of course, very comfortably covered, and after allocations of £300,000 to pensions fund as before and £100,000 to premises account, against £200,000, the carry-forward is £30,567 higher at £526,585. Net profits, however, show a reduction of £193,427 to £1,557,162, or 11 per cent. compared with the 1937 level, against an average fall of less than 6 per cent. for the other members of the "Big Five." Lloyds Bank "A" share dividend is maintained at 12 per cent. and the "B" shares receive the maximum of 5 per cent. The National Provincial payment is also unchanged at 15 per cent., and the profits at £1,771,785 show a decline of £103,175 on the year, though they are still a trifle higher than in 1936. It must be remembered, however, that this is the only member of the "Big Five" which shows its dividend gross. The repeated allocations of £100,000 to premises account and £250,000 to pensions fund leave the carry-forward substantially unchanged at £573,588. Lloyds Bank profits are reduced by £127,201 to £1,705,300. Premises account again receives £100,000, but the allocation for contingencies is reduced from £400,000 to £300,000, leaving a slightly larger carry-forward of £527,456. All five of the large banks thus show some decline in published profits from the high level of 1937. Grossing up the figures before tax and N.D.C. suggests, however, that the gross earnings of one bank, the Midland, were actually higher last year and that all except the Westminster earned more than in 1936, before deduction of tax.

London Fares Increase.—For many weeks past it has been an open secret that the Standing Joint Committee of London Transport and the main line railways were considering steps to secure increases in certain fares in the London Transport Area. The general character of the proposals, published this week, closely follows the suggestions on page 223 of *The Economist* of October 29, 1938. The main line companies and the Board are to apply

to the Railway Rates Tribunal for permission to increase passenger fares by 5 per cent. or thereabouts on the suburban railways operated by the main line companies, or on which joint running is in force. For their part, London Transport propose to increase fares on their railways, which are not covered by the application to the Railway Rates Tribunal, to bring them nearer to the standard rate of 1d. per mile. Season ticket rates will be increased commensurately, with a limit of about 5 per cent., but workmen's fares will only be raised where single fares are increased. No general revision of fare stages is contemplated on the road services, and the standard of 1d. a mile will be maintained. But certain exceptionally low fares, such as cheap "all the way" and mid-day tickets, will be adjusted. Little change in single fares will be made on the coach services, but return tickets will cost slightly more. London Transport and the main line companies express regret at the proposed increases. But their contention that their credit must rank high enough to secure the necessary finance for extensions is inescapable—and a pointer of importance for London Transport "C" stockholders.

New Woolworth Record.—Dividend announcements which raise share prices are rare to-day. But the jump in F. W. Woolworth ordinary from 58s. 3d. to 60s.

last Tuesday was well merited on the results. Profits, after provision for properties (£176,654) and fixtures (£137,825), but before taxation, have reached a new high level of £6,961,141, against £6,490,014 in 1937. The dividend accounted more directly for the market's joy, for few investors were expecting a 5 per cent. increase in the cash bonus, raising the total distribution to 65 per cent. for the year. Our analysis below shows that the margin of undistributed profits is broadly maintained despite the fact that increased taxation has absorbed almost three-quarters of the disclosed increase in profits:—

	Years ended December 31st	1936	1937	1938
Profits	£	5,854,335	6,490,014	6,961,141

Funds exceed £25,000,000

It is probable that some decline occurred last year in the consuming power of the population. Hence the fact that the Woolworth business (which is dependent at first hand on general consuming power) has reached a new level of prosperity is a meritorious achievement. To some extent, perhaps, recession may have assisted the undertaking, since it may have encouraged economy buying at the company's stores. Again, the stores opened in recent years may have become more fully remunerative during the past year. But investors who are disposed towards caution will note that last year's rate of increase in gross profits was reduced to 7.3 per cent., compared with 10.8 per cent. for the preceding year. This is, in fact, the first check since 1932. Whether it is a reliable portent for the future remains to be proved. But assuming that profits and dividend were maintained a year hence, returns of £5 13s. per cent. on cash distributions, and over 7½ per cent. on earnings which are now obtainable on the 5s. shares, at their *cum* dividend price of 60s., may be regarded as satisfactory.

* * *

John Summers Finance.—The reports current last November that negotiations were in train between John Summers and Sons and United Steel Companies have been confirmed this week by the announcement of an important development and finance scheme undertaken by the two companies with the co-operation of the Bankers Industrial Development Company. John Summers is erecting a new American type strip mill at Shotton which is due to be completed at the end of this year. The finance for this project is to be covered, firstly, by an issue of £2,000,000 first mortgage debenture stock by John Summers on terms to be arranged; secondly by the subscription at par for 1,288,185 "A" ordinary £1 shares by United Steel Companies and, thirdly, by the subscription of 1,000,000 "A" ordinary shares at par by Bankers Industrial Development. These funds will meet the balance of the cost of the new mill, repay bankers' advances and the existing £100,000 4½ per cent. debenture stock, and provide for improvements and further working capital. At the same time, the existing capital of John Summers is to be reorganised by the conversion of the 1,711,815 7½ per cent. £1 preference shares into "A" ordinary shares and of the existing 2,000,000 £1 ordinary shares into "B" ordinary shares. The two classes will rank for dividend in the proportion of 3 per cent. on the "A" ordinary to 1 per cent. on the "B" ordinary shares, with limits of 7½ per cent. and 2½ per cent. respectively. The balance of profits after these limits have been reached will be divided into two equal parts between the 4,000,000 "A" ordinary shares and the 2,000,000 "B" ordinary shares. It is anticipated that in the absence of abnormal conditions the demand for black steel sheets will at least be maintained, and the directors expect that the new mill should materially increase the rate of profit on the company's present output. Thus, after the service of the projected debenture issue has been met, "a substantial margin" should remain for reserves and dividends.

* * *

Effect of the Scheme.—Accompanying these financial changes is an important change in ultimate control, reminiscent of the changes in the direction of Richard Thomas. One of the new "A" ordinary shares will be allotted majority voting powers, which will be exercised by a Committee composed of: Mr Montagu Norman, Mr B. G. Catterns (governor and deputy-governor of the Bank of England respectively), Mr H. H. Summers (chairman of the company), and Sir Walter Benton Jones (chairman of United Steel). During a period of seven years, the 1,000,000 "A" shares subscribed by the Bankers Industrial Development may be purchased by United Steel Companies without capital profit, but with payment of interest, and so long as United Steel retain a substantial holding, the voting share rights will not be terminated before a ten-year period has elapsed. The preference shares fell sharply on the announcement from 19s. 6d. to 17s. On their dividend record to 1937, their treatment seems at first sight rather hard, but the 1938 results might tell a different

story. Last year, for the first time in a decade, the company failed to pay an ordinary dividend, although the preference dividend was met in full. The net profits available for the gross preference dividend (which calls for £128,386) expanded steadily from £177,477 in 1932 to £279,739 in 1937. In future, the service on the new debenture (taken, say, at a 5 per cent. rate), might absorb £100,000 from the balance available for dividends. To meet this sum, and to maintain a 7½ per cent. rate on the "A" ordinary shares (together with 2½ per cent. on the "B" capital), would require, in all, gross profits before tax of £450,000, compared with an average of £219,605 for 1932 to 1937. The prospects for preference shareholders under the new scheme thus depend intimately upon the realisation of impressive working economies from the new mill, and also upon the future level of demand for the wide type of sheets which it is to produce. The scheme, at any rate, avoids the pitfalls of an excessive burden of prior charges. And if preference shareholders find the proposed exchange into an equity share repugnant (as some of them may) the hard fact remains that the company has been compelled by external competition to reorganise its plant on a modern and necessarily expensive scale.

* * *

Odeon-Gaumont Merger?—The announcement that Odeon Theatres have under consideration an offer to the ordinary shareholders of Gaumont-British Picture Corporation, and that negotiations are proceeding to acquire the interests of the Ostrer group, including the voting shares of Metropolis and Bradford Trust (which holds 2,915,000 of the 5,000,000 10s. ordinary shares of Gaumont-British), did not fall on unsuspecting ears in the City. For some weeks past, reports have been current that some form of merger between the two groups is under discussion. It now rests with the accountants and valuers to produce their figures, and a formal offer is not expected until the end of March or early in April. Theirs will not be a light task, for on the one hand the Gaumont-British group is highly complicated, while the Odeon group is fairly integrated (and will be even more compact when a further 82 cinemas are acquired from Odeon Cinema Holdings). Hence the terms of the merger (which may well take the form of an offer of shares by a new holding company to the shareholders of the constituent concerns) must remain an open question for the moment. Complexity, however, does not end there. Since its costly adventures into film production, Gaumont-British has been unable to pay ordinary dividends for three successive years, and preference payments were covered in 1937 and 1938 with lean margins. The Odeon Theatres group, on the other hand, has grown rapidly, but since the company was formed in 1937, only one accounting period has elapsed. Agreement on the basis of the respective earnings records of the two companies, therefore, will present obvious difficulties. It may also be recalled that the decision of the Board of Trade regarding the application for an inspection of the company's affairs is still awaited. And the proposed merger has obvious relevance for the Associated British Picture shareholders. In 1936, this company acquired 250,000 non-voting shares in Metropolis and Bradford Trust, and an option to acquire the majority holding of 5,100 voting shares owned by Mr. Isidore Ostrer, at a later date. The second part of this deal has never been carried through. Is it, therefore, to be presumed that the consent of other holders of voting shares which may not have been accorded to the Associated British Picture deal would be forthcoming in the event of a Gaumont-Odeon merger?

* * *

Cordoba Central Reorganisation.—With commendable promptitude after the final passing into law of the purchase of the Cordoba Central Railway by the Argentine Government, the directors have issued the broad details of the necessary reorganisation plan. The present capital structure is relatively simple. Some £8,000,000 of 4½ per cent. first debenture stock (on which there are interest

arrears outstanding) is in issue, together with £6,376,791 of 5 per cent. income debenture stock and £6,178,355 consolidated income stock. The proposed new capital will consist only of £8,000,000 3½ per cent. debenture stock and £1,903,115 of "B" debenture stock, entitled to residual income and assets. First debenture stockholders will receive the same amount of 3½ per cent. stock, but in consideration for waiving the 7½ per cent. premium on redemption they will receive 2½ per cent. in cash. The income debenture and the consolidated income stockholders will receive for each £100 nominal £25 and £5 respectively of the new "B" stock. The company's future revenue will be derived from the purchase consideration for the railway. This totals £9,500,000, and comprises £8,800,000 Argentine State Railways 4 per cent. sterling bonds (which also carry a 1 per cent. sinking fund), some £700,000 in cash, and an unspecified sum in respect of stores. Gross income will thus amount to at least £352,000, apart from revenue arising from the investment of any cash balance after paying £200,000 to the first debenture stockholders. The latter will receive £280,000 gross annually, and the balance of available revenue would suffice to meet 3½ per cent. on the "B" debenture stock. Hence the first debenture (which in future will be tantamount to an Argentine Government stock) will yield £6 4s. per cent. at the present price of 59, after adjustment for the 2½ per cent. cash payment, compared with a flat yield of approximately 5 per cent. on Argentine 3½ per cent. Conversion. And since the company will have power to purchase stock in the market (as the sinking fund payments on the State Railway bonds are met) the residual assets and earnings of the "B" stock, which is valued at 45 on the basis of its constituent stocks, should assume greater importance in the future.

* * *

The Week's Company Profits.—The number of company reports is again small this week, and our analysis of profit and loss accounts on page 106 includes no more

than 18 companies, excluding banks and companies for which comparable figures are not available. The total net profits of these companies amount to £1,994,000, of which nearly half is due to the British Tobacco Company (Australia). This total is 11 per cent. less than the corresponding profits of £2,241,000 earned by the same companies a year earlier. Aggregate net profits of 41 companies reporting in 1939 amount to £5,098,000, against £6,118,000, and show a decline of 16½ per cent. The results are discussed on page 89 under the heading "Shorter Comments."

* * *

Company Meetings of the Week.—Reports of company meetings will be found in this week's issue from page 95. At the *British-American Tobacco* meeting, Sir Hugo Cunliffe-Owen emphasised the difficulties of the Far Eastern trade. Although he was not hopeful that business would be easier during the current year, the chairman expressed confidence in the future. Mr J. Ernest Cox, at the *Jute Industries* meeting, suggested that as the railways asked for a "square deal," Dundee might ask for a "fair deal" against Eastern competition. He acknowledged, however, the assistance of Government orders for sandbags to the jute industry. At the *Cleveland Petroleum* meeting Mr E. A. Radford disclosed that lower trading profits had been due to successive reductions in motor spirit prices, and to the 9d. per gallon duty on commercial alcohol in the 1938 Budget. The importance of recent developments near their southern boundary was stressed by Mr Walter Maclachlan at the *Apex (Trinidad) Oilfields* meeting. Sir Edmund Davis, addressing *Fanti Consolidated Investment* shareholders, described the past year's profits as satisfactory, for few opportunities for profitable share transactions had arisen. At the *Transvaal and Delagoa Bay* meeting, the chairman referred to inadequate railway facilities, which prevented a substantial increase in the collieries' output last year. Remedial measures are, however, in progress.

THE STOCK EXCHANGES

London

SETTLING DAYS
TICKET ACCOUNT
JANUARY 24 JANUARY 26

A MARKET almost barren of features has been distinguished by the strength of gilt-edged, the success of the Southern Railway issue, the response of Woolworth to the increased distribution and of Attock oil to good development news. The industrial markets have been idle, lacking any decided trend. And the rise in gilt-edged, although it originated in the transfer of gold to the Exchange Equalisation Account, has subsequently been due to the "snowball" effect of bear covering.

The initial rises in gilt-edged amounted to half a point for the undated list, and after Tuesday's check a strong technical advance produced similar rises in War Loan and Consols and Funding 4's. New Zealand issues maintained their recent recovery.

In the foreign bond market, further offering of German bonds was experienced, and by mid-week "Dawes" 5 per cent. had lost 1½ points and Young 4½ per cent. 1½ points. Some interest was shown in Brazilian list on vague reports of a resumption of partial interest payments. After a steady opening Japanese issues were again sold on a market bare of support.

*

The new Southern Railway debenture was the main factor among home rail stocks this week. Prices of existing issues were promptly adjusted to the

attractive terms of the new stock. The two Southern 4 per cent. issues each lost three points on Monday, but the new stock closed at ½ premium on Thursday. "Berwick" guaranteed stocks made no further progress on the full payments; on Wednesday, indeed, the junior issue again lost one point. The prospect of a rise in fares encouraged London Transport "C" stock at first, but it was not held. The Argentine rail group was stimulated by the rise in Cordoba debentures on the publication of the outline reorganisation plan (discussed on page 86). Despite reports that the exchange would be maintained at 16 pesos to the £ in 1939, however, other debentures lost ground later in the week.

Industrial shares were again idle and irregular. Turnover remained small, and though price changes were unimportant, the general tendency was slightly towards lower levels. Iron and steel shares opened firm, but turned weaker, partly on the lower output figures for December. Both United Steel and John Summers lost ground on the John Summers' scheme (discussed on page 86), but at the beginning of the week Tube Investments were firmer. Coal shares were slightly better, until a reaction was caused by the September quarter output figures. Engineering shares were uninteresting, and price movements irregular. With some exceptions, electrical equipment shares were uncertain. Motor shares recovered on

the November registration figures, and in mid-week Leyland rose in anticipation of the full report. Aircraft issues derived no better support, and prices tended to ease through lack of interest. Though quotations were steadier on Wednesday, textile shares were mostly marked down, and rayon issues were also lower. Brewery issues strengthened at first on provincial support, but in mid-week sellers reappeared on a small scale. Tobacco issues remained firm, and Gallaher gained slowly. The stores group was undecided, except for Woolworth, which rose in anticipation of the profits statement, and improved further when it appeared, though profit-taking caused a mid-week reaction. For a time Marks and Spencer rose in sympathy. Several provision and catering shares were a shade firmer. Tate and Lyle continued to advance, and Liebig's were supported on the results. Miscellaneous issues again made a dull and irregular showing. Lever and Unilever were depressed on Amsterdam selling, while De la Rue were a firm feature. Gaumont-British and Odeon rose on the merger announcement. The behaviour of bank shares was mixed. Hongkong and Shanghai reacted after improving on the maintenance of the dividend, while Westminster recovered after initial disappointment with the profits.

★

After a quiet start, oil shares improved on Tuesday to the accompaniment of a slightly better turnover, but interest slackened again in mid-week. The feature of the week was the spurt in Attock on news of production from a further well. Rubber shares remained dull, most changes being downwards on small scattered sales, and tea shares were disappointing.

The mining markets were no more lively than other sections, apart from a slightly more cheerful tendency in late dealings on Tuesday. After a firm tone early on Monday, Kaffirs tended to ease, largely under the influence of Cape selling of the developing mines. After Johannesburg had closed, local support reversed the trend, but subdued conditions returned in mid-week. West African issues were relatively strong, on the Ashanti issue. Rhodesian copper shares were dull and mainly lower. Base metals remained neglected.

ACTUARIES' INVESTMENT INDEX

The Actuaries' index of industrial equity prices (which now covers 160 instead of 151 securities, owing to the annual revision of the index) stood on Tuesday, January 10, 1939, at 61.1, against 61.5 on December 30, 1938, and 61.3 a month ago. The corresponding average yields are 6.16 (or

6.11 before giving effect to the annual revision), 6.13 and 6.13 per cent. We give below a selection of the separate indices, including a new group for aircraft manufacturing shares:—

Group (and No. of Securities)	Prices (Dec. 31, 1928 = 100)			Prices 1938 High

† Not fully comparable with previous yields, owing to revision of the index.

New York

WALL STREET now appears to be hedging on the industrial prospects for the spring, and also on the revised estimates of the importance of the defence programme for the aircraft industry. Stock prices this week have oscillated, but their downward trend was definitely established in mid-week, when the Dow industrial average fell nearly two points and the rail index by over a point. With adverse fourth-quarter earning statements still to appear, some professional caution is doubtless salutary, and while the long run outlook for the market is regarded as favourable, few operators are disposed to increase their commitments at the present moment. In the mid-week setback, Chrysler suffered a fall of \$3½, while U.S. Steel fell \$2. Aviation issues, on the other hand, had displayed special weakness earlier in the week and were among the more resistant groups on Wednesday. Rail stocks reflected doubts whether relief legislation would be considered until next year, despite the satisfactory estimate of current car loadings. Speculative rail bonds were also weak, although Treasury issues remained steady. According to *Iron Age*, steel mill activity for the current week is running at 52½ per cent. capacity, against 52 per cent. last week, and buying is described as "hand to mouth."

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values calculated on closing prices (1926 = 100).

Canada

CANADIAN stock markets showed little vigour during December. The brisk trading which followed the Munich settlement gave place in the middle of November to a sagging tendency on the revival of political tension in Europe. The slight upturns which have since occurred have proved short-lived and practically all the advances between the beginning of October and mid-November have now been lost, and the firmer tendency after Christmas was not enough to close the gap. Speculators

continue to favour aircraft stocks and steel issues have also improved. A sharp advance occurred in western oil stocks following the announcement that new wells in Turner Valley oilfield had come into production. But stocks of most other Western companies have reacted on the gloomy outlook for western agriculture revealed at the wheat marketing conference at Winnipeg. The mining market has enjoyed bursts of activity, but no consistent rise in prices. The Bureau's "Investors' Index" reached a peak of 112.3 on November 12th, but it dropped to 105.3 on December 9th, and after rising to 107.4 on December 14th, again slipped back to 105.8 on December 21st. The bond market has remained relatively firm and for the week ending December 22nd the Bureau's index for long-term Dominion issues was 117.5, compared with 118.0 for the corresponding week of November and 115.8 for the corresponding week of December, 1937.

BY STOCK EXCHANGE INTRODUCTION

O.K. Bazaars (1929), Ltd.—Particulars of issue of 300,000 6 per cent. cumulative £1 preference shares. Taken by London and Yorkshire Trust at 19s. 7d. net. Dividends on new shares due May 31st and November 30th. First payment of £2 4s. 8d. per cent., May 31, 1939.

H. Polliack and Company, Ltd.—Issued capital, 1,340,104 5s. ordinary shares and 75,000 £1 8 per cent. cumulative preference shares (both South African currency); also £300,000 6 per cent. registered secured notes (English currency), redeemable at various dates and rates 1941–44, and finally at par 1948. A South African wholesale and retail house specialising in musical instruments, electrical appliances, etc. Profits, after depreciation and South African taxation, years to May 31: 1937, £73,376; 1938, £87,945. Net assets, £578,071.

PRIVATE PLACINGS

Hampton Court Gas Company.—This company has placed privately £15,000 4 per cent. perpetual debentures to provide funds for development.

Great Universal Stores.—There has been placed privately £250,000 new 4½ per cent. first debenture stock.

BY TENDER

Brighton, Hove and Worthing Gas Company.—Sale by tender of £25,000 4 per cent. perpetual debenture stock at a minimum of 102.

Watford and St. Albans Gas Company.—Sale by tender of £100,000 4 per cent. preference stock, redeemable at par July, 1959. Minimum price, cubic feet; 1937, 1763.1 millions cubic feet; 1937, 1763.1 millions cubic feet. Accumulated funds, £80,902.

ISSUES TO SHAREHOLDERS ONLY

Ashanti Goldfields Corporation.—Issue of 250,000 4s. shares at £3, to holders at January 31st, in proportion of one for 20 held.

Tavoy Tin Dredging.—Issue at par of 215,000 2s. shares at rate of one for every ten held on December 28, 1938.

South African Distilleries and Wines, Ltd.—It is proposed to issue 100,000 £1 ordinary shares to holders on January 10th at £2 (to rank *pari passu* with existing ordinary shares) in proportion one new for ten shares held. To rank for final dividend for year to June 30, 1939.

Trust Houses, Ltd.—Issue of 113,982 new £1 ordinary shares at par, in proportion of one new for ten shares held on December 28, 1938. These new shares rank for final dividend for year to March 31, 1939, but not for interim paid January 9th.

FORTHCOMING ISSUE

British Rola, Ltd.—The list of applications will open and close on January 18th, for an offer for sale by Whitehead Industrial Trust of 75,000 6½ per cent. redeemable cumulative preference shares of £1 each at par and 400,000 ordinary shares of 2s. each at par in British Rola, Ltd. The business is that of electrical and general engineers, tool makers and stampers.

SHORTER COMMENTS

Company Results of the Week.—Net profits of BRITISH TIN INVESTMENT CORPORATION, reduced from £337,557 to £149,318, have been affected by low and unstable prices at the beginning of 1938, and low production quotas at the end. The market value of the securities, however, is in excess of book cost. GREAT NORTHERN INVESTMENT TRUST also show a satisfactory appreciation in the portfolio above book values, although net revenue has fallen from £78,540 to £76,934. Stability of profits is shown by BRITISH TOBACCO COMPANY (AUSTRALIA), whose net earnings are practically unchanged at £911,479. Owing to an increasing turnover in proprietary articles, and despite the difficulties in cattle supplies, LIEBIG'S EXTRACT OF MEAT COMPANY reports total profits of £531,910 against £448,360, though a sharp rise in taxation reduces net profits from £271,009 to £259,678. MICHAEL NAIRN AND GREENWICH, the oilcloth and linoleum holding company, have experienced a ½ per cent. drop in net profits, to £241,196. Total profits of JOSEPH NATHAN AND COMPANY are a little higher at £138,811, but net profits are slightly lower at £90,647 owing to the increase in taxation. The year 1937–38 was one of difficulty for RIO DE JANEIRO FLOUR MILLS, although the quantities of wheat handled were larger than in 1936–37. Total profits amount to £139,359 against £151,348. SOUTH AFRICAN DRUGGISTS report profits of £50,380 for a seven-month period. This suggests that the rate of profits has been maintained, for £78,124 was earned for dividend in the year 1937.

BANKING PROFITS & DIVIDENDS

Lloyds Bank, Ltd.—Profit for 1938, £1,705,300 against £1,832,501 for 1937. Dividends 12 per cent. for year on "A" shares and the maximum of 5 per cent. on "B" shares (as before). To contingencies, £300,000 (£400,000). To bank premises, £100,000 (same). Carry forward raised from £524,705 to £527,456.

National Provincial Bank, Ltd.—Net profit 1938, £1,771,785 against £1,874,960 for 1937. Ordinary dividend maintained at 15 per cent. for year. To bank premises, £100,000 (same). To pension fund, £250,000 (same). To reserve, nil (against £500,000). Carry forward £573,588 against £573,715.

Westminster Bank, Ltd.—Net profit, 1938, £1,557,162 against £1,750,589 for 1937. Dividends absorbed £1,126,595 against £1,271,508. Rate, 18 per cent. on £4 shares against 20 per cent. (which included a cash bonus of 2 per cent.). Dividend on £1 shares, 12½ per cent. as before. To contingencies, £100,000 (£200,000). To pension fund, £300,000 as before. Carry-forward raised from £496,018 to £526,585.

Union Discount Company of London, Ltd.—The company is maintaining its dividend for 1938 at 10 per cent. Staff fund, £15,000 (same). Carry forward raised from £203,264 to £250,048. Net profits are about £10,620 higher at £261,159.

North of Scotland Bank.—For 1938 net profits of bank (affiliated to Midland Bank) were £242,077, a decline of £4,071. Total dividend maintained at 16 per cent. Other allocations unchanged, as follows: To bank buildings, £5,000; superannuation, £10,000; dependents' fund, £5,000; reserve, £35,000. Forward £103,843 against £99,326.

Hongkong and Shanghai Banking.—Final dividend £3 per share, making £5 10s. per \$125 share for 1938 (the same as for three preceding years). Written off bank premises account, \$1,000,000. Carry forward raised from \$3,383,004 to \$3,400,000.

Union Bank of Australia.—Final dividend 4 per cent., making 7 per cent. for year as before, but for 1937 a special centenary bonus of 2 per cent. was also paid. Carry-forward raised from £146,864 to £157,264.

(Continued on page 106)

Industry and Trade

Anglo-German Coal Discussions.—In contrast to the international trade in iron and steel, which is regulated by market and price agreements, competition in the coal export trade remains intense, especially between Britain and Germany. Due partly to heavy export subsidies and partly to the considerable rise in British prices, Germany has progressively increased her share in the coal shipments of the principal European exporting countries. As was shown in an article on the prospects for the conclusion of a European coal cartel in *The Economist* of September 10, 1938, Germany's share of the aggregate exports (excluding bunkers) of Britain, Germany, Poland, Belgium, Holland, Czecho-Slovakia and France rose between 1929 and 1937 from 23.4 per cent. to 37.9 per cent., while Britain's proportion declined from 53.6 per cent. to 40.3 per cent. There have been many discussions on the possibility of forming a European cartel, but so far all attempts at concluding an agreement have foundered on the choice of the period to be taken as a basis for the allocation of export quotas. Germany has been holding out for a bigger share of the total exports of the seven prospective cartel countries than the British industry was willing to concede. In recent discussions, however, the gap between the views of the industries in the two countries appears to have been narrowed. The British coal-mining industry is now understood to favour average exports during the past ten years, and Germany an average of the past three years, as the basis of quota allocations. With a modicum of good will this gap could be bridged. The outcome of the discussions now proceeding will provide a test of Germany's professed willingness to co-operate with British industry.

Fall in Iron and Steel Production.—Activity in the iron and steel industry suffered a sharp contraction between November and December. Production of pig iron declined from 461,500 tons in November to 445,800 tons in December. A year ago output rose during the same period from 762,300 tons to 783,800 tons. The output of crude steel declined by almost a quarter, from 860,000 tons in November to 655,700 tons in December. During the corresponding period in 1937 output fell by only 6.3 per cent., from 1,178,300 tons to 1,103,800 tons. It is doubtful whether consumption showed a proportionate decline, however, and there is some ground for believing that purchases towards the end of the year were reduced to a minimum in the expectation of a reduction in prices in the current year. The figures for January should give a better indication of the trend of

consumption. It is expected that the first batch of Government orders for the construction of steel shelters will be placed fairly soon, and these orders will naturally assist the industry in maintaining its activity.

Discussions on Wheat.—This week the International Wheat Advisory Committee has been discussing in London the problems of a record wheat crop. The supplies of wheat available in exporting countries for shipment abroad are estimated to have increased from 770 million bushels in 1937-38 to 1,135 million bushels in the current season, an amount which represents about twice the expected purchases of importing countries in 1938-39. These countries have in recent years considerably increased their acreage under wheat, and have thus aggravated the difficulties of the exporting countries, but the primary cause of the

WHEAT SUPPLIES AND CONSUMPTION (million bushels)

	World Exportable Surplus, including Carry-over	World Import Requirements
1928-29	1,376	888
1935-36	711	502
1936-37	688	599
1937-38	714	524
1938-39	1,135	540

present glut is the occurrence in a single season of exceptionally good yields of wheat in nearly every country, Australia being the only important exception. It is doubtful whether any agreement on export quotas could be enforced in the present season among exporting countries, since the United States and Canada have already exported large quantities of their current crop, while Australia and the Argentine have barely begun their exporting season. However, it is announced that the Advisory Committee has decided to summon a conference of the countries represented on the International Wheat Council.

Suspension of Russian Flax Exports.—The news that the Soviet Government had suspended further exports of flax from the 1938 crop was hardly unexpected by the linen trade. Russian supplies of flax and flax tow have been shrinking for some months, due probably to the increasing domestic requirements. The embargo will, nevertheless, seriously affect the linen industry in this and other countries; as the accompanying table shows, the British industry has drawn in past years a large proportion of its raw material from Russia. The fears of such an

embargo and the news of the decision have been responsible for a sharp rise in the price of flax in recent weeks; Slanetz medium, first sort, which was quoted at £94 per

ton shortly before Christmas, has now risen to £100 per ton, and other types have been similarly affected. The British linen trade has for some time past suffered from the competition of cheap cotton goods, and the present rise in the price of flax is therefore a serious blow to the linen manufacturers.

Coal-mining Profits Maintained.—The diagram on page 92 shows, quarterly from 1927, the course of net costs and proceeds per ton in the coal-mining industry, as well as changes in the output per man-shift, on the basis of the quarterly ascertainments. The area between the lines indicating costs and profits represents profits (if shaded) or

losses (if unshaded). But the net cost as computed does not include items such as interest on debentures and loans, which total about 3d. per ton. Between 1929 and 1935, when proceeds per ton showed a downward trend, the industry invariably operated at a profit (before deducting debenture interest, etc.) in the winter and at a loss in the summer. These variations are due to the seasonal changes in demand, which is highest in the winter and lowest in the summer. Since 1935, however, the industry has consistently shown a credit balance, but the improvement in the profitability of coal-mining has been accompanied by a marked increase in proceeds per ton, due partly to the increase in demand, but chiefly to the control of prices and production which virtually eliminated price-cutting. The increase in proceeds per ton was arrested last year, when a slight fall

AUDITORS' REPORT

TO THE SHAREHOLDERS, THE ROYAL BANK OF CANADA: We have examined the above Statement of Liabilities and Assets as at 30th November, 1938, with the books and accounts of The Royal Bank of Canada at Head Office and with the certified returns from the branches. We have checked the cash and the securities representing the Bank's investments held at the Head Office at the close of the fiscal year, and at various dates during the year have also checked the cash and investment securities at several of the important branches. We have obtained all the information and explanations that we have required, and in our opinion the transactions of the Bank, which have come under our notice, have been within the powers of the Bank. The above statement is in our opinion properly drawn up so as to disclose the true condition of the Bank as at 30th November, 1938, and it is as shown by the books of the Bank.

in demand rendered price-control less effective. Steps are now being taken to tighten the control of domestic selling prices by closer co-ordination between the prices of the various districts, while discussions are taking place between representatives of the British and German coal-mining

COSTS AND PROCEEDS PER TON AND OUTPUT PER MANSHIFT

industries with a view to concluding a European coal cartel which would arrest price-cutting in the export markets. But the improvement in the profitability of the British coal-mining industry and in the wages of coal miners has been due, in the main, to an increase in selling prices, which are now appreciably higher than in 1929. As a result, the fuel bill of British industry has shown a considerable increase. The rise in fuel costs has been serious in the case of industries, such as iron and steel, whose fuel bill represents a substantial proportion of total costs. The problem of reducing costs, therefore, has become urgent. Unfortunately, the reorganisation of the coal-mining industry is still proceeding at a snail's pace, and, as the diagram shows, output per man-shift, for example, has actually tended to decline since the spring of 1937.

Expansion of German Engineering Industry.—Mainly, though not entirely, owing to the speeding-up of re-armament, the capacity and output of the German engineering industry has been rapidly increased in recent years. The value of its output, which did not exceed Rm. 2,800 millions in the best pre-war year, rose from Rm. 4,000 millions in 1929 to Rm. 4,500 millions in 1937 and Rm. 5,500 millions in 1938. The expansion since 1929 was due to the growth of domestic requirements, for whereas the value of exports nine years ago was Rm. 1,500 millions, it reached only Rm. 800 millions in each of the past two years. Nevertheless, the engineering industry is one of the most important of Germany's export trades, accounting for nearly 16 per cent. of her total exports, by value, in 1938, compared with 7.6 per cent. in 1913. The accompanying table, taken from the latest issue of the Reichs-Kredit-Gesellschaft's review of Germany's economic position, shows the trends of domestic and export orders. While export orders have shown a downward trend since the third quarter of 1937, in sympathy with the shrinkage in international trade, this decline has been more than offset by the rapid expansion in domestic orders. But the growth of the industry's labour supply has not kept pace with the growth in demand. Labour was already scarce at the end of 1937, and last year's increase in output was

made possible mainly by mechanisation and by an increase in working hours, which averaged 8.35 hours per day last autumn. A special Commissioner with plenary powers has recently been appointed for the industry in order to speed up production still further.

British Metal Stocks.—Stocks of copper, tin, lead and spelter in official warehouses of the London Metal Exchange have fluctuated considerably in the past twelve months. As these stocks provide the basis for the dealings on the L.M.E., their size must be taken into account in an attempt to assess the probable course of metal prices. Lead and spelter stocks both increased in the past year, but even at their present level they are not high. More significant than the comparatively low level of total copper stocks is the change which has taken place in the last two years in their composition. Stocks of refined copper at the end of

	Dec., 1936	Dec., 1937	June, 1938	Dec., 1938
	(In long tons)			
Copper:				
Refined	45,519	9,968	6,263	4,551

In bond	11,545	16,654	20,698	18,572

December were only one-tenth of their level in December, 1936, and this shortage is reflected in the increased premium on electrolytic copper. Stocks of tin in official warehouses of the L.M.E., after doubling in 1937, have increased nearly fourfold in 1938, due largely to the holdings of the buffer pool, so that these reserves cannot be regarded as part of the regular supply. Taken as a whole, therefore, the British metal stocks at the end of the past year are not high enough to exercise a downward pressure on the price level, and they may prove too low to check an advance if a general revival of buying takes place.

Stability in Wool Prices.—The latest estimates of the world wool clip in 1938-39, given in the table below, show that the prospective fall in Australian supplies is slightly larger than the increase expected from the other four main exporting countries. Stocks in these five coun-

	1931-2	1936-7	1937-8	1938-9
Australia	1,008	983	1,015	938

Uruguay	106	114	110	114
Total	2,080	2,056	2,048	2,003

tries at the end of last season (June or September) were estimated at 165 million lbs., an increase of 109 million lbs. compared with the end of 1936-37. Total supplies this season are therefore bigger than in 1937-38.

INDUSTRIAL REPORTS

A FEATURE this week has been the publication of proposals to assist the shipping industry; they are discussed on page 65. There is a fairly good demand for coal for heating purposes, but forward purchases, especially for export, are still comparatively small in volume. Under the agreement between the cokemakers and the iron and steel industry, the price of furnace coke was reduced from January 1st. Purchases of steel have not yet shown much expansion but Government contracts for the construction of steel shelters are expected to be placed soon. Activity in the tinplate industry showed little improvement, and the new prices for export will be determined at the meeting of the Executive Committee of the International Cartel later this month. Transactions in cotton goods remain disappointing. The outlook for the jute industry has improved as a result of the agreement between the different sections of the industry in India, which is expected to be followed by a curtailment of output.

Coal

Sheffield.—The market is firm with a good home demand for most classes of fuel. Collieries are working well. There is a heavy call for locomotive hards, and the cold weather has given a spurt to the demand for household coal. Gas coal moves freely, and electricity concerns are taking full deliveries of smalls, which are very firm. Demand for blastfurnace coke continues poor, but there is a heavy call for central heating sorts. In consequence of the falling off in the demand for small coke for industrial purposes makers are endeavouring to recover their former considerable trade with Scandinavia.

The export market continues dull, and plentiful supplies of screened coal are available. Buyers are disinclined to pay present prices, and purchases are limited to bare requirements. Bunkers are very quiet. A moderate demand exists for coke.

Newcastle-on-Tyne.—The prompt trade on the North-East coal market is brisk, but there is no forward export inquiry of any importance. Northumberland steam collieries are very busy with tonnage that has been delayed in loading, owing to the severe frost of last week. In Durham coking collieries are better placed, under a slightly better Italian demand. Patent oven coke is a quiet market in both the home and export sections.

Cardiff.—Shipments have been a little more active at the South Wales docks owing to the increase in shipping capacity. During the week ended January 7th they totalled 376,300 tons, compared with 382,072 tons in the corresponding week last year, and there are prospects of an improvement in respect of the current week. Foreign buyers, moreover, appear to be reconciled to the prospects of a stabilised price level, and inquiries for future deliveries are consequently a little more active. The Alexandria Electricity

Works and Malta are asking for tenders for steam, large peas and beans.

The reduction of 3s. 4d. per ton in the average price of coke for iron and steel works became operative at the beginning of the year. Other quotations are nominally unchanged. It is reported in Cardiff that the negotiations for an International Coal Agreement will be resumed in the next few days.

Iron and Steel

Sheffield.—The market for iron and steel is quietly steady; the volume of business is not large, many consumers of forge and foundry iron continue to buy only sufficient to cover their known requirements, although here and there contracts over the first quarter or even the half-year are being arranged. With prices fixed for an indefinite period, users declare that they see little advantage in forward buying, especially as supplies are plentiful, with ample stocks at furnaces. On the other hand, a sudden heavy increase in consumption might reveal a shortage, leading to difficulties in placing business.

A good demand exists for basic iron, but hematite shows only very moderate signs of revival. In finished iron common and marked bars are the best features.

There is a sound undertone on the steel market, although business is at present rather slow. Basic billets are in fair request, as are small bars and wire rods. Structural steel requirements are limited, but the prospects are regarded as satisfactory.

Production of more open-hearth steel is reported, and there is a record demand for stainless steels. Most of the heavy engineering works are fully employed, but in the lighter sections there is some irregularity.

Middlesbrough.—The expected increase in demand for pig iron has not developed yet, but there is a confident feeling that consumers will shortly be coming on to the market and placing orders. Producers of Cleveland foundry pig iron do not hold large stocks and as the output is intermittent, the statistical position is satisfactory. The needs of local consumers are slowly expanding and as Continental iron is not now available, it is expected that the demand will result in a regular output being maintained. The output of East Coast hematite is required to cover current needs, but there are indications of increasing demand, and buyers still have quantities to take under uncompleted contracts.

Manufacturers of sheets and steel sections required under the A.R.P. schemes are expecting contracts to be placed immediately. Rather more constructional steel is being specified and

whilst the departments providing ship-building steel are anxious for further orders, it is announced that one of the local shipyards has secured a contract for the construction of a 9,300 ton steamer.

Glasgow.—Plants have been busy since the restart after the holidays and work on books gives promise of regular employment for steel makers for some months. In the West of Scotland practically all branches of the industry are interested in the Government A.R.P. programme. The Lanarkshire steel makers are particularly well equipped to supply the steel material required while, of course, the two leading sheet makers in Scotland have their rolling mills in this district and during the recent crisis supplied large quantities of galvanised and corrugated sheets for shelters to be used in all parts of the country. There is also in Glasgow and neighbourhood a number of structural firms who are already designing shelters which can be produced cheaply and expeditiously.

Cardiff.—The provisional returns under the pooling arrangement in the South Wales tinplate trade show that the mills were employed at an average of 45.59 per cent. of capacity in 1938, compared with 72.70 per cent. in 1937. There is little improvement to report in the current demand position, and the new minimum prices for export will not be determined till the Executive Committee of the International Cartel meets this month. Confidence is expressed, however, that the tendency will be towards a better demand, particularly in view of the fact that the stocks at works have been reduced by more than 50 per cent. during the past twelve months. The position in the sheet trade is practically unchanged, and production in the heavy branches of the industry is disappointing.

News from Abroad.—The seasonal slackness of demand on world steel markets is stressed by the political uneasiness and rumours of imminent price reductions by the International Cartel. This expectation, arising from the recent cut in Britain's domestic prices, is not generally considered justified, since the lower British prices affect only a few of the Empire markets. Moreover, it is unlikely that the Cartel will alter prices until the future trend of demand can be better foreseen. Although consumers' purchases were fairly satisfactory during the closing months of last year, quite sizeable requirements have recently accumulated and must be covered sooner or later.

Some preliminary inquiries have come from Scandinavian countries, Holland, the Far East and South

COMMODITY PRICES AND STATISTICS
The tables of Wholesale Prices and Commodity Statistics have been transferred to the "Current Statistics" section; they will be found this week on pages 107 & 108.

JUTE INDUSTRIES, LIMITED

COMPETITION FROM IMPORTED GOODS

DUNDEE ASKS FOR A "FAIR DEAL"

The 18th annual general meeting of Jute Industries, Limited, was held, on the 11th instant, at Winchester House, London.

Mr J. Ernest Cox (the chairman) said that looking back upon the past twelve months he could only describe them as extremely anxious ones, for the amount of new business booked was, until the year was almost ended, exceedingly small and the profit for months on end was negligible. A welcome change came in July, when American customers resumed shipments and the general tone of business improved. By that time, however, three-quarters of their financial year had passed, but the resumption of deliveries was of sufficient volume to make a considerable difference in their profit. The gross manufacturing profit was £30,255 lower, while dividends from subsidiary companies were less by £3,810 than last year. The net profit was £32,363, and directors recommended a dividend of 3 per cent. on the preference shares.

It was a matter for regret that they had been unable to maintain the profit standard and the rate of dividend attained last year, but the state of trade had prevented them from doing so. After five years' continuous improvement in production the tonnage of orders booked last year was 25 per cent. less than in 1937, and the number of bales of raw material used showed a drop of 22 per cent.

OVER-PRODUCTION AND WORKING HOURS

At this time last year stocks of light and heavy goods in Calcutta were 344 million yards, but it gradually increased until September, when it amounted to over 675 million yards. Faced with serious over-production, the Calcutta Jute Mills Association had been endeavouring for a considerable time to come to an arrangement with the mills outside their Association, with the object of curtailing the number of hours worked. No agreement having been reached, the Governor of Bengal promulgated an Ordinance fixing the number of hours which the looms in the jute mills might be worked. As from September 26, 1938, the total number of hours was fixed at 45 per week in the case of mills with over 175 looms, and 72 hours for those with less than 175 looms. Prior to the Ordinance, mills in the Association worked 54 hours, and some of the mills outside the Association as much as 108 hours per week.

Owing to excessive production and decreased consumption, the Indian mills had been experiencing difficulty in keeping their machinery reasonably well employed, and in their endeavour to do so they were taking away more and more of our home trade. For the first ten months of 1937 Calcutta exported to the United Kingdom 131 million yards of jute cloth, while in the same period of 1938 148 million yards were shipped, showing that the peak had evidently not yet been reached. Of bags 51 millions were imported against 55 millions in the comparable period in 1937. To bring home to shareholders the implication of these figures, he might say that, on a conservative estimate, it would require 6,000 looms working for a whole year to produce this quantity of cloth and bags. In addition the yarn used in the manufacture of the cloth required to be made, and, reducing the question to one of labour, employment could be found for approximately 10,500 additional workers.

The railways in this country asked for a square deal. Dundee asked for a fair deal, the right to live, by being protected against the importation of goods of Asiatic origin destined for use in this country but produced under conditions very different from those prevailing here. Meantime the trade was being assisted by orders from H.M. Government for sand bags, which had enabled manufacturers to restart machinery and thus employ more operatives.

An unfavourable feature was the possibility of a reduced acreage in the jute-growing districts in Bengal, and a consequently higher price for the raw material. The Government of India was again reported to be determined to institute propaganda aimed at curtailing sowings. Any curtailment of the crop coming on the top of what had been estimated to be one of the smallest in recent years seemed to be ill-timed and to be fraught with possible serious consequences.

As to the outlook, while they had carried forward a smaller profit on undelivered orders, demand had been considerably better for the past three months than in the corresponding period last year. The figures of unemployment for the industry, which had dropped from 11,186 in May of last year to 6,203 in November, indicated a general improvement. It was anticipated that American trade would continue to improve, and so long as there was a necessity for the production of sand bags, work for their narrow looms, the products of which now came directly into competition with Indian goods, was partially assured.

The report was unanimously adopted.

TRANSVAAL AND DELAGOA BAY INVESTMENT COMPANY, LIMITED

(Incorporated in the Union of South Africa)

PROFIT AND DIVIDEND MAINTAINED

The ordinary annual general meeting of the Transvaal and Delagoa Bay Investment Company, Limited (Incorporated in the Union of South Africa) was held in Johannesburg, on December 1st.

Mr S. C. Black presided, and, in the course of his speech, said:—The results show a slight improvement compared with the previous year, and having regard to the many influences restricting business opportunities during the period under review, you will, I am sure, be satisfied with what we have achieved.

Our net profit, after making the usual provision for taxation and depreciation, amounts to £120,826, compared with £120,141 for the preceding year. We brought forward from last year, after paying the final 1937 dividend, £173,924, making £294,750. We paid an interim dividend of 2s. 6d. per share last June, which absorbed £34,688, leaving £260,062. We again placed to the reserve fund £15,000, leaving a balance of £245,062 to the credit of profit and loss account. The reserve fund now stands at £255,000.

The interim dividend of 2s. 6d. per share was declared on May 16, 1938. We now recommend payment of a final dividend of 4s. per share, bringing the total distribution for the year to 6s. 6d. per share = 32½ per cent. free of Union of South Africa ordinary income tax, the same as in the previous year.

THE TWO COLLIERIES

Our two collieries, the Transvaal and Delagoa Bay Collieries and Douglas Colliery, Limited, produced jointly 1,003,262 tons of coal, which is an increase of 4,804 tons compared with the previous year. Had railway transport facilities during the year corresponded to our needs, it would have been possible to have raised the output materially, but, as in previous years, the supply of railway truckage has been inadequate. During times of increased internal demand there often remains insufficient rolling stock to transport the required tonnages of export and bunker coals. This not only causes difficulty and dislocation of working at the time, but also seriously handicaps the Transvaal Coal Owners Association in tendering for overseas contracts. The remedial measures promised last year have not yet entirely rectified this unsatisfactory position, and we can but await the delivery of further rolling stock ordered from overseas by the Railway Administration.

Shareholders are aware that after many years' service, the old plant at No. 2 Pit of the Transvaal and Delagoa Bay Collieries had become obsolete and expensive to maintain, and it was decided to sink a new shaft and erect a new plant at No. 1 Pit, in a central position convenient for working the virgin coal-bearing areas of the company.

Consumers of coal are now very much more exacting in their demands than they used to be, and the opportunity was therefore taken to design and order a plant and washery which, by its flexibility and adaptability, would enable us to meet any requirements of the trade.

The new installation has been in full operation since the beginning of August last, and has given entire satisfaction. Erection was carried out in steel and concrete, and every modern improvement to increase the efficiency of the plant was incorporated. The "Baum" washer, supplied by Messrs Simon-Carves, Limited, of Stockport, England, has handled our small coals most satisfactorily, and has proved easily adjustable to give the required calorific values for each class of coal.

The old plant at No. 2 Pit has now been permanently closed down.

At the Douglas Colliery, Limited, the position is entirely satisfactory, and the company repeated last year's dividend distribution.

The Transvaal Coal Owners Association (1923), Limited.—The Transvaal Coal Owners Association (1923), Limited, of which both your collieries are members, continued its sale and distribution activities with the greatest efficiency.

NIGEL GOLD MINING COMPANY

The Nigel Gold Mining Company, Limited, has, during the year, made the progress predicted at our last meeting. At that time its maximum monthly tonnage milled was 28,000 tons, but this figure was increased to 36,000 tons in November last, and progress will continue until 40,000 tons per month are milled—the present capacity of the plant. We have the greatest confidence in the ultimate future of the mine.

GENERAL SITUATION

The Chairman, having dealt with the Company's other interests, continuing, said:—The past year has been an exceedingly anxious

one from many points of view, culminating in the critical international situation which developed in September last, when your board took such steps as it thought necessary to protect shareholders' interests in the event of war, in so far as it was possible to do so. Although a general outbreak of war was happily averted, the world situation still remains unsettled.

Within the Union of South Africa itself business is comparatively normal, and we have no reason to be unduly concerned about the future. The taxation of gold mines is still onerous, with little or no prospect of relief, but assuming a fairly stable price for gold, development of South African mining and industrial undertakings should continue to expand.

The report and accounts were unanimously adopted.

FANTI CONSOLIDATED INVESTMENT COMPANY, LIMITED

A SATISFACTORY INCOME

The ordinary general meeting of Fanti Consolidated Investment Company, Limited, was held, on the 12th instant, at Southern House, London.

Sir Edmund Davis (chairman and managing director) said that interest, dividends and sundry receipts for the year totalled £42,821, only £3,432 less than the income of £46,253 received during the previous year, which, in the circumstances they thought satisfactory. Net profit on realisation of investments, £7,156, showed a reduction of £28,761. Bearing in mind the depressed markets and extremely difficult conditions prevailing throughout the period under review, shareholders would no doubt appreciate that there were very few opportunities for profitable share transactions.

The amount at which their investments were taken into the balance sheet consisted of a valuation of each separate investment at market price or cost whichever was the lower. On that basis they showed at the date of the balance sheet a depreciation of £34,418 for the year, and they had made provision for that amount out of reserve account. At the end of 1937 they had had to provide £53,633 for depreciation, but, even though prices continued their downward trend during most of the past year, the aggregate market value of their investments at December 31, 1938, showed an appreciation above cost amounting to £55,594, and no part of that surplus had been taken into their accounts.

Prospects for the future naturally depended on the course of events, and he would not attempt to prophesy, but it was reasonable at least to expect that, with any appreciable easing of the existing international tension, there should be a marked recovery in financial activity and security values. Given such a recovery, their depreciation position should improve and enable them to recover part of the amounts they had had to provide in the past to cover depreciation. A resolution would be submitted for the payment of a dividend of 9d. per share—that was at the rate of 9½ per cent., less income tax—for the year ended December 31, 1938, and if that was approved the average annual rate of dividend paid over the period of 21 years since 1918 would work out at 10.61 per cent.

The report was unanimously adopted.

APEX (TRINIDAD) OILFIELDS, LIMITED

RECORD PRODUCTION

The ordinary general meeting of Apex (Trinidad) Oilfields, Limited, was held, on the 12th instant, in London.

Mr Walter MacLachlan, the chairman, said that the net profit amounted to £315,554, and the directors recommended the payment of a final dividend of 27½ per cent., making 40 per cent. for the year, less tax at 2s. 10.72d. in the £, equivalent to a total of 47 per cent. if subject to full tax of 5s. 6d. in the £. The production of crude oil amounted to a record of 562,942 tons, and the total from the commencement up to the end of last month was approximately 6,500,000 tons. The casing-head gasoline plant had produced 8,889

tons of high-grade petrol spirit. The average price per ton realised during the year was slightly under that for the previous year. The deeper zones of oil-sands had continued to provide a very high proportion of the total production from the field.

In the vicinity of their Southern boundary highly important developments had recently taken place. The Trinidad Petroleum Development Company had been testing part of their property, which immediately adjoined the Southern boundary, with the result that they were now in a position to report that they had no doubt that the whole of such area was oil-bearing. In view of those important developments the Apex Company had started further drilling operations in that section of its property. The first well drilled was yielding substantial production of good grade oil.

The Commission appointed in 1937 by the Secretary of State for the Colonies to inquire into the labour disturbances had presented its Report early in 1938. In common with the other oil companies the Apex Company was supporting the institution of methods by which matters in dispute which might arise could be dealt with so as to arrive at a fair and reasonable agreement.

With regard to prospects for the current year, he trusted that notwithstanding strikes in the earlier part of the year production would not be materially less than that of the past year. The outlook for the immediate future was necessarily influenced by the conditions and lower prices prevailing in the United States, but the directors had every confidence in the long-term outlook both for the industry and for the company's undertaking.

The report was adopted.

CLEVELAND PETROLEUM COMPANY, LIMITED

RESULTS OF A DIFFICULT YEAR

The annual general meeting of the Cleveland Petroleum Company, Limited, was held, on the 12th instant, in London.

Mr E. A. Radford, F.C.A., M.P. (the chairman of the company), presided.

In the course of his speech the Chairman said:—The profit for the past year, after charging all expenses and providing for National Defence Contribution to October 31, 1938, and income tax liability for 1939-40, and a sum of £21,730 for depreciation, amounted to £290,719.

The trading profit for the year has been materially less than that of the preceding year owing to two outstanding causes:—

(1) The retail prices of motor spirit were subjected to reductions of ½d. per gallon in July, 1937, February, 1938, and May, 1938.

(2) A duty of 9d. per gallon was imposed in the Budget of 1938 on commercial alcohol blended in motor spirit.

This meant an addition to the cost of Cleveland Discol of a figure materially in excess of the existing margin of profit, and your directors were confronted with a problem of some difficulty. After the most careful consideration they decided to raise the price, and this was done by ½d. per gallon, and it is eloquent testimony to the popularity of Cleveland Discol and to the extent to which its merits are recognised by the motoring public, that I am able to tell you to-day that the increased price has been willingly paid and that the sales of Cleveland Discol have not suffered. The trading profit on Cleveland Discol is now a very modest one, notwithstanding a special concession made to us by our friends the alcohol suppliers, The Distillers Company, Limited.

Cleveland Guaranteed motor spirit retains its popularity and our sales of this grade still form the backbone of the company's business.

The report was unanimously adopted; £50,000 was transferred to general reserve; an amount of £8,000 was set aside for staff pension scheme, the final dividends recommended in the report were declared, payable on the 27th instant, and the balance of £41,413 was carried forward to the current year.

The retiring directors, Mr R. A. Carder, Sir Thomas D. Nicol, and Mr Frederick J. Wolfe, were re-elected, and Messrs James Todd, Adams and Wilcock, chartered accountants, were re-appointed auditors for the current year.

OIL OUTPUTS

Anglo-Iranian Oil Company, Ltd.—Output in Iran for October, 1938, 929,000 tons. Total output for period January 1 to October 31, 1938, was 8,393,000 tons.

British Burmah Petroleum.—Output for December, 1938, 53,694 barrels.

British Controlled Oilfields, Ltd.—Total output week to January 7, 1939, 11,711 barrels. Total output December, 1938, 52,460 barrels. Shipments, December, 1938, 39,204 barrels.

Kern Oil Company.—Total output

December, 1938, 243,641 barrels, or about 34,806 tons.

Attock Oil Company.—One of the Dhulian test wells mentioned in the chairman's speech in June has now been drilled into production at about 7,780 feet.

Finance

GOVERNMENT RETURNS

For the week ended January 7, 1939, total ordinary revenue was £27,612,000, against ordinary expenditure of £27,833,000. Thus, excluding sinking fund allocations and Defence expenditure from loans, the deficit accrued since April 1st last is £249,667,000, against a deficit of £170,336,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.
On January 6th applications at £99 17s. 3d. per cent. for bills to be issued for on Wednesday, Thursday, Friday and Saturday of the following week were accepted as to 29 per cent. of the amount applied for. Applications at higher prices were accepted in full. Applications at £99 17s. 4d. per cent. for bills to be paid for on Monday and at £99 17s. 3d. per cent. for bills to be paid for on Tuesday were accepted in full. £25-0 millions of Treasury bills are being offered on January 13th.

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

SHORTER COMMENTS

(Continued from page 89)

Westinghouse Brake and Signal Company.—Net profit year to September 30, 1938, £262,518 (£259,776). To staff pensions £10,000 as before. Ordinary dividend 10 per cent. plus a bonus of 7½ per cent. both as before. To reserve £75,000 as before. Carry forward raised from £60,060 to £70,569. Total reserve now £400,000.

Liebig's Extract of Meat Company.—Profit for year to August 31, 1938, £448,360 against £397,432. To tax and N.D.C., £174,882 (£112,623). Ordinary dividend 11 per cent. tax free as before. Carry forward reduced from £217,435 to £207,113.

Fanti Consolidated Investment Company.—At the annual meeting on January 12th, Sir Edmund Davis disclosed that the separate securities were valued at market price or cost, whichever was the lower. To

meet the resulting depreciation, £34,418 had been provided from reserve in 1938, but at the end of the year, aggregate market values exceeded cost by £55,594, no part of which had been taken into the accounts.

North Eastern Electric Supply Company.—The directors have appointed Lt.-Col. S. E. Monkhouse as managing director, and Mr E. H. B. Woodward as general manager.

seems to have taken, throughout, two incompatible lines, either of which can be dropped and taken up again at any moment according to the way things turn out. On the one hand—and this, last week, was his dominant note—he beat the drum of peace. He wanted peace for the world, for Europe and for Italy; and he even went so far as to disclaim any intention of vindicating his claims against France by other than peaceful means. In sharp contrast to the language of the celebrated “spontaneous demonstration” in the Italian Chamber, the territorial element in these Italian claims seems to have been thrust into the background in Signor Mussolini’s presentation of them to Mr Chamberlain. Emphasis seems to have been laid on points on which there is obvious scope for give and take: the tariff of the Suez Canal dues and the Italian claim to some share in the administrative and financial control over the port of Jibuti and over the railway to Addis Ababa. The Italian demand in Tunisia, again, was presented, not as a direct territorial claim upon the French Empire which would inevitably mean war, but rather as a suggestion for securing equal rights for the Italian and French settlers in a Tunisian Arab State restored to full independence.

Yet, even while the last reverberations of this benignant big drum were still resounding reassuringly in the British visitors’ ears, the Duce, who is a consummately skilful conductor of his propaganda orchestra, was already calling up his screeching fifes. The Italian Press campaign against France ceased fire for the bare duration of the British visit to Rome, only to crackle out again, with all its former spiteful fury, the moment the British party boarded their train for Calais; and while they were still *en route* it was announced in Rome that Signor Mussolini had told them that, if in the near future any large-scale intervention were to occur in favour of the Spanish Republicans, then Italy would regard the non-intervention policy as having failed and would resume her liberty of action. This is perhaps the most impudently plain statement that Signor Mussolini has yet made of his own construction of the term “non-intervention” to mean intervention by the Axis Powers in the Spanish Nationalists’ favour while all other parties are to be inhibited from giving any corresponding help to the Republicans. At the same moment, the ominous meaning of this insistence is shown by the Duce’s refusal to entertain negotiations with France until General Franco has

conquered Spain. This can only mean that, in spite of all Signor Mussolini’s carefully-phrased pledges to evacuate his troops and maintain the *status quo*, a Fascist Spain is to be used to threaten France and consequently, at a near remove, Great Britain.

Thus the account of Italian policy which the Duce served up to his British guests was a kind of mixed grill in which peace with France and war with France were laid side by side on the dish. Mr Chamberlain—and we give him due credit for it—seems to have made it clear that only an Italian policy of peace with France would be compatible with Anglo-Italian “appeasement.” He is reported to have told Signor Mussolini that Britain’s ties with France were far closer than anything that could be expressed in mere juridical commitments, and that no threat to the well-being of France and the French Empire could fail to affect Great Britain and the British Empire immediately and profoundly. Signor Mussolini is said to have signified his recognition of this important international fact, and logically this ought to mean that an Italian policy of war with France is no longer contemplated. The head of the Italian State, however, is not a logician; he is an opportunist who is keeping both of two incompatible policies up his sleeve. And, while the solidarity of Great Britain with France might be decisive in deterring him from attempting a coup against Sfax or Jibuti, some conjunction of circumstances—presumably in the shape of potent and willing allies—which seemed to offer a reasonable chance of felling both the democratic Powers at one blow might equally well move him to throw to the winds his present policy of Anglo-Italian “appeasement.” Here lies the radical weakness of Mr Chamberlain’s attempt to place Anglo-Italian relations on an assured footing of peace. We are paying our side of the bargain cash down—in Spanish coin. But so far from there being any security whatever for the performance of Signor Mussolini’s undertakings, there are many signs—since his actions speak more convincingly than his words—that he intends to repudiate them just as soon as he is strong enough to do so. The conversations at Rome have changed little or nothing. They have certainly done nothing to diminish the likelihood that, before long, the Western Powers will have to face another aggressive demand from both Axis Powers, backed by the threat of their totalitarian force.

Fixed Prices for Farmers—I

The Farmers’ Chosen Remedy

IN recent weeks both the National Farmers’ Union and the Agricultural Committee of Conservative Members of Parliament have put before the Government proposals for fixed prices for all agricultural products. The N.F.U. sponsored in October a plan of “price insurance” to prevent the prices of farmers’ produce from falling to unremunerative levels. “Price insurance,” as the term is understood by the N.F.U., has already been applied to bacon pigs, wheat, barley and oats, and the proposal is that, for everything the farmer produces, a minimum should be set, below which his receipts cannot fall. The Conservative Agricultural Committee calls for guaranteed standard prices to cover the costs of efficient production plus reasonable profits. It is a feature of both schemes that the prices to be insured or guaranteed shall be fixed by an independent Commission on the lines of the Import Duties Advisory Committee. The formula—a guaranteed or insured price payable by an independent Commission—is that of the Wheat Act of 1932, and the Conservative Committee specifically refers to this Act as the example to be copied.

The Wheat Act has certainly worked more smoothly and to the greater satisfaction of the farmers than any of the other devices of agricultural policy in recent years. Its principles are simple in the extreme. A standard price (at present 10s. per cwt. or 45s. per quarter) and a standard quota of production (at present 36 million cwt.) are fixed, variable only at intervals of several years. Provided the total production does not exceed the standard quota, every grower of wheat receives such a sum as is necessary to cover the gap between the average market price actually realised and the standard price. If the production rises above the standard amount, the rate of assistance is reduced proportionately, so that the liability of the Commission cannot exceed the standard price for the standard quantity. The funds for these payments are raised by a levy imposed on all wheat flour, home-grown or imported, and the levy is, of course, incorporated in the price of flour and of bread.

The Wheat Act thus incorporates both a method of raising funds (by levy on the consumer) and a method of distributing the funds thus raised (by deficiency payments

limited to a standard output). When the farmers’ representatives put the Wheat Act forward as an example for universal imitation, it is not quite clear whether their approval extends to both sides of the transaction, to the methods of collecting the funds as well as to the methods of disbursing them. Very few consumers of bread are aware that the price of their loaf includes an element of tax. The wheat levy, in flat contradiction to one of the fundamental principles of the English Constitution, is not annually voted, or even annually discussed, by the elected representatives of the people. It is, in fact, out of the public’s sight and out of the public’s mind. But the principle of it is, nevertheless, iniquitous in the extreme. The wheat levy, it is true, is spread very thinly over a very large consumption, and it can make for itself the classical excuse that the serving-maid put forward for her illegitimate baby: it is a very small one. But the excuse is equally unacceptable; if this method were applied to other commodities, some of the levies would represent a sizeable proportion of the retail price. To raise money for agriculture by regressive taxes on the consumption of food is inadmissible. To attempt to do so in any other way than in the full light of day, by including the amounts in the annual Budget and requiring an annual vote, would be doubly unpardonable. As a principle of public policy, if any subsidies are to be paid to agriculture, they should be paid direct from the Exchequer and not raised by concealed taxes on essential foods. And if the application of the principles of the Wheat Act implies any departure from this principle, it deserves—and will doubtless receive—the most unyielding opposition.

It is only reasonable, however, to assume that the farmers’ representatives are much less concerned with the methods of raising the money than with the spending of it. They would be as well pleased—or almost as well pleased—if the cost of guaranteeing fixed prices were found out of the general funds of the Exchequer. The farmers’ proposals fully deserve to be discussed on the assumption that the money needed would be raised by more equitable and less damaging methods than the levy.

There is an interesting difference—which may perhaps be of more than purely verbal significance—between the original proposals put forward by the National Farmers’ Union and the form in which they were endorsed by the Conservative Agricultural Committee. The N.F.U. plan calls for “price insurance” plans to operate “wherever unduly low price levels are shown to exist.” The Conservative Agricultural Committee desires the guarantee of standard prices to be fixed at a level which will cover the costs of efficient production and allow for a reasonable profit. It might be thought that the wording of the N.F.U. proposal implied a more modest request; that the intention was not to guarantee a standard but to insure against excessive loss. In point of fact, it is unlikely that any such distinction can be drawn in practice. The statement by the N.F.U. in October, in which the proposal was formulated, declared that the prices “insured” by the Government’s present schemes for barley and oats and contemplated for manufacturing milk were “demonstrably too low,” and dissatisfaction is implied even with the standard wheat price, which has been above the market price throughout virtually the entire history of the Wheat Act.

It would therefore be unwise to assume that there would be any practical difference between the prices fixed by “price insurance” and those determined under the “guaranteed standard.” But the Conservative Committee has pledged itself to the policy of determining prices by cost of production plus a reasonable profit. Now this may sound very plausible if we discount the endless argument about what constitutes a “reasonable” profit. But the cost basis is, in fact, completely useless. To start with, costs are not independent of prices. At whatever level prices may be

fixed, the amount produced and the costs of production will in time adjust themselves to that level, either by the elimination of the higher cost producers or by their entry into production. Prices determine costs quite as much as costs influence prices. Secondly, there is no “cost of production” for any agricultural commodity; there is a very large range of costs. For instance, a recent survey of the costs of farms producing milk for the wholesale market showed total costs (excluding rent and interest on capital) ranging from 6d. to 14d. per gallon. Where in this range would the Conservative Agricultural Committee propose to draw the line between efficient and inefficient production? Further, in the case of crops, costs per unit of output vary with the yield. Whether the crop is a total loss or of record size, the farmer has incurred the costs of cultivation, of manuring, drilling and harrowing, and these costs will be lower per unit in a good year than in a poor one. But does the Committee mean to recommend that their standard prices for each crop should vary with the weather?

The truth is that the Committee has departed from the precedent of the wheat quota precisely where it should have been copied. If we are to have standard prices for agricultural products, these prices must be fixed in relation, not to any hypothetical “cost of production,” but in order to call forth that amount of each commodity (averaged in the case of crops over a series of fluctuating yields) which is considered desirable. For each major product, of which we may list twelve—milk, beef, mutton and lamb, bacon, pork, eggs, poultry, wheat, barley, oats, sugar beet, potatoes—the independent Commission which, in both schemes, is to determine the standard prices, would need to decide what quantity grown in these islands would best serve the interests of the urban consumer and the agricultural producer. Having settled this, it would further have to decide what price must be offered to call forth that quantity. And if the Commission took to heart the interests of the nation as a whole, it would decide for more milk, eggs, fruit and vegetables, and less wheat, beef and sugar, and would reduce accordingly the prices of these latter commodities, which Britain can get most cheaply from abroad.

But would the Commission be allowed to make such decisions? Both the N.F.U. and the Conservative Committee propose that it should be “independent.” But it is strange inconsistency to propose an independent Commission with such drastic powers and yet to storm against the “bureaucratic tyranny” of the Milk Commission, which Mr Morrison in his now moribund Milk Bill proposed to endow with infinitely less potent functions. Or are we to take it that what the farmers and their Conservative friends mean by an independent Commission is one that will be independent, not of agricultural interests, but of the nine-tenths of the population who are not farmers?

The main provisos to the farmers’ scheme that have been raised here are three: the money must not be obtained by levies on the consumption of food; any attempt to fix prices by cost of production is wrong in principle and administratively impracticable; and the body charged with fixing prices must be genuinely independent and charged with considering the interests of the farmers only in the framework of the national economy as a whole. When these provisos are made, however, there is much that is attractive in the proposal. It has consistently been urged in *The Economist* that such assistance as the community may decide to provide for the farmer should be given in the form of cash subsidies in aid of prices. But before the farmers and their political friends can be congratulated on conversion to the views of *The Economist*, the argument must progress beyond generalities and come down to specific figures, from which alone the cost can be calculated. This task will be attempted in a second article.

India Approaches Federation

A FEW weeks ago, in an address on the pressure of population in India, General Sir John Megaw drew attention to the fact that over half the Indian people, at least in the rural areas, fall below a minimal standard of nutrition, even on the frugal scale of a warm Oriental country. He showed that, in default of some improvement in economic output, the pressure of population is likely to drive down the average standard of life still further; for the population of some 400 millions is now increasing at the rate of $3\frac{1}{2}$ millions a year. The political leaders of India have themselves been earnestly taking up this problem. Late in December a so-called Planning Committee organised by the Congress met in Bombay, under the chairmanship of Pandit Jawaharlal Nehru, to consider how India's industries—urban and rural—should be developed with a view to raising the standard of life, combating unemployment, and caring for the rapidly rising numbers of the population. The industrialisation of India has been proceeding apace and is likely to go much further, since in the end it provides the only possible solution of the demographic problem. As Sir Thomas Aiscough, the British Senior Trade Commissioner in India, says in his latest report, published last week:—

During the past ten years scores of new industrial enterprises have been inaugurated in India which are swelling the total and increasing the variety of her production. They are, moreover, displacing imports, which have hitherto been obtained largely from the United Kingdom and which have provided a steady Customs revenue for the Government of India.

Industrialisation has been aided by the cheapness of labour, itself but a reflection of the low standard of living wrested from the land. It is true that the Indian workman is far less efficient than his European competitor, and that in total wage cost per unit of output the latter not infrequently has the advantage. But that does not alter the fact that standards of life in the tenements of India's industrial cities are appallingly low.

Nevertheless, the problems of industrial labour have not yet assumed the first prominence in Indian politics, although it is now nearly two years since popularly-elected Governments assumed office in the provinces. There are many reasons for this. In the first place, the rural and agricultural community greatly outnumbers the urban and industrial. In the second place, the factory workers are very difficult to organise because the majority of them keep one foot, so to speak, in their home villages, whither they return at any sign of serious industrial disturbance and where they can always find a living, either by their own efforts or at their relatives' expense. In the third place, the leadership of the Congress, which holds office (with or without allies) in every province but two, is predominantly middle-class in outlook, and is much more closely associated with agrarian agitation than with industrial trade unionism. Finally, the vital economic problems of India, urgent as they are, still remain partially obscured by the politics of nationalism. It is still possible for Mr Subhas Bose, the current president of the Congress, to perambulate the country declaring that nothing worth while can be done to improve the lot of the poverty-stricken Indian until India has obtained her complete constitutional freedom.

In so far as this propaganda has any rational grounds at all, it is based on two main allegations: that the British Government has overtaxed the people of India in order to maintain an expensive army for Imperial purposes, and that until British power has gone, with its inherent con-

servatism and its covert alliance with the landlords and capitalists of India, no national economic or social reform will be countenanced. Even if we take this claim at its face value, the landlords and capitalists will not disappear with the British administration. Many of them are to-day prominent in the Congress Party. Indeed, to judge from the way matters have gone in the provinces, a second bloodless revolution will be needed if power is to be transferred from the *bourgeoisie* to the masses and the vested interests of capitalism overthrown. Nevertheless, the movement of economic revolt has undoubtedly been gaining ground, especially in the peasant areas of Bihar, Orissa and the United Provinces, and big inroads have already been made on the privileged position of the *zemindars* (landlords). At the centre, great importance attaches to the Income Tax Bill which Sir James Grigg, with immense determination, steered through before the rising of the Assembly last month. For not only is it a vital element in the structure of finance on which the new Constitution will depend; it is also a critical step in the modernisation of India's fiscal system, by a shifting of some of the burden from the agricultural to the commercial and industrial classes.

There is not much elasticity in the Indian fiscal system, even in its revised shape. The difficulty of finding money for the purposes of government—expanding purposes, if Indian democracy fulfils its promises of economic and social reform—will be increased by the policies of prohibition, which eats into liquor excise revenue, and of industrial protection, which eats into the yield of Customs. This is one of the main reasons for Indian agitation for control of the Army, the cost of which threatens to increase with mechanisation and improved rates of pay. The Congress is to-day laying stress upon its policy of a "people's army." This implies not only the elimination of the British Army and the Indianisation of the officer cadre in the Indian Army, but also the recruitment of troops in proportion to the numbers in different areas and different communities.

This proposal at once raises in an acute form the problem of Hindu-Muslim relations; for at present the Indian Army is drawn very largely from the Muslims; and more especially from the Muslims of the Punjab. Hence the agitation has tended to embitter the already strained relations between the Muslim League and the predominantly Hindu Congress. This is one reason for the recent breakdown of attempts to establish a working pact between the two groups. Such a pact would pave the way for Congress leadership under the future federal constitution. At present, the ostensible Congress policy is still one of rigid opposition to a federation imposed from outside and scored with reservations and safeguards designed to inhibit the free working of Indian democracy. Beneath the surface, however, Congress opinion has drifted round to a more co-operative attitude. Certain conditions, it is stressed, must still be fulfilled, conditions which the more conservative Congressmen are anxious to prove can be satisfied without formal amendment of the Government of India Act. Of these, by far the most important is the stipulation that the system of election to the federal Chambers shall be such as to give the Congress itself a reasonable chance of obtaining—with reliable allies if necessary—a working majority.

This does not seem an extravagant demand on the part of an organisation which has proved its claim to speak for the bulk of Indian electors by forming Governments (in two cases with partners in coalitions) in nine of the eleven

provinces of British India. But the federal Constitution allows the Congress no hope of a majority even in the Lower House of the Federation, so long as the mass of the Muslims are hostile and so long as the States' seats are filled by the Rulers' nominees, who would presumably be anti-Congress. The approach to the Muslims having broken down on the fundamental point of the Congress's refusal to acknowledge the Muslim League as the sole effective representative of the Mussulman community, the Congress leaders have naturally turned their eyes to the seats allotted to the princely States. The agitation for democratic reform in the States is in part a spontaneous movement among the States' subjects themselves, and to outward appearances it is directed primarily to the greater participation of the people in the States' internal government. But it will be misunderstood unless it is seen against

the background of the struggle for power in the federal India of the future. For the Congress, the question of democratic election of the States' federal representatives is fundamental, deciding—as it may—whether the federation is to be introduced with the co-operation of the Congress or in face of a vast civil disobedience movement. It is, of course, even more fundamental for the Princes themselves. It is also fundamental for the Muslim League, whose only hope of federal power as a distinct organisation lies in the chance of straddling a balance between other groups. And, above all, it is fundamental for the British Government, with whom lies the decision at what moment and on what terms the great step of federation will be taken. This is the gravest of the important issues that will have to be solved in 1939, if federation is to be inaugurated with any chance of success in 1940.

British Overseas Trade

THE setting for Britain's overseas trade was not propitious in 1938. Last year resembled 1930 in that, when it began, the trade of the world was caught in recession, but differed from it in that the force of the downward movement in world trade and commodity prices was broken in the summer by the vigorous recovery in the United States. At home, business activity declined rapidly in the early months of 1938, was marking time in the summer and autumn, but turned again downwards towards the end of the year. The tables at the end of this article show how the interplay of domestic and world economic developments influenced the course of British overseas trade in 1938.

Recession at home and abroad inevitably curtailed the value of imports and exports in 1938, but, owing to the lull in the downward movement of business activity in the summer, the decline was much less marked than in 1930. Thus, between 1929 and 1930 the value of total imports and domestic exports declined by 14.4 per cent. and 21.7 per cent. respectively; between 1937 and 1938 imports fell by only 10.4 per cent. and exports by 9.6 per cent. But whereas in 1930 the decline in exports was proportionately much more marked than the fall in imports, the position was reversed last year, and exports declined less in proportion than imports. As a consequence of this, the import surplus, which rose by £5.5 millions between 1929 and 1930, actually fell by £43.4 millions between 1937 and 1938. By coincidence, the import surplus last year, £387.9 millions, was almost exactly the same as in 1930, though the combined value of imports and exports in 1938, at £1,391 millions, was £224 millions smaller than nine years ago.

To complete the comparison of trade movements in 1929-30 and 1937-38, reference must also be made to

changes in the average price and in the volume of imports and exports, revealed by the Board of Trade's quarterly indices and shown in the two tables printed at the foot of this page.

The timing of the turning points in the average price and volume of imports and exports in 1929-30 and in 1937-38 shows close correspondence. In 1929 the average price of imports turned downwards in the third quarter and in 1937 in the fourth quarter. Average export prices began to fall six months later in both periods, i.e. in the first quarter of 1930 and in the second quarter of 1938. The fall in average import prices between the third quarters of 1929 and 1930 and the corresponding quarters in 1937-38 (the figures for the fourth quarter of 1938 are not yet available) was 11.7 per cent. and 9.1 per cent. respectively. The fall in average export prices during those periods was much smaller than the decline in import prices, amounting to 2.6 per cent. and 1.2 per cent. respectively. But both import and export prices fell slightly less in 1937-38 than in 1929-30. The reduction in imports in both periods was appreciably smaller, by volume, than in exports. But while the quantitative decline in imports was almost identical both times, the shrinkage in exports has been much smaller this time. This can be attributed, in the main, to the recovery in the United States last year, which cushioned the recession in world trade and prices last summer.

As was to be expected, the incidence of changes in the value and volume of imports and exports between 1937 and 1938 was unequal. Quantitative changes in important commodities are shown in Tables III and IV. In view of the fall in the price of foodstuffs and raw materials and of the heavy accumulation of stocks in 1937, the fall in the value of imports was most marked in the case of primary

RETAINED IMPORTS (1935=100)					DOMESTIC EXPORTS (1935=100)				
(a) Average Price (c.i.f.)					(a) Average Price (f.o.b.)				
	First Quarter	Second Quarter	Third Quarter	Fourth Quarter		First Quarter	Second Quarter	Third Quarter	Fourth Quarter
1929	150.8	151.1	150.8	148.7	1929	124.8	122.5	124.5	123.2
1930	144.3	136.1	133.2	123.7	1930	126.0	122.2	121.2	117.6
1937	113.5	119.9	123.7	120.4	1937	105.2	109.2	113.1	113.2
1938	117.6	113.4	111.3	...	1938	113.9	111.9	111.7	...
(b) Volume					(b) Volume				
1929	104.0	100.5	100.2	113.1	1929	133.0	132.6	135.7	137.8
1930	102.2	97.9	96.3	110.6	1930	122.4	108.2	105.9	103.8
1937	106.0	110.5	110.6	128.6	1937	108.2	112.0	111.6	112.8
1938	111.4	104.4	106.7	...	1938	99.7	94.3	95.5	...

products. Thus, the fall in imports exceeded £5 millions in the case of the following items:—

PRINCIPAL DECREASES IN IMPORTS

	Imports in 1938 £'000	Decline between 1937 and 1938 £'000
Grain and flour	74,434	16,933
Wood and timber	42,900	18,872
Raw cotton	29,587	19,143
Raw wool	42,694	9,446
Hides and skins	18,249	6,920
Non-ferrous metals	40,848	14,865
Iron and steel	14,505	5,300

Imports of iron and steel were deliberately curtailed in order to soften the impact on the domestic industry of the fall in demand. Dairy produce and tobacco were the only items whose imports rose by more than £5 millions between 1937 and 1938.

An analysis of changes in the value of exports between 1937 and 1938 shows striking contrasts. The fall in exports, though fairly general, was greatest in textiles, iron and steel and non-ferrous metals. The decline in these items alone was £43.2 millions, representing more than four-fifths of the total fall in domestic exports. In textiles alone, the fall was of the value of 35 per cent., an indication of the severity of the slump in these industries caused by the fall in the prices of primary products and accentuated by the heavy stocks accumulated in many importing countries in 1937. In contrast, the value of coal exports was almost unchanged, and shipments of machinery and vehicles (mainly motor cars) actually rose. Exports of machinery in 1938 were actually £3.5 millions higher than in 1929, an indication, perhaps, of the tendency of primary producing countries to establish manufacturing industries of their own.

The long-term trend of the exports of most of the old staple industries compares unfavourably with that of the

remaining trades. This tendency is revealed in the next table:—

	DOMESTIC EXPORTS (In millions of £'s)				Decline 1929-1938 %
	1929	1932	1937	1938	
Coal.....	48.6	31.6	37.6	37.4	23
Iron and steel ...	68.0	28.0	48.4	41.6	39
Cotton.....	135.4	62.8	68.5	49.7	63
Wool.....	52.9	24.0	35.5	26.8	49
Total	304.9	146.4	190.0	155.5	49
Other exports....	424.3	218.4	331.3	315.4	26

The average decline in the value of the exports of the four staple trades between 1929 and 1938 was almost twice as heavy as the fall in other exports. Cotton has been replaced by machinery as the leading export trade. In contrast to the general belief, the decline in the value of coal exports during this period has been smaller, proportionately, than the fall in that of "other exports." This is due partly to the rise in the average price of coal exports, from £0.806 per ton in 1929 to £1.04 in 1938. By weight, exports of coal have fallen from 60 million tons in 1929 to 40 million tons in 1937 and 36 million tons in 1938.

On the whole, the reduction in Britain's overseas trade between 1937 and 1938 has been less severe than might have been feared. If recovery in America continues in the current year, the outlook for British exports is not altogether bad, though some further reduction may be expected in the next few months, when primary producing countries may adjust their purchases to the lower level of their exports. The course of our imports may also show a further shrinkage, at any rate in the early part of the year, when general business activity is expected to continue its downward trend. But when so much depends on political factors, it is foolhardy to predict the course of overseas trade more than a few months ahead.

OVERSEAS TRADE IN 1938

Topics of the Week

Publicity for Defence Problems.—Not the least pointed criticisms of the Government's attitude to defence continue to come from their own members. A week ago Mr R. S. Hudson declared that the country's motto for 1939 should be "drive, efficiency and outspoken truth."

I believe (he said) that the people of this country will rise to any occasion if they are told the truth about it.

In the same vein Sir Auckland Geddes, adviser to the Lord Privy Seal, in a speech made on Tuesday to rebuke the Government's extremist critics, said:—

I think there is too much secrecy. I think that if more were known of what was going on people would understand better. I wish a lot more could be told. I wish that the Press could let the people know how much is done so that the whole morale of the country could rise.

Most citizens and newspapers will share Mr Hudson's faith and echo Sir Auckland's longings. As it is, the public can only weigh the state of the nation's defences and the adequacy of the Government's plans by what they see and are told. Inevitably, they experience the forebodings voiced by Mr Eden last week-end: Are we really moving with sufficiently rapid strides in re-armament? Still organised, as we are, on a purely peace-time basis, can we ever overtake the arrears into which we have fallen by contrast with other countries? Their chief impression must be of an apparent reluctance on the part of the Government to take the initiative in devising bold (and expensive) plans for civil protection; of a situation in which official schemes are continually being altered, under protest, because of pressure from expert critics. Nor does this impression, in fact, arise merely from the Government's undue secrecy. There is an important point of principle involved. The Prime Minister has told us that he will not introduce a war-time regime until an emergency actually arises: there can be, for instance, no Ministry of Supply and no compulsory register until war is actually in sight. And, on Tuesday, Sir Auckland Geddes revealed that, although a Ministry of National Service already existed in skeleton form, with "a young and active man" already earmarked to be Minister, neither would be produced until the day of disaster dawned. Perhaps the best comment on the doctrinaire position which the Government have taken up in this matter was made by Sir Auckland himself:—

As an island nation (he said) we have been accustomed to wars which allowed us a period to make the necessary arrangements after the beginning of the war. That position is now past.

That is precisely why, in Mr Eden's words, "The nation

would welcome the greatest possible national effort in every sphere of defence"—even in peace-time.

Headway and Hesitation.—No sincere critic of the Government can ignore the difficulties under which Ministers are working. Rome was not built in a day; nor can London be defended in three months or even six. Passive defence is only a limited part of the problem of protection; and, within those limits, to reconcile the twin tasks of making Britain's cities as safe as possible in the very short run, and giving them maximum protection in two years or more is not easy. Camps for persons evacuated from urban centres may be desirable; but, as the Minister of Health maintained in a speech early this week, plans for billeting in private houses are essential until such camps can be fully provided. Similarly, even if deep bomb-proof shelters are ultimately indispensable, blast-proof shelters are needed until the underground refuges have been constructed; and there is the serious danger that, if deep shelters are decided upon and war comes before they are completed, the rush of citizens to occupy refuges which are not capable of accommodating them all may cause panic and chaos. Yet these are not arguments for sacrificing the long-term programme for greater safety to the temporary measures which are immediately needed, but rather for working along both lines at once with all speed whatever the cost.

The urgency of far-reaching action is now being realised. The latest evacuation proposals have been officially designated as provisional, and the construction of camps on a large scale is under consideration. The efforts of fore-sighted authorities, like Finsbury Borough Council, to provide deep bomb-proof shelters are at least not being discouraged. Sir John Anderson has approved the appointment of whole-time officials to organise the recruitment and training of air-raid wardens; and he has announced that, at long last, the regional A.R.P. inspectorate of the Home Office will be appreciably strengthened. On Tuesday, a White Paper detailed a plan to organise transport in war. Headway is being made. But the root trouble of hesitation remains. Sir John Anderson agreed last week, for example, that the Central London authority to co-ordinate A.R.P. which the metropolitan boroughs are asking for was needed. He even said that such a body was provided for in principle, but he added that it could only be set up in time of war. Better late than never, they say; but, in matters of defence nowadays, late and never may well prove to be synonymous.

The British Note to Japan.—An incisive note on the British attitude towards Japanese aims in China was presented at Tokyo on January 14th by the British Ambassador. The note begins by outlining, on the basis of authoritative Japanese official statements, what the Japanese plan is. There is to be, in Eastern Asia, a *bloc* of three states: Japan, "Manchukuo," and Intramural China, the two latter being the puppets of the first, which is a Great Power in military, economic and political occupation of her nominal partners' territories. It is easily demonstrated that the partnership can only be a fiction to mask the reality of Japanese domination, and that the "sovereignty" of the two puppets can only be a sham. Yet, in the name of this sham sovereignty, all foreign Powers and their nationals are to be deprived of their present extra-territorial rights in China, as well as of their settlements and concessions. This will be fatal to the interests of every foreign Power in China save Japan. All of this is flatly contrary to the Nine-Power Treaty, and the British Government do not agree that this treaty can be modified by the unilateral action of one signatory.

* * *

Nor does the Government agree that the Treaty is obsolete or that it no longer meets the situation—except in so far as the situation has been altered by Japan in contravention of this treaty's terms. While not unwilling, in principle, to consider negotiating for the modification of any treaty, the British Government for the present reserve all their rights under the existing treaties relating to China. On the Japanese side, it is admitted that the Nine-Power Treaty is the crux. As long as Great Britain and the United States hold fast by the Nine-Power Treaty, they will be holding out for a state of affairs in Eastern Asia which is incompatible with Japanese aims. Japan is determined to turn the whole of Eastern Asia into a vast Japanese preserve, which will make Japan independent of all other sources of supply and all other markets. And she cannot do this if she has to keep her promise to respect China's territorial and administrative integrity. If the English-speaking Powers will only sacrifice Chinese independence to Japanese ambitions, then, in the Japanese view, there will be a possibility of reconciling strictly British and American interests with Japanese purposes. Japan might be prepared to ensure to the English-speaking Powers the preservation of their existing trade and investments in China in return for their abandoning to Japan the whole of the rest of the Chinese field, political as well as economic. The Japanese are now hinting that if the British and Americans remain obstinate in clinging to the Nine-Power Treaty, the Anti-Comintern Pact may be turned against them as an instrument for bringing them to reason. This suggestion is perhaps unlikely to make us more pliant.

* * *

The Palestine Conference.—The round-table conference on Palestine seems at last to be getting under way. The Transjordanian delegate reached London at the end of last week, and on Sunday there was a preliminary gathering of other delegates at Cairo, where the Prime Minister of Iraq, General Nuri es-Said, and the Crown Prince of the Yemen, conferred with the five Palestinian Arab leaders who have now been released from their place of internment in the Seychelles. The five had previously been in conference in the Lebanon with the Mufti of Jerusalem for the selection of the Palestinian Arab delegation and the determination of its programme. The representatives of the independent Arab states will probably prove to be in favour of some compromise which will enable them to reconcile their championship of the national cause with their desire to remain on friendly terms with Great Britain. At the same time, they are unlikely to press their views as vigorously as their Palestinian Arab colleagues, whose interests are directly at stake, and in the Palestinian delegation the Mufti and intransigence seem to be in the ascendant. The Mufti and his friends are fighting a simultaneous war against the Jews and British on one front and against their fellow Palestinian Arabs of the Nashashibi faction on the other; but this dispersal of energies may not weaken them so much as might be

expected at first sight, since the Nashashibi party seems now to have been routed so thoroughly as to be unable to put a spoke in the Mufti's wheel in the perhaps decisive months that lie immediately ahead. The Nashashibi party have been completely ruled out from representation, and the Palestinian Arab community will be represented in London by a monopolistic single party on the familiar "totalitarian" pattern. The delegation will also put forward a "totalitarian" programme. They will demand the establishment of an All-Palestinian Arab sovereign independent state, and the total and permanent shutting off of Jewish immigration. In return, they will be willing to grant minority rights to the existing Jewish population of Palestine, and to enter into treaty-relations with Great Britain on the lines of the Anglo-Iraqi Treaty of 1930. Beyond this, they will concede nothing; and it is equally certain that the Jewish delegation with whom they are nominally expected to confer will not look at such terms. It can thus already be foreseen that the conference will be little more than a time-consuming prelude to the imposition of a settlement by the British Government on both parties. This is the Government's declared intention supposing that the conference does not quickly lead to a settlement by agreement; and the Government have now had ample time to decide at last what their policy is to be. We wish we could feel confident that they know their own minds to-day any better than at any time during the last three years.

* * *

Closing in on Barcelona.—With its Government meeting in sound of the gunfire, the Republican army took up its stand on Thursday on the outer of Barcelona's last two lines of defence. They had fought a steady rearguard action all the week: on Sunday Tarragona and Reus fell, on Monday Cervera, on Wednesday Pons. On Thursday, General Franco made contact with the fortified line which runs down from the hills east of Pons, through the small industrial town of Igualada to Villafranca and thence to the coast at Vandell. Up to the time of going to press no breach has been made in this line, although it has now been shelled and bombed for close on forty-eight hours. The week-end may tell another story. If forced out of this line the Republicans will retreat to the final line which covers Barcelona, running from Cardona through Solsona and down the Llobregat river to the coast a few miles west of the city. Their gallantry is beyond doubt. Their reserves of native morale show no more signs of running out than do General Franco's reserves of foreign ammunition. In France, as in this country, feelings are deeply stirred by their resistance; and in France General Franco's advance has raised in more pressing form than ever before the dilemma of Non-intervention. The closed frontier is the subject of grave misgivings in the minds of many besides the followers of M. Blum, even though the Cabinet has decided against any change in policy.

* * *

The Temper of France.—M. Daladier has been enjoying publicity such as French Prime Ministers rarely enjoy, for on every cinema screen in the country he is being shown touring Corsica and Tunisia as the personification of France's refusal to surrender her imperial position at the sound of Italian trumpets. M. Daladier draws political strength from his ability to fill the rôle of the representative Frenchman—a democrat, a small town baker's son, glorified by the aureole of high political office. His prestige is liable to wax and wane like the moon owing to his difficulty in choosing and formulating a policy, but he is at the moment without any doubt by far the most popular and powerful member of his own Government. It has even been suggested that he might aspire next May to pass, like Poincaré in 1913, from the premiership to the presidency, but he would be unwise to entertain such ambitions before he has piloted his way through the greater part of the three and a half stormy months which lie before him. M. Daladier's own strong position has pushed momentarily into the background the rivalry between the pro-Munich and anti-Munich wings of his Government, led by M. Georges Bonnet and M. Paul

Reynaud. M. Reynaud had the advantage at the end of the year when he held the parliamentary stage and could claim a number of financial successes, whereas M. Bonnet's conciliatory attitude to Italy was becoming daily more unpopular. The prestige of a Finance Minister who bases his policy on the revival of confidence inevitably suffers when international tension brings rentes down, especially if he is off the stage. M. Daladier's tour, by satisfying national pride, has paradoxically provided M. Bonnet with some of the psychological cover which he needs for his policy. With a considerable section of the French public the case for it has been strengthened by the guarantees which Mr Chamberlain believes he obtained with regard to Spain while in Rome, and by the defeats suffered by the Spanish Government. The reception given to M. Flandin's speech on Tuesday, showed that M. Bonnet's position has been improved on the eve of his first full-dress speech on foreign policy to the Chamber—after nine months' tenure of the Foreign Ministry. The political weight of the Left is still noticeably diminished by the fiasco of the general strike and the differences on foreign policy revealed at the Socialist Party Congress. But it would be wrong to assume that French opinion is either acquiescent in Italian aggression or happy about the consequences. Under provocation, French tempers are rising.

* * *

Peace in East Norfolk.—The several rebels against Cabinet policy among Government supporters have one characteristic in common: their bark is worse than their bite. On Tuesday, the independent Conservative candidate who had been put forward by local farmers to fight the National Liberal nominee of the Government in the East Norfolk by-election, was not after all nominated. In response to a personal appeal by the Prime Minister and his written pledge that it was the Government's intention to proceed as quickly as possible with whatever legislation might be needed to restore prosperity to agriculture, Mr Wright, who had already declared himself to be an unswerving supporter of Mr Chamberlain's foreign and general domestic policy, withdrew; and the National Farmers' Union themselves endorsed his refusal to split the Government vote. The internecine quarrel in the Conservative ranks, which was not unconnected with the fact that the Government nominee in East Norfolk was a dependent Liberal, has suddenly collapsed, with both sides claiming victory. It is the official view that, since the prime issue in the election is Mr Chamberlain's peace policy, the farmers have loyally permitted the interests of the National Government to prevail. The farmers, on the other hand, whose outspoken criticisms of the Government's present agricultural programme have not ceased, also claim the day. Mr Chamberlain's message to Mr Wright means, they argue, that the justice of their demands has been conceded; and, presumably, they believe that the discussions which are now going on between their representatives and the Minister of Agriculture about an extended policy of price guarantees will result, not in a measured scheme to serve the interests of the community as well as those of producers (such as we discuss in a leading article on page 110), but rather in the payment of the full ransom they have demanded with menaces. It has still to be seen whether blackmail has really won. Pending a decision, farmers up and down the country are remaining at battle stations.

* * *

The Labour Opposition.—The leaders of the Labour Party have drifted into troubled waters and Sir Stafford Cripps is cast once more for the rôle of Jonah. On Wednesday a special meeting of the Party Executive was held to pass judgment yet again on the factious conduct of their learned colleague and to decide whether or not to cast him overboard at last. A week ago the Executive rejected by 17 votes to 3 a memorandum by Sir Stafford calling for co-operation with other parties and political groups in united opposition to the Government. The rebel retaliated by distributing his proposals to all members of the party, who were then hurriedly exhorted by the Executive to dis-

regard Sir Stafford's overtures since they were calculated to bring the party into confusion. The Executive's chief difficulty in taking action in this matter, which they referred on Wednesday to a sub-committee, lies in the inconvenient fact that Sir Stafford is, generally speaking, right; there is a large volume of anti-Government feeling which at present has no means of expression, and the sentiment is widespread, even in the Labour Party, that some common channel should be created. It is true, too, that the Labour Party has no discernible chance of winning an election in the near future unaided; that, in fact, the chief Opposition party has not gained a proportionate access of strength from the recent growth in criticism of the Government. Actually, the Labour Party's leaders, obsessed by a kind of doctrinal "racism," seem to have no over-riding wish to win elections. They have indeed lately formed a propaganda axis with the Co-operative movement, whose latitudinarian views about a Popular Front appear to place them perilously near the category of socialistically "non-Aryan"; but the writ *de haeretico comburendo* rules the party's councils rather than their constitutional obligation to seek the redress of popular grievances by persuading a majority of electors to follow their lead. The present position is deadlock: Sir Stafford is too able a colleague and has too much support among Labour Members of Parliament and constituency groups to be banished; but the opposition to his plans from the Executive and the trade unions who dominate conference votes is too strong for him to have his way. The unions distrust "intellectuals," and few of Labour's leaders are able to accept Sir Stafford's odd premise (unspoken this time) that the Labour Party can find the greatest volume of support among the handful of Communists on its Left rather than among the millions to its Right. Effective opposition to the Government from the Opposition seems, in these circumstances, unlikely. It is the Conservative dissentients who probably have success nearest to hand, if they care to grasp it.

The Fenians Again.—The mysterious series of bomb explosions in the neighbourhood of electric power-stations and transmission lines, which began on Monday, has a faintly nostalgic air of mid-Victorian Fenianism. There is strong evidence that the so-called Irish Republican Army is responsible, and the object appears to be to draw attention to the desire of that body to get rid of "partition"—i.e. of the continued existence, within the United Kingdom, of Northern Ireland. Fortunately, except for one case in Manchester, where one man was killed and two were injured, little damage has been done, and the general attitude of the British public seems to be that of tolerant amusement which is traditionally extended to the actions and antics of Irishmen, even when they are playing with dynamite, political or otherwise. Nevertheless, if the bombs serve the purpose

of attracting attention to the state of affairs in Northern Ireland, they will have served a useful purpose. The Englishman obstinately considers that the question whether or not Northern Ireland shall have Home Rule, and within which country that Home Rule shall be exercised, is a matter for Irishmen to settle among themselves. But to leave the people of Northern Ireland to decide their own fate is one thing, and to use British money and British military force to bolster up, within the United Kingdom, a regime whose actions (as exemplified by the recent commitment to prison, without trial, of 34 men arrested on suspicion of Nationalist sympathies or worse) are contrary to Magna Carta, the Petition of Right and the Habeas Corpus Act, is quite another matter. It is high time that the political bases of Orange power in the six counties were fully examined.

* * *

Hungary Squares the Triangle.—One question which the Munich Agreement left unanswered was the precise way in which Herr Hitler meant to capture the political machinery of Balkan and other countries. The technique is now declared: the foreign policies of those countries are to be harnessed to the Anti-Comintern Pact. Hungary, after Czecho-Slovakia the least capable of protest, announced her adhesion last week. In the last resort, she had no alternative: but there is more than a hint of alacrity both in Hungary's adhesion to the Axis and in her adoption of an anti-Jewish policy. This, and her Ruthenian policy, have forfeited Hungary a large part of the respect she enjoyed in the West. It is being said—though on circumstantial evidence only—that Yugoslavia and Roumania have had private warning that the Third Reich expects similar movements on their part; and although the report may be premature, it is at least based on an intelligent reading of such facts as are known. Her size and position make Poland a special case. But it is unlikely that Colonel Beck's conversation with Herr Hitler, having by all accounts included the subjects of colonies, of the German minority in Poland, of a motor-road across the Polish Corridor, and of a more closely defined regime in Danzig from which League influence would be finally removed, left out the all-important subject of German-Polish relations and their bearing since November's improvement on feeling between Poland and the U.S.S.R. It is unlikely that last week's meeting at a shooting expedition of the Regent Prince Paul and King Carol was not used to discuss what the Governments of Yugoslavia and Roumania would do if they had to choose between the Anti-Comintern Pact, or alliance with Italy and thereby at second-hand with the Axis, and the chancy (and perhaps impossible) course of remaining unattached to anyone outside the Balkan Entente. And it is unlikely that Herr Hitler, having brought Hungary and Czecho-Slovakia into the anti-Comintern fold, will forgo further use of an effective means to East European hegemony. Exchanging pious sentiments this week with Dr Stoyadinovich, the Yugoslav Prime Minister, Count Ciano must have reflected bitterly on the impotence of Italian foreign policy which Hungary's action reveals. Her commercial influence in the Balkans is now negligible, and her diplomatic influence rests on no firmer base than the bombastic proclamations of the Italian Press. For all that Italy can do to stop them, every Government in the Balkans and beyond may hand over the conduct of its affairs to Berchtesgaden. Faced with the British Government's apparent indifference to their fate, those Governments have really a simple choice: to go in with Germany without preamble, or to wait upon events and trust that the British and the French will back their neutrality when the ultimatum falls. They may wish to take the second course, but if past events are any guide they will take it with grave misgivings, realising full well that their trust may be misplaced.

* * *

and Imrédy Takes the Offensive.—Inside Hungary the pace of political development is speeding. Imrédy means to put his land reform, now limited

to the annual transfer from big estates to small holdings of 140,000 acres up to a total of 2,000,000 acres, through Parliament as soon as possible. The sixty-odd Conservative deputies who caused the Government's defeat on a motion of confidence some weeks ago are still in clamant opposition to the land proposals, but in the event some of them may think twice before voting against them, all the more because the proposals are being criticised as too moderate. The Conservative opposition—as distinct from the extremists, who seem to be even more blind than most fanatics—now begin to see which way their defection is pushing the Prime Minister. They had hoped that he would drop the land reform, shuffle his Cabinet, and carry on in defiance of popular opinion. But M. Imrédy is proving himself of tougher metal. With the Regent behind him (and, for the moment, Herr Hitler too), it is he and not the land-owning Conservatives who is forcing the issue. On January 9th was founded a new national "movement," heralded in the German Press as a movement "of the masses quite unlike the old parliamentary clubs," which is clearly intended to provide a substitute for the extremist organisations and a warning to those who endanger the Government's stability. If M. Imrédy cannot get a majority for his land proposals, he may decide to shelve Parliamentary business until his new movement has organised itself for fighting elections, and then go to the country with full-blooded nationalist slogans and—one may guess—appropriate technique. For the letter of Hungarian democracy cannot long survive its spirit—and its spirit died this week with the formal recognition of Germany's predominating influence in Budapest.

* * *

The "Square Deal."—The railways' "Square Deal" is daily assuming a much more complicated geometrical shape. At the end of last week the Transport Advisory Council published some important modifications to the original proposals for complete abolition of rate-control. As a result, the railways now seek no alteration in the law relating to the provision of reasonable transport facilities, through rates and standard conditions of carriage. Moreover, the fears of many transport users, particularly the heavy industries, have been recognised by the proposal to hold regular consultations between the various trading associations and the railway companies on railway rates and charges. In the event of breakdown, appeal would lie to a body such as the Railway Rates Tribunal, which would have the power to decide upon the reasonableness or otherwise of the charges under dispute. By using recognised trading associations as a sort of clearing house for complaints and by employing negotiation before appeal proceedings, the railways would obtain part, at least, of the elasticity of charges which they originally sought, while traders would enjoy ultimate protection against unreasonable rates. The railway companies, moreover, are prepared to accept the suggestion that any legislation which may be introduced should be limited in its application to, say, five years. These modifications are to be welcomed, although they do not, in themselves, guarantee the success of the sectional discussions now proceeding between the various interests concerned nor ensure the ultimate aim of co-ordination. The precise state of the negotiations between the rail and road representatives is particularly difficult to determine. Reports that the road-rail discussions had practically reached an *impasse* have conflicted with hopes of agreement. It is understood, however, that further road-rail talks are due to be held next week, and their outcome will obviously be crucial. Meanwhile the evidence of the Traders' Co-ordinating Committee to the T.A.C. emphasises the need for simplification of the present railway classification, concedes that exceptional rates should be quoted without reference to the Railway Rates Tribunal, but makes certain stipulations regarding maximum rates. Whether these conditions would commend themselves in all railway quarters is doubtful, in view of Lord Stamp's criticism of maximum rates at a meeting in Manchester this week.

