The report and accounts were unanimously adopted.

PEASE AND PARTNERS, LIMITED

STRONG FINANCIAL POSITION

The ordinary general meeting of Pease and Partners, Limited, was held on May 26th at Darlington.

Mr J. Frater Taylor (the chairman), in the course of his speech, said that they had now no bank loans at all and he thought that they could claim that, from the viewpoint of finance, their standing was strong.

Profits were down by £45,325. While coal profits showed an increase, coke and iron profits were less. He had expected that profit from the sale of pig iron would show up less favourably and had indicated that at their last annual meeting.

In the case of their mainstay, coal, the reduction in output was negligible, but the outputs of other products were lower. In addition, there had been a weakening in prices—not of coal but of coke, by-products and certain other commodities. Insofar as the price of coke was concerned, he thought that a reduction was necessary, but in his opinion the lowering of the price had been overdone. At the beginning of 1938 blast-furnace coke sold at 32s. 6d. per ton at the ovens, whereas to-day's price was 24s. 3d. per ton. Those responsible had gone to the other extreme.

In reference to the operations of their main subsidiary companies, the Skinningrove Iron Company's results for the year had been disappointing. That was due to a great extent to the somewhat misjudged importations of iron and steel, especially of pig iron, which had taken place from 1937 onwards. In view of the increasing accumulation of unsold pig iron, the Skinningrove company had had no alternative but to blow its blast-furnaces out for approximately five months last year, and that in turn had necessitated the curtailment of coke and limestone production and the closing down of your company's ironstone mines with a good deal of regrettable, and he thought unnecessary, unemployment as a further result. However, the position seemed to be improving.

Insofar as their two important subsidiary coal companies were concerned, Henry Stobart and Company, Limited, and T. and R. W. Bower, Limited, the earnings in both cases had shown only a relatively small decrease. Stobarts for the first time were paying a dividend of 5 per cent., while Bowers were increasing their dividend from 5 per cent. to 8 per cent.

The report and accounts were unanimously adopted.

LONDON COUNTY FREEHOLD AND LEASEHOLD PROPERTIES LIMITED

INCREASED RENT ROLL

The twenty-ninth annual general meeting of this company was held, on the 1st instant, in London.

Sir William J. M. Burton (the chairman) moved the adoption of the directors' report, which stated that they felt that in view of the great difficulties with which they had been faced during the period under review the stockholders would consider the results satisfactory. The demand for attractive flats of all grades persisted, although the unsettled state of trade had resulted in a larger number of tenants being unable to continue their tenancies at the expiration of their agreements. That had caused an increase in losses from voids, but the rents generally had been so well maintained that a net increase in rent roll at the rate of £4,732 per annum had been obtained on the renewal of tenancies and re-lettings during the year.

From the year's revenue they had appropriated £20,000 to repairs, redecorations and renewals reserve and £30,000 to general bonus of 1 per cent., making a total distribution to the ordinary stockholders of 11 per cent. for the year as for the previous eight years, carrying forward a balance of £134,042. The properties were maintained in an excellent state of repair; they had spent about £500,000 in recent years out of revenue on reconditioning and improvements. The company was also paying for rates and water rate, Schedule "A" tax and N.D.C. some £492,000 per annum. The reputation of Key-Flats was now world-wide.

Keysign House was now practically completed. Their central Enquiry Bureau would shortly be opened on the ground floor "opposite the clock at Selfridge's." Already the advantage of having the various departments centrally housed under ideal conditions had been proved.

It was said that lack of insurance against war risks was one of the causes of the low price of property shares. They hoped that the Government would soon be able to announce its full proposals. In any event, the company's properties were spread over a wide area and the highest percentage of loss should be small compared with that which would be sustained by a commercial concern if its main factory or warehouse were hit.

The report was unanimously adopted.

UNITED SUA BETONG RUBBER ESTATES, LIMITED

SIR JOHN HAY'S REVIEW

The annual general meeting of the United Sua Betong Rubber Estates, Limited, was held, on the 30th ultimo, in London.

Sir John Hay (chairman of the company) presided, and in the course of his speech said: The manner in which we propose to deal with the profits is that in addition to providing for taxation, depreciation, etc., we have placed to Estates reserve £30,000, and we are recommending a final dividend of 6 per cent., making a total of 12 per cent. for the year.

I should emphasise a point which I made last year—namely, that a distinction should be drawn between the rate of dividend that we pay on our nominal issued capital and the rate of earnings on the actual capital employed in the business. If we make some allowance for obsolescence and depreciation of estates our earnings for the last five years, which is the period so far covered by the regulation scheme, represent an average of 4½ per cent. per annum on the capital employed in the business. While we are grateful for the protection of the regulation scheme, it is quite evident that the powers under the scheme have not been exercised unduly in favour of the producer.

OIL PALMS OF MALAYA'S PROGRESS

Our company holds a substantial interest in Oil Palms of Malaya, Limited. The company has made great progress in productive efficiency, but the difficulties which confront us in finding profitable markets for our produce are formidable. In the United States, which was the principal market, we have to contend with a processing tax of £13 per ton, and the increasing currency difficulties of Germany and Italy, both of which were large consumers, have severely restricted business with those two countries.

Impressed with the example of the United States, the dairy interests in Canada made an application for the imposition of specific duties on the importation of vegetable oils. In virtue of the Ottawa Agreement these proposals could hardly be carried out by the Government of Canada without consultation with the British Government and a request for their views was submitted. We made representations to the British Government in respect of this matter, and I am pleased to say that we have just heard by telegram from America that the British Government has expressed its disapproval of the proposal.

In the course of our representations to the Government we pointed out the seriousness for British producers of this spreading tendency to exclude our product from one market after another. In addition to the virtually prohibitive tax in the United States and the difficulties I have mentioned in respect of Germany and Italy, there is in India a 25 per cent. *ad valorem* import tax, and in France there is a preference which, in effect, reserves that country for producers in the French Colonies.

I sincerely trust that in view of all these circumstances, which are all within the knowledge of the British Government, they will omit no opportunity of affording us their fullest support. That is said not as implying any less reliance on our own efforts, but in countering the actions of other Governments, the support of our own Government is essential.

RUBBER REGULATION

Since we last met the legal formalities incidental to the renewal of rubber regulation for a further period of five years have been completed, but experience in a wider sphere should have taught us to rest our faith in the fulfilment of any treaty not on its legal basis but on the good faith of the parties concerned. Our own scheme can only function smoothly and efficiently if each of the parties to it is animated by the true spirit of partnership. Happily, in this instance these conditions do exist and in a measure sufficiently strong to repel any attacks against the scheme whether coming from within or without.

Perhaps it is appropriate I should remind you that the scheme exists to keep the world at large supplied in a regular and orderly manner with all the rubber it may require, and to make these supplies available to every country on the same terms and on the same conditions, irrespective of their different forms of Government. Thus, in one of its most fundamental provisions the scheme upholds the principle of making freely available to all countries an essential raw commodity and we could not, without offending against the principle, extend a favour to any one country and withhold it from another (hear, hear). Subject to these essential conditions, we are ready to welcome and to fulfil promptly any demand for our commodity which may come from any country.

The report and accounts were unanimously adopted.

BATANG CONSOLIDATED RUBBER ESTATES, LIMITED

CAPITAL REORGANISATION SANCTIONED

The nineteenth ordinary general meeting of this company was held, on the 31st ultimo, in London.

Mr E. F. Slade, who presided, in the course of his speech said:—The actual crop harvested for the year 1938 was 609,700 lb., as compared with 805,739 lb. in the previous year. The average gross price received was 7.679d., as against 8.650d. in 1937. These are the two factors which caused the profit to fall from £12,071 to £3,297.

The standard assessment for 1938 was 840,000 lb. For the current year it is 921,100 lb. In our considered opinion, we are entitled to a much larger increase.

When we met about a year ago, I foreshadowed the probability of our formulating a scheme for the writing down of the capital of the company. It at present stands at about £92 per acre and the market quotation for the shares is somewhere between 5d. and 6d. In 1920, shareholders received on bonus terms 2½ shares for every one share held. This generous valuation of rubber land was justified in those days, but if this company is to put itself in line with other progressive concerns, it must write down its capital to an equivalent price per acre, so that it may have its shares standing at a premium when world conditions become sane and normal.

The aim of the directors is to acquire an area of young vigorous rubber, which will not only be of immediate benefit but will safeguard future years. When the time is ripe for this, most certainly the offer of new capital would be made in the first place to the shareholders. It should prove a good investment, but if shareholders are not able or do not desire to participate, they will have the knowledge that their old shareholding has been vastly improved by any such new issue.

The report was unanimously adopted.

At a subsequent extraordinary general meeting resolutions were passed reducing the capital from £300,000 to £115,587 by writing off 1s. 6d. of each of the 2,458,840 issued 2s. shares; consolidating every four of the 6d. shares into one 2s. share; increasing the authorised capital to £300,000 by the creation of 1,844,130 shares of 2s.; and amending the articles of association.

(Continued from page 566)

Moody's index of the prices of sensitive commodities in the United States, after minor fluctuations, stood on Wednesday at 144.4 (December 31, 1931 = 100), compared with 144.9 a week ago and 131.8 a year ago.

Metals

Copper.—It became known this week that the Anaconda concern has closed its Stewart mine in Montana, and similar steps are being taken by Kennecott and Phelps-Dodge. As the excess supply of copper on the American market has been the chief depressing influence on copper prices, this news brought a sharp revival on the London market, and the price of standard cash closed on Wednesday at £42 15s. per ton, a rise of £1 12s. 6d. per ton on the week.

★

Tin.—The London market was supported by the improved tone on the stock exchanges, and standard cash closed at £227 5s. per ton, the highest price since 1937. According to Messrs A. Strauss and Co., Ltd., visible supplies declined in May by 2,631 tons to 29,945 tons, due chiefly to the fall in supplies by 1,428 tons to 8,207 tons; deliveries increased by 611 tons to 10,031 tons, the highest level since January.

HOLYROOD RUBBER, LIMITED

SALE OF PLANTING RIGHTS

The twenty-sixth annual general meeting of Holyrood Rubber, Limited, was held, on May 25, at 7 Martin's Lane, London.

Mr W. Arthur Addinsell (the chairman) said, *inter alia*: Although the net profit has declined from £16,367 to £5,138, I do not regard it as a matter for great concern, having regard to the conditions which have prevailed. Indeed, we should count ourselves fortunate that the results fully justify a dividend of 5 per cent. The two responsible factors for the lower profit—the decrease in output and the average net price realised—need no exhaustive explanation.

Our standard production for 1939 has been increased by 14,500 lbs. If we estimate that the quota release for this year averages 55 per cent., the estate will be allowed to export 605,275 lbs., which is again less than for the past year, but there are good prospects of a higher price. The quantity shipped and sold under export licence this year to date has realised approximately 8d. per lb. net, which compares with 6½d. per lb. last year.

The planted area, including the 50 experimental acres, is now 2,459 acres. Under the Rubber Regulation Agreement the company was entitled to planting rights on 115 acres; but there is no suitable land available for economic extension within our present boundaries. We are interested in the Edensor Rubber Estate, and, in common with other companies in this group who are co-shareholders in Edensor, have agreed to transfer planting rights to that company, which will allow of an extension in total of some 650 acres. It has been agreed that the consideration should be about £3 per acre.

Were it not for the obscurity surrounding the international political outlook, it would be justifiable to regard the prospects of the rubber producing industry in a favourable light. The International Control Committee appear to have the situation well in hand, and, despite captious criticism from certain quarters, the regulation scheme is working in the best interests of those whom it directly concerns. The announcement last week increasing the quota for the July-September quarter by 5 per cent. was welcomed, and has caused no dislocation in any section of the industry.

The report was adopted.

Lead and Spelter.—The final settlement of the zinc duty removed a weight of uncertainty from the market, though the prospects of a renewal of the cartel are not altogether favourable. Both these markets, however, shared in the upward trend; the price of lead rose by 7s. 6d. to close on Wednesday at £14 13s. 9d. per ton, and that of spelter by 6s. 3d. to £14 3s. 9d. per ton.

Grains

In the United States the spring wheat in the North-West has received a good rainfall, but the hard winter wheat belt is still short of moisture. American prices rose during the last week in view of further crop deterioration in this area, but a slow demand in the international market offset any upward tendency in prices. Some rain has also fallen in Canada, but reports from the wheat area there indicate a serious deficiency in moisture. Little business has been transacted in maize, and the market for feeding barley has also been quiet.

Other Foods

Provisions.—Dominion butter prices continued to rise in price during the past week, and New Zealand was quoted on the London Provision Exchange at 114s. per cwt. Demand for meat continues to be concentrated on chilled and frozen beef and lamb.

★

Colonial Produce.—The sugar market has been considerably steadier

in the past week, though little business has been transacted in the futures market and some prices are only nominal. In the cocoa market Accras improved slightly in price.

★

Fruit and Vegetables.—The hot weather over the Bank Holiday helped the sales of all salads, and a brisk business took place, both before and after the week-end. Increasing supplies of English fruits, such as strawberries and gooseberries, have sold well, and prices of imported fruits, such as oranges and grapefruit, have tended to fall.

Miscellaneous Commodities

Oils and Oilseeds.—These markets are steady to firm, although the volume of business is not extensive. Plate linseed is dearer, on the confirmation of reports that the balance remaining to be shipped, now estimated at 550,000 tons, is some 140,000 tons less than the original estimate. Egyptian cottonseed has also improved in price, but little business has been transacted at the higher level, and forward positions are at a good premium. In sympathy with linseed, linseed oil has advanced in price by 5s. per ton.

★

Rubber.—In spite of the Whitsun holiday, the rubber market has shown a firm tendency, and the price of standard sheet on the spot closed ½d. higher at 8½d. per lb.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On May 26th applications at £99 16s. 8d. per cent. for bills to be paid for on Tuesday, Wednesday, Thursday and Friday of following week were accepted at about 74 per cent. and applications at higher prices in full. Applications at £99 16s. 9d. for bills to be paid for on Saturday were accepted in full. £45.0 millions of Treasury bills are being offered on May 26th.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

An Imperial Policy

IT is a commonplace of historians that the British Empire was acquired in a fit of absence of mind. It is a standing reproach to the Imperial Government to-day that the administration of Britain's dependent colonies tends to continue in the same spirit of careless indifference. The Report for 1938 of the Colonial Office was published last week, and its contents add appreciably to the misgivings which many Members voiced when the Commons debated the Colonial Office Vote on Wednesday. Mr Malcolm MacDonald rightly said in the debate that the objective of British colonial administration was the best interests of the colonial peoples themselves; but both within and without Parliament the feeling that very much more could and should be done forthwith is widespread.

This is not to say that the Colonial Office Report tells a story of maladministration. The claim is made early in the Report that "we have done our best to govern the territories for which we are responsible well"; and it is impossible to deny that the members of the Colonial Service on the spot have continued last year, as throughout the recent past, to do the best within their power for the welfare and well-being of the native populations entrusted to their charge. It is at the fountain head in Whitehall and in Westminster that the chief responsibility rests for Britain's failure to make most of the Empire. The Colonial Office Report admits in a significant phrase what is in many ways the crux of the question. "In some parts of our Colonial Empire," the Report says, "in spite of the peaceful con-

ditions which have resulted from British rule, populations still live under primitive conditions and suffer seriously from preventable disease." There is a vicious circle: the function of local administrations is to provide social services, largely of a health order to counter the poverty of the subject peoples; and that poverty is enhanced by the volume of taxation which it is necessary to raise in order to pay for administration and defence as well as for precisely these vital social services.

What is needful now has been only too well demonstrated by the events of the very recent past. In the oldest parts of the Colonial Empire, that is, in the West Indian islands, riots and disorders have revealed a situation of economic dislocation which it is beyond the power of local administrations to resolve. The staple sugar industry has only been able to survive on the basis of wages so low that they fail to cater for adequate subsistence and good health. The cocoa industry, too, burdened by heavy debt, struggles on with the lowest of wages and widespread under-employment. While wages are inadequate to support a proper standard of living, the staple agricultural industries are themselves incapable of supporting an adequate standard of wages. Faced with the need for heavy expenditure to lessen the impact of poverty, unemployment and ill-health, local administrations are compelled to levy heavy taxes, which in their turn make the economic impasse more impassable. The various administrations need to take over half of the revenue, which is raised by heavy duties

on the imports of almost all the necessities of life, for the payment of debt and to defray the charges of administration and defence. There is neither money nor authority in the West Indian islands to carry out the schemes that are needed to raise social and economic standards to a profitable and an equitable level: there is needed a broad plan to save the West Indies, not only from social distress, but also from continued political discontent and unrest.

THE FINANCIAL DILEMMA

In widely different degrees the same comment is applicable to large sections of the sixty million peoples scattered within the British Colonial Empire. In West Africa, for instance, where British rule has achieved a political triumph by developing indirect rule by the natives themselves, and where the working of their natural resources of cocoa and palm oil has also been largely conducted by the natives, there is the same Gordian knot of finance to unravel. The revenue of the local administrations is dependent upon world prices for products which have lately felt the worst effects of the general restriction of international trade. And for lack of funds the administrations on the spot have found themselves unable to develop the social services and public works that are needed.

Heavy upon the West Indian and all the African Colonies is the burden of fixed interest charges. It would be fallacious to forget that the taxable capacity of the dependencies is already mortgaged to the hilt to pay for the investment of the recent past, as well as for the costs of administration and the charges for social services which their poverty and malnutrition make imperative.

"If the pace of internal development is to be quickened, it can only be as the result of assistance given in the form of free grants": this conclusion of the African Survey points in general terms the responsibility which now rests upon the political wisdom and the economic resources of Britain. Nor, be it noted, is it possible to confine this sort of comment to the dependent Colonies of Africa and the less dependent Colonies of the West Indies. The same situation in a different guise is visible in the island of Cyprus. Cyprus is a Mediterranean distressed area; and it is unfortunately true that, while the Italians have made notable progress in Rhodes, Cyprus has been left to decay and the Cypriots to the discomfort of an autocratic government which does not carry even the advantage of a benevolent policy of development.

It is not possible to lay down here and now in all completeness a practical policy of Imperial development. The curse of British Imperial policy, next to indifference, is ignorance. Introducing the first twelve members of the Fellowship of Nuffield College, Mr H. B. Butler, Warden-elect, this week cited among the present problems to be solved by collaboration between experts and practical men that of colonial development; too little is known about the Colonies, about their problems and about their needs, for a programme to be readily laid down. But this much is certain: the interest of traders seeking to sell in Colonial markets, the interest of industrialists and ordinary people seeking to secure raw materials and foodstuffs from the Colonies, and the interests of the Colonial inhabitants themselves seeking to escape from poverty, malnutrition and disease, alike require that a policy of Colonial development should be centrally conceived, centrally carried out and centrally financed. It is impossible, at this moment of time, to avoid the question of what a newly colonising Germany would do for her overseas possessions; and it is impossible to escape the answer that, whatever essential elements of political freedom, racial toleration and social justice might be lost in a Nazi Empire, at any rate a policy of intensive economic development would be pursued which, while designed to supply essential raw materials to the Reich, would, incidentally, by making more of the Colonies' resources, raise the income of the Colonies themselves.

The point is whether we can make the best of both worlds. On the political side, British administration has hitched its wagon to the star of ultimate self-government, the star which has come into sight in a shower of sparks in the great sub-continent of India. Can that political development be associated at the same time with a parallel policy of economic development which will give to the shadow of political self-rule the substance of economic well-being and welfare?

OUTLINE FOR ADVANCE

All that can be projected at this time, after long years of neglect and piecemeal progress, is a plan of the most general kind. First, there is needed, as the African Survey rightly urged, a comprehensive survey of the resources of the dependent Empire. It is imperative that such a survey should be carried out, not by the British Government alone, but by them in collaboration with the Governments of the other independent Dominion members of the British Commonwealth. It is imperative, too, that such a commission of inquiry should from the outset be assured that its findings, unlike those of the Dominions Commission some years past, shall be the basis of immediate constructive action. There might be set up a Joint Board of the Commonwealth entrusted by Royal Charter with executive power to proceed with a programme of development.

If one call came more clearly than another from Thursday's debate in the Commons it was precisely this demand for broad vision and constructive action. The need for vastly more life in the administration at the centre in Britain was agreed on all sides, and very much could be done at once even before bolder plans have time to mature. The proposal for a Committee of the Commons to consider Colonial affairs has much to commend it, and the need to educate the British people in the full nature of their Imperial responsibility is imperative. There is a Colonial Empire Marketing Board which works well but quietly: its scope might well be magnified. And it is something like a scandal that, for example, Nigeria, larger in population than Australia, New Zealand and South Africa put together, should have no trade representative in London or anywhere else.

There will remain the wider task of Colonial development, and here the crux is finance. The present limitations upon the rate of economic development in the Colonies are many: first, there is the heavy cost of administrative and social services which hamstrings the very progress which would lessen these charges; secondly, there is the heavy weight of fixed interest upon past investment which makes new Colonial loans impracticable. There is no miracle to be wrought in a single night; but it is possible even now to lay down certain principles of policy.

First and foremost, it is important that the impoverished Colonies should be helped to bear the heavy burden of administrative costs which hamper their social and economic progress and largely serve to provide an avenue for the employment of British Civil Servants. The principle of "no taxation without representation" is a century and a half old; the time has surely come to apply it. Secondly, it is unquestionable that the Colonies cannot be saddled now with further fixed interest charges: what is needed is Imperial subsidies for social services and communications far beyond the meagre six to eight millions contributed from the Colonial Development Fund since its institution in 1929; what is needed most of all is the supply of capital in equity form rather than in the shape of prior charges, to bring to Colonies the manufacturing, processing and refining industries which will lessen their too-exclusive dependence upon agriculture on the one hand and mining on the other. The whole plan must be bound up with the evolution of new methods of co-operation between Imperial Governments and private enterprise

in the supply of capital and in its control and management; and what is needed, finally, "is to foster those forms of economic progress which will enable Colonial populations to contribute in greater measure than they have done so far to the up-building of capital resources themselves." The Colonies in Africa and elsewhere have been given a skeleton of transport and administration which imposes upon them, until they can fill in that skeleton with diversified economic activities, immense overhead charges.

The fact cannot be avoided that the Colonial development of the kind inescapably needed will impose costs on the Mother Country. The expenditure of the several Colonial administrations last year passed £70 millions: of this administration, debt and defence accounted for perhaps £32 millions, and these are the items on which assistance should be given first. Secondly, there is the charge to the Imperial Budget of Colonial development. This cannot be frighteningly large: it could be limited to the service on the capital raised for development purposes under the new plan; and whatever this was it would only be a fraction of the vast sums spent on raising the standard of living of those of His Majesty's subjects who have votes. Nor can such spending be regarded as solely altruistic or dutiful. It is bread cast on the waters, for to raise the standard of living in the Colonies cannot but benefit our traders and manufacturers.

The task is not easy. It is economically futile to anticipate the solution of the Colonial problem by extraordinary and artificial expedients or simply by lavish capital expenditure. "The rate at which capital can be absorbed by Colonial territories depends upon the rates at which the other complementary factors of supply can be made available"; but the difficulties do not mean that progress is impossible. Similarly, the whole process of economic development involves the clash between native and Euro-

pean interests; unwisely done, it means the exploitation of native communities for the advantage of European traders and manufacturers. But this again is not a *non possumus* to progress; the principle of trusteeship, which politically means native self-rule and native welfare, must mean also native well-being and native prosperity; and the task of Imperial development cannot be shirked simply because there are serious problems of native and labour right to be solved at every stage.

Britain's Imperial task, and indeed that of every Empire-building nation, is to reconcile the political and economic aspects of trusteeship. Britain's political responsibility is by now so explicitly known and accepted that it ought to provide all the safeguards needed to make proper Imperial economic development possible without injustices and exploitation. But the task has a wider meaning. It is not by the redistribution of Colonial territories that the economic ills of nations, whether they have colonies or not, will be remedied. It is by two means only that this end can be achieved; first by the removal of those restrictions upon world trade which are the over-riding cause of all the world's economic difficulties; and secondly by raising the income and the standard of living of all consuming populations all the world over so that, on the one hand, they may buy and sell more and, on the other, that they may be preserved against the ill-health and social distress that comes of poverty and deprivation. It is not in the balance of world economic power that the Colonies stand foremost, whatever their owners; it is as a test of the good faith, good will, good sense and resourcefulness of statesmen that they hold first place. What we now need to do for the Colonies we owe it to them to do. And we owe it to ourselves no less: if we are prepared to fight to keep our Colonies we must be ready to strive to the utmost to clear our title of deserved reproaches.

M. Daladier and France

(By a Correspondent in France)

STILL waters run deep. French internal political life has moved so smoothly since the end of March that one is easily tempted to think of the country simply as a mechanism for its own defence. But the tremendous pressure of contemporary events is remoulding France as it is remoulding all Europe. The effort France is now making and the political form in which that effort is being made will leave their traces permanently in her political and social life.

Last October the division between "Munichois" and "Anti-Munichois" split every political party, except the Communists, and even divided the Cabinet itself. It seemed to be the one important issue on which the country must make up its mind, and the future was discussed in terms of the victory of M. Bonnet and his friends or of M. Reynaud and his, as the representatives of the two rival schools. M. Daladier was thought of as the interim Premier typifying the nation's own indecision, for it was well known that he was not as satisfied in his own mind about what he himself had done at Munich as was his Foreign Minister. The appointment of M. Reynaud to the Ministry of Finance in November, after weeks of hesitation as to what course to pursue, was interpreted in many quarters as a success for the Anti-Munichois party in foreign policy, even more than as a decision in favour of orthodox financial policy. It was generally supposed that in the moment of a decisive victory for either one side or the other M. Daladier would be eliminated.

The course of events has been entirely different. Foreign policy has indeed been reversed, but this has worked out entirely in M. Daladier's favour. He is now very much stronger than his best friends could have supposed possible six months ago. On the other hand, M. Paul Reynaud's striking success at the Ministry of Finance has remained strictly departmental. He has, of course, made an invaluable contribution to a stronger French foreign policy by strengthening French finances, but no one in France talks as if he was the inspirer of the foreign policy. M. Bonnet, on the other hand, seems to have become a fixture at the Quai d'Orsay, and his enemies are no longer making serious efforts to drive him from it. But his position has sunk to that of an executant.

The most marked peculiarity of M. Daladier's position is his refusal to accept the votes of his former Socialist and Communist allies even when he can have them—as, for instance, for his foreign policy. Had he allowed the last important vote of confidence in the Chamber three weeks ago to be submitted in two sections, so that the Opposition could have voted for his foreign policy, without expressing approval of his Government's other activities, he could have offered the world the spectacle of a unanimous Chamber. This aspect of his policy goes back to his broadcast speech last August, when he declared that it was necessary to lower the rates of overtime pay, without having previously consulted his Minister of Labour and Minister of Public Works. He thus secured the resignation of the two Ministers

most closely connected with the Front Populaire conception and prepared the way for the reversal of his majority after Munich, when he made it clear at the Marseilles Radical Party Congress that the internal enemy was not Fascism on the Right (the thesis of the Popular Front) but Communism on the Left. This attitude was emphasised by M. Reynaud's financial policy, which was the occasion of the abortive general strike at the end of November. It was M. Daladier's success in crushing this strike which finally stamped him—one of the founders of the Front Populaire three and a half years before—as the restorer of law and order, the breaker of trade-union tyranny. It very nearly handicapped him at the same time with an ugly reputation as a would-be dictator, but he was saved, as was French foreign policy, by the Italians.

M. Daladier's greatest political gift is a certain representative quality; he enjoys the confidence of a vast class of peasants, shopkeepers and small professional men, who feel that he is judging events by their categories, reacting as they would react. For this reason he can afford to change his mind and his policy with greater impunity than most politicians. This same characteristic qualified him admirably to protest in the name of the whole French nation against the Italian demand for "Corsica, Nice, Tunisia." However divided the nation might be about his internal policy, they were united in supporting him when he spoke at Bastia, Tunis and Algiers. The sting was taken out of internal controversy by union in face of Italy. At the same time, the Italian attitude, and still more the aggressions of Germany and Italy in March and April, freed M. Daladier from the pressure of the relatively small group of extreme Munichois, led by M. Flandin, who were necessary to him for his rather narrow majority. Ever since his Corsican and North African tour his political strength has been twofold. On the one hand, he has been strictly the representative of an anti-Socialist coalition; on the other hand, he has been the spokesman of all France, and, as Minister of War, more especially of France in uniform, against the insufferable aggressiveness of the totalitarian nations.

In ordinary times this twofold rôle would be difficult to fill, but every blow at the old structure of Europe delivered by Herr Hitler and Signor Mussolini makes it easier for M. Daladier. The dispute over foreign policy between Munichois and Anti-Munichois has been not so much settled in favour of the latter as superseded. The relaxation of rigid working hours is now a question of national defence as much as an issue between Capital and Labour. In any case, the working class is tired of disputes, and, since the general strike, no longer considers that they can be entered on with impunity. Thus all questions are being merged in military policy, which is the peculiar affair of M. Daladier's own Ministry. Bitter polemics are main-

tained in the Socialist and Communist Press against M. Reynaud's financial measures and M. Daladier's claim to have united France and put her back to work. It remains true that M. Daladier is at the head of the Government under which Frenchmen have rallied.

The Opposition, though large in numbers, gives him little ground for anxiety. The Communists have been successful in restoring the old distrust towards themselves which had been dissipated for a short time in 1935-36. The Socialists are hopelessly divided, and, however highly M. Léon Blum's personal qualities may be regarded, he is unthinkable as a national leader in present circumstances. His name is irrevocably linked with the collapse of State authority, that of M. Daladier with its restoration.

But the most singular aspect of the present situation is the decadence of parliamentary life. At no period during the last war was the French Parliament so unimportant as it is to-day. Enjoying plenary powers of decree, the Government does not require its legislative assistance. The plenary powers were granted at the height of the March crisis by a Chamber quite unable to maintain its own dignity. M. Daladier did nothing to help the Chamber in this respect and almost denied its right to discuss foreign policy. Since then the Chamber has devoted its attention to authors' rights and proportional representation. The general public scarcely expects that the international situation will allow a general election to be held when it falls due next April, and a reform of the electoral system consequently does not arouse great interest. Parliament is simply ceasing to be the centre of political life. The Chamber is now paying the penalty for having allowed itself to be driven before the wind of the strikes three years ago.

There is singularly little anxiety in the country about the consequence of this abeyance of parliamentarism. M. Daladier governs empirically by rule of thumb; he does not make the impression of a man with the ambition to reconstruct a constitution. His representative qualities already referred to dispel fears of dictatorship. There has been no noticeable interference with the liberties of the Press except in military matters. The generals are all old enough to remember the lesson of the Dreyfus case and most carefully avoid any action which might arouse suspicions of political ambition. Their technical authority is therefore all the more firmly established. The atmosphere of the country remains Republican, but the principal organ of French political life, by which the French electorate has hitherto controlled politicians, is visibly falling into disuse and disrepute. The nation attaches more importance to the increased efficiency of the State than to control of the State's activities. New political habits are being formed, probably no less important than new political doctrines and constitutions.

Agenda for Preparedness—V

Food Production in War

IN the totalitarian wars of the twentieth century the task of securing sufficient supplies of essential foods for the belligerent peoples necessarily falls upon their respective Governments. And the decisions taken by any Government about the volume and type of domestic food production required in time of war must be made in the framework of the wider problems set by the use of limited resources to produce means of unlimited destruction. The decision to grow, to import or to do without some part of the normal food supply must depend on the extent to which imports can be maintained at their peace-time level, on the routes by which they can be shipped, on the distribution of manpower between the armed forces, the munition works and

the land army, on the probable duration of the conflict and on the speed by which transport systems and storage space can be adapted to war-time needs. The factors are so many and so indefinite that the claim of the farmers to be told in June, 1939, exactly what would be expected of them in the first year of war is obviously impossible of fulfilment. But from the experiences of this country in 1918 and 1919 it is possible to deduce the main principles on which the Ministry of Food would have to work.

The peace-time embryo of that Ministry, the Food Defence Plans Department, published in its report for 1937 estimates (of which a summary is given at the head of the next column) of British consumption of important foods.

BRITISH FOOD SUPPLY (AVERAGE OF 1934-35)
(Quantities in thousand tons, except where stated)

Commodity	Total Consumption	Home Production	
		Amount	% of Total Consumption
Foods:—			
Cereals (a)	4,418	575	13
Meat.....	3,086	1,529	50
Fish.....	974	861	88
Milk, fresh, mill. gals.	918	918	100
Milk, condensed, etc.	259	169	65
Fats (c).....	943	107	11
Cheese.....	199	62	31
Eggs in shell, millions ..	7,182	4,668	65
Fruit.....	2,380	601(b)	25(b)
Potatoes.....	4,576	4,395(b)	96(b)
Sugar (refined).....	1,935	506	26
Tea, coffee, cocoa.....	283	...	0
Feeding stuffs (d):—			
Cereal.....	9,796	3,232	33
Oil cakes, etc.	1,848	78	4

(a) In terms of flour. (b) Including an allowance for allotments and gardens. (c) Butter, margarine, lard. (d) Excluding feeding stuffs entirely home grown, such as hay, roots, etc.

At present standards of consumption, in only three important foods—fish, milk and potatoes—is Britain self-supporting, and in three essential groups of foods—cereals, sugar and fats—home production provides only a small fraction of the amount required. In any war of the near future, therefore, no realisable increase in home production can prevent the people of this country from starving if their flow of imports is cut off. In time of war the farmers could not be expected to feed the 45 millions crowded in Great Britain; their task would be to diminish the probable pressure on import trade by increasing production from home resources. And this could best be done by increasing the home output of cereals and possibly sugar, foods which are bulky in proportion to their value and which are therefore extravagant of cargo space. In this connection it may be interesting to compare the agricultural situation as it is to-day with that in 1914 and in 1918:—

	1914	1918	1938
Crops (million acres):			
Total cultivated.....	31.90	31.75	29.26
of which permanent pasture...	17.61	15.90	17.41
Total arable.....	14.29	15.85	11.86
of which temporary grasses...	3.86	3.45	3.35
Total under crops.....	10.43	12.40	8.51
of which Wheat.....	1.87	2.64	1.93
Oats and barley	4.55	5.68	3.08
Potatoes.....	0.61	0.80	0.61
Roots.....	1.91	1.71	0.97
Sugar beet.....	...	...	0.34
Livestock (million):			
Cattle.....	7.09	7.41	7.97
Sheep.....	24.29	23.35	25.41
Pigs.....	2.63	1.83	3.80
Horses (on agric. holdings) ..	1.30	1.34	0.99

Compared with 1914, there has been a fall of 2.6 million acres in the cultivated area, due very largely to the absorption of land for urban and non-agricultural uses. But while the area of permanent pasture has changed little, that under arable cultivation has fallen by 3.4 million acres, or by 17 per cent. of the 1914 area. Owing to the operations of the wheat quota, the acreage under wheat was larger in 1938 than in 1914, but there have been sharp falls in the area under barley and oats, roots and bare fallow, which have more than counterbalanced the effects of the growth of the sugar beet industry. The most serious feature of this decline, from the point of view of food production in war, is the complete disappearance from many districts of the implements for and the traditions of arable cultivation.

The shift away from arable land has been accompanied by a marked expansion in the livestock population. In spite of the decline in the use of sheep on arable land, the sheep population, on the average of its fluctuations, is about the same as in pre-war days. The cattle population has increased, owing to the increase in dairy herds, and it is probable that the necessity for maintaining winter milk production is largely responsible for the expansion compared with 1914 in imports of cake; cows are more dependent on imports than steers. And, finally, the

number of regular farm workers has fallen in the last twelve years alone by nearly one-quarter.

In these respects, therefore, Britain is in a worse position now than in 1914, but the changes brought about in the last quarter of a century cannot all be counted as a debit, even from the point of view of war supplies. In the first place, the fall in the number of horses, not only on agricultural holdings but also in towns and in the army, has released a large acreage of cereals and grass for use as human food, in the form of flour or meat or milk. The fall of 310,000 in the numbers of horses on the land alone since 1914 could be accompanied by a fall of three-quarters of a million acres in the area under cereals without a reduction in the food supply for humans. In the second place, while tractors were unreliable novelties even in 1918, there are at present some 50,000 tractors working on British farms. Owing to the relatively small size of most holdings, there are very few tractors that are being worked to their full capacity. Here then is a huge reserve of power which could be used, through schemes of local co-operation, to cultivate additional acres at the cost of only the additional fuel and labour. Thirdly, the fact that farm work can now be carried out with far less labour than was necessary before the last war is obviously an index of the improvement in technique and, in view of the demands likely to be made on labour in the next, the increase in efficiency can only be welcomed. It is probable, however, that the rapid exodus from the land in the last few years has left many farms short of labour, and in war time the services of the women's land army would be in great demand. Fourthly, the increase, not recorded in the agricultural statistics, in the production of fruit and vegetables which has taken place in the last twenty years will make the maintenance of the nation's supply of vitamins easier than it was in 1914-18. And fifthly, the administrative experience acquired by the marketing boards would be invaluable to a Ministry of Food in war time.

The fall of 17 per cent. in the total arable area since 1914 is undoubtedly a handicap if cereal production is to be increased even to the level it attained in 1918. There are very few arable farms in Britain which can grow successive harvests of corn without a serious and rapid fall in yields, and most wheat-growing land can only take alternate crops of corn, or even two years out of five. Even to maintain this rate of production, extensive use of cultivators, fertilisers and manure is often required. Consequently, the Ministry of Food could not expect to grow cereals on more than half of the total arable area. In 1938 the proportion of the arable acreage under wheat, barley or oats was 42 per cent.; to raise this to 50 per cent. would involve an increase of 900,000 acres, which at average yields would provide an addition of 18 per cent. to the production of cereals. But it must be emphasised that average yields could only be maintained by the liberal use of fertilisers, of which nearly 5 million tons were imported in 1938. Hence the importance of adequate reserves.

If cereal production had to be increased beyond this point, it could only be done by breaking up permanent pastures. There is, in fact, a very large area of so-called pasture in England which provides little more than rough grazing and which should in any case be ploughed up and re-sown. The high initial cost of this operation and the lack in many grazing and dairying districts of the necessary implements, together with lack of knowledge, have impeded this necessary work, and the recent ploughing-up campaign initiated by the Government, together with the fertiliser subsidy, will be a stimulus in this direction. But while rough pasture will need much cultivation, fertilising and manuring before it will produce either good grass or good crops, really good pasture, well grazed and manured, provides one of the best reserves of fertility; when ploughed up, three or four harvests of cereals can be taken off suitable land in really good condition before signs of exhaustion become apparent.

The breaking-up of good pasture for corn production necessarily involves a loss in the food supply for livestock. To a certain extent, livestock must, in time of war, be regarded as competitive with humans; particularly those animals which consume cereals and imported feeding stuffs. The exception to this rule may be found in the dairy herds; the supply of milk is so important an item in the nation's diet that every effort must be made to maintain the milk production. But as soon as the pressure of imports on cargo space became noticeable, the numbers of pigs and poultry fed on grain would have to be reduced; and these might, if the situation became acute, be followed by the slaughter of beef cattle, dairy cows and any sheep which could not feed themselves on rough grazings with a minimum of winter keep. The fact, however, that the livestock population might have to be drastically reduced in the course of a long war does not alter the fact that the existence at the outbreak of hostilities of a large population of meat animals provides an excellent reserve of food which can be drawn upon if necessary. And hence, the recent subsidies for cattle and pigs, the forthcoming guaranteed price for sheep, as well as the subsidies for the production of cereals, may turn out to have had a defence value to set against their heavy cost.

But the best and cheapest way of increasing the productive capacity of British agriculture for war-time use lies in building up the fertility of the soil. Here the greatest

need at the moment is undoubtedly drainage, and if the Government sees a reasonable possibility of avoiding war in the next three years a subsidy towards field drainage would well repay the nation in peace time as well as in war. But apart from this long-period consideration, the steps which should be taken now to prepare agriculture for a war in, say, the next eighteen months may be summed up in four headings: (1) The storing of reserves of fertilisers, tractors, the oil to drive them, and the seed they will plant (the Government has already begun to lay in stocks of the first three); (2) the development of such processes as grass drying, ensilage, and the use of by-products like sugar beet pulp as substitutes, if necessary, for imported foods; (3) the encouragement in purely grass areas of the traditions of cultivation as applied to pasture, whether permanent or temporary; and (4) the planning of the necessary administration. The Food Defence Plans Department has already appointed the chairmen of the regional committees, which will interpret to the farmers the commands of the Ministry of Food and allocate among them the limited supplies of farm requisites. The organisation of the other side of food production, that of marketing, with its necessary corollaries of transport, price-fixing, State purchase and rationing, is almost of equal importance in the scheme of national defence—almost, for if there are no imports, no organisation of marketing will prevent Britain from starving in a few weeks.

Russia's Standard of Living

NO country, not even Germany or Italy, has been the object of so many contradictory assertions as the Soviet Union. Russia is inaccessible, and occasional personal impressions are of small value in a country so vast and populous; moreover, there is lack of statistical data. Nevertheless, there is sufficient material to warrant an objective survey.

Mr Colin Clark's study of the Russian national income* is both timely and bold. Indeed, its boldness may even be a liability. Mr Clark is right in saying that, for Soviet Russia as for any other country, the only theoretically valid and complete measure of economic progress is the figure of the national income. But in Russian practice there are difficulties in the way of attaining the ideal. First, many of the constituents of the national income are not known and have to be guessed. Secondly, the quantities of goods and services produced in Russia cannot be valued at the prices at which they were actually sold in any recent year, as these include a very high turnover tax, the proceeds of which are used to finance State investment. In avoiding these difficulties Mr Clark is forced to use a number of ingenious but hazardous calculations. As a result the theoretical excellence of the national income

as a measurement of economic progress becomes much more dubious.

One of these calculations is illustrated in the following imaginary dialogue. It concerns the calculation of the output of industrial goods and public services (amounting to nearly a quarter of the national income) in 1927-28.

ENQUIRER: I can see that you have calculated from official figures that retail sales of industrial goods in 1927-28 were 14.2 milliard roubles, but since prices have presumably changed since then, I suppose that you use a price index number in order to estimate the change in actual quantities purchased between 1927-28 and 1934?

MR CLARK: Yes, but as Russian prices are arbitrarily fixed and in any case difficult to obtain, it is better to recalculate all items in pounds sterling of 1934 purchasing power.

ENQUIRER: How do you do that?

MR CLARK: First of all we calculate by means of a price index number the number of roubles which would have been needed in 1913 to buy the goods that cost 14.2 milliards in 1927-28.

ENQUIRER: How is it that, in order to convert Russian roubles in 1927-28 into British pounds in 1934, you have to go back to 1913?

MR CLARK: This is because it is difficult to measure the relationship between the purchasing powers of a Soviet rouble and a capitalist pound.

ENQUIRER: Is it easy, then, to convert Russian roubles in 1913 into the equivalent number of British pounds of the same purchasing power?

MR CLARK: It is not easy, but it is possible with a little ingenuity. If we assume that prices in Russia proper and in the areas which now form Finland, Estonia and part of Poland, were approximately the same in 1913, we can calculate what the Russian rouble would have been worth, if it had still been circulating in the Succession States in 1930.

ENQUIRER: How does it help to know what the rouble would have been worth, if it had been circulating in the Succession States in 1930?

MR CLARK: Because thanks to comparisons made by the Ford Motor Company and the International Labour Office we can then calculate what the rouble would have been worth, if it had been circulating in Great Britain in 1930, and with the aid of British price indices it is child's play to calculate how many roubles would have been required

to buy in Great Britain in 1913 the goods that were purchased in Russia in 1927-28, if the rouble had been circulating in Great Britain at that time.

ENQUIRER: But the rouble was not circulating in Great Britain in 1913

MR CLARK: Quite so, but in 1913 Russia was on the gold standard and the exchange rate was 9.45 roubles to the pound. So all we have to do is to divide the total by 9.45 and we have converted the roubles into pounds of 1913 purchasing power. Then by a further use of British price indices we have no difficulty in calculating that £768 millions spent in Great Britain in 1934 would have been sufficient to buy all the industrial goods that were obtained for 14.2 milliard roubles in Russia in 1927-28.

For 1934 Mr Clark has found a more direct method of valuing industrial goods in pounds sterling. By examining lists of prices collected by Sir Walter Citrine, Mr E. C. R. Kahn and others, he computes rates of exchange for different commodities. These have a staggering range, varying from 1s. 5d. as the value of a rouble spent on a balalaika orchestra and 1s. 3d. spent on a cotton bathing suit to only 1d. spent on scent and less than 1d. spent on a camera. The unweighted average drawn from such a bewildering variety—namely, one rouble equals 3½d.—does not inspire very much confidence.

In regard to food consumption, Mr Clark adopts a simpler procedure for all years, that of valuing the consumption per head of each of the principal foodstuffs at British retail prices in 1934. It might have been better to use Polish prices, which would have reflected Russian conditions more closely than British, but the error, being one of weighting, would not be of first importance. But it is more serious that two alternative methods of computing food consumption, which Mr Clark presents as checks, give quite different results. The adopted method, described above, gives a fall of a fifth in food consumption per head between 1928 and 1934, whilst the other methods give no such fall. This is a pity—even though it is probable that some fall did take place—and not an encouraging introduction to the final estimates of the national income, which are given in the table in the next column.

In 1928 a national income of the same dimensions as in Tsarist times had to be distributed among a rather larger population. Between 1928 and 1934 the aggregate national income rose by 16 per cent., whilst the population only increased by 8 per cent. But this increase was entirely due to the expansion of industry. The supply of meat, milk and eggs was halved; that of other foods was barely keeping pace with the increase in population. But the total of all other output rose by something like two-thirds.

The broad picture is reasonable and enjoys some confirmation from official estimates, which, in Mr Clark's words, "may be excused of any charge of minimising the decline in agricultural production which took place between

RUSSIAN NATIONAL INCOME IN BRITISH PRICES IN 1934
Net income Gross income per head

	Aggregate in £ millions (I)	Per head £ (II)	Consumption of livestock products £ (III)	Other food consumption £ (IV)	Total income less food £ (V)
1913	2,803	20.1	4.3	6.6	10.1
1927-28	2,840	18.8	4.9	6.4	8.1
1934	3,299	20.5	2.3	6.4	13.3
1937	4,637	28	...	...	...

NOTE.—Since the publication of Mr Clark's book, the population of the U.S.S.R. at the census last January has been provisionally estimated to be 170 million. Mr Clark appears to have used the figure of 168 million for 1934. In the above table the figure of 161 million has been adopted and Mr Clark's estimates of income per head in 1934 correspondingly raised. These figures as well as an estimate of net income per head in 1937, obtained by dividing Mr Clark's aggregate by 167 million, are shown in italics. Otherwise Columns I and II are as published on page 41 and Columns III, IV and V are derived from tables on pages 10, 25 and 40 of Mr Clark's book. Net income is gross income less an allowance for depreciation.

1928 and 1932." Milk production declined from 26.6 million metric tons in 1930 to 18.8 in 1933 and then rose to 21.3 in 1935. Production of beef, mutton and pork fell from 1.8 million tons in 1930 to 1.5 millions in 1934 and then rose to 1.7 in 1935. Already in 1935, the last year for which such figures are available, the supply of grain for feeding cattle was increasing and supplies of meat and milk were following suit. The conjecture that both industrial and agricultural output have been increasing faster than population in the most recent period is not extravagant. Mr Clark's provisional estimate for 1937 would give an increase in the national income per head between 1934 and 1937 of more than a third. But a large part of this increase must have been devoted to armaments. If defence expenditure is assumed to have trebled in the three years, living conditions might have been improved to the extent of 5 or 10 per cent.

A few years ago the Russians were engaged in a tremendous struggle to lessen the pressure of their increasing population on the means of subsistence. Since 1934 they have been following the advice which an orthodox economist† is now offering to the overpopulated countries of South-Eastern Europe, namely industrialisation and the expansion of "labour-intensive" farming, viz., meat, vegetables, industrial plants and cattle. The Malthusian devil, it seems, has now been curbed, and Russia would stand on the threshold of a vast improvement in the conditions of her 170 million people were it not for needs of defence. It is possible that Russia may be able to prepare for war and raise the welfare of the masses.

NOTES OF THE WEEK

H.M.S. Thetis.—Last week the whole nation shared in the poignant sequence of anxiety, high hope, renewed fear and final despair which followed the sinking of the submarine "Thetis" on Thursday afternoon. On Saturday morning the last chance of saving more of the crew than the four men who escaped on Friday was announced officially to have gone; and on Wednesday this week the country mourned for the passing of 99 brave men, most of them of the Royal Navy, but some employees of the builders, Messrs Cammell Laird. The disaster was the worst among many grave losses in the history of the submarine service; its tragic course was accompanied by the wildest of conflicting rumours; the apparent inability of both the Admiralty and the shipbuilders to make public what was going on and what was likely to happen left room for widespread doubt, suspicion and recrimination. It is now known that the cause of the disaster was the flooding of the vessel's forward compartments owing to the opening of the door of one torpedo tube; and, though no explanation of why the door was open can be usefully attempted until the salvaging of the submarine, already begun, has been completed, there is no tangible evidence that more could have been done, or more quickly, by the authorities to save the men. Doubts about the completeness of the organisation and equipment which was available for rescue work remain in many minds. It is a mystery why more men did not follow the gallant and fortunate four to safety through the Davis escape gear. And, on all counts, there is the fullest case for the public inquiry which the Prime Minister has promised. But all signs point to a tragedy of accidents rather than a tragedy of errors: the tides were too strong for the divers and the angle of the submerged vessel was too steep for the rescuers. The Admiralty inquiry is already in train, and its findings will be before the public tribunal. Meanwhile there are the dependants of the lost men to care for, and there is no doubt that the success of the fund that the Lord Mayor of London has opened will measure the nation's deep sorrow.

* * *

The King Goes to Washington.—On another page our Ottawa Correspondent tells something of the triumphs of the King and Queen in their Dominion of Canada. This week Their Majesties have crossed a border unguarded except by hundreds of thousands of welcoming citizens to pay their respects to President Roosevelt and the 130 millions of English-speaking people he represents. It is an event of historical significance that the King of the British Commonwealth of Nations should meet the President of the United States on American soil. It fires the imagination that George VI should tread the soil lost by George III. But those are much mistaken who see in this visit a gesture of propaganda. Not one iota will the King's visit deflect the course of American policy. Nor was it ever intended that it should. The Royal visit to the United States is no more and no less than an act of courtesy due to Canada's great neighbour; and it will not be misinterpreted by the American public.

* * *

Finding a Formula.—The sole remaining major point of disagreement in the British-Soviet negotiations is that of the means by which Russia shall be secured against "indirect aggression" through the Baltic States. The latest Soviet Note, which was received by the British Government last week-end, repeated the request made in M. Molotov's speech that a direct territorial guarantee should be given to Finland, Estonia and Latvia: or, in other words, that the Peace Front should be pledged

to defend the integrity of those States whenever that integrity was considered to be menaced by German aggression. The Baltic States in question have now categorically stated their desire not to be guaranteed; Latvia and Estonia have signed non-aggression treaties with Germany which make it all the more difficult for them to accept guarantees. The one thing left to do, therefore, is to find a formula which will satisfy the Kremlin without employing coercion on the Baltic States. There are several alternatives. One would be for the Powers of the Peace Front to declare that any attempt to undermine the independence and neutrality of the Baltic States would be regarded as an unfriendly act. Another alternative, understood to be put forward by the French Government, would be a general guarantee of the *status quo* in Eastern Europe, made without mentioning names. This has much to recommend it. Not the least of its advantages would be that at need it could be taken to include Yugoslavia and Bulgaria as well as Finland, Estonia and Latvia. And in its generality it would leave would-be aggressors with no legalistic loopholes through which to smuggle their ill intentions, or would-be appeasers their misbegotten if well-meaning policies. From Mr Chamberlain's statement in the House of Commons on Wednesday it would seem that a formula on some such lines as these is in the British Government's mind. The statement itself went surprisingly far. "It is not intended that the military support which the three Powers would agree to extend to one another should be confined to a case of actual aggression upon their own territory," for it was possible to imagine various cases in which any one of the three Governments might feel that its security was indirectly menaced by the action of another European Power. These cases, Mr Chamberlain said, had been reviewed in detail. There remained the matter of an acceptable formula. To hasten the negotiations, Mr William Strang, head of the Central European Department of the Foreign Office, an expert who has been closely connected with the negotiations since their beginning, is being sent to Moscow as an assistant to the British Ambassador. That Lord Halifax himself or Sir Robert Vansittart has not been chosen to visit Moscow at this critical moment may or may not be a pity according to whether the choice was directed by motives of prestige (M. Potemkin, after all, did not go to Geneva), or by a conviction that agreement is so close that Mr Strang's help will be sufficient to obtain it. Meanwhile, it is permissible to indulge in a tempered optimism that the Soviet Government will not show such a conviction to be false.

* * *

The Axis and Yugoslavia.—After the broken pledges of the last few years it is worth noting as important, though not necessarily reassuring, that Herr Hitler has declared Germany's frontier with Yugoslavia to be "determined for ever." In fact, of course, Herr Hitler could scarcely say less: Yugoslavia is not yet sufficiently tied to the Axis to be treated without blandishment, although this declaration, as much as the pomp and circumstance with which Prince Paul was received, make it plain that the bonds are being drawn tight. It may have been no coincidence that, during Prince Paul's stay, the Fuehrer indulged in a number of extremely violent speeches against Great Britain. Welcoming home the Kondor Legion (the main means of German intervention in the Spanish civil war) Herr Hitler admitted that he had decided to help General Franco as long ago as July, 1936, "and to help him in the same measure and for so long as the rest of the world helped the enemies of Spain," a help which he gave "out of deep sympathy for the sufferings of a land which in spite of all the blackmailing efforts of England remained

neutral and friendly with us during the World War." What sort of peace is possible, we may ask, with a man whose point of view is still where it was in 1918? "The robbery of German colonies, the annihilation of German trade, the destruction of the bases of German existence and therefore of German life, the abolition of German political importance and power—" these, declared Herr Hitler, were the aims behind the Versailles Treaty, and these are the aims of "French and British encirclement statesmen" to-day. Signor Mussolini meanwhile was saying much the same thing, though in less offensive language, when he greeted the "Littorio" division (the Italian troops from Spain) with the handsome accolade that "for thirty months they had been the nightmare—literally the nightmare—of the plutodemocracies." The significance of all this will not have escaped Prince Paul, although, owing to the censorship, it is very likely to escape most Yugoslavs. The knowledge that Herr Hitler has pledged the integrity of their frontier with Germany will only give edge to that clause in the German-Italian military alliance which is understood to define "spheres of influence" in the Balkans. Public opinion in Yugoslavia will be uneasy for knowing that the German-Italian conflict of interests in Slovenia and Croatia-Dalmatia is now resolved.

* * *

Organising Supply.—The White Paper explaining the initial scope of the functions of the new Minister of Supply came too late last week for comment in *The Economist*. In the event, comment is scarcely needed, since the Government has not failed to disappoint those people who had based high hopes of an effective organisation of war-like supplies upon the sweeping and apparently adequate powers envisaged in the actual Ministry of Supply Bill. Fears that limitations would be placed upon the Minister, which would nearly nullify the Government's acceptance of the case for a Supply Ministry, have been realised. True, the Minister will at once be able to secure priority for Government contracts, though he will not have the control over raw materials which proved the most effective sanction in this matter between 1914 and 1918. For the rest, he will simply be at the beck and call of other Departments each with its own supply organisation and its own view of the urgency of its requirements. The new Minister's actual functions in the direct provision of supplies will extend no further than the arms and clothing of the Army, certain goods now furnished by the War Office to other Ministries, other goods used by more than one Department (if, and only if, central buying is centrally agreed upon) and fertilisers. The Admiralty and the Air Ministry will continue to organise their own supplies separately; the A.R.P. Department of the Home Office, with certain exceptions, will be another independent supply unit; and even the War Office, for whose aid the Ministry is avowedly being set up, will retain very wide supply powers. As was suggested in these columns a week ago, the central point of the supply problem has been missed. If the organisation of supply means anything, it means the institution of a central authority with full power to marshal the needs of Departments whose requirements of raw materials and labour at least and to a large degree of plant and equipment, too, compete and conflict. It is not enough to establish priority for Government contracts over civil orders; the Government's own demands must be met according to a strict schedule of urgency.

* * *

Diplomatic Procedure.—No episode in modern history has been marked by more deception and evasion under the cloak of diplomatic usage and phraseology than the lately ended Spanish War. For the most part Britain's share in this unsavoury process was small and indirect, but the admissions made in the Commons on Wednesday by the Prime Minister about Italian war material now left in Spain show that it was not, in fact, unimportant. It

seems that from the very outset of negotiations for an Anglo-Italian Agreement the handing over of Italian material to Franco after the war was envisaged and accepted by Mr Chamberlain. It seems that the pledge in that Agreement to remove all Italian men and materials did not mean what it said. It will not do for Mr Chamberlain to claim that there has been a misunderstanding; such a claim underrates the intelligence of both Parliament and the public.

* * *

German Finance.—The new German financial plan came into effect on May 1st. The first month's experience has already shown both the strength and some of the weaknesses of the scheme. The essence of the scheme was that 40 per cent. of sums due by the Reich to contractors are paid in tax certificates. The certificates are of two types: type I can be used to pay taxes six months after their issue, and bear no interest; type II will be accepted in payment of taxes at 112 per cent. of their face value after three years. In order to induce contractors to hold type I for more than the minimum six months, their ownership confers certain privileges of increasing the deductions from taxable income allowed for depreciation of plant. This attraction was sufficient to ensure a very brisk demand for certificates of type I as they made their appearance in recent weeks and their price on the Berlin Bourse rose at one time to a premium of nearly 5 per cent. But for the same reason the demand could in any case only be temporary, since to secure the depreciation privileges in 1939 it is necessary to hold the certificates for six months before December 31st. In one respect, therefore, the new system has met with success. But there are signs that even this success is embarrassing to the Government, which is beginning to fear the effect on its tax revenue of the exercise of depreciation privileges on a large scale. The minimum period of holding certificates to qualify for these privileges has been raised to sixteen months, with the result that the price of certificates on the Bourse fell. In other respects, also, the results of the new system have not been so fortunate. One purpose of their introduction was stated originally to be the freeing of the capital market for industrial issues. But there is already talk of reimposing the Reich's monopoly over the supply of capital, and the *Frankfurter Zeitung*, which is very well informed on financial matters, understands that Reich issues of about Rm. 8,000 millions will be made this year—that is, of about the same amount as last year. Moreover, it has proved impossible for contractors to pass on the certificates to their own suppliers, as was originally envisaged. There is a seller's market for all forms of raw materials in Germany

WILLS & TRUSTS

In acting as an executor or trustee, the Westminster Bank aims at putting itself in the position of a private trustee. It is therefore its practice to employ the family solicitor, if there is one, or any other solicitor the client may name; by such means the Bank succeeds in combining domestic tradition with business efficiency. A book showing the advantages of corporate executorship and the terms of appointment may be had at any branch

WESTMINSTER BANK LIMITED
Trustee Dept., 53 Threadneedle Street, E.C.2
Also in Piccadilly, Bournemouth, Bristol, Liverpool
and Manchester

to-day and the seller is in a position to impose his preference for cash. The net result is that the issue of certificates still further reduces the liquidity of firms directly supplying the Reich, who are compelled to sell their holdings of other securities and of Reich loans, with a depressing effect on the Bourse. The new plan has thus uncovered no new and untapped source of credit. It has hardly solved Herr Funk's problem. Indeed, it could not, since his problem is insoluble.

* * *

State Aid and War.—It is inevitable that the growth of State aid to industry, which has been conspicuous since 1931, should be accelerated by preparation for the risks of war. The proposed subsidy for sheep and the revised subsidies for oats and barley, which are together officially estimated to involve an annual expenditure of some £6,370,000, are clear cases in point. Another is the scheme announced in March for the assistance of British shipping, which proposes to make £2,750,000 per annum available for deep sea and near continental tramps, up to £500,000 a year for owners placing new orders with shipbuilders for tramps or cargo liners and £2,000,000 for the purchase of suitable vessels for a shipping reserve, together with loan facilities of £10 millions in the next two years for new building. But there is no little danger that the compelling call for preparedness may be used to drown all reasonable demands for the most careful scrutiny of the disbursement of public funds in this way. Agriculture and shipping merit aid in any plan for national defence; but the estimated cost of the new farming subsidies seems higher than even the extra assistance demanded by emergency considerations requires (see *The Economist*, May 27th, p. 486); and shipping and shipbuilding are to be aided with extreme generosity without any guarantee that the costs of the industries will not continue to be higher than those of their competitors.

* * *

The Cost of Subsidies.—It is hard to stand firm against the tide and the policy of subsidies is now on the flood. But the tale of State aids given in the Commons this week by Captain Crookshank makes disturbing reading. The Financial Secretary to the Treasury gave particulars of the subsidies payable since January 1, 1932, from public funds to industry, and he added the estimated sums for 1939:—

	1932-38	1939
Beet sugar	18,594,585	3,000,000
Cattle industry	18,114,794	4,625,000
Milk	5,696,861	492,910
Land fertility	1,961,513	1,500,000
Bacon industry	...	*425,010
Oats and barley	164,868	930,000
Herring industry	109,807	73,450
Tramp shipping	4,002,183	...
Mechanical transport	7,560	...
Light horse breeding	35,549	...
Civil aviation	3,539,723	2,000,000

* Anticipated receipts of £228,010 to be set off against this.
† See above.

And these very large items add up to no more than a small part of the direct and indirect aids given to industry under the new economic policy of the 'thirties. There is to be added, not only tariffs, preferences and quotas, but also rating relief and monopoly privileges given by statute. It is the citizen as consumer or taxpayer who pays for this mounting programme of costly artificial respiration; and it is the citizen as elector who has the unmistakable right to ask that adequate returns in industrial efficiency should be ensured. State aid in all its forms has long since ceased to be regarded as a depression device to avert industrial distress or disaster. It has become practically a perquisite of industry and, while no one nowadays would dispute the merit of aiding industries in cases of proven need, few impartial observers can contemplate the present trend without alarm.

Japan and Great Britain.—A few days ago it was announced at Tokyo that the policy of the Japanese Government towards Europe, which had been decided in principle on May 20, was now in concrete shape, in the form of a draft which was on the point of completion. At the same time it was hinted that the decision of policy would shortly be made public, either through the publication of the full text of the Cabinet paper, or through a public résumé of its contents. At the moment of our going to press this week, this public statement has not yet been made, and we are as far as ever from gaining any light on a closely-guarded secret. At the time when the decision was taken, it was believed, as we then recorded, that it registered a victory of the more cautious representatives of the Navy and Business over the more hot-headed representatives of the Army. If this belief was correct, the fact will presumably be reflected in the forthcoming statement, since there is no hint of any reversal of policy during the intervening weeks. At the same time, there are growing indications, both in the tone of the Japanese press and in the behaviour of the Japanese armed forces where British subjects are concerned, that Great Britain is increasingly being made the scape-goat for Japan's failure to finish off the China War. This may, of course, simply be the Army's way of trying to save its face. On the other hand, the atrocious murder of Mr Tinkler at Shanghai—an atrocity of which the Japanese perpetrators were not soldiers but marines—suggests a more serious anti-British turn of Japanese policy, unless we are to suppose that the outrage was entirely the work of non-commissioned officers or privates who were taking the law into their own hands with a complete disregard for the instructions and the policy of their superiors. If it is really the considered policy of the Japanese Government to refrain from making a breach with the Western Powers, it is amazing that they allow their subordinates to commit outrages of this kind with apparent impunity.

* * *

Regenerating Roumanian Politics.—The first Roumanian elections to be held under the new constitution have passed off in what may be called an efficiently totalitarian manner. Of the 258 deputies to be elected to the Lower House, 86 stand for agriculture and manual labour, 86 for commerce and industry, and 86 for professional interests; 88 senators were also elected by various occupational organisations, 14 of whom represent manual labour, 11 industry, 11 commerce, and 22 the professions. The whole thing, it will be perceived, is admirably clean and neat. Certain democratic customs have, however, been allowed to survive the establishment of Roumanian corporativism. The presentation of election manifestos, for instance, was allowed, though the length of these was limited to 100 words. Voting was in secret, though here again it is necessary to add that the nomination of candidates was carried out with a view to ensuring that the new parliament was as competent (and as desirable) as it had been planned to be. To democratic eyes the elections can seem little better than a formality; that does not detract from the go-ahead way in which King Carol and his Ministers are trying to reorganise Roumanian ways and means of living. At least they will not fail for lack of trying. Their greatest need is a long period of peace, because war is the one disaster which is certain to prevent the Roumanians from enjoying the great natural riches they possess. And just as King Carol can be relied upon to defend Roumania's neutrality against attacks, at least by his immediate neighbours, so it seems from the latest reports that his Ministers are determined not to give Germany a dominating position in Roumania's foreign trade. Meanwhile, in Bucharest they are watching with apprehension the changing balance of interests in the Balkans, Yugoslavia's approach to the Axis, Turkey's pact with Britain, and wondering, too, what will be the practical outcome of the British negotiations with Russia.

The Birkett Report.—Almost exactly two years ago the Minister of Health and the Home Secretary set up a committee, with Mr Norman Birkett, K.C., as chairman, "to inquire into the prevalence of abortion and the state of the law relating thereto." Last July the need for such an inquiry was underlined by the case *Rex v. Bourne*. Under an Act of 1861 the unlawful use of an instrument to procure abortion is forbidden; and an Act of 1929 clarified the position—which depends upon the meaning given to the word "unlawful"—by stating that an operation to save the immediate life of a mother would be lawful, even though the life of the unborn child were lost. In *Rex v. Bourne*, one relevant point, which was that a surgeon had procured an abortion to avert the consequences of rape upon a child, was not passed upon; the judge ruled that it was not possible in fact to distinguish between danger to the immediate life of a mother and danger to her general health, and the jury found for Dr Bourne because on the latter ground the operation was needful. The Birkett Committee, whose report has now been published, follow this ruling and recommend that the law should be clarified to make it unmistakably plain that abortion is legal both when the operation is done to save the mother's life and when its object is to prevent the serious impairment of her health. If this recommendation is accepted it will be a logical and humane advance; but the question whether the termination of pregnancies resulting from rape should be legalised as such has still to be settled. A Minority Report recommends that this should be done, but the majority of the committee, opposed as they are to any broad relaxation of the law on ethical, social and medical grounds, can suggest no way of legalising such abortions, even though they would welcome it if it could be done. It should not exhaust ingenuity to find legal means to this desirable end. Meanwhile, there is common sense in the committee's view that, when the annual total of abortions in England and Wales runs between 110,000 and 150,000, with two-fifths of them criminal and many of them dangerous to life or health, it would be expedient that the existing powers of local authorities to give contraceptive advice to married women whose health would be adversely affected by pregnancy should be more fully utilised. Indeed, many people would go further and follow the Minority Report in recommending that such advice should be given to all married women who desire it. It will not be claimed for the report that it is a final solution of the problem of abortion, since it is pre-eminently a question on which public opinion is slowly changing. But adoption of the report's recommendations would end the present dangerous state of affairs in which the apparent state of the law is out of accord with the opinion all but universally held in the community.

* * *

A Dublin By-Election.—The result of the by-election in South Dublin City is a moral defeat for Mr de Valera. At the general election held less than a year ago the Government party candidates obtained 30,768 first preferences against 16,083 secured by Mr Cosgrave's candidates. At the by-election, which was a straight two-party fight, the Government candidate's votes numbered only 20,059, while the Opposition candidate obtained 15,877. Thus it will be seen that the Government party has lost over a third of its supporters during the year, while the Opposition strength has remained practically unimpaired. The swing of the pendulum is clearly observable in the reduction of Mr de Valera's majority in the constituency from 14,685 to 4,182. The fall in the total poll is also remarkable; only about 40 per cent. of the electors thought it worth their while to vote at the by-election. The reasons for this apathy are not hard to find. Growing unemployment, the rise in the cost of living, the slowing down of the housing programme and the increased taxation imposed by the Budget, have all helped to alienate support from the Government, whose programme at the election was a further drive to revive the Irish language and the solution of the problem of partition. The fact that the votes lost by Mr de Valera

were not transferred to Mr Cosgrave signifies that the ordinary Irishman is "fed up" with both parties, and the country badly needs a new party competent to frame a realistic economic programme and to implement it courageously. There are parallels to be drawn between Eire and Britain in this respect, though the causes of the political standstill are very different in the two countries.

* * *

Wage Rates in the Recession.—Now that the economic barometer seems to be pointing once again to recovery, it is interesting to record that the average level of wage rates was not reduced during the recession. In the third quarter of 1937, when business activity reached its peak, the Ministry of Labour index of wage rates was 102½ (1924=100) and it continued to rise to 106 in the second quarter of 1938. But the index did not fall and has since remained at the peak figure of 106, while the trend of retail prices has been downward. Mr E. C. Ramsbottom has just published details* of the course of wage rates in individual industries up to the end of 1938, and these show that on the whole the average experience of a slight rise between December, 1937, and December, 1938, has also been typical. There were only two decreases of 1 per cent., though big increases, as shown in the table, were more numerous. But these were in some cases the results of negotiations concluded before the decline in business began. Thus in the iron and steel industry wage rates rose by 5 per cent., but average earnings reported to the British Iron and Steel Federation actually fell as a result of short-time working. For this reason, the increase in working-class incomes last year is not likely to have greatly exceeded the increase in wage rates.

INDUSTRIES IN WHICH WEEKLY WAGE RATES ROSE BY MORE THAN 5 PER CENT. BETWEEN DECEMBER, 1937 AND DECEMBER, 1938

	Increases %			Increases %	
	Dec., 1937 to	Dec., 1929 to		Dec., 1937 to	Dec., 1929 to
	Dec., 1938	Dec., 1938		Dec., 1938	Dec., 1938
Iron mining ...	13	46	Agriculture :		
Coke ovens ...	7	29	Scotland ...	6	8
Public works			Aerated waters	5	4
contracting ...	7	5	Iron and steel..	5	28
Shipping	6	6			

Wage rates at the end of last year were higher than in 1929 in nearly all industries except textiles. The drop of 10 per cent. in the woollen industry was, however, the largest, that in the cotton trade being only 2 per cent. The spectacular increases are shown in the table, but rates in cement manufacture, tinplates, shipbuilding and coal-mining were all more than 10 per cent., and in engineering and agriculture just under 10 per cent., above the 1929 level.

* "Wage Rates in the United Kingdom in 1938." *Journal of the Royal Statistical Society*. 1939. Part II.

THE WORLD OVERSEAS

Baltic Trio

SINCE they crystallised from the post-war chaos the republics of Estonia, Latvia, and Lithuania have asked only for one thing—to be left alone. If their variations on this common Baltic theme have not always been harmonious, if at times they have voiced bravado and at other times whispered in sudden caution, the reason lies in the precarious tenure of small countries that are surrounded by great Powers. For the Baltic trio the Big Bad Wolf, whether he growled in German, Polish or Russian, has never been able to wear convincingly the disguise of fairy godmother; they may at times have been uncertain of his exact identity, but never for a moment have they forgotten that he was there. That he might appear in double form, or even in triplicate, and thus magnified devour them piecemeal was (and to some extent remains) their constant fear. The Baltic republics fear problems far more urgent than those which Sweden, Norway and Finland, or even Denmark, have to face; not for nothing are they in the news.

It is true that in their wish to keep outside the play of Power politics the interests of all the Northern States are the same. The point of departure is in the method they shall use to steer this policy through changing circumstances. It was not until the Italians proved in Abyssinia that no small country could rely on the Covenant for its absolute protection that the dilemma became acute: with that proof the Northern statesmen withdrew their support from those articles of the Covenant which pledged them to collective action against aggressors. From that moment they could rely only on a policy of unreserved "neutrality towards the conflicting interests of the Great Powers," as Mr. Richard Sandler, Foreign Minister of Sweden, has expressed it, "and the avoidance of entanglements in any action incompatible with this attitude." For the rest, they could only hope that the push-and-pull of Power politics would ensure their territorial integrity.

Now the tables are turned. The British, playing fairy godmother, may even be in danger of killing the trio by kindness. The argument is clear enough. If Anglo-Russian guarantees are given of the frontiers of Latvia and Estonia (and equally of Finland), it runs, then military assistance is implied. This would offend Germany which might then regard Latvia and Estonia as the legitimate prey of an "anti-encirclement" war; and this in turn raises the question of what M. Karl Selter, Estonian Foreign Minister, has called "preventive aggression"—Russian counter-measures to a possible German invasion, or "by implication, the occupation of some of the territories of the Baltic States." The non-aggression pacts signed this week in Berlin by Estonia and Latvia (Lithuania is a case apart, and Finland has refused the offer of a pact) do not mean a falling-away from the policy of "neutral attitude." They are meant to be regarded as complementary to those signed with the U.S.S.R. in 1927, and are understood to be entirely unequivocal.

Lithuania, Poland and Germany

Lithuania is a special case. Russian insistence on Baltic guarantees and the events which have preceded that insistence threaten to isolate Lithuania from the Northern security system. It is well worth a digression to examine Lithuania's special problems. When the German troops retreated westwards in 1919-20 Estonia and Latvia were left without frontier disputes to settle. Not so Lithuania. In 1923, further, the Lithuanians seized Memel from the hands of a French garrison. It is fair to say that in doing so they were thinking more of what Poland might do than of their own immediate needs, for Lithuania's Big Bad Wolf has usually growled in Polish. Poland's last appearance in this rôle was in 1937, when Lithuania was forced by ultimatum to recognise Polish sovereignty over Vilna. Since then Polish-Lithuanian relations have vastly improved, though tempered still by neighbourly suspicion—that Lithuania will "let in the Germans" or that Poland has "secret ambitions

on our territory." The two countries have signed a commercial treaty to take advantage of their newly-opened frontiers; diplomatic and military contacts have paved the way for more permanent friendship.

Germany's relations with Lithuania are now regulated by the new commercial treaty reported in *The Economist* of May 27th last. But the severance from Lithuania of Memel and its adjoining territory was a blow to the country's economy that will be little softened by the new treaty. In the slow industrial development made by Lithuania since she became independent special attention was given to Memelland; as many as 25 per cent. of all industrial undertakings, estimated at a capital value of £2,000,000, are in territory which is now part of Germany, including several important saw-milling and cellulose plants, while about

£1,000,000 has been spent in improving Memel harbour facilities. From the point of view of the balance of payments, those industries are now lost to Lithuania, though the restricted importance of this may be gathered from the fact that only 7 per cent. of the Lithuanian population is engaged in industry; more serious is the potential stranglehold which the Reich is now in a position to exert on the transit traffic between Lithuania and her best customer, Great Britain. In face of this potential stranglehold the Lithuanian Government has a choice of three courses of action. The first course is to maintain existing arrangements whereby the two British ports of entry regularly used by Lithuania, London and Hull, are served by Memel, and to take advantage of the German concession, granted as compensation for Lithuanian capital expenditure in the past twenty years, of free-port rights in Memel for 99 years. In the second place, the Lithuanians may arrange to use the Latvian port of Liepaja for one of these two shipping lines, a course which would recommend itself to Latvia as a means of enlivening a badly-hit seaport, and which would require only the building of a 20-mile stretch of railway. The third course is to develop as a deep-water port the fishing roadstead of Shventoji near the Lithuanian-Latvian frontier; this is supported by extreme nationalist opinion, but is obviously conditional on the Lithuanian Government's ability to borrow the necessary money.

Having already signed a non-aggression pact with Germany, Lithuania stands outside the immediate problem,

She has no quarrels with the U.S.S.R.; Poland has ceased to appear vulpine; and, even if the wolf is now about to undergo metamorphosis into a Teutonic guise, the Germans so far have shown tact and generosity in their dealings with the most southerly of the Baltic Trio.

A Multilateral Guarantee?

Lithuania perhaps apart, the present problem for all the Baltic States is the same. The Soviet preoccupation with Baltic guarantees has only one excuse to recommend it. The Russians are asking: Can Germany contrive to force Lithuania, and then Latvia (which has a common frontier with the U.S.S.R.) into "accepting" German guidance if not the actual status of protectorate? Can the Germans "peacefully occupy" this Baltic "corridor"? For Lithuania above all the question is urgent: if Anglo-Russian guarantees are pressed on Latvia and Estonia it might be that the Germans would press on Lithuania something much less pleasant.

Latvia and Estonia are against accepting a direct territorial guarantee. The point of view of the Finnish Government is that the acceptance of a guarantee would be contrary to their policy and would weaken their neutral position *vis-à-vis* their Scandinavian friends. M. Erkkö, the Finnish Foreign Minister, made this clear last Tuesday when he said that "Finland must treat as an aggressor every State which, on the basis of an unasked guarantee, intends to give its so-called assistance when it perhaps considers that the 'guaranteed' State requires help." At the same time there is a general, if as yet unofficial, recognition that the British-Soviet negotiations are much too important to be allowed to stumble for lack of a formula to guarantee Baltic neutrality. What that formula will be cannot be foretold; it is understood that the French Government have a general guarantee of the *status quo* in mind, although, as is pointed out in the Note on page 592, there are also other alternatives. It should be possible to find a means of relieving Russian anxiety without transferring it to the Baltic States. Even so, there will be reluctance. After all, the young lady who went for a ride on a tiger was a native of one of the Baltic Trio.

The Tennessee Valley Authority

[FROM OUR NEW YORK CORRESPONDENT]

THIS Correspondence has often referred to regionalistic developments in the United States, maintaining the Federal idea in principle, but in a form not exactly identical with the historic concept of the Federal Union of the 48 States. One example is the Port of New York Authority, which holds a limited type of jurisdiction over New York harbour, derived from a treaty between the States of New York and New Jersey. Another example of a different type is the Tennessee Valley Authority, which derives directly from an Act of Congress, and involves activities by the Federal Government within the territorial jurisdiction of Tennessee, Virginia, North Carolina, South Carolina, Georgia, Alabama, Mississippi and Kentucky—by virtue of the clause of the Constitution giving Congress jurisdiction over navigable internal waterways.

To Wall Street, the T.V.A. is one of the Beasts of the Apocalypse: Wall Street knows it principally, or exclusively, as Government competition with privately owned public utility enterprises. To constitutional lawyers, the T.V.A. is charged with the development of a navigable, inter-State waterway. To the "planners" the T.V.A. is an idealised scheme of regional development, commercial, and agricultural, built around a great river system. Historically, the scheme is an outgrowth of the war-time Government-built nitrate plant at the falls known as Muscle Shoals. It is variously described as an example of throwing good money after bad, as a dubious attempt to salvage a war-cost that should have been written off, and as a promising investment in a great national resource. This letter will do no more than describe the area and undertaking briefly and impressionistically—on the basis of a brief visit to Knoxville, Tennessee.

The Tennessee River rises on the West slope of the Appalachian Mountains and flows Westward, with a long arc to the South, into the Ohio River at Paducah, Kentucky, not far from the confluence with the Mississippi. The river is about 650 miles long, and between Knoxville and Paducah drops about 500 feet. The drainage area comprises about

40,000 square miles. Of this area, about half (13,000,000 acres) is forest-covered, including some 6,500,000 acres of farm woodland, and about 2,000,000 acres of (federally-owned) national parks and national forests near the headwaters. The population of the area is somewhat over two millions, of whom at the time of the last census (almost ten years ago) 300,000 were classed as farmers or farm workers and about 100,000 as industrial workers. These proportions have probably shifted in the last decade. The ratio of the number of farms to the number of farmers indicates that the prevailing type of agriculture is the one-family farm, rather than the plantation; but this is more characteristic of the Eastern and more rugged end of the area than of the Western, which is an alluvial cotton-growing district. In the same way, while the entire area may be described as predominantly agricultural, industrialisation has developed extensively at the Eastern end, where, in addition to the forests, there are extensive deposits of non-metallic minerals, as well as some iron, copper and zinc.

Complex Tasks

The river itself presents three obvious aspects: (1) It is a waterway, more potential than actual, although some barges ply the lower reaches; (2) it is subject to floods itself, and a contributor to floods in the Ohio and Mississippi; and (3) its long declivity creates a great potential of hydro-electric energy. In addition, the rainfall of 50 inches, besides causing occasional floods, is a cause of erosion, to which the soil, especially on the upper river, seems extremely susceptible. Under the United States general scheme, navigable inland waterways have always been regarded as a Federal concern; flood control has been divided among local, State, and Federal jurisdictions; the development of electric energy has been regarded as a domain of corporate enterprise; and erosion as the problem of the individual farmer.

But a river carrying off 50 inches of rain in a course of 650 miles with a drop of 500 feet is no respecter of the neat conventions of political economy. When our Federal Constitution was adopted there was only a handful of white settlers in the whole Tennessee Basin; when the T.V.A. was created a whole complex of institutions was already deep-rooted in the Valley. But the basis of the T.V.A. was grounded in two facts—that the Tennessee was a more or less navigable river, and as such under Federal jurisdiction, and that the Federal Government already had a hydro-electric plant at Muscle Shoals for the production of nitrates. In creating the T.V.A., Congress directed it "to control the Tennessee River to provide for navigation, flood control and the production of power incidental to such development."

These terms of reference are in themselves more complex than they seem. River navigation implied more or less subsidised competition with existing railways, which are in no thriving condition, and the production of "incidental" electric power, competition with utility corporations supplying a limited market. Flood control could be secured by dams; but erosion control is a function of individual farming, and involves a whole train of co-ordinated effort under a variety of guidances and stimuli. It is not surprising that the history of the T.V.A. has been as turbulent as the river it was directed to "control"; and its manifold activities have been and are likely to continue to be a source of continuous controversy between the Authority and the numerous and varied interests on which it impinges.

The programme called for the construction of a series of dams. The Wilson Dam in mid-river had been begun in 1918, but was not closed until 1924; a second, privately owned, was already in existence. Four others have been completed, four others are under construction, and numerous others (on tributaries) are under consideration.

The NATIONAL BANK of NEW ZEALAND, Limited

Established 1872

Head Office:—8 MOORGATE, E.C.2

Subscribed Capital - £6,000,000
Paid-up Capital - £2,000,000
Reserve Fund - £1,000,000
Currency Reserve - £500,000

The Bank has branches throughout New Zealand and conducts every description of Banking business with that Dominion.

The undertaking is too new to make more than sketchy appraisals. As a navigable waterway the plan calls for a 9-foot channel to the head of navigation, which is variously interpreted as Chattanooga, about 400 miles from the mouth, or Knoxville, above 600 miles; but little can be done for navigations until the dam system is nearer completion. Its efficacy of flood control has only partially been tested; but in the great floods of 1937 it is estimated that the resistance then offered reduced the flood-crest at the junction of the Ohio and Mississippi by about six inches.

The Power Programme

It is, of course, the power programme that has caused the most acrimonious controversy, and for two reasons. First, it introduced the Government as a competitor into an area already served by existing utility corporations, and raised the spectre of similar competition in other areas. Secondly, it was continuously stated that the T.V.A. power would be used as a "yardstick" to determine "fair" prices for power privately generated elsewhere. It is obvious that, whatever other merit the programme possesses, the quality of a "yardstick" is conspicuously lacking. The power generated is specifically "incidental" to the navigational and flood control features, and it is, of course, impossible to make a non-controversial allocation of capital and operating costs among these three different functions. And without an indisputable figure of costs its function as a norm or yardstick is completely invalidated.

As yet the actual generation and distribution of power is still comparatively small, although the recent purchase of the privately owned system of Knoxville will approximately double its customers. When the programme is completed, however, the area will have access to a great supply of cheap power, which is expected—and with good reason—to accelerate its industrialisation, particularly at the Eastern end, which includes a good deal of marginal farm acreage. That is, the programme at that point becomes definitely social and impinges on the so-called "agricultural problem," which in this instance is essentially a problem of getting a fraction of an agricultural population out of marginal or sub-marginal farming into local industry.

The problem of soil erosion is quite distinct from navigation, flood control or power production; but it is a major consideration in the T.V.A. scheme. Here it is co-ordinated with the Federal and State departments of agriculture, with the Forestry service of the Department of the Interior, with the work of the Civilian Conservation Corps, and with farm organisations. Soil erosion is not much of a problem in the North-Eastern United States, but in the South-East it is a conspicuous feature of the rural landscape.

Finally, the greater part of the Tennessee Valley lies in the single State of Tennessee. This raises the question of the equity of spending such large appropriations of Federal money primarily for the benefit of a single State. The proposal advanced some time back to create duplicates in half-a-dozen other river systems, although it met this point of sectional equity, raised such a storm of diverse protests that it was not pursued.

To sum up, all of the objections raised against the T.V.A. are individually valid. It is costly; it does benefit a fraction of the country at the expense of the Federal Treasury; it does introduce Government competition with private enterprise in the utilities and potentially with the hard-pressed railroads; it is questionable if a single programme can serve with optimum effect three such diverse objectives as navigation, flood control and "incidental" power production; and serving these three objectives, it is a more than dubious "yardstick" of fair costs for privately generated and distributed power. But, on the other side, it is a boldly-conceived, schematic plan of regional development, centred on the con-

version of a more or less destructive river into a positive natural resource. As an experiment it is large enough to test its merits and its defects; yet the area and its population are small enough, compared to the whole nation, to be in the nature of a social and geophysical laboratory. That it is raising, and promises to raise further, the standard of living of the area is almost certain; whether this praiseworthy objective might have been realised by other means of lower direct and indirect costs to our political economy is debatable.

May 29th.

The Motorisation of Germany

[FROM OUR BERLIN CORRESPONDENT]

TO spread the use of motor vehicles throughout the nation was one of the cardinal points in the original National Socialist Party's programme. During the past six years the campaign to do this has been remarkably successful. Motor cars are no longer articles of luxury in Germany, and their use is now very widespread indeed. But military considerations have played an even greater rôle in the country's motorisation than the popularisation of private cars; and a large part of the growing output of the German motor industry is taken over by military and semi-military organisations, such as the S.S., the S.A., the N.S.K.K., and the police.

In 1933 the first measure undertaken to create employment was the construction of the Reich motor roads; of these, about 3,000 km. are now in use, and about 13,000-14,000 km. (including Austria and the Sudeten territory) are now under construction or planned. These highways serve to supplement the regular roads for the carriage of long distance and fast traffic, and they constitute the backbone, in conjunction with the railways, of Germany's military routes. And with the new roads has come a flood of new cars.

Simple facts and figures give a striking picture of the progress made. They show how remarkably quickly production and sales have risen in the last few years:—

	(Numbers)	1929	1932	1937	1938
Private cars:—					
Production	96,161	43,430	269,005	276,592	
Domestic sales	92,047	38,207	210,021	211,430	
Exports	3,973	7,588	57,889	64,260	
Lorries, omnibuses:—					
Production	31,577	8,234	62,404	64,127	
Domestic sales	28,230	6,877	48,565	49,966	
Exports	2,806	1,739	13,780	13,230	
Tractors:—					
Production	5,928	1,593	18,025	24,636	
Domestic sales	3,795	1,195	14,870	20,591	
Exports	2,348	683	3,089	3,557	
Motor cycles:—					
Production	195,686	36,262	159,815	190,018	
Domestic sales	188,789	36,706	148,266	154,132	
Exports	7,577	2,694	22,973	34,394	
Three wheeled vehicles:—					
Production	5,361	10,939	14,116	14,906	
Total sales	†	10,940	14,655	14,781	

† Included in motor cycle figures.

In Great Britain, at the end of 1938 there were 2,334,900 private cars and commercial vehicles in use. In Germany (not including the Sudeten territory) 3,596,516 motor vehicles were counted last December, against 3,027,547 a year before, and of these 1,689,695 were motor cycles, 1,395,561 were private cars, 422,318 were lorries, 67,225 were tractors and 21,717 were omnibuses. For every 1,000 inhabitants there were 48 motor vehicles, against only 45 in the preceding year and 25 in 1932; in Great Britain the figure is 52 vehicles per 1,000 (excluding motor cycles and tractors). Exports, too, have risen notably. Since 1929 Germany's foreign trade in motor vehicles shows the following course:

	(Rm. millions)	Import	Export	Export Surplus
1929	62.0	75.4	13.4	
1932	9.1	33.9	24.8	
1933	7.3	32.9	25.6	
1934	10.2	32.8	22.6	
1935	9.6	54.1	44.5	
1936	6.1	81.8	75.7	
1937	6.9	146.4	139.5	
1938	12.0	161.1	149.1	

Italy was by far the largest purveyor of motor vehicles to Germany last year, with 1,518 private cars and 5,580 chassis; Great Britain came second, with 372 private cars, 26 tractors and 283 motor cycles; and the United States third.

Export Progress

On the export side, it is noteworthy that Great Britain and the British Dominions figure among the greatest buyers of German cars, though protests against dumping have produced a considerable reduction in British imports of German cars. The position now is that Germany is coming up hand over fist in the competition to supply the world's cars. Last year Great Britain was in second place among exporters (behind the United States) with a total export of 68,000 private cars. Germany, with an export of 61,000, was close up third position. And in the case of motor-cycles, of which England until now has exported more than any other country, Germany reached first place, exporting 41,607, at value of Rm. 13.8 millions, against 14,612 in 1936, valued at only Rm. 4.6 millions.

In commercial vehicles also the advance in Germany has been outstanding. Between 1934 and 1938 the size of the German commercial vehicle fleet was doubled, and figures given by the Petroleum Press Bureau show the following comparisons between German experience and that of other countries:—

	NEW REGISTRATION OF COMMERCIAL VEHICLES	1934	1935	1936	1937	1938
United Kingdom	79,058	82,582	103,395	101,050	94,687	
Germany	23,509b	33,798	45,731	48,565	49,967a	
France	24,063c	21,065c	23,905	23,209	23,978	

(a) Second half-year includes Austria. (b) Including three-wheeled vehicles. (c) Excluding buses.

The number of commercial vehicles and buses in use in Germany has risen from nearly 210,000 in 1934 to over 420,000 in 1938; and, it is significantly pointed out by the Petroleum Press Bureau, again political influences are evident in the figures. Sales of goods vehicles of less than one ton have fallen from 36 per cent. of the total in 1934 to 15 per cent. in 1938; and the share represented by vehicles of 3 to 4 tons has risen from 8 to 24 per cent. Heavy vehicles of military value have come more to the fore.

The People's Car

It is the goal of National Socialist policy to catch up with other well-motorised countries, such as the United States, France and England. The number of private cars is to be increased by 6-7 millions; and, since the German industry has neither the technical capacity nor the materials or labour for this effort, a special Commissar has been appointed to carry out a complete rationalisation programme. The first measure to be taken is a reduction in types of vehicles: instead of 150 motor-cycle types only 30 types will be constructed; instead of 113 lorry types only 14-15 will be constructed; instead of 20 three-wheeled vehicle types only 2-4 will be constructed. At this year's Domestic Automobile Exhibition in Berlin the so-called *Volkswagen*, or People's Car, was shown for the first time. This small vehicle symbolises the new motorisation policy. Its price is about Rm. 950 (say £75), and the authorities believe that the car can be bought by workers with low incomes.

It is doubtful whether even the People's Car can come within the compass of low-paid manual or black-coated workers to buy and run. The motorisation policy has a long way to go; and the problem is one both of demand and supply. On the one side, popular purchasing power in Germany will have to be very much raised if the use of cars is to be generalised—and the armament-directed economic policy at present in operation scarcely helps this. On the other side, the calls of an expanding motor industry for labour and materials already conflict with the prior claims of the war industries. Nevertheless, although domestic sales of private cars in the last few years have averaged only about 200,000-300,000 annually, the first batch of the People's Cars, which is to be marketed at the end of this year, adds up to some 450,000. The future of the Nazi motorisation policy, like that of all aspects of their programme, must depend in the last resort on the proportion of the German nation's resources its leaders are willing and able to devote to civil, as distinct from military, purposes. But much of the demand for motors is, in fact, military, and the industry is clearly due to work at the fullest pressure for some time to come.

The Royal Visit to the Prairies

[FROM OUR OTTAWA CORRESPONDENT ON BOARD THE ROYAL TRAIN]

THEIR Majesties, King George and Queen Elizabeth, have reached the Pacific Coast and completed the first stage of their tour through Canada. It has been by common consent a triumphal procession since they landed at Quebec, and observers have been surprised that such demonstrations of affectionate loyalty to the British Crown could have been evoked from a people so unemotional and inarticulate as the Canadians are under normal circumstances. Everywhere the crowds which gathered to welcome and cheer Their Majesties have been tremendous, and their enthusiasm has been whole-hearted and genuine. Even in Quebec, where anti-Imperialist and isolationist sentiment is very strong, the French-Canadian population were not behind their English-speaking compatriots in the ardour of their welcome. In the prairie country and in British Columbia people drove to stations on the line from villages and farms 200 miles away, and contingents of Americans came from adjacent states like North Dakota and Montana.

Their Majesties have not spared themselves to make the tour a success. At many places they have mingled freely with the crowd, and they have delighted everybody with their friendly democratic ways. The only adverse comments about the tour come from stern isolationists who express the fear that the present outpouring of loyal sentiment makes certain Canada's immersion in another European war, if it comes.

It is a happy chance that, coincident with the visit of Their Majesties to the prairie country, its all-important grain crop has had a recent set-back checked by generous rains. The seeding season was earlier than usual, and there was then available in most places a fairly moist and satisfactory seedbed but, from mid-April until the last week in May, there was practically no rainfall in any part of the prairies, and the moisture reserves were rapidly exhausted. But about May 20th a widespread rainfall came which changed the whole picture. The young grain crops which had been wilting, revived at once. In the Southern areas of the three prairie provinces, which have been the districts worst afflicted by drought in recent years, as much as four or five inches of rain fell within a week, and fields of grain, which were thought to have been ruined by the drought, now show the young grain springing up. It is true that these particular areas still need more moisture before they can be assured of a decent crop, but they have now at least a hope of it. The rains and the succeeding cool weather are also expected to operate as a check upon the annual plague of grasshoppers, which was promising to be quite serious this year. Pastures on the prairies have had a wonderful revival, and when their Majesties passed through last week, the countryside, which had been brown a week before, was green.

The Railway Battle

At Ottawa there have been some interesting developments in connection with the railway problem. When the report of the Special Committee of the Senate, which had been investigating the railway problem, came before the whole House, it was a document drafted by Senator Dandurand, the Government leader; and, while pronouncing against unification, it urged more effective measures of co-operation between the two railway systems. Senator Meighen, the Conservative Leader, submitted an amendment advocating unified management for the two railways. He spoke very ably in favour of his plan, and eventually managed to get the Senate,

ESTABLISHED 1810

in which the Conservatives still have a majority, to endorse unification by 25 to 21. The number of absentees was large; and the majority for the Meighen proposals was composed wholly of Conservatives, though six other Conservatives voted with 15 Liberals against it. They took the view that they could not endorse a policy which ran directly counter to the definite pronouncement of the National Convention of the Conservative party last July, and Dr Manion, the leader of the Conservative party, found himself in a similar position.

A Bill to provide for a measure of compensation to railway employees who had been laid off as a result of schemes for economy, provided Dr Manion with an opportunity for reaffirming his resolute opposition to any plan for unification. He held that the advocates of unification were "simply preaching something which is impossible." But the sharp divergence of opinion between its two leaders on the railway problem is very embarrassing to the Conservative party.

The King Government has published correspondence disclosing that the British Government, through Sir Thomas Inskip, the Secretary for the Dominions, has refused to consent to the readjustment of certain terms of the Anglo-Canadian fiscal agreement which would enable the Canadian Ministry to carry out proposals embodied in its last Budget for an increase in the duties on vegetable oils. These changes had been made in response to complaints from Canadian farmers that the demand for butter and pork lard was being curtailed by the increasing use of substitutes made from vegetable oils.

New Zealand's Import Control

[FROM OUR CHRISTCHURCH CORRESPONDENT]

THE publication of a detailed list of the percentage reductions to be imposed on imports for the second half of 1939 compared with the same period of 1938 gave New Zealand a new and fuller appreciation of the meaning of trade control. For the first half of this year licences have been required for all imports, and the problems of importers have

been difficult enough. Now it appears that the reductions already made have been quite inadequate; that imports for the first half-year have been greater than was expected and will use up a large part of the exchange funds accumulated in the export season; and that restrictions in the second half of the year must be correspondingly more severe.

The reductions now announced give preference first to British and second to Empire goods; they either cut luxury imports heavily or prohibit them altogether; and they prohibit also imports of most goods that can be manufactured in New Zealand. There are, for instance, reductions of 100 per cent (for the second half of the year) in imports of cigarettes, cigars and tobacco, wine and spirits, carpets and linoleums, preserved fruit, fish and meat, etc. Completely assembled motor vehicles are prohibited, though unassembled motor vehicles are reduced by only 40 per cent. Most apparel, finished clothing, hats, etc., are prohibited; though textile piece-goods and materials for manufacture are permitted subject to licence. It is reported also that agreement has been reached to import certain brands of whisky and cigarettes, provided that the private arrangements made for payment do not require the overseas funds under Government control to be drawn upon.

Moreover, Government responsibility apparently ceases when licences to import are provided. The licences carry no guarantee that exchange will be made available to pay for the goods concerned, and the importer, even though he secures a licence, must still arrange with the banks to provide the necessary exchange funds overseas. Hence the final decision rests with the banks, and there are many people who point out that it would have been far better had the banks been left to carry out the restriction themselves and to apply such rationing and control as they think necessary. This procedure has worked well in the past when conditions have made it unavoidable, and it would have freed the Government from much criticism from both external and internal sources and would have avoided all the costly complications of the present licensing system.

The Consequences of Control

Meanwhile, importers and others are claiming that the restrictions imposed will force many traders out of business and will promote unemployment in the wholesale, distributive and transport trades, while the community will have to pay higher prices for a narrower range of poorer quality goods. A group of foreign wool buyers has suggested that, if the national products of their country are to be excluded from New Zealand by Government edict, they may be unable to buy at the local wool sales, where their competition is an important factor in maintaining prices. A conference between the Government and the shipping interests on overseas freight contracts is reported to have reached no agreement, and the shipping representatives are doubtless perturbed about the reduction in inward freights likely to result from import control.

The Government, while it has announced an anticipated Budget surplus of £NZ800,000 for the financial year just closed, is silent about the probable effects of its import control scheme on customs duties for the present financial year 1939-40. Local manufactures which compete with imports, however, are expanding. The establishment of many new factories is reported, and some overseas concerns are setting up factories to manufacture their products locally. The Government is trying to stimulate the transfer of labour from relief and public works to expanding manufactures and is prepared to subsidise wages during the period required for training. In most lines, importers still hold fair stocks and, as yet, consumers have noticed no shortage of imported goods, though the prices of some are tending to rise.

At the end of March last, the overseas funds held by the Reserve Bank were a little less than at the end of December, 1938, but the trading bank holdings and the total held by all banks had increased by about £NZ2½ millions. Mr Nash, Minister of Finance and Customs, who is in charge of import control and is most closely concerned with overseas funds, has gone to England where he expects to discuss trade and finance. Though the Labour Government has in the past been opposed to external borrowing, there are indications that in the face of present necessity its opinion has changed, and it is generally believed that the Minister hopes to raise an external loan while he is away, perhaps for defence purposes. If such a loan could be raised and most of the money spent in New Zealand, its effect would be to augment the overseas funds whose depletion was the chief cause of import control. The raising of a loan would therefore remove much of the present necessity for drastic restriction of imports and might do much towards modifying the cumbersome licensing system now in force.

May 10th.

Letters to the Editor

The Czech Gold

TO THE EDITOR OF THE ECONOMIST

SIR,—In your June 3rd issue you rightly state that the decision of the B.I.S. to surrender the Czech gold to Germany "contravenes British notions of the duty of a prudent banker." Yet, your Note on the subject is concerned about the effect on London's reputation as a financial centre of a refusal by the Bank of England to carry out a decision which was known to have been taken in contravention of British notions of the duty of a prudent banker!

Several legal experts of high standard have expressed the view that, since the B.I.S. had no right to surrender the Czech gold upon instructions received obviously under duress, it would have been the right and duty of the Bank of England to await a ruling by a British law court, instead of executing instructions for the wrongful surrender of the Czech gold. Such an attitude is usually adopted by British banks in similar circumstances. It was actually adopted in many instances last year, when instructions signed by Austrian owners of London accounts were disregarded, owing to very strong presumption that those instructions were given under duress. And yet London's reputation did not suffer as a result of the attitude taken up by her banks. The legal grounds on which a clearing bank refused to carry out instructions given by the Bank of Spain were incomparably flimsier than those on which the Bank of England ought to have disregarded instructions by the B.I.S. concerning the Czech gold. The defence of the decision to block the Bank of Spain's sterling balance was that if there is the slightest reason to fear that a subsequent legal action may compel the bank to pay out for a second time, the best course is to do nothing. The worst that could have been said about the Bank of England if it had refused to comply with the instructions of the B.I.S. would have been that the "Old Lady" was being somewhat over-cautious, and no banking centre ever lost its reputation owing to such a charge.

Your Note is liable to create a false impression in the minds of its readers. It can hardly be maintained that the immunity granted by the Government to the London assets of the B.I.S. covers those assets also against legal action, or compels the Bank of England to surrender those assets if doubts arise whether the B.I.S. was legally entitled to dispose of them. There is nothing in the letter or the spirit of the Agreements of 1930 and 1936 providing for immunity of those assets against Government action which would have placed them outside the jurisdiction of British law courts.

What surprises me more than anything else since the beginning of the controversy is your remark that a decision to retain that Czech gold in London "would certainly violate the spirit of the undertakings that were given to the B.I.S. when it was set up, even if it could be accommodated with their letter." I should have thought that the object of the undertakings was exactly to safeguard the assets of small countries against confiscation in case of war, and not to facilitate the task of the conqueror to obtain its victim's gold on the ground of legalistic technicalities. Clever lawyers may doubtless be able to make out a strong case in favour of the surrender of the Czech gold on the basis of the strict letter of the guarantee. But the moment they depart from the letter of the undertaking and refer to its spirit their contention would become untenable. It is hardly complimentary to the authors of the B.I.S. scheme to imply that this surrender of the Czech gold to Germany is in accordance with the spirit of their idealistic proposals. Had they envisaged the possibility of such a situation as has arisen, some of them at any rate would certainly have insisted upon making provisions to safeguard the assets of victims of aggression.

Only those to whom form is everything and substance nothing can possibly defend the surrender of Czech assets, which would have been an immoral act even if the legal case in its favour had been 100 per cent. watertight. As it is, since it is at least doubtful whether the B.I.S. and the Bank of England were even legally entitled to act as they did, their decision is simply unpardonable. Had they wished to pay attention to the moral aspects of the case they could undoubtedly have found sufficient legal justification for suspending action and awaiting a decision of the Swiss or British law courts. The chances are that the German authorities would never have dared to submit their dealings in Czecho-Slovakia to impartial and independent judgment.

Yours faithfully,
PAUL EINZIG.

[Our Note drew a distinction between the actions of the B.I.S. and of the Bank of England. There is a *prima facie* presumption (it is no more) that the instructions sent from Prague to the B.I.S. were given under duress. But there is no suggestion that the B.I.S. itself was acting under duress in giving its instructions to the Bank of England, and we repeat our opinion that for the Bank of England to have refused to obey these instructions would have been a violation of the spirit of the undertakings given when the B.I.S. was set up, even if reconcilable with their letter.—EDITOR.]

Poland Under Arms

TO THE EDITOR OF THE ECONOMIST

SIR,—In the interesting article about Poland's war potential ("Poland Under Arms," *The Economist*, May 20th) your correspondent in Poland, describing the strong position of the Polish population, points out that the Jews subscribed only 7 per cent. of the Air Defence Loan.

We, the Warsaw readers of *The Economist*, do not know what is the statistical source of this information. However, as there are as yet no available statistics of the subscribers of the Air Defence Loan and the fragmental data of some districts (e.g. Kraków or Polesie) show a very high percentage of Jews among the subscribers, we are asking ourselves whether this information is not by any chance suggested by the misleading figures of the anti-Semitic Press prompting the absurd thesis of the Jews boycotting the loan.

Yours faithfully,
WARSAW READER.

[Our correspondent informs us that he received the information from what he believed to be a reliable source. The intention of mentioning the figure was not in the least to underrate the patriotism of the Polish Jews but rather to emphasise the fact that subscriptions to the loan had not been confined to financial circles.—EDITOR.]

The Poverty of a People

THE quest after that mystic quantity the per capita income has the same fascination to the economist and statistician as the search for spices and gold had for explorers and merchant adventurers in the expansive Elizabethan era. The concept of national income has come to stay as a measure of the wealth of nations; and, during the last seventy years, politicians like Dadabhai Naoroji, the Grand Old Man of India, a Gladstonian Liberal and the first Indian M.P., pro-consuls like Lord Curzon, administrators like Atkinson and professional Pundits like Shah and Khambhata have attempted in turn to arrive at some estimate of the Indian nation's income.

Dr Naoroji was a pioneer in the field and, in view of a pioneer's difficulties, the fact that his figure of the value of the agricultural produce of British India was practically identical with that of the Indian Famine Commission of 1880 was a tribute to his statistical skill. His weakness lay in underestimating the value of non-agricultural output and excluding the income accruing from services. Naoroji approached the subject from the physiocratic concept of the "materiality" of income, whereas to-day the majority of the economists concede that income consists of utility, and services which conduce to utility are on a par with income.

Going through the literature on this subject one cannot help feeling that, all too often, the researchers have investigated the topic, not so much to compute correct data and allow the results to speak for themselves, as to make out a case or prove a thesis. For example, William Digby, in order to prick Curzon's complacency and to prove that India was actually getting poorer under British rule, calculated the value of India's agricultural income on the basis of land revenue assessments, which led him to underestimate the total grossly. And, if Digby presents too depressing a picture, Atkinson goes to the other extreme. He uses without question over-generously increased estimates of yield per acre and in prices in computing agricultural income, and too readily assumes both that the number of earners in non-agricultural occupations is equal to all the males of the ages of 15 and above and that they are continuously employed. Also, his figures are swollen by "double counting" and by crediting the "unproductive" class of 9.8 lakhs of beggars and mendicants with an income of Rs. 7.1 crores! (one lakh=100,000,

and one crore=10,000,000). Finally, we have Messrs Shah and Khambhata concluding that the income from cattle (excepting for labour) is nil.

It is a welcome relief to turn to the brief and brilliant essay* in which Dr Rao makes a courageous, and, it would seem, successful, attempt to arrive at a trustworthy figure for British India's average annual national income for the years 1925-29. Dr Rao shirks no difficulties and, when he is compelled to make assumptions, he has the candour to say so and he chooses estimates likely to involve the minimum margin of error.

The debatable ground which has to be traversed is enormous. Even to-day, detailed classifications of the cultivated area and estimates of yield per acre are available for only 80 per cent. of the total gross area of India, and one has perforce to apply to the remaining area an average value per acre calculated from the value of agricultural production of the area for which there are figures. Official statistics of milk yields, slaughter for meat, production of hides and skins, bones, hams and manure, are wholly lacking. The incidence of income tax is restricted to non-agriculture incomes, that is to say, some 30 per cent. of the total population; and the income tax returns furnish no evidence of the magnitude of even that class of income, for, with the minimum taxable income at Rs. 2,000 (£150), there are hardly more than three lakhs of assesseees. There is no agricultural or industrial censuses of production. The contribution of railways is measured by the services of the labour and capital employed and, as the Indian railways have mostly foreign capital, it is treated as equivalent to their wages and salary bill. It is taken for granted that 50 per cent. of the agricultural and 66½ per cent. of the industrial production are transported by road. Lastly, half of India's gross agricultural produce, two-thirds of industrial products, the whole of forest products and minerals are taken as "traded" and appropriate deductions are made in all cases to arrive at the net income.