Road Transport in War.—The Government scheme for the organisation and control of goods transport by road in the event of war was issued by the Ministry of Transport on Tuesday. The scheme is based on the unanimous recommendations of the Road Transport (Defence) Advisory Committee, representing road transport operators and workers, and the railways, which was set up to advise the Minister of Transport. The basis of the plan is that all classes of operators, whether public hauliers or private traders, should in peace time and without interfering with their ordinary business, voluntarily form themselves into working groups. Fuel will be rationed in war-time for each group. The grouping will not apply to petrol and oil tank vehicles, nor to vehicles specially constructed for the conveyance of abnormal indivisible loads. The Chairman of the Traffic Commissioners, who is the licensing authority for goods road vehicles, will be the chief administrative officer in each traffic area, and in war he would become the Regional Transport Commissioner. The traffic areas are to be divided into districts, in each of which a Government district transport officer will be appointed, who will have under him sub-district managers, nominated by the operators who have joined recognised groups. The sub-district manager will have no duties in peace-time, but in an emergency he will be in charge of the rationing of fuel and the general operation of the groups. Alongside the Government officials will be area committees and district committees of operators on the same lines as the Ministry of Transport's own advisory committee. Except in special circumstances, groups will consist of not less than 25 and not more than 100 vehicles, and should comprise, as far as possible, vehicles used for the same type of work. Private traders' vehicles operated under "C" licence should normally be grouped together, and it is particularly desired that vehicles normally used in carrying raw materials for food manufacture and for the wholesale distribution of food, e.g. insulated meat vans, should be grouped together separately. An operator entering a group must agree to remain in it for one year, and after that give three months' notice of intention to leave. It is intended to compile and keep up to date a complete record of all licensed goods vehicles, and operators will be required to notify the group organiser of any changes in their fleets. The requirements of active and civil defence will have first claim on available fuel supplies, and fuel for ordinary commercial traffic will be severely rationed. No fuel ration above the minimum will be available for ungrouped vehicles. Steps are also being taken to ensure a sufficient supply of road transport drivers in war-time. As with so many other plans for war-time organisation, the chief criticism that can be made of this scheme is that it was not drawn up long ago. There is now an urgent need that it should be put into force, and the personnel appointed, as rapidly as possible.

* * *

Deaths on the Roads.—Since 1934, deaths and injuries on the roads have ceased to increase *pari passu* with the number of motor cars. Last year's returns show very little change on the preceding year, although the number of licensed vehicles increased by 6 per cent. between November 1937 and November 1938. This is, of course, an improvement, but it is regrettable that it has not yet been possible to reduce the absolute toll of life and limb. The returns do not readily reveal the effects of measures designed to reduce accidents, but there is some evidence of the success of the "courtesy patrols." This experiment was started last spring in the Metropolitan Police District, Essex County and in certain areas of Lancashire and Cheshire. Comparing 1938 with 1937, road deaths in the Lancashire patrol areas declined by 4½ per cent. and the number of persons injured by 17 per cent. against increases in the rest of Lancashire and in Yorkshire. Deaths in the Metropolitan Police District and Essex County declined by 7½ per cent. and numbers injured by 1 per cent., compared with a fall of 4 per cent. in deaths and a rise of 2 per cent. in numbers injured in the rest of Essex, Surrey, Kent and Herts. While not conclusive, these figures are certainly suggestive. The following table summarises the principal statistics for the whole of Great Britain.

	Pedestrians		Pedal Cyclists		All Classes	
	1937	1938	1937	1938	1937	1938
Killed	2,978	3,023	1,421	1,392	6,590	6,595
Seriously injured.....	16,593	16,561	14,663	13,540	52,412	50,977
Slightly injured	56,266	57,873	53,041	52,205	173,943	175,877
Total	75,837	77,457	69,125	67,137	232,945	233,449

Accidents to children continue at a high level, children forming 28½ per cent. of pedestrian fatalities, 37 per cent. of serious injuries to pedestrians and 43 per cent. of slight injuries: 15 or 16 per cent. of pedal cyclists killed or injured in 1938 were children.

* * *

Wages in 1938.—The well-known fact that wages tend to increase for a considerable time after business activity has reached its peak and has begun to decline is emphasised in the annual survey of wage changes published in this month's "Ministry of Labour Gazette." While business activity reached its peak in the late summer of 1937, wage rates continued to rise until May of last year. Since May increases in wages in some industries have been more than counterbalanced by decreases in others. But on balance the average level of wage rates at the end of December was estimated to be between 1 and 1½ per cent. higher than at the end of 1937. The following table summarises the position since the end of 1935:—

End of Dec.	INDICES 1924=100					
	Wage Rates (including Agriculture) (1)	Retail Food Prices (2)	Rents, Cost of Clothing, Fuel, Light, etc. (3)	Purchasing Power of Wage Rates in terms of		Insured Unemployed (excluding Agriculture) (6)
				Food (4)	Rents, Clothing, etc. (5)	
1935 ...	95.6	77.1	93.7	124	102	13.4
1936 ...	98.6	80.0	95.1	123	104	11.5
1937 ...	103.1	85.3	98.6	121	104½	12.1
1938 ...	104½	81.2	98.9	129	105½	12.9

Col. (1) Mr E. C. Ramsbottom's index for 1935, 1936 and 1937; provisional and independent estimate for 1938. Col. (2) Ministry of Labour index of food prices. Col. (3) Ministry of Labour index of the cost of living after excluding food prices. In Col. (6) the percentages for 1935 and 1936 have been adjusted for new method of counting the unemployed introduced September, 1937.

It has often been commented that the present cost-of-living index number, based on the purchases of pre-war working-class families, is inadequate to provide a reliable guide to the measurement of changes in real wages. This is partly because the average working-class family of to-day spends less than the assumed 60 per cent. of its income on food and partly because it buys a great many things, which either did not exist before the war or simply could not be afforded. Since the movements of the total cost-of-living index are in the main a reflection of changes in food prices, the table printed above divides it into two parts. Expressed in terms of food wage rates fell throughout the period of recovery and only rose last year, when food prices fell. On the other hand, the rise in money wages has all the time been greater than the rise in rents, and the cost of clothing and other miscellaneous items included in the present index; it has also quite probably been greater than the rise in the prices of other goods now purchased by the working classes. In any case, it is apparent that real wages to-day, though possibly on the downward grade, are still higher than a year ago.

The NATIONAL BANK of NEW ZEALAND, Limited

The Dogma of Purchasing Power

NEW YORK, January 8.—At the present time, four economic concepts pervade and, perhaps, may be said to dominate American thought. They are not mere opinions, for the term opinion implies something more or less lightly held, and these views are now held in a dogmatic or doctrinaire fashion. That is to say, they are accepted as, say, the gold standard was formerly accepted—as something so generally accredited that to doubt it would be economic heresy if not social perverseness. These doctrines are not confined to any one party, group or class, and, while they are not unanimously held, the number of open dissenters is few.

The first—the other three largely derive from this one—is the doctrine of purchasing power. This appears in so many forms that it is perhaps best described by example. Last year the railways were hovering on the brink of bankruptcy; but railway wages, which had been raised just prior to the crash of 1937, were not cut because their reduction would retard recovery by reducing purchasing power. Again, the tariff has always been defended by the argument that it permitted high wages and so increased purchasing power; and, in the same way, the agricultural programme aims at raising the purchasing power of the farmer, to enable him to buy the products whose price has, by hypothesis, been raised by the tariff.

The purchasing power doctrine is often coupled with the theory of over-saving, especially in discussions of taxes intended less for revenue than to redistribute the national income. Historically, it is related to the theory of under-consumption as an explanation of the disequilibrium of supply and demand, which is otherwise called over-production. Under this doctrine purchasing power is regarded as antecedent to production; that is, purchasing power is not so much the reward of production as the initiating force of the demand that calls production into being. This concept is not, of course, confined to the United States; it has won considerable acceptance elsewhere, notably in France; but in no other country have its implications been so fully worked out.

The second doctrine is represented by the view that the cash deficit of the Treasury represents a contribution by the State to the national income—regardless of whether the deficit is financed by increasing the supply of money or by savings. Since the cash deficit is a contribution or addition to the national income (the aggregate of individual incomes, not the value of national output), and since the largest possible national income is admittedly desirable, any argument in favour of a balanced Budget is economically subversive, so long as the national income is below some acknowledged "normal" level. The view of the cash deficit as an addition to the national income has largely superseded the concept of the deficit as a "pump-priming" fund—just as the latter concept superseded the concept of the cash deficit as a vehicle of credit reflation.

The Short Working Week

The third dogma is the doctrine of the short working week. While the reduction of the working week to 48 hours was usually defended on grounds of good health, the reduction below 48 hours during the Depression was intended for the purpose of "sharing the work." The forty-hour week became quite widespread, and in 1933 it was incorporated in some of the National Recovery Administration's codes. The codes were abandoned, but practice in industrial relations quickly becomes traditional right, and the forty-hour week was widely retained or prescribed under collective bargaining agreements—which occasionally, indeed, reduced hours materially below forty.

Consequently, the legal limitation of the working week to forty-four hours in October occasioned comparatively little disturbance of existing industrial practice, particularly in the larger establishments. The Wages and Hours Act provides for stepping-down to a universal forty-hour week in two years' time.

Under the doctrine of purchasing power it is invariably insisted that hourly wages or piece-rates should be adjusted to compensate for the shortening of the week. In the pursuit of the principle of the shorter week, comparatively little attention has been given to its effect on labour costs.

There is some evidence that, in certain industries, improved technique or re-equipment has compensated for the shorter week, so that the benefit of technology has been translated into leisure for the workers, rather than into lower prices for the consumer, larger profits for the owners, higher wages or more employment. Labour-saving machinery has been, in a limited number of cases, utilised to offset the shorter week, but such re-equipment is costly, and only the strongest concerns have been able to do it.

Pensions Proposals

The fourth dogma is that the non-employed (the unemployed or the aged) have a claim to income related primarily to the need to maintain or increase their purchasing power. The principle of this theory is most clearly illustrated in the attitude towards old-age pensions. At present the law provides for non-contributory pensions of \$30 a month, of which (in general) \$15 may be contributed by the Federal Treasury and the remainder by the State of residence. The contributory Old Age Benefits of the Social Security Act do not become operative for some years, and they average much lower. In the recent election campaign promises of larger old-age pensions were among the commonest of arguments. The Townsend Plan for pensions of \$200 a month to every person over sixty causes less furore than two years ago, and the principle is now more widely accepted: namely, that the increased purchasing power generated by the pension payments would of itself cause an increase in consumption, and hence in production, that would, of itself, provide for their payment. If it did not, the cash deficit incurred by paying the liberalised pensions would increase the contribution of the Federal Treasury to the national income, and hence the payments would be economically justifiable.

Each of the three last-mentioned doctrines, as was said, stem from the doctrine of purchasing power. And this doctrine is shared by all sections of the community. Yet the tradition of the balanced Budget dies hard; and one commonly encounters an insistence upon the necessity of an eventual balancing of the Budget combined with an equal insistence upon the importance of sustaining purchasing power by the cash deficit's contribution to national income. Other people find it hard to reconcile devotion to the principle of purchasing power, as exemplified by the high nominal and real wages secured in the short working week, and the persistence of large unemployment—but they do not question their doctrinal premises.

This emphasis on the expression of the purchasing power theory in terms of the national income is of relatively recent growth. Earlier emphasis was on the influence of the price-level on purchasing power. Confidence that the price-level can be controlled, or the rate of industrial activity determined, by solely monetary devices has been considerably weakened in recent years; but to a considerable and growing extent the public mind is shifting to the belief that the national income can be raised to, and maintained at, a desired level.

France

National Effort

PARIS, January 19.—During the three months that followed Munich French policy benefited by a kind of armistice. The immediate foreign danger was past, but the fear of a conflict in September had been strong enough to convince public opinion of the need for a national effort to safeguard peace. During the period of respite it was possible to start an economic recovery by liberal methods as the recent rise in public funds has proved, but the need for

a national effort is still present. The foreign danger is no longer in the past tense; the Italian claims have shown that it is still to come. "The dictators will never give us a respite," is the view which is currently heard in the markets; and it is this sentiment that has put a brake on the spectacular recovery of the Stock Exchange.

Nevertheless, the situation now does seem rather different from the position in September—for three main reasons. In the first place, the military menace now comes from the Mediterranean. On the Rhine France is on the defensive, as Germany was in September. The Navy and the North African colonial troops are highly efficient. The output of aeroplanes is making good progress. And, moreover, French and British interests are nowhere so intermingled as on the road to India.

In the second place, the restoration of social peace at home has been greatly assisted by the Fascist claims on French territories. The workers are working longer hours, and many conservatives are convinced of the need to safeguard the standard of life. M. Daladier meets with unanimous approbation when he recommends a great national campaign to preserve peace and guarantee security against foreign dangers.

Thirdly, the national effort has already achieved results. The latest figures of industrial and commercial activity show that recovery is under way. This is, however, no more than a beginning. Further measures to reduce State expenditure, to lessen the burden of taxation, and to expand credit will become unavoidable. But the success achieved so far will make these steps correspondingly easier. France is in need of reform, and, if re-armament does not end in war, the foreign dictatorships will have done the country a service, because the mounting cost of re-armament will be met from the fruits of the national revival which has now been made inevitable.

Nothing very new and important has yet been done by the Government in the direction of far-reaching reconstruction. Orthodox members of the Senate have criticised the "Malthusianism" of certain employers. Exporters' associations have been created which will benefit from special tax exemptions. The grouping of industries is being planned so that they may raise money and re-invigorate business by profitable investment instead of bolstering the economy by the present costly public works.

These are only the first items in a joint public and private effort, which should produce significant results without weakening the rôle of profit and private capital.

Railway Economies

The National Railway Company has published its receipts for 1938 as follows:—

	1937	1938	Increase
Passenger fares	3,407,756	4,087,273	679,517
Luggage	69,805	86,542	16,737
Postal parcels	484,307	577,308	93,001
Merchandise	8,663,468	10,113,895	1,450,427
	12,625,336	14,865,018	2,239,682

Traffic actually fell. The number of loaded wagons was 15,528,475 against 17,170,859 in 1937. The rise in revenue combined with a shrinkage in traffic shows that the swelling of receipts was due to the increased rates and fares which were imposed in 1937 and 1938. These increases amounted on the average to 50 per cent. in the case of passenger traffic and 53.8 per cent. for goods. In the first week of 1939 279,207 loaded wagons were dealt with against 258,230 in the first week of 1938.

Finally, it must be noted that the total railway deficit for 1938 was still as high as 2,500 million francs. The Government refuses to increase rates still further, and the only way out seems to be to reduce costs, notably by a better co-ordination between rail and road. Operating costs per vehicle-kilometre are 15 francs by rail, 10 francs by railcar and 4 francs by bus. Experts estimate by replacing railway by bus services and railcar by bus services it would be possible to effect a considerable saving. A good deal has already been done in these directions, and other savings have been secured by stopping the fresh recruitment of staff and the fusion of services. Even a slight revival in business should practically cover the balance of the deficit.

In the week ended January 7th, the number of persons unemployed was 416,604, against 404,730 in the previous week and 380,938 a year ago.

Prices Up Again

Wholesale prices which have remained steady since the

summer are now tending to rise, mainly owing to seasonal circumstances, such as the rise in vegetable prices due to short supply.

Franco-German negotiations have been begun in Berlin for a new economic agreement. The chief topics under discussion are quotas, coke and iron ore contracts and the consequences of the annexation of the Sudetenland. In addition, M. Alphand, the president of the French delegation, has had a long conversation with Dr Schacht about the main economic problems of interest to both countries.

Germany

Jews and Christians

BERLIN, January 15.—Negotiations between the director of the Evian Committee, Mr Rublee, the president of the Reichsbank, Dr Schacht, and other officials of the Third Reich have reached a deadlock. The proposals made by Dr Schacht in London are not likely to be accepted; for the Third Reich intends to gain some material benefit from Jewish emigration, which other countries will on no account permit. On the other hand, Mr Rublee has made counter proposals which would be hard for Germany to accept, especially since guarantees against further Jewish persecutions are required.

At a ceremony at Lippe to celebrate the Nazi victory there in the 1933 elections, Dr Rosenberg, the "Party Philosopher," defined his attitude towards the Jews and the Churches. Possibly to exert an indirect pressure on the negotiations between the Evian Committee and the Government, Dr Rosenberg stated that the Jewish question would only be solved when there was no Jew left in Germany. He further maintained that the Jews were trying to obtain their own State in Palestine in order to appoint diplomatic representatives in other countries, who would further Jewry's desire for domination; and he voiced his suspicion that the projected Jewish State would be a hide-out for "Jewish criminals." How far the radical Nazis intend to go in their persecution of the Jews is indicated in Dr Rosenberg's statement that the Jewish question in Europe would only be solved when the last Jew had left the continent.

Dr Rosenberg launched into a similar tirade against the Churches, which he accused of shielding the Jews. The "era of creeds" was past, he said, and the "era of races" had begun. Such remarks suggest that Germany may intensify her anti-Semitic policy should the negotiations about Jewish emigration come to nothing; and that she may simultaneously strike a blow at the Churches, as the *Schwarze Korps* has so long demanded.

At the same festival, Dr Ley, leader of the Labour Front, discussed the shortage of labour. He was, he said, convinced that the productivity of German labour would be doubled within six years. The fundamental principles for efficiency were, according to Dr Ley, "work, achievement, diligence, sacrifice, willingness to give one's all and the spirit of communal life." It is worth noting, however, that, to take one example, the productivity of miners is already beginning to decrease, because these workers are over-pressed. Leading State officials have recently demanded that maximum wages should be granted only in exceptional cases, in order to avoid too heavy demands on the supply of scarce consumer goods.

Railways and the State

In a provisional report, the Reichsbahn (State Railways) announces that passenger traffic increased by 8 per cent. and goods traffic by 11 per cent. in 1938. Revenue from the carriage of passengers and luggage rose by 9½ per cent. to Rm. 1,300 millions, and goods receipts by 6 per cent. to

BRITANNIC
ASSURANCE COMPANY LIMITED
(Established 1866)

Rm. 3,120 millions. The average income per passenger-kilometre rose slightly, because the number of "Strength Through Joy" trips at reduced fares fell owing to the intense activity on defence works.

AVERAGE RECEIPTS (In pfennigs)

	Per passenger-km.	Per ton-km.
1929	3.02	4.56
1933	2.81	3.80
1937	2.37	3.68
1938	2.38	3.53

Average receipts from goods traffic fell further because of the numerous low exceptional rates. Transportation for State purposes (military, fortifications, Party, Four Year Plan and welfare) played a large part in the year's working; and the mobilisation during the summer and autumn was an appreciable factor. The free facilities granted for winter relief work were responsible for a fall in receipts of Rm. 16.2 millions. The revenue of the Reichsbahn, even including Austria, the Sudeten territories and the associated private undertakings, was Rm. 300 millions less in 1938 than in 1929, which is an interesting commentary on recent rate policy.

The accounts of the Reichsbahn for 1938 closed with gross receipts of Rm. 4,730 millions, against Rm. 4,420 millions in 1937; if Austria is included, total receipts were Rm. 5,050 millions. Details of expenditure are not yet available, but the ratio of receipts to revenue has moved unfavourably. Taxes and other payments to the State now amount to 12 per cent. of the railways' income.

The linking-up of the Austrian, Sudeten and German railway systems will entail costly works and extensions, while at the same time the general introduction of German rates and fares means reduced receipts. The Reichsbahn emphasises that its own resources are insufficient to carry through "urgent tasks of vast dimensions," and that the capital market, which is now practically at the sole disposal of the Reich, must be made available to the Reichsbahn for a loan. The current railway programme includes the new North-South municipal railway in Berlin; the centralisation of Berlin's large railway stations; the extension of the railway system in Austria and Sudetenland; the Rhine-Ruhr project; the electrification of the Nuremberg-Halle line; the reconstruction of municipal lines in Hamburg, Munich, Nuremberg, etc.; and the building of extra locomotives and wagons. Since the last public loan of the Reich has not yet been fully subscribed, the launching of a loan for the Reichsbahn will be difficult.

Government Building Demands

Abnormally heavy Government contracts have led to the overtaking of the building industry. The State orders are mainly for military and defence works; Government and Party buildings; and work on the motor roads, of which 1,000 kilometres are completed yearly. The contracts which have been given out up to the present amount in value to Rm. 30,000 millions, and, since the building industry can only handle Rm. 12,000 millions' worth of construction at one time, despite the fact that the industry's capacity is 40 per cent. greater than in 1929, the supply of orders represents two and a half years' full employment. In the first three quarters of 1938, however, there was a fall of 21 per cent. in the erection of flats and dwellings compared with 1937, which explains the housing shortage.

Herr Funk, Minister of Economics, who was recently charged with the centralisation of "rationalisation activities," has set up an advisory committee to increase output. This will entail further encroachment by the State on private industry. Similarly, General Goering has appointed a commissioner for the power industry with full powers to bring about an increase in the output of electrical power and to standardise its distribution—"setting aside all obstacles."

In December work on many building projects was stopped by bad weather, and the number of persons recorded in paid employment fell by a million, bringing the total number of employed persons down to 19.2 millions. The number of unemployed, however, only rose from 152,000 at the end of November to 456,000 at the end of December, against a rise of a million in December, 1937. The total number of unemployed in Greater Germany, including Austria and the Sudeten territory, was 824,000 at the end of 1938.

Coffee has become scarce owing to trade difficulties with Brazil—which sheds an interesting light on the alleged stability of bilateral trade agreements and barter arrangements. A Government decree has restricted the amount of coffee to be roasted; and shopkeepers will only sell coffee in limited quantities, and often only when other goods are bought as well.

Sweden

Independence and Neutrality

STOCKHOLM, January 12.—The speech recently delivered by the Foreign Secretary, M. Sandler, on the problems of foreign policy which confront this country in particular and all small countries in general, won approval far beyond the ranks of his Socialist Party. The passages emphasising the Government's intention to adhere to a policy of strict neutrality and not to give way to any foreign pressure, either of an economic or a political nature, gained special praise. M. Sandler called particular attention to the recent declaration of the Baltic States about common rules of neutrality, which coincided with those already adopted by the other Northern countries and therefore represented a constructive contribution to the regulation of the situation in the Baltic in case of war.

The Office of the Accountant General has completed its estimates of State revenue in the forthcoming budget year, 1939-40. Compared with the Budget estimates for the current financial year, there will be an increase in revenue from Kr. 1,130 millions to Kr. 1,190 millions. To make up the extra Kr. 60 millions, it is estimated that taxes will bring in an additional Kr. 27 millions, receipts on State account will rise by Kr. 13 millions and miscellaneous revenues by Kr. 20 millions.

Total State revenue, including revenue from productive State enterprises, is estimated at Kr. 1,341 millions, compared with Kr. 1,295 millions in the current Budget year, and the emergency Budget provides Kr. 70 millions for armament expenditure which, under prevailing political conditions, has become a necessity. It still remains to be seen whether the Government will resort to further increases in taxation or whether they will abstain from additional expenditure on social welfare—in view of the prevailing uncertainty about the development of the economic situation in the near future.

Business Improvement Persists

At the moment the improvement in general economic activity, which began in the autumn after a period of decline lasting from August, 1937, to June, 1938, is still proceeding. The general index of business activity (1935 = 100) showed a further rise from 113.3 to 114 in September. Important factors in this advance were enlarged industrial output, greater iron and steel consumption and satisfactory employment—all factors bound up with the building boom.

Foreign trade remains an unsatisfactory feature. In the period January-October the value of exports was Kr. 1,610 millions against Kr. 1,500 millions in the same months of 1937; and imports fell in the same period from Kr. 1,734 millions to Kr. 1,679 millions. In October the import surplus was Kr. 179 millions, compared with Kr. 124 millions in October, 1937. As long as the outlook for pulp and paper remains as unpromising as it is at present, no appreciable improvement in the state of trade can be expected.

Wholesale prices are still moving downwards, and the index of wholesale prices prepared by Professor Silverstolpe fell in November from 123 to 122—partly under the influence of declining corn prices. The money market is gradually returning to normal; refugee money is leaving the banks and the cash holdings of the joint-stock banks have contracted from Kr. 823 millions to Kr. 604 millions. Bank advances have risen by Kr. 48 millions to a total of Kr. 4,335 millions and deposits have fallen by Kr. 95 millions to Kr. 4,237 millions in all. No gold purchases have lately been made by the Bank of Sweden, whose gold reserve now stands at Kr. 707 millions.

The Stock Exchange was extremely dull throughout November and not even encouraging news from New York could induce investors to enter the market. Yet, most Swedish companies whose shares are listed on the official list have considerably consolidated their position in recent years, and should be able to maintain the present level of dividends, even in face of a business recession, provided this does not assume the aspect of a prolonged depression.

The war danger and, still more, fears of further increases in taxation and a more radical policy by the Socialist Government are the main factors which tend to divert investors from the stock market to less remunerative, but less speculative, investment opportunities. The growing unwillingness of capital to take risks, which must in the long run paralyse the normal growth of production and economic development, has become a subject of considerable concern to prominent business leaders in this country; and the problem will certainly crop up in the forthcoming informal discussions between the Government and representatives of industry.

Japan

Expenditure Still Growing

TOKIO, December 18.—The Budget estimates, for the fiscal year which begins on April 1, 1939, were approved by the Cabinet Council on December 2nd. Expenditure was fixed at 3,694.7 million yen, compared with the current year's original estimates of 3,514.5 million yen. The increase is mainly due to the growing debt services; various relief measures for disabled soldiers and soldiers' families; air-raid precautions; the extension of industrial capacity; the promotion of export trade; and river improvement.

The Army and Navy estimates together amount to 1,148 million yen, or 31.8 per cent. of total national expenditure, compared with 1,247 million yen, or 35.4 per cent. of expenditure, in the current year. This comparison, however, is now practically useless unless the war estimates, which are to be separately budgeted for, are taken into account. And any attempt to draw a line between defence votes and civil votes is rendered largely meaningless, because a good deal of expenditure incurred in the prosecution of the war is actually included in the civil estimates.

Revenue for the coming fiscal year, 1939-40, was estimated at 2,801 million yen, an increase of 295 million yen compared with the current year. Once more there is a huge deficit, this time of 893 million yen. Of this deficit, 809 million yen is to be met by a new loan.

Despite the objections of the Minister of Commerce and Finance, it was eventually decided that the financial provisions in the National Mobilisation Act should be enforced with the rest of the Act. Those controversial provisions provide, *inter alia*, for restriction of the dividends of companies benefited by the war and compulsory bank loans to war industries. This decision was a severe shock to business circles and the investing public, and they have not yet fully recovered. The clauses are, however, to be applied so as not to interfere radically with business management; the maintenance of "usual" rates of dividend, however high, will be allowed and only increases in dividend will be restricted. And, in the case of compulsory loans, the Government has apparently no intention yet of interfering with the loan policy of the commercial banks.

Satisfactory Foreign Trade

The returns of foreign trade are still surprisingly favourable. In November both imports and exports were higher than they were twelve months ago. The value of imports in the month was 217.4 million yen, which was 7.4 million yen, or 3.5 per cent., higher than in November, 1937. Exports, valued at 262 million yen, were 9 million yen, or 3.6 per cent. higher than in the previous November, and their value was the largest monthly figure recorded this year.

During the eleven months ended in November imports showed a fall of 1,145 million yen (32.5 per cent.) to 2,380.4 million yen; and exports registered a decline of 508.9 million yen (17.5 per cent.) to 2,393.8 million yen. Thus, in the eleven months, there was an export surplus of 13.4 million yen, compared with an import surplus of 622.5 million yen in the corresponding months of last year.

This improvement is not, however, quite so marked as it seems, if trade with China and Manchukuo (which is transacted in yen) is excluded. In trade with countries outside the so-called yen bloc there was an import surplus of some 500 million yen in the eleven months, compared with a deficit of over 900 million yen a year ago.

There has been a continuous expansion in the note circulation. In November, the average for the month was 2,025 million yen, compared with 1,997 million yen in October and 1,671 million yen in November, 1937. The Tokio Chamber of Commerce's index of wholesale prices registered a slight rise in November of 0.2 per cent. The Tokio Stock Exchange's index of share prices for November fell by 9.4 points, and at the end of the month stood at 136.7 against 146.1 a month earlier.

Hongkong

New Importance of Macao

HONGKONG, December 21.—The Japanese have not succeeded, so far, in killing British trade with South China, but since their entry into Canton some two months ago they have placed many formidable obstacles in its way. The railway has been entirely out of commission, the telephone line is cut, the air service suspended, and the river forbidden

to all non-Japanese vessels. Nevertheless, foreign gunboats have ignored the ban and an unofficial bi-weekly service has been arranged between the British, American and French navies. This gunboat traffic provides the only means of communication between Hongkong and Canton (except for wireless); and the boats carry a limited number of non-Chinese passengers whose baggage usually includes purchases on behalf of residents of Shamen as well as correspondence. Although the regular mail service has been suspended since the fall of Canton, the Japanese are prepared to dispatch mails from Canton to Hongkong via Formosa, a detour of some five or six hundred miles for a direct journey of 90 miles.

Trade which would normally flow from Hongkong to Canton and the ports on the West River is diverted to the Portuguese colony of Macao, some 40 miles from Hongkong. Between the two colonies there are now some six or seven river steamers plying daily with cargo and passengers. Macao, which has steadily decayed during the ninety-eight years since the establishment of Hongkong, is now a busy entrepôt from which goods filter, chiefly by junk, into the interior and to which the produce of South China is conveyed by all sorts of devious ways and means.

At present the port of Macao is too shallow for ocean-going steamers to call; but the Japanese have announced that they will start a line of steamers between Macao and Canton to carry Chinese and Japanese passengers only. There is also a report that they mean to assist the Portuguese in developing Macao to replace Hongkong as the deep sea port of South China. In the meantime, however, some of the foreign firms which have hitherto functioned in the Shamen at Canton have transferred their offices to Hongkong, and a certain amount of business is being done in silk and other China produce. It is possible that the valuable silk trade may be transferred to this Colony in the same way as the tea trade has come here from Shanghai.

Canton and Refugees

The city of Canton is beginning to show signs of life again. For the past two months trade has been confined to the market for looted goods and the places where country people assemble to sell vegetables. Now tea houses and small shops are reopening, and many of the better-class citizens are returning from a countryside where brigandage is rampant. The Japanese have set up a puppet Government and with great difficulty have persuaded Chinese ex-officials to take office as Chairman of the Provincial Government in one case and as Mayor of Canton in another. For all practical purposes, of course, the city will be administered by the military commander. The troops at his disposal appear to be limited and garrisons left on the march from the coast to Canton are now withdrawn.

A few weeks ago a small force made its appearance along the British border for the purpose of rounding up remnants of the Chinese defenders; and its operations led to a large influx of refugees into British territory, at one time estimated at more than 50,000. Later negotiations between the British and Japanese military authorities resulted in the complete withdrawal of the Japanese troops, but it was some little time before the refugees could be persuaded to return to their villages. With the co-operation of the Hongkong Government local charitable organisations have established in Chinese territory a refugee centre which provides food

Wealth and Welfare

THE politicians seem likely to leave the League of Nations in the lurch. Economists are more loyal, for they cannot dispense now with Geneva. They rely upon the data collected and expounded by the Economic Intelligence Service of the League for comparative information about social and economic matters in most countries of the world; they base their assessments of current economic trends upon calculations made by the League's experts; and they look to economic committees of the League to furnish, not only news about the policies pursued by member States, but also guidance in tackling problems of production, trade and welfare on practical lines. Economic views from Geneva are commonly accepted without prejudice and, since applied economics is first and last a comparative study, the clearing house which the League has set up is indispensable to professors and Ministers alike.

Four volumes* published this month aptly illustrate the double function of the League's economic and financial publications. Two, on world trade and balances of payments, are annual surveys; every year they are relied upon for the most authoritative statements of their subject matter. The other two impinge upon policy: one records the measures which have lately been applied by various Governments to survey the food habits and state of nutrition of their citizens as first steps towards improving their standard of living; the other analyses the need for organised credit in agriculture and describes the different systems of credit and insurance that have been introduced for the benefit of farmers.

The interest of the two statistical volumes is not confined to their scope and reliability. In the comprehensive and ingenious tables of the foreign trade of 66 countries in the years 1935-37 (improved once again by the compilation of an increasing number of tables of imports and exports on the common basis of the "Minimum List" of 456 commodities recommended by the League Council in 1935), the varied pattern of world recovery from the depression of the early thirties can be traced. It is possible to contrast the differing fortunes of different countries by comparing the rate and extent of their trade, during the trade cycle's upward swing, in raw materials, machinery, metal products, textiles and chemicals, respectively.

Similarly, the survey of 33 countries' balances of payments in the decade up to and including 1937 shows striking changes in trend. Six creditor countries (the United States, the United Kingdom, France, Holland, Eire and Sweden), who between them had a considerable credit yearly on current account up to 1930, showed on aggregate a debit balance in

A World-wide Survey of Price-Control Schemes

GOVERNMENT PRICE-FIXING

By JULES BACKMAN

Instructor in Economics, New York University.

A critical survey of government price-fixing and production-restriction schemes in all parts of the world from the Great War period to the present day. The author analyses each scheme, and suggests means of overcoming its defects. 304 pages. 12/6 net (by post 13/-).

Order from a bookseller or direct from
PITMAN, Parker Street, Kingsway, London, W.C.2

four out of the succeeding seven years, as well as in the seven years taken together. Several debtor countries, on the other hand, were able to pay off part of their foreign debt in the busy years 1936 and 1937 by reason of their current credit surplus. Throughout the later period the importance of "hot money" in international payments is clearly shown by the figures.

Against the world background etched in fine detail by these statistical surveys the programmes of betterment indicated by the last two of these four volumes stand out in relief. Nutrition has become a chief theme at Geneva; and, in the simplest language, the report on national nutrition policies describes what is being done to analyse the nutritional value of actual diets. The conclusion that, even in the wealthiest countries, the diets of something like half the population are in some ways insufficient shows how imperative and widespread the need for State policies to make cheap and nourishing food generally available really is.

From food to food producers is scarcely a step at all. Popular nutrition and farmers' prosperity go hand in hand. M. Tardy's report on systems of agricultural credit is an invaluable item in the formulation of programmes to stabilise the livelihood of farmers in face of the vagaries of harvests and markets. In all, the rôle of the economic labours of the League has never been more evidently vital than now, despite the rising toll taken of the world's wealth by preparations for war, for upon the success of such labours peace no less than prosperity may well depend.

Shorter Notices

"Our Own Times, 1913-1938." By Commander Stephen King-Hall. (London). Nicholson and Watson. 1,150 pages. 12s. 6d. net.

In 1935 Commander King-Hall's "Our Own Times" provided an excellent example of how vivid descriptive powers allied to a gift for condensation could produce a contemporary history with a wide appeal. The original two-volume work, which went through four editions, has now been brought up to date by including an account of the last five years up to the crisis of September, 1938. The high standard set remains unchanged, and "Our Own Times, 1913-1938," can be read as history or, helped by a comprehensive index, can serve as a first-class work of reference.

"Le Mouvement des Grains dans le Monde." By Paul van Hissenhoven. (Brussels). Editions Ceres. 860 pages. No price stated.

The recent meetings in London to discuss the world wheat position lend added interest to this survey of grain marketing. M. van Hissenhoven discusses in detail the capacity and characteristics of grain exporting countries, one by one; describes exhaustively the Antwerp market for grain; and concludes a compendious work with a valuable account of the principal grain markets in other countries. From his complete and vivid picture emerges what he calls the grain problem: no longer the problem of producing the cereals men need, but rather of making available or distributing the plenty which is now produced. He envisages grain as the essential item in the flood of goods which freer international trade would let loose once autarky were ended as the policy of nations.

"Foreign Affairs." (January, 1939). Council on Foreign Relations, Inc., 10 Ferry Street, Concord, N.H., U.S.A. \$1.25 quarterly.

The views of contributors to this American quarterly are always expert and authoritative, and the first issue of 1939 is more valuable than ever. The set-piece is a 90-page article by Hamilton Fish Armstrong on the proximate origins of the Czechoslovak crisis of last year, the detailed course of diplomatic events from March to October and the consequences for world affairs of the Munich Settlement. The narrative is shrewdly and succinctly told, assembling episodes and documents in a fuller pattern than we have yet seen and unfolding a tale which, for all the objectivity of its telling, must make sorry reading for French and British people. Excellent pendants to this comprehensive account of events are articles by Miss Wiskemann, on "Czechs and Germans after Munich"; by Dr Toynbee on "A Turning Point in History"; and by Mr Nicolson and M. Géraud on what their two countries, England and France, now mean to each other in the frame of international uncertainty.

THE BUSINESS WORLD

The Plight of Shipping

FOR many years British shipping and shipbuilding stood unrivalled in efficiency and size. As lately as 1937 the net earnings of our merchant fleet, amounting to £130 millions, were sufficient to pay for nearly 14 per cent. of our net imports of merchandise. To-day both industries are threatened with serious calamity. The income of shipowners is insufficient to maintain the efficiency of their fleets by replacing old vessels with modern tonnage, and shipbuilders find the greatest difficulty in obtaining any new orders. Both industries, hitherto the champions of free trade, have now asked the Government to come to their rescue. The public is sympathetic and the Government has promised generosity. But the discovery that the two industries in which we have hitherto been pre-eminent are in need of such extensive help has come as a shock. How did it come about that Britain's position in shipping and shipbuilding has been undermined so swiftly?

The fundamental acquiescence of the pre-war world in Free Trade and in the economic interdependence of nations was demonstrated in nothing so strikingly as in the willingness of the world to allow Great Britain to build its ships and carry its goods. In the years before the war, Britain owned about half of the world's shipping tonnage; in the years 1909-13 British yards actually built 61 per cent. of the world's mercantile tonnage. The Great War, however, disclosed to foreign countries the disadvantages, to them, of the near-monopoly of British ships and shipbuilders. In the war years, British ships were fully occupied in supplying Great Britain and the British armies, while the shipyards were not interested in foreign orders. From this time dates the determination of many countries to acquire an adequate merchant marine of their own, even at the cost of drafts on their exchequers. The effects of this change in policy can be seen in the following table and in the diagrams on page 153.

BRITAIN'S POSITION IN SHIPPING AND SHIPBUILDING
(In thousands of gross tons)

	1913	1929	1938
I. Tonnage owned (a) :—			
Britain	18,274	20,046	17,675
Rest of world (b)...	20,944	41,115	43,685

Rest of world	Not available	1,347	2,027
Britain's share %	...	55	20

(a) Steam and motor tonnage. (b) Excluding Empire and American lake vessels.

At first foreign countries were content to increase their shipping capacity with the assistance of British shipbuilders. Thus, while Britain's proportion of the world's steam and motor tonnage (excluding Empire and American lake vessels) fell from 46½ per cent. in 1913 to 33 per cent. in 1929, the proportion of the world's tonnage launched by British shipbuilders declined only slightly, from 58 per cent. to 54½ per cent.

During the past ten years, however, Britain has also lost her position as the world's shipbuilder. While Britain's proportion of the world's shipping capacity declined further, from 33 per cent. in 1929 to 29 per cent. in 1938,

the proportion of the world's tonnage launched by our shipbuilders fell from 54½ per cent. to 34 per cent. The decline in shipbuilding, moreover, has already gone beyond the loss of foreign custom, for the high cost of construction has forced British shipowners to place orders abroad. At the end of 1938, when the tonnage under construction in this country for foreign owners was valued at £3,500,000, shipbuilders abroad were building vessels for British owners valued at £6,500,000. In 1938, British shipbuilders obtained only one-fifth, and in the last quarter only 15 per cent., of the world's orders for merchant vessels.

"Shipping," as Mr Kennedy, the American Ambassador, recently pointed out,

"has ceased to be a business in most countries and has become instead an adjunct of national defence. . . . We sometimes find it expedient to do things for ourselves which could be done better and more cheaply by the people of other nations."

But while the tendency to economic nationalism, and with it subsidies and flag discrimination, may have been accelerated on strategic grounds, it would be doing a disservice to the British public (which will have to foot the bill for assistance to shipping and shipbuilding) not to draw attention to certain other factors which have contributed to the decline of the two industries.

The Deep Sea Tramp Fact-Finding Committee of the Chamber of Shipping, in its report issued last week, did not mince words. Foreign tramp shipping has the advantage over the British industry by reason of :—

- (a) The lower capital cost of ships, which cannot be ascribed solely to State aid;
- (b) lower running costs—wages, manning, insurance and in some cases accommodation;
- (c) lower cost and speedier execution of repairs;
- (d) Government subsidies, indirect aids, preferences, and flag discrimination.

The Committee adduces a mass of evidence in support of these statements. So far as construction costs are concerned, it states categorically that these are higher in the United Kingdom than in other countries. The price of a cargo vessel of 7,500 tons d.w. built to plain specifications has risen from £67,500 at the end of 1929 to £108,000 at the end of last year, an advance of 60 per cent.

The increase in running costs during the past two years has been substantial. The cost of repairs has risen by 30-35 per cent.; the price of coal has advanced by 25-30 per cent.; stores have risen in price by about 10 per cent. and wages by 20 per cent. Moreover, the improvement in labour conditions has also added to expenditure.

Shipbuilders, in turn, point out that theirs is only an assembly industry, and that the rise in construction costs is due to higher prices of materials and wages over which they have no control. Re-armament, in their view, has contributed to the rise in costs.

These, briefly, are the unpalatable facts which prompted the once stout defenders of free competition to seek Government aid. It is contended that if British shipping is not to be driven off the high seas, and the shipbuilding industry is to continue to exist, the Government will have to come to the rescue of the two industries. But in view of the fact that the resources of the Treasury are already

heavily mortgaged by the increase in defence expenditure, a further appreciable draft on the Exchequer needs to be justified on solid grounds. The case for assistance, however, transcends mere sectional interests. The vast distances between the units of the British Empire, and Great Britain's dependence on overseas supplies of foodstuffs and raw materials, necessitate the maintenance of a large shipping, and consequently a large shipbuilding, industry. The demand for Government assistance, therefore, does not rest merely on the desire to maintain these industries in being for reasons of prestige, but on an urgent strategic necessity. In sum, it is widely held—and there is justification for this view—that Government assistance to the shipping and shipbuilding industries should form an integral part of re-armament, and is as urgent and necessary as the manufacture of guns.

But, granted the necessity for the maintenance of vigorous shipping and shipbuilding industries, what form should Government assistance assume? Here we come to the crux of the problem. The shipping industry, at the behest of the Government, has already presented its proposals, outlined on page 65 of *The Economist* last week. These proposals involve an annual expenditure of at least £8½ millions, and if "something is to be done" for shipbuilding as well, total expenditure would, on this basis, exceed £10 millions per annum.

In essence the shipping industry's proposals consist of a list of demands for financial assistance to the various sections of the industry and for other measures designed to increase the employment of British shipping. The industry lays stress on the importance of shipping in peace and war, but the published proposals have no reference to the size of the various categories of shipping tonnage which it is desirable should be maintained. Moreover, the proposals are purposely confined to shipping and have not been designed as a comprehensive scheme for shipping and shipbuilding together. They contain no suggestions concerning the industry's own contribution to the solution of the problem. In short, the shipping industry was asked to make out a case for assistance and it has done so.

It would be folly if the Government were to carry out these proposals without a further and searching investigation. First, the problems of shipping and shipbuilding must be tackled as a whole. Secondly, the Government, after carefully examining the relation of shipping and shipbuilding to the national economy in peace and war, must take a view concerning the size of the total fleet as well as that of individual categories which it is desirable to maintain in the national interest. The proportion of the world's merchant fleet owned by Britain should clearly not be allowed to fall below the British Empire's proportion of the world's sea-borne trade. As the table following shows, Britain's proportion of the world's sea-going steam and motor tonnage is already no greater than the Empire's proportion of the world's sea-borne trade. But to attempt the maintenance of a fleet largely in excess of the Empire's requirements of carrying space might be much too costly.

THE WORLD'S SEA-BORNE TRADE

	1913		1936	Proportion carried by British vessels
	% of Total	% of Total		
Empire to U.K.	6.1	9.3	93

World Trade	100	100	40	
Britain's proportion of world's sea-going steam and motor tonnage...	52	37	...	

Thirdly, the capacity of the British shipbuilding industry should be effectively maintained at a level at which it will be able to meet the maximum of likely requirements of the Admiralty, and British shipowners, with a margin for export orders.

Lastly, though it is unquestionably true that the British shipping and shipbuilding industries have to compete against subsidies, low wages, inferior conditions and flag discrimination, it is not so self-evident that these factors are the full explanation of their competitive failure. How is it possible, for example, for Dutch shipyards, as has frequently been alleged, to build ships entirely of British materials for less than the cost in British yards? How is it that the Scandinavian countries, with wages not much lower than the British, with crew conditions on the average superior, and with little or no advantages by way of subsidies or legal preferences, maintain their competitive position with more success than we do?

Before any subsidy or "fighting fund" is granted, the Government must carefully investigate the causes of the comparatively higher building and running costs in this country and must insist on cost reductions where this is possible by technical, structural or organisational changes in the two industries and in those of their chief suppliers. Shipping and shipbuilding could never thrive if their costs remained permanently above those of other countries, exclusive of subsidies. As a further step, the Government must see to it that British ships obtain fair treatment from other countries; the means must be considered of answering discrimination by discrimination. Such a policy could not, of course, be carried to fruition at short notice and some financial assistance is probably essential for a period. But to make £8½ millions per annum unconditionally available for a period of five years for shipping alone would be an open invitation to other depressed industries to seek support from the National Exchequer on no firmer foundation than a catalogue of their woes.

American Investment Trusts

NO bald comparison of the experience of British and American investment trusts will throw much light on the principles of investment policy. The two movements are dissimilar in so many respects that the task would be misleading rather than informative. The broad lines of British investment trust experience in recession are clear enough. Having failed to reflect, to any great extent, the dramatic rise in industrial profits during recovery, British trusts are now showing the effects of recession. For once, the power of the "time-lag" to offset declining earnings appears to have been small. There has been no evidence of significant "switching" operations designed to reap the profits of recovery and to prepare for recession. And investment portfolios, which were, generally speaking, fully covered by market values at the end of 1936, have since

shown a substantial degree of depreciation. What is the parallel experience of American investment trusts during the past two years? This question can be answered more promptly for the American trusts than the British, since the former usually issue quarterly statements of their income and capital positions. Our review, therefore, covers the period from December 31, 1936 (the position of the leading American trusts at this date was examined in *The Economist* of September 4, 1937), up to September 30th last year. Within this period, the Dow Jones index of 30 industrial stocks fell from a "high" of over 190 in March, 1937, to under 100 a year later. Investment policy, if it was successfully to cushion the impact of falling markets on the trusts' assets values, had accordingly to be formulated and executed at great speed and with

almost superhuman insight. The table at the foot of this page attempts to assess the methods and the degree of activity of different groups to achieve this object. The first column, showing the change in the market value of net assets over the 21 months' period, provides a rough measure of their relative success. The decline in asset values has been calculated after adjustment for changes in issued capital, and bank loans have not been deducted from the net assets. Hence the resulting figures are not affected by leverage factors associated with the capital structure or indebtedness of the trusts. Columns 2 and 3 showing the relation of cash and quick assets to total assets at end-1937 and last September illustrate more particularly differences in the trusts' investment policy during the first three quarters of 1938. Six of the nine trusts shown had built up substantial holdings of cash and "shorts" by the end of 1937—which can be taken chronologically as the middle point of recession. Of the three which showed relatively small liquid resources, American General Corporation redeemed some \$18 millions of funded debt in the early months of 1937—a rare example of nice timing—while the other two trusts, American European Securities and U.S. and Foreign Securities, are conducted on conservative investment lines, and have special portfolio characteristics.

By September 30th stock market recovery was well established. The Dow Jones industrial average had, in fact, jumped from its low point of 98.95 at the end of March, 1937, to 141.45. The third column of the table shows that of the six trusts which had accumulated substantial cash holdings, one had almost entirely re-invested and three had partially re-invested. An exception must be made for General Public Service Corporation, whose cash balance of \$4,227,470 must be associated with the existence of \$5 millions of callable funded debt, bearing interest at relatively high rates. The management of Prudential Investors alone appears to have been sceptical of the duration and soundness of the market recovery.

On a superficial examination of the first three columns of the table, it might be concluded that the best timing of the onset of the recession should be credited to American General and Prudential Investors, while the best timing of recovery should be awarded to General American Investors. It must be noted, however, that the latter trust benefited to a greater extent from the downward adjustment of taxation provisions in respect of unrealised appreciation. The heavy portfolio losses shown by U.S. and Foreign Securities and Tri-Continental cannot strictly be compared with the experience of the other seven trusts owing to the leverage factor. U.S. and Foreign Securities owns practically the whole equity of another geared trust (U.S. and International), and within a certain range of market prices movements in the asset values of the parent trust are greatly augmented by movements in the net worth of its subsidiary, whose underlying securities are very similar to those of the parent company's portfolio. Again, some 17 per cent. of the gross assets of Tri-Continental Corporation at December 31, 1936, consisted of marginal

holdings in two other trusts under the same management—Selected Industries and Blue Ridge—which accelerated the fall in the net assets of Tri-Continental.*

American investment trusts have never pursued the wide diversification of investments which is the peculiar feature of the British trusts. A brief indication of the general character of the holdings of each trust will thus throw additional light on their experience during the past two years. U.S. and Foreign includes in its portfolio a large proportion of consumption goods and oil stocks, whose high quality probably justified the comparatively small changes made in the holdings during the recession. Both American and European (in the management of which Swiss financial interests are represented) and General Public Service specialise in utility issues, with a high proportion of bonds and preferred stocks. Prudential Investors, Adams Express, American General Corporation and General American Investors have concentrated more on leading common stocks, covering industries which experience marked fluctuations over the trade cycle, and the first two of these trusts also have a large interest in the oil industry. Tri-Continental and Selected Industries have important interests in rails, utilities and oil stocks.

How far has the market already discounted investment trust recovery in America? In Wall Street, break-up values are of greater importance than earnings prospects as a measure of the value of investment trust stocks. The fifth and sixth columns of the table express these break-up values as an amount per dollar of the common stock prices at December 31, 1936, and September 30, 1938. The gearing ratio, which may be read in conjunction with these figures, expresses total net assets applicable to all classes of capital outstanding as a multiple of the net assets available for the common stocks of each trust. Over the period the excess of market value over break-up value of some of the more highly-g geared common stocks has re-asserted itself. Even last September buyers were prepared to pay substantially more than the net asset value for the common stocks of American European, Tri-Continental and U.S. and Foreign. Although the British investor tends to distrust any process of market valuations based on break-up values rather than on dividend yield, Wall Street has at least behaved rationally according to its lights in valuing highly-g geared investment trust equities at a discount (compared with break-up values) at the height of prosperity and at a premium in the very early stages of recovery.

The position of the preferred stocks is best computed by the earnings cover calculations shown in the table. Comparison of the percentage yield on gross assets (for the year to September last, and not for the calendar year, which may well be smaller) and the earnings required to cover expenses, interest and preferred dividends shows that in four cases out of seven available the latest year's total earnings have met full preferred dividend requirements. But

* Since September 30, 1938, Blue Ridge has ceased to be under the management of Tri-Continental.

a further fall in earnings will almost certainly be shown by the fourth-quarter statements which have yet to appear. Despite the appreciable fall in net asset values over the period, the capital protection for preferred stocks was in most cases satisfactory last September, though it had deteriorated substantially compared with December, 1936. The preferred stocks of General Public Service and Selected Industries, however, were the only issues in the list not fully covered by net break-up values last September, and on the former dividend default also exists.

The conclusions suggested by this survey are that while most of the trusts did not fare conspicuously better from December, 1936, to September, 1938, than the Dow Jones composite average of 65 stocks (which fell 29 per cent. over the period), the managements showed considerable investment activity. But, indeed, for the fact that they switched so readily into cash and short-dated stocks, the average depreciation on their portfolios would have

been greater than it was. Counters selected for rapid capital appreciation during recovery appear, in fact, to have been promptly weeded out, leaving the residue of the investment portfolios, in most cases, to follow the general experience of the market. Whatever the claims of the American investment trusts may be as a medium for rapid capital appreciation in prosperity, they have not made out a decisive claim for "beating the averages" over the period under review. And, in consequence, both common stocks and preferred stocks have felt the effects of gearing upon their assets and earnings cover. The premium over net asset value reflected in the September 30th quotations of the more highly-g geared common stocks suggests that the American investor expects the gearing factor to work in his favour during the coming year. But, on the earnings side, it will be 1940, rather than the current year, which will principally benefit from further recovery in the United States.

British Bank Accounts

THE balance sheets of the leading British banks for December 31st, 1938, reveal several points of interest when compared with those of the previous year. Broadly speaking, a noticeable drop in deposits is offset by minor reductions in cash, investments and advances, but by an appreciable contraction in discounts, noticeably in Treasury bills, call and short loans are in the aggregate smaller than a year ago, and so is that omnibus item "balances with other banks and cheques in course of collection." Acceptances and endorsements show varying trends, and Mr Fisher, in his speech on Thursday to Barclays Bank shareholders, revealed that this year certain new items were included under this heading. It is therefore impossible to surmise what has really happened here.

Any attempt to analyse this year's accounts must needs take as its starting-point first the continuance of the trade recession, and second the outflow of foreign funds with its attendant consequences. Notwithstanding the recession, advances to customers show little reduction from last year. This bears out the impression left by the annual analysis of bank advances compiled by the Bank of England, and reproduced in *The Economist*, December 10, 1938. The inference to be drawn from these figures was that the

1937-38 recession had not been serious enough to create a new mass of frozen loans. Nor did that table provide any evidence that the rearmament industries were requiring a greater amount of bank credit. The final balance sheet figures for December, 1938, are not such as to suggest any qualification of these views.

Of greater importance, from the purely banking standpoint, is the consequence of the year's outflow of foreign funds. This must be one of the chief explanations of the contraction in deposits shown in the latest balance sheets, for in this respect it makes no difference whether the foreigner withdraws a deposit from a British bank (or from the London office of a foreign bank, which keeps a balance with a British bank) or sells securities to some British resident who draws on his bank balance in payment. Whether it is the only explanation is a moot point, but it may be significant that the three Lancashire banks, which presumably do not hold much foreign money, on the whole gained deposits during the year. It seems, therefore, a reasonable assumption that much of the year's drop in total deposits was due to the outflow of foreign funds.

† Includes "reduction of bank premises account."

Thanks to the well-known manner in which the Exchange Equalisation Account handled that outflow, there was no serious loss of cash by the banks. Any tendency to reduce their till-money in proportion to the contraction in deposits was probably balanced by the remains at the end of the year of the crisis expansion in the note circulation. Bankers' deposits at the Bank of England provide little guide. There was no Bank return for December 31st in either year, while contiguous returns are so variable as to suggest no more than that bankers' deposits were much the same at the end of both years. Thus the loss of deposits only led to a minor loss of cash.

It is not surprising to see that the main brunt of this contraction in deposits fell upon the banks' discounts, the exact comparison being a drop of £77 millions in deposits and one of £45 millions in discounts. The reason for this is by now well known, for as the Exchange Equalisation Account sold gold to cover the foreign withdrawals, it took over Treasury bills from the portfolio of the banking system. Actually the tender Treasury bill issue shrank during the year by £134 millions, so that in losing £45 millions of all kinds of bills the joint-stock banks escaped comparatively lightly. There must, however, also be added the year's drop of £8 millions in call and short loans, which include the market's borrowings against Treasury bills. Even so, the full brunt of the shrinkage in the tender issue did not fall upon the banks.

The year witnessed a moderate reduction in the banks' investments, but this does not confuse the main picture. It is that the foreign outflow of funds occasioned a loss of deposits balanced mainly by a reduction in discounts. Once this is realised, the year's trend cannot be called seriously deflationary in fact, whatever may be its potential effects. All the banks have lost is the excrement on their deposits representing fugitive money from abroad. There is no need to suspect any contraction in British-owned deposits, while the balance sheets prove that it was not necessary for the banks either to call in their advances or to realise their investments to any serious extent. The banks' cash is also maintained. In short, the country has as much money and credit at its disposal as it had a year ago.

Nevertheless, the recent trend does not entirely justify a complacent attitude. As the attached table shows, a slight rise in the cash ratio has been accompanied by a fall in the proportion of the "secondary" reserves.

While the banks have increased their cash ratio, their "liquid asset" ratio has fallen from 33.9 to 32.3 per cent. Had the banks bought securities to replace their lost Treasury bills, so as to maintain their deposits intact,

	Dec. 31, 1937	Dec. 31, 1938
All Banks	£ mill.	% of Deposits
Deposits	2,306	2,229
Cash	255	250
Cheques and balances	92	86
Call and short loans	160	152
Discounts	277	232
Total "liquid assets"	784	720
Investments	624	612
Advances	958	957
Total, Inv. and Adv.	1,582	1,569

their cash ratio would still have been at the satisfactory level of 10.8 per cent. Their liquid asset ratio, however, would have fallen to 31.2 per cent., which would have been rather near its minimum. Thus, it is arguable that a small part of the year's drop in deposits was not primarily due to the outflow of foreign funds, but to the reactions of that outflow upon the banks' supply of bills. To that extent, the outflow had a slightly deflationary influence.

This point has a direct bearing upon the immediate future. There may soon arise a dearth of Treasury bills; Mr Fisher, in effect, repeated in his speech to Barclays Bank shareholders the warning recently given in *The Economist*. To take an extreme, but not entirely impossible, example, let us assume that during the coming months the joint-stock banks lose a further £50 millions of Treasury bills, now held either in their portfolios or as collateral to call and short loans. This would reduce their more liquid assets from £720 to £670 millions. To maintain their present ratio of 32.3 per cent. their deposits would have to fall to £2,075 millions. Thus a contraction of £50 millions in liquid assets would, on these assumptions, entail one of £155 millions in deposits, and so investments and advances would have to be reduced by £105 millions. This would be a definite move in the direction of deflation, with obvious consequences on the gilt-edged market and possibly on the trade and industry of the country.

Thus the latest bank accounts, while satisfactory in themselves, contain warnings for the future; they lend emphasis to the suggestion made here a week ago, that the Bank of England might restore to the banking system part of its recent acquisition of Treasury bills and replace them by dated securities. The vital point is that the banks need an adequate supply of bills as well as cash, and starvation in the one direction is just as deflationary as it is in the other.

Finance and Banking

The Discount Houses.—Like many other financial institutions the Discount Houses have had a variable year. On the debit side of their accounts must be set the depreciation of Government securities, and Alexanders, who alone disclose how they handle this problem, announce the transfer of £300,000 from Investment Reserve Account. It is noticeable that all three houses have reduced their holdings of securities during the year, and that was an obvious precautionary measure at a time when markets were becoming adverse. September was also an anxious month, for while the Discount Houses were pressed to take up bills they had to reckon on the possibility that the outbreak of war would bring with it higher money rates. On the credit side was the firmer tendency of discount rates during the closing months of the year. This probably explains why two of the three houses show larger profits. The balance sheets for the two years may not be strictly comparable, for at the end of 1937 the discount market was able to reduce its holdings of Treasury bills so as to avoid borrowing at the Bank. This was not possible on

December 31, 1938, which fell on a Saturday, and so it would be natural to find the market holding considerably more bills than at the end of the previous year. The balance sheets of the three Discount Houses only reveal a limited tendency in this direction, and so it is tempting to

infer that actually they were holding fewer bills, especially since there may have been some transfer of Conversion Loan to the "bills and short-dated securities" item. On the other hand, Sir Sigismund Mendl, at the National meeting, stated that the company had been able "to revert to the normal function of a discount company—namely, the discounting of bills," and Mr Colin Campbell of Alexanders referred to indications of an increase in the volume of commercial bills on offer. Apart from the encroachments upon Investment Reserves, the Discount Houses have had a satisfactory year.

* * *

Exchange Speculation.—Rather over a fortnight ago it became known in the City that the Treasury wished to emphasise its desire, first expressed in 1935, and never

since withdrawn, that bankers should as far as possible curb speculation against the pound, though at the same time taking care not to hamper legitimate trade. This intimation at once raised the delicate question of where to draw the line, and since then consultations have been in progress in the City. It is understood that these have crystallised in the issue this week of a circular from the Foreign Exchange Committee to all the London banks, defining in some detail the classes of business which either would or would not be regarded as legitimate. Broadly speaking, any trader will remain perfectly free to follow his normal business, even if that involves forward exchange transactions, provided that they are a normal and proper hedge against future exchange fluctuations. The same applies to stockbrokers with connections in foreign centres. There is no impediment against the transfer of funds

MONEY MARKET NOTES

The Bank Return

THIS week there has been a further contraction of £7.8 millions in the note circulation, which in consequence is now £8 millions below its pre-Christmas level. This is an unusually big drop, and it looks as if all the time the Christmas rise and fall was in progress there was a steady dishoarding of notes held by foreigners.

Issue Dept.	Jan. 19, 1938	Jan. 4, 1939	Jan. 11, 1939	Jan. 18, 1939
Gold	326.4	326.4	126.4	126.4
Notes in circulation	475.7	488.1	475.6	468.0
Banking Dept.				
Reserve	51.3	69.0	51.4	59.1
Public Depts.	11.0	20.5	19.2	12.3
Bankers' Depts.	124.4	136.0	118.1	119.9
Other Depts.	36.9	37.2	36.7	36.7
Govt. Secs.	104.4	71.4	96.2	85.8
Discounts & Advances	13.0	48.9	22.1	18.5
Other Secs.	21.8	22.4	22.3	23.6
Proportion	29.7%	35.6%	29.5%	34.9%

In the banking department the Reserve has risen by £7.8 millions as a result of the contraction in the note circulation. Government securities are £10.4 millions lower, possibly because of maturities among Treasury bills held by the Bank. The fall in discounts and advances represents repayments unconnected with the money market. Public deposits are £6.9 millions lower. At this time of year, when large amounts are flowing into and out of the Exchequer, wide variations must be expected. All these movements have almost cancelled each other out, and bankers' deposits have only risen by £1.8 millions.

Foreign Exchanges

THE tightening-up of the regulations against speculation, referred to in a Financial Note, have unsettled the foreign exchange market, and there is now a general disposition to close down dollar positions. For one thing, maturing forward exchange contracts can only be renewed if they relate to legitimate business, and also the transfer of £350 millions of gold to the Exchange Equalisation Account has made operators think that the authorities can raise the value of sterling if they desire to do so. With the New York rate still under \$4.70 there is an obvious temptation to clear out and take a profit while the going is good. As matters stand, the New York spot rate rose this week from \$4.67½ to \$4.68½ on Thursday morning, with the Control on Wednesday a heavy buyer of dollars. Later on

Thursday the rate reacted to \$4.68½, and the Control at once turned seller. It has, therefore, been in both ways this week and has the market thoroughly cowed; but on balance it has gained dollars. The big demand for forward dollars has equally subsided, and three months' dollars are no better than 1½ cents premium. The spot Paris rate has remained steady at Frs. 177½, but forward francs have at times been offered. The three months' rate is now Frs. 4 discount, which is practically upon an interest basis. Although belgas followed the dollar on the whole, they were inclined to harden, and the discount on forward belgas has largely disappeared. Guilders were inclined to be offered, and on Tuesday morning the rate was up to Fl. 8.63, but it came back to \$8.61½ later in the day. Swiss francs followed the dollar.

The Money Market

IN spite of the inflow of revenue, money has been very easy this week. More notes have returned from circulation to swell the clearing banks' cash reserves, while Treasury bill maturities this week were, so far as the tender issue is concerned, £23 millions in excess of payments. This last is probably the main cause of the prevailing ease. The only change in the opposite direction is that bond money is no longer obtainable at ½ per cent.

	Jan. 20, 1938	Jan. 12, 1939	Jan. 19, 1939

Others	12-5*	12-5*	12-5*
Discount Rates:			
Treasury bills	12	12	12
Three months' bank bills	17½	9½	17½-9½

* Viz. ½ per cent. for loans against Treasury bills and other approved bills and British Government securities within six months of maturity. ¾ per cent. for loans against 1 per cent. Treasury bonds and other gilt-edged stocks within six months of maturity. 1 per cent. for loans against other collateral.

Last week three millions were cut off the top of the Treasury bill tender, leaving only £22 millions to be paid for this week. Although the market put its tender price up by one penny, it only obtained a 24 per cent. allotment. The tap issue is now up to £525 millions, while the tender issue has dropped to £449 millions for January 14th, and will be only £426 millions by the end of this week. The banks have been ready buyers of March and early April Treasury bills at ½ per cent., but the

market was not keen to sell owing to the difficulty of finding other employment for its funds.

The Bullion Market

THE new restrictions upon gold dealings, in which other centres are co-operating, have led this week to a steady sale by those with maturing forward contracts. This gold has been absorbed by fresh Continental buying, which has come from interests strong enough to finance their own purchases. These two movements have largely balanced each other, and the British Control has not had to give much gold. There was, in fact, a suggestion that on Wednesday the Control was buying gold. Certainly its agent was in the market, but as that agent also acts for other clients, it does not follow that the Control was buying.

* Above or below American shipping parity. This week's calculations are based on a temporary parity, in which the war risk rate is taken as 1s. 3d. per cent.

† At fixing.
The New York price of silver remained at 43 cents per ounce .999 fine during the week.

The silver market was upset by the introduction into Congress of the Townsend bill, with its clauses empowering the Treasury to cease buying foreign silver and to prohibit imports of silver. London prices have consequently eased, but the total decline is not very marked as India is not impressed by the potentialities of this Bill, and so has continued to buy. Nevertheless, the opinion is that the current London price is artificial, and is only maintained by American official buying. Even in a prosperous year India would need a lower price before she bought on a normal scale. For these reasons the market is beginning to look ahead to the summer, when Congress is due to review the whole American silver policy. There is no expectation of any reduction in the Indian import duty.

abroad, either for investment or for deposit in foreign banks. Nor is a customer deterred from borrowing from his bankers against normal collateral, and it is not a banker's business to ascertain how the customer proposes to use his loan. On the other hand, a banker will not henceforward lend sterling against gold or foreign currencies. In some instances bankers will not have sufficient information at their disposal, and for this reason the co-operation of the Stock Exchange was formally sought this week. The news has also emerged that the authorities in certain foreign centres have agreed to help, notably in New York, Paris, Amsterdam and Switzerland. Clearly the Treasury is making every effort to stop up all possible loopholes, and already there has been some falling-off in business in the foreign exchange market, while dealers take stock of the new conditions. Complete success, however, cannot be attained, and it is to be hoped that in any border-line case the importance of not hampering legitimate business will be the deciding factor.

* * *

Another Record Gold Output.—The output of gold during 1938, estimated by the Union Corporation at 36,700,000 fine ounces, beats the previous record set up in the previous year by the comfortable margin of 5.6 per cent. Slightly more than one-fifth of the increase of about 2,000,000 ounces in production came from the Union of South Africa. It will be seen from the following table that after an inordinate leap in the rate of increase of gold production between 1931 and 1936, the figure is now settling down between 5 and 6 per cent. per annum. This may be well above the average rate of increase in the 1920's, namely, 1½ per cent., but it is reassuringly below the leap of 11.7 per cent. recorded in respect of the 1936 production—a figure which played some part in creating the gold scare of the spring of 1937. The rate of production in relation to existing national stocks of gold has kept fairly stable between 4½ and 5 per cent. over the past four years:—

	Production Thou. ozs.	Rate of increase %	National Gold Stocks Thou. ozs.	Ratio of Output to Stocks %
1931	22,405	...	547,832	4.1
1932	24,301	8.5	574,782	4.2
1933	25,335	4.2	579,174	4.4
1934	27,295	7.3	624,543	4.4
1935	29,569	8.3	638,665	4.6
1936	33,022	11.7	667,549	4.9
1937	34,783	5.3	744,732	4.6
1938	36,700	5.6	780,000 (est.)	4.7

The output of Soviet Russia is still an uncertain factor in arriving at an estimate of the world production of gold,

and the Union Corporation have provisionally estimated the 1937 and 1938 figures of Russian production at 5,000,000 ounces. The figures of national gold stocks in the above table include the reserves of Exchange Funds where such figures are officially published. According to the above figures the output of gold over the past eight years has totalled about 233,000,000 ounces, while the national stocks have risen by about 222,000,000 ounces. In order to arrive at an estimate of the metal which has gone into private hoards and into undisclosed national reserves, allowance must be made for dishoarding from India, a movement which over the past eight years has made available to the bullion market gold currently valued at £247,474,000. Adding this figure to the margin of about £80,000,000 (at current price) between the output of new gold and the absorption of the metal into monetary stocks over this period, we get an approximate estimate of the amount of gold at present privately hoarded in the West, and held by undisclosed Exchange Funds.

* * *

The U.S. Silver Question.—The movement in the United States for a substantial amendment of the Silver Purchase Act is gathering momentum. Its latest expression this week has been the tabling of a Bill by Senator John Townsend to empower the Secretary of the Treasury to sell the Treasury's stock of silver, now amounting to 1,700 million ounces, "at such prices as he may deem fit," and in addition to cancel the power of the Government to acquire further imported silver or to issue silver certificates. Conservative elements in Congress are being spurred to support this measure. They are apparently receiving some paradoxical support from the silver group which is becoming antagonistic to the external aspect of the silver purchase programme in which they see the seeds of the ultimate collapse of their own industry. In London these developments are not yet regarded as the immediate precursors of a collapse of the United States Silver legislation. They are interpreted rather as an isolated instance of the general Conservative reaction against the President's powers of government by decree in matters financial than as a reasoned assault on the Silver Purchase Act. For this reason they have not been taken unduly seriously, and though the price of silver has come back this week by ½d. to 20½d. it is still slightly above the American parity. One reason for this is the fact that the open position—small though it is—is almost wholly on the bear tack. Were it not for this technical factor of strength the reactions to this week's silver developments in the United States would have been more startling.

Stock Exchange Probity.—The standard of probity of Members of the Stock Exchange in their dealings with one another and with the outside public is a by-word. In relation to the enormous volume of business transacted, largely on a word-of-mouth basis, the number of complaints or differences which ever reach the point of official consideration is minute and of these only a tiny fraction involves anything more than technical infringements of the stringent Rules and Regulations—and equally important, practices—which the "House" has evolved through long decades of experience. The news this week that the two comparatively junior members constituting the partners in a small firm had been expelled by the Committee on the ground of irregularities involving defrauding the public came as a grievous shock to the body of members. The degree of Press publicity accorded to this intrinsically serious but materially insignificant incident in itself illumines the sober and conscientious background from which it stands out. It is all the more regrettable that the opportunity should have been seized for the publication of entirely unfounded suggestions which in effect alleged the prevalence of criminal malpractices among "House" firms, and that these were under official investigation. Such imputations, of course, contain no vestige of truth.

Members and Exchange Speculation.—The re-introduction of the embargo of 1935 on undesirable exchange transactions (discussed on page 132) has had its repercussions on the Stock Exchange. Members have received a circular comprising the recent letter from the Chancellor to the Governor of the Bank of England on the subject and one from the Governor to the Chairman of the Stock Exchange. The gist of this correspondence is to the effect that the co-operation of the City as a whole is necessary to secure effective discouragement of speculative activities involving undesirable foreign exchange transactions. It may be doubted whether the facilities of the Stock Exchange are at present used to any great extent to effect such transactions, but a number of firms do, on occasion, handle business in exchange and gold when specially requested and it is obvious that such outlets call for control no less than normal exchange and money-market transactions. The "House" however, is not altogether clear to what extent, if at all, members are expected to decline, or reduce, ordinary security transactions which may involve, for example, the purchase of dollars. This highly important point, which affects the whole of the extensive and elaborate arbitrage machinery, will presumably receive greater clarification. And there are certain types of transactions such, for instance, as raising a loan against purchases of foreign securities, against which members of the Stock Exchange will now be on their guard.

Chinese Customs Loans Threat.—The news, recorded in *The Economist* of January 7th, that the Chinese Government had made good from its own strained resources the shortfall of Customs revenue required for

the service of the Customs loans created much uneasiness. But it heralded a more profound shock this week—the reported decision of the Chinese Government to withhold any further advances for the service of the Customs loans and to retain the sums raised in ports still under Chinese control in special accounts. Yet every suggestion that China might be compelled to default (like Mr Franklin Ho's suggestion last year) meets a rejoinder. This week, the spokesman of the Ministry of Finance at Chungking has declared that China wishes to pay all her obligations secured on the Customs and is ready to consider any fair arrangement to that end. A "fair arrangement" would presumably entail the payment of the share of the Customs derived from Japanese occupied areas. But the Japanese authorities, in turn, have refused to make such payments until the Chinese Government accepts the Anglo-Japanese Customs Agreement of May last year. It appears, in particular, that the Chinese Government is unwilling to meet the payments due to Japan under the Boxer indemnity, which amount to £30,000 monthly. Some Chinese circles argue that if the Boxer indemnity were paid, China would be profitably reimbursed by payments from the Japanese authorities for the latter's share of the loan service under the agreement of last May. The fundamental Chinese objection to this procedure is, of course, that it involves the tacit abandonment of Chinese sovereignty in the Japanese occupied areas. The uninterrupted service of the Customs loans, which successive Chinese Governments have honoured, will temper the bondholder's regret that she has been forced into a position of threatened default. Perhaps this week's message from Chungking leaves the door slightly ajar for further negotiations. It can hardly be supposed that China, reflecting on the amount of capital which may be required after hostilities have ceased, would willingly contemplate so severe a blow to her credit as the cessation of service on the Customs issue.

London Area Fares.—The general character of the fare increases which are being sought by the main line railways and London Transport in the London area was examined in *The Economist* last week on page 84. Some provisional estimates of the effect of given increases on the position of the main lines and London Transport stocks may now be attempted. Assuming that a primary objective of the proposed increase is to raise London Transport "C" stock earnings to the standard rate of 5½ per cent., the Board must increase its net receipts by £618,000 compared with the 1937-38 total. But the Board's gross receipts are derived from its share in the London Passenger Transport Pool, nominally fixed at 62.10364 per cent., though the actual proportion last year (presumably after making allowance for such factors as unfructified capital) amounted to 73 per cent. of the total takings. Hence, on its nominal share of the Pool receipts, the required amount for London Transport "C" stock (assuming that expenses remained equal) would be covered by an increase of £997,000 in the total receipts of the Pool, while on the basis of last year's actual share received by London Transport, the Pool takings would need to increase by £847,000. These figures represent approximately 2½ and 2 per cent. of last year's Pool receipts.

It is generally conceded that the adjustment of London Transport's charges (which will not involve any raising of existing maximum scales) may not provide the same rate of increase in receipts as the railways' application for a basic 5 per cent. increase in suburban railway fares, on which the average fare, being higher, can also be adjusted more readily. The heavy workmen's traffic which is carried at reduced fares on the Board's road services may also

tend to limit the rate of increase which the Board can make in its contribution to the Pool. It is desirable, of course, that the main lines and the Board should, as far as possible, maintain a roughly proportionate relationship between their contributions to and their benefits from the Pool. If we assume, as a basis of estimation, that the latter achieves an over-all increase of 2½ per cent. from the adjustment of fares, the Board's "C" stock requirements would be met with a margin. For a recent year, Sir William Wood has estimated that Southern Railway derived 46 per cent. of its gross passenger receipts from the London area, L. and N.E. some 18 per cent., L.M.S. 9 per cent., and Great Western 6 per cent. On the basis of 52 weeks' passenger receipts for 1938, the application of these percentages to an effective increase of 2½ per cent. in London area receipts would provide rather under ¾ of one per cent. for Southern preferred and approximately ½ of one per cent. for L. and N.E. first preference stock. The equity of the other two lines in London area passenger traffic is quite small. In the absence of any knowledge of the precise distribution of pool receipts, and of the time which will necessarily be involved in adjusting fares (assuming that the main lines' application is granted by the Railway Rates Tribunal) these figures can only be regarded as rough orders of magnitude, which cannot exert much influence on the earnings of the current calendar year.

Unit Trust Yields.—Two statements have been issued this week on the vexed question of unit trust yield calculations. The Municipal and General group, after consulting with its accountants, has evolved a comprehensive form of certificate, to be signed by the auditors of the trusts managed by the group. The certificate sets out the amount of income per unit or sub-unit based on the most recent gross dividends and income cash bonuses declared or recommended on the investments held by the trust concerned for one complete year only, and declares that full provision has been made for the remuneration of the trustee

and managers of the trust. Such certified amounts of income per unit will be employed in all references to yields. The form of words employed would, of course, cover a final dividend declared on any underlying security during the first half of the trust's year and an interim dividend declared during the second half of that year. For example, for a trust holding Courtaulds the certificate for the calendar year 1938 would be based on the 7 per cent. final dividend paid on March 21st and the 1½ per cent. interim dividend declared on August 16th last. In this instance, the computed yield would tend to over-state the current earnings position. This, however, is a defect which applies to all yield calculations in some degree, and the certificate emphasises that future income must depend on the rates of dividend to be paid in respect of the particular securities held, which may be changed in the flexible trusts of the group. No capital items, arising, for instance, from the sale of rights, are included in the income calculation. Indeed, the amount of income received from investments in companies whose assets are regarded as wasting is set out in detail in the auditors' report, so that the managers may make an allowance for amortisation.

In the second announcement, the Keystone group of unit trusts define their responsibilities to the investor as exceeding the mere certification of yields. They point out that only cash dividend and cash bonuses should be included, but prefer to make the yield calculation upon the last two distributions, or the last complete year's distributions, of the trust, rather than dividends computed according to the Municipal and General formula. The statement, however, sets out the principles of true yields clearly and fairly. And it concludes with two points regarding yield calculations on Stock Exchange purchases. Quoted yields on Stock Exchange securities make no allowance for the amounts paid for commission, stamps and fees (which are usually treated as expenses), though these charges are necessarily included in the calculation of unit

PROSPERITY, YES - But how soon

IN ADDITION—

to the annual Forecaster and Special Report for 8/-, you will receive, with our compliments ... as long as the limited supply lasts, three valuable Brookmire Bulletins covering the following subjects:

- 1. Capturing Profits**
—and how to keep them.
- 2. 1939 Stock Prospects**
with pointed analysis of the Market Outlook and recommendation on Stock Market Policy for Investors to follow.
- 3. \$50,000 Program**
of Common Stocks designed to profit from Prosperity.
- 4. \$50,000 Program**
of Investment Bonds for Safety and Conservation.
- 5. The Brookmire List**
of Approved Common Stocks suitable for sound investment.

Profits will come to those who understand the forces at work in America in 1939... and who act decisively. "How the Major Industries will Progress in 1939" is the title of the Special Report on American affairs that will accompany the annual Brookmire Forecaster.

Send for the BROOKMIRE FORECASTER

This annual FORECASTER points out what you may expect in Business, Commodity Prices, Money Rates, Bonds and Stocks. It tells a graphic story of what to look for, what to avoid... a guide to successful business and investment planning. While the Forecaster outlines WHAT to anticipate, the accompanying Special Report is a penetrating analysis of present economic conditions and in concrete terms points the way in the changing and complex period that lies ahead. This report gives definite conclusions backed by 34 years of Brookmire experience in guiding Business Men and Investors... it tells the vital effects that Economic Factors and Political Trends are likely to exert on the Building, Automotive, Steel, Armament, Aviation, and the other Important Industries... also it shows the real causes behind the Trends of the securities of all these Industries. Make certain of receiving your copies of these valuable guides promptly.

GREENWOOD

trust yields, since they are, in effect, capitalised. Again, the price of a unit in a unit trust tends to rise during any given distribution period owing to the accumulation of dividend payments on the underlying securities. Towards the end of the period, therefore, the true yield on those securities tends to become somewhat understated. We welcome these endeavours to lay down the principles of accurate yield calculations. The reproach that, in the past, a certain minority of unit trusts has not been free from the suspicion of publishing inflated yields should not be allowed to survive.

Woolworth Balance Sheet.—The 5s. stock units of F. W. Woolworth have maintained the rise which greeted the excellent 65 per cent. dividend (discussed on page 85 of last week's issue). The profits of the company were analysed in detail on that occasion and are accordingly shown in diagrammatic form since 1931 in the following chart:—

F. W. WOOLWORTH'S PROFITS, 1931-1938

The balance sheet as at December 31st shows that the company has extended its trading organisation, but has also, it would appear, made further improvements in its trading efficiency. For instance, freehold and leasehold property have together risen from £9,524,000 to £9,891,000, but stocks have actually been reduced from £3,320,760 to £3,254,356. Cash holdings, which were already impressive enough at the end of 1937, have jumped by £1,278,000 to the high level of £8,492,395, at which they account for no less than one-third of the balance-sheet total. The stock units yield 5s. 12s. 9d. per cent. at the present price of 60s. 1½d.

Leyland Motor Results.—Shortly before the preliminary profits announcement of Leyland Motor, the ordinary shares were an improving market, but they fell back when it was known that the dividend had been no more than maintained. In the meantime, the railways' "Square Deal" campaign has infused a new element of uncertainty into the long-term prospects of all commercial motor manufacturers. The full report of the company for 1937-38 shows a rise of 2 per cent. in total profits, which although satisfactory for a year of difficulty, does not add greatly to the exceptionally strong upward trend of the previous years. An increase of only £11,664, from £631,597 to £643,261, had been indicated by the preliminary profits statement. Important contracts are

believed to have been received during the year, and it is possible that their full effect has yet to be reflected in the company's profits. We show below the allocation of earnings in the past three years:—

	YEARS ENDED SEPTEMBER 30		
	1936	1937	1938
Total profit	557,390	750,686	770,145
Depreciation	70,976	78,054	82,701
Taxation	119,677	224,075	277,141
Other expenses	25,699	43,382	44,183
Prefce. dividends.....	52,041	51,188	49,481
Ordinary shares—			
Earned	288,997	353,987	316,639
Paid	137,250	168,750	163,125
Earned %	42.1	52.4	48.5
Paid %	20	25	25
General reserve	150,000	150,000	100,000
Carry-forward.....	49,234	84,470	137,984

The effect of taxation is to reduce the amount earned for ordinary dividend by £37,000. But in spite of this, little more than half the available earnings are distributed. General reserve is brought up to £1,000,000 with the reduced allocation of £100,000, and free reserves (including the carry-forward) now amount in all to £1,159,000, against an ordinary capital of £900,000. The increase in net fixed assets from £1,107,903 to £1,304,293 reflects the technical vigour of the company and may possibly include outlay in respect of Government work. Following their recent fall, the £1 ordinary shares yield 6s. 7s. per cent. at the present price of 78s. 9d., though this is the more attractive in view of the company's conservative distribution policy.

William Hollins' Dispute.—The position of William Hollins has become entangled with the bindweed of personal controversy. Hence it is difficult for the shareholder to reach an objective conclusion from this week's barrage of circulars from the two opposing camps. On July 25th last year a shareholders' committee was appointed to investigate and report on the affairs of the company. Its report, signed by the five members of the committee under the chairmanship of Mr F. J. Dickens, and dated January 3, 1939, recommends that the board should be reconstituted under the temporary chairmanship (for a period not exceeding six months) of Mr Dickens and that full-time executives should not be members of the board of directors. These proposals are embodied in extraordinary resolutions to be submitted to the shareholders on Wednesday next, January 25th. They are opposed by the present chairman, Mr P. C. Cooper-Parry, who took office at the beginning of last June. Mr Cooper-Parry proposes the appointment of a new board, under the chairmanship of Mr Sydney Shephard, the chairman and managing director of Bairns-Wear, Limited, and would himself become deputy-chairman and financial director. Mr Cooper-Parry takes strong exception to the committee's proposals for reconstituting the board, partly on the ground that three of the proposed appointments out of five would only be temporary. Hence he urges that shareholders would be "in complete ignorance" regarding the control of the company in six months' time. He does not, however, propose to move an amendment to the resolutions at this stage, since they involve a clear issue. Further difficulty has been created by the suggestion that the new chairman nominated by Mr Cooper-Parry is chairman and managing director of a company which competes with William Hollins. The suggestion, at least, is explicitly made in a further circular from Mr Dickens, though it has been stated elsewhere that William Hollins is, in fact, a customer of Bairns-Wear. It is regrettable that divergent views have so seriously clouded the issues involved. But shareholders have already given their support to the committee of investigation and presumably are prepared to consider its recommendations the more thoughtfully for that reason. It is at least indisputable that the company to-day sorely needs first-class directorial ability, for its earnings record during the past ten years has been quite unsatisfactory.

The Week's Company Profits.—Company results are now appearing in greater number, and even excluding bank reports our usual analysis of profit and loss accounts on page 159 covers 34 companies. Owing to the inclusion of the F. W. Woolworth results, the total net profits of these companies amount to £6,800,000 and show a fall of just over 1 per cent. compared with £6,877,000 earned by the same companies a year ago. Aggregate net profits of 75 companies (other than banks) reporting in 1939 amount to £11,989,000 against £12,994,000, a decrease of 8½ per cent. We discuss the week's results in preceding Notes and on page 140 under the heading "Shorter Comments."

Company Meetings of the Week.—Reports of company meetings will be found in this week's issue from page 144. The proceedings at the *National Discount* and the *Alexanders Discount Company* are referred to in a Note on page 131. At the *Barclays Bank* meeting Mr

Edwin Fisher disclosed that at the end of October last the number of customers having advances was 216,210, and the average advance £893. He remarked that the distribution of the total amount between different trades, industries and private persons varied little from the proportions shown in the previous year. Captain Oliver Lyttelton disclosed that the *British Tin Investment Corporation* was now fully invested. Opportunities had been seized during the latter part of 1938 to strengthen the portfolio at reasonable prices. The chairman of *Rio de Janeiro Flour Mills and Granaries* pointed out that flour was now one of the cheapest local foodstuffs in Brazil and that consumption should be maintained. Sir Michael Nairn informed shareholders of *Michael Nairn and Greenwich* that the new plant at Kirkcaldy would give more economical production. Mr W. F. Foster, at the *National Building Society* meeting, regretted that details of the Government's war risk insurance scheme were not yet available. Members of *Liebig's Extract of Meat* were informed that the volume of trade in the company's proprietary lines had shown some expansion.

THE STOCK EXCHANGES

London

SETTLING DAYS

TICKET ACCOUNT
JANUARY 24 JANUARY 26

MARKETS opened with an easier tone this week, and although prices were somewhat steadier in mid-week, the volume of business remains entirely subnormal, and markets are very sensitive to selling, particularly from overseas. *Gilt-edged stocks* closed unchanged on Monday, for opening firmness was succeeded by reaction. Tuesday's initial losses, however, were not fully recovered, and until the close on Wednesday the market tended to show further falls. The improvement in sterling on that afternoon assisted prices, but on Thursday selling, reported to emanate from Switzerland, led to an easier close. In the Colonial market prices were adjusted to the terms of the new Jamaica issue, and fractional losses were general.

The *foreign bond market* suffered a severe blow from the report that the Chinese Government would make no further advances for the service of the Customs loans. The 4½ per cent. loan of 1898 fell 7 points on Monday and the Boxer loan 4 points. Some recovery occurred on succeeding days, though it was limited to one point. Further selling of German issues was attributable to general uneasiness regarding the political and economic situation, though a recovery occurred in mid-week. Some selling of Argentine issues was reported at first though the market became steadier.

Depression continued in the *home rail market* under the lead of the prior charges, and at one time on Tuesday the new Southern 4 per cent. debenture fell to ½ premium. The stock recovered on Wednesday to ¾ premium, but other debentures remained weak. Preference and ordinary stocks also rallied, since the traffics were less depressing than had been expected. The volume of selling in the Argentine rail market was small, but it had a disproportionate effect upon prices. With the exception of Pacific Consolidated and Argentine G.W. debentures the prior charges continued to fall in mid-week. *Industrial shares* continued dull, prices at first tending to sag under the

influence of small sales owing to uneasiness over the international situation. In mid-week, however, this selling was less in evidence. The lower prices attracted bargain-hunters, and the undertone improved in consequence, although turnover remained low. Iron and steel shares followed the general trend, and were indifferent to news of the order for A.R.P. shelters. Indian Iron, and Steel Corporation of Bengal were firm on support from the East. Movements in coal shares were irregular. Though they responded to the general firmness in mid-week, engineering issues tended to ease. Head Wrightson rose on the interim dividend announcement. Electrical equipment issues were uncertain. Contrary to the general tendency, Crompton Parkinson lost ground slightly after early firmness. The tone in motor shares was heavy, and movements were irregular. Dennis hardened on news of a big Government order. Aircraft shares tended to fall from lack of interest. In textile shares, the trend was mostly downwards, and among rayon issues Courtaulds reacted further on dividend fears. Brewery shares remained dull, and changes in the tobacco section were few and small. Provision and catering issues were weaker on the whole. Cow and Gate fell sharply on the dividend announcement. Lower prices ruled in the stores group. Lack of business made for irregularity in the miscellaneous section. Lever and Unilever recovered whenever Amsterdam selling relaxed. The shipping group was undecided, but steadied in mid-week.

Though price changes were unimportant, *oil shares* continued dull, and the smallest sales caused a disproportionate drop in prices. Quotations for rubber shares, where changed, were nearly all lower. The tea share market remained inactive.

Until Thursday, when there was a marked recovery in Kaffirs in early dealings, the mining market was depressed, although business was small. Among Kaffirs, developing mines were the weakest section, Cape selling being an important factor on Tuesday. Paris support for the dividend-payers steadied the market at times. Rhodesian copper shares became firmer in mid-week after a dull start. Other base metals were neglected and moved to lower levels.

The Theory of the Thing

Business and stock market forecasting depends primarily on a study of monetary factors. Money, and its "flow," governs spending and trade. To mention supply-factors only (omitting the Demand-factors, which may also be important)—it was the 20% inflation of bank deposit money which caused the 1926-29 boom in America. It was a 28% deflation of bank money which caused the 1929 slump to reach the 1932 level. It was a 40% deflation of bank deposits which caused the Roosevelt boom of 1936. And it was a 6% deflation of bank deposits which caused the 1937 slump. Finally, it is the recent 9% deflation of bank deposits, coupled with prospective further deflation, that has caused the recent revival.

Deflation of the Supply of Money

It is generally conceded that inflation and deflation of the total supply of money influence prices, profits and employment. But changes in the Demand for money (either notes or bank deposits) can have a similar effect. A fluctuating demand for money is in fact an important cause of Trade fluctuation.

Deflation of Velocity—due to Fear

There are, however, two different sorts of Demand for money: (i) the Medium-of-exchange demand, which varies passively with the volume of trade without influencing it; and (ii) the Store-of-value demand, which fluctuates with confidence and fear, and actively influences Trade.

The point is that money, including bank money, is used or "demanded" not only for the sake of doing business (i.e. to spend soon), but is also widely used or "demanded" as an investment (i.e. to hold, and not spend soon). These differences in the time factor concerning the "holding" of money are subtle, but vitally important to Trade and the Stock Market. Bull markets can develop in money itself; and can bring about bear markets in securities and trade.

For instance, whenever general nervousness creates a desire for liquidity, the investment or liquidity-demand for money (including idle bank deposits) rises rapidly. Such bank-money is then used as a store of value: it is spent with less rapidity than usual; its velocity of circulation through industry is checked; and the volume of actual spending (on commodities and services) is reduced. Thus, trade, profits and employment suffer (from this Deflation of Velocity, or, if you like, from the growing Store-of-value Demand for money)—just as much as if the total Supply had itself been deflated. In both cases, the "flow" of money through industry (on to goods and services) is checked!

Pre-War Fallacies

Normally, this industrial disease (of a growing liquidity-demand for money) grows cumulatively during bad Trade, and makes matters worse. For, the greater the fear, the more the non-spending; and the more the non-spending, the greater grows fear.

Obviously no government can take away the liberty of an individual to hoard (i.e. not spend) his notes or bank deposits, if he so wishes; it is his own property, prerogative and often very sensible. But the fact is that if the majority of individuals act (maybe prudently) in this way, their collective action becomes socially harmful, and causes bad Trade. The government is then confronted with the problem of whether it should "mind its own business" and let Business decline naturally, or whether it should interfere and check the slump, by setting the "natural" supply of money to the harmfully growing "natural" investment-demand.

In the post-war era, with all its scares, the Store-of-value or Liquidity-demand for money has fluctuated much more violently than in the pre-war era. And unless something "artificial" is done to counteract these "natural" psychological variations in the "total" demand for money, the cumulative fluctuations in business may be aggravated.

A Cumulative Industrial Disease

Every banker and business man agrees that trade and prices (i.e. the value of money) are influenced by confidence, but many persons object to Money Management on the ground that "money does not influence Trade." They would not, however, hold these views if they understood that although in periods of declining Trade the Medium-of-exchange demand for money automatically declines, the Store-of-value demand normally increases (because of fear) even faster than the Medium-of-exchange demand declines—with the result that the "net" Demand for money as a whole positively grows (rather than decreases) during industrial depressions.

The Classical economists failed to emphasize this important fact. They emphasized rather the view that money was merely a Medium-of-exchange (which had no influence on Trade itself), and that the total Demand for it fluctuated parallel with business, declining when Trade fell off, and rising when Trade expanded. And, from this entirely false premise, they often argued that in so far as bank deposits were used as money, it was by no means unhealthy for bank deposits to be automatically contracted (as a result of bank loans being called in or investments reduced) as Trade fell off, and expanded as Trade improved. In fact, they rather approved the idea.

Law of Supply and Demand Disobeyed

But this reasoning is incomplete. The more modern view is that since, and because, the aggregate demand for money increases during bad Trade (even though the Medium-of-exchange demand declines), the total Supply should be adjusted to the Demand, and scientifically increased during periods of depression and falling prices (rather than being automatically or "naturally" reduced). (And vice-versa during booms, so as to prevent wild price-inflation.)

Instead of this being done in practice, however, the reverse operation normally eventuates. Nature has inconceivably arranged that, in the monetary sphere alone, the Law of Supply and Demand shall not be automatically and "naturally" obeyed, as it is in every other economic sphere, but rather should viciously work in the opposite direction—so that instead of a rise in the value or 'price' of money

BOOMS AND SLUMPS

The "Managed Money Digests" of Major L. L. B. Angas

A Unique Service on the American Market

Money Management—and Money Management alone—has been responsible for two recent abrupt changes in the major trend of the American Stock Market. A new super-power—the Government Money Managers—is at the helm, and their purposes and methods must be understood by investors wishing to operate with safety and profit.

Under Money Management, many of the older methods of cyclical forecasting are rendered partially obsolete. The well-tried Dow Theory, which pre-supposes wide cyclical swings, should become less reliable as a long-term market guide. Even the widely accepted principles of "cyclical" investment, promulgated in Major Angas' standard work "Investment for Appreciation," may require modification. For, insofar as money is properly managed, long-term Cyclical Fluctuations will be replaced by shorter (though perhaps sharp) Managed Money Cycles.

To assist investors in judging the medium-term and longer-term fluctuations in stocks and bonds under these new monetary conditions, Major L. L. B. Angas now writes a series of "Digests on the Outlook for Stocks and Bonds Under Managed Money."

In these Digests an attempt is made to aid investors in putting themselves in the place of the Money Managers so as to analyze: (1) The ever changing economic conditions which are likely to induce early action on their part. (2) The probable action to be taken. (3) The likely results on the stock and bond markets.

The analyses, which vary in length from Spot messages to 30-page pamphlets, have attained a wide circulation in America. So incisive are their arguments, so often have they "called the turn," that they are now regarded as indispensable by many leading bankers and business executives.

No extravagant claims are made for these Digests, but to participate profitably yet cautiously in the American Market, their study is advised. They will also help investors to apply the investment principles which have been followed by Major Angas in his various market pamphlets, a complete list of which follows:

Forecasts of Falls		
	Date	Subsequent Decline
Reparations, Trade, and Foreign Exchange (Forecasting the collapse in the German mark)	Feb. 1921	99%
The Coming Collapse in Rubber	Jan. 1926	80%
The Coming Collapse in Gold. (Included alternative forecast of further boom if America re-valued).....	Nov. 1933	—
Slump Ahead in Bonds (U.S.A.)	Feb. 1937	10%
Forecasts of Rises		
	Date	Subsequent Advance
The Coming Rise in Gold Shares	Feb. 1931	150%
The Coming (English) Boom	Sept. 1931	100%
Stock Market Tactics (Forecasting the Bond Boom, etc., in England)	Jan. 1932	28%
The Coming Rise in Wall Street	Apr. 1933	190%
The Coming American Boom	July 1934	100%
The (American) Boom Begins	Apr. 1935	65%
The Coming Rescue-Inflation (and Scramble for Stocks).....	Apr. 1938	45%

(SEPT. 1937) FORECAST OF A PANIC—UNLESS

Part of a telegram sent to the Washington Money Managers on September 10, 1937 (five weeks before the panic of October 19). (Three further supporting messages were sent). "Monetary Management is now on test. Irresolute half measures are bound to fail. If you do not act at once you will have a panic and a new depression, which will rapidly gather unexpected cumulative downward momentum as a result of the public's experience and bitter lesson learned in 1929-30. Everyone will try to get out simultaneously."

SIGNIFICANT DIGESTS OF 1938

Digest	Date	Remarks
"Coming Scramble for Stocks"	March 22	Published within 10 days of cyclical bottom.
"Nose Dive"	July 24	Issued at the first intermediate "top."
"Be Bold and Buy"	September 28	Issued at subsequent bottom.
"Start Selling—When"	October 14	
"Flare-up Ahead"	December 14	A sharp rise followed.

Your opportunity to profit from the American Market should be greatly enhanced by a subscription to Major Angas' Digests. A minimum of 12 issues is published each year, as market conditions seem to warrant rather than on specific dates. (18 were issued in 1938). Their cost is Five Pounds (or \$25) per annum. Six months: Three Pounds (or \$15).

Other Investment Services

Personal management of individual portfolios is also undertaken. In addition, Major Angas conducts a Telegraphic Service in which are made recommendations for purchase and sale of specific American stocks. The charge for this exclusive of cable costs, is \$100 (or £20) per annum [six months: \$60 (£12)] which subscriptions include the Digest service.

L. L. B. Angas, Investment Consultant, 570 Lexington Ave., New York

(namely a fall in general prices) benignly evoking an additional supply of money (as it ought to), it actually evokes a malignant and cumulative reduction. This monetary anomaly operates as follows:

Another Cumulative Industrial Disease

When general Trade shows signs of falling off, and when commodity prices start to fall, the collateral behind bank loans tends to shrink in value and many private bankers feel bound to call in loans—for prudence's sake. Forced sales in consequence occur; general prices deteriorate further; additional bank loans are therefore called in; and cumulative downward momentum is given to prices. Meanwhile the bank-money used by the public is itself deflated—instead of being inflated as it ought to be so as to meet the growing Store-of-value demand which invariably matures (through fear) during depressions. Supply is "naturally" deflated, when it ought to be inflated! The Laws of Supply and Demand are thus not only not obeyed, but positively disobeyed, in the Monetary Sphere.

The economic disease matures because of a natural (and prudent) tendency among individual bankers. It is nobody's fault: it is just endemic, and unavoidable in the very Nature of our modern banking system.

Need for Monetary Management

The disease of a cumulative growing Liquidity-demand for money would be bad enough, even if it operated in isolation, but when it is reinforced and aggravated (as it is) by the additional disease of 'a cumulative contraction of the supply,' it is too much for the industrial system to stand.

And these two cumulative diseases operate, not only on the deflationary side, but also in the direction of cumulative inflation, whenever an upward trend in Trade has once been established, after depression.

Stock Market Prospects

Meanwhile, the American stock exchange will jump or fall, as the throttle or brakes are alternately applied. Investors must keep their eyes and ears on the brains and feet which control the money pedals. They are vital. (Hence these Digests)

See Chart on Digest 48

Tuesday, January 17, 1939, compared with 61.1 a week ago and 61.1 a month ago. The average yields are 6.25, 6.16 and 6.15 per cent. respectively. We give below a selection of the separate indices:—

We are officially informed that Mr Frederick Joseph Yeardsley and Mr John Houlden, trading as Ritcher and Company, have been expelled from the Stock Exchange as from January 18, 1939.

New York

QUIET conditions prevailed on Wall Street this week. Turnover has been running well below the million mark, and the net movement in prices, except for a mild rally on Tuesday, has been very limited. Dealers continued to display caution regarding the immediate trade outlook, and demand was affected by the realisation that forthcoming company earnings will make a poor showing. Rail stocks followed the general trend of the market and were not specifically affected by the withdrawal of the railroad support for the revision of bankruptcy laws. In the bond market Treasury issues remained very firm and small improvements occurred in the second-grade rail and utility bonds. Iron Age estimates steel production for the current week at 53 per cent. capacity, against 52½ per cent. last week, but records that demand is not so far gathering much momentum.

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values calculated on closing prices (1926 = 100).

Industry and Trade

Steel Shelters.—The official announcement on Tuesday, that an order had been placed with the steel industry for 400,000 household air raid shelters, was very much on the lines forecast in *The Economist* of December 3rd. Galvanised corrugated sheets of 14 gauge thickness (weighing 3.2 lbs. per square foot), with six five-inch corrugations on each sheet, will be employed for the shelter. The sheets are curved to meet overhead, and their lower edges rest between the flanges of two channels measuring four inches by two inches and weighing 7.09 lbs. per foot. At the top the sheets will overlap slightly and be bolted together, the whole contraption providing accommodation for four or five people, and being of such a simple nature that the veriest tyro could erect one. The Home Office instruction is that the site should be excavated to a depth of two feet and the earth placed on top of the shelter, so that persons in a recumbent position in the shelter will have the additional protection of being below ground level. This design was adopted by the Home Office experts after exhaustive tests and it is believed to offer adequate protection against bomb splinters and "blast." It should help to stiffen the morale of the Home Front.

To the steel industry this initial order—it is understood to be one-fifth of the total quantity to be ordered—will mean 100,000 tons of sheets and 18,000/20,000 tons of channels, with a considerable tonnage of bolts and nuts. Delivery is to be completed in 13 weeks, and, so far as the rolling is concerned, there should be no difficulty about the time-table. The capacity of the sheet trade for making five-inch corrugations and curving the sheets is not quite so certain; and the Home Office might have enlisted greater resources if they had confined themselves to the three-inch corrugations which are the usual standard of the sheet trade. Presumably the experts considered that the five-inch corrugation, which is 1½-inch deep as against the ¾-inch depth of the three-inch corrugation, made for greater strength. Practically all the members of the Sheetmakers' Conference participate in this order, and 14 members of

the Steelmakers' Association divide the order for the channels in varying proportions. The value of this order is just over £2,000,000. The ends of the shelters, which will also consist of corrugated sheets, have not been finally designed, and there is also a strong probability that a bracing strap will be necessary between the channels to prevent the sides from creeping inward under the earth pressure from the outside. This order will give a welcome fillip to certain sections of the iron and steel industry.

Support for Cotton Enabling Bill.—The Cotton Industry Enabling Bill is already assured of substantial support, and a full meeting of the Joint Committee of Cotton Trade Organisations, the sponsors of the Bill, will be held on Friday, January 27th. An official statement issued this week by the Joint Committee stated that a sufficient number of signatures had been received by last week-end to show that the proposals were now endorsed by a very large proportion of each of the producing sections. "Up to now the majority is greatest in the weaving section, but spinners are not far behind, and there is no reason to doubt that the verdict of the finishing sections will confirm that of spinning and weaving." All the organisations represented on the Joint Committee have reported in favour of the Bill, and in addition, outside organisations have adopted resolutions urging their members to support the Joint Committee's efforts. When the Committee meets on January 27th, steps will be taken to ensure the introduction of the Bill at the earliest possible moment.

American Copper Market.—The decline in copper prices on the London market during the last fortnight was caused mainly by the weakness of the market in America. According to the American Copper Institute, the United States' apparent consumption of copper declined from 808,300 short tons in 1937 to 481,300 tons in 1938, while production fell by only 221,374 tons to 743,876 tons. Owing, however, to the large exports of copper from the

SHORTER COMMENTS

Company Results of the Week.—**TRANSVAAL AND DELAGOA BAY INVESTMENT COMPANY** report that while South Africa could not entirely escape the effects of international affairs, business within the Union is comparatively normal. Net profits for the year to August 31 are maintained at £120,825. Investment trusts continue to show declines in revenue of varying degrees of severity. **DEBENTURE CORPORATION** have earned about £7,000 less at £125,215, but the 10 per cent. dividend is maintained. **GOVERNMENT STOCK AND OTHER SECURITIES** now show revenue on a gross instead of net basis, which would account for the apparent rise in net income from £41,892 to £45,556. The decline in **LAW DEBENTURE CORPORATION** total profits from £106,103 to £91,920 is due chiefly to a lower profit on sales of securities. In contrast with a trading profit of £59,586 in 1937, **JOHN CROSSLEY AND SONS**, the carpet manufacturers, have made a trading loss of £46,928 in 1938. The report, however, puts forward no explanation. In view of the industrial recession, maintenance of **STEAD AND SIMPSON** net profits, at £38,074, is satisfactory. Trading profits of **WILLIAM TIMPSON, LTD.**, whose accounts are presented in the improved form adopted last year, are 5 per cent. lower at £152,994. **L. AND J. WEBER AND PHILLIPS**, the boot manufacturers, are reducing their dividend from 6 to 3½ per cent.