The conclusions arrived at after this jungle has been cut through are depressing. The net figure for British India's national income works out at Rs. 2,068 crores (1,290 from agriculture, 362 from livestock and 267 from industry) made up of 1,190 lakhs of incomes. The annual income per head works out at Rs. 79.5. If allowances are made for the profits of foreign capital, and to cover remittances made by foreign residents in the country, the national income available for human subsistence amounts to Rs. 2,023 crores, or Rs. 77.9 per capita. This works out to a little more than a rupee (1s. 6d.) a day for a family of five, and the figure includes the incomes of both the millionaire and the manual labourer.

It is not surprising that the mass of the Indian population "live in hovels, have only a few clothes, know no furniture, rarely drink milk, hardly ever eat meat or fruit or other expensive though nutritious items of diet" and have little to spend on the "miscellaneous" items which serve as an index to the standard of life. Dr Rao is able to show that India is not growing poorer in an absolute sense, but the pace of progress is slow with the national income increasing by about one per cent. per annum.

THE BUSINESS WORLD

Life Assurance in "Near-War"

LIFE assurance thrives on human longevity, and the threat of increased mortality through war presents the assurance offices with a formidable problem, to which they have given careful thought, both individually and in concert. The normal assumption that experienced mortality can be translated into probabilities of future mortality has been so distorted by the war risk that little proof is required to show the necessity of higher premiums. The business of assurance is not, however, purely a matter of formal logic and the conclusion that premiums should be raised, or that cover for war mortality should be excluded, has not so far been adopted by the offices. With minor exceptions for some special classes of contracts, the ordinary offices are still transacting life assurance at normal rates, without restrictions for the war risk, and there is no immediate expectation that they will change their practice. A new assured, in other words, is gratuitously presented with cover against the greatly enhanced hazard of death through war, either as a combatant or as a civilian. Since the offices have decided, after mature deliberation, to continue this practice, it may be a fair assumption that, throughout the stage of "near-war," they will make no changes in premiums or conditions.

The industrial offices are a rather different case. Industrial policies frequently contain a condition that the office may require a higher premium or lower sum assured in the event of the assured person being engaged as a combatant in active service. In the Great War this condition was voluntarily waived, and no differentiation was made on old policies between civilians and combatants. Whether this precedent would be followed in the event of future hostilities is a question for the offices, but it may be noted that it is the civilian and not the combatant risk which, rightly or wrongly, now assumes the greatest importance in the public eye. Hence, the difference between the position of the ordinary and industrial offices in relation to the war risk is to-day less marked.

Why are the ordinary offices, in effect, offering free cover against war? It is evident, in the first place, that they are unable to vary the vast bulk of life assurance contracts already in force; these are long-term contracts, binding on the parties on the terms agreed at their inception. These conditions made no exception for a state of war, nor were the premiums loaded to cover a risk which was present in few minds. Given irrevocable liability for the huge mass of policies written in the past, the offices may well have concluded that the increment of business during the "near-war" stage would have relatively little effect on their aggregate liability, whether the war risk was included or not. Another somewhat contradictory factor is that a rise in rates—perhaps a massive rise—would greatly prejudice new business, and although new business with an unremunerative war liability might prove decidedly costly, staffs have to be employed, and branches and agents maintained; new premiums are useful when interest rates are hardening; competitors are active; and large new business figures are a valuable advertisement.

Thus, the offices' motto is still "Business as Usual," but there are some subtle departures from the normal. Business of the less profitable or more hazardous type is being transacted on more circumspect underwriting standards. Family income proposals and large individual

assurances are being examined with a keener eye. And the adoption of conscription, together with the doubling of the Territorial Army, is prompting a number of offices to consider the introduction of a clause for policies on lives under 21—or, in some cases, 25—excluding the risk of death while engaged on active service. "Active service" means service in actual war conditions, not merely in pre-war training and, in any case, moral liability for the return of premiums or a surrender value remains. But the importance of this suggested exclusion clause for ordinary life business is strictly limited owing to the small volume of business written under the stipulated ages. It may be noted that for persons in the Civil Air Guard and Air Clubs, an extra premium is already demanded, to cover the specific risks involved.

Under such circumstances, an emphatic stimulus to new assurance business might, in theory, be expected. Since family responsibilities are so patently enlarged under "near-war" conditions, the offices' gratuitous assumption of the war risk might have been regarded as peculiarly attractive. In fact, however, the general public has been reluctant to undertake new assurances for even the average sums recorded during 1938. Possibly, times of unrest destroy human prudence at least as much as they create it. A more dominant factor is the uncertainty of maintaining premium payments. If some stand to gain by war, the majority must suffer loss of income. Moreover, assured persons usually have sufficient economic knowledge to realise the fact that a fixed sum of money may not always maintain its real value in terms of goods, and it may be that fears of the advent of inflation have produced a reaction among many potential new policyholders. There may be others whose apprehension is concerned less with inflation than with the possible depreciation of insurance office assets which they deem inescapable in war-time, even if extreme inflation were circumvented. To both classes, the large proportion of gilt-edged securities included in insurance investment portfolios appears as a factor of incipient weakness. Without in any way impugning the investment wisdom of insurance managements, which has always earned high praise, some part of the community is unsure of the war-time stability of insurance assets.

What is the reply of the insurance offices to these vaguely-felt apprehensions? In the ordinary branch, assured persons have the benefit of the "non-forfeiture clause" on their policies, which provides for the payment of overdue premiums out of the surrender value of the policy, and is practically universal. In the industrial branch, the Act of 1923 bestows on policyholders the right to a "paid-up policy" of stipulated amount if their premiums come into default, and for certain policies the Act of 1929 grants a surrender value after one year. The effect of these various provisions is, indeed, qualified, for an ordinary policy does not usually acquire a surrender value for two or three years after inception, while in the industrial branch the "free-policy" provisions apply only when policies are one or two years old (most offices having voluntarily reduced the three years' limit laid down by the 1923 Act). But they are valuable, and their existence should be stressed. Whether a further protection for the policyholder—a moratorium on premium payments—would be available on any outbreak of

hostilities is a question incapable of an answer at this stage. It may, however, be recalled that a moratorium was declared very early in the Great War for industrial policyholders, and that it bore hardly on the offices, which were forced to keep policies in existence while premium arrears mounted—even if the assured lapsed the policies after the period of gratuitous cover. A moratorium was not declared on ordinary policies, but conditions in any future war might be entirely different from those of two decades ago.

As for the fear of inflation and investment depreciation, the insurance offices' reply might well take the form of a *tu quoque*. All investments are subject to the war risk, some in greater, some in lesser degree, and the offices have done much, by judicious choice of investments, to minimise the risk. A far smaller proportion of their funds has been invested in gilt-edged securities in the recent past than was the case some years ago, and even this smaller proportion is placed very largely in short-dated stocks. There has been a notable expansion in ordinary shares, probably the best hedge against the war danger. The changed distribution of the investment of new funds has not, of course, been dictated solely by war considerations—the need to maintain earning-power during a period of low interest rates has been a major determinant in the new policy—but it happens that, broadly speaking, the assets of higher earning-power are those which best guard against war hazards. No assurance office would maintain that its portfolio was 100 per cent. proof against war-time depreciation; but insurance offices are perhaps more

capable of avoiding it than many private individuals. Any dangerous fall in insurance assets would be followed, inevitably, by a demand that the Government should ease the situation. Moreover, temporary declines in investment values may be less significant than they seem. The American expedient of the "conventional" valuation of insurance assets—by which depreciation at the date of the balance sheet need not be brought into the books—may have been misused, but it possesses some element of justification in special circumstances of strain. And probably the expansion in expenses in war time, relatively to fixed premium payments, is almost as great a danger as investment depreciation, since its effects would be immediately felt in the revenue account of every insurance company.

This discussion of the possible behaviour of insurance investments in time of war is, happily, a matter of abstract consideration at the moment, but it has natural links with conditions in "near war." The element of depreciation in values may still be present, though in less emphatic guise. But the major problem might conceivably prove to be, not depreciation of assets, but their regulation; not the rise in interest rates which may, sooner or later, follow large-scale Government financing—this, after all, would provide greater earning-power on new investments—but an unpalatable degree of Government control over investment policy at large. But insurance offices would not be alone in finding the bureaucratic arm extended in their direction; the whole of the City of London will come within its reach.

Cement Profits

"MULTIPLE correlation" may sound a formidable term for the layman, yet it is a technique which provides considerable guidance in long-term equity investment. Its application depends upon the availability of sufficient statistical material for the industry examined, but it does not call for any attempt to fit curves or calculate co-efficients—matters which fall more strictly within the competence of the trained mathematician. The cement industry certainly provides sufficient statistics. And recent developments towards a more closely co-ordinated price and output policy within the industry have renewed the investor's interest in the investment possibilities of leading cement shares, viewed against the industry's economic background. Analysis thus falls into three parts. It is necessary, first, to ascertain the trend of profits of representative companies during recent years; secondly, to correlate that trend with the course of certain "explanatory" statistical series; and, finally,

after allowing for other factors which are incapable of numerical evaluation, to frame general conclusions regarding the future outlook.

In the first of the accompanying charts, the percentages earned on the ordinary shares of four well-known cement-producing companies (set out in Table I) for each year from 1929 to 1938, have been plotted on a logarithmic scale. The choice of percentage ordinary share earnings for this purpose is necessary to eliminate the disturbing effect on total profits of increases in issued capital and the absorption of competing producers; in any case they provide the best measure of the long-term equity appeal of an ordinary share. By using a logarithmic scale, "in just proportions we just beauties see"—in other words, relative instead of absolute, fluctuations can be seen at a glance. Of the four companies whose figures form the basis of our first chart, Associated Portland Cement, which is much the largest and oldest established, has

a controlling interest in British Portland Cement and absorbed Alpha Cement at the beginning of 1938. The fourth company, Eastwoods Cement, is independent of the "Associated" group. The chart shows, on even a cursory inspection, that though in 1929-30 (and still more during the general industrial depression of the early thirties) cement company earnings were relatively moderate, something happened between 1933 and 1936 to raise the industry's profit-earning power to a new plane. The trend of the last two years has been less decisive—on the whole, even somewhat reactionary—but the chart affords no suggestion of the probability of an early return to the former level of earning power. The "something," whatever it was, affected all the companies shown, though its results were most pronounced in the case of the largest concern.

What is this unknown but all-important *x*? This brings us to the second stage of our inquiry. What statistical material is available to throw light on the industrial background during the critical period? Official returns of

for the brickwork of dwelling houses, but the steel-frame-cement type of construction is more commonly used in the largest buildings—modern factories, blocks of flats, etc. Accordingly, it is desirable to subdivide the building plans total into dwelling houses and other buildings.

The figures under all these heads are set out in the tables and have been plotted logarithmically in the second of the charts. This compares the trend of earnings of the Associated Portland Cement Company with the "explanatory" series, whose fluctuations may afford some clue to trend of profits. Our task is to discover what correlation exists between the earnings trend and the explanatory series. All the series but one, in fact, show some positive correlation with Associated Cement profits; only in the case of cement prices is the correlation negative. In other words, despite the importance attached to price maintenance within the industry, the striking fact emerges that the last big rises in output, consumption and profits were achieved on a falling price level. So far as the latter has represented the passing to the consumer of the economies of increased efficiency, it has paid the industry, and the investor, handsomely. Actually, the rise in price in 1938 was contemporaneous with a reduction in demand and the confirmation of a check to the upward curve of profits.

Building plans, clearly, tend to move in close relationship with, but something like a year in advance of, cement output. The sub-division of the building figures into dwellings and non-dwellings, however, discloses certain significant facts. Changes in the trend of plans for non-dwellings tend to occur about a year later than changes in plans for dwelling houses. And correlation, both in respect of time and the extent of relative movements, is closest between profits and non-dwelling plans than between profits and any other series shown in the Chart.

For investors contemplating a substantial placing of funds in cement shares, further mathematical analysis may be recommended. Even in its absence, however, the

total cement output are available for the Census of Production years (1907, 1924, 1930 and 1935), supplemented, in more recent periods, by reliable annual figures. These provide a continuous measure of the productive activity of the entire industry. Official figures of average prices of Portland cement delivered in London are also published, though these are known to have been subject in some cases to "shading" in actual contracts in the earlier years of the '30's—though less so in the later years. Of the consumption of cement in its different uses, direct evidence is lacking, but its main purpose is constructional. Hence, the building plans passed by a large number of local authorities throw some light on the trend of demand. Cement is a constituent in the mortar used

graphic method adopted in this article has brought out three important conclusions. In recent years the correlation between cement prices and cement profits has been negative. Profits, nevertheless, have risen faster than output. And the series which has closest correlation with profits is plans for buildings other than houses. As this latter statistic is available regularly to investors each month, its usefulness as a guide to the trend of cement profits is obvious—though the exclusion from the figures of all direct Government contracts necessarily reduces their accuracy in times like the present. The total value of such plans for the first four months of this year shows a rise of 3.6 per cent. as compared with the corresponding months of 1938.

We have thus reached the third portion of our analysis. The supercharging factor which raised cement profits a few years ago, would seem to have been a compound of the building boom, new capital expenditure by industry in the Great Recovery, and, later, the rearmament programme—all at a time when cement was replacing other constructional materials in the largest buildings and was being increasingly used for other purposes like road-making. That the industry, and particularly its dominant producer, made so profitable a use of its opportunities, can be attributed in no small part to its ability to maintain a cohesive internal organisation. Ever since the merger of thirty firms brought the Associated Company into being in 1900, the industry has been subject to recurrent periods of intense competition, inevitable in a trade where the only bar to new entrants is the fact that the economies of moderately large-scale pro-

duction are considerable. On every occasion, however, when competition has threatened permanently to depress the level of profits, the leading group has succeeded in bringing other groups, by one means or another, under its expanding umbrella. Within the period covered by the charts, the competing "Red Triangle" companies have been absorbed, the Alpha and Tunnel companies have been brought under the group's auspices, and cartel arrangements have been successfully maintained in the industry as a whole. And these arrangements seem likely, for the present at least, to stand firm.

The omens, on the whole, seem to be against any substantial increase in the volume of constructional work, particularly if the deep shelter policy for A.R.P. is finally turned down. Long-term influences, however, will be with the industry so long as the tendency is to use cement to an increased extent whenever new public and industrial buildings are being erected. So long as the industry pursues the policy announced a couple of months ago by the chairman of the Associated Company, of passing on the economies of increased demand by a lower price, the case for holding the ordinary stock of the dominant concern as a long-term investment (at the present price of 73s. 1½d. the £1 stock units yield £5 9s. 6d. per cent.) appears to be sound, even though the immediate trend of earnings may be somewhat indeterminate. Long-run prospects may turn, ultimately, less on the industry's present strength to ensure the maintenance of prices, than upon the future ability of the leading organisation to impose, if necessary, a sufficient reduction in prices further to stimulate demand on the grand scale.

The Cotton-Rayon Controversy

THE main point of controversy that has been raised during the passage of the Cotton Industry (Reorganisation) Bill through Standing Committee of the Commons has concerned the precise place in the new organisation that is to be played by the rayon industry. The Committee decided on Thursday not to make it obligatory on the Board of Trade to set up a separate rayon committee within three months of the passing into law of the Bill. This decision represents a setback for the rayon-producing interests, and if it is not modified before the Bill becomes law it will mark a definite turning-point in the history of the relation between the cotton and rayon interests.

The differences between the two sections have been complicated from the beginning by the fact that while the production of rayon yarn and staple fibre is a distinct industry, rayon and cotton can be and are woven on the same looms. (About 40 per cent. of the rayon yarn woven into tissues is now processed by the cotton industry.) The issue has been rendered more involved by the fact that many rayon weavers have not been in sympathy with the attempt of the rayon producers to secure the recognition of rayon as a separate industry. Finally, the matter has hardly been clarified by the statements issued by the opposed interests in the course of the controversy, which reached a new climax during the past week with the publication of notices in the Press on behalf of the rayon producers. These statements have been of a purely propagandist nature, with both sides refusing to fight on the other's ground and neither side presenting its figures in a straightforward and objective fashion. The cotton interests have been particularly disingenuous in their public pronouncements.

Nevertheless, it is possible to indicate the main landmarks in the controversy and to state the principal issues still outstanding. The original proposal to carry out by statute a reorganisation of the cotton industry met with strong opposition in Lancashire. In this the rayon producers took no part, mainly owing to the internal differences of their industry. During the passage of the present Bill through Parliament, however, the rayon producers have energetically contended that the rayon industry is fundamentally distinct from cotton and have accordingly sug-

gested amendments to the Bill. As a result of this agitation certain concessions have been made. The possibility of a veto by the Cotton Industry Board over schemes to control the prices of rayon goods has been removed and any such schemes may be forwarded for consideration to the Cotton Industry Advisory Committee (a more broadly based body) and to the Board of Trade. In addition, rayon has been promised better representation on the Export Development Committee.

Issue was next joined on the critical question of the status of the Rayon Committee which might be set up under Clause 15 of the Bill. The original clause states that the Board of Trade may set up such a committee on the recommendation of the Cotton Industry Advisory Committee after that body has consulted with representatives of all stages of rayon production and manufacture. To the interposition of this procedure between an application for a rayon committee and its actual setting up the rayon producers strongly objected. It is easy to see the grounds of their objection. Even if the Advisory Committee does not actually refuse the application the procedure offers considerable opportunities for delaying tactics on the part of anti-rayon interests, and in fact presents the latter with a bargaining point which could at least drive the rayon producers to make concessions in the course of the application. The rayon producers therefore contended that the intermediate steps should be eliminated and the Committee should be "established as part and parcel of the Bill." This proposal has now been negatived and the clause stands in its original form.

There can be no doubt that the rayon producers' contention that they should not be forced to submit to domination by cotton interests was in principle reasonable. The fact that the President of the Board of Trade prefers to speak of cotton and rayon "not as two industries but as two materials" makes no difference to the fact that these two materials are in sharp competition with each other. Nor does it affect the even more important point that cotton is a declining industry which requires statutory reorganisation to prevent it from declining still further, whereas rayon production is a rapidly expanding industry which requires statutory control, if it needs it at all, to

prevent it from deriving undue benefit from its strong control over the supply of a material for which there is a large and rising demand. The actual effect of clause 15 of the Bill might be to place the rayon producers virtually in a position of dependence upon their competitors.

Mr Oliver Stanley gave as his reason for opposing the setting-up of a statutory, and therefore probably less dependent, rayon Committee his desire not to force the rayon weavers into a scheme which they feared would give too much power to the rayon producers. These fears were not entirely groundless. Rayon is a new and successful industry, which is still largely protected by patents, and the producers of the filament have sometimes shown little consideration for the interests of those who weave it. But it is unjust and unnecessary to assume that the only way to remove the cause of the rayon weavers' fears is to place the whole rayon industry under the dominance of cotton interests. The contention of the latter that they would not take advantage of their position is, to say the least, a trifle hard to believe. The cotton manufacturers are not in business for the health of the rayon producers. A combination of the two as envisaged by the present Bill would be very similar to the combination which subsisted between

Jonah and the whale, and might have to be brought to an end in similarly drastic fashion.

The fact is that cotton and rayon need control for different reasons. The cotton industry because in the absence of reorganisation it will continue to stagger under a burden of excess capacity and to lose its overseas markets. The contacts between cotton and rayon are so intimate, especially in the weaving stage, that if cotton is controlled, rayon is necessarily affected. Moreover, the recent tendency towards a closer organisation of the rayon producing industry gives it a strong position with regard to both the public and the weavers of rayon-cotton mixed fabrics. In the absence of a recognition of this fact the issue will remain as confused as the advocates of either side and the President of the Board of Trade like to make it. It is easy to see the objections to giving the semi-monopoly of the rayon producers a statutory form, which their proposal for a completely independent committee would do. But the rayon producing industry, if it is to be statutorily organised, requires control from outside in the form of the representation of the public on the controlling body, and this is not at all the same thing as its substantial domination by cotton.

Finance and Banking

Chinese Stabilisation Hitch.—The market in Chinese dollars was thrown into considerable confusion on Wednesday of this week by the sudden withdrawal of support from the Chinese Stabilisation Fund. In view of the persistent deficit at which the Chinese balance of trade has been running the Stabilisation Fund had for some time past been the dominant factor in the market and the pegging of the exchange rate at 8½d. could be maintained only by dint of persistent intervention on its part. The sudden cessation of that support must not be interpreted as an indication that the reserves of the fund are exhausted. Last March the resources at the disposal of the Chinese National authorities were strengthened to the extent of £10 millions by external credits, of which half came, under a British Government guarantee, from British banks operating in the Far East. These resources are far from exhausted, though it must be realised that some encroachment on them has been made. Chinese export trade must inevitably be hampered by the continuation of hostilities against Japan. Import trade for its part is swollen by the abnormal purchases of war materials for which those hostilities call. With the Treaty ports so largely in the hands of Japanese or Japanese-controlled authorities, the proceeds of maritime customs revenues are to a large extent prevented from reaching National Chinese reserves. The combination of these factors has evidently convinced those in charge of the Stabilisation Fund that the situation demanded an immediate adjustment of the exchange rate and that unless such an adjustment were made the resources of the fund would be seriously weakened. Hence the decision to abandon the exchange market to its own devices for the time being. An awkward period of transition between one stabilisation level and the next may therefore ensue. That it will be short may be assumed from the reassuring statements which the Stabilisation Fund Committee have already made. It should, incidentally, be noted that the difficulties of the Chinese Stabilisation Fund are in no way due to the attempts of the Japanese-controlled authorities to establish their own currency. As yet these attempts have met with negligible results outside the northern provinces, and in the north, where the yuan has now been in circulation for over a year, the penetration of the new currency continues to meet with passive resistance from the bulk of the population.

Guilder Weakness.—The Dutch currency has shown persistent signs of weakness during the past few days. From a rate of 8.71½ quoted on July 1st, the guilder has

this week fallen to 8.83, and it is only persistent and considerable intervention by the Dutch control which has succeeded in bringing the quotation back to around 8.79. The causes of this weakness of what is regarded in the foreign exchange market as one of the inherently strongest currencies are twofold. In the first place, there is the technical factor of considerable French sales of the guilder proceeds of the loans recently placed in the Dutch capital market. The French Exchange Fund has taken over these proceeds and has made the franc equivalent available to the Treasury. There has apparently been some hitch in the direct operation of the Tripartite machinery by which the guilders held by the French control should have been converted into gold. The French authorities have found it more profitable to sell the guilders against sterling and obtain their gold by earmarking it in London against their purchases of sterling. This provides a partial explanation of the weakness of the guilder in terms of sterling. Incidentally, it also provides one of the reasons for the strength of sterling in terms of dollars, since the Dutch control following their normal procedure offered the bulk of their support for the currency by selling dollars (the greater part of the Dutch gold reserve abroad is earmarked in New York). The second and more deep-seated reason for the depreciation of the guilder is to be found in a steady though moderate outflow of Dutch capital, which remains highly sensitive to international tension and which more recently has been rendered uneasy by the rumbles of dissension within the Dutch Cabinet on the question of financial policy. Increased expenditure on armaments must be incurred in Holland as elsewhere, and the question whether to borrow or to tax is causing more genuine controversy there than in any other country faced with the similar alternative. It led to the resignation of the Finance Minister three weeks ago, and this week Dr Trip, in the annual report of the Netherlands Bank, returns to the charge with the hardest of "hard money" precepts. Holland is, perhaps, fortunate to be able to indulge this discussion of a question which answers itself in most countries that have had to face it. But to the average Dutchman the issue does not appear in this

BRITANNIC ASSURANCE COMPANY LIMITED

comparatively favourable light, and the very existence of well advertised controversy on financial questions has caused suspicion and some precautionary export of capital.

May Clearing Bank Averages.—The averages for the ten English clearing banks for May show a distinct easing in the liquid assets position. Whereas in April the ratio of quick assets—cash, cheques in transit, short money and bills—to deposits had fallen to the inordinately low figure of 24.3 per cent., it had recovered to 29.9 per cent. in May, and was thus virtually back to the basic minimum figure of 30 per cent. to which the banks tend to work. The progress towards this basic figure has been made by an increase of £7.2 millions in cash and of £16.4 millions

	(In £ millions)

* Amended figure.

in bills discounted—the latter movement being due almost entirely to increased purchases of Treasury Bills. The greater readiness of the market to sell bills to the banks, and the exceptional quietude of Stock Exchange business during the greater part of May, are reflected in a slight reduction in short loans from £141.2 millions to £139.7 millions. With this return of the liquid assets position towards normality the banks should be in a position to play their part in the gilt-edged market if and when the Defence loan makes its appearance later in the year. There is, however, no sign yet of increased banking participation in the investment market, and last month's average of security holdings shows a drop of £5.9 millions on the April total. Advances are £4.7 millions down on the month, a movement which is not strictly in keeping with all the evidence of rising industrial and commercial activity in this country, but which may in part be explained by the repayment of loans contracted towards the close of the financial year for meeting income tax.

U.S. Treasury Financing.—The plans announced in Washington last week-end for meeting the September 15th maturities of Treasury bonds betoken an unbounded confidence in the strength of the market for U.S. Government securities over the next few months. The bonds which have to be met bear interest at the rate of $1\frac{1}{8}$ per cent. They are to be converted at par into five-year bonds, carrying interest at the rate of $\frac{3}{4}$ per cent. This is the lowest rate at which medium-term securities of the U.S. Government have yet been issued. The offer will not be open to cash subscriptions, the U.S. Treasury having complete confidence in the virtually unanimous response of conversion holders. The reasons for this confidence will be found in the present banking position in the United States. The Federal Reserve system is again glutted with excess reserves. The excess reserve balances of member banks are now at around \$4,220 millions, the highest figure ever recorded. They are about \$1,000 millions higher than their 1936 peak, which preceded the drastic measures taken to reduce this inflationary potential by doubling for a period the member banks' legal reserve requirements. Over the past twelve months the excess reserves have risen by about \$1,600 millions, wholly as the counterpart of the flow of

gold into the United States. The artificiality of the credit situation in the United States has given rise to demands for yet another investigation into the whole problem of currency and credit as affected by the present abnormal conditions. Senator Wagner, encouraged no doubt by the very full and informative answer he got to his gold questionnaire, has in his capacity as Chairman of the Senate Banking Commission announced the need for a detailed Congressional inquiry into the structure of the United States banking and monetary systems.

Italy's Balance of Payments.—Despite great efforts Italy has not yet succeeded in bringing her balance of payments into equilibrium. Last year's trade deficit was only 3 milliard lire, against 5.7 milliards in 1937. Yet, even so, according to Dr Guarneri, the Minister for Exchange Control, this reduced trade deficit was not covered by the surplus of invisible exports, mainly derived from tourist receipts, and the Bank of Italy lost two million lire. Nor, despite the further reduction in the trade deficit this year, has equilibrium been reached. In ordinary circumstances invisible receipts would easily cover the two milliard lire estimated as Italy's probable trade deficit this year. But high prices (even at the tourist rate of exchange of 98 lire to the £1) and political tension have combined to keep away the lucrative British and American tourists. At the same time, according to Dr Guarneri, the expenditure of the State abroad has increased, though it is not clear whether this is to be taken to refer to direct expenditure on diplomatic and consular representation, propaganda, etc., or to imports which are not included in the official returns. The following table analyses Italy's trade deficit:—

	In million lire		January–April	
	1937	1938	1938	1939
Total*	5,719	2,962	1,467	534
Germany†	1,566	1,115	492	165
Other "clearing" countries	337	580	347	1
"Non-clearing" countries	3,813	1,267	628	368

* Excluding trade with colonies and Albania.
† Including Austria and Czecho-Slovakia.

From these figures it is evident that, if Germany is excluded, Italy has succeeded on balance in equalising her trade with those countries with which she has clearing agreements. The principal draft on her foreign exchange in the first four months of this year is due to trade deficits of 112 million lire with the United States, of 129 millions with British Dominions and Colonies (other than the United Kingdom, with which Italy has, of course, a clearing) and of 127 millions with other "non-clearing" countries. Germany's position is peculiar. Italy normally has an import surplus in trade with Germany counterbalanced by the expenditure of German tourists. Last October the balance in the clearing moved in favour of the Italians and since then has steadily increased to the large figure on May 19th last of 342 million lire, equivalent to over £3 millions. It is difficult to gauge the precise reason for this movement. It might be due to the slowness of German exporters in delivering goods which have been ordered, or to very heavy expenditure by Germans in Italy. Possibly both surmises contain some element of truth.

Bank of New Zealand.—In view of the circumstances which induced the New Zealand Government to adopt foreign exchange control towards the end of last year, the results of the Bank of New Zealand for the twelve months ended March 31st are very satisfactory. The profits show a small rise of £2,732 to £585,941, and the dividend is maintained at 10 per cent. The flight of capital from New Zealand, which it was one of the objects of the new exchange regulations to prevent, may account for the decline in deposits from £34,731,532 to £33,328,479, for the increase of £785,417 in bills discounted and advances provides evidence that business activity inside the country was well maintained. Cash also shows a rise from £6,103,579 to £7,677,919, so that the bank is in a very liquid position, but there has been a corresponding fall in the money at call items and investments are down by £1,611,046 to £6,294,511.

MONEY MARKET NOTES

The Bullion Market

At the beginning of the week the strength of the pound tended to restrict arbitrage demand, and the turnover was consequently small. The Exchange Account has been in the market as a seller on more than one occasion. Its action in supplying gold on Monday and Tuesday, and thereby indirectly helping the pound's progress, is open to

* Above or below American shipping parity. This week's calculations are based on a temporary parity, in which the war risk rate is taken as 1s. 3d. per cent.

† At fixing.
The New York price of silver remained at 43 cents per ounce .999 fine during the week.

criticism, for later on both days it contradicted itself by purchasing dollars to check the rise in sterling. On Thursday, with the weaker turn in the pound, there was more scope for arbitrage, and the turnover was considerably higher. The silver market continues to be quiet.

The Bank Return

The gold in the Issue Department this week has been valued at 148s. 4d., compared with 148s. 5d. last week; and as the value of the total gold holding is unchanged, the difference must have been made up by a transfer of gold from the Exchange Account. The note circulation shows a fall of £1.4 millions,

and the Reserve has benefited accordingly. Payment of the War Loan dividend on June 1st has reversed last week's switch-over from bankers' to public deposits. Thus the latter are down by nearly £20 millions, while bankers' deposits show a rise of £18.2 millions.

The Money Market

The discount market is coming under the influence of the end of the half-year, and discount rates have accordingly tended to harden. On Wednesday the banks virtually suspended their bill purchases, in preparation for their half-year balance sheets, although one or two resumed buying on Thursday. As the market syndicate obtained another large allotment quota at last Friday's Treasury Bill tender, amounting to 73 per cent. of its applications, it has had about £44 millions of bills to take up in the last fortnight, while its correspond-

INSURANCE NOTES

£3,835,000 and accident premiums from £4,899,000 to £4,866,000. Marine premiums were £15,000 higher at £345,000. The underwriting results in the accident department were even more satisfactory than in 1937. The results of the last two years are given below:—

	1937		1938	
	Profit £	% of Prem.	Profit £	% of Prem.
Fire	422,214	10.7	332,251	8.7
Accident	491,391	10.0	536,911	11.1
Marine	14,479	13.6	3,138	9
Life	26,000	...	28,000	...
	894,866		900,300	
Charges to profit and loss	700,000		535,000	
Net trading surplus	194,866		365,300	

In 1937, £450,000 was written off investments, while in 1938 £300,000 was transferred to general contingencies; these amounts are included in the profit and loss charges. Apart from reserve of 40 per cent. of premiums for unexpired risk, additional reserves are held in the fire, accident and marine accounts of £1,775,000, £1,250,000 and

£300,000 respectively. Total assets increased from £32,742,000 to £32,989,000. The latest report separates, for the first time, assets belonging to the life assurance and annuity funds. Mortgages and loans showed a large increase from £1,618,000 to £2,380,000; British Government securities fell from £5,450,000 to £4,865,000, but foreign and Colonial Government securities increased from £8,340,000 to £9,070,000. This latter sum, which represents no less than 28 per cent. of the total assets, is no doubt associated in large part with the company's world-wide insurance activities. Debenture and ordinary stocks both fell sharply, from £6,086,000 and £3,524,000 to £5,638,000 and £2,962,000 respectively. General contingency fund amounts to £2,007,000 and the balance at profit and loss, after paying the 1938 dividend, is £906,000. The dividend on the share capital (which is held by the Royal) is 67½ per cent. for the ninth successive year, and costs £524,000, compared with available interest earnings of £382,000.

Foreign Exchanges

THE pronounced strength of sterling was one of the chief features of the foreign exchange market at the beginning of this week, the sterling-dollar rate rising from 4.68½ to 4.68½ on Monday and to 4.68½ on Tuesday when the market was more active than for some time past. The following day, however, after touching 4.68½ in the morning, the rate reacted as a result of some demand for dollars on continental account, and closed ½c. lower. The one month forward dollar showed a small movement in favour of the pound, the premium contracting from ½c. to ¾c., while the three months dollar remained at a premium of 1½c. On Thursday there was a further fall in the spot rate, in spite of official support, to about 4.68½-½. The Canadian dollar on Monday closed ½c. dearer in terms of sterling and at 4.69 showed a discount of only ¼c. over the London-New York rate. Swiss francs, after falling to 20.72½ at the end of last week, turned weaker on Monday and on Thursday afternoon were quoted at about 20.76½. Belgas have also been rather easier. The spot rate on Tuesday rose to 27.52½, compared with 27.51½ on Monday, but on Thursday afternoon it was back to 20.50½.

Investment

Markets and the Australian Loan.—The proximate cause of this week's more sober markets was the Australian loan. Yet neither this large-scale operation, nor the return of ill-defined political rumours in the "House" on Thursday, provides an entirely satisfactory explanation of the week's smaller business and halting prices. The arguments in support of equity shares as against gilt-edged, which, in different forms, received considerable emphasis last week, have proved unavailing. So indeed, has a spectacular employment return and excellent railway traffic. Two or three slack days, and dead markets, have the reverse technical reaction from a few days of greater activity and improving prices. Moreover, the claim of the equity markets to independence has not been substantiated; gilt-edged, and War Loan in particular, may be regarded as a European barometer which measures changes in political pressure; and only while the barometer is rising, it seems, can the equity markets strike out into new territory. In these days the markets are totalitarian, and enjoy no regional autonomy. And their capacity for absorbing new trustee issues, which appeared to be well on the mend, judging from the response to the South African and Northern Ireland issues, has been found wanting in the case of the Australian issue. The terms of this £6 million issue, of 4 per cent. stock, 1961-64, at 98½, appeared generous to a fault, for extensive scaling-down immediately occurred throughout the trustee lists. From one aspect the authorities are to be commended for not attempting to extract the last halfpenny in devising new issue terms. But marked generosity—particularly when it is associated with large size—carries its own message for the market, and many would-be subscribers to the loan must have held their hand until dealings commenced on

Thursday, when the stock closed at 1½ discount, leaving the underwriters with the problem of finding firm holders for 80 per cent. of the issue. On present indications, it would seem, this disturbance of a promising revival in trustee borrowing may involve a waiting period before the market's decks are cleared again for action.

Brazil to Resume Debt Service?—The announcement in Parliament on Monday that the Brazilian Government is considering a method for the resumption of debt payments, and that a further announcement may be made before July 1, stimulated interest in Brazilian bonds early in the week. But the market's general attitude towards this apparently favourable news was slightly sceptical rather than enthusiastic. As an indication that the Brazilian Government has not lost sight of its obligations, whose service has gone unpaid since the Aranha scheme was suspended in November, 1937, it provides some substance for hopes of resumed payments which have swayed the bond market. No less important, it stresses that the Brazilian Government intends to give all creditors equal treatment. This point would in any case be generally welcomed in principle; but it gains further importance in view of Senhor Aranha's statement three months ago that the Brazilian Government intended to resume debt service on the American bonds from July 1. Perhaps the market's reserved reception of the announcement may be due to preoccupation with Brazil's present economic burdens. Certainly, her exchange position would hardly permit the

resumption of payments on any generous scale, and in the present context the service prescribed under the 1934 scheme would certainly be reckoned generous. At this stage, the most that can be said is that the senior funding loans, which were accorded Grade I status under the Aranha scheme, should receive preferential, though not necessarily exclusive, treatment. On this assumption, the 5 per cent. Funding issue of 1898 advanced from 21½ on Monday to 23½ on Tuesday (though this gain was not fully held later in the week) while corresponding movements occurred in the other Funding issues. The "secured" loans in Grades II and III can also establish their second-charge claims, and particularly the San Paulo 7 per cent. Coffee Realisation Loan. At the moment, the investor has no more than an expression of Brazil's intentions, but he should learn fairly promptly what they may mean in terms of coupon payments.

London and Provincial Broking Conversations.—It is quite understandable that the authorities have avoided precise publicity concerning the exploratory discussions which are to take place shortly between representatives of the London and the Provincial Stock Exchanges. Of the need for co-ordinating the established stockbroking organisations throughout the country in the interests of the public and the profession there is ample evidence. But while co-ordination is desirable, it bristles with difficulties, which were outlined in *The Economist* of April 22nd. Hence, it would be as great an error of tact as of diplomacy publicly to define the issues. It is clear, however, that any limitation of discussion to such matters as a revision of the £2,500 rule, to put the provincial broker on the same footing as the London broker, would limit the approach to an extent which would hardly fit the views recently expressed by Mr R. B. Pearson, chairman of the London Stock Exchange, Mr C. H. Goode, president of the Council of the Associated Exchanges and Mr H. Goodes, chairman of the Provincial Brokers Exchange. The real problems are those of rationalisation, and they involve different and even opposing interests, which must be reconciled by mutual accommodation, if the profession is to enjoy better health and work with greater efficiency.

Without full acceptance of this principle, a constructive solution, for example, of the superficial incompatibility of the needs of the London market and the development of the provincial dealing organisations could hardly emerge. Fluid dealings and businesslike quotations can only be maintained if the throughput of business is adequate. London jobbers claim that, when trade is active, and bargains are easy to undo, the cream is skimmed by provincial dealers who can vary their stocks and their willingness to make prices, and, in the last resort, can turn to the London market to undo a bad bargain or level up their books. Provincial dealers, on the other hand, might reply that they have developed a legitimate and profitable business, in which no one holds a rightful monopoly. Yet a system which ensured the maintenance of the freest possible market would clearly encourage the largest aggregate turnover in the interests of both groups. As an adjunct to this main issue, questions of alignment of commissions and the position of agents necessarily arise. There are at present important differences of practice, and vested positions almost amounting to right have grown up accordingly. Compared with these complicated matters, such problems as uniformity of new issue dealing facilities and of membership standards seem comparatively simple. Above all, if the necessary co-ordination of policy and business practice can be secured, an appropriate constitutional structure will be more easily devised; its importance for the co-ordination, on national lines, of orthodox stockbroking institutions needs no emphasis.

Industrial Profits in May.—There is little sign as yet that the rate of decrease in industrial profits in general is slackening. The decline of 6.29 per cent. in the profits of 303 companies whose reports were published in May compares with 11.57 per cent. in both March and April. But the reduction in May could hardly be attributed to improved business conditions towards the end of 1938. Indeed, analysis of the month's figures suggests that it is due to the absence of any adverse weighting of the aggregate by large companies or groups, for the fall is consistent with adjusted March and April figures, after the exclusion of certain exceptional results in those months. The course of industrial net profits over the past two years is shown in the following table:—

INDUSTRIAL PROFITS 1937-39							
Year and Month	No. of Cos.	Net Profits*	Inc. on prev. year	Year and Month	No. of Cos.	Net Profits*	Change on prev. year
1937		£	%	1938		£	%

March	337	56,721,336	9.19	March	293	41,440,326	-11.57
April	225	28,481,318	17.19	April	233	24,067,714	-11.57
				May	303	46,863,324	-6.29

* After debenture interest.

The total of £46,863,324 for the month (against £50,010,120 recorded in the previous financial years of these 303 companies) includes the improved profits of the iron, coal and steel group, in which 19 companies show an advance of 15.3 per cent. from £4,333,510 to £4,997,776. The results of Imperial Chemical Industries and Burmah Oil contribute £11,076,537 towards the month's total.

Insurance Share Index.—The decline in insurance share prices which began in the latter part of 1938 continued in the first quarter of 1939. *The Economist* index of insurance share values (based on an investment in 1913 of £1,000 in the ordinary shares of 24 companies) declined from 4,198 to 4,057 in the first three months of this year. The index, which takes account of bonus share issues by assuming the sale of rights and reinvestment in an additional holding, is given in detail below:—

Company	Average 1937	Average 1938	March 31, 1938	June 30, 1938	Sept. 30, 1938	Dec. 30, 1938	March 31, 1939

GREENWOOD

London and Manchester Assurance.—In line with other industrial-cum-ordinary offices, new sums assured in the ordinary branch last year showed a slight reduction on the previous year, at £3,530,000, compared with £4,041,000. In the industrial branch, however, new sums assured increased from £6,553,000 to £6,785,000, and premium income amounted to £1,891,000, against £1,850,000. Expenses and commission in the industrial branch amounted to 36.8 per cent. of the premium income, showing a reduction of 1.5 points on the year. The net rate of interest earned on the ordinary branch funds fell by 7s. per cent. to £3 19s. 2d. per cent. and in the industrial branch by 4s. 4d. per cent. to £4 2s. 5d. per cent. The usual annual valuation of liabilities was made as at March 31, 1939; on the same bases of valuation as previously. The published figures, however, do not enable us to provide the usual detailed table of results. The rate of bonus declared on the ordinary branch is again 40s. per cent., calculated on the sum assured, and in the industrial branch distribution is also maintained. Total assets increased from £19,127,000 to £20,382,000. The dividend is repeated at 50 per cent., free of tax.

nium, which are shown below, together with the corresponding figures for 1929-33. In 1933 the OM⁽⁵⁾ table was used for whole life and the OM table for endowment policies, with interest at 2½ per cent. and 3 per cent. for participating and non-participating classes respectively. On this occasion, the A¹⁹²⁴⁻²⁹ Ultimate table has been used with special net premiums, with the result that the reserves are "very materially greater" than those of a 2½ per cent. A¹⁹²⁴⁻²⁹ net premium valuation. The reduction in the amount carried forward is stated to be due to the strengthening of the valuation reserves.

	1929-33	1934-38
Surplus earned	877,106	959,788
Brought forward	111,949	260,555
	989,055	1,220,343
Allocations:—		
Policyholders' bonuses	610,650	868,500
Shareholders	67,850	96,500
Invest. and cont. reserve	50,000	—
Written off investments	—	150,000
Carried forward	260,555	105,343
	989,055	1,220,343

The rate of bonus declared is again maintained at 48s. per cent. on the sum assured, and it is intended to pay interim bonuses at this rate on claims arising before the next valuation. Shareholders receive one-ninth of the amount due to policyholders, and during the present quinquennium profit and loss will be credited with £19,300 annually, compared with £13,570 and £9,610 for the two previous quinquenniums. New sums assured last year

reached a record of £3,030,000, compared with £2,855,000 in 1937, and the net rate of interest was £4 2s. 11d. per cent., compared with £4 3s. 8d. per cent. Annuity considerations increased from £123,000 to £163,000. Fire premium income fell by £24,000 to £870,000, while accident and marine premiums showed little change at £1,479,000 and £437,000 respectively. The "additional reserves" of £320,000 and £220,000 in the fire and accident accounts have been transferred to general reserve, and interest earnings in these accounts and in the marine account have been carried direct to profit and loss account, and not, as hitherto, shown in the respective revenue accounts. Departmental results are shown below:—

	1937	% of Profit	1938	% of Profit
	£	Premiums	£	Premiums
Fire	142,825	16.0	120,702	13.9
Accident and Gen.	23,843	1.6	80,343	5.4
Marine	—	—	—	—
Life	13,570	—	13,570	—
Profits from reversions	8,000	—	8,950	—
Charges to profit and loss	188,238	—	223,565	—
	119,590	—	135,857	—
	68,648	—	87,708	—

Total assets amount to £16,640,000, while general reserve fund stands at £1½ millions, and the profit and loss balance, after paying the 1938 dividend, at £163,000. The dividend is repeated at 47½ per cent. and costs £139,000, against available interest earnings of £103,000.

Yorkshire Insurance.—The chief interest of the 1938 report lies in the results of the actuarial valuation of the life department for the past quinquen-

The general nature of the decline was again in evidence, for compared with the end of 1938 only two companies show rises, while five show no change. May's market recovery in which insurance shares have participated is, of course, not yet reflected in the index.

Company Notes

Rolls-Royce Expansion.—The preliminary figures of Rolls-Royce have been known for the past month, and the full report adequately confirms their satisfactory character. After providing for trading expenses, "liberal depreciation of buildings, machinery and plant" and obsolescence, but without including any profits from subsidiaries, the company's net trading profit amounts to £483,333, against £396,378. Since the taxation provision is raised from £100,000 to £140,000, the amount available for ordinary dividends has increased less sharply, but earnings represent 29.2 per cent. on the ordinary capital, compared with 25.1 per cent. for 1937; hence, as the following table shows, the increased dividend of 25 per cent. is covered by a slightly higher margin:—

	Years ended December 31		
	1936	1937	1938
Total profit, after contingencies ...	393,498	396,378	483,333
Taxation	90,000	100,000	140,000
Pension fund and fees	33,261	33,119	33,383
Ordinary stock:—			
Earned	270,237	263,259	309,950
Paid	223,296	242,959	276,189
Earned %	26.8†	25.1	29.2
Paid %	22½*	22½	25
Consol. reserve funds	35,000‡	22,266	30,000
Carry forward	93,913	91,947	95,708

* 7½ per cent. interim on old capital, plus 25 per cent. capital bonus; final paid on new capital. † On new capital of £1,065,514, or 33.5 per cent. on old capital of £852,464. ‡ Of which £5,000 to dividend equalisation.

Reference to the balance sheet shows, in fact, that depreciation of property and plant absorbed £168,611 last year, against £81,836 in 1937, and of this increased sum £45,000 consists of special depreciation. The necessity for the most generous depreciation provisions will be acknowledged, for the company is plainly working at high pressure. Trade and other debtors have increased from £644,380 to £860,861, while stocks stand at £888,720 against £615,770 at the end of 1937. The construction of a new aero-engine plant near Glasgow, to be managed by the company, at a cost of some £4 millions, is indicative of the pressure upon its existing plants. Yet the concern is not wholly preoccupied with defence business, for the report records that, during the year, a substantial interest was acquired in Park, Ward and Company, the coachbuilders, with an option to obtain a controlling share. Investments and advances to associated companies now appear in the balance sheet at £269,096, which presumably also reflects the subscription of £100,000 debentures in Phillips and Powis, against £160,000 for "other investments" at the end of 1937. The £1 ordinary stock units yield £4 9s. 3d. at the present price of 5½.

Iron and Steel Results.—Iron and steel results published this week present a varied picture. The most satisfactory results are reported by Stanton Ironworks,

whose progress, in recent years, has continued at a higher rate. Profits (apparently struck before debenture interest and fees) amount to £507,074 for the year to March 31st, against £398,884—a rise of no less than 27 per cent. The rate of dividend is again 10 per cent., but it absorbs a higher amount, since the 20 per cent. capital bonus of 1937-38 receives full dividend. The latest rise in profits is so dramatic, even in relation to the progress of recent years, that the report will be eagerly awaited. Last year the chairman of Guest, Keen and Nettlefolds expressed the view that, since reduced demand was to be expected while excess stocks were being worked off, the maintenance of earnings at the higher level of 1937-38 was unlikely. The actual results for the year to March are, however, fairly satisfactory. Profits amount to £1,085,525 against £1,176,735, a reduction of 7½ per cent., and before providing £200,000 (against £150,000) for depreciation, the decline is no more than 3 per cent. Earnings for the ordinary stock can be calculated at £658,268 against £748,735, or 10.2 per cent. against 11.6 per cent., tax free. The tax-free dividend is, however, reduced from 7½ per cent. to 6 per cent., and a transfer of £300,000 to reserve necessitates a draft of £27,800 on the carry-forward. Reserve fund also receives £43,557 from debenture redemption, but £225,000 is transferred from it to investments reserve. In the absence of any detailed comment, it is difficult to appraise the Whitehead Iron and Steel profits. Earnings for dividend for the year to March amount to £229,576, against £337,874 after deducting a special charge of £60,000 for depreciation and contingencies. These sums are equivalent to 41 per cent. and 61.2 per cent. respectively on the ordinary capital. The cash distribution is reduced from 35 per cent. to 25 per cent. by omission of the 10 per cent. cash bonus paid in 1937-38, but the directors propose a 25 per cent. capital bonus, as in 1934-35 and 1936-37. The company's conservative dividend policy and the rapid expansion of its assets adequately explain the capital bonus, but the apparently sharp drop in net profits is less readily to be understood. A substantial reduction in profits is recorded by Consett Iron Company for the year to March 31st. Trading profits are reduced from £983,229 to £613,308 (before depreciation, which absorbs £125,000 against £155,000), while plant and machinery improvement reserve is credited with £100,000 against £200,000. The dividend has been reduced from 10 per cent. to 7½ per cent. and is covered by earnings of 6.4 per cent. against 13.7 per cent. It would appear from the report that Consett Iron, as a supplier of semi-finished products to steel processors, was sharply affected by reduced demand last year, coupled with reduced prices in the first quarter of this year.

Triplex and Lancegay Safety Glass.—In July last year, the Triplex Safety Glass Company received three months' notice from the Austin Motor Company of the termination of the contract for the supply of safety glass to the latter company, on the ground that the Triplex price was less favourable than that charged by another manufacturer. This news was widely interpreted as indicating the emergence of the Lancegay Safety Glass Company to challenge the dominating position of Triplex in the industry. That conclusion is confirmed this week by the offer of one 10s. Triplex share for 13 shares of 1s. in Lancegay. Already there was a threat of acute price competition between the companies. But, in addition, patent claims were entered by Triplex against Lancegay, and the share exchange offer has apparently resulted from discussions originally intended to devise an agreed solution of these claims. The present capital of Triplex consists of £500,000 ordinary capital, in 10s. stock units, while Lancegay's capital amounts to £164,230, divided into 1s. shares, with £35,000 of unissued capital under option. If the issued and option capital is exchanged for Triplex shares, the latter company's capital will be increased by £153,254. The terms of exchange are apparently based upon current market values (which have

recently shown significant improvement) for, on the eve of the circular, Triplex ordinary closed at 38s. 9d. and Lancegay at 3s. Shareholders of Lancegay are not likely to complain that, on the basis of recent years' earnings and dividends, they have an apparent advantage in the exchange.

British Electric Traction.—The deferred stock of British Electric Traction has been described as a sur-tax payers' savings bank. At its present price of 102½ it offers the exiguous dividend return of 9s. 9d. per cent., and even on earnings (which were equivalent to 59.4 per cent. last year) the yield is below 6 per cent. The company's policy is to restrict cash dividends to 5 per cent., and to distribute annual capital bonuses of 10 per cent., though in 1932 the scrip bonus was 100 per cent. Revenues have marched in step with this steady compounding of capital. For the year to March 31st, investment revenue increased to £667,746, compared with £605,200 for 1937-38. Despite the 21 per cent. increase in deferred capital during the past two years, earnings have increased from 49.5 per cent. to 59.4 per cent., as the following table shows:—

	Years to March 31,		
	1937	1938	1939
Income from investments	528,833	605,200	667,746
Total income	585,673	669,404	728,513
General expenses†	56,109	61,707	61,928
Income tax	59,190	81,746	104,709
Debenture interest	79,479	79,479	79,479
Prof. and pref. ord. divs.	163,121	163,121	163,121
Deferred stock:—			
Earned	227,774	283,351	319,276

Issued deferred stock, after bonuses	653,513	718,865	790,752

† Including staff fund and directors' fees.
‡ 10 per cent. in deferred stock each year.

There is, clearly, an ample margin of current earning power to justify the continuation of the long-standing bonus policy for some time to come, without taking account of any potential further increase in investment revenue. The company is, in fact, one of the most successful of British investment trusts, although its subsidiary and transport interests account for £3,117,688 of the total portfolio of £6,985,558. No comment is offered on the current market value of quoted investments—the total is described as being at or under cost—but to judge from the modest book valuation of the interests in Birmingham and District Investment Trust, the total portfolio figure makes allowance for appreciable hidden reserves, in addition to disclosed reserves from undistributed profits totalling £2,452,724.

Great Universal Stores.—The rising profits curve of Great Universal Stores since 1936-37 has been maintained during the year to March 31st, for total revenue amounts to £530,528 compared with £408,714. The directors' report indicates that some benefit—though not covering a full year—has been derived from the new subsidiaries acquired during the latest financial period. Funds for their purchase, it will be recalled, were derived from the issue of £1,000,000 4½ per cent. debenture stock in June last year, while a further £250,000 stock was placed privately in December. The latest accounts show a charge of £22,822 for interest on these issues, compared with sums of £40,781 net (or £56,250 gross)

which will be required in a full year. The commencement of the 1½ per cent. sinking fund from 1941 will increase the total prior charge to £75,000. The ordinary dividend is maintained at 50 per cent., and is covered by earnings of 78.7 per cent. Three years' comparative figures are given below:—

	Years to March 31st		
	1937	1938	1939
Total income	359,529	408,714	530,528
Directors' fees	2,135	2,946	2,750

† Includes N.D.C.: £13,500 in 1938; £10,750 in 1939.
‡ Part year only.
* 76.0 per cent. after charging full preference divs.
§ Also 10 per cent. capital bonus in "A" ord. shares.