BANK REPORTS

Baring Brothers and Company.—Total assets, December 31, 1938, are £23,001,356, a decrease of £2,486,886. Investments, at £9,923,146, show an increase of £1,265,192.

Erlangers, Ltd.—Balance sheet total, December 31, 1938, £11,349,961 against £11,718,178 for 1937. Deposits, £4,976,005 (£5,063,080). Cash £1,357,690 (£2,235,661). Advances, £3,887,651 (£3,078,487).

Glyn Mills and Company.—Balance-sheet total, December 31, 1938, £40,903,040, against £40,123,055 for 1937. Deposits, £35,809,496 against £35,094,351. Advances, £9,503,636 (£9,059,138). Investments, £10,158,921 (£10,483,293).

Munster and Leinster Bank.—Net profit half-year to December 31, 1938, £68,506 against £70,684 for second half of 1937. Dividend 12 per cent. per annum, tax free, as before. To contingency account, £15,000 (same). To premises, £5,000 (same). To staff pensions, £5,000 (same). Carry-forward, £43,725 (£44,339). Deposits are £24,184,036 (£24,157,131). Total assets, £26,845,172 (£26,820,772).

The National Bank.—Total assets, December 31, 1938, £41,275,903, against £41,478,833 at end of 1937. Deposits, £36,168,326 (£37,144,751). Advances, £17,273,932 (£16,631,853). Profit for half-year to December 31, 1938, £104,348, a decrease of £5,338 compared with second half of 1937. Dividend maintained at 12 per cent. per annum. To reserve, nil

(£10,000). To premises, £12,500 (£10,000). Carry-forward raised from £38,813 to £42,458.

Provincial Bank of Ireland.—Net profit for second half of 1938, £37,544 against £38,087 for second half of 1937. Dividend, 12½ per cent. per annum, absorbing £24,469 against £25,313. To reserve fund, £5,000 (same). To premises, £8,000 (£6,000). Carry-forward raised from £38,246 to £40,246. Deposits, £14,904,319 (£15,260,503). Advances, £6,242,821 (£6,267,650). Total assets, £17,085,778 (£17,418,380).

Hibernian Bank.—Net profit for half-year to December 31, 1938, £37,900, against £40,468 in second half of 1937. Dividend, 12 per cent. per annum, as before. To premises, £5,000 (£2,500). Carry-forward raised from £27,850 to £30,354. Total assets, £12,160,939 (£12,512,167). Deposits, £10,310,179 (£10,685,205).

Bank of Ireland.—Net profit for 1938, £379,821 against £390,749 for 1937. To reserve for contingencies, £75,000 (same). Total dividend, 13½ per cent., as before. Forward, £142,078 (£126,988). Total assets, £43,106,916 (£44,295,444). Deposits, £30,841,829 (£31,714,929). Advances, £14,803,160 (£14,347,746).

Yorkshire Penny Bank.—Total assets, December 31, 1938, £41,751,904, against £40,619,833 at end of 1937. Deposits, £39,251,904 (£38,119,833). Investments, £29,998,393 (£27,505,327).

(Continued on page 159)

United States, made possible by the restriction of production in other countries, stocks in the hands of American producers increased by only 30,000 tons during the year; at the end of December, 1938, they were estimated at 289,750 tons. At this level, producers' stocks are by no means excessive and consumers' invisible stocks, despite their rise during 1937, are still below the lowest level of the last slump. The technical position of the United States' copper market is, therefore, not as weak as might be indicated by its adverse influence on the London market. An improvement can also be expected after the closing on Tuesday last of the Lonard mine of the Anaconda group, which was followed on Wednesday by a 10 per cent. cut in the output of Utah Copper, a subsidiary of Kennecott Copper. But while this restriction of production will help to diminish the pressure of American supplies on world markets, it will not stimulate consumption in the United States, where the domestic price has been held at 11.25c. per lb.—the peak level of 1938—since October 14th, although the export price, reflecting the decline in London, has fallen below 10.25c. per lb. United States consumers are holding back in anticipation of an adjustment in the internal price and American producers would be wise to adapt their prices to the ideas of buyers, as past experience has shown the folly of restricting consumption by excessively high prices.

December's Overseas Trade.—The year's changes in British foreign trade and its prospects for 1939 are discussed in a leading article on page 113, but to complete the monthly record, the usual tables are given here. The value of both imports and total exports declined slightly between November and December, which latter month had one fewer working days than November. Compared with a year ago, the value of imports in December was 21.4 per cent. lower, and that of total exports 10 per

U.K. IMPORTS AND EXPORTS (£000)

	1936	1937	1938	Change between 1937 and 1938	Per cent.
December					
Total Imports	83,543	94,261	74,122	-20,139	-21.4
British Exports	40,516	43,882	39,099	-4,783	-10.9
Re-exports	6,200	4,979	4,779	-200	-4.0
Total Exports	46,716	48,860	43,877	-4,983	-10.0
Excess of Imports over Exports	36,827	45,393	30,245	-15,048	-33.1
Transshipments under bond	2,906	2,911	2,852	-59	-2.0
Year					
Total Imports	847,752	1,027,824	920,438	-107,387	-10.4
British Exports	440,605	521,391	470,883	-50,508	-9.6
Re-exports	60,769	75,134	61,608	-13,526	-18.0
Total Exports	501,374	596,525	532,491	-64,034	-10.7
Excess of Imports over Exports	346,378	430,299	387,947	-42,352	-9.8
Transshipments under bond	28,960	37,303	32,584	-4,719	-12.7

cent. lower. For 1938 as a whole, the value of both imports and total exports declined by a little over 10 per cent.; owing to the much larger absolute fall in the value of imports, the import surplus declined during the year by nearly 10 per cent. The fall in values between November and December was not due entirely, however, to the smaller number of working days; *The Economist* index of the volume of imported raw materials, on a daily basis, declined from 90½ in November to 86½ in December (1935=100) and the index of the volume of British exports also fell by two points, from 98 to 96.

Overseas Trade by Commodities.—The volume of retained imports of eleven out of the eighteen commodities listed in the table below rose between November and December, 1938; imports of textile fibres, of meat and sugar, and of non-ferrous metals, were all higher in December than in the previous month. Compared with December, 1937, however, imports of only five groups showed a marked increase—mutton and lamb, iron and steel scrap, raw sisal, flax, hemp and jute and petroleum. Among the commodities given in the second table,

RETAINED IMPORTS—MONTH OF DECEMBER

Item and Measure	1936	1937	1938
Wheat	'000 cwts. 8,886	7,986	7,586

exports of only iron and steel scrap and of pig iron were appreciably larger than a year ago, but trade in both these commodities fell between November and December; exports of leather, of woollen tissues and of machinery continued to improve between these two months.

The International Sugar Council.—At its meeting in London last week, the International Sugar Council decided to postpone until its next meeting the consideration of changes in the exports allotted to the free market. The Council noted that the requirements of the free market (which is dominated by Great Britain) had been materially increased in the present season by the low yield

BANK OF LONDON & SOUTH AMERICA LIMITED

of the main European sugar beet crops, but as no arrangement has been made for an immediate increase in the current export quotas, it is presumed that current supplies are considered sufficient. The Council also noted that, unless the yield of sugar beet should again be exceptionally low in 1939, another reduction in export quotas will be necessary in the next season, but no decision has yet been taken on the matter. Such a reduction is likely to be a difficult problem, for the Council reached the limits of its existing powers when it authorised a 5 per cent. cut in exports for the present season. The necessity to reduce exports still further will therefore involve complicated negotiations among the countries represented on the Council.

Wholesale Prices React.—Towards the end of last year there were indications of an improvement in the prices of primary products. The pound had recovered in terms of dollars, and the favourable trend of business in the United States prompted a section of consumers to increase their stocks. The re-stocking movement, however, was short-lived and, as *The Economist's* indices show, the past fortnight has witnessed a set-back in the prices of many primary products. For England the complete *Economist* index has fallen by 0.8 per cent., and the primary products index by 1.6 per cent. The decline in American prices is less marked, for the complete Irving-Fisher index has only fallen by 0.3 per cent., and *The Economist's* primary products index by 0.6 per cent. With the exception of the index for the textiles group, the component series of the complete *Economist* index all declined during the past fortnight.

INDUSTRIAL REPORTS

BUSINESS in coal remains patchy; the demand for coal for heating purposes remains good, but export business is unsatisfactory. The Government has now placed orders for 400,000 steel shelters, involving about 100,000 tons of sheets, 18-20,000 tons of channels, as well as a large quantity of bolts and nuts. This order is believed to represent one-fifth of the total number of shelters to be provided by the Government. The returns of the value of building plans passed by 141 local authorities in December are disappointing, for they show a fall of 30.6 per cent. compared with the figures for the corresponding month in 1937. The Joint Committee of Cotton Trade Organisations is obtaining widespread support for its proposals for an Enabling Bill; the volume of new orders for cotton goods remains small.

Coal

Sheffield.—Business remains good, with house coal a strong feature. Industrial steam coals are in moderate demand, and improvement in the heavy trades should stimulate buying. Electricity works are taking heavy deliveries of smalls, the tonnage under contract reaching high proportions. Gas coal is moving very freely. Coking smalls are in plentiful supply.

There is no improvement in the demand for blast furnace coke, but central heating qualities are more freely taken up. For renewal of contracts the Coke Producers' Association has fixed 21s. 6d. per ton on rail at ovens, a reduction of 3s. 6d. per ton.

The export market is quiet. Large coal is in some request, but for smalls and singles there is little demand. Prices are unchanged.

Cardiff.—The position on the Cardiff coal market is unchanged and there are no prospects of any immediate improvement. Production and supply is being adjusted as closely as possible to the current demand, but the market is not absorbing the outputs and stocks have increased. Forward inquiries are not inactive, and current tenders include one for the supply of 140,000 tons of coal and patent fuel for delivery to the Algerian Railways between April and December.

Best large steam coals are steady and dry sized coals firm and relatively scarce; other grades are plentiful, and particularly ordinary steam and coking smalls. Prices are nominally unaltered. The price for pitwood under the French coal-pitwood barter agreement for the next three months has been reduced from 22s. 14d. to 22s. per ton at Bristol Channel ports, subject to a further reduction to 21s. 9d. if the quantity of coal taken is increased from 80,000 tons to 100,000 tons. The demand for coke and patent fuel shows little improvement.

Glasgow.—The collieries in Scotland are enjoying one of the busiest spells for a long time past. This is due mainly to the severity of the weather, which has stimulated demand both in home and overseas markets, but chiefly the former. Conditions are favourable in so far as the colder weather has called for increased consumption and has not yet retarded production. Pressure in the inland branch is chiefly for domestic fuel. A notable feature is the expansion in bunker coal business, ship-owners now entering into contracts more freely in order to secure the con-

cessions in price which such a course provides.

Iron and Steel

Sheffield.—The iron and steel market is slow to expand, and business this week has been on a limited scale. Pig-iron consumers are, in the main, apparently satisfied to cover their requirements as they arise, although a number of contracts over the first quarter have been placed. More interest is shown in foundry than in forge, demand for which continues to be restricted. Business in hematite shows a slight improvement, but users show little disposition to buy forward to any extent. Bar iron is showing a rather more healthy tone, although crown iron continues very dull.

Steady business is done in basic and acid steel billets, and a better inquiry exists for wire rods. Business in structural steel shows a downward tendency. Stainless steel sheets are very active.

Local production of alloy steels is reaching high levels, but there is a decline in the output of ordinary steel, though this is not serious. Some important overseas orders for machinery and railway track-work have come to hand, and there is heavy pressure of re-armament orders. The cutlery branches are not fully employed, but toolmakers have substantial order books.

Middlesbrough.—The placing of orders for sheets under the A.R.P. schemes will provide some of the local sheet mills with work for the next two or three months. It is understood that the requisite orders for joists, which will be required for the construction of

the shelters, have not yet been allocated. Plant producing shipbuilding steel is only moderately occupied and in this respect steel makers are waiting for developments in the position with regard to the suggested subsidies for British shipping.

There is more inquiry for pig iron, but buyers are not yet inclined to make big purchases. The output of Cleveland foundry pig iron is not large and stocks in makers' yards are not increasing. Makers of East Coast hematite expect increased orders as users come in to cover their requirements. Basic iron produced locally is all reserved for makers' own steelworks.

The market in foreign ore is quiet, whilst good Durham blast-furnace coke is freely available at 24s. 2d. per ton, free on trucks at the ovens. The heavy steel scrap position is unchanged and deliveries from local merchants remain restricted.

Glasgow.—The two principal sheet makers in the West of Scotland have secured a share of the contracts which have been placed by the Government for sheets for air raid shelters and these, with other work on hand, will keep rolling mills and galvanising plant busy over a considerable period. Steel-makers in the district will also benefit from the placing of the above contracts as much of the sheet bar material required will be supplied locally. Outside this business no particularly important contracts are reported, although the total tonnage of the various sections booked is quite heavy.

Cardiff.—Hopes are entertained that the Government orders for steel sheets and other materials for air raid shelters will benefit South Wales and Monmouthshire, but no information is yet available concerning either the extent of the Government's commitments or the regional distribution of the orders. The demand for tinplates shows no improvement, and in the first week of the year production was equal to only 34.83 per cent. of capacity, compared with 60 per cent. in the corresponding period of 1938. Galvanised sheets were firmer under a better inland demand. Prices are nominally unchanged.

News from Abroad.—Business on the international steel markets has remained quiet. Although there are no definite signs of an early reduction in official prices, consumers remain reluctant to cover more than immediate requirements. The decline in sterling, however, is a weak point in the price structure. American competition has remained keen in thick plates, but competition for other steel products has diminished. On the Dutch market a price concession of about 5 fl. per ton is expected for thick plates to meet American competition. The Cartel is investigating complaints that official prices are undercut by members, with the object of taking special measures to stop these infringements. The market for thin sheets, for instance, is subject to such an investigation.

A new convention will shortly be formed for cold rolled sheets, after the difficulties with the prospective German members of the group have been removed through intervention by the German Government.

The prospects of demand in the spring are widely regarded as promising. Japan is negotiating for the purchase of 50,000 tons of rolled products, but the terms are causing difficulties owing to the Japanese currency regulations. In South America, competition of American producers is keen in several products, in spite of the recent improvement in the domestic demand. In Europe, inquiries have come forward from Scandinavia and Holland, but the volume of transactions is relatively small.

Textiles

Cotton (Manchester).—Although there has been rather more inquiry, the volume of business has not increased. Amongst buyers there continues an absence of confidence partly owing to a fear of lower prices, and partly because of the uncertain political situation. There has been very little change in raw cotton prices.

The dullness of the yarn market has not been relieved. In one or two direc-

tions, however, there has been a little more activity in coarse American counts. Exceptionally low prices have been accepted for medium ring beams. Business in Egyptian numbers has been patchy and not of any weight.

Some manufacturers of piece goods have been tested in price on a rather freer scale, and in small lots there has been a slight improvement in the turnover, but this has not been accomplished without a further inroad upon margins. Many producers have now to make the choice of cutting prices or stopping more looms. Only a limited business has been done for the several outlets of India. Useful lines have been reported in fancies for Java and Singapore. Irregular buying has occurred for South America in printing and finishing styles. Home trade buyers have displayed more interest in prices and the turnover has been on a rather freer scale than recently.

Wool (Bradford).—The first series of Colonial sales opened on Tuesday in London with an all-round decline of 5 per cent. for both merinos and cross-

SOME ENCOURAGING FACTORS FOR THE FUTURE

MR EDWIN FISHER'S REVIEW OF THE POSITION AT HOME AND ABROAD

The forty-fourth ordinary general meeting of Barclays Bank, Limited, was held, on the 19th instant, at Southern House, Cannon Street, London, E.C., Mr Edwin Fisher, chairman of the Bank, presiding.

The Chairman said: My Lords, Ladies and Gentlemen,—I will call upon the Secretary to read the notice of meeting and the certificate of the auditors which appears at the foot of the balance sheet that has been submitted to you.

The Secretary (Mr W. N. Seeley) then read the formal notice convening the meeting and the report of Messrs Price, Waterhouse and Company and Messrs Kemp, Chatteris, Nichols, Sendell and Company.

The Chairman: My Lords, Ladies and Gentlemen,—Is it your pleasure that the report and accounts submitted be taken as read? (Agreed).

THE DIRECTORATE

As will be seen from the report, Mr William Favill Tuke has retired from the board. This step, which he decided to take on the grounds of health, brought to an end a term of service with the Bank and its predecessors extending over a period of 54 years—a proud record. When he gave up the chairmanship, I made reference to his long association with the Bank and to his achievements, which are known to you all. We hope that he will find enjoyment in his well-earned retirement for many years to come.

During the year, the directors have elected to the board The Right Hon. Lord Cornwallis, M.C., Mr Lawrence Emllyn Douglas Bevan and Mr David Martyn Evans Bevan. Lord Cornwallis has many associations with Kent and will be of great assistance to us in connection with our business in that county. Mr L. E. D. Bevan has been a local director of the Bank at Lombard Street for several years. Mr Evans Bevan has numerous interests in South Wales, where, as you know, we have important branches. You will be asked to confirm the election of these directors, at a later stage in our proceedings.

That Mr B. J. Foster should have felt obliged to retire from the service of the Bank on account of ill-health is a matter of great regret to us. Mr Foster served the Bank for 38 years and had been connected with our foreign business for 27 years. Formerly assistant foreign general manager, he was appointed foreign general manager in 1934. I feel that you would wish to join with us in expressing gratitude to him for his valued services to the Bank and to wish him well in his retirement.

THE BALANCE SHEET

You will see from the report and accounts submitted to you that the total of our current, deposit and other accounts on December 31st last amounted to £433,081,185 and revealed a slight reduction from the figure of £434,645,323 at the end of 1937.

If one takes the figures shown in our monthly statements of average weekly balances and compares the movements in the total of our current, deposit and other accounts from month to month in 1938 with those in 1937, it will be seen that there has been remarkably little change. This we consider a most satisfactory feature, for during the past year, in view of the general atmosphere of uncertainty

at times prevailing, which resulted in a large withdrawal of foreign balances from London, a wider fluctuation in our figures might have been expected.

The rise in acceptances and endorsements, etc., for account of customers, from £8,532,516 to £14,933,082 between December 31, 1937, and December 31, 1938, does not indicate the expansion in trade which might be inferred from an increase in this figure in the balance sheet. In addition to the usual items which go to make up the total, certain other engagements entered into on behalf of customers, which had not been shown previously, have now been included. This accounts in large measure for the increased figure appearing in the balance sheet. The total is offset by a contra entry on the other side of the accounts, for, as we assume responsibility for the obligations which we undertake on behalf of customers, so are those customers liable to us to a similar extent.

CASH POSITION

Our cash in hand and with the Bank of England at the end of December last stood at £53,241,449 and the ratio of this sum to the total of our current, deposit and other accounts was 12.29 per cent. As a result of long practical experience, it is possible to judge very accurately the probable needs of our customers for actual currency and the amount which we retain to satisfy their requirements is always more than adequate to meet these demands. In the employment of our assets, however, provision is made so that large additional sums in cash are readily obtainable should they be required. If you turn to the balance sheet you will see that, broadly speaking, the assets are arranged in the order of their liquidity. The item of balances with other British banks and cheques in course of collection is self-explanatory.

The next asset, money at call and short notice, which at the end of the year amounted to £26,207,550, is one that can very quickly be turned into cash. It consists of money lent in the money market, mainly to bill brokers, although a minor part is represented by loans to members of the Stock Exchange. The sums lent are repayable at call or at short notice and the loans are made against readily realisable security, the bulk being secured by Treasury Bills or other bills discountable at the Bank of England. If at any time we should wish to increase our holding of cash, these loans can be called and, owing to the terms on which they are made, the high standing of the borrowers, and the nature of the security held against them, quick repayment is assured.

BILLS DISCOUNTED

Bills discounted, the next asset in order of liquidity, may be termed our third line of defence. The bills we discount consist almost entirely of maturities not exceeding three months, and the purchases are so arranged that bills are continually maturing. On December 31st last, the bills we had discounted amounted to £54,594,153, which included £30,455,000 of Treasury Bills. At the close of the previous year our total of bills discounted was £50,362,681. The increase in our holding of bills was secured in spite of the fact that there was a reduction during the year in the average allotment of Treasury Bills at the weekly tenders to £40 million, compared with £43.3 million in 1937. It is essential for the efficient working of the banking system

and of the money market that there should be an adequate supply of bills and, in view of the dependence of the discount market on the Treasury Bill, and the important rôle which these bills play in enabling the banks to secure a proper distribution of their assets, it is to be hoped that the authorities will bear in mind the requirements in this respect in framing future policy.

The total of these four exceptionally liquid assets in our balance sheet represented no less than 34.38 per cent. of our current, deposit and other accounts at the end of the year. It will be seen, therefore, that, in the employment of a large proportion of the assets of the Bank, the primary consideration is liquidity, rather than the acquisition of profit; but the maintenance of liquidity also depends upon the continued efficient functioning of the money market. At times, it may become advisable to reduce the credit that has been granted to the money market, in order to increase the Bank's holding of cash. Such an operation, in achieving this object, proves that the system is working properly, and that assets that are liquid in theory are equally liquid in practice. The efficacy of this system was amply demonstrated in September last, when, at a time of crisis, it was considered prudent to build up cash balances, entailing corresponding reductions in the amount lent in the money market and in the total of bills discounted.

THE MONEY MARKET

A feature of the London Money Market in recent years has been the low level of rates both for short loans and for discounts. These low rates are largely a reflection of the cheap money policy officially pursued in this country since the middle of 1932. For the bulk of our loans to the money market we earn only $\frac{1}{2}$ per cent. per annum. Discount rates for high class bills have shown some increase during 1938, the average rate at which three months' Treasury bills have been allotted in response to the weekly tenders being 12s. 4d. per cent. per annum, compared with the low figure of 11s. 2d. per cent. per annum in 1937. This rise, however, was due to the higher rates prevailing around the period of the international crisis in September and to the slightly more stringent monetary conditions at the close of the year, which forced the market to borrow large sums from the Bank of England.

In addition to its effect on discount rates, the crisis had other reactions on monetary conditions in this country. London has been for generations the principal international monetary centre of the world, for the intrinsic strength of sterling and the unrivalled facilities of the London Money Market made it a centre for the employment of funds from other countries. Foreign money employed in international markets is, however, always liable to sudden movements and the possibility of such movements is greater when, as in recent years, a considerable part of the foreign balances held in international centres appears to be "fugitive" money seeking temporary security rather than profit. It was not, therefore, surprising to see, as the result of the crisis in September last, large transfers of these balances taking place from London to New York, a centre far removed from the fears that overshadowed Europe. The flow of funds to the United States has also been encouraged by the economic improvement in that country. In addition, there has been a repatriation of balances to France, notable in recent months, as a result of the initial success of the steps taken by the French Government to restore economic and financial equilibrium.

At times last year the transfer of funds from the United Kingdom was reflected in a tightening of conditions in the London Money Market, but having regard to the magnitude of the outflow, the fact that the market was only temporarily affected stresses the value of the new monetary technique evolved in recent years and the skill of the authorities in managing the situation during an abnormal period. The experience of the past twelve months is particularly notable, owing to the fact that the heavy outflow of balances, as opposed to the previous sustained inflow, has now enabled a real test to be made of the working of the new machinery, in periods not only when large inward movements of money were taking place, but also when there was a large efflux.

NEED FOR STABILITY

To the extent that the recent withdrawal of balances from London represents a repatriation of money, due to a revival of confidence in its country of origin, the movement is healthy, for any reduction in the volume of funds moving from one centre to another for no other purpose than to seek a refuge from temporary uncertainty would eventually tend to improve the stability of the exchange and money markets of the world. Reasonable stability in exchange quotations is a prerequisite to the satisfactory conduct of international trade and the aim should be to maintain conditions in which overseas business

can be carried on without the risks attaching to frequent wide movements in the relative values of currencies. Recent experience has shown that, if the withdrawal of funds assumes large proportions and the pressure on the currency is insistent, a certain dislocation is inevitably caused. It was in anticipation of a development of this kind that gold was accumulated here through the Exchange Equalisation Account, and the fact that the account has had to dispose of substantial quantities of gold indicates the wisdom of the step taken to provide for such an eventuality.

EXCHANGE EQUALISATION ACCOUNT

The persistent pressure on sterling has caused the authorities to increase the amount of gold held by the Exchange Equalisation Account. As you know, on January 6th it was announced that £200 million of gold, valued at the statutory price equivalent to 84s. 11 $\frac{1}{2}$ d. per fine ounce, which it would appear had been previously sold by the Exchange Equalisation Account to the Bank of England, had been transferred by the Bank of England to the Exchange Equalisation Account. At market price, this gold was worth about £350 million. Although in the nature of a book-keeping transaction, the effect of the transfer is to mobilise a large sum in gold, so that it can be used in case of need in defence of sterling; and when we add to this amount such stores of gold as were still held by the Exchange Equalisation Account, the extent of the support available to uphold the external value of the currency will readily be seen.

This operation necessitated an increase in the fiduciary note issue of the Bank of England, which was raised from £230 million to £400 million, the increase of £170 million being £30 million less than the total of gold transferred. It will be remembered, however, that the fiduciary note issue was raised by £30 million in December last as a temporary measure to meet seasonal requirements, so that the total of the note issue reverted to the level at which it had previously stood and the various adjustments involved no inflation of the currency.

INVESTMENTS

The total of our investments, excluding our holdings in subsidiary banks, amounted at the end of December last to £96,876,802 and showed a contraction of £5,546,593 compared with the end of December, 1937. Of this total, £89,527,002 were securities of, or guaranteed by, the British Government and a very high proportion of these has a definite maturity date. Throughout the year, the total of our investments was maintained at a somewhat lower level than in 1937, partly because we considered it prudent to increase our liquidity by holding a larger portfolio of bills.

Included in the item of investments in subsidiary banks is our shareholding in Barclays Bank (Canada). I mention this specially, as, in October last, I visited the branches of that Bank in Montreal and Toronto. Instituted as recently as 1929, it is a newcomer to Canada. The progress made has been satisfactory and steady, and we find that our points of contact in that country are of considerable use to us in linking up our various activities not only in this country, but also in the many other parts of the world where we have associations.

ADVANCES

There has been an increase in the total of our advances to £199,452,980 at the end of December last, against £196,264,896 on 31st December, 1937. Banking advances tend over a period to reflect changes in industrial and commercial activity, although there is frequently a time lag before these changes are apparent in the demand for accommodation. According to the calculations of the Board of Trade, industrial production in this country reached a record high level in the December quarter of 1937 and, thereafter, there was a moderate setback. The total of our advances, however, continued to increase and reached the record figure of £202,668,708 at the end of June. Since then, there has been some reduction, but the decline has been small, the total at the close of the year being 1.6 per cent lower than on 30th June, while, as I have already pointed out, it was greater than at the end of 1937.

The detailed analysis of our advances which was made at the end of October last shows that, at that date, the number of customers having advances from the bank was 216,210 and the average advance was £893. The distribution of the total amount among the different trades, industries and private borrowers varied little from the proportions shown in the analysis for the previous year.

The accommodation which we had granted to farmers, as at the end of October last amounted to nearly £14,000,000, and represented

about 7 per cent. of the total of our advances then outstanding, the number of farming customers having advances being some 21,000.

AGRICULTURAL CONDITIONS

In addition to a general fall in agricultural prices last year, there was a heavy decline in the prices for certain products, which naturally affected some districts more than others. In these districts, the position of the farmer is serious and, in view of the national importance of the industry, this is a matter for genuine concern. Fortunately, British farming is very diverse in character. At the same time, this diversity is a difficulty which faces the Government in its attempts to afford assistance to the industry as a whole, for what may help one farmer may be of no assistance to another. One must not, of course, overlook the numerous ways in which the Government has rendered help to the farming industry up to the present time. The Wheat Act, to mention only one measure by which the Government has supported the industry, has undoubtedly done a great deal to meet the serious fall in the price of wheat. In recent weeks, however, owing to the low prices ruling last year for home-bred sheep and home-grown barley, which have caused heavy losses to many farmers, the Government has had represented to it the urgency of finding methods for aiding those branches of farming, and a review of the situation is understood to be in progress.

Changes for better or worse in the fertility of the land, upon which the success of agriculture so much depends, are, as a rule, very gradual in their operation and difficult or impossible to assess accurately from year to year. It is for this reason that a considered judgment of farming problems can only be formed from observations over a number of seasons. Thus it is, that such conditions for agriculture are required as will lead the farmer, with some degree of assurance of stable and remunerative prices, to put back those reserves which will build up the fertility of the land, in the way that has been traditional of British farming at its best, while assuring, at the same time, a reasonable livelihood for himself. It is the land itself which must first be served in any enduring system of agriculture.

It is not for us as bankers to provide permanent or long-term capital for agriculture or for any other industry, for should we do so, we should be lessening our general usefulness to the community and exceeding our proper functions. As I have already pointed out, we do provide accommodation of a banking nature to farmers and, in case of need, a degree of latitude is allowed, where the circumstances justify a departure from the terms governing the advance, for it is in the interests of the bank, no less than in those of its customers, that borrowers worthy of credit should be assisted whenever it is possible to do so.

NET PROFIT

The net profit of the bank for the year ended 31st December last, after payment of all charges and making provision for all bad and doubtful debts and for contingencies, amounted to £1,926,457 18s. 8d. The sum of £511,390 15s. 3d. was brought forward from 31st December, 1937, making a total to be dealt with of £2,437,848 13s. 11d. The directors have appropriated £250,000 to contingency account and £150,000 to reduction of premises account. After making these appropriations, the directors recommend the payment of dividends at the same rates as previously, namely, 10 per cent. per annum on the "A" Shares and 14 per cent. per annum on the "B" and "C" shares, less income tax, involving a total of £1,510,128 14s. for the year, leaving the sum of £527,719 19s. 11d. to be carried forward.

Although one always hopes to see undiminished profits, the decrease this year was not unexpected, in view of the extra provision which had to be made for taxation and bearing in mind the general conditions ruling. It was those conditions which led us to reduce, to some extent, our holding of securities and to reinvest part of the money in the less remunerative but more liquid form of bills. We have no reason to be displeased with the results or with the earning capacity shown by the bank. It is satisfactory to be able to make the allocations referred to, and the amount placed to contingency account is a transfer which, I am sure, in these times, will meet with the general approval of the shareholders.

THE ECONOMIC SITUATION

When I addressed the shareholders twelve months ago, I was speaking at the close of a year that had seen industrial production and the employment of insured workers in this country attain fresh high records. Already, however, indications were apparent that the confidence which had carried the United Kingdom through five years of recovery was on the wane, and a decline in activity in the United States, coupled with a fall in the prices of certain important commodities, had awakened fears of a downward movement in the

trade cycle in minds that were acutely conscious of the severe depression of 1929 to 1932. Some industries had experienced a falling off in business, resulting in a decrease in employment, in addition to which there was a general feeling of uneasiness in the international field, which even at that time had to be taken into account in assessing the prospects for the future.

The year 1938 will be inevitably linked in our minds with the crisis which brought us to the brink of war little more than three months ago. The immeasurable relief that swept over the world after the Munich Agreement has unfortunately not been followed by that confidence in world political conditions which is so essential to prosperity. Various factors in the economic situation appear to be encouraging, but in an atmosphere of unsettlement and restlessness there is a natural disinclination to do business or to enter into forward commitments until the outlook becomes clearer and calmer.

ARMAMENTS

It is a sad reflection that in almost every part of the world human energies and natural resources are being diverted to increasing armaments, with the result that progress in raising the standard of living must be retarded, if, indeed, the standard itself is not actually reduced. In present conditions, the United Kingdom has no alternative but to take every step to perfect its defences to ensure the protection of the country and of the Empire. Our ability to undertake this burden is unquestioned. Nevertheless, we have to realise that this growth in unproductive expenditure creates increasing problems for those controlling our national finances, and calls for a close scrutiny of every item of the cost of Government, so that no unnecessary calls should be made upon the public purse. Fresh money will have to be found, and no one will envy the Chancellor of the Exchequer his task. The position calls for a delicate adjustment to be made between State borrowing and taxation, for, with taxation at its present high level, it is important to do nothing which either diminishes the returns from taxation, or destroys the ability or the incentive to save. It is by the savings of the people that the capital assets of the country are created, and if the demands made by the State bear too heavily on the shoulders of the citizen, there is a risk that the priceless habit of saving may be impaired.

It is in these conditions that one must view the economic events of the past twelve months and the prospects for the future. It would be unreasonable to expect that this country could escape the decline in trade that has affected other nations, and it is, therefore, not surprising that, in spite of the growth of production for armaments, there has been a decrease in industrial output and a rise in unemployment. The tendency towards a lower level of activity has not, however, assumed serious proportions. Business in the home market, the importance of which has been enhanced by the tariffs imposed in 1932, appears to have been relatively well maintained in a period that has seen declining activity in many parts of the world and great tension in international affairs, and, in saying this, it is encouraging to note that the spending power of the population, as measured by the value of retail sales, has shown remarkable stability.

OVERSEAS TRADE

The importance of our export trade has been emphasised again and again. The subject loses nothing of its importance by repetition. Our dependence upon export business, as an outlet for a substantial part of our production and for securing to us the foodstuffs and raw materials which we need, is self-evident. The steps which the Government are taking, therefore, to obtain fairer competitive conditions for British products in markets abroad are of great moment. The arteries through which the stream of international trade ought to flow have become numbed and atrophied, and any measures that can revive and stimulate the flow of goods between one country and another are welcome. It is for this reason that the proposal to extend the export credits guarantee scheme is encouraging. The Bill now before Parliament is designed to increase the amount and the scope of the guarantees which, judged on strictly commercial grounds, can be given through the Export Credits Guarantee Department of the Board of Trade in connection with exports from this country. In addition, it includes an innovation, the effect of which will be to empower the Board of Trade to give guarantees in respect of transactions not coming within the strict category of a commercial risk, but which, nevertheless, can be regarded as in the national interest. Such a departure has been forced upon us, owing to the methods adopted by certain other countries, and the new powers will be needed until it proves possible for trade to be conducted on more normal lines. The success of measures to facilitate exports, however, must in the long run depend upon industry itself and upon its determination to make the most of its opportunities. A study of the

special requirements of overseas markets by investigation on the spot, either by manufacturers individually or through the combined efforts of trade groups, so as to ensure that the goods offered are those most suited to the needs of our customers abroad, would do much to raise British competitive power and should assist us to combat the new forms of competition with which we are faced.

ANGLO-AMERICAN AGREEMENT

The signing of the Anglo-American Trade Agreement is no ordinary achievement, for, apart from the benefits which must surely accrue as an immediate and direct result of the Agreement, it will have a far-reaching influence, wide in its scope, and possessing infinite possibilities. This Agreement, made between the two largest trading nations in the world, comes into being, fortunately, when the economic conditions in the United States are showing signs of improvement. It was made possible with the help of the Dominions and India who, in order to facilitate the negotiations, were willing to forgo certain of the advantages to which they were entitled under the Ottawa Agreements. It is a great contribution towards freer world trade. Reducing many duties, it raises none, and it demonstrates what can be accomplished when two countries make up their minds to negotiate and solve difficult problems to their mutual benefit.

THE BALANCE OF PAYMENTS

The figures of our overseas trade in recent months have shown a slightly better tendency, although for the year as a whole both imports and exports are lower than in 1937. As is known, we import a great deal more than we export. Last year, imports of merchandise and silver were £939 million and exports were £562 million, leaving what is described as an "adverse balance" of £377 million. In 1937, imports were £1,048 million and exports were £606 million, leaving an adverse balance of £442 million. To make up the difference between what we have to pay for imports and what we receive from customers abroad for our exports, we rely on "invisible exports," i.e. interest on overseas investments, shipping earnings, income from banking and insurance services, brokerage and commissions.

The estimated figures of invisible exports for 1938 are not available, but in 1937 the net receipts from this source were estimated at £395 million and their importance is shown by the fact that, although insufficient to cover the deficit on our visible trading account, they were equal to no less than 65 per cent. of the total of our exports of merchandise and silver in that year. It may be that, taking all the various factors into consideration, there will be some reduction in the total of our invisible receipts for the year 1938, for one has to bear in mind that in 1937 general trade was more active than during the past year.

It is for this reason that one is glad to see the decline in the adverse balance of visible trade, although unfortunately it has not come about by reason of increased exports but of reduced imports. To some extent, this country has gained, owing to the fact that prices of the goods we import have fallen, whereas prices for exported goods have on the whole been maintained. But such changes in the relative levels of prices may not of themselves be of ultimate benefit, for their reaction on the purchasing power of consumers abroad may eventually be reflected in reduced orders placed in this country.

BASIS OF STANDARD OF LIVING

A study of the changes in the balance of payments from year to year is important, for these figures indicate the extent to which the nation is building up or reducing its resources invested abroad. The United Kingdom, which is so dependent upon overseas supplies of foodstuffs and raw materials, is able to enjoy a high standard of living, largely owing to the substantial income which it derives from investments in other countries as the result of the thrift of past generations. During a period when increasing sums have to be devoted to unproductive expenditure, it would not be unreasonable for this country to draw on its external resources, but this state of affairs, while it need not give rise to undue concern if of short duration, could not be viewed with equanimity if it were allowed to become protracted.

Over a long period, the earnings of this country from its exports of merchandise and from its invisible exports have been sufficient not only to pay for the imports we consume but also to provide a margin for investment abroad. In the years 1936 and 1937, however, the returns were insufficient to cover the cost of our purchases from overseas and, consequently, we had to use part of the resources which had been accumulated abroad in order to adjust our international

balance of payments. Taking a longer view, the importance to this country of its income from external capital, which in 1937 yielded a net amount estimated at £220 million, emphasises the need wherever possible to build up our resources abroad.

OVERSEAS LENDING

The restrictions which, in present conditions, it has been found necessary to place on foreign lending by this country can be well understood. Apart from such restrictions, however, investors are naturally hesitant to venture their capital in new enterprises and the great volume of short-term money which has been accumulated in international monetary centres testifies to the lack of confidence that discourages holders of capital from employing their resources in a more permanent manner.

Opportunities for profitable investment abroad do arise, but in a world that has seen vast changes in methods of trading, the growth in the policy of self-sufficiency, the restriction of trade by clearing agreements and barter arrangements, and many defaults on foreign loans, any marked increase in foreign investment can hardly be expected; and in so far as such lending proves possible, the provision of capital by this country may need to be largely confined to transactions which result in some direct benefit to British industry. Moreover, the willingness of the lender to employ his capital abroad will be affected by conditions in the world at large and a feeling of confidence in the ability and determination of the borrower to meet his obligations, while the borrower will need to be assured that opportunities exist for employing the additional resources with profit to himself.

ESSENTIALS FOR CONFIDENCE

The passing of the year 1938 leaves us with few regrets. But if it has been memorable for the anxious times through which we have passed, it has also been memorable for the steadiness and solid purpose which have been displayed by the nation, even when conditions seemed most threatening. Events have crowded in, one upon the other, with great rapidity, and hopes, based upon a state of affairs to-day, too often become dissipated in the changing tide of events on the morrow.

Who can speak with any certainty of the future while the present uncertainty in international affairs persists? If the feeling of unsettlement could be dispelled, economic improvement would surely follow. Business enterprise has been held in check, but, in a clearer and more certain atmosphere, there is no doubt that confidence would be re-born, that funds now awaiting investment would be made available and British trade would receive that fresh impetus which is so much needed. In any event, there is no room for pessimism in our creed. Let there be faith in the future, faith in the ability of this country to surmount its own difficulties, and faith that the efforts which are being made in the cause of world peace will not be set at naught. (Applause.)

THE RESOLUTION

I now beg to move: "That the Report of the Directors produced, together with the annexed statement of the company's Accounts as at December 31, 1938, duly audited, be received, approved and adopted, and that a final dividend of 5 per cent., making 10 per cent. for the year, on the "A" shares of £4 each fully paid, and a final dividend of 7 per cent., making 14 per cent. for the year on the "B" and "C" shares of £1 each fully paid, less income tax in each case, be declared, payable on the 1st proximo, to the shareholders registered in the books of the Company on December 31st last."

I will ask Mr Goodenough, the deputy chairman, to second the motion.

Mr W. M. Goodenough (deputy chairman): My lords, ladies and gentlemen, I beg to second the motion.

The Chairman intimated that if any shareholders would like to make any remarks or ask any questions he would be glad to hear them.

No questions being asked the resolution was put to the meeting and carried unanimously.

The Chairman then proposed the following resolution:—

"That Mr Bertrand Yorke Bevan, Mr David Martyn Evans Bevan, Mr Lawrence Emlyn Douglas Bevan, Sir John Caulcutt, K.C.M.G., The Right Hon. Lord Cornwallis, M.C., The Right Hon. Lord Melchett, Mr Roger Henry Parker, M.C., Mr Hugh Exton Seebohm, Sir Harold Edward Snagge, K.B.E., and Mr Cecil Mercer Woodbridge, the retiring Directors, be re-elected Directors of the Company."

Mr W. M. Goodenough (deputy chairman) seconded the resolution and it was carried unanimously.

LORD EBBISHAM'S REMARKS

The Right Hon. Lord Ebbisham, G.B.E., proposed:—
"That Messrs Price, Waterhouse and Company, and Messrs Kemp, Chatteris, Nichols, Sendell and Company, chartered accountants, be reappointed auditors to the Company, to hold office until the next annual general meeting, at a remuneration for their services to be fixed by the Board."

In doing so he said he would like to add his tribute of appreciation and thanks to the Chairman for his interesting speech and for the admirable way in which he had steered the Bank through the anxious times of last year. They must all agree with the Chairman that there was no room for pessimism in their creed and that they must have faith that the efforts which were being made in the cause of world peace would not be set at naught.

Mr F. W. Rafferty, in seconding the motion, said he would like to associate himself with what Lord Ebbisham had said in thanking the Chairman for the speech to which they had just listened.

The resolution was unanimously agreed to.

VOTE OF THANKS TO STAFF

Mr R. H. Parker proposed that the cordial appreciation and thanks of the shareholders be given to the General Managers and the whole of the staff for the manner in which they had carried out their duties during the past year. He regarded it as a privilege, he said, to propose this vote of thanks, for the prosperity of the Bank depended upon the ability and loyal service of its staff. The work done by the General Managers and their assistants and the work of the managers of the various special departments at Head Office, as well as that of the inspectors, was worthy of all praise. They had a most efficient and at the same time human head office team, if he might call it such. Praise was equally due to all the local directors and district managers and their assistants at the various local head offices, and the valuable work which they did fully justified the Local Head Office system on which the Bank prided itself. Praise was also due to those who were responsible for the control of the London branches. Above all, this was an opportunity of saying "Thank you" to the Branch Managers and to the staff as a whole up and down the country. They bore to a great extent the heat and burden of the day, and it was largely through their efforts that the business of the Bank continued to expand. All the members of the staff had played their part in helping to produce the success which had attended the year's working, and in promoting the welfare of the Bank—not only by the care and efficiency with which they had performed their duties, but also by the spirit in which they had represented the Bank to its customers and to the community in general. That spirit was the spirit of service, cheerfully and willingly given. They had a most excellent and loyal staff of whom they could be proud. (Applause.)

Mr L. E. D. Bevan seconded the resolution, which was cordially approved.

MR STEVENSON'S RESPONSE

Mr W. O. Stevenson (one of the General Managers) said that in thanking Mr Parker for his very generous expression of appreciation of the work of the staff, he might, perhaps, remind those present that Mr Parker spoke not only as a Director of the Bank but also as a Local Director, which meant that what he had said was the result of his experience of and daily contact with a large number of the staff. The staff of the Bank consisted of some 13,000 men and women, and it would be readily understood that from year to year the changes which occurred were, in the ordinary course, numerous and frequent.

In speaking of changes, he wished to refer to one which had already been mentioned by the Chairman, namely, the retirement of Mr B. J. Foster, who until a few weeks ago held the post of Foreign General Manager of the Bank, and with whom he himself had been closely associated. He did not propose to endeavour to enlarge upon what the Chairman had already described as Mr Foster's valued services, but he did wish, as all his colleagues would wish, to say how sincerely they regretted the cause of his premature retirement and to wish him many years of renewed health and strength in which to enjoy his retirement.

It was gratifying to feel that those who were called upon to fill the vacancies which occurred from time to time were imbued with the same spirit of enthusiasm for and devotion to the Bank as were their predecessors. So long as this could be said they could feel assured that Barclays Bank would continue to hold the eminent

position which it had achieved among the great financial concerns of this country, and that it might be so, and that the Bank might go on from strength to strength was the united wish of Directors, Shareholders and Staff. (Applause.)

THANKS TO THE CHAIRMAN

Mr H. Eric Miller said he was sure it would be the wish of his fellow-shareholders to accord their very sincere thanks to the Chairman for his conduct of the meeting. They felt that they had a very steady hand at the helm, and he would like to assure the Chairman that he and his colleagues had the full support of all the shareholders.

Mr W. G. Haill seconded the vote, which was unanimously accorded.

The Chairman, in thanking the shareholders, said that he would like to associate himself with what had been said on the subject of the staff. He would pay a tribute to them not only for the excellent work which they had done throughout the year, but particularly for the admirable way in which they dealt with the difficult situation in those days of stress in September last. A great deal of extra responsibility fell on their shoulders. This was accepted by them willingly and ungrudgingly, and it was due to them that the work of the Bank was carried on smoothly and effectively. (Applause.)

The proceedings then terminated.

MICHAEL NAIRN AND GREENWICH, LIMITED

DISTRIBUTION MAINTAINED

The seventeenth annual general meeting of Michael Nairn and Greenwich, Limited, was held, on the 17th instant, in London.

Sir Michael Nairn, Bart., the chairman, said: The history of the Nairn Company since 1847 has been one of unbroken continuity and progress. The net revenue for the year under review receivable from investments, etc., amounts to £241,195, which compares with £255,591 for 1937, but the comparatively small reduction is largely accounted for by the increase in the standard rate of income tax. The board recommend the payment of a final dividend of 7½ per cent., together with a bonus of 2½ per cent., less income tax. In a year of great anxiety and recurrent international crises we are fortunate in being able to maintain the same dividend as we have paid since 1923, and at the same time to repeat the payment of a bonus of 2½ per cent., which has now augmented our dividend for four years.

Throughout practically the whole year the international situation has proved a serious deterrent to the free course of trade at home and abroad, resulting in a stifling of normal business enterprise and a lessening of the confidence so vital in maintaining a healthy flow of trade. Only those enterprises whose resources in time of peace and prosperity have been developed and husbanded to the fullest advantage find themselves in these more precarious days sufficiently fortified to stand the strain of the inevitable reactions which follow international unrest and uncertainty.

The Prime Minister stated, early this year, that in his view 1939 would prove more peaceful than 1938, and if that view is correct I see no reason why the new year should not see an expansion in trade. The new plant at Kirkcaldy is now practically completed and will enable us to concentrate more economically than in the past in the manufacture of certain grades of linoleum.

Referring to the growing national expenditure, the Chairman said that there was a rapidly increasing municipal spending largely directed by Government Departments, resulting in ever-increasing rates, which bore not only heavily on the community but hampered trade and discouraged enterprise.

The report was adopted.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to:—

ALEXANDERS DISCOUNT COMPANY, LIMITED

CONDITIONS IN THE MONEY MARKET

A DIFFICULT YEAR

MR COLIN CAMPBELL'S REVIEW

The seventy-first ordinary general meeting of shareholders of Alexanders Discount Company, Limited, was held on the 18th instant, at Southern House, Cannon Street Station, London, E.C.

Mr Colin Frederick Campbell (the chairman of the company) presided.

The acting secretary (Mr E. P. G. Baggallay) having read the notice convening the meeting and the auditors' report,

The chairman said: Ladies and gentlemen, I assume you will take the report as read as usual. (Agreed.)

The Board of Directors has been increased by one member during the year, Mr Mark Dineley, whose appointment you will be asked to confirm later on in this meeting. Mr Dineley has had considerable business experience in several directions, and he is also connected with the Alexander family, who have always been the largest shareholders in the company.

POLITICAL UNCERTAINTY

The year 1938 will be looked back upon as one of great political difficulty and uncertainty; in fact, in September we were brought to the brink of war, which happily was averted at the last possible moment. In the existing circumstances it is hardly necessary for me to say, indeed it is obvious, that a discount company such as ours has passed through periods during the year when the outlook was very disconcerting.

Our main business has continued to be on the same lines as in recent years, by which I mean that we have held large blocks of short-dated Government securities, financed with money lent by bankers and others. Our most important holding consists of 4½ per cent. Conversion Loan, the running profit on which has been considerable. This stock can be repaid in July, 1940; consequently, with a probable maturity only eighteen months hence, it is now regarded in the discount market generally as a bill rather than an investment.

You will appreciate that the earning power of the business on a holding in securities of about 9½ millions, which is the amount shown in the balance sheet now in your hands, is satisfactory, in view of the low rates now prevailing.

THE LONDON DISCOUNT MARKET

We sometimes hear it said that the discount market is no longer a necessary part of the London money market and that no great harm would result if it came to an end. I venture to think that such a view is a wholly mistaken one and that it still constitutes an important link in the general financial structure of the City of London. (Hear, hear.) It is the "cushion," if I may use that expression, between the great banks and the Bank of England and so long as it fulfils this function it is entitled by usage and tradition to borrow money on bills and certain short-dated securities on specially favourable rates. It has a further use, inasmuch as it is the quickest and most convenient channel through which changes in money rates are effected. This became apparent during the week of crisis in September, when the future of rates was most uncertain.

So far as our business is concerned there is, however, another factor besides that of the rate of interest at which we can borrow which has to be taken into account, and that is the fluctuation which has to be taken into account, and that is the fluctuation in the prices of the securities which we hold. This we cannot control, and the movements take place very rapidly according to the political situation or the volume of money available at any one moment. It was in view of these fluctuations that we created one moment. It was in view of these fluctuations that we created a special reserve a few years ago, and, as the contingency for which we provided this reserve has now arisen, we have transferred this reserve to the credit of the profit and loss account.

BILL BUSINESS

Turning next to our bill business, this I am glad to say has been a little more profitable than in 1937, due in large measure to a rise in rates during the latter part of last year. We continue to turn over a very large volume of money on bills, and we do

our utmost to keep in touch with the many merchant house and companies with whom we have had business dealings over a long period of time. Commercial bills are still scarce, though recently we have seen indications of an increase in the volume on offer and we can only hope that this improvement will develop during the coming year and become a steadily increasing quantity. The Anglo-American Trade Agreement to which I referred a year ago is now an accomplished fact and we are fully justified in the belief that this most important agreement will result in a substantial increase in trade between America and this country and, indeed the British Empire.

THE ACCOUNTS

Referring to the statement of accounts in your hands, you will notice in the profit and loss account that the expenses at £39,473 are rather higher, due to several special causes as well as an increase in income tax; dividends absorb the same amount as in the previous year, while the amount carried forward is increased by £2,500 and now stands at £131,000. On the credit side of the account the rebate is also increased by £10,400 and now amounts to the important total of £163,131.

The figures in the balance sheet show some interesting features. Securities at £9,755,502 are much lower than they were a year ago when the figure was £14,014,462, while on the other hand bills discounted and short-dated bonds are nearly nine millions higher, the figure being £24,066,578 against £15,387,020. These changes in the relative position of investments and bills are due in great measure to our having transferred the holding of 4½ per cent. Conversion Loan from the former to the latter.

VALUE OF INVESTMENTS

Before leaving the subject of the investments there is one important point I would like to add, which is that the result of the transfer of the £300,000 from investment reserve account is that the value of the investments in the balance sheet is below the market price ruling on December 31st last and I need hardly remind you that as the value in our books declines so the return on these securities increases. Once again I can repeat what I have said on several previous occasions, that there are no commitments due by foreign Governments or foreign municipalities.

The money market was subject to wider fluctuations last year than in 1937, which brought about a rather higher average price for discounts. The rate at which the Treasury issued its Bills was 12s. 2½d. per cent. against 11s. 2d. per cent. in 1937. We were able to continue to borrow from the banks at ½ per cent. but even so the margin is wholly inadequate.

PRESENT POSITION

It is difficult to say what the position may be during this year, but it has to be borne in mind that the bulk of the foreign and fugitive money, which had been in London for some considerable time, has now been withdrawn.

The volume of the trade of the country, as measured by the figures issued by the London Clearing House, has not been maintained at the high level of 1937 and the export trade has not increased as we could have wished. It may be said that this country's proportion of the foreign trade transacted was fairly satisfactory, but it will never reach the dimensions we so much desire until the endless restrictions on trade of one sort and another are removed and the nations of the world are permitted to trade with one another with greater freedom. This is the aim and driving force behind the policy of the Government of this country, and we can only watch the steps being taken with both hope and confidence.

In conclusion, I would like to pay a tribute to Mr Newcomb and the sub-manager, together with all those connected with the management of the business for the loyal and excellent service they have rendered during the year.

The report and accounts were unanimously adopted and the formal business was duly transacted.

NATIONAL DISCOUNT COMPANY, LIMITED

DIVIDEND AND BONUS MAINTAINED

SIR SIGISMUND MENDEL'S SPEECH

The ordinary annual general meeting of the National Discount Company, Limited, was held, on the 19th instant, at Southern House, Cannon Street, London.

Sir Sigismund F. Mendl, K.B.E., who presided, after expressing regret at the death of Sir Sidney Peel, said:—The year which has just come to an end has been one of much anxiety, culminating, as we all know, in September in the severest international crisis since the Great War. I do not propose to dwell upon the many aspects of 1938, except in so far as they have had repercussions upon the London money market in general and the National Discount Company in particular.

ADVANTAGES OF RECENT ACQUISITION

We have indeed an important matter to report of a domestic nature which is of special interest to the shareholders—namely, the acquisition last July of the business of the well-known firm of Reeves Whitburn. This we feel sure will redound to the advantage of the company, and it has already, as you will observe, had some effect, in the comparatively short time which has elapsed, upon the amount of business we have transacted. The amalgamation has also provided one additional feature upon which I think we are to be congratulated, and that is that during the six months that have since elapsed we have had the good fortune of securing the co-operation, as directors of our company, of two gentlemen who were actively engaged in the business of Messrs Reeves Whitburn. We welcome them to our board as men in the prime of life and with experience in the practical working of a discount house which should prove of great value to our company.

DIVIDEND AND BONUS MAINTAINED

Dealing with the profit and loss account, you will observe that our gross profits have increased by a sum of £11,730 over the preceding year, and that after making provision for the National Defence Contribution, allocating £50,000 to the reserve fund and £5,000 to the Pension Fund, we are able to maintain the dividend and bonus at the same rate as last year and to carry forward rather more than we brought in. The allocation to the Pension Fund, though less than last year, brings that fund to a figure which in the board's opinion is approximately sufficient for the time being to provide for the purposes which it was created to meet.

With regard to our balance sheet, investments at £5,199,945, it will be noticed, are considerably lower than during the preceding year. As mentioned on a previous occasion, our investments are mostly of a short-dated currency, and by the method now adopted for the presentation of the accounts a considerable portion of those investments is, owing to their early maturity, included in the item "Bills and short bonds discounted." On the other hand, we have an increase in "Bills discounted," which is the more satisfactory as during the latter part of the year there has been a more favourable margin between the rates of interest and discount than for some time past. We welcome this all the more as it has enabled us to a greater extent to revert to the normal function of a discount company—namely, the discounting of bills.

ASSISTANCE FOR EXPORT TRADE

As a discount house we welcome any increase in the available volume of bills, for at no time in recent years has the standard of commercial acceptances been higher than at present. I might add at this point that the efforts of the Government in assisting export trade are encouraging and are much appreciated by those, who, like ourselves, realise the great importance of international trade to a country situated like our own. I need not say that I am more particularly referring, firstly, to the Anglo-American Trade Agreement, and, secondly, to the increased importance and financial support lately announced by the British Government in connection with the Export Credits Department of the Board of Trade.

In the accounts presented this year the provision for rebate has been computed on the same basis as heretofore, but on this occasion it has been deducted in arriving at the amount shown for "Bills and short-dated bonds" instead of being stated as a separate item on the liabilities side of the account. The reduction in the item "Bills

re-discounted" is, as will be seen from the balance sheet, due to the exclusion of Treasury Bills.

A prominent feature of the latter part of the year has been the improvement in French credit, leading to the repatriation of French funds, and other foreign balances here have generally been much reduced, no doubt owing to existing political uncertainty in Europe, which has led to the transfer of balances to the other side of the Atlantic. It is also to be noted that whereas in 1937 the money market negotiated its end of the year requirements without recourse to the Bank of England, in the year just ended recourse to the Central Institution by the market reached a high figure.

HOPEFUL FEATURES IN THE OUTLOOK

While there are certain symptoms which may, I think, lead us to feel more optimistic as to the coming year compared with 1938, I do not attempt to prophesy what the year has in store. Trade recovery in America and some indications that our own trade recession has been arrested are two hopeful features, and unless fresh political complications mar the progress of appeasement in Europe, which was initiated by the Prime Minister early last year, and which we all hope will prove to have been furthered by his visits to Munich and Rome, there is, I hope, ground for anticipating that 1939 may show a general improvement over 1938.

The recent Government measures aiming at the protection of the sterling exchange afford a welcome indication that the authorities are fully alive to the vital importance to this country of the maintenance of the international value of the pound. In this connection it is a regrettable fact that there has been a lack of confidence and a feeling of uncertainty in many financial and commercial centres, not only abroad, but even in our own country. It must be evident to everybody who takes a calm and dispassionate view of the position of this country and of the vast resources of the British Empire, that there is no reason either in the economic, commercial or financial spheres for any feeling of pessimism or depression.

In conclusion, the Chairman expressed his appreciation of the work of Mr Goldsmith, the managing director, and all members of the general staff.

The report and accounts were unanimously adopted, and proposed dividends were approved, viz. 2s. 6d. per share on the "A" shares, and 6s. 6d. with a bonus of 2s. per share on the "B" shares, all less tax.

THE NATIONAL BUILDING SOCIETY

A NORMAL YEAR

The eighty-ninth annual general meeting of the National Building Society was held, on the 13th instant, at Southern House, Cannon Street, London, E.C.

Mr W. F. Foster, F.R.I.B.A., F.S.I., the chairman, who presided, described the society's condition as very satisfactory. He said that, although Stock Exchange securities had fallen during the year, building society investors had preserved their capital without depreciation.

As from January 1, 1939, the rate of interest on "B" shares (i.e. investments made after June 1, 1933) had been raised from 3 per cent. to 3½ per cent., free of income tax. This applied to all new share investments.

Share capital amounted to £28,458,682, and deposits were £4,038,663. Mortgage assets had risen £3,007,956 to £33,139,558, and advances during the year totalled £6,188,309. Trustee investments stood at £1,703,986, the market value of stocks being £55,083 above book value. The cash balance was £929,657, a very satisfactory figure in the interests of liquidity.

Balance of profit was £1,205,277 allocated as follows: (1) Share Interest £925,064; (2) premises written down by £11,000; (3) to general reserve £140,000; (4) to reserve No. 2, £134,135, making total reserves £2,123,409, and £26,157 was carried forward.

Income tax had cost the society £213,704 and N.D.C. £24,317.

He regretted that details of the Government's War Risk insurance scheme were not yet available. He believed, however, that it was possible to show undue anxiety on that score. The society's mortgages covered 60,000 units; this spread of risk made building society investment as safe as any other.

Mr Wm. Cash, Junr., M.A., F.C.A., had been elected to the board, filling the vacancy occasioned by the death of Mr Huckle.

Granted a continuance of peace, the society could employ an increasing volume of new capital.

The report and accounts were adopted, and the retiring directors and members' auditor re-elected.

LIEBIG'S EXTRACT OF MEAT COMPANY, LIMITED

EXPANDING DEMAND

The seventy-fourth annual general meeting of Liebig's Extract of Meat Company, Limited, was held, on the 19th instant, in London. Mr Kenneth M. Carlisle (chairman and managing director) said that the accounts reflected the operations of a year which had not been so favourable as the previous one, nor entirely immune from the difficulties and problems characteristic of a period of general trade recession and declining prices. The figure of profit available for distribution was some £10,000 less and he felt that in the circumstances that result could be regarded with satisfaction, particularly having regard to the heavier taxation now levied on profits under the guise of the new N.D.C. and the higher rate of income tax. Depreciation in the value of foreign currencies, chiefly South American, had been fully taken up in the accounts and the amount involved was substantial.

As a set-off, it had not been found necessary to make such large provisions in respect of contingencies and subsidiary companies.

Having regard to the general situation and outlook and to the substantial balance brought into the profit and loss account, they had felt justified in drawing on that to the extent of £10,000, allowing them to maintain a final distribution at the same rate as last year, namely 7s. per share.

VOLUME OF TRADE MAINTAINED

The volume of trade in their well-known proprietary lines, Oxo, Fray Bentos, Lenco, Beefex, etc., had not only been well maintained but showed encouraging expansion in some fields, and they had little to complain of unless it be import quotas and restrictions as well as exchange control.

Their factory at Colon in Argentina had accomplished a smaller programme than customary owing to the difficulty of securing cattle at an economic level of price, but in Paraguay they had been successful in handling a larger number than for the past three or four years.

As regarded the latter country, the treaty of peace with Bolivia, by virtue of which a new frontier line was demarcated by a commission of South American Powers, who acted in the capacity of arbitrators, and had been accepted by both contending parties, was ratified in July last and it was hoped would provide a basis of lasting peace between the two countries. With more stable conditions Paraguay should forge ahead and already substantial progress had been made with the reconstitution of the herds which had suffered much depletion from the ravages and requisitions of the protracted war.

In Uruguay, where their activities were now confined to farming, the year had been a favourable one for agriculture and livestock and, with the exception of wool, the proceeds from which were much reduced owing to the fall in world prices, all sections provided good returns. Their exhibits of bulls and rams had met with success at the various livestock shows, but the end of the tale had been a reduction in the sterling proceeds of the dividend due to the heavy decline in the value of the Uruguayan peso.

RETURNS OF RHODESIAN COMPANY

The returns of the Rhodesian company showed a great improvement and the ranches in South West Africa had furnished the best returns so far. A considerable improvement was anticipated in the current year at the Kenya factory. As to the current year, sales of proprietary and manufactured products had been most satisfactory and showed an encouraging expansion, but there had been a further decline in value of South American currencies.

It would be hazardous to venture an opinion as to what the rates of exchange might be at the end of next August, as so many incalculable factors came into play, when planned and managed economy, combined with a general system of liberal subsidies to agricultural and pastoral producers was adopted by Governments as part and parcel of their policy.

Funds for the payment of the subsidies had to be found somewhere or somehow, and the strict control of exchange operations had provided the Governments of Argentina and Uruguay with an instrument which could be tuned in high or low key by varying the margin between buying and selling rates, to produce at will the wherewithal required to meet the difference between market and guaranteed minimum prices. As those differences were large at the moment the key was pitched high, and only the future could show if the bounteous crops in process of being harvested in Argentina would find markets and prices which would help to mitigate the heavy toll levied by the subsidiaries already in force.

The report was unanimously adopted.

BRITISH TIN INVESTMENT CORPORATION, LIMITED

BENEFITS OF RESTRICTION

The ordinary general meeting of the British Tin Investment Corporation, Limited, was held, on the 17th instant, in London.

Captain Oliver Lyttelton, D.S.O., M.C. (chairman and managing director), said that the company was now fully invested; they regarded that as the right policy to have pursued during a time when tin shares had fallen to comparatively low levels. Last year he had referred to the exceptionally prosperous conditions obtaining in the early part of 1937, and had told them that the board had taken the opportunity of realising some shares and that at the end of 1937 they had not yet reinvested the proceeds. Opportunities had occurred, however, during the latter part of the year, and they had been able to add to the strength of their portfolio at reasonable prices.

Over 97½ per cent. of the Corporation's and its subsidiary's investments were quoted; 87.8 per cent. were in shares of the following companies:—Associated Tin Mines of Nigeria, Ayer Hitam Tin Dredging, British American Tin Mines, Kamunting Tin Dredging, Kuala Kampar Tin Fields, London Nigerian Tin Mines, London Tin Corporation, Malayan Tin Dredging, Pangnga River Tin Concessions, Petaling Tin, Southern Kinta Consolidated, Southern Malayan Tin Dredging, Southern Tronoh Tin Dredging, Tekka Taiping, and Tronoh Mines.

VALUATION OF INVESTMENTS

The investments of their subsidiary company showed a small depreciation of about £4,500 below their book cost; its undistributed profits, however, covered the depreciation with a good margin. In the parent company, if they ignored the general reserve, the appreciation above the value at which the investments stood in the balance sheet was a small one, something between £40,000 and £50,000. That need cause little anxiety, because many of the prices were nominal and the purchase of a few hundred shares was often enough to cause a substantial rise in prices. Furthermore, there was a general reserve of £575,000. In conjunction with associated companies they had purchased a substantial interest in British American Tin Mines, a holding company owning through an operating subsidiary a mine in Siam. The property appeared to be of major importance, and he thought they might fairly classify the venture as a developing asset rather than a speculation.

The year 1938 has been a bad year for tin-mining companies, but it showed what restriction could do for an industry in bad times. It would be fair to say that, though tin-mining companies had found themselves on short commons, they had not starved.

THE BUFFER POOL

He had spent several weeks in Malaya and had seen a great deal of the industry and found much to admire. Last year had been marked by two events of great importance, first, the granting to Malaya and the Dutch East Indies of an increase of 7½ per cent. in their standard tonnages. There was no doubt that the experiences of 1937 showed that those countries were entitled to such an increase. The second important event had been the signing of the Buffer Stock scheme. The formation of that stock gave the Tin Restriction scheme the most complete machinery of its kind that existed. It was an interesting experiment, and he made so bold as to say that, if it achieved even some of its objectives it would be widely followed in other primary commodities. He had every confidence that the management arrangements for the Buffer Stock would work out satisfactorily. Naturally, the complete success of the scheme could only be achieved if there was an increase in consumption, particularly in the United States of America.

A FALLACY EXPOSED

There was one last subject upon which he wished to touch. Some critics said that the price range at which the International Tin Committee was aiming was too high, and that it would be better to have a larger quota and a lower price. This was a specious argument; quotas were governed by consumption. The idea that by producing, say, 1,000 tons per month more than the current consumption, the result would be a stable price of, say, between £170 and £200 was entirely fallacious. Just as there was no evidence that other metals were substituted for tin if tin sold between £200 and £230, so there was none that more was consumed if prices were £20 or £30 lower.

In conclusion, he said that he was hopeful that 1939 would prove a much better year for the industry than that which had just passed away unmourned.

The report was unanimously adopted.

RIO DE JANEIRO FLOUR MILLS AND GRANARIES, LIMITED

DIVIDEND MAINTAINED

The fifty-third ordinary general meeting of this Company was held, on the 17th instant, at River Plate House, London.

Mr S. C. Sheppard (the chairman), in the course of his speech, said that the fall in Brazilian exchange during the year, which meant a reduction of some 20 per cent. in the conversion rate, had very materially affected the currency assets and liabilities shown in the balance sheet. He considered the slightly lower net earnings should be thought satisfactory in view of the difficulties mentioned in the directors' report, and the balance available of £79,438 has enabled the board to recommend a final dividend of 5 per cent., which (with the interim dividend of 3 per cent.) made a total dividend of 8 per cent., the same as for last year.

(Continued from page 143)

breeds due to the absence of Continental competition on the opening night. The quality of both merino and crossbred wool offered appears to be good.

Judging by cables, there is good competition at every overseas selling centre, with prices varying very little from week to week. Heavy direct arrivals are at present pouring into manufacturing centres, thus relieving the trade of covering any urgent requirements.

Manufacturing conditions, particularly in Yorkshire, apart from khaki orders, are not at all good. The spring trade has opened very quietly, and many mills are not as busy as they were. The keen, wintry weather of the past month, however, should have materially helped retail clothiers, and the hosiery section is enjoying the greatest measure of prosperity. At the same time there is plenty of room for improvement in connection with both the men's and women's trade, and not until there is a larger consumption can prices rise.

THE COMMODITY MARKETS

THE decline in commodity prices a week ago has given way to a steadier tendency. On the whole, price changes were small this week, both in this country and in the United States.

Moody's index of the prices of staple commodities in the United States, for example, rose slightly during the week ended last Wednesday, from 142.8 (December 31, 1931 = 100) to 143.1. Consumers, however, are still reluctant to cover their requirements for a longer period ahead.

The prices of wheat and raw sugar are scarcely changed on the week. American raw cotton was steadier, but rubber fell below eightpence per lb. Linseed and linseed oil were slightly cheaper on Wednesday than a week ago. Flax and jute continued their upward movement, due to special causes. With the exception of spelter, non-ferrous metals were marked down. The immediate outlook for prices is uncertain.

Metals

Copper.—After falling to £42 10s. the price of standard cash recovered to £43 1s. 3d. per ton and thus closed on Wednesday with a net loss of 12s. 6d. on the week. Earlier this week the market was depressed by the

December statistics, and the slow demand for copper in the United States kept sentiment under pressure. On Tuesday, however, it became known that Anaconda had shut down one of its Butte-Mines and later the Kennecott company followed suit. This curtailment of the U.S.A. output has improved the outlook, the prospects of which are discussed in a Note on page 140.

Tin.—The price of tin showed much the same tendency as that of copper; after falling to £215 10s. per ton with a poor demand and the depressed Wall Street markets, it rallied to close on Wednesday at £216 7s. 6d., a loss of only 12s. 6d. on the week. There was no change in the basic position of the market. According to the Metallgesellschaft, the world's tin mines output declined from 186,034 metric tons in the first eleven months of 1937 to 146,412 tons in the same period of 1938. All leading producing countries except Bolivia and the Belgian Congo took part in the decline. Bolivia is apparently recovering from the effects of the Chaco war, while the Belgian quotas are fixed at such high levels that even the participation of those producers in restriction does not interfere with the expansion of their production.

Lead and Spelter.—The price of lead closed on Wednesday 5s. down at £14 10s. per ton, while spelter closed at £13 13s. 9d. per ton and thus was the only metal whose price showed no change on the week. While lead is still neglected for seasonal reasons spelter benefited this week from the reports of a pending decision on the British duty, which stimulated buying for nearby delivery. Moreover, it is expected that a greater tonnage of spelter will be used for galvanised sheets and corrugated iron in air raid shelters.

Grains

THE market for wheat has been quiet, but prices are little changed. The continuation of the drought in India has brought a resumption of interest there in Australian wheat. The Wheat Advisory Committee agreed last week that the wheat situation was sufficiently serious to justify the holding of an International Wheat Conference to discuss measures to improve the wheat markets; no date has yet been announced for the proposed Conference. A brisk demand for maize at the end of last week found the market short of

It had probably been one of the most difficult years the company had experienced for a long while past, but, notwithstanding this, the aggregate grindings of the flour mills were above those of the previous year although the actual deliveries were slightly down. As usual, they had to contend with fierce competition, and the depreciation in exchange had likewise to be faced; in addition to this the company had suffered considerable increases in local taxation. During the year there had been wide variations in the price of wheat and the falling market had not lent itself to satisfactory trading, but as flour was now one of the cheapest of local foodstuffs the consumption of that commodity should be maintained in Brazil, because once people became accustomed to the use of wheat flour they seldom abandoned it.

With regard to the future, it was more difficult than ever to express an opinion, but he believed that the authorities were making every possible effort to improve the situation.

The report and accounts were adopted.

supplies and prices rose considerably but declined later, on reports that the Argentine crop has much benefited from recent rain; compared with a week ago, prices show a small decline. The market in barley has also been quiet; the prospect of a good crop in Argentina is about balanced by the world shortage of maize.

Other Foods

Provisions.—Dominion butters continue to advance in price, but there was some weakening in Danish. Bacon prices were reduced by about 5s. per cwt. at the end of last week and meat prices also declined with a poor demand. Imported eggs were also cheaper.

Colonial Produce.—The market for cocoa was poor and the price of Accra fell by 9d. per cwt. compared with a week ago. There was a strong demand at the London tea auctions for most grades, and prices showed some improvement. Other markets were quiet.

Fruit and Vegetables.—Supplies of potatoes in London have been plentiful, but prices have been maintained except for those damaged by frost. Supplies of oranges have also increased and prices declined during the week.

Miscellaneous Commodities

Oils and Oilseeds.—These markets have been quiet, and with only a small volume of business, prices have tended to fall. An exception is linseed, for which prices remain firm. Egyptian cotton seed is in poor demand and quotations for March shipment to Hull have fallen to £6 10s. per ton. Trade in vegetable oils is disappointing; the price of refined cotton oil ex Hull is 15s. per ton lower on the week, though the price of linseed oil is firm.

Rubber.—The market has been consistently dull during the past week, in spite of the favourable December statistics. Stocks in the United States at the end of December were 9,000 tons lower than at the end of November, and the decline in consumption in December was less than had been expected. Compared with a week ago, the price of standard sheet on the spot declined by ½d. per lb., influenced mainly by the unfavourable situation in Europe.

GOVERNMENT RETURNS

For the week ended January 14, 1939, total ordinary revenue was £41,383,000, against ordinary expenditure of £7,051,000. Thus, excluding sinking fund allocations and Defence expenditure from loans, the deficit accrued since April 1st last is £215,335,000, against a deficit of £141,859,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturing. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On January 13th applications at £99 17s. 4d. per cent. for bills to be paid for on Tuesday, Wednesday, Thursday, Friday and Saturday of following week were accepted at about 24 per cent. and applications at higher prices in full. Applications at £99 17s. 5d. for bills to be paid for on Monday were accepted in full. £25.0 millions of Treasury bills are being offered on January 20th.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest securities allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

Germany After Schacht

THE very noticeable increase in international tension and in the nervousness of world markets during the past week is a convincing tribute—though perhaps a grudging one—to the respect in which Dr Schacht's competence and ability were universally held. General Franco's approach to Barcelona and its strategic consequences—now, at last, realised in quarters hitherto obstinately blind—have played a part in the creation of anxiety. But a victory for the Spanish rebels has for so long seemed an ultimate, even if not an immediate, probability that its effects ought by now to have been discounted. Dr Schacht's dismissal from the presidency of the Reichsbank, on the other hand, was unexpected. In any circumstances it would have been unwelcome news. But in the exact context of the present it is a disturbing proof that the last links that bind Nazi Germany to commonsense and moderation are being snapped. Just as 1938 opened with the departure of the "moderate" Generals and the replacement of Baron von Neurath by Herr von Ribbentrop, with what consequences we all know, so 1939 begins with Dr Schacht's dismissal and still further steps to subordinate the Army to the Party. The parallel is not comforting.

That Dr Schacht should have retained, in such degree, the respect, if not the admiration, of foreign bankers and statesmen is in itself a remarkable achievement. Admittedly, he stored up for himself a substantial reserve of confidence in the years when he was putting Germany's finances to rights after the havoc of the inflation. But his differences

with the republican Government over the Young Plan had far more politics in them than is usually permitted to bankers. Moreover, since 1933, Dr Schacht has been a mainstay of the Nazi regime. It is he who has driven such hard bargains with the standstill creditors. It is he who has pushed Germany's default on her foreign debts (many of them borrowed on the security of his own earlier policies) up to the very verge of commercial retaliation. It is he who has been the chief technician of the Nazi trading methods, whose ingenuity is admired in foreign countries as much as their immorality is reprobated. It is he who has been the financier-in-chief of that German re-armament which now threatens the lives of us all and weighs like an impenetrable cloud on all business enterprise. A man with achievements such as these is not a man who, in general, could expect to be liked in foreign countries. But whatever Dr Schacht has done, it has always been clear that the real Nazis, had they been in his place, would have done worse. And so his going is a signal for despondency.

Dr Schacht has himself described his policy as "elasticity in method and persistence in fundamentals." It is an apt characterisation. For a man who scored his first great success by insistence on the full rigour of the rules of orthodoxy, he has shown a very remarkable power of mental adaptation. There is dispute over the precise share he had in evolving the plan for stabilising the mark in 1923. But there can be little doubt that it was his forceful personality that created the necessary conditions of confidence in

the new currency and his rigid insistence on the virtues of economy and orthodoxy that prevented a relapse once the immediate danger was past. In the years from 1923 to 1929 there was no leading banker in the world who more fervently preached balanced budgets, adherence to the gold standard, the removal of restrictions on the free movement of capital and the rest of the elements of the orthodox faith.

This past of rigid orthodoxy did not prevent him, when he returned to the Reichsbank in 1933, from pursuing *à outrance* precisely the opposite policies. The Reichsmark is still on the gold standard only in the most empty formal sense, while there is an ever extending range of special marks by using which the German exporter is given the advantages of depreciation at the expense of the "blocked" creditor or the persecuted Jew. The Budget is as fully unbalanced as a Budget can be. And the free, liberal, capitalistic economy has disappeared beneath the towering structure of Nazi controls. State spending and State control have gone much further than Dr Schacht originally intended or now approves, and he has never tired of proclaiming his hope that Germany may one day return to her place in an integrated world economy. But the fact remains that Dr Schacht has played the leading rôle in the actual development of Nazi economic policy. What is more, judged by the results to date, it has been a remarkably successful policy.

If the story stopped at this point, with Schacht the High Priest of orthodoxy converted into Schacht the Witch Doctor of expansionism, he could be put down as no more than a very able technician who changed his views as he turned his coat; he would find his place in history alongside the Vicar of Bray. But his dismissal last week shows that there is more than mere time-serving in Dr Schacht. Behind his elasticity of method there is a persistence in fundamentals. The fundamental fact for him, indeed for all of us, is that finance is no more than clothing for the stark limbs of economic reality. In 1923 he proclaimed that what is not economically possible cannot be accomplished by any monetary magic. In 1933 it was the other facet of the truth which needed emphasis: that if a thing is economically possible, financial means for carrying it out can be found. In that sign Herr Hitler has conquered. But for a year or more Dr Schacht has been pointing out, with growing insistence, that conditions have returned to 1923 and that to pursue any further the financial policies that served their purpose five years ago is to set the financial machine a task it cannot possibly solve.

We do not know the exact occasion of Dr Schacht's dismissal or why affairs came to a head on January 19th. But the main substance of his disagreement with the Party authorities is clear. He has offered to Herr Hitler the advice that finance cannot obscure or override economic facts. And the advice has been distasteful, as it always has been, and always will be, to the heads of spending governments.

The main facts about Germany's economic position are concisely stated in a letter from Mr Thomas Balogh which will be found on page 180. The year 1938 was much less favourable for Germany in economic than in political matters. It is true that the volume of production was still further increased, but only at the cost of very severe strains. The shortage of labour has led to a "combing-out" of men from all non-essential industries, the drafting of women (in contravention of Nazi principles) and even the importation of workers from Italy. Partly as a result of longer hours, partly owing to the employment of less efficient workers, the productivity of labour is falling sharply. In addition, the chronic over-working of capital equipment and the failure to provide funds for maintenance or replacement is leading to a decline in the efficiency of capital. The fall in exports has caused a severe shortage of imported raw materials.

The financial system shows similar signs of strain. During the twelve months to October the published debt of the Reich rose by approximately Rm. 8 milliards (or nearly £700 millions at the official rate of exchange). The issue of long-term loans has been pushed as far as it can go. Indeed, the recent loans have been possible only because of the extreme pressure that has been put on the savings banks, insurance companies and other financial institutions to subscribe. The savings banks now have in their portfolios nearly seven times the amount of securities (almost all Reich loans) that they had in 1928, while the security portfolios of the life insurance companies have increased nearly nine-fold. Altogether, the securities held by all financial institutions have increased from Rm. 2.9 milliards in 1928 and Rm. 4.9 milliards in 1934 to Rm. 16.3 milliards in 1938. This has meant, of course, that credit for purposes other than the State's has been unobtainable. Even so, the very qualified success of this month's loan offering shows that the limit has been reached. The financing of the Reich has not been confined to long-term loans. The banking system's holdings of bills of all varieties has increased in the past year by Rm. 3.7 milliards. And, finally, there has been an expansion in the note circulation of Rm. 2.7 milliards, which is far larger than can be explained by the increase in production and by the annexation of Austria and the Sudetenland.

Germany, in short, is already deep in inflationary finance. The State already absorbs half the whole national income, and if there is to be any further expansion of the production of armaments or other "capital" goods it can only be at the expense of a direct reduction in the supply of consumption goods—that is, in the standard of living of the population. No financial policy, as Herr Funk will discover, can avoid that dilemma. If economies in State expenditure are ruled out (as Herr Hitler, impelled by his ambitions, has ruled them out), the only remaining choice is between different methods of curtailing the people's consumption. Inflation secures this end by raising prices. Taxation does it by reducing incomes. Control by rationing does it more directly. Dr Schacht preferred the open, honest and equitable method of taxation. But the Nazis do not like openness or honesty, and they believe in inequity to minorities. So Dr Schacht makes way for the obedient Nazi, Herr Funk.

Herr Funk has been given three public instructions. One of these is merely political—to merge the Reichsbank in the apparatus of the State—and has been accomplished in the act of Dr Schacht's dismissal. The second instruction—to open the capital market to private industry—can only complicate his task. The third, to maintain the stability of prices and wages, is an impossible counsel of perfection. For Herr Funk's real task is to release more funds for armaments, and a reduction in the purchasing power of wages is not merely an incidental corollary of such a task but its essence. An inflation of prices in the 1923 sense is improbable; it would be far too damaging to the prestige of the regime to be allowed. But the control of what the worker can buy is obviously going to be progressively tightened. His substance will not be wasted in inflated prices so much as in endless food queues.

And the moral for the rest of us? The Nazis can be under no illusions about the unpopularity among their own people of their war economy. It is unlikely that they entertain any vain hopes about their ability to maintain the present pace for very long—for purely technical reasons if for no other. All the evidence suggests that every industrial, financial and technical reserve is being depleted for one gigantic effort. Germany's striking power is being deliberately raised to a peak which could not be excelled, and could hardly even be maintained, in time of war itself.

For what purpose?

Britain's Man Power

A NATION-WIDE recruiting campaign to fill the gaps in the ranks of our defence and fighting forces, and to set behind their front-line strength a powerful and trained reserve, has been begun this week. On Monday the Prime Minister broadcast an appeal for the most generous and ungrudging response to the Government's call. On Tuesday the Minister of Labour made public a compendious list of the reserved occupations from which volunteers for services likely to be whole-time in war will not in general be accepted in peace-time. On Wednesday the distribution of the National Service Guide, listing all the civilian, military, naval and air force duties for which recruits are required, was set on foot. Every section of the population will share the heartfelt hope that this call to national service will meet with swift and abundant success.

The manner of the call to arms is in marked contrast to the methods of mobilising man-power in other lands. Only a week ago a decree of the German Führer placed all citizens of the Reich over the age of sixteen under military training, both before and after their actual term of conscript service. Here the success or failure of recruitment is left to the goodwill and loyalty of citizens themselves.

It was precisely this contrast that the Prime Minister underlined in his wireless appeal.

Compulsion (he said) is not in accordance with the democratic system under which we live, or consistent with the tradition of freedom we have always striven to maintain.

There can be no doubt that, in willingness for service and readiness for sacrifice, the volunteer will always rank higher than the pressed man. It is true, too, as the last world war showed, that the free enterprise of democratic countries contains a capacity for adaptation to swiftly shifting demands which has a large part to play in eventual victory. Strait-jacketed, neither labour, capital nor technique can preserve a flexible efficiency, if only because the war we plan for is never the war which comes. On political and technical grounds alike, therefore, the true test of democratic citizenship is the readiness to serve when danger threatens.

Nevertheless, the issues involved in shoring up the nation's defences with all the speed that the character of modern warfare makes needful are more than matters of political procedure or democratic etiquette. It is swift and comprehensive results that will count. Patriotism is not enough; according to a precise calculus of defence requirements, it must be guided into the channels where loyalty, enthusiasm and ability are most needed. Man-power must be fully apportioned, trained and equipped before the first bomb bursts. "There will be no time (said Mr Chamberlain) to train after war starts." It is the likely practical consequences of the Government's personnel programme which must be analysed.

The general outline is clear. Of the nation's man-power between the ages of 18 and 64, half, including some 3 millions over 45 years of age, will be held back, by reason of their occupation, from services which, in war-time, would take them wholly away from their important civil duties, though they will remain available for training in part-time defence duties, especially those associated with their workplaces. The other half, or a further 6 or 7 millions, including four-fifths of the men between 18 and 45 and a majority of women, will form a reservoir for all varieties of national service, such as air-raid precautions, police, fire services, first aid, land work, and the vital reserves and auxiliaries attached to the armed forces. A citizen army of some 1,800,000, including 600,000

trained reserves, is required for citizen services. There is no restriction on the members of either group, reserved or not, to prevent their immediate whole-time enlistment in the armed forces.

The foundation-stones of the voluntary system announced are four. The National Service Guide aims to inform every citizen of the openings available. Actual recruitment will be conducted by the responsible bodies already instituted for the several services. The local offices of the Ministry of Labour will serve as clearing-houses to prevent recruits in reserved occupations from joining forbidden services. Finally, 210 National Service Committees in the counties and boroughs of Great Britain and Northern Ireland will stimulate recruitment by publicity and propaganda, give impartial advice and information to would-be volunteers and endeavour to hold a proper balance in each area between the intakes of the various services.

The burden laid upon the National Service Committees, which are to represent capital, labour, the civilian services and the armed forces, is a heavy one. The detailed list of services in the Guide will inform readers fully of the jobs to be done: but many will not discover which service is the most suitable for them to join or which branch is in most urgent need of their aid. The booklet is a reference book rather than a real guide, and the Committees' publicity and advice will be all-important sign-posts for citizens anxious to serve.

In part, the priorities which the Committees will indicate are already obvious. In general, recruitment for defence duties has so far not been gravely deficient. Over a million volunteers have come forward. But many are still untrained; and certain areas and certain services, such as the police war reserve, the auxiliary fire brigades, and the first-aid groups, are seriously undermanned. These are clear cases for the swiftest and most sonorous guidance.

Quite clearly the several parts of the scheme, which is comprehensive and ambitious, are designed to prevent the chaos and confusion in the use of man-power which marked the opening years of the last war; and it is clear again that there now exists the national machinery of the Ministry of Labour to register the occupational classification of volunteers. Yet it is by no means certain that the fullest possible success in the mobilisation of man-power according to the nation's needs will in practice be achieved by the scheme as it stands.

The argument that a voluntary system may not result in the coming forward of all the suitable recruits required, and may fall far short of the complete registration of all the country's personnel according to their capacities, is officially met by the confident claim that citizens are unanimously anxious to serve. This contention is correct; but the fact that, even after every householder has read the Guide, many will still be uncertain about their next step suggests that there may be a considerable wastage of willingness. One source of wastage that is still very apparent is in the mobilisation of brains, which was such a valuable element in the last war and will be vital again in the next war. It is difficult for brains to volunteer in advance, for they do not fit easily into any large category. But the failure to provide obvious means by which brains can serve their country may result in their being enrolled in services where brawn and courage are more needed. Most of the best brains of the country are fully occupied in work which they could not wholly abandon in war-time, and their ability to volunteer is correspondingly limited. This difficulty might be got over, and many advantages secured,

if it were possible to allocate in peace-time to established groups of professional men (such as advertising agencies, engineering consultants, technical businesses) work for which, together with the skeleton of their peace-time work, they would be responsible, as a group, in war, and with which they could be familiarising themselves now. The Advisory Council set up under Sir Walter Moberley's chairmanship might consider the feasibility of such a scheme.

"It is for the Government to make clear what service the country needs and in what forms it can be given," Sir John Anderson has said. The job has been only partially done. The individual has not in every case been given a clear idea of the priority of the various claims upon his services. The community as a whole has not yet been fully informed of the programme of priorities upon which the Government's defence policy, enclosing active striking power, production, supplies, consumption and foreign trade in an integrated pattern with personnel, is based. All our peace-time preparations must be rationally related to envisaged war-time needs. We must have the map of the war economy on our walls, in full colour and contour.

In the case of personnel we must have our minds made up at once about the proportion of available man-power needed by the armed forces for front line, reserves and auxiliaries—active striking power is still the crucial factor in war; for the production of war material and equipment; and for the production of goods and services to meet essential civilian needs and maintain exports at the highest possible level. At present, for instance, the total number of regular and territorial troops available for active service, excluding 64,000 anti-aircraft irregulars, is under 450,000. In 1914 the corresponding total was over 650,000. In the light of recent European changes can we continue to contemplate the next war in terms of only a "token" army to

assist France? It is said that we can afford no more of our man-power than a bare half million; but, if the object of our fighting is to win the war, can we afford less than a million, or even more, fully equipped and mechanised for expeditionary use?

This problem is no more than one illustration of the general problem of priorities which underlies the Government's defence policy. It may be that a comprehensive and sufficient programme for the apportionment of all the nation's resources and activities has been prepared to spring fully armed from the heads of the State; but recent failures in planning and production have scarcely spread confidence. The Government's attitude towards proposals for a Ministry of Supply and a compulsory register has shaken faith in the full rotundity of their plans; and, in the specific case of training for national service in civilian defence, the lamentable lack of training equipment and accommodation which has lately marred progress in vital branches—and may still prove the most serious obstacle to the present campaign—has been but a poor advertisement for public policy.

Nevertheless, when all is said, it cannot be too strongly emphasised that a chief remedy for past failures now lies in the hands of the people of Britain themselves. If each and every citizen is fully resolved to find a proper place in the roll of active service, to use every effort to dispel all uncertainty, to exploit to the full the advice and information offered by the National Service Committees and to resist every temptation to wait upon the course of events before acting, then, when Parliament comes to review the recruiting campaign in March, it may be found that loyalty and determination have been triumphant over hesitation and doubt. We must all hope and pray so, for the sands are swiftly running out.

Changes in Yugoslavia

ROMAN trumpets have blown hard for Count Ciano's visit to Dr Stoyadinovich. For too many Englishmen Yugoslavia is just another Balkan uncertainty: but the Italians, with good historical reason, do not under-estimate a country with far greater natural wealth and an area little less than their own, lying on the ancient trade route between Central Europe and the Mediterranean. After the events of October, friendship with Yugoslavia is their bet for the Balkan stakes.

Prince Paul Karageorgevich became senior Regent of Yugoslavia in 1934. His modest words to the Skupshchina on that occasion, that "he hoped they would be pleased with him," have typified his Regency, for he has remained a modest autocrat, ruling from behind the scenes. Three major political changes distinguish his rule: the first concerning internal politics, the second commercial development, and the third foreign policy.

The Government's victory in the general election of December 11th against a ragged coalition of disgruntled nationalists, the valiant fragments of a democratic Opposition, and the well-knit Croat home-rulers, may have been little more than a tribute to a certain Balkan aptitude for uncomfortable election technique on the Government's part; but it also owed something, even if not much, to the zeal shown by Dr Stoyadinovich's Radical Union. For the fact does remain that the political system is becoming less illiberal. The rigours of 1929, when the Croat leader, Radich, was murdered by a Serb deputy and the Skupshchina suspended by King Alexander, are slowly thawing out. The absolute monarchy is no longer an absolute regency. In last month's election only four people were killed in riots; and there have been few charges of intimidation. Throughout Croatia and North Dalmatia, Dr

Matchek and his followers in the campaign for Croatian home rule have been free to state their views and attack their opponents; their newspapers, at least in comparison with those of neighbouring countries, have had a fairly free hand; and even in Belgrade, Serb and Croat Opposition parties have held united demonstrations without being haled off by the police. But the return to responsible parliamentary government is very gradual, and those parties are still, and for a long time will remain, lost in the wilderness. Their numerical strength is uncertain, except for Dr Matchek's Croat People's Party, which is all-powerful in its own provinces; but what they lack in authority they make up for in enthusiasm. The Serbo-Croat Opposition "popular front" was joined for last month's election, and made even more incongruous, by General Zhivkovich, Dr Yevtich, and their Serb nationalist party. The Slovenes, third partner in the South Slav Union, unlike the Croats, have usually voted with the Government, for they are few and without strong grievances, and until the recent Cabinet changes have had, for talisman against discrimination, their leader, Father Koroshetz, as Minister of the Interior.

The credit which may be assigned to Prince Paul for liberalising politics must be tempered by the realisation that no union of three peoples, such as the Croats, Serbs and Slovenes, could long endure without a great deal of give and take and a great deal of delegated responsibility. The strength of Croat federalism rests precisely on the fact that the Serbs, having had a flying start in 1918 by virtue of possessing not only the king but also the capital and the embryo of government, have wished to take too much upon themselves. The Croats, moreover, are Roman Catholics; while the Serbs are Orthodox. Serbian dictator-

ship will always be a chancy business. The measure of Prince Paul as a statesman will be taken by his handling of the Croat case. Until now he has treated the Croats high-handedly, though the Concordat riots of 1937 did not make things easy for him; but he must soon decide whether it is to be suppression or appeasement. It should not be beyond his powers to supplement the cultural and economic equilibrium which already exists with a better political balance between Croatia and Serbia.

The second change is really only an incipient tendency, and may be summed up by the word "industrialisation." Although Yugoslavia is first and foremost agrarian, with about 80 per cent. of the population working on the land, history records that King Stephen Dushan ate from a golden platter, and six hundred years later the modern Yugoslav is taking the hint. Indeed, for a country rich in coal, iron, copper, lead, zinc, chromium, manganese, and bauxite, and possessing deposits of the precious metals and of antimony, Yugoslavia is remarkably underdeveloped; and this despite the fact that there has been little hesitation in calling in foreign capital.

Mineral production has fluctuated from a maximum value in 1929 of 1,499 million dinars to one of 1,414 million dinars in 1936, falling to 1,052 million dinars in 1932. In common with the growth of trade between Yugoslavia and Germany, which has been strong since sanctions put Italy out of the running, there has been an influx of German capital. The State-controlled mines at Ljubija, Vreche and Zenitsa, forming the core of Yugoslavia's infant metallurgical industry, were all equipped by Krupp; but the most important foreign enterprises remain those of the French copper interests at Bor and the British lead interests at Trepka. Among important Yugoslavian concerns are the aluminium plant at Lozovats and the cellulose refinery at Duruvor; while a good deal of activity is being directed towards research and survey work. Export of mining products in 1937 amounted only to 1,169 million dinars (about £4.2 millions at par); but if, as Herr Funk implied when at Belgrade the other day, Germany is willing to offer virtually unlimited markets for mineral raw materials, then there seems no reason why German capital should not double that total in the not distant future. At this point Belgrade remembers the balance of power. Sanctions, the *Anschluss*, and the transfer of Sudeten Bohemia, have successively strengthened the German hold on Yugoslav trade, to the discomfiture of Italy. Count Ciano's visit carries a step further the corrective applied by Dr Stoyadinovich in the autumn of 1938, when a decree restricted Yugoslav exports to Germany by half; and the reported granting of an Italian credit worth £5 millions, confirms the impression that an improvement in trade was the immediate purpose of the visit.

Fixed Prices for Farmers—II

The Cost of Fixed Prices

THE general principles of the policy of "insuring" or guaranteeing prices for agricultural produce, which is currently being advocated both by the National Farmers' Union and by the Conservative Agricultural Committee in the House of Commons, were examined in an article in *The Economist* last week. The proposal is, in brief, that a standard price should be fixed by an independent Commission for each product and that when the price actually obtainable by the farmer falls below the standard, the deficiency shall be made up to him in cash. The volume of production on which this guarantee would be given would, presumably, be limited, as it is in the Wheat Act whose successful operation has inspired the present proposals.

It was suggested in last week's article that, subject to

The extent to which the Government will permit or encourage the inflow of foreign capital is conditioned by their zeal for industrialisation. Unlike Atatürk, neither King Alexander nor Prince Paul have thought it possible to lay down a hard-and-fast rule, and for the moment it seems very unlikely that any serious measures could be contemplated to discourage the entry of foreign capital. But the rate of industrial advance depends less on the business-men than on the politicians.

If Yugoslavia were given another twenty years of peace, it would be safe to say that by then she would be a country with a settled constitution. She is not that to-day. The country's leaders have the unenviable task of keeping in trim a ship of State when many of its passengers are doing their best to rock it. Prince Paul and Dr Stoyadinovich have steered a middle course, but, because of the snags, also a tortuous one. They have had to bear in mind the ever-present danger that German, Hungarian and Bulgarian minority claims will take an acute form; they have had to deal with Serb nationalists and Croat federalists; most controversial of all, they have had to match their foreign policy with a post-sanctions pattern, change direction when the League failed and Germany was re-armed, patch up hasty friendship with indignant Italy, and all this without alienating the Western Powers more than could be avoided.

Because she is a satisfied Power it is in the interest of Yugoslavia to maintain the *status quo*. Things as they are may not suit her perfectly, but at least they could be much worse. To think of Prince Paul, or even of Dr Stoyadinovich, as being "pro-German" or "pro-Italian," is to miscalculate the fundamentals of their foreign policy. For although Yugoslavia is a balance-of-power State, and might be supposed to view with alarm German domination of South-East Europe, nevertheless to have expected her rulers to bolster French and British interests in the Balkans when it was plain for all to see that other and nearer nations were in the ascendant, was to expect a show of light-headedness or of sheer altruism. In Europe after the defeat of sanctions, and *a fortiori* after the meeting at Munich, it must be the aim of Dr Stoyadinovich and his successors to play off Italy against Germany, to maintain intact the Balkan entente and good relations with Bulgaria, and whenever possible (as at Nyon last year) to co-operate with Britain and France. They should be happy to carry out the last part of this programme if only because democratic alignment in foreign policy is one of the main planks in the Opposition's platform. But while the Berlin-Rome Axis holds firm, scope for co-operation with Britain and France will remain small; and Yugoslavia's impeccable neutrality during the last crisis is a guide to what she will do in the next.

three important provisos, the scheme represents the method by which the community can assist the domestic agricultural industry with least damage to itself. The first proviso is that the funds necessary shall not be raised by a tax on the consumption of food. Secondly, any attempt to base the standard prices on cost of production is both wrong in principle and administratively impracticable. And lastly, the Commission which is to administer the plan must be not only genuinely independent of the agricultural industry but also specifically charged with trusteeship for the interests of the community as a whole.

If these three provisos are observed, a scheme of guaranteed prices would have a great deal to be said for it. But it remains to estimate what it would cost in practice.

Any such estimate is very difficult to make; it is impossible to make with any precision. In the first place, the farmers have not revealed what they would regard as reasonable prices, and there is no method of deciding what figures might be agreed upon between them and the Government. There are the same uncertainties about the maximum quantities of each product to which the fixed price would apply. Even when standard price and quantity have been determined, there are no means of estimating what actual market price will be. And for most commodities there is a whole array of diversities of grade and kind that hinder any calculation which treats the commodity as a unit.

Nevertheless, the policy cannot be discussed in a financial vacuum. Before Parliament or the public can be expected to form an opinion on the scheme they must know whether its cost will be of the order of five or of fifty million pounds. An attempt has therefore been made in this article to estimate what might have been the cost of such a policy if it had been in force over the past decade. The estimate has involved, as will be seen, a number of necessarily arbitrary assumptions, and the result is therefore at best nothing but a rough indication. But in every case where a choice has had to be made between possible assumptions, care has been taken to understate rather than to exaggerate the cost.

The first step in any such calculation is to fix the standard prices and quantities. For livestock products, the production of 1936-37 has been taken as standard. For crops, the standard is a production equal to the average 1928-37 yield on the actual 1937 acreage. The livestock figures apply to Great Britain, the crop figures to the United Kingdom. The assumption is then made that actual production is equal to the standard every year. Milk, sugar beet, hops and potatoes are omitted from the calculation, since their prices are already controlled. Any cost that falls on to the community in respect of these four commodities must, however, be added to the final totals reached by the calculation.

For standard prices, two alternative series have been chosen—a lower and an upper standard. For each of the nine commodities included in the calculation, annual average prices were taken from the Ministry of Agriculture's official statistics for each of the ten years 1928 to 1937. These ten annual prices constituted a range, the highest year being at the top of the range, the lowest at the bottom. The lower standard price was assumed to be one-third of the way up from the bottom of the range to the top. The upper standard price was assumed to be one-third of the way down from the top to the bottom. The standard quantities and standard prices arrived at by this means are shown in the following table:—

STANDARD PRICES AND QUANTITIES

	Upper Standard Price	Lower Standard Price	Approx. Present Price	Standard Quantity
Wheat	8s. 3d.	6s. 7d.	4s. 5d.*	32,700,000 cwt.
Barley	9s. 10d.	8s. 9d.	7s. 11d.*	14,800,000 cwt.
Oats	8s. 10d.	7s. 2d.	6s. 2d.*	36,800,000 cwt.
Fat Cattle	42s. 4d.	37s.	37s. 3d.	2,022,000 head of 10 live cwt.
Fat Sheep per lb. dead weight	11d.	9½d.	9¼d.	2,600,000 head of 65 lb. dead wt.
Fat Lambs per lb. dead weight	18½d.	11½d.	8½d.†	7,810,000 head of 40 lb. dead wt.
Bacon Pigs per score dead wt.	13s. 8d.	11s. 4½d.	12s. 1d.	1,900,000 head of 140 lb. dead wt.
Pork Pigs per score dead wt.	15s. 2d.	12s. 9½d.	14s. 9d.	1,700,000 head of 80 lb. dead wt.
Hen Eggs	17s. 8d.	15s. 4d.	18s.	36,000,000 great hundreds.

* Excluding subsidy.

† Quotation for end of October.

It may be remarked in passing that even the upper standard prices would in all probability be unacceptable to the farmers. The upper standard for wheat, for example, is considerably below the standard of 10s. per cwt. fixed by the Wheat Act (for a quantity of 36,000,000 cwt.) with

which the N.F.U. has hinted its dissatisfaction. The calculations of cost based on these prices and quantities are therefore certainly below the figures the farmers envisage.

When the standard prices and quantities have been determined, the estimate of cost follows by a simple arithmetical calculation of the deficiency between the actual price and the standard for each commodity in each year, multiplied by the standard quantity. The results are shown in the next table, using the lower standard for prices:—

COST OF LOWER STANDARD PRICES
(£ millions)

	1928	1929	1930	1931	1932	1933	1934	1935	1936	1937	Ten Years
Wheat	...	...	...	1.4	1.1	2.0	2.9	2.3	...	...	9.7
Barley	...	...	0.6	0.6	0.9	0.6	0.1	0.6	...	...	3.4
Oats	...	...	1.8	1.7	0.3	2.9	1.7	0.6	1.5	...	10.5
Fat Cattle	...	...	...	...	...	2.2	2.8	5.4	3.8	...	14.2
Fat Sheep	...	...	...	...	1.2	1.1	...	...	...	...	2.3
Fat Lambs	...	...	...	...	2.2	1.9	0.3	0.3	...	...	4.7
Bacon Pigs	...	...	0.5	...	1.6	0.8	...	0.7	...	...	3.6
Pork Pigs	...	...	...	...	1.7	0.9	0.1	0.9	0.5	...	4.1
Hen Eggs	...	...	1.1	...	2.8	3.1	4.2	2.7	0.7	...	14.6
Total	...	...	2.4	5.3	11.8	15.5	12.1	13.5	6.5	...	67.1

On this basis, then, the cost, averaged over the whole decade, would be £6½ millions per annum. The average cost for the seven years in which some payment would have had to be made would have been £9½ millions.