The balance sheet shows a 10.2 per cent. reduction in cash from £481,307 to £431,815. Current claims on subsidiaries have increased from £474,421 to £621,276, while shares in subsidiary companies have jumped from £970,979 to £2,197,430. In addition, £63,158 has been paid as a first instalment towards the purchase of further subsidiaries, as part of total considerations of £430,116. The striking expansion of the group's interests is best traced in the consolidated balance sheet, which shows that debtors and deposits (which presumably are connected with instalment sales) have jumped from £567,222 to £1,320,549, and thus have absorbed a considerable portion of the new money. The consolidated goodwill item for the group now stands at £998,382, against £407,682. How far this remarkable increase is represented by fixed assets which have been taken into the accounts at written-down values, below their real value, is, of course, impossible to determine. It is, however, a matter of importance, for the company's earnings are now dependent on subsidiary companies to a very considerable extent. The directors' statement under Section 126 shows that the subsidiary companies have distributed approximately the sum due on the parent company's holdings. But the apparently high figure for goodwill could only be adequately tested with the aid of a consolidated profit and loss account. For the moment, the group's income is in the ascendant; and it has no reason to regret the fuller development of its old mail order and outfitting business, and the rearrangements on the chain store side. The immediate outlook is perhaps not over-discounted in the yield of £7 11s. 6d. on the 5s. ordinary shares, quoted at 33s., but the new acquisitions have yet to prove their permanent earning capacity.

From the Chair.—Investors have been well provided with food for thought at this week's company meetings. Probably no more dissimilar list of companies could be compiled than J. Lyons, Boots Pure Drug, Suez Canal and Callender's Cable, but the chairman of each company has had something of interest and importance to discuss from the chair. Lord Trent, for example, showed that

last year's total transactions of the Boots Pure Drug organisation was the highest on record, while profits had only once been surpassed—in the exceptional year 1936-37. The group is also transacting a steadily increasing export trade, while its importance as a medical supplier lends emphasis to the chairman's suggestion that stocks might be built up in private hands to meet any emergency, as they have already been built up by the hospitals. Our comment last week on the Boots Pure Drug report misinterpreted Lord Trent's reference at last year's meeting to the special provision of £36,000 for depreciation. This was made not against the profits of 1937-38, but in 1931-32. The net income of the latest year, £951,946, is thus fully comparable with £941,372 recorded in the previous year. Air-raid precautions and their finance occupied a considerable section of Sir Isidore Salmon's speech at the J. Lyons meeting. The profits of this concern are struck after provision for contingencies, and during the latest year a sum of £12,000 has been charged for A.R.P. before disclosing the figures. In view of the potential increase in this expenditure, moreover, the directors made further allowance in the contingencies provision, though Sir Isidore issued a warning that it may not prove sufficient. At the Suez Canal meeting, the Marquis de Vogüé made a lively rebuttal of Italian claims regarding the construction of the canal and its present management, and emphasised, incidentally, that the company has for the past fifty years admitted to the management representatives of users of the canal. The passing of the 5 per cent. cash bonus by Callender's Cable was a disappointing feature in the recent report. At the meeting on Wednesday, Sir Fortescue Flannery declared that the past year was not one of "exceptional prosperity" which alone would have justified a bonus payment. Slackness of orders at the Erith works, which specialise on super-tension cables, has given place within the past month to very active business, however, while the Leigh works are fully occupied on ship cables.

Brazilian Traction's Exchange Problem.—In December last, Brazilian Traction announced that, owing to the cessation of remittances from Brazil, no ordinary dividends could then be recommended. Hence, the only distribution on account of 1938 consists of 50c. per share, distributed last July, whereas \$1 was paid for 1937, and 70c. for 1936. The full report, however, confirms the inference, already drawn from the December announcement, that exchange difficulties, rather than unsatisfactory working results, are responsible for the dividend disappointment. Gross operating earnings of subsidiaries, however, show a slight fall from \$38,555,900 to \$38,078,934, though the operating statistics show an expanded volume in all the main departments of the group's widespread activities, including the traction, electricity, gas, and telephone businesses. The final result for the parent company is a reduction in gross revenue from \$11,587,531 to \$10,316,205, of which \$9,646,076, or \$1.37 per share, is available for the common shares after expenses and preference dividends, against \$10,862,677 or \$1.54 per share in the previous year. This 12 per cent. setback contrasts with the halving of the dividend. In fact, exchange stringency at the end of 1937 was ameliorated during 1938 only in respect of current imports, and funds distributed through the Bank of Brazil were restricted to imports, and not for such purposes as dividend or interest payments. Moreover, the 3 per cent. tax on foreign exchange purchases has been increased to 10 per cent. for purposes other than payment for imports. And while banks may now purchase export bills, the Bank of Brazil still retains control of exchange for other remittances. Brazilian Traction is clearly working under an onerous burden. There is some consolation in the continued growth in its operations, but the fruits for the investor must await, it would seem, a significant strengthening of Brazil's exchange position, towards which, possibly, the closer financial relations between Brazil and the United States may assist.

Oil Company News.—The Burmah Oil report (discussed on page 560 of last week's issue of *The Economist*) showed a satisfactory level of profits and a strong financial position, and though much of Sir John Cargill's speech at the meeting on June 2nd was devoted to the difficulties of the industry in general and of the company in particular, throughout his comments an undertone of basic confidence in the company's ability to deal with current problems was evident. The disappointing setback in world consumption of oil in 1938, in Sir John's view, was probably already in operation in 1937, but masked by re-stocking business. But apart from difficulties arising from the world oil markets, the company has considerable local problems, in India and Burma. In addition to the customs and excise duties imposed by the Central Government, the provincial governments, in their new search for revenue, are imposing local consumption or sales taxes on petroleum, over and above the main duties. And there is also a drive in certain provinces by interested merchants to impose maximum and minimum prices for petroleum. In addition, labour troubles which have hampered the company's activities, have their roots less in genuine grievance than in political agitation. Sir John did not attempt to minimise any of these unfavourable factors, and anticipated a further setback in trading profits in the current year (unless values improve in the remaining months of the year) which may not, in the next report, be compensated by investment income. The full report of Venezuelan Oil Concessions (whose preliminary results were also discussed last week) shows gross income for 1938 of £6,478,489, against £5,328,950, a 21 per cent. rise, but expenses increased in greater proportion and earnings for dividend show a decline from £1,589,016 to £1,482,829. Production in 1938 totalled 57,865,086 barrels, against 50,151,985 barrels in 1937, and the bulk of the increase came from the Lagunillas Tia Juana fields, where an active drilling policy was maintained. Exploration drilling has also commenced in Eastern Venezuela, on the Venezuelan Oil Development concessions, in which V.O.C. has a one-third interest, under arrangements with the Royal Dutch-Shell group. The progress of Attock Oil is underlined in the full report. Sales are now on the basis of 1,700 barrels of crude oil daily, the capacity of the existing refinery, but shipments of plant for the new refinery have been fairly well up to time, and it is hoped to complete the main refining units by the end of this year.

The Week's Company Profits.—The heavy industries and colliery companies are well represented in this week's table of profit and loss accounts, which appears on page 642, and contains 66 companies, excluding banks and companies for which comparable figures are not available. Tea companies also form a large group, numerically. Net profits of the 66 companies amount to £7,762,000 against £8,224,000, and show a fall of 5½ per cent., while net profits of 1,258 companies reporting in 1939 to date total £168,027,000, or 8½ per cent. less than £183,138,000 earned by the same companies in the preceding year. The week's results are discussed in preceding Notes and on page 616 under the heading "Shorter Comments."

Company Meetings of the Week.—Reports of company meetings will be found in this issue on page 621. The chairman's comments at the *Callender's Cable*, *Suez Canal*, *Boots Pure Drug* and *J. Lyons* meetings are discussed on page 613, while Sir John Cargill's review of *Burmah Oil* prospects is referred to above. At the meeting of *Beecham's Pills*, Mr Philip E. Hill anticipated an expansion of business and a new source of demand following the repeal of the medicine duties, which would presumably come into force in September. Mr A. R. Rye informed shareholders of *Lisbon Electric Tramways* that the company's participation in the Lisbon town-planning scheme,

now under consideration, would probably necessitate considerable capital outlay. At the *Henderson's Transvaal Estates* meeting, Mr W. L. Castleden expressed satisfaction that the market value of the company's quoted investments was above book value. At the meeting of *East Geduld Mines*, Mr P. M. Anderson explained that development work would not be carried out on so large a scale as in the past owing to the strong ore reserves position. At the meeting of *Marievale Consolidated Mines*, Mr Anderson emphasised the necessity of expending available funds on areas yielding payable ore quickly, leaving other areas to be investigated at a later date. At the annual meeting of *Geduld Proprietary Mines* he anticipated fluctuation in development results, since efforts are now being concentrated on leaders and formerly unpromising areas. At the meeting of *Van Dyk Consolidated Mines*, Mr Anderson estimated that, under present conditions, it was unlikely

that amounts set aside for taxation and share of profits would exceed 25 per cent. of working profits at any time in the next ten years. And at the *Grootvlei Proprietary Mines* meeting, he informed shareholders that capital funds in hand were sufficient to meet not only the cost of the recent increase in production plant capacity to 80,000 tons a month, but also of the further extension to 120,000 tons. Mr Charles Emerson informed shareholders of *Malacca Rubber Plantations* that the replanting of 3,440 acres, to be completed in 1940, had so far left them with considerable financial resources, but a conservative financial policy was necessary during replanting programme. At the *Associated Newspapers* meeting, the Hon. Esmond Harmsworth confirmed the continuation of the new policy of paying an interim and a final dividend in the current year. Earl Castle Stewart, at *Mining Trust* meeting, referred to improved extraction and lower costs at the Mount Isa Mine.

THE STOCK EXCHANGES

London

SETTLING DAYS

TICKET	ACCOUNT
JUNE 20	JUNE 22

THE mood of the stock markets has become more sober this week, and although the undertone remains entirely satisfactory and prices steady, there has been no fresh upswing in quotations.

In the *gilt-edged market*, the week began with a slight recession once the week-end accumulation of orders had been worked off, and news of the Australian loan terms was followed by a marking down of quotations. But sufficient buyers appeared towards the end of Tuesday's session to make net changes negligible on the day. In mid-week, prices were steady, though the volume of business shrank. That the market's morale remained good, however, is shown by the absence of any reaction to the Prime Minister's statement on negotiations with the Soviet or to indications that response to the Australian loan had been disappointing. Undated securities were the more volatile, but were little changed on the week, although they were in the forefront of the interim movements. Redeemable securities were steady, and moved only within narrow limits. Early in the week, Dominion stocks were hit by the Australian loan, when prices were adjusted to the terms of the new issue. The South African scrip reacted on profit-taking but later came in for renewed support. New Zealand issues were sold fairly steadily.

Among *foreign bonds*, Brazilian issues provided one of the chief features of the markets. Prices rose confidently on Mr Butler's statement (discussed on page 614), though the impetus was partly lost towards mid-week. Owing to doubts whether the July coupon on the 1913 loan would be met, Chinese bonds slipped back. European issues were dull, though quite steady until mid-week.

Home rails were inclined to give way early in the week. Prices were firmer, however, on publication of the good Whitsun traffics, though gains were modest and business was not greatly increased. London Transport "C" stock was steady. Argentine rails were dull, and some interest was shown temporarily in Brazilian issues.

Industrials followed the market's general course. The undertone was steady, but the volume of business very small and, on the whole, slight decreases in prices predominated. Iron and steel shares were firm at first, but tended to

ease later from lack of buying support. Activity declined in coal shares, which at first continued their upward movement. Engineering issues were firm, except for slight irregularity in mid-week, while electrical equipment shares made a mixed showing. Motor shares also turned dull after a steady start. Triplex hardened and then reacted, on the offer to Lancegaye (discussed on page 612). Aircraft issues tended to ease. Parnall weakened on the new issue proposals. Exceptionally, Rolls Royce gained slightly in mid-week. Textiles opened with a renewal of their recent advance, and remained steady if not very active. Rayon shares turned dull after early cheerfulness. Brewery issues made an independent showing, and revived in mid-week after a dull beginning. The stores group went ahead, and then turned easier. Miscellaneous issues lacked interesting features, but were almost consistently steady. Shipping shares gave way slightly after early support.

Oil shares were in demand at the beginning of the week, "Shell" and Royal Dutch advancing under local and Continental support. Burmah Oil and Anglo-Iranian were adversely affected by Sir J. Cargill's speech (discussed on page 614). Among the West Indians, Trinidad Petroleum Development were well supported. Later, however, uncertainty imparted a duller tone, though Paris supported the market leaders. By mid-week the uncertainty spread, prices drifting fractionally lower in idle markets, though Trinidad issues, led by Apex, offered some resistance.

A steady tone was apparent among rubber shares on Monday, the supply of shares being limited. Later, a weaker tendency developed, investors standing

out for a rise in rubber prices. By mid-week, the political situation and absence of a lead from the commodity prevented a revival of interest. Among tea shares, Monday saw some selective buying of Indian and Ceylon issues, but lower dividend announcements were a depressing influence in mid-week.

Among *mining shares* Kaffirs were featureless throughout the week, though the undertone was firm, since Cape support and dividend announcements by Randfontein and others assisted prices in mid-week. Among the developing mines Cape buying imparted a firm tone, Western Holdings and Venterspost being particularly favoured, though later prices tended to ease. Finance shares drifted fractionally lower, led by Central Mining. West Africans at first lost ground, to recover later in the week led by Ariston. Among copper shares, Rhokana provided a diversion but finished the week lower on balance.

New York

THE week opened dull, with slight losses on balance, except for a mild rally in aviation shares. On Tuesday a more cheerful tone developed. Steels made a belated response to the reports of higher mill activity, while utilities and rails also improved fractionally, but industrial shares were still neglected. In mid-week, utilities continued their modest advance and industrials received more attention, but rails could not hold the gains made early in the week. *Iron Age* reports steel mill activity this week at 53 per cent. of capacity, an increase of one per cent. on last week. The industry is now feeling the benefit of the recent low-price contracts, naval and railroad orders.

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values calculated on closing prices (1926 = 100).

PUBLIC OFFER

Commonwealth of Australia.—Issue of £6,000,000 4 per cent. registered stock at 98½; redeemable at par January, 1964, or from 1961 on notice. A Trustee stock. Proceeds for defence (to be spent in U.K.). Population

1938: 6,864,000. Public debt, June, 1938: £A.686,142,710 in Australia; £stg. 544,252,619 in London; £stg. 44,630,432 in New York. Excess of exports, 1937-38: £stg. 11,848,000. Total revenue, 1937-38: £A.89,458,154. Lists closed at end of banking hours on June 7. Underwriters take up 80%.

FORTHCOMING ISSUE

Parnall Aircraft Limited.—It is proposed to create 1,200,000 new 5s. ordinary shares, ranking for final dividend for year to July 31,

marked improvement in the statistical position of the rubber market has been reflected mainly in the substantial premiums of forward over spot prices, but a further rise in spot prices is not unlikely.

* * *

Agricultural Development.—The publication of Sir Reginald Dorman-Smith's comprehensive Bill, rather surprisingly entitled the Agricultural Development Bill, clears up some of the ambiguities contained in the statement of policy made by the Minister a fortnight ago. The standard price for fat sheep is to be 10d. per lb. of dressed carcass weight, not live weight, as some wishful thinkers have hopefully argued. The standard quantity will not remain unalterably at 27 million head of sheep; if for two successive years the average market price falls below the standard price the latter will be reduced by $\frac{1}{8}$ d. for each quarter of a million by which the sheep population exceeds 26 millions, and if this action fails to restore the balance within two years the basic number will be reduced to 25 millions, until market prices have again equalled or exceeded the standard price. The section which deals with barley is drawn up in vague terms, presumably because the Government and the brewers have not yet decided on the type of subsidy to be given to growers of malting barley. But the Bill provides for a special subsidy to barley growers for the 1938 and 1939 harvest. The Bill also provides finance for the Government's stocks of agricultural machinery, but no mention is made of the stocks of fertilisers, which, according to the Minister, have also been acquired, or of stocks of seed which will certainly be necessary if the production of cereals is to be rapidly expanded in wartime. There is still no hint of any State encouragement towards land drainage, unless the annual grant of not more than £60,000 per annum for twenty years to the Agricultural Mortgage Corporation is regarded as an indirect subsidy; the grant will presumably enable the Corporation to lower the rates for its loans, which still remain at the high level which prevailed when the Corporation issued its 5 per cent. debentures.

* * *

The Co-operative Congress.—The Co-operative Congress held at Margate during Whitsuntide was quiet and undemonstrative compared with its predecessors. Mr W. B. Neville, the general manager of the London Co-operative Society, in his presidential address to the 2,000 delegates, deplored the dissipation of co-operative economic energy by "propagandists who find a first-class platform in the co-operative movement for the advocacy of their various specifics for the ills of a very sick world," and stressed the fact that the co-operative movement was essentially a trading and industrial organisation. He argued for the fuller development of co-operative factories and banking, and urged that in some circumstances it would be advantageous to take a controlling interest in established business rather than embark on limited production in a co-operative factory. On this point Mr Neville quoted figures showing the disposition of the funds of the Co-operative Wholesale Society. The assets at the end of 1938 totalled £140,229,269, of which only £25,187,125 is credited to land, buildings, machinery, stocks and investments in the joint co-operative enterprises. £81,330,718 has been placed with British Government long-term securities, while of £19,013,510 invested in other directions £904,317 is in commercial undertakings. He showed that in 1920 the percentage of all co-operatively produced commodities to total

sales was 20.5. In the eighteen following years to 1938 it rose to 21.8 per cent. only—a slow progression compared with the increase in retail sales. To follow up Mr Neville's proposals co-operative trade would have to be reorganised on modern lines and stimulated by the creation of a scientifically trained research and development department to seek new ways of reaching the public. The president's view of the economic foundation of co-operation impressed the Congress and gave pause to the arguments of the extreme political elements which have tended to divert the movement from its commercial functions.

* * *

Rise in Shipping Freight Rates.—The improvement in *The Economist's* index of tramp shipping freight rates continued during the past month, but at a much faster rate than between March and April.

The Economist INDEX OF FREIGHT RATES
(1898 — 1913 = 100)

	Average, 1913	Apr., 1938	May, 1938	Feb., 1939	Mar., 1939	Apr., 1939	May, 1939

Outwards	106.9	+ 9.7	India—homewards ..	134.9	+ 6.4
Homewards	129.5	+ 0.4	Far East, etc.	99.7	+ 2.7
North America ...	113.2	+ 1.9	Australia	109.1	+ 1.4

At the beginning of the month there was a consistent demand for tonnage at advanced values all round, the grain trade being particularly heavy. After a period of quieter conditions in the middle of the month there was a strong revival of demand from the River Plate last week and general chartering showed a moderate improvement.

* * *

Lower Tea Supplies.—The International Tea Committee has now published estimates for the supply of tea during the season which began on April 1, 1939. The quota for the season was fixed at 90 per cent. of the standard amounts, against 92.5 per cent. for the 1938-39 season, and supplies from the co-operating countries will reach 727.56 million lbs. against 747.80 million lbs. a year ago. The carry-over of unused licences from last season amounts to 26.47 million lbs., giving total permissible exports from the restricting territories (India, Ceylon and D.E.I.) at the rate of 754.05 million lbs. Owing to the war in China, the combined exports from the non-restricting countries in the new season should be below rather than above those in the preceding twelve months, so that world supplies may be some 15 million lbs. or so below the 1938-39 level. This decline in supplies coincides with a steady improvement in world absorption. For the first eleven months of last season world absorption is estimated at 803.67 million lbs., a rise of no less than 30 million lbs. compared with the previous year. It is especially satisfactory that this increase was shared by practically all the important consuming territories with the exception of the American continent, in which the Tea Development Committee has now intensified its propaganda. Supplies in the present season are still sufficient to meet any expected increase in absorption without a rise in prices.

INDUSTRIAL REPORTS

THE big improvement in the latest unemployment figures is reflected in the news from industrial centres. All districts report further increases in activity and in many cases it is becoming difficult to obtain supplies of both steel and coal. The output of coal for the week ended May 27th, at 4,768,600 tons, is 250,000 tons higher than in the corresponding week last year. The production of iron and steel is approaching a record.

In the lighter industries activity is also well maintained; the combination of Government orders and fine weather has been very beneficial to the cotton textile trade. The United States has invited ten of the major cotton exporting countries to a conference in the United States on September 5th to discuss the possibility of a world cotton marketing agreement. It is now thought that the consideration of an American cotton export subsidy is likely to be postponed until after this meeting, and raw cotton prices have, therefore, advanced.

Coal

Sheffield.—In the industrial section there is a steady call for steams, chiefly under contract, but there is room for improvement in the demand for smalls, of which stocks are considerable. Coking smalls are moving more freely owing to heavier consumption of furnace coke and the additional blast-furnaces in operation. Household demand has been reduced by the hot weather and that from public utility undertakings is normal for the season.

The export market is stronger, with a good demand for washed doubles and singles. Forward inquiries are on a good scale and bunker coal is in moderate request. The reduction of 1s. per ton in the Cartel price of furnace coke for export is likely to promote a better demand. All other prices are unchanged.

*

Newcastle-on-Tyne.—The inability of Germany to meet her engagements in the export of coking coal is diverting considerable trade to this district. Durham coking collieries are now so heavily committed that they have little coal to offer for delivery this year, and prices have advanced to as much as 20s. 6d. per ton f.o.b. Northumberland steam collieries are fully occupied so far as large coal is concerned, but there is still difficulty in disposing of smalls. Patent oven coke is steady under a good export demand.

*

Glasgow.—The market has been affected by the continued fine weather. There has been a marked contraction in demand in certain directions, chiefly the household trade, but also among the public utility undertakings. The supply position has therefore been much easier than for a month or two past. The shipping trade is keeping up well, and the improvement in this direction is one of the most encouraging features of the whole trade. Scandinavian markets have

been well represented in the increased business. Industrial demand is good owing to the continued activity in the iron and steel and ancillary trades. Employment at the collieries is good and prices are steady.

*

Cardiff.—Although current inquiries are not quite as urgent as they were a few weeks ago, there is a steady volume of new business and the collieries are now well stemmed over the next two or three months. The original quotas have been virtually exhausted, and at a meeting of the Central Council in London on Thursday applications for additional inland and export supply allocations of considerable quantities were considered from the principal coalfields. The tonnage position is favourable, and it is anticipated that this week's shipments will be well up to the pre-Whitsun improved levels. Outputs are better, and the production of the coalfield in the week ended May 20th was 110,000 tons greater than in the corresponding period last year. Second-class steam large coals are now available in increased quantities, but there is a scarcity of best large steam grades for prompt shipment, and dry sized classes are scarce and strong. Coke is very firm and the improved position in the patent fuel trade is being well maintained. Prices are nominally unaltered. It is reported that under the International Coke Cartel the prices for the Scandinavian countries have been reduced by 1s. per ton.

Iron and Steel

Sheffield.—Business this week has been on a good scale, especially in the steel section. It is becoming impossible to guarantee early delivery for basic steel billets, and the call for acid qualities is becoming more widespread. Business in wire rods and small steel bars is very active, while for strip there is substantial buying.

There is a very full demand for basic pig and output is being increased. Some use is being made of the accumulated stocks of forge and foundry iron at furnaces, but users show little disposition to buy forward until the duration of the existing range of fixed prices is announced. Deliveries of hematite are often being held up until the lower quotations come into operation, but some new business is being arranged for the third quarter of the year. There is no change in finished iron, though better orders for common bars are reported.

The output of steel in Sheffield is reaching a record tonnage, both for ordinary and special qualities. While the quantity of armament work continues to grow, there is also a very encouraging inflow of commercial orders, mainly on home account, but with a substantial volume from overseas.

*

Middlesbrough.—Shipments of pig iron from the Tees during May amounted to 4,384 tons, an increase of

2,700 tons over the previous month; but shipments of manufactured iron and steel totalled only 30,650 tons in May, against 32,900 tons during April.

Producers of basic steel are working to capacity, but increased commercial demands added to the volume of Government orders are necessitating the import of further quantities of semi-finished steel. Imports of this class of material during May were the highest since February, 1938.

The production of basic pig iron has increased since the beginning of the year, but it is all required for consumption in the local steelworks. The present restricted output of Cleveland foundry iron is ample for current needs, though foundries are taking slightly better tonnages. East coast hematite is in moderate request.

Demand for heavy steel melting scrap is very strong and steel makers have no hesitation in taking deliveries of any quantities offered at control prices. Good Durham blast-furnace coke is in ample supply, whilst imports of foreign ore remain about the same level.

*

Glasgow.—Users of every description of steel material are urging makers to give early delivery. Makers of light structures in Glasgow and in different districts in Lanarkshire have an exceptionally heavy amount of work on hand and are absorbing substantial quantities of steel. Supplies of Continental semis have helped to relieve the situation for some of the re-rolling industries, but there is still anxiety in many industries about supplies of their raw material. In every branch of the steel trade in this district there is intense activity and orders on the books are sufficient, in most cases, for many months' work.

*

Cardiff.—Practically all branches of the iron and steel industry in South Wales are very active. All the available pig iron furnaces are in blast and 96 per cent. of the steel furnaces. The tinplate industry is this week operating at approximately 70 per cent. of its capacity under the pooling scheme. Owing to the continued scarcity of scrap the melting furnaces are using increased quantities of pig iron, but foreign scrap is expected, and it is reported that from 15 to 20 vessels have been chartered for the transport of between 120,000 and 150,000 tons from the United States. The inland demand for tinplates is quieter but export business is more active, and it is expected that shipments may increase owing to the failure of Germany to fulfil contract deliveries. Prices are nominally unchanged, but those for tinplates will be reviewed again next month.

*

News from Abroad.—The demand on international steel markets shows no signs of recession. It is now felt that the favourable situation will be maintained over the whole of this year.

OTARD'S EST. 1793
V.S.O.P.
LIQUEUR BRANDY

MATURED AND BOTTLED AT CHATEAU DE COGNAC

THE COMMODITY MARKETS

There is a certain reduction of purchases made against a possible emergency, since the most urgent amplification of stocks has now been effected.

Inquiries are being received from practically all steel-importing countries for the whole range of steel products. Semi-products are in particular request, chiefly from Great Britain, and it is expected that another supplementary quota for the English market will soon be fixed. Ship-plates are in keen demand, but buyers are trying to work down prices, assisted by American and other offers outside the price agreement. Otherwise, official prices are now being paid without much difficulty. Occasionally producers have been able to make price increases. On the Swedish market, for example, the quotations for plates and wire rods have been marked up. Furthermore, extras are sometimes being charged for quick delivery, particularly in the case of thin sheets.

The future price policy has recently been the subject of much speculation in market circles. Up to now, the request for a general price increase has been resisted in official quarters. It is to be expected that this problem will be finally dealt with about the end of this month.

Textiles

Cotton (Manchester).—Business has not been of a general character, but the undercurrent of inquiry remains more encouraging. Raw cotton prices have continued to advance owing to less favourable weather reports from the American belt. Also, there is now less expectation of an export subsidy, for it is thought that no action will be taken in Washington before the proposed International Conference in the United States in September. The tight spot position in Liverpool is becoming more pronounced and spinners are finding it difficult to secure supplies of certain types of material.

The yarn market has not been very active, but spinners have obtained some fair orders. Most of the American demand has run on coarse counts. Egyptian spinners are now receiving rather improved delivery instructions from Germany. Export business in piece-goods has been patchy. Rather less support has come from India, but useful orders have been secured in printed and dyed styles for the minor outlets of the Far East, South America and the Continent. The hot weather has had a marked effect upon clearances of light summer materials in the retail establishments, and the wholesale houses have reported much better deliveries.

★

Wool (Bradford).—Government orders have led to better conditions throughout the whole of the West Riding industry. Mills that have been comparatively quiet for months have shared in the increased orders placed, and very few carding machines are standing idle to-day, particularly in the woollen section.

The fixing of the price for 50's tops has given stimulus to other qualities, and there has been a great run upon New Zealand fleece and slipes in particular, whose prices are moving against the buyers.

THE strong upward movement in the prices of non-ferrous metals which occurred last week has not been maintained; with a slow demand, London prices of copper, tin, lead and spelter are all lower than a week ago. Wheat prices have also declined, on the reports of favourable rains in Canada, the United States and the Argentine. The undertone of most markets remains firm, however, as industrial activity in this country is steadily increasing. American crude oil prices were marked up last week, in the face of a noticeable increase in the demand for motor oils, and prices of raw cotton have also improved.

Moody's index of wholesale prices in the United States, reflecting the fall in the prices of important commodities, declined from 144.4 (December 31, 1931 = 100) on May 31st to 143.6 on Wednesday.

Metals

Copper.—After its recent rise, the price of standard cash copper reacted slightly and closed on Wednesday at £42 6s. 3d. per ton, a net loss of 8s. 9d. on the week. Demand was slack owing to the approach of the quiet season. There were no reports of further curtailments of production in the United States, although Kennecott and Phelps-Dodge are known to be preparing a certain reduction of their supplies.

★

Tin.—Demand in this market was very quiet this week and tin prices closed on Wednesday £1 10s. down at £225 15s. per ton. The price is now approaching the upper limit suggested by the pool agreement and consumers are obviously taking no steps to carry larger stocks, as the probability of a further large rise in price is small. At present, of course, new supplies are well below requirements, so that sooner or later the price must rise to about £230. When that limit will be reached depends largely on the result of next week's meeting of the International Committee, at which the quota for the third quarter of this year will be fixed. The statistical position would justify an increase in the quota of at least 5 per cent., but as the Committee may be in favour of selling some of the buffer stocks at an early date in order to accumulate liquid funds, the maintenance of the present quota is not impossible.

★

Lead and Spelter.—Lead prices lost 6s. 3d. to close on Wednesday at £14 7s. 6d. per ton, while that of spelter declined by 1s. 3d. to £14 2s. 6d. per ton. The turnover of the L.M.E. has increased this week, due to freer offerings rather than to a genuine rise in demand. The low rate of building activity still has a depressing effect on lead consumption, while the demand for spelter for A.R.P. purposes has fallen off of late.

Grains

GOOD rains have fallen in the wheat belt in both Canada and the United States, and much more favourable reports have been received of the condition of the growing wheat. The average of various unofficial estimates of the American crop indicates a harvest of about 700 million bushels, against 931 million bushels last year. Conversely, the hot, dry weather in Europe during the past fortnight has also benefited the wheat crop. In view of these favourable developments, the rise of wheat prices in Chicago has been checked and Liverpool prices are also rather easier. The maize market has also relapsed into a dull state, except for some speculative buying before the Argentine crop estimate of 5.15 million tons, a reduction of 250,000 tons on the previous estimate. The premiums for cargoes afloat have now disappeared. The rise in freight rates for immediate shipments has steadied the market for North African barley but the volume of business is small.

Other Foods

Provisions.—The seasonal improvement in the prices of Dominion butters continues and the hot weather brought a sharp rise in the price of Danish butter as well. After some weeks at a low level, egg prices in London improved last week.

★

Colonial Produce.—Dealings in the futures market for raw sugar have been small and centrifugals for prompt shipment are now quoted at 7s. 6d. per cwt., a fall of 6d. per cwt. from the prices obtained last week. Refined prices were reduced on Monday by 3d. per cwt. to meet a quieter demand.

★

Fruit and Vegetables.—The spell of hot weather has stimulated the demand for fruit and salads. Large supplies of English gooseberries are now on the London markets and realise good prices. Demand for strawberries is brisk and a large turnover is being done in English asparagus and tomatoes. The trade in old potatoes has fallen off, as demand is now concentrated on the new crop.

Miscellaneous Commodities

Oils and Oilseeds.—The market for these products have a firm tone. Indian linseed sells steadily, but English crushers have no interest in Plate linseed, whose price, affected by the import duty and the rise in freights, is out of line with that of Indian; America, however, is taking good quantities from the Argentine until the domestic crop is harvested. Supplies of Egyptian cotton seed on the spot are at a discount, and new crop is offered at £6 per ton for September loading; prices of linseed oil are firmer in sympathy with those of linseed.

★

Rubber.—The market has remained firm, except for a short period of weakness at the end of last week, and price are little changed. The prospects of the rubber market are discussed in note on page 617.

COMPANY MEETINGS

FACILITIES FOR STAFF SERVING IN FORCES

SIR ISIDORE SALMON ON COMPANY'S PROGRESS

The forty-fifth ordinary general meeting of J. Lyons and Company, Limited, was held, on the 6th instant, at the Trocadero Restaurant, Piccadilly Circus, London.

Sir Isidore Salmon, C.B.E., D.L., J.P., M.P. (one of the managing directors), presided.

REPORT OF THE DIRECTORS

The directors have the pleasure to submit their forty-fifth annual report, with a balance sheet and profit and loss account, made up to March 31st last, showing the financial position of the company at that date.

The business done by the company during the past year shows satisfactory progress, but the continued unsettled conditions make essential the providing of still more substantial contingency reserves against further abnormal expenses. After setting aside a sum for this purpose, the amount brought in from trading account shows an increase of £980 on last year's figure.

	£
The balance of trading account after providing reserve for contingencies (including N.D.C.) is	1,011,980.00
To which is to be added the amount brought forward from last year	145,188.74
Showing available for distribution a total of	1,157,168.74

From this total the following dividends have been paid or provided:—

On preference and preferred ordinary shares to March 31, 1939	490,353.27
On ordinary, "A" ordinary, proportional and "B" proportional profit shares—interim paid December 1, 1938	154,689.42

And the directors propose to deal with the balance as under:—

To pay a final dividend of 2s. 10d. per share on the ordinary and "A" ordinary shares, making 4s. 6d. per share for the year ended March 31, 1939	236,055.34
To pay a final dividend of 6.8d. per share on the proportional and "B" proportional profit shares, making 10.8d. per share for the year ended March 31, 1939	26,916.66
Leaving to carry forward to next account	249,154.05

The dividends received from subsidiary companies have been included in the company's trading account. In the aggregate the profits of the subsidiary companies exceeded the declared dividends. Losses of subsidiary companies so far as they concern this company have been dealt with in this company's accounts.

The board and the company have suffered a loss during the year in the death of Mr G. A. Pollard. He was held in the highest esteem both by his colleagues and the staff, and his passing is keenly felt.

Since the close of the year Mr J. M. E. Sierra has been appointed an employee director.

Messrs G. W. Booth and B. A. Salmon retire from the office of director, and being eligible offer themselves for re-election.

Messrs H. H. G. Bennett and L. H. Lampitt, employee directors, retire and are eligible for re-election.

Messrs Turquand, Youngs, McAuliffe and Company, the auditors, retire and are eligible for re-election.

(Signed) ISIDORE SALMON } Managing
HARRY SALMON } Directors.

Cadby Hall, London, W.14.
May 19, 1939.

CHAIRMAN'S SPEECH

Mr H. H. G. Bennett (one of the secretaries) having read the notice convening the meeting and the report of the auditors,

The Chairman said:—Ladies and gentlemen, my colleagues and I are pleased to welcome you once again at the annual general meeting and to lay before you the accounts of the company's forty-fifth year of trading.

LATE MR G. A. POLLARD

Before dealing with the main business of the meeting, it is my sad duty to refer to the loss we sustained just before the close of the year in the death of our friend and colleague, Mr G. A. Pollard. Mr Pollard had served the company zealously and untiringly for nearly 35 years and had been our colleague on the board since 1919. He was held in the highest esteem by us all, directors and staff alike, and his service to the company will be remembered with gratitude. We deeply mourn his passing.

Since the close of the financial year, as you will have seen from the report before you, we have appointed Mr J. M. E. Sierra an employee director. Mr Sierra has been in the company's service for more than 30 years and is our chief engineer. We are delighted to welcome him now as one of our colleagues.

It may be advisable to begin my comments on the figures by a word or two on the subject of the paragraph in the report which explains how the additional sum in the balance brought in from trading account is arrived at.

PROVISION FOR A.R.P.

This paragraph was inserted to drive home the fact that this balance is what remains after providing for contingencies, but it may be well to mention that the year's trading figures have borne a charge of £12,000 for expenses of Air Raid Precautions. Having in mind, however, that such expenses will be very heavy in the future, this method of treating them cannot be maintained. We cannot continue to charge them against revenue as if they were ordinary expenses of trading, and therefore, after allowing for common contingencies including provision for N.D.C., we have provided in the contingencies reserve a further sum to meet them. This provision, however, may not be sufficient, for in present circumstances it is next to impossible to arrive at a satisfactory estimate, and this must be borne in mind in looking to the future.

ADDITION TO CARRY FORWARD

Last year, you will remember, we suspended what had been for some years a regular practice—namely, the placing of a sum of £100,000 annually to reserve. Instead, we carried the surplus forward in the profit and loss account, making the comment that if our provision for N.D.C. were not sufficient we could draw upon

its balance for any deficiency. That, however, has not been necessary, but we have followed the precedent again this year, carrying forward the surplus in the profit and loss account. This figure, as you will see, now amounts to £249,154, so we should have a more ample amount to draw upon for air raid or other precautionary measures if our contingencies reserve should not be sufficient to meet these demands.

DISTRIBUTIVE POLICY

You will gather from these remarks that the year has been for us good one in that increased business has given increased profits, but that, as I have said, in these troublous times we do not feel justified in regarding these profits as available for distribution.

The balance of trading account is £1,011,980; adding to this carry forward from last year, £145,188, we have a total available for distribution of £1,157,168. Out of this we have paid or provided for preference, preferred ordinary, and interim dividends a sum of £645,042. From the balance we propose to pay the same interim dividends on ordinary, "A" ordinary, and proportional profit shares as last year, which will leave to carry forward to the next account the sum of £249,154, or £103,966 more than was brought forward from last year.

That, I think, is all that is necessary to be said on the report and profit and loss account, and I will now pass on to the figures of the balance sheet.

You will see we have again shown last year's figures side by side with this year's for purposes of comparison. We have again used in the balance sheet the decimal notation, our object being to draw some attention to our conviction that the adoption of decimal coinage would be of real value to the country. I am pleased to say that the Decimal Association, whose object is the achievement of this step, is receiving encouragement in its efforts from a number of bodies representative of the commercial interests of the community.

BALANCE-SHEET FEATURES

On the property and assets side of the balance sheet the first item, freehold land, buildings, etc., shows a further net increase of some £350,000, representing additional expenditure on buildings—mainly in factory extensions—and on new equipment and plant. The next item, investments, is £35,000 more than last year, accounted for by the provision of capital for another subsidiary company. Loans to subsidiary and associated companies are down by £33,000, of which £20,000 represents the repayment of part of the loan to Cumberland Hotels, Limited. The remainder reflects a quite normal fluctuation in the current financial requirements of subsidiaries. The figure of £200,000 in respect of a mortgage on freehold property has, you will see, disappeared, the mortgage having been repaid to us during the year in accordance with its terms. Stock in trade at £2,764,000 shows an increase of £166,000; this and debtors and cash call for no comment.

On the capital and liabilities side, mortgages are down by £17,000, representing repayments of principal and redemption policy premiums during the year. Trade and other creditors, etc., show an increase of £188,000, while the two items subsidiary companies, current accounts and deposits have together increased by £25,000. The surplus is, in round figures, £104,000 more—the amount added this year to the carry forward.

INTERNATIONAL SITUATION AND BUSINESS

The last six months of the year under review have been a period of unprecedented international tension, which, unfortunately, still continues. The great re-armament programme made necessary by it is placing on the country an increasingly heavy burden, which must have its effect upon our economic life for many years to come, even if, as we are all fervently hoping, the threats of war disappear. It may appear strange to talk or to think of development of the business in these conditions; but while it is likely that the slogan "business as usual," of which we heard so much in the last war, will not be heard again in time of war, we feel it is quite appropriate at this moment, and is serving the best interests of the country.

We are not retarding the normal development of the business; for we cannot supinely await a catastrophe which, however much it threatens to overwhelm us, may never materialise. Inertia in an undertaking of this magnitude must lead to retrogression—a result which would leave us less well equipped to meet and survive the catastrophe.

CONTINUED IMPROVEMENTS

We have accordingly been adding to our factories where necessary to meet the increasing demand for our various products; we

have continued our programme of improvement and modernising in our teashops and in other ways followed the normal course of development of the business.

During the year the Popular Café, Manchester, has been closed. This was one of the establishments in the Midlands and North of England which we acquired some 30 years ago. The licence attached to the premises was, unfortunately, a very restricted one, which meant that there was very limited scope for increase of business. We did not, therefore, feel justified in incurring the great expense involved in bringing the premises up to our present-day standard, and as an opportunity occurred of disposing of them on favourable terms, we took advantage of it.

The immediate burden of taxation has fortunately not been heavily added to this year, although one particular item in the Budget—the increased sugar duties—will cost us a considerable sum per year. But there are increasing demands being made upon industry for time and services on the country's behalf, the cost of which, though not easily assessable, is nevertheless very substantial. This is not meant as a grumble but as a reminder of what is demanded of us all in these times and of the fact that these expenses have the effect of additional taxation, although they do not appear in the Chancellor's Budget.

STAFF AND NATIONAL SERVICE

We, in common with others, readily bear our share of the necessary burden of ensuring the safety of the country, and acquiesce cheerfully in the efforts the country is making to be prepared. I think it is generally agreed that the response of employers to the need for co-operation in the increase of the auxiliary forces by giving facilities for their men to attend drills and annual training has been magnificent.

We ourselves have not lagged behind in this respect. Our employees serving in any unit of these forces are, and indeed have been for many years past, given leave to attend annual training in addition to their usual paid annual holiday. During attendance at annual training we make up their service pay to their normal wages and give them an additional allowance according to their personal circumstances. We shall do the same for those of our staff who, as members of the Auxiliary Forces, are called up for special service under the new Act—limited to the period of one month for each man.

CO-OPERATION ON FOOD PROBLEMS

In the crisis last September we were able to co-operate with various Government Departments and public authorities in schemes for meeting the food problems which then seemed likely to confront them. Fortunately, the emergency passed off and no call was made upon us beyond the preparation we made and the advice we gave at the expenditure of considerable time and energy. If an emergency should arise again we shall have gained valuable experience in conjunction with the authorities concerned and be ready and willing to place our productive resources at their disposal.

I referred earlier in my speech to the expenditure we have already incurred on air raid precautions. We had, even before the Civil Defence Bill was introduced, prepared a scheme for the protection so far as is possible of our personnel and premises, so great a proportion of which is in the vulnerable area of London. Indeed, for many months past a great deal of our thought and time has been devoted to this matter.

A.R.P. WORK

We have made good progress in the provision of concrete-lined trenches and shelters at our Greenford factories. At Cadby Hall, where we have large basement areas, suitable strengthening by means of struts is being provided. At both these places we have erected steel and concrete lookout towers. Large numbers of our employees have received, and others are still receiving, training in various A.R.P. services—such as first aid, anti-gas measures, decontamination, and fire fighting. We are providing equipment for all these services and for fire precautions, and we have a gas van so that these anti-gas wardens and first aid parties may be practised in the wearing of gas masks in the actual presence of gas. The response of our staff to the call for volunteers for these services has been very gratifying.

In conclusion, I want to say that once again our thanks are due to the members of our staff of all grades for their unflinching zeal in carrying out their duties. The successful results are due in no small measure to their loyalty and devotion to the company's interests and we want them to know that we appreciate the services they

render. I am sure that you, as shareholders, wish to be associated with us in this tribute to them.

I now propose the resolutions, which the secretary will read, and shall ask Mr Harry Salmon to second them.

The Secretary then read the resolutions as follows:—"That the report of the directors and the balance sheet submitted to this meeting be and are hereby adopted; that the payment of interim dividends of 1s. 8d. per share on the issued ordinary and 'A' ordinary share capital of the company, and 4d. per share on the proportional profit and 'B' proportional profit share capital of the company be and is hereby confirmed; and that a final dividend be paid for the year ended March 31, 1939, of 2s. 10d. per share to the holders of ordinary and 'A' ordinary shares of the company, and 6-8d. per share to the holders of proportional profit and 'B' proportional profit shares of the company who were on the registers on the 5th day of May, 1939."

MR HARRY SALMON'S REMARKS

Mr Harry Salmon, J.P. (one of the managing directors): Mr. Chairman, ladies and gentlemen,—I do not feel it is necessary for me to make a lengthy speech in seconding the resolutions, but there is one matter I should like to refer to. The chairman mentioned the restrictions on the licence of the Popular Café, Manchester, and that has prompted me to refer to a licensing matter which was recently discussed in "another place." A Bill called the Licensing (Declaration of Justices) Bill received on May 17th its first reading in the House of Commons. In introducing it Captain Arthur Evans said that some of the justices who, at Quarter Sessions recently, refused to confirm new licences granted by the local justices for establishments in the West End, were shareholders in companies operating restaurants and hotels in that district.

Obviously against his own wish, but in deference to the wish of the House, he stated that two of the justices were shareholders in this company. As we do not know their names we are unable to confirm or deny that statement, though we cannot think that any consideration of that kind influenced their minds; but even if it did, we should regard such an excess of zeal as detrimental to the company's interests. It would have been contrary to the directors' policy, for we have never in the whole course of the company's existence opposed or joined in opposing an application for a licence.

I should like to add that we were asked by a group of West End restaurants to join them in opposing the applications, but, as always, we declined to do so. In any case, we find it difficult to conceive an over-supply of restaurants in a district like the West End of London—the hub of the world—with its constant influx of enormous numbers of visitors from every part of the country, and, indeed, the world. In our view its need for licensing facilities cannot be judged on the same basis as those of an area where the population is stationary.

I have pleasure in seconding the resolutions.

The Chairman: Before I put the resolutions, are there any questions? (A pause.) Then I have much pleasure in putting the resolutions which have been proposed and seconded.

The resolutions were carried unanimously.

RE-ELECTION OF DIRECTORS

Major M. Gluckstein (one of the managing directors): Ladies and gentlemen,—I have pleasure to propose the re-election of Mr G. W. Booth and Mr B. A. Salmon. If I do not dilate at length on their abilities and their value to the company it is only in deference to what I know is their wish.

Mr Booth is a very familiar figure to you, for he has served the company for more years than perhaps he cares to be reminded of. His ability and energy are unabated, and we look forward to many more years of happy association with him.

Mr B. A. Salmon, though not yet a veteran, has spent his whole business life in the service of the company and has reached that maturity which comes of many years of experience.

I am sure you will agree that the company is fortunate in having two such men to assist in the direction of its affairs, and I therefore cordially recommend them to you for re-election. (Applause.)

Mr A. J. Wood: I have pleasure in seconding that.

The resolution was carried unanimously.

Mr G. W. Booth, on behalf of Mr B. A. Salmon and himself, thanked the shareholders for their re-election. The welfare of the company, he said, was their chief interest and they would continue to work for that welfare to the best of their ability.

The chairman then proposed the re-election of Mr H. H. G. Bennett and Dr L. H. Lampitt as employee directors of the company. Both these gentlemen, he said, had given yeoman service to the company and he could not speak too highly of their usefulness and

the way in which they did all they possibly could to assist the company.

Mr Harry Salmon seconded the resolution, and it was carried unanimously.

Mr H. H. G. Bennett, on behalf of Dr Lampitt and himself, thanked the shareholders for their re-election. Their work for the company was as near pleasure as work ever could be, and was made so by the kindness and consideration they always received from those they were proud to call their colleagues on the board. He assured the shareholders that they would continue to give whole-hearted devotion to the interests of the company.

On the motion of Mr G. L. Lyon, seconded by Mr F. J. Sims, the auditors, Messrs Turquand, Youngs, McAuliffe and Company, were re-appointed.

VOTE OF THANKS TO DIRECTORS AND STAFF

Mr A. J. Wood said it had been his privilege on many previous occasions to propose a vote of thanks to the directors and staff, and he did so this year with particular pleasure in view of the difficult conditions obtaining during the past financial year. The crisis in September dislocated business all round and the Christmas shopping week was one of the worst ever known. In spite of all that, the results obtained far exceeded the anticipations of the most optimistic. He would like to add that he was sure the directors had the support of the shareholders in conserving the resources of the company as they had done in view of the international position. (Applause.)

Mr F. M. Wharton, in seconding the resolution, said that the prosperity of the company continued in such a way that it might be thought by some that it went on automatically, as if the directors had discovered the secret of some wonderful perpetual motion, but he felt sure that all those present would agree with the proposer of this resolution that it was, in fact, due to the work and ability of the board and of their associates and employees, who had maintained profits in very difficult times. (Applause.)

The vote was unanimously accorded amid applause.

The chairman said that on behalf of his colleagues and himself he would like to thank Mr Wood and Mr Wharton for the very kind way in which they had submitted the resolution and the shareholders generally for their acceptance of it.

The proceedings then terminated.

LISBON ELECTRIC TRAMWAYS, LIMITED

SUCCESSFUL YEAR—INCREASED PROFIT

The forty-first ordinary general meeting of this company was held, on the 7th instant, in London.

Mr A. N. Rye, M.I.E.E. (the chairman), said:—The traffic still continues to be satisfactory. During the year 131,987,670 passengers were carried, which is an increase over the preceding year of 5,224,975, and again constitutes a record.

The working profit for the year as shown in the accounts at £171,498 5s. 11d. is an increase of £5,736 19s. 1d. on the preceding year.

The board now have pleasure in recommending the declaration of a final dividend of 4½ per cent. net on the ordinary shares. This with the interim dividend that has been paid will make 7½ per cent. net for the year, which is at the same rate as for last year.

The Lisbon municipal authorities have under consideration a town planning scheme and we have assured them that when they are ready to discuss with us the transport requirements which may be necessary for their scheme our company will be willing to give careful consideration to their proposals. We do not yet know what will be required, but it appears probable that considerable capital outlay may be necessary. As, however, the scheme is for the progressive development of Lisbon, it is expected that any expenditure on our part will be spread over a period of years.

It may be of interest to mention that on March 31st last we had on our pay roll in Portugal 3,853 employees, excluding casual labourers. Another interesting fact is that of this large number only 16 are British, which, I think, is clear evidence that we are giving full effect to the wishes of the Portuguese authorities that we should employ Portuguese in preference to foreign personnel. No company could wish for a more loyal, competent and trustworthy body of men than our Portuguese staff.

Our relations with the Portuguese Government departments and the municipal authorities of Lisbon continue on a very friendly basis, and it is our policy to meet their requirements to the utmost of our ability, while they on their part are always willing to consider any views we put before them.

The report and accounts were unanimously adopted.

SUEZ CANAL COMPANY

REPLY TO ITALIAN CLAIMS

PRINCIPLES ACTUATING BOARD'S POLICY

MARQUIS DE VOGÜE'S SPEECH

The annual general meeting of the Suez Canal Company was held, on the 5th instant, in Paris.

M. le Marquis de Vogüe, chairman of the board of directors, presided.

The Chairman said:—Encouraged by the results obtained, and fortified by your confidence, we shall pursue our policy, without being affected by contradictions or criticisms to which, in the confusion of present times, it may give rise. These are singularly troubled times indeed, when the essential principles of moral law are flouted, when the pledged word is no longer considered as sacred, when integrity is considered "a luxury reserved for the rich," when from an official platform the words, "force is the foundation of relations between peoples," can be hurled to an exulting crowd. It is a new law which is being evolved, founded on violence and envy, and where the Rome of the glorious days, the Rome of "jus gentium," would have difficulty in recognising her generous and civilising inspiration.

By reviving ways of which this great ancestor had condemned the barbarism, the would-be innovators have shown a desire to try their hand on your company.

ITALIAN CLAIMS

It is in Italy that the movement started, by a veritable crusade in which all the papers of the peninsula enrolled, great and small, those of the capital and those of the provinces, with a unanimity the source of which is not difficult to guess. Relying on inaccuracies as regards facts, on errors of dates or figures which denote an extreme bad faith if they are deliberate and an extreme ignorance if they are not, its promoters and their allies have striven to contest our rights, to belittle our management, to cast doubt upon our integrity.

Our modern crusaders have even summoned history to their aid. According to them, Ferdinand de Lesseps was no more than an impostor skilled in the art of parading in borrowed plumes. The Canal, they say, is the work of three Italians: Negrelli, who drew up the plans; Paleocapa, who supervised the work; and Torelli, who carried out the propaganda and brought in the subscriptions.

Now, Negrelli, a talented Austrian civil engineer and a member of the "Société d'Études," founded by Infantin, in which he was at the head of a German group, died in 1858, a year before work was even started on the execution of a plan which was not his own and of which a Frenchman, Linant de Bellefond, was the inspirer. Paleocapa, in a letter dated the same year, 1858, asks to be excused by de Lesseps for not being able to collaborate on account of his having been stricken with blindness. Moreover, it is well known that the execution of the work was entrusted almost entirely to French civil engineers under the direction of Mougél and later of Voisin. As to Torelli, on the eve of the opening of the Canal, when all work was practically finished, he wrote to a friend in the following terms:—"In Italy people are beginning to take the great enterprise seriously—it is somewhat late, but better late than never." Indeed, only 2,719 shares had been taken up in Italy, scarcely more than ¼ per cent. of the capital—whereas de Lesseps' appeal had been answered in France by the purchase of 207,888 shares—i.e. 52 per cent. of the capital.

The professed object of all this clamour, where political purposes can be seen behind the claims to imaginary rights, is to secure seats on the board for Italy and an extensive reduction in transit dues, pending the dispossession of your company and its replacement by an International Commission. In answer to pretensions actuated by such a spirit and formulated in such a manner, we shall only state once again the principles which guide your board in carrying out the mandate which you have entrusted to them.

PRINCIPLES OF BOARD'S POLICY

In the first place, it is an unalterable and absolute rule for the board not to operate the Canal, as it is accused of doing, by stint-

ing on what it should do and for the sole benefit of the shareholders. Conscious of the responsibility assumed towards Egypt, from whom it holds its rights, and towards universal trade, in the interest of which these rights are exercised, the first and foremost care of your company is to endow the Canal, in advance wherever possible, with all the improvements called for by the growing requirements of navigation.

Furthermore, your board have always applied themselves to making reductions of dues and increases of dividends go together, showing thus their firm will not to dissociate the interests of ship-owners from those of shareholders.

The company, at the instigation of the board, has gone even further, and, anticipating an idea which is sometimes considered an achievement of modern outlook, has for over 50 years admitted to the management of the undertaking representatives of users of the Canal. By virtue of an agreement signed by Ferdinand de Lesseps in 1883, seven seats on the board were reserved for representatives of the British mercantile marine. Other shipowners, chosen in France, Holland or Germany, joined the board later on. Circumstances may lead the company not to stop at that, but the company is sole judge of the opportuneness of a decision. It is, in any case, indispensable that representatives of users, when joining the board, should do so with the desire to collaborate loyally in the proper running of the concern, and not with the intention of thwarting it, for it would be ridiculous to open the door of a house to someone wishing to gain admittance merely to ransack it.

EGYPTIAN, BRITISH AND FRENCH INTERESTS

In maintaining these points of view, which are, you will agree, founded on reason itself, we are certain of being in complete agreement with the Governments whose opinions weigh with us, and in the first place with the Egyptian Government. The Suez Canal is in Egyptian territory; this sometimes appears to be forgotten. If Egypt thought fit to entrust the construction and management of the Canal to a private company, and if she has organised its protection within the limits of treaties and conventions signed by her, that brooks no interference. It is Egypt's rights which we defend when we defend our own, and the Egyptian Government, in safeguarding the free exercise of our rights within the terms of the concession granted us, and which we administer under its control, is serving at the same time the interests of Egypt, both present and future.

Besides, it must always be borne in mind that Great Britain is the largest shareholder in the company, and that the majority of the capital belongs to the French. Hence the obligation for the British and French Governments to defend, the one, their own interests, and the other the interests of their nationals. They are each devoting themselves thereto with a firmness to which we are pleased to pay tribute.

Everything incites us, therefore, to continue on our road without any change in our course of action, deaf to unjust criticisms and empty threats.

The meeting unanimously approved all the resolutions presented by the board.

ANNUAL REPORT

The following are extracts from the directors' report:—In 1938 shipping through the Canal was slightly less than during 1937. To the reduction in sterling receipts resulting from this fall in traffic was added the effect of two reductions in dues: one made on April 1, 1937, the influence of which was felt during the first quarter of 1938; the other, which was only in force during the last two weeks of the year. As to expenditure, it would have remained approximately the same had it not been for a monetary factor: the rise in the price of gold which brought about increases in charges for debentures, for interest on and amortisation of shares, and for the service of certain debts at present on the gold basis.

The reduction in receipts and the increase in expenditure have brought about an appreciable reduction in the net results of the year, which, expressed in Egyptian pounds, are 18.6 per cent. less than 1937. On the other hand, the depreciation of the French franc has once again swollen, although to a lesser extent than last year, the results which, converted into French francs at the average rate for 1938, show a surplus of receipts of 953,021,522.81 f., an increase of 11.8 per cent. over 1937.

As last year, to this figure must be added a purely financial profit which amounts to 65,074,859.74 f. and arises from the advantageous

conditions in which, during the year, transfers of funds have been made between London and Paris.

BURDEN OF TAXATION ON SHAREHOLDERS

These results warrant our proposing to fix at 900 francs the gross revenue of the Action de Capital, whilst at the same time making all necessary allocations to amortisation and reserve funds. This revenue of 900 francs represents, as compared with that of the previous year, an increase of 9.75 per cent., which approximates the rise in the cost of living in France during the last year. Thus, in spite of the slowing down of general economic activity, the purchasing power represented by the gross revenue of the Action de Capital will have remained practically constant.

If such is not the case for the net revenue, this is due on the one hand to the increase in the rate of French taxes, on the other hand to the fact that profits distributed this year will be subject for the first time to Egyptian income tax. This tax, which was voted last January, affects all payments made since September 1, 1938; its rate, which is at present 7 per cent., is to be gradually increased to 10 per cent. during the next three years. Taking the French taxes into account, the fiscal load to be borne by most shareholders of the company has become extremely heavy. It is consequently our earnest wish that between the Egyptian and French Governments a convention on double taxation should rapidly materialise, permitting a limitation of the total fiscal burden imposed by the two States.

TRAFFIC THROUGH THE CANAL

Traffic through the Canal in 1938 amounted to 6,171 transits, representing 34,418,000 tons net register. Although this tonnage shows a reduction of 2,073,000 tons, or 5.7 per cent., on the exceptional figure for 1937, it is nevertheless greater than that for any other year, in particular 1929, a year of great commercial activity.

The reduction, as compared with 1937, is due for the greater part to the falling off of Italo-Abyssinian traffic, which, from one year to the other, dropped by 1,222,000 tons—i.e. more than one-third. Apart from this particular traffic, the reduction is of 851,000 tons—i.e. 2.6 per cent.

The classification of net tonnages by nationalities shows that British traffic still occupies the first place, with a tonnage of 17,358,000 tons, which is 50.4 per cent. of the total, against 47.3 per cent. in 1937. On the other hand, Italian traffic, while still occupying second place, has fallen by more than one-fifth from one year to the other, and its percentage is now only 13.4 per cent., after having been 16.1 per cent. in 1937 and 20.2 per cent. in 1936. Then come Germany, the Netherlands, and France.

The number of passengers has fallen from 697,800 to 479,802, the reduction being mainly in passengers of Italian nationality.

Goods through the Canal have, as usual, been more affected than tonnage by causes of depression. The total weight of goods reached 28,779,000 tons, 12.2 per cent. less than in 1937.

The north-south movement, which depends on European exports, has been particularly affected, having had to suffer not only from the state of economic crisis, but also because of the restrictions due to the Sino-Japanese conflict.

From south to north the total was 21,011,000 tons, a reduction of 1,608,000 tons, or 7.1 per cent., on the exceptional results of 1937.

IMPROVED EFFICIENCY

The conditions in which, in 1938, transits of the Canal were made, were fully satisfactory. They bear witness to the continuity of progress made since its origin in the functioning of the great highway of international commerce which the Suez Canal constitutes. Thus, thanks to the improvements carried out it has been possible, in spite of the growth of traffic and the increase in the dimensions of transiting ships, to ensure that these can transit the Canal with ever-increasing ease and security. Whilst during the early years of the working of the Canal there was an average of 150 groundings per thousand transits, this figure was reduced in 1900 to 17; in 1938 it was only three, and even this reduces itself to 1½ per thousand if groundings due to causes of *force majeure*, such as sudden squalls, fogs, or engine breakdowns, are eliminated.

The results just analysed show (as always with a certain time-lag) the evolution of world economy. This economy remained very much depressed during the whole of 1938, and the examination of the present situation does not give much hope of an immediate recovery.

The revival which has shown itself during the last few months in European exports to China and Japan—exports which, as we have already stated, had considerably fallen last year—is, however, to be noted as a favourable symptom as regards Canal traffic. The future remains uncertain and will remain so as long as the evolution of world economy is dominated by the uncertainty of the international political situation. But the day when, as all of us wish, these anxieties disappear, there is every reason to believe that economic activity and international exchanges will rapidly develop; the firmness shown during the last few months by the gold price index of primary commodities is, in this connection, an encouraging indication. The traffic of the Canal which, in spite of present circumstances, shows a remarkable resistance to a reduction would then have every chance of regaining its upward trend.

The full report may be obtained upon application at the company's Inquiry Office, 6 Bishopsgate, London, E.C.2.

HENDERSON'S TRANSVAAL ESTATES, LIMITED

EMINENTLY SATISFACTORY RESULTS

MR W. L. CASTLEDEN'S SURVEY

The twenty-seventh ordinary general meeting of Henderson's Transvaal Estates, Limited, was held, on the 7th instant, at River Plate House, Finsbury Circus, London.

Mr W. L. Castleden (deputy chairman and managing director), who presided in the absence of the chairman, Sir Abe Bailey, in the course of his speech said:—The profit for the year is £73,592—rather more than £2,200 below that of the previous year. Adding to this the balance of £52,064 brought into the accounts, we have a credit to profit and loss amounting to £125,656. Out of this your directors recommend a first and final dividend of 12½ per cent. for the year, less income tax, the same dividend as for the previous two years, leaving £55,226 to be carried forward, subject to the directors' additional remuneration amounting to £1,565 14s. 11d.

On the revenue side the most satisfactory and important feature is the increase in our return from dividends and interest by about £2,700. Owing to the conditions which have prevailed throughout the year, the opportunities for making any profit from share dealings practically disappeared and our revenue had no assistance from this source, which last year produced £4,108.

It is with satisfaction that, notwithstanding the general low level of market quotations, we are again able to inform you that on March 31st the market value of our quoted investments in the aggregate was in excess of book values; the same remark applies to the holdings in our own subsidiary and associated companies.

During the Henderson Consolidated Corporation's financial year, which ended on December 31, 1938, income generally was well maintained and there was an increase in the return from coal interests. The demand for farming land, however, was negligible and no properties were disposed of during the twelve months. The corporation repeated the previous year's dividend of 15 per cent. and carried forward a balance of £31,891.

DELAGO BAY DEVELOPMENT CORPORATION

This corporation during the financial year ended June 30, 1938, earned a slightly smaller net profit but, nevertheless, was again able to pay a dividend of 4 per cent.

The Tweefontein United Collieries, Ltd., continues to maintain its satisfactory position among the leading coal producers of the Transvaal. Although the tonnage actually sold during the year ended September 30th last showed a slight reduction, the profits for the year were on a higher level, which enabled the company to increase the rate of dividend paid on the Ordinary share capital from 15 per cent. to 17½ per cent., the Preference dividend being maintained at the maximum rate of 10 per cent. for the year.

Perhaps, ladies and gentlemen, I may be forgiven for reminding you that, during the past fifteen years—years which have included both the world economic crisis and a series of international crises—the shareholders of this company have received no less than 108 per cent. in dividends, or an average of over 7 per cent. per annum; while, at the same time, we have continued to build up the strength of the company to its present sound position. (Hear, hear.) I trust that the account which I have just given you of the company's affairs will have satisfied you that we are in a position to face the future with comparative confidence.

The report and accounts were unanimously adopted.

ASSOCIATED NEWSPAPERS LIMITED

THE HON. ESMOND HARMSWORTH'S REVIEW

A DIFFICULT YEAR

The thirty-fourth annual ordinary general meeting of Associated Newspapers Limited (proprietors of *The Daily Mail*, the *London Evening News*, and the *Sunday Dispatch*), was held, on the 8th instant, in the Memorial Hall, Farringdon Street, London.

The Hon. Esmond C. Harmsworth, the chairman, presided.

The Secretary (Mr J. P. Hobbs, F.C.I.S.) read the notice concerning the meeting and the report of the auditors.

The Chairman, in moving the adoption of the annual report and balance sheet, said:—Ladies and gentlemen, the directors' report and the balance sheet have been in the hands of shareholders for several days, therefore, with your approval, I will take them as read.

The profit of the company for the year to March 31st last, after providing for interest on the company's 3½ per cent. registered notes, depreciation of plant and machinery, National Defence Contribution, income tax, etc., was £445,266 ls.

The dividends on the 5 per cent. preference shares and 7 per cent. ordinary shares have been paid.

During the year two interim dividends of 4 per cent. each were paid on the deferred shares, one in July and the second in January. It is now proposed to pay a final dividend, making a total of 12½ per cent., less tax, for the year.

From the balance on the appropriation account £100,000 has been allocated to reserve for contingencies.

The balance sheet is presented in the same form as previous years, and there are few items that call for comment.

Share and loan capital are unaltered except for the reduction of the amount of the 3½ per cent. registered notes by £25,000, this amount having been drawn in October last, for repayment of 101 per cent. on November 1st, in accordance with the terms of the issue.

The reserve account and pensions funds are unchanged. In the item for dividends, provision has been made for the final dividend on the deferred shares. With regard to creditors and reserves for contingencies, I might mention that there is a considerable decrease in the amount included for ordinary trade creditors this year.

On the assets side of the balance sheet the book values of properties and plant, after depreciation, show a reduction of £86,455. The item for stocks of paper, etc., is £79,183 less than last year, as we were carrying considerably smaller stocks of newsprint.

The item amounts owing by subsidiary companies shows a reduction on last year, and the small alteration in the figures for investments is mainly accounted for by an arrangement concluded in respect of one of our provincial newspapers. The return the company received from its total investments amounted during the year to just under 6 per cent., and the return from our investment in our provincial newspapers was slightly in excess of 6 per cent. I think shareholders will regard these results as satisfactory.

Debtors remain practically the same as last year. Cash at £459,783 6s. 10d. shows a healthy increase.

ANGLO-NEWFOUNDLAND DEVELOPMENT COMPANY, LIMITED

The Anglo-Newfoundland Development Company has recently announced its final dividend for the year of 3½ per cent., making 6 per cent. in respect of 1938 as compared with 8 per cent. for the previous year.

As you are aware, the Newfoundland Company derives a large part of its profits from its mining interests, and owing to the much lower average prices of lead and zinc for 1938 as compared with 1937 the company received considerably less revenue from its interest in the Buchans Mine. On the newsprint side of the business there was some increase in profit, but as the result of a drastic shrinkage in world consumption of pulp and paper products in 1938 the Anglo-Newfoundland Company, in common with many other newsprint manufacturers, was compelled to reduce its scale of operations and with the increased cost of production applicable to a smaller output the advantage of a higher price was largely offset.

In the past year or two the Newfoundland Company has spent large sums on improvements and additions to its plant and

machinery and has thereby put itself into a good position to take advantage of any improvement in the trade in the future.

I can again repeat that we are well satisfied with the position and prospects of this company and with our investment in it. The Anglo-Newfoundland Company's annual meeting will be held shortly and the chairman's speech will be published as usual in *The Daily Mail*.

ADVERTISEMENT REVENUE

With regard to advertising, there is no need for me to refer at length to the great difficulties of the year which every business has had to face.

A state of affairs developed in which effort and enterprise were negated to a considerable extent by the threats of obscurities of the European situation.

Although our publications retained their pre-eminence in the advertising field, it was only to be expected that they would be among the newspapers most affected by the general setback, seeing that in normal times they enjoy perhaps the highest advertisement revenue of any group of newspapers in the country.

It is, however, both gratifying and significant that for the year under review our sum total advertisement revenue should have reached its very high figure.

"THE DAILY MAIL"

Throughout the last financial year *The Daily Mail* again carried more trade display advertising than any other newspaper in the country.

This lead in advertisement revenue, which *The Daily Mail* has maintained now, year after year, over all competitive publications, continues as a highly satisfactory feature.

It demonstrates, in a very practical manner, that *The Daily Mail* continues in its unique position as the most powerful advertisement medium in the country, and is the first newspaper to be considered whenever national advertising appropriations are being allocated.

"THE EVENING NEWS"

The position with *The Evening News* also gives rise to satisfaction. In net sales to the public *The Evening News* has a big lead over its nearest rival to the extent of hundreds of thousands of copies per day, and the ascendancy is just as marked in the direction of advertisement revenue.

During the year under review nearly 30 per cent. more trade display advertising was carried by *The Evening News* than that apportioned to the second London evening newspaper.

Trade display advertising includes store and drapery announcements which are keyed for the purpose of keeping check on response. Such advertising can thus be accepted as a guide to the comparative pulling powers of the newspapers being used.

It is significant to note, therefore, that over our last financial year *The Evening News* carried more store and drapery advertising than the two other London evening newspapers combined.

In single column inches the actual 12 months' total for store announcements in *The Evening News* is nearly double that for the second London evening newspaper and well over double that for the third.

"SUNDAY DISPATCH"

In Sunday journalism the *Sunday Dispatch* continues to hold, and to an extent improve, its great position among Sunday newspapers. This applies not only to net sales but to advertisement revenue as well.

As one indication, records for the six months ended March 31, 1939, show that the *Sunday Dispatch* carried more advertising, in comparison with the corresponding period of the previous year, to the extent of nearly 1,000 single column inches.

The Overseas Daily Mail has again had an excellent year. There is evidence enough that this popular weekly edition of *The Daily*

Mail, with its special colour issues, is undoubtedly doing good work for British trade, especially in the Empire markets.

Individually and collectively, therefore, your publications have come through a period of alarms and unrest in a manner which speaks for their strength and prestige.

The confidence can most definitely be expressed that every move towards the settled conditions favourable to normal buying and selling will see an immediate corresponding advance in the advertisement revenue of your newspapers.

In support of this is the fact that in volume of display trade advertising *The Daily Mail*, in particular, well maintained its lead over all other newspapers during the opening months of the current financial year.

It is with satisfaction that I can report that the sales of our three papers, *The Daily Mail*, *Evening News* and *Sunday Dispatch*, are all—at the present time—in excess of those for the corresponding period last year.

IDEAL HOME EXHIBITION

The *Daily Mail* Ideal Home Exhibition was held at Earls Court for the first time, and 473,869 visitors paid for admission. Many exhibitors reported that business at the Exhibition was better than elsewhere in the country, and in a large number of instances that results had exceeded what they had expected.

International interest in the Exhibition was shown by exhibits, which included those of Australia, the Dominion of New Zealand, the Indian Coffee Market Expansion Board, and a number of Continental countries. National Services took up the opportunity the Exhibition offered for close and friendly contact with the public. There were successful exhibits representing the Navy, the Army, the Air Force, Territorial Army and the Home Office A.R.P. Section.

We might claim, finally, that *The Daily Mail* in presenting and maintaining its unique Exhibition at an even higher standard than usual gave to the people and the business of Great Britain a wholesome centre for relief from the stress of the times.

Our provincial newspapers maintained their position both in regard to sales and advertising revenue, and although they had to bear an increase in the cost of newsprint, the dividends they paid to this company gave the satisfactory yield on our investment to which I have already referred. During the year your directors were able to effect a merger of our paper in Leicester—the *Leicester Evening Mail*—with the opposition paper the *Leicester Mercury*. Under this arrangement both papers continue their separate entities but with the elimination of unnecessary and costly expenditure. So far the results have fully justified the arrangement made.

NEWSPRINT

In my reference to the Anglo-Newfoundland Development Company, Limited, I mentioned the subject of newsprint. During the year under review your company had to bear a heavy increase in the cost of this raw material, and the fact that this rise coincided with a lower output of newsprint by the Anglo-Newfoundland Company with increased costs of production and a falling off in that company's profits from its mining interests, meant that the dividends from our investment in Anglo-Newfoundland Development Company, Limited, did not show the increase for which we had hoped.

A review of the newsprint position at the present time would not indicate that there should be any further increase in price in the immediate future.

In the directors' report on the printed balance sheet reference is made to the reduction in the company's profits. I have already explained that the extra cost of newsprint is one of the main reasons for the reduction. There is also the fact that this year's profits are reduced by the income tax payable on the higher profits of last year, for, as you know, income tax assessments are always made on the previous year's earnings. For the rest we must look to the unprecedented conditions existing in an unsettled world, which applied to a greater part of the period covered by the accounts you have before you. I do not propose to introduce a gloomy note into my speech, but I suppose there is hardly a business of any kind in the country which has not felt the effects of the tension and unsettled conditions through which we have been passing.

A newspaper business is, of course, particularly susceptible to such conditions as it not only suffers a loss in revenue from advertisements, but in its service to its readers it is called upon to incur heavy extra expenditure on such items as sending extra correspondents to

different parts of the world and the printing of special late editions in times of crises, etc. In spite of these facts, however, I hope you will agree that we should count ourselves fortunate in the strength and stability of our business, and the fact that we have been able to make such a good showing. As to the future, I find it difficult to make a forecast, but I can only say that your directors are satisfied that any improvement in the international situation and in world trade generally should be reflected in the results of your company.

Last year, as you know, we decided to alter our policy of paying quarterly dividends on the deferred shares and paid two interim dividends, one in July and a further one in January, and in passing the accounts to-day you are asked to approve the payment of the final dividend of 4½ per cent. It is obvious that it is necessary to continue this prudent policy and this year we propose to pay an interim dividend on the deferred shares in January, 1940, and the final dividend when we meet again next June.

This year I want to pay a specially warm tribute to our many loyal friends connected with the industry, particularly to the advertisers and advertising agents, who have shown great courage under trying conditions, and also to the wholesale and retail newsgagents. May I also acknowledge to our staff throughout the business our thanks and appreciation for their loyalty and good work.

The chairman concluded by moving the adoption of the report and accounts.

Mr Stanley Bell (managing director) seconded the resolution, which was carried unanimously.

The retiring directors were re-elected, and the auditors, Messrs Lever, Honeyman and Company, were reappointed.

The proceedings terminated with a vote of thanks to the chairman and directors.

MALACCA RUBBER PLANTATIONS, LIMITED

REPLANTING PROGRAMME

The thirty-third annual general meeting of the Malacca Rubber Plantations, Limited, was held, on the 6th instant, in London.

Mr Charles Emerson (the chairman) said that last year he had indicated that it was unlikely that profits for the year which he now had to review would be as considerable as those obtained for 1937, and that had proved very definitely the case. They had made a profit of £41,722, or less than half that obtained for the previous year. They regretted that they were unable to recommend a dividend on the ordinary stock. They were impressed with the necessity of conserving their financial resources in view of their heavy replanting programme.

The problem of replanting was the most important one that confronted all the senior rubber plantations at the present time. At the end of the year this company had an area of 1,350 acres already replanted; during the current year they were dealing with a further 1,050 acres, and they had sanctioned for treatment in 1940 an area of 1,040 acres. That gave a total of 3,440 acres, which was a very considerable area even in relation to their large total acreage. Looking further ahead, it was exceedingly difficult to give any definite estimate of the areas which would subsequently have to be treated.

There was a marked and significant contrast between the crop they had been allowed to export for the year under review and that for 1937. For 1937 their exportable crop had amounted to 5,985,628 lbs., whereas for 1938 the figure was 3,591,267 lbs. The adverse effect on production costs was obvious; there had been an increased cost of production and less rubber to sell. The decline in profits would have been steeper but for advantageous forward sales. For the current year the standard assessment was 6,957,822 lbs.

Their financial resources, despite the heavy inroads on them made by their replanting operations, were still very considerable, but, as it was apparent that large demands would be made upon them before they had finished replanting their older areas, a conservative financial policy was indicated, and was in the best interests of investing shareholders.

The report was adopted.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to the Reporting Manager of THE ECONOMIST, 8 Boulevard Street, Fleet Street, London, E.C.4.

BOOTS PURE DRUG COMPANY, LIMITED

LORD TRENT'S REVIEW OF A SUCCESSFUL YEAR

The fifty-first annual general meeting of Boots Pure Drug Company, Limited, was held, on the 8th instant, in Nottingham.

The Rt. Hon. Lord Trent, chairman of directors, said:—Our trading profit, after providing for contributions to staff pension funds, management remuneration, income tax and National Defence Contribution, amounts to £951,009—an increase of £10,677.

The profits before taxation have only once been beaten, and that was in 1936-37, when chemists' trade was exceptionally good. The figures on our profit and loss account emphasise the heavy burden of taxation which is now being borne by industry.

Repairs and renewals, whilst less than the abnormally high figure of last year, are well up to our average of the past few years. Depreciation shows an increase of over £11,000.

The net balance amounts to £776,292—an increase of £13,667. After payment of all preference and preferred ordinary dividends, and of four quarterly dividends of 6 per cent., less tax, on ordinary shares, we have a balance of £295,542, which, together with the balance brought forward, amounts to £642,272, against £598,862 last year. Your directors recommend the payment of a bonus of 3d. per share, free of income tax, on the ordinary shares, absorbing £80,000. This, together with the allocations to which I have already referred, will leave £248,724 to be carried forward to next year.

EMERGENCY STOCKS

During the past year our total stock was turned over at a faster rate than ever before—and this, in spite of the fact that we felt it desirable prior to the crisis last autumn to increase our stocks of essential drugs, surgical goods and first-aid requisites. Our precautions proved more than justified, for we were sold out of the increased stocks in our branches in a very short time.

The Ministry of Health has advised all hospitals to carry a month's stocks of essential drugs and dressings. It is clear, from our experience last autumn, that the need is no less urgent for the public to provide themselves with essential medical requirements. In fairness to themselves, to the manufacturers and distributors, and particularly to the transport services, those who can should lay in a stock of first-aid requisites and everyday medicines before a possible emergency and not wait until too late.

During the past year we have opened fewer branches than usual, but, in addition to 20 new branches, which bring the total up to 1,195, we closed five and we have rebuilt, enlarged and improved 50, and actually our expenditure on shop properties exceeded that of any previous year.

RECORD SALES

We are beginning to reap the benefit of our new factories in reduced manufacturing costs, which we have already passed on to our customers in the form of lower prices for a number of articles. In a year of disturbed conditions and heavy unemployment our total sales transactions again beat all previous figures and increased by over four millions, while the number of prescriptions dispensed increased by over half a million, and was easily a record.

Our figures reflect the great care which was taken, and which in point of fact is continuously taken, to control every item of our expenditure.

The new dry goods factory and the building which comprises the new canteen and the school for juvenile workers were opened at Beeston during the year, and have proved a most valuable and highly appreciated addition to the Beeston group. We now possess premises worthy of the school which has contributed so much to the creation of a contented, keen and efficient staff. During the year over 19,000 visitors were shown over the Beeston factory, that has won tributes from so many quarters and is regarded as a model of what a factory should be.

Our medical specialities are increasingly prescribed by the medical profession as their worth becomes better known.

Two years ago I mentioned that we had sent representatives to Toronto to obtain the earliest information about Protamine Insulin (with Zinc) Suspension. This step has been fully justified, since the product has become of increasing importance. That the manufacture of this product is not controlled in this country by foreign interests is due solely to our action.

The sales of our agricultural products are steadily increasing. During the past year our veterinary department, in conjunction with official bodies, have carried out a great deal of research, and two of the results which have proved very successful have been for the

treatment of black-head disease in turkeys and sway-back disease among sheep.

HORTICULTURE

Our research department have done a great deal of investigation on rooting stimulants in association with high authorities on the biological side of the work. Whilst we are actively pursuing what I might term "long range" scientific work, we have also taken steps to cater for the hundreds of thousands of amateur gardeners in this country.

You will recall that a year ago we appointed Mr C. H. Middleton, of broadcasting fame, as our horticultural consultant. During the past year we have organised a series of public meetings for garden-lovers in eleven cities, and Mr Middleton has addressed large and enthusiastic audiences.

It is especially gratifying to be able to report a steady increase in our export trade during a period when the general conditions for foreign trade were deteriorating. Export trade is a matter of such vital importance to the country that we intend to develop energetically all possible openings in this direction, either on our own account or possibly in co-operation with other pharmaceutical manufacturers.

The first valuation of the general staff pension fund, which was inaugurated on April 1, 1935, has now been completed. It shows that while the surplus was somewhat less than had been provisionally estimated, the fund is established on a sound basis.

The two chief factors affecting the result were, firstly, the rate of mortality was considerably lower than that expected from the official tables, and, secondly, practically the whole of the funds were invested in gilt-edged securities, which, whilst providing a sound foundation, gave a low yield.

Once again I am delighted to put on record our keen appreciation of the contribution made by the staff to the success of the firm and to the high esteem in which it is held by the public. The knowledge that the staff can be relied upon to do their utmost for the company in all circumstances is a source of great strength to us and provides ample justification, if justification were needed, for all the schemes of staff welfare to which I have referred again and again in my annual speeches.

We have special reason to be proud of the splendid way in which they faced the many problems which confronted them last September.

NATIONAL SERVICE

For many years we have granted full pay to Territorials whilst in camp, and given them their full holidays with pay in addition to the fortnight spent in camp. When the scheme for training women for the Civil Nursing Reserve was announced, we decided to place those attending their hospital course on the same footing as the Territorials, namely, to grant full pay in addition to their paid holidays. This applies in peace time, both in the case of men and women Territorials and Auxiliary Nurses, but does not apply to the men called up under the Military Service Act, whose places will, of course, be kept open for them.

During the past two years we have been training volunteers for our own A.R.P. requirements. In addition, we have a large number trained for local authorities' schemes. Altogether in the defence services and trained or under training for A.R.P. in either our own or local authorities' schemes we have 5,200 people.

He would be a rash man who would venture at the present time to hazard any forecast of the coming year's results. In normal times the affairs of this country are conducted on the assumption that there is no danger of war in the next ten years. Until it is once again safe to make an assumption of that sort it will not be possible to look ahead with any degree of certainty. But with this proviso it is perhaps permissible to call attention to the brighter side of the picture.

At the present time trade as a whole is good, in spite of bad patches in the country, and we are fortunate in having branches situated in districts where there has been a great improvement in unemployment figures, as well as in places where trade is not so good. We have a great and growing goodwill both on the professional side of our business and also with the public at large. We look ahead, therefore, without complacency but with complete confidence in the knowledge that we are prepared, as far as it is humanly possible to be prepared for anything that the future may bring.

The report and accounts were unanimously adopted.

BEECHAMS PILLS, LIMITED

NEW RECORD IN PROFITS

ENCOURAGING OUTLOOK

The eleventh ordinary general meeting of Beechams Pills, Limited, was held, on the 8th instant, at the Hotel Victoria, London.

Mr Philip E. Hill (chairman of the company) presiding, said: Ladies and gentlemen,—The profit of £723,663 creates a new record in the company's history. The year under review has been a most eventful one, not only from the company's point of view in the acquisition of two very important new businesses—Macleans and Eno's—but also from the extremely difficult trading conditions which have existed (and to some extent still exist), occasioned by world affairs.

Although we are all tired of the continual references to "unsettled political conditions," unfortunately any predictions which we may make with regard to the future must be subject to a nearer return to normality.

EXPORT TRADE

Dealing first with export trade, which I consider of the highest importance both from the point of view of your company, but even more so from a national standpoint, I feel that this present year should exceed anything hitherto achieved.

When your directors purchased the Eno business one of their principal motives in doing so was to take advantage of the wide-spread export organisation belonging to that company and to obtain the benefit of its specialised export experience covering a long period of time.

We have already made arrangements for our company and its subsidiary and associated companies to take advantage of Eno's unique position. We are utilising their factories and old-established selling organisations throughout the world to manufacture and sell our lines, and when this policy has been fully developed it should result in big economies in manufacturing and selling costs. Eno's export director has just completed a comprehensive tour of Egypt, India, Ceylon, Malaya, New Zealand and Australia, while our own export manager has just returned from an extensive tour of the West Indies, U.S.A., Canada and the South and Central American markets.

Sales to date show steady progress all round, and we are justified in anticipating important increases in our overseas profits.

Turning to our home trade, last year we received only a portion of the annual profits from Macleans and Eno's, and this year we shall have the benefit of a full year's trading. Since the acquisition of the Maclean and Eno businesses we have been able to effect very considerable economies in manufacture, administration and selling, a considerable portion of which economies will be realised in this year's accounts. We should be able to look forward to sales reaching a higher level, and we anticipate successful results from Livaclean and Lucozade—two new lines marketed by Macleans.

PROPOSED REPEAL OF MEDICINE DUTIES

An event of outstanding importance during the past year—probably the most important event which has ever happened in the history of the proprietary medicine and proprietary article business—is the proposed repeal of medicine duties. It is, of course, too early for one to make any accurate forecast as to the extent of the benefit it will prove to our business; but one thing is already abundantly clear, and that is, that it opens up a vista of great possibilities. When the repeal comes into force, as presumably it will in September next, a much wider field of distribution will be available. Exactly how we shall deal with that is a matter which requires the most careful consideration.

We have already been approached by some of the largest potential distributors in the country, who, in consequence of the conditions which previously existed, have in the past been prevented from dealing in our type of merchandise. There is also no doubt that as we get nearer to September, we shall be approached by many others. Our first consideration will be to deal fairly and equitably with the whole of our distributors—old and new, large and small.

CURRENT YEAR

In conclusion I feel I am not unduly optimistic in looking forward to this year's results with added confidence. Personally, I shall be very disappointed if this time next year I am not able to refer to the fact that the record of profits established this year has been well broken. I have always had the greatest belief in the future of this business, and I feel that its prospects to-day are greater than at any time since its formation.

The report and accounts were unanimously adopted.

CALLENDER'S CABLE AND CONSTRUCTION COMPANY, LIMITED

15 PER CENT. DIVIDEND FOR THE TWENTIETH YEAR

SIR FORTESCUE FLANNERY'S REVIEW

The forty-third ordinary general meeting of Callender's Cable and Construction Company, Limited, was held on the 7th instant, in London.

Sir J. Fortescue Flannery, Bart., H.M.L., M.Inst.C.E., the Chairman, first referred to the sad loss sustained in the death of the late Sir Tom Callender.

Continuing, he said:—I have frequently had the good fortune to announce increasing business and consequent higher profits, but on this occasion the vicissitudes of trade have operated, and the income for the year 1938 is considerably less than for 1937. Later on I shall outline the circumstances which have caused this reduction.

Nevertheless, we have made more than sufficient profits to pay a dividend of 15 per cent. for the 20th year in succession, which is eminently satisfactory. Indeed, with the exception of 1936 and 1937 the gross profits are the highest in the history of the company.

Unfortunately the international position did not clear, but worsened until the crisis in September, with the consequence that for many months the demand for supplies from our Erith Works was further restricted, and it is only within the last month that a return to more normal conditions has been experienced.

Taking the balance sheet, we have expended £164,919 on additions during the year to the freehold property and machinery, which, with the amount reported to you last year, makes £323,000 in two years.

PROFIT AND ALLOCATION

Taking the profit and loss account itself, the profits from manufacturing account and contracts, including interest and dividends on investments, are £723,306 or roughly £200,000 less than last year. This has been due to the slowing down of orders owing to the international crisis, especially in supertension work.

After providing £60,000 for depreciation of plant, buildings and machinery and £60,000 for income tax and £15,000 for National Defence Contribution and the appropriate sums for interest on the Debenture stock and the dividends on the Preference stock, there remains a net balance of £244,112. Bringing in the balance from last year, £565,023, there remains for consideration £809,135.

Your directors, therefore, recommend that there shall be paid a dividend of 15 per cent., of which 5 per cent. was paid last November, and that £250,000 be transferred to reserve, leaving to be carried forward £390,548.

The question uppermost in all your minds is probably the reasons for your directors considering it not desirable to pay the special cash bonus for the year 1938, as for the last two years. The first reason is that this was not a year of unusual prosperity, in which a special cash bonus is justified. An additional reason is the existing threatening international situation. Your company, with considerable foreign and overseas interests, are specially obliged to have such considerations prominently in their minds in relation to the appropriation of any surplus.

Further, there are heavy expenses of an unusual nature which the company has to face during the coming year. (1) The expenditure for air raid precautions estimated in the neighbourhood of £50,000, and (2) the still further expenditure of over £10,000 on the safeguarding of machinery as a consequence of the recent Factories Act.

The considerations I have mentioned will convince any reasonable man and woman that at the present time it is but being prudent to "plough in" to the resources of the company any surplus.

THE OVERSEAS TRADE

As regards our general trading we experienced a heavy demand for our products from abroad during the year, and the export business was large—made up of a steady stream of orders from our friends and clients overseas, who continue to place their faith in Callender Cables. Our trade in Australia and New Zealand has been maintained for all classes of our manufactures. In South Africa our business has been steady and well above the average of the last few years. In India there was an absence of any very large contract, but the level of our important exports to India has been very well maintained.

As regards the future, whilst the beginning of this year was affected by slackness of orders, there has been a substantial improvement in the last month, and at present our Erith works are very busy, particularly in respect to the manufacture of cables for supertension transmission.

The report and accounts were unanimously adopted.

BURMAH OIL COMPANY, LIMITED

SIR JOHN CARGILL'S SPEECH

The thirty-seventh annual general meeting of the members of the Burmah Oil Company, Limited, was held, on the 2nd instant, in the Merchants' Hall, Glasgow.

Sir John T. Cargill, Bt., the chairman, in moving the adoption of the report, said that last year he had ventured the fairly content forecast that results for 1938 should not be materially inferior to those of 1937. The actual results broadly confirmed that forecast. Their trading profits, for reasons then envisaged, were lower than in 1937, but, thanks to larger investment income, the overall reduction in profits was only £147,039, despite somewhat greater provision for depreciations, increased charges for taxation, and the cost of the duty on the increase in capital and of the issue of bonus ordinary shares. When allowing for the lower amount brought forward from 1937 and that year inherited from 1936, the disposable balance for 1938 of £4,652,517 was less than that of 1937 by £156,923.

CONSUMPTION IN 1938

There could be no better barometer of confidence and of the trade activity generally which went with it, or of the reverse, than was furnished by the demand made or not made on the products of petroleum. Contrary to all past experience, petroleum consumption had encountered an actual setback in 1938 and not merely a decline in the rate of expansion, and that was significant of the unhappy and unsettling conditions affecting world trade. With that falling away in demand for petroleum products, there had necessarily been a falling away also in the demand for tanker tonnage; freights had consequently declined considerably and the c.i.f. value of products had fallen.

The industry was thus facing, even although he was confident only temporarily, a situation in which, while readily available supplies were probably greater than they had ever been from producing sources geographically more widely distributed, demand for defensive or offensive stocking precautions by Governments disturbed by political conditions in Europe and the Far East was drying up, one could only hope for good. Demand by ordinary consumers was disappointing; even although there were countries where consumption continued to expand, aggravating those unfavourable conditions, production in certain countries continued imperfectly controlled.

So much for the general world position of the industry; their own markets in India and Burma could not escape world influences but, even if the increase was only small, there was an overhead expansion in them in 1938. Provincial Governments in India in their search for revenue were, however, now encroaching on the sources of Central revenues by imposing on petrol and other petroleum products their own consumption or sales taxes on the top of the excise or customs duties of the Central Government, and one could not be too happy about the effects of all this on the future volume of consumption.

There were at the moment also movements in Provincial India to fix maximum and minimum selling prices for petrol and kerosene. Politically-agitated labour unrest also continued to be a matter of grave concern in India and Burma, although it would be a mistake to conclude that the conditions were universally applicable in those countries or that anything more than a particularly vocal and active minority of trouble-makers was responsible, or that the policies which those people advocated had the sympathy of any material section of the population.

NEED FOR CAUTIOUS OUTLOOK

All those conditions, however, had necessarily required consideration by the board in arriving at their decisions and recommendations in respect of the disposable balance after depreciations of the 1938 profit, for, unless there were some improvement in values between now and the end of the year—and frankly he could see no grounds for expecting that—their trading results in the current year could quite definitely register a still further setback. It would be unwise also on this occasion to look to their investment income for the necessary compensation.

While not ignoring the fact that not too favourable conditions were still in operation and the necessity for conservatism and caution in one's outlook on the immediate future, he thought it only right to emphasise also the necessity for maintaining a proper sense of proportion and perspective. That they would find in their balance sheet, which was an open book for all to read, of their ability to come through and smiling anything which the industry as a whole, or even in its best parts, could survive. Taking the long view and assuming fair treatment and the peaceful enjoyment of the enterprises which they had built up, he saw no reason for pessimism as to the further future.

The report was adopted.

THE MINING TRUST, LIMITED

PROGRESS AT MOUNT ISA

The tenth annual general meeting of The Mining Trust, Limited, was held, on the 8th instant, at Winchester House, Old Broad Street, London, E.C.

Earl Castle Stewart, M.C., chairman of the company, said:—Referring to the assets, shares in subsidiary companies standing at £3,324,208 show an increase of £1,188 by reason of the repurchase at a profit of 3,700 shares of Mount Isa Mines, Limited, which had been sold in the previous year. The increase in "Other Investments" by the sum of £56,982 is the result of the payment of outstanding calls due on 882 shares of Saudi Arabian Mining Syndicate, Limited, and the acquisition of a further 1,315 shares. Cash resources amounted to the satisfactory figure of £279,891, an increase of £20,887 over the previous year. Income for the year totalled £124,767. Total expenditure amounted to £20,274, and shows a decrease of £4,419, mainly due to a reduction in the technical advisory fees payable by the company. The balance of income over expenditure amounts, therefore, to £65,690, and this has been applied to reducing the debit balance to £892,065.

MOUNT ISA MINE

In view of the fact that the largest single investment of the Mining Trust is a very important holding of first debenture stock and 80 per cent. of the issued share capital of Mount Isa Mines, Limited, it seemed to your directors important that some representative of your company should visit the property this year. Accordingly, Mr Mitchell, the chairman of your Technical Committee, and myself went to Australia in the early months of this year. I will say that we came back convinced that the technical management at Mount Isa is exceptionally able.

Mount Isa is a large but somewhat low-grade mine, and without the greatest economy in management and skill in production it would not have been possible during the last operating year, when the price of lead fell from £23 3s. 1d. to £17 9s. 3d., to have earned and paid all interest upon the large amount of debentures and loans outstanding, and to have earned for the second year in succession a small profit. There has been a further improvement in the average mill extractions for the past year amounting to 5.9 per cent. silver, 5.9 per cent. lead and 2.3 per cent. zinc, whilst operating costs show a reduction over the similar costs for the previous year.

OTHER INTERESTS

With regard to New Guinea Goldfields, you recollect that by agreement with the principal shareholders the chairmanship of this company was offered to Mr Kruttschnitt. The agreement which Mr Kruttschnitt was able to make with the Koranga Gold Sluicing Company, whose property adjoins part of our own, will certainly facilitate the working of the Wau alluvials, where there are considerable deposits which can be worked at a profit.

Our investment in the Saudi Arabian Mining Syndicate has been considerably increased during the year; the pier and oil storage tanks have been completed at Jeddah; the mill, which is capable of handling 300 tons per day, has been erected, together with the necessary diesel engine power plant and pipe line for the water supply. Milling started at Mahad Dahab upon the first of this month.

The Big Bell Mine in Western Australia has now paid off advances amounting to £346,920 (Australian) and has declared a first interim dividend of 3s. 6d. (Australian) per share on account of 1939. Mining Trust, in consequence, has received from this source a refund of £17,346 (Australian) and a first dividend amounting to £3,500 (Australian).

BRITANNIA LEAD COMPANY

The Britannia Lead Company has again been in successful operation throughout the year. B.L.C.O. lead is now a well-known brand and finds ready sale, and the company's by-products are disposed of without undue difficulty.

The Britannia Lead Company paid to the Mining Trust, Limited, £14,943 in fees and commissions and carries forward a total profit since commencement of operations of £33,290.

Throughout the year metal prices have been disappointingly low, and whilst Mount Isa continues to earn sufficient to pay interest on debentures and loans we cannot at present hope for any dividend upon our holding of the ordinary shares of that company. Under these circumstances it seems to your directors that it would be better to wait a while before coming to a decision as to the advisability of a capital reconstruction, which naturally would not be carried through unless it were the intention of the directors to recommend a dividend.

The report and accounts were unanimously adopted.

EAST GEDULD MINES, LIMITED

YEAR OF OUTSTANDING PROGRESS

RECORD PRODUCTION AND DIVIDENDS

The twelfth ordinary general meeting of East Geduld Mines, Limited, was held at Johannesburg on May 4, 1939.

Mr P. M. Anderson, chairman of the company, presided, and, in the course of his remarks, said:—Shareholders will have noted that 1938 has been another year of outstanding progress for the company. It was the first full year in which the plant as enlarged in 1937 has been in operation, with the result that records were established in the quantity of ore milled, gold production, working costs per ton milled and in the dividends distributed, which exceeded one million pounds for the first time. It is interesting to record that during the eight years that production has taken place just over five million pounds have been distributed to shareholders.

The ore milled during the year amounted to 1,751,800 tons, being an increase of 255,800 tons compared with the previous year. The yield per ton, at 5.77 dwt., showed a slight decrease, but this was more than offset by an increase of 2s. 2d. per ounce fine in the average price obtained for the gold production. Working costs, which averaged 16s. 2d. per ton milled, reflected a net reduction of 11d. per ton milled, mainly due to a lower charge for development redemption. The main capital expenditure programme having been completed, the funds required for sundry items of a capital nature are provided through charges to working costs.

PROFIT AND DIVIDENDS

The substantial increase of 69,072 ounces fine in the gold production, together with the effect of the higher price of gold and lower working costs, resulted in an increase of about £403,000 in the gross profit, which totalled £2,190,410. Out of this, £1,025,600, or nearly 47 per cent., had to be provided for taxation, the net profit amounting to £1,158,870, or £186,066 more than for the previous year. With the balance brought forward at the beginning of the year there was £1,266,932 available for disposal, of which £1,035,000, equal to 11s. 6d. per share, was absorbed in the distribution of two dividends totalling 5½ per cent., an increase of 8½ per cent. over the previous year; and, after providing for the additional remuneration due to the directors and our proportion of the outstanding liability under the Miners' Phthisis Act, a balance of £220,132, or £112,071 more than last year, remained to be carried forward to the current year's accounts. A substantial portion of this balance is represented by your company's holding of 134,400 shares in The Grootvlei Proprietary Mines, Limited.

DEVELOPMENT WORK

Development work during the year continued to disclose most satisfactory results. Of the 24,192 feet driven, 20,360 feet were on reef and sampled and 14,650 feet, or 72 per cent., were payable, the average value being 13.2 dwt. over a width of 35 inches. As I explained when addressing you last year, it is no longer necessary to carry out development work on the same scale as in past years owing to the strong ore reserves position. These were recalculated at December 31st last on the basis of a slightly lower pay-limit than in the previous year and showed a substantial increase of 1,400,000 tons to the impressive total of 11,500,000 tons having an average assay value of 6.0 dwt. over an estimated stoping width of 58 inches, the value being one-fifth of a dwt. lower and the width 2 inches less in comparison with the figures for the previous year.

THE CURRENT YEAR

Working results for the first quarter of the current year show an improvement over the corresponding period of last year, the tonnage milled having increased by 18,000 tons to 444,000 tons, though the yield per ton milled decreased slightly. Working costs per ton milled, at 15s. 6d., show a further substantial reduction of 8d. in comparison with the average for the whole of last year. The working profit increased by £91,428, to £599,218, in comparison with the first quarter of last year, due to an increase of 8s. 10d. per ounce fine in the price of gold, combined with the additional output of 4,460 ounces fine and the lower working costs. Development work during the quarter totalled 5,323 feet, of which 3,695 feet were on reef and sampled and 1,700 feet, or 46 per cent., were classed as payable, the average value being 12.7 dwt. over 33 inches, equivalent to 418 inch-dwt.

The Grootvlei Proprietary Mines, Limited, in which your company has a valuable share interest, commenced production in September last and is earning profits at a steadily increasing rate, which will continue until normal conditions are reached and full benefit is

derived from the recent increase in the capacity of the reduction plant.

I feel sure that shareholders will agree that the results for the past year have been eminently satisfactory and that the mine has attained a very sound position. I need hardly add that, in the light of the information I have given you and that contained in the reports before you, the outlook for your mine can be viewed with confidence.

The report and accounts were adopted.

THE GROOTVLEI PROPRIETARY MINES, LIMITED

MR P. M. ANDERSON'S REVIEW OF OPERATIONS

The thirty-second ordinary general meeting of The Grootvlei Proprietary Mines, Limited, was held at Johannesburg, on May 4, 1939.

Mr P. M. Anderson, chairman of the company, presided, and in the course of his remarks said: The Report and Audited Accounts for the past year cover an important stage in the promising career of the company, namely, its entry into the ranks of gold-producing mines of the Witwatersrand.

Trial runs of the reduction plant, which is of the latest and most modern design, took place in August, production started in September, and in October the ore milled amounted to just over 60,000 tons, the plant thus reaching its initial nominal capacity with a rapidity that is a tribute to all concerned in its design and operation.

During the four months to the end of last year 230,500 tons were milled and, after allowing for the initial losses incurred, the net working profit for this period amounted to £8,841. This was increased by sundry revenue to £12,019 and that amount was carried forward to the current year. During this period a high proportion of low-grade development rock was sent to the mill to supplement the ore from stopes as it takes time to open up and equip stope faces sufficiently to supply the requisite amount of ore for a large mill from that source. You will appreciate, therefore, that the average grade of the ore sent to the mill has been below what would obtain under normal conditions and, furthermore, the yield has been adversely affected for the time being by the usual absorption of gold in a plant where crushing is not done in the presence of a solution of cyanide. That steady improvement in grade may confidently be expected is illustrated by the fact that the yield per ton milled has risen from an average of 3.30 dwt. for the four months ending December last to 4.28 dwt. for the first quarter of the current year and to 4.52 dwt. for last month. It will, however, be some time before results become quite normal, especially as the plant has only recently been extended from a nominal capacity of 60,000 tons to 80,000 tons per month. You will be glad to hear that the enlarged plant is functioning satisfactorily and should reach full capacity in a month or so.

Capital expenditure during the year totalled £915,616 and at the end of the year the balance of capital funds in hand amounted to £497,099, which should suffice to cover not only the cost of the recent extension of the reduction plant to a nominal capacity of 80,000 tons per month, but also the contemplated further extension to 120,000 tons per month which it is hoped to decide upon next year.

Another important event during the year was the completion of sinking at No. 3 Shaft. This shaft, which has been fully equipped to its final depth of 4,164 feet, will serve to open up a further section of your extensive property.

DEVELOPMENT WORK AND ORE RESERVES

Development work during the year, excluding shaft sinking and stations, totalled 37,247 feet, and the results obtained were satisfactory. Of 22,450 feet on reef and sampled, 13,125 feet, or 58 per cent., were payable with an average value of 11.9 dwt. over 32 inches, equivalent to 379 inch-dwt. The payable footage is well distributed over the work done.

The ore reserves as at December 31st last amounted to 3,750,000 tons of an average value of 5.5 dwt. over an estimated stoping width of 55.5 inches. In comparison with the position as at the end of the previous year there has been an increase of 1,250,000 tons, while the value and width have decreased by 0.3 dwt. and 2.0 inches respectively.

CURRENT YEAR

Working results for the first quarter of the current year reflect the satisfactory progress that is being made. The tonnage milled totalled 200,500 tons; the working revenue was £318,145, or 31s. 9d. per ton milled; and the working profit £93,763, or 9s. 4d. per ton

milled. Working costs averaged 22s. 5d. per ton milled. These included a charge of 5s. for development redemption, which, in the normal course of events, should be gradually reduced. During this period 14,751 feet were driven and of 8,990 feet on reef and sampled, 57 per cent., or 5,100 feet, were classed as payable, the average value being 12.6 dwt. over 27 inches, equivalent to 340 inch-dwt. The figures for the quarter include the results of the first development work done from No. 3 Shaft and I am sure you would like to have some details of this work. Up to the end of March, 830 feet were on reef and sampled and 500 feet, or 60 per cent., were payable, the average value being 12.1 dwt. over 27 inches, equivalent to 328 inch-dwt. These results are distinctly encouraging as they have been obtained in exposures which are about a mile to the east of the nearest workings from No. 4 Shaft. Development work in this section of the mine will be accelerated when the main haulage from No. 3 Shaft connects with the haulage from No. 4 Shaft, an event which is expected to take place next month.

The progress made in bringing the mine to the profit-earning stage and the steady improvement since are gratifying, and I feel that we have every reason to view the future of the mine with confidence. According to present indications, the Company will be in a position to declare its first dividend next month.

The company's shareholding in the Palmietkuil Gold Mining Company, Limited, remains intact.

The report and accounts were adopted.

MARIEVALE CONSOLIDATED MINES, LIMITED

ENCOURAGING DEVELOPMENT RESULTS MAINTAINED

The fourth ordinary general meeting of Marievale Consolidated Mines, Limited, was held at Johannesburg on May 5, 1939.

Mr P. M. Anderson, Chairman of the company, presided, and in the course of his remarks said:—Since we met last year the encouraging development results in the area tributary to Nos. 1 and 2 Shafts—to which I then referred—have been fully maintained. The incline from No. 1 Vertical Shaft was sunk 4,241 feet during the year and the 9th, 11th, and 12th Levels opened therefrom. The No. 2 Incline was extended 1,168 feet and the 9th and 10th Levels started, while connection between the shafts was made on the 5th and 7th Levels. The total footage of development on reef and sampled was 17,780 feet or about 2,000 feet less than in the previous year, but the percentage payable improved 30 per cent. to 56.6 per cent., and the value was 14.2 dwt. over 23 inches, equivalent to 327 inch-dwt., which compares with 230 inch-dwt. for the year 1937.

The opening up of the eastern side of the property from No. 2 Shaft has been delayed by the intrusion of further water-bearing fissures which had to be dealt with by cementation. The dyke which appeared in No. 2 Incline Shaft down to the 7th Level has been found to traverse the property to No. 1 Incline, which it crossed between the 12th and 14th Levels. It has a down-throw of about 160 feet, but entails no loss of reef-bearing area, and, beyond temporarily delaying development eastwards on the 9th, 11th and 12th Levels from No. 1 Shaft, causes no real inconvenience. Development is proceeding below the dyke on the 9th and 10th Levels at No. 2 Shaft and on the 14th Level at No. 1 Shaft. Work at the Nos. 3 and 4 Shafts on the Draaikraal section of the property has been suspended for reasons of economy. It will be appreciated that, in framing the initial development programme for a property as large as ours, with about seven miles of sub-outcrop, prospecting at a number of places was justified, but that, at the stage we have now reached, it is essential to expend the available funds on the development of areas where payable ore can be obtained quickest and to defer to a later date, the investigation of other areas that hold out promise of yielding satisfactory ore.

ORE RESERVES

At December 31st the consulting engineer estimated the ore reserves at 1,100,000 tons having an average assay value of 6.1 dwt. over an assumed stoping width of 39 inches. At that date 37,405 feet had been sampled, of which 15,280 feet were payable, averaging 14.7 dwt. over 20 inches. During the first quarter of this year a further 6,005 feet of development on reef has been accomplished and the sampling results show 71 per cent. payable, having an average value of 11.4 dwt. over 25 inches.

When, at the end of last year, it was decided to proceed with

the erection of a reduction plant with a nominal capacity of about 500,000 tons per annum, it was not thought possible to have the plant ready for operation or the mine ready to feed the plant fully and continuously until early next year, therefore this approximate date was mentioned in the circular to shareholders dated December 30, 1938. However, work both on the surface and underground has proceeded so well that there is now every hope that this date will be improved upon, provided that deliveries of machinery from overseas are according to schedule. Work on the plant, which is designed for easy and economical expansion should results justify such a step, is well in hand. It is expected that virtually the whole of the plant to be imported from overseas should be shipped by about the end of next month.