The certain refusal of the farmers to accept the lower standard of prices lends more significance to the calculation on the basis of the "upper standard":—

COST OF UPPER STANDARD PRICES
(£ millions)

	1928	1929	1930	1931	1932	1933	1934	1935	1936	1937	Ten Years
Wheat	...	...	0.4	4.1	3.8	4.8	5.6	5.0	1.8	...	25.5
Barley	...	...	1.4	1.4	1.7	1.4	0.9	1.4	1.1	...	9.3
Oats	...	...	4.7	4.6	3.4	6.0	4.6	3.9	4.2	0.4	31.8
Fat Cattle	...	...	...	...	2.8	7.6	8.2	10.9	9.3	4.3	43.1
Fat Sheep	...	...	...	...	0.5	2.5	1.6	0.7	0.7	...	6.7
Fat Lambs	...	...	...	...	0.4	4.3	3.9	2.4	2.4	1.9	15.3
Bacon Pigs	0.1	...	...	...	2.0	3.1	2.3	1.6	2.2	1.5	13.7
Pork Pigs	0.3	...	...	...	1.6	3.5	2.7	1.8	2.6	2.2	16.1
Hen Eggs	...	...	0.7	5.2	7.0	7.5	8.4	6.9	4.8	3.3	43.8
Total	0.4	...	7.2	19.8	32.1	37.7	34.2	36.0	27.5	10.4	205.3

The average annual cost over the ten years would have been £20.5 millions. There were two years in which no more than a negligible sum would have been paid; the average cost for the remaining eight years would have been £25.6 millions a year. This figure, it will be remembered, is additional to sums paid in milk or beet sugar subsidy, but it would, of course, have replaced the present subsidies for wheat and cattle whose cost from their inception up to 1937 amounted to £37 millions.

It must be emphasised once again that these figures can be no more than illustrative and the actual cost might be very different. It is worth while, however, mentioning some of the variable elements that might affect the cost.

Standard Prices.—The higher these are, the higher the cost. As has already been mentioned, it is certain that the farmers would not agree to prices lower, on the average, than the "upper standard" assumed above, and probable that they would insist on something much higher. If the precedent of the wheat quota was followed and prices were fixed at the highest annual level of the years 1928-37, the total cost over this decade would have exceeded £350 millions.

Standard Quantities.—The figures taken for the volume of production allow for no increase, but, equally, they assume that a volume of wheat, barley and oats equal to the standard is sold off the farm, which is not necessarily the case. It may be noted that in the only case in which a direct comparison is possible, that of wheat, both the "upper standard" price and the standard quantity are well below those laid down in the Wheat Act at present in force.

Market Prices.—If the prices on the open market over the next decade were higher than those that prevailed in the years 1928-37, the cost of the scheme to the Exchequer would be less. No one can predict the future of prices. But the decade chosen for comparison includes two years (1928-29) when prices were considerably higher than they

show any signs of being in the immediate future. It is part of the N.F.U.'s proposal that imports should be restricted. If this were done and prices rose as a consequence, the cash burden on the Exchequer would, of course, be diminished—at the cost of a heavier burden on the domestic consumer applied regressively in inverse proportion to the ability to pay.

The policy of guaranteed prices is thus likely to be extremely expensive. On a balance of considerations, the actual cost seems likely to be above, rather than below, that estimated in the last table. The truth is that British agriculture is one of the first industries to feel the ill-effects of that increasing disproportion between British prices and world prices which is encouraged by our new policy of

Topics of the Week

Barcelona Falls.—Five weeks of steady advance against their untrained levies, half-dug defences and meagre supplies, have forced the Republicans out of Barcelona and northwards into the Pyrenees. The astonishing speed of General Franco's advance owes much to able strategy and ample war material, but something also to that mixture of hunger, weariness, and failing hope which assails the morale of men who have been driven backwards day after day for so long. By Thursday the Government had moved to Figueras, near the frontier, and declared its intention, if necessary, of going to Valencia. After the Government went the refugees, their plight perhaps a little improved by the precision of General Franco's plans. Barcelona might have been stormed on Wednesday after the Navarrese had crossed the river Llobregat; but no entry was attempted until encirclement was complete. The army corps operating in the north meanwhile took Solsona and pressed towards the frontier, thus reducing the country remaining Republican to the inhospitable corner from Seo de Urgel to the sea. Its surrender must be only a matter of time; but it remains to be seen whether a substantial number of troops can be transported by sea to the southern provinces. At Valencia, General Miaja has remained very quiet during the disasters in the north. His offensives in Estremadura and around Madrid have made no progress for two full weeks, but it seems as probable that, foreseeing the fall of Barcelona, he purposely called them off so as to prepare a new defence of Valencia, as that the Insurgents were able to offer adequate resistance.

An Enemy on the Pyrenees.—The French have watched the fall of Catalonia with troubled eyes. This week's foreign affairs debate in the Chamber gave a chance to those voices, and they were authoritative, who wished to hurl Jeremiads at a Government that—whatever way one looks at the policy of non-intervention—has been partly responsible for giving France a third hostile frontier. But how hostile? Doubts as to Italian intentions in Spain, and particularly in Majorca, have grown intense these last days. They were expressed in the Chamber: on Tuesday even the *Temps* was startled out of its blinkered urbanity far enough to declare that if the Italians established themselves in Spain after a Franco victory, "it would be France's *imperious duty* to obtain compensatory positions," and that, it is said, means Minorca and Spanish Morocco. Monday's talk between M. Bonnet and the German Ambassador in Paris sent a score of rumours scurrying round the newspapers: but one report which appears to be founded on fact is that French troops are now concentrated on the frontier between French and Spanish Morocco. The widespread belief, reflected in M. Bonnet's declaration of firmness on Thursday, that the fall of Barcelona will signal a renewal of Italian Mediterranean claims, this time in official form, was strengthened by Signor Mussolini's aggressive speech this week, by the calling-up of 60,000 Italian reservists, and by the rumours of German mobilisations in Southern

protection. The £40 millions or so in subsidies to agriculture, the £10 millions or so to shipping and the unspecified amounts that are to be raised for the export trades are all part of the cost of protection. If a protected Britain wants to continue to have a healthy agriculture, it will have to pay heavily for the purpose. One merit of the scheme of guaranteed prices is that it does not, by raising food prices, give another vigorous twist to the vicious spiral of protectionist economics. The other merit is that it brings out into the open, as this article has attempted to do, the full cost of supporting agriculture. It is for the community to say whether the cost is a fair price for the value received.

Austria. Herr Hitler's speech to the Reichstag also cast its shadow ahead. The feeling that this may be zero hour for them is accompanied in many Frenchmen by a growing irritation at the ceaseless barrage of adverse comment coming from the Italian and German Press, and by a bitter suspicion that M. Daladier has been tricked into accepting an agreement which is, after all, what the Left said it was—a humiliation.

The Prime Minister and Parliament.—Next Tuesday Parliament will reassemble. Once again the resumption of business in a New Year finds British politics overhung by problems of foreign policy, defence and finance; and the skies are darker rather than brighter for last September's contact with the grimmest of realities. There are differences now from the situation when Members met twelve months ago. Events in Austria, Czecho-Slovakia and Spain have brought the angel of death, whose companionship is the price of failure to be strong and wise in diplomacy, out into the open. As the world watches the fall of Barcelona and awaits the Fuehrer's words to his Reichstag, spoken with Count Ciano at his side, war is a concrete possibility to most citizens, not the abstract proposition of pundits intended to be in January, 1938. Accordingly, the debate on foreign affairs, which will appropriately begin the resumed session in place of the Bacon and Cancer Bills, will have a sharper edge than the discussions which absorbed so many days last year; and the significance of the speeches will to say the least, scarcely be diminished by the fact that, as the Prime Minister's policy of appeasement has failed so far to bring rewards, because of the dictators' unwillingness to deliver goods of any kind, so has the anxious criticism that comes from party friends and party foes alike grown in volume. The multi-coloured opposition has n

common focus; dissident Conservatives and Opposition Liberals are not in harness; farmers and Labour's official spokesmen are yoked to no one. But no degree of confusion next week can hide the fact that Mr Eden, Mr Churchill and Sir Archibald Sinclair, to say nothing of those Labour leaders who have put issues of peace and war before heresy-hunting, have to date been proved wholly right in their contention that continued concessions to aggression, without any firm stand on principles of international law or collective action, must invite rather than rebuff the very menace Mr Chamberlain is seeking to prevent. Party loyalty will rule in the division lobby next week. It is too late now to reverse the tragedy which one-sided intervention miscalled non-intervention has set in train in Spain. It is not Parliament but a few Ministers who seem to decide the country's destinies nowadays. But the rising clamour for firmness in foreign policy and full strength in our arms and defences will none the less be heard above all other pleas. Mr Chamberlain will know with a new force that failure in the course on which he has staked his future will bring him down, if only at the feet of wiser members of his own party.

* * *

Socialist Heresy - Hunting.—To the impartial observer Sir Stafford Cripps seemed too able a politician and too right in his diagnosis of the electoral position to be discarded by the Labour Party in these crucial days. It now appears that, on the contrary, the Official Opposition is too stupid and, be it said, too undemocratic to keep him. On Wednesday the indicted rebel refused the Executive's plea to cease preaching the popular front and, by 18 votes to 1, they drove him into the wilderness. More correctly, perhaps, they have driven him from the wilderness of unreality and make-believe in which they themselves stubbornly dwell. Apart from the offence of speaking his own mind freely—which should surely be no crime in a party with pretensions to democratic qualities—Sir Stafford committed the *gaffe* of telling the Labour rank and file the truth. Quite truly the memorandum he recently circulated claimed that the Labour party had no conceivable chance of winning an election, and that since, on the outstanding issues of foreign policy which dominate politics at present, something near to half the electorate was agreed upon an attitude opposed to Mr Chamberlain's views—an attitude professedly shared by the Labour chiefs themselves—it was the duty of the leading Opposition party to work to secure an electoral majority for the Opposition case. To spare Sir Stafford on previous occasions for sponsoring the revolutionary views of the doctrinaire Left extremists, and to axe him now for stating, quite democratically, widely-known and important, if unpalatable, truths is simply the measure of the Labour party's political ineptitude. They are unable to win elections. They are indeed unwilling to win elections. Wrapped in the cloak of an outworn and exclusive creed, they are content that the Government should enjoy an unrepresentative power in Parliament. They are conducting a platform campaign against the Government's foreign policy, but their actions speak louder than their words. Mr Eden and Mr Churchill are still members of the Conservative Party in spite of their heresies; and the sacrifice of Sir Stafford to the Pharisees strengthens the more tolerant Tories just when it is all important that the division of public opinion should be precisely represented by the balance of political forces.

No Eastern Front Next Time?—The busy back-and-forth of Central European diplomats takes in this week a visit to Berlin by M. Chvalkowsky, Czecho-Slovak Foreign Minister, and another to Warsaw by Herr von Ribbentrop. The first compares with last week's journey to Berlin of Count Csaky, Hungarian Foreign Minister, who retired with clear instructions on the conduct of his office and reproof that Hungary was still hankering for Ruthenia; in the same way, M. Chval-

kowsky's return to Prague was accompanied by a minor German press campaign against "Benes elements" who remained in Bohemia to protest that Czecho-Slovakia was not a German colony. Herr von Ribbentrop's reception at Warsaw, again, is comparable with Count Ciano's in Yugoslavia; the purpose of each was to arrive at an understanding with an important neighbour at a time when his neutrality might be required of him. In official terms, the Warsaw visit is a return for Colonel Beck's to Berlin in 1935, and a means of reaffirming the non-aggression pact signed by Herr Hitler and Marshal Pilsudski in 1934. Unofficially, the visit is more likely to be interpreted as a return for the call which Colonel Beck made at Berchtesgaden a week or so ago. Nothing is known of the result of the Hitler-Beck talks, although agreement on questions of Polish-German relations seems to have been reached, if anything in Poland's favour. If the German answer to Poland's *rapprochement* with the U.S.S.R. is to drop activities in the Ukraine and put a silencer on the clamour of Nazis in Danzig, Memel, and Poland itself, then Colonel Beck is to be congratulated on astute diplomacy. At the same time, however, comes an improvement, implied by trade negotiations and a holiday for anti-Bolshevik propaganda, rather than actually expressed, in relations between Germany and the U.S.S.R. This would suggest that Poland is the "balanced" rather than the balancing factor in Eastern Europe. The Anti-Comintern Pact, in so far as it means anything in ideological terms, is not specifically anti-Russian; indeed, the clear advantages which both Germany and the U.S.S.R. could draw from a non-aggression understanding have long been discussed as a prelude to a German push westwards by those who have reason to fear that menace. The trivial incident which occurred in Holland the other day, when the Nazi Press took advantage of two catapult pebbles flung through the windows of German diplomatic offices in Amsterdam and The Hague to assert that the Dutch were "threatening their neutrality," an incident published far and wide and the cause of a Stock Exchange flutter, showed how general was the fear of that westward push. "The Ukraine" has become a pleasant symbol of safety for people in Western Europe who see in their imagination the German armies disappearing into the limitless steppe, and think of 1812; but it is a facile and improbable symbol which need deceive none who remember that Napoleon was in Spain before he led his armies into Russia.

The Palestine Arab Delegation.—Before coming into action against the Jews, the representatives of the Arab States, who are to attend the London Conference, have had an arduous struggle over the composition of the Palestinian Arab Delegation. The ancient feud between the Huseini and Nashashibi factions has come to a climax. The Mufti has insisted that the Nashashibis shall be excluded altogether from representation; Raghib Bey Nashashibi demands half the places on the delegation for his own National Defence Party. In the hope of breaking the deadlock, a deputation consisting of General Nuri es Said, the Prime Minister of Iraq, Fuad Bey Hamza, the Under-Secretary of State for Foreign Affairs in the Saudi Arabian Government, and Jamal Bey al Huseini, the head of the Mufti's own delegation, flew on the 22nd from Cairo to Beirut in the hope of persuading the Mufti to agree to at least some representation of the Nashashibis. On the 23rd they returned successful—so they thought. The Mufti had been induced to agree to admitting two specified representatives of the Nashashibi to the delegation; but this time it was the turn of the Mufti's rival, Raghib Bey Nashashibi, to be intransigent. He objected to the two proposed delegates; he objected to their being nominated for him instead of being chosen by himself; he objected to being asked to accept less than the 50 per cent. representation to which he lays claim; and he objected to the nomination, as delegates of his party, of an invalid and a man who, he claims, has deserted to the

Mufti. At the moment it looks as if the combined Arab delegation would travel from Cairo to London without any representative of the Palestine Defence Party being included on it. This open quarrel between the two Palestinian Arab factions may not damage the Palestinian Arab cause as much as might be expected at first sight. For one thing, both parties have exactly the same programme, so that whatever happens the Arab case will not go by default; then, again, either party will be keyed up to insisting upon the maximum demands by the knowledge that, if it compromises, its rivals will jump in and accuse it of having betrayed the national cause—to which they alone have remained faithful. All this is much less awkward for the Arabs than it is for the British Government—who may succeed in coming to terms with the Mufti's representatives, only to see the agreement repudiated by Raghib Bey Nashashibi in the name of the other half of the Palestinian Arab community. These Palestinian Arabs are awkward customers.

* * *

Air Raid Precautions.—The chief item of defence news this week has been the launching of the national recruitment campaign. But, as those who called out for bomb-proof shelters while Sir John Anderson was speaking at Tuesday's National Service Rally evidently believed, the massing of men does not hide the pressing need for material equipment. The Lord Privy Seal has himself given grounds in recent speeches for the belief that, once again, the Government are making ready, under pressure, to extend their defence programme to meet demands which hitherto they have steadfastly denied. Their reluctance to embark upon the provision of deep shelters, now shaken sufficiently to make "careful consideration" officially possible, was probably in large measure financial in origin. If the building of such shelters by local authorities in target areas is sponsored and assisted, the step will represent a considerable victory for Sir John Anderson over the Treasury view. Meanwhile, in Finsbury and Westminster plans for safe shelters proceed.

* * *

In other ways, too, official schemes are belatedly burgeoning. Sir John Anderson is ready to substitute regional for merely local planning wherever needful, but not, so it seems, until the emergency arises; and dilatory local authorities are being pressed to act with speed and efficiency. Centrally, where decision has hitherto been sadly lacking, headway is being made towards more satisfactory schemes for urban evacuation than the purely provisional programme announced a few weeks ago. Plans to make London's hospitals available to render adequate and efficient aid in air raids are being made by consultation with doctors and hospital governors to replace the confused improvisations of last September. The serious deterioration of the trenches dug in the crisis is being taken seriously in hand by the central A.R.P. authorities; and it may be that, in the new wave of effort, more will be made to provide sufficient accommodation, in trenches and blast-proof steel shelters, for most of the population pending the construction of genuine refuges underground. The whole of A.R.P., however, is still put together piecemeal without, seemingly, any co-ordinating plan, and numerous classes of recruits still lack vital training equipment. A proposed Bill to compel employers to furnish workpeople with protection, to be introduced early next month, is much overdue; and it may be the first sign of a policy which, as well as securing the supply of all the men and materials needed for civilian defence, will set out the inescapable minimum duties of every category of the population, and secure their strict observance by the clearest instructions from the Home Office and the closest supervision at every point by central officers. The local authorities are indispensable executive agents; but the Government's sole responsibility for success or failure in defence cannot be set aside.

British Commercial Policy.—Last summer the Federation of British Industries, disturbed by the increasingly unfavourable balance of payments, urged the Government to assume increased powers to negotiate with foreign countries about trade questions, to institute a discriminatory tariff system to penalise countries not prepared to purchase a "reasonable" amount of British products and to take steps against subsidised competition. The Board of Trade has now replied. Rightly, the Board argue that the balance of payments has improved since the Federation's statement and, not out of reason, they rebuke the Federation for too close attention to the balance of visible trade in goods to the exclusion of invisible items. In reply to the Federation's call for active retaliatory measures, they point out that countries unwilling to give United Kingdom goods reasonable treatment have been warned that British patience is not boundless; and that the extension of the export credits guarantee system to form a fighting fund has created a weapon against subsidies. The Federation are not content; and they have put out a further memorandum to say so. They seemingly wish to balance our commercial exchanges with individual countries by penal tariffs; and, in so suggesting, they have fallen victims to the crudest mercantilist errors of theory which, if applied in practice, would still further cut down British overseas trade at a time when concentration on re-armament is in any case likely to impair our position in foreign markets. There is indeed a case that can be made out for a three-decker tariff, discriminating between different classes of countries according to their commercial conduct. But the sole justifiable objective for such a step would be to expand and free world trade; and it should take the form, not of raising present duties against recalcitrant countries, but of lowering them in favour of amenable ones. On the general question of weapons against subsidised competition, the Federation are also at sea. Since their ideal state of trade would be one in which we sold everything and bought nothing, they pay little or no attention to Britain's most powerful weapon, her buying power.

* * *

Civil Aviation.—The accident to the Imperial Airway's Short flying boat "Cavalier," which was forced down on the sea last Sunday by bad weather *en route* from New York to Bermuda, with the loss of three lives, underlined the dangers which have still to be overcome before Transatlantic airplane services can be developed with an adequate margin of safety. In May, after a series of experimental tests of various types of machine which has not been wholly free from mishaps, an air-mail link across the Ocean to Newfoundland and North America is to be inaugurated; but the perils of being compelled to alight on the water in rough weather are still too great for early passenger services to be contemplated. The economic gains of Atlantic crossings by airplane, set

INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

against the speedy sea services now available, are not sufficiently considerable to justify any attempt to proceed in this direction until the several outstanding problems have been solved. In established fields, however, it is quite another kettle of fish. It is nearly a year since the Cadman Report, *inter alia*, confirmed wide fears that, apart from the Empire routes, British civil aviation had fallen behind foreign rivals in speed, efficiency and design. A root trouble revealed by the inquiry was the use of obsolete craft, due to delays in the delivery of more up-to-date machines. It is now, to say the least, somewhat disturbing that two of the newest types since introduced on British lines, the Frobisher and Ensign machines, have each had to be temporarily withdrawn from service on account of suspected defects. The pressure of armament demand has seriously impeded the supply of civil aircraft; but, even apart from the fact that orders for replacements might with reasonable foresight have been placed earlier than, in fact, they were, there seems no proper reason why Britain should be less able than other countries, also busy with rearmament, to furnish air services on European routes with speedy, up-to-date and reliable machines. The current hitches are no doubt very temporary, but that the old outmoded craft condemned long before last March's report should have to reappear as our main stand-by is a poor advertisement.

* * *

Britain and the Near East.—Lord Gort's departure on Thursday on a visit to Egypt and Palestine may be taken as a sign of the times. With over 20,000 British troops in Palestine and a force not far short of half that number in Egypt, with the naval bases at Haifa and Alexandria being completed or extended and construction of the Cyprus air base at last under way, we might seem in a strong strategic position in that vital area; but Levantine opinion varies with the actual display of force, and it must be an important charge on the Imperial war chest to provide adequate, and obviously adequate, means of defence in the Eastern Mediterranean. Although Whitehall is non-committal, the journey of the Chief of the Imperial General Staff may perhaps be read in conjunction with the fact that the British Government is now making up its mind what must be done with Palestine failing a decision by the delegates to the coming conference. Nor will the Arab leaders, in Palestine and elsewhere, underrate the importance of his visit. If the Arabs do not get their way, a decision will be imposed upon them. If they do get their way, and an Arab State emerges from the conference, Britain will have strategic claims to make upon it. In their present mood—one more pressing argument for an immediate and statesmanlike decision—each of the Arab leaders is inclined against the Mufti's intransigence and well-disposed to admit those claims. They are clearly in favour of the present balance of power. They are also anxious for a rapid settlement. The hint dropped by General Nuri es-Said, Prime Minister of Iraq, that their meeting at Cairo might lead to some sort of Arab coalition, need not be taken very seriously, for there are wide psychological differences: the antagonism, for instance, between King Ibn Saud and the Emir Abdullah, and the unyielding individualism which marks the Arab and near-Arab rulers. The difficulty of amalgamating elements so volatile cannot be better seen than in the proposal for a Syrio-Palestine. The appointment of a new High Commissioner for Syria has coincided with a Cabinet crisis in Damascus brought on by weeks of intermittent rioting, the Shahbandar Opposition demanding that the Franco-Syrian Treaty of 1936 shall be ratified and the way paved for Syrian independence. If this were not enough to point the moral, it might be added that the Druses want autonomy and the Aloumites a betterment of their lot. Pan-Arabia is not yet in sight. But, in fact, the leaders of what might one day form that union of aim and sentiment are now gathered together for a common end; and that end is not unfriendly to the British Government. It would be foolish to miss so rare an opportunity cementing our moral defences in the Near East.

The Fortification of Guam.—An important American counter-move to Japan's long course of aggression is now in the air. The Naval Affairs Committee of the House of Representatives at Washington has introduced a Bill authorising expenditure which includes an item of \$5 millions for improving the naval and air facilities on the American island of Guam in the Western Pacific. The expenditure is being authorised without the corresponding funds being appropriated, and the improvements at present contemplated do not amount to fortification. The Committee's action is like a warning shot fired across the bows of the Japanese pirate ship of state. If the pirate heaves to, then, no doubt, the shot will not be repeated; if he ignores the warning, then the United States may set about fortifying Guam in earnest. The island is wonderfully placed—due east of the Philippines, due south of the Main Island of Japan, and due north of Papua, while eastward Wake Island and Midway Island provide stepping-stones between Guam and Hawaii. In fact, the fortification of Guam would carry the American naval front in the Pacific westward from Hawaii to the Philippines, and would deprive Japan of that virtual immunity from naval attack which she has enjoyed for the last seventeen years in virtue of the Washington Treaties. Article 19 of the Washington Five-Power Treaty established in the Western Pacific a zone in which all the parties—Japan, the United States, the British Empire, France and Italy—undertook not to improve or add to their existing fortifications and naval bases. This article left Japan navally supreme and impregnable in Western Pacific waters, and consequently mistress of the narrow seas between herself and China. Accordingly, the Five-Power Treaty was accompanied by the Nine-Power Treaty guaranteeing the territorial and administrative integrity of China. Both these treaties have since been torn up by Japan. She has not only attacked and overrun China; she has broken the Five-Power Treaty too by fortifying her own mandated islands, which lie round Guam in the non-fortification area (these Japanese mandated islands are not actually mentioned in the Five-Power Treaty, because their non-fortification had already been stipulated in the terms of the Japanese mandate; but the fortification of them has been a moral breach of the Five-Power Treaty, besides being a juridical breach of the mandate). Owing to Japan's previous treaty-breaking, America's hands are now free. She can fortify Guam if she chooses; or she can use her power to fortify it as a bargaining point if there seems any likelihood of bringing Japan to reason by negotiation.

* * *

Canada and Commonwealth Defence.—The debate on defence policy in the Canadian Senate was discouraging in its evidence of lack of realism in the Government's approach to external problems. According to the cabled summaries, Senator Dandurand said that the Government's defence programme was directed mainly towards three contingencies: an attack on Canada, the preservation of Canadian neutrality in a war in which the United States was involved, and possible retaliation by an aggressor State against an embargo to which Canada was a party. It is hard to decide which of these contingencies is furthest from the probable course of events in the post-Munich era—a war involving the United States from which Canada and other parts of the British Commonwealth could abstain, a violation of Canadian soil not arising as an incident of a world war into which she would long before have been drawn, or the imposition of economic sanctions in such a way as to provoke an armed reaction against the Dominion. Mr Mackenzie King's tactics are obviously to evade the real issues over defence in order to preserve a façade of national unity among internationalists, isolationists and imperialists in Canada. Nor does the Conservative Opposition greatly help by crying Imperial solidarity. The real question is whether Canada will play her part in the now apparently inevitable *Kraftprobe*—perhaps not in the end resulting in war—between two great world groups and the different causes they stand for; and whether she will prepare herself now to play a worthy part if she should be called upon to do so.

Housing Progress.—Despite all prophecies of imminent decline house-building in England and Wales continues to remain stable at about 340,000 a year. This stability, as can be seen from the table appended below, is the result of a declining output by unassisted private enterprise and an increasing output by local authorities under slum clearance and other schemes. If these two contrary movements continue at their present rates, the output of new houses will be about the same this year as last. Actually 340,000 may be considered as an upper limit. The rate of decline of private building is more likely to be accelerated than retarded. The figure of 1,700,000 new houses, estimated a few years ago by the Registrar-General as required on the present standards of accommodation between 1931 and 1941, has already been exceeded. If, as is probable, popular purchasing power reached its peak in the year ended September 30th last, the drop this year may well contribute to a more rapid falling off of private building. Local authorities, too, may be approaching the completion of their current programmes, and, unless a more vigorous attack on overcrowding is launched, the big increase in building by them last year may be followed by a smaller increase or even a decline this year.

HOUSES BUILT IN ENGLAND AND WALES BY

Years to Sept. 30	Private Enterprise without State Assistance	Local Authorities with State Assistance	Total*
1934	257,746	49,679	313,669
1935	275,069	32,685	318,644
1936	274,348	63,749	339,528
1937	264,231	70,630	337,134
1938	248,913	87,452	340,878
1939	230,000†	105,000†	340,000†

* Including provision by local authorities unassisted and private enterprise assisted.

† Present trends projected.

The increasing proportion of private building formed by cheap houses built to let is encouraging. Newly-built houses with a rateable value of under £13 (£20 in Greater London) and occupied by persons other than their owners were 11 per cent. of the total in 1934 and 17 per cent. in 1938.

* * *

Poverty in Bristol.—In recent years Mr Keynes and many other economists have given support to the

opinion that the major social evil of our times was the slump and the principal goal full employment. While there is no reason to criticise this view, it has certainly distracted attention from the poverty which still exists even when booms reach their height. This new survey of the standard of living in Bristol* in the middle of 1937 is, therefore, of exceptional value. It was carried out in a prosperous town at the peak of Britain's recent prosperity. Not only has Bristol a great variety of industries, many of them sheltered, but in respect of at least one industry, namely, aircraft manufacture, the city has benefited from the rearmament programme. A survey of the whole of Britain would have shown more, and not less, poverty. Yet, even in the summer of 1937, one-tenth of Bristol's working- and lower middle-class families could not afford to purchase even the very meagre amounts of food, clothes, fuel, light and cleaning materials taken as minima for the purpose of the survey without sacrificing other essential needs, such as provision for sickness, savings, holidays and recreation. Another 20 per cent. of the families, though not suffering the same poverty, stood precariously on the borderline. Even so, the minimum food requirements used in the survey, which were based on the report of a committee of the British Medical Association published in 1933, are definitely too low in the opinion of the Ministry of Health's Advisory Committee in Nutrition. This is particularly important, since it is in the poorest families that are to be found the largest number of children under 14 whose nourishment ought to be most imperative. One-fifth of the children covered by the survey were living in families below the poverty line and another third in families with seriously scanty means. Only about two-fifths of the children were living in reasonably satisfactory conditions, compared with three-fifths of the persons of all ages. In the interest of the nation's physique and of the future of the population there is, these disturbing figures show, the strongest possible case for more numerous, more varied and more nourishing free meals at school and for the most careful examination of the practicability of family allowances. An effective scheme to meet the minimum needs of families with three or more children would abolish three-quarters of child poverty, and, as suggested in this survey, there is *prima facie* evidence that the cost, even without the imposition of a means test, would be surprisingly small.

Message and Budget

NEW YORK, January 16.—The President's annual Message to Congress on the State of the Nation was promptly followed by the presentation of the Budget. In the Message the President stated:—

We have now passed the period of internal conflict in the launching of our programme of social reform. Our full energies may now be released to invigorate the processes of recovery in order to preserve our reforms and to give every man and woman who wants to work a real job at a living wage. . . . The first duty of our statesmanship to-day is to bring capital and man-power together. We want to get enough capital and labour at work to give us a total turnover of business, a total national income, of at least eighty billion dollars a year.

To attain this objective, the chief, and indeed the only specific, method mentioned in the Message is a continuation of Federal expenditure in the vicinity of \$9,000 millions a year.

The table printed overleaf gives an outline of the Budget. An increase of taxation to bring in about \$400 millions is proposed, but the form of this was not suggested; there was only a hint that certain forms of tax exemption might be removed. A Bill to subject State and municipal employees to Federal income tax has already been introduced, but this would hardly provide 10 per cent., at the outside, of the suggested increase.

If one is to judge financial opinion by the behaviour of the share market, the response is uncertain. But, by and large, the announcement of larger deficits and a continued expansion of the public debt was received with vigorous criticism by the Opposition Press (naturally), and without enthusiasm by others.

Spending for Recovery

Faith in spending as a recovery device is somewhat weaker than it has been. This loss of faith in spending for recovery should not, however, be categorically construed as opposition to deficits, or even as support for retrenchment. For every one who is sceptical that deficits mean prosperity, there are many who fear that retrenchment means depression. The belief that the curtailment of "productive" Federal expenditures in 1937 caused the collapse of that year is not only implicitly believed in Washington, but is widely held elsewhere.

For every one who "believes in" the fiscal policy of the last six years, there are a great many who hold that our economy has now become conditioned to an \$8,000 or \$9,000 million Budget and a continuous increase in the public debt, precisely as our economy in the 'twenties was conditioned to a \$4,000 million Budget and a continuous increase in brokers' loans against stock market collateral. These persons are put in the dilemma of being apprehensive of the continuation of the present policy and equally apprehensive of any change in that policy.

The number of persons sufficiently hard-boiled to advocate taking the position which Mr Roosevelt himself took with reference to a Budget half the present size in March, 1933, that is, to cut it to the bone, is much smaller now than it was then. The number of persons alarmed by a public debt above \$40,000 millions is smaller than the number alarmed by a public debt of \$20,000 millions. Opinion is thus divided pretty evenly between the group that believes that the programme indicated will bring the national income to the desired haven of \$80 billions, and so effect its own remedy; and the group who merely hope that, in some way or other, because of the fiscal programme or in spite of it, the national income will rise to \$80 billions "by the natural forces of recovery," and so solve the whole problem automatically.

A "Lion in the Way"

It is recognised that anything resembling full activity implies or includes activity in the heavy industries, or in the creation of goods for production, which means heavy capital

outlay. But in this respect a kind of defeatism or resignation has come into vogue. The period of domestic expansion, it is held, is over; no longer does our economy afford an outlet for the co-operation of capital and enterprise. American enterprise is "saturated," and can never again afford full employment for capital and labour; hence the economy of recent years, with the Government providing the principal demand for capital and the marginal demand for labour, is to be regarded as normal and perpetual.

Just how widely these views are held is conjectural. It is worth recalling that in the 'eighties (when the "free land" epoch was visibly drawing to the close) they were current and found persuasive expression, even in public documents; but it is also worth remembering that we are only one decade removed from the New Era, when the future of American enterprise seemed as boundless as it now seems circumscribed.

The psychological interpretation of economic phenomena has support in Holy Writ itself, for the explanation given by Proverbs of a lack of the spirit of enterprise is the existence of a hypothetical "lion in the way." At the present time the spirit of enterprise is as sluggish as it was exuberant in the New Era. All sorts of reasons are given for this state of affairs. Our economy has been marking time in recent weeks at a level which is suspended between earth and heaven, and, like the rock on Mount Moriah, much nearer earth than heaven. The question whether we shall emerge from the present phase by a revival of private enterprise or an extension of *étatisme* will largely be determined by factors that do not lend themselves to statistical measurement and report.

Armament Expenditure and Trade

The Budget Message has been quickly followed by the special Message on armaments, with its suggestion of special appropriation of \$522 millions, of which \$210 millions would be attributed to the fiscal year 1940, bringing the total military Budget for that year up to \$1,336 millions. This may be, and probably will be, supplemented by relief projects having a military or quasi-military character, such as certain suggested highways. These figures were very close to earlier estimates and smaller than suggested figures derived from rumours of an "armaments boom." The share market fell rather sharply following the Message, and although it is easy to describe it as a reflection of disappointment that the "armament boom" is not to be, the real causes are probably simpler.

The fact is that the index of manufactures, having snapped from 75 (73 if seasonally adjusted) in June to 103 in November, has since then showed no certain trend. Indeed, it has probably sagged slightly, as it commonly does in mid-winter, once the automobile industry has got into its stride. Such a period of hesitation at this time of year is absolutely non-committal about the future—it is, of itself, not evidence that the forces of recovery are exhausted, nor can it positively be described as a mere breathing spell, consolidating the advance preparatory to an upward thrust. Both opinions are held by competent observers, and each can be sustained by persuasive arguments.

France

Foreign Tension Checks Recovery

PARIS, January 26.—The Italian claims, the dismissal of Dr Schacht with its repercussions on world markets, the approach of Herr Hitler's speech on January 30th, have all exercised an unfavourable influence on the Stock Exchange. Prices fell back from the high level of last December to the level of mid-November, when the recent series of decrees began. Public opinion is strongly opposed to any concession to Rome; and the signs of financial difficulty in Germany appear to be the prelude to new international complications and, therefore, an additional reason for firmness *vis-à-vis* the dictatorships. Feeling in political circles is, then, that the idea of fresh concessions must be put aside by London and Paris as inopportune and even dangerous for both the British and French Empires.

In such an atmosphere the economic progress that has been made seems to lose much of its significance, though it does afford timely support to the markets. The franc is still steady, and more gold has come back in the last seven days.

Germany

Slower or Faster?

BERLIN, January 23.—The Government has lately curtailed its capital schemes to a noticeable extent. Programmes have been spread over a longer period of time than originally planned. Many building projects have been cut down, dropped altogether or simply postponed. Even work on fortifications has slackened; and the building programme of the "Strength Through Joy" organisation has been limited. For the moment, even the *tempo* of re-armament has been checked, and it is being said that military projects will be cut down by 40 per cent.

This tendency will not, however, affect current military expenditure. It remains to be seen, too, whether the continuation of the present foreign policy of the Nazi Party will not make it necessary actually to increase immediate armament outlay; and it is worth mentioning in this connection that the colonial aspirations of the Reich are again being freely discussed.

The reason for the slowing down of capital expenditure is the present difficult financial situation—underlined by the dismissal of Dr Schacht from the Reichsbank. As a result of recent vast public contracts, German industries, and especially the armament and building industries, have reached the limit of their capacity. In May, 1938, the Nazi system of financing work by means of delivery certificates was introduced. Since then, the annexation of Austria, the Czecho-Slovak crisis, which caused Germany to construct great chains of fortifications, and the autumn mobilisation have made fresh State expenditure necessary, and, as a result of all these measures, delivery certificates are now falling due for payment in increasing numbers, while income from taxation is only rising very slowly.

In addition, while the first three Reich loans of 1938 were well subscribed, the fourth loan, amounting to Rm. 1,500 millions, was not fully subscribed within the appointed time, and some Rm. 300 to Rm. 400 millions had subsequently to be disposed of, being taken up, presumably, by savings institutions and insurance companies. Thus, for the moment, it would be quite impossible to float another Reich loan.

Consequently, as the Government's construction and other capital programmes far exceed the possibilities of financing them, from loans and/or taxation, an *impasse* has resulted and plans have to be cut down. The situation is the more difficult because industry itself is now in need of capital for renewals, etc. Competent authorities have suggested substantial increases in taxation. These have been rejected by Herr Hitler as being contrary to the social policy of the Nazis, for the German worker's standard of living is already low. One further reason for the Fuehrer's rejection of higher taxes is that already more than 47 per cent. of the national income is taken by the State.

Thus, retrenchment seems the only way of immediately bridging the financial gap. On the other hand, it must be realised that a continual cutting down of State contracts must lead to an increase in unemployment, which would be dangerous for political reasons.

Trade and Textile Troubles

The unfavourable trend of foreign trade, which is not without its place in the Reich's present difficulties, remained in evidence in December. Imports into Greater Germany were valued at Rm. 541.9 millions and exports at Rm. 504.3 millions. For the whole of 1938 Greater Germany's imports were valued at Rm. 6,052 millions and exports at only Rm. 5,619 millions. Thus, Greater Germany's import surplus

The increase in production, however, is still slow to get under way. As M. Reynaud warned the country, "the effort must be long and sustained." But if the consequences of the lowering of the rate of interest are to be backed by troubles abroad, and if further increases in hours of work can only be carried through by Government interference, the favourable results of recent measures will be still further postponed. The return of more capital and greater industrial activity are expected; orders and inquiries have steadily increased; the reduction of the tax burden on certain industries has proved a useful aid. But credit expansion is still condemned by the monetary authorities; and foreign alarms dominate the immediate scene.

Higher Prices

Increased orders are now coming from the Government for war purposes, since the Treasury is at present well provided. An artificial increase of production stimulated by monetary expansion would lead to an increase in demand for consumption goods and then would follow a fresh rise in prices, which already show a dangerous trend in that direction, although in the week ended January 21st the rise which has recently been noticeable was temporarily arrested:—

Wholesale Prices	Dec. 17th	Dec. 24th	Dec. 31st	Jan. 7th	Jan. 14th	Jan. 21st
General Index	654	658	666	669	671	671

Foodstuffs	627	636	648	652	657	655
Industrial products ...	678	679	682	685	683	686

Improved Coal Output

Coal output in 1938 was 47,560,000 tons, against 45,334,000 in 1937, or markedly lower than the 55 million tons raised in both 1929 and 1930. The recent improvement is due to the increase of the total number of persons employed at the mines from 244,500 to 249,000, and also to the inclusion of three extra working days; working days were 261 in 1938, compared with 258 in 1937.

Coal consumption, on the other hand, fell appreciably from 76,160,000 tons in 1937 to 68,170,000 tons last year. It is true that consumption in 1937 was swollen by speculative purchases due to fears of a rise in prices; but the falling-away last year was also caused by general economic depression. Stocks, which fell by 985,000 tons in 1937, after a notable rise of 1,908,000 tons in 1936, rose last year by 915,000 tons.

Imports of foreign coal fell from 30,875,000 tons in 1937 to 22,725,000 tons, or roughly the low level reached in 1936. This decline was a significant indication, not only of the economic inertia that was internationally experienced, but also of the failure of French industry to respond to the spur of national need. Nevertheless, it is true that imports still represented a value of 4,867 million francs, however, against 2,198 million francs in 1936. The import price per ton average 220 francs in 1938, against 162.5 francs in 1937, and 99 francs in 1936. Average daily output in the mines was in general unchanged since 1937; and the yield, which has fallen by 9 per cent. since 1935 (or by 15 per cent. in the mines of the North), is also unchanged compared with last year.

Increased Oil Imports

Imports of both crude and refined oil from foreign sources amounted in all to 8,136,524 tons in 1938, against 7,757,636 in 1937, an increase of 4.9 per cent.; and imports of crude oil were 13.3 per cent. higher. The principal supplier was no longer Roumania but the United States, who delivered 4.1 million tons of petrol, against 2.8 millions in 1937, while purchases of Roumanian oil fell from 3.8 million to 2.2 million tons. The actual consumption of oil products was nearly 5 million tons, which was practically the same as in 1937, so that the increase in imports is accounted for by the building up of greater stocks.

Potash production made further progress last year. Some 3,274,000 tons were extracted, against 2,833,000 tons in 1937, 2,073,000 tons in 1936 and a record of 3,136,000 tons in 1930. In the week ended January 14th the number of persons unemployed was 415,568, against 416,604 on January 7th and 393,212 a year ago. This is the first fall for many weeks, and the weeks of seasonal increase have seemingly come to an end.

The
MERCANTILE

for the year was Rm. 432.4 millions, whereas in 1937 the Old Reich alone had an export surplus of Rm. 443 millions. The change which has taken place is shown by the fact that, for the Old Reich alone, imports were Rm. 5,449 millions in 1938 and exports Rm. 5,257 millions, making an import surplus for the old territories separately of Rm. 192 millions.

As a result of Germany's lack of foreign exchange, the textile industry has been seriously hampered in recent years for lack of raw materials. Various substitutes, and especially imitation silks and wools, have not made up for this deficiency. The elimination of Jews from the textile trade has had an unfavourable effect, since it was they who were chiefly responsible for the industry's development in Germany. The latest persecution of the Jews has coincided with a new low level of textile exports. And it is significant that emigrant textile experts are now setting up competitive enterprises in foreign countries, such as Holland, England, the United States and Switzerland.

In 1929, German textile exports were valued at Rm. 1,400 millions. In 1937 they were only Rm. 422 millions; and in the first eleven months of last year they were only Rm. 330 millions. In 1933 Great Britain, the United States, Holland, Switzerland and the Scandinavian countries took 82 per cent. of total textile exports from Germany. The rest was divided among between 60 and 70 smaller customers. In the first six months of 1938, however, the group of chief buying countries took textile exports worth only Rm. 100 millions, while the numerous smaller buyers bought Rm. 84 millions' worth.

Credit to Turkey

Following the visit of Herr Funk, Minister of Economics, to the Balkans, the Reich has granted to Turkey a trade credit of Rm. 150 millions, which compares with a credit of £16 millions granted by Great Britain to Turkey last May. The German credit corresponds roughly to the value of a year's trading between the two countries and bears an interest of 5 per cent. It will be used to develop Turkish industries as well as to finance armament purchases. The credit will run for ten years, and the agreement discriminates against other countries competing in the Turkish market, since Turkey is put under an obligation to employ German engineers should it become necessary to use foreign experts to complete the contracts. In addition, shipment must be made on German ships and lading must be dealt with by German firms.

The recent course of trade between Germany and Turkey has been as follows:—

(Millions of Reichsmarks)		
Oct. to Oct.	Imports from Turkey	Exports to Turkey
1935-36	106	71.6
1936-37	132.9	87.1
1937-38	75.7	153.7
1938, Sept. to Dec.	55	52 (estimated)

By reason of rigid restrictions on Turkish exports to Germany, the balance in the clearing which existed before 1935 has been rectified, and over the above years the value of exchanges has been equalised.

Italy

Savings

TURIN, January 16.—Statistics of savings are published by different offices and arrived at by different methods, so it is not easy to get a homogeneous picture of the whole of them. The following table, issued by the Inspectorate of the Insti-

tute for the Protection of Savings, embraces all the most important banks (or those whose deposits exceed 5 million lire):—

(In million lire)			
	1935	1936	1937
Public Banks	5,539	6,922	7,254
National Banks	12,241	13,589	14,152
Ordinary and Co-operative Banks	10,992	12,505	12,955
Savings Banks	18,559	19,302	19,687
Postal Savings Banks	19,958	22,309	25,523
Total	67,289	74,627	79,571

The public banks (Istituti di credito di diritto pubblico) consist of six non-shareholding corporations: the Bank of Naples, Bank of Sicily, Labour National Bank, the St. Paul Institute at Turin, and the Monte dei Paschi at Siena. The big increase in 1938 is partly (about 1,100 millions) due to a shifting of figures from the savings banks, whose deposits appear, therefore, to be declining. The national banks (Banche di interesse nazionale) include the three biggest ordinary banks: Banca Commerciale Italiana, Credito Italiano and Banco di Roma; but since they are controlled by the I.R.I.—which is a State-owned corporation, they also may be classed as non-private banks. The savings banks (which include the Monti di Pietà, or "pawn" banks) are likewise non-shareholding corporations; and, of course, the postal savings banks are State-owned.

Out of 82,799 million lire, 83.8 per cent. (69,318 millions) are deposited with public banks and only 16.2 per cent. (13,481 millions) with private banks; and if one takes the end of 1936 as the practical dividing line between the lira of December 21, 1927 (0.0792 grammes of fine gold) and the lira of October 3, 1936 (0.04677 grammes), deposits are seen to have increased by 7,338 millions during 1936 and by 8,172 millions during the following 20 months. It appears that the alignment or devaluation of the lira has not been followed as yet by a corresponding increase in the monetary national income, and that therefore the margin for savings has proportionately decreased.

Bank Investments

The movement of deposits in banks of various kinds is depicted in the following table:—

(Million lire)					
	1934	1935	1936	1937	Oct. 31 1938
Public Banks					
Cash and bank balances	588	755	1,376	1,109	1,543
Discount	1,649	1,940	1,085	2,517	2,710
Advances	1,016	752	640	925	776
Correspondents	890	1,265	2,232	2,664	2,905
Contangoes	280	138	217	221	140
Securities	1,532	1,410	1,814	1,960	2,572
Savings Banks					
Cash and bank balances	1,555	1,199	1,597	1,550	1,570*
Discounts	1,550	1,361	1,129	1,140	412*
Advances	339	396	359	683	404*
Contangoes	332	202	194	223	160*
Loans	4,522	4,715	4,512	4,401	2,566*
Loans (mortgage)	1,896	1,825	1,651	1,727	1,281*
Securities	8,829	8,910	8,976	9,086	6,675*
National and Ordinary Banks					
Cash and bank balances	...	...	5,349	5,393	4,761
Discounts	...	...	9,795	9,926	9,662
Advances	...	...	175	1,013	1,415
Correspondents	...	...	5,710	5,961	6,244
Contangoes	...	...	1,118	1,095	981
Securities	...	...	3,361	3,565	4,143

* Inclusive only of banks with deposits of over 200 million lire or about 70 per cent. of total deposit.

Public banks and savings banks increased, and ordinary banks decreased, their cash and bank balances. The figures for discounts, advances and correspondents usually reflect trends in industry and commerce; but the big increase in discounts and correspondents by public banks probably refers to money lent to new public bodies (such as those which monopolise the trade in silk cocoons, wheat, hemp, rice, coal, various minerals, etc.), or to industrial concerns controlled to the I.R.I.

Stock Exchange financing, which in our country takes the form of contangoes (riporti) from end to end of monthly settlements is being progressively reduced; and speculative activity on the Stock Exchanges came, indeed, to a standstill during 1938, the most marked increase in business being in State securities.

Credit Machinery

Mortgage loans by savings banks to landowners and householders are decreasing, as are also loans by the Land and Real Estate Credit Institutes (Istituti di credito fondiario). The total of land bonds issued against mortgages decreased from 1,333 million lire in 1934 to 314 in 1935, 194 in 1936, 214 in 1937, and 184 in the first ten months of 1938.

Nor can a noticeable expansion be registered in loans granted by the Agricultural Credit Institutes towards permanent land improvements (rural house building, irrigation, roads, etc.); and these fell from 152 millions in 1934 to 136 in 1935, 82 in 1937 and 133 in the first nine months of 1938. By contrast, loans to agriculturists for current farming operations have undergone a great expansion: 668 million lire in 1934, 818 in 1935, 1,744 in 1936, 3,369 in 1937, and 3,455.3 millions in the first nine months of 1938. The expansion seems to be due to advances granted by the Agricultural Credit Institutes to finance larger cash purchases of wheat, silk cocoons, hemp, rice, etc., by public bodies. In cases of this kind, discounts and advances to merchants by ordinary banks are replaced by loans to public bodies which trade in agricultural products.

The Agricultural Credit Institutes in their turn go to the Bank of Italy for finance; and discounts and advances by the issue bank are therefore bound to rise.

(In million lire)			
	Discounts	Advances	Total
1933	14,656.4	9,701.6	24,358.0
1934	13,049.9	20,409.5	33,459.4
1935	14,176.3	24,625.4	38,801.7
1936	11,758.8	20,758.9	32,517.7
1937	7,801.1	33,320.6	41,121.7
1938 (11 months) ...	12,064.9	32,764.1	44,829.0

This increase in the number of bills discounted and advances made need not have a durable influence on the number of notes issued. Agriculturists, who were wont to sell their products as and when the market called for them, now sell their wheat or hemp, etc., immediately after the harvest. Notes issued thus return almost at once to the banks and are depleted gradually during the year. It may be said that the increasing control of economic activity by State organisations makes the financial market more and more dependent upon those same organisations.

New Investment

Private demand for new capital is moderate. After the slump, joint stock companies, which reduced their capital from 52,281 million lire at the end of 1930 to 44,095 millions in 1935, increased it again to 44,805 millions in 1936, to 47,695 millions in 1937, and to 52,760 millions by October, 1938. In the increase of 5,065 millions for the first ten months of 1938, winding-up accounted for about 1,297 millions, the formation of new companies for 298 millions, and new issues by old companies for the remainder. Fresh money required was, however, much less than 5,065 millions, new issues by old companies being in part paper transactions, such as transfers from reserve to capital account. The 1938 10 per cent. levy on joint stock company capital gave the statutory opportunity for these transfers.

As new savings are thus going mostly into State concerns, changes in the rates of discount and interest have lost much of their significance, and variations are few. During 1938 the official rate remained unchanged at 4½ per cent.; the private rate for commercial paper hovered between 5 and 5½ per cent. at Milan, and the rate for contangoes on stock exchange monthly settlements was between 4 and 5½ per cent. Contango rates on 3½ per cent. Rentes oscillated between 4 per cent. at the beginning of the year and 1-2 per cent. in September, when a moderate bear speculation took place, increasing again to 3 per cent. in the last months. Rates were generally ½-¾ per cent. higher than in 1937.

Finland

Increased Estimates

HELSINGFORS, January 7.—The Diet has now passed the Budget for 1939. Revenue for January-October amounted to 3,467.6 million marks, against 3,303.3 millions in the same months of the previous year, and it is estimated that revenue from Customs and Excise duties and from income and

property taxes will rise—especially in view of the fact that, under a law passed last spring, an extra 20 per cent. will be levied on the direct taxes for financing greater purchases for defence purposes. Only income from Government sawmills is expected to fall off owing to the depressed state of the timber market.

Estimated expenditure records a similar rise, divided among a large number of grants for various purposes. The principal items among these are the increased cost of hospitals and defence; and, in addition, appropriations have been made for converting certain State loans. The main items in the Budget, compared with the corresponding figures in the Budget for 1938, are as follows:—

	1938 Mill. mks.	1939 Mill. mks.
Current revenue	4,131.6	4,502.2
Capital revenue	304.6	709.1
Total	4,436.2	5,211.3
Current expenditure	3,154.3	3,475.9
Capital expenditure	1,281.0	1,733.9
Total	4,435.3	5,209.8
Surplus	0.9	1.5

The conversions referred to represent in part a continuation of the policy of redeeming foreign loans and replacing them by internal ones.

Banking Changes

When Finland abandoned the gold standard on October 12, 1931, no changes were made in the regulations of the Bank of Finland except that the Bank was released from the obligation of redeeming its notes in gold or gold currency. Since that time, therefore, the gold reserve has been valued in the books at the old parity of exchange, and the reserve of foreign currency at rates corresponding very closely to the old parities or even below them, while foreign currencies, in fact, depreciated.

In other words, these assets are booked considerably below their present value. This has caused the Bank considerable inconvenience. Changes in the distribution of the foreign balances between different kinds of foreign currency have occasioned unnecessary alterations in the Bank's statements. In order to avoid such disturbing fluctuations, a law has now been issued which provides that gold and foreign currency can be booked at values more consonant with current prices and gold at a value not exceeding 50,000 marks per kilo.

The appreciation of the gold reserve results in a book profit, which is to be employed, since there is no actual profit and the Bank's assets remain unchanged, to increase the funds of the Bank. The Bank's capital is therefore to be raised from 1,000 to 1,250 million marks; and it is also stipulated that, until the capital and reserve fund together amount to 3,000 million marks, half the annual profit of the Bank is to be employed in increasing these items.

Some less important changes in the Bank's regulations were made at the same time. The note cover has been raised from 1,200 to 1,800 million marks. This alteration was found necessary owing to the great development of economic life since the cover existing hitherto was fixed. For example, the total value of the harvest is now 41 per cent. larger than in 1924, while industrial production has increased by about 114 per cent., deposits in the joint-stock banks by 86 per cent., the turnover of the larger wholesale businesses by 122 per cent. and clearing business by 141 per cent.

The British and Polish Trade Bank A.G., Danzig

Paid-up Capital: D. Gulden 5,000,000. --

Letters to the Editor

Dr Schacht and the Nazi System

TO THE EDITOR OF THE ECONOMIST

SIR,—The present juncture seems appropriate for a review of the results of Nazi economic policy as reflected in official statistics and for an attempt to arrive at a tentative interpretation of their significance.

The main facts are presented in the tables below and illustrated in the chart. In the first years of the Nazi regime, the existence of large stocks of commodities, and of a huge reserve of unused capital, equipment and unemployed labour made it easy, from the economic point of view, for the Nazis

to achieve their primary aim—re-armament. The expenditure of the State was increased out of borrowings and the reserves were absorbed; indeed, the chief difficulty was to prevent an increase in consumption, in private investment or in the demand for imports, any of which would have restricted the field for the expansion of State expenditure. These difficulties were surmounted by the elaborate system of controls of prices, wages, dividends and new investments, and by severe taxation. The forms of private property and of a free market economy survived, but little of their spirit. The Nazi system, as it has grown up, was not thought out beforehand in its entirety. It has been the empirical and gradual outcome of the Nazis' determination to re-arm.

The reserves of labour and idle equipment came to an end in the middle of 1938. But State expenditure has been very sharply increased. Furthermore, large stocks of certain raw materials and foodstuffs have been accumulated. The increase in expenditure is explained by the expansion of the army and air force, by the two mobilisations and the building of fortifications. The two latter items (which may be non-recurrent) are said to account for Rm. 5 milliards out of the total increase of Rm. 6-10 milliards. The increase in

GERMANY'S ECONOMIC PROBLEM

NOTE TO CHART

The above chart, which is based on the official statistics of employment and the indices of the Institut für Konjunkturforschung, does not claim to be more than an approximate illustration of the facts. The top line represents the total productive capacity of the German economic system. The shaded portion represents unemployment. The spaces between the remaining lines indicate the production of investment and consumption goods. "Investment," of course, includes armaments; private investment may have fallen. The output of consumption goods is not an adequate measure of the standard of life, owing to changes in quality and in the volume of stocks and the distorted emphasis placed on agricultural production. The chart probably understates consumption at the beginning of the period and overstates it in the later years.

The chart shows clearly that the output of "investment" goods (i.e. armaments) can be increased in 1939 only at the cost of a reduction in the standard of living.

* Partially including Austria and the Sudetenland.

budgets of Reich, States and municipalities had a deficit in 1932-33 of Rm. 2.5 milliards, and (ii) that "ordinary" expenditure has not increased since then. This involves some simplifications which do not, however, affect the main correctness of the figures. (e) Excluding changes in the volume of bills held outside the banking system, for which no statistics are available since 1936. (f) Figures for seven months only; the total for the year will be proportionately larger. (g) No allowance has been made for the reductions effected in the pre-war or foreign debts, as it is not known what the cost of such repayments was. (h) Rm. 1.5 milliards has been issued in January. (i) Some part of this increase is due to the incorporation of Austria and is therefore not a net gain to the Reich. (k) Including an estimate for amounts received through the replacement of private by State bills.

Anglo-American Comparisons

TO THE EDITOR OF THE ECONOMIST

SIR,—Writing under the above title your United States correspondent referred to the issue, in December, of U.S. Government bonds at 2½ per cent.—maturing 1960-65.

Even before this funding operation, so much of the floating debt had been paid off that the remainder maturing before 1946 barely exceeded the Treasury's gold stock—which is still rapidly increasing. Moreover, in November the average yield of U.S. bonds callable after 12 years, was 2½ per cent., and that of Treasury bills issued during the month, 1/40 per cent. (Federal Reserve Bulletin, December, 1938, page 1070).

It seems clear that a "Dearth of Bills," such as was anticipated, in the London market, in an article in your issue of December 24th, must long have been felt by the U.S. banks; and to this their failure to make use of their large excess reserves for a much more extensive purchase of Government securities is no doubt attributable.

A policy of borrowing at 2½ per cent. for 25 years, when money can be obtained for practically nothing for three months, and the gold stock exceeds the debt maturing within seven years, has the appearance of a reduction to absurdity of the somewhat similar policy of the British Treasury: and an explanation by your U.S. correspondent, or anyone who understands it, would be of the very greatest interest to students of government finance.

Yours faithfully,

A. C. DOBBS.

Co. Dublin.

Sterling and Gold

TO THE EDITOR OF THE ECONOMIST

SIR,—In your interesting article on "Sterling and Gold" in your issue of January 14th, you combat the "tendency abroad to regard the gold transfer" (of £200,001,571) "as inflationary." It is true, as you point out, that the gold transfer has involved no like increase in the note circulation. But it has, according to the Bank of England Return of January 11th, reduced the reserve ratio (gold stocks to deposits and notes) from 49.9 per cent. to 19.6 per cent. compared with a year ago as a result of the increase of the fiduciary issue by £170 millions.

The gold transferred to the Exchange Equalisation Account is for the purpose of bolstering up the pound, and presumably will be so used. This will reduce the gold reserve available for the redemption of the notes; and the whole transaction is decidedly of an inflationary character. Inflation of the currency exists to-day and can be proved at any time by the adverse rate of exchange and the continuous flow of gold to America. This will continue in spite of this latest transaction, and can only be arrested by reversing the process or stabilising the pound at or about the present exchange.

I am, Sir,

Your obedient servant,

D. M. MASON.

The PARTITION of IRELAND

HOW BRITAIN IS RESPONSIBLE

BY HENRY HARRISON, O.B.E., M.C.

The most dangerous Anglo-Irish issue is here comprehensively stated with precision and brevity; in good faith and with obvious good will.

Obtainable at Newsagents and Booksellers 6d.

expenditure has been possible only with severe rationing and the compulsory diversion of labour.

There has been no sign of any reduction of armament expenditure in recent months. On the contrary, naval re-armament, which would be very costly, seems to be beginning. The imports necessary for the present scale of expenditure have been partly paid for out of the reserves of gold and foreign currency obtained in Austria. These reserves cannot last for ever, and when they are exhausted, imports will have to be paid for by exports—in the absence of windfalls such as foreign loans or tributes. But increased exports involve a diminution of internal supplies. (Moreover, the growing unpopularity of German goods means that a larger amount must be exported for a given volume of imports.) In addition, there is a strong and increasing demand by the Labour Front for a higher standard of life.

The present policy of the German authorities seems to require, simultaneously, an increase in armament expenditure, an increase in exports, an increase in building activities and (probably) a rise in the standard of living of the workers. Not one of these things, let alone all of them together, can any longer be accomplished by drawing in unused resources—because there are none.

The desperate efforts made to increase voluntary savings were the final attempt to preserve the appearance of a free capitalist system, since an increase in savings would reduce consumption without the use of compulsion. The confiscation and sale of the assets of certain minorities (of whom the Jews have been the first) is a step nearer to compulsory control. The sale of Jewish assets to "Aryans," of course, diminishes the consumption of the "Aryans" by the amount of the purchase price. Similarly, the consumption of the peasants might be reduced by inviting them to buy land confiscated from the Catholic Church or other large proprietors.

Further resources could also be mobilised by the collective rationalisation of industry, by further conscription or importation of labour, by compelling a reduction in the consumption of the rich, especially their consumption of domestic service, and by still further reductions in expenditure on the maintenance of capital in "non-essential" industries. But these devices are limited and necessitate far-reaching political and social changes.

The monetary means employed to accomplish these ends are of relatively small importance. It must not be forgotten that the Nazis, even if they resort to the "printing press," can always sterilise the effect of the money they create through their complete control over the things, and the quantities of them, that the public may buy. It is most unlikely that prices will be allowed to rise. Direct controls to bring about any desired shift in production exist or can be easily created. It is a police problem, not an economic problem. The experience of last summer is revealing. The rate of State expenditure then increased so rapidly that, in any other system, "inflation" would have been inevitable. But labour and capital for the State's requirements were secured by compulsion, not by being competitively bid for.

The conclusions seem to be clear :—

(a) The advantages gained at Munich were not used by the Nazis to consolidate their economic position. They could have used the labour and capital set free by the completion of the fortifications, by demobilisation and by the gains in productive capacity secured in the Sudetenland to increase the standard of living or to raise the allocations for the maintenance of the equipment of civil industry. They did not do so.

(b) On the contrary, further efforts seem to have been made to increase Germany's military striking power to the utmost degree in the shortest possible time, by collecting reserves of materials and continuing re-armament at a very high rate, even at the risk of serious social tension at home and some loss to the popularity of the regime.

(c) This policy is sinister, since it suggests a desire to solve external political "problems" before any attempt is made to solve the domestic economic problems. The Nazi Government, which is spending up to 25 per cent. of the German nation's income on armaments, could unquestionably, if it chose, bring about at once a considerable increase in the standard of living.

The present tension—social, economic and financial within Germany, political outside Germany—is not the incidental result of misunderstandings, misadventures or mistakes. It is not the necessary effect of totalitarian economics. It is the direct consequence of deliberate policy.

Yours faithfully,

THOMAS BALOGH.

Books and Publications

Work and the Workless in America

Toward Full Employment. By H. S. Dennison and others. (London) McGraw Hill Publishing Company. 297 pages. 12s. 6d. net.

Labor's Risks and Social Insurance. By H. A. Millis and R. E. Montgomery. (London) McGraw Hill Publishing Company. 453 pages. 18s. net.

Planning and Administration of Unemployment Compensation in the United States. By B. M. Stewart. (New York) Industrial Relations Counselors. 665 pages. \$4.00 net.

Unemployment Relief Without Taxation. By E. C. Burdick. (New York) Samuel R. Leland Inc. 125 pages. \$1.25 net.

The four able authors of "Toward Full Employment" declare that they can claim no technical training as economists. It is perhaps for this reason that their arguments in favour of a flexible Budget policy are so refreshingly free from economists' jargon. The case put forward is none the less sound theoretically, and already familiar in this country. The majority of economists here have for long agreed that full employment demands such a policy—expenditure plans ready to offset a decline in purchasing-power, and retrenchment plans ready to curtail unduly speculative conditions.

There are also some extremely interesting statistical appendices giving estimates of possible United States Federal expenditure for the years 1938-43, based on work carried out in co-operation with the United States Department of Agriculture. This section is of distinct importance to anyone trying to estimate America's economic prospects. A tentative estimate of the secondary and tertiary re-employment that would result from a given initial expenditure is made, and this should be closely studied in relation to the points raised

by Mr Kahn and Mr Keynes in their discussion of the "multiplier."

"Labor's Risks and Social Insurance" approaches employment in the United States from a different angle. It is the second of a compendious three-volume series on the economics of labour in the United States. Here health and old age risks are given specially full treatment. The authors, while keeping their recommendations close to the "insurance principle," are not neglectful of the need for Government aid when insurance alone appears to be insufficient. It is, perhaps, unfortunate that British experience (on which current American researches rely to some extent) should have kept up the pretence of the "insurance principle"; it has stereotyped a system of taxation, one half of which is regressive and the other designed to penalise employment—for these, in fact, are the weaknesses of a workers' and employers' contribution scheme. A recognition that the community, to pay for the luxury of unemployment, must be taxed in the way least harmful to consumption and to employment itself, is the only basis on which a sound system of public finance can be devised.

"Planning and Administration of Unemployment Compensation in the United States," too, is concerned with the problem of providing for America's workless. It is a reference book about the social security legislation passed during the last six years in America, and constitutes one of a series of four studies on the unemployment policies adopted in various parts of the world. The overwhelming impression that emerges is that the American system of unemployment relief is passing through a very difficult and (it is to be hoped) transitory phase. Sooner or later a uniform Federal system will have to be accepted by the nation. The considerable achievements already gained, as well as the intolerable confusion that remains, are set out systematically and impartially.

"Unemployment Relief Without Taxation," which suggests a short cut to the solution of this difficult problem, contains a new dodge for inflation without tears. The author abhors all banking activities (such as pumping money into circulation) designed to relieve unemployment; and announces that he is opposed to all monetary remedies. His own elaborate scheme of Purchase Orders, however, is, in fact if not in name, a credit or monetary scheme, and one which, as a few minutes' examination easily reveals, would (even if used in conjunction with banking advances to consumers) work more crudely than ordinary banking methods or than consumers' credits. The author's economic "laws of motion" are not much more reliable than his history when he tells us that "the French lost Canada twelve years before Sir Isaac Newton discovered the basic Laws of Motion." This sort of book has a limited interest derived from the beautiful fallacies in it, and from its being a sign of the revolt of even the uninstructed thinker against the economic system and the banking orthodoxies that persist in high places.

Shorter Notice

"The Norway Year-Book, 1938." Sverre Mortensen. Forlag A/S. Roadhusgaten 25, Oslo. 398 pages. 12s. 6d.

This year-book is remarkably readable as well as informative. Statistics and charts are clearly and agreeably presented, and the chapters on Norway's social services are particularly interesting.

THE BUSINESS WORLD

The Bank Chairmen

NO casting of horoscopes is more eagerly awaited than the astrological exercises in which bank chairmen indulge at their annual meetings in January. No New Year is fairly begun until these eminent persons have said their say about the way in which the winds of economic fortune are blowing, about the shelters that should be erected against coming storms or about the barriers that should be torn down on the approach of fine weather in the world's markets. A year ago the burden of the chairmen's speeches was the need to reduce restrictions on trade, to get rid of exchange controls and to restore the free international movement of capital, in the cause of galvanising the world economic forces that had then halted into renewed activity.

It must have been with sad thoughts about their last year's proper zeal for sound and constructive policies that the chairmen turned this month to the composition of their latest addresses. Recovery was not renewed twelve months ago; and circumstances have now made modes of commercial warfare, far removed from the liberalism they then preached, the order of the day.

Thus the chairmen have turned their attention in the past week chiefly to two topics; last year's trade depression and the diplomatic tension from which we have not yet begun to recover; and the need for forthright action to counter inequitable, unorthodox and subsidised competition in overseas markets. The bankers' united anxiety about the continued unsatisfactory state of trade is underlined by the contents of this month's Trade Supplement (published with this issue of *The Economist*). In November last year *The Economist's* Index of Business Activity fell to 101½; in December it fell further to 100½, the lowest figure recorded since August, 1935; and there are no appreciable signs in the industrial and commercial scene of any early change in trend. But the chairmen have sounded no note of despair. True, shipbuilding, shipping, coal and agriculture are in varying degrees in the doldrums. The plight of the textile trades, and especially cotton, is parlous; and most of the chairmen emphasised the anxious anticipation with which the Cotton Enabling Bill and the new British India Trade Agreement are awaited. But business in the home market, apart from certain specialised and localised branches of retail trade, has been reasonably well maintained; building activity did not fall away last year to the extent that might have been expected; wages and earnings suffered no appreciable setback; and there is evidence now of some slight upward movement in certain consumption trades (not quite duly represented perhaps in the composition of *The Economist's* Index), such as motor-car sales. "We have grounds for the belief," said Mr F. A. Bates at the Martins Bank meeting, "that we have seen the worst."

On balance, too, the country's financial structure withstood the successive crises of last year well. In an instructive comparison, Lord Wardington at the Lloyds Bank meeting showed in how many ways Britain's banking and monetary system was much stronger and more elastic in the anxious days of September last year than in August, 1914. The abnormal demand for currency was easily and automatically met, and even the mass flight of "floating unemployed capital" created no radical dangers. Inevitably the considerable foreign balances held with London banks to finance world trade, which accumulated in 1936 and 1937 and reached a peak last spring, were withdrawn on a

wide scale under the pressure of political alarms. But, as Mr McKenna claimed at the Midland Bank meeting, "contrary to all previous experience, the transfer was effected without any rise in Bank rate," owing to the operations of that "new and efficient instrument," the Exchange Equalisation Account. The abundance of available bank credit was unimpaired; and, though Mr McKenna may by implication have overstressed the rôle of Bank rate as a measure of cheapness, the maintenance of cheap money, which the bank chairmen called for in January, 1938, was successfully achieved. Domestic business was protected against extraneous developments and "to this extent at least we have become masters in our own house."

This is not to say that all is gas and gaiters at home. Several chairmen spoke with apprehension of the diversion of resources to sterile re-armament; and Mr G. P. Dewhurst, at the Williams Deacon's Bank meeting, called for the most rigid economy in unessential expenditure, "unless we are prepared to live on our capital." On the other hand, a large part of our resources is at present idle, and, to quote Mr McKenna again,

the problem of the proper use to be made of the nation's savings presents at the moment no difficulties for us; it is solved by the fact that the Government has come into the market as a borrower on a large scale.

The heavy additional defence expenditure which the Government cannot escape ought to be directed to bring unemployed men and equipment into activity as far as possible. Taxation cannot help here; but, in present conditions, borrowing will stimulate employment.

Vast Government expenditure, however, must upset our balance of international payments. The purchase of supplies and storage stocks of raw materials and food will swell imports greatly, and the problem of to-day is whether current income from sales abroad and the yield of overseas investment can meet the cost of these purchases. It is precisely in the realm of exports that prospects are most uncertain. Many of our customers are temporarily embarrassed and, all in all, it is overseas that the outlook is gloomy, despite the broadening of the base of British trade by the agreements last year with Eire and the United States. At the Barclays Bank meeting Mr Edwin Fisher re-stated strongly how vitally our standard of living depends upon expanding exports and a favourable balance of payments.

Last year's depression was, indeed, closely associated with a falling off in foreign trade; and this was by no means wholly due to the effects of political uncertainty. As Mr Rupert Beckett pointed out at the Westminster Bank meeting, 1938 was a year of new barriers to trading. The Open Door to China was shut. A programme of nationalism and expropriation was embarked upon in Mexico. Aggressive tactics adopted by German traders with Reich support became a menace to British exporters.

It is perhaps this topic of economic war and trade weapons that marks this year's bank speeches most strongly. It can be too strongly stated. Germany's trade record in 1938 does not show outstanding success in foreign markets. Britain's share of the one market, South-Eastern Europe, where the Nazi drive has been greatest, was small at the outset. Elsewhere, in Europe, Asia, Africa, and even, on balance, South America, British traders have not been perceptibly ousted by Germans.

Yet it is more than ever important, since foreign trade is our most vital arm in national defence, to expand, not simply to maintain, our sales abroad. And this is endangered by Germany's methods of commerce, by her State sales and purchases, her subsidies, currency manipulations, barter and clearing arrangements and debt devices. To counter these the bank chairmen have lent their authority to the present wide-flung call for Government action.

Being bankers, and British bankers, the chairmen are moderate in their claims on this score. They do not follow the Federation of British Industries in calling upon the Government to penalise the entry into this country of goods from recalcitrant countries. They are not anxious to see Britain imposing upon herself a semi-blockade in peacetime. They repudiate firmly the establishment of export subsidies as in any sense a permanent part of Britain's commercial structure. They are not disposed to confuse necessary defence measures with progressive policy.

All the chairmen welcome the strong words lately spoken by the Secretary to the Department of Overseas Trade about fighting the Germans with their own weapons. The extension of the export credits guarantee system to furnish a temporary fighting fund is generally approved. But it is to Britain's own special armoury of economic resources that the bankers very rightly look for weapons. It was Mr Colin Campbell at the National Provincial Bank meeting who put this point most plainly. "We have the financial resources to fight competition, and we can give our clients free exchange." "We are still the world's greatest buyers," and it is by the use of our buying power that we can best preserve our foreign commerce. "Our import trade should be used to the full," asserted Sir R. Noton Barclay at the District Bank meeting, "in pressing our advantage against foreign competitors."

It is only a few weeks since *The Economist* urged that Britain's most important weapon in the commercial conflict was her buying power. It is encouraging that leading bankers, loth to see the principles of sound business wholly abandoned under the pressure of immediate menaces, have expressed agreement. Concerted action by the members of distinct industries, and by groups of exporters, to examine and exploit overseas markets and to enter into agreements with their rivals is needed, and might, indeed, have been widely done much sooner as part and parcel of normal efficient trading. It is a welcome sign that British and German industrialists are to try again to reach an understanding next month. The distasteful device of subsidies is unavoidable in the short run, if only as a bargaining instrument. But it is all-important that these aids should be envisaged as temporary only; that the method of their levy should be clearly worked out with the British consumer's interests fully in mind; that the criteria to qualify industries for assistance should be rationally defined (would it help in any way, for instance, in the present situation to subsidise the declining cotton trade?); and that the terms and conditions of their payment should be independently decided and administered.

Meanwhile, it is not to these agencies, but to the natural processes of international trade and international investment that we must look for progress in a future unclouded by war threats and economic aggression. It is to that distant and far-off prospect that the bankers have looked in their latest speeches; and it is but a sign of sadly disjointed times that their faith in a freer future is dimmed by immediate dangers. For peace as for war, it is infrangibly true that "only by preserving our foreign trade can we maintain our national economy."

London Store Shares

JANUARY is the month of retail store sales. It is also the month in which many London department stores close their financial year. It would be idle to pretend that the Stock Exchange is anticipating much excitement from the dividends and profits of the London stores for 1938-39. The majority of the shares are quoted on a significantly higher yield basis than, say, Marks and Spencer or F. W. Woolworth, and some of them are at levels which plainly leave room for reduced payments at the forthcoming dividend season.

This distinction between the department and chain stores has been a guiding investment factor for several years. The West End has retained its attractions for the shopper. But it has kept its position only by a long and expensive fight, while retailing in the London suburbs and the provinces has gone rapidly ahead since 1933. The extensive rebuilding schemes which have been undertaken by many leading London stores in recent years might be superficially regarded as a sign of rapid growth; but it is probable that their result has been to improve selling service as much as selling capacity. And service to-day implies the maintenance of a series of ancillary services, such as restaurant facilities, which are designed to keep the shopper under one roof and thus to enhance the store's goodwill rather than its immediate profits. Some services undoubtedly entail much greater expense to-day. Credit transactions, ordering by telephone, and free delivery over a wide radius involve considerable booking and transport costs. And such failures as Gamage's (West End) and Glaves illustrate the cost of acquiring (and, by inference, the cost of maintaining) the customer's goodwill. Under the stress of competition, once-familiar names like Shoobreds and the Haymarket Stores have disappeared.

The clientèle of the London department store may perhaps be divided into two classes. There is first a wealthy, but essentially stable, population living in the Central and West End areas. This class accounts for a considerable amount of the stores' turnover, but it is distinctly sensitive to general financial conditions. The second class consists of the enormous suburban and provincial

population which makes occasional pilgrimages to the Mecca of the West End. But this second class, during recent years, has enjoyed the benefit of a substantial improvement in retail trading facilities on its own doorstep. For its ordinary domestic requirements, such as food and simple household equipment and clothing, the suburban and provincial stores offer a service to-day which is scarcely less efficient, and probably more convenient, than the large West End department stores. Hence the suburban shopper comes to the latter mainly for fashion goods and special items of household need. And such categories are plainly affected to a more considerable extent by general economic conditions than the day-to-day needs which are met locally.

This factor may account, in part, for the striking divergence between retail sales in Central and West End London and in London suburbs and the provinces of England and Wales. The index numbers published by the Retail Distributors' Association and the Bank of England (based on 1933) show that sales in the West End and Central London rose by 12 per cent. between 1933 and 1937, while sales in the suburbs and provinces climbed steadily to 130 and 127 per cent. of the 1933 level in the same period. But the average of the monthly figures for 1938 shows a fall in the London index to 105, compared with 112 for 1937, while the suburbs and provinces made further headway. These trends are compared on the chart opposite. In one respect, at least, the evidence of the chart is reassuring. The striking progress of suburban and provincial sales has not been at the absolute expense of the London stores. In part, it may be due to the decline of the small trader and the growth of the chain stores, which are better represented in the index. The fall in London sales for the period February-December last year was of the order of 7.3 per cent., compared with a rise of 2 per cent. for the whole country. It is true that these movements relate to the value of sales and not to the volume of transactions. But between 1933 and 1936 retail prices (other than food) changed comparatively little, and even in 1937, when rising wholesale prices forced a general

marking-up of retail prices, the increase involved did not exceed 6 per cent. on the average. The department stores can also claim credit for an improved rate of stock-turn. For the twelve months ending January, 1931, the rate was 6.37, but by the twelve months ending December, 1937, it had improved to 7.20. This indicator of merchandising efficiency shows, in fact, that the average length of time for which goods are kept in stock has been reduced by about one week over the period. Hence the risk of inventory losses through changes in fashion has been reduced and working capital has been turned to better advantage.

RETAIL SALES INDICES

Price changes, as we have seen, have not proved so difficult a problem as might have been expected in the early months of 1937, but the "mark-up" which they entailed caused a fall in the volume of trade, even though cash sales were maintained. But in the autumn of that year the London stores began to experience a fall in sales, some nine months after Stock Exchange values had turned downwards. The effect of these factors upon department store profits, which are analysed in the following table, has been depressing, though the year to January, 1938, witnessed no reduction in ordinary dividends, except in the special case of Selfridge and Company:—

DEPARTMENT STORE PROFITS AND DIVIDENDS

(b) Ordinary shares of Gordon Selfridge

Fluctuations in department store profits between good and bad years are relatively moderate, compared with those of industry at large. But dividend policy, in many cases, has reflected the effect of rebuilding schemes. This point is particularly obvious when the record of John Barker and Company is examined. During the past decade the company has set aside no less than £1,661,000 for rebuilding, and broadly speaking the directors have distributed only half of the available profits. This factor, suggestive of increased distributions when the scheme is finished, coupled with the company's ability to earn steady profits during a period of dislocation, accounts for the lower yield basis on the ordinary shares compared, say, with Harrods. The latter company (which effected its improvements at an earlier stage) increased its total profits from £2,271,600 in 1933 to £2,713,000 for 1937-38. But while the trading profits of 1929-30 were comfortably exceeded, the residual earnings for the ordinary shares were considerably reduced. As the company's accounts so clearly suggest, retail trading profits are highly geared, for overhead expenses bear a high ratio to total costs. The net effect for Harrods' shareholders (as indeed for John Barker's) is that the pre-depression rate of dividend has not been restored. But the undistributed earnings margin in the latter case is more substantial.

The prospects for the Selfridge group have occasioned special concern in the market during recent weeks. Despite official denials of rumours reflecting on the position of the group, the Stock Exchange still values the 10 per cent. preferred ordinary stock of Selfridge and Company (which has fallen from 33s. to 11s. 10½d. over the past year) on a 16.8 per cent. yield basis. This very fact suggests that a substantial body of investors is not satisfied with the company's position and prospects. For 1937-38, in fact, the company overdistributed, in order to pay its 8 per cent. ordinary dividend. This payment, costing £60,000 gross, was sufficient to meet the preference dividend of Gordon

Selfridge Trust, which owns the ordinary capital of Selfridge and Company. If this preference dividend were to fall into arrears, the preference shareholders would receive equal voting power with the ordinary shareholders who, in effect, control the Selfridge group. Selfridge and Company has adequate reserves to avoid this challenge to the controlling interest, at least for a time, but the problems affecting the group may, if Stock Exchange valuations are any sign, be of a more fundamental nature. Meanwhile, there are two relevant factors in the group's position. First, the managing director's account showed a balance of £119,000 due to the company at the end of January last year, which was secured by the deposit of ordinary stock of Gordon Selfridge Trust. This issue controls the equity of Selfridge and Company, but in the past seven years it has received only two dividends, totalling 7 per cent. Secondly, Selfridge and Company is committed to a guarantee of 25 per cent. on £450,000 cumulative ordinary stock of William Whiteley. This commitment has cost about £40,000 in each of the past two years, and it continues until 1942. Hence the reaction of the Selfridge group to a period of falling profits is double-edged and extremely high-gear.

So far, the store companies discussed are those which sell a wide variety of merchandise. Among the companies which concentrate more on drapery and furnishings, John Lewis and Company deserves attention. In recent years the company has extended its interests by the purchase of Peter Jones in 1933 and Knight and Lee in 1934. These acquisitions have plainly contributed to the strong upward trend of profits—total profits in 1933 were no higher than £170,600. But this group has shown a vitality in recent years which has found its reflection in profits, and it is perhaps somewhat anomalous that its senior preference issue yields practically 6½ per cent. On the other hand, John Lewis' profits are already subject to a considerable

prior rent charge, consisting of the service of the Properties company's debenture and preference capital. Swan and Edgar, whose ordinary dividend was raised from 6½ per cent. to 7 per cent. last year, provides another example of progressive drapery profits. A. W. Gamage, however, appear to have developed the profit-earning capacity of its mail-order business very successfully in recent years. Debenhams is in a class of its own, for in addition to its retail interests (which include Debenham and Freebody, Marshall and Snelgrove, Harvey Nichols, Stagg and Russell, and Bobby and Company) it conducts a wholesale drapery business. But, in addition, its structure is among the most highly-gear in the trade. Its debenture capital, together with three classes of preference capital, amounts to £8,526,738, leaving the small equity of £500,000, in 1s. shares. Moreover, its profits derived from subsidiaries are already subjected to their own gearing. Debenham's have maintained a 20½ per cent. dividend in each of the past two years, but the ordinary shares must be regarded as liable to wide fluctuation.

The interim dividends declared by London store companies provide no hint of any decline in profits. And past experience suggests that, if a decline occurs, it should not be excessive. The investor, however, cannot fail to note the effect of high overheads and prior charges on equity earnings when turnover is falling. Although the stores in Central and West-End London have reduced their sales staff by 7.2 per cent. during the past year, such measures are protective and cannot compensate for falling business. The shadow of falling earnings has been seen for the past sixteen months, and in some cases the profits for the year now closing may be insufficient to maintain ordinary dividends in a second year of recession. It follows that the holder of London store shares must be prepared to look to his earnings cover, if he wishes to avoid the shock of reduced payments.

Finance and Banking

Dr Schacht and the Reichsmark.—The dismissal of Dr Schacht, the "saviour of the mark," from the Reichsbank was bound in any case to lower the external valuation of the mark, and this reaction has been accentuated by the special circumstances attending his dismissal and by the reputation of Dr Funk his successor—an ex-financial journalist with a strong predilection towards inflation and currency devaluation as a method of commercial aggression. Even the official reichsmark rate, which is strictly controlled and moves in the closest relationship with the dollar, weakened on the news from Rm. 11.68½ to Rm. 11.75 to the £, while on the same day sterling was steady at \$4.68. This movement of the official rate was, however, entirely psychological, and does not appear to have been tested by any appreciable business. It was followed by a rapid recovery of the official rate to about Rm. 11.69 at which it has been held steady. The repercussions of Dr Schacht's dismissal, however, have been much more pronounced in the uncontrolled markets for different types of blocked marks. The discount on registered marks has widened from 58½ per cent. immediately before the Reichsbank changes to 63 per cent. Next in order of importance are Handelsmarks (with which credit and emigrant marks are now merged), the discount on which has risen this week from 89 to 92 per cent., which means a depreciation of nearly 30 per cent. The markets in these types of marks have been almost nominal. The slump in tourist traffic to Germany has blocked the only appreciable outlet for the sales of registered marks, while the past week's developments in German finance have been calculated to destroy any remaining incentive to acquire Handelsmarks for making long-term investment in Germany.

The weakening in the registered mark rate may reflect some apprehension on the part of Germany's standstill creditors regarding the ultimate fate of their commitments. Such apprehension can readily be understood. Dr Schacht may have been a keen negotiator and hard bargainer in past standstill discussions, but at least he spoke the same kind of language as the creditors. Both sides dealt in terms of concepts of international trade and finance which were common to each of them. It remains to be seen whether the same can be said of the new personalities at the Reichsbank. The test will come next April when the renewal of the standstill agreement (which on the last occasion was prolonged for three months only) comes up for discussion. On purely logical grounds, the fears of any tampering with the agreement may be dismissed as unreasonable. It provides Germany with an essential volume of external short-term credits which are being used to an increasing extent for financing her external trade, and which could not be obtained at cheaper rates. It is not necessary to be a "moderate" in Germany to appreciate the strength of this case.

The Guilder under Pressure.—Towards the end of last week the guilder suddenly came on offer, and in consequence weakened against most leading currencies. The chief movement occurred last Monday, when sterling rose from Fl. 8.61½ to Fl. 8.64½, the dollar from Fl. 1.84½ to Fl. 1.85½, and the Paris rate from Fl. 4.86½ to Fl. 4.89 per Frs. 100. On that day the Netherlands Bank offered to sell dollars at Fl. 1.85½, and such was the respect felt for its resources that it was able to check the deprecia-

tion of the guilder without selling a single dollar. On Tuesday the guilder was firmer against the dollar at Fl. 1.84½, but the next day the rate weakened again to Fl. 1.85½. Meanwhile, sterling rose to Fl. 8.66½ and the Paris rate to Fl. 4.89½, but the steadiness of the New York rate was of much the greater importance. The primary cause of the guilder's weakness was a new flight of Jewish capital to New York, and this in turn is traceable to the general nervousness felt over the international political situation. French speculators also took advantage of the weakness to sell guilders against francs and dollars, and some Dutch quarters attribute this attack partly to feelings of disappointment at the relative failure of last week's Fl. 100 millions 4 per cent. French Railway Conversion Loan. Fl. 30 millions of this loan was taken firm, but the remainder was offered on the market at 95 and evoked a poor response. Incidentally, a striking contrast came the next day, when a Dutch Oil 3½ per cent. Loan for Fl. 100 millions was offered at 100½ and heavily over-subscribed. Holland is now the repository of a huge amount of refugee capital, and so must be prepared to suffer the same disturbances as Great Britain experienced last year. On the other hand, the Dutch gold reserves are very strong. The Netherlands Bank holds Fl. 1,461 millions, which has never been revalued and which is to-day worth nearly Fl. 1,800 millions. The Dutch Exchange Equalisation Account of Fl. 350 millions probably consists almost entirely of gold. There is also a steady commercial demand for guilders, while this week's flurry may have left a short guilder position on the Continent. The Dutch banks were long ago asked not to facilitate speculation, and while there are no restrictions analogous to those now in force in London, these would rapidly be applied if a serious flight of capital developed. Certainly, Dutch banking opinion is not perturbed at this week's fractional drop in the guilder.

December Clearing Bank Averages.—The December returns of the ten English clearing banks give the average position over the whole month, and so are hardly affected by the preparation for the end of the year. Thus the increase since November in clearing bank cash has no connection with year-end calling. Rather it reflects the release, through the War Loan dividend payment, of funds accumulated during November in public deposits. These were Exchange Account funds, and what really happened was that the increase in the floating debt, necessitated by the War Loan dividend payment, took the form of issues of

tap Treasury bills to the Exchange Account. The Account continued to acquire bills during December, and this led to a progressive decrease in the tender issue. Hence the month's drop in clearing bank discounts, only partially mitigated by an increase in call and short loans.

December also witnessed some increase in balances with other banks and cheques in course of collection. This represents the more active circulation of cheques in connection with Christmas. Advances were rather higher than in November, and this has apparently necessitated some reduction in the banks' investments, for even in December advances plus investments were up to the normal maximum ratio of about 70 per cent. of deposits. The net result of these contradictory movements was a small increase in deposits.

Currency War in China.—A currency war between the dollar notes issued by the three Chinese banks and the yuan notes issued by the Reserve Bank of Peiping is proceeding alongside the military struggle—with somewhat analogous results. The yuan notes issued by the Japanese puppet institution had an extremely difficult and unpromising start, but they are slowly ousting the currency issued under the authority of the Chinese Government through the Central Bank of China, the Bank of Commerce and the Bank of China. The whole of the expenditure of the army of occupation met by yuan notes which, moreover, have been decreed as the sole means of payment of taxes and customs due

31st December, 1938

Mr Frederick Hyde.—The death of Mr Frederick Hyde, who from 1929 until last year was sole managing director of the Midland Bank, leaves another gap in the ranks of those who were responsible for the amalgamations which gave birth to the big banking combinations of today. Mr Hyde will be remembered in the banking world for his work in co-ordinating the accounting methods used by the various banks of which the Midland Bank became the amalgam. His system of branch control and accounting is used by many overseas banks. To a wider public his evidence before the Macmillan Commission has now become the classic exposition of the way in which a modern bank regulates its advances. But to those who really knew him Mr Hyde leaves a different memory. As managing director he was always ready to give the utmost sympathy and encouragement to any member of the enormous and widespread Midland Bank staff. He took care to see that every man received due recognition and credit for his work, and in this way "F.H.," as he was known in the bank, inspired a hero worship, even among juniors in remote branches who never came in contact with him. On his retirement last year a large presentation fund was subscribed by the staff. It was typical of Mr Hyde that he asked that the major part of this fund should be used to endow a prize to be given by the Institute of Bankers in connection with their new higher diploma for banking. This is the tangible memorial to Mr Hyde. It is the memorial which he himself would most have desired to leave behind him.

Sun Life Assurance Report.—The Sun Life is the first insurance report to appear each year, and is invariably examined with particular interest. In 1938, new sums assured amounted to £21,660,000, a figure which is second only to the record of £22,010,000 secured in 1937. Consideration moneys for annuities granted were slightly smaller at £190,000. The net rate of interest earned on the life assurance and annuity funds fell from £4 0s. 7d. per cent., to £3 18s. per cent. Premium income, exclusive of single premiums, showed a large and satisfactory increase of roughly £350,000 to £4,878,000, while death claims amounted to £1,278,000 against £1,071,000. In pursuance of the investment policy of recent years, a further reduction was effected in total investments outside the United Kingdom, and mortgages again increased. Property loans (all within the United Kingdom) amounted at the end of 1936 to £3,959,000, at the end of the following year to £4,725,000 and on December 31st last increased further to £5,494,000. A large portion of these mortgages are doubtless connected with house purchase schemes, which have the valuable feature of attracting life assurance business. Policy loans were further reduced from £2,643,000 to £2,459,000. British Government securities increased by approximately £500,000 to £10,900,000; on the other hand, Colonial and Foreign Government securities were again substantially reduced from £5,070,000 to £4,549,000. Debentures increased by nearly £1 million to £11,150,000, and combined preference and ordinary shares remained practically unchanged at the comparatively small figure of £1,200,000.

Investment

Prey to Politics.—The behaviour of the Stock Exchange for the first three weeks of this year was ominously reminiscent of the uneasy August dealings last year. And the pattern has been disagreeably confirmed this week by two major setbacks, both of them directly traceable to the resurgence of political fear. Wall Street actually gave a sign of what was in store for London, by staging a fall of 2½ points in the Dow Jones industrial average on Saturday of last week. London took its unhappy cue on Monday, when heavy selling depressed gilt-edged, foreign bonds and equity prices. After a short respite on Tuesday—or more, accurately, a closing rally which put gilt-edged stocks slightly higher on balance—the falls were resumed on Wednesday. There is, of course, no necessity to discuss the causes of this retreat in detail. The dismissal of Dr Schacht has been interpreted as a victory for the extreme party elements in Germany, and has received, therefore, political rather than economic emphasis. The fall of Barcelona has removed a blind spot from the eyes of some investors which has hitherto prevented them from realising the strategic implications of the Spanish civil war. The calling-up of Italian conscripts and the approach of Herr Hitler's speech have reminded the world that diplomatic initiative lies with the Axis powers. And the world has not been slow to sell its securities.

The result is that many securities—gilt-edged, industrials and mining shares alike—stand to-day at levels lower than those of the September crisis. Movements in representative securities since that date are shown in the following table.

	Sept. 28, 1938	End 1938	Jan. 20, 1939	Jan. 23, 1939	Jan. 25, 1939	Jan. 26, 1939	Fall this Week

It is hardly surprising that falls of this order have uncovered certain positions in London. Until recently, the technical strength of the market had been fairly resistant to selling—but now a new purge of weak positions may be inevitable. Losses of this week's order are not easily regained, at the best of times. And the Stock Exchange dare not hope that the causes of its uneasiness will be quickly removed.

Imperial Tobacco Profits.—Last month the Stock Exchange Committee suggested a standard form for dividend and preliminary profit statements. It is rather disappointing that a company of the standing of Imperial Tobacco has failed to set an example to smaller concerns in this matter. The utility of the Committee's suggested form is, in fact, underlined by the Imperial Tobacco figures, for it is necessary to deduce from the information given an approximate profits figure, since the latter is not specifically stated by the board. The distribution, following general expectations, has been maintained at 25 per cent

tax free, but disclosed profits have fallen from £10,750,609 to £10,685,565 (approximately), while ordinary earnings are slightly reduced from 26.4 per cent. to 26.2 per cent., tax free. The results are analysed in the following table:—

	Years ended October 31		
	1936	1937	1938
	£	£	£
Profit	10,636,316	10,750,609	10,685,565*
Preference divs.	852,209	852,209	852,209
Ordinary stock (tax free):			
Earned	9,784,107	9,898,400	9,833,356
Paid	9,390,762	9,390,762	9,390,762
Earned %	26.0	26.4	26.2
Paid %	25	25	25
General reserve	250,000	250,000	500,000
Carry-forward	1,183,767	1,441,405	1,384,000*

* Approximate figures.

The apparent fall in profits is, in fact, more than accounted for by the rise in the standard rate of income tax during the year and by the incidence of a full year's National Defence Contribution, compared with only seven months' payment for 1936-37. Unless there is any specific importance in the doubling of the general reserve provision to £500,000 (which entails a reduction in the carry-forward to £1,384,000), the figures contain no surprises, and they must be regarded as satisfactory. The amount of tobacco retained for home consumption for the eleven months to November showed a further increase from 168.4 million lbs. in 1937 to 175 million lbs. for the same period of 1938, but the average import price of unmanufactured tobacco rose last year from 15.54d. per lb. to 15.8d. per lb. The growing use of Empire leaf may already indicate a slight shift of demand towards cheaper varieties, and although the impact of rising leaf prices is cushioned by the company's stock equalisation policy, it must have some influence upon earning power. Presumably, the failure of British American Tobacco to repeat the 1½ per cent. bonus for the year to September 30, 1938, will affect the current year's revenue account. The sum of these factors suggests that Imperial Tobacco is not likely to expand its earnings during the current year. On a gross basis the £1 ordinary stock units at 6½ yield £5 12s. 6d. per cent.

Cables and Wireless Earnings.—The Cables and Wireless traffic index is now available for the full year 1938, but the task of estimating the financial results for the year is, on this occasion, peculiarly complicated, since the comprehensive reduction and simplification of Empire rates came into force at the end of April. Hence the traffic index is a poor guide to the net revenue position, for while it provides an indication of the course of receipts, it does not show the movement of the volume of traffic. The average of the twelve monthly indices is 69.3 compared with 78.9 for 1937—a movement which suggests a fall in gross receipts of £612,000. On the other hand, the beam rental of £250,000 per annum was cancelled with effect from March 1st, thus providing savings of £208,000 for 1938. Moreover, the Company was relieved of certain other financial obligations, and the Governments concerned in the agreements agreed to reduce their terminal and transit rates. It is impossible to estimate the power of these factors to offset an otherwise inevitable rise in the operating expense ratio. The other items of income of the operating Company, such as charter of ships and income from investments, must also be expected to show a decline, perhaps of not less than £50,000. On this basis the operating company's net profits may not show a smaller decline than £400,000 to about £450,000, which would mean a fall in earnings to about 3 per cent. But last year the directors set aside £300,000 which was specifically earmarked for equalisation of dividends. Taking this reserve into account, the Communications company might well be able to maintain the dividend rate at 3½ per cent. by dipping into the fund for no more than £150,000.

The amount received by the Holding company from the Communications dividend would be reduced as the result of the transfer to the Government of 2,600,000 £1 Communications shares at the time of the agreement. On a 3½ per cent. dividend basis, this would represent a loss of income of £91,000. Of the income from other sources, the Marconi interim dividend was increased from 2½ per cent. to 3½ per cent., and while the Cables Investment Trust income for the 12 months to June 30, 1939, must show some reduction, there is no reason to think that the Trust's interim dividend of 2 per cent. need be reduced (in which case the Holding company's receipts for the calendar year from this source would be unchanged). Directly-owned investments may, at a guess, be estimated to yield £10,000 less. In short, the revenue of the Holding company need not be reduced by more than £100,000 or so. This would cover the amount required for the 5½ per cent. Preference dividend and almost 3 per cent. on the ordinary capital. Were the Communications company to distribute current earnings in full and to utilise the whole of the £300,000 reserved, then the Holding company might be able to maintain its Ordinary dividend at 4 per cent. Such a generous policy could hardly be considered conservative, however, in view of the continuing adverse traffic trend. Moreover, it is equally pertinent to observe that, on the above chain of hypotheses, actual earnings for the year applicable to the Holding company's Ordinary may possibly not exceed 2 per cent.

Investment Trust Results.—A considerable number of investment trusts have issued their reports for the year 1938, and broadly they confirm the trend set up by reports issued last autumn. The majority of recent reports show a fall in income—a fact which suggests that the traditional time-lag has proved an inadequate brake upon declining profits, though it can be attributed in part to the earlier impact of depression in the U.S.A.

* Proportion by which valuation of investment exceeds (+) or falls short of (−) book values. † Years to following January 1 or 2. ‡ Income, and dividends, etc., paid, shown gross for 1938; previously net.

By its business, its capitalisation, and its division of securities into separate funds, the *Law Debenture Corporation* is not a representative trust, but its results for last year illustrate the general experience. Investment income declined by about 8 per cent. (some 82 per cent. of the main portfolio is in bonds and debentures), but profit from the sale of securities fell from £16,789 to £4,691. The Corporation is, however, the only trust in the list to show a surplus over book values. The depreciation recorded by other companies varies, but frequently the deficiency is not covered by reserves. Of the five remaining trusts, *Debenture Corporation* shows the best cover, for depreciation requires only about one-third of available reserves. Distribution of investments, geographically and by categories, shows only fractional changes during the past two years, which are of no special significance. Perhaps the most consistent among these small variations is the decline in the proportion domiciled in European countries. Falling revenues and a substantial degree of depreciation, however, are the key features of 1938 investment trust reports.

Tilling and B.A.T.—The total income of Tilling and British Automobile Traction increased last year from £474,978 to £550,800. That is the main fact in a report which is otherwise content to provide the minimum of information to the shareholders. The total distribution is 9 per cent. tax free, compared with 10 per cent. gross for 1937, and is equivalent to 12.42 per cent. on a gross basis. The distribution, however, is not quite covered by disclosed earnings, which are equivalent to 8.9 per cent. tax free, and the balance carried forward has been reduced by

approximately £5,000. The results, however, are clearly most satisfactory. They would be read with even more eagerness if the directors were to see their way to provide fuller information regarding the assets and earnings of the associated companies in the group. The balance sheet shows that these interests (including capitalised bonus shares) amount to £4,344,746, while shares in subsidiaries stand at £114,733. Presumably the usual form of consolidated statement might not be applicable to this type of grouping, although the distinction between associated and subsidiary companies (for group accounting purposes at least) is often rather vague. Other companies with the same accounting problem have adopted such expedients as summary balance sheets and profit and loss accounts, and while Tilling and B.A.T. has interests in no less than 24 provincial transport undertakings, fuller information regarding the more important units would be appreciated by shareholders. The ordinary shares yield £5 per cent. gross at 51s. 3d.

Amalgamated Cotton Setback.—The fall in Amalgamated Cotton Mills Trust profits for 1937-38 is no less serious than the setback shown by Lancashire Cotton Corporations. Trading profits of the group are about £100,000 lower at £166,814, and total receipts for the parent company amount to £120,977 against £219,181. Provision, however, has already been made for stock depreciation, whereas in 1936-37 a special fund of £30,000 was created for the purpose out of profits. This fund has not been drawn upon, and has been transferred to general reserve, which is increased to £100,000. Despite the conservative valuation of stocks, however, the book value of subsidiaries' stocks has increased from £405,098 to £458,671, though the Trust's own stocks are only £8,000 higher at £551,110. The balance of earnings available for the Trust ordinary shares is £31,472 (against £89,581, after charging the special stock reserve), and represents 15.7 per cent. tax free. A year ago (the first year since capital reorganisation), only one-fifth of the earnings was distributed, and it has thus been possible to maintain the 8 1/2 per cent. tax free distribution on the highly-g geared ordinary shares, even out of the latest year's attenuated profits. But the surplus is only sufficient to add £14,740 to the balance carried forward. Meanwhile the outlook for the cotton industry remains obscure. Hopes that all sections of the industry would support the Enabling Bill have been checked, for the time being, by opposition from the Manchester Chamber of Commerce, where a vote adverse to the Bill was recorded—something unexpectedly—last Wednesday. Already five unsatisfactory months have elapsed in the Trust's current year, and the potential benefits of the Enabling Bill would not be reaped before it elapses. A yield of 10 per cent. gross on the ordinary shares is, therefore, appropriate to current trading conditions.

The Week's Reorganisation Schemes.—Happy is the company which can reshape itself, in the hope of better times ahead, by a simple equity capital cut. The reorganisation schemes presented by Burtol Cleaners and Sheffield Steel Products are both of this nature. The former company, incorporated in 1934, has an issued capital of £250,000 in 5s. shares, and showed a debit balance at profit and loss of £14,950 at September last. It acquired for £146,753 goodwill, patents and trade marks which have singularly failed to provide commensurate earnings. These are to be written down to £11,000, and with other write-offs on property, furniture and preliminary expenses, entail cancellation of £200,000 of the ordinary capital. Since the directors estimate that the 1938 results on the reorganised basis would have amounted to £5,000, the capital structure is being brought into reasonable line with earnings. The reference to a reduction in depreciation, consequent upon the writing down of fixed assets, however, does not absolve the company from the task of earning sufficient profits to replace its assets, at cost and not book values. The issued ordinary capital of Sheffield Steel Products is to be

reduced by two-thirds from £558,262 to £186,087. In this instance, intangible items, including the loss carried forward, amount to £86,000. Finally, the full scheme of reorganisation has now been circulated by the directors of Cordoba Central Railway. It confirms the favourable interpretation of the preliminary details given in *The Economist* of January 14th, page 86. The directors point out that after payment of all expenses and the service of the first debenture stock, the balance of liquid assets will amount to between £350,000 and £400,000, which, together with interest on the State railway bonds, should provide sufficient income to cover between 3 per cent. and 4 per cent. on the new "B" debenture stock. The yield on the latter (inferred from the present prices of income debentures and consolidated income stock) would amount to 8 1/2 per cent. on a 3 1/2 per cent. payment.

Rhodesian Copper Earnings.—The announcement by Rhokana Corporation of profits of £896,000 for the half-year to December 31st (subject to income tax, but not including any dividend from Mufulira) undoubtedly satisfied the market, and does not account for this week's fall in the shares from 10 1/2 to 9 1/2. The figure in fact compares with £869,000 for the previous six months, and £1,136,000 for the corresponding half-year of 1937. The Roan Antelope earnings estimate (also subject to tax) for the December quarter shows a substantial expansion at £461,500, compared with £250,500 for the September quarter. In the latter period, of course, production was at 95 per cent. of basic quotas, whereas the companies were freed from restriction for two months of the past quarter, and operated at an average of 100 per cent. for the other month. Copper prices also rose from an average of £40 15s. 10d. to £44 16s. 10d. during the quarter. A similar increase in earnings is also shown by Mufulira for the December quarter at £345,500 against £201,500 for September. This company has produced £547,000 during its first half-year, against £564,500 for the corresponding period of 1937, and provided that current prices are maintained at the existing level of output (100 per cent. of basic quotas) a higher dividend may be payable to Rhokana. But both assumptions are rather less certain than they were. It is difficult to make any precise estimate of possible earnings during the current half-year. But if the quota is maintained at 100 per cent. and copper averages £45 (which is understood to be the objective of the authorities), Rhokana's copper earnings, allowing nothing for Mufulira dividends or cobalt revenues, might well be of the order of £850,000, while Roan Antelope and Mufulira might earn £660,000 and £550,000 respectively.

Ashanti Goldfields Report.—Little change has occurred in the results of this veteran West African gold producer during recent years. A tendency towards increased costs has been more than offset by expansion in revenue. Moreover, the increase of 1.3 dwts. in the average value of the reserves occurred despite the treatment of ore averaging fully 1 1/2 dwts. above the grade shown by the reserves at the end of September, 1937. The notable expansion in the ore reserve tonnage reflects highly satisfactory development not only in the deep levels, but also in certain immediate portions of the mine. The results of the past three years are analysed below:—

	Year to September		
	1936	1937	1938
Ore treated, tons	213,710	216,600	224,120
Average yield, dwts. ...	19.31	20.19	21.8
Total income	£1,503,930	£1,598,260	£1,659,730
Revenue per ton ...	140/9	147/7	148/4
Working costs	26/1	28/2	29/2
Net profit	£964,920	£1,014,040	£1,042,060
Per ton	90/4	93/8	93/2
Dividends	£950,000	£950,000	£950,000
Per cent.	95	95	95
Carried forward*	£134,400	£100,360	£112,430
Ore reserves, tons	1,458,030	1,595,110	1,834,290
Average value, dwts. ...	20	19.7	21

* After allowances for income tax, reserve, etc.

As already announced, the capacity of the new treatment plant is to be 30,000 tons a month and not 20,000 tons as originally contemplated. The consulting engineer declares that "the position generally warrants a larger and longer view of the future of the mine." Meanwhile, a monthly profit of about £100,000 is budgeted, and this figure will probably be maintained until the 30,000-ton stage has been reached. The proceeds from the residue re-treatment plant (practically completed by the end of the year) and from certain improvements at the Central treatment plant, may be offset by reduction in the grade of ore treated. During the period of waiting, the company may accordingly do no more than maintain its dividend upon the increased capital at the recent rate. At the current price, allowing for the bonus of one in five and the bonus issue of one in 20 at £3, the shares would return about 5 1/2 per cent. on this basis, until the increased profits are available for distribution. The report makes no reference to the necessity for providing additional capital for Amalgamated Banket and Ariston, in which the Ashanti is understood to hold substantial interests. The balance sheet, however, shows British Government securities, below market value, at £208,060 (against £363,520), while shares and interests in other companies are somewhat increased to £722,930. Cash and bullion amounted to £183,550, against creditors and other items totalling £285,380.

Bibiani.—Last year's income of £311,500 compares with £303,940 for 1936-37. But owing partly to native labour troubles, net profit at £83,130 shows a decrease of some £25,200. Once again 15 per cent. has been paid, and the slightly increased balance of £90,070 is carried forward. The chief feature of the report lies in the increase of 153,870 tons in the ore reserves to 2,961,670 tons, the value being unchanged at 7.25 dwts. The new plant is expected to start in June, but not to operate at full capacity until towards the end of the current financial year, when on the basis of full operation a monthly revenue of £64,680 is expected—rather more than double the present yield. Meanwhile, the 4s. shares are quoted at 22s. 9d.

Rand Selection Corporation.—The falling-off in last year's profits of Rand Selection proves to have been much greater than might have been inferred from the cut in the dividend to 40 per cent. There is a new charge of £8,100 for interest on the £1,000,000 5 per cent. convertible notes issued during the period; but with earnings on a lower scale, only £25,000 is required for tax reserve as against £125,000, while no further appropriation is made to reserve, which in 1936-37 received £200,000. Underwriting commission and expenses in connection with the note issue absorbed £27,830; and after providing for the dividend, a slightly increased balance of £104,940 is carried forward. The bulk of the money received from the

note issue has meantime been utilised for loans, which total £1,192,660, as against £485,660 twelve months ago. Shares and other interests stand at £2,479,430, as compared with £2,282,850 at September, 1937. The notes will, of course, rank for interest in respect of the whole of the current financial year. The company has apparently realised the interest previously held in Rietfontein No. 11 and the Spaarwater undertakings. As usual, the assets exceed by "a substantial amount" the figure at which they appear in the balance sheet. A current price of 23s. 9d. may be regarded as making some allowance for the rather uncertain outlook.

Commonwealth Mining Scheme.—The long-expected capital reorganisation scheme of Commonwealth Mining has now appeared. It is likely to encounter criticism on two grounds—first, that it discusses the group's interests very briefly indeed, and secondly that although it involves writing down the capital by one-half it may be none too severe. Despite the optimism prevailing when several of the company's subsidiaries were floated, the circular very truly says that they "have not lived up to expectations." Certain other investments have also depreciated in value. On the other hand, substantial profits have for many months past been reported by the Yellowdine and Comet undertakings, though in the former case earnings have shrunk from around £16,000 in the middle of the year to around £12,000 in the last month or two. But by contrast the profits of Comet have in the meantime expanded from under £2,000 to around about £3,000. The official circular, however, makes no specific reference to these two interests, which are considered to be the most hopeful among the company's holdings. Apparently the idea is entertained that they may provide partial compensation for losses in other directions. The market price of the existing 5s. shares is 1s. 4½d., and a cut in the par value to something approaching this level might have been sounder policy than the one proposed.

The Week's Company Profits.—Our usual analysis of profit and loss accounts on page 230 includes, apart from three companies for which comparable figures

are not available, the results of some 36 companies, among which investment trusts are well represented. Net profits amount to £1,799,000, compared with £1,711,000, and thus show an increase of 5 per cent. The aggregate net earnings of 111 companies reporting in 1939 amount to £13,697,000, a total which is 7 per cent. below total earnings of £14,705,000 for the previous year. The week's results are discussed in preceding Notes and on page 196 under the heading "Shorter Comments."

Company Meetings of the Week.—In this issue reports of company meetings begin on page 202. The chairmen's speeches at the annual bank meetings (the latter include *Midland Bank, National Provincial Bank, Westminster Bank, District Bank, Williams Deacon's Bank and Martins Bank*) form the subject of a leading article on page 183. Addressing *Turner and Newall* shareholders, Sir Samuel Turner expressed satisfaction with the progress of *Turners Asbestos Cement Company*. The new Trafford Park buildings and plant reorganisation had been practically completed, and on the selling side turnover as a whole had been substantially higher than in any previous year, both in the home and export markets. Mr Eric Miller informed *United Serdang (Sumatra)* shareholders that at the end of 1938 stocks of tyres and other rubber goods in the hands of manufacturers and dealers were probably lower than at the end of 1937. At the *Langen (Java) Rubber* meeting, Mr Miller pointed out that as the N.E.I. quotas for 1939 were appreciably higher than in 1938, internal cuts in the exportable rate should be less severe. Addressing members of *The National Bank*, Mr Michael J. Cooke stressed the importance and value of the trade agreements between England and Eire and the United States of America. The technique of amortisation on short-term securities carrying a high nominal rate of interest was discussed by Sir William Goschen at the *Union Discount Company* meeting. The importance of the New Zealand import regulations for *Joseph Nathan and Company* was examined by Mr Alec Nathan. Although further information was needed to judge their effects, the chairman anticipated that the company's import business would be maintained without material alteration.

THE STOCK EXCHANGES

London

SETTLING DAYS

TICKET ACCOUNT
FEBRUARY 7 FEBRUARY 9

THE Stock Exchange has been at the mercy of politics this week and appreciable selling, much of it from Continental quarters, has depressed prices to the lowest point touched since last September's crisis. The falls have been so precipitate that some positions have

been uncovered, particularly in the American market, although so far no serious technical weakness has developed. Forced selling, however, was a definite factor in the week's setback, and it was only relieved by "bear" covering at the end of the week.

In the *gilt-edged market*, Old Consols and War Loan fell ½ and Local Loans ¾ on Monday. On the following day, a weak opening was succeeded by a late rally, and many stocks showed net rises of one-eighth. In midweek, however, further selling occurred, and despite

a steadier feeling in the afternoon, falls of up to ¾ were recorded in gilt edged, and were repeated on Thursday. The Jamaica loan improved to 1½ discount in midweek and encouraged the Colonial section of the market slightly.

Sharp falls were recorded in *German bonds*, the "Dawes" loan falling 3½ and the "Young" loan 3 on Monday, though a rally on Tuesday was held. Potash 7 per cents. were a weak feature, having fallen no less than 6½ points to 58½ by midweek. Further weakness was evident in Egyptian issues and although Far Eastern bonds were not a target for selling, they were quoted lower where changed. Brazilian issues were fairly steady, but Chilean bonds were marked down on the news of the earthquake.

Home rail stocks proved vulnerable to a fair volume of selling, in every department. L. and N.E. debenture issues were particularly weak, and this line also led the fall in guaranteed stocks. L.M.S. first preference were marked down sharply on dividend fears, and the condition of the market after an unfavourable batch of traffics and certain doubts about the "Square Deal" was extremely weak. London Transport "C" stock weakened further to 71. The Argentine rail market was depressed, although selling was not unduly large; Pacific Consolidated debentures led the fall.

Although it showed some resistance on Tuesday and early on Thursday, the industrial market deteriorated considerably during the week. Selling did not reach large proportions, but buying support was completely absent. Although selling pressure relaxed after Monday, the trend in iron and steel shares was downward, Thornycroft being among the worst victims. Coal shares continued dull, and engineering issues showed small losses. The general weakness affected even electricity supply shares, besides electrical equipment issues. In the motor group, the "heavies" were the most affected, although a steadier tone developed on Tuesday. Exceptionally, A.E.C. hardened, but Leyland lost ground after the meeting. While sharing in the general movements, Aircraft issues also became steadier on Tuesday. Textiles showed small losses, apart from some support for Jute Industries preference. Except for a slight rally in Courtaulds on Tuesday and Thursday, rayon shares were weak. Brewery shares followed the rest of the market, and the normally steady tobacco group also lost ground. Stores were depressed, and losses were general in the provision and catering section, especially in Liebig's. Miscellaneous issues were typical of the rest of the market. Foreign selling depressed Lever and Unilever and Swedish Match "B," though they recovered slightly on Thursday. International issues fell sharply on Monday, and turned erratic after a steadier tendency on Tuesday.

While selling did not gather real momentum, sales of the leading oil issues depressed prices, which were further weakened by a precautionary marking down. A little support from the Continent—who were otherwise sellers—brought temporary relief on Tuesday and again on Thursday. Rubber shares suffered less severely than industrials on Monday, but quotations gave way all round under a steady trickle of sales.

The mining market had another bad week, and Tuesday's rally did not go far towards cancelling the losses of the other days. In the Kaffir section, depressed conditions on Monday were largely due to Cape and Amsterdam selling, though quotations were lowered out of proportion to its volume. Steadier nerves at the Cape brought some respite on Tuesday, but weakness returned later, helped this time by Swiss and local selling as well. West African and diamond issues followed Kaffirs. Rhodesian copper shares resisted further declines on Tuesday, but base metal shares generally moved in step with other sections.

ACTUARIES' INVESTMENT INDEX

By falling 1.8 points in a week, the Actuaries' index of 160 industrial equity prices had reached 58.5 on Tuesday, January 24, 1939—or only 0.5 above the "low" of September 27, 1938. A week ago the index was 60.3, and 61.5 at the end of December. The corresponding average yields are 6.48, 6.25 and 6.13 per cent. In the following table we give a selection of the component indices:—

New York

WALL STREET gave its first reaction to growing political fears at the end of last week when the Dow Jones average fell by 2.35 and turnover reached the comparatively high level of 660,000 shares. This fall proved a reliable signal of what was in store, for on Monday turnover reached 1,870,000 shares and the Dow Jones industrial average collapsed 5½ points, leaving the chartist's resistance level well behind. Heavy selling again occurred on Tuesday, but the temper of the market fluctuated wildly and stocks showed little change on balance. The volume of turnover subsidised appreciably in mid-week and fractional losses predominated in the industrial and rail groups. Utilities, on the other hand, proved relatively resistant. The fall in steel output from 53 per cent. of capacity to 52 per cent., according to "Iron Age," also discouraged the market, which has been anticipating a steady improvement in output by the end of January. The sharp break in the market has been received with consternation by investment advisers, although during the past few weeks certain quarters in Wall Street have been less optimistic regarding the pace of industrial recovery in the United States.

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values calculated on closing prices (1926 = 100).

the industry. Every other section of the trade, including the operatives' organisations, had supported the proposals, and although it was known that there was a good deal of opposition among the merchants, it was not thought that the proposals would meet with an adverse vote. The meeting was attended by nearly 700 members, and on a show of hands the resolution was defeated by 281 votes to 237. There were 150 abstentions. It must be emphasised that the meeting was open to all members of the Chamber of Commerce, no matter what trade they followed. The industry is now wondering what effect the decision will have upon the attitude of the Government. The whole position will be considered by the Joint Committee of Cotton Trade Organisations, at a meeting in Manchester on Friday (January 27th), and there is still the possibility that a further vote will be taken, for if 40 members sign a requisition, a ballot of the whole 4,000 members of the Chamber can be taken. The members of the producing sections have expressed the opinion that it would be a pity if the reorganisation proposals were jettisoned by the merchants' vote, especially as some of the adverse votes may have been registered by members of the Chamber who are not directly interested in the cotton industry.

* * *

The Small "Tramp."—The fact-finding committee concerned with the near-Continental and Russian Trades draw attention in their report to the plight of this section of the industry, which has been more seriously affected by depression, foreign competition and Britain's tariff policy than any of the other branches of shipping. A substantial proportion of this trade is carried by small, handy vessels; these small "tramps" were a valuable asset in 1914-18. As the following table shows, their number has been appreciably reduced since 1913.

BRITAIN'S SMALL VESSELS

(In gross tons)				
Gross Tonnage	December 31, 1913	August 31, 1938	No.	Tonnage
100-1,000 ...	4,405	1,326,000	3,961	1,305,000
1,000-2,500 ...	1,275	2,115,000	724	1,166,000
2,500-4,000 ...	1,480	4,947,000	351	1,138,000

The Committee provides a mass of evidence revealing the decline in the proportion of the trade between Britain and the Continent carried by British vessels. In 1929, the proportion of the net tonnage of vessels entering and clearing United Kingdom ports in our trade with Northern Europe, flying a foreign flag, was 58.2 per cent. and 52.8 per cent. respectively; in 1937 the respective proportions were 69.1 per cent. and 65.3 per cent. Although Britain took nearly one-half of Europe's total exports of timber in 1937, the proportion brought to our shores in British vessels was negligible. The proportions of timber imports from Russia, Finland and Sweden carried by British ships in 1937 were 4.7 per cent. (9.2 per cent. in 1936), 7.4 per cent. (9.5 per cent. in 1936), and 7.1 per cent. (7.6 per cent. in 1936) respectively. Again, the proportion of our coal exports in 1937 carried in British vessels was below 10 per cent. in shipments to Sweden, Norway and Finland, and only 30.6 per cent. and 49.4 per cent. in shipments to Germany and France respectively. Meanwhile, the President of the Board of Trade has received a deputation of shipowners representing the various sections of the trade. He promised to give full consideration to the results of the industry's inquiry and the report, in the knowledge of the importance of the industry and of the need for prompt consideration of its problems.

* * *

Reduction in Crude Oil Output.—So strong is the secular upward trend of oil consumption that the decline in world economic activity between 1937 and 1938 necessitated only a slight reduction in the output of crude oil. According to the estimates recently published by the Petroleum Press Service in a special bulletin (this bulletin contains a number of authoritative articles on various aspects of the oil industry), the world's output of crude oil fell from 281.0 million metric tons in 1937 to 271.4 millions in 1938, a decline of only 3.4 per cent. Last year's output, however, was still 29 per cent. bigger than production in 1929. The geographical incidence of changes in production during the past two years is shown in the following table:—

WORLD CRUDE OIL PRODUCTION

	(Thousand metric tons)		Percentage Change 1937-38
	1937	1938	
U.S.A.	173,734	164,740	- 5.2
U.S.S.R.	28,397	29,300	+ 3.2
Venezuela	27,723	27,740	...
Iran	10,330	10,000	- 3.2
D.E. Indies	7,189	7,300	+ 1.5
Roumania	7,147	6,600	- 7.7
Mexico	6,751	4,800	- 28.9
Iraq	4,314	4,250	- 1.5
Colombia	2,904	2,980	+ 2.6
Trinidad	2,253	2,470	+ 9.6
Argentina	2,282	2,370	+ 3.9
Peru	2,319	2,100	- 9.4
Bahrein	1,016	1,150	+ 8.4
Burma	1,083	1,060	- 2.1
British Borneo	793	895	+ 12.9
Canada	366	940	+ 156.8
Greater Germany	486	625	+ 28.6
Poland	501	507	+ 1.2
British India	298	365	+ 22.5
Japan	368	360	- 2.2
Ecuador	280	290	+ 3.6
Egypt	170	220	+ 29.4
Other countries	226	300	+ 32.7
Total	280,975	271,362	- 3.4

While output in the United States fell by 8,994,000 metric tons between 1937 and 1938, production in the rest of the world showed a decline of only 619,000 tons or 0.6 per cent. The United States remains the most important producer of oil, her share of world production last year

being 61 per cent. Among other countries, the most significant changes were a sharp fall in Mexico, due to the expropriation of foreign oil companies, and proportionately large, if quantitatively small, increases in Canada, Greater Germany, British India and Egypt. But as the world's productive capacity is substantially in excess of consumption, the comparatively small reduction in demand last year was accompanied by a proportionately much greater fall in prices, despite the fact that output was deliberately curtailed in a number of countries. The extent of the decline in prices is shown by the following price indices, calculated by the Petroleum Press Service, on the basis of U.S. dollars:—

AVERAGE EXPORT PRICES, f.o.b. GULF

	(1929 = 100)			
	Motor Spirit (U.S. Motor)	Kerosene (41/43 pr. wk.)	Gas & Diesel Oil (Average of all qualities)	Fuel Oil ("C" Bunker)
1934	51.9	58.0	86.2	122.0
1937	67.6	68.5	99.7	121.7
1938	55.4	59.1	89.5	93.5
Dec., 1938	50.3	55.5	85.4	90.5

The export price of American motor spirit has been halved, and that of kerosene almost halved, between 1929 and the end of 1938. In contrast, the fall in the prices of gas and diesel oil and of fuel oil since 1929 has been much less marked.

* * *

Idle Shipping.—The Chamber of Shipping's returns of the number and tonnage of ships laid-up at ports of Great Britain and Ireland show a slight, mainly seasonal, reduction during the last quarter of 1938:—

SHIPPING TONNAGE LAID-UP AT BRITISH PORTS

	British Vessels		Foreign Vessels	
	No.	Net Tons	No.	Net Tons
January 1, 1938	75	95,377	38	79,256
April 1, "	139	232,802	51	106,523
July 1, "	159	245,299	39	86,705
October 1, "	190	363,252	42	92,415
January 1, 1939	174	342,423	49	109,943

Compared with the figures for the years 1931-34, the volume of idle tonnage remains comparatively small. The shipping tonnage on the United Kingdom register increased by 79,000 gross during the last quarter of 1938. Since the laid-up tonnage declined by 48,000 gross during that period, there must have been an increase of 127,000 gross tons of British vessels in commission. The foreign vessels laid-up at British ports on January 1st, incidentally, included 36 Spanish ships of 73,164 net tons.

* * *

Decline in Rayon Output.—The growth of the rayon industry was checked in 1938, when the production of both filament rayon and staple fibre showed a decline:—

OUTPUT OF RAYON YARN AND STAPLE FIBRE

	(In thousands of lbs.)	
	Filament Rayon	Staple fibre and Rayon Waste
1933	80,039	4,041
1934	88,878	4,236
1935	112,319	11,520
1936	116,811	28,497
1937	119,696	35,116
1938	106,448	33,875

INDUSTRIAL REPORTS

THE flow of new orders to industry has not yet shown much increase. The home demand for coal remains quite good, but export business continues dull. Consumers of iron and steel show no inclination to cover their requirements far ahead. As our Sheffield correspondent puts it, "consumers (of iron),

fully aware that supplies are plentiful, continue a hand-to-mouth buying policy." Activity in the tinplate industry has shown some improvement, but output remains about 30 per cent. below the level of the corresponding period a year ago. Reports from the engineering industry, however, indicate

a slight expansion in new business, commercial as well as military. Business in cotton goods remains depressed, and the industry was disappointed by the failure of the Manchester Chamber of Commerce to give its support to the proposals for an Enabling Bill. Turn-over in rayon was disappointing.

The output of staple fibre has increased more rapidly than that of filament rayon in recent years, and in 1938 the fall in production was proportionately much bigger in filament rayon than in staple fibre. The reduction in the industry's activity last year was due, in a large measure, to the shrinkage in exports which affected all textiles. Thus, exports of tissues made wholly of rayon or staple fibre fell from 38.5 million square yards (valued at £2,028,058) in 1937 to 31.2 million square yards (valued at £1,576,173) in 1938; during the same period shipments of rayon tissues mixed with other fibres declined from 39.5 million square yards (valued at £1,697,910) to 29.5 million square yards (valued at £1,309,372). Moreover, there are no indications of an early improvement in export trade.

* * *

Record Nitrogen Consumption.—The bulk of the world's output of nitrogen is consumed by agriculture as a fertiliser. The British Sulphate of Ammonia Federation's annual estimates of the world's consumption of nitrogen thus provides some indication of changes in the fortunes of agriculture. The accompanying table shows changes in the world's production and consumption of various forms of nitrogen in recent years. The statistics cover the fertiliser year ended in June. As a result of the fall in prices and demand, consumption fell sharply between 1929-30 and 1931-32. Since then, however, consumption has risen without interruption, the figures for 1937-38, a record, showing an increase of 47 per cent. over those for 1929-30. In recent years the increase in agricultural consumption of nitrogen has been accelerated by the policy of self-sufficiency adopted by many countries. It is scarcely surprising, therefore, that the

WORLD PRODUCTION AND CONSUMPTION OF PURE NITROGEN

	(In thousands of metric tons)				
	1929-30	1931-32	1935-36	1936-37	1937-38
Production:—

* Highest figure ever reached.

increase between 1936-37 and 1937-38 was most marked in Germany, Italy and Japan; the figures for the United States and China, on the other hand, show decreases during this period. But if the demand for nitrogen has shown a rapid increase in recent years, the world's productive capacity for synthetic nitrogen has increased even faster. In 1937-38, for example, the world's synthetic nitrogen plants operated at only 53 per cent. of capacity. As a result of the surplus capacity of the industry, production tended to exceed consumption for many years, and prices, consequently, tended to fall. The Chilean nitrate industry was almost put out of business. In 1931-32, however, the tendency to overproduction was arrested and, as the figures show, output and consumption have been brought into equilibrium as a result of the conclusion of international agreements which were recently prolonged for a further period of 3-5 years.

RENT your new factory
BUILT TO YOUR REQUIREMENTS
in the safest
district in England

CAPITAL ASSISTANCE

WEST CUMBERLAND offers you the following exceptional advantages if you select it as a location for your new factory: plentiful labour, skilled and unskilled, male, female and juvenile. Foundries working the purest hæmatite in the Empire, producing pig iron and steel of all grades, and forgings. Manganese deposits in the area. Coal of all grades for engineering. Abundant lime. Water—soft water—in plenty: waterside factory sites. Good ports—good transport facilities. Magnificent country—mild climate—sporting amenities.

ADD TO THESE the unique facilities now offered by the Government. Your factory planned and built for you to your requirements, and rent only (on a non-profit basis) charged. Substantial assistance with capital. Contributions towards Rent, Rates, Income Tax and N.D.C.

Coal

Sheffield.—The pressure for household coal has eased with the milder weather, and supplies are much more readily obtainable. Industrial steam coal is being taken up rather more freely, smalls for electricity works are active, and gas coal moves readily. South Yorkshire and Derbyshire hards are quoted at 18s.-19s. per ton at pits. Rough slacks are around 15s. and nutty slacks 14s. per ton at pits. More interest is being displayed in blast-furnace coke at the new price of 21s. 8d. per ton on rail at ovens for renewal of contracts, this being a reduction of 3s. 4d. per ton on last year's price. Large patent oven coke and graded qualities for industrial and central heating purposes are meeting with a substantial demand.

The export market continues quiet, and competition is keen for any available business. The market in bunkering coal also continues dull.

★

Newcastle - on - Tyne. — Whilst foreign inquiry for North-East coals is disappointing, inland trade is steady, shipments to home ports being brisk. Northumberland steam collieries are comfortably placed, large coals being fully booked for several weeks ahead. The Durham section is steady, but it is noticeable that there is little pressure for supplies for February. Patent oven coke is a quiet market, there being no strong demand from home consumers, and buyers abroad are taking no interest as they have covered their needs.

★

Glasgow.—Stringency in the house coal market remains the chief feature. Owing to the cold weather demand is so heavy that in spite of increased output and the use for domestic purposes of other qualities, supplies are inadequate, and a kind of rationing system is therefore in force. As a result difficulty is found in meeting export needs, and in Fife especially vessels are on occasion being delayed for several days before contract tonnages are secured. Apart from the smaller sizes of nuts in Ayrshire practically nothing is available for new shipping business. Further ahead the export position is somewhat obscure, for while the collieries in Fife are well booked for some time ahead the outlook in the other areas is less assured. Navigation fuel is well taken up, while in Lanarkshire nuts are only just adequate, for the utility undertakings are taking substantial tonnages.

★

Cardiff.—The volume of trade at the South Wales ports shows little change. Transport has been disorganised by the recent gales, and many chartered vessels are overdue. Loadings at the Great Western docks last week were only 351,600 tons, compared with 404,299 tons in the corresponding week last year. Contract business, however, is a little more active. Italy is reported to have placed orders for 500,000 tons of anthracite for delivery during 1939, and small purchases have also been made by the Algiers Electricity Works and the Tunis Tramways; while new inquiries include 350,000 tons for the Brazilian Railways, 10-12,000 tons of sized coals for the Egyptian State Rail-

ways, and 5,000 tons for the Antwerp Electricity Works.

The undertone of the market is steady. Best large steam coals are being regularly absorbed and dry sized grades are scarce and firm, but for ordinary large classes supplies are plentiful, and stocks of steam smalls are exceptionally heavy. Coke prices are a little steadier, but there is no improvement in the patent fuel trade.

★

Workington.—Production of house coal is scarcely adequate, and shipments to Ireland have therefore dropped to between 5,000 tons and 6,000 tons weekly. There is a glut of industrial fuel on account of the short-time working at the coking plants serving the furnaces on hematite pig iron. There are stocks of small coal on the ground. Prices are firm.

Iron and Steel

Sheffield.—The iron market is slow to revive, and the volume of business this week has been limited. There have been a few more inquiries for forge and foundry iron, and buying to cover immediate needs has been on a little better scale. Forward business, however, continues meagre, consumers, fully aware that supplies are plentiful, continuing a hand-to-mouth buying policy. Hematites are somewhat more active, but with a number of contracts still to be liquidated, new business is by no means active. There is no development in bar iron, with the exception of common bars, which are in slightly better demand.

In the steel market the outlook is regarded with confidence, but here again the upswing is slow. Business in basic and acid billets is small, but there is a rather better demand for wire rods and strip. Structural steel requirements are easily met.

There is a strong flow of Government orders to this district, and the heavy branches are booking a fair number of ordinary commercial home and overseas orders. The lighter sections are well employed, and rolling mills on hire work are busier than for some time.

Production of steel ingots and castings showed a heavy drop in December to 93,500 tons, the lowest total for many months. Reports show, however, that output in January is likely to be considerably above this figure.

★

Middlesbrough.—The market continues quiet and so far users of foundry iron are confining their purchases to immediate requirements. As the price is only fixed for an indefinite period, there is no inducement to make forward contracts, and the idea of some of the consumers seems to be that by waiting they may do better. There are twenty-one blast-furnaces in operation in the North-East Coast area, of which eight are producing hematite pig iron, twelve basic iron, and one ferro-manganese. One of the furnaces producing basic iron is changed over at week-ends to the production of foundry iron.

Re-rollers are requiring increased supplies of semi-manufactured steel; whilst manufactured steel departments

are rather busier, with the sheet mills better occupied than for some time.

Heavy steel melting scrap is only being sent in under strict control. There is no change in the position regarding blast-furnace coke, or foreign ore.

★

Glasgow.—Little new business has been placed in the West of Scotland during the present week; the deterioration in international relations hindering the placing of fresh contracts. But there is still much work on hand and in most branches of the industry plant is steadily employed. Steelmakers and sheetmakers are now busily engaged in the production of the steel and sheets required for the household air raid shelters.

★

Cardiff.—Business on the Swansea Metal Exchange was a little more buoyant on Tuesday, and preparations are already in hand to meet the Government requirements for steel sheets for air raid shelters. There has been a slight improvement in the production of tinplates, but it remains about 30 per cent. below the level at the beginning of 1938. The depressed state of exports is mainly responsible for the low rate of output, and shipments last week totalled only 3,540 tons, compared with 5,596 tons in the corresponding week last year. Prices are nominally unchanged.

★

Workington.—No improvement in the North-West Coast hematite pig-iron trade has followed the price reductions. Business is from hand-to-mouth, but what is worse is that users are still refusing delivery of the greater part of the iron they bought towards the end of 1937. Occasionally, too, local absorption ceases, so what were already heavy stocks are becoming more formidable, and nothing short of a substantial improvement can prevent a curtailment of output. Prices are unchanged. Refined iron is not now being smelted because of the lack of demand. Malleable iron, at £7 14s. 6d. per ton, delivered at Birmingham, is a dull trade, and so also is ferro-manganese at £16 15s. per ton, home.

The steel trade is very quiet. Though this is the rail-rolling season, the mills at Workington and Barrow are not in regular employment, and orders do not justify more than two to three weeks' activity in four. Native ore, at 24s. 6d. f.o.t., is in poor request. Sales to the East Coast and Scotland are small.

★

News from Abroad.—Business in steel products on the export markets has remained quiet, many prospective buyers hoping to be able to obtain materials more cheaply at a later date. It is true that the weakness of the pound has to a certain extent upset price relationships, and it is also true that the prices for a few products and for some markets are being adjusted to meet non-Cartel competition. A general downward adjustment of official prices is, however, considered unlikely.

American competition, for instance, was responsible for a reduction in the prices of sections for the Venezuelan market by 5s. per ton, and similar measures have been taken on Far Eastern markets. Lower c.i.f. prices for

South American markets have also been made possible by a further decrease in freight rates. On the Dutch market unofficial rebates have now been authorised by the Comptoirs for thick and medium plates in order to meet American competition. Producers of thick plates for shipbuilding are considering more comprehensive measures against American competition. Thin sheets are also subject to American competition in some markets, but a reduction in Cartel prices is not expected. The question of a price reduction for merchant bars for Empire markets, in connection with the decline in British prices, has recently been discussed in Paris. The formation of an international Cartel for cold-rolled sheets, which was forecast in this column last week, has now been completed.

Inquiries have recently been a little more numerous, showing that consumers' requirements are quite substantial. A moderate turnover has been recorded with South American countries. Negotiations with Scandinavian and Dutch buyers proceed slowly.

Textiles

Cotton (Manchester).—Spinners and manufacturers continued to give out disappointing reports regarding the amount of business done. Now and again producers report rather more price-testing, but business is still being confined to sorting-up lines, and in view of the unsettled European political situation there does not seem to be any likelihood of traders adopting an attitude of anything but extreme caution.

The raw cotton markets remained dull, and only narrow fluctuations have taken place in prices. The report that America is considering calling an international cotton conference to limit world acreage has caused interest, and it may be that South America and some other cotton-growing areas will be in favour of the move, but it remains to be seen what attitude will be taken up by Egypt, India, Russia and China, all important cotton-growing countries. On this point it might be mentioned that seven or eight years ago, when Egypt proposed a world cotton conference with a view to limiting output, the American Government refused to participate. Further confusion has also been caused by the announcement that the total American acreage allotment will be 27,543,000 acres. This seems a peculiar form of crop control, for this season the harvested acreage was 25,346,000 with a production of 12 million bales.

Business in the spinning section remains dull. There has been a slightly better turnover in American coarse counts. Only a restricted business has been done in Egyptian descriptions, while export demand for all qualities has continued depressed.

There is a little more activity in the cloth section, and in one or two quarters there has been a slight improvement in sales. Trade has recently been so depressed that even the slightest improvement is apt to be exaggerated. The business done is still in retail lots for export, and there has been no disposition on the part of shippers to act with freedom. After being quiet for several weeks home demand has improved a little.

Jute (Dundee).—A big change has come over the jute trade during the past fortnight. The price of the fibre has fluctuated wildly in Calcutta, but with a strong tendency, and is now about £2 higher. Imports of raw jute into Calcutta are now reported to be falling off rapidly and there are grave fears that there will not be sufficient jute to satisfy requirements for the current season.

Another item which had a considerable influence in causing the rising tendency was the report that the British Government had placed orders with Calcutta for 220 million yards of hessians for sand-bags for purposes of defence in the East. These could have been bought from Dundee, but it is understood that it is a question of obtaining quick delivery, which Dundee could not give. There are, however, prospects that the present deliveries of 3,000,000 bags per week, which Dundee manufacturers are giving at the present time, will be increased in the near future, as manufacturers have been asked how many additional sand-bags they could supply. Calcutta goods strongly advanced on the news of the sand-bag orders, but profit-taking has led to a relapse in prices.

The raw jute market appears to be entirely in the hands of speculators and their operations are not allowing prices to remain unchanged, even for an hour. The full group of Daisee-2/3 has been up to £22 5s. per ton and back to £21 10s., January/February.

Buyers of jute yarns have bought fairly freely recently at from 2s. 1½d. to 2s. 2½d. for common 8-lb. cops and 2s. 2½d. to 2s. 3½d. for 8-lb. spools, the higher rates being now the lowest possible, while there has been an improvement in business in jute cloth at 2½d. for 10-oz. 40-in. and 2½d. for 8-oz.

★

THE COMMODITY MARKETS

THE slightly firmer tendency of the prices of primary products, noticeable a week ago, has not been maintained. The causes of the weakness of commodity prices are the same as those responsible for the precipitous fall in security prices in New York and in London; they are the deterioration in European political relations and the less encouraging view taken of business prospects in the United States.

The decline in prices, however, has been comparatively small. Thus, Moody's index of the prices of staple commodities in the United States (December 31, 1931 = 100) fell from 143.1 to 142.6 during the week ended last Wednesday. In this country, the prices of wheat and raw sugar were well maintained. Raw cotton is scarcely changed in price on the week, but rubber and non-ferrous metals were all marked down. The outlook remains uncertain.

Metals

Copper.—The price of standard cash closed on Wednesday at £42 5s. per ton, a loss of 16s. 3d. on the week and the lowest level since December 6th last. The cause of the decline, however, was solely the reserve of con-

sumers in view of the uncertain political outlook. The basic position of the copper market has actually improved this week. In the United States the restriction of production has been adopted by all leading producers, and the question of United States exports (which have been well in excess of the quotas in recent months) is at present being discussed between Mr Sengier, managing director of the Union Minière du Haut Katanga, and the leaders of the United States copper industry. Supplies are likely, therefore, to show a contraction within the next few weeks, particularly as the cut in the extra U.S.A. quotas is now beginning to make itself felt in current offerings.

★

Tin.—The tin market also suffered from the political situation and the price of standard cash lost 77s. 6d. to close on Thursday at £209 per ton. The demand was small during the greater part of the week and in particular United States consumers failed to continue their recent purchases. There was, however, no change in the extremely strong statistical position of this market, and the appointment this week of Mr A. Ellinger as assistant manager of the Tin Buffer Pool suggests that in the view of the authorities the time has approached at which the pool will have to supply part of its holdings in order to relieve the shortage of offerings. It is now believed that the pool may start to sell well below the upper limit of £230 in order to accumulate liquid funds with which the effects of possible political crises in tin prices could be averted.

★

Lead and Spelter.—The price of lead lost 3s. 9d. to close at £14 6s. 3d. per ton, while spelter declined by 5s. to close on Wednesday at £13 8s. 9d. per ton. The demand for both metals was small, but supplies were also limited, as holders expect large orders shortly in connection with the intensification of A.R.P. work and in particular with the building of air raid shelters. Whether these orders will be large enough to counterbalance the loss of demand owing to the poor state of general building is doubtful. Consequently the two markets remain vulnerable, particularly as the current output continues to be high.

Grains

A FAIR demand kept the market steady during the past week and wheat prices show little change. The United Kingdom took ten cargoes of Argentine wheat which are presumed to be an addition to Government stocks. Australian exports to India are continuing in spite of the Indian import duty on wheat, and there has also been a good trade in Australian flour to China. The maize market showed some weakness, due to increased offers from the Argentine and the appearance on the futures markets of South African maize; competition from cheap Polish barley has also restricted the demand for maize. There has been a very poor demand for barley and prices of feeding barley have tended to fall.

COMPANY MEETINGS

MIDLAND BANK LIMITED

POSITION AND PROFITS WELL MAINTAINED

DIVIDEND UNCHANGED

THE BANKS AND INTERNATIONAL MONEY MOVEMENTS

GOLD AS AN INSTRUMENT OF MONETARY POLICY

NO ROOM FOR DESPONDENCY: COUNTRY IN STRONGER POSITION THAN EVER

MR R. McKENNA'S ADDRESS

The ordinary general meeting of shareholders of the Midland Bank Limited was held, on the 26th instant, at the head office of the bank, Poultry, London, E.C., the Right Hon. R. McKenna, chairman of the bank, presiding.

The Chairman said: My Lords, Ladies and Gentlemen,—I cannot do otherwise than open my address with an expression of deep sorrow at the death of Mr Hyde. For more than fifty years his exceptional qualities had been devoted to the service of the bank, and it was only last June that he was compelled by continued ill-health to retire from the position of managing director. His career provides an example of the contribution made by native gifts and sterling character to the building up of a great institution, while winning for their possessor the affection of colleagues and the loyal collaboration of assistants. We deeply deplore his death, and I am sure you will all wish to join me in a message of profound sympathy to his family.

We are meeting in surroundings which are new to the majority of those present. For many years before the head office was finally moved to London, our shareholders' meeting was held regularly on bank premises. This year the completion of our new head office building has enabled us to revert to the former practice. I believe the change will be of convenience and comfort to the shareholders, and if so we shall in future assemble annually in this room.

I propose to say something to-day upon a matter which has attracted much comment, the movement of foreign balances and the effect of the movement upon the banks. In common with all other business undertakings, banks felt the decline of trade activity during the first half of last year, but it was not until the autumn that they became affected in a special way by the withdrawal on a large scale of foreign funds, a withdrawal induced by the grave international anxieties at that time.

For the purpose of financing world trade considerable foreign balances are always held with London banks. These, however, are sometimes heavily supplemented for reasons having nothing to do with trade: a change of opinion as to the economic or political stability of this or that country will lead to large transfers from one centre to another. At one time London may be the favoured depository, at another New York. In 1936 and 1937 foreign balances in London were steadily increased, reaching their maximum in the spring of last year. The movement was then reversed as the European political outlook became threatening, and in nine months nearly the whole addition to foreign balances, accumulated over more than two years, had been re-transferred from London to other centres.

EFFECTS OF THE MOVEMENT OF FUNDS

The interesting feature for us in this huge transfer of funds lies in the operations of the Exchange Equalisation Account. During the years when foreigners were increasing their balances in London the Exchange Account prevented a too rapid rise in the exchange value of sterling by continual purchases of gold. Part of the gold was re-sold to the Bank of England, but even so the accumulation by the Exchange Account was very large. When the movement of foreign balances was reversed and heavy sales of sterling over the exchanges took place, the Exchange Account again exercised its function of maintaining a fairly steady day-to-day rate for sterling, and sold gold as readily as it had previously bought it.

To see how the banks were specially affected by the withdrawal of foreign deposits we may follow the course of a typical transaction. When a foreign deposit is withdrawn, the cheque drawn upon the bank is met in the clearing by a claim upon the bank's

balance at the Bank of England. A number of intermediate transactions may then take place in which the money passes through the hands of exchange brokers, bullion dealers and their banks. For the sake of simplicity we may omit these from consideration and, looking only at the conclusion of the various dealings, we find that the money paid out by the bank from its Bank of England balance goes to pay for gold sold by the Exchange Equalisation Account, and is then utilised by the Exchange Account in taking up Treasury bills. Thus at this stage public deposits in the Bank of England are increased by the amount paid for Treasury bills, corresponding to the reduction in bankers' balances arising from the withdrawal of the foreign deposit.

REDUCTION OF CASH RESERVES

It is here that the banks feel the pinch in the reduction of their cash reserves. The money has passed out of the banking stream into the pool of public deposits. Ordinarily, however, the consequent stringency is only temporary and is continually being eased. The Government does not keep an unusually large balance for long; the added amount of its balance is shortly distributed among contractors and others, who have their accounts with the joint stock banks, and in this way the money comes back to the joint stock banks as a deposit and passes once again into bankers' balances in the accounts of the Bank of England. Thus the original cash position of the banks as a whole is in the end made good, and, on the supposition—to which I shall refer later—that they are able to work back to their customary ratios, deposits also will in due course be restored. The only important change will be that a larger proportion of the deposits will be domestic and a smaller proportion foreign.

We may note that the withdrawal of the exceptional foreign deposits accumulated in recent years has not materially diminished the importance of London as a centre for financing world trade. But far more noteworthy is the fact that, contrary to all previous experience, the transfer was effected without any rise in the Bank rate. There was no monetary restriction to aggravate the shrinkage of internal business which was already taking place as the universal falling away of 1938 developed. Although in the autumn interest rates in the money market stiffened, the movement was without effect on the cost of accommodation for business. The abundance of available bank credit was unimpaired, a small decline in advances being due, not to any restrictive policy, but simply to a natural reduction in demand for borrowed money in the uncertain trade outlook.

EXCHANGE EQUALISATION ACCOUNT

Thus we see how with this new and efficient instrument, the Exchange Equalisation Account, in skilful operation there need be no conflict between the measures required to cope with large and irregular exchange movements and the measures required to maintain an internal monetary policy appropriate to the conditions of domestic business and finance. The conduct of the Exchange Account is entrusted to the Bank of England, acting as agent for the Treasury, and the events of last year afforded a valuable test of the working of a managed currency under exceptional and very difficult conditions. I could quote many examples to show how, under the gold standard, external influences caused grave disturbance to internal credit. The vulnerability of the money market to external influences was extreme, and was due mainly to the statutory obligation to maintain the pound sterling at a fixed gold value. To-day the

central bank is no longer under this obligation; there is freedom to allow the rate of exchange to swing more widely and, by judicious purchases or sales of gold as foreign balances increase or diminish, to take the weight of great international movements of funds without affecting internal trade credit.

A more lasting result of the outward flow of foreign funds than its reaction upon the banks is found in the appreciation of the dollar. The first effect of the outflow was to create a demand for dollars which, not being offset by a simultaneous sale of gold, tended to depress sterling in the exchange market. As the outflow continued, the counteracting influence of the gold sales lagged constantly behind, and sterling sank to a lower level. The recent fall of sterling was the reverse of what happened in earlier years, when the inflow of foreign funds, notwithstanding the very large purchases of gold, forced the dollar down, down even to a level at which sterling probably became materially overvalued. Thus, even though in both periods the weight of the transfer was ultimately carried by official dealings in gold, nevertheless under the pressure of the inward flow of foreign funds sterling touched 5.04, while on the outward movement it fell momentarily to 4.62.

THE NEW SYSTEM AND THE OLD

The Exchange Equalisation Account is an essential part of the machinery for regulating monetary conditions. Let me observe, however, that no monetary mechanism can of itself perform the numerous and complicated tasks connected with the control of currency and credit. In internal policy, for instance, it must always be difficult to draw a precise line between the legitimate demands of trade and the illegitimate demands of excessive speculation. Expansion and contraction cannot be regulated by a sort of financial thermostat, acting automatically according to the temperature of the economic body. No automatic system could be devised which would prove sufficiently elastic or adaptable for the purpose.

The new technique of monetary management called into being since 1931 requires for its proper exercise far more knowledge, judgment and skill than were needed in working on the gold standard. There was no room for doubt then as to the action to be taken. If too much gold was leaving the country the Bank rate was put up and credit restricted until gold flowed back. If gold was coming in beyond what was necessary for reserve requirements, the Bank rate was lowered until foreign borrowing checked the inward flow.

The simplicity, the almost automatism, of currency and credit control under the gold standard has been highly praised. But at what cost to trade and industry did the system operate? The Bank rate might have to be raised when internal conditions required not restriction but expansion of credit—as for example last year, when the outflow of gold would have led to severe credit restriction at the very time when confidence was already shaken and enterprise languishing. Seen in retrospect, the pre-war automatism in monetary affairs meant doing nothing until an acute stage of financial weakness had been reached—a stage at which drastic action was inevitable, however damaging its effects might be on industry and trade. But why should the British industrialist and trader pay more for credit, or find credit more difficult to obtain, because foreign capitalists choose to transfer their bank balances from London to New York? To-day human skill and judgment must take the place of automatism. Open market dealings by the Bank of England and the operations of the Exchange Equalisation Account are the modern instruments of control, and after several years' experience we can appreciate how well they have been used. Monetary management on this scale is a new system and therefore in some degree experimental, but we all recognise the readiness of the authorities to profit by experience and the adaptation of methods to changing needs.

GOLD'S ESSENTIAL PART

It must not be overlooked that the departure from the gold standard is by no means the same thing as the abandonment of gold as an instrument of monetary policy. Gold plays and will continue to play an essential part in the exchange relations between countries conducting the bulk of international trade. But for us it no longer plays a governing part. True, our stock of gold is much larger than ever it was in the old days, but the essence of the present system lies not in the amount but in the availability of the stock. The gold lies in the Exchange Equalisation Account and in the Bank of England can be made immediately available, as we have recently seen, for regulating the external value of sterling without necessarily affecting our internal issue of currency. The great achievement of monetary progress since 1931 is the discovery that our domestic business can be protected against extraneous developments with which it has nothing to do and for which it is not responsible,

and that we can expand or contract credit according to internal needs. To this extent at least we have become masters in our own house.

I say "to this extent" because when we consider the prospects of business we have to remember that a good monetary system will facilitate trade but cannot make it. It is akin to cheap and convenient transport, which carries the goods but does not produce them. When world conditions are adverse to trade we cannot escape altogether from the general decline, however efficient our monetary system may be. At the present time, sustained recovery in the United States would be the biggest single factor in a general revival of world trade. There have recently been welcome signs of recovery in that country, but we cannot be certain that it is on a solid foundation until we see a convincing revival of capital investment. New capital construction on a large scale, which is essential for the maintenance of a high level of employment, will be undertaken only when men of business can allow themselves a confident outlook on the future. Confidence breeds enterprise, and enterprise calls for the expenditure of the capital funds representing the accumulation of savings. If, as in America, savings are left idle through fear of loss and are not ventured freely in new enterprise, trade depression sets in and unemployment increases. There is no similar ground for depression in our own country, but we cannot isolate ourselves from depressing factors elsewhere. The most we can say is that the decline here has been less than in many other countries and that our general standard of living has been fully maintained.

TAXATION AND BORROWING

The problem of the proper use to be made of the nation's savings presents at the moment no difficulties for us; it is solved by the fact that the Government has come into the market as a borrower on a large scale. The great additional expenditure on armaments has to be met, and the question of ways and means is gravely exercising the minds of all engaged in commerce and industry, no less than the mind of the Chancellor of the Exchequer. We shall agree that the method we want to see adopted is the one which in the long run will be best for the country. I remember that, when in 1915 it was my lot to go to the Exchequer, one of my first duties was to receive a very important deputation of bankers and merchants of the City of London who came to press upon me the need for an increase of taxation. I was fully in accord with their opinion, and in the autumn of that year introduced a second Budget increasing taxation heavily. I mention this to show that the spirit of sacrifice is not wanting in our people when an emergency clearly confronts them. The willingness to do the right thing is not in question; the problem is how to raise the requisite resources without injury to our total national production.

The choice lies between additional taxation, borrowing, or something of each. If labour to-day were in full employment I should, for my part, unhesitatingly lay the emphasis on taxation. But when there is very considerable unemployment, questions arise which may lead to a different conclusion. New taxation disturbs industry for the time being by reducing the demand for goods of widespread consumption, or at any rate by creating a belief that there will be such a reduction in the near future. Orders are withheld and employment is consequently diminished. In a condition of full employment the labour so displaced might readily be absorbed, but when we have already nearly two million people unemployed we must be careful not to add to their number. The additional expenditure by the Government ought if possible to be so directed as to bring into productive activity men and women who are now out of employment. Taxation will not help in this respect; borrowing, on the other hand, under existing conditions will stimulate employment, and as the demand for labour grows industrialists will be forced ultimately to draw from the pool of unemployed. The limit to this policy is obviously reached when all labour employable at a profit at the current rate of wages is fully engaged, but we are a long way from that condition at the present time.

EFFECT OF GOVERNMENT EXPENDITURE

It may be asked, however: What effect will this huge Government expenditure have on the balance of international payments? Obviously, for a country which produces within its own borders so little of the raw materials required for re-armament, the carrying out of a vast programme such as Great Britain has undertaken must involve an expansion of the volume of imports, against which there is no prospect of countervailing exports. Add to this the laying in of stocks of food and other necessities, and there arises a strong probability that our current income from sales abroad of British goods and services and the yield on our overseas investments may

be insufficient to meet our purchases. A year ago I suggested that the balance of payments is under ordinary conditions a test of whether we are right or wrong in going on with an expansive monetary policy. I expressed some doubt as to the accuracy of previous estimates, but it may well be now that our specially enlarged imports have not been financed out of current income from abroad. Are we then to infer that the time has come when our monetary policy should be reversed, and restrictive financial measures adopted in order to reduce consumption?

I do not think we need contemplate, as an early necessity, any such drastic—and damaging—steps. The temporary enlargement of imports for purposes of defence is a different matter from a growth of imports for immediate consumption. If we are incurring a deficit on our current balance of payments we must, it is true, be drawing on our capital abroad; but so far as we are accumulating stocks we are merely exchanging one kind of asset for another. In any case, we are not drawing on our capital abroad to maintain a standard of living higher than we can afford. If it should become clear that rearmament is causing true inflation, as indicated by over-employment and an all-round rise in costs, it will, I think, be undeniable that restrictive measures have become a matter of urgency. But I see no sign of a near approach to that condition.

From all this I conclude that our monetary system and practice are well fitted to cope with the great demands imposed by national necessities. We are, moreover, far stronger than ever before to face any possibilities of financial disturbance that might arise from developments abroad. We are technically better equipped for management, in which our authorities are achieving by experience a rising standard of skill. Above all, under the guiding hand of the Treasury, a high degree of co-ordination is being attained between the major elements in our monetary system, the Bank of England and the commercial banks.

POSITION AND PROGRESS OF THE BANK

Dealing now with the position of our bank, you must all have been sorry to learn of the resignation from our board of Sir John Anderson, who has been called to serve his country in the Government. We heartily wish him well in his new position, which is of vital importance to national defence. Unhappily, death has removed another of our directors, Mr Darling, who in years gone by had achieved great distinction in a banking career, at home and abroad, but whom ill-health obliged some years ago to refrain from active work. I have also to record, with deep regret, the death of a former managing director, Mr Woolley, who, after serving as a director for several years, retired from the board in 1935. On the other hand, I am happy to say that the board has been strengthened during the past year by the appointment of Mr Arthur Chamberlain, who has a high and, may I say, well deserved reputation as a man of great constructive business ability.

Mr Hyde's withdrawal from active management necessitated a rearrangement of responsibility among the general managers. We may congratulate ourselves that Mr Astbury, whose large experience and qualities as a banker are well known to us all, was available for the principal post. He has been appointed chief general manager, with a seat on the board. Mr Lederer and Mr Sadd—both exceptionally able bankers—have been appointed assistant chief general manager and deputy assistant chief general manager. The directors are united in their confidence that under these arrangements the progress of the bank will be fully maintained and its traditions worthily carried on.

To this end, however, something more than wise and experienced head office management is required; it is essential that this should be supported by faithful, able and well-trained service on the part of managers of departments and branches and every member of the staff. Fortunately, this indispensable condition of strength and progress is present in our bank, and on your behalf I warmly thank all those who contribute, by their loyalty and the high quality of their work, to the fulfilment of our responsibilities to the public. The volume of business is constantly increasing, so that, notwithstanding the extent to which we have introduced machines for a great deal of the work formerly done by hand, our staff is still growing, and to-day numbers 13,600, as compared with 12,900 five years ago.

PROFIT AND LOSS ACCOUNT

I come now to the profit and loss account. The net profit, at £2,446,000, is slightly less than for 1937, but the decline is more than accounted for by the larger provisions required for income tax and National Defence Contribution. There has, in fact, been little change, as between the two years, in the actual earning power of the bank. Adding to the sum I have mentioned the balance brought

forward, we have £3,037,000 for disposal. In view of large provisions in the past and the completion of the head office building, we are appropriating this year the smaller amount of £150,000 to reduction of bank premises account. On the other hand, having regard to the unsettled conditions, which often have serious if temporary effect on values of investments, we think it desirable to make a larger allocation to reserve for future contingencies. To this fund we have set aside £500,000.

The interim dividend of 8 per cent. less tax absorbed £879,000, and if you approve our recommendation of a final dividend at the same rate an equal amount will be required for that purpose. The sum of £628,000 is carried forward. I may point out that the dividends for last year, notwithstanding the unchanged rate, absorb a trifle less than those for 1937; the greater income tax provision this year has slightly more than offset the enlarged effect of the capital increase fifteen months ago.

BALANCE SHEET

Turning to the balance sheet, deposits are £34 millions below the record figure of December, 1937. The decline was concentrated in the last four months of the year, and represented the first stage of the process I described earlier in my address. It is natural that heavy withdrawals of foreign-owned funds from London should be reflected most clearly in the figures of the bank which transacts probably the largest share of the overseas business passing through London. For reasons I have explained, we should ordinarily be justified in regarding the shrinkage in total bank deposits as likely to prove no more than temporary; indeed, the first sign of re-expansion is already apparent in the restoration of cash reserves. You will notice that our cash on December 31st provided a ratio exceeding 11½ per cent. of deposits, whereas on some weekly make-up days within the last four months of the year the ratio was only a little above 10. With cash reserves replenished, therefore, we might reasonably expect a rapid recovery of deposits to the former level; but at present what would ordinarily be regarded as probable is subject to an important qualification. The banks, as I have mentioned on previous occasions, must look not only to the maintenance of a requisite cash ratio, but also to the provision of an adequate supply of supporting liquid assets, particularly bills. If they cannot find sufficient bills to keep up their second line of defence, they must maintain a stronger first line, by working to a higher ratio of cash to deposits.

This is exactly the position at the present time. The banks cannot proceed to a re-expansion of deposits on the restored cash basis, because they cannot acquire the bills they need to ensure fulfilment of their standards of liquidity. Our discounts of trade bills have declined by £9 millions over the year, and, so far from being able to make up a compensating total of Treasury bills, our holding of these has diminished by no less than £24½ millions. The supply of bills—and I speak here of Treasury bills, which provide the great bulk of the total—is determined in the long run by policy in respect of public finance. To illustrate the difficulties we have to contend with, I may mention that our holding of Treasury bills has been subject to an important qualification. The banks, as I have mentioned, have a maximum of £73 millions to a minimum of £27 millions.

In view of the seasonal inflow of taxation, there seems little prospect of a fuller supply of bills becoming available in the early future; hence the re-expansion of deposits may be delayed, even though it appears that the outflow of foreign money may now be coming to an end. On a longer view, however, provided bank cash is maintained at the restored level, and more bills are issued to the market, there is no reason to suppose that the decline in bank deposits as a whole will prove to be more than a passing phase.

ADVANCES

Money at call and short notice stands at about the same figure as a year ago; activity on the Stock Exchange has remained at a low level, and a smaller volume of bills is being carried in the money market, the decline in loans to bill brokers being offset, however, by other short money items. Advances are on balance £1 million higher, but, whereas in the first half of the year they continued to increase, since then trade conditions have led to a diminution of borrowing. I find from the quarterly analysis of our advances that accommodation for industrial and trading purposes reached its peak about May, the subsequent falling off having been more than enough to account for the reduction in advances as a whole. We must regard this movement, therefore, as being associated with the business recession, coupled with the fact that much of the industrial activity arising from the re-armament programme is financed without recourse to bank advances. One thing we can say very definitely; it has certainly been no part of our policy to press for

the repayment of advances, nor has there been any change in the standards by which we judge applications.

Investments are slightly higher, this being the net effect of purchases of short-dated securities earlier in the year, almost wholly offset by sales in the later months with a view to increasing our liquid resources. In conformity with our practice of entering investments in the balance sheet "at or under market value," we have made full provision to cover depreciation.

Our liabilities on behalf of customers show roughly compensatory movements. Acceptances are down by £3 millions, partly due to the shrinkage in the turnover of international trade, and partly to the smaller proportion conducted by the time-honoured method of London acceptance credits. Engagements are unchanged in amount, but the note on the balance sheet gives a figure for forward exchange commitments £4 millions higher on the year. The expansion is mainly in dollar liabilities, resulting from the disturbed conditions in the exchange market.

AFFILIATED INSTITUTIONS

To conclude my observations on the balance sheet, I would make just this reference to our affiliations. Our three related banks in Scotland and Northern Ireland have maintained throughout the year the high standards of strength and liquidity, combined with a full range of service to customers, which are common to them all. The amount of business undertaken by the Midland Bank Executor and Trustee Company increases consistently, necessitating additions to the staff and extended branch representation. Altogether, this company now operates through twenty branches, seventeen of which are in provincial centres.

You would perhaps wish me, before I sit down, to mention the special measures taken to protect the interests of our staff and customers against the physical risks of war. Already, when the crisis of last autumn occurred, our plans were well advanced in several directions. We had arranged for the duplication of ledger balances and other records as an insurance against the difficulties that might arise from destruction. Currency stocks in provincial centres were enlarged, to avoid any local shortage that might have resulted from transport difficulties. A scheme had been elaborated for decentralisation of head office management as far as possible. And for those who would of necessity have had to remain in exposed positions we had made such arrangements for personal protection as were feasible. In all urban branches our staff was organised to deal with the disturbances that might arise within the bank from air raids, and I may add that large numbers of them had volunteered for national service of one kind or another. All the measures evolved are being kept in working order and under constant review, ready to be put into action at short notice if, as we devoutly hope may not be the case, an emergency should arise.

THE OUTLOOK

The business outlook is still overshadowed by international anxieties, but, just as we have experienced sudden turns for the worse in foreign affairs, so we may yet experience an equally sudden change for the better. If this should happily take place there would be little doubt as to the probability of a marked recovery in business during the coming year. Even as things are, I think we may reasonably look for some modest improvement. In external trade, the Anglo-American agreement and the arrangements associated with it mark a big step forward in the direction of a larger volume of free interchange of goods over the greater part of the world. In domestic trade, we are probably far from having felt the full effect of the re-armament programme in stimulating output and employment. On all grounds, there is assuredly no room for despondency; our difficulties are there to be overcome, and a brighter future will reward the exercise of patience, courage and resource in dealing with the problems we are called upon to face.

The report was adopted, other ordinary business was transacted, and the proceedings ended with a vote of thanks to the Chairman.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to:—

THE NATIONAL BANK LIMITED

THE IMPORTANCE OF WORLD TRADE

MR M. J. COOKE'S ADDRESS

The annual general meeting of The National Bank Limited was held on the 26th instant at 13 Old Broad Street, London.

Mr Michael J. Cooke (the chairman), in the course of his speech, said:—It will be seen that our aggregate means are £41,275,000, while the proportion of our liquid assets to our liabilities to the public payable on demand is 56 per cent. We propose to pay the usual dividend at the rate of 12 per cent. per annum, less Income Tax, and we transfer £12,500 in reduction of bank premises account. The sum of £42,457 is carried forward. The number of accounts on our books, both in Ireland and England, continues to increase, and considering the conditions ruling, I am sure you will agree that the results are satisfactory.

The year has been characterised by very important events, both political and economic. The crisis of last September, culminating in the Munich agreement, and later, in the Franco-German non-aggression pact, might have been expected to produce far more detrimental effects than were actually the case. Apart from the cost of preparation for a possible war, and a certain inevitable loss of confidence at the time, which naturally adversely affected the banks, as well as other forms of business activity, it can be said with some justice that confidence is returning and that this country shows signs of determination to proceed, not only with defence measures of a precautionary nature, but also with a policy designed to improve her trade and stabilise her currency. Perhaps nothing but a severe shock such as the crisis could have brought about such a united desire to see these measures reach fulfilment. It should be realised, however, that the crisis, disturbing as it was to political and economic life, is as nothing compared with the consequences which would have followed in the train of war on a large scale.

TWO IMPORTANT AGREEMENTS

The Sino-Japanese and Spanish wars still continue, and, at a time so disturbed by wars and rumours of wars, the two trade agreements signed last year stand out in clear relief—that between England and Eire signed in April, 1938, and that between England and the United States of America signed in November. Nothing during the year has been so beneficial to the understanding between nations, and to the enlargement of the sphere of world trade, than these two Treaties. Trade is vital to all three countries and it is hoped and expected that Eire will benefit by the full working of the agreement with England, and that the textile trades, in particular, of both Great Britain and of Ireland will benefit by the American Treaty. This Treaty is particularly welcome as a first step on the part of a great country towards the relaxation of those restrictions which so hamper the normal course of trade and prevent such a redistribution of the world's goods as would give producers and traders their legitimate reward and prevent the anomaly of "poverty in the midst of plenty."

Considering the unsettled state of Europe in the last few months, the trade position is still good.

In Eire the harvest was the poorest for many years, owing to bad weather, but the cattle trade, on the other hand, showed a distinct improvement, due to the Anglo-Eire Trade Pact. The poor harvest has had one redeeming feature: it has focused attention on the agricultural situation. The Government has set up a Commission to investigate agricultural conditions, which it is hoped will show how agriculture, so essential to Irish economy, can be made once more one of Eire's most prosperous industries. The foreign trade statistics recently published by the Department of Industry and Commerce show that for 1938 imports decreased and exports increased in value compared with 1937, and that the adverse balance of trade was the lowest for some years.

Northern Ireland also had a disappointing harvest, the crops generally being well below the average, and the cattle trade proved unprofitable. The shipbuilding industry was employed on work for the Union Castle, Blue Star and Royal Mail Lines, and there is every reason to believe that the linen trade will benefit by the American Trade Treaty which has come into force this month. Foreign trade has increased, both in imports and exports, while the Commission appointed by the Government to inquire into the co-ordination of road and rail transport proposes measures which it is hoped will help to solve this problem.

In regard to Ireland generally, as you are aware, it is our practice to review the trading position in greater detail at the July meetings in Dublin.

The report was unanimously adopted.

NATIONAL PROVINCIAL BANK LIMITED

SATISFACTORY RESULTS IN DIFFICULT YEAR

DIVIDEND MAINTAINED AT 15 PER CENT.

A LESSON OF THE CRISIS: IMPORTANCE OF LIQUIDITY

HOME AND FOREIGN TRADE CONDITIONS

NEED FOR LESSENING OF BUSINESS RESTRICTIONS

MR COLIN F. CAMPBELL'S ADDRESS

The annual general meeting of the shareholders of the National Provincial Bank, Limited, was held at the head office, 15 Bishops-gate, London, E.C.2, on the 24th instant, for purposes of receiving the report and balance sheet, electing directors and auditors and transacting other ordinary business.

Mr Colin F. Campbell (the Chairman) presided.

Mr R. H. Cutting (the secretary) read the notice convening the meeting and the report of the auditors.

The Chairman said:—My lords, ladies and gentlemen,—During the past year I regret to say that the bank has lost through death three directors, Sir Harcourt Butler, Mr Colin Cooper and Mr Eustace Abel Smith. Sir Harcourt Butler joined the board in 1928 after long and distinguished public service in India and Burma. There were very few days when he was not in attendance at the bank, and his wide experience and commonsense outlook on life were always most helpful when discussing difficult problems. Mr Cooper had been a director for only six years, and with his boundless energy and enterprise we had looked forward to the benefit of his services for many years. Mr Eustace Abel Smith had been a director since the amalgamation with the Union of London and Smiths Bank in 1918, and prior to that he was a director of that bank from 1902. He was in every way a practical banker, and retained a very lively interest in the affairs of the bank both in London and in Lincolnshire where he lived.

The Rt. Hon. the Earl of Cromer and Mr R. D. Trotter have been appointed to the board since we met a year ago, and I have no doubt their appointment will meet with your warm approval. Lord Cromer was, for a period before the War, a managing director of Messrs Baring Brothers and Company, which gave him a close insight into international banking, and he is also a director of several other important companies. Mr Trotter, who is chairman of the Provincial Bank of Ireland, and has been a local director of our bank in London since 1918, has been trained in banking ever since he came down from Cambridge.

THE ACCOUNTS

I will now turn to the statement of accounts for the year ended December 31, 1938. I am pleased to be able to say that our business as represented by the number of accounts opened continues to expand.

Current, deposit and other accounts amount to £310,094,154, which is £10,152,260 lower than the figure quoted in the previous report. This reflects the general tendency of bank deposits to fall, a feature which was in evidence particularly during the last few months of the year. The weekly average of our deposits, on the other hand, was slightly higher than in 1937.

On the assets side, coin, bank notes and balances with the Bank of England stand at £34,320,774, and amount to 11.1 per cent. of our deposits. This large sum, I would remind you, is wholly unproductive—in fact, the movement of notes and coin to meet our customers' requirements costs a large sum annually. Money at call and short notice stands at £17,991,279, and bills discounted at £32,189,714. As would be expected in view of the fall in deposits, these balances are somewhat lower than those of a year ago. The return to the bank on these items continues to be very small. The Treasury bill rate for the year 1938 averaged nearly 12s. 3d. per cent. against 11s. 2d. in 1937. Investments have been reduced in volume during the year. Our policy has been to hold mainly redeemable stocks, a large percentage being short term, though this has involved some sacrifice of income. This course does afford some protection from violent fluctuations, but even short-dated securities are subject to considerable changes in price.

Advances at £139,586,103 show a small decline compared with a year ago, but here as in the case of deposits the weekly average

for the year was in excess of that for 1937. The figure represents 45 per cent. of our deposits as compared with 43.9 per cent. at the end of 1937, and reflects the attitude adopted by the bank towards its customers who may require additional funds for the development of their trade or business. We do our best to support industry in every possible way, and it is very gratifying to receive many assurances that our help through troublous times in the past has resulted in many trading concerns coming through to a period of relative prosperity.

PROFIT AND DIVIDEND

The profit and loss statement discloses a net profit of £1,771,785 as compared with £1,874,959 last year, which, having regard to the difficult times through which we have passed and the demands on us in the way of ever-growing expenses and taxation, is, we think, a satisfactory result. There is an increasing volume of work passing through the banks which entails an addition to expenses for which up to the present we have not been able to obtain adequate remuneration, and I doubt whether it is fully appreciated how greatly the services rendered by the banks have been extended in recent years.

The dividend continues at 15 per cent. as before, and after allocating £100,000 to bank premises and £250,000 to pension fund there remains to be carried forward £573,588, which is practically the same figure as last year.

DOMESTIC AFFAIRS

In taking stock of our position at the end of 1938, the feeling dominant in all minds must be that although ground has been lost in some directions during the year, the position might well have been disastrously worse. We faced the imminent possibility of war, with all its unspeakable horrors, in September, and the arrangements we were called upon to make during the crisis threw a heavy burden upon the management and the staff of the bank, besides involving us in considerable expenditure.

Looking back now on all that took place during that eventful fortnight, it is some consolation to know—and the knowledge should give us confidence for the future—that our great financial institutions can sustain the shock of such a grave crisis, although it should be recognised that so far as the Stock Exchange is concerned, minimum prices were introduced in the gilt-edged market. (Hear, hear.) These happenings clearly indicate that in these uncertain days nothing is more important than that the great banks of this country should continue to maintain a position of liquidity and strength even though this involves sacrifice of earning power.

TRADE FAIRLY WELL MAINTAINED

Domestic trade, according to reports obtained from our branches in all parts of the country, has been fairly well maintained throughout the year. Making allowance for the fall in prices, this impression is confirmed by returns of the Provincial Clearings which, with the exception of Bradford, Liverpool and Manchester, show relatively moderate declines. Further confirmation of a general nature is available in the official index number of the value of retail sales, which shows an appreciable increase in the total figure in spite of a substantial decline in the area figure for Central and West End London.

The Provincial Clearings of Bradford, Liverpool and Manchester, to which I have just referred, show declines of 20.7 per cent., 24.3 per cent., and 15.9 per cent. respectively. The prosperity of these three great centres is largely dependent on the woollen and cotton textile industries, and the deterioration indicated by the above figures is related in some degree to the great contraction of the export trade in textiles.

The position of the Lancashire cotton trade in particular, so far as exports are concerned, is grave, and it is to be hoped that the enabling bill now being considered will have the effect of bringing back a measure of prosperity to that sorely stricken industry.

If I may refer to some of our important industries other than the textile trades, our branches report that the manufacture of finished goods for the home market has been well sustained, and the falling off in exports is largely attributed to international conditions.

IRON AND STEEL

The iron and steel industry, apart from undertakings occupied in the manufacture of special products, has experienced a less satisfactory year. Broadly speaking the great activity of 1937 was carried well into the first half of 1938, but the second half of the year was disappointing. The reasons generally given are the high prices of pig iron and steel and consequent slackening of demand and accumulation of stocks. The recent reduction in the prices of a considerable range of these products is a welcome recognition of the fact that the activity of these basic industries is to a large extent conditioned by the replacement and extension demands of all other industries. It is permissible to hope that the wisdom of this step will be appreciated by other industries whose main outlet lies in the same direction.

Engineering, on the other hand, is more active now than a year ago and re-armament is given as the mainspring of this activity.

SHIPBUILDING

Shipbuilding, generally speaking, has been fairly well occupied in completing contracts, but the outlook is not reassuring. Construction of both large and small vessels on Admiralty account has kept some areas busily employed, but new orders for mercantile craft have been disappointing, although as an exception a contract has just been placed by Turkey for eleven ships.

This well equipped and efficiently managed industry is seriously handicapped by unfair and subsidised foreign competition, and in view of its vital importance to the nation it is to be hoped that early steps may be taken to ensure that it receives a fair share of the construction and repair of merchant vessels.

Shipping has been seriously affected by the decline in the volume of world trade: idle tonnage being now much greater than a year ago.

The scarcity of cargoes has involved a severe fall in freight rates, the average index for 1938 being 126.9, as compared with 175.6 for 1937. In the present state of world affairs it is not possible to regard the deterioration of the position of this great industry as a matter apart from the strategic position of this country, and the movement at present on foot designed to enlist the support of the Government for this industry must command the sympathy of all those who take a broad realistic view of our situation.

OTHER INDUSTRIES

The brick and cement industries report a decline in housing demand, though the output in cement is maintained to some extent through orders on Government account and the erection of works connected with re-armament and national defence.

The position of the coal and coke trades, both of which depend on the metallurgical industries to take a considerable proportion of their total output, has deteriorated to a marked extent.

A measure of the situation facing the coke industry is shown by the number of furnaces in blast. As against an average of 124 in 1937, the number in blast in the first and second half of 1938 average approximately 99 and 80 respectively.

Exports of both coal and coke for 1938 have ruled well below the figures of 1937. Here, however, the decline in activity must be regarded as part of the general reduction in foreign trade. Actually both in output and exports it is likely we have well maintained our share of world production and export trade.

AGRICULTURE

One of our largest industries—agriculture—is in a depressed state, despite the subsidies. Farmers of both arable and pasture land have two main complaints, the price of barley and the price of sheep, both of which are much lower than twelve months ago. Districts where concentration on these two commodities occurs are very depressed. Elsewhere, though other agricultural prices too are lower, the mixed farm seems able to hold its own.

Earlier in the year drought was responsible for a disappointing hay crop, and caused a serious decline in the yield of sugar beet

which was also attacked by the Aphis fly. Bulb and flower farms suffered too from lack of moisture, and fruit crops were poorer. Later crops, notably potatoes and wheat, were good, with the result that prices declined.

There is ample evidence that Government assistance plays a considerable part in deciding what crops or type of stock the farmer invests in. Milk production has engaged the attention of farmers to an increased degree and the swing towards pasturing has also received encouragement from the beef subsidy.

NEW INDUSTRIES

At a time when some of our old-established industries are finding it difficult to maintain their markets, it is well to bear in mind that with the progress of science and the discoveries which are continually brought to light, new industries are being built up which find employment for a considerable volume of labour. Among these industries the cinema world occupies a foremost place.

It may not be realised that the box office receipts can fairly be estimated at £50 millions per annum gross, of which £5/6,000,000 passes to the Revenue by way of Entertainments Tax, nor is it realised that the admissions to cinemas amount probably to 23 millions in a week or, say, 1,200 millions in a year.

Films are produced to meet the tastes of every class in the community and the development of educational films is one which it is hoped may receive increased attention. There is no doubt that much good can result from showing pictures which draw attention to the beauties of Great Britain as a country and extend knowledge of its trades and industries.

Last but not least, in this industry alone it can be stated that from the point of view of labour, direct employment is given to not less than 200,000 people, while indirectly employment is given to a much larger number. I think it may be taken as a matter for satisfaction that this bank has been able to play an important part in the development of this new form of entertainment and education.

UNEMPLOYMENT FIGURES

I cannot pass by the domestic situation without reference to the unemployment figures. These, unfortunately, have been a good deal higher in 1938 than the average of 1937, and as far as gross figures go, we are in about the same position as we were in the summer of 1936. Of the additional unemployed, one group of industries—textiles (mainly cotton and wool)—accounts for an unduly large share. It seems to be certain that as consumption in the home market has been fairly well maintained the increase in unemployment over this period must be mainly attributable to the contraction in our foreign trade.

FOREIGN TRADE

It is sometimes pointed out that the volume of our domestic trade is much greater than that of the export trade, and the inference is drawn that more attention should be paid to developing the home market. Without in any way minimising the importance of the home market, it must be said that this idea is superficially as attractive as it is inaccurate, particularly when conditions in overseas trading are as difficult as they are at present. A vigorous and flourishing export trade is, in the case of this country, a condition of the very existence of domestic trade. Any appreciable contraction of the volume of our foreign trade must reduce general prosperity and be reflected sooner or later in a decline in the general standard of living.

The difficulties which face exporters are not peculiar to this country. The volume of world trade has not yet regained the level of 1929 and present international competition is confined to a field not only smaller than in pre-slump years, but one which should, because of the increase of populations of most countries during the last ten years or so, have expanded well beyond the 1929 level. The real task which confronts the great trading nations is not that of seeking to increase individual shares of a restricted market, but to do away with the impediments and restrictions which still limit the total volume of international trade. If we may be guided by the League of Nations latest published analysis of the quantum of world trade, the United Kingdom has more or less held its proportionate share over the last nine years.

INEQUITABLE COMPETITION

Although we still maintain our share of world trade, we cannot ignore the existence of practices, new to the conduct of international commercial affairs, which distort normal economic channels of

trade and may eventually inflict lasting damage upon our export industries.

In times of difficulty, like the present, there may be a disposition to over-rate the permanence of what appears to us to be inequitable competition. Subsidising exports can only in the long run impoverish the nation pursuing such a policy and there is also evidence that some countries which have entered into bulk export and import bargains are finding actual business much less attractive than seemed likely to be the case.

NEED FOR CONCERTED ACTION

None the less, although there is some reason to think that inequitable and subsidised competition is not likely to be permanent, we must, in view of the paramount importance of our export trade, be prepared by concerted action of industries concerned, together with Government support, to meet such competition, and it is satisfactory to know that discussions have already taken place with this end in view.

The special attention which is being devoted to the revival of British export trade by both the Association of British Chambers of Commerce and the Federation of British Industries is a matter of supreme importance.

The knowledge that our leading industrialists are placing their unrivalled experience at the disposal of these representative bodies is a factor that cannot be over-estimated.

THE EXCHANGES

When considering the causes which have brought about the reduction of our foreign trade over the past year, it cannot be doubted that over-valuation of the pound played some part. This factor has probably been more or less adjusted at the present exchange level, but human affairs are proverbially uncertain, and irregular fluctuations in the real worth of independent currencies are to be expected. Our task is to endeavour to curb and compensate them whilst recognising that we cannot abolish them. Reasons connected with the crisis of 1931 led to a policy of low money rates inside the country and left disparities between the external and internal values of the pound to be manifested in fluctuating exchanges. The responsibilities placed upon the management of the Exchange Equalisation Account were given by the Chancellor of the Exchequer when he said that the object of the Exchange Equalisation Account was to make the exchanges more steady and to aim at restraining undue oscillations.

To carry out this function is not so simple as to state it, for it implies an unerring diagnosis of the causes of unusual pressure on the exchanges. It implies an immediate recognition of an over-valuation or an under-valuation of the pound. It implies exact knowledge of the nature of an over-valuation or under-valuation—whether it is likely to be temporary or long-lived. And it also implies, having regard to the International Currency Agreement, the acquiescence of other nations in such correctives as our own authorities may think desirable. The task of those who "manage" our money is thus, from the external point of view, a formidable one.

The huge amount of gold which the Exchange Equalisation Account accumulated over a period of years has enabled the authorities to deal satisfactorily with the withdrawal of the large quantities of floating funds which have left this country in recent months.

DEALINGS IN FORWARD EXCHANGE

It is important, however, that the operations of irresponsible parties should be reduced to a minimum. An unnecessary element of uncertainty is introduced through their operations on the "forward" market. Dealings in forward exchange are essential in modern times, more particularly for those who are engaged in the movement of produce, but dealings by those whose only object is to make a turn on the market should be discouraged. It should be borne in mind that abuse of facilities offered by free markets has led elsewhere to restrictions not only detrimental to the Exchange market, but much more harmful to traders and others who rely on its efficiency.

It is gratifying to note that, notwithstanding the embargo on long-term borrowing recently imposed, several medium-term foreign credits have been arranged, under the authority of Government, which have secured for the benefit of the country valuable export orders. It is to be hoped that the increased facilities recently proposed for the Exports Credit Guarantee Department will have the effect of extending still further our trade on credit terms which are not unduly long.

U.S.A. AGREEMENT

The Anglo-American Trade Agreement is a matter of the utmost importance and we are justified in believing that it will have a far-reaching effect of the most favourable kind on the trade relations between the two countries and, indeed, with the British Empire, especially as traders can now take a three-year view of conditions. Article 18, relating to currency fluctuations, is one that is worthy of particular notice in view of its fundamental importance. It is true that such an article is not unique in the history of our trade agreements for something similar is to be found in the Anglo-French Treaty of 1934, but its very existence is evidence that the contracting parties do not intend to allow extraneous matters, over which neither of them have complete control, to vitiate a valuable agreement which is the outcome of prolonged discussion and exchange of experience.

THE OUTLOOK

When we come to consider the future course of world trade, we are compelled to adopt a short-term view in face of international uncertainties with which we are surrounded. Given normal conditions, the guiding factors are price tendencies, stocks of goods for consumption, and general demand.

The course of both wholesale and retail prices during the past twelve months would seem to indicate that both have reacted to an extent that justifies us in thinking that prices are now on a much firmer basis.

The contraction of demand of the United States in world markets was a most important factor in the fall and prolonged weakness of a large number of commodity prices, and it is reasonable to expect that a sustained resumption of activity in that great country would tend to strengthen world prices and restore confidence to the primary producing areas. There has already been a marked recovery in the United States which I hope may gather strength, founded as it is on a broad basis of expenditure on capital goods. It is true that some time will have to elapse before the spending programme will be in full operation and that immediate progress may be slow, but in the end it is permissible to take a hopeful view of the course of U.S.A. development.

Stocks of consumption goods, which both in the United States and this country showed a rising tendency for the most part during 1937, have now been substantially reduced according to official figures.

Thus on the score of prices and stocks there is justification for the view that the situation at present is more healthy than it was a year or so ago when prices were still falling and stocks were accumulating.

REARMAMENT EXPENDITURE

A further consideration which cannot be ignored when looking into the future is the enormous expenditure to which the country is committed in connection with rearmament. I am not thinking so much of the provision of the money required, for this can be provided without excessive strain, more especially in view of the fact that the people of this country have expressed themselves quite clearly that it is their wish that the country should be strong enough to resist all eventualities. What I have in mind is the economical outlay of the money so provided. We need both assurance and confidence that waste and extravagance are being carefully watched so that the final result will prove to have been good value for the money expended.

When all has been said regarding future prospects, we are still left with the over-riding consideration of international political factors. Both in Spain and in China, war drags on its miserable course. Apart altogether from the direct cost in human suffering, both disputes inflict untold injury and loss over a wide area. The war in the Far East in particular has this year developed to the serious detriment of the trade of not only this country but of all countries whose normal trade and prosperity are bound up with that of China. What the future has in store for that vast country no one can foresee, but the powers of recovery of the Chinese are proverbial and I believe that in the end there will be once again a substantial trade passing between that country and Great Britain.

When we look nearer home and think of the series of shocks and crises to which the world in general was exposed in 1938, it is too much to hope that the desire for peace—so strong in this country—which has been increasingly made manifest by the plain men and women living in the great and powerful countries in Europe will prevail over all other considerations, and that both they and ourselves will be enabled to live our lives and to carry on our daily duties this year without the spectre of war being ever before us. (Applause.)

I now beg to move:—"That the report and accounts, as presented, be received and adopted."

Captain E. C. Eric Smith, M.C. (a Deputy-Chairman), seconded the motion, and, the Chairman having replied to shareholders' remarks, it was carried unanimously.

The chairman then proposed the re-election of Mr George Finch Hotblack, Sir Alfred Edward Lewis, K.B.E., Sir Austin Low, C.I.E., and the Right Hon. Lord Riverdale, K.B.E., the Right Hon. The Earl of Cromer, P.C., G.C.B., G.C.I.E., G.C.V.O., and Mr Richard Durant Trotter, as Directors.

Captain Smith seconded the motion, and it was unanimously adopted.

On the proposition of Mr Dudley H. Illingworth, seconded by Mr John Cadogan, Sir Nicholas Edwin Waterhouse, K.B.E. (of Messrs Price, Waterhouse & Co.), and Sir William Henry Peat, K.B.E. (of Messrs Peat, Marwick, Mitchell & Co.), were re-appointed auditors for the current year.

VOTE OF THANKS

Mr John B. Braithwaite moved a vote of thanks to the Directors, General Managers, Branch Managers, and other Officers of the Bank for their efficient management and services.

Mr J. Scovell Adams seconded the vote, which was cordially passed, and brief acknowledgments were made by the Chairman and by Mr Ernest Cornwall (Chief General Manager).

A vote of thanks to Mr Colin Campbell for his able conduct in the chair, proposed by Mr Theodore Goddard and seconded by Mr H. Carron Scrimgeour, concluded the proceedings.

THE UNION DISCOUNT COMPANY OF LONDON, LIMITED

POSITION STRONGER THAN EVER

SIR WILLIAM GOSCHEN'S REVIEW

The eighty-first ordinary general meeting of the shareholders of the Union Discount Company of London, Limited, was held, on the 26th instant, at the offices of the Company, 39 Cornhill, London, E.C.3.

The Hon. Sir William H. Goschen, K.B.E., the chairman, presided.

The Secretary (Mr C. W. Holliday), having read the notice convening the meeting and the auditors' report,

The Chairman said: Gentlemen, I presume you will take the report as read. (Agreed.)

It has been my custom for many years before I address you once again on the outlook—domestic and international—to refer to what I said to you a year ago and compare that with what has happened since.

I mentioned then the adoption of policies of national finance with all their restrictive effects as opposed to international finance, which policies have not since been altered, and though the Anglo-American Trade Treaty has been signed it will be some time yet before its results on world trade can be measured with precision.

CATASTROPHIC FALL IN COMMODITY PRICES

It is true that the 1937 catastrophic fall in the price of raw materials has not gone much further—except in the case of wheat, which has fallen from 7s. 3d. to 4s. 6d., a percentage fall of 38 per cent. since the beginning of 1938.

The failure of raw materials generally during 1938 to make some important recovery has been a disappointing factor to an exporting country like our own, and while we do not desire to pay too high a price for wheat, of which we import relatively more than any other Great Power, moderate prices for commodities would suit both sellers and buyers better, as the extent of our industrial exports depends on the producers of primary commodities obtaining a margin of profit on their sales to us in order that they can buy their imports from us and make such exchanges of goods mutually beneficial.

The Government's policy of cheap money has not been changed and so long as the U.S.A. retains the monopolistic position she does as the world's greatest holder and magnet for gold, it is difficult to see how any reversion to a dear money policy can be advantageous in any way to a country which has never-ending increases of National Debt.

DANGERS OF POLITICAL SUSPICION

Last year I emphasised the fact that political suspicion was one of the greatest dangers this country had to face, and it is due to the fact that we had a Prime Minister in power last September possessing all the qualities of character, vision and goodwill in accord with the traditions of our race that war was averted.

That was one of the fortunate happenings of 1938 and another was, I believe, the great reduction of the excessively large foreign balances which had accumulated in London for some years through anti-social and anti-national flights of currency from one country to another. Surely France's repatriation of much of her large London balances is a gain to her as well as to us, her ally, with only a temporary period of inconvenience to ourselves.

Keeping this in mind when making comparisons of total figures of balance sheets, one would naturally expect to find 1938 to be a year of contraction, especially in view of the fact that the deposits of the Big Five alone show a reduction of £80 millions, and the issues by tender of Treasury bills were reduced during the year by £148 millions from £622 millions at January 1, 1938, to £474 millions at the end of December of that year.

REBATE

When discount and money rates are very high, the total under this heading must be very high also, for example, in 1927, our amount of rebate was almost £800,000. This does not mean that the margin of hidden reserves behind these large figures is necessarily very great. In recent years when discount rates have been mainly between $\frac{1}{2}$ per cent. and $\frac{3}{4}$ per cent., the rebate itself at such low rates must inevitably be small.

For some years, you will have observed that the rebate total in our balance sheet has not varied very much, and that its former description as "rebate" has been changed to "rebate provision and reserve." Any rise in the rate of discount, especially from a bed-rock present level round about $\frac{1}{2}$ per cent. means a loss—in fact, no discount profits can be made on a rise in bill rates before the loss relating to all bills in stock at lower rates is first offset by the profits on purchases at the higher rates.

AMORTISATION

Our company has been a pioneer, so to speak, as large holders of short-term securities, in the discount market. We have recognised all along the essential differences that exist between the holding of short-term securities and bills of exchange, especially when short terms carry high nominal rates of interest, say, from $4\frac{1}{2}$ per cent. to 6 per cent., which means that the premiums to be amortised annually must be high and the current yields obtainable, much below the nominal interest rates. It has to be remembered, too, that the technique of amortisation in dealing with bonds of this class can only be known through experience, as the risks of under-amortisation are not obvious, nor are the effects of under-amortisation on future earnings generally understood. Further, the capital loss on bonds of this class in times of crisis is likely to be much greater for the same reasons. So it is wise, for amortisation purposes, to assume an earlier date of maturity and have provision for amortisation completed before the actual due date, if one is to be on the safe side.

The gross profits for the year, after making provision for rebate, contingency and taxation, including N.D.C., amount to £336,835 against £326,276 last year. Directors' fees and current expenses £75,677 against £75,738. We have paid an interim dividend amounting to £74,766, and have placed £15,000 to staff provident fund, and we now ask you to approve the payment of a final dividend of £124,609, carrying forward £250,047 against £203,264 last year.

POSITION OF DISCOUNT MARKET

The financial Press has lately been full of articles implying that the discount market as a whole was on the down grade. Well, that is not true of all its members, and you will be pleased to hear that our Company is stronger to-day than it ever was at any previous time in its history.

I now beg to move that the report of the directors and accounts for the year ending December 31, 1938, be received and adopted, that £15,000 be placed to the staff provident fund and that a final dividend for the half-year of 1s. 3d. per £1 unit stock, less income tax, be declared, payable on and after the 28th instant.

Mr A. Louis Allen seconded the resolution, which was carried unanimously.

The retiring directors, the Hon. Sir William H. Goschen, K.B.E., and Mr Robert Holland-Martin, C.B., were re-elected, and the auditors, Messrs Deloitte, Plender, Griffiths and Co., and Messrs Turquand, Youngs, McAuliffe and Company, were re-appointed.

A cordial vote of thanks to the chairman, directors and staff concluded the proceedings.

WESTMINSTER BANK LIMITED

PROFIT SATISFACTORY IN VIEW OF PAST YEAR'S EVENTS

A STATE OF "MODERATED ACTIVITY"

CONTRACTION OF OVERSEAS TRADE: PROBLEM OF RETAINING MARKETS

EFFECTS OF POLITICAL MANŒUVRES AND NATIONAL EXPEDIENCY

TOTALITARIAN NATIONS DEVELOPING NEW METHODS

THE HON. RUPERT E. BECKETT'S ADDRESS

The annual general meeting of the Westminster Bank Limited was held, on the 25th instant, at the head office, 41, Lothbury, London, E.C.2, the Hon. Rupert E. Beckett (chairman of the bank) presiding.

The secretary (Mr J. H. Arnold) having read the notice convening the meeting and the report of the auditors, and the directors' report, the balance sheet and the profit and loss account having been taken as read,

The Chairman said: My Lords, Ladies and Gentlemen,—The only change that I have to report in your directorate is that Lord Runciman has resigned his seat on the board. This is due, of course, to his having again taken office under the Government. His colleagues much regret the loss of his valuable services to the bank.

It is fitting that I should make some reference to our past secretary, Mr Frederick Mytton, who retired in February last year after no less than forty-seven years' service in the bank. He gave of his best in whatever post he occupied, and for the eighteen years during which he was our secretary, his ability, tact and discretion earned him the good will and respect of all with whom he came into contact.

BALANCE SHEET

There are some points in our balance sheet to which I will draw your attention. The total of our current, deposit and other accounts as compared with the figures for 1937 shows a drop of over £22 millions. This, however, must not be taken as representing a diminution of that amount during the whole year. As a matter of fact our average for the past twelve months shows a materially higher figure. It is fortuitous that at December 31st last the showing was as disclosed in the balance sheet. The big movements in deposits have occurred in those offices where such variations are to be expected. They have arisen out of the abnormal conditions which prevailed during the past year, and have naturally included the loss of foreign deposits in sterling. Our provincial branches have not been affected in the same manner; their deposits have been well maintained, and the fluctuations that have occurred have been no more than the ebb and flow ordinarily expected in banking business.

When making my address to you last year I was able to announce a satisfactory increase in our advances to customers and other accounts during 1937 by some £11 millions. This increase—as indeed was to be expected—has not continued, and the amount of our advances shows on the year a decrease slightly in excess of £2,300,000. One regrets, naturally, to see any contraction in this, the most profitable item in our accounts, but the fact that so many industries are engaged on Government work, and that there has been a slowing-up of general trade, is sufficient to account for the change in the situation.

As regards our premises, we have undertaken no building operations of magnitude during the past year. I can report the satisfactory completion and occupation of our premises at the junction of Old Broad Street and Threadneedle Street as the headquarters of our trustee and executor department. The building gives general satisfaction, I think, to our clients and certainly to our own officers. If there is a criticism, it is that owing to the shape of the building it will be difficult to find means for the expansion which sooner or later a trustee department seems inevitably to entail. I will mention here that we are opening in Bournemouth another branch bank, to include a trustee department. We hope that this will be ready for business about the end of next month, and judging by our experience in other centres, we anticipate that this extension

of our trustee and executor department will be extensively used and appreciated.

PROFIT AND LOSS ACCOUNT

I now come to the results of the past year's trading. The profit for the year amounts to £1,557,161. This enables us to declare the same dividends, amounting for the year to 18 per cent. on the partly-paid shares and to 12½ per cent. on the fully-paid shares. I seem to hear a still small voice murmuring a regret that it has not been possible to repeat the bonus of last year, but I would point out that this is only in accordance with my warning that such bonus was on no account to be taken as an anticipation of similar benefits in years to come. Considering the events of 1938 as a whole, the crisis that supervened in autumn, the diminution of world trade, and the lessened resources at our disposal, I hold the opinion that the profit declared is satisfactory, and in conformity with what might be reasonably expected. It enables us to maintain the allocation of £300,000 to the officers' pension fund, a most necessary item, to place £100,000 in reduction of premises account, reducing last year's balance sheet figure by £35,000, and to carry forward £526,000, against £496,000 brought in.

Our affiliation in Ireland, the Ulster Bank, shows a slight diminution in profit, but has been able to make the usual allocations and to pay the same dividend to the parent bank. Those in charge of our auxiliary, the Westminster Foreign Bank, are to be congratulated in that the bank earned a fair profit, and has been maintained in the state of liquidity appropriate to the changes and chances that confront it from time to time.

THE ECONOMIC SITUATION

In my address to you at our last annual meeting, I summarised our economic history in 1937 as one of continued progress during the greater part of the year, succeeded by a slight but perceptible pause in the closing months. In the early part of last year, this pause developed into a definite recession, with a decline of considerable rapidity in some spheres. Fears were widely entertained that we were on the downward path to severe depression. And indeed, as events unfolded, there was some justification for such fears, especially as the economic influences tending towards recession were rendered more formidable by the acute political tension. Again a stage was reached, however, though at a lower level, when little perceptible change was visible, and for more than half a year business as a whole neither advanced nor receded. It is in this state of moderated activity that we still find ourselves to-day.

Of the statistical evidence that could be adduced, I need quote only a few of the most representative items. For more than five years the Board of Trade's index of production, allowing for seasonal variations, had moved consistently upwards, but last year a decline was registered, and the average for the first three quarters was 6 per cent. lower than in 1937. The composite index of business activity published by *The Economist* averages 112 (1935 = 100) for 1937, and 104½ for the first eleven months of 1938; an eight-months' period of almost uninterrupted decline came to an end last May, and since then there has been no pronounced change. The trend of unemployment figures was also indicative of the state of inertia which succeeded the first abrupt setback. A sharp increase, adding 420,000 to the total of unemployed, occurred between October, 1937, and January, 1938, but since then the monthly fluctuations have produced no decisive movement either up or down. The numbers of those in employment, though also varying month by month, showed little change in the latest total from that of a year ago.

TEXTILE INDUSTRIES

The fortunes of individual industries were largely conditioned by the degree of their dependence upon exports, and although a falling-off in home trade was seen in some directions, it was in overseas trade that deterioration was most severe. The textile industries were among the worst hit, and exports of cotton and woollen and worsted goods were about 25-30 per cent. less in volume than in 1937. The cotton trade suffered from a temporary boycott in West Africa, its second most important market for piece-goods, and from unfavourable developments in certain other outlets.

Some indication of the retrogression of the trade in the past two years is afforded by the fact that, after the elimination of over 4½ million spindles, the excess capacity is greater to-day than it was when the process was begun. Preparation of the Cotton Industry Enabling Bill, by the enactment of which it is hoped to secure much-needed internal improvements, makes slow headway. The trade's proposals are now under consideration by the various sections of the industry, and it remains to be seen whether sufficient unanimity can be secured to warrant the next step of incorporating the proposals in a Bill for parliamentary consideration.

In the wool textile industry, raw material values were on a lower and steadier basis during the year, but the disturbance of overseas markets greatly impeded progress, and the home demand showed no compensating increase. A large carry-over of contracts effected at previous higher rates was a hindrance during part of the year, but with these dear contracts now out of the way, business prospects are somewhat brighter. The rayon trade experienced a very moderate demand for its products, but there was a slight improvement towards the end of the year.

COAL, STEEL AND SHIPBUILDING

For the first time since recovery from the general depression, production in the coal industry and in the iron and steel industry was last year less than in the preceding year. At home, coal consumption was well maintained, but exports were 11 per cent. below those in 1937, the fall being due principally to the exceptional competition of countries which were content to disregard price considerations. The total production of coal, at 229 million tons, was also lower, by approximately 11½ million tons. It is of interest to note that, as recently as 1929, our exports of coal represented over 80 per cent., measured by volume, of our total exports, and it is satisfactory to know that both the Government and the industry itself have specially emphasised their recognition of the vital importance of this trade and their determination to do all that is possible to maintain it.

The output of steel, at 10,394,000 tons, was 2,590,000 tons (or 20 per cent.) less than in 1937. The decline became apparent in the second and third quarters of the year, and some recovery occurred in the fourth quarter. This late recovery would probably have been greater, had not buyers been anticipating price reductions at the year end, which have now been announced. At 6,763,000 tons, pig-iron production showed a fall of 1,731,000 tons, or 20 per cent., partly as the result of the smaller requirements of the steel industry, but also on account of the gradual substitution of steel for iron in the manufacture of articles of everyday use. Engineering, which had been fairly flourishing, became somewhat less active in the closing months of last year, but certain important branches remained busy. The building-up of the country's defences has given rise to a large volume of work for many sections of the industry. Engineering was one of the few major industries able to improve on its export figures for the previous year. Shipbuilding slipped further into depression, with private orders dwindling almost to vanishing point. Admiralty work was thus a very welcome support, but a great many yards remain bare of orders. Throughout the year, it was difficult to secure employment for vessels, and freight markets, after a great upward bound in 1937, followed an irregular course, at a considerably lower level, rates being on an average 28 per cent. below those ruling in 1937.

The year was a disappointing one for agriculture, with few favourable developments to offset many adverse features. Large losses were incurred through considerable falls in the prices of livestock, and although crops were good, with that of wheat exceptionally large, the marketing of them produced poor returns. Whilst tribute may be paid to the Government for its efforts in various ways to assist agriculture, there is still much to be accomplished, not least in order to secure the maximum production of home-grown produce, as a measure of defence.

SHRINKAGE OF WORLD TRADE

This country has inevitably been a heavy sufferer from the shrinkage of world trade, though our import and export trade has

sustained a somewhat smaller reduction than that of the world as a whole. Thus, while the value of world trade in the first ten months of 1938 fell by 13 per cent., that of our own fell by 8 per cent. The economic evolution of the world has considerably diminished the demands of other countries for many of our products, while not sensibly lessening our dependence upon imports. It is true that a marked expansion of our home trade in recent years has enabled us not only to maintain but to increase substantially our total production. But this is a process which cannot be continued indefinitely even by those countries most favourably endowed by nature; and for us, who have relatively few indigenous products, home trade can never take the place of export trade, because we must buy abroad, and in order to buy we must sell.

The contraction of our overseas trade last year was accompanied by an important change in its balance. The reduction in imports having been greater than that in exports, the gap between the two narrowed—by £43 millions. To bridge this gap, we look to our invisible exports, arising mainly from our shipping, banking, insurance, and kindred services, and income from overseas investments; and unfortunately there is no room for doubt that these will themselves have suffered considerable reduction through the diminished activity of international trade.

There is thus every probability that our income from exports and from these other items will have failed to cover payment for our imports by a margin not greatly different from that of the previous year, which according to the estimates of the Board of Trade was £52 millions. For three years in succession, our overseas trading has resulted in deficits of substantial dimensions, and even though these deficits have arisen partly out of abnormally large and essential imports for re-armament purposes, which, of course, produce no compensating exports, they give legitimate cause for concern. We cannot go on indefinitely buying more than we can pay for without making inroads upon the capital accumulations of past years, and to rectify this position, as most of our imports cannot be excluded to any significant extent, it is vitally necessary to expand our exports.

EFFECT ON STERLING

The heavy excess of imports over exports would inevitably have imposed a considerable strain upon sterling in the foreign exchange market, even in more tranquil times. In this era of sudden alarms and upheavals, fears for the safety and stability of currencies have been frequent and widespread, and fugitive capital has moved very freely from one financial centre to another. Sterling, because of its unique position, has had to bear the brunt of these movements, and in view of the magnitude of the disturbances, especially during the past year, it was hardly to be expected that our currency would come through unscathed. In January last, the £ sterling had an average value of \$5.00. It moved upwards in February, but thereafter fell away steadily month by month. The September crisis caused a precipitate fall to \$4.60, and although a partial recovery followed, the rate at the close of the year was only \$4.65. The Exchange Equalisation Fund has proved its worth as a defensive weapon. Without the assistance of this great buttress to our exchange, it would have been impossible to withstand onslaughts on the unprecedented scale recently experienced.

BRITISH TRADE JEOPARDIZED

The past year has seen certain developments which have not only intensified existing trading difficulties but created others, and the problem of retaining some of our old markets is becoming as difficult as that of finding new ones. Our trade with certain countries which owe their development largely to British capital investment in the past is threatened with extinction. The "open door" in China has been closed, and promises to be bolted and barred; in Mexico, the arbitrary expropriations of the Government have created a very unfavourable impression, and prejudice our exporters in future trade enterprise with that country. In many other countries where British interests were well established, particularly in South-Eastern Europe and South America, they have been seriously jeopardized by the intrusion of political considerations and influences into the economic sphere.

Fair competition British traders can meet, but to-day the destination of business is frequently decided not by competitive efficiency but by political manœuvres and considerations of national expediency. A new, and more subtle, form of trading has come into vogue, in which one country undertakes to absorb another's output of a particular crop or material. A primary producing country naturally finds the prospect of securing an assured market for its products an alluring one, but in practice the interchange has

proved to have considerable drawbacks. The dominant partner in the agreement, whilst itself receiving much-needed raw materials, has been able to dump inferior or unwanted goods on the other. In addition, the latter has found itself deprived of the foreign exchange that would have accrued if its goods had been sold through normal channels. But these are the lesser evils. Far more important is the sacrifice of freedom of action by the smaller country, bringing it under a sort of economic hegemony, which may eventually lead to a political hegemony.

NEW METHODS

In the development of these new trading methods, the totalitarian nations have displayed remarkable ingenuity, and they have made full use of the advantages derived from their system of government, whereby the whole resources of the State can be marshalled behind its traders. To all intents and purposes, the State is the only seller and the only buyer; the State is a manufacturer in bulk, paying wages fixed by itself; capital and labour can be transferred without a moment's delay from one part of the economic organisation to another; rapid decisions can be made without the necessity for consultation among all the parties concerned; and if the interests of the State as a whole demand it, goods can be either sold below or bought above world prices.

What weapons have we with which to counter competition of this description—a competition utterly different, not only in magnitude but in kind, from any we have been accustomed to meet in the past? The Secretary to the Department of Overseas Trade struck the right note when he said that if the countries concerned continued to employ these unorthodox methods then we should fight them at their own game, and if we fought we should win. These words will have to be backed by deeds. The lack of success that has attended our efforts hitherto makes it certain that the old methods must be overhauled, and it may well be that new and novel methods will have to be devised and practised. All the advantages do not lie with our competitors, and there are some respects in which we enjoy a distinctly more favourable position. In the first place, our financial resources and our free exchange give us a decided pull. Neither those who sell to us nor those who buy from us need have any fear of becoming enmeshed in complicated exchange difficulties. We are still the world's greatest buyers, and we have this additional advantage—that we are not tied to any particular supplier; our importers are free to operate in any market.