CASH POSITION

At the year end the cash available, after deducting creditors and credit balances, was about £52,600, and the offers of shares, dealt with in the circular to which I have referred, provided a further £709,100, which shareholders have been informed may be about £150,000 short of the amount required to bring the property to the producing stage. While it is still too early to say whether this estimate will prove to have been correct, it seems likely that the speeding up of our programme may result in the amount of temporary finance needed being somewhat less.

The report and accounts were adopted.

GEDULD PROPRIETARY MINES, LIMITED

SUCCESSFUL RESULTS—INCREASED PROFIT

The thirty-eighth ordinary general meeting of Geduld Proprietary Mines, Limited, was held at Johannesburg, on May 4th, 1939.

Mr P. M. Anderson, Chairman of the company, presided, and in the course of his remarks said: The satisfactory position of the Company has been fully maintained during the past financial year, and there is remarkably little variation in the operating results as compared with those of the preceding year.

A record was again achieved by milling 1,328,500 tons, which is 27,500 tons more than in the previous year and was due to bringing into commission an additional tube-mill towards the middle of the year. The yield per ton milled was lower by one-tenth of a dwt. and working expenses per ton milled rose by about 1½d., due to equipping the property with water-borne sewerage which cost 4½d. per ton milled. Owing to the increased tonnage milled and the average price obtained for gold being 2s. 2d. per ounce higher, the working profit, at £1,355,617, was slightly better than that of the previous year. Due principally to increased dividends received on our shareholding in East Geduld Mines, Limited, sundry revenue increased by £53,631 to £404,285. After providing £620,020 for taxation and debiting £4,140 for donations and sundry contributions, the net profit was £1,135,742, or £51,392 more than in the previous year. Including £252,492 brought forward from the preceding year, the funds available for disposal totalled £1,388,234, after allowing for £36,000 utilised in subscribing for our proportion, amounting to 9,600 shares, of the Grootvlei Proprietary Mines' increase of capital; our proportion of the outstanding liability under the Miners' Phthisis Act, directors' additional remuneration, and two dividend distributions, totalling 15s. per share which absorbed £1,095,643, a balance of £247,791 remained to be carried forward to the current year's accounts.

DEVELOPMENT WORK

As you are aware, major development work was completed some years ago, and the work now being done consists almost wholly of the exploration of various small faulted areas, of larger areas where initial development gave unpromising results, and the systematic testing of leaders above and below the main reef. Fluctuations in the development results can, therefore, be expected, and in general, as time goes on, payability becomes less; but, notwithstanding this, the results for the year were satisfactory. The total footage driven was 13,377 feet, of which 9,660 feet were on reef and sampled. 4,000 feet, or 41 per cent., were classed as payable, averaging 7.8 dwt. over 33 inches, equivalent to 259 inch-dwt. This work did not quite suffice to fully maintain the ore reserves, which were reduced by the small quantity of 50,000 tons to 9,050,000 tons of an average value of 4.9 dwt. over 57 inches. The width is unchanged and the value is one-tenth of a dwt. less than at the end of the preceding year.

A borehole which is being put down east of No. 2 Shaft for the purpose of sand-filling worked out areas of main reef has passed through the Black Reef and Kimberley Reef Series without disclosing any values of economic importance. Further work of an exploratory nature will be done to determine the extent to which the reefs in these upper series occur in your property and whether they would warrant active development.

THE CURRENT YEAR

During the first quarter of the current year 337,500 tons were milled and the working revenue amounted to £582,123. The working costs averaged 14s. 8d. per ton milled, and the working profit was £335,028, or £7,487 more than in the corresponding period of the previous year. Development work proceeded normally, the footage payable being the same as in the first quarter of last year and the average value somewhat better at 9.1 dwt. over 34 inches.

Our substantial shareholdings in East Geduld Mines, Limited, and in The Grootvlei Proprietary Mines, Limited, remain unchanged since we last met. The Grootvlei plant commenced production in September and operating results are steadily improving.

The report and accounts were adopted.

VAN DYK CONSOLIDATED MINES, LIMITED

GRATIFYING RESULTS

The fifth ordinary general meeting of Van Dyk Consolidated Mines, Limited, was held at Johannesburg on May 5, 1939.

Mr P. M. Anderson, Chairman of the company, presided, and in the course of his remarks said:—There is every reason to be gratified with the results achieved during the past year. The excellent progress made in every direction reflects great credit on all our technical staffs and operatives.

The equipment programme of the company has been carried out in accordance with the time schedule and the 60,000 tons per month plant was completed during April, so that crushing of mine ore started at the beginning of May. Since then the feature of the year's work has been the smoothness with which all units of the equipment have functioned and the rapidity with which the mine has responded to the demands of large-scale production.

The first units of the extension of the plant to a nominal capacity of 80,000 tons per month came into operation during December, and by the end of February of this year the full plant had been brought into commission. It is probable that the rated capacity of the plant will in due course be exceeded by about 10 per cent.

The output of gold has steadily increased each month but normal production has not yet been reached, as there is still some absorption of gold in the new plant and the value of the ore coming from the mine is not yet up to average.

(Continued from page 616)

No explanation appears in the W. J. BUSH AND COMPANY report of the sharp drop in total profits from £134,617 to £73,124. A moderate decline in earnings is shown by FISHER AND LUDLOW, whose net profits amount to £160,564 against £168,531; the dividend, however, has been reduced from 20 to 15 per cent.

MISCELLANEOUS

Wm. Cory and Son.—Profit for year to March 31, 1939, after depreciation, £764,310 (£777,338). Preference dividend, £42,500 (same). Ordinary dividend, 20 per cent., absorbing £590,019, as before. To investment reserve, £100,000 (nil). Carry-forward raised from £975,758 to £998,549. Cash, £614,014 (£488,809). Investments, £3,668,454 (£3,607,042). Debtors, £1,755,493 (£1,851,415). Creditors, £1,803,303 (£2,071,153).

William Baird and Company.—It is proposed that this company should amalgamate with Scottish Iron and Steel, and sell certain assets (as at December 31, 1938) for 750,000 6 per cent. cumulative £1 preference and 1,200,000 £1 ordinary shares of the Scottish company, which will change name to Bairds and Scottish Steel. Baird then

will be wound up and its assets transferred to a new Baird company for £2,476,833 in 1,857,625 £1 ordinary shares (that is, one new £1 ordinary for £1 existing ordinary stock, at 6s. 8d. premium). Meetings, June 26th and 27th.

Anglo - Palestine Bank.—Deposits increased during 1938 from £6,844,919 to £7,269,524. Cash, etc., amounted on December 31, 1938, to £1,195,684, against £1,063,082. Reduction during the year from £681,799 to £505,819 in bills, etc., discounted, but an increase from £2,690,201 to £3,098,458 in investments. Loans, advances, etc., at £3,419,193, compare with £3,010,144. Net profit for 1938, £86,660, against £97,046. To contingency account, £40,000 (£25,000). "A" ordinary dividend reduced from 10 to 6 per cent.

Hambros Bank.—Profit for year to March 31, 1939, £270,363 (£323,884). Directors' fees, £15,497 (£15,206). To contingency reserve, £100,000 (£170,000). Ordinary dividend on £10 shares (£2½ paid) 18 per cent., and 6 per cent. on fully-paid £1 "A" shares, both as before. Carry-forward raised from £87,478 to £94,445. Total assets, £29,759,982 (£31,105,357).

Shipley Collieries.—Net profit for year to March 31, 1939, £147,703 (£120,364). Ordinary dividend and bonus raised from

YEAR'S PROFITS

During the period ending December 31st last 508,000 tons were milled and the gold recovered therefrom, which averaged 4.2 dwt. per ton, was realised for £761,908. Working costs amounted to £591,464, equivalent to 23s. 3d. per ton milled, which included a charge of 5s. 3d. per ton for development redemption. Profit-earning commenced in June and, after accounting for starting-up losses, there remained at the end of the year a net working profit of £170,444, to which has to be added sundry revenue of £2,663, making a total of £173,107. Against this, £1,630 was debited for donations and contributions and £5,000 was set aside to meet taxation and Government share of profits, leaving a net profit of £166,477 to be transferred to the appropriation account.

The small amount set aside for taxation and share of profits is due to the comparatively small initial profit. Larger amounts will have to be provided in future, but under present conditions it appears unlikely that such provision would at any time during the next ten years exceed 25 per cent. of the working profits.

After allowing for our proportion of the outstanding liability under the Miners' Phthisis Act, directors' additional remuneration, and a maiden dividend of 3d. per share declared last December which absorbed £68,750, the carry-forward is £95,858.

DEVELOPMENT WORK

Turning now to the development position, the footage accomplished last year totalled 50,356 ft., of which 27,480 ft. were on reef and sampled. The proportion payable was 48 per cent., having an average value of 12.2 dwt. over a reef channel width of 26 in., equivalent to 316 in.-dwt. These figures show a substantial improvement in value as compared with the preceding year.

A large proportion of the total footage accomplished was necessarily off reef in work connected with the general layout, such as cross-cuts, haulages, ore passes, etc.

The centrally-situated incline haulage-way from the outcrop to the 11th Level horizontal haulage connecting Nos. 2 and 3 Shafts has made satisfactory progress, in spite of bad ground in places, and is expected to be completed in about three months' time. When this is in commission it should greatly facilitate the opening-up of the outcrop section and improve ventilation. A centrally situated incline is also being sunk below the 11th Level haulage, and preparation is being made for an incline from No. 4 Vertical Shaft.

The development work done during the year resulted in a substantial increase of 450,000 tons in the ore reserves. The re-estimate of these at the end of the year showed 2,250,000 tons of an average value of 5.8 dwt. over an assumed stoping width of 40 in.

During the first three months of the current year 238,400 tons were milled and yielded 4.75 dwt. per ton. Working costs averaged 22s. 8d. per ton milled, and the working profit amounted to £149,165. Development work is at a slightly increased rate, so that the advance was 15,467 ft., compared with 11,591 ft. in the first quarter of the previous year. Fifty-one per cent. of the footage sampled was classed as payable, having an average value of 8.9 dwt. over 29 in.

The report and accounts were adopted.

12 to 12½ per cent. To reserves: General, £35,000 (£32,955); investment, £10,000; Workmen's Compensation, £5,000. Carry-forward raised from £51,950 to £60,510.

Antofagasta (Chili) and Bolivia Railway.—Gross receipts, 1938, £750,874, a fall of £133,279 or 15.07 per cent. Working expenses, £558,834, a reduction of 2.08 per cent. Net receipts, £192,040, a decline of £121,417 or 38.73 per cent. A further 1½ per cent. of preference dividend arrears has been paid. Carry-forward reduced from £135,030 to £128,780.

Imperial Tea Company.—Profit, 1938, £95,264 (£127,153). For tax and N.D.C., £16,500 (£25,500). Ordinary dividend, 8 per cent. as before. To reserve, £25,000 (£35,313). To buildings and machinery reserve, £5,000 (£8,000). Carry-forward reduced from £4,264 to £2,258.

Morgan Crucible Company.—Trading profit for 15 months to March 31, 1939, £543,590, against £552,409 for year 1937. Other income, £47,266 (£20,616). To tax and N.D.C., £157,980 (£179,954). Preference dividend, £98,736 (£81,712). Ordinary dividend, 9½ per cent., absorbing £149,936, against 8½ per cent., absorbing £134,874. Carry-forward raised from £104 to £362.

The B.B.C.'s Audiences

The diagrams of potential audiences and the analysis of tastes by age and class are based on B.B.C. enquiries made in July, 1938. It should be noted that, as many listeners interpreted the term orchestral music in a very wide sense, thirteen million is probably too great a figure for those who like, say, a symphony concert. The section on the popularity of talks and news bulletins is based on an enquiry made in January, 1938, when bulletins were broadcast at 6.00, 7.00, 9.00, 10.00 and 11.30 p.m. The diagram of programmes in 1938, unlike the other, shows not what listeners like, but what was actually broadcast. It is based on the number of hours of programmes actually broadcast, and account being taken of relays.

Finance

GOVERNMENT RETURNS

For the week ended June 3, 1939, total ordinary revenue was £7,188,000, against ordinary expenditure of £43,423,000 and £245,000 issued to Sinking Funds. Thus, including sinking fund allocations, the deficit accrued since April 1, 1939, is £110,281,000, against £81,181,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On June 2nd applications at £99 16s. 8d. per cent. for bills to be paid for on Monday, Tuesday, Wednesday, Thursday and Friday of following week were accepted at about 73 per cent. and applications at higher prices in full. Applications at £99 16s. 9d. for bills to be paid for on Saturday were accepted in full. £45.0 millions of Treasury bills are being offered on June 9th.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

The Meaning of Tientsin

THE purpose of the Japanese blockade of the British Concession at Tientsin, it has rapidly become clear, is to inflict a resounding public humiliation upon Great Britain. The calculation is presumably that if, at one point in her widely scattered empire, Great Britain can be forced to submit to an indignity which is incompatible with the traditional status of a Great Power, the vast edifice of British rights and interests throughout the Far East, and perhaps still nearer home, may be shaken down by the shock.

To this ulterior end, every means of local pressure is being applied. Contrary to the original Japanese statement that the food supplies of the Concession would not be interfered with, the entry of fresh food, vegetables and ice is now being impeded, with a view to quickly starving the British community at Tientsin into surrender. The barbed-wire fence with which the British and French Concessions have been surrounded is being electrified at night. Inside these lines of circumvallation the Japanese are striking at the authority of the British Municipal Council by pressing its Chinese public servants to repudiate their duty to their employers, under threat of punitive measures. As for the British residents who have been constrained to pass the Japanese barrier by the exigencies of their lawful occasions, they have been deliberately insulted in public: they have been kept waiting for hours, have been pushed out of their positions in queues, and have been stripped naked under the pretext of searching them. The patent intention is to show the Chinese—and perhaps the Russians, Poles and Roumanians as well—that *Civis Britannicus Sum* is no longer the talisman that it used to be.

There is thus no doubt that the Japanese Army is on the warpath. The international settlement at Kulangsu is also being blockaded and a Japanese landing at Swatow, the only important Treaty Port not hitherto in their occupation has been followed by a peremptory demand that the foreign residents abandon their rights and decamp. The Army's attitude and intentions are not in doubt. The only question is whether or not it has completely succeeded in implicating the Government at Tokyo in its policy. It was announced at Tokyo on Friday, June 16th, that the Cabinet had decided, that day, that the Tientsin incident must be settled locally—a decision which would leave the Army a free hand. But the Government has not yet committed itself publicly to endorsing the Army's demand that Great Britain must positively co-operate with Japan in working for the achievement of Japanese aims in China, and on the 18th a semi-official statement was published at Tokyo which looks like an attempt to circumscribe the range of Japan's objectives. What Japan wants, it was here stated, is a correction of the policy of the British authorities in China as exemplified in the refusal to hand over the four incriminated Chinese. If this is all, a settlement can be reached at any moment on the basis of the British offer, which still remains open, to submit the question of extradition to a mixed Anglo-Japanese arbitral board with a neutral chairman. The United States is known to be willing to lend her good offices for mediation in this or any other way. Unfortunately, past experience indicates that, when once the Japanese Army has succeeded in engaging Japan's prestige, the Japanese Government is apt to fall into line with the soldiers, however strongly it may disapprove or even deplore their action.

We are thus faced with the likelihood that the Japanese Army will succeed in its aim of bringing the Tientsin crisis to a head on the major issue of Great Britain's status as a Great Power. We may be faced at any time now with the choice between capitulation and retaliation; and at this precise moment, when, after an unparalleled

series of setbacks and disappointments to British diplomacy, we are trying to convince the world that we shall retreat no further, the consequences of a further capitulation of a dramatically humiliating kind, even on an issue of small intrinsic importance, would be so incalculably grave that even the Prime Minister and his colleagues, who are not retaliators by nature, have publicly announced that the possibilities of retaliation are being actively studied.

Great Britain could, of course, place a partial or complete embargo on Japanese trade with the British Empire; and, if parallel action were to be taken by the United States as well, then Japan would not only find herself eventually unable to carry on her war in China, but would also be threatened with a general collapse of her economic life. No doubt the Japanese are aware of this ultimate risk, but they are also no doubt inclined to discount it for two reasons. In the first place, they reckon that they will be able to avert American co-operation with British retaliatory measures by carefully refraining from any infringement of American national interests in the Far East at this stage. The Tokyo *communiqué* of June 18th is at pains to declare that the alleged British policy, to which Japan objects, has nothing to do with the policy of other Powers having interests in China, and to deny that the rights and interests of all countries with treaty rights in China are affected by Japan's present anti-British moves.

The second consideration which must be giving the Japanese Army confidence is the knowledge that, whereas an embargo or even a long-distance blockade would take time to bring Japan to her knees, even in the unlikely event of the United States co-operating with Great Britain when American national interests were still not being touched, there are a number of British pawns—and, for that matter, of American and French pawns—on the Far Eastern chess-board which could immediately be taken, with a flourish, by the Japanese armed forces. In the event of a rupture resulting in a physical struggle, Japan could immediately seize all or nearly all British, French and American continental and insular possessions and holdings in Eastern Asia and the Western Pacific between Singapore and Hawaii. Of course, such easy local victories would not be strategically decisive, any more than the capture of Fort Sumter by the Confederates in 1861 saved the Confederacy from utter defeat and overthrow in 1865. Understanding this, President Lincoln gave the momentous order for the re-provisioning of Fort Sumter, in full awareness of the probability that the immediate result would be the fall of the fort and the outbreak of war. But have the present leaders of the Western democracies Abraham Lincoln's faith and courage? That is the crucial question which is being asked to-day not only by Japanese soldiers in China and politicians at Tokyo, but also by European dictators at Berlin and Rome, and, last but not least, by the Western peoples themselves.

The choice with which the British Government is faced is undeniably difficult. The alternative to humiliation is resistance in an area of the world where we should be helpless for many long months after the outbreak of the armed conflict which resistance might well provoke. But though it is possible to deplore the fact that British policy is faced with this dilemma, it is frankly difficult to regret that it is the present Government that has the dilemma to resolve. Ever since Sir John Simon embarked upon his Manchurian policy in the autumn of 1931, the Government has been repeatedly and precisely warned that this dilemma would some day confront it. Never have chickens more justly come home to roost. From September, 1931, to March, 1939, through all the steadily unfolding

stages of aggression against China, Abyssinia, Spain, Austria and Czecho-Slovakia, the Government of which Mr Chamberlain, Sir Samuel Hoare and Sir John Simon are the surviving mainstays has insisted that a policy of taking British risks for the sake of upholding the League Covenant would be criminal folly, and that, if only we let the aggressor "get away with" just this one—or one more—piece of aggression, the tension would pass and we could sleep again at ease. To-day, even the most convinced practitioners of this policy have been driven to confess that the British Empire can only survive in an environment of international law and order. In other words, the Government's critics were right from the start in maintaining that the Covenant was the first and last line of British defence, and that the Anti-Comintern Pact was a euphemism for

a grand design against the British Empire, which, in a lawless world, is by far the largest, the most tempting, and, in many of its parts, the most defenceless prize for the plunderer. At this moment, the Government are desperately striving, at the eleventh hour, to rebuild a rump League under the *alias* of a Peace Front. What is happening at Tientsin ought to spur them to redouble their efforts to arrive, without further delay, at the vitally necessary agreement with Russia. The price we have to pay for a Peace Front now is admittedly many times greater than it was in 1935 and infinitely greater than in 1931. But the perils of being without it are now apparent even to the most short-sighted. Blindness in high places is costing the nation very heavily in treasure already and may yet cost us still more dearly in blood.

The Armament Profits Duty

WHEN the Prime Minister made his momentous announcement of the introduction of conscription two months ago, he accompanied it with the assurance that the parallel problem of what has come to be known as the conscription of wealth was not out of the Government's mind. The proposals he had to make were not, it is true, much more precise than the very vague public notion of what constitutes the conscription of wealth; but one of the items was the promise of a tighter control over profits made out of the manufacture of defence needs. Instructions went out to the competent departments to conceive and bring to birth a new tax on the excess profits of armament firms. The departments have not found this an easy task; reports that have slipped out to the waiting public from the chamber where the *accoucheurs* have been at work have told of a long and difficult labour. But the new fiscal infant was at length displayed in a White Paper published on Tuesday of this week. It has been christened the Armament Profits Duty and, like its father, the E.P.D., and its elder brother, the N.D.C. (who suffered an accident at birth), it is destined to be known, by its initials, as the A.P.D.

The new tax results (if the obstetrical metaphor may be continued) from the marriage of two separate fiscal principles—more strictly, of two separate fiscal aspirations. The first is that "excess" profits should be subjected to heavier taxation than "normal" profits. The second is that "armament" profits should be similarly penalised. As ideals, these are unexceptionable. The difficulties start with the definitions and multiply with the assessments.

For the definition and assessment of excess profits there is a wealth of precedent to go upon, and the new tax does not depart very far from it. "Excess" profits are defined as profits in excess of those earned in a past standard period. Except for new businesses, the standard period can be selected from four: the year 1935; the year 1936; the average of 1935 and 1937; or the average of 1936 and 1937. As will be seen from the figures of *The Economist* index of profits on page 724, this choice is designed to provide a basis of profits immediately below peak levels (since the profits of 1937 can only be used in an average). For industry as a whole, the profits selected in this way should be satisfactory; it would, indeed, be hard to find a better rough way of selecting a year that was normally, but not excessively, prosperous. And for individual businesses on whom this procedure would work injustice, provision is made for appeal to a Board of Referees. This, of course, is only the main outline of the complicated machinery by which "excess" profits are defined. Provisions have had to be included for businesses that have started since the standard period and for those

that have increased their capital since then. Some particulars of these provisions, and of the problems to which they give rise, will be found on a later page.

So much for the calculation of excess profits. There remains the problem of defining what are armament profits. The draughtsmen of the new tax have wisely decided to face this problem, not by a general definition but by specific identification. The Minister of Supply will have full information on all defence contracts and sub-contracts, and he is to compile a list of businesses that "have received a sum of not less than £200,000 (per annum) in respect of armament supplies." The firms on this list will be the armament suppliers to whom the new duty applies, and their excess profits will be calculated by the method already described. The last difficulty is to decide what proportion of an armament supplier's excess profits are his excess armament profits, and this hurdle is jumped by providing that the proportion of total excess profits to be taxed is the same as the proportion of armament turnover to total turnover. The corpus of taxable excess armament profits being thus finally defined, the rate of tax is to be 60 per cent., though as a little less than one-third of this will be saved to the taxpayers in income tax and N.D.C., the net effective rate is about 40 per cent. The tax is to run for three years from April 1, 1939.

A structure as complicated as this is obviously open to detailed criticism, of which much will doubtless be heard when the companies that will be affected have had time to calculate the incidence of the tax upon them. It is already apparent that criticism will be directed against the exemption of all contractors doing less than £200,000 per annum of armament work. Even if evasion by the spawning of subsidiaries and similar devices can be prevented, it will be asked why the figure of £200,000 was selected. Administrative convenience dictates the wisdom of an exemption level in any tax. There are many big fish who will be caught above the £200,000 level. But there will be many sizable middle-sized fish who will escape. And would the net be overstrained if the limit were reduced to £100,000, or even to £50,000?

The main body of the public, however, will not be unduly concerned over these details of mechanism. It will want to know whether the new tax is a good tax. To answer that question, it is first necessary to know by what criterion A.P.D. is to be judged. By the normal fiscal tests, it is not a good tax. It will be difficult to administer and it will produce a very small revenue. But the context of the Prime Minister's announcement on April 26 shows that the main purpose of this tax is (rightly) political. It is intended to satisfy the public demand that if any excess profits originating in the armament programme can be identified, they should be heavily taxed. And if a tax on excess

armament profits is required, A.P.D., subject to quite minor adjustments, represents the nearest approach that can be made to that inaccessible ideal.

It is permissible, at the same time, to point out that this tax is hardly more than the embryo of anything that could be called the conscription of wealth. Moreover, it is an entirely new, and rather questionable, departure to introduce into the British tax system a duty whose purpose is neither to raise revenue nor to restrict the particular form of activity on which it is imposed. And though the origin of the tax lies in the search for the widest equity, it may result in detailed inequity. There are many firms that have gained business, and made "excess" profits because their competitors are busy with defence work. But they are not to pay the new tax, while their no less patriotic and no more avaricious competitors do. Or again, have the effects of re-armament upon profits been exhausted when even the last sub-sub-contractor has been drawn into the net? Is not the brewer who makes more money because the men working in an arms factory drink more beer enjoying excess armament profits just as much as the owner of the factory itself? It is true that if excessive profits are being made in a period that is dominated by re-armament expenditure, they are most likely to be found in the specifically armament industries. There is, consequently, a strong case for taxing the excess profits of these industries more than the excess profits of other industries. But is there a case for taxing them heavily

and leaving other excess profits untaxed (untaxed, that is, *qua* excess profits)?

The wider solution would, therefore, seem to be in the revival, not as the alternative to A.P.D., but as a reinforcement of it, of the Excess Profits Duty itself. The attempt was made in 1937 in the first version of N.D.C., but it had to be withdrawn in the face of strong opposition. Apart, however, from the technical defects of the first N.D.C., there is one enormous difference between the conditions of 1937 and those of 1939. Increasing profits (the real meaning of "excess" profits) two years ago were the result of natural recovery, far more than of re-armament. But to-day we have seen a natural slump start and then be stopped and reversed by armament expenditure. If the profits of any industry increase, after the beginning of 1939, to a level higher than that of a normally prosperous year, there is a very strong *prima facie* presumption that they originate, directly or indirectly, in the defence programme. By the same token, it is legitimate to tax them for the finance of re-armament. The time has not yet come to subject excess profits to very heavy taxation—indeed, they have hardly yet arisen. But there is a strong case for setting up the machinery by which they could be taxed when the time comes. The demand for the conscription of wealth could not be better answered than by the erection, in advance of the need, of such a comprehensive tax structure, adapted to abnormal times, in which the A.P.D. would take its place as a special department.

Negligence On Land and Sea

NO branch of the law is more difficult than the law of contributory negligence, and for more than a hundred years the judges have been striving, without great success, not merely to administer the law fairly but also to state it in intelligible terms. The latest attempt appears in a report of the Law Revision Committee published last week; and, in spite of the learning and ability of its members, it can scarcely be said that they have clarified what generations of judges had left obscure.

No attempt will be made here to define the words contributory negligence. Illustration is easier than definition. Conceive first of all a cyclist riding out of a drive into a main road. He is going at full speed, looks neither to right nor to left, and swings carelessly into the road with no regard to the probability of oncoming traffic. He is grossly negligent. At the same moment a car driven at an excessive speed on a zig-zag course by a drunken man reaches the drive, hits the cycle and kills the cyclist. The car driver, too, is negligent, so that the accident arises from the concurrent and contemporaneous negligence of the driver and the cyclist. In that case, if the law is rightly administered, the cyclist has been guilty of contributory negligence, and his widow must take the consequences without compensation.

Now imagine the cyclist coming out of the drive in the same reckless way, and the oncoming car driven in the same reckless way. But this time the car is thirty yards from the drive when the cyclist emerges. Being drunk the driver does not pull up but charges on and kills his man. Here, although the cyclist was no less negligent than in the previous example, he is not guilty of contributory negligence, because the driver, if he had been sober and careful, could have pulled up in time and so prevented the accident. The thirty yards would thus make the difference between contributory and non-contributory negligence. The cyclist's widow would be compensated.

Up to this point the law is the same for land and sea. But from here onwards maritime law and land law part company. The Admiralty Court, which deals with collisions between ships, must in cases of material danger weigh the

negligence on *both* sides and try to apportion the degree of negligence shown by each of the two ships. If the "Saucy Ann" collides with the "Laughing Jane" and sinks her, and the Court holds that there was contributory negligence on the part of the "Laughing Jane," it must make up its mind what percentage of the blame lay with the "Laughing Jane" and award damages accordingly.

On the land the principle is altogether different. Here contributory negligence, however small, deprives the plaintiff of all right of recovery, and the defendant's negligence, however gross, gets off scot-free. One per cent. negligence in the plaintiff and ninety-nine per cent. negligence in the defendant means a verdict for the defendant and no damages for the plaintiff. If, for example, in the recent Cheltenham case, in which a driver of a car got three years for manslaughter, it was proved in a subsequent civil action that the dead cyclist could by swerving on to a grass verge have avoided the car, then the common law rigidly administered might result in a verdict for the defence—even though the defendant were spending three years in penal servitude for criminal negligence embodied in a peculiarly shocking act of manslaughter. It is not easy for the layman to appreciate these subtle distinctions.

Nor is this all. The common law also emphasises in cases of tort another and a kindred principle which produces results not less strange and is open to criticism not less damaging. If two people have combined, either deliberately or by chance, to do injury to a third person, the third person may bring an action against them jointly and severally, and recover damages if he gets his verdict. Those damages will be given, not against either of the two defendants, but against them both, and by the common law the plaintiff is at liberty to collect them in full from either of the two defendants at choice, irrespective of the relative blame attaching to them. For example—a passenger in an Austin car driven recklessly by an intoxicated uninsured relative is injured in a collision with a Morris driven by a sober insured stranger. The reckless driving of the Austin has frightened the Morris driver, who, in the urgency of the moment, is guilty of an error of judgment. The passenger

is awarded damages and, passing over his drunken kinsman, he can collect the whole amount from the sober stranger's insurers. This is a purely hypothetical example; but, in an actual libel case tried a year or two ago, the Argus Press, as printers of a Fascist paper, had to sit idly by while their joint tortfeasors, the proprietors of the paper, ran up enormous costs and aggravated the damages to a colossal figure. The printers took no part in the fight and had clearly no sympathy with it, but the plaintiff, because of this rule in the common law, could let the peccant newspaper go unscathed and collect the whole bill from the unfortunate printer. The printer paid the piper though he had no sympathy with the tune that was played in court.

The oddity of this rule has not gone unnoticed by the pundits. Its unfairness was partially recognised in 1935 when the Law Reform (Married Women and Joint Tortfeasors) Act was passed, but the underlying anomaly still remains and the Law Revision Committee, though apparently in favour of reform, deal very briefly and not very adequately with this side of the law of tort. The changes which the Committee actually recommend may be summarised as follows: they recommend that the common law should be assimilated to Admiralty law. This means

two things: first, that if two motorists negligently damage each other or each other's property in circumstances of contributory negligence, the jury will be asked to assess the blame and state their answer in a percentage—85 per cent. to one driver and 15 per cent. to the other, etc.; secondly, that if a passenger or a pedestrian is injured in a collision between two cars in circumstances of contributory negligence, then he will be able to collect the full amount from either of the two drivers. But the jury will have assessed in percentages the relative blame of the two men, and the man from whom the injured person collects the full sum will be able, without further action, to collect from his joint tortfeasor the percentage of the damages which the jury has ordained. In other words, the right of the injured person to collect from either tortfeasor will remain, but the respective contributions of the tortfeasors, which at present can be enforced only by a second action, will now spring directly from the original action. So long as both tortfeasors are solvent the arrangement will be reasonably fair. On the other hand, if one of them is (a) insolvent and (b) insured by an insolvent company, then the other will foot the bill for both. It is not easy to render the law fair and reasonable, though resolute attempts would not be out of place.

Reconstruction in Spain

THE representation of the Spanish Civil War as one between Reds and anti-Reds or Fascists and anti-Fascists, and the final victory of the generals, has largely obscured the essential nature of the social revolution which has now been largely accomplished in Spain. The Old Spain, with its ruling class of grandees and clericals, had long been doomed. Indeed, though it survived, its foundations were severely shaken in 1899, when Spain was deprived by the United States of the last remnants of the Empire on which once "the sun never set." With the final loss of America, Spaniards devoted greater energies to their own material progress; and capitalist enterprise began to spread among certain classes and in certain regions, notably in Biscay and Catalonia. A gulf was created between Castilian on the one hand and Catalan and Basque on the other. Outside of Biscay and Catalonia shop-keeping and manual labour continued to be regarded with disdain, while, traditionally, nobleman and beggar alike were regarded with respect. Like the poor Valencian boatman in a novel of Blasco Ibañez's, many Spaniards could feel nothing but contempt for men who cultivated the ground: "they were labourers and to him that sounded like an insult."

Even during the years of the Republic it was clear that neither the mediæval attitude to work and progress, nor the old influence of the landowner and its resultant universal distrust of government, had yet been wholly overcome. Agrarian reform became a pressing necessity and industrial workers were discontented. The Government moved too slowly, and the peasants would not wait. Here was a part of the origins of the bloody Civil War. The Old Spain called on the Army to save it from destruction, knowing that it was the ambition of every Spanish general to save his country by becoming its leader. But the *pronunciamento* failed and gave way to a prolonged war. In order to win it, popular support was required, and the old class distinctions had to go. The generals became more revolutionary than the revolutionaries; the object of simply saving Old Spain was jettisoned willy-nilly. While in Republican territory the property of those who had sided with the insurrection was divided among the peasantry, in Nationalist territory the absent grandees, who had sought safety abroad, were persuaded to contribute to the Government war chest as a thank offering for the restoration of their property. On both sides the need for food was paramount over all other considerations. Anachronistic land laws were set aside and

traditional practices ignored. No longer was idleness the quality of an honoured *caballero*; it was treason.

Thus the Spain that has emerged from the war is strangely different from the Old Spain. The Falangist State, like the Communist State and indeed every modern State, demands that its people shall have a taste for organised and constant labour. Its watchword, as General Franco stated at a recent meeting of the National Council of the Party, is "Produce, produce, produce!" Spain has entered the modern world.

It is against the background of a war-weary people and a modernised State that Spain's problems must therefore be seen. First and foremost is the land problem, simply because at least half of the population is normally engaged on the land. But, whereas before the war the problem was agrarian, to-day it is agricultural. It is no longer tenure, but productivity which demands attention. True, there are still the *latifundia* of Andalusia and the dwarf-holdings of Galicia—the division of the former and the agglomeration of the latter form part of the Falangist programme. But, on the whole, the size of holdings is of less importance than the improvement of technical methods and marketing facilities and the extension of irrigation.

These are the general needs of Spanish agriculture. For the present, certain more specific matters require examination. Before the war Spain was self-sufficient in the principal foodstuffs, and was, indeed, a considerable exporter of food. Two-thirds of Spain's exports in 1935 consisted of foodstuffs, half of this or one-third of the total being fruit, mainly oranges, grown along the Mediterranean littoral. During the Civil War Nationalist Spain, with a relatively small population, possessed nearly all the cattle and a disproportionate amount of wheat, while Republican territory included nearly all the oranges and lemons, most of the wine and all the early vegetables apart from those grown in the Canary Islands. At first the Republicans were able to export oranges, new potatoes and other early vegetables and import in exchange the food they required; but, as the blockade was intensified, this became more and more difficult, and the "export" crops were neglected in favour of beans and potatoes for direct consumption. The Nationalists at different times exported both meat and wheat, almost entirely to Germany.

Now that the two parts of Spain are once more rejoined, the old "Nationalist" food surplus is required at home.

Despite small increases in area sown and in yield in certain parts of the former Nationalist zone, total supplies of wheat are very much below those of the pre-war period. Estimates of wheat production and consumption are given in the following table:—

SPANISH WHEAT SUPPLIES
(In '000 metric tons)

Crop Years	Harvest at beginning of Year	Net Imports	Consumption
1933-34	3,762	0	3,762
1934-35	5,085	0	5,085
1935-36	4,300	0	4,300
1936-37	3,307	350	3,657
1937-38	3,000	550*	3,550
1938-39	2,620	? *	?

* Exports to Germany were about 25,000 tons in 1937-38, and have been 10,000 tons in 1938-39 up to the end of March.

In three years preceding the war wheat consumption averaged 180 kg. per head per annum, compared with 160 kg. in the same period in the United Kingdom. But last year's harvest amounted to little more than 100 kg. per head per annum. Under these circumstances the present Spanish Government has found it necessary to arrange for imports. A barter agreement has been concluded with the

Argentina for the delivery of some 400,000 tons of wheat, of which 50,000 had been shipped by June 7th last. This is only temporary. It should not require very great efforts to reach the level of wheat production achieved by the relatively inefficient agriculture of pre-war Spain. More serious than the wheat problem is that of rehabilitating the "export" crops in the former Republican zone. Despite increased exports of citrus and early vegetables in April and May, the season 1938-39 is likely to have been the most unprofitable ever.

But the most urgent problems of reconstruction are to be found in the field of industry and communications. Most of the peace time industries of Madrid, for instance, have disappeared. The Catalan textile industry, which in 1933 possessed 93 per cent. of the spindles in Spain and 82 per cent. of the looms, has suffered very severely. One-fifth of the mills are estimated to have been destroyed, while in many mills textile machinery was replaced by machinery for the manufacture of war material. Before these mills can be started they will require new machines.

The railways have suffered particularly from the ravages of war. In 1936 Spain possessed some 3,000 locomotives, of which 1,700 are still in existence; but of these 700 are in need of repairs, so that the total actually usable is only 1,000. It is estimated that some 3,000 wagons and at least 1,000 locomotives will have to be supplied. Harbours, particularly those in the former Republican zones, are in need of new equipment; and many roads are in disrepair. The Government has already announced a great programme of public works including irrigation works, the construction of new and the repair of old roads, the re-equipment of harbours and the supply of railway material.

The other pressing need of the moment, the conversion of war industries back to peace-time purposes is most in evidence in the former Nationalist zone, and particularly in the North. After the conquest of the Basque country in 1937, the Nationalists, with the aid of German technicians, made great efforts to expand the production of Spain's largest iron and steel industry based on local

coal and ores. They succeeded in producing 304,000 tons of pig iron in the Biscay area last year, compared with 256,000 tons in 1934 and 241,000 tons in 1935. Similarly with regard to steel ingots and castings. Last year the production in the Biscay area was 352,000 tons, compared with 324,000 tons in 1934 and 355,000 tons in 1935. Since this region accounted before the war for nearly three-quarters of Spain's output the progress is notable.

But whatever efforts Spain may make to expand her metal industry and to manufacture her own machines, she will still require to import a very considerable volume of capital goods. The question of interest to Great Britain is from whom these supplies will be obtained. There can be no shadow of doubt that Spanish interests would be served by reliance on the assistance of Great Britain and the United States. With the aid of a loan Spain would be able to tide over her inherently temporary difficulties without encroaching further on the standard of living already sunk to a very low level. The democracies are able and willing to supply Spain with all the materials, machinery and technical assistance she may require; a guarantee of non-aggression would almost certainly induce them to grant a loan. The three great democracies, which took more than half Spain's exports in 1935, are willing to do so again.

Great Britain alone in 1935 took 22 per cent. of Spain's exports against 13 per cent. sent to Germany. Spain's exports to this country since the end of the war are far in excess of her imports.

But co-operation with the democracies, though economically expedient, is politically most difficult. All the available information suggests that Spain must enter, or rather remain, within the German economic orbit. Not all the stories of German infiltration in the Spanish economy are to be believed, but it is clear that Germans now hold many of the key positions. British imports of iron ore from Spain

and Spanish ports in North Africa fell from 1,425,000 tons in 1934 and 1,430,000 tons in 1935 to 760,000 tons in 1938. German imports rose from 634,000 tons in 1934 and 1,321,000 tons in 1935 to 1,808,000 tons in 1938. British exports of coal to Spain, which continued during hostilities, have been non-existent since the war came to an end. Indeed, although no complete figures are available, British exports to Spain since the end of the war appear to be little more than a quarter what they were a year ago. It is quite clear that Germany hopes to play a very large part in Spanish reconstruction.

When Señor Serrano Suñer, on his return from Italy, warned the democracies that their plans for the encirclement of Spain would be ruthlessly checked, what he said would have been perfectly justified, were not the facts the exact opposite. No plans for encirclement exist; rather is the contrary the case. The fact is that some of Spain's leaders appear to be intoxicated with the glories of victory and their heads, like Don Quixote's, to be "filled with nothing but enchantments, quarrels, battles, challenges, wounds, complaints, torments and abundance of stuff and impossibilities." Spain's economic as well as her political future depends on whether she allies herself with the Axis or remains neutral. Perhaps General Franco will remember the advice of Sancho Panza to his master: "Do not put your thumbs between two millstones," for assuredly, if Spain were our enemy, a war between the democracies and the Axis would place her in that position.

NOTES OF THE WEEK

Moscow Mañana.—Last Wednesday's talks between M. Molotov and the British and French Ambassadors with Mr Strang, resumed after a five days' lapse of contact (semi-officially ascribed to the exigencies of tripartite negotiation), will probably be seen as crucial when the full story comes to be told. They were the occasion for the proposal of new Anglo-French suggestions designed to cover the points outstanding against final agreement. As they stood at the beginning of this week these were four in number, and as follows: the question of Baltic guarantees, the inclusion of a clause to the effect that none of the three Powers would conclude a separate armistice or peace in the event of war, and, again at the Soviet's wish, an understanding that the main agreement shall have force only after the evolution of its complementary military arrangement; finally, the form in which reference shall be made to the League of Nations. Of these only the first is a real stumbling-block: latest reports suggest that the obstacle to agreement may be removed, as was suggested here last week, by the conclusion of a general guarantee omitting names. The Soviet attitude meanwhile remains inscrutably, disappointingly, the same. The least that can be said is that informed opinion in London—as far as any available opinion on the Moscow negotiations is informed—remains confident that a pact will be signed, though there are no indications as to whether it will be next week or next month. Given the volcanic effect, exploded or exploding, which the formation of a Triple Alliance will certainly have on Axis policy, delay in these negotiations may even be valuable, though it can, of course, be carried too far. In part this delay is the result of mutual suspicion fostered over many years, in part it is the result of genuine difference of opinion though not of ultimate aim, and in part it is the result of the Soviet Government's deliberate bargaining tactics. We are getting used to the appearance of a damping communique, like the one that came out on Thursday morning reporting "no progress as compared with previous proposals," at the end of a day's talks: it is to be hoped that the Soviet Government will perceive that, beyond a certain point, bargaining becomes a liability.

Supply Powers.—The Supply Bill has passed through Committee in the Commons. On Monday a Labour attempt to extend the Minister's powers forthwith to control over all service supplies was unsuccessful; and on Tuesday a Conservative attempt to restrict the Minister's authority to select arbitrators in cases of dispute between him and contractors met with a similar fate. There can be little question that the Government's obdurate reliance upon departmental goodwill to settle all questions of interdepartmental priority in matters of supply will be shown unsound by events. As Sir Arthur Salter argued in the House, all experience suggests that the supply sections of the several services will be unlikely to hand over their powers voluntarily to Mr Burgin. To say this is not simply to criticise the departments for being unduly narrow-sighted; the fact is that it is not their job to co-ordinate their claims with those of other Ministries; and it is their job, as well as their marked tradition, to regard their own needs as of paramount importance. To argue that Mr Burgin should be put at once in a position to act in the fullest sense as a controller is not, however, to claim that he should be given needlessly over-riding powers over the details of arms contracts. In war time it might well be that the need for expeditious procedure would require the Minister's own accountants to determine disputed questions of costing and pricing. In peace time, as the Bill itself concedes, these may be regarded as matters for arbitration; and so long as this somewhat cumbersome procedure is possible and expedient it is surely reasonable to

claim that it should be impartial as well. Mr Burgin did well to reject the startling proposition that some such body as the Federation of British Industries should be called in to give impartial (save the mark!) judgment. Nor are the ordinary courts appropriate for the purpose. The proposed panel of arbitrators is the right idea; but there seems no good reason why the Minister should have powers of "hire and fire" over them.

Militia Issues.—Nearly 230,000 men between the ages of 20 and 21 have now registered under the Military Training Act; and the jeremiads of those who forecast a serious lack of good physique and good health among the conscripts have been confounded. Of the first 20,000 examined only about 2.3 per cent. were rejected as clearly unfit for training. This gratifying state of affairs is clearly the welcome fruit of post-war advances in housing, social services and the general standard of living, and it now remains for the authorities to take special care, in view of the epidemic diseases and pulmonary troubles which ravaged the home cantonments of the recruits of the last war, not to worsen it by overcrowded and under-protected temporary hutments.

The real troubles of the militiamen are likely to be economic rather than physical; and two items of controversy about them have lately occupied the news. First, there is the problem of university students: are they to anticipate their liability and do their training when they leave school and before they go to college, or are they to postpone it until they come down? Most headmasters have advocated postponement, while most University spokesmen have supported anticipation. These are clearly interested points of view, and the proposal made this week by a joint conference, largely on the intervention of Government representatives, that the young men should be entitled to choose between these two alternative courses is probably the right one. Far more important, simply because the question seems likely to be overlooked, is the clear need for precisely the same elasticity of choice to be given to other classes of students who are caught by conscription in the middle of important technical or professional courses.

The second problem has been the cause of battle in Parliament this week. The Government's draft Orders to free militiamen, auxiliaries and reservists, in case of need, from their financial liabilities during training were described in the Lords by the Lord Chancellor himself as unsatisfactory; and in the Commons they were characterised, on the one hand, as inadequate for the protection of militiamen and, on the other hand, as injurious to the

interests of insurance companies and landlords. It is undoubtedly true that the risk of default by militiamen on a large sum of accumulated debt after a moratorium of six months is a real one. It cannot be questioned that, if the Government was to assume this risk itself, as in war it would do under a Defence of the Realm Act, all interests would be more safely served. But criticism and anxiety seem to have been pitched too high. Very few of these young men have heavy regular payments to make—only a surprisingly small fraction of them are married. Most of their liabilities could be put back on to a regular footing at the end of their training, without any accumulation of arrears, by simply extending the total period of payment. And, in any case, it is possible for official hardship committees to make special allowances up to £2 a week in case of need. There is small reason to suppose that militiamen will be driven into insolvency by their withdrawal from civil life and, in some instances, from civil obligations; and less still to fear that, say, insurance companies and building societies, who may indeed have to revise their calculations a little, will have to close their doors.

* * *

Films Reprieved.—The Chancellor of the Exchequer has had an oddly mixed experience this week. His chief thunderbolt, the new arms profit tax, was greeted with uncommon calm, while uncompromising opposition to three of the taxation changes he announced last April gathered force rapidly as the time to discuss them in Thursday's Finance Bill debate drew near. On the much-criticised new Excise duty on cinematograph films Sir John Simon gracefully gave way on Wednesday, just in time to forestall a wide-flung protest by Press advertisement which, at the last moment, was transmuted into a pæan of gratitude. It had been strongly urged by the film industry ever since the new duty was first known that its consequence would be fewer films, shorter news reels, and increased unemployment; and, announcing the withdrawal of the duty, Sir John confessed that its implications had not been fully understood when it was devised. In particular the incidence of the Excise duty would have been unfair; on the one hand, it would have hit the news-film companies, who consume a very large quantity of film for their short-lived weekly reels, disproportionately hard; and, on the other, it would have been readily passed on in many cases by both producers and distributors to the exclusive detriment of exhibitors. The whole incident provokes the question whether the secrecy which is necessary in the preparation of the Budget has not in fact been carried too far, for it would appear that a very brief discussion with the film industry itself would have prevented this *gaffe* from being made. Meanwhile, the rate of Customs duty on films which was raised in the Budget to correspond with the new Excise duty remains unchanged, though some adjustment is promised. This duty is burdensome upon that specialised section of the cinema trade which lives by showing rare foreign films to a limited public for artistic and educational purposes. It is to be hoped that Sir John will decide to make a clean sweep; and if he wishes to recover the £750,000 that was the estimated yield of the proposed increases in the duty on films (including that on photographic roll films, which is also to go) he has only to accede to Sir Arnold Wilson's plea, backed by 200 Members of Parliament, for the retention of the medicine stamp duties.

* * *

He only does it to Annoy . . .—In the past it has not been the Nazi custom to give the world warning of pending annexations, and it is therefore surprising that Danzig's return to the Reich has already been announced, for an unspecified date, not only by the Fuehrer himself but also by Dr Goebbels. The German Minister of Propaganda spoke at large over the week-end on the Fuehrer's determination to unite Danzig with the Reich, and on Wednesday he promised that "we will deal with this question very

soon," adding that "we want to conquer all that belonged to us in history." It is part of Mr Goebbels' strength in this war of words and nerves that he is not afraid of overstatement: he knows that none of his hearers are disposed to laugh, at least out loud, and he also knows, in accordance with Nazi technique, that Germany can get what she wants in Danzig not by strengthening herself but only by weakening Polish morale. It is a good sign that Dr Goebbels should blow so hot. If he said nothing we might suspect that some *coup* was being prepared by which Poland would be presented with a *fait accompli* and the Western Powers with another, at least temporarily successful, aggression. Less encouraging are the reports of "feverish" work on the East Prussian fortifications. Meanwhile Polish nerves are standing this racket very well; the annual "high tension" period of late August is approaching, the German manoeuvres (as usual on a scale "never before seen in peace time") are already being discussed, and if the maximum pressure is to be brought to bear, as it was on the Czechs last year, just at the time of the Nuremberg party rally, then Dr Goebbels must lash himself to bigger and better fits of fury. But this time he will not exercise them on a people deserted by their allies.

* * *

Peaceful Change.—The long-awaited Turco-French agreement had a happy issue on Wednesday of this week with the announcement of an accord whereby France will immediately recognise as Turkish territory the autonomous Sanjak of Alexandretta, lately known as the Hatay, and both countries will sign a declaration of mutual assistance on the lines of that already made between Britain and Turkey. This is highly satisfactory, for it not only puts a term to German and Italian propaganda aiming at spreading doubts of Turco-French friendship, it also seals up the Peace Front in the Near East. On the one hand, it means that France will lose suzerainty of a region which already was autonomous and could in certain circumstances have become a danger to French goodwill in the Near East; on the other, Turkey fulfils her one irredentist ambition. It is an excellent instance of peaceful change. In another direction, too, Turkey has improved the shining hour—the Minister—by drawing closer to the second most important Near Eastern State. From the British as much as from any other point of view it is good that Turkey and Egypt should be agreed together on affairs in the Eastern Mediterranean: with their agreement an established fact, it will be less easy for mischief-makers to disrupt the peace.

* * *

General Franco and the Falange.—The duality of opinion on foreign policy known to exist among high Spanish officials, touching even the security of the Generalissimo himself, has been accentuated by pronouncements during the past few days. On the one hand General Kindelan, chief of the Spanish air arm, is understood to have told his Roman hosts that with Italy at war "none of the Spanish services, the air force least of all, will be able to remain impassive," sentiments which tie up well with those uttered by Señor Suñer, the very influential Minister of the Interior, during his stay in Italy. This promise of armed support was later denied by Señor Lequerica, Spanish Ambassador in Paris, who said that Spain was in no way committed to the Axis; and as if to complete the confusion General Aranda, a soldier of high repute in Spanish Nationalist opinion, told a British journalist that "Spain would assume no obligations to foreign countries except in the form of commercial and cultural treaties." This interesting statement, made during an official visit to Berlin, was capped a few days later by General Franco with the declaration that, "indifferent to the artificial atmosphere of war in Europe, we are giving an example of serene judgment by getting down to the work of reconstructing and strengthening Spain."

The indifference would be more encouraging were it more in accordance with a knowledge of the facts: but if General Franco really meant that he would keep Spain out of military entanglements at a time when the country lay devastated by nearly three years of war, then the judgment is wise as well as serene. But it will not be as easy as all that: there are innumerable voices in the Spanish Falange to cry out against a neutral foreign policy, to urge with an indifference to facts which is truly fanatical the pursuit of whole-hog intervention on the side of the Axis, and to sacrifice to the fancied honour and glory of Spain those who concern themselves with the simple well-being of Spaniards. Domestic differences have also beset General Franco's collaborators and supporters since the beginning of their association, and with the end of the war those differences are bound to come to a head. All the evidence goes to show that they are deep and firmly rooted. The possibilities of a change of management may, indeed, be weighing with the French Government in its hesitant attitude towards the Bérard-Jordana agreement. Although about half of the 500,000 refugees have now gone back to Spain, none of the £7 millions of Spanish gold in the vaults of the Bank of France has taken the same road: and this, manifestly, for political reasons outside the scope of the agreement. The position is clear: unless we are sure of General Franco's neutral intentions, we shall remain suspicious of all he says and does; and now, with Spanish dissensions becoming vocal outside Spain, we shall require a further proof of his own stability.

* * *

The Hungarian Appeal to the Vatican.—The opening of the newly elected Hungarian Parliament by the Regent, Admiral Horthy, on June 14th, gave the opportunity for an appeal to the Pope to call a conference for a new settlement of Europe. This adjuration to the Papacy was a striking tribute coming from the lips of the head of a European State who is himself a Calvinist. It is yet another sign of the closing of the ancient breaches within the Christian Church as the new pagan threat to Christianity of every persuasion grows more formidable. In the Parliament House at Budapest on this occasion that threat was pointed by the presence of a *bloc* of Hungarian Nazi deputies standing stiffly and hostilely apart in their black uniforms. If Hungary is again engulfed in war, she knows that her ancient and highly prized parliamentary constitution will be one of the first of her cherished possessions that she will lose. She further stands to lose, in fact even if not in form, her national independence, and perhaps her very national existence—and this whoever may emerge as the nominal victors and vanquished. If Germany loses, Germany's allies will once again have to pay the piper; if Germany wins, they will find themselves reduced to a common level of servitude at which Hungary's, and even Italy's, status will perhaps be barely distinguishable from Czecho-Slovakia's. In fact, Hungary has the same interest as Italy in avoiding war and in preserving the existence and independence of Poland. The Regent's re-affirmation of Hungary's determination to stand by her friendships with Italy, Germany and Poland alike drew significant applause from a majority of the deputies. The Vatican, too, is no doubt deeply concerned to avert war by some settlement not involving the sacrifice of Poland, which is the leading Catholic Power in Europe since the break-up of the Danubian Habsburg Monarchy. How these two aims can both be achieved simultaneously is the crux. For the history of the destruction of Czecho-Slovakia has revealed Hitler's mastery of the diplomatic art of achieving his aims by nicely calculated stages. A settlement of the Danzig Corridor questions which seemed, at the moment, to leave Poland's sovereign independence intact might prove, in the sequel, to have placed her at Germany's mercy and doomed her to share Czecho-Slovakia's fate. Can the Vatican devise a settlement between Germany and Poland which will effectively draw the sting from the present European crisis? Such efforts, if made *bona fide*, will no doubt be welcomed by Poland and her allies; but any negotiations on these lines will obviously demand, on our part, the utmost vigilance.