BULK SELLING

It is as a seller that a totalitarian regime has its greatest trading advantage, and in this sphere we can perhaps learn something from our competitors, without adopting all their methods. As I see it, their bulk selling, under the aegis of the State, will have to be countered by bulk selling on our part. However much it may offend against our characteristic ingrained individualism, and however great may be the difficulties of securing co-operation among trade rivals, we have voluntarily to forge a weapon capable of resisting this new form of attack. Our industries cannot hope to compete successfully in foreign markets unless each is organised to speak, to negotiate, and to bargain, as a unit. Such a course would afford great scope for economy through the elimination of redundant sales machinery, and at the same time the pooling of resources, information and market knowledge would enable a more efficient and progressive service to be established. In the past, the loans which we made to developing countries abroad paved the way for an increase in our trade, but the virtual cessation of such lending has deprived us of this valuable aid.

Various organisations of industrialists and traders have devoted much attention to the study of methods whereby the whole of our export trade might be revived, and their recommendations will no doubt receive careful and sympathetic consideration in official quarters. Meanwhile, the Government has not neglected its opportunities to work for the same end. The Export Credits Guarantee Scheme, which in the past few years has been instrumental in attracting a substantial volume of trade to this country, has recently been extended. Further, a number of important trade agreements, including those with the United States and with Eire, have been concluded during the past year, which should effect a broadening of our trade.

SELF-SUFFICIENCY

It has lately become evident that even totalitarian countries are more keenly alive to the need for increased export trade, although

the aim of self-sufficiency still governs their policies. So long as the emphasis remains on this policy, concentration upon indigenous products must deny to their people the enjoyment of a great variety of articles which are available outside their own borders, this denial being part of the price paid for self-sufficiency. In these countries, substitutes for a number of products such as wool, cotton, and rubber, are being widely exploited, and many have been brought into use, but these are usually less satisfactory, and far more costly to produce, so that not only is the range of goods available in these countries restricted, but the goods themselves are relatively dear.

The standard of living has undoubtedly been depressed, because food, clothing and some everyday necessities have been either lacking in quantity, or of inferior quality, or too costly to buy. It is certain that the past year has not alleviated, but intensified, hardship in these countries, and it is well to bear in mind that debasement of the standard of living is an inevitable breeder of discontent among peoples, which many times in history has been responsible for national upheavals. But whilst pointing out this economic weakness, I would add that history also teaches that hardships will be endured over a prolonged period before the weight of sheer necessity forces a change.

AMERICAN AGREEMENT A BRIGHT FEATURE

A bright feature of last year's events was the conclusion of the trade agreement between the United Kingdom and the United States—an event, indeed, whose importance it would be difficult to exaggerate. These two countries together are responsible for more than a quarter of the world's imports and exports, and any arrangement calculated to promote the freer exchange of goods between them must necessarily have a profound influence favourable to the development of world trade as a whole.

But this is not the only aspect of the agreement, and, indeed, it may prove in the long-run to be not the most important. In the existing unsettled state of the world, the moral and political implications of the treaty cannot be ignored. Agreement was not reached without long and arduous negotiation, in the course of which mutual concessions were made, not only by the United States and ourselves but also by the other countries of the Empire. The agreement is a triumph of compromise. It shows that two nations, one with a long record of tariff protection and the other charged with the safeguarding of the trade of a great Empire, are nevertheless willing to make substantial concessions of particular interests, in order that the currents of trade may be made freer. And although the treaty itself is concerned solely with matters of trade, its successful conclusion inevitably draws the two nations together in a closer sympathy. It is this spirit of accommodation—of "give and take"—which is so essential in international, as in other, relationships. Without it, no agreement can have any permanence.

TWO VITAL PROBLEMS

What I have put before you to-day is a plain narrative of the course of trade and industry during the past year. I have so far ventured upon neither forecasts nor theories, as both would be out of place in the world of to-day, where, to put it mildly, so many unorthodox conceptions of human relationships are in the ascendant. I will mention, however, the two outstanding and vital problems that confront this country. For national safety, even perhaps for national existence, we have to expand our armaments to make up the leeway between ourselves and those totalitarian States which have not hesitated to scrap orthodox national economy in the relentless pursuit of military efficiency in all its branches. Secondly, our internal means of subsistence being what they are, we must at the same time keep going such a volume of overseas trade as will pay for the food of our people and the necessary materials without which this country is frustrate and immobile. Further, it is only by preserving our foreign trade that we can maintain our national economy, upon which the Empire has been founded and developed. These are formidable burdens indeed, but we can rely upon the courage and resolution of the nation successfully to bear the load.

The Chairman then moved the adoption of the report and accounts and Sir Malcolm Hogg, deputy chairman, seconded the resolution, which was carried.

After brief comments by shareholders, the retiring directors were re-elected, and the auditors were re-appointed for the year 1939. To a vote of thanks to the staff for their admirable work during the past year, proposed by Lord Hunsdon, the chief general manager (Mr Charles Lidbury) responded, and a vote of thanks to the chairman terminated the proceedings.

MARTINS BANK LIMITED

ENCOURAGING EXPANSION

HIGH RECORD OF DEPOSITS

FOREIGN TRADE OUTLOOK

THE STIMULATION OF EXPORTS

MR F. A. BATES' SURVEY OF HOME INDUSTRIES

The 108th annual general meeting of members of Martins Bank Limited, was held, on the 24th instant, at the Head Office, Liverpool.

Mr Frederic Alan Bates, the Chairman, presiding, said:

My Lords, Ladies and Gentlemen, the report and accounts have been circulated. I assume you will take them as read.

It is with deep sorrow we record the death of Mr Charles Booth, a director of the bank for twenty-seven years and chairman for the years 1916, 1917 and 1918. We have lost a colleague of wide experience, whose passing will be felt particularly in Liverpool, in business circles and wherever there is the need for social service of the high character associated with his family.

Not long ago Sir Richard Holt, desiring to relinquish some of his heavy duties, under doctor's orders, decided to resign from the chairmanship. We were, however, gratified by his acceptance of the position of a deputy-chairman, which he had held previously. Sir Richard's many friends are delighted to know that he has completely regained his health after his illness. To succeed Sir Richard, the directors have appointed me as chairman and have also elected me to the London board. Conscious of the responsibility of my office, and of the honour conferred upon me, I shall serve the bank to the best of my ability.

Colonel L. E. Pilkington and Mr T. M. Wormald have resigned from the Manchester board for reasons of health. They were members of the board of the Lancashire and Yorkshire Bank prior to the amalgamation with Martins Bank. The loss of their valued co-operation and the reason for it are much regretted. I should add that Mr Wormald's family association with banking goes back to the private bank of Hagues, Cook and Wormald, of Dewsbury, which joined the West Riding Bank more than a century ago. It is most interesting to us to trace back these banking connections, because we are glad to say that the old spirit of personal contact between our bank and its customers is still preserved.

NEW DIRECTORS

To fill vacancies in our Manchester and North Eastern boards, the Marquess of Reading and Mr G. Stirling Newall have been elected to those boards, respectively. These new members of our district boards have extensive interests, and their advice will be of great value to their colleagues.

It gives me great pleasure to inform you that the directors have elected Mr Furniss, our general manager, who is already a member of the London board, to a seat on the general board. Although I have not occupied the chair for long, I should like to add my own tribute to his qualities and personality, which have been of the greatest value in conducting the bank's affairs, and which I hope may continue at the disposal of the board for many years to come. This is a tribute which would, I know, be endorsed by all my predecessors in the chair who have worked with Mr Furniss. I am confident you will confirm this special recognition of his outstanding services to the bank.

Our Manchester district general manager, Mr Percy Woodhouse, has retired after a banking career of forty-seven years, twenty-two of which were spent with us. The board, in appreciation of his work, and to have the advantage of his experience, have elected him to the Manchester board. Mr C. J. Verity, assistant district manager, has been appointed to succeed Mr Woodhouse, and Mr J. Froggatt has been appointed assistant district manager. They have both had much experience of this important section of our affairs.

YEAR'S GOOD RESULTS

I will now ask you to refer to the accounts. Our net profit of £872,929 is an increase of £19,363 on the previous year, due to further expansion in our business generally. With £309,007 carried

forward from last year, we have available for distribution £1,181,936. An interim dividend of 7 per cent. was paid in July last. For the December half-year we propose to increase the dividend to 7½ per cent., making 14½ per cent. for the year. These two dividends will require £603,206.

We have added £50,000 to reserve fund, bringing it up to £3,550,000, and we have placed £100,000 to premises redemption account and £100,000 to Pension fund. After these allocations, £328,730 has been carried forward.

The bank's liquid position has been maintained. Cash in hand and at the Bank of England amounts to £11,142,000, that is 11.07 per cent. of our liabilities to the public. Total cash items represent 21.42 per cent. of those liabilities. Money at call and short notice is £6,100,000, being £1,175,000 less than last year, but Treasury Bills at £3,265,000 show an increase of £705,000. There is again little change to report in our holding of commercial bills, which at £1,413,000 compares with £1,290,000 a year ago. We have added to investments, which are now £33,395,000, an increase of £2,172,000. Bank premises and rentable properties also show an increase, and at £2,743,000 are some £96,000 higher. Acceptances, endorsements, etc., affected by the vicissitudes of foreign exchange and trade, appear at £8,198,000, a reduction of £1,620,000.

Deposits have again expanded, and with an increase of £4,530,000 have established the new high record of £100,038,000. Advances have also increased. At £44,421,000 they are £2,001,000 more than twelve months ago.

ADVANCES MORE WIDESPREAD

The chairman's speech last year referred to evidence of hesitancy in trade. The hesitancy continued, accompanied by some slackening in the demand for overdrafts in certain sections. I hope the new year may see a revival in this respect, and that an active demand for bank accommodation, the best evidence we have of good trade, may set in. The classification of our customers' overdrafts was dealt with at length in last year's speech. There has been little change in the direction in which our money is lent, but you will be interested to know some of the details. There have been increases to agriculture, shipping and transport, retail trades, iron and steel manufacturers, furniture manufacturers and distributors, and to private customers. Notwithstanding the falling off in the building of private houses, advances in connection with housing have increased to some extent. Reductions are shown in the textile group and shipbuilding, and loans against stock exchange securities are appreciably down. One feature, a satisfactory one, is that our advances have a tendency to become more widespread.

Optimism was restrained throughout the year, but, if trade has not been as good as was hoped, satisfaction may be felt that conditions are no worse having regard to the international situation. The beginning of a setback in trade, detected in the autumn of 1937, developed during 1938, but those who held the opinion that there was no fear of a depression comparable with that which commenced about ten years ago proved to be justified. The movement became rather a slowing down from a state of great activity to moderate activity, and conditions were in no way the same as on the previous occasion. The influence of restriction schemes preventing excessive accumulation of stocks—one of the main causes of the persistence of the late depression—undoubtedly had a steadying effect. We have, therefore, grounds for the belief that not only have we seen the worst, but that some progress has been made in the search for a technique which may serve to limit the severity of trade recessions in future.

FOREIGN TRADE DIFFICULTIES

It is difficult to find any simple reason for the recession that commenced in 1937. It may be that the force of world opinion,

stimulated by quick and universal communication with little lag even between continents, caused trade to overrun itself by anticipating an expected upward course too far ahead. But however much or little the course of events was affected by this psychological factor, it is certainly true that ultra-nationalism and political movements abroad were beginning to have their effect. This country's export trade has been languishing for some time, but in spite of that our adverse trade balance has been reduced. The hope has, therefore, been expressed that invisible exports arising out of shipping, banking and insurance services may have been sufficient in 1938 to fill the gap, and we are asked to take consolation from that possibility. Even if it proves to be a fact it is doubtful whether we can really derive lasting satisfaction therefrom, for, if our export trade falls off, our shipping and other overseas services will eventually suffer correspondingly, as, indeed, they already are doing.

Almost coincident with the beginning of the decline in trade the Government's main re-armament campaign was launched, and we cannot escape the conclusion that re-armament, so essential to the country's safety, has had some effect on the export trade of our industries by placing Government contracts at their doors. Added to this, there is the fact that foreign debtors are out of favour. Our foreign loans in the past laid the foundation of our world trade, but where can we lend money abroad nowadays for the purpose of creating the power to purchase our manufactured goods with any assurance that it would be safe? Many loans made in the past are in default. If for the purpose of creating purchasing power for our goods we lend money abroad which is lost, we are, in effect, making the countries to which they are shipped a present of our goods. These problems will tax the wisdom of our administrators at home and the ingenuity of our commercial agents abroad. The true position seems to be that trade is being deflected from any predictable course, on the one hand, by conflicts which unhappily are engaging the energies of mankind over wide areas, and, on the other, by defensive re-armament on a huge scale by the rest of the world. The Department of Overseas Trade, in a recent statement issued for the guidance of traders in the conduct of their overseas business, set forth the difficulties existing in forty countries. In almost every case import licences are required; in many there is strict exchange control; in some payment can only be obtained through clearing house arrangements, often after much delay, and in many cases certain imports are prohibited altogether.

EXPORT PROBLEMS

It would seem as though all the countries of the world were combining to strangle trade. Actually, they are endeavouring to live within their incomes, but the effect upon the flow of international trade is disastrous. The desire among the nations to become self-sufficient arises from the difficulty experienced in obtaining exchange with which to pay for imported goods. This difficulty, in turn, leads governments to sequester exchange as it becomes available to their nationals, for the purchase of necessities or the materials for munitions of war. We have recently seen a considerable fall in sterling in terms of the leading currencies of the world, and particularly in relation to the dollar, but the point will not be overlooked that this depreciation will operate as an aid to the expansion of our export trade. While from that angle the fall in the pound may not be regarded adversely, provided stability can be achieved at the lower level, the reverse applies in the case of our imports, as their cost is thus increased.

When we consider unemployment in this country, we find that it is in the export industries that it is most prevalent. Concentration upon re-armament and activity in those of our industries producing goods for home consumption have not absorbed our unemployed. It is essential, therefore, that we should look ahead to the time when work upon re-armament and development arising therefrom will diminish, and that we should use every appropriate means to expand our export trade. We cannot afford to rely upon methods which were adequate when trade flowed normally, but must adjust our actions, consistently with sound procedure, to meet the tactics of competing countries that, under the influence of strained economic conditions, adopt exceptional measures inimical to British interests. The Anglo-American trade agreement recently announced is evidence that governments and their trade advisers, on both sides of the Atlantic, are co-operating to their mutual advantage. It is early yet to assess the full benefits that will accrue from the agreement, but its outstanding significance, both from the political and trade points of view, will at once be recognised. The cotton industry is looking for stimulation in its export trade as a result of the agreement when it comes into force during the present year; but while the signing of the agreement was received with enthusiasm, it is realised that it will benefit only a section of the industry. The Cotton Enabling Bill has emerged, after animated discussion, in a revised form, its

proposals now being limited to the reduction of surplus plant and the fixing of minimum prices or margins. It is satisfactory that special provisions for the export trade have been included, and that latitude will be given in the application of prices to overseas business. With other safeguards comprised in the Bill it will make some contribution to revival of the trade, but material recovery can only be expected from settled world conditions and from the trade's ability to develop new lines. There is a difficult period ahead, and spectacular improvement is not probable.

SHIPBUILDING AND SHIPPING

It is not my intention to review our industries in detail, but, taking a broad view, it can be said that, notwithstanding the difficulties facing trade during the past year, industry as a whole, although halting under the restraint of international affairs, and with a downward tendency, has done moderately well, a statement supported by examination of our own business. There have certainly been disappointments in various sections of trade. The steel industry has passed through a difficult year, production falling well below the figure of the previous year, and exports, due partly to the establishment of further steel works abroad, have suffered appreciably. The industry was also affected by the decline in shipbuilding, Lloyds register recording that during the year ended June orders placed for new tonnage were only half those of the preceding year. Shipbuilding and shipowning are so closely related that it may be deduced from the fact that merchant shipbuilding had a difficult year, so also had shipowning. This was disappointing, because at our last meeting we had to report that shipping had done well in 1937, particularly in the cargo-carrying class. Even then conditions were pointing to reaction. High costs of shipbuilding have prevented orders being placed, but the inability of shipowners to earn adequate profits has, in any case, restrained them from placing orders. A combination of factors common to all industries, such as exchange difficulties, political disturbances and lack of confidence, resulting in inactive commodity markets, has reduced the demand for tonnage in all trades. The British shipping industry, particularly looking to the future, thus finds itself in a position where urgent measures may be necessary to maintain this life-line industry of an island nation at its former prosperity. The proper bodies representative of shipping are dealing with the position, and the Government have indicated that consideration would be given to recommendations made.

The coal trade, of necessity, depends for its success upon the prosperity of coal consuming industries. Exports and inland consumption both fell, the steep decline in pig-iron and steel production, along with diminished orders from other directions, being responsible for the falling off in the home market, but the sales control committees appointed in 1936 prevented the heavy drop in prices which previously accompanied reduced demand.

Turning to the wool textile industry, conditions over the last two years have presented peculiar difficulties. The rising markets of the first half of 1937 were followed during the latter part of that year by a severe fall in values. It followed that 1938 opened with many high-priced forward contracts to be liquidated under adverse market conditions. In practically every category of textile exports the Board of Trade returns for last year reveal the persistence of restricted trade. Wheat has been a nervous market, and trading by various governments in this commodity has been an upsetting factor.

OFFICIAL ACTION ENCOURAGING

In the reports upon our various trades one significant statement seems common to them all, namely, that so long as there is political disturbance throughout the world, and trade continues to be affected by the methods of certain foreign countries, we cannot look for sustained improvement. It is encouraging, therefore, to turn to a recent speech of the Secretary of the Overseas Trade Department, which indicates the possibility of vigorous action to deal with the situation. He pointed out that, owing to the increasing industrialisation of countries which originally only produced raw materials, a great many of our former markets had been lost; adding that, in future, we should have to search for new markets, and above all develop the production and sale of new types of goods. He was alive to the suggestion that we should see that countries selling to us also bought proportionately from us, and in the case of countries which had gone out of their way to discriminate against us, he gave instances where the Government had had no hesitation in taking measures to counteract such practices. It is satisfactory that the department is energetically tackling the problem of the country's

trade in collaboration with the various industries involved, and there will be support for the appeal that our industries should organise so as to give driving force to the Government's bargaining powers.

Following the revival of confidence in France as a result of the determined efforts of the Government to take the country's finance and trade in hand, there was considerable repatriation of French funds from London. Owing to this and to the withdrawal of other Continental funds for the purchase of dollars, and subsequent speculation, the pressure on sterling naturally became heavy, causing the British authorities to take action and transfer gold to a large amount from the Bank of England to the Exchange Equalisation Fund. Great confidence is felt in the conduct of the fund, and this evidence of the authorities' intention to defend sterling has been received with satisfaction.

BRITISH BANKS AND THE CRISIS

The soundness of British banks is taken so much for granted that it is, perhaps, pardonable to recall the way in which they faced the crisis at the end of September. The service they then rendered to the nation is apt to be overlooked. They had to meet considerable withdrawals of foreign and other deposits for investment in the United States. Simultaneously they were faced at the height of the crisis with a severe fall in the value of stock exchange securities held on account of customers, yet it may be said that in no case did this result in the withdrawal of overdraft facilities during the crisis. The value of such calmness, possible only because of the maintenance of well tried traditions, is surely very great, and that it took place almost without comment is, perhaps, the finest tribute to the confidence reposed in our banking institutions.

I will shortly move the adoption of the report and accounts, but I would first say a word with regard to the management and staff. The directors have recognised the services of the general manager in electing Mr Furniss to the board. In Mr McKendrick, our able assistant general manager, and the other officers at head office and throughout the service, we have a personnel working loyally in the interests of the bank, and our thanks are due to them and the staff generally for the year's results. (Applause.)

The Chairman concluded by moving the adoption of the report and accounts and confirmation of the final dividend of 7½ per cent. as recommended.

Lord Colwyn, one of the Deputy Chairmen, seconded, and the motion was carried unanimously.

Col. F. A. Woodcock proposed that the Hon. David Bowes-Lyon, Mr J. H. B. Forster, D.L., and Mr Alfred Watkin be re-elected directors of the bank, and that the election of Mr J. M. Furniss as a director be confirmed.

This was seconded by Mr Ernest A. Cookson and unanimously agreed to.

On the motion of Mr James Lye, seconded by Col. G. B. Leathart Rae, Messrs Harmood Banner and Son of Liverpool, Messrs Peat, Marwick, Mitchell and Company of London, and Messrs Thomas Bowden, Sons and Nephew of Newcastle-upon-Tyne, chartered accountants, were reappointed auditors.

Lord Ebbisham proposed a vote of thanks to the directors, the standing committee, and to the director and general manager and other officers and staff of the bank for their valuable services during the year.

Mr Ralph Armitage having seconded, the resolution was heartily carried.

DIRECTOR AND GENERAL MANAGER'S REPLY

Mr J. M. Furniss, who met with a most cordial reception, acknowledged the resolution. He referred to the perplexities of business generally, and said that each year they looked for respite from anxieties, but were always baulked of their hopes. Fortunately hope and faith were inherent in mankind. It was gratifying to have the goodwill of those present, shown by the warm response to the resolution. He acknowledged the support of the chairman and directors, and thanked his colleagues and the staff throughout the bank for their help during a trying year. He particularly mentioned Mr Bromley-Martin, the London managing director, who had been a tower of strength, and whose clear thinking reduced difficult problems to simplicity. He also complimented Mr Babcock, the bank's foreign manager, whose work, at all times exacting, had recently specially called for able supervision. Mr Furniss then thanked the meeting for confirming the honour of a directorship conferred upon him by the board.

On the motion of Mr J. R. Hobhouse a vote of thanks to the chairman for presiding was carried unanimously.

JOSEPH NATHAN AND COMPANY, LIMITED

STRONG FINANCIAL POSITION

The thirty-ninth ordinary general meeting of Joseph Nathan and Company, Limited, was held on the 26th instant, in London.

Mr Alec Nathan (the chairman) said that their gross income at £138,811, was £1,682 higher than last year. Since the period covered by the accounts included what had been called a "business recession" the profit, virtually the same as last year, was satisfactory. The balance carried forward to next year's accounts, after paying the dividend on the ordinary shares, would be £51,779, as compared with £35,318 brought in.

The floating assets of the group this year exceeded the current liabilities by £312,000, as compared with £260,000 last year. These figures demonstrated the improved strength of the company's financial position.

GLAXO LABORATORIES

In regard to Glaxo Laboratories, Limited, the company's business was world-wide in its operations. Shareholders would be gratified to know that the increasing strength of the production and selling organisation had been well demonstrated by a further increase in turnover, in spite of more difficult conditions. This expansion had not been confined to any one market. In certain countries restrictions imposed for political or other reasons necessitated business being conducted at little or no profit; where the market had been substantial and profitable, the directors had determined to continue the company's activities in order to preserve the goodwill against more favourable trading conditions.

During the year the deputy-chairman had visited the Glaxo Laboratories' subsidiary companies in India, Australia and New Zealand, and had reported on the excellence of their organisation in those countries. They believed that whatever might be the vicissitudes of overseas business at present, the steady building up of their organisation would be well justified. The directors confidently believed that their overseas sales organisation was of the calibre and experience to take full advantage of potentialities.

In regard to their produce businesses, there had been a material improvement in certain directions. Their importing business had had a successful year's trading. The marketing of New Zealand butter in packet form, under the "Golden Bud" trade mark, had made substantial progress during the year.

It was not until after the close of the year under review that the Government, at long last, announced their bacon policy. The new marketing policy did not become operative until January 1st of this year, and it would be some months before it became effective. As this policy was based on an expansion of the bacon trade, as distinct from the harmful restrictive policy which had been in existence for the last five years, the prospects for the future of their Smithfield business were on a much sounder foundation than for some time past.

THE NEW ZEALAND IMPORT REGULATIONS

The New Zealand business had had a satisfactory year. Shareholders would expect him to say something about the import regulations which came into operation in December last. How would it affect their business? He could not say. At present they had not received sufficient information. Nevertheless, as they imported into New Zealand goods that entered largely into the production of primary products, or were necessary for the farmers, they anticipated carrying on that business without material alteration.

When New Zealand payments were greater than her receipts her funds decreased overseas. A decline in those funds meant that the Dominion had been paying more than it had been receiving, and had been drawing on its reserves for the excess expenditure. It was generally considered that about £N.Z. 10,000,000 per annum was required to pay interest on public debt held abroad, and that export receipts should exceed import payments by this amount if the reserves were to remain intact.

So frequently during the past few years had he reiterated that it was the policy of the directors to consolidate the resources of the company and to direct them into the most profitable avenues, that it might seem unnecessary repetition again to mention it. He did so, however, for the purpose of making clear to shareholders that the directors' policy was unchanged. That it had proved the correct policy was beyond doubt, as would be readily realised on comparing the present balance sheet with those of the past five or six years. The steady progress which had been made demonstrated the success with which the policy had been carried out. The strength of the company today was greater than at any time in its history.

The report and accounts were unanimously adopted, and a vote of thanks was passed to the chairman, directors and staff.

DISTRICT BANK, LIMITED

SATISFACTORY RESULTS DESPITE DIFFICULT TRADING CONDITIONS

FURTHER INCREASE IN DEPOSITS

CHECKING TOTALITARIAN COMPETITION IN EXPORT TRADE

SIR R. NOTON BARCLAY'S ADDRESS

The one hundred and ninth annual meeting of shareholders of District Bank, Limited, was held, on the 27th instant, at the Head Office, Spring Gardens, Manchester.

The Chairman, Sir R. Noton Barclay, presided, and in moving the adoption of the report and balance sheet said:

My Lord, ladies and gentlemen,—I know you will join with me in expressing pleasure at the recognition in the New Year Honours List of the valuable public services of Sir Peter Rylands, a member of the Board, and in offering him your congratulations.

Since our last meeting Mr H. H. Summers has, in view of his advancing years, tendered his resignation. He has been our esteemed colleague for many years and has given valuable service to the Bank. I am sure you will associate yourselves with me in sending him a message of goodwill on his retirement. I am pleased to report that we are to have the services of his son, Mr Richard F. Summers, who has been elected to a seat on the board.

The balance-sheet figures for the past year are before you and, with your permission, I will take them as read. I propose, however, to refer briefly to one or two items.

BALANCE SHEET ITEMS

I am pleased to report a further increase in the current deposit and other accounts, which reached the figure of nearly £83,500,000; about £2,400,000 more than last year. Such a high figure is unprecedented in the history of the bank, and is particularly gratifying in view of the fact that during the latter part of the year we, in common with other banks, had to meet considerable withdrawals of money lodged with us by overseas customers. That these outgoings were more than made good may be attributed to the steady growth of our domestic deposits and the increased scope of our activities.

Our assets conform to the usual high standard of liquidity, cash and other short assets representing 31.6 per cent. of our deposit liabilities. These first lines of defence, added to our large holdings of gilt-edged investments, which show little change over the year, provide us with a total of no less than £55,692,000. The market value of investments is still considerably in excess of the figure shown in the balance sheet. The principal change in assets is an improvement in our advances, which show an increase of over £1,700,000. Comparing the current balance sheet with that of December, 1935—the first balance sheet published after the County Bank absorption—we find that there is an increase of £7,600,000 in advances. Our present total lendings are well spread. Industries classified under the headings of textiles; heavy industries; agriculture and fishing; food, drink and tobacco; shipping and transport; building trades; miscellaneous and retail trades; local government authorities and public utility companies; and miscellaneous professional and private advances all show increases. There have, however, been slight decreases under the headings of mining and quarrying; leather, rubber and chemicals; and finance.

Since the date of the absorption of County Bank Limited we have opened a number of new branches, and we anticipate that others will follow. New branches of the Trustee Department have also been opened at Liverpool and Lancaster, and the Manchester office of the department was transferred to more commodious premises at 57 King Street. By this removal we have provided adequate room for the continuing growth of the department and a reserve of space for the future. This change has also enabled us to utilise the surplus space at 57 King Street, made available by the transfer of the County Bank administration departments to Spring Gardens. The space vacated by the Trustee Department at Spring Gardens has in turn enabled us to meet the need for increased accommodation by the foreign and certain other departments of the bank.

PROFIT AND DIVIDENDS

Our profit is arrived at after full provision has been made for bad and doubtful debts; the figure of £508,808 is a little less than

that for the previous year, but we consider the result satisfactory, having regard to the difficult trading conditions of 1938, the increase in taxation, including the National Defence contribution, for all of which we have provided.

With the amount of £285,611 brought forward, the disposable profit is £794,419. The directors have appropriated £70,000 to pensions and annuities fund and £60,000 to write down bank property. It is now recommended that a final dividend of 9½ per cent. actual should be paid on the A and C shares, which, together with the interim dividend at the same rate, makes 18½ per cent. for the year, as compared with 17½ per cent. for the previous year. It is proposed to pay a final dividend on the B shares of 5 per cent. actual, making the maximum dividend of 10 per cent. for the year. There remains to be carried forward to the current year's accounts the sum of £287,894.

BANKING AND THE CRISIS

The political crisis which occurred in September last year placed a great strain upon the Government, public services, the banks and all sections of the community. In the critical period the deposits of the clearing banks fell by some £40,000,000, equivalent to 2 per cent. of the total. Considering that no restrictions were placed on the withdrawal of deposits in the emergency, the fact that these figures were not much larger proves the widespread faith of the British public in their banks, and no better demonstration of such public trust has been witnessed in any of the numerous crises of the past. Our own experience, as shown by the monthly averages which we publish, was that our deposits actually increased during the month of international turmoil; the increase continued, without interruption, for a period which both preceded and followed the crisis.

In recent months sterling has shown considerable weakness and the resources of the Exchange Equalisation Fund have been heavily strained in its support. It has been found expedient to restore the method of embargoes, which cover foreign lending, forward dealings in gold, advances against gold, and speculative exchange transactions. I must admit to a dislike of embargoes unless other methods have been tried and have failed. I feel that if the present Bank rate were made effective by the market rate of discount being permitted to rise to its normal relationship to Bank rate, the sale of sterling would be less attractive. Speculative activities, although having their origin in a real economic setback may, if unchecked, easily lead to nervousness and possibly to a genuine flight of capital on the part of the less well-informed. I am old-fashioned enough to believe that the orthodox methods of correction, by making adjustments in the short-term rates of interest in the free monetary centres of the world, have not entirely lost their efficacy.

While an advance in market rates would increase the cost to the Government on short-term borrowing, it is to be anticipated that this adverse factor would be offset since the consequent strengthening of sterling should contribute materially to a better market for gilt-edged securities, and so facilitate cheaper long-term borrowing by the Government under their programme of re-armament finance. The Treasury should benefit also from an improvement in capital values by an increased yield on death duties.

Repatriation of foreign holdings and bear speculation, although serious enough on the short view, are not so vital to the long-term prospects for sterling as the balance of international payments. An efflux of foreign balances is a movement we must expect and there is always, in due course, a reaction to speculation. But the effect upon sterling of a worsening of our balance of payments is more damaging and cannot be removed by palliatives. It is therefore fitting that the problem of increasing exports should now be claiming so much attention in responsible quarters.

EXPORT TRADE DIFFICULTIES

In last year's address the many difficulties which then beset the export trades prompted me to recommend that steps should be taken by the Government to assist industry in competing for overseas markets. At that time the problems appeared urgent enough, but, serious as were past troubles, they are insignificant compared with present difficulties; and I must not allow this opportunity to pass without voicing an earnest request to the Government for as much practical help as possible for this most important side of our economic life.

Distorted ideas of ultra nationalism as opposed to internationalism appear to dominate the world to-day. While statesmen and economists alike pay lip service to the importance of stimulating world trade, each country seems to be obsessed by the idea that individual prosperity can best be fostered by hampering trade with other countries. To this end they impose restriction upon restriction and, as it were, erect additional stories to a house of cards which must ultimately collapse. Have things gone too far, or is it yet possible for the nations to regain some measure of true economic perspective?

The question is a vital one and until a solution is found our exporters will remain hampered by tariffs, quotas, depreciated currencies, exchange restrictions, and foreign cheap labour. But serious as these troubles are the competition from totalitarian States now adds more acute difficulties and it seems that these will be intensified this year. In so far as these States succeed in reorganising industry by sound methods, and thereby raise their standard of efficiency, we might do better if we copied their example rather than complained of their success. We might also avoid eventually some of the damaging effects of defeatism here if we recognised that much of the elaborate restrictive planning of dictator States is ill-considered, and much less likely to promote efficient enterprise than the methods of the democracies. We must not accept in a spirit of discouragement the results of totalitarian measures such as conscription of labour and capital. This planning covers up many inefficiencies: employers are saddled with unskilled labour, losses and waste ensue, and, instead of directing capital and human effort towards the development of branches of production in which those countries have the best natural advantage, valuable assets are applied to pressing forward schemes of self-sufficiency. It should be observed also that the dictator States cannot incur their present vast Government expenditure indefinitely. The position is more ominous when it is considered that, despite such an artificial stimulus, the workers' standard of living has been reduced.

THE EXPORT GUARANTEES BILL

Yet the probable misfortunes of formidable competitors do not dispose of a present emergency, wherein our export trades might suffer great damage or even extinction at the hands of totalitarian States. In their pursuit of markets to-day conscripted cheap labour and capital, subsidies, and political pressure are used with damaging effect, and it is against these State-controlled forces that private enterprise has little defence. In these matters Governments only can match their strength against each other, and it is therefore pleasing to know that, in the case of this country, the Export Guarantees Bill may be expected to reach the Statute-book shortly after Parliament reassembles. It may be anticipated that this measure will be supplemented by co-operative organisation of each exporting industry to supervise and even conduct export business, but that these in turn should be armed with the limited funds suggested to counter the subsidised exports of our competitors is laudable, if perhaps hardly effectual. As has been stated in another quarter, the export trades most in need of fighting funds are the least able to find the money for this purpose. Again, the wise and prompt spending of it would in itself create a problem if the dispensation of the money were left to a committee or trustee elected from within an export organisation, and the spending of public money by members of an organisation for its own benefit would not be conducive to sound re-organisation for the purpose of increasing efficiency in production and marketing. Independent representatives or advisory councils of business men for each group of exporting industries, with full powers to use the public funds in the public interest, hold out some reasonable prospect of effective action. Very active full-time officers, however, and a much larger amount than £10 millions for the type of export guarantees covered by the Bill seem to be required to make real headway.

This need for able administration will be appreciated since we have to counter a very intricate mechanism underlying State-controlled export drives. Self-defence must therefore be planned according to the weapons used against us. Success will the more certainly be achieved provided full use is made of our vast buying power, and our import trade should be used to the full in pressing

our advantage against foreign competitors. Purchase of our goods should be a *sine qua non* of entry into the British market. We have the purchasing capacity and the resources for counter-action, and full use should be made of them.

TRADE AGREEMENTS

In this connection the benefits which should accrue to the export trade through the commercial treaties of 1938 have not to be overlooked. The Anglo-Rumanian and Anglo-Italian agreements endeavoured to remedy defects in earlier exchange clearing agreements; the Anglo-Egyptian and Anglo-Turkish pacts were more satisfactory—the former particularly to Lancashire—and, finally, of course, we have the Anglo-American agreement. In the last we have an agreement which not only endeavours to benefit our mutual trade but also attempts to reduce trade barriers generally, and, therefore, is a development which contributes to world peace and prosperity. In this treaty lies a wider significance than the mere advancement of trade between the contracting parties—the strengthening of the political ties between two great democracies. From this viewpoint the Government deserves all the congratulations which have come its way.

But in admitting the good offices of the Board of Trade in the matter of trade agreements generally, the fruits of many months' conscientious labours seem more a matter of intricate technical detail than of tangible result. Pacts have been sought which should satisfy many interests, but which in practice satisfy far too few. Small advantages to many trades are of no avail against dictator States, and a really big advantage to a few of our important industries seems more likely to provide practical results in larger exports and more employment. If totalitarian countries have key products to export, so have we; and if they succeed in finding expanding markets for such exports, so should we. In the case of Lancashire it is textiles which take pride of place. They have, of course, been remembered in recent pacts, but, I am informed, the practical benefits are likely to be small. Yet the Government can do much to further the interests of Lancashire in 1939; new or revised treaties are to be negotiated with India, Burma, Switzerland, Chile and Colombia. Each of these countries has key exports, and a pact based on reciprocity between such products and their British counterparts will be infinitely preferable to small advantages spread over a wide range of products.

NEED FOR ORGANISATION

It would, however, be a disservice to industry to suggest that either subsidies or trade pacts would remedy its problems. As always, efficiency and enterprise play a big part in success, and external help from the Government merely makes the effort worth while. In the absence of such help, however, it is better to organise for the worst rather than to rely on fortuitous benefits, and the high cost of our exports, as reported in the *Board of Trade Journal*, points to a very real need for reorganisation to reduce costs and prices. The latest official estimates of the changes in the average values of exports show that our prices, and particularly those of manufacturers, have been maintained or, in some cases, even raised, though orders at the existing rate of quotations have fallen off. This position is regrettable since our design and range of exports are improving, but when the world purchasing power is falling we cannot expect to sell if our prices are so inflexible.

Some industries have been at great pains to find a way of surmounting their difficulties. The cotton trade, for instance, has been tireless in its efforts to find a practical scheme of organisation for benefiting the industry as a whole. After more than two years of hard work on the part of the Joint Committee of Cotton Trade Organisations the original draft proposals for an Enabling Bill have been greatly modified, and many safeguards introduced with a view to meeting the requirements of the Government and the criticisms of the trade. Time is an important factor and it has yet to be decided by the trade whether the Bill will be presented to Parliament. Is it too much to hope that the trade will, at an early date, arrive at a definite decision? If the cotton trade is to make its influence properly felt in Whitehall it must speak with a united voice. There is much to be done for the improvement of our foreign trade, and, obviously, better terms could be obtained in trading agreements if the Government knew that the trade was united in its demands. In these agreements disunity on the cotton industry's side of the conference table will benefit only our competitors.

TRIBUTE TO STAFF

Before concluding I desire to place on record our sincere appreciation of the loyal and efficient service rendered by the staff during

the year. Only those who are intimately connected with the inner work of the bank can realise the value of that service, and I welcome this opportunity of thanking not only the senior officials, but also all members of the staff who have so ably supported their efforts.

WILLIAMS DEACON'S BANK, LIMITED

SATISFACTORY RESULTS OF DIFFICULT YEAR

NECESSITY FOR RIGID NATIONAL ECONOMY

CONDITIONS IN COTTON TRADE

MR GERARD POWYS DEWHURST'S ADDRESS

The annual meeting of the shareholders of Williams Deacon's Bank, Limited, was held on Thursday, January 26, 1939, in the board room, Mosley Street, Manchester, Mr Gerard Powys Dewhurst (the chairman) presiding.

The secretary read the notice convening the meeting and the auditors' report.

The chairman, in moving the adoption of the directors' report and statement of accounts, said:—Gentlemen, I have received apologies for unavoidable absence from our meeting to-day from certain members of the board. From the report in your hands you will note that, following upon the rebuilding of our old office in Birchin Lane, we have opened, or are opening shortly, new branches of the bank in London and the North.

You will also see from the report that our late general manager, Mr Harold Bradburn, was elected last summer to a seat on the board, which appointment you will presently be asked to confirm. During a life-long career in the bank Mr Bradburn has in turn filled with distinction most important positions in the service both at Sheffield and Manchester, while as general manager since 1931 his ability and conduct of affairs have earned our keenest appreciation, and now as a colleague on the board we are fortunate in retaining the benefit of his experience and advice. To fill the position of general manager of the bank we have appointed Mr J. M. Thomson, and we take this opportunity of wishing him every success in his new sphere of office and assuring him of our whole-hearted support.

BALANCE SHEET ITEMS

Taking the remainder of the report, with your permission, as read, and turning to the figures of the balance sheet, our capital shows no change, but successive increases in the balance of profit carried forward in the last few years have enabled us to place £100,000 to our reserve fund, bringing this figure up to £900,000.

Lower totals of deposits following the withdrawal of foreign balances, which this year have been a feature of most bank balance sheets, are hardly reflected in our figures, where we note a reduction of £229,000.

Acceptances show little change, but our endorsements and obligations on customers' account at £1,539,000 show an increase of £448,000.

ASSETS

Turning to the assets side of the sheet, our holding of cash is higher than last year by some £400,000, representing over 11 per cent. of our deposits. Balances with other banks also show a small increase; on the other hand, we have employed rather less short money on the market than last year.

A reduction in our holding of Treasury bills accounts mainly for a decrease of over half a million in the item of bills discounted.

Our investments show little change during the year, while our advances at £14,175,000, appearing at a slightly lower figure, are an indication that for the time being our customers' requirements on balance have been affected by the smaller amount of finance required for the movement of goods.

Bank premises account, after an appropriation from the year's profits, shows a net decrease of £28,000.

I feel that the figures I have quoted, which, of course, have only been arrived at after full provision has been made for weak or doubtful positions, definitely emphasise the liquid position of the bank.

PROFIT AND DIVIDEND

Turning now to the figures of profit and loss, our net profit, after making the usual provisions, appears at a total of £301,418, as compared with £310,921, or a decrease of £9,503. This profit, with a balance of £148,592 brought forward from last year, gives us a total of £450,010 now to be dealt with.

The report and accounts were adopted, and the retiring directors were re-elected.

Messrs Halliday, Pearson and Company, and Mr Leslie Shaw, the retiring auditors, were re-appointed.

After the usual votes of thanks the proceedings terminated.

After transferring £30,000 to premises account and £100,000 to reserve fund, we are in a position to pay a dividend at the rate of 12½ per cent. on both our "A" and "B" shares, and carry forward to next year's account £85,635, as against £148,592 brought in.

The incidence of taxation has to some extent had its effect on our net figures, and we can be well satisfied with the results recorded for the year.

CONDITIONS DURING PAST YEAR

In the year under review the country has experienced two major crises in Austria and Czecho-Slovakia, which were more dangerous to the peace of the world than any since 1914, and hardly a week has passed without some occurrence calculated to restrict trading enterprise and weaken confidence. Feelings of political and economic insecurity have been intensified and have caused the diversion of resources from productive trade to sterile re-armament.

Under such conditions it is hardly surprising to find that the turnover of British overseas trade in 1938 was lower by some 11 per cent. than in 1937; on the other hand, the trend of prices with dearer exports and cheaper imports has in many instances favoured this country for the time being; consequently the visible adverse balance of trade was substantially smaller than in 1937, and this should help to offset the less favourable result which we may anticipate will be shown by invisible exports. But even so, unless we are prepared to live on our capital, the country's position appears to call for the most rigid economy, especially in view of our enormous re-armament programme, which must involve heavy purchases of material from abroad. No expenditure can be grudged that is considered essential to the safety of the country, but "value received" rather than "expenditure voted" should be the measure or standard by which every Government spending department must be judged.

ANGLO-AMERICAN PACT

From the point of view of international trade, the principal achievement of the year has been the successful conclusion of the Anglo-American Pact, the main feature of which is that a large part of the United Kingdom concessions consist of an agreement not to raise duties rather than an undertaking to reduce them, while the United States concessions are much more in the nature of a reduction of duties than a stabilisation; but, apart from the point of advantage or disadvantage to either contracting party, this treaty may prove of very great value by creating a large area of freer trade and demonstrating the advantages of such a development to the world at large.

Its ratification, therefore, is most welcome from both the economic and political points of view.

The Stock Exchange has had a most difficult year, and mainly through lack of confidence, normal investment business has been reduced to a minimum.

During the September crisis all Government securities fell heavily to a point where prices were fixed below which dealings were not allowed, but the subsequent recovery still leaves prices considerably lower on the year.

A further sequel to the September crisis was the heavy withdrawal of foreign moneys from London, which, coupled with the repatriation of French funds, caused a fall in sterling which necessitated the reimposition of the embargo on foreign issues and advances against gold which had been withdrawn earlier in the year.

COTTON TRADE

If we turn to the area more directly served by the bank, I am afraid the improvement in the cotton trade which we were able to note twelve months ago has entirely vanished, and conditions during the past year can only be described as having been extremely difficult. The volume of cotton piece-goods exported to overseas markets has declined in the year by nearly 28 per cent. and in value by

UNITED SERDANG (SUMATRA) RUBBER PLANTATIONS, LIMITED

MR ERIC MILLER ON THE OUTLOOK

The thirty-first ordinary general meeting of this company was on the 25th instant, in London.

Mr H. Eric Miller, the chairman of the company, who presided, after referring to the hardships of double taxation and to other domestic matters, went on to say that the downward turn in trade, particularly in the U.S.A., and the unsettling political conditions elsewhere, had had a detrimental effect on the absorption of rubber. It was difficult for any important primary commodity to escape from the paralysing effects of nervous tension which was so much in evidence at the present time, and the underlying improvement which had been effected in the statistical position of the commodity was apt to be obscured. Under those circumstances the decision to raise the exportable percentage for January/March, 1939, to 50 on a higher basic quota had met with an unfavourable reception and the price had fluctuated on a rather lower level.

Although complete data for 1938 were not yet available, the absorption of rubber in manufacturing countries must have been about 905,000 tons, nearly 190,000 tons less than the absorption in 1937. There were indications that stocks of tyres and other rubber goods in the hands of manufacturers and dealers were lower at the end of 1938 than at the end of 1937. Were it not for the clouds on the international political horizon and the consequential general desire to keep commitments down to a minimum, one would be entitled to anticipate a rise in price during 1939, but how events would shape depended on incalculable factors beyond his ken.

Without exaggerating or belittling possible competition from synthetic substitutes, the plantation industry must do all it could further to reorganise itself on sound progressive lines. As speedily as circumstances warranted, areas carrying middle-aged trees raised from unselected seed should be converted into up-to-date gardens carrying trees raised from known high yielding parents.

As to the result of the company's trading for the year under review, the credit balance on profit and loss account to be dealt with was £242,638. They recommended a dividend of 9 per cent. and would carry forward £94,544.

The report was unanimously adopted.

LANGEN (JAVA) RUBBER ESTATES COMPANY, LIMITED

LOWER PRICES REALISED

The twenty-ninth ordinary general meeting of this company was held, on the 20th instant, in London.

Mr H. Eric Miller (the chairman), in the course of his speech, said: During the period covered by our accounts the export quota fixed by the International Rubber Regulation Committee averaged 70 per cent., but owing to the internal cut in the Netherlands Indies the export licences we received amounted to less than 64 per cent. of our standard production, which for the calendar year 1937 was fixed at 1,513,112 lb. and for 1938 at 1,548,195 lb. We are therefore in a position to account for 979,640 lb. We brought forward from the previous year 314,877 lb., and harvested 892,720 lb.; after covering the export licences allotted to us we finished the year with a surplus of 227,967 lb., which are taken in at bare cost. Including at a conservative valuation the unsold portion of the crop accounted for, the average price realised is about 1d. per lb. lower than that obtained for the previous year's crop, but nevertheless compares favourably with the average monthly sale price of standard sheet in the London market during the period.

The Java company was able to declare a dividend of Gls.81,000, which has been brought into the English company's profit and loss account together with the maiden dividend at the rate of 8 per cent. paid by the Namoe Tongan Company.

We have £20,832 14s. 2d. to deal with to-day. We recommend the payment of a dividend of 6 per cent., which is just one-half the rate we paid the year before.

The exportable percentage for the latter half of 1938 was fixed at 45 per cent. internationally, but internal cuts brought this down to 40 per cent. of standard for N.E.I. estates. The exportable rate for the first quarter of 1939 has been fixed internationally at 50 per cent. of 1939 quotas, which in the case of the N.E.I. are appreciably higher than 1938, so that internal cuts should be less severe. It is clear, however, that our 1938-39 accountable crop is likely to be smaller than that of 1937-38; we therefore require better conditions in the market for our produce to enable us to show you even a modestly reasonable return on your money.

The report and accounts were unanimously adopted.

nearly £19,000,000, practically all markets showing reduced figures. This is the lowest recorded figure of export since 1850, and for the first time we find cotton piece-goods displaced as the most valuable section of the British export trade.

The repercussion on the home trade already fully catered for has been immediately felt, and weak selling, coupled with indiscriminate price-cutting, has once more been a prevailing feature in this section of the trade.

Faced with this position, all concerned in Lancashire are anxiously awaiting the terms of the new British-India Trade Agreement, which is to supersede the Ottawa Pact of 1931, in the hope that some understanding may be arrived at with regard to imports into India in place of the existing prohibitive duties.

SENIOR TRADE COMMISSIONER'S REPORT

The report of His Majesty's Senior Trade Commissioner in India is illuminating, though not encouraging. He states that the fiscal activities of the Indian Government, with the object of fostering indigenous industries, have reduced several of the leading British exports to India to comparative extinction (high revenue duties raised as a temporary measure to meet the financial crisis of 1931 have had an effect that was never intended), and he goes on to point out that this policy of maximum industrialisation must lead first to a clash of interest with the agricultural element, secondly to a crisis in India's finances, as the Government rely upon Customs receipts for 60 per cent. of their revenue, and finally to a collapse of the economic and financial fabric of the Government of India, which is dependent upon an excess balance of exports to meet India's financial commitments in London and maintain the exchange.

It is in the hopes that this report will bear weight with the respective Governments in their discussions, and that due consideration will be given to the fact that this country is by far the best customer for India's exports, that Lancashire awaits the publication of the new agreement.

COTTON ENABLING BILL

An even more momentous issue in the shape of the Cotton Enabling Bill is now before every firm in the industry, and their individual opinion is being tested by ballot, which will decide whether the proposals of the Joint Committee of Cotton Trade Organisations shall go to the Board of Trade for embodiment in legislation.

Opposition there has been, which the Joint Committee has gone to the limit to meet, and now it is to be devoutly hoped that, taking the widest view of the needs of the cotton trade, a convincing majority will register their approval of these proposals.

As I stated last year, some such co-ordinating authority as is envisaged by this Bill is essential if the cotton trade is to put its house in order and maintain and improve its position in the markets of the world.

STEEL, IRON AND COAL

From our branches in the Sheffield area we gather that the steel trade made a certain recovery in the autumn from the recession that was apparent in the earlier part of the year, the production of pig iron and output of steel having shown up better in the later months, while the reductions announced in the price of steel and the acceleration of the re-armament programme hold out good promise for increasing turnover in the coming year.

Reports from the colliery districts of South Yorkshire, while not so good as last year, give indications of a fair trade, though stocks of coal in yards and colliery sidings seem to be unduly heavy. With the exception of engineering, which has been heavily engaged on re-armament work, reports from the Bolton area are not good, unemployment figures there in the cotton industry alone showing an increase of over 3,000. And I am afraid the same tale of distress comes to us from Wigan, Rochdale and Oldham districts.

In Manchester and surrounding districts considerable activity has been experienced during the year by the engineering and allied trades, and, with order books well filled, the outlook of that trade here is distinctly favourable.

TRIBUTE TO GENERAL MANAGER, OFFICERS AND STAFF

Before I conclude I should like on your behalf to convey to our general manager, Mr Thomson, the assistant general manager and the officers and staff of the bank our best thanks for their efficient services and to assure them of our keen appreciation of the way in which the work of the bank has been conducted during the year.

The chairman then moved the adoption of the report and accounts, which was seconded and carried.

The retiring directors, Lt.-Col. Sir Henry K. Stephenson, Bt., D.S.O., D.L., and the Rt. Hon. Lord Bradbury of Winsford, G.C.B., were re-elected, the appointment of Mr Harold Bradburn was confirmed and the auditors, Messrs Ashworth Mosley and Company, were re-appointed.

TURNER AND NEWALL LIMITED

FURTHER EXPANSION OF OPERATIONS

DEMAND FOR ASBESTOS PRODUCTS

SIR SAMUEL TURNER'S REVIEW

The annual general meeting of Turner and Newall Limited was held, on the 26th instant, at York, Sir Samuel Turner, the chairman of the company, presiding.

The secretary, Mr John L. Collins, read the notice convening the meeting, and the report of the auditors, Messrs Deloitte, Plender, Griffiths and Company, was read by Sir Alan Rae Smith.

After dealing with purely financial matters, Sir Samuel Turner gave the usual detailed survey of the company's various activities, and among other things he said:—

The opening-up, development and equipment of the Havelock mine in Swaziland is proceeding satisfactorily, and unless something quite unforeseen should occur, I see no reason why production should not begin in 1939 in accordance with our original programme. The mines in Southern Rhodesia continue to produce to capacity and there is nothing of outstanding interest to mention with regard to them. A new recreation club house at the Shabanie mine was opened in August, 1938, and this is greatly appreciated as a valuable addition to the amenities of life at Shabanie.

With regard to the Bell mine in Canada, I referred last year to the fact that this mine was experiencing a very satisfactory demand for its product, and this is still the case. It is proposed to sink a new shaft during the year 1939 and the early part of 1940, and we are confident that the amount of ore available in the unexploited portion of this mine should be very substantial.

TURNER BROTHERS' GOOD YEAR

Turner Brothers Asbestos Company Limited has had another satisfactory year. The turnover was naturally affected to some extent by the trading conditions prevailing during the spring and summer, and particularly by conditions in export markets, but the total volume of business for the whole year was encouraging.

At the Rochdale factory of Turner Brothers Asbestos Company Limited the extensions to which I referred last year are completed, but others are still in prospect and will be undertaken shortly. Our new research department has been considerably developed and is proving of definite value. Equipment for the manufacture of rubber transmission and conveyor belting is being enlarged, as the company's entry in this particular field has met, with success, and we have the advantage of an absolutely modern manufacturing plant, which, coupled with our sales effort, should give us a steadily increasing place in the rubber belting market. A further development in our belting activities is the decision to manufacture "V" type endless belting, as we are convinced that the class of industrial drive for which it is employed has a rapidly expanding future. This new line will be placed on sale by Turner Brothers Asbestos Company Limited early in 1939.

J. W. Roberts Limited has had a successful year, the turnover being substantially in excess of that for the previous year.

FERODO LIMITED

Ferodo Limited during the year under review has experienced a satisfactory demand for its products, which hold such a high reputation for quality in the motor and engineering industries. Considerable extensions have taken place at the works at Chapel-en-le-Frith; it has been found necessary to increase the size of the offices, and a completely new building is being erected for testing and research work.

The production of fan belts for motor vehicles (which represents a widening of the activities of Ferodo Limited) is now well established, and "Ferogrip" fan belts are being generally offered to the trade.

The year 1938 saw the setting up of some remarkable land speed records, particularly outstanding being those of Captain George Eyston and Mr John Cobb. The fact that Ferodo Brake and Clutch Linings were used in connection with these records has done much to enhance the world prestige of Ferodo products.

ASBESTOS CEMENT COMPANY'S PROGRESS

Turners Asbestos Cement Company, whose widespread activities were referred to in my last speech, has continued to progress throughout the year. As you know, this company's headquarters are at Trafford Park, with extensive works there and at Widnes, Erith, Rhoose, and recently, at Dalmeir, near Glasgow. The heavy programme forecast last year has, for all practical purposes, now been carried out. The new buildings at Trafford Park and the necessary reorganisation of plant there have been completed, and ample room is therefore now available for the expansion of our electrical department in various directions as required by the industry, and, in addition, more space has been provided to cater for the growing demand for asbestos cement decorated products.

In the main, I think I can rightly claim that the developments with regard to Turners Asbestos Cement Company briefly outlined in my previous speech have been fulfilled. The constant expansion of its business makes it necessary for us to contemplate further capital expenditure during the coming year, and it is proposed to re-model and improve some of the older plant and bring it up to date in the light of our more recent experience. This will apply to the older sections of the works at Trafford Park, Widnes and Rhoose. It is also our intention to establish a new and fully equipped central research laboratory at Trafford Park, as our laboratory facilities in the asbestos cement section of our business have become somewhat out of balance compared with its rapid and progressive development.

WASHINGTON CHEMICAL

The Washington Chemical Company and Newalls Insulation Company have during the past year specially developed the production and application of acoustic treatment materials. A considerable amount of work has been carried out in connection with the development of material for the suppression of noise in diesel and steam-driven passenger liners. Our product, which is now being extensively used, is known as Paxmarine ("Newalls" Brand) which not only absorbs noise but, in addition, is a most efficient fire protection and medium for insulation of heat. During the past year we have applied this form of insulation to various types of passenger ships, including cross-Channel vessels used entirely for night travel, where for the comfort of passengers the silence of their cabins is most important. A number of orders are on our books to-day awaiting execution, and we expect a considerable expansion of this business in the future.

Owing to the increasing demand a new plant for the manufacture of various grades of insulating bricks, which are incorporated into the construction of boiler settings and many types of furnaces for the conservation of heat and the saving of fuel, is now in course of erection at Washington, and is expected to be in production within a few months. This new equipment should enable us to produce insulating bricks of the highest quality with the maximum of economy.

KEASBEY AND MATTISON

The Keasbey & Mattison Company, which as I have previously mentioned is now wholly owned by Turner & Newall Limited, has continued to make satisfactory progress, but has suffered from the difficult economic conditions prevailing in the United States of America.

I think it is common knowledge that during the past twelve months a serious trade depression has been evident in that country and naturally the Keasbey and Mattison Company has not been exempt from its effects. However, notwithstanding the serious falling off in business, the Keasbey and Mattison Company has not departed from its programme of steady development, and during the year under review plants for the manufacture of asbestos cement pipes have been erected at both Ambler, Pennsylvania, and St. Louis, Missouri, and are now in operation.

Ferodo and Asbestos Incorporated, whose brake lining and friction material factory is at New Brunswick, New Jersey, U.S.A., has made satisfactory progress during the past year.

NO MONOPOLY

In common with the Keasbey and Mattison Company and all other industrial enterprises in the United States, Ferodo and Asbestos Incorporated has suffered a reduction in the volume of business obtained during the past year. I am glad, however, to be able to tell you that the percentage reduction in volume which they have experienced is not as great as the percentage reduction experienced by the friction material industry in the United States as a whole.

Asbestos Cement Limited, our Indian subsidiary, has now completed the two new works in Bombay and Calcutta to which I referred last year, and both factories are in production. In addition to manufacturing our usual range of asbestos cement products the factory at Bombay will also manufacture asbestos cement pipes, which previously we have exported to India from our factories in England. The business of Asbestos Cement Limited in India continues to expand and the future prospects for this company seem bright.

A VERY SATISFACTORY YEAR

You will agree that our company has again had a very satisfactory year, and I think you would wish me to make a few remarks with regard to the effect on the company of the present international situation. In view of the troubled state of the world and the difficulties constantly arising in respect of export trade, we consider that to have maintained our total sales at their present high level is extremely satisfactory. There has, however, been a distinct falling off in sales during the last few months in the case of certain sections of our organisation, and the chance that this decrease may continue must always be borne in mind. If the international position improves and the economic condition of our own country is satisfactory, I see no reason why this company should not continue to be as successful as has been the case during the last few years, but in the present condition of world affairs it is impossible to foresee what the conditions will be even in the immediate future.

In recent months our attention has more than once been called to references in a certain section of the daily press to Turner and Newall Limited as a "monopoly" of "semi-monopoly" company. I should like to make it quite clear that any suggestion of monopoly or semi-monopoly in connection with our business is not in accordance with facts.

INDUSTRIAL REPORTS—continued

Other Foods

Provisions.—Throughout the week there has been only a poor demand for meat, particularly for fresh meat. The Board of Trade has arranged for the import of an additional quantity of 15,000 cwt. of bacon in the next fortnight to replace a temporary deficiency in home supplies. Egg prices continue their seasonal decline.

★

Colonial Produce.—The price of Accra cocoa again weakened with only a poor demand. At the coffee auctions, there was a brisk trade in Kenya kinds, but coffee from Costa Rica was again neglected. Prices at the London tea auctions improved with a good demand. The sugar market has been quiet.

★

Fruit and Vegetables.—Increasing supplies of potatoes tend to reduce prices for all except the best samples. Trade in other vegetables at the London markets has also been quiet and the demand for apples appears to have slackened.

★

Milk.—We give below our usual monthly table compiled from statistics issued by the Milk Marketing Board. Owing to the inclusion in the scheme from October, 1937, of various classes of producers who were previously exempt, it is not possible to compare directly the sales of milk in 1937 and

1938. Comparing the last three months of the two years, however, liquid sales on wholesale contracts (excluding sales by producer-retailers) increased from 153.9 to 156.8 million gallons, sales of milk for manufacture (including milk manufactured by farmhouse cheesemakers) increased from 33.9 to 52.8 millions and total sales through the Milk Marketing Board therefore increased from 187.8 to 209.6 million gallons.

	Dec., 1937	Oct., 1938	Nov., 1938	Dec., 1938
Prices (per gall.)	d.	d.	d.	d.
Liquid	18	17	17.5	17.5
Av. manufacturing ..	7.673	7.199	7.111	7.327
Av. pool	15.64	14.0	15.07	15.43
Contract sales (mill. galls.)				
Liquid	51.2	52.9	51.0	52.9
Manufacturing	12.9	20.6	15.2	13.2
Total contract	64.1	73.5	66.2	66.1
Used by farmhouse cheesemakers	0.7	2.2	1.0	0.5

Miscellaneous Commodities

Oils and Oilseeds.—These markets have again been quiet and prices, where changed, are lower on the week. The up-country sales of linseed in the Argentine remain large and visible stocks at the ports have increased, in spite of good shipments. Quotations for cotton seed declined by 2s. 6d. per ton during the week, but business is still very small.

Rubber.—The market has been overshadowed by political developments and by the approach of the next meeting of the International Regulation Committee. Consequently business in the last week was small and prices again drifted downwards; the price of standard sheet on the spot closed on Wednesday at 7½d. per lb.

★

Furs.—The opening of the Australian sale in London had to be postponed from Thursday to Friday of this week, because the close of the series of silver fox sales was delayed considerably owing to the large supply. In spite of the large offerings, however, silver fox prices declined but slightly on December. In most cases the decline in the closing week of the sale did not exceed 5 per cent. This comparatively satisfactory state of prices, however, was only partly due to the substantial demand, which came mainly from France, the United Kingdom and South America. In many cases the high limits of the sellers and as a result the large withdrawals helped to keep prices up. On the free market the position is not promising at present. Consequently the outlook of the Australian sale and the general winter sales series, which will start at the beginning of next week, is not too good, although a number of furs are expected to show improvements on the very low levels paid at the autumn sales in October, which were adversely affected by the political September crisis.

Customs Revenue

The figures of tobacco and petrol consumption for 1938-39 are estimates on the basis of returns up to the end of October. Revenue from petrol includes small sums from other hydrocarbon oils.

Finance

GOVERNMENT RETURNS

For the week ended January 21, 1939, total ordinary revenue was £40,964,000, against ordinary expenditure of £12,134,000. Thus, excluding sinking fund allocations and Defence expenditure from loans, the deficit accrued since April 1st last is £186,505,000, against a deficit of £109,043,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On January 20th applications at £99 17s. 5d. per cent. for bills to be paid for on Tuesday, Wednesday, Thursday, Friday and Saturday of following week were accepted at about 22 per cent. and week were accepted at higher prices in full. Applications at £99 17s. 5d. for bills to be paid for on Monday were accepted in full. £20.0 millions of Treasury bills are being offered on January 27th.

SHORTER COMMENTS

(Continued from page 196)

British Plaster Board.—In connection with the recent offer by this company to shareholders of D. Anderson & Son, Ltd., acceptances have been received in respect of over 95 per cent. of both the preference and the ordinary shares.

Dufay-Chromex, Ltd.—For the 16 months to September 30, 1938, there is a loss of £122,378. Total sales for the six summer months of 1937 were exceeded in the following winter months and nearly doubled in the summer of 1938. Consolidated

balance sheet shows cash £154, compared with £52,298 at March 31, 1937.

Tilling and British Automobile Traction.—Net profit, 1938, £511,588, a rise of £69,489. Dividend for year 9 per cent. tax free, against 10 per cent. less tax. To general reserve, nil (£10,000). Carry forward reduced from £150,833 to £145,869.

New South Wales Gold Production.—The gold production in New South Wales during 1938 totalled 91,650 oz. fine, an increase of 23,043 oz. fine, on 1937. The value of the gold output was £813,500, an increase of £212,795 on 1937.

South Metropolitan Gas Company.—Final ordinary dividend, 3 per cent. actual, less tax, making 5½ per cent. for 1938 (same). Balance applicable to final ordinary dividend, £218,242 (£214,747).

Watford and St. Albans Gas.—With distribution now proposed of £3 8s. 9d. per cent. on ordinary stock, total for year is £6 17s. 6d. per cent., against 7 per cent. In July last rate was compulsorily lowered under sliding scale on account of increase in price of gas. Profits are £94,147 (£92,330).

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

to be able to lay the blame for the difficulties of the export trades exclusively at Germany's door, since that would absolve us from any inquiry into our own mistakes and failings. There has been a growing tendency in this country in recent years for discussions of the future of export trade to be conducted on the unspoken assumption that the world is, in some way, under obligation to concede a certain volume of trade to us. Perhaps the attitude is an extension of the much more noticeable tendency of individual industries to formulate demands on the assumption that the community owes them a living. But in either case the effect is that the energy of those who suffer misfortune is diverted from the search for means of bettering their lot to the mere generation of wrath.

If we could bring ourselves to examine critically the bases of our export trade, we should find that we are, in fact, deliberately and cumulatively handicapping our own capacity to export. There would, after all, be nothing very novel in this discovery. It is part of the proven and accepted stock-in-trade of economics that a country which protects its domestic industries injures its export trades. The effect was postponed between 1932 and 1937, owing to the coincidence that the initial period of British protection was a time of very rapid industrial and commercial recovery. But the effects of protection, though postponed, have not been avoided, and they are coming to the surface, now that the concealing factor of trade recovery has been withdrawn.

The position of Britain in world trade is fundamentally similar to that of a manufacturer who buys his raw materials and sells the finished product. His competitive ability depends upon the price he charges for the service of converting materials into manufactures. Save for coal in a few markets, all our exports have to face competition in the countries that buy them. Save again for coal, all our exports are very largely produced from imported materials. Our competitive ability is measured by the conversion cost, the margin between the prices of imported raw materials and the prices of the exported manufactures. The quarterly calculation of these prices by the Board of Trade is recorded in a Note on page 263. If 1938 is compared with 1929, the average prices of our imports of raw materials have fallen by 30 per cent., those of our exported manufactures by only 13 per cent. As a result, the relative prices of British exports (the so-called "Terms of Trade") have risen by 24 per cent.

To a considerable extent this is inevitable. Raw material prices always suffer first and most from a period of depression, and it would be unreasonable to expect

manufacturers to reduce their prices in the same ruinous proportions. Every industrial country suffers in depressions from what is euphemistically known as a "favourable" movement of the terms of trade. The real complaint against our price policy is not that it has failed to close the gap between the prices of raw materials and manufactures (since that is an impossibility), but that it has widened it. Since 1935 the rise in the average price of our manufactured exports has been actually greater than the rise in the average price of our imported raw materials. We have added to the price-disability under which we were labouring three years ago instead of diminishing it. The reasons for this are, of course, obvious. Since 1935 wage-rates have been quite substantially increased. The prices that the exporter has to pay for coal, steel and railway transport—the three most fundamental ingredients of the manufacturing process—have all risen, the first two substantially, in the last few years. The policy of protection has, of course, played its leading part in this raising of the British price structure. But it has been powerfully aided and abetted by the encouragement given to domestic industries, by Marketing Acts, Enabling Bills and the like, to form themselves into tight, semi-monopolistic cartels of producers who, with a shadowy minimum of public control, dictate the prices they will charge.

Ten years ago the public was familiar with the distinction between the sheltered and the unsheltered industries. What has been happening since then is that the sheltered industries, with several added to their number, have been barricading themselves in. The cost of the process has naturally fallen with increased force on those unfortunate industries which enjoy no shelter. Agriculture is half in and half out of shelter; though it has been given some tariffs, the political importance in an industrial community of cheap food inevitably limits its freedom. The export industries are wholly without shelter.

It is very important that the country should realise what is going on and should enter on the correct account the cost of supporting the increasing number of indigent industries who depend on exports or compete with imports. Shipping wants nearly £10 millions a year. Shipbuilding will want a tidy sum. Agriculture is putting forward a policy which, as was shown in these columns last week, will cost at least £30 millions a year. When others are added in, the total bill will be something like £60 millions a year in direct cost to the Exchequer, let alone the losses to private individuals through high prices at home and sinking exports abroad. Is this brand of Protection really worth a shilling on the income tax?

vinced that a superiority of force is the sovereign means of victory in the international arena. That conviction is frankly expressed several times over in this week's speech. He tells us, for instance, that, immediately after the crisis of last May, he set about mobilising the total military resources of Germany for the purpose of taking the Sudetenland from Czecho-Slovakia in the autumn—and the nature and significance of this fact are not affected by his naïve postscript that it would be "a gross distortion of the facts" to call this action "military blackmail." He tells us, again, that—notwithstanding his acknowledged economic and financial anxieties—he is going to continue the re-armament of Germany to the limit of his power. He has also told us that, while he is not going to war with Great Britain and France just now for the sake of recovering possession of the ex-German colonies, the present distribution of the world's riches will be corrected sooner or later by force if it is not corrected first by "justice."

Here we have a clear notification that Herr Hitler is as closely wedded as ever to his philosophy of force, and that he is only restrained from acting upon it by his awareness of certain limiting factors which may be more powerful than a dictator's will. In this week's speech he has admitted his awareness of a financial limitation. Germany must "export or die"—and here the Fuehrer is not on strong ground, seeing that Germany's closed economy is parasitic upon the open economy of the democratic Western Powers. If he does carry out his threat to launch a desperate trade offensive against us, he will be simply inviting us to treat him, in matters of commerce, as he has so long been treating us; and the result would certainly not be to Germany's advantage. Again, he denounces the B.B.C.'s broadcasts in German, and threatens to retaliate in kind; but this threat too falls flat, because Dr Goebbels has been broadcasting his propaganda abroad for years past. A country with a free Press is not in the least afraid of propaganda broadcasts from abroad, while the Fuehrer's anger is itself the best possible evidence that the B.B.C.'s scrupulously accurate and moderate broadcasts are having their effect in Germany.

German public opinion is, indeed, threatening to clip the Fuehrer's wings rather closely; and the present situation in Germany is reminiscent of that in China during the early years after the revolution of 1911. A long-suffering people will submit to being plagued and harried to a degree that fills a democratic observer with amazement; but all the same there is a certain line which the most reckless war-lord knows that he cannot overstep with impunity. Herr Hitler knows that he cannot with impunity subject the German people to a second bout of inflation in one lifetime. He also knows that, last autumn, he would have had difficulties in leading the German people into a major war—even for the sake of vindicating that right of national unification which, in the peace settlement of 1919-20, had been denied to the Germans when it had been granted to the Yugoslavs and Poles and Roumanians.

Now that, without a war, the incorporation of Austria and the Sudetenland into the Reich has been accomplished, it is not easy for Herr Hitler to present the Germans with a war-aim for which they will be willing to give their lives. After Munich there were many prophecies that Herr Hitler would swiftly gather in the Eastern fruits of his victory in the power game over the Western democracies. It was prophesied that Roumania, Yugoslavia and Poland would crumple up, and even that their troops would follow, perforce, in Herr Hitler's train in an expedition against Russia this spring in the style of Alexander the Great. Germany's machinations over the Carpatho-Ukraine pointed that way. But for this spring, at any rate, the Russian expedition seems to have been called off—at least, that is how the outcome of Herr von Ribbentrop's recent visit to Warsaw is apparently to be interpreted. Perhaps Herr Hitler now has reason to expect that, if he strikes eastward, Poland and Roumania, as well as Russia, will resist, and that he will then find himself committed to an arduous war for which his people will have no stomach.

Has he then—abandoning the fundamental thesis of "Mein Kampf"—and reverting to the pre-war policy of the German General Staff which he has so often castigated—now transferred his aggressive intentions to the Western front in the belief that here he will find a softer option? The Maginot Line is as formidable as ever, while a German air attack would find both Great Britain and France far better prepared for defence to-day than they were four months ago. In this week's speech Herr Hitler has made no immediate direct demands upon Great Britain and France. Indeed, he prophesied a long period of peace with them. This statement would be definitely encouraging were it not for two facts. The same voice promised in May, 1935, to respect "unconditionally" the

territorial changes of the Treaty of Versailles and declared that no annexation of Austria was intended or desired; and it told us in January, 1937, that the era of surprises was over. And, secondly, there was the passage this week which pledged Germany's armed support for Italy. This is the passage which is being the most anxiously scanned by the German public; and it is exceedingly obscure; for the official published German version does not tally with what the listeners thought they heard the Fuehrer say, or again with the semi-official English translation. Did Herr Hitler declare that Germany would take up arms on Signor Mussolini's behalf if they were involved in war in any circumstances? Or did he only say that Germany would fight for Italy if some third party wantonly picked a quarrel with her for ideological reasons?

Supposing that Herr Hitler really has pledged Germany's armed support to Signor Mussolini in any war in which Italy may be involved in any circumstances—and supposing further that this promise can be relied upon—which of the two partner-countries will be the cat's-paw? It is common knowledge that the Hitler-Mussolini Axis is unpopular in Germany and Italy alike. Each nation resentfully suspects that its own leader may one day decide to sacrifice it for the other nation's leader's benefit. Is it Signor Mussolini, with his preposterous demands upon France, who is dragging Germany towards the precipice? If so, the history of 1914 would be repeating itself; for, on Monday, Herr Hitler reminded his audience that Germany "simply slid into" the war of 1914-18 "from some at the time doubtless wrongly understood loyalty to an alliance." Or is the boot on the other foot? Is Herr Hitler, behind his momentary show of moderation, egging Signor Mussolini on to involve Italy in a war with France, on the calculation that Germany will then be able to fish for African colonies in troubled Mediterranean waters, with the certainty that Italy will be committed too far for neutrality?

Much depends, no doubt, on the extent of the strategic advantages which the pair of dictators believe that they can extract out of the victory which they have conferred upon General Franco in Catalonia. Pace the Prime Minister's prime article of faith, Signor Mussolini's promises have no better history than Herr Hitler's. If he can force General Franco to play the Italian game he will, and Castilian pride may be as impotent to evict the Italians and Germans from the Balearics, the Canaries, the Basque country and Galicia as it has been, for the past 235 years, to evict the British from Gibraltar. Will Signor Mussolini judge that his strategic leverage in Spain, together with Herr Hitler's perhaps rather equivocal backing, offers him the possibility of pressing, with success, his demands upon France in face of a decisive French "No"? If he does come to that conclusion, the breathing-space given to Europe by Herr Hitler's latest speech may prove, after all, to be a short one.

The Prime Minister was unquestionably right in requiring from Herr Hitler a demonstration of sincerity, in the form of an agreement to limit armaments, before any of the democracies' suspicions or precautions could be relaxed. Mr Chamberlain did not add—though he would have to if his suggestion were accepted—that any such limitation would need to be on the basis of complete equality in the air and would have to include provision for the most stringent control of all parties to see that promises were kept. These, of course, are admittedly very difficult conditions. But it is the bane of Nazi diplomacy that Germany's neighbours are so aroused and apprehensive that they can no longer be lulled by a speech, even one full of the fairest promises. Until actions, or the lack of them, reinforce Herr Hitler's words, the only possible course for the rest of us to pursue is embattled watchfulness and the utmost despatch in defence preparations.

Berlin and Barcelona

HERR HITLER might justly boast that he now holds the well-to-do bourgeoisie of the Western democracies on a string. He has only to give the string a jerk, and they get the jitters; to slacken it, and they cheer up again. At any moment the dictator in Berlin can make or mar business on the Stock Exchanges of London, Paris and New York. Last week, under the shadow of a fear that, in his speech on Monday, he was going to make swingeing demands upon the West European Powers, prices slumped; on the morrow of a speech which unexpectedly fell short of these apprehensions, prices rose sharply again. Both the downward and the upward movements were excessive; for by this time the City and Wall Street ought to have had enough experience of Herr Hitler's ways to have avoided both their exaggerated scare before, and their exaggerated relief after, the delivery of the Fuehrer's loudly trumpeted oration.

We know, for instance, that he is wholeheartedly con-

Camps for Peace and War

THE Englishman's home is proverbially his castle, and his objection to sharing it with strangers has deep historical roots. It is set out in the seventeenth century Bill of Rights where the billeting of soldiers in private houses is prohibited. It was heard again last September, when the billeting of children evacuated from towns met with protests, and it has been loudly restated since.

The reluctance of individuals to perform a distasteful type of national service might be disregarded. Clearly the Government's short-term plans for evacuation must envisage large-scale billeting. To save lives is more imperative than to spare susceptibilities. Nevertheless, there are obvious social, strategic and administrative reasons why billeting, except as an improvisation, is scarcely a satisfactory policy by itself. A considerable part of the evacuated population would probably have to be boarded out in war-time under any scheme. But there is a growing volume of lay and expert support for the view that camps, consisting, not of tents, but of sets of permanent buildings, like the holiday camps that have recently become popular, provide at least a partial alternative to billeting in private houses. It is widely argued that well-built and safely sited evacuation camps could be well used in time of peace to provide cheap and healthy holidays for the rising number of work-people who now take holidays with pay, or to supply the need for country schools at which town children might with benefit spend some part of each scholastic year. And it has been officially stated within the last few days that the inclusion of camps in the Government's defence programme is seriously contemplated.

The Government's task is one of considerable magnitude, and it is hard to see how it can be successfully undertaken solely on the basis of mass billeting. It was the considered view of the Anderson Committee last summer that a substantial proportion of the population of vulnerable urban areas, adults as well as children, would have to be transferred in case of war. Only those necessary to maintain vital war-time industries and essential services would be kept *in situ*. Estimates of the numbers that it would be practicable and wise to move from danger spots have run as high as 2,000,000 from Middlesex and London, 130,000 from Tyneside, 500,000 from the West Riding, 600,000 from Manchester and Merseyside, and 300,000 from the Birmingham district, making in all more than 3,500,000. Probably these estimates would in the event be proved much too generous. But it is scarcely likely that many fewer than 2,000,000 would have to leave London for safety.

The resettlement of 2,000,000 or so Londoners of all ages would strain the most comprehensive evacuation programme severely. Almost certainly it would be impossible as well as undesirable and dangerous to place them all in the private houses and public institutions to be found within the comparatively limited area over which it would be feasible to move so many people. Transport facilities are limited, and it would be difficult to organise supplies in, say, the remote West country, unless transport were considerably developed and a wholesale extension and improvement of dock facilities made the diversion of trade from Eastern to Western ports possible. The setting up of camps, built to withstand all weathers and provided with light, heat, water and power, may be the only means to solve the vast problem of London's refugees within the confined compass of the Home Counties.

The basis of any calculation of the capacity and cost of evacuation camps must necessarily be their prototypes, the holiday camps that are to be found in growing numbers on the East and South coasts and, less frequently, in North

Wales and Lancashire and inland in Surrey. The 150 or so camps of this kind that have so far been founded can be divided roughly into three groups. There are first of all those run primarily for the benefit of members of social groups or movements, such as the Civil Service Holiday Camps, which were pioneers in the field, and the camps of the Young Men's Christian Association. These are small camps which, although they commonly possess a minimum equipment of restaurant and common room for games and dancing, as well as sleeping chalets or huts, chiefly rely upon impromptu amusements, such as dances, cards and concerts, to entertain their visitors, who may number 200 or 300 at a time.

Secondly, there are the smaller camps run by private enterprise, with an accommodation up to about 500. They make up the bulk of the existing holiday camps, and, apart from ordinary common room amenities, their guests are left to make their own amusements, either in the camps or in near-by towns. The prices charged in these smaller commercial camps are broadly the same as in those run by social organisations and, last year, they ranged from £2 5s. to £2 10s. per head per week.

The large commercial camps which make up the third category are somewhat more costly, and they may house 2,000 or 4,000 visitors. The charges announced for this year vary from £2 12s. 6d. to £3 3s. a week, and these "super" camps make no attempt like the smaller ones to avoid mass-produced entertainment. To a large degree they are feeders to the amusement parks attached to them and provide such facilities as swimming pools, tennis courts, bowling greens, miniature golf courses, boats, licensed bars, billiards, hairdressing saloons, shops, post offices and, for an extra charge, riding and skating, in addition to paid organisers and games instructors. There can be no doubt that holiday camps, both large and small, are symbols of the times we live in. Just as the traditional boarding house provided, and still provides, a background to the annual family holiday that became a national habit in Victorian days, so does the holiday camp provide pleasures in keeping with the modern desire to be out of doors and away from conventional restrictions. It is certain, too, that, quite apart from their relevance to the problems of war-time evacuation and the need for country annexes to town schools, the camps' rôle in the life of the community is likely to grow in importance.

Already over 8 million working people enjoy paid holidays, and, of those insured against sickness, there are another 11 millions to be similarly furnished if general holidays with pay are to be achieved. So far the contribution of the holiday camps to the problem of accommodating the new class of holidaymakers, with their families, at cheap rates has been relatively small. The average accommodation in camps of all kinds is between 450 and 500, and the average number of visitors per camp is between 5,500 and 6,500 a year. Thus, between May and September, a total number of 850,000 or 950,000 visitors is catered for. With less than 1 million visitors a year and weekly charges of at least £2 2s. per head the camps cannot meet the vast new demand for cheap holiday accommodation.

Steps are already being taken by public and semi-public bodies to organise camps to meet these peace-time holiday needs. The National Fitness Council propose to organise camps with a minimum weekly charge of £2 10s. *per family* and, to take only one instance of local enterprise, Lambeth Borough Council is negotiating for a camp site at Herne Bay. Up and down the country, semi-permanent school camps are being set up by urban educa-

tion authorities. The question of organising camps on a wide scale for evacuation purposes has, therefore, more than merely a defence aspect. How far is it possible to kill three birds with one stone and provide camps for the refugees of any future war which will also serve as holiday centres and country schools? Is it feasible, in short, to build holiday camps cheaply, and so lower the present over-high weekly charges to working-class visitors, by subsidising their initial building costs out of Government expenditure, which would in any case have to be incurred?

In theory it is almost certainly possible. If 1,500-2,000 camps were built to house 1,000,000 of the total number of refugees (500 in each to spread the dispersal thin), the rest being assigned to billets, it would be possible in peacetime to accommodate some 10 million holidaymakers annually for a fortnight each between May 1st and September 30th at a low family charge. Estimates of the cost range from £30 to £50 millions, since what the camps lacked in the full range of amenities given by the super-commercial camps they would gain in necessarily much stouter construction in view of probable winter use. But a large part of the outlay would come back in holiday receipts, although the subsidised prices would be small.

In practice, it will not be so easy. The establishment of dual (or triple) purpose camps depends upon one all-important factor, namely, that the sites suitable for evacua-

tion camps will coincide with those suitable for holiday (and school) camps. Many of the present coastal camp sites would be unsuitable. Distant sites suitable for holiday camps would be inaccessible for evacuation and difficult to organise in war-time. Remote rural sites suitable for evacuation camps are not necessarily popular as holiday resorts, though they would serve well as country schools. London, for instance, would have to rely on the Chilterns, the North and South Downs, the Thames Valley, the coast from, say, Hampshire to Suffolk (avoiding all large towns), and perhaps the Cotswolds. In some of these districts water supply in summer is already a problem. In most of them the organisation of food supplies and essential services would not be simple.

The case for experiment is unassailable, and the rumour that the Government are to set up trial camps is welcome. Only thus can the practical obstacles be gauged and met. It may well be found that camps can solve only a limited part of the evacuation problem, which is, in any case, not isolated, but a sector of defence economy, dependent for its strategy upon the Government's plans with regard to trade, transport and distribution, food supplies and man-power. But, in so far as any part at all can be solved by dual or triple purpose camps, war will be used to pay the price of peace, and safety and the standard of good living will march together.

The Two Ukraines

(By a Correspondent)

ARE the Ukrainians a nation? The answer is both "Yes" and "No," for whereas the Ukrainians exist as a distinct people in relation both to the Russians and the Poles, their national aspirations are so different in Poland and in the Soviet Union that they must be regarded as two nations rather than one. This separation is a fact of great importance for any consideration of the prospects of Nazi expansion in Eastern Europe, and it is a fact which cannot easily be altered, because it is a product of long historical development and not merely of political conditions in the last twenty years.

The word *Ukraina* means "Frontier," and was originally applied to the southern fringe of the settled "Russian land" towards the wild uncultivated steppe near the Black Sea, which was the domain (up to the eighteenth century) of Tatar nomads. As this territory comprised the most fertile soil of Eastern Europe, the famous "black earth" belt—and as it lay nearest of the Russian lands to Constantinople, it was for a long time the most civilised and thickly populated part of Russia, but it was also the most exposed to raids and invasions from the Tatar steppe. Ethnically, the people of the Ukraine called themselves Russians, but they spoke South Russian dialects diverging considerably from the North Russian of Novgorod and the upper Volga country, from which modern standard Russian is derived.

The difference of dialect, however, would probably not have sufficed to create a Ukrainian nationality, if the Ukrainians had not been cut off politically from the main body of the Russians for four centuries. The Russians of the Ukraine were conquered by the Tatars in the thirteenth century, and when the Tatar power declined they did not regain their independence, but fell under the rule of the Lithuanians and of the Poles advancing from the west. Lithuania was eventually united with, and swallowed up by, Poland, which included in its widest extension

It should be noted that the above map shows the maximum Ukrainian claims on Polish territory.

Kiev, Poltava and Smolensk. The Poles themselves got hold of the Ukraine proper; the Russians who remained within the Lithuanian subdivision of Poland called themselves Lithuanians until the nineteenth century, when they took the name of White Russians (*Byelorussky*—not to be confused with politically "White" Russians), forming a third branch of the Russian people, distinct both from the Russians of Muscovy and from the Ukrainians.

As a result of the long Polish domination the linguistic separation of South Russian (Ukrainian) from North Russian was greatly accentuated; the former, took over many Polish words, which were often ultimately of German origin. On the other hand, the Poles did not succeed in absorbing the Ukrainians, so as to make a single Polish-Ukrainian nation, because of a profound cultural contrast. Polish culture was Latin and Catholic, the

Ukrainian was Byzantine and Orthodox. The Poles converted the Ukrainian nobles to Polish speech and the Catholic religion, but the Ukrainian peasants held fast to their old language and faith, and the linguistic and religious lines of division thus became identical with that of class antagonism.

A Ukrainian national movement, anti-Polish and anti-Catholic, came into being in the seventeenth century; its political base was the little republic of the Zaporog Cossacks, military colonists who guarded the south-eastern border of Poland against the Tatars. The Cossack Khmel-nitsky led a great revolt of the Ukrainian serfs; failing to set up an independent state, he put himself under the protection of the Muscovite Tsar. Thus a large area of the Ukraine became once more a part of "Russia," but from 1654 to 1708 it formed an autonomous unit called the Hetmanschina (also known as Little Russia) under the supremacy of Moscow. From the time of Peter the Great, however, the Russian Ukraine was brought more and more under centralised Tsarist rule, and the same process was applied to the Ukrainians further west after the Partitions of Poland.

The Ukrainians had at first welcomed the Muscovite Russians, their brothers in religious faith, as deliverers from Catholic Polish tyranny. But the harsh despotism of the Tsars was bound to clash with the Cossack republican tradition alive in the Ukraine from the days of Khmel-nitsky, and new hatreds arose out of the scramble of Muscovite nobles for black-earth lands. After the collapse of Poland Ukrainian antipathy was turned against Russia, and in the nineteenth century the struggle took the form characteristic of nationality conflicts all over Europe. Scholars and writers began to cultivate Ukrainian as a language distinct from Russian; the Petersburg bureaucracy replied with the *ukaz* of 1876, which made it practically impossible to print in Ukrainian. At this point a new saviour appeared for the oppressed people. By the Partitions of Poland the Ukrainians of Galicia had come under Austrian rule, and Austrian statesmen were quick to see in them an element which could be used as a counterweight both to Poles and to Russians. Ukrainian was recognised as one of the *Landessprachen* of Austria, and Lvov became the centre of Ukrainian literary culture.

In 1918 the Germans set up, after the collapse of Russia, separate Polish and Ukrainian states, the latter including all regions with a Ukrainian majority. The immediate aim of the Germans in the Ukraine was to get hold of grain to relieve the food shortage in Germany, and with this end in view they backed the Government of General Skoropadsky, who represented a clique of great landowners. But when Germany and Austria in turn collapsed, Skoropadsky had to flee, and the Ukraine fell into utter confusion. The Poles occupied part of the territory of the Ukrainian Republic in the west, while further east Ukrainian nationalists (Petlura), Russian "Whites" (Denikin), Anarchists (Makhno) and Bolsheviks fought for mastery. In the end the Ukraine was partitioned between Poles and Bolsheviks, and the two sections of the Ukrainian people have had quite different destinies ever since.

Most of what is now the Polish Ukraine was formerly Austrian, and the inhabitants look back to the days of Austrian rule as to a Golden Age. The Poles at first promised autonomy for the Ukrainian provinces, but they have never attempted to carry out their promise, and have on the contrary made every effort to obliterate Ukrainian nationality and Polish the population. Resistance on the part of the Ukrainians has been met with repression; in 1930 a systematic "pacification" was carried out, and cavalry detachments went from village to village flogging peasants at random without any form of trial. To-day there is probably no hatred in Europe equal to that of the Ukrainians for the Poles, and the irony of the situation is that, because Nazi Germany has found it convenient to

champion a cause which Britain and France formerly ignored, the anti-Fascists of the West will now be driven almost automatically to deny the claims of Europe's largest and worst-treated national minority.

There can be no doubt but that the Ukrainians of Poland are responding readily to agitation coming from Carpatho-Ukraine under the patronage of Germany. The memory of Austrian favour makes them naturally pro-German; they see no hope of a free national life except through separation from Poland; and the Ukrainian middle class in the towns would provide the social basis for a state of Fascist type subservient to Germany. In the Polish Ukraine the landlords, the officials and the bigger capitalists are Poles, but the Ukrainian *petite bourgeoisie* is large enough to take the lead in the nationalist movement.

In the Soviet Ukraine, on the other hand, both the landlords and the middle class have been eliminated, and a new kind of society has been created in which State officials have taken the place of the upper social strata of former times. This social order has given rise to conflicts of a new kind, but these are no longer definable in terms of nationality. It cannot be said that there is a struggle of Ukrainian against Russian comparable to that of Ukrainian against Pole. The Ukrainian Socialist Soviet Republic is one of the constituent republics of the Soviet Union, and the Ukrainian language is formally recognised as its proper speech. There is no persecution of Ukrainians as such in the Soviet Union, as there is in Poland, and the language question, which provided the Ukrainians with their principal grievance for half a century before 1917, is no longer an issue. There is, indeed, considerable unrest in the Soviet Ukraine, but it is not really separatist, and it is certainly not pro-German. The Ukrainians east of Galicia only remember the Germans as invaders who hanged peasants on portable gibbets and preserved the great landowners in their possessions at a time when the Bolsheviks were driving them out. What does undoubtedly exist in the Ukraine, and in much larger measure than in Russia proper, is anti-Stalinism, but opposition to Stalin is only equivalent to treason if one accepts the contention of the Stalinists that Stalin and the Soviet regime are identical. In a democracy, however, it is recognised that opposition to the Government in power does not necessarily involve treason to the State, and there is every reason to believe that, if the Soviet Union were a real democracy, what is called "Trotsky-Bukharinism" would express itself as a constitutional opposition in no way damaging to the unity and stability of the federal State. The Ukraine is a stronghold of opposition tendencies because the proportion of well-to-do peasants was much larger there than in Central Russia, and the crisis produced by Stalin's forced collectivisation policy was correspondingly more severe. To-day the collective farms are an accomplished fact, but the struggle has taken a new form; it is no longer between collective and individual farming but rather between bureaucratic and democratic tendencies within the collectives. That Stalin is well aware that the Ukraine is a focus of opposition to his dictatorship is shown by the special severity of the recent purge of its administration. According to a reliable account of the conspiracy against Stalin early in 1937, it was planned that General Petrovsky, a son of the President of the Ukraine Republic, should seize the Kremlin, and Ukrainian troops under General Dubovoi were to be rushed to Moscow. But it should be noted that there was no question of separating the Ukraine from the Soviet Union; the idea was to change the Government at the centre. The Soviet Ukraine is the part of the U.S.S.R. where genuinely democratic tendencies are strongest, but just for that reason it is the least suitable for Nazi penetration. Herr Hitler can find as many friends as he needs in the Polish Ukraine, but if he seeks them farther east he is more likely to be successful in Moscow itself than in Kiev.

Topics of the Week

Recruiting Ministers.—The Cabinet changes announced last week-end scarcely represent even the beginning of the remodelling of the Ministry that is now overdue. Admiral of the Fleet Lord Chatfield becomes Minister for the Co-ordination of Defence in place of Sir Thomas Inskip, who goes to the Dominions Office. At the Ministry of Agriculture Sir Reginald Dorman-Smith supersedes the unfortunate Mr Morrison who, as Chancellor of the Duchy of Lancaster, will represent Lord Chatfield in the Commons; and the late Chancellor of the Duchy, Lord Winterton, has left the Cabinet and accepted the unpaid office of Paymaster-General to concentrate on his work as chairman of the Inter-Governmental Committee for Refugees. Lord Strathcona, who has been Parliamentary Under-Secretary for War for over four years and was recently associated with a protest of certain junior Ministers against the lagged progress of re-armament, has been jettisoned, and his place is taken by Lord Munster, of whom little is known. Mr R. S. Hudson, Secretary of the Department of Overseas Trade, who was the leader of the junior Ministers' protest, offered his resignation, but it was not accepted. The most important changes were made in response to pressure. Dissatisfaction with the co-ordination of defence policy made the supersession of Sir Thomas Inskip inevitable many months ago. His successor has a high reputation in the Navy, and has just ended his work as chairman of the Committee on Indian Defence. His appointment suggests a development of strategic co-ordination between the defence services rather than the co-ordination of supplies and production between the defence departments which is still needed; in supply matters his experience is necessarily extremely limited. Sir Reginald Dorman-Smith, too, is a specialist. Virtually, his appointment is *ex officio*, since he is an ex-president of the National Farmers' Union whose outcries brought down Mr Morrison; and it remains to be seen whether the poacher can successfully turn gamekeeper. It has been the practice of the present Government to reply to criticism from time to time by playing a species of musical chairs with Ministries and Ministers and, since talent is not over-abundant in their ranks except among members who have lately given evidence of a muted discontent, the number of players available is now small. Moreover, it must not be forgotten that Lord Chatfield is now not only Minister for the Co-ordination of Defence, nor is Sir Reginald Dorman-Smith merely Minister of Agriculture. Both are also members of the Cabinet. The elevation of outside specialists direct to Cabinet rank must arouse misgivings. Either they will become influential in decisions on matters of which they have little knowledge. Or, more likely, the power of the Inner Cabinet will grow still greater. The constitutional implications of this tendency will bear close scrutiny.

Commons, Dictators and Spain.—Parliament re-assembled on Tuesday and the Commons' attention was turned at once to the diplomatic scene. The Prime Minister's statement of satisfaction with the recent frank talks he had had in Rome with Signor Mussolini was followed by a debate on Spain. Mr Chamberlain batted on a wicket that played much more easily than might have been expected a few days earlier. The German Fuehrer's moderate speech on Monday had at least dispelled fears of an immediate crisis, and the latest news about the progress of re-armament tended to confirm the view that the Government were at last achieving appreciable results. Moreover, the Prime Minister's stance was much firmer than it has been a few months before. Several of his sentences made it clear that the next move in the process of appeasement must be made by the dictators themselves. He was satisfied that the Duce had a deep desire for peace. He did not believe

that Herr Hitler was preparing to plunge Europe into another crisis. But a proposal from their side for the limitation of armaments would be welcomed as earnest that they were sincere. The keynote of the Government's case was still faith in the dictators' goodwill and, in particular, faith in their claims that they had no territorial ambitions whatsoever in Spain. Consequently, one-sided non-intervention in the form of refusing arms to the Spanish Government, and so ensuring General Franco's ultimate triumph, was justified as a contribution to world peace. Mr Chamberlain's critics were still not persuaded that Germany and Italy had paid a heavy price in men and materials merely for the altruistic object of extirpating a Bolshevik menace in Spain which both Nazis and Fascists knew very well did not exist. Perhaps the most significant statement made on Tuesday was the Prime Minister's revelation that Signor Mussolini had stated that the settlement of Italy's claims on France could not come until the Spanish war was over. Apparently the time for the true test of appeasement—and of both the Axis and Entente—is not yet quite ripe.

Relief in the Pyrenees.—During his speech, Mr Chamberlain touched on what he called "the humanitarian aspect" of the Spanish war, and revealed that the Government had paid over £40,000 to the International Commission for the assistance of child refugees from Spain. We hope, as the Prime Minister hinted, that there will be more to come; and that the measure will not be stinted. For the French Government, dealing less in fine phrases, have meanwhile admitted to their charity between 40,000 and 50,000 human lives. These people have struggled as best they could over snow-covered passes and mountain roads, suffering great privation, nursing their wounds and their weaker brothers, sleeping and living as they could until they had passed the frontier. Many more await their chance: and, much to their honour, there is no sign that the French will carp at the cost of taking them. Only able-bodied men of military age are being turned back, and some thousands who had crossed the frontier have since been sent again into Catalonia. To prepare for a Republican rout which may come whenever the Insurgents have pushed the line to breaking point, the French have stationed 50,000 troops between the sea and the boundary at Andorra: and they now face the contingency of standing to arms against the worn-out Republicans with whom their sympathies, especially after the sad scenes of refugee plight this week, must more than ever lie. From Barcelona come reports of food shortage somewhat mitigated by release from air raids: so far General Franco has shown no vindictiveness, but the promised trials, which are not yet begun, will show the real quality of his mercy. In southern Spain General Miaja has declared his intention of fighting on: and it is very evident that the war may easily continue for a number of months.

America and the Democracies.—Any doubts that may have remained in Europe about the rapidity with which American opinion on world affairs is changing should have been dispelled by the events of the past week. The crash of a new type of military bomber while undergoing tests in California last week revealed the presence on board of a member of a French Air Mission. The isolationists in Congress immediately demanded to know how it came about the representatives of a foreign power were testing one of the latest products of American aeronautical design. On inquiring further they discovered that the French Air Mission was not merely being allowed to place orders for military machines in the United States but positively encouraged to do so and

given exceptional assistance in pursuing its investigations. Foreign policy was here obviously involved and one of the celebrated Senatorial investigations was promptly set on foot. The Administration relied at first on the argument that it was an advantage to have the capacity of American factories occupied by foreign orders pending the coming programme of expansion of the United States' own Air Force. But Mr Roosevelt, with characteristic directness, was not content with this incomplete revelation of the purposes of his policy. He summoned the investigating Senators to the White House and told them in secret—according to reports so circumstantial, and so similar in different newspapers, that they must be believed in general, even though they may be inaccurate in detail—that the United States had a direct interest in strengthening the hands of Britain and France. Adopting Lord Baldwin's celebrated phrase that Britain's frontier is on the Rhine, he is reported to have declared that America's frontier was in France and that the United States must do everything short of actually declaring war and sending troops to support the democrats against the dictators. He is even reported to have declared that there were understandings with the British and French Governments for "definite commitments" in time of war. Only a few short months ago it would have been inconceivable that an American President should have made statements of this sort, even in secret. As it is, there is a shout of protest from all the isolationists and pacifists. There will be a sharp debate throughout America, but there can be no question that the President has a very large body of opinion, perhaps a majority, on his side. The howl of rage from Germany is even louder than from the Senate, and since the American people's antipathy to the dictatorships is currently stronger than their love for the democracies, the higher-pitched are Dr Goebbels' screams, the more is Mr Roosevelt likely to be pleased. He has, at the very least, openly stated a case in which increasing numbers of Americans are coming to believe. And at best he has changed the course of history.

M. Daladier and M. Bonnet.—Before the end of the long foreign policy debate in the French Chamber, M. Daladier and M. Bonnet both made verbally similar declarations of firmness towards Italy. They both rejected categorically the Italian demands at the expense of France, and declared that France would not yield a foot of territory anywhere. M. Daladier was heartily cheered in almost all quarters of the House; M. Bonnet was received tepidly save for the little knot of Flandinists. Why this different reception for declarations that were ostensibly identical? Because the Chamber felt sure that M. Daladier was speaking with complete sincerity, while it suspected that M. Bonnet's identical words were a screen for some tortuous policy of setting out to meet Signor Mussolini halfway—a journey which would probably not stop at its original destination. M. Bonnet has succeeded in making himself completely suspect at home and abroad, and his prestige has not been enhanced by a report that, in speaking with French journalists, he begged them not to reply in kind to the abuse of the Italian Press and remarked that, after all, Italy had been badly treated. This report, in one form, has been officially denied; but there are many who hold that, in a slightly different form, it is true. In any case, M. Bonnet is completely out of tune with the feelings not only of the country but of his own Cabinet colleagues, since all its recent actions have emphasised firmness rather than a search for compromise. Thus M. Daladier has been openly in consultation with his military advisers on the problems of the defence of France and the Empire against attacks coming from Italy or Spain. The Cabinet has decided to refrain for the present from accrediting a representative to General Franco (the "appeasing" move of accrediting a French Ambassador to the Italian Emperor of Ethiopia being taken, it is to be presumed, as a discouraging precedent). The collective responsibility of French cabinets is never as rigid as that of British

cabinets. But it would be an advantage to France if she could acquire a Foreign Minister who believes in French foreign policy.

Agriculture's "Square Deal."—It is apparent both from the fact of the appointment to the Ministry of Agriculture of last year's President of the National Farmers' Union and also from the terms of his first official speech in the Commons debate on Wednesday, that the Government are disposed to accept the Union's policy of "price insurance." Sir Reginald Dorman-Smith accepted a motion endorsing this policy and promised both the farmer and the farm labourer a "square deal." The precise terms of the farmers' square deal are as obscure as those of that other square deal that the railways have been pressing—and in the case of agriculture there is not merely a suspicion but a certainty that there will be an added burden for the community to bear. The Minister of Agriculture rightly rejected the notion that any system of guaranteed prices can be determined by "the cost of production of the efficient producer," and that is one point gained. The question now becomes virtually one of naming prices. Sir Reginald Dorman-Smith is not to be envied his task of finding prices which will satisfy the farmers while not costing the Exchequer more than it is prepared to find. But he must not be allowed to escape from the conjunction of this Scylla and Charybdis. Any attempt to slip out of the dilemma by artificial enhancement of prices would not in any way diminish the cost to the community of bearing the farmers' burden, but would merely distribute it in the most inequitable and regressive way. The policy of guaranteed prices or "price insurance" will be tolerable only if the cost is openly admitted and fairly assessed.

Progress in the Air.—It would be false to suppose that anxiety about the inferiority of Britain's striking power in the air compared with possible enemies has appreciably died down. It would be equally false to imagine that no progress is being made to make up the leeway. Complaints about retarding faults in the Government's central direction of the air programme still persist, and there is still no convincing evidence that a Minister of Supply could not cut several knots that still hamper progress. But the recent record none the less makes reassuring reading. Last year, it has been officially stated, the monthly output of machines was more than doubled. By May, 1940, claims the Prime Minister, the rate of production will be four times what it was two years before. The Air Estimates for the coming Budget year are likely to be ten times what they were in 1935, and, from all the statements made, it seems probable that the production of aircraft has been already raised to 400 a month, which it would probably be possible at least to double by continuous working and other speeding-up under actual war-time conditions. The initial difficulty of creating an expanded industry, equipping it with factories, artisans and tools and setting it in motion—a difficulty which, until 1937 at least, and in many respects until last year, was made greater by the Government's reluctance to recognise the full magnitude of their task—has been in considerable measure overcome. The shadow factories are widely at work, and the industry's labour force has been trebled in four years. This much is welcome news, but the deficiencies due to lack of foresight and resolution in the past, and to dilettante peace-time ways of designing, contracting and co-ordinating supplies and output which have not yet been wholly given up, have not yet been removed. The central need for safety and equality in diplomatic power is parity with Germany in the air, a need which the devoutly-to-be-wished-for agreement to limit arms could not ignore. And, though it is certain that the margin between present production and potential output in war-time is smaller in the Reich than in Britain, parity is not yet in close view.

National Service.—It is not yet possible to estimate the adequacy of the response to the call for recruits for National Service that was made last week. In general terms the flow of volunteers has been described as satisfactory by most local authorities, though there still seems to be a wide reluctance to join up as first-aid workers or local ambulance drivers. Car-owners are not anxious to put their property at the disposal of the authorities for defence purposes; and there are at least two other disquieting features about the events of the last ten days. In the first place, nation-wide publicity has been allowed to lag since the Prime Minister inaugurated the appeal for volunteers, and there is some danger that the immediacy of the present need will not be sufficiently stressed by local efforts. Secondly, there has been an unseemly scramble by some individuals and groups to secure inclusion in the list of reserved occupations. In the event it may well prove that the timing and publicity of the issue of such a very extensive provisional schedule of such occupations was inexpedient. A revised schedule is likely to appear very shortly. Perhaps it will then be possible for the people who have so far been troubled about the status of their jobs to devote more energy to the selection of the kind of National Service for which they are fitted—though the erroneous belief that membership of a reserved occupation absolves from all obligation to volunteer dies hard.

Civilian Defence.—Events are moving in the field of home defence. Sir John Anderson has notably shown signs of a desire, on the one hand, to speed up work in hand as much as possible and, on the other, to take the public into his confidence. A week ago, in a circular to local authorities, Sir John emphasised again the prime urgency of air-raid precautions, and the supervisory contacts of his department with local bodies are being steadily expanded. To the London Chambers of Commerce he has given an assurance that all interests affected by the Government's defence plans would be fully informed and consulted; and it has now been made quite clear that the plans so far announced are the first instalments of a wider and longer-term programme. In the case of evacuation, for instance, it is now known that the billeting scheme, which it is hoped to complete within a month, is only a first step, and that camps to supplement billets represent the next. In the case of shelters, too, there is evidence that previous piecemeal improvisations are being brought together in a more comprehensive scheme. On Thursday the report of three engineers chosen to advise Sir John Anderson on shelter policy was made public. First, the engineers agree with the Lord Privy Seal that the provision of a blast and splinter-proof shelter at, or in close proximity to, the home of every citizen is a sound policy, and they approve the supply of sectional steel shelters to cottage types of houses and two-storeyed terraced houses. In basement houses the same minimum protection can be given by propping the basements; but for tenements permanent trenches and subsidiary shelters, as well as considerable transfer of inhabitants, will be needed. These are, however, only first steps. The sectional shelter and its equivalents have their place in immediate short-term policy, but safer and more permanent brick and/or concrete pill-boxes are needed, as well as extensive communal shelters and trenches. The logical end of the engineers' argument is the ultimate provision of deep bomb-proof shelters, but they do not look that far ahead. Meanwhile, they call for the use of the resources of every suitable trade to the utmost extent and at the utmost speed to supply the shelters they advocate. Their plea will be universally echoed.

Helping the Czechs.—It is announced that Czecho-Slovakia is to receive from the French and British Governments a total sum of £16,000,000, made up by a loan of £8,000,000 guaranteed by those Governments, a British gift of £4,000,000 in cash, and a similar gift on the French part by relieving the Czechs of responsibility for the 1937-42 5 per cent. Czecho-Slovak loan

of 700 million francs. The necessary agreement was signed in London on January 27th, and on Wednesday a White Paper was issued with details of how the money would be apportioned. The British gift of £4,000,000 (remaining from the original advance of £10,000,000, three-fifths of which is to be repaid out of the new guaranteed loan) will be at the service of the Central Institute for Refugees in Prague, controlled by French and British representatives; and, from this, sums of £200 together with travelling expenses will be given to approved but penniless individuals or families who wish to emigrate. For would-be emigrants with money of their own, exchange transfers will also be made from crowns to currencies of the receiving countries. In recording the apportionment of this money, which morally is more a debt than a donation, we cannot help recalling Mr Chamberlain's announcement on October 3rd that the Government had received an appeal for a loan of £30,000,000, and that he believed "that the House will feel with the Government that this is an appeal which should meet with a sympathetic and even a generous response." The advance of £10,000,000 was, indeed, generally interpreted at that time as virtually a gift, instead of which it now appears that only £4,000,000 is being given. It is a poor excuse that "the money would go straight to Germany": for it need not, and in this case it will not. And if the cash does go indirectly to Germany, are the plundered Czechs to blame? "He who gives quickly," commented the Prime Minister, "gives twice." He who gives after prolonged negotiations, it would appear, gives two-fifths.

Poland Going "Back to France"?—The fear that the official visit to Warsaw last week of Herr von Ribbentrop, the German Foreign Minister, might upset Poland's "policy of equilibrium" in Eastern Europe proved to be at least premature. Nothing, apparently, was said during the visit about a fundamental change in Poland's treaty relations with France, Roumania or the Soviet Union. Germany has always been far better informed than the Western Powers about Polish internal affairs and about Polish susceptibilities, and if Herr von Ribbentrop had made the mistake of asking the leaders of Poland to choose between abandoning the alliance with France or the pact of non-aggression with Germany, he would greatly have strengthened the "back to France" sentiment which is now, too late, clearly emerging from the confusion of the last few months. Herr Hitler's speech before the Reichstag showed clearly why Germany has lately wished to show her "friendship" for Poland. Until Germany has recovered her colonies and obtained "full satisfaction" for Italy the situation in Eastern Europe is to be regarded as stabilised; but that is no reason why the Polish Government should regard with complacency the aggrandisement of Germany and Italy at the expense of Britain and France—even if it brought some compensating advantages to

Poland in the so-called colonial sphere. Those Polish newspapers which are given a certain latitude in writing about international affairs now regard with the deepest suspicion recent German moves in Danzig and Lithuania and the refusal of Germany to allow Hungary to annex the Ruthenian province of Czecho-Slovakia. The view is now at last to be heard that, as soon as Germany and Italy have obtained "satisfaction" on the colonial question, an arrangement would be made with Britain and France that would leave Germany free to "organise" Eastern and South-Eastern Europe by the wholesale application of the ethnographic principle: in other words, the self-determination which Poland herself invoked less than six months ago in the case of Czecho-Slovakia. Pro-German publicists have been brought down to earth by Germany's Ruthenian policy; and the Poles are now, in fact, alarmed at the rôle which a Germany strengthened by colonies and a pact with Britain and France might assign to an isolated Poland in the "organisation" of Eastern Europe. The official attitude will no doubt continue to be to press forward vigorously with the defence programme and to await developments in the West; and internal politics are now completely dominated by home defence and international affairs. The new Parliament has made no move towards electoral reform, and this important question seems to be indefinitely shelved.

Japan in Difficulties.—The fall of Hankow has not meant the end of Japan's difficulties. In their desperate search for a respectable Chinese figure-head for a "puppet" Government in the parts of China now under their military occupation, the Japanese militarists have tried to round up Marshal Wu Pei-fu, who was one of the most respectable of the Northern Chinese war-lords of the pre-Kuomintang era. Since his smashing defeat by General Chiang Kai-shek in the Kuomintang's northern expedition in 1926, Marshal Wu Pei-fu has been in retirement, placidly reading the classics and writing poetry, unmolested by the Kuomintang regime. No doubt he has found this life more agreeable than the agitated career of a Chinese war-lord; and he is now exerting himself with adroitness and success to avoid the dismal fate of being thrust by the Japanese into the still more unenviable rôle of a Japanese stalking-horse. Determined attempts to collar him have been eluded by the Marshal, who, knowing his worth, is stiffening his terms as the Japanese repeat theirs. He wants an army of 400,000 men and partial evacuation of occupied territory. He is willing to declare himself anti-Communist but not, it appears, anti-Chungking. In the art of diplomatic fencing the Chinese can beat the Japanese any day.

More serious for Japan is the announcement at Moscow that the fishing grounds in the Far Eastern territorial waters of the Soviet Union are to be let by tender or by auction on March 15th next. The Japanese claim that they have a prescriptive right to the lease; but it is hard to see on what ground the claim is based; and it is preposterous that a country which has entered into a triangular "anti-Comintern" pact with Germany and Italy should demand, as of right, to obtain her food supply by the good will of the very country against whom that pact is directed. To withhold the fishing lease from Japan is an obvious retort for Russia to make; and it is a *riposte* that will touch Japan in a vulnerable spot; for fish is an important part of the Japanese people's staple diet, and the Soviet fishing grounds have hitherto been one of Japan's main sources of fish supplies. It is only by such lessons as this that the subjects of aggressive governments can be taught that, in

the long run, aggression does not pay, and that, if they want a tolerable life for themselves, they must compel their governments to adopt less anti-social foreign policies.

The Palestine Conference Meets.—On Tuesday the long-awaited Palestine Conference assembled within the calm of St. James's Palace. Since last week-end the delegates have been arriving, and by mid-week all had come except the Nashashibis and stray members of the Jewish camp. It is a great chance. The rival Jews and Arabs will confront each other in a strictly neutral atmosphere, and what they say and the way they say it will be noted not only at second-hand by an interested world, but directly and personally by representatives of the four Near Eastern kings, of Egypt, Iraq, Saudi Arabia, and the Yemen. The Jews are here in strength. Their delegation is headed by Dr Weizman; and to strengthen counsel they have arranged for a conference committee of 35 leading Jews of several nationalities to be at hand. Among those who matter, only the Mufti is absent: yet he is represented by six delegates and an advisory council. The anti-Mufti faction of the Palestine Arabs is, after all, to be represented by three delegates, and though the Mufti has apparently not agreed to this, his opponents have rather adroitly promised, if he retires in dudgeon, to withdraw themselves, and accept any solution agreed to by the Arab Kings. There are two indispensable conditions of success: that there should be a willingness to listen to hard words, and that there should be a genuine intention in all present of coming to terms. Each of the delegates and the Mufti, too, knows that the British Government must impose its own terms if negotiations fail: and to that extent the Conference is overshadowed by the unquestionable need of British Imperial policy to make peace in Palestine. It will help the Conference towards success if the Arabs, for whom the problem is confined to Palestine, will try to understand that need; and if the Jews, on their side, will use this opportunity of achieving a better grasp of the Arab temperament than they have shown themselves to possess in the past. On Mr MacDonald falls the task of ensuring that the negotiations do not stick over trivialities: he will need skill and patience, but above all he will need the firm bearing which comes of a decided mind. It will be bad if the Conference fails; but it will be disastrous if, after it, the Government fails too.

A Defeat for Mr Gandhi.—That Mr Subhas Bose, who has been a leading figure in Indian politics for many years, should have been re-elected President of the National Congress in preference to Dr Pattabhai Sitaramayya, whose name is scarcely known outside India, would not in itself be surprising. But everyone concerned agrees that the election stood for something much deeper than personal rivalries—a victory of the Left Wing of the Congress against the upper hierarchy who take their leadership from Mr Gandhi. To-day, Mr Gandhi is the leading moderate in Congress politics, and about him is a group of men who, on the critical issue of federation, believe (though they do not always state in public) that relatively small changes would make it acceptable to Indian nationalists as a path to complete self-government. This moderate wing has hitherto been successful in every major trial of strength within the Congress during the past two years. If the election of Mr Bose means its supersession in power, then the path of the British Administration in bringing about federation peacefully will become far more hazardous. But the occasion may mean more: it may mean, not so much a trend of the Congress as a whole, as its division into two camps. This would be an entirely healthy development, not only from the standpoint of British policy, but also from that of Indian democracy, which has been in danger of succumbing to the totalitarian idea, so long fostered by the Congress, and especially by Mr Gandhi, of a single national party containing people of widely varying political and economic creeds.

Scotland's Dilemma.—Scotland's economic condition presents a real problem. Her heavy manufacturing industries, admirably fitted for armament production, expanded during the war; but when the war ended and the special demand fell away, she was left with an industrial structure that was unbalanced and in certain directions over-capitalised. With the contraction of former export markets, the heavy iron and steel, engineering, shipbuilding and coal industries found themselves handicapped by burdensome overhead expenses, and they inevitably declined. Nor has the present re-armament programme brought even temporary recovery. Exports of iron and steel manufactures in 1937 were only 60 per cent. of the 1929 figure, and last year unemployment in the industry rose from 3,425 to 6,293. Between 1937 and 1938 unemployment in general engineering rose from 5,585 to 9,143. The coal industry now employs only 85,000 hands, as compared with 141,000 in 1929, and exports of Scottish coal have declined from 13,353,000 tons in 1913 to 7,287,000 tons in 1937 and to only 2,786,000 tons in the January-June period of 1938. In the shipbuilding industry unemployment stands at the high rate of 21 per cent. Unemployment as a whole rose 24,500 last year to almost a quarter of a million. These are a few of the distressing facts contained in the Report, "Scotland's Industrial Future," published this week by the Scottish Economic Committee. The task of solving this

problem is formidable, and the Committee has clearly found itself on the horns of a dilemma. The only real and lasting prosperity that can be achieved within a reasonable period by an industrial country so dependent on export trade as is Scotland is a revival of world trade; and the Committee, while recognising the need for fulfilling defence orders at the present time, regrets that this will tend to distract attention from the real solution and still further concentrate activity in production which will slump when the emergency demand for arms is satisfied. Yet Scotland's industry cannot wait upon world peace and the lowering of trade barriers. And at the risk of diverting capital and labour into production for which, in normal times, Scotland is not so well fitted, the Committee recommends measures designed to broaden the basis of Scotland's economic life and encourage the development of new light industries. The Committee goes further. Without displaying any predisposition in favour of State control, it reaches the frank conclusion that as things are at present, with the Government intervening to regulate industry in many spheres, Scotland must have State assistance in her time of need. The Committee therefore advocates the appointment by statute of a Planning Authority to direct the country's economic life with the object of achieving a sounder balance between the heavy and the light industries and of alleviating unemployment. It is not a very hopeful Report.

A Credit Cycle?

NEW YORK, January 20.—Since our economy is at the moment marking time, there is justification for reviewing the cyclical data of recent months. In a condensed sketch of this sort refinements of dating must be sacrificed, and, in any case, it is always questionable, as Aristotle remarked, whether one should purport to be precise in fields where actual precision does not exist. The top of the cycle came at about the end of the first quarter of 1937; its bottom was somewhere in the second quarter of 1938. For convenience, April will serve for the 1937 top and June for the 1938 bottom. In the following table, whenever there is a choice between seasonally adjusted data and data without adjustment, the latter is employed (except in the case of department store sales). Cyclical peaks

CYCLICAL DATA

	April, 1937	June, 1938	Nov., 1938
Index of manufactures	125	75	103
Index of residential building contracts	51	46(a)	52
Index of non-residential building contracts	68	76(a)	101
Factory employment (b)	109	82	91
Factory payrolls (b)	109	71	84
Freight car loadings	79	58	70
Department store sales (c)	93	82	89

Total loans, Reporting Member Banks	9,428 million	8,321 million	8,317 million
Total investments, Reporting Member Banks (h)	12,774 "	12,240 "	13,008 "
Demand deposits, Reporting Member Banks	15,388 "	15,036(g)	16,013 "
Debits	37,133 "	35,501 "	32,166 "
Sterling exchange	\$4.92	\$4.96	\$4.71
Index of share market (e)	125	73	95
Yield on long - Government bonds (d)	2.74%	2.52%	2.50%
Yield on 3-5 year Treasury notes	1.59%	.67%	.71%
Yield on currency in circulation (f)	4,919 million	4,837 million	5,096 million
Merchandise exports	269	223	252
Merchandise imports	287	146	176

(a) For January, 1938, residential building 22, other building 59. (b) Employment dropped to 82 and payrolls to 71 in June, 1938. (c) Exception: adjusted for seasonal. (d) Average, all issues over 12 years. (e) Standard Statistics Co. 420 common stocks. (f) Coin and currency under \$50 denomination. (g) At end of March, 1938, \$14,268,000,000. (h) Investments in nation. (i) At end of March, 1938, \$14,268,000,000. Total loans and investments fell from January, 1937, were \$13,736 millions. Total loans and investments fell from \$22,734 millions in January, 1937, to \$22,202 at end of April.

commonly coincide with strong seasonal influences and cyclical bottoms with weak seasonal influences.

On the whole, these data give the impression of a credit cycle. Between September, 1937, and the end of April, 1937, the reporting member banks reduced their holdings of Government obligations from \$9,930 millions to \$8,370 millions, while in the same time the "public debt publicly offered" increased from \$33,088 millions to \$34,295 millions. That is, in six or seven months, the market was called on to absorb about \$1,200 millions of new Treasury offerings plus \$1,500 millions of Treasury securities disposed of by the reporting member banks.

No doubt the motivating forces of any cyclical movement are numerous and complex. But it seems questionable whether the emphasis (as is done officially) should be put almost exclusively on the cessation or diminution of the spending programme. On the whole, the data suggests that it was a credit phenomenon, with its initial impact on the capital market; and that a major factor was the strain on the capital market involved in an attempt to absorb simultaneously large new offerings by the Treasury and large sales of Treasury securities by the reporting member banks.

Exemption from Taxes

The personal income tax was established in the United States during the administration of President Wilson, by authority of a Constitutional Amendment authorising the levy on income "from whatever source derived." Yet, from the first, it was successfully maintained in the courts that income derived from employment by a State or municipality or income derived from the interest on State and municipal obligations was exempt from income tax. Every President since Mr Wilson—Messrs Harding, Coolidge and Hoover, as well as Mr Roosevelt—has protested against this exception; so, too, have the last three Secretaries of the Treasury, Messrs Mellon, Mills and Morgenthau. But, for all that time, every obligation issued by the Federal Treasury itself has been wholly or partially exempt from taxes.

Last year approximately \$3,000 millions of new securities were offered in our markets, Federal, local government and corporate, and of these about \$2,000 millions were wholly or partially tax-exempt. In most recent years this ratio would have been as high or higher. Indeed, given the existing surtax rates and the availability of tax-exempt securities, one could make the generalisation that no person in the higher income grades could afford to invest in corporate enterprise, whether shares or obligations. No return that any well-protected corporate security could offer could yield a return after the deduction of taxes competitive with the return on tax-exempt securities, even with yields on such securities at their current low levels.

Risk-Capital Wanted

There was a market for corporate obligations of institutional rating among institutional investors. There was a market for tax-exempts among wealthy individuals and institutions.* But such market as there was for second-rate investments or for hazard capital was limited to individuals of modest fortune; and the resources of these small capitalists (even swollen by the flow of capital from Europe) was, it would seem, barely able to absorb the liquidation of estates, or of wealthy individuals flying from the liability of investment in corporate enterprise. The limits of the risk-capital market are illustrated by the fact that, in 1938, the public issue of equity capital amounted to only \$17 millions. And, of all stocks, ordinary and preferred accounted for less than \$100 millions. It is true that 1938 was a bad year for the issue of risk-capital securities; but it is illustrative (even if a somewhat exaggerated illustration) of the period since (a) high surtaxes were imposed and (b) tax-exempts became available in quantity.

The net conclusion is that the type of capital most capable of appraising and bearing the risks of enterprise has been driven or is being driven by taxation, or by tax differentials, into supposititiously riskless investment. Risk capital has been sought, of necessity, only from those less capable of bearing or appraising risks; and these have either been too poor or too cautious to provide the amount of risk-capital that our economy requires.

Of the two alternatives to remedy this—the reduction of surtaxes or the removal of tax-exemption—the Administration has chosen the latter. It would seem, from the testimony offered before the Congressional Committee, that it was moved by two motives—(a) to secure revenue and (b) to remove a differential attraction that was deflecting capital from investment in corporate enterprise. It would appear that the latter was the more immediate cause of the removal. The President stated in his annual Message that the immediate object of statesmanship was to bring idle capital and idle men together, and the removal of tax-exemption would, to a degree, work immediately in that direction. As the proposal to abolish tax-exemption is not retroactive, but applies only to future issues, its influence on Federal revenue would be felt only as the public debt (Federal and local) increases, or as existing issues mature and are refunded.

Playing for Safety

In a general discussion of the supply of capital to enterprise, however, at least two other considerations may be taken into account. Even if tax exemption were removed, the high surtaxes would remain. There would still be the question whether the hazards of risk-investment would support the current level of surtaxes. Capitalists are, as Burke said, "calculators, economists and sophists," and it is at least open to question whether the calculating capitalist in the higher income grades (and one must suppose that a capitalist in the higher brackets is either a calculator or employs a

calculator) will invest in that portion of the economy which is most obviously deficient in capital—i.e. that most loaded with economic risk—and face the handicap of existing surtaxes and taxes on capital gains.

Secondly, there is a good deal of evidence that investors, small and large, have been profoundly shaken by the vicissitudes of the past decade. What Mr Keynes would call the liquidity preference, and American commentators would call the suspicion, of Wall Street, what Wall Street would call generically "lack of confidence," and what the man in the street (or his wife) would call simply "playing safe," has made thousands of American investors disinclined to keep their savings in any form but cash.

France

After the Berlin Speech

PARIS, February 2.—The speech of Herr Hitler was received with some relief, because the Fuehrer did not give categorical support to the Italian colonial claims. The general opinion now is that Germany, hampered by her own economic difficulties, is not ready to follow Italy in any fresh adventure, and that the Nazi colonial claims are made mainly with a view to being given new markets for German exports. Herr Hitler's pronouncements are therefore taken in conjunction with the suggestion of M. Daladier that an international conference should be summoned for the purpose of solving Europe's problems, by discussing the limitation of armaments and world economic collaboration. Such a conference should be backed by Mr Roosevelt, and the Jewish problem would be a foremost item on its agenda.

The annual report of the Bank of France emphasises that the franc has been virtually stabilised against sterling since last May, forward rates being often quoted at par. During the international crisis of September there was no flight of capital, but since the Franco-Italian crisis the flight has been resumed. Working hours have been increased; the rate of interest is falling; prices are low; and unemployment is falling. The revival of business is on its way.

"With the hundred tons of gold we have recovered in the last three months," M. Reynaud has said, "we could buy 5,000 aeroplanes abroad." And the Minister of Finance added that the surplus of deposits over withdrawals in the savings banks since the beginning of 1939 amounted to 1,150 million francs, against 410 millions in the same period of 1938. The Bourse has been firm since October, while other stock exchanges have been weak. The Treasury has covered needs amounting to 12,000 million francs since October 27th without difficulty. The index of production has risen by 6 points in two months, and unemployment is actually falling two weeks before the seasonal recovery of February normally sets in. The third week of January showed a fall of 1,036 in the number of persons out of work and the fourth week a further fall of 881. The fourth week of January, 1938, saw an increase of 6,516; in January, 1937, the increase was 3,232; in 1936, 5,262; and in 1935, 10,763. M. Reynaud's optimism was followed by a strong recovery on the Bourse, which had been pleasantly surprised by the "leniency" of Herr Hitler's speech.

Colonial Development

The interest which the French public has begun to show in the Empire since the recent Italian claims is growing daily. The Government, aided by the Press, loses no opportunity to exploit this revival of interest. The National Economic Council is preparing a plan of production in France and the colonies to regulate trade between them in such a way as to reduce France's dependence on foreign imports, especially of foodstuffs, and to co-ordinate better French and colonial economic activities, which are too often the same, particularly in the sphere of agriculture. The objective, the Minister of Economics says, is to prevent competition between France and the colonies and to make their economies complementary.

On January 1st the tonnage of ships under construction in French yards (excluding naval building) was 89,825 tons, made up by 13 ships, against 69,330 tons and nine ships a year ago. World tonnage under construction on the same date was 2,668,864 tons, against 2,900,000 on January 1, 1938.

French shipbuilding is thus going ahead while world construction is falling back. Nevertheless, France is still only in ninth place among shipbuilding countries, and the French mercantile marine is smaller than it was in 1914. Longer

hours of work and special cheap credit will no doubt aid the recovery of French shipping; a first instalment of 100,000 tons will begin building almost at once.

Wholesale prices are continuing their upward movement:

	Dec. 31	Jan. 7	Jan. 14	Jan. 21	Jan. 28
General Index :	666	669	671	671	676
Domestic products	692	696	698	697	705
Imported products	620	620	621	625	624
Foodstuffs	648	652	657	655	656
Industrial products	682	685	683	686	693

In the week ended January 21st the number of persons unemployed was 414,688, against 415,568 on January 14th and 399,728 a year ago.

Germany

Nazi Economic Policy

BERLIN, January 30.—The business and financial policy of the Nazi regime during the last six years has led to the setting up of a complete war economy, in which man-power, factories, material and money have been placed entirely at the service of the State, while Government orders have made demands upon industry in excess of its capacity. Production for export and to supply domestic needs has been neglected. This policy has led to shortages of labour and materials, disturbances in foreign trade, the rationing of the domestic market and signs of disorder in production and transport. Merely commercial considerations of profit have been widely disregarded.

In no single year while this has been going on has the Third Reich been able to balance its Budget. Although tax receipts rose from Rm. 6,650 millions in the fiscal year 1932-33 to about Rm. 17,000 millions in the current fiscal year, Reich debts, according to official figures, have increased by Rm. 25,680 millions. Authoritative estimates recently put the entire public debt at Rm. 50,000 millions, which means that the debt has been doubled in the last six years. Since 1935 the Reich has issued loans of Rm. 15,000 millions. During the same period the value of industrial and agricultural production rose from Rm. 46,500 millions to about Rm. 100,000 millions in 1938, though the increase was mainly in unproductive capital goods. Credit expansion, allied to the wide discrepancy between the output of capital goods and the output of consumers' goods, made necessary a rigid system of quotas and price control. The index of wholesale prices rose from 64.8 in April, 1933, to 75.5 in October, 1938, and the index of the cost of living from 76.5 to 82.3.

Financial Difficulties

In May, 1938, Dr Schacht began a system of financing by means of delivery certificates: the limit of industrial capacity was reached, and production could not be increased sufficiently to cover this expansion of credit. The political events of the last year led to a much larger issue of delivery certificates than could be redeemed by current receipts or consolidated through Reich loans. This in turn resulted in an accumulation of payments due, which led to the present financial crisis and to the change in the direction of the Reichsbank.

The existing financial position of the Government is also marked by the fact that, quite apart from the payments due on account of delivery certificates, the current demand for money is extremely heavy and out of all proportion to the inflow of taxes. In addition, industry is itself in need of capital. The situation is further illustrated by the fact that, in addition to the increased debt, the means of payment in circulation has risen to Rm. 10,400 millions, of which Rm. 8,605 millions are notes, against Rm. 3,562 millions of notes at the end of 1934.

Herr Hitler has refused to increase taxes to relieve the monetary strain. The task of the new Reichsbank president, Herr Funk, is to find measures to tide over the difficulties temporarily. He is to keep wages, prices and the currency stable, and at the same time he is expected to open the capital market to private business. He will have to extend the short-term and medium-term debts which are now falling due; and although the Government's building programme, and, for a limited period, the armament programme also, have been curtailed, he will have to find new means of financing large-scale State projects in advance. No decision has yet been made about how he proposes to do this; but it may be anticipated that short-term or medium-term State paper not

bearing interest will be created, and these may be used for later tax payments. Such bills would stand somewhere between the present Treasury certificates and the earlier tax coupons. Possibly the system of financing projects by means of bills or Treasury certificates may be retained; but there is the danger that the Reichsbank may be forced too quickly to rediscount these instruments, which might result in an appreciable increase in the monetary circulation.

For the future Herr Funk plans a settlement of the foreign debt question. He is of the opinion that the danger of a flight of capital will no longer exist after the problem of Jewish emigration from Germany has been solved, and that the present foreign exchange regulations can then be relaxed. This relaxation would be an important pre-requisite for the return of confidence on the part of foreign capital. Herr Funk hopes that then, as formerly, international credit would be freely granted to Germany.

Export Prospects

The former German colony of Tanganyika still plays an important part in the provision of Germany's raw materials. The distribution of Tanganyika's trade gives the following picture:—

	Imports		Exports	
	1936	1937	1936	1937
	%	%	%	%
England	23.8	21.7	29	24.2
Rest of Empire...	17	17.9	31.4	41.6
Germany	14.8	13.9	6.5	8.2
Japan	24.4	24.7	2.1	0.2
United States ...	6.8	6.7	6.2	3.8
Holland	1.4	2.4	2.9	3.5

The Reich complains that the open-door policy is in fact not applied. In 1929 Germany's share of Tanganyika's imports was 12.2 per cent; in 1930 it was only 7.6 per cent.; but in 1937 it was 13.9 per cent.

Exports of artificial silk showed a decrease in 1938 of 44 per cent. compared with 1937. This fall is due not only to diminished purchasing power abroad, but also in large part to higher domestic demand, since the supply of foreign raw materials for the textile industry has been insufficient, as a result of restrictions on imports.

ARTIFICIAL SILK EXPORTS

	1935	1936	1937	1938
Million Kg. ...	5.4	8.7	6.7	3.9
Million Rm. ...	20.4	29.3	25.5	14.5

The falling-off represents a serious loss in foreign exchange, and some increase in exports of artificial silk is imperative. German producers of viscous and copper artificial silk long ago agreed to refrain from mutual competition in the export business, and they now have an understanding with the Italian producers about the Hungarian market. This system of agreements is to be extended.

* Treasury Bonds are not exempt from surtaxes on individuals. Notes and bills are fully exempt from all income tax.

German trade with countries bordering on the Baltic has been greatly increased, although Germany has had to face strong British competition. This competition was all the stronger because Britain had come to an agreement with the Baltic countries about sales of coal. In 1937 England delivered 12½ million tons of coal and coke to these countries, while Germany, which as far as freight is concerned is in a more favourable position, was only able to deliver 4 million tons. England was the chief purchaser from nearly all these countries; and was also the chief supplier except in the case of Poland, Sweden, Latvia and Estonia, where Germany was the leading exporter. Last year, however, a noticeable change in favour of the Reich was evident, as the previous table shows. Here, as in certain parts of South America, German traders are making considerable headway.

Eire

Agricultural Overhaul

DUBLIN, January 28.—The Minister for Agriculture has appointed a well-chosen Commission "to consider and make recommendations as to the measures which might be practicable for the purpose of promoting and maintaining increased agricultural production." The chairman of the Commission is Professor Smiddy, who has much experience in handling economic problems. Professor Smiddy resigned the Chair of Economics in University College, Cork, to act as the first Irish Minister in Washington, and he has also served as High Commissioner in London. He was chairman of the Fiscal Inquiry Committee of 1924 and was a member of the Tariff Commission. Under his able guidance the new Commission on Agriculture will doubtless make rapid progress, and will contribute advice of value on the most central problem of Irish economic life, the revival of the prosperity of the farming community.

It is generally agreed that, at least for the present, the only export outlet open to Irish farm produce is the British market, and the main task that confronts the Commission is to consider how the requirements of the market can best be met. The first relevant factor is the probable trend of future demand for food in Great Britain, and in this connection, the development of a national nutrition policy and the rising standard of living must not be overlooked. The trend of demand is moving in favour of animal foodstuffs, and it is for the production of these that Ireland luckily enjoys a high degree of natural advantage. There are certain products, however, which the British farmer will supply, such as, for example, liquid milk and vegetables, and there is no hope of developing an export trade in these commodities. This limits the field to live animals, meat and dairy products, and it is on the intensification of the production of this group of foodstuffs that the future prosperity of Irish agriculture depends.

These articles, unfortunately, are the object of much overseas competition from Denmark, New Zealand and elsewhere. Butter, for example, cannot be produced as cheaply in Ireland as in New Zealand. If, however, the whole group of mixed dairy farming products be regarded for the purposes of export as a single commodity, they can be produced profitably as a whole, even if some of the joint products are doomed to be sold at a loss. It may be necessary to set up trading bodies of a public or quasi-public kind to handle dairy exports and to operate levy and subsidy schemes to maintain the export of the unprofitable commodities. Behind these marketing problems there are the deeper problems of the cost of production on the land; and difficult technical matters relating to the breeding and feeding of livestock and to the increase of fertility of the soil will engage the attention of the experts on the Commission.

One of the most important technical problems will arise in connection with winter dairying. At present, milch cows in

Ireland suffer from starvation during part of the year with very adverse results on their annual milk yield. Opinions differ regarding the respective merits of hay, dried grass, forage crops, imported cereals and tillage as winter feed. The increase in milk yields to the Danish level is not desirable because Irish farmers must always breed for the dual purpose of milk and meat and also because it is thought that very high yields weaken the resistance of cattle to disease. The proper utilisation of grass lands in the light of new techniques is very important, and the provision of subsidised fertilisers for pasture land will probably figure among the Commission's recommendations.

On the financial side, there is general agreement that adequate supplies of capital and credit must be rendered available for the introduction of improved methods. Such facilities, however, should not be provided until the technical problems of production have been exhaustively investigated, and the Government's agricultural policy decided. The provision of credit in a period of depression and uncertainty is injurious rather than beneficial, as it involves farmers in unproductive debt which is a millstone round their necks. It may, of course, be necessary to afford some temporary relief from burdens which the industry finds unduly onerous; but it is all-important, clearly, to distinguish between short-period relief and long-period reconstruction.

New Zealand

Government Under Fire

CHRISTCHURCH, December 22.—It has long been said that the real test of the Labour Government's policy in New Zealand would come only when prices fell. No Government has enjoyed more favourable conditions than the one that came into power in 1935, and probably none has succeeded in creating so many difficulties for itself in so short a time. In the two years that followed its election, export prices rose rapidly, and the national income grew. The Government extended social services lavishly; raised wages; reduced hours of work; increased State control over industry and trade; promoted public works to make up ground lost during the depression and to absorb the unemployed; and converted the new Reserve Bank into a State institution. Now the testing time has come.

Few countries are more dependent than New Zealand on overseas trade. Normally the Dominion exports about 45 per cent. of its total production and relies on export receipts for about 45 per cent. of its income. Few countries are less well fitted for insulation or for any marked departure from the levels of costs obtaining amongst competitive producers throughout the world. Yet, almost all the Labour Government's legislation, which aimed at social reform and the redistribution of income, resulted in increased costs. Up to the end of 1937 these increases were covered by the more rapid rise in export prices and income.

Between 1935 and 1937 export prices rose by 40 per cent.; export receipts by 50 per cent.; and aggregate private income by 45 per cent. Between 1935 and 1938 the yield of tax revenue (including employment taxes) increased by 45 per cent. Over the same three years, average weekly wages rose by 25 per cent. and, if allowance is made for the reduction of the working week to 40 hours, hourly wages probably increased by 35 per cent. The rapid increase in labour costs retarded the expansion of private enterprise and the absorption of the unemployed in productive private industry, and public works were begun on an extravagant scale, many of which could be justified only as relief works. Some of these were financed from revenue, from the proceeds of employment and highway taxes, but the cost of the greater part was met by borrowing.

It happened that reserves accumulated during the early period of recovery were available, money was abundant, and interest rates were low. In 1936 to 1937 the Government borrowed most of what it needed from public departments, and no substantial appeal to the public was required. For short loans against revenue to come, the Reserve Bank was available, its rates were low, and Treasury bills were redeemed as revenue came in.

Drastic Steps

In the year ended January, 1938, exports reached £NZ67 millions, £NZ10 millions more than in the highest pre-depression year. In addition, the Government borrowed £NZ7½ millions in 1937-38 for expenditure on public works

and proposed to increase its borrowing to £NZ14 millions in 1938-39. In these conditions the note issue expanded, internal trade was prosperous, and imports reached a peak of £NZ58 millions in the year ended April, 1938. But, in the 1937-38 export season, wool prices fell, though the prices of dairy produce rose, and total exports were only £NZ3 millions less than in the previous year.

The opening of the 1938-39 export season saw the prices of wool, lamb and dairy produce at still lower levels. Moreover, much labour had been attracted from the farms to public works, fertiliser sales had fallen off, and the production of dairy produce, lamb and other farm products was tending to decline. Hence exports were lower both in price and quantity. In the year ended October 31, 1938, they amounted to £NZ58.8 millions, a total still well above the pre-depression normal. Imports, stimulated by internal expenditure, which was still high, amounted to £NZ55.4 millions for the same year. This left a surplus of only £NZ3.4 millions, whereas about £NZ10 millions is required to meet normal payments for interest, etc., due abroad.

In consequence sterling funds were drawn on to meet the balance of about £NZ6.6 millions; and they were further drawn on for the usual seasonal passive balance in the second half of the year, perhaps amounting to another £NZ6 millions. The social security plan and the general election which returned Labour to power in October, 1938, accelerated the flight of capital, and sterling funds fell to very low levels, the decline amounting to £NZ16 millions between

October, 1937, and the same month in 1938. From early in December the position became acute and the Government took drastic action. From December 5th it suspended the obligation imposed on the Reserve Bank to exchange New Zealand currency with sterling at its quoted rate, and imposed a rigid licensing system on both exports and imports. The avowed object of this control is, first, to pool all the exchange funds accruing, and, second, to control the distribution of those funds amongst their various uses.

It is apparent that no limitation of exports is intended. Since it is desirable to accumulate funds overseas, exports must manifestly be encouraged. But it appears that export receipts will be lower than for last season. About £NZ10 millions is required to pay interest on debt, etc., and some accumulation of overseas funds is desirable.

The real difficulties of the situation have, however, not yet been faced. The fundamental problem is one of comparative cost. The Government's programme has imposed on the country taxation and labour costs which could barely be met in a time of high prosperity and high income. If retrenchment is decided upon, it must mean the curtailment of social services and of public works. This will mean that fewer people will be employed and less money will be available to meet the distress occasioned by unemployment and similar causes. Public and private spending must be adjusted to a lower level of income and to less borrowing. This means retrenchment, and retrenchment is always difficult and unpopular.

Letters to the Editor

Dr Schacht and the Nazi System

[We regret that two small, but important, misprints crept into the main table accompanying the letter from Mr Thomas Balogh under the above heading in last week's issue. In view of the importance of the subject the table is reprinted below.—EDITOR.]

TAXATION, BORROWING AND EXPENDITURE IN GERMANY
(In Rm. milliards*)

	1932-33	1933-34	1934-35	1935-36	1936-37	1937-38	1938-39
1. Tax revenue (inc. States & municipalities) (b)	10.2	10.6	11.9	13.4	15.5	18.4	22.0†a
2. Unemployment insurance contributions	1.3	1.5	1.5	1.4	1.5	1.8	1.8†
3. 1 plus 2	11.5	12.1	13.4	14.8	17.0	20.2	23.8†
4. Cost of unemployment relief (c)	2.8	2.3	1.6	1.3	0.9	0.4	0.2†
5. 1 plus 2, minus 4	8.7	9.8	11.8	13.5	16.1	19.8	23.6†
6. Available for "extraordinary expenditure" out of taxation (d)	- 2.5	- 1.4	0.6	2.3	4.9	8.6	12.4†
7. Increase in bill portfolio of the banking system (e)			3.76		2.57	1.54	1.11†f
8. Increase in internal post-war debt (g)—							
Short-term	...	0.4	0.75	0.5	- 0.5	...	2.5†f
Long-term	...	0.85	0.75	1.7	2.6	3.3	4.25†f
9. Total visible borrowing	...	1.25	1.5	2.2	2.1	3.3	6.75†f
10. Total borrowing	...	4.15	4.15	4.5	4.67	4.84	7.0†(i.e. about 11 or 12 in year)
11. Estimated total sum available for "extraordinary expenditure" (i.e. 6 plus 10)	...	2.75	4.75	7.4	9.57	13.44	19 to 23

* It is very difficult to estimate the value of the Reichsmark for purposes of conversion into sterling. Its purchasing power is high in terms of labour, low in terms of raw materials. On the whole, a rate of conversion of Rm. 15 = £1 seems very conservative.

† Estimated. (a) Excluding the fine imposed on the Jews and the proceeds from the sale of confiscated property. (b) The table excludes contributions to health, old age pensions, etc., insurance (amounting in 1938 to not less than Rm. 3.1 milliards) and contributions to the Labour Front and Winter Relief Fund (Rm. 0.9 milliards). These and "voluntary" contributions to the Party are additional taxes, part of which are available for military and para-military purposes. (c) Excluding payments out of the insurance fund proper of Rm. 0.4 milliards. (d) This calculation is based on the assumption (i) that the combined budgets of Reich, States and municipalities had a deficit in 1932-33 of Rm. 2.5 milliards, and (ii) that "ordinary" expenditure has not increased since then. This involves some simplifications which do not, however, affect the main correctness of the figures. (e) Excluding changes in the volume of bills held outside the banking system, for which no statistics are available since 1936. (f) Figures for seven months only; the total for the year will be proportionately larger. (g) No allowance has been made for the cost of such repayments as war or foreign debts, as it is not known what the cost of such repayments was. (h) Rm. 1.5 milliards has been issued in January. (i) Some part of this increase is due to the incorporation of Austria and is therefore not a net gain to the Reich. (k) Including an estimate for amounts received through the replacement of private by State bills.

The Future of Credit

TO THE EDITOR OF THE ECONOMIST

SIR,—The new provisions set out in the Currency and Bank Notes Bill presented by the Chancellor of the Exchequer last night have been fully discussed in their technical aspects by to-day's Press. It is possible, however, to look past the immediate effect on sterling into the position which the Bank of England is assuming as controller of monetary and credit policy.

Such control is traditional to the Bank, but this new Bill transposes entirely the interests for whose benefit the control has hitherto been exercised.

Under the classic regime of Bank rate and gold standard, monetary and credit policy was subjugated to the needs of the owners of capital, and it was their requirements which led to the Bank's intervention.

To-day, it is the interests of the trading community which the Bank appears to have at heart, and for the future the Bank will be in a position to indicate to the owners of capital upon what terms capital may be lent to industry.

The new Currency and Bank Notes Bill is no isolated instance of the Central Bank's new attitude. From the inauguration of the Bankers' Industrial Development Trust until the recent issues of Richard Thomas and John Summers there are continuous instances of new methods of, and new reasons for, credit control.

The correct definition of the present policy is Socialist; not, however, in the sense which has come into such disrepute since its adoption by the Labour Party, but in its older sense of benefit to the entire community—not excluding the owners of capital who will sacrifice to some extent their position of command for greater and more stable opportunities of employing their wealth.

I am, sir,

Your obedient servant,

ROLLO VILLIERS.

Meat and Monopoly

SOME eighty-five years ago *The Economist* correctly forecast that Britain's consumption of meat would grow greatly; but it could not have been foreseen then that, out of nearly one million tons of chilled and frozen meat imported into the United Kingdom in 1937, over 44 per cent. would come from Argentina. A valuable study* by Mr Hanson, of the University of Louisville, describes how this came about. The extensive bibliography that is given suggests dimly the wide range of Mr Hanson's research, but quite inadequately his skill in concentrating its essence, like some literary Liebig, into a moderate compass; and his book, though the argument is occasionally somewhat hard to follow, is a store-house of valuable facts and figures, the usefulness of which is unfortunately impaired by a wholly inadequate index.

The author begins by sketching the Argentine economy before the advent of refrigeration, which became an effective process round about 1880; and carries the story up to the closing of the British market to Argentine livestock in April, 1900. This livestock ban stimulated refrigeration in Argentina; and the meat industry began to expand under the control of the three pioneer *frigorificos*. The balance of pastoral and agricultural activities in Argentina changed; cattle supplanted sheep near the cities; and the colonisation of the sheep lands of Patagonia proceeded in step with the development of crops and cattle in the metropolitan provinces. Railways, built by British capital, carried beef and moved crops; and Argentina became a great exporter of both meat and agricultural products.

T.T.1939

The seven years following the ban on livestock were years of prosperity. The three pioneer *frigorificos* maintained their "understanding" to restrain competition. The *estancieros* learned to breed better stock, largely from British pedigrees, and to increase the capacity of the land for cattle by growing alfalfa. But they made the fatal mistake of being too content—or too proud—to engage in meat marketing as well as cattle raising; and the *frigorificos* were left with a virtual monopoly in the control of sales.

In 1907, the American wolf descended upon the *frigorificos* Argentine fold. Owing partly to the rapid growth of population in the United States and partly to the invasion of Western ranges by the arable farmer, the exportable surplus of American beef, on the hoof and chilled, was falling away. American packers, in order to retain their share of the British market and to avoid scrapping an elaborate sales organisation, promptly poached on Argentina's preserves.

During the slump which followed the post-war boom the native *estancieros* at last woke up to their dependent position. The Government, called upon to protect producers, withdrew their aversion to State interference and official control. The steps taken by the Argentine Government, and the more recent action of the British Government on behalf of British consumers, make up the latest episodes of Mr Hanson's story. The Anglo-Argentine Trade Agreement of 1933 (renewed in 1936) and the recent report of a joint committee, set up under the Agreement, on vested interests in the meat trade (discussed in *The Economist* of October 22, 1938, on page 162) illustrate the efforts that are now being made to safeguard both Argentine producers and British consumers against the monopolists' ring.

The main features of Mr Hanson's most interesting account are, first, the exploitation of a single great urban and industrial market by a geographically handy country ideally suited to meat production; and, secondly, the circumstances which permitted the control of the trade by a close ring. At present, six firms, sharing 85 per cent. of the trade and working in close co-operation, dictate their own terms. Distribution is strictly controlled by these concerns, who buy cattle from the Argentine breeders and kill, chill and sell it in Britain. Production by breeders is freely competitive. If marketing control in the interests of breeders and consumers, instead of packers and merchants, is to be made effective, output, too, will need to be regulated. Mr Hanson himself leaves us with the feeling that the Argentine meat industry, supplying as it does a prime need of Britain's population, is ripe for control in the public interest and for the introduction of fixed maximum profits—for treatment, in short, as a public utility by the two Governments concerned.

THE BUSINESS WORLD

Gold Revalued

IT was apparent at the time of the recent transfer of gold from the Bank of England to the Exchange Equalisation Account that legislation would be needed to put on a permanent footing the accompanying adjustment of the fiduciary issue. The Government have now decided, however, to take the opportunity of this legislation to effect a revolutionary change in the note issuing system of the country. The essence of this revolution is that in future the assets backing the Bank of England note circulation—gold and securities—are to be revalued each week at market prices and that any discrepancy between the resulting figure and the amount of notes outstanding is to be remedied not, as hitherto, by adjusting the issue to the backing, but by exactly the reverse process, namely, diminishing or increasing that backing, as the case may be, through transfers of gold or securities to or from the Exchange Equalisation Account. In future, therefore, it is the outstanding volume of notes issued which becomes the determinant factor in the position of the issue department of the Bank of England. The note issue is no longer to be determined automatically by changes in the volume of the gold reserve. The change is the symbol of the tremendous transition which has occurred from the rigid currency ideals of the "Currency school" which found their expression in the Bank Charter Act of 1844, to the elasticity of the new "currency management" towards which we are evolving. This transition has been made with all the gradualness typical of British institutional evolution—almost imperceptibly during the 19th century with the development of the cheque system and its nullification of the rigidities of the 1844 Act; much faster, of course, after the departure from the gold standard in 1931, and the setting up of the Exchange Equalisation Account. But not until now has the transition been openly proclaimed.

The measure which achieves this is the Currency and Bank Notes Bill, 1939, which was introduced in the House of Commons on Wednesday by the Chancellor of the Exchequer. Its main provisions are those relating to the revaluation of the assets in the Issue Department and to the consequent adjustment of the fiduciary circulation. The revaluation is to take place on the basis of market prices certified by the Bank of England. The first revaluation is to take place on the first Wednesday following the day on which the Bill receives Royal Assent. This initial operation should, on the basis of the existing gold price, raise the gold reserve in the Issue Department from £126 millions to £221 millions. In order to neutralise this surplus of £95 millions the fiduciary circulation is to be reduced from the present figure of £400 millions to £300 millions, which will in future be the "normal," replacing the £260 millions so regarded under the Currency and Bank Notes Act of 1928. The new measure will maintain the existing provisions for varying the fiduciary issue by Treasury minutes. The immediate net effect of the gold revaluation and of the reduction in the fiduciary issue will thus be to cancel some £5 millions of notes and correspondingly to reduce the reserve in the Banking Department.

It must not be assumed from this that the intention of the authorities is to stabilise the total note issue at the sum of the first revaluation of the Issue Department's gold plus the £300 millions fiduciary circulation. Apart from variations in the fiduciary issue, which, as in the past, are likely to occur at periods of seasonal demands for additional currency, there is nothing to prevent future gold transfers between the Issue Department and the Exchange

Equalisation Account in addition to the "correctional transfers" following the weekly valuations. In fact, the new Bill provides specifically for such operations, stating that any gold bought or sold between the Issue Department and the Account is to be priced at the last weekly valuation of the Department's gold holding. Thus the authorities will have complete freedom to vary the amount of notes in issue by shifting gold to and from the Issue Department as well as by changing the fiduciary circulation. Greater freedom of action could hardly be demanded.

The Bill's changes will have the effect of giving the Bank returns a greater claim to realism than these documents have had since September, 1931. Their effect can best be shown by presenting the Bank return issued this week in the form in which it actually appeared and in that in which it would have appeared had the proposed legislation been in force:—

Notes	54,465,750	49,051,493	
Gold and silver coin	782,563	782,563	
Ratio of unissued notes and coins to liabilities ("Proportion")	35.0%	31.6%	
Ratio of gold to circulation	26.8%	46.8%	
Ratio of gold to notes and deposits ("reserve ratio")	18.5%	32.6%	

From the accountancy point of view the proposed changes effect a considerable improvement. They will make for a bank return which will convey a true picture of the position and will prove more understandable to the foreign observer than the documents hitherto published. Assuming no transfer of gold is made from the Exchange Account to balance the difference between the £95 millions excess value of gold and the £100 millions reduction in the fiduciary circulation the reserve of unissued notes in the banking department will be reduced by about £5 millions and the "proportion" will be correspondingly weakened. On the other hand, the ratio of published gold to the active circulation will be strengthened to a figure which in foreign eyes will seem more respectable than the percentage shown by the latest return.

Is it too much to hope that this improvement in the presentation of the return will now be taken to its logical conclusion, namely, the merging of the issue and banking departments of the Bank of England? The case for this removal of the fiction of separation was strongly enough argued in the Macmillan Committee's report in 1931. It will be stronger than ever after the gold reserve position has been regularised by the coming legislation.

In their future gold operations between the Issue Department and the Account the authorities will no longer be hampered by the book-keeping fiction of valuing the Bank of England's gold at the old parity. The consequent neces-

sity of debiting the Exchange Equalisation Account with the book losses made when selling gold to the Bank and the resultant reductions in the borrowing powers of the Account will no longer apply. In fact, the whole cumbersome book-keeping aspect of the relations between the Issue Department and the Exchange Account has been cleared by the recent transfer of £200 millions of gold (at nominal price) from the Bank to the Account. This transfer brought the gold holding of the Issue Department approximately to the level at which it stood when the Exchange Equalisation Account was launched. Thus the book losses shouldered by the Account through its sales of this £200 millions (nominal) of gold to the Bank will have been more than made good by the retransfer of the metal in question—"more than made good," because the gold sold to the Bank between 1932 and 1939 was acquired by the Exchange Account at a much lower average price than the market price of around 148s. per fine ounce obtaining when the Bank was called upon to resell it to the Account at the price of 85s. The complications caused by this differential between market and nominal gold prices have now disappeared and can no longer recur since all future gold deals between the Bank and the Account will be at market prices. The measures taken to regularise the note issuing system involve certain amendments in the existing legislation and in particular the formal abolition of the obligation on the Bank of England to issue notes in exchange for gold at £3 17s. 9d. per standard ounce. This abolition marks the final break with the Bank Charter Act of 1844. Also, though the point is not specifically covered in the Bill, the right of the authorities to buy compulsorily at 85s. per ounce any gold holding of over

£10,000 owned by a resident of the United Kingdom will presumably lapse. This provision has frequently frightened the gold hoarders and its lapsing will *pro tanto* encourage hoarding.

There remains to be considered the question of the disposal of the surplus of about £95 millions created by the revaluation of the gold reserve. Under the existing legislation, this surplus, which must be considered as a profit of the issue department, would go to the Exchequer. Under the proposed Bill, such profit will in future accrue directly to the Exchange Equalisation Account—a provision which incidentally will make it impossible in future to ascertain the extent to which the normal profits of the issue department have been increased or reduced by official operations in the gilt-edged market. The £95 millions in question will therefore go to the Exchange Account, offsetting what may still remain of the losses incurred in the repayment of the 1931 credits and increasing the borrowing powers of the Account. Whether the Government will decide to leave the windfall in this somewhat indefinite form, or whether they will take it into Miscellaneous Receipts to the relief of the next Budget, or whether they decide to use it for some other purpose, is a question on which the coming Finance Act may shed greater light. It should be remembered, however, that under Section 26 of the Finance Act of 1932 the assets of the Exchange Account are, on the winding up of the Account, to be applied "in such manner as the Treasury may direct for the redemption of debt." It would need fresh legislation to divert this particular paper profit, once it is paid to the Exchange Account, to serve a purpose of lesser financial rectitude than that laid down in the Act of 1932.

The Road Haulage Industry

THE road haulage industry is intimately concerned with the railways' "Square Deal" proposals, not only because of their obvious reaction on the competitive position of the road haulage industry as a whole, but also because of their indirect bearing upon the internal organisation of the industry. The question of rates is at least as important for the hauliers as for the railways. And this fact has been recognised in the private negotiations between the two parties, who have now reached agreement on a joint "Square Deal." This is reported to provide for a Bill, covering a transitional period, under which both rail and road charges would be subject to Government regulation. The Minister of Transport would be given powers under the Bill to make orders governing conditions and charges, and hence to vary existing rates and conditions, while a Tribunal would hear applications and objections and would advise the Minister.

To what extent will this agreement affect the road haulage industry? Since the report of the Transport Advisory Council on Service and Rates, considerable work has been done by the industry in building up the machinery of a rates structure. The announcement of the railway companies' demand to be released from the obligations of statutory rate-fixing has, of course, brought this movement in the road industry to a standstill, since road hauliers could hardly be expected to assume the obligations of compulsory rates just as the railways were being divested of them.

The establishment of a system of compulsory rates for goods haulage by road would, in the general expectation, accelerate the movement towards the consolidation of the industry into fewer and larger units, similar to that which occurred in the omnibus industry after the fixing of statutory fares by the Road Traffic Act of 1930. This movement in goods haulage has already been given some incentive by the limitation upon the number of haulage vehicles imposed by the licensing system. The number of "A" licences, or whole-time public haulage vehicles (excluding those directly operated by the railway companies), has fallen from 76,350 in 1936 to 74,000 in 1937 and 73,550 in 1938, while during the same period the number of operators has decreased from 25,650 to 23,000. Railway road delivery vehicles, on the other hand, have increased

from 9,000 units in 1936 to over 10,000 units in 1938. Only 11.8 per cent. of the haulage industry (apart from the railways), however, is controlled by firms operating more than fifty vehicles, and the proportion of the industry represented by amalgamations is probably not more than 6 per cent. But further amalgamation schemes have recently been mooted. Some of them are very ambitious and aim at modelling road haulage mergers on the type which has proved so successful in the omnibus industry, consisting of a central holding company and semi-independent but non-competitive operating units, with centralised buying and pooled technical facilities for the group as a whole. The campaign for freeing the railways from rates control, however, has put these schemes into cold storage, pending the clarification of the road hauliers' position.

The road haulage industry will probably have to pass through a period of trial and error until the proper types of organisation for goods transport by road are established. It may be that road hauliers, impressed by the financial results of omnibus operators, are apt to make too little allowance for the difference between the problems of passenger traffic—which concerns a more or less standardised traffic, self-loading and unloading, running on fixed routes according to definite time-tables under closely comparable conditions—and goods transport, which has to deal with a great variety and complexity of services. Passenger operation lends itself to a happy combination of decentralisation of the day-to-day work with centralisation of the functions suitable for central control. Goods operation, on the other hand, has in the past provided few examples of successful remote control. In general, the most profitable units are of a size in which few problems of centralisation and decentralisation occur; the exceptions are units which concentrate on one type of traffic, often requiring a specialised vehicle-body, and which are thus largely insulated against competition, except from a comparatively small number of similar specialists.

It is sometimes alleged that the scope for haulage amalgamations is also limited by the lack of personnel trained in large-scale goods operation and that a suitable technique for the administration of large haulage units has yet to be

evolved. There is certainly an element of truth in these contentions, and the problems of exercising control through comparative costs, relatively so simple in omnibus operation, may appear at first to offer almost insuperable difficulties in goods traffic. But the small haulage unit must inevitably run a considerable waste mileage if it attempts to give a reasonably regular and rapid service, because of the difficulty of matching the traffic on any particular day with the haulage facilities available, and when demands are heavy it may be compelled to refuse traffic. The large unit, on the other hand, is in a better position to smooth out chance fluctuations in the volume of traffic on any particular day, and it is potentially able, even more than the omnibus which is rigidly tied to a time-table, to ensure that all vehicles running are fully loaded. This can be achieved by giving the man on the spot the power to make rapid decisions and by keeping a central authority advised of the vehicle and traffic position, thus enabling it rapidly to equate the supply of vehicles to the demand at the various depôts.

It may well be that the emergency organisation for road transport, now slowly taking shape, will ultimately give a further impetus to the amalgamation movement. The emergency organisation is based on the pooling of vehicles with a view to reducing wasteful duplication, and on the provision of machinery for enabling supply to be equated with demand as equitably and rapidly as possible, both as between districts and different requirements. In some measure it is aimed at achieving, for emergency purposes, the type of organisation to which the industry is in any case being slowly driven by economic forces operating within the existing legal framework.

All the factors now at work, and not least the compulsory payment of statutory wages, are calculated to assist the larger operator at the expense of the smaller, but few, if any, will affect the position of the very smallest unit, consisting of the owner-driver with a single lorry, or the two-lorry business usually run entirely by two members of the same family and not employing any paid labour. This type of unit already accounts for 29 per cent. of the industry and represents the norm in many agricultural areas. In view of the highly individualised services required of them by their customers, such units are, perhaps, best left outside any rationalisation scheme. Certainly the attempt

of the Northern Ireland Road Transport Board to move in one stage from this type of unit to a road haulage monopoly has not been very successful. Even the grouping of such units for emergency purposes presents many difficulties, not least among which is the fact that such grouping can only be organised on a local basis, and the persons concerned are in normal times keen, and not infrequently bitter, competitors.

The organisation of road transport, whether for passengers or goods, is increasingly conditioned by the legal framework within which the industry must operate, and the extent to which amalgamation proceeds will in the long run be determined partly by this legal framework and partly by the limits set by economic and administrative considerations. The recognition of the potential value of the flexibility of road transport in emergency conditions, however, has introduced a new factor into the situation. It may now reasonably be expected that the Government, which for administrative reasons would prefer under emergency conditions to deal with fewer units, will be disposed to assist the tendency towards amalgamation and consolidation. This can most easily be accomplished by establishing conditions which tend to promote amalgamations when, following the discussions of the railways' case by the Transport Advisory Council, new transport legislation is introduced.

But the pace of the movement towards consolidation is set by the rate at which the difficult practical problems of large-scale road haulage organisation are solved. An attempt to force the pace may not, therefore, be in the general interest, which demands cheap and efficient transport. This possibility exists, for once the relations between the railways and the road hauliers have been put on a satisfactory basis (and any other policy would be contrary to the Government's declared desire to secure the co-ordination of both road and rail facilities), finance, which in the past has been rather shy of the road haulage industry, may be forthcoming for amalgamations on an adequate and, according to some transport experts, on a dangerously lavish scale. Past experience in other industries suggests that wisdom lies in the encouragement of amalgamations originating within the industry rather than in the promotion of "financial" amalgamations, not able to assure a reduction in costs and an improvement in efficiency.

Outlook for Cotton Shares

LANCASHIRE is not officially scheduled as a Special Area, but no one would deny the existence of severe depression in the cotton industry. Some 19.7 per cent. of the insured workpeople in the spinning section were unemployed in December; and in the weaving section, the proportion was as high as 22.8 per cent. Only 53 per cent. of the total spinning capacity is in production, and last year the total value of cotton yarn and cloth exports fell by no less than 28 per cent.—a fall which was matched by the volume in each class. More specifically, from the investor's viewpoint, the profits recently reported by Lancashire Cotton and Amalgamated Cotton Mills Trust show that earnings have been roughly halved.

The recovery which Lancashire enjoyed during 1937 proved ephemeral. In that year, the employed spindles percentage reached 91, while unemployment fell to the moderate level of 11 per cent. It was not, of course, recovery in any full sense: exports of piece-goods were only maintained at 1,922 million square yards, though yarn exports reached the highest level (159 million lb.) since 1929. But with the assistance of the minimum price schemes, the spinning section showed the best profits for well over a decade. Even in 1929, the losses of 175 spinning companies totalled £593,398, according to *Tattersall's Cotton Trade Review*. Last year, no more than 85 com-

panies remained, but their total profits of £913,119 show that Lancashire was nearer to prosperity in 1937 than at any time since 1921.

To-day, the story is different. The investor might question whether, even on the best assumptions, more than a handful of cotton shares hold out ultimate promise of real recovery. What are the assumptions? The passage of the Enabling Bill obviously comes first. It was indicated last month that a substantial body of support had been given to the Bill, and last week a two-thirds agreement was announced. The Enabling Bill is a much revised draft of proposals which had their roots in "Lancashire's Remedy," first published by the Joint Committee of Cotton Trades Organisations as long ago as October, 1937. The modifications which have since been made illustrate the difficulty of securing agreement in an industry where technical conditions vary widely, and the individual tradition dies hard. Only two days before the Joint Committee's statement last week, indeed, the Manchester Chamber of Commerce surprisingly rejected the proposals by 281 votes to 237. And Mr Oliver Stanley, announcing the impending publication of a White Paper containing the Clauses of the Bill, in Parliament on Thursday, added that an official ballot would be taken.

The supporters of the Bill are still hopeful that it will

receive the assent of Parliament. The controversy which the Bill has created, however, in part reflects the division of the cotton trade into a relatively prosperous home section, and a depressed export section. The manufacturer for the home market is obviously bound to oppose any measure which, in his view, might increase the cost of yarn. Among the spinner-manufacturers catering for the home market are Ashton Brothers, Barlow and Jones and Tootal Broadhurst Lee. Ashton Brothers have lately reported excellent trading profits of £70,332 for 1938, against £41,075 for 1937, and have paid a 5 per cent. ordinary dividend—the first for more than a decade—from adjusted ordinary earnings of 31.1 per cent. The latest figures for Barlow and Jones relate to 1937, when a 7½ per cent. dividend was paid. The reduction of the interim payment from 3½ per cent. to 2½ per cent. suggests that in this case the results for 1938, which are shortly due, may be less favourable. The flexibility of the provision against investment and plant, which in 1937 absorbed £40,000, against £20,000 in 1936, may, however, provide some cushion against falling profits. But the leading member of this group of companies is Tootal Broadhurst Lee, which has successfully developed branded cotton goods, particularly in the home market. The latest results for this company refer to the year to June 30th last, when trading profits showed a moderate reduction from £295,661 to £257,301, although the total distribution was maintained at 12½ per cent., including 2½ per cent. bonus. But Sir Kenneth Lee, at the annual meeting last August, expressed doubt whether this rate of payment could be maintained.

These companies produce part of their yarn requirements, but depend for the remainder on outside supplies. They do not, of course, exhaust the list of spinner-manufacturers, but their results indicate the more consistent earnings record of the manufacturers, particularly those interested in the home market, as contrasted with the spinners. The problem for the holders of spinning shares is whether the Enabling Bill is likely to lead directly to improved profits, either by increased business or by an improvement in spinning margins. Undoubtedly, the rapid recovery in profits during 1937 was due in large measure to the minimum price schemes which covered the majority of spinners in the Egyptian and American sections. But as soon as demand fell off, and outside competition for the available business became acute, the inevitable threat of defection had to be faced. A "loyalty-rebate" scheme in the Egyptian section induced yarn purchasers to confine their business to the spinners in the agreement, but the Medium American Ring Yarn agreement broke down last September. The experience gained under these schemes will undoubtedly prove useful, if the Enabling Bill is passed into law. In its simplified version, the Bill provides for sectional schemes for only two main purposes—minimum prices and redundancy.

Neither type of scheme makes a direct contribution to

the spinners' and export manufacturers' most urgent need—the resuscitation of export trade. Both are directed rather towards the appeasement of what is known to-day as "uneconomic competition" which Lancashire formerly used to regard as the rationale of its existence. But regarded from the narrower investment viewpoint, statutory minima which do not prejudice home consumption, but are yet sufficiently flexible to enable the industry to compete effectively in export markets, must be regarded favourably, though they cannot be introduced in time markedly to influence the profits of the current year.

The extent of redundancy can only be measured in the spinning section—though the weaving, and even more the finishing, branches of the trade are faced with the same urgent problem. In its second report, to September 14th last year, the Spindles Board recorded that 4,569,000 mule equivalent spindles had been acquired during the previous two years. The purchase programme of the Board is due to end next September, and it is safe to assume that the total spindles purchased will exceed 6 millions by that date. In addition to the Spindles Board, recognition must be given to the vigorous measures taken by Lancashire Cotton Corporation to meet its own redundancy problem. But although spindle capacity has been reduced from 45,875,251 in September, 1936, to 41,224,630 two years later, the latter total exceeded the number of spindles required to produce the yarn output actually attained for the half-year to September last by no less than 14 million spindles, compared with a surplus of 3.9 millions a year earlier. It is difficult to resist the conclusion, therefore, that the industry has something like 20 per cent. of spinning capacity surplus to "normal" requirements, and that there is room for further scrapping.

So far as concerns the industry as a whole, the scrapping of redundant plant would seem, therefore, to be at least as essential as the fixing of minimum prices. But from the investor's point of view, there is a distinction to be drawn between the two methods. Whereas minimum prices would presumably affect all producers equally, further scrapping would react most advantageously for the larger combine spinners who have already achieved some degree of rationalisation, of which Lancashire Cotton Corporation is the leading example. Reading between the lines of the recent report, it is evident that appreciable inner reserves against stock values have been made before striking profits. The Investment Note on page 32 of *The Economist* of January 7, 1939, discussed this conservative valuation of stocks, which, if the Enabling Bill is passed, will act as an offset against the decline in trade during the current year. Again, the profits of Amalgamated Cotton Mills Trust (discussed in *The Economist* of last week) were struck after providing for depreciation of stocks, without recourse to a reserve of £30,000 which was set up in 1937. The conclusion, in these two cases at least, is that defensive reserves have been set up against the possibility of falling stock values—and, by inference, against the threat of more acute competition. But, in the absence of recovery (of which there is no present sign), spinning profits are likely to be disappointing this year. Although it is to be presumed that the dividend on the Lancashire Cotton 5 per cent. non-cumulative preference stock would not willingly be passed, it was covered with a rather slender margin last year, which is recognised in the yield of £6 19s. per cent. at the present price of 14s. 4½d. Again, the highly-g geared 1s. ordinary shares of Amalgamated Cotton Mills (which stand at 1s. 3d.) received 8½ per cent. tax free last year, but the earnings ratio fell from 44.6 per cent. to 15.7 per cent. tax free.

Lancashire's remedy is not simple, and her complaint that she must face subsidised competition abroad, and has received scant treatment by Egypt and India (which depend on Lancashire, incidentally, to absorb an important share of their raw cotton) is not unreasonable. But the investor must be prepared to regard even the best of his cotton holdings as long-term recovery counters. There are many companies whose capitalisation still needs to be brought into relation with earnings realities, and some of them will be hard hit by a further period of depression. Unfortunately, the list of such companies is lengthy, and selection would merely be invidious. Recovery in the cotton trade will be to the few who are strong.

Finance and Banking

War Risks Cover.—Sir John Simon's statement of the Government's scheme for covering war risks on land and sea has received a mixed reception. Property owners, including the building societies who speak for four million investors and borrowers, have welcomed the principle that compensation for war losses will be payable from public funds, though they hoped for a detailed scheme. But, as the Chancellor of the Exchequer pointed out, normal insurance methods cannot be applied to covering war risks to property, and compensation must be based on the highest scale compatible with the circumstances of the country after, and not before, a conflict. Provision, however, will be made for payment in full up to a certain limit of loss, and for graded payments thereafter. Although payment will not be made until the end of hostilities, a Compensation Board under one of His Majesty's judges would be set up for the prompt assessment of damage, and provision would be made for emergency reconstruction of property. A scheme is also being devised to cover war casualties to civilians (not confined to those in National Service schemes) and for members of the mercantile marine, on the basis of army and navy compensation scales.

The plans to cover shipping and stocks of commodities have been linked more closely to insurance practice. In the first place, a scheme of marine war risks will shortly be announced, under which the marine war risks associations will be able to re-insure with the Government up to 80 per cent. of the value of ships (as fixed by the agreement) against King's enemy risks, on a premium basis after an emergency has arisen. Cargo insurers will form a pool, which will be able to reinsure similarly with the Government. Secondly, a scheme has been worked out by the companies and Lloyd's to cover stocks on land. Owners of goods will receive compensation for war losses in full immediately, and will pay premiums as soon as war occurs. No premium will be payable in peacetime, but persons requiring cover will register on payment of a nominal fee, and the scheme would become compulsory in time of war. Retail trade stocks are still under examination. The marine war scheme is clearly designed to relieve traders from the risk of rapidly rising premiums in the event of emergency—a risk which exists at present under the 48 hours' notice clause in marine policies and under the provision that steamers must sail within seven days (in other words, that rates cannot be fixed more than a week ahead of sailing). The provisions for covering goods should persuade traders to maintain normal stocks, and not (as in recent weeks) to allow them to dwindle to a hand-to-mouth basis.

U.S. Excess Bank Reserves.—The Federal Reserve Board has this week informed Congress that the present and prospective volume of excess bank reserves might "become the basis of an injurious credit expansion" and has requested "more power to meet such a crisis." The excess reserves (i.e. reserves in excess of those required by law to be kept against deposits) of member banks of the Federal Reserve system, amounted on January 26th last to \$3,600 millions. This constituted a new high record, being more than \$200 millions above the 1936 peak reached before the doubling of member bank reserve requirements in 1936 and 1937. Under section 19 of the amended Federal Reserve Act, the Board was given power to increase reserve requirements of member banks up to double what they were in 1935. In August, 1936, reserve requirements were raised by 50 per cent. and during the first four months of 1937 by another 50 per cent., thus fully exhausting the Board's powers. By these actions the Board eliminated about \$3,000 millions of excess reserves whose previous accumulation had been in the main the counterpart of the

influx of gold in the United States. From the point of view of their psychological effect, these increases in the Reserve requirements cannot altogether be held free from blame for the decline in commodity prices and recession in business activity, whose inception coincided with them.

Although the gold inflow to the United States continued unabated, and led to a rapid re-creation of excess reserves, the Federal Reserve Board decided in April, 1938, to reduce member banks' reserve requirements by approximately one-eighth. This was part of the comprehensive programme of Governmental measures for the encouragement of business recovery—known as the pump-priming programme—which was at that time announced by President Roosevelt, and it had the effect of raising excess reserves from about \$1,700 millions to \$2,500 millions. Under the existing legislation, therefore, the Federal Reserve Board's power to deal with the excess reserve situation is exiguous in the extreme, and its request for additional power presumably involves a demand for a further amendment of the Federal Reserve Act. Before such action is taken, it is to be hoped that the events of 1937 will not be altogether forgotten.

The Guilder's Weakness.—There have been further offerings of guilders during the past ten days, and as there has been little other business in the market, they have perhaps had a disproportionate influence on rates. On

COMMERCIAL SERVICE

The Bank has over 380 Branches in Africa, and Agents and Correspondents throughout the world. The closest touch with Trade and Industrial conditions is maintained, with special attention to Commercial and Credit Intelligence. This service is available to Exporters, Importers and others wishing to develop trade with South, East and Central Africa.

THE STANDARD BANK MONTHLY REVIEW, which is sent post free on application, gives the latest information on all South, East and Central African matters of Trade and Commercial Interest.

THE ECONOMIST BY AIR

To meet the growing demand from overseas readers for *The Economist* by air, special subscription rates have been introduced applicable to those countries to which Letter Mail is now normally transmitted by air. These are as follows:

	12 months	6 months
	£ s. d.	£ s. d.
Europe	4 17 6	2 8 9
Empire Air Routes	6 10 0	3 5 0

These rates include all supplements, but the latter will be sent by the surface routes and not by Letter Mail.

Unexpired subscriptions may be transferred to the new category on application to

THE PUBLISHER, THE ECONOMIST,
8 BOUVERIE STREET, LONDON, E.C.4

Thursday of last week the Netherlands Bank sold a few dollars at a rate of Fl. 1.85 $\frac{7}{8}$ to the dollar, and from then onwards it slowly raised its rate, until it was quoting Fl. 1.86 $\frac{1}{2}$ on Monday. On that day there was a heavy attack on the guilder, and it is believed that the Netherlands Bank sold between \$10 and \$20 millions. This vigorous intervention proved effective, for since then the bank has neither had to alter its rate nor sell any more dollars. There is some doubt about the origin of this selling, though it is traceable not only in Amsterdam but also in Paris and New York. Probably it represents a further efflux of

MONEY MARKET NOTES

Foreign Exchanges .

THE foreign exchange market has been comparatively unaffected by the developments in the international situation. Herr Hitler's speech stimulated business on Tuesday morning, but the increased activity did not last and on Wednesday and Thursday conditions were again very quiet. The sterling-dollar rates have shown small net gains in favour of sterling each day; the rate late on Thursday afternoon was quoted at 4.67 $\frac{1}{2}$ — $\frac{3}{4}$. Before the week-end the premium for forward dollars increased slightly to $\frac{1}{8}$ for one month and 1 $\frac{1}{2}$ for three months, but it has since come back to $\frac{1}{4}$ and 1 $\frac{1}{2}$ respectively. Control operations have been in evidence throughout the week, although on a small scale. On Tuesday morning, however, the Control was able to acquire fair quantities of dollars during the early appreciation of sterling. Francs have been very steady within the range of 176 $\frac{1}{2}$ —177 $\frac{1}{2}$. The French Control has prevented any appreciation in the spot rate, but the firm undertone is reflected in the narrowing of the forward discounts, which on Tuesday were down to $\frac{1}{8}$ for one month and $\frac{1}{8}$ for three months, compared with $\frac{1}{4}$ and $\frac{3}{8}$ before the week-end. The guilder has been erratic. On Monday the rate fell to nearly 8.73 $\frac{1}{2}$, at which point bear covering brought about a sharp recovery. This was maintained on Tuesday morning, when the guilder appreciated to 8.62 $\frac{1}{2}$, but a reaction set in later and the trend has since been very irregular. Other Continental currencies have been fairly steady except for a sharp appreciation against the dollar on Tuesday morning.

The Bank Return

THE note circulation shows an increase on the week of £8.1 millions, and the Reserve is down by almost exactly that amount. This expansion is due to currency requirements for the end of

month. In the corresponding week of last year the increase was only £3.5

funds combined with some speculation. In spite of the recent narrowness of the market there is still a steady commercial demand for dollars, both against shipments of rubber from the Netherlands East Indies and against shipments of eggs and other produce from Holland. On the other hand, there is a feeling in Holland that at its present rate the guilder may be slightly over-valued, and that feeling has probably been intensified by last autumn's depreciation of sterling. So long as this feeling exists the guilder may show signs of weakness from time to time, but the Dutch gold reserves are ample, and this week's

millions, but this year's Return is dated February 1st and there has not been time for any of the notes to return, as was the case last year. The currency withdrawals from the joint-stock banks, indicated by the increase in the note circulation, have caused a sharp drop in bankers' deposits. These are actually down by as much as nearly £10 millions, since, quite apart from the note increase, transfers of tax money to the Treasury are tending to reduce them. No attempt has been made to counteract the deflationary effect of these transfers; on the contrary, Government securities are down by £4.1 millions.

The Money Market

CONDITIONS are still dominated by the dearth of bills, and business as a result has been very quiet, although there was the usual big turnover of money associated with end of the month operation. A favourable reception was given to both the Liverpool and Northern Ireland bills, which are in both cases now eligible for rediscount at the Bank of England and do not therefore come under the clearing banks' ban. The Liverpool bills, amounting to £1,000,000 and running for six months, were placed at an average rate of 12s. 0.22d. per cent.; applications totalled £2,825,000. For the £300,000 Northern Ireland Treasury bills on offer applications totalled £2,675,000. Their short currency—they are repayable on April 6th—made them very attractive to the market, and the average rate at which they were placed was 10s. 3.54d. per cent., compared with 10s. 6.3d. for the previous issue on

January 16th. It is expected that more "eligible" municipalities will take advantage of the present conditions to secure tenders at favourable rates, for the scarcity of bills has now reached such a point that the market is hardly able to satisfy any of the clearing banks' demand. Commercial paper is.

naturally, in eager request, and the rate for the three months fine bank draft has often been below $\frac{1}{2}$ per cent. in competition. Credit has been abundant, and bond money has been available at $\frac{1}{8}$, and sometimes at $\frac{1}{4}$ per cent., throughout the week. There are still no signs that any steps are being taken to relieve the present abnormal position, and business, now that the turn of the month has passed, will probably again relapse to negligible proportions.

The Bullion Market

THERE has been more arbitrage demand for gold this week, in spite of the steadiness of the sterling-dollar exchange. Further maturing of forward contracts which can no longer be renewed has maintained the supplies at the fixing at a fairly high level, but on Monday and on Wednesday the Exchange Account had to provide nearly half of the amount in demand. It is possible that part at least of the unusually large re-sales from Continental sources on Tuesday was the result of Herr Hitler's speech. Hoarders may have been reassured to the extent that they thought it no longer necessary to hold their gold, or, more probably, they may have considered that the favourable effect of the speech on the sterling-

The New York price of silver remained at 43 cents per ounce .999 fine during the week.

dollar rate, and the consequent decline in the price of gold, would go further and last longer than it actually did and that they should seize the chance of getting out at the present high level. The silver market has sagged throughout the week. On January 27th there was an exceptionally sharp fall of $\frac{1}{8}$ d. in the cash price which may have been due to sales of Spanish silver. The following day, however, it rallied again, as a result of bear covering and some Indian buying, but the rally proved to have been very short-lived.

successful defence shows that the authorities have the situation well in hand.

The Dumping of Reichsmark Notes.—It has been noticed for some time past that substantial quantities of brand-new Reichsmark notes fresh from the printer and in the original wrappers of the Reichsbank have been arriving in London. This influx has become accentuated during the last week or so. Considering the existence of watertight exchange control around Germany's borders, it is almost inconceivable that traffic on such a scale should take place without the knowledge and approval of the German authorities. While the Reichsmark rate itself is reasonably stable, the price of these notes has been fluctuating very widely during recent weeks, and the risk attached to holding them is considerable. Owing to the difficulty of covering the exchange risk, it is very unlikely that any London firm would be willing to acquire and hold large quantities of these notes on its own account. It must be assumed, therefore, that those who introduce large quantities of the notes into London are acting as agents for the exporters of these notes—presumably the German authorities. Needless to say, the natural absorbing capacity of the London market is limited, but with the price fluctuating between 42 and 52 to the pound, there is a strong inducement for ship-owners and sailors to buy them and spend them in

Investment

Course of Share Values.—The accompanying chart, which portrays the course of equity shares in London and New York during the past two years, does not fully reflect the remarkable changes in market sentiment during the past fortnight. The course of security prices for the last full week in January (as shown on page 190 of last week's issue) showed that markets had succumbed to a degree of political fear which had no parallel since the crisis last September. *The Financial News* index of ordinary shares, for example, fell to 73.7 on January 26—the same level as was reached on the

BRITISH AND AMERICAN INDUSTRIAL SHARE VALUES DURING THE PAST TWO YEARS

(July 1, 1935 = 100)

British: *Financial News* Index of 30 Ordinary Shares.
American: *Standard Statistics* Index of 50 Common Stocks.

Wednesday of the crisis week. Herr Hitler, in fact, had the market at his mercy, and although at the end of last week markets were recovering their poise, it was not until investors' radio sets were switched off last Monday night that they could breathe with real assurance. The speech, in fact, contained no specific threats of the character which the Reichstag cheered to the full last year, and it provided an immediate signal for "bear" covering and for a renewed flow of investment orders, usually of the smaller type, on Tuesday and Wednesday of this week. In terms of *The Financial News* index number, the market has

German ports on the purchase of stores. The control over smuggling-in of notes in small amounts is not so strict as the control over exporting any form of capital. It is possible that the whole traffic constitutes a method of procuring exchange through the sale of notes on the pattern practised in 1923, though now on an incomparably smaller scale. Possibly the German authorities close their eyes to the re-smuggling of notes in small quantities in order to keep up the absorbing capacity of the market. Such is the exchange shortage in Germany that it does not appear at all unlikely that the authorities would resort to these and similar methods for the sake of raising comparatively small amounts of free exchange.

Union Bank of Australia.—At the annual general meeting, Sir John Davidson referred to the over-stocking which affected many Australian secondary industries after the prosperous 1936-37 season had given way to slump. To support these firms and also the primary producers suffering from drought in addition to low prices, the banks increased their advances by £A23 millions in the year ended last August. Those of the Union Bank of Australia alone rose by £2,350,000, and this is the chief cause of the increase of £61,000 in the gross profits. The decline in the net profit is the result of an increase of £71,000 in expenses; of this, taxation, with which Sir John dealt in detail, accounted for £26,000.

recovered from 73.7 at the close last Friday to 78.7 on Thursday this week. Although much of the rise is attributable to technical factors (for last week's fall was, in reality, overdone), the condition of the "House," despite occasional slackening of interest such as occurred around noon on Wednesday, is certainly more confident. On the other hand, the large professional and institutional investor does not appear to have followed this week's rises very vigorously. Wall Street has taken a rather more sceptical line, and is showing some pre-occupation with the new interest of the Administration in European politics. On the other hand, the resumed rise in steel output after last week's fall has provided a modest pointer towards industrial recovery which should be welcomed.

Foreign Bonds Depressed.—Although foreign bonds shared in this week's rally, prices fell heavily on balance during January. The index of 107 bond prices, computed by Municipal and General Securities, thus shows a further fall from 61.3 to 58.6 (January-June, 1934 = 100). Political nerves affected the European index most severely, and are marked by a fall of 8 points to 70.1. Chinese issues were depressed owing to the uncertain future of the Customs loans service. It is a relief to find that South American States issues are higher—an improvement due to hopes of resumed Brazilian debt service. Details of the index are given below:—

AVERAGE JANUARY-JUNE, 1934 = 100.

N.B.—Figures in brackets denote number of bonds included.

Delicate questions of policy are involved in the Stock Exchange Committee's decision regarding the proposal to quote Greek Bonds ex dividend. The matter has been deferred until March 13th in the hope that meanwhile it may be possible to resume the debt negotiations. Foreign Bond dealers had requested the Committee to mark the Bonds ex dividend in view of the fact that many holders, having acted against the advice of the Council of Foreign Bondholders and the League Loans Committee by accepting the offer of 40 per cent. in payment of their coupons since March 31, 1937, now find that their Bonds are bad delivery. The objection to allowing an ex dividend quotation is that it would, it is felt, be considered as implying a *de facto* acceptance of Greek Government's offer and would prejudice the efforts to secure better terms.

Capital Issues in January.—Although the amount of new issue activity continues on a low scale, there has been a slight revival in the capital market. As will be seen from the following table, subscriptions of new money (calculated on our "old basis") were higher in January either than a month ago or than in January, 1938:—

(000's omitted) excluding conversions

The largest issue of the month was of Southern Railway 4 per cent. debenture stock, which involved over £7,000,000 of new money, and next in size came the Jamaica 3½ per cent. loan. Only two public issues were made by industrial companies, and industrial placings remained small. The market, having come to a full stop owing to political nervousness, has reopened this week with the important John Summers' debenture issue.

Building Society Trends.—Evidence is accumulating regarding the experience of the building societies during 1938. According to figures compiled by the *Building Societies Gazette*, the results of 70 societies reporting to the end of January show an increase in mortgage advances from £46,880,592 in 1937 to £48,982,032 for 1938, while shareholders' balances increased from £186,231,563 to £196,322,232 and depositors' balances from £46,420,803 to £52,812,329. The report of the Abbey Road Building Society for 1938 confirms this general trend. During the past year the Society made advances amounting to £7,310,699, compared with £6,756,952 in 1937, while its liabilities to shareholders and depositors rose to £48,879,879, against £47,460,974 in 1937. Moreover, the report of a smaller society, Northampton Town and County, although showing a small reduction in mortgage advances (from a record figure of £1,511,219 to £1,439,396) and in deposits, shows an increase in shareholders' capital of over £400,000 to £5,432,238. There

is little evidence, therefore, either of a setback in mortgage business during 1938 or of an embarrassing withdrawal of funds by shareholders and depositors. The movement can congratulate itself on both counts in a year of reduced building activity and political uncertainty (coupled with the absence of war risks cover). The present position of the movement, after several years of unsurpassed building activity, nevertheless warrants careful consideration by those who are in a position to influence building society opinion. Despite the rise in the total assets of the 70 societies included in the *Building Societies Gazette* computation from £248.5 millions to £267.3 millions, it is worth pointing out that non-mortgage assets comprise only 7½ per cent. of the latest total compared with 8½ per cent. of the 1937 total.

Gas Company Results.—The past year included a mild spring and autumn and extreme cold before Christmas. Although in the latter period output showed a sharp expansion, the quantity of gas sold in 1938 was lower than in 1937—Gas Light and Coke shows a fall of 1 per cent. and South Metropolitan a fall of 3.46 per cent. Increased selling prices enabled both companies to maintain a satisfactory level of gross revenue, though the further rise in costs has offset (as was anticipated) any net benefit from higher prices. The results of Gas Light and Coke and South Metropolitan Gas for the past two years are analysed below:—

	Gas Light and Coke		South Metro. Gas	
	1937	1938	1937	1938

† After crediting Treasury grant of £336 and debiting issue expenses of £339.

Gas Light and Coke shows total revenue, including residuals, of £13,653,391, against £13,573,409, though gas sales were slightly reduced from 271 million therms to 268 millions. Manufacturing expenses were, in fact, reduced in somewhat greater proportion, but some further increase occurred in distribution expenses. The 5½ per cent. dividend, however, has been more nearly earned than in 1937. Although Gas Light and Coke fared relatively well in the residual business last year, South Metropolitan showed a fall in residual revenue. High coke prices have made a useful contribution to such revenues during recent years, while the extension of mains to new housing districts has entailed considerable capital and distribution costs to obtain a load which may, on the average, be lower than in older districts. Gas ordinary stocks are highly esteemed as stable equities (though South Metropolitan was actually compelled to reduce its dividend from 1936), but the maintenance of high coal costs is necessitating corresponding increases in selling prices, which react adversely on consumption, and provide no margin for the stockholder.

Gaumont-British Inspection.—The Board of Trade has appointed Mr. Russell Kettle, F.C.A., of the firm of Deloitte Plender Griffiths and Company to inspect the affairs of Gaumont-British Picture Corporation. An application for an inspector was lodged, with the support of holders of 10 per cent. or more of the share capital, in

January last year. A combination of circumstances—including discussions between the Corporation and the Shareholders' Committee, legal proceedings against the Corporation by Associated British Picture Corporation, and more recently the projected merger of Odeon and Gaumont-British—may have contributed to the delay in reaching a decision regarding the application. Section 135 of the Companies Act, under which it has been made, provides that all officers and agents of the company are required to produce to the inspector all books and documents "in their custody or power," and they may also be questioned on oath, with penalties for contempt of Court if they do not comply. The Inspector's report is made to the Board of Trade, which must send a copy to the company, and, on request, to the applicants for the investigation. The inquiry should have the salutary effect of answering the many questions which have been raised regarding the Corporation's affairs in recent years, for it is in expert hands. Whether the investigation will affect, or even delay, the projected merger negotiations between Odeon Theatres and Gaumont-British is uncertain. The inspection concerns the past affairs of the Corporation, but since the report may throw additional light on the present assets and earnings position, shareholders of both companies might prefer to await its outcome.

U.S. Steel Results.—Political factors, rather than reported earnings, were the dominant force in Wall Street this week. Comparatively little response followed the announcement by U.S. Steel Corporation of net profits of \$4,394,454 for the December quarter, compared with the loss of \$5,847,791 for the September quarter. The December quarter profit (equivalent to \$1.22 per share on the 7 per cent. preferred stock) is the first in 1938. Operations averaged 44.6 per cent. of capacity, against 34.6 per cent. for the third quarter—a fact which suggests that the "break-even" point, despite the new price arrangements, has proved lower than expected. The quarterly dividend of \$1.75 on the preferred stock has, of course, been regularly paid during 1938, although even last quarter it was not fully earned. The loss for the full year amounts to \$7,755,918 net, compared with profits of \$99,930,836 before tax in 1937. Youngstown Sheet and Tube shows a comparable setback, from profits of \$12,191,000 in 1937 to a loss of \$659,000 for 1938. Inland Steel is in a special category, but its common stock dividends were reduced to \$2.50 per share last year, compared with \$5 per share in 1937, while net earnings fell from \$12,665,317 to \$4,916,203 last year, equivalent to \$3.12 per share. The common stock dividend has been maintained for the current quarter at 50 cents per share.

Canadian Pacific Earnings.—Compared with the ominous fall in Canadian Pacific gross earnings in the summer of last year (when the cumulative loss approached \$6½ millions) the eventual loss of \$2,827,000 for the full year (from \$145,086,000 to \$142,259,000) is more consoling to stockholders. Virtually the whole of the loss, however, is borne by net earnings, for aggregate operating costs increased slightly from \$121,344,000 to \$121,506,000, and net earnings fell from \$23,742,000 to \$20,753,000—a fall of \$2,989,000. The latter figure, however, is only the first step—and certainly the clearest—towards an estimate of eventual net revenue for the year. Dividend income, which includes the revenue from the company's holdings in Consolidated Mining and Smelting, will suffer a reduction of \$1,682,500 from that source. And although net receipts from steamships recovered to \$2,459,000 in 1937, after two years "in the red," last year was not generally favourable for shipping earnings. Again, the precise position of the company for guarantees in respect of the Minneapolis St. Paul and Sault Sainte Marie Railway is difficult to determine. Under the reorganisation plan filed at the end of 1937, Canadian Pacific was due to be relieved of annual interest charges amounting to \$119,500, while the company was advised

that its guarantee of interest on the "Soo" Line first mortgage bonds, amounting to \$2,681,320 annually, would cease on July 1st last. The importance of these transactions, and of provision for losses on lines abandoned (which, however, do not influence dividend policy) is readily apparent. Hence, although under favourable assumptions it is possible to estimate earnings of 2 per cent. on the non-cumulative preference stock (the actual rate paid for 1937), the market is probably wise in anticipating a payment of no more than 1 per cent.

Woolworth Expansion.—Shareholders of F. W. Woolworth and Company, already fortified by record profits and an increased dividend for 1938, should draw additional satisfaction from Mr W. L. Stephenson's speech at the annual meeting. Sales last year reached a new record, for the fall in demand during the crisis was successfully made good by the end of the year. The expansion programme of 1937, when 34 new stores were opened, and a large number improved, has contributed its full quota to the excellent 1938 results. During 1938, 26 new stores and 40 enlargements and replacements contributed only part of their potential earnings, which will be fully reflected in the current year's results. There are now 737 stores in operation, and their profit ratio was maintained last year, despite higher expenses. Moreover, the policy of expansion is to be continued. Schemes costing £2½ millions have been approved for the current year, which are designed to add rather more than one new store per week, and to extend or replace 75 existing stores. This bold programme, undertaken in full knowledge of prevailing political uncertainties, disposes of the idea that the Woolworth group has reached a prosperous and satisfied maturity. The saturation point argument, which must to some extent be in the mind of the observer when a group has reached this scale, and when popular purchasing power may be near its maximum, evidently makes no appeal to the Woolworth board.

Boot and Shoe Profits.—The past year proved difficult for boot and shoe companies, and their profits have suffered in consequence. Brighter features, however, are not entirely lacking. W. Barratt & Company, whose profits have risen consistently since 1932-33, have increased their interim dividend from 4 per cent. to 4½ per cent. Again, Stead and Simpson appear at least to have maintained their earnings, though comparison is admittedly imperfect since a £38,000 preference share issue was made in January, 1938. The proceeds, however, do not appear to have been converted into fixed assets which would contribute to profits. In the following table we give a selection of recent results:—

Company (years to December 31)	Total profits	Tax	Earned for Ord.		Div.	Present	
			Amt.	%		Price	Yield
Lotus—	£	£	£	%			%
1936.....	110,886	22,000	57,418	11.1	7	13/9 (£1)	5.81
1937.....	98,370	27,000	40,765	8.0	6

1938.....	8,068	...	6,668	3.6	3½		

† On £290,720, increased as from January 1, 1937, by two-for-three capital bonus. (i) 4½ per cent. debenture stock.

Of these five companies, Lotus and Weber and Phillips are primarily manufacturers; J. Darnell and Son are factors, while Stead and Simpson and William Timpson have their own retail stores. The published results alone do not indicate how profits have been affected by sales volume and how far by manufacturing and costing problems. But fluctuating material values and an increase in wages evidently played an important part in the year's difficulties. It may be significant that industrial recession has least affected Stead and Simpson and William Timpson, who supply a more popular and less specialised market than some other companies. Moreover, Public Benefit Boot Company (who own retail shops) report total profits only 4½ per cent. lower, though owing to higher charges, equity earnings are reduced from £14,647 to a mere £716. Recent industrial reports do not suggest that the industry has begun 1939 with a flourish. Since boot and shoe shares are not among the more readily marketable issues, the current yields seem to flatter their immediate prospects.

"Chartered" Results.—The market correctly assumed that the reduced distribution of British South Africa Company of 1s. 3d. against 2s. per share was due to lower investment profits and mining royalties. Total revenue for the year to September, 1938, declined from £960,090 to £706,970, and the net amount earned for dividend (£402,573, against £686,649) failed to cover the distribution by £27,467. Dividends and commissions show an increase of just over £100,000 at £498,583, but mining royalties are almost as greatly reduced at £199,395, while realised investment profits have shrunk from £266,973 to £8,992. The market, however, did not find these results depressing, for the 15s. shares rose from 22s. to 23s. 9d.

OVER ONE HUNDRED AND TEN YEARS OF SERVICE
SCOTTISH UNION & NATIONAL

London: 5 Walbrook, E.C.4, and 45 Pall Mall, S.W.1.

later in the week. The portfolio shows a reduction in gilt-edged securities from 20.6 per cent. to 12.5 per cent., while "other mining investments" show a rise from 3.6 per cent. to 14.7 per cent., owing to the acquisition of ordinary and preference shares in Anglo-American Corporation, to which Sir Dougal Malcolm referred at last year's meeting. It is difficult to estimate prospective earnings for the current year. They should benefit from distributions from the Rhodesia Railways, in respect of the year to September last, after the latter have filtered through Rhodesia Railways Trust. Some £100,000 has been set aside to dividend reserve by the railways company, and "Chartered's" holding in the Trust is slightly under 80 per cent. Owing to the fall in the price of copper below the datum line of £55 (above this level "Chartered" receives a royalty of 2½ per cent., and below it one of 2 per cent.) copper royalties fell by £110,632, although production increased by almost 10,000 tons. Assuming an average rate of production of 95 per cent. of quotas for the first nine months of the year, production and royalty income should only be slightly lower in 1938-39. Some small reduction in dividend income may be sustained, and unless there is a marked recovery in the markets, little improvement in investment profits is to be expected. On the past year's distribution, the 15s. shares yield £5 14s. 6d., after adjusting for Dominion tax relief—a return which appears to measure their recovery prospects fairly.

The Week's Company Profits.—Textile company results are well represented among the 42 companies whose profit and loss accounts are analysed in our usual table on page 282. These companies show net profits of £2,375,000, against £2,893,000—a fall of 18 per cent. Aggregate net profits of the 153 companies (other than banks) reporting in 1939 amount to £16,072,000, and are 8½ per cent. lower than the total profits of £17,599,000 earned by the same companies a year ago. The week's results are discussed in preceding Notes and on page 262 under the heading "Shorter Comments."

Company Meetings of the Week.—In this issue reports of company meetings begin on page 267. Addressing *Lloyds Bank* members, Lord Wardington stressed that devices to encourage greater borrowing and spending failed if the public refused to take advantage of the opportunities. Comparing events in August, 1914, and September, 1938, he concluded that our banking and monetary system had become both stronger and more elastic. In an analysis of the Bank's advances, Lord Wardington pointed out that agriculture had required more finance during the past year, and had shown remarkably few bad debts. The average overdraft in all categories was £822. At the *Union Bank of Australia* meeting, Major-General Sir John H. Davidson estimated that total taxes payable by the bank in the current year would reach £250,000, which was more than the net dividend being distributed. Sir William H. Goschen, addressing the *Sun Life Assurance* meeting, expressed satisfaction that for the fourth successive year the commission and expense ratio showed a decrease. Mr W. L. Stephenson's survey at the *F. W. Woolworth and Company* meeting is discussed in a Note on page 257. Members of *General Consolidated Investment Trust* were informed by Mr R. H. Otley that the decline in gross income from investments was partly due to lower receipts on account of arrears. The Board's attitude towards the use of the revenue reserve was discussed by Mr J. S. Austen at the *Government's Stock and Other Securities Investment* meeting. At the *Ashanti Goldfields* meeting, Mr J. H. Batty explained how important developments had revolutionised the outlook. Reserves, on a throughput of 30,000 tons a month, represented five years' supply. Mr Batty informed *Bibiani* shareholders that the new treatment plant should be ready for trial runs towards the end of May or early in June.

SETTLING DAYS
TICKET ACCOUNT
FEBRUARY 7 FEBRUARY 9

THE dramatic reversal in market sentiment which occurred after Herr Hitler's speech finds its only parallel in the Munich "boom" last September. In fact, some parts of the market had prepared themselves for a sharp rally, for speculative sellers had in many cases reduced their open position on Monday and their covering caused an appreciable strengthening of prices. The gilt-edged market did not share in this preliminary improvement, but followed the general rise later in the week. Indeed, on Wednesday and Thursday the demand for the Funds was the outstanding feature of the day. Buying has not, generally speaking, been of a large-scale professional character, but a sufficient volume of moderate orders has been received to strengthen prices considerably in all departments. The revaluation of gold acted as a further stimulus on Thursday on the perhaps optimistic assumption that it would remove the necessity for additional taxation and, more reasonably, that the high price of gold could be regarded as assured.

The *Funds* gave a poor display at the opening and undated stocks showed falls ranging up to ½. A striking recovery, however, occurred on Tuesday, assisted by substantial "bear" covering and Old Consols jumped no less than 1½. The improvement was continued in mid-week and again on Thursday, which was a "gilt-edged day." The tone also improved among dominion stocks and several New Zealand issues made fractional gains in mid-week. In the foreign bond market, "bear" covering was responsible for a sharp rise in German issues, but after further appreciation a reaction occurred on Wednesday afternoon. Support for Japanese issues was the feature in the Far-Eastern group, but Brazilian bonds failed to maintain last week's advances owing to greater scepticism regarding resumption of the debt service.

Home rails shared in the week's recovery, partly on appreciable "bear" covering and partly on the progress of the "Square Deal" campaign and the road-rail pact reported on Thursday. Despite the poor traffics, prior charges showed useful mid-week advances. Argentine rail prices were marked higher but business remained quite small.

Even before Herr Hitler's speech on Monday, the *industrial market* thought its previous attack of nerves overdone, and the week opened with a good technical recovery. Prices again went ahead smartly on Tuesday, helped by "bear" covering and some buying of the leaders, but though calmer conditions returned later and profit-taking caused occasional irregularity, prices were consolidated and even improved. Iron and steel shares rose firmly on Monday and Tuesday, but the best prices were not maintained in some cases. The Anglo-German agreement helped coal shares, which, on the whole, held their ground. In the engineering section also, prices remained firm after their initial gains. Electrical equipment shares behaved

similarly, and electric supply shares recovered after early weakness. The "heavies," and in particular Leyland, were prominent among motor shares, which were well supported almost throughout the week. After Monday's sharp rise, aircraft issues did not make much further headway. De Havilland improved on the report, but Blackburn gave way on the new capital proposals. Textiles shared modestly in the general trend. Listers lost ground on the results, but Courtaulds were helped by the decision to reopen the Leigh mill, though they became more irregular in mid-week. Brewery shares were well supported, and continued to go ahead on the beer output figures and taxation optimism. Tobacco shares showed the same tendency. Both store shares and provision and catering issues improved. Miscellaneous shares were typical of the rest of the market, and the leaders on the whole held their early gains. Shipping shares behaved independently, and were rather steadier after early irregularity.

In *oil shares*, the better tone over the week-end was followed by a good upward trend on Tuesday, with support for the leaders reinforced by Paris and Amsterdam. Wednesday, however, saw some reduction in turnover and weaker prices, but quotations recovered on Thursday. The improvement in rubber shares early in the week, both in prices and turnover, was not maintained, and greater reserve was shown in mid-week. Tea shares followed other sections of the market.

The *mining markets* went ahead strongly. Bear covering on Monday brought a firmer tone, and Tuesday's gains were considerable. The better tendency in Kaffirs persisted in mid-

week, and was given further impetus by the decision to revalue the Bank's gold stock. Investment support was mainly local, though the Cape turned buyers of the developing mines, and Paris interest in the dividend-payers revived in mid-week. West Africans followed the trend of Kaffirs and improved further on Thursday. Rhodesian coppers quietened down after an initial spurt. Buoyant prices for base metal shares were assisted early in the week by Paris inquiry. Treppa were a bright feature. Some renewed interest in tin shares was shown in mid-week.

ACTUARIES' INVESTMENT INDEX

ON Tuesday, January 31, 1939, the Actuaries' index of 160 industrial equity prices had recovered from the low point of a week ago to 59.1, but it compared with 61.5 a month ago, and 73.5 a year ago. The corresponding average yields are 6.40, 6.13 and 4.85 per cent. We give below a selection of the component indices, and also the usual monthly particulars of fixed interest securities.

CANADIAN stock markets last month were not in a healthy condition, and public buying was reduced to a minimum. At intervals, especially at the end of January, there were some upward movements, but depressing news about the international situation produced a recession. Declines were not important for the first twelve days or so, but losses then became considerable, and only at the end of the month was the trend reversed. Speculators maintained their interest in armament shares. The mining market followed the general trend, with base metals usually in the lead. The "Investors' Index" of the Bureau of Statistics, which stood at 108.7 on December 31st, fell to 105.9 on January 11th. The bond market opened relatively firm, and the Bureau's index for the price of long-term Dominion bonds for the week January 6th-12th remained unchanged at 117.9, compared

with the corresponding week of December.

Capital Issues

THE resumption of new issue business has been encouraged by the market's response to Herr Hitler's speech. The most important offer of the week consists of £2,000,000 4½ per cent. first debenture stock, redeemable 1959, by *John Summers and Sons*. The proceeds are required to finance the erection of the new strip mill at Shotton (full details of which were published in *The Economist* of January 14th last). An estimate of profits for 1938 shows that, after adjusting for depreciation, the full service of the stock was covered two and a half times by earnings. In view of the powerful affiliations of the company, and of the expected earning power of the new plant, the stock may be regarded as a sound industrial debenture. The mixed issue of preference and ordinary shares by *Kennings, Limited*, motor distributors and engineers, is likely to appeal more especially to investors in the Derbyshire area. Profits during the latest year show an appreciable fall. Particulars have been published this week of an issue of 4 per cent. debenture stock by *Railway and General Investment Trust*.

PUBLIC OFFERS

John Summers and Sons.—Issue of £2,000,000 4½ per cent. first mortgage debenture stock, at 98½. First charge on fixed assets and on capitals of two chief subsidiaries; further £500,000 can be issued. Redeemable at par December, 1959, or by drawings from

1941, or on notice at various rates and dates. Proceeds for new mill, etc. Net assets (after debentures), £5,668,317. Combined profits, after depreciation, before interest: 1935, £353,194; 1936, £423,158; 1937, £661,774.

Kennings, Ltd.—Issue of 100,000 5½ per cent. cumulative £1 preference shares at par and 400,000 5s. ordinary shares at 6s. 6d. Proceeds to repay loans, etc. Motor distributors, etc. Combined profits of company and subsidiaries (before interest), years to June 30: 1936, £44,393; 1937, £72,750; 1938, £54,472. Combined net assets, £164,152. Lists closed at noon on January 31st.