Trade Union Policy.—It cannot be claimed for the trade unions that the part they have played since the admission of the possibility of this country's being involved in a war has been a distinguished one. On the one hand they have failed, as the dominant element in the Labour Party, to provide any consistent and constructive opposition to the policy of Mr Chamberlain's Government. On the other hand their recognition of the necessity for re-armament has not been accompanied by any preparation for the vital part which labour will be called upon to play in war time. Their unwillingness to co-operate automatically in the plans of a Government whose policy they distrust on many points is understandable. But their refusal to discuss measures for meeting an increasing demand for skilled labour is prejudicial not only to national defence but also to the interests of trade union members. In peace time the alternative to expert planning by the unions themselves might be less well-informed and sympathetic planning by Government departments; and in war time the alternative to co-operation would certainly be the compulsory regimentation of labour to which the unions are so resolutely and rightly opposed. In the present unsatisfactory situation it is appropriate that the first tentative advance towards clear and realistic thinking should be made by the union which has so far been most prominent in the discussions of labour in re-armament—namely, the Amalgamated Engineering Union. At the annual conference of the National Committee held at Llandudno last week it was decided to oppose all forms of dilution until such time as the whole of the available skilled engineering workers were absorbed in full-time employment. The admission of the possibility of dilution was grudging; but the preceding discussion produced some very salutary remarks by the General Secretary, Mr Fred Smith, to the effect that dilution must essentially follow from the Government's present programme, and that the union must be prepared to control it. Moreover, with every diminution of the number of its unemployed members, the A.E.U.'s insistence on the absorption of all skilled men before dilution can begin loses force. The other small ray of hope which the conference produced was its decision to postpone the termination of its agreement of 1935 with the Transport and General Workers' Union whereby the two unions agreed not to "poach" members from each other. The whole question will now be discussed at a conference between the leaders of the two unions to be held on June 27. If the unions can resolve their own differences they may become free to concentrate on the formation of an effective policy for the Labour party. And if the Parliamentary Labour Party can by this means regain the confidence of the public it may yet become an effective instrument of government. But if the faint sparks emanating from the engineers' conference do not kindle the other

unions, then both the political and industrial power of Labour are likely to be wasted in ineffective opposition at a time when they might have enormous positive value.

* * *

Future Population.—The need for investigating ways and means to stop the decline that is now imminent in Britain's population was urged by Lord Samuel on Wednesday in the House of Lords. He laid special stress on the desirability of family allowances. The Government's spokesman, Lord Templemore, rejected Lord Samuel's plea, partly on the ground that there was doubt about when the population was likely to begin to fall—and, indeed, about whether it would fall at all—and partly because an inquiry could only be useful when the operation of last year's population Statistics Act had produced information about the cause of the prospective decline. Lord Templemore's first argument was wrong: he adduced the rise in the birth rate since 1933 as a reason for optimism, but overlooked the fact that the increase in the birth rate in England and Wales from 14.4 in 1933 to 15.1 in 1938 was less than the rise in the marriage rate from 7.9 to 8.7 in the same period. This means that the increase in the birth-rate is wholly or largely due to the first children of an increased number of newly married couples and not to any increase in the number of children per family; and, at the best, this can only portend a slight postponement of the decline in the population. Lord Templemore's second argument had more force. More facts are needed, and the new information now obtained at the registration of births and deaths needs to be amplified by a census of fertility, which should be taken, at the very latest, as part of the general census in two years' time. Nevertheless, the case for an immediate public investigation of the whole population question still stands. A considerable body of evidence is already available and it urgently needs sifting. Much of it is favourable to schemes for family allowances, difficult though the issues involved by such schemes undoubtedly are. Perhaps most important of all, it is needful that the attention of Government and public alike should be firmly turned to the true facts of the present position. Those facts are concealed when the number of births in any year are simply related to the total number of the population. Only a small proportion of the population is able to bear children; and it is the number, age and fertility of these women that is all-important.

* * *

Relay Broadcasting.—The recent Parliamentary debate on the conveyance of broadcast programmes by wires to listeners raised several important questions. The first was the desirability of the extension of "wire broadcasting" as such, on the ground that it is less subject to interruption in war time than the present reception of wireless broadcasts. Any such development is valuable and the need to encourage it was not questioned in the House. The means by which the development should take place is a separate question, in which there is room for considerable difference of opinion. At present relay broadcasting is carried on by a dozen or so private companies who receive programmes broadcast by wireless and distribute them over a local wire network to subscribers. An additional service will be provided by the Post Office at the end of this year, by which telephone subscribers in central London, Edinburgh, Birmingham and Manchester will be enabled to receive B.B.C. programmes over the G.P.O. lines for a charge which will probably not exceed 1s. per week. Thus in future in some areas there will be three alternative means of receiving programmes, one by radio all the way, one by radio or wire to a company's station and then by relay wire, one by G.P.O. wire all the way. It was suggested in Parliament that the alternatives should be reduced to two by the handing over of all relay services to the Post Office. The Postmaster-General opposed this development and announced that the relay companies'

licences will be extended for ten years, or double the period for which they were ever previously granted. His reasons were that the Post Office already had too much to do, that the companies were providing an efficient service, and that they were already subject to a sufficient measure of public control. This explanation does not exhaust the subject. There is a presumption that if relay broadcasting requires regulation at all, as it undoubtedly does in view of the vital service it provides, that control should be centralised, and not, as at present, divided among local authorities and the Post Office. Secondly it is doubtful whether the relay companies can be said to be performing their functions efficiently when they have so far failed to provide any service to rural districts, where the alternatives to broadcast news are fewer than in towns and satisfactory reception correspondingly more important. Thirdly it is manifestly undesirable to add numerous privately owned networks to the already complicated system of wires which exists in this country. A single development which would overcome all these difficulties is the control and operation of all wire broadcasting by the Post Office. It would provide unified direction, eliminate the duplication of costly capital equipment and maintenance services, and allow of the observance of a standard of equal service to all sections of the community, instead of a standard of private profit maintenance which at present dictates that wealthy towns shall have good relay services and rural areas none.

* * *

Agricultural Development.—The debate in the House of Commons on the Agricultural Development Bill was the opportunity for some unusually clear thinking on the part of members of the Opposition. Mr Richards criticised the Bill because it outlined no agricultural policy except that of subsidies. That, unfortunately, is true of most of the agricultural Bills introduced into Parliament in the last few years, with the notable exceptions of those provisions of recent Acts which encourage cleaner milk, the use of lime and slag and the ploughing of worn-out grass land. Nowhere, and certainly not in the latest Bill, are there any indications that the Government has a coherent policy for the future development of British agriculture; the provision of tariffs, subsidies and import quotas on a lavish scale has been designed mainly to bolster up existing systems of farming whether or no these are suitable to a rapidly changing world. Many members of the Conservative Party seem to wish to return to some golden age for farming, when there were 2 million acres under wheat, 2 million people on the land and any farmer reasonably efficient in the practices of his forefathers could make a very good living. But, as Mr Alexander pointed out later in the debate, the "drift from the land" is both a sign of technical progress in agriculture and a necessary step towards a higher standard of living both for those who leave the land and those who remain on it. But it must be admitted that the exodus of rural workers which has taken place in the last two years under the stimulus of industrial revival and new aerodromes is seriously hampering the seasonal pressure of farm work. But those who talk of "redressing the balance between town and country" by further subsidies to farmers must be suspected of using empty words to conceal confused thinking. To-day, farmers are being subsidised to the tune of some £30 millions a year, to which the Minister of Agriculture is proposing to add another £10 millions or so; this sum is given (without a means test) by piecemeal arrangements in order that the profits to be made by the production of a number of unrelated commodities should be restored to the level of ten years ago. That is not agricultural development but agricultural retrogression, and half that sum, spent wisely on research, technical education, drainage, rural housing and electrification, would give a far greater return in the long run.

* * *

Social Service in War Time.—The number and volume of social services must necessarily be modified in time of war to meet a variety of new demands. These

include the welfare requirements of an augmented body of female and juvenile workers, special provision for evacuated non-combatants, and also for non-evacuated bread-winners, and the payment of relief and allowances to the dependants of men on active service. At the same time the amount available from Government funds for activities not directly connected with the prosecution of the war will undoubtedly be restricted, and official attention will be directed elsewhere. The National Council of Social Service has shown its appreciation of the fact that a greatly increased strain would be placed upon voluntary organisations by producing, in consultation with its associated bodies and with the Lord Privy Seal's Department, the Ministry of Labour and the Ministry of Health, a series of proposals for strengthening societies which would be particularly valuable in war time and planning new voluntary services to meet the new needs. An Emergency Standing Conference of Voluntary Organisations has been in existence for the past six months, and it has now been indicated through Sir George Chrystal, the Secretary of the Ministry of Health, that the Government will in future make full use of the machinery which the Conference provides for contacts with voluntary organisations. So far four suggestions have been made as to particular activities which could be undertaken by voluntary organisations in war time. These are (1) the provision of bureaux to give essential information to individual inquirers who require personal guidance in the many problems which will arise through evacuation, dislocation of usual services and emergency legislation, (2) welfare organisation for juvenile workers, (3) the administration of relief in cases not covered by Government measures and (4) the setting up of local bodies to plan and co-ordinate all voluntary services. The fulfilment of this programme alone would place a heavy burden on any combination of voluntary organisations, and the National Council of Social Service, if it is to do the work efficiently, will undoubtedly require the assistance and advice of fully qualified officials in the Ministries concerned as well as the voluntary service of able and influential private individuals. The Council has shown its willingness to serve by taking the present initiative, and it deserves every assistance in advancing its plans and giving them as concrete a form as possible before the occurrence of any actual emergency.

* * *

Singapore, Indo-China and Siam.—While the Japanese blockade of the British Concession at Tientsin has made North China for the present the storm centre in the conflict between Japan and the Western Powers, a conference of more than fifty British and French Army, Navy and Air Force officers is being held at Singapore to study measures of joint defence for the territories and interests of the two Powers in the Far East. Hitherto there has been no co-ordination of defence among the Western Powers concerned, and even now the United States and Holland remain outside the conversations, though it is understood that they are to be kept informed of them. The British and French commands will discuss the strategic situation which would arise in the event of hostilities resulting either from a clash over treaty rights in China or from a direct Japanese threat to Hongkong or French Indo-China. The starting-point of all such discussion must be the naval superiority which Japan holds in the China Seas as long as Britain and France must keep their main fleets in European waters and the United States is not definitely committed to action with them in the Far East. This naval superiority, however, has its limits; it diminishes with distance from Japan itself, where the Japanese navy has its battle-fleet bases, so that the local defence of Singapore and Saigon should be by no means a forlorn hope. The point of danger, should the Far Eastern war be carried to the south of China, is likely to be Siam. From their new stronghold in the island of Hainan, the Japanese could not only attack Haiphong, the port for two railways into South China, but could also join hands with the Siamese by a drive through central Annam, where the Annamese "emperor" still keeps his court at Hué under the French

protectorate. Siamese policy has recently been both anti-French and anti-Chinese, the former because of territories formerly belonging to Siam which were taken by France in the building of French Indo-China, and the latter because of the commercially dominant Chinese colony described the other day by a Siamese nationalist in a phrase of sinister import as the "Jews of Siam." Very skilful diplomacy will be needed in the near future if Siam, with its strategic threat, not only to French Indo-China but also to Burma, is to be kept out of the political orbit of Japan.

Soviet Naval Strategy.—A recent decree of the Presidium of the Supreme Council of the Soviet Union makes alterations in the regulations governing compulsory service in the Russian Navy. The length of service is increased from four to five years and the minimum extension period for those wishing to serve longer is to be three years. Those who have secondary and higher education are no longer to be released after two years' service, but must serve the full five years. Hitherto it has been very questionable whether the efficiency of the Soviet naval personnel has been on the same plane as in other large fleets. Primarily the decree aims at the strengthening of the technical ranks and should place more expert ability at the disposal of the newly-appointed Naval Commissar, Admiral Kuznetsov. Parallel with this development are the programme of naval expansion, now in full swing, and the change-over from a defensive to an offensive strategy in the Baltic. The decision to make the latter change, which reversed the previous policy of the higher command, is reputed to have been at the root of the recent purge. The main fighting strength of the Soviet Navy is concentrated in the Baltic. Two of its three capital ships, three cruisers, most of the new heavy destroyers and 15 out of the 16 older destroyers are there, and so are most of the 100 odd fast motor torpedo boats. Only in the case of submarines, of which there are about 150, is more than 50 per cent. of the total number stationed in the Pacific and the Black Sea. The threat of so formidable a force, pursuing an offensive strategy, may well give pause to any German designs for the domination of the Baltic States. It is obvious that the independence of these States is a vital Russian interest; and the opposition of the Soviet representative at Geneva to the refortification of the Åland Islands, together with M. Molotov's present insistence on the inclusion of a guarantee to Russia's Baltic neighbours in the Anglo-Russian pact now under discussion, provide sufficient evidence of a determination to let no detail pass unexamined which may ultimately weight the strategic balance in the Baltic in Russia's favour. Moreover, any move which increases the effectiveness of the Soviet fleet cannot now be a matter of indifference to the British naval high command.

New Move in Mexico ?—Reports from Washington, where the Mexican Under-Secretary for Foreign Affairs has been holding discussions with the State Department, are hopeful that President Cardenas may be adopting a more reasonable attitude towards the expropriated oil companies. It appears that counter-proposals (to those put forward recently by Mr Donald Richberg) have been presented in Washington, which include representation of the oil companies on the administrative board of the industry, and are understood to mention the return of foreign technicians; in line with the Government's general policy, oil distribution would be under unified control, as would also the supervision of labour. If these are the full extent of the proposals, then hopes of a settlement need not run high: it is unlikely that the companies would be prepared to co-operate for the small bribe of a representation that would remain impotent in the face of Mexican control, and it is just as unlikely that they would be prepared to accept a mere right to distribute—and that without guarantees of undisturbed conditions. What the companies apparently are prepared to accept—and this marks a long step towards the Mexican standpoint—is Mexico's ownership of the wells, *provided* that the Mexican Government accord them a lease to operate. In thus preserving the status of lessee rather than owner they have in fact come down from perpetuity to a few score of years: it is to be hoped that Señor Beteta at least, who is recognised to be one of the more reasonable representatives of the Mexican Government, will realise that in this compromise the companies are holding out what is virtually the only solution that will not in the long run poison American goodwill towards his country. For it is very evident from the financial position of the Mexican Government that, once the companies let go their right to operate if not to own, and talk in terms of compensation, they are lost. Compensation for investments (the only sort of compensation of which it is less than silly to talk) in the form of a right to distribute oil, such as the latest proposals are said to discuss, is almost as good as nothing. And, indeed, if President Cardenas does not relent of his doctrine and allow the companies facility to produce, the whole future of Mexican oil seems in doubt. The alternative is already becoming evident: Mexican oil exports, in the fourteen months following the expropriation of March, 1938, have fallen by 45 per cent., and the much advertised barter deals with Germany and Italy have raised the proportion of Mexican oil in those countries' total annual consumption only by two or three per cent. over what it was in 1936 or 1937. As was the case with the agrarian expropriations, which were followed by a falling off in production, technical inefficiency has been the net result. If President Cardenas wishes to correct this state of affairs, he must not expect the whole of his demands to prevail.

* * *

Balkan Anxieties.—Prince Paul's return from Berlin was accompanied by a host of rumours—that Herr Hitler was disappointed with the visit, that General Goering had offered a non-aggression pact, that the Prince Regent would come to London in August—but by no firm conclusion of a German-Yugoslav treaty of whatever kind, nor by Yugoslavia's formal adhesion to the Axis. The most probable reason for this is that the Nazi leaders knew better than to suggest a treaty, in view of the Regent's difficulties at home, and that they continued in the diplomatic sphere their commercial policy of gentle but unrelenting pressure, the success of which is clear from Belgrade's recent acceptance of a £12 millions credit. The state of Yugoslav opinion was strikingly brought out the other day by the Yugoslav ambassador in Paris, who asked at a public meeting, "Why have these (Anglo-French) guarantees not been given to Yugoslavia?" a wide cross-section of Yugoslav public opinion would resent any step which took them finally into the Axis camp. A realisation of their true position is nevertheless coming home to those many Yugoslavs who have hoped against hope that their Government had not pledged and would not pledge itself to act against the

democracies or adopt a position of neutrality "benevolent," and therefore subservient, to the Axis. A few days after a significant speech by M. Shubasitch, the Croat representative in Belgrade, had appeared in the Serb Press, saying that "the Croats were ready to march side by side with the Serbs, but only on condition that all disputes between them were previously settled in a brotherly way," Dr Matchek himself made one of his rare pronouncements. A Serbo-Croat agreement, he said in effect, was in any case inevitable because only thus could a strong Yugoslav State exist. And Dr Stoyadinovich is reported to have been expelled from the Radical Union (the influential party coalition of which he was president and on which he fought his elections) for having criticised the Government's efforts at obtaining agreement. These are signs of the times which are not confined to Yugoslavia. During his visit to Athens M. Gafencu, the Roumanian Foreign Minister, was at pains to emphasise the peaceable intentions of the Balkan Entente, and to make it clear that Yugoslavia was still considered a loyal Balkan brother. On their side the Bulgarians are seeing the red light in the visit of their Finance Minister, M. Bujiloff, to Berlin; it is even thought that the Germans may request an alteration in their favour of the mark-leva rate, already at a parity dangerous to Bulgaria's commercial freedom. The Balkan countries, each in its way, are preparing for the worst.

* * *

Palestine before the Mandates Commission.—During the past few days the Permanent Mandates Commission of the League has been in session at Geneva on the subject of Palestine. Normally, the Commission simply examines the latest annual report of a mandatory Power in the presence of its accredited representative in the person of some civil servant who is competent to elucidate the printed word and to answer the Commission's questions. This procedure has been carried out in the case of Palestine this time as usual but, of course, this time much more is in question than the mere supervision of current administration. The British Government has published a declaration of policy which, if implemented, will give a new turn to the destinies of Palestine as a whole and of the two nationalities composing its mixed population; and, on this account, the Secretary of State for the Colonies, Mr Malcolm MacDonald, has rightly gone to Geneva in order to meet the Commission face to face and speak for the mandatory Power with an authority that could not be commanded by any civil servant, however widely experienced or highly placed. On June 15th Mr MacDonald expounded the Government's present policy to the Commission with praiseworthy frankness. He admitted that the term "Jewish National Home" in the Balfour Declaration and in the text of the Mandate had been deliberately ambiguous, because it had been impossible at that time to foresee the extent either of Jewish efforts to re-establish a Jewish community in Palestine or of Arab efforts to resist this Jewish enterprise. He dwelt on the Hogarth mission to King Hussein as evidence that, in adopting the policy of the Balfour Declaration, the British Government of the day had not intended to ride roughshod over the Palestinian Arabs. And he pointed out that there was nothing in the Mandate to compel the mandatory Power to promote Jewish immigration into Palestine up to the limit of the economic absorptive capacity of the country. Palestine's political absorptive capacity must be taken into account as well; and the Arab revolt, though it had been disgraced by many criminal acts, "has also borne the undeniable stamp of a wide patriotic national protest." Hence the new line of British policy. Mr MacDonald is reported to have come under hot and searching fire from some members of the Commission, at any rate; and the Commission's Arab and Jewish memorialists have raised their voices in unison on the single point of condemning the new British policy as unsatisfactory. It is fairly safe, however, to prophesy that this policy will continue to hold the field in the absence of any less unsatisfactory alternative suggestions.

THE WORLD OVERSEAS

Football Pools in Sweden

(From a Swedish Correspondent)

DURING the season the Swedish public displays an extraordinary interest in English League football. The man-in-the-street avidly studies the form of English teams; the Stockholm evening papers issue special editions containing English match results and League placings every Saturday night; and the Sunday or Monday papers publish long reviews of the latest football battles on the other side of the North Sea. Some of this interest can be ascribed to the genuine attention of Swedish sportsmen to the game as it is played in the country of its origin. But much more is unquestionably due to the fact that football pool betting, which enjoys widespread popularity in Sweden, has to be based on English matches during the winter months because the game cannot then be played in Sweden on account of the climate.

To-day, about one million kronor (or approximately £50,000) is spent every week on football pool betting in Sweden—a very considerable sum for so small a country. Nevertheless, in strong contrast to the situation in Britain, no controversy rages in Sweden about the social and economic consequences of the public's eagerness to stake millions merely on the results of football matches. This is due mainly to the unique and now generally approved system of football betting control instituted by the Swedish Government precisely five years ago.

During the early 1930's football pool betting was the subject of much debate in Sweden, too. Privately-run pools had sprung up like mushrooms, and their completely uncontrolled activity was regarded by many with great concern. Attempts were made to suppress them under the Swedish betting laws, which prohibited betting on sporting contests other than State-licensed totalisator betting on horse racing. The net result was that the promoters conducted their pools covertly instead of in the open, and a stream of money began to leave the country to football pools organised abroad.

Finding that prohibition simply drove the traffic underground, the Swedish Government decided upon an ingenious course. Their plan satisfied the Swedish Football Association's plea that football pool betting should be legalised—thereby ending a situation which did not enhance the game's repute—and, at the same time, ensured that the major part of future pool betting profits would be reserved for an object of which all could approve—the development of public facilities for sport. By an Act passed in March, 1934, the Riksdag prohibited football pool betting in Sweden save by Government licence; and, though a great many applications were made, the only licence granted was to a company established by an Order-in-Council on June 7, 1934.

This company, which is registered under the name of *A/B Tipstjänst*, has thus become the sole authorised football pool business in Sweden. Though in form a private undertaking it is, in effect, a State enterprise. The share capital is limited by the terms of the licence to 45,000 kronor (about £2,250) and the shares, though nominally subscribed by the public, may be held only by certain specified persons. Of the company's five directors two must be appointed by the Government, and these must hold the positions of chairman and vice-chairman respectively. Furthermore, the Minister of Commerce is empowered to appoint one or more controllers to exercise continuous supervision of the company's activities.

During the winter, the company bases its pools on English matches, and during the summer, when the home season is in progress, on Swedish games. Every week, about one million coupons are forwarded to *Tipstjänst's* headquarters by its 39 territorial collectors, who receive them from some 6,000 local authorised agents—tobacconists, grocers, co-operative stores, and so on. The minimum stake is 25 öre (about 3d.) a line, and about two-thirds of the backers confine themselves to this modest investment every week. The company has itself taken steps to encourage moderation among its clients, such as restricting bets to 48 chances per

coupon, limiting the highest prize to 75,000 kronor (about £3,750), and refraining from advertising or "sales promotion." It has also prohibited persons under 18 years of age from taking part. Under the terms of the licence the dividend the company may pay on its shares is restricted to not more than 5 per cent., the sum it may use to meet expenses must not exceed 25 per cent. of its income, and 50 per cent. of the company's income must be allocated for pool winnings. (All prizes of 24 kronor or more are subject to a 10 per cent. tax.)

Financing National Sport

After State and municipal taxes have been paid, the net surplus, with the exception of a minor sum appropriated for ordinary State Budget purposes, has to be paid into a State-controlled fund for the promotion of sport. During the four complete fiscal years that *Tipstjänst* has been in operation, it has paid into this fund a total of 20,930,850 kronor, of which about 18,000,000 kronor has been distributed for the establishment of premises and grounds for gymnastics and sport, the training of instructors, the purchase of materials, and for contributions to the administrative costs of the various national sport associations.

By far the greater part of the grants have been made for sports establishments, such as football and athletic grounds, baths, skating rinks, ski-jumps and sports halls. In general the grants are approved on condition that the sites can be obtained freehold or on lease for at least 25 years, that at least an equal sum shall be subscribed by the locality concerned and that the upkeep can be guaranteed by other means than grants from the sports promotion fund. The allocations have been apportioned on the principle that as much attention should be paid to the needs of the smaller places as to those of the large population centres.

How widely the grants have been distributed can be judged from the fact that, in four years, some 600 grants have been given to rural communities and 300 to urban communities. In addition, large sums have been allocated to establish a People's High School for Gymnastics at Lillsved and a National Sports Training Institute at Bosön. A grant was made in 1936 towards Sweden's expenses at the Olympic Games in Berlin; and, during its five years' existence, *Tipstjänst* has functioned so well, and given the Swedish public such tangible benefits, that to-day one rarely hears any plea for allowing football pool betting to be run by private promoters. The fact that the profits are now applied to promote the nation's physical development is a powerful argument in a country where the cultivation of bodily fitness is rated so highly and pursued so widely. This argument has now been strengthened still further by the recent broadening of the use of *Tipstjänst's* surplus. The surplus arising during the present fiscal year, which is estimated to amount to no less than 15,000,000 kronor, will be so divided that 30 per cent., or 4,500,000 kronor, will go to the State Exchequer, 50 per cent., or 7,500,000 kronor, to the sport promotion fund, whilst the remainder (reinforced by the undistributed balance in the fund) will constitute a new 5,000,000 kronor fund "for the promotion of open-air life."

This change is due to the fact that *Tipstjänst's* profits are now much larger than when the original basis was fixed for the use of its surplus; and other forms of physical culture than gymnastics and organised games are becoming increasingly popular. The intention is to apply the new fund for the setting up of permanent establishments such as youth hostels, mountain huts, ski-cottages, open-air bathing places, for marking out hiking and ski-ing routes and for other practical measures calculated to enhance the public's facilities for open-air recreation. Thus in Sweden men's weakness is harnessed to the cultivation of their strength and happiness.

June 12th.

The United States' Flood of Imported Gold

[FROM OUR NEW YORK CORRESPONDENT]

FOUR facts during recent weeks seem to have considerable significance for our economy. First, there has been a great influx of gold. Secondly, there has been a spectacular rise in the price of long-term Government securities. Thirdly, there has been a marked increase in labour troubles. Finally, there has been a rapid deterioration of the wheat crop.*

The month of May has brought a downward revision of the estimates of the wheat harvest, due to the recurrence of drought, especially in the south-west. But the harvest season is now beginning, and there is still time for further revision, either way. The success of the coal strike has been followed by a number of other strikes, especially in the motor industry, which is now winding up its 1939 model year.

Broadly speaking, our labour policy has been concentrated on two objectives—high hourly rates and an ever shorter week. These objectives have been realised and the sequels are by no means what was hoped for. The high hourly wage was sought with the object of raising the worker's income; the short week was sought with the object of increasing employment. Hourly wage rates have been lifted to the highest peak in history, but total wages actually paid out have not risen accordingly. The working week has been formally reduced, both by legislation and by collective bargaining, but unemployment remains extremely high. Such a sequence is not proof that one factor is the cause of the other. But there is sufficient evidence of causal relation between the various factors to justify more examination than the subject is receiving. For example, in the business community, there is an almost exclusive concentration of attention on taxation; while, in the political community, pre-occupation with relieving the consequences of unemployment has distracted attention from inquiring into its cause.

It is perhaps the influx of gold on a spectacular scale that most merits scrutiny. The gold imports of April (more than \$600 millions) were perhaps the largest of any month in our history; but some was subsequently earmarked and therefore not added to our gold stock. In May the figure dropped to about \$400 millions; and during that month, the increment to our gold stock was very much less, as some \$300 millions was added to the earmark account, raising it above \$1,000 millions. The effective change is best shown by the Treasury figures of the gold stock:—

GOLD STOCK (\$'000,000)			
End of	\$	End of	\$
Apr., 1938	12,869	Jan., 1939	14,682
May, "	12,919	Feb., "	14,874
June, "	12,963	Mar., "	15,258
July, "	13,017	Apr., "	15,791
Aug., "	13,136	May, "	15,956
Sep., "	13,760		
Oct., "	14,065		
Nov., "	14,312		
Dec., "	14,512		

* There has since been a considerable improvement.—ED.

The net increment in the past twelve months has been somewhat above \$3,000 millions. Not all this gold has passed into member bank reserves, which have risen about \$2,300 millions. Currency in circulation has increased by more than \$500 millions. But, just over a year ago, member bank reserves had been augmented by the monetisation of the Inactive Gold Fund; and member bank reserves at the end of May, 1939, were just over \$10,000 millions, compared with \$7,300 millions at the end of March, 1938. Gold certificates issued to the reserve banks amounted to \$13,300 millions at the end of May, 1939, against \$9,213 millions at the end of March, 1938. That is, over \$4,000 millions of gold has been monetised by our system in fourteen months, and about three-fourths of this has become member bank cash.

A Gigantic Increment

This increment to our gold stock is not far from the combined present holdings of England and France. It is of the order of three times the world production of the fourteen months in which it was accumulated. It—that is, the increment by itself—is almost equal to the entire gold stock of the United States at any time during the New Era of the 'twenties; it is in excess of the required reserves of the member banks (if those are computed against the former legal requirements); and it is approximately equal to the present sum of excess reserves.

Yet, as a comparison of the gold certificates and the member bank reserves shows, the full effect of the gold inflow has not yet made its influence felt even on member bank reserves. The combined figures of gold in the Treasury General Fund and of General Fund Deposits in the Reserve Bank add to close on \$1,500 millions, to say nothing of the unmonetised gold in the Stabilisation Fund, amounting to \$1,800 millions.

It is probable that if any economist a decade ago had been confronted with the hypothetical question of what would happen to an economy under a gold increment of this absolute and relative magnitude, he would have anticipated an "orgy of inflation." Actually, commodity prices are at about the same level as in March, 1938; production has recovered somewhat; employment is a little higher; the foreign exchanges are a little lower; common stocks are somewhat higher. This is hardly a picture of inflation; and, indeed, "inflation mindedness," which has been a recurrent phenomenon in the financial and business community on several occasions during recent years, is conspicuously absent.

The absence of "inflation mindedness" is evidenced by the decline in total loans by reporting member banks from \$8,771 millions on March 30, 1938, to \$8,126 millions on May 31st this year. Loans on Stock Exchange collateral are almost identical with 14 months ago. Real estate loans are unchanged—although residential building is substantially greater. Other loans, that is, commercial loans, account for the decline. In short, in this period, the sole borrowers have been the Government and Government agencies, and the sole outlet for the bank cash created by the gold inflow has been Government or Government-guaranteed securities, with a small overflow into a corporate market that has been mostly concerned with refunding. The net increase in the reporting banks' total loans and investments taken together is less than \$900 millions between March last year and May this year, while their cash and deposits have risen three times as much.

June 12th.

Germany's Food Supplies

[FROM OUR BERLIN CORRESPONDENT]

THE National Socialists have made great efforts to make Germany something like self-sufficient in foodstuffs, but the Third Reich is still heavily dependent upon imports for food and feeding-stuffs. Before the war Germany's population was 67 millions. To-day, after the annexation of Austria, the Sudetenland, Memel, Bohemia and Moravia, it is 89 millions, an increase of 29 per cent. since 1913, while the acreage of land that can be used for agricultural purposes has increased by barely 10 per cent. The proportion of agricultural land to a third since 1913; and the number of cattle has increased to a quarter and pigs by nearly a seventh. These changes, coupled with the increase in the number of persons per square kilometre from 124 in 1913 to 135 to-day, explain the enhanced importance of imports—especially when it is remembered that *per capita* consumption of the principal foodstuffs has simultaneously shown an appreciable rise. Nor has there been an increase in agricultural productivity anything like sufficient to meet the augmented demand.

Last year, while Germany's total imports fell to Rm. 5,449

millions from Rm. 5,468 millions in 1937, her imports of food rose from Rm. 2,045 millions to Rm. 2,111 millions. The chief items imported are vegetable foodstuffs, and especially grain. With a domestic wheat production (including Austria and the Sudetenland) of 6,240,000 tons, as much as 1 million tons had to be imported; though, on the other hand, rye imports were small, because the domestic output of 9,620,000 tons was sufficient to meet the demand. Butter, too, was important: production fell back from 520,000 tons in 1937 to 510,000 tons last year; and a rise in imports from 87,000 tons to 92,000 only partially covered the increased demand. Although domestic fat production has risen by 360,000 tons since 1932, it still covers only about 55-60 per cent. of total German demand; and only one-third of the whale oil needed by German margarine factories is supplied by German whaling activities.

This is not to say that there have been no recent improvements in the food situation. In 1937, because of poor crops and in order to eke out short supplies, the Government decreed that maize and potato flour should be mixed with wheat and rye flour for baking. But total supplies of all bread grains at the end of last year, at 10 million tons, were 4,400,000 tons higher than twelve months before, and the decree was lifted. Nevertheless, the ban forbidding the use of grains for fodder remains; and, with a total yearly demand of some 25 million tons, Germany's grain stocks would scarcely last six months.

The Meat Problem

The supply of meat, moreover, is not nearly so satisfactory. Large quantities are being tinned for military use; and last year the number of livestock fell, as a result of the shortage of farm workers, the scarcity of feeding-stuffs and the prevalence of foot-and-mouth disease. At the same time, the demand for meat has risen, owing to increased earnings. It is hard to increase imports of meat because the available foreign exchange is needed to purchase armament materials. The quota of beef and veal for slaughtering has been reduced to 80 per cent.; and, as beef and veal accounted for just over a third of last year's meat consumption, there will be something like 7 per cent. less meat available for consumers. There are often long queues at butchers' shops; there is a considerable increase in the "black trade" at illegal prices; and the practice by shopkeepers of compelling customers to buy goods they do not necessarily want before they can buy what they have come for is growing.

Again, the position should not be misread. An official analysis of *per capita* consumption gives the following picture:—

(Consumption in kg. per person per annum)		
	1932	1938
Meat	48.9	57.7
Sugar	20.2	24.3
Seafish	8.5	12.4
Butter	7.5	8.8
Milk	105.0	112.0
Wheat flour	44.6	55.0
Beer	51.4	69.0

This is not surprising. Nineteen thirty-two was a year of depression and distress, and since then an armaments boom has developed. Incomes have risen and with them consumption. But the fact remains that many important foodstuffs, such as meat, oil, fats, butter, fruit, vegetables, coffee, eggs, etc., can only be bought at normal prices in insufficient quantities, or at inflated prices in the "black market." Moreover, the practice of "double sales" (mentioned above) means that dealers try to sell costly, bad or unsaleable goods with wanted goods that are scarce; and this, together with the deterioration in quality frequently noticeable, is not reflected at all in the cost-of-living figures.

To relieve the scarcity of meat and fats the authorities have turned to fish. Consumption and the catch are to be increased. Last year the fisheries brought in 782,000 tons of fish. It is proposed to raise the yield of deep-sea fishing alone from 500,000 to a million tons. Fish imports last year were about 250,000 tons.

Food and Foreign Policy

Nor is it easy for the Reich to tide over food difficulties by trade with Eastern and South-Eastern Europe. States in that region have foodstuffs to sell, it is true, but Germany cannot offer foreign exchange in payment, while to pay promptly in industrial goods is increasingly difficult because of concentration on arms. And the struggle for self-sufficiency is plainly limited by the shortage of something like 700,000 to 800,000 labourers in agriculture. Last year about 200,000 land workers, mainly Poles, were imported. This year the

Poles have not come and the Italians imported have not filled the gap. Schoolchildren and students have been called up for harvest work. The burden thrown upon farmer families is very heavy; and, while agricultural prices have been fixed since 1936, costs for fertilisers and machinery have risen, and the profitability of farming is falling.

This is the background of Germany's foreign policy in Central Europe. *Der Deutsche Volkswirt*, discussing agricultural difficulties, poses the Reich's claim to assume the economic management of *Mittleuropa*. The intention is clear as is the present situation in German farming.

June 20th.

The Limits of French Resources

[FROM OUR PARIS CORRESPONDENT]

THE total number of wholly unemployed persons at the end of May was 375,522, against 380,826 in May, 1938 and 345,503 in May, 1937. The seasonal fall of unemployment since it began in February has this year been 10,636, against 11,947 in 1938 and 16,910 in 1937. Moreover, the figures of partial unemployment are more satisfactory still. And the following table, which shows the distribution of workers in 8,389 factories according to the weekly hours they work shows how widely the 40-hour week has been abandoned. This is especially the case in works busy on armament orders and the workers are co-operating in the increase of working hours because the extra earnings they get afford a means of defence against the increasing cost of living.

Percentage of Sample of 8,639 factories		
Weekly duration of work	May, 1938	May, 1939
	%	%
48 hours and more	0.05	2.04
More than 40 and less than 48 hours	1.92	32.73
Forty hours	78.23	56.60
More than 32 and less than 40	10.65	5.52
Thirty-two hours	5.13	2.03
Less than thirty-two	3.52	1.08

The duration of working hours could be lengthened still further, but the number of workers who could be regained by industry—notably skilled workers—is practically nil. The problem of economic recovery in France is nearer to the German problem, where there is full employment, than to the British one, where many are still out of work. This is why a policy of monetary expansion (with or without monetary control) is excluded on the general ground that it would lead to a dangerous rise in prices.

M. Reynaud, for that and other considerations, has chosen an orthodox financial policy. But such a policy implies that public expenditure should be as far as possible covered by taxes. It assumes the need for an increased business turnover in order to yield increased taxes to the Treasury. Though mounting arms orders, in the military sector of industry, accompanied by regular wage payments are maintaining a fairly high level of purchasing power among the working class, the situation of investors and the middle classes, on the other hand, who bear the chief part of the tax burden, cannot have been very much improved by M. Reynaud's six months of recovery.

M. Lambert-Ribot, French delegate to the I.L.O. Conference at Geneva, has estimated the variations of French incomes (making allowances for changes in the value of the currency) in 1935 and 1938 compared with 1913:—

(1913 = 100)		
	1935	1938
Weekly wages	140	114
Rentier income	40	20
National income	100	66

land-owners, of the liberal professions, of the civil and war pensioners has considerably fallen. The return of confidence cannot work miracles. The amount of expatriated capital is estimated at about 100,000 million francs, but public expenditure will reach 130,000 millions this year. War orders can produce only limited effects, especially when international tension still hampers private initiative.

The Need for Loans

The conclusion is inescapable. Largely because of re-armament, which cannot be avoided, public expenditure must exceed any fiscal receipts that can reasonably be expected, in view of the country's limited resources of labour and capital. Inevitably, the Treasury must turn to borrowing. To cover a Budget of 135,000 million francs by taxes would necessitate a national income of 400,000 millions instead of the present 250,000 millions. French production cannot bring about this needed increase of 60 per cent. in national income; the Reynaud efforts themselves have brought about a rise in the index of industrial production of less than 15 per cent.

This country has a natural tendency towards tenacious saving. The task of the Government, therefore, is to carry out a policy of strong defence of the franc which will regularly bring back to the Treasury the francs which are put into circulation by the State to cover its huge public (i.e. re-armament) expenditure. This policy is the policy of financing re-armament by the "floating debt" which can be periodically funded by long-term loans.

The defence of the franc is now aided by the credit surplus on the balance of payments, but fresh efforts must still be made in order to increase exports. It is imperative to get new markets for French raw materials and manufactured goods while French products (after three devaluations of the franc) have still the benefit of a margin below world prices.

The success of this policy demands a skilful distribution of the sums which are raised between taxation and borrowing. It also requires that the rise in prices, which is checked by limited purchasing power and the need for saving on the part of the public, is not pushed forward either by demagogical expenditure nor by too large concessions to agricultural interests. It seems that these claims may be averted politically by a prorogation of Parliament and economically by the results of a crop which, after certain doubts, seems to be reasonably good.

Autarky and Trade in Italy

[FROM OUR TURIN CORRESPONDENT]

THERE is no definite evidence that the consequence of the policy of autarky has been inflation. Figures of banknotes and cheques in circulation give little suggestion that an inflationary movement is in progress.

	(Millions of lire) ends of years			
	1936	1937	1938	March, 1939

and 20.8 millions at the end of 1938. Whether this increase is an index of inflation is not easy to say. But the extension of the territory in which notes are now, at least partially, circulating and the increase that has taken place in physical economic production and activity go far to explain the increase, without any reference to inflation.

How, then, is the autarky plan, which is mainly a plan for war industries, financed? According to discussions in the Credit Corporation and in the Autarky Committee last September and since, the means have been found in the utilisation of effective savings. It is very probable that to date this is so. The movement of current and deposit accounts in the banks and in post office and other savings banks has been upwards, as the following figures show:—

(In thousands of million lire)

End of	Time Deposits (including Post Office Banks)	Current Accounts	Total
1936	34.5	22.4	56.9
1937	37.9	23.4	61.3
1938	40.8	25.2	66.0
1939 (January)	41.2	25.3	66.5

The figure of 66,500 million lire at the end of January, 1939, represents mainly deposits originating from a true act of saving by the customers of the banks. And the increase of 4,700 millions in this total in 1938 may be said to be the sum that savers did not invest directly in agricultural land improvements, house building, industrial plant and equipment, or State and other securities. But, and this is the point, it must be emphasised that this sum, that is, the 4,700 millions increase, which is frequently held in common parlance to be the total amount of savings, is only the residual and minor item in savings. It would be very rash to evaluate the total amount, but at a guess a figure of 18,000-20,000 million lire may not be very wide of the mark; and the recent deficits on the State Budget (16,230 millions in 1936-37 and 11,174 millions in 1937-38) were met mainly by these savings. Other sources were a moderate increase in the note circulation (extraordinary advances to the Treasury were 2,000 million lire), and the proceeds of the revaluation of the lira, of the gold gifts to the Exchequer and of the sales of foreign securities commandeered by the State. If, in the current and future Budgets, extraordinary expenditure (that is, expenditure not financed by taxation) could be kept within the 10,000 millions limit, its financing out of true saving appears to be possible without giving rise to inflation.

Thus, autarky is not necessarily connected with inflation; but it is logically the cause of a gradual and radical change in external trade. Newspapers are now full of comments about the scarcity of coffee. Queues are to be seen in the cities; dealers are selling an ounce of the precious drug to old customers at stated days and hours; the Secretary of the Fascist Party has ordered members not to consume any more; a big drive has begun in the Press to the same end. True, the sum spent by Italy in purchasing foreign coffee is not very important; 130 million lire in 1938 and 31 millions in the first quarter of 1939. This is a small part only of the total sum of 1,000 millions yearly spent by Italian consumers in buying crude coffee; and the rest went mainly to the Exchequer in the form of taxation. Indeed, the biggest loser in the campaign for the reduction of the consumption of coffee will be the Exchequer, which will also lose some part of the tax on sugar, which is complementary to coffee.

As an article in the May 13th issue of *La Stampa* explains, the point is one of principle. Brazil, which is the biggest seller of coffee to Italy, refuses to buy enough Italian goods to balance her trading accounts; in the last 18 years and three months Brazil has sold to Italy goods to the value of 2,077 million lire more than Brazil has purchased from Italy; as Brazil will not purchase Italian goods, Italy will not buy Brazilian coffee.

The regulation of foreign trade, according to the Minister of Foreign Trade in a speech on May 12th, has gone through three stages. First there was the *bolletta* system. Only those importers who introduced foreign goods in a certain quarter of 1934 and possessed a certificate (*bolletta*) of import were authorised to import a specified quota of their former imports. This was tantamount to fixing trade at a set level, and it discriminated in favour of particular individuals. Therefore the *bolletta* system was replaced by the *licence* system. Import licences were granted to those industrialists and traders who had a priority right because they were better equipped, from an economic and technical point of view, or because their industry was important from the public, military or other point of view. This system, too, did not work satisfactorily for two reasons: first, foreign trade continued to be conducted on an individual basis and Italy was unable to obtain compensatory bargains with

foreign countries as a whole; secondly, the licence system gave rise to numerous "middlemen" or "go-betweens," who claimed payment for their good offices in securing licences. The Government decided to stamp the middleman out, and a beginning was made towards the institution of yet a third system. Italy will henceforward adopt a corporative solution of the problem. Goods will be more and more imported exclusively by public bodies, on which the consuming industries, the Corporation or Confederation concerned and the State will be represented. Imports will be gradually transferred from individual traders to privileged companies and bodies, which will distribute the goods imported according to some priority table.

Meanwhile the Minister observed that the regulation by authority of foreign trade has already resulted in 1938 in total exports covering 73 per cent. of imports against 60 per cent. on the average in the years 1934-37. Countries with which Italy is bound by clearing or other compensation agreements supplied 66 per cent. of total goods imported into Italy and purchased 71 per cent. of goods exported by Italy. Import prices, it is true, increased in 1938 by 88 per cent. over 1934, while export prices increased by only 46 per cent.; and the terms of trade may seem to have moved against Italy. But the Minister observes that the 1934 terms of trade, owing to a too high external value of the lira, badly handicapped exports; the alignment or devaluation of the lira has restored the balance between external and internal purchasing power of the lira.

June 5th.

Canton under Japanese Control

[FROM OUR HONGKONG CORRESPONDENT]

THE city of Canton has never boasted of natural beauty or architectural glories, but for centuries it has been the home of a restless and enterprising people who were the first of the Chinese race to trade with Occidentals and to voyage into the outer world. To-day the city is virtually an empty husk. A great part of it is in ruins and its normal population of two millions reduced to a few hundred thousand. Those that remain or have returned are on the verge of destitution and under the heel of a conquering army.

Viewed from the deck of a Hongkong steamer, during a recent trip to Canton, the country bordering the sixty miles of river appeared much as it does at any time during the spring. For miles on either hand peace seemed to prevail over the bright green paddy fields, the darker laichee orchards and the distant hills. The river itself, however, seemed very different. Instead of a busy stream of junks, sampans and small steam craft, there were a dozen or more Japanese cargo steamers, a destroyer or two and a number of lighters flying the Japanese flag. At Whampoa, which a year or two ago the Chinese had hoped to develop as a port for ocean-going steamers, there was some activity and many wooden sheds were in course of construction while Japanese steamers were discharging cargo at the wharves. Within a few miles of Canton one passed sugar mills and other factories which had been badly damaged by bombs, and villages in the neighbourhood had been reduced to ruins.

A tour of the city itself impressed one with a sense of desolation. Large areas had suffered from incendiary fires, the houses and shops in most cases being entirely gutted. At the terminus of the Canton-Hankow Railway the explosion of an ammunition dump had wrought enormous damage to the neighbourhood. On the outskirts of the city many residences had been wrecked by shell fire and aerial bombardment. In some parts of the city which had escaped fire and bombardment, most of the shops were open and the streets crowded with poorly clad people. The pavement was fringed with hawkers sitting almost shoulder to shoulder, their stock in trade consisting of household goods, presumably looted. Japanese troops were much in evidence and the street traffic was almost entirely made up of military motor cars and lorries, and rickshaws occupied by Japanese soldiers. At various points the streets were partially closed by barbed wire barricades with a machine gun post at each end.

Apart from the main thoroughfares, where shops and tea houses were open, most of the streets seemed deserted, rows of houses being empty and showing signs of having been looted. The older sections of the city, where formerly the silk merchants, the blackwood furniture vendors and the silversmiths displayed their wares to the delight of the tourist,

seemed devoid of life; and it was in the new broad streets constructed since the demolition of the old city walls that the feeble pulse of Canton could still be felt. The trade of those areas is a monopoly of the Japanese military authorities, who import rice, flour, beer and canned goods by transport and sell to Chinese dealers. The currency used is Military Yen, which is forced on the people at par with Chinese National currency.

Trade at a Standstill

There appears to be no export trade at present, as the produce which formerly reached Canton has been diverted through other channels for eventual shipment to Hongkong. Recently a party of Japanese civilians has been touring the silk growing districts with a view to taking control of the silk filatures; and Compradores of well-known foreign exporters, at present in Hongkong, have been approached with the suggestion that they should return to Canton and reorganise the silk market there. It is extremely unlikely that there will be a response to this appeal, but it appears as if the Japanese are determined to stop the silk from finding a market in Hongkong.

The business of the foreign firms on Shameen has been at a standstill ever since the occupation of the city, and staffs are reduced to a care and maintenance basis. Unlike the foreign community in Hankow, those living in Shameen are able to keep in touch with civilisation by gunboats and by the fortnightly passenger boat to Hongkong. They are also allowed by the Japanese authorities to import provisions from Hongkong and, quixotically enough, they pay the usual import duty on such goods to the Chinese Customs House, which is still functioning although it is unable to collect duties on the wide range of commodities imported in Japanese transports for sale to the Chinese population.

The future of foreign firms in Canton, as in the other occupied areas of China, grows dimmer as time goes on. It is now perfectly clear that what the Japanese term the "new situation" entails the denial of all trading rights to the British, French and possibly the Americans, and a very doubtful sufferance to German interests. Even if the liberation of British and French naval forces from duty in European waters allows the democratic powers to try to curb Japanese aggression, it is extremely doubtful whether there can be a full restoration of "pre-incident" treaty rights. The solution of the problem is more likely to be found in some compromise with Japan, whereby the Northern provinces become another Manchukuo, and as such the close preserve of the Japanese, while the other occupied areas are gradually relinquished leaving foreign merchants to recover as much of their lost trade as a pauperised people can provide.

In the meantime, the Japanese seem to have no set policy in regard to Canton. Nearly eight months have elapsed since the occupation but, although Japanese inspired reports point with pride to the number of Chinese returning to the city, neither the military nor the naval authorities appear to offer facilities to the Chinese of substance who desire to resurrect their demolished business houses. In fact every irritating regulation that can be invoked seems to be applied to them. Even when these people have succeeded in landing on the Shameen and cross to the exit into the city, they are confronted by Japanese sentries to whom they must bow and hold up both arms so as to be searched. With these humiliations, to which can be added the risk of assault by soldiers and the possibility of being robbed by Chinese desperadoes, it

is no wonder that Chinese visitors to Canton return to Hongkong with as little delay as possible. It seems, therefore, as if Canton will be of little value to the Japanese as a prize of war. Without the aid of those who enabled the city to flourish as a trading centre there can be no revenue to pay for the army of occupation or to meet Japan's urgent need of foreign exchange.

June 6th.

Latvian Taxation and Trade

[FROM OUR RIGA CORRESPONDENT]

THE Budget for the financial year 1939-40, dating from April 1st, is balanced at about 199 million lats—or nearly 8 millions more than in the previous year. The national income was around 965 million lats in 1936 and 1,149 million lats in 1937; while in 1938 it is estimated to have risen as high as 1,200 millions. Receipts in the new Budget are planned as follows: Direct taxes, 27 per cent.; indirect taxes (Customs, etc.), 30 per cent.; State monopolies, enterprises and capitalisations 31 per cent.; special revenues, 12 per cent. From these figures, the prior position of State enterprise in the national economy is clear.

Two main considerations affect the distribution of taxes: first, that the well-being and social standards of the people shall be improved; and, secondly, that the productive capacity of the country shall be increased. In this connection it should be pointed out that the defence allocations in the Budget have risen from 45.9 to 47.3 million lats, those for the Ministry of Finance from 28.3 to 29.0 millions, and those for the Ministry of Agriculture from 22.3 to 22.9 millions. Special importance is attached to agriculture, production still leaving much to be desired. In the new Budget means are provided of maintaining the policy of fixed prices, of pushing mechanisation, and of supplying land workers with cheap credit. In particular, care is being taken to direct the State's attention towards the land by the creation of favourable conditions for the construction of workers' houses. The object of all this is to diminish to a minimum the number of foreign workers imported for seasonable labour, chiefly from Poland. The State is also carrying out improvement works.

In regard to foreign trade, the Minister of Finance said that he had no grounds for believing that conditions would worsen in 1939. Efforts would also be made to increase the amount of business passing within the country, and at better prices; it is likely that a compulsory price system will be replaced by freer competition in order to regulate supply and demand. The rationalisation of industry continues to advance, and to afford a better organisation of labour and production. The Minister spoke of the need of giving industry a national character and of the importance of establishing close contact between State and private industry. These references have had a dubious reception in private industrial circles, for it is thought that the building up of a "community of interests" may well hinder the development of private industry. There has recently been a marked recession in expenditure on public works, and the direction of activity has changed. Large sums have been spent on the improvement of communications; plans have been made for the construction of concrete roads. Rivers are being made navigable and their conditions improved.

The first quarter of 1939 produced no striking changes. Receipts from foreign trade have somewhat increased over the same period of 1938; banking activities have also improved, and the money circulation is larger. The cost of living is higher than it was at the beginning of 1938. The index of industrial production (1930-33 = 100) stood at 174 in January of this year, against 169 in January, 1938.

OTARD'S EST. 1795
V.S.O.P.
LIQUEUR BRANDY

MATURED AND BOTTLED AT CHATEAU DE COGNAC

The Bases of Belgian Recovery

[FROM OUR BELGIAN CORRESPONDENT]

BELGIUM, having for six months been incapable of forming a stable Government, succeeded in doing so during the last days of April. The gravity of the situation caused Parliament to grant to M. Pierlot its confidence and the special powers for which he asked.

This caused a sudden change in the markets, especially in exchange rates. Foreign currencies promptly cheapened and ended a weakness which, since the beginning of the year, had forced the National Bank to export 4,500 million francs of gold, equalling 30 million pounds sterling.

The characteristic feature of the present situation is that Belgium, once more, has been sharply influenced by the world depression. In 1936-37 she greatly benefited by the general upturn, and at that time she made the mistake of undertaking a heavy expenditure programme. But, in 1938, the world depression made itself severely felt, and taxation receipts fell while unemployment increased. At the same time the Belgian public, owing to internal and international crises, gave little support to loans to the Treasury.

If Belgium had had a stable Government at the end of 1938, measures would have been taken at once and the Budget position would never have been seriously compromised. The regrettable political dissensions over Belgian representation in Nationalist Spain, and the Flemish question (the Martens case) for a long time prevented the Government from making a move. The result is, to-day, that the country has to face a deficit in the ordinary Budget amounting to about 650 million francs (about £6 millions). Moreover, the Treasury, already burdened by this deficit, has to bear the exceptional costs of armaments and the usual extraordinary Budget for public works, the whole exceeding 2,500 million francs.

M. Gutt, Minister of Finance, undertook first to reabsorb the deficit on the ordinary Budget. He will reduce current expenses to about 300 millions and increase taxes to 350 millions. On the other hand, he hoped to be able to issue the necessary loans on the Belgian market when confidence was sufficiently restored. The first expression of returning confidence has appeared with the setting right of the exchange market and the slight improvement in Government stocks.