RESULT OF TENDER

Liverpool Corporation Bills.—The tenders for £1,000,000 bills to be dated February 6, and payable August 5, 1939, were opened February 1st at the Bank of England. Total amount applied for, £2,825,000; amount allotted, £1,000,000; tenders at £99 13s. 11d. receive an allotment of about 46 per cent.; tenders at higher prices receive allotment in full; average rate of accepted tenders, 12s. 0.22d. per cent. per annum. At the date of this notice the corporation have no bills outstanding.

BY STOCK EXCHANGE INTRODUCTION

Railway and General Investment Trust.—Issue of £300,000 4 per cent. debenture stock Series "B" taken by Messrs James Capel and Company at 98½ less ½. Redeemable from December, 1960, at 101, or at par in 1965 (102½ on a voluntary liquidation).

BONUS SHARES

Vulcanite, Ltd.—The directors propose a 10 per cent. non-cumulative preferential dividend for the preference, instead of existing participating rights, and to capitalise £12,500 (or 100 per cent.) of general reserve by a bonus of 50,000 ordinary 5s. shares to ordinary shareholders.

ISSUE TO SHAREHOLDERS ONLY

Blackburn Aircraft.—Issue of 800,000 10s. ordinary shares at par, in proportion of one share for one held. To rank from April 1, 1939.

SHORTER COMMENTS

Company Results of the Week.—Current shipping profits show that recovery was sharp but short-lived. **WM. FRANCE FENWICK AND COMPANY** report total profits of £112,651 against £171,142, and the dividend is reduced from 10 per cent. to 7½ per cent. Net profits of **SINGAPORE TRACTION COMPANY** show a sharp fall from £53,426 to £40,624, largely owing to the strike last summer. **WESTINGHOUSE BRAKE AND SIGNAL** is among the few companies to show a rise in total profits to £265,518 against £262,776. In 1936-37, moreover, a special credit of £15,856 from reserves was included in profits. Satisfactory earnings stability is recorded by **BEANS INDUSTRIES**, which pays 32 per cent. for the year, against 30 per cent. actual for the initial period. The rise in **DE HAVILLAND AIRCRAFT** net profits from £230,089 to £262,259 is considerable, though less marked than in the previous year. Stocks and work in progress have risen sharply to £1,345,961 gross. Recession has affected warehousing companies. **BRAD-**

BURY GREATOR net profits have fallen from £46,471 to £31,906, and though the 9 per cent. dividend is maintained, it is covered by earnings of only 5.6 per cent. **HOUNDSDITCH WAREHOUSE COMPANY** total profits have fallen by the relatively moderate amount of £21,000 to £262,552, and the 17½ per cent. dividend is repeated. **LISTER AND COMPANY**, whose past profits record is irregular, have sustained a loss of £37,513 against a profit of £75,084. Total profits of **LINEN THREAD COMPANY** amount to £162,887 (against £296,623 after providing for contingencies), and the previous year's 2½ per cent. bonus is omitted from the distribution. **ENGLISH VELVET AND CORD DYERS'** total profits of £13,886 are reduced to one-third of the 1937 total, and debenture service entails a transfer from reserve. **MCINTYRE HOGG MARSH** total profits are halved, and the 10 per cent. dividend is short-earned by 3 per cent., if special profits are excluded.

MISCELLANEOUS

Trust of Insurance Shares.—Notice is given of a variation in the provisions of the Trust Deed dated June 21, 1934 (as amended) by a Supplemental Trust Deed dated December 29, 1938. Copies of the deeds and a statement of their effect are obtainable by certificate holders at the offices of the Trust, 30 Cornhill, E.C.3.

National Mutual Life Assurance Society.—As result of valuation made on December 31, 1938, reversionary bonuses for 1937 and 1938 will be at same normal rates per annum compound as before, viz.: Fully participating whole life, 42s. 6d. per cent.; endowment, 37s. 6d. per cent.; low premium participating, 15s. per cent. The directors have decided not to declare the small extra bonuses distributed in two previous valuations, owing to the obscure financial outlook and consequent need for conserving resources. Interim bonuses for 1939 will be at same rates as before, and equal to those now declared.

Swiss Bank Corporation.—Net profit for 1938, Frs. 10,029,946 against Frs. 9,574,185. Dividend 5 per cent. as before. Carry-forward raised from Frs. 1,574,185 to Frs. 2,029,945. Total assets end 1938, Frs. 1,451,066,892 against Frs. 1,512,755,363. Total of debtors and advances, Frs. 449,627,622 against Frs. 469,957,380.

Beira Railway.—For year to September 30, 1938, net operating revenue was £553,409, a gain of £414. After charges (including taxation, £170,000 against £145,000), profit shows decline of £13,711 at £264,454. Provision of £50,000 is made for rebuilding. Net profit £214,454, an increase of £13,233 on 1937, when £50,000 written off for issue and expenses and various items totalling £26,943 were charged. Dividend is unchanged at 2s. a share; £60,000 (£80,000) to reserve; £40,000 (£20,000) to dividend equalisation. Carry-forward raised from £30,203 to £39,658.

United Kingdom and Argentine, 1933, Trust.—Auditor's report for 1938 shows that, as last year, £11,449,760 of certificates have been issued. These are: £3,578,050 4 per cent. "A," £2,504,635 5½ per cent. "B" and £5,367,075 "C" certificates. There are deposited in the Trust: £5,367,075 British Government 3 per cent. Conversion Loan, £7,156,100 Argentine 4 per cent. sterling bonds, 1933, and £168,690 (against £170,509), cash and securities. Balance of income carried forward is £25,896 (£17,179).

De Havilland Aircraft Company.—Trading profit increased by £52,344 to £357,453 in year to September 30, 1938. To depreciation, £109,446 (£85,774). Ordinary dividend and bonus, 12½ per cent. as before, but absorbs £100,000 against £75,000. To reserve, £50,000 (£35,000). To staff fund, £10,000 as before. Carry-forward reduced from £18,130 to £10,943. Fixed assets stand at £863,833 (£720,253); stocks, etc., at £1,345,961 (£871,225).

(Continued on page 279)

Industry and Trade

Anglo-German Coal Talks.—Last Saturday evening the Central Council of British Colliery Owners announced that "all points of difference" between the industries in this country and in Germany had been settled, and that it was proposed to resume the negotiations for a "general agreement" with the other prospective members of the proposed cartel. Since Germany's policy to increase her share of European coal exports had hitherto been the chief stumbling block in the way of an international agreement, the long-awaited cartel has at last come into sight. The terms of the bargain between the British and German colliery owners have not yet been disclosed, not even to the other prospective cartel countries, but rumour has it that the agreement covers coal (except shipments for the use of steamers engaged in foreign trade), coke and coal briquettes and that the two countries are to share equally in the aggregate exports of these fuels. As the following table shows, a fifty-fifty arrangement would be very favourable to Germany on the basis of the relationship between the two countries' exports in 1929, but slightly less favourable on the basis of the figures for 1937. In the past year, however, Britain's exports were slightly higher than those of Germany:—

U.K. AND GERMAN COAL EXPORTS

Year	Coke			Total (in terms of coal)
	Cargo	Briquettes	Coal	
1929—				
United Kingdom.....	61.2	3.0	1.2	66.8
Germany	32.3	10.6	0.8	49.0
1933-37—				
United Kingdom.....	39.1	2.4	0.7	43.3
Germany	28.7	6.8	0.8	39.7
1937—				
United Kingdom.....	41.0	2.5	0.7	45.4
Germany	38.2	8.8	1.0	52.4
1938—				
United Kingdom.....	36.4	2.0	0.3	40.0
Germany*	29.6	5.3	1.1	38.6

* Estimated on basis of eleven months.

† Annual average.

If the reports of the terms of the agreement concerning the relationship between British and German exports are correct, Germany has struck a hard bargain, and she has consolidated the position in the export markets gained in recent years, mainly at the expense of this country. The rapid increase in Germany's share of Europe's coal exports is widely attributed to subsidised price-cutting. But Germany's export drive was facilitated by the price policy of the industry in this country; thus, between 1929 and 1937, when Germany gained ground rapidly, the average export price of British coal rose by 16 per cent., whereas the sterling equivalent of the average price of German shipments fell by 8 per cent. Between 1937 and 1938, when both British and German average export prices rose by about 12 per cent., Germany's exports of coal fell much more steeply than Britain's. The figures for the past year suggest that Germany has not been able, or willing, to continue her policy of gaining business at the expense of Britain, and has even been prepared to lose ground in order to secure a higher price per ton. The agreement concluded last week merely confirms this change of policy.

Volume of Overseas Trade.—The latest quarterly survey of the average price and volume of British overseas trade, published in last week's *Board of Trade Journal*, relates to the last three months of 1938 and to the year as

a whole. The results of this survey are summarised in the table given below:—

AVERAGE PRICE AND VOLUME OF IMPORTS AND EXPORTS

	Total Imports			Domestic Exports		
	Declared value	Index of average import prices	Index of volume	Declared value	Index of average export prices	Index of volume
	Million £	1935=100	1935=100	Million £	1935=100	1935=100
1936	848	105.3	106.5	441	101.9	101.5
1937	1,028	120.3	113.9	521	110.2	111.1
1938	920	112.8	107.9	471	112.1	98.6
1937—						
1st quarter	229.9	114.9	105.9	121.1	105.2	108.2
2nd quarter	254.2	120.9	111.2	130.1	109.2	112.0
3rd quarter	258.5	124.5	109.8	134.4	113.1	111.6
4th quarter	285.3	120.6	125.2	135.7	113.2	112.7
1938—						
1st quarter	245.2	117.7	110.2	120.9	113.9	99.7
2nd quarter	224.4	113.3	104.8	112.3	111.9	94.3
3rd quarter	221.5	111.2	105.3	113.5	111.7	95.5
4th quarter	229.3	108.9	111.4	124.2	111.1	105.0

The comparative stability of British foreign trade in the last nine months is well shown by these figures. The last quarter of the year brought a, mainly seasonal, increase in the volume of both imports and exports. The increase in the volume of imports was entirely due to an expansion in the quantity of foods imported, the quantity of raw materials and of manufactures imported having changed very little in the last half of the year; the rise in exports was caused by an increase in the volume of manufactured exports. The stability in the average price of British exports was maintained throughout the whole of the latter nine months of the year; as the average price of imports has declined more rapidly than that of exports, it appears that British conversion costs have shown a further increase in the past year.

Trade Disputes in 1938.—The number of trade disputes begun in 1938 showed a considerable reduction compared with 1937, but, with the exception of that year, was the highest since 1929. Most of the disputes, however, involved only a single firm; as the table shows, the

THE BANK AS
EXECUTOR

This is one of the many services which

renders to its customers.

Full particulars may be obtained from any Branch or from
THE TRUSTEE DEPARTMENT
37 KING WILLIAM STREET, LONDON, E.C.4
27 REGENT STREET, LONDON, S.W.1

duration in working days of all disputes was far smaller in 1938 than in 1937:—

	No. of Disputes beginning in year	Thousands of Persons involved in Disputes beginning in year			Duration in million working days of all disputes in progress in 1938
		Direct	Indirect	Total	
1929	431	493	40	533	8.3
1930	422	286	21	307	4.4
1931	420	424	66	490	7.0
1932	389	337	42	379	6.5
1933	357	114	22	136	1.1
1934	471	109	25	134	1.0
1935	553	230	41	271	2.0
1936	818	241	75	316	1.8
1937	1,129	388	209	597	3.4
1938	866	212	63	275	1.3

Only two disputes in 1938 involved more than 5,000 persons, the week's strike at the Austin aircraft works and a day's strike in the Welsh coalfield. The coal-mining industry continues to provide about two-fifths of all disputes and was responsible for about two-thirds of the number of persons involved.

Falling Butter Consumption.—Imports of butter into the United Kingdom in 1938 amounted to 9,509,000 cwts., an increase of less than 1 per cent. compared with 1937. As the table below shows, there was a decline in New Zealand supplies, so that imports from the Empire fell from 4,910,000 cwts. to 4,803,000 cwts.:—

U.K. IMPORTS OF BUTTER (000 cwts.)				
	1929-31 (Average)	1936	1937	1938
Australia	1,092	1,694	1,492	1,798
New Zealand	1,598	2,792	2,951	2,583
Other Empire	547	643	468	422
Total Empire	3,237	5,129	4,911	4,803
Denmark	2,330	2,172	2,256	2,365
Netherlands	105	745	717	712
Russia	287	412	273	...
Other Foreign	1,133	1,283	1,260	1,628
Total Foreign	3,855	4,612	4,506	4,705
Total	7,093	9,741	9,416	9,509

Imports from foreign countries increased from 4,506,000 cwts. to 4,705,000 cwts.; the complete absence of Russian supplies was more than counterbalanced by larger imports from the Baltic countries. A year ago, stocks of butter in cold storage reached the remarkably low level of 537,000 cwts., but they have gradually increased during 1938; stocks at December 31, 1938, were estimated by the Imperial Economic Committee at 1,536,000 cwts. Consequently, although imports of butter increased in 1938 compared with 1937, consumption has declined from about 9,583,000 cwts. to 9,290,000 cwts. The fall was no doubt due to the rise in butter prices during the first nine months of last year; the price of finest New Zealand butter was about 6 per cent. higher on the average of 1938 than in 1937. The corollary of this decline in butter consumption has been the increase in that of margarine. According to the Imperial Economic Committee, deliveries of margarine in the United Kingdom in 1938 increased by 13 per cent. of the 1937 figures to 4,166,000 cwts.

Shipping Freight Rates Steadier.—The deterioration on the tramp shipping freight market was arrested last

month. *The Economist* index of freight rates, given below, showed no change between December and January:—

The Economist INDEX OF FREIGHT RATES (1898-1913=100)						
	Average, 1913	Jan. 1938	Oct., 1938	Nov., 1938	Dec., 1938	Jan., 1939
European waters	110.0	124.6	110.5	108.0	109.1	107.4
North America	113.1	118.5	110.8	111.0	110.3	111.6
South America	123.4	110.6	117.2	116.0	113.2	110.4
India	106.3	142.6	112.7	108.1	106.4	108.6
Far East and Pacific	117.4	128.6	104.5	101.3	97.0	97.8
Australia	127.9	130.0	111.6	112.2	111.3	111.3
Total	116.3	125.8	111.2	109.4	107.9	107.9
1913 = 100	100.0	107.9	95.6	94.1	92.8	92.8

But, as the next table shows, the improvement was by no means general, a rise in freight rates on some routes having been offset by a fall on others:—

	Index No.	Inc. or Dec. Points		Index No.	Inc. or Dec. Points
Home trade	95.4	- 3.4	South America:—		
Bay—outwards	122.4	+ 1.3	Outwards	66.9	- 3.1
Bay—homewards	129.2	- 0.8	Homewards	153.9	- 4.5
Mediterranean:—			India—outwards	92.6	- 2.1
Outwards	76.0	+ 0.4	India—homewards	124.5	+ 6.4
Homewards	125.8	- 4.0	Far East, etc.	97.8	+ 0.8
North America	111.6	+ 1.3	Australia	111.3	...

As the volume of unemployed shipping tonnage remains comparatively small, freight rates would quickly respond to an expansion in the demand for carrying capacity. But the immediate outlook remains uncertain.

No Improvement in Commodity Prices.—The indices of wholesale commodity prices given below show little change during the past fortnight. *The Economist* indices for the prices of primary products in this country and in the United States are a shade lower. The more comprehensive indices for Britain, the United States, and Germany are unchanged, but the figures for France and Italy are slightly higher:—

SEPTEMBER 18, 1931 = 100									
The Economist Indices				Price of Gold (sterling)					
Date	British Complete Index (sterling)	Primary Products (sterling)	Price of Gold (sterling)	U.S.A., Irving-Fisher	France, Statistique Generale	Italy, Milan Chamber of Commerce	Germany, Statistisches Reichsamt

* These figures relate to January 25th. † Monthly average.
Details of the constituent series of *The Economist's* complete index for this country are given below:—

	Sept. 18, 1931	Feb. 2, 1938	Jan. 18, 1939	Feb. 1, 1939
(1927=100)				
Cereals and meat...	64.5	89.4	69.1	69.1
Other foods	62.2	59.6	57.2	58.2
Textiles	43.7	57.8	53.4	53.0
Minerals	67.4	94.7	91.3	91.1
Miscellaneous	65.8	79.3	75.0	74.6
Complete index	60.4	76.5	68.7	68.7
1913 = 100	83.1	105.2	94.5	94.5
1924 = 100	52.2	66.1	59.4	59.4

But while the price indices show little change from the figures for January 18th, they mask the fluctuations which took place in the interval. With a few exceptions, including wheat, prices fell last week owing to the pessimistic view taken by the markets of the political outlook, but they recovered this week on the relaxation of tension.

INDUSTRIAL REPORTS

Iron and Steel

Sheffield.—Business is slow to expand. Consumers appear to be fairly well stocked. Forward business is extremely quiet, and it is likely that the hand-to-mouth buying policy will persist for some time.

Basic steel billets are in limited request, but a slightly more active market exists for acid qualities. Wire rods are being fairly well bought, and there are steady inquiries for bright drawn steel. There is not much business in structural steel.

The iron and steel scrap market is showing some improvement. Heavy cast iron for the foundries is selling at 65s. to 72s. 6d. per ton, and heavy iron-free basic steel at 59s. per ton.

Middlesbrough.—Movement in the pig-iron market is slow, but further orders have been released this week and makers are still hopeful of a revival in trade. The output of foundry iron has not increased, but the demand for hematite iron is a little better.

Steel producers indicate that the

THE relaxation in political tension is expected to stimulate the flow of orders to a number of industries, especially textiles. The demand for house coal remains fairly active, and output is now not as much below the level of a year earlier as it was in December. The implications of the Anglo-German coal talks, which resulted in the settlement of "all points of difference," are discussed on page 263. The demand for iron and steel has shown little improvement, and many consumers are still content to cover only immediate requirements. The prospects of the electrical engineering industry remain fairly bright, for during the nine months ended December the Electricity Commissioners sanctioned the borrowing by Public Authorities (Joint Electricity Authorities, Joint Electricity Boards, and Local Authorities) of £17,527,628, against £12,371,117 during the corresponding period in 1937. In future the Electricity Commissioners will issue four-monthly statements of loans sanctioned.

Coal

Sheffield.—Demand is best for household fuel, stocks being heavily drawn upon. Although the demand for industrial steams is steady, the output of smalls is not fully absorbed. Electricity and other public utility concerns are, however, taking heavy deliveries. Brickworks are taking smaller consignments, and there are surplus supplies of coking smalls. Coke for central heating is a firm market, supplies being fully taken up. The demand for blast-furnace coke continues quiet.

Export trade shows no change, suppliers holding that the disparity between Midland and North-East Coast prices renders it difficult to arrange business without the aid of a subsidy.

Newcastle-on-Tyne.—The feature of the North-East coal market is the heavy demand for large screened steam coal, particularly in the Northumberland section, where the D.C.B. collieries are now quoting 19s. per ton for shipment February or March. The strength of the market is due chiefly to the domestic demand, there being very little new export business. The Durham market is steady, gas collieries being busy, but the coking and bunker sections are only moderately active. Patent oven coke is freely offered at minimum prices, but there are no buyers.

Glasgow.—The weather remains the chief factor in the Scottish coal market. Home demand continues strong, and although collieries are producing at capacity, not all requirements are being fully met. The call is mainly for domestic fuel; the collieries are heavily in arrears with deliveries, the better qualities being most scarce. All areas are benefiting from the high level of demand, and five collieries, usually engaged largely on shipment business, are sending substantial quantities to the industrial districts. With good overseas contracts on hand delays in securing supplies are frequent in both the inland and shipping branches.

This area and the Lothians seem to

SITES FOR WORKS Apply to above address for particulars

position is slightly better; a good demand is being experienced for semi-manufactured steel, but the heavy steel departments, whilst busy on commercial orders, would welcome an improvement in the demand for shipbuilding material. Sheet makers are busy and the mills are fully employed. Orders for sections in connection with the A.R.P. shelters have not yet been placed.

The scrap trade remains quiet. Imports of iron ore into the Tees in January amounted to 105,000 tons, against 79,000 tons in December, 1938.

★

Glasgow.—The expected revival has not yet come, but as there are many important inquiries on the market an early improvement is looked for. Sheet-makers have been able to keep a large proportion of their plant employed; in addition to the A.R.P. orders they have booked considerable tonnages for the motor trade, while export demand has also shown some improvement. In most branches employment is steady, although new work is not so plentiful as desired and expected, but orders on books are sufficient for some weeks' regular employment.

★

Cardiff.—Domestic and export business in the tinplate trade remains inactive. The mills are operating at only just over 40 per cent. of capacity and forward commitments are estimated at about 2½ million boxes, equal to just over 20,000 tons. The heavier branches of the industry are relatively better employed, and some of the works are now busy manufacturing sheets for air-raid shelters. Prices are nominally unchanged. A meeting of the International Tinplate Cartel is to be held this month to consider the export trade position.

★

News from Abroad.—The demand for steel on international markets has remained quiet and, in some cases, has further declined. The hopes of better political relations, however, have created a more optimistic feeling.

Consumers' purchases are still confined to immediate requirements. In several Empire countries, however, the lower prices are gradually stimulating the appetite of buyers, particularly in British India, where consumption is said to be quite satisfactory. A large inquiry from Manchukuo has been taken up by the Cartel which assigned it to a Belgian producer, but a German group has nevertheless submitted an offer. A small but regular demand is coming from Scandinavia and Holland, and British orders for semi-finished products have recently contributed to a better situation in Belgium. South American business has remained difficult on account of competition from the United States.

Some more unofficial price reductions have been made by the Comptoirs which, however, concern only comparatively small tonnages.

A number of Comptoirs are examining the prospects of demand in connection with future price policy. Cartel export prices are based on gold, converted into sterling at a rate fixed from time to time. Although the sterling price of gold is now 75 per cent. above the former parity, Cartel prices are still converted into sterling on the basis of an increase of 67.5 per cent. in the

price of gold. Importing countries whose currencies are not related to sterling are thus able to obtain their supplies more cheaply, but it is expected that the conversion rate may soon be raised to conform to the actual sterling-gold ratio.

The recently formed international cold-rolled hoop Cartel has fixed uniform basis prices and extras. Quotas have been based on exports during the first half of 1937.

Textiles

Cotton (Manchester).—The tone of the market has been slightly better, partly owing to the relaxation of political tension. Some buyers who have been extremely cautious for several weeks are now less reluctant to place orders with producers. Turnover, however, has not shown much expansion.

Only minor fluctuations have taken place in raw cotton prices. It seems probable that legislation will be passed in the United States to enable supplies to be released on a freer scale, but the authorities will not take any action which is likely seriously to depress prices.

The yarn market remains dull. A few more orders, however, have been secured in coarse American counts. Home users of Egyptian yarns have purchased sparingly, but some special contracts have been put through for the manufacture of thread.

Buyers of piece-goods have been anxious to keep in touch with prices and manufacturers have given out numerous quotations, but buying has been very irregular. Export demand continues disappointing. Some leading home trade buyers have been more inclined to make replacements, and in certain directions delivery instructions against old contracts have been received on a freer scale. Further Government contracts have been given out in fine and heavy materials.

★

Wool (Bradford).—The first series of Colonial sales in London will end on Friday; it has been well supported by both the home and Continental trades, although prices have shown a decline compared with those realised at the preceding auctions. Merinos have lost a little ground, while crossbreds generally are 1d. per lb. (in the grease) cheaper than at the last sales.

In consuming centres there is little or no improvement as regards demand for yarns and piece-goods; there has been little change in machinery activity. The mill which is running full time in the West Riding is the exception rather than the rule. Many mills are running about 75 per cent. of their machinery, and even then profits are exceedingly small, if they exist at all. The trade is missing export demand, while an increasing quantity of very cheap imitation woollen and worsted cloths is being imported from the Continent.

THE COMMODITY MARKETS

THE commodity, like the security, markets have been swayed by politics during the past fortnight. Wheat, characteristically, rose, while many other com-

modities fell, in price with the growing pessimism last week. After Herr Hitler's speech the movement was reversed. The prices of wheat and raw sugar tended to decline a little, while the markets in non-ferrous metals, rubber and linseed oil showed a slight improvement.

But if the downward trend in the prices of primary products has been reversed, the improvement has not yet gone very far. Moody's index of the prices of commodities sensitive to changes in market psychology (December 31, 1931 = 100), for example, rose from 142.6 to 142.9 during the week ended last Wednesday.

Metals

Copper.—The copper market was easy in the earlier part of the week, owing to the uncertainty regarding Herr Hitler's speech. Later, however, the price recovered and standard cash closed on Wednesday at £42 16s. 3d. per ton, a net gain of 11s. 3d. on the week. Production outside the United States is now again below consumption and the American producers are also curtailing their output. Apart from the political position, the trend of prices will be chiefly determined by the outlook for American consumption. If this shows the expected improvement in the next few weeks and the political position does not deteriorate the copper price will soon be back to £45 per ton.

★

Tin.—The price of tin fluctuated widely this week. On Thursday of last week the price fell temporarily to £208 15s., but during the past week it recovered to close on Wednesday at £216 per ton and thus showed a net gain of £2 15s. on the week. The forward price, on the other hand, has now fallen well below the cash price for the first time for twelve months. On Wednesday the "backwardation" was as high as £1 5s. The cause of the wide fluctuations and the revival of the backwardation was the uncertainty regarding the position of the buffer pool, which caused speculators to sell heavily. So far the pool has not sold any metal, so that there is a danger that the tin price will be vulnerable in periods of political uncertainty. Moreover, the failure of the pool to sell may force the I.T.C. to keep the quota for the second quarter of the year at 35 per cent. As the buffer pool quota (10 per cent.) will have to be dropped by March 31st this maintenance of the 35 per cent. level would actually mean a 10 per cent. cut in the quotas. According to the International Tin Research and Development Council, the world's tin output reached 148,000 tons last year, against 208,300 tons in 1937. Apparent consumption totalled 152,000 tons in 1938, against 198,700 tons in 1937. According to Messrs A. Strauss and Company, Limited, the visible supply of tin increased by 3,394 tons to 32,771 tons in January. New supplies, at 8,708 tons, showed an advance of 2,269 tons on the month, while world deliveries, at 7,742 tons, were 1,964 tons higher than in December. The rise in the visible supply was rather bigger than expected. As, however, a great part of the higher stocks was the result of

COMPANY MEETINGS

LLOYDS BANK LIMITED

REVIEW OF A DIFFICULT BANKING YEAR

LIQUID POSITION MAINTAINED

BRITAIN'S STRONG MONETARY SITUATION

FAVOURABLE COMPARISON WITH 1914

LORD WARDINGTON'S ADDRESS

SIR FRANCIS BEANE

The eighty-first ordinary general meeting of shareholders was held, on the 27th ultimo, at Southern House, Cannon Street, London.

Lord Wardington (Chairman of the bank) presided.

The notice convening the meeting having been read by the secretary, and the auditors' report by Mr F. S. Tull (Price, Waterhouse and Company),

The chairman, in moving the adoption of the directors' report, said:—My Lords, Ladies and Gentlemen,—Before reviewing the results of the year's working, as exemplified in our figures, there are one or two matters of domestic interest to which I would like to refer, and I presume you will, as usual, wish to take as read our report and balance sheet.

THE DIRECTORS

Two of our directors have either retired, or are not seeking re-election. Sir Edwin Stockton, who joined our board in 1923 and retired last month owing to ill-health, brought with him to our councils a wide knowledge of Lancashire business conditions, and as a director of the London, Midland and Scottish Railway Company, of the London and Lancashire Insurance Company, of the Manchester Ship Canal, and, in addition, of several other companies, as also as ex-president of the Manchester Chamber of Commerce, he could rightly be described as a thoroughly representative man of the North-West portion of the country.

Mr G. A. Harvey came to us on our amalgamation in 1918 with the Capital and Counties Bank, Limited, of which he was a joint general manager. At that time he had already had forty-eight years of banking experience, and now that he has decided not to seek re-election he can have the satisfaction, vouchsafed to few people, of being able to look back upon no less than sixty-eight years of active and useful banking service. To both of these gentlemen you will want to offer your grateful good wishes on their retirement.

TRIBUTE TO MR ABELL

One other retirement I must also mention with the greatest regret, equalled only by our gratitude, not merely for his great service to the bank, but also for the high standard which he has set both in our own bank and in the City. Mr Abell retired from the post of chief general manager at the end of the year. The details of his career since he first began banking in the Worcester City and County Bank in 1893, and the success and ability with which he has filled various positions until he attained the highest executive office of chief general manager, outstanding as they are, are not so important to my mind as the respect and regard which he universally gained and deserved throughout the whole of his active business life. This is not only what might be called an interested and partial opinion of my own, but I am convinced it is shared by all his colleagues in the bank, by our customers, and by those in financial circles generally. The City cannot have too many men of the character and ability of Mr Abell. Our regret at losing him as chief general manager is tempered by the satisfaction we feel in gaining him as a director. He was elected to the board on his retirement, and you will have an opportunity in a few minutes of showing your gratitude to him for his past services by confirming that election. To fill his place we have appointed Mr R. A. Wilson and Mr Sydney Parkes as chief general managers, and with all confidence we wish them every success in carrying out the responsible duties of their high office. This is perhaps not an inappropriate moment to congratulate Mr Wilson on the recognition of his banking services and ability by his re-election for a second year as president of the Institute of Bankers.

BALANCE SHEET

If you will now kindly turn to the balance sheet you will find the figures not greatly changed as compared with those of 1937, and I shall only draw your attention to some of the more important.

To take the liabilities side first, the total due on current, deposit and other accounts has been comparatively well maintained at a figure showing a reduction of £12,000,000 in the year. This decrease is not due to any loss of foreign deposits, because, as I told you when we last met, we refrained from offering unduly competitive rates for this class of deposits, believing them to be a not unmixed blessing either to ourselves or to the country, owing to their fleeting character, which rendered them liable to become an embarrassment to us and the exchanges if they were hurriedly withdrawn. The reduction under this heading is due to two principal causes. In the first place to the amalgamation of a large group of accounts which previously figured on both sides of our books, as overdrafts on the one hand and credit balances on the other. The net figure alone is now shown, causing a contraction on both sides of the balance sheet. The remaining part of our reduction is widespread over our system, and the balances have been withdrawn for investment, or in search of a higher return of interest than that which we felt justified in offering.

ENDORSEMENTS, GUARANTEES AND OTHER OBLIGATIONS

The only other item amongst our liabilities worthy of special remark is that under the heading of endorsements, guarantees and other obligations. This shows the large increase of nearly £12,750,000; and is almost entirely due to forward exchange operations. These transactions have been undertaken on behalf of our customers, or correspondents, whose liability appears on the other side of our balance sheet. As far as we know these represent legitimate operations arising out of genuine commercial transactions, but, as you are doubtless aware, we and all other banks are tightening up our investigation of these operations at the request of the authorities, with the object of eliminating any obligation undertaken for purely speculative purposes. They are in any case an indication of the present unsettled state of international affairs which we all so earnestly deplore.

BRITISH, COLONIAL AND FOREIGN BILLS

On the assets side of our balance sheet, the liquid assets of cash, money at call, etc., bear very much the same proportions to our deposits as they did last year, but you will be glad to notice the welcome increase of £3,000,000 under the heading of British and Colonial and foreign bills.

Our investments show a decrease of £6,000,000, and this is due to two main causes. The larger part is the result of actual sales, or

repayment of investments reaching maturity or drawings for payment, and a substantial sum has been taken from the interest received on those which were bought at a premium, in order to write them down to par by the first maturity date. This, no doubt, you will agree is a wise and conservative proceeding, although it is done at the expense of our profit figures for the year. The remainder of the decrease as compared with last year is caused by the ordinary process of writing down those investments, the market price of which has fallen since last year. I shall have some more to say on this point later on.

LOANS AND ADVANCES

Loans and advances, the most important item of our assets, show a reduction of over £6,000,000, which undoubtedly is a disappointment, and if those who insist that banks should be forced to increase their credit facilities can tell us how this can be done, in the absence of willing and credit-worthy borrowers, no persuasion, let alone force, would be required to induce banks to comply. They would be only too glad to see a keener disposition on the part of the public to take greater advantage of the credit facilities we are anxious to give.

MONETARY EXPANSION

This argument on the part of our critics is a striking instance of the neglect which theoretical economists so often give to psychological factors. Everything may point to the desirability of increased loans. It may seem plain that it would put more money into circulation, increase the purchasing power of the public, and be a stimulant to trade, but the maintenance of cheap money and monetary manipulations, and other devices to encourage borrowers and greater spending, fail in their object if the public refuse to take advantage of the opportunities offered to them.

PSYCHOLOGICAL FACTORS

An individual may have a bulky roll of notes in his pocket, or a firm may have large resources at its disposal, either in the shape of credit balances or the offer of loans, but they will not buy to-day if they think they can buy cheaper to-morrow, neither will they embark on new enterprises if they do not feel confident that they have a fair chance of conducting them profitably, and so the day of improvement is indefinitely postponed. As Lord Stamp put it in a recent address, the horse of economics is like his counterpart in the animal world; you can lead him to the water, but you cannot make him drink if, either for good or bad reasons, he is disinclined to do so.

Apart from this neglect of psychological factors, those who advocate the doctrine of monetary expansion as a panacea for any recession in business are not always happy in the moment which they choose for putting forward their views. The recession which began in 1937 and evoked the usual demands for increased expansion, occurred, as a matter of fact, at a time when monetary conditions had been kept easy, bankers' deposits with the Bank of England averaging nearly £13,000,000 higher in the first half of 1938 than in the corresponding period of 1937. Further, it is incorrect to assume a too automatic and rigid association between bankers' cash and other assets, which, in fact, does not exist and which it is not practical to attain. The banks have had both the means and the will in these difficult times to give both industry and the stock market all the support considered safe and expedient which was asked for.

U.S.A. EXPERIENCE

The example of the United States of America indicates the dangers and difficulty of the policy which it is suggested we should follow. There the reserve balances of the commercial banks expanded from 1933 to 1936 in excess of current commercial requirements. Excess reserves piled up until the total of reserves was double legal requirements. In 1936 the authorities used their power to vary legal reserve requirements to increase them by half; but this still left a large excess. Then the rise in prices, which it had been the object of this policy to assist, suddenly, under the impulse of re-armament plans, showed signs of running away. To check a dangerous expansion, reserve requirements were raised again. But it is not easy to time intervention in market movement of this kind, and the sale of securities by the banks in order to comply with the new reserve requirements came just at a time when security prices were weak and needed support. It is easy to be wise after the event; but it would seem that either there was a latent danger in the policy of

allowing the cash resources of the banks to outrun current requirements and the curtailment should have been applied earlier, or that the movements in the prices of commodities and securities do not lend themselves to alternate stimulus and control by credit expansion and contraction so readily as our advisers would have us believe.

PRESENT CONDITIONS

It should be observed that our conditions now are not the same as conditions in 1932, and there is no assurance that a repetition of the 1932 experiment would have identical results. In 1932 a series of political changes had led to a revival of business confidence which encouraged the use of money; there was an enormous opening for the employment of cheap long-term capital in housing and construction, the only form of capital outlay in which interest rates are of decisive importance; and the conversion of the largest outstanding Government obligation made possible an immediate and large adjustment in interest rates. To-day the political outlook discourages investment; the demand for new houses is waning, and there is no scope in present levels for a sudden and large further reduction in interest rates.

This is a matter of special concern for the banks, because if we were pressed, for instance, into taking up large issues by local authorities for public works, as has been suggested, our investment portfolio, vulnerable as it already is, would become a great deal more so. In times of crisis our investments are of very little use to us in meeting heavy withdrawals of deposits. It is impossible to sell any important amount at any price at such times, and we are also faced with the problem of providing for depreciation. In the interests of our depositors, therefore, quite apart from our shareholders, it would be improper to increase much further our already large proportion of investments to deposits. It has been estimated that the clearing banks must have seen a temporary depreciation of their investments last September of over £40,000,000. It is only natural, therefore, that bankers should hesitate in making any considerable addition to their vulnerability in this respect under existing conditions.

This may seem somewhat of a digression from the subject of the amount of our loans, but I think you will agree that what I have said has some bearing on the matter.

ADVANCES TO AGRICULTURE

Under some headings in our advances we do see a tendency to increase. Those engaged in agriculture, though they are borrowing less than they did a few years ago, have taken slightly more from us this year than last, and again I must pay a tribute to the farming community for the remarkably small amount of bad debts which we have suffered under the heading of agriculture. They are, as usual, the largest borrowers of all the categories into which we divide our advances, and considering the many difficulties of which they have been the victims, our comparative immunity from bad debts on their account is greatly to their credit.

"Banking, Insurance, and Finance" show a substantial rise, and in the categories of "Engineering," "Public Utility," "Shipping and Shipbuilding," "Local Authorities," "Brewing and Distilleries," we see welcome increases, but they are more than offset by falls, particularly in the class entitled "Iron and Steel," with somewhat smaller decreases in "Theatres, Hotels, etc.," "Miscellaneous," "Silk, Linen, Hosiery," "Stockbrokers," and "Corn." Our average overdraft in all categories, comprising 198,938 accounts, comes out at £822.

PROFIT AND LOSS

In our profit and loss account, and in our report, you will notice the simplified wording which at our last meeting I told you we intended to employ. In its old form it was very cumbersome, and I think it can be taken for granted, without being specifically stated, that our profit figure has been ascertained after payment of such necessary items as salaries, pensions, staff bonuses and allowances, the annual contributions to staff funds, rebate, income tax, etc. The final figure of our profit and loss is £127,000 less than last year, but in a period of reduced loans and turnover, and, on the other hand, of increased costs, such as National Defence Contribution, and tens of thousands spent on Air Raid Precautions, which latter we devoutly hope will not be a recurring item, I think we may be justified in thinking that a sum of £1,705,000 is not unsatisfactory.

AN ANXIOUS YEAR

Well, ladies and gentlemen, these are the figures representing the result of our trading during a year which none of us is likely to

ABNORMAL DEMAND FOR CURRENCY

There was, it is true, an abnormal demand for currency, but this demand was not due to any feeling of panic.

On the contrary, the general public behaved with exemplary calmness. What happened was that emergency A.R.P. expenditure, the mobilisation of the Fleet and the anti-aircraft division of the Territorial Army, and the special currency needs of those who were sending their families away to the country, all meant that additional notes were required. Also we, in company with the other banks, felt it advisable to reinforce our local currency reserves throughout the country, for had war broken out railway and other communications might have suffered from air attack. But the real point of contrast is this. In 1914, a new paper currency had to be created in order to satisfy the war-time demand, and the banks remained shut for three days while the currency was improvised. Last September, on the other hand, the big increase in the note circulation took place entirely automatically and with no disturbance at all.

EXTERNAL FINANCIAL RELATIONS

From our internal currency position I pass next to our external financial relations. Here the first point of contrast is that we were not faced once more with the 1914 problem of outstanding bills accepted in London on behalf of overseas clients. There was no need for the bank to devise a scheme of putting such bills into cold storage. There were various reasons for this contrast. One of them is the regrettable fact that international trade has fallen to a low ebb, and it has been common knowledge that for many years past the London Discount Market has been dealing in Treasury bills rather than in commercial bills.

Secondly, there is the fact that many bills in the London market have since the crisis in 1931 been subject to the various standstill schemes. These bills were already, in a sense, in cold storage long before the September crisis became imminent. To that extent, emergency arrangements were already in existence. Also the majority of London houses interested in these bills have for a long time past so ordered their affairs that even if the bulk of the standstill bills were not met, no serious difficulty would have arisen. Granted, therefore, the fact that the outbreak of war would have meant the sudden disappearance of some of the standstill schemes and a complete and final loss on the bills covered by such schemes, even then there would have been no serious new problem to be solved.

MOVEMENT OF FUNDS

Last year's anxiety over our external position arose in quite a different way. For years past a mass of floating unemployed capital has been constantly shifting from one centre to another, the motive behind the migrations being generally a search for safety rather than a desire for profit. Much of this money had found refuge in London. So soon as the possibility of war emerged it began to flow to other centres, and, if war had broken out, or even had the crisis been prolonged, the stream might have developed into a torrent, and even as it was a considerable strain was put upon the Exchanges. We were, however, in a much stronger position to protect ourselves. In contrast to 1914, when the Bank of England only held £37 millions of gold, with, perhaps, £130 millions of gold coin in the pockets of the public and the tills of the banks, last August we were in a very strong position. On March 31, 1938, when they were then at their peak, our total gold reserves, valued at the then current market price of 140s. per ounce fine, were no less than £835 millions. The Bank of England's own reserves valued at 140s. came to £538 millions, while the Exchange Equalisation Account—a new factor since 1914—held £297 millions. Although in defending sterling we lost nearly £100 millions of gold during the autumn crisis, only minimum disturbance was caused to the banking system, or the Money Market, as none of this gold came out of the Bank of England, but from the Exchange Equalisation Account, and so it did not lead pound for pound to a corresponding contraction of the credit basis.

THE STERLING-DOLLAR RATE

The past year has seen a fall in the sterling-dollar rate from round about \$5.00 to round about \$4.65. This fall is a matter for regret, as bringing to an end for the time being the comparative stability which had been established after the disturbed period 1931-34, when at one time it had been as low as \$3.23. But it took place without weakening the friendly relations which existed between the parties to the Tripartite Agreement, which means that it was recognised as being due, not to any deliberate policy of depreciation, but to causes which were not under the control of our monetary authorities. I

forget. It was a year of deep anxieties, and within an ace of being a year of tragedy. Those anxieties have not yet been wholly removed, in spite of the great efforts made by the Prime Minister and his colleagues, and even those who regard the future with greater optimism than some others must feel that now is the time to review the situation in order to discover, and if possible remedy, the weak points in our defensive armour. Political and military deficiencies, however much the financial and commercial situation may be affected by them, are outside the scope of any appropriate comment at our annual meeting, but I think it might be not without interest to see how our financial situation has stood the strain, and what lessons we ought to have learned.

COMPARISONS WITH 1914

Perhaps the most instructive line of approach is for me to compare shortly the events and possibilities of last September with those of similar anxiety in August, 1914. My chief purpose is to show that in many ways our banking and monetary system was both much stronger and more elastic last September than it was at the outbreak of war twenty-four years ago. On the other hand, this ought not to delude us into thinking that no weaknesses were revealed by the recent crisis. In August, 1914, we had a currency almost entirely of gold. Gold sovereigns were in circulation. The Bank of England was bound to redeem its notes in gold; the fiduciary issue was limited to £18,000,000, and the Bank was bound to buy and sell gold on demand. At the same time, the Bank's gold reserves on July 29th only amounted to £37,000,000. There was thus a real danger of a rapid exhaustion of the Bank's gold reserves, either through an increased demand for currency by the public or else through a transfer of funds abroad, with its consequent reaction on the exchanges. The problem of meeting the public's increased currency needs was met by the creation of Treasury notes.

THE TREASURY NOTE ISSUE

These had to be hurriedly improvised, and, incidentally, the banks were empowered to borrow Treasury Notes up to the limit of 25 per cent. of their deposit liabilities. Comparatively little use was made of this facility, but the fact that it was available gave instant relief and at the same time checked any tendency to withdraw deposits. Ultimately the Treasury issue was taken over by the Bank of England on behalf of the Treasury in 1928. At the same time the fiduciary note issue was established at £260 millions (compared with £18 millions in July, 1914), but with the very important reservation that the limit could either be expanded or reduced under defined conditions. After being reduced to £200 millions, with a seasonal increase of £30 millions over last Christmas, we have seen within the last few weeks how it has been increased to a total of £400 millions.

The next problem arose from the fact that large credits had been issued by banks and accepting houses to their clients all over the world. Failure to meet these bills on maturity would have involved the discount market and the whole British banking system in serious trouble and loss. After a temporary moratorium it was arranged for the Bank of England to take over approved pre-moratorium bills without recourse to the holder, and to hold the bills in cold storage until the end of the war. The Government guaranteed the Bank against loss, and the acceptor who was liable for payment of the bill was charged interest at 2 per cent. over Bank rate.

STOCK EXCHANGE PROBLEMS

Another series of important problems arose in connection with the Stock Exchange. At the end of July, 1914, there were many open positions on the Stock Exchange, and a large number of these were financed directly or indirectly by the banks. As a consequence the Stock Exchange remained closed from July 31, 1914, until the beginning of 1915, and minimum prices were fixed for most first-class securities.

These are only a few of the problems and the methods of meeting them which arose in 1914. If we pass on to September, 1938, the first point which springs to light is the far greater elasticity of our first point which springs to light is the far greater elasticity of our first point, monetary and banking system compared with that of 1914. First, for good or for evil, we were no longer on the gold standard, gold is not now in circulation, and our note issue, as I have already mentioned, has been rendered very much more elastic, and the improvisations of 1914 were unnecessary last September.

emphasise the fact that the fall was not due to deliberate policy, because there were voices raised in favour of the deliberate depreciation of sterling in terms of dollars, on the ground that sterling was "over-valued" and that this over-valuation constituted a heavy handicap to British export industry.

Is it not time that the fallacy was realised of explaining the course of British trade with the whole of the rest of the world by reference exclusively to the exchange rate of sterling on one other currency, viz., the dollar? Sterling may be over-valued, and this may be a cause of the recent excess of imports over exports; but the over-valuation is presumably in relation to the currencies of the countries from which the imports come and to which exports have declined; and the United States is only one among a number of these. Most of the Empire and sterling area currencies have been maintained at a discount in terms of sterling ever since the great devaluation movement of 1930-33. How is it proposed that this discount should be removed? By the English monetary authorities buying and holding of Japanese yen, Argentine pesos, Swedish kronor, or even Australian and New Zealand pounds? If this is not proposed, what is?

A FALLACY DESCRIBED

It is a fallacy to explain the British trade balance by reference to the sterling-dollar rate; it is equally fallacious to explain the sterling-dollar rate by reference exclusively either to British or to American foreign trade. The sterling-dollar rate depends on the aggregate of transactions that take place between the sterling area as a whole and the dollar area as a whole, and of these transactions only a fraction are trade transactions. In recent years, as everyone in touch with exchange markets knows, the sterling-dollar rate has been determined mainly by capital movements from Europe to America and vice versa.

Even in the figures given for Anglo-American trade there is a fallacy lurking. The "gigantic figure" of the excess of American sales to Britain over American purchases from Britain is given without any reference to the large amount of gold which has been sold by Britain to America. If Britain is paid with gold for exports to South Africa, and then exports the gold to America to pay for imports from America, can she expect—or should she wish—to pay for these imports with British exports again?

STOCK EXCHANGE PRECAUTIONS

So far as the Stock Exchange was concerned, there was one fundamental difference between August, 1914, and September, 1938. Twenty-four years ago war came as a complete bombshell, and the Stock Exchange was caught with many open commitments. By last September, however, the danger had been foreseen weeks and even months ahead, and indeed this apprehension was one reason why Throgmorton Street did not respond to the summer recovery in Wall Street. There were, thus, comparatively few open positions of a character which would have called for special treatment. Nevertheless, as the danger of war became more imminent, there was a general fall in prices, chiefly because no one cared to buy securities. A day or two before the culminating point of the crisis, therefore, minimum prices were fixed for a wide range of Government securities, and the Stock Exchange agreed of its own volition not to deal below those prices. This was a very desirable precaution. The intrinsic soundness of these securities was beyond question, and bankers and others had very properly been accustomed to accept them as collateral for loans. The fall in their market price was reaching the point where the margin of security was disappearing, and so a serious banking and credit problem was beginning to arise. Let me say at once that no banker would have thought of calling in his loans just because the value of his collateral was shrinking for reasons far beyond the borrower's control. Yet both bankers and their customers are grateful to the Stock Exchange for taking action which saved them from what might have been an embarrassing position.

As far as I have gone in this comparison between the two periods, the advantage generally, I think you will agree, is largely in favour of 1938, but in one respect we are not so well off as we were in 1914, as we have lost a large proportion of our 1914 reserve of American securities.

BRITAIN'S EXPORT TRADE

The question of our export trade figured in the speeches of nearly all bank chairmen to their shareholders last year, and it has lost none of its importance to-day. That it is still receiving considerable attention in Government and trade circles is indicated by what has been said in Parliament, by the increased export credit facilities

which have been foreshadowed, by the trade agreements entered into, particularly the important Anglo-American agreement, and by the deliberations of such bodies as the Federation of British Industries, and the Association of British Chambers of Commerce. In these days of fierce competition, with an ever-increasing tendency towards national self-sufficiency and industrialisation; when all countries are striving to sell and are becoming more unwilling to buy; when every kind of obstacle is placed in the channels of commerce, trade takes on the aspect more and more of commercial warfare, instead of being as it should be, an exchange of goods for the benefit of both parties. Anything that can be done, therefore, in the direction advocated by the President of the Board of Trade, whereby arrangements might be made between the industries in the various countries, including our own, which would allocate markets fairly, and enable everyone to do the maximum of trade on the soundest possible basis, would be greatly welcomed.

AN OBJECT LESSON

I see from the papers that the Locomotive Manufacturers' Association have provided an object lesson of this kind in the negotiations which they have opened up with Turkey. In these days, when the tendency in some quarters to hurl insults and challenges across the seas is so noticeable, I wonder if you will think it out of place at a bank meeting if I recall an ancient warning, which seems to me as modern and as truly appropriate to our international problems of to-day, whether political or economic, as it was nineteen centuries ago: "If ye bite and devour one another, take heed lest ye be not consumed one of another."

I now beg to move: "That the report just taken as read be received and adopted, and that, in accordance with the recommendation of the directors therein, final dividends be declared for the year ended December 31st last on the paid-up capital of the company of 6 per cent. actual on the "A" shares, and of 2½ per cent. actual on the "B" shares, payable, less income tax, on and after January 28, 1939."

The resolution was seconded by Sir Austin E. Harris, K.B.E., the deputy-chairman, and carried.

The retiring directors were re-elected (with the exception of Mr G. A. Harvey, who did not offer himself for re-election), and Messrs Price, Waterhouse and Company were reappointed auditors for the year 1939.

Votes of thanks to the directors for their services during the past year, to the staff for their excellent work, and to the chairman for presiding, were carried, and the proceedings then terminated.

GOVERNMENTS STOCK AND OTHER SECURITIES INVESTMENT COMPANY, LIMITED

BOARD'S DIVIDEND POLICY

The sixty-seventh annual ordinary general meeting of this company was held, on the 27th ultimo, in London.

Mr J. S. Austen (the chairman) first referred to the death of his predecessor in the chair, Viscount St. Davids. He said: Lord St. Davids became a director of this company 48 years ago and I became a director within a few months of that time. It was the time of the Baring crisis, and on a valuation the capital represented by our deferred stock had disappeared and part of the capital of the preference stock as well. However, we built up the company until the capital was intact and we were paying 10 per cent. on the deferred stock. Furthermore, from time to time we made a free distribution of stock. In the course of building up no class of investment contributed so much to our progress as our investments in South American railways. Then by a strange irony of fate those very railways which had served us so well suddenly turned and rent us. Railways, I think, are never likely to be worse than they are, and we can reasonably hope for an improvement, but it is very difficult to see how the railways can once more hold the position they formerly held.

In order to maintain our dividend we have taken £2,000 odd from the revenue reserve account. I say this in no apologetic tone, for in fact I rather glory in what we have done. This company lives largely on the dividends paid by other companies, and I claim that we set other companies an example. I always regard a reserve fund as something upon which you may call in times of trouble. If you do not, I can really see very little use in having a reserve fund at all. The report and accounts were unanimously adopted.

SUN LIFE ASSURANCE SOCIETY

RECORD NUMBER OF NEW POLICIES

SIR WILLIAM GOSCHEN'S ADDRESS

The general meeting of members of the Sun Life Assurance Society was held, on the 31st ultimo, at the Chief Office, 63 Threadneedle Street, London.

The Hon. Sir William H. Goschen, K.B.E. (the chairman), in the course of his speech, said: The year 1938 with its international crises has been a very difficult one, but nevertheless, as Chairman of your Society, I am glad to be able to report steady progress. The total new life assurance business for the year was rather more than 35,000 policies for Sums Assured exceeding £21,500,000, and although a small decrease of £350,000 has robbed us of a record for sums assured, we have scored with the number of policies, which is 1,500 more than the previous best, in 1937. Moreover, an analysis of the new business shows that we have also achieved a record in the amount of the sums assured secured under the Whole Life and Endowment Assurance classes. You will observe from the Report that the Funds of the Society have again made a substantial advance, from £43,000,000 to over £45,000,000.

Turning to the Revenue Account for the Life Assurance Business, you will see that the premium income is now nearly five million pounds and our interest income nearly one and a half millions. Low interest rates still prevail, and last year has had to bear the burden of an increase in the rate of Income Tax. The net rate earned on the Life Assurance Fund during 1938 was £3 18s. 7d. per cent., which is somewhat less than that earned in 1937, but still quite satisfactory.

On the other side of the Account, claims both by death and maturity naturally show an increase in amount, about £200,000 in each case. The claims by death are, however, well within the expectation, the ratio of the actual to the expected number being lower than in the year 1937, which was itself a very good year.

There is also an increase in surrenders, but bonuses in cash have fallen considerably, as is to be expected in a year following a distribution of profits.

REDUCED EXPENSE RATIO

You may remember that last year I announced that for the third year we had achieved a reduction in the "commission and expense" ratio, and I ventured to prophesy that the year 1938 would see yet a further fall. It is, therefore, gratifying to be able to tell you that for the fourth year in succession the ratio shows a decrease, and a very appreciable one. The Annuity, Sinking Fund and Accident Accounts need little comment. The Proprietors' Fund follows a normal course, and now stands at £729,000.

Turning to the Balance Sheet, the items on the Liabilities side need no explanation. There are a few points on the Assets side to which I might draw your attention.

One of the largest items among the Assets is £10,872,000 in British Government Securities, nearly 25 per cent. of the total. During last year we continued to reduce our foreign investments and they are now no more than 5 to 6 per cent. of our total Assets, while those in the British Empire are about 94 per cent. Railway and other Debentures show an increase of nearly £1,000,000, but there is little change in the relatively small amounts which we have invested in Preference and Ordinary Stocks and Shares.

You will recall that in 1937, a year characterised by great financial instability, the depreciation in our Assets was rather less than two per cent. The valuation made at the end of 1938 disclosed a further depreciation of a little over two per cent., a total of only four per cent. over the two years.

RECORD OF STABILITY

We may, I think, consider that this small rate of depreciation in two years of such general instability has amply justified our investment policy and provides evidence of the unchallengeable security offered by the Society to its policy-holders. I may also mention that the aggregate market value of our Assets exceeds the values at which they appear in the Balance Sheet by a considerable margin, thus providing a valuable reserve for the future.

That this record of stability with its guarantee of future security is appreciated by the public is evidenced by the very large amount of With Profit Assurance which is granted by the Society each year.

I have, as you see, confined my remarks solely to the Report and Accounts, and have tried to show you the Sun Life Assurance Society going steadily on its way notwithstanding the difficulties with which we have been confronted.

The report and accounts were unanimously adopted.

UNION BANK OF AUSTRALIA LIMITED

BURDEN OF TAXATION

The annual general meeting of the Union Bank of Australia, Limited, was held, on the 30th ultimo, at 71 Cornhill, London.

Major-General Sir John H. Davidson, K.C.M.G., C.B., D.S.O. (chairman of the bank), presided.

The Chairman, referring to the interchange of visits by members of the board and staff between this country and overseas and various changes in appointments among the higher officers in Australia, proceeded: As regards taxation, since last year an increase of 15 per cent. on the Federal income-tax rates has been made by Australia, primarily for purposes of defence expenditure. This is, of course, in addition to National Defence Contribution tax, which we pay for defence purposes on this side, and on which we get no Dominion relief for double taxation. As for New Zealand taxation, the position remains as I described it last year. The taxes there in the past year have absorbed virtually the whole of the profit derived from our operations in that Dominion. There is some hope that during the coming session of the New Zealand Parliament there may be adopted some change in the system of taxation of the banks. I calculate that for the current year the total taxes to be paid by this bank will amount to no less a sum than £250,000, which is greater than the net dividend we are distributing.

The Chairman, having given an exhaustive review of world conditions, and particularly of conditions in Australia, continuing, said:—

The balance-sheet total stands at £47,658,187, which shows little change on last year's total. There is a reduction of some £350,000 on the liabilities side caused by the fall of a like amount in deposits. On the assets side there is a fall of some £2,700,000 in cash and balance of remittances and drafts in transit, and this is accounted for by an increase of £2,350,000 in advances and the decrease in deposits already mentioned. The gross profits are up by over £61,000. On the other hand, expenses are up by some £71,000. The net profit is £244,682, and to this amount must be added £145,914 carried forward, making a total available of £390,596. We have declared a final dividend of 4 per cent., less tax (making 7 per cent., less tax, for the year), leaving £157,263, i.e. an increase of £11,349, to be carried forward.

The report and accounts were unanimously agreed to.

F. W. WOOLWORTH AND COMPANY, LIMITED

RECORD SALES AND PROFITS

The thirtieth annual general meeting of F. W. Woolworth and Company, Limited, was held, on the 27th ultimo, in London.

Mr W. L. Stephenson (chairman), who presided, in the course of his speech, said: The company has in 1938 reached a new high in sales and consequent profits. This is doubly pleasing when we realise that 1938 was by no means a boom year. The remunerative business enjoyed during the Coronation period of 1937 was only partially countered by improved Scotch business resulting from the Glasgow Exhibition. Later came the crisis, when we, in common with other shopkeepers, found the people, with gloom and uncertainty in their hearts, had little inclination to buy. Happily, as we shall always thankfully recall, this passed and trade resumed its normal course, with the result that by the end of the year we found that in our old stores we had made a gain in sales which, though small in percentage, represented a considerable volume in itself.

The net profit, after all expenses and depreciation, at £6,961,141, is an increase of £471,127, which represents a gain of 7.26 per cent. After the deduction of tax the profit is £4,929,395, an increase of £136,448, which represents a gain in real profit of 2.85 per cent.

Stocks of merchandise on hand, despite the considerable addition to selling space, are lower than at previous inventory. This reduction in stock was deliberately brought about and certain departments were permitted to run down, as towards the end of the year it became evident that some types of merchandise were easing in price. Our buyers are now in the happy position of securing advantages in their purchases of such goods which will in turn be passed on to the customer in improved value.

There have already been dividends on the preference shares and an interim dividend of 9d. per share on the ordinary shares. The directors now recommend that the available balance should be dealt with as follows: transfer to freehold building reserve, £100,000; transfer to reserve for staff benevolent fund, £110,000; payment on February 1st next of a final dividend of 1s. 9d. per unit, less income tax, on 30 million 5s. units of ordinary stock, £1,903,125; payment on the same date on the ordinary stock of 9d. per unit cash bonus, less income tax, £815,625.

The report was unanimously adopted.

GENERAL CONSOLIDATED INVESTMENT TRUST, LIMITED

DIFFICULT MARKET CONDITIONS

The forty-third ordinary general meeting of this company was held, on the 27th ultimo, in London.

Mr R. B. H. Ottley (chairman of the company) said that the company's general reserve account had been brought up to a figure of £50,000 by a transfer of £10,000 from the revenue account. The carry-forward, although lower by £590 than the amount brought in, was still substantial at the figure of £24,655. In the geographical distribution of their securities what little change there was to be observed tended to illustrate a general improvement of the list which it was the board's constant endeavour to achieve. The percentage of investments in the continent of Europe became 10.19, whereas twelve months ago it was 11.38.

Although gross income from investments showed a shrinkage from £106,836 to £99,802, this was in great part accounted for by the fact that in 1937 the company was fortunate enough to collect £2,700 in respect of arrears of cumulative dividend, whereas in 1938 only £350 was received under that head. For the first half of the year revenue was maintained at the high rate of the previous year; the reduction had all been experienced in the latter half.

The stupendous figures of expenditure which re-armament would entail would, of necessity, cast upon the nation a heavy burden, which might, however, in some measure be alleviated by the extent to which industry might derive benefit from its repercussions. How far the load could be laid upon the already heavily burdened shoulders of the taxpayer without bringing into operation the inexorable law of diminishing returns, or how far the day of reckoning might be deferred by State borrowing, must be a problem of the greatest perplexity to those who had to decide it.

If it were possible for the company to adopt any consistent investment policy, he suggested it would be to sell such foreign holdings as remained to them and intensify the course they had been following in the past four years of relying almost exclusively upon investments in Great Britain and the British Empire. No longer was geographical distribution of investment a criterion of strength. It was all the more pleasing, therefore, to observe the development taking place in British possessions abroad, particularly in Canada, where the mining industry, which exerted an important influence on the economic life of the country, continued to show steady improvement.

But in times such as these, any investment policy must be governed to a great extent by prevailing conditions, and it was increasingly difficult either to buy or to sell on the Stock Exchange even moderate amounts of securities without an entirely disproportionate disturbance of their market quotation. He had stated last year, and he repeated, that too much importance need not be attached to the figure of depreciation, which, in common with the experience of all investment trust companies, had risen during the past year from 4.8 per cent. to 12.4 per cent. That by no means indicated a shrinkage in the real value of their investments, but a shrinkage in the Stock Exchange quotation which had largely lost its significance, for it was true to say that at the prices quoted in the vast majority of cases, little if any stock could be purchased, or indeed sold.

Their company rested upon sure foundations and, in the absence of any major upheaval, stockholders need have no anxiety about their investments.

The report and accounts were unanimously adopted and a final dividend of 5 per cent., less tax, on the ordinary stock, making, with the interim dividend, 7 per cent. for the year, was declared.

Our Information Service

The Intelligence Branch of *The Economist* has been enlarged to meet the growing demand for economic and statistical information. The Department has been able to secure the services of a number of experts, and is prepared to supply information and reports on any branch of industry and finance as well as on international relations at a fee proportionate to the work involved.

ASHANTI GOLDFIELDS CORPORATION, LIMITED

BONUS SHARE ISSUE

Speaking at the forty-second annual general meeting of Ashanti Goldfields Corporation, Limited, held on the 31st ultimo, in London, the chairman, Mr J. H. Batty, said that the share capital was £1,000,000, and shareholders had received a circular giving notice of a resolution to increase this by £250,000, bringing the share capital to £1,250,000. Of this, £200,000, or one million ordinary shares of 4s., was recommended to be distributed among shareholders, and a resolution would be put for their approval at an extraordinary meeting, immediately following this meeting, to authorise the directors to distribute same to the shareholders as a free bonus on the basis of one in five. The balance of £50,000, or 250,000 4s. shares, was being offered to shareholders at £3 per share, in the proportion of one for twenty shares held.

Income-tax reserve was £255,299 and the National Defence Contribution £47,336. The dividend equalisation account, £200,000, was to be capitalised to enable the directors to carry out the recommendation of a free share bonus of one in five shares to the shareholders. Sundry creditors, exploring account and investment reserve came to £285,376. This included the investment reserve, being profits on the sale of investments of about £155,000.

RECORD PROFITS AND DEVELOPMENTS

This year's profit, after providing for depreciation of £61,129, was £1,042,064, and again showed a record. After deducting income tax reserve of £24,000 and £46,000 for National Defence Contribution, £972,064 was available for distribution. Of this the company would have distributed £950,000. After providing £10,000 for the pension fund there would be a total balance carried forward of £112,425.

Expenditure during the past year was considerably heavier than usual, this being primarily explained by the cost of erecting the residues retreatment plant (now completed) and additions to the power plant.

Investments in other mining companies were £722,929, an increase of about £38,000, which was explained by taking up their share in the Bibiani new issue. They would be participating in the new issues of Amalgamated Banket Areas and Ariston Mine. The income from these investments was improving year by year.

REMARKABLE DEVELOPMENTS

There had been vitally important developments, especially at the bottom of the mine. This discovery, with the promise it implied that the reef would go down to the limits at which mining was possible, and the existence of the Obuasi South Shoot, made a more progressive programme possible to give an increase in the monthly output. These discoveries made the outlook much more promising than a year ago. The exposure on 29 level to date, by eleven cross-cuts, was in length 500 feet, with an average width of 19.5 feet and an average value of 38.4 dwts.; on No. 30 level, by eight cross-cuts, the corresponding figures were 350 feet, 18.6 feet and 50.9 dwts. In neither had they come to the end of the payable ore shoot, which, according to diamond drill indications on No. 29 level, they might expect to have a length of about 900 to 1,000 feet. These developments, in conjunction with payable discoveries on the Obuasi South Shoot, had revolutionised the outlook.

The main shaft had now been sunk to 31 level. A cross-cut would shortly be started to cut the reef, which was expected to be reached at, say, 500 feet. It might be possible to have this cross-cut through the reef in April. The sinking of the main shaft would in due course be continued to 35 level.

OUTPUT TO BE INCREASED

The consulting engineer had outlined a programme to bring the output within the next two years to 30,000 tons a month. The first step was the commencement last November of a new south shaft, mainly for developing the new South Obuasi Shoot; they were hoping this year to sink this shaft to 500 feet, and it would be continued to 1,800-2,000 feet. The site selected would enable the shaft to open up and work the Obuasi South Shoot from the surface and to tap the southernmost shoot on the Cote d'Or fissure and/or any other ore shoot which might be discovered further south on the lower levels. The addition of the new Obuasi South Shaft would make it possible, they hoped within two years, to increase output to 30,000 tons.

Ore reserves showed an increase of 239,176. They had now 1,834,289 tons of an average value of 21 dwts. On last year's output the reserve represented eight years' supply and on an output of 30,000 tons a month five years' supply.

The resolutions submitted to the extraordinary general meeting were duly passed.

BIBIANI (1927), LIMITED

INCREASED ORE RESERVES

Speaking at the twelfth ordinary general meeting of Bibiani (1927), Limited, held in London, on the 31st ultimo, the Chairman (Mr J. H. Batty) stated that the profit and loss account showed a net profit of £83,127, after writing off for depreciation £32,228.

The appropriation account showed that, after crediting the account with the profit of £83,127, there was available for distribution £170,469. Of this sum the directors recommended a dividend of 15 per cent., less income tax of 4s. 8d., which would absorb £75,000, leaving a carry-forward of £93,069.

The output for the year of a total of 136,220 tons of ore mined and treated gave a yield of 44,162 oz. This represented an increase of 6,617 tons and 1,546 oz., compared with the previous year. It was expected that the present output of about 12,500 tons would be maintained until the new treatment plant came into operation.

There was particular interest in the recent developments at No. 8

level south of the No. 1 shaft south. The southern ore body had hitherto been regarded as of lower grade than the average for the mine, but recent developments indicated, for the first time, the presence of a higher grade shoot in the main ore body there. Considerable importance was attached to this development. To the end of December a length of 200 ft. had been proved, having an average width of 24 ft. and average value of 11.4 dwts. per ton.

The Chairman felt sure that directly the new treatment plant—which had a capacity of 30,000 tons per month—was working satisfactorily, the consulting engineer would without delay recommend duplicating the plant.

The latest reports from the manager indicated that the new treatment plant should be practically ready for trial runs towards the end of May or early in June.

The ore reserves were in the region of 3,000,000 tons, with an average value of 7½ dwts. It would therefore be seen how highly satisfactory the ore reserve position was, and that the company would be justified in supplementing the output directly the new plant was proved.

The report was unanimously adopted.

INDUSTRIAL REPORTS—continued

unusually large deliveries to the buffer pool, the increase does not give reason for concern.

★

Lead and Spelter.—The price of lead closed on Wednesday 2s. 6d. up at £14 8s. 9d. per ton, while the price of spelter closed at £13 12s. 6d. per ton, a net gain of 3s. 9d. on the week. There was no new feature on the two markets, which benefited to a certain extent from Government orders. It is to be expected that an announcement regarding the British zinc duty will be made very shortly, a step which will be welcome, as it may provide the basis for new international discussions.

Grains

In spite of changes in political sentiment during the past week, the wheat market has been fairly steady and prices, where changed, are a little higher than a week ago. There has been a considerable trade in Australian wheat and the Soviet Government has appeared as a buyer for shipment to Vladivostok. The relative cheapness of wheat continues to affect the sales of other feed grains; the demand for both maize and barley has been slow and prices have tended to lower levels.

Other Foods

Provisions.—There was a sharp fall in the prices of all types of eggs during the week, due to the seasonal increase in supplies. The meat trade remains slow, demand being concentrated on chilled and frozen meat and home killed veal. The bacon market was firm with smaller supplies and prices were marked up by 5s. per cwt.

★

Colonial Produce.—The market for raw sugar was easier and quotations for prompt shipment tended to decline. Kenya coffees met with a fair demand, but other varieties were again neglected. Trade in all types of cocoa improved with a slight rise in prices, but demand for tea was irregular.

★

Fruit and Vegetables.—The usual seasonal shortage in green vegetables has been accentuated by damage caused

by floods and frost and prices rose sharply during the week. Supplies of potatoes continue large and prices for only the best lots are maintained.

★

ing of the International Regulation Committee on the 14th of this month.

Miscellaneous Commodities

Oils and Oilseeds.—These markets remain quiet, though the undertone is steady. The United Kingdom requirements of linseed have been met by Indian supplies and prices are unchanged. The price of Egyptian cottonseed has rallied from the low levels recorded last week, but trade is still slow.

★

Rubber.—The market was influenced by changes in political sentiment, which at one time caused a rise in the spot price to 7½d. per lb.; later, however, there was a reaction and prices closed on Wednesday at a little below this level. Little business is expected in the London market until after the meet-

Furs.—At the end of last week a short sale of Australian skins was held in London. The undertone of the sale was firm, but prices showed no change on October. A considerable part of the offerings was withdrawn, as sellers' limits were higher than the majority of buyers were willing to pay. This sale was followed on Monday of this week by the opening of the London general winter sales. The auction began as usual with the Hudsons Bay Company's offerings, and the tendency was very firm. Beaver showed a rise of 30 per cent. on October last; Persian lambs (South-West African) improved by 10-15 per cent. Musquash and otter were more or less unchanged, compared with October, but at this basis a substantial part of the offerings was withdrawn. The sale is well attended, both by British and foreign merchants, and the demand in general is quite good.

HOW RETAIL TRADE IS FINANCED

At any given moment millions of pounds worth of merchandise is exhibited in the shop windows and showrooms in thousands of wholesale and retail industries throughout the country. In the course of a short stroll through any main shopping street any idle shopgazer can run an envious or an appraising eye over thousands of pounds worth of different goods—all waiting to be purchased. Someone is the owner of all these riches piled up in such profusion in places like Bond Street, Great Portland Street, or the Tottenham Court Road, and whoever that owner happens to be, it is quite clear that an immense amount of capital is tied up in merchandise in the process of being sold, in goods on their way from the manufacturer to the final consumer.

The above is the opening paragraph to the first of two unusual and very informative articles which are appearing in the columns of THE FINANCIAL NEWS on Tuesday and Wednesday next, February 7th and 8th, under the general heading "How Retail Trade is Financed." In recent years the enormous multiplication of the more expensive sort of consumer goods—such as motor cars, furniture, radio, and electrical appliances—and the big widening of demand for them which has received such a stimulus from Hire Purchase facilities, have greatly complicated the whole distributive and financial structure. These two articles do not deal with the financing of the final stage—the ultimate sale to the consumer—but with the intermediate stage, or stages, from the time when the manufactured article leaves the factory. The first of these two articles deals exclusively with the motor industry; the second goes on to discuss the "intermediate" financing which takes place in the furniture, piano, and radio trades, as well as the household appliances industry. They make a two-fold appeal—to the people engaged in these trades and to the consumers of these products—and since the investor falls often into the first category, and always into the second, these articles, though a little off the beaten track, should provide interest and information for all investors.

GOVERNMENT RETURNS

For the week ended January 28, 1939, total ordinary revenue was £42,796,000, against ordinary expenditure of £17,388,000. Thus, excluding sinking fund allocations and Defence expenditure from loans, the deficit accrued since April 1st last is £161,097,000, against a deficit of £92,437,000 a year ago.

‡ After concessions of £100,000 made during passage of Finance Act.
§ After adding Navy and Air Supplementary Estimates, Consol. Fund increase under Eire Act and reduction by revised Civil Estimate (net increase, £2,150,000).

After reducing Exchequer balances by £181,950 to £2,633,719, the other operations for the week (as shown below, but excluding £5,250,000 issued under the Defence Loans Act and £255,000 issued to Sinking Funds) reduced the gross National Debt by £20,085,000 to about £8,347 millions.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.
On January 27th applications at £99 17s. 5d. per cent. for bills to be paid for on Monday, Wednesday, Thursday, Friday and Saturday of following week were accepted at about 18 per cent. and applications at higher prices in full. Applications at £99 17s. 6d. for bills to be paid for on Tuesday were accepted in full. £20.0 millions of Treasury bills are being offered on February 3rd.

SHORTER COMMENTS

(Continued from p. 262).

Rheostatic Company.—Net profit, after depreciation, year to September 30, 1938, £11,346 (£11,244). Ordinary dividend, 8 per cent., against 12 per cent. To general reserve, £2,000, as before. To investment reserve, £3,000. Carry-forward raised from 1,506 to £1,579.

Qualcast Limited.—It is announced that the result of the half-year's trading to December 31st is satisfactory. The acquisition of Messrs Follows and Bate, Limited is now practically complete and over 98 per cent. of its issued capital has been acquired. It is not proposed to issue any further permanent capital in connection with this purchase.

Eburite Corrugated Containers.—Net profit for 1938 before tax and N.D.C.,

£35,135, against £45,162 for 1937. Ordinary dividend 20 per cent., against 25 per cent. for 1937.

Taylor Woodrow Estates.—Profit for year to October 31, 1938, £21,931, a reduction of £5,837 compared with 1936-37. To general reserve, nil, against £20,000. Ordinary dividend reduced from 6 to 3 per cent. Carry-forward raised from £6,732 to £18,162.

Weyburn Engineering.—Provisional net profit for year to October 31, 1938, is £35,368, against £26,565. Total distribution raised from 25 to 30 per cent.

Thomas Tilling Limited.—Final dividend, 5 per cent., making 10 per cent. (same, but on capital increased by 25 per cent. bonus). Net profit is £512,195, against £456,398.

CENTRAL AND SOUTH AMERICA

THE BANK OF LONDON AND SOUTH AMERICA, LTD., issues the following details relative to quotations for certain of the South and Central American exchanges. All these exchanges, with the exception of Bolivia and Paraguay, are related to the United States dollar, and the approximate sterling rates may be obtained by applying the dollar-sterling exchange rate.

Bolivia.*	Sight selling rate on London was 141.40 bolivianos per £ (nominal) on January 7, 1939.
Colombia.*	Sight selling rate on New York was 175.15 pesos per 100 U.S. dollars on January 9, 1939. This rate applies to holders of permits buying in the "open" market.
Ecuador.	Sight selling rate on New York was 14.56 sucres per U.S. dollar on January 7, 1939.
Guatemala.	Sight selling rate on New York is maintained at one quetzal per U.S. dollar, but a commission of 1 per cent. is charged by the Central Bank for the sale of drafts.
Nicaragua.*	Sight selling rate on New York for payment of imports was fixed by the National Bank at 5.52½ cordobas per U.S. dollar (including 10 per cent. tax and ½ per cent. commission) on January 10, 1939.
Paraguay.	Exchange is quoted on Buenos Aires; the sight selling rate was 73.25 Paraguayan pesos per Argentine "free" paper peso on December 30, 1938.
El Salvador.	Sight selling rate on New York was 2.49½ colones per U.S. dollar on January 11, 1939.
Venezuela.	Sight selling rate on New York has been maintained at 3.19 bolívares per U.S. dollar since April 27, 1937.

* Exchange controls are operative in these countries.

SHORTER COMMENTS

(Continued from page 278)

Transvaal Output and Employment.—Gold output, December, 1938: Witwatersrand, 999,955 fine ounces; outside districts, 26,274 fine ounces; total, 1,026,229 fine ounces. Value for purposes of declaration, 148s. 6d. Total output, November, 1938, 1,032,886 fine ounces. Number of natives employed at end of December: Gold mines, 307,373; coal mines, 16,398; total, 323,771.

Consolidated Mines Selection Company.—Ordinary shares dividend 15 per cent. for 1938 against 25 per cent. for 1937. Net profits, subject to tax, have fallen from £229,694 to £110,083.

English Velvet and Cord Dyers.—Net loss for 1938 is £12,827 against a net profit of £15,259 for 1937. After £10,000 from reserves (against nil) balance forward is reduced from £4,782 to £1,954. Total reserve now £85,000.

British Tobacco (Australia).—Net profit year to October 31, 1938, £911,479 (£911,386). Ordinary dividend again 10 per cent. In previous year bonus of 3½ per cent. also distributed. Carry forward increased from £40,174 to £41,700.

Houndsditch Warehouse Company.—Second report shows net trading profit, etc., £260,552 for 1938 (£283,800). Charges include reserve for amortisation of properties, £8,837 (£7,350); depreciation, £3,767 (£3,889); tax and N.D.C., £27,000 (£31,000). Written off goodwill, £10,000 (£28,430, including pre-incorporation profit). Final ordinary dividend 12½ per cent., making 17½ per cent. for year (17½ for initial period); forward, £39,668 (£22,650).

Wm. France Fenwick and Company.—Profit for 1938, £112,651 against £171,142. To depreciation, £34,096 (£28,146). To tax and N.D.C., £9,911 (£22,394). To reserve, £11,904 (£11,249). To contingencies, £7,000 (£40,000). Ordinary dividend, 7½ per cent. against 7½ per cent. plus a 2½ per cent. cash bonus. Carry-forward raised from £12,004 to £12,247.

Lister and Company.—Net loss for year to March 30, 1938, £37,513. For previous year available profit was £72,346. Debit to be carried forward is £34,691 against credit of £2,821 brought in.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum. div." shares.

Italian minds are not calculated to increase Signor Mussolini's readiness, if it really exists, to withdraw all his men and material immediately the fighting in Spain is over. But his pledge is specific and unconditional. It was annexed to the Anglo-Italian Agreement of last April, and it was confirmed by Signor Mussolini last month. And when Count Ciano's attention was called this week to suggestions made by Signor Gayda (whose inspiration is usually official) that the troops would not be withdrawn until concessions had been exacted from France, the promise was, it is understood, repeated once more. This might seem to be decisive. But Italian promises have frequently been broken before, and it is difficult to believe that Signor Mussolini is really prepared to surrender what he has won at such heavy cost. Moreover, there is the ostentatious preparation of claims on France, whose presentation is clearly linked with the outcome of the Spanish war. It would be safer to assume that Signor Mussolini intends to use his conquest of Spain as a club to brandish over the heads of the French, even though that would involve some departure from his pledges to Britain.

This being so, it is immensely to the good that Mr Chamberlain has at last given a specific assurance of backing to France. On Monday, he stated explicitly that "any threat to the vital interests of France, from whatever quarter it came, must evoke the immediate co-operation of this country." Ordinarily words such as these would be utterly conclusive. But the world cannot yet have forgotten the speech that Sir John Simon made at Lanark at the end of August. It was then said that any war started by an attack on Czecho-Slovakia would probably involve Britain. This was interpreted as a warning to Germany; but within a month its real meaning was discovered to be that, since Britain would probably be involved in a war starting by an attack on Czecho-Slovakia, Britain must persuade Czecho-Slovakia to make the attack unnecessary. The Government have only themselves to blame if the German and Italian Press is busy putting a similar construction on the new pledge to France. Actually, the cases are quite different. France could not be coerced as Czecho-Slovakia was; the declarations of the French Government leave no room for doubt. No British

Government would wish to persuade France to surrender any of her vital interests—or, if it tried, could withstand the political storm that would be raised at home by any such attempt. Mr Chamberlain's statement is what it purports to be: a categorical warning that Britain and France stand together. It is the wisest and most effective step that British diplomacy has taken for very many months.

Across the Atlantic, too, some certainty is emerging from the half-probabilities of American foreign policy. The storm that has been aroused over the President's methods of secrecy in concealing the extent of purchases of war materials by the European democracies has served the useful purpose of showing how little opposition there is to the substance, as distinct from the methods, of Mr Roosevelt's policy. Even Mr Hoover, who represents nowadays a fairly extreme form of isolationism, has uttered the warning that America would fight in any war that involved the wholesale bombing of women and children in open cities. This is enough to give the dictators pause; for the only way in which they could hope to win a war against Britain and France combined would be one that included civilian terrorism as its chief weapon.

The events of the past fortnight have thus delivered Spain into the hands of the dictators' ally. But, on the other hand, they have established the certainty that Britain and France cannot be separated and subjugated piecemeal, and the strong probability that a war against Britain and France means also a war against all the material resources of the North American continent. The importance of these facts should not be over-rated. They should be set against the signs that the self-confidence of the dictators has been dangerously inflated, that they realise their time is short, and that everything is being done to raise their striking-power to its highest point this spring. The scales of history are still visibly balancing between war and peace and the pointer has not yet come to rest at either. But this at least can be said: that the weights cast into the balance in the last two weeks have been on the side of peace, and that the greatest of them is the evidence that has been given of the growing strength, the growing firmness, the growing clarity of purpose, and the growing unity of the great democracies.

The Arab World and Palestine

THE Conference—or, more strictly, the Conferences—on Palestine which opened at St. James's Palace on Tuesday have never been anticipated with over-much confidence in a successful outcome. The start has not been too promising, even within the framework of the very moderate expectations. Not only do the Arabs refuse to sit with the Jews, but three days were absorbed in persuading the Mufti's followers and the Nashashibi faction of the Arabs of Palestine to co-operate on a single delegation. But against these disappointments must be set the fact that the delegates from countries other than Palestine have emphasised—and with obvious sincerity—their desire to see a solution reached for a problem that is almost as troublesome to them as to the British Government.

This goodwill is important; for one of the peculiar difficulties of the Palestine problem lies in the fact that this tiny country is the focus of pressure and counter-pressure from vast, and indeed world-wide, external forces. It has been obvious all along that the Jewish interest in Palestine is not confined to the small fraction of Jewry that may happen to be resident in Palestine, but extends to the whole of the Jewish Dispersion abroad among the Gentiles. Until lately it has, perhaps, not been so obvious that the Arab interest in Palestine is likewise not confined to the local Palestinian Arabs. The wide Arab interest in Palestine has

now been formally recognised, in a striking way, by the representation, not only of the Palestinian Arab community, but also of five independent Arab States—Egypt, Saudi Arabia, Iraq, the Yaman and Transjordan. Even so, the present Arab representation at this London Conference is far from covering the whole of the Arab world; for Palestine is not the only Arab, or partly Arab, country that still lacks complete sovereign independence. For example, no Arab community, outside Palestine itself, is so closely interested in the Palestine question as are the two adjoining States of Syria and the Lebanon. The very separation of Palestine from the main body of Syria was an arbitrary and artificial act of the Allies in 1919. The Arab world, however, extends far beyond these immediate neighbours of Palestine. South-east of the Yaman and Saudi Arabia there is a large tract of the Arabian Peninsula facing the Indian Ocean and the lower reaches of the Persian Gulf, from the Aden Protectorate to the Bahrein Islands inclusive, which is under a British *ægis*. And then, in the opposite quarter, Egypt is no more than the threshold of the Arab domain in Africa. Moreover, in the non-independent section of the Arab world Palestine is by no means the only province in which there is trouble. Far away in Morocco, for instance, a tug-of-war is taking place at this moment between the Arab, or Arabicised, Moroccans

of the Atlantic lowlands and their French overlords to decide whether the Berber highlanders of the Atlas—the last reservoir of white barbarians since the compulsory civilisation of the Scottish Highlands after 1745—are to be converted into Arabs or into Frenchmen.

Thus even the Arab representation at this week's London Conference is by no means fully representative of the whole Arab world; at the same time, it is sufficiently representative of the heart of it to be able to act with authority in the name of all the Arabs everywhere; and it is on this fact, we may guess, that the British Government have pinned their main hopes of securing a settlement. It is hoped, on the one hand, that the non-Palestinian Arab delegations, being less directly affected than their Palestinian brethren by the questions on the agenda of the Conference, may prove to be less intransigent and more inclined towards compromise. On the other hand, there is some idea that the solution of the local problem of Palestine might be facilitated if it were to be linked up with the problem of Arab federation.

Of these two hopes the second probably has more substance in it than the first. On the first point, however much the independent Arab States might hanker after a compromise, they would probably shrink from playing the invidious part of forcing the Palestinian Arabs to accept a status conspicuously less favourable than the full sovereign independence they have all successfully insisted on as a *sine qua non* for themselves. In these circumstances, a strong show of intransigence on the Palestine Arabs' part might reduce the mediating power of the other Arab delegations to vanishing point. By contrast, there would seem to be considerable hope in the project of solving the problem of Palestine within the framework of an Arab federation. For one thing, this federation is widely desired by the Arabs as an end in itself; for another thing, it would reduce the proportions of the menace which, in Arab eyes, Zionism presents to the cause of Arab nationalism. While, within the limits of Palestine, even including Transjordan, there might be a serious danger for the Arabs of being overshadowed, if not overwhelmed, by the Jews, this nightmare would fade away if Palestine were built into an Arab federation extending from Gaza to Aleppo and from Haifa to Basrah.

The construction of an Arab federation is not, however, without inherent difficulties of its own—widely desired though it may be. For, if it is to be a natural, healthy growth, it will have to crystallise round some leading Arab State; and of the five States now represented at the London Conference there are two possible candidates for leadership—namely, Egypt and Saudi Arabia—whose claims might not be easy to reconcile.

In almost every way these two Arab States present the strongest possible contrast to one another. On material and historical grounds the claims of Egypt would carry the day. With her 15 million inhabitants, her valuable crops, her great modernised cities, and her unique position at the

waist of the sea route between Europe and the Far East, Egypt stands to-day in material matters head and shoulders above all other existing Arab States. Culturally she is in an almost equally strong position; the antique religious learning of the old-fashioned world of Islam still centres upon the university mosque of Al-Azhar at Cairo, while conversely the new-fangled Egyptian Press (largely the creation of Syrian and Lebanese Christian Arabs) has a circulation which, expedited by air-mail, now reaches Tunis in one direction and Baghdad in another. Moreover, Egypt's premier position in the Arab world is historically well established; for the sceptre passed to Egypt from Iraq as long ago as A.D. 1258, when the Abbasid Caliphate was extinguished by the Mongol invaders.

On the other hand, Saudi Arabia's claims to leadership are no less impressive, though quite different in kind. In the first place, both King Abdul-Aziz Ibn Saud himself and his people enjoy the immense prestige which goes with their being genuine pure-blooded Arabs, born and bred in Arabia itself, whereas the Egyptians are, after all, by origin merely Arabicised Copts, with a provincial dialect and a rather narrowly parochial Egyptian patriotism. Ibn Saud's domain further includes the Hejaz, which is the Holy Land of Islam and contains its first two holy cities, Mecca and Medina (the third in rank is Jerusalem). In fact, Ibn Saud's present dominions practically coincide with those of the Prophet Muhammad at the high tide of his political success. But the chief asset of Saudi Arabia is Ibn Saud himself: a great statesman, who displays his statesmanship in his moderation. Starting life as an exile, he has since 1901 recovered and greatly enlarged the defunct empire of his Wahhabi forefathers. The first stage of this process brought him into collision with most of his neighbours, since his puritan Wahhabi fighting men were not only fanatical but turbulent and hungry for loot. But within the last dozen years Ibn Saud has tamed his own followers and *pari passu* has improved his relations with all the Arab countries round about—with Iraq, Egypt, the Yaman and even Transjordan, whose Emir is a son of the King Hussein whom he turned out of Mecca. He has been converting the bedouin of Arabia into husbandmen settled in the oases; and, in the nick of time, Fortune has given him the means for carrying through this constructive but ambitious economic and social revolution. Americans have struck oil in Al-Hasa, and the Saudi Government is beginning to draw substantial royalties.

Thus, within the Arab world, Palestine is a small corner. And its fate may well be settled, as the fate of other small corners has been settled before, not by its own wishes so much as by the clash or compromise between the wishes of more powerful neighbours. The task before Mr Malcolm MacDonald and his coadjutors is to act as honest (but not entirely disinterested) brokers not only to Jewish-Arab negotiations but to Egyptian-Saudi Arabian talks as well. And the latter may well be both more fruitful and more decisive than the former.

Science and Economic Progress

EVERY year the report of the Department of Scientific and Industrial Research presents a vivid picture of the vital problems which are steadily being solved by the co-operation of science and industry under the *ægis* of the State. This year's report,* published last week, is no exception. Of the extent to which the community has become dependent upon scientists for abundance and good health in peace-time, as well as for safety and the power to destroy in war, the

* Report of the Department of Scientific and Industrial Research for the year 1937-38. Cmd. 5927. H.M. Stationery Office. 203 pages. 3s.

Department's report gives a small but significant glimpse.

Yet many people nowadays believe that all is far from well with science, and it is perhaps the scientist himself who has most cause to be restive. It is to state the current complaints and misgivings of not a few of his colleagues that Professor Bernal, of Birkbeck College, has written a notable, if rather confused, book.† He is anxious about the poor use that is being made of science.

On scientific researches proper barely one-tenth of one

† "The Social Function of Science." By J. D. Bernal, F.R.S. Routledge. 482 pages. 12s. 6d.

per cent. of the national income is spent annually by the State, the universities and industry combined; and this despite the fact that (according to a highly hazardous calculation quoted by Professor Bernal) the eightfold increase in the national income in the last hundred years would have been impossible save for a total expenditure of about £100 millions in all on scientific research. He scarcely recognises, however, what is really the limiting factor in technical progress. The advance he cites would have been wholly impossible without the application of capital resources to the exploitation of invention, and the sum of those resources at any point of time is strictly limited.

Professor Bernal wants a tenfold expansion in expenditure on scientific research. He wants a horizontal reorganisation of research to bring, say, physics, chemistry and biology into closer contact, and a vertical reorganisation to weave theoretical researchers, experimental scientists, technicians and business firms into a conscious and continuous chain. "The task of the future (he says) is to make the work of the scientist more conscious, more organised and more effective." At present he estimates that the wastage of money and effort applied to research in science varies between 50 and 90 per cent. He claims that an increase in annual research expenditure from about £5 millions to, say, £40-50 millions, coupled with improved organisation, might raise the national income by more than a quarter and social welfare *pro rata*. This calculation based as it is on estimates of recorded achievement, is scarcely sound. To say that the expenditure of £x on research in the past has increased the national income by £y is by no means to prove that the expenditure of £2x in the future will increase the national income by £2y. It all depends upon the amount of capital available to apply and exploit the discoveries made.

The lions in the way of Professor Bernal's millenium are economic. In the first place, science must show quick profits to induce industrialists to spend money on it. Subsidies from industry and the State are science's sole means of support. "Science is thought of and paid for in proportion to increased value of products or reduction of costs": it must show a profit. The trouble is that the profitability of new developments in research is never certain. Financing invention is risky; competitive concerns are seldom inclined to large-scale hazards; and, since research is a long-term speculative venture, it is easy and obvious to scrap it when times are bad. The enormous secular benefits of scientific research in general are easy to show; the immediate advantages of particular pieces of inquiry to particular firms are not demonstrable. Boulton spent £70,000 before he saw a penny back on Watt's steam engine patent.

Nor is this all. Science may be too successful for commercial enterprises to stomach. Successful research may render costly plant and equipment obsolete on a wide scale. Already new plant may be wholly written off in four, or even two, years; and science is something deliberately held in check to prevent an even faster rate of obsolescence. There are other difficulties. It is true that, in time, the demand generated by the introduction of new machines must vastly outweigh the unemployment caused immediately; the whole of economic history proves this. But technological unemployment is a real phenomenon: something like one-seventh of American unemployment over a period of years has been attributed to it; and Lord Stamp has calculated that some 250,000 of the unemployed in Britain may be the victims of scientific innovation.

So far Professor Bernal sees the dilemma he wants to expose plainly. There are mass demands for plentiful and nutritive foodstuffs, for new, more varied and inexpensive clothing materials, for more convenient and more habitable houses, for more durable motor-cars of new design

and for greater control of health and disease; and scores of scientists are more than half-way to furnishing solutions to these problems. The need for more rapid application of scientific discoveries seems evident. Yet advance seems to be arbitrarily blocked and checked.

It must be insisted again, however, that what Professor Bernal and a multitude of other critics forget is that the rate of technical advance is dependent not only on the flow of scientific discovery, but much more directly upon the capital resources available to embody those discoveries; the higher the fraction of the community's total resources that is devoted to technological development the smaller is the fraction that can be put to other uses. Scientific progress is not expansible at will, because our resources are not freely expansible. And, moreover, the social revolution which Professor Bernal, in his generous indignation, seems to sponsor would not alter this limitation by one iota. After all, the fact that the two countries which, over the past two decades, have enjoyed the highest rate of technological progress are probably Soviet Russia and the United States suggests that ideologies and forms of political organisation have little decisive influence in the matter. The initial consequences of revolutionary change would be retrograde because resources would be destroyed or pass out of use, and the problem of the Socialist economy would be the same as our own problem: how to make the best use of available resources by parcelling them out between a host of alternative employments of which the pursuit of scientific discovery and the exploitation of invention would be one. Scientific inventions can be rapidly exploited and the supply of goods for consumption increased in the future if the community will limit its consumption now. A dictatorial regime may advance more rapidly than a free one if it chooses to impose a restriction of consumption. But it is this use of compulsive power, and not the social theory held by the rulers, that effects the result.

On the other hand, bearing in mind that a quart can never be got out of a pint pot, it would be mere reaction to claim that Professor Bernal's points have no practical validity whatever. His larger claims are simply flights of fancy, because he has little or no understanding of the real economic issues involved. His less ambitious claims are well founded. It is true that, even within the limits of the resources which the community is at present willing, by refraining from consumption, to set free for embodying the scientists' inventions, we are not getting the best possible returns from science and invention. There is a margin of wastage which might be much diminished. The problems of technological unemployment, high obsolescence charges, economic instability and the long-term financing of invention "cannot be spirited away"; but they can be very much eased. The lack of financial facilities for invention and research is not an inevitable feature of the capital market, but a flaw. Industry's annual contribution of less than £3 millions to official and independent research is far below the limit imposed by considerations of profit and loss. That the coal industry should contribute no more than 0.003 per cent. of the value of its net product yearly to joint research with the State, the iron and steel industry 0.07 per cent., the automobile industry 0.03 per cent., the electrical and allied industries 0.18 per cent., the textile trades 0.08 per cent. and the food and drink trades 0.03 per cent., is due to traditional apathy, not commercial common sense. That consumers should be mulcted in taxes or high prices for an elaborate structure of subsidies, tariffs, forced mergers and marketing schemes, which makes practically no provision for research to improve products or lower their cost, is unreasonable. There is an open-and-shut case for heavier expenditure by both the State and industry, even by compulsory means.

On the broader question of the adjustment that invention may make necessary, too, the responsibility of the

State and private enterprise is similar. The impact of science, like the recurrence of trade cycles, calls for flexible long-term budgeting, for new methods of accounting and less obeisance to the state of the balance sheet on a fixed annual date. Industry's obsolescence policy must be adjusted to the rate of technical progress, not the rate of progress to the dictates of the accountants. The long-term cost of scientific research must be borne. Clearly the task is one for Governments and industries in collaboration rather than for single firms. We cannot claim that more technical progress is impossible within the limits set by economic facts. All we can say is that unlimited and sweeping advance is quite impossible unless our resources enormously expand, or our present consumption is severely restricted.

In large measure the immediate problem of obviating the unnecessary waste of science and invention which does exist is one of education. It is a dull and lifeless

science to which we are tentatively introduced at school (*vide* the recent Spens Report). It is an out-of-date and socially meaningless science which is frequently taught at universities. It is an inaccurate and distorted science that is given news space in the Press—far inferior to the contents of the entertainment and sports columns. The leaders of our public life are lawyers and business men, with hardly a sprinkling of scientists. And industry is no better placed: in nine electrical or chemical firms, all of which owe their entire existence to science and were founded by men of scientific attainments, firms which control three-quarters of industrial researches, only 13 out of 114 directors have any scientific qualifications. So long as this remains an Age of Science, but not of scientifically-minded people, we will throw away with one hand the prizes we pluck with the other. We lose in wealth and welfare far more than we short-sightedly gain by an indifferent ignorance that has become traditional.

Rising Interest Rates

NO department of economic discussion is more confused than the theory of interest. Some economists explain all economic change by reference to movements in "pure" rates of interest—a concept which can be defined for analytical purposes, but has no counterpart in the City. There is another school (*vide* Oxford Economic Papers, No. 1) which is sceptical about the effects of changing interest rates upon the policy of the average business man. Yet when the latter is not feeling too confident he apparently appreciates occasional reminders from the Treasury Bench that cheap money remains the cornerstone of domestic economic policy.

The truth is, of course, that the price paid for new capital includes something more than pure interest. Even British Government credit includes its risk element—to cover political uncertainties and major economic changes, like violent movements in commodity prices. And it happens that last year, for the first time since 1932, political factors assumed crucial importance. As for industrial borrowing, the sharp fall in economic activity during the year heightened the industrial risk element in the terms for new debentures and preference shares. In the table at the foot of this page the amount of new capital raised and the price paid by Government, corporation and industrial borrowers are set out, together with similar details relating to conversion issues. And in the chart the course of the average rate of interest paid by the British Government on long-term borrowing since 1929 is compared with the rates on industrial debentures and preference shares.

The rising price of new capital last year is obvious from

these figures. Rates on new gilt-edged issues depend, in part, upon the life of the issue concerned, and the average rates each year are therefore not always comparable. But it seems significant that, last year, the average yield on gilt-edged borrowing by prospectus was higher than at any time since 1932. Hitherto, the Treasury has been virtually in the position of a dictator, and when it drove a hard bargain with the investor (as on the occasion of the first Defence loan in 1937) it could, and did, fall back on the public departments to act as its underwriters, confident in the assumption that the public would sooner or later absorb the bulk of the loan. The change in the official attitude is clearly marked by the comparatively generous terms adopted for the second instalment of Defence borrowing last year (which carried a redemption yield of £3 2s. 8d. per cent. against £2 11s. per cent. for the first *tranche*). Out of £400 millions originally authorised to be borrowed by the Defence Loans Act, some £195 millions, in round figures, has been included in the Defence Estimates and £178 millions actually raised by loan. And the total figure is itself to be increased "at the appropriate time" this year. Hence, instead of using the spur, the Treasury must now cajole, and provide more attractive terms for the gilt-edged investor.

The rise in borrowing rates last year is therefore unlikely to be reversed in the near future. There is no sign that the banking system is being prepared to absorb an appreciable volume of investments—indeed, some observers have recently expressed the fear that gilt-edged portfolios might have to be reduced if the banks are to

maintain their usual liquidity ratios. If this were true, the Treasury would find it difficult to maintain low bill rates and low long-term rates at the same time.

British corporations borrowed £10 millions less last year than in 1937, and paid approximately the same rate (3.38 per cent.). But the queue of borrowers had been much reduced during the previous two years, and for considerable periods of 1938 there was an effective close season to new corporation borrowing. Hence the average corporation rate deserves much less emphasis than the rates on industrial debentures and preference shares. Under each of these headings the amount of new borrowing increased last year—a natural movement in a year of recession, when equity issues cannot be so readily made—but the rates paid increased by one-fifth and one-quarter of one per cent. respectively. The industrial risk inherent in both types of new borrowing may be measured by comparing the yields on the new issues—4.32 per cent. on debentures and 5.13 per cent. on preference shares—with the yields of the more seasoned groups of miscellaneous industrial debentures and preference shares included in the Actuaries' Index, which stood at 3.98 per cent. and 4.46 per cent. respectively at the end of last year. On the other hand, the margin between the yields on the old and the new securities is much smaller if the "new" category is expected to cover securities placed in the market or granted permission to deal as well as public issues.

The second section of the table demonstrates the narrowing scope for conversion issues last year. Such operations were for smaller amounts, and the converted stocks carried lower rates of interest, in most cases, than in previous years. So much depends upon accidents of the calendar in conversion issues (Australia, for instance, has actually reconverted some issues previously converted earlier in the present low-interest cycle) that the slight fall in the average new yields on converted Empire and Industrial securities last year probably has no special significance.

Topics of the Week

Rail-Road Peace.—The compromise achieved after protracted negotiations between rail and road representatives, while it may not satisfy everyone, does at least hold out the possibility of the establishment of a workable co-ordinated rates structure within a reasonable period. The precedent for rates agreements of the type proposed is, of course, the agreement already in force between the South Wales hauliers and the Great Western Railway, and presumably this was an important factor in the negotiations, since it provided a basis for agreement that was already in operation and working satisfactorily. The road haulage industry, which has already done much of the spade work for a rates structure for road operations, has established area committees, and these will be empowered to negotiate rates agreements for their areas with the local railway officials. The level of rates agreed upon will, on the road side, be based on cost-plus-profit, and will then have to be adjusted to meet with the railway view of what is satisfactory, with, in some cases, a further allowance for what the traffic will bear. Broader issues between the two parties will be decided by a central consultative committee formed of representatives of both rail and road. The road operators, knowing the limitations of an industry with such a large number of operating units, have wisely suggested that there should be some form of statutory control to render adherence to rates agreements enforceable, and provision for this will be included in any railway Bill. In addition to the provision for rates agreements, the railways have undertaken not to oppose, for two years, applications for additional vehicles made by existing holders of "A" and "B" licences, with a limit of twenty-five miles on the operating radius of the latter. This clears up a matter

What of the future? At no time since 1932 has the part of management been so important in the maintenance of low interest rates. Recent steps to reimpose control over transactions involving foreign securities or exchange speculation (though not direct business in overseas investments) show that this point is officially recognised. So far as the gilt-edged market is concerned it is probable that comparatively little "hot money" remains. Hence the problem

AVERAGE PRICE OF NEW BORROWING 1929-38

of management is to that extent eased. But the margin between net available savings and defence borrowing requirements is not so large that tactful direction of the market has ceased to be needed. And a year which will contain an enormous peace-time Budget, possibly a General Election, and almost certainly a recurrence of political nervousness, will provide the authorities with the keenest tests.

about which road operators have felt strongly for some time. Altogether the rail-road agreement should make for a better understanding between the two forms of transport, a very necessary prelude to any form of co-ordination. Both sides seem to come quite well out of the deal. The road operators are given concessions that represent remarkably good progress for such a young and loosely-knit industry. The railways in return are given an assurance that no objection will be raised to their "Square Deal" proposals. Thus the railways have surmounted the main obstacle to their goal. It remains to see how the trading community will react to the sight of rail and road walking hand-in-hand. They have two safeguards—they can go to the enlarged rates tribunal and appeal against any rates they consider unreasonable, or they can take out a "C" licence, which the railways have stated they will not attempt to restrict. This may or may not be considered sufficient safeguard. Clearly it will be the trading community who will have to pay for any improvement in transport finances resulting from the rail-road agreement and, even though it will be the consumer who ultimately pays, the trader may not take kindly to the idea. The success of the railways' campaign will clearly depend now upon their negotiations with the trading organisations.

Regional Defence.—It has long been apparent that the absence of any regional framework of administration, to co-ordinate the efforts of local authorities over wide areas and to bring representatives of the central defence departments, civil and military, more closely into touch

with the detailed execution of air raid precautions, was a serious defect in Britain's defence preparations. Sir John Anderson's decision, announced a week ago, to appoint regional commissioners in twelve large areas (corresponding with the present Ministry of Labour divisions) and to provide each with a war staff representative of local A.R.P. authorities and Government defence departments, is accordingly to be welcomed on general strategic and organisational grounds. In detail, however, the scheme is not wholly satisfactory. In one respect it hardly goes far enough: in peace-time the regional structure will remain no more than a "shadow" framework, with the commissioners and their staffs holding only a watching brief. In another respect it may prove to go too far: in the event of a breakdown in communications during hostilities the regional commissioners, who will be nominated as men of standing and not elected or chosen as democratically popular leaders, will be vested under the Defence of the Realm Regulations with the full powers of His Majesty's Government and will exercise unlimited authority. The need to safeguard the maintenance of law, order and government in emergency is clear; but the rumoured refusal of Mr Herbert Morrison (who, incidentally, would surely be chosen for the job were a ballot taken) to serve as London's "dictator apparent" is scarcely surprising.