The best qualified observers consider the situation of Belgium without pessimism, although in their opinion certain weaknesses still persist. To begin with, Belgium has a high national income, although relatively smaller, of course, than that of a country like England. For 1938, it was calculated that this income must have amounted to 64,000 million francs, which, in view of the fall in prices, represents a purchasing power appreciably above that of 1930. Taxation absorbs only 16 per cent. of the national income, or, including local taxation, about 18 per cent. The figures will be rather higher for 1939, because the national income will be lower.

National saving is important and is generally estimated to be between 5,000 and 6,000 millions. This is evidently sufficient to meet the State's needs, but these savings are not readily entrusted to the State, after the experience of post-war devaluations.

Belgium, therefore, is not an overtaxed country, nor a country whose savings are insufficient. But any increase in the proceeds of taxation is made more difficult by the even distribution of income. There are scarcely any large fortunes in Belgium that can be easily taxed. On the other hand, saving, for the last two years, has principally taken the form of purchases of gold or of foreign currencies, even though the trade in precious metals has been legally forbidden.

One of the first measures of the Pierlot Government was to declare that it had no intention of devaluing the franc. Indeed, no proposition of this kind has ever been considered by the authorities in Brussels, industrialists who advocate such a measure being a small and powerless minority. The idea of being linked to the pound sterling at the present rate, that is to say, without devaluation, has a much more powerful following, on the ground that the country would find therein a monetary security which is at present lacking. The popular tendency, however, is to link such a measure mentally with devaluation, and this fact forms a psychological barrier to its adoption.

On coming into power, the Pierlot Government has, therefore, to overcome superficial difficulties rather than to fight against fundamental weakness. Everyone agrees that it has a good chance of success if there is a truce from politics. Furthermore, Belgium has certainly been affected by the unsettled international situation. If the general tension were to slacken, the solution of Belgium's problems would become much easier.

June 7th.

Australian Government Finances

[FROM OUR SYDNEY CORRESPONDENT]

At the beginning of the financial year 1938-39 it was estimated that the combined Budget deficits of the Commonwealth and States would be £A0.4 million. In the case of the Commonwealth the bulk of the increased expenditure was due to bigger defence plans; and it was decided to raise the necessary extra revenue by increased income, sales and land taxes, and a higher tobacco excise. The New South Wales Budget contained some tax concessions, but in the other States additional revenue was sought from increased railway fares, heavier motor taxation, additional wharfage rates and similar measures.

At the end of April the accumulated deficits of the Commonwealth and States totalled £A6.7 millions, which showed a retrogression of £A4.7 millions compared with the corresponding month in the previous financial year. It had become apparent that certain of the States would incur larger deficits than they had budgeted for, and at the Loan Council meeting in March it was decided to raise additional loans to the extent of about £A3 millions to meet the anticipated deficits in New South Wales, Victoria, South Australia and Western Australia.

Total Commonwealth revenue was slightly below estimates for the first ten months of the year. As, however, the bulk of the receipts from higher income tax will be received during the last two months of the financial year, there seems to be every reason to expect that the Commonwealth Budget will be balanced. In New South Wales the anticipated deficit of £A1.7 millions or more has been caused by short-falls in stamp and probate duties, income and wages taxation, land revenue, and railway earnings. The loss on the railways is owing to higher operating costs and a fall in revenue caused by the drought. In Victoria virtually the same trend is visible, with the added strain of relief expenditure in the areas which suffered so severely from bush fires during the summer.

In South Australia and Western Australia a similar decline in revenue can be seen. And it is interesting to note that Tasmania has suffered from the embargo on the export of funds from New Zealand, since the absence of New Zealand subscribers has caused a drop in the receipts from the State Lottery tax. The only State to show a surplus at the end of April was Queensland, where expectations have been fairly well realised.

The loan programme of £A14 millions for States' public works and farmers' debt adjustment (£A2 millions) will be completed by June 14th when applications for the present loan of £A4,750,000 will close. The failure of the public to subscribe fully to the February loan of £A8.5 millions has resulted in a slightly higher rate of interest for the current loan which bears the same flat rate of £3 17s. 6d. per cent., but is issued at £99 maturing in December, 1955, which gives a yield to redemption of £3 19s. 2d. per cent.

Treasury Bill Policy

It was thought that Treasury bills to the amount of about £A3 millions would be issued to finance the States' deficits. There has never been an open market for Treasury bills in Australia. The bills are discounted by the Central Bank, which in turn re-discounts them with the trading banks. This re-discounting is purely arbitrary, as there is no tender system, the rate of interest and allotments being fixed by the Central Bank. This method restricts the use of Treasury bills as a measure of control credit, as the trading banks cannot be forced to take up Treasury bills and the Central Bank's opportunities of passing them on are very restricted.

In the present circumstances the Commonwealth Bank

and the Treasury have devised a new technique whereby the Treasury has issued to the Commonwealth Bank £A3 millions of 3½ per cent. Commonwealth bonds maturing in 1943 in exchange for Treasury bills previously issued to provide temporary accommodation to the States. By these means the deflation which usually accompanies the funding of Treasury bills will be avoided, provided the bills are withdrawn from the Central Bank's own holdings. In the normal course of events these Treasury bills would have been funded by a loan raised on the open market to finance Budget deficits.

The net result is to give the Commonwealth Bank securities which are readily marketable and which will be available to the authorities as a weapon of open market control. The Government will have to pay 3½ per cent. for its accommodation instead of 1½ per cent., which is the rate obtaining for Treasury bills at the present time. One doubts whether it would not have been a wiser policy for the authorities to have established an open market for Treasury bill in the favourable circumstances of the past few years.

The End of Tsarist Russia

It is unnecessary to describe Sir Bernard Pares's qualification for presenting a history of the fall of the Russian monarchy.* Because of his personal contact with so many of the people and events he writes about, it is perhaps to be regretted that he keeps himself so much in the background, but in setting out to produce an objective history and accurate record he understandably refrains from stressing his own views.

Sir Bernard holds that all the evidence points to the fall of the monarchy coming from above, and with this no student of the history of Imperial Russia's latter years will disagree. When Alexander III died on November 1, 1894, the autocracy died with him. Nicholas II was autocrat in name only and in other circumstances would probably have made a successful and respected constitutional monarch. Like many honest and well-meaning men he lacked resolution and judgment and was over-conscientious. He believed himself to be morally bound before man and heaven to maintain the tradition of autocracy; and whenever he showed any misgiving or fleeting doubt of his divine right the Empress was at hand to restore his confidence and revive his resolution; for she was convinced beyond argument that the Tsar of Russia was autocrat by divine right.

The notion, too commonly held and sedulously fostered by propaganda, that the Government and ruling classes unconsciously exploited and oppressed the peasants and working classes is corrected by Sir Bernard. He points out that, after the emancipation of the serfs, "the students . . . came in larger proportion from the peasantry than perhaps in any other European country," and that legislation for the regula-

tion and safeguarding of factory labour was by no means elementary. The 1905 Revolution was the result of many causes of popular discontent, by no means all of which were of an economic character.

The futility of the Japanese War, coupled with the official corruption and Government ineptitude that it showed up, gave an enormous impetus to the demands for reform, which were only fortified by reactionary police measures and the Government's refusal at first to consider any concessions to the growing political consciousness of the nation. The eventual grant of a Constitution and the establishment of the Duma were due more to the pressure of the liberal-minded professional and educated classes than to the more spectacular factory strikes and peasant risings.

From the evidence presented by Sir Bernard it is apparent that Nicholas personally was not irrevocably opposed to the principle of popular representation. That he resisted to the utmost, and then yielded with reluctance, was due partly to honest doubts whether Russia was fit for constitutional government, and partly to the notion that in granting any measure of popular representation he was betraying the trust imposed on him at his coronation. Moreover, the Russian people had no tradition of party politics and did not understand the principle of compromise.

In 1903 the sinister shadow of Rasputin first appeared over the Court. Sir Bernard traces the growth of his influence over the Empress, and to a somewhat less extent over the Emperor, and quotes innumerable letters, conversations and other evidence to show the extent to which he interfered in the conduct of Government. His influence was particularly fateful during the war. It was mainly on account of Rasputin that the Grand Duke Nicholas Nikolaievich was removed from the command of the armies on the Eastern front and practically exiled to the Caucasus.

Sir Bernard does not attempt an exhaustive analysis of the policies and events that led up to the final tragedy. He contents himself with affording the reader the material necessary to make his own conclusions. His own sympathies were with the liberal intellectuals, to whom the highest compliment he can pay is that they took English liberalism as their model. But after reading his book one cannot help feeling that, however well-meaning, the men who actually forced the abdication and took over the Government of the country were rather an ineffectual and impractical lot. The autocratic system resting on pure bureaucrats like Goremkin had prevented the rise of politicians with any experience of responsibility. When the monarchy crashed the whole bureaucracy crashed with it, leaving the country in the hands of idealists, with a touching but ill-founded faith in their own theories. It was they and not the Imperial Government that fell to the Bolsheviks who were unhampered by any humanitarian or ethical scruples.

Trial and Error

IN "Warnings and Predictions"† Lord Rothermere has quoted and elaborated a selection of articles he wrote for the *Daily Mail* during the last twelve years, chiefly on the necessity for a large air force and the desirability of friendly relations between England and Germany. Lord Rothermere takes credit to himself that he perceived the significance of Hitler immediately he became Chancellor in 1933, and that only nine months later he started to advocate a fleet of 5,000 warplanes for Britain. The book is intended, not only as a proof of Lord Rothermere's sagacity in the past, but also as a programme, which he sums up in these words:

Our interests do not lie in Europe. We are an oceanic people. We are the descendants of the Vikings, and should adhere to our historic rôle as a maritime people. We should

look after our Dominions and overseas possessions and proclaim it as our policy that whatever happens on the Continent of Europe—except, possibly, a menace to the French and Belgian frontiers—is no concern of ours.

It is consonant with this that Lord Rothermere should view the annihilation of Czechoslovakia with equanimity. Indeed, he classes the Czechs with the "barbaric slave-traders of Ethiopia," describing them as the savage and uncivilised oppressors of German- and Magyar-speaking minorities. Since he regards the Czechoslovak State as having been the greatest menace to the peace of Europe, however, it is odd to find him saying:

The idea of an independent Czechoslovakia first reached the minds of the masses of the Western nations through *The Daily Mail* and its associated newspapers, and I very much doubt whether, except for the publicity thus given, Czechoslovakia, as we know it to-day, would have had any existence.

It is quite clear that it is above all fear of Socialism in general and the U.S.S.R. in particular which leads Lord Rothermere to advocate a Four-Power Pact between Britain, France, Germany, and Italy, and to speak with admiration of Hitler and his achievements. One wonders whether he would to-day stand by his words about Hitler:

He is supremely intelligent. . . . There is no man living whose promise given in regard to something of real moment I would sooner take . . . the impression that has remained with me after every meeting with him is that of a great gentleman.

Indeed, Lord Rothermere's very advocacy of a Britain armed to the teeth raises a doubt whether he ever really believed in the possibility of friendship with National-Socialist Germany, unless indeed Germany were to be scared or bullied into such friendship. His own views about international understanding are made quite clear; and perhaps the most disconcerting sentence in the whole book is this:

Although in this country we dislike the idea of inquiring into a man's political opinions, those who have the appointment of the instructors of the younger generation should insist that their influence shall be used to encourage ideals of good citizenship, and not the perverted and pernicious theories of a false internationalism.

It is interesting and instructive to read Lord Rothermere's vaticinations side by side with Herr Stern-Rubarth's "Three Men Tried . . ." Like Lord Rothermere Herr Stern-Rubarth was also a journalist—the editor of the *Diplomatische Korrespondenz* until he was dismissed six years ago. While Lord Rothermere regards the triumph of Hitler with gratification, the German Liberal, now an exile in this country, says:

Hitler has destroyed the very source of Germany's intellectual and moral strength. And in doing so he has robbed the world of one of its chief aids to progress.

This whole book is a pathetic, sometimes naïve, lament for a lost opportunity. Herr Stern-Rubarth has a patriotic faith in German genius, and believes that it might have made a great contribution to the well-being of Europe and the world; but he does not believe that in order to do so it was necessary to achieve either political hegemony or totalitarian centralisation.

The "three men" of his title are Stresemann, Briand and Austen Chamberlain, and to each he makes eloquent tribute as being good Europeans and protagonists in the struggle for perpetual peace. But the hero of the book is Stresemann, whose confidant the author was, and whose ideal of an economically federated Europe based on a friendship between France and democratic Germany he shared. It is in the account of Stresemann, and of his doings and sayings at Locarno, Thoiry and The Hague, that Herr Stern-Rubarth makes an original and valuable contribution to our knowledge of the period of the "policy of fulfilment."

The author's hero worship of Stresemann does, indeed, sometimes blur the picture. It makes him underestimate the work of others. But it nevertheless does provide a tribute to Stresemann's devoted work for peace worthy to replace the memorial to him on the banks of the Rhine, now closed and neglected by a people taught to reverence other gods.

THE BUSINESS WORLD

New Zealand's Credit

IT is impossible to withhold a certain sympathy from Mr Walter Nash, Finance Minister of New Zealand, over the difficulties he is encountering in his preparatory negotiations in London for the conversion of £17,172,191 of 3½ per cent. stock which matures on January 1st next—and in his quest for some extra millions of new money for New Zealand's re-armament needs. The present Government of New Zealand is certainly not to blame for the fact that an amount equal to nearly £10 per head of the inhabitants of a country with a population of slightly over 1½ millions falls due for repayment at a single date. The operation is comparable (allowing for the fact that Great Britain's population is approximately thirty times that of New Zealand) with a British Government conversion of, say, £500 millions—or about one-fourth of the amount of 5 per cent. War Loan which the Treasury successfully converted to 3½ per cent. seven years ago. But that was not merely an internal, as distinct from an external, obligation; in addition, those originally responsible for its issue had taken care to give the British Government sixteen years, between 1929 and 1944, within which to exercise their option to "call" the stock before its final maturity. The authorities were then free to choose their own time, and to come home handsomely in a period of low interest rates. Failure to take a similar precaution in New Zealand's case has saddled the Dominion with the necessity of meeting a heavy obligation at a moment when market conditions could hardly be more unfavourable. Interest rates have risen, and overseas capital investment as a whole is frowned on by the British Government, which has its own reasons for holding potential competitors off the market. Meanwhile changing political tendencies in the Pacific have inevitably modified the British investor's traditional appraisal of New Zealand's external problems, and simultaneously increased the need for armament expenditure.

All this is less New Zealand's fault than her misfortune. But some share of responsibility for the changed attitude of the London capital market towards New Zealand stocks within the last four years must unquestionably be laid at the door of the Dominion's own economic policy. The accompanying table, based on quotations for stocks with identical rates of interest and roughly comparable lives

Stocks	October 30, 1935		June 21, 1939	
	Price	Red. yield %	Price	Red. yield %
New Zealand 3½% 1955-60	104	£ 8. 6	82	£ 8. 10

(f) Flat yield.

shows that although all gilt-edged prices have fallen since the autumn of 1935 (when Mr Savage's Government assumed office), the decline in New Zealand issues has been

greater than for either British Government or Commonwealth of Australia stocks, and the yield differential has widened considerably.

As Mr Nash has come here to woo the British investor, the latter's attitude towards New Zealand deserves careful analysis. In general, it is always in the investor's interest that countries in which he is financially interested should enjoy as high a standard of living as possible, if only for the reason that a prosperous borrower is the best of credit risks. The investor, as such, has little concern with party labels and less with class distinctions. He is interested less in policies than in their results. He has long recognised a peculiar and welcome intimacy in the Imperial link between New Zealand and this country, and he does not question the constitutional right of its sovereign government to pursue whatever economic and social policy is desired by a majority of the people.

Nor, equally, can he overlook the fact that the results of that policy, so far as they have impinged on his own special interest, have been unfavourable. The Government of Mr Savage, since November, 1935, has nationalised the Reserve Bank of New Zealand, introduced and implemented a dairy produce marketing and a guaranteed price scheme, actively promoted labour and social legislation and encouraged the establishment of secondary industries. Concurrently, it is estimated that private incomes in New Zealand have risen from £90 millions to £166 millions, while retail prices have increased by 15 per cent., wage rates by 27 per cent. and wages in the aggregate by as much as 50 per cent. Thus, the rise in internal purchasing power and costs has been substantial. Despite a rise in the value of New Zealand's exports, from £NZ46.5 millions in 1935 to £NZ58.4 millions in 1938, imports during the same period have increased from £NZ36.3 millions to £NZ55.4 millions. Since the service of New Zealand debt (including interest payable by local bodies abroad) requires approximately £NZ10 millions per annum, the reduction in New Zealand's favourable visible balance (accelerated a few months ago by a flight of capital which has now been checked) has imposed a severe strain on New Zealand's sterling funds in London. These fell from a high point of £45 millions to £28 millions in April, 1938, and to £7 millions last November. Their present figure is put by Mr Nash at £12 to £13 millions, but a period of seasonal contraction in these balances is now beginning.

Thus, the moment is not far off when the prospect of an empty locker may have to be faced. The New Zealand Government, aware of this danger, has imposed a system of import restrictions, but on Mr Nash's own admission, their full effect will not be felt until after next year, because imports of capital equipment for the development of New Zealand's secondary industries will largely offset the restrictions on luxury and consumable goods during the next eighteen months. Indeed, the immediate effect of the imposition of exchange restriction may have been to increase rather than diminish the drain on London funds and the Dominion will require additional sterling to the amount of perhaps £10 millions to meet its foreign commitments up to the end of the year. This sum roughly coincides with (but is, of course, in no sense due to) the expenditure that will probably be undertaken outside the Dominion in pursuance of re-armament over the next year

or two. If it were possible for the Dominion to borrow now in London for defence purposes, the fact of having these funds in advance of the expenditure would relieve the immediate shortage of sterling, and the solution of this problem would help to solve that of the loan maturity next January.

The surmounting of the immediate difficulties will not, however, impress the British investor unless he is convinced that they will not recur every year. And that depends on the future course of the whole economic policy of the New Zealand Government. Mr Nash has defined New Zealand's policy as "insulation not isolation." But investors may be sceptical of the extent to which "insulation" is feasible for a country which has specialised in meat and dairy produce for export, whose foreign trade per head has been for years the highest of any country in the world, and whose national income must needs be profoundly affected by the amount which the United Kingdom (which took 76.3 per cent. of New Zealand's exports in 1937) is willing to absorb and the price it is prepared to pay—with due regard to the fact that the British Government is now squarely embarked upon a policy of fostering its domestic agricultural production. Failing a complete reversal of the Savage Government's expansionist policy, some reduction of New Zealand's imports below the current level is inevitable, if default on external debt is to be avoided. That result might be attained either by a further depreciation of the New Zealand pound, or by direct import restriction on more effective lines than those followed hitherto. Currency control is an expedient which the City of London can scarcely be expected to welcome in itself, while restriction of New Zealand's purchases from abroad must needs be even more distasteful to British exporters. Whatever the letter of the Ottawa Agreement, however, it would be hard to justify the argument advanced by the Federation of British Industries that New Zealand is, in effect, a tied house of the Mother Country, which has a prescriptive right to sell a specified minimum quantity of its products there every year. The import licence regulations have been drafted in such a way that the United

Kingdom proportion of New Zealand's total imports cannot decline and is almost certain to increase. Moreover, Mr Nash has declared that the New Zealand Government is willing to spend the whole of the balance from the proceeds of its exports to Great Britain, after deduction of the external debt service, in purchases from this country. Beyond that, in these times, it may be difficult to ask any Government to go.

On the whole, so far as the immediate question of New Zealand's £17 millions debt maturity is concerned, the most practical way out of an admittedly difficult position would seem to be the granting of facilities for the offer of conversion stock in the London market, including underwriting arrangements, etc., on the best terms the Dominion can secure from the investor. It has been made clear this week that there is no question of a Treasury guarantee for New Zealand borrowing. This is hardly a time when the damaging consequences of acute disagreement between Great Britain and the Dominion can be contemplated. But the terms of the conversion must be entirely voluntary, and the repercussions on New Zealand's external credit of her Government's policy must find due recognition in an enhanced rate of interest—possibly of 5 per cent.—offered on the new stock, as compared with the old. For the rest, friendly but firm representations from London to New Zealand will not be out of place, regarding the ultimate dangers of a policy of "insulation." Here, the British Treasury, though it has no clear *locus standi*, may at least recall a relevant precedent. New Zealand's Government loans are trustee stocks under the Colonial Stock Act. The British Treasury is specifically excluded from financial liability under that Act, but it was deemed advisable, in Newfoundland's case, to give special treatment to trustee issues, at the expense of the British Exchequer, rather than to allow default to occur. The British authorities may well urge the New Zealand Government not to confine itself to mere declarations of determination to maintain its debt service, but so to frame its policy that danger will never arise. Ultimately, those who will the end must also will the means.

The Market for Electrical Appliances

A HUNDRED years ago it was possible to regard a house simply as a collection of living rooms. Then new amenities such as modern plumbing and gas supply introduced a complicating factor, for in order to secure their full benefit it was found to be necessary to modify first some small details of building and then the whole structure. The development has not slackened, and it is becoming possible to regard the house as being adapted to the needs of the people who live in it, but not merely to those of an increasing number and variety of domestic machines. Of the latter, an increasing proportion are electrically operated.

The latest phase of the domestic change has an industrial counterpart. The market for electrical domestic appliances is expanding. The construction on a large scale of houses and flats equipped with electricity, and the cheaper cost of electricity itself, are probably the most important causes; but the demand for labour-saving devices in both home and office, is undoubtedly of great importance. And the potential market for electrical appliances is still enormous. The tables on the next page show that the use of appliances has already attained a considerable size in the United States, and comparison of the American with the British figures strengthens the view that this market is still almost untapped in this country.

Nevertheless, it is doubtful whether the British market can, in the near future, hope to rival the American. There is, first of all, the question of price. The appliances in this table are of the expensive variety; and, in comparing the statistics for the two countries, it should be pointed out

that in the United States 16,000,000 out of 30,000,000 families, according to some estimates, have an income of over £4 a week, against only 3,000,000 out of 12,000,000 families in the British Isles. The higher level of family incomes, the absence of our own prejudice against electrical devices, and the responsiveness of the public to intensive selling campaigns, have enabled the American manufacturer to exploit a market which even in its early days was large enough to justify mass production methods. And by lowering prices he has been able to expand it still further.

In Great Britain, on the other hand, circumstances have been unfavourable from the start. There is, first of all, a strong preference for coal fires; and there is also strong competition from the gas companies both for cooking and heating. Thus, the number of all-electric houses is small compared with the total number of houses wired; and this in its turn hinders the general adoption of the "two-part" tariff, which aims at encouraging the general use of electrical appliances by providing additional current required at cheaper rates. The lack of a standard voltage, inadequate wiring, insufficient points—even in new houses—and the refusal of a large part of the public to look upon electrical appliances as anything but luxuries, have all tended to discourage manufacturers from producing on a scale large enough to enable them to make a substantial reduction in prices.

The question of price can also be regarded from the angle of distribution. Table I shows that the number of cookers per thousand wired homes is actually slightly higher in this country than in America, and the total number of

TABLE I.—Electrical Domestic Appliances in use in the U.S.A. and the British Isles

	U.S.A.		British Isles	
	In use	Per 1,000 wired homes	In use	Per 1,000 wired homes
Electric cookers	3,000,000*	132	1,000,000*	143
Electric washing machines and boilers	11,000,000	500	300,000	42.8
Elec. refrigerators	9,000,000	416	200,000	28
Vacuum cleaners	11,000,000	500	2,300,000	333

* Low figures explained by extensive use of gas.

TABLE II.—Yearly Sale of Electrical Domestic Appliances in the U.S.A. and the British Isles

	U.S.A.	British Isles
Electric cookers	400,000-500,000	200,000
Water heaters	...	85,000
Wash boilers	*	30,000-40,000
Washing machines	2,000,000	9,000
Electric refrigerators	2,000,000	20,000
Vacuum cleaners	2,000,000	400,000
Electric irons	over 2,000,000	1,500,000

* Included with washing machines.

cookers in use compares very favourably with that of refrigerators, washing-machines and boilers. To a certain extent this is because a cooker of some sort is an accepted necessity, and an electric cooker is therefore not regarded with the same suspicion as a refrigerator; but another reason for the cooker's relative success is that it is not as a rule owned by the householder but hired from the local supply company or Corporation, which has a virtual monopoly of the distribution of cookers. In encouraging the use of cookers by means of small hiring charges and free upkeep services, the supply companies are working to their own advantage, for cookers use considerably more current than the smaller appliances, or even than vacuum cleaners. The companies have not the same incentive to push these and other devices, and their distribution, as a result, is mainly left to the retailers—who are not in a position to give the householder the facilities which the methods of the distributors of the expensive-to-run apparatus have taught him to expect. The inability of the public to grasp the fact that it cannot have cheap running costs and cheap hiring as well as service facilities is one of the reasons for the failure of manufacturers to obtain a wide sale for many of their products.

Another reason for the comparatively small sales of devices other than cookers in Great Britain is that many electrical domestic appliances are still looked upon as expensive toys. In general, it may be said that an electrical appliance which has (by traditional esteem) the character of a necessity and replaces an already existing apparatus has a better chance of success than an entirely new device, even though the latter may be cheaper both to buy and to run. Thus, the electric cooker is substituted for the kitchen range, and the vacuum cleaner for the old carpet sweeper; but a refrigerator is frequently regarded as a white elephant, except for a very short time each year, and gadgets such as kitchen mixers for cooking purposes, hot plates and electric drying-cupboards are still eyed somewhat askance. In the case of the electric iron, necessity, low price and low running costs have combined to ensure its popularity. There are now over 800 electric irons per thousand wired homes, and the yearly average sales still remain at about 1,500,000 as a result largely of replacement purchases. In contrast, the annual sale of wash boilers and washing machines is only 30-40,000 and 9,000 respectively, but there are signs of an expanding market for these in Wales and in the North, where the tradition of the home laundry has so far stubbornly persisted.

When all allowances have been made for conservatism and inertia the fact still remains that the British market for domestic electrical appliances is likely to go on expanding, and it is necessary to examine what facilities are required to supply the growing need. If these can be provided by the adaptation of existing plant rather than by the undertaking of new capital construction, so much the better.

It is therefore opportune to direct attention to the reduction of profits in the wireless industry during the past year and the consequent fall in the value of shares in wireless companies. Over-stocking and the industrial setback of the autumn of 1937 were the immediate causes of the decline. But even if the industry had enjoyed another good year it is probable that soon the demand would have contracted. The fall in the number of wireless licences held from 8,968,089 in March, 1939, to 8,962,850 in April was the first instance of a decrease in the history of the British Broadcasting Corporation and probably indicates that saturation point was very near. The maintenance of the industry at full productive level would have been problematical under the most favourable circumstances. As it was, the industry was hard hit by the general recession; and many firms, seeing no improvement in prospect, began to look out for alternative employment for their productive capacity.

The special technique of wireless manufacture requires plant which does not readily lend itself to other forms of employment. Television is an obvious alternative, but the sale of television sets is still seriously hindered by their high price and by technical considerations. More attractive is the manufacture of electrical domestic appliances. Their smaller parts can be made by wireless firms without entirely reconstructing their existing plant, and their sales can in many cases be handled by existing organisations and distributors.

In addition to the uncertainties arising from the vagaries of the market and the not easily calculable rigidities of habit and custom, the wireless manufacturer turning his attention to electrical appliances will have to face competition from firms who are already well established in this field, firms who have in many cases no other manufacturing activities. These firms, some of whom are of American origin and consequently have access to the resources and research data of America's own thriving industry, are in a position to make difficult any encroachment on their markets; and even in appliances which have not yet been exploited, the organisations of the established firms are well equipped to hold their own against rivals.

All these considerations might well deter any new entrants into the manufacture of electrical appliances. Yet, forced to choose between the likelihood of a rapidly contracting market for wireless sets and the possibility of an expanding market for toasters, shavers, water heaters and the like, the wireless manufacturer may feel that he has nothing to lose and everything to gain by launching out in new directions. He will not find success easy to come by; but, increasingly as time goes on, he will find working on his side a strong aversion to unnecessary manual labour in the home and a consequent welcome, once prejudice has been overcome, for the speed and efficiency which are the distinctive properties of an electrical appliance to-day.

Next week's issue of THE ECONOMIST will include the annual review of BUILDING SOCIETIES

The survey will contain articles on the Government's Bill, and will examine the problems arising from War Risks and the present trend in house construction.

A statistical analysis of the finances of 110 leading societies since 1925 forms a unique feature of the survey.

Finance and Banking

Record Floating Debt.—For the first time since the post-war inflation period, the Treasury bill issue in the past two weeks has topped the £1,000 millions mark. Last Saturday's total was £1,011 millions, which, although far below the record level of £1,221 millions reached in the spring of 1921, is substantially greater than the figures of recent years. Including Ways and Means Advances, the total floating debt now stands at £1,055 millions. There is, of course, nothing unexpected about this expansion. It results simply from the widening of the Treasury's current deficit caused by heavily increased defence spending in the lean revenue quarter; though it is interesting to note that last week the Treasury charged a small part of its outgoings "below the line," under the Defence Loans Acts, whereas previously no loan charge has appeared in the accounts until late in the financial year. The high level of the floating debt has, however, been linked by some market commentators to recent discussions about a further instalment of Defence borrowing and consequent funding of Treasury bills. After the spectacular failure of the Australian issue and the subsequent weakness of Gilt-edged, those who had believed in the imminence of a Defence issue have concluded that the authorities have once again "missed the boat." But the rise in the floating debt beyond £1,000 millions has drawn attention to the fact that there must be an upper limit of safety, and the question has been raised whether the point will soon be reached at which the Treasury might feel it expedient to fund, whether or not market conditions are particularly propitious. This question is, indeed, of some practical importance for, since the early post-war years, Treasury policy in the management of the floating debt has on the whole been distinctly conservative, and the total has never been allowed to remain for long in the vicinity of £1,000 millions.

Is Funding Urgent?—It is, of course, impossible to say whether the authorities have in mind any maximum figure which the Floating Debt should not exceed. The only rule about floating debt management which is definitely known to have influenced Treasury policy was propounded by the Colwyn Committee, which suggested that the Treasury bill issue ought not to be allowed to rise much above £600 millions. Presumably that principle has been abandoned—and perhaps forgotten—long ago. But it might be argued that if the Treasury regarded £600 millions as reasonable before 1931, it certainly ought not to contend that anything less than that figure, excluding the Exchange Account bills, is unreasonable now. Clearly, there can be no danger in carrying bills which are wholly backed by gold held outside the banking system, while the Exchange Account "tap" bills are the most nominal of all nominal debts—they represent simply the Account's unutilised borrowing powers. On this argument, if the Treasury shows concern at a Treasury bill issue of anything appreciably less than £1,200 millions, it would be managing the debt more conservatively than it did before 1931, when the need for conservatism was greater. Such conservatism, however, will almost certainly be displayed. But if a funding issue were launched at an early date, a distinctly liberal expansion of the credit base would be required to ensure a really willing response from the banks. The effective floating debt—the "tender" bill issue—still stands at no more than £469 millions. And in May the bill portfolio of the eleven clearing banks was still only £200 millions—they had absorbed only £10 millions of the average expansion of £75 millions which had occurred in the tender issue since the low point was reached in March. The banks have succeeded, none the

less, in virtually restoring their ratio of liquid assets to 30 per cent., but it is significant that they achieved this principally by sales of investments. That a further reduction occurred in May, when advances—for the first time since November—also declined, may have been due simply to the firmness of the Gilt-edged market. But the sales do suggest that the banks would hardly welcome the chance to subscribe to an issue which would be used to redeem their most liquid earning assets.

The B.I.S. New President.—Dr Beyen's term of office as president of the Bank for International Settlements was originally fixed for three years from May, 1937, and it was already known that he did not seek re-appointment, owing to his decision to join the board of Lever and Unilever N.V. The appointment of his successor, Mr T. H. McKittrick, though it is due to apply from January 1, 1940, has therefore no connection with the recent controversy regarding the transfer of Czech gold to Germany. Mr McKittrick is a partner of the banking house of Higginson and Company and has been a member since 1931 and vice-chairman since 1933 of the Arbitration Committee under the German Standstill Agreement. Since he is of American birth and has worked for many years in the City of London, he is well chosen as president of what should be a truly international financial institution. The president of the Bank occupies a position of considerable prestige and responsibility, but it is worth noting by those who stress the political aspects of the Bank's management that it will now have an Anglo-American president and two managers, one French and one German, to supervise its work.

The Reichsbank.—The new Reichsbank Statute, which came into force on June 16th, gives legal form to the *de facto* nationalisation of the Reichsbank. Though the capital will still remain in the hands of private shareholders, they will have no say in the bank's management, which will be entirely under the control of Herr Funk, acting as Herr Hitler's deputy. As foreshadowed in *The Economist* last week, the foreign ownership of the bank's capital is to be eliminated; it is now learned that foreign shareholders are to receive for every Rm. 100 Reichsbank

SWAN HOTEL SOUTHWOLD SUFFOLK

Tel. No. 5 Southwold.

shares, not, as was stated last week on the basis of preliminary reports, $4\frac{1}{2}$ per cent. Treasury bonds, but Rm. 200 non-voting 4 per cent. preference shares of the Gold Discount Bank, plus a non-recurring bonus of $1\frac{1}{2}$ per cent. on their new shares, both interest and bonus to be transferable. "Eligible" German nationals will be given Rm. 500 new Reichsbank shares, on which the dividend will be fixed at 5 per cent. in order to put an end to "speculation" in the shares, for every Rm. 500 old shares, and also Rm. 400 of the 1938 $4\frac{1}{2}$ per cent. Treasury bonds. Formerly, the Reichsbank dividend was 12 per cent., of which 8 per cent. was paid in cash and transferable and 4 per cent. placed on loan-stock deposit, so that the income actually received by the foreign shareholders will be unaltered, while the German holders will receive 8.6 per cent. In addition, their claims on the loan-stock will be met by the payment of Rm. 3.78 tax credit certificates for every Rm. 100 Reichsbank shares. (The certificates are negotiable but not transferable.) This treatment of the foreign shareholders contrasts very favourably with that generally accorded to foreign creditors of the Reich, and no difficulty about accepting the offer is expected. As usual, some discrimination is made against "ineligible" German nationals, that is, Jews, who will only receive Rm. 900 of the Treasury bonds for every Rm. 500 Reichsbank shares, thereby obtaining a return of 8.1 per cent., but this discrimination is comparatively mild. Apart from these changes in the capital structure, the chief point of interest in the new statute is the formal divorcing of the gold and foreign exchange reserves of the bank from the currency in circulation, which is declared, somewhat vaguely, to be based on the productive capacity of German labour.

Insurance Moratorium for Militiamen.—An Order-in-Council, published only late last week and rushed through Parliament on Tuesday and Wednesday, has added to the "near-war" problems of life assurance offices, which were reviewed in *The Economist* of June 10th. The Order establishes a moratorium on premiums, both for the ordinary and industrial branches, for militiamen in training and Territorials or reservists called up for service. The period varies according to a complicated formula, but on old policies it will usually be eighteen months for militiamen—plus, apparently, the usual period of grace stated on the policy—and for a Territorial or reservist called up, the period of his service plus a more or less extended period thereafter. Thus, the offices may be deprived of premium payments over considerable periods in respect of the majority of men coming within the moratorium, for no differentiation is made between those who can, and those who cannot, reasonably be expected to maintain their premiums. Hence the unsatisfactory position arises that an assured person may obtain life cover for the period for which his premiums are in arrear and afterwards may surrender or lapse the policy. The offices can only protect themselves under the Order by reducing the surrender value—or, on maturity, the claim—to the extent of the arrears (or by a stipulated sum in certain types of industrial life assurance) but claims by death under industrial policies will have to be paid in full.

A REASONABLE PRECAUTION

is for every responsible citizen to protect his dependants by securing Life Assurance now. Obtain advice on a suitable Policy from the

NATIONAL PROVIDENT INSTITUTION

for
MUTUAL LIFE ASSURANCE

ESTABLISHED 1835

48 Gracechurch Street, London, E.C.3

The Position of New Policies.—For policies taken out after June 15, 1939, the period of moratorium is less than for old policies, and does not apply until the policy is a year old, but there is an obvious danger that policies will be taken out simply in the expectation of free cover after the first year's premium is paid, the policy being afterwards lapsed when no surrender value exists out of which the office can recoup itself. The objections of the offices are, in fact, largely directed against the application of the moratorium to new policies. In all cases, however, the interest which is foregone on premiums withheld under the moratorium represents a serious loss. The Order might be less objectionable if it applied only to the militia, though the charge for relieving the conscript army of contractual payments should surely be a national one, not one on the general body of assured persons. Moreover, the Order clearly implies the possibility of a moratorium in war-time for all engaged in national or military service—already Territorials and reservists called up are within its provisions. Perhaps there is a prospect of the Order being revised on some of these points, for the Prime Minister and the Lord Chancellor have admitted that some amendments may be necessary. If it is unaltered, the offices may have to review their decision to continue to issue policies unrestricted for the war risk without extra premiums.

The Ottoman Bank.—The balance sheet of the Ottoman Bank at December 31 of last year shows only small changes compared with 1937. Deposits are virtually unaltered at £17,711,837, and the only change of importance in the assets is a rise of £1,198,118 in cash and a corresponding fall in Government securities and bills in portfolio. With so little to comment upon in the Bank's report, the chairman's speech at the annual general meeting was mostly concerned with trading conditions in the countries of the Near East. He pointed out that many of them cannot find an adequate market for their exports in countries with a free exchange, so that they have been forced to look to Germany—and to a lesser degree to Italy—to find an outlet for their products; and the resulting clearing and payments agreements, together with the growing multiplicity of exchanges rates, make normal banking very difficult to pursue. Nevertheless, the Bank has been able to maintain its dividend at 3s. per share, and the chairman emphasised that the results for the year were very much better than those shown by the published accounts.

Bank of British West Africa.—The depressed state of trade in West Africa is reflected in a further fall in the profits of the Bank of British West Africa for the year to March 31st last. It will be recalled that the previous year was a bad one for the Bank because of the cocoa producers' hold-up in the Gold Coast, and though the hold-up came to an end soon after the opening of the year under review, the market has since been very weak. Nor can the Bank have fared better in the other territories of West Africa, for the prices for ground nuts and palm products continue to be low. In the circumstances, therefore, it is not surprising that deposits show a fall of £2,571,376 at £7,280,393. On the assets side, the counterpart to the fall in deposits is shown in the cash items which are down by £3,590,144 to £2,275,422. Last year's balance sheet showed that the cash total was equal to more than half the deposits, so that part of this year's fall may be explained by a desire to restore the ratio of the various assets to deposits to more normal figures. Thus, investments show a rise of almost £1,000,000 at £3,411,449 and bills are also slightly higher, while, in view of the state of West African trade, it is encouraging to note that advances are only about £200,000 down at £2,349,548.

MONEY MARKET NOTES

The Money Market

THE higher rate at which the Treasury Bills were allotted at the June 16th tender caused an adjustment in other rates and the market houses quoted $1\frac{1}{2}$ – $\frac{3}{4}$ for the fine three months' bank draft. After the week-end, however, rates tended to weaken, for though there was no eagerness on the part of any of the clearing banks to buy, the market was equally reluctant to sell. One or two banks were purchasers of September bills at $\frac{3}{4}$ per cent., but the market, convinced that rates will fall once the end

* Viz. $\frac{1}{2}$ per cent. for loans against Treasury bills and other approved bills and British Government securities within six months of maturity. $\frac{3}{4}$ per cent. for loans against 1 per cent. Treasury bonds and other gilt-edged stocks within six months of maturity. 1 per cent. for loans against other collateral.

of the month is passed, was an unwilling seller at this rate, preferring to carry its bills into July. It is even anxious to obtain more commercial paper, and rates for the fine bank draft have not been maintained at the higher levels to which they were raised at the end of last week. Though $1\frac{1}{2}$ per cent. is still quoted, the best paper can often only be obtained at $\frac{3}{4}$ per cent. Credit conditions have remained very comfortable, and even the bigger demand for credit on Wednesday, when the market had to take up a big quota of Treasury bills, had no effect on short loan rates. The clearing banks are willing lenders against bills at their $\frac{1}{2}$ per cent. minimum, while for loans against bonds borrowers pay only $\frac{3}{4}$ per cent. and sometimes even less.

The Bullion Market

ON Wednesday an interesting feature of the bullion market was the revival of sales of gold from Continental hoards, which accounted for the bulk of the turnover of £356,000. This was the first time for many weeks that unhoarding of an appreciable size took place.

Date	Gold			Silver price per oz. standard

* Above or below American shipping parity. This week's calculations are based on a "temporary parity," in which the war risk rate is taken as 1s. 3d. per cent.

† At fixing.
The New York price of silver remained at 43 cents per ounce '999 fine during the week.

The silver market continues to be very weak under the influence of persistent fears lest a fall in the American Treasury's official buying price for foreign silver should be made on June

30th. Tuesday was thought to be the last day on which purchases could be made for shipment to New York in time for resale to the American Treasury before the end of the month, and prices on that day fell by as much as $\frac{1}{4}$ d. for cash and $\frac{1}{8}$ d. for forward. On Wednesday, however, it was discovered that a Dutch liner was leaving in time, and some purchases for shipment were made in the afternoon, which to a certain extent counteracted the earlier heavy selling from India and elsewhere, and the market closed steadier. On Thursday, India took a more optimistic view of the outlook and sent over some buying orders which raised both the cash and forward prices by $\frac{1}{4}$ d.

The Bank Return

A FURTHER small fall in the note circulation is shown by this week's Bank Return, but it may be noted that the level is over £10 millions higher than at the corresponding date of last year. Bankers' deposits have not benefited by the return of notes, for they are down by £3.1 millions, while there has been an exactly similar rise in public de-

posits. This switch-over to public deposits can probably be explained by the incidence of Treasury bill payments and maturities. It is known that the market was paying for a large amount of bills on Wednesday. There is a fall of £3.7 millions in Government securities, but this has been almost counterbalanced by a rise of £0.9 millions in discounts and advances and £2.2 millions in other securities.

Foreign Exchanges

STERLING has withstood the uneasiness felt over the situation in the Far East fairly well, and on Monday and Tuesday actually showed small gains against the dollar, closing on Tuesday at 4.68 $\frac{3}{4}$ d. After a firm opening, however, on Wednesday, a weaker trend set in during the afternoon, although this was more the result of small purchases of dollars, in a narrow market, by Continental hoarders converting their gold holdings than of any widespread selling of sterling. On Thursday, the market continued to be very quiet, and only a small amount of official support was necessary to keep the rate at 4.68 $\frac{3}{4}$ d. Continental currencies have shown very little change but have been, if anything, slightly firmer in terms of sterling. Thus the Swiss franc was quoted at 20.76 $\frac{1}{2}$ on Thursday, against 20.78 on Saturday, and the belga at 27.52 $\frac{1}{2}$,

against 27.54 $\frac{1}{2}$. The Shanghai rate continued to be held at 6 $\frac{1}{2}$ d., and was unaffected by unconfirmed rumours which reached London on Wednesday evening that the Chinese banks in Shanghai were declaring a three-day moratorium.

INSURANCE NOTE

Beacon Insurance.—The results of the triennial valuation of this company at December 31st are set out below. Life contracts have been valued on the same basis as three years ago, i.e. 0.3 per cent., but reserves for annuities and capital redemption policies have been somewhat strengthened:—

	1933–35	1936–38
Surplus earned	235,515	218,186
Investment profits realised	3,736	4,861
Brought forward	32,941	15,215
	272,192	238,262
Allocations—		
Policyholders' bonuses	241,977	167,110
Staff pensions	5,000	5,000
Shareholders' account	10,000	12,500
Strengthening of reserves	—	4,977
Carried forward	15,215	48,675
	272,192	238,262

The reversionary bonus on the sum assured has been drastically reduced from 36s. per cent. per annum for whole life and 34s. per cent. per annum for endowment assurances to 22s. per cent. for whole life and 20s. per cent. for endowment assurances. It will be noticed that the carry-forward has been increased from £15,000 to £49,000, but had it remained unchanged, the bonus earned would have been increased by only about 4s. per cent. The net rate of interest was £4 0s. 9d. per cent., compared with £4 0s. 1d. per cent., and the mortality experience is favourable. Over the last ten years, actual deaths in the "Abstainers" section amounted to 75 per cent. of the total expected by the A¹⁹²⁴⁻²⁹ table and to 90 per cent. in the "General" division. Expenses, however, amounted last year to £106,000, or more than 23 per cent. of the premium income. This rate seems unduly high, even allowing for the effect of increased new business and for the low scale of premiums in the "Abstainers" section. New sums assured amount to £1,291,000, a record for the company. Business in the fire and accident department further expanded, and premium income increased from £135,000 to £240,000. After providing for unexpired risks, this department showed a trading loss of £35,000. Total assets amount to £5,253,000, of which £2,470,000 is represented by mortgages on property in the United Kingdom, probably a result of the company's house purchase scheme, which has now been in operation for forty years. Stock Exchange securities total almost £2 millions; during the year depreciation accounted for £37,000, which has been provided from investment reserve, now standing at £102,000. The new issue of capital towards the end of 1938 provided a premium of £40,000, of which £30,000 was transferred to development account. The company has expanded rapidly in recent years, and it is stated that the policy of the directors for the next few years will be one of consolidation.

Investment

A.P.D. and the Investor.—Compared with the storm which greeted N.D.C. in its original form, the City's reception of the Armament Profits Duty has been mild in the extreme. Its announcement coincided with a rise of 1½d. in Vickers ordinary stock to 18s. 9d., and even further reflection upon its possible consequences exerted limited effect upon aircraft shares, except for a fall of 1s. in Fairey Aviation to 21s. In fact, the operative factors in this week's market movements have been initial optimism—apparently unbacked by any firm evidence—that the Tientsin incidents would be solved, and that an Anglo-Russian pact was progressing towards conclusion. Such explanations appear to have been devised to fit the technical fact that the market, and particularly gilt-edged stocks, staged a useful list of gains without the benefit of any considerable amount of business. Nor can the mid-week reaction be attributed to A.P.D., for its general influence had apparently been relatively fully discounted in such shares as Vickers, which have fallen from a "high" of 24s. this year, while the majority of the aviation issues stood at levels which discounted some possible interference with profits. A rough examination of their earnings position, however, suggests that serious effects upon dividend policy are unlikely, since the general incidence of the tax, in most cases, does not threaten the whole margin of excess earnings over recent dividend payments. Precise computation of the effect of A.P.D. on individual companies, however, is ruled out, for a number of reasons. It is impossible, in the majority of cases, to divide the turnover of the companies, concerned between arms and civil production, which is the basis on which the arms profits will be computed. That, however, is but one of the complexities. It has yet to be seen where the Minister of Supply will place the dividing line between firms "substantially engaged" in the supply of armaments and others. Will this definition cover suppliers of materials for "works," as opposed to "articles" required for the armed forces? Will the minimum arms turnover of £200,000 exclude a considerable number of sub-contractors, whose ratio of profits arising from the defence programme is probably considerably greater than that obtained by direct contractors?

The Tax in Practice.—Generally, however, the authorities have avoided the main injustices which would have been inflicted by the first version of N.D.C. For example, the base years—1935 or 1936, or an average of either year with 1937—appear to provide a reasonably high standard of profits for the calculation of the excess, as the following table, based on *The Economist's* profits records for the groups most closely affected, suggests:—

	CHAIN INDEX OF PROFITS AFTER DEBENTURE INTEREST	
	Iron, Coal and Steel	Motor Cycle and Aviation
1935	100	100
1936	129.6	129.0
1937	174.1	162.5
1938	215.8	157.0

BRITISH GENERAL SERIES 'C'

Managers: **BRITISH GENERAL FIXED TRUST LTD.,**
36/37 King Street, London, E.C.2

GREENWOOD

These index numbers suggest that the average profits for the years 1936 and 1937 will usually be selected for the standard. No mention is made in the White Paper regarding the treatment of subsidiary companies. For N.D.C. a parent company may group the income of subsidiary companies controlled to the extent of 90 per cent. with its own income. The importance of consolidation is evident, not merely from the aspect of assessment, but also for the equitable apportionment of contracts, where these may have been let out to subsidiaries in amounts below the £200,000 minimum. E.P.D., however, has left its legacy—which also appeared in the first version of N.D.C.—in the exclusion of debentures from the computation of capital. Hence a company which happens to have increased its capital appreciably by means of debenture issues since the standard years will not obtain the 8 per cent. allowance on additional capital. This point may have some relevance for Hawker-Siddeley, which issued £3½ millions of debenture stock in November last year. But the position of this company, like that of Vickers, is complicated by the problem of subsidiary companies. In general, companies whose civil business was poor in the base years, or who entered the rearmament field at a late stage, will suffer the bigger impost. On this general criterion, aircraft and machine tool companies may fare relatively badly, while individual examples among shipbuilding companies—William Beardmore is a case in point—may also suffer. An approximate computation for a group of companies suggests the following possibilities:—

	Latest Earnings	Latest Dividend	Net A.P.D. on latest profits on Ord. Cap.
	%	%	%
Wm. Beardmore	39.1	3½	9*
Vickers	22.0	10	5½†
Fairey Aviation	25.7 t.f.	15 t.f.	6 t.f.‡
Rolls-Royce	29.1	25	3§

* Maximum estimate; 6 per cent. allowance on reduced capital may apply.
† Difference attributable to Vickers-Armstrongs only.
‡ After allowance for increased capital.

These results, however, are subject to reductions for commercial business. They take into account the effective net incidence of 41½ per cent. for A.P.D. after allowance for the consequent saving in N.D.C. and income tax.

Stock Exchange Discussions.—"A considerable measure of agreement" is officially reported to have been reached in the three-day discussions last week between the representatives of the London Stock Exchange and the Council of Associated Stock Exchanges. The subjects "very fully considered" included problems affecting inter-market relationships and the control and conditions of agency. It remains for the provincial delegates to report to their various bodies, who, in turn, will doubtless raise supplementary points for consideration in the further discussions which are expected to take place in due course. The precise nature of the Stock Exchange Committee's communiqué confirms the expectation that the discussions have been exploratory, but even at this initial stage they have evidently covered a certain amount of detailed ground. Meetings were also held on Friday this week between the representatives of the London Stock Exchange and the Provincial Brokers' Stock Exchange, and were expected to be concerned mainly with the establishing of personal contacts and general explanatory talks.

Company Notes

John Brown Yield.—The preliminary profits of John Brown were discussed in some detail in *The Economist* of June 3rd. In the interval, the 10s. ordinary shares have fallen from 33s. to 28s. 9d., of which 1s. 3d. is represented by the final dividend of 12½ per cent. tax free. Trading profits increased at a better rate than was suggested by the net profits shown in the preliminary announcement, for total income for the year to March 31st amounted to £925,032, compared with £817,544. Of this sum, the tax collector demands £212,213, against £141,243, while the depreciation provision has been increased from £49,787 to £64,317. These increased provisions account for the very modest increase in equity earnings from £477,963 to £501,672, equivalent to 23.3 per cent., tax free, against 22.2 per cent. for 1937-38. The Clydebank shipyard and engineering works were fully employed last year and Thos. Firth and John Brown recorded a further improvement in profits, while their output continues at a high level. But the collieries and coke ovens, although working at a satisfactory rate, were affected by the reduced demand and prices for coke. The coke section should show better results this year, in view of the high level of activity in the steel industry, and the problem of adequate mercantile shipbuilding orders (the more urgent in view of the expected completion of the "Queen Elizabeth" early next year) has been relieved by the Government's subsidy proposals. Meanwhile, the naval yards remain busy, and the group's interests cover a wide range of heavy industry—much of it closely connected with the defence programme. Moreover, John Brown now holds a 50 per cent. interest in Westland Aircraft. It is impossible to establish the degree to which the group will be affected by A.P.D., since the proportion which arms turnover bears to its total business is unknown. But the presumption from the earnings margin of nearly 6 per cent., tax free, is that the present rate of dividend is not seriously threatened. In such circumstances, a yield of 8 8s. per cent. gross appears relatively generous, compared with certain other returns in the arms group.

Guest, Keen and Nettlefolds.—The preliminary profits announcement of Guest, Keen and Nettlefolds (discussed in last week's issue of *The Economist*) indicated a moderate fall in earnings, and the customary insistence by the directors on a cautious distribution policy. The full report throws little additional light upon these results, but it makes the point that the new steel bar strip mill at Cardiff only came into operation towards the end of the financial year, and is now in full production. Conditions also showed a gradual improvement during the year to March 31st. Hence the reduction in trading profits, before depreciation, from £1,326,735 to £1,286,311, was evidently a consequence of quieter trading during the summer months of 1938 than of any failure of the group to participate in the subsequent recovery in the heavy industries. The balance sheet shows that a further sum of £341,320 has been expended on plant, which now stands at £2,523,767 after depreciation, compared with £1,924,690 in March, 1936. In the same period the company's cash holding has been increased from £250,698 to £1,055,756. The parent company's own position, of course, is not fully representative of the group, for subsidiary companies account for £10,778,907 out of total assets of £19,359,697. But it has made steady provision for the possibility of technical expansion at some future date. The group has yet to decide whether to follow the lead of Richard Thomas and John Summers in installing hot strip mills. Certainly, its present cash holdings would permit the company to cover an appreciable proportion of the heavy capital costs involved. Meanwhile, steel and tinplate activity in South Wales appear to justify the current yield of 5 4s. 3d. per cent. tax free (equivalent to 7 4s. per cent. gross) on the ordinary stock.

General Electric Profits Maintained.—The General Electric report confirms the favourable news of the preliminary announcement that total profits have been fully maintained, at £1,776,099 compared with £1,772,181. Full employment is reported at the works, but the satisfactory results may have been assisted in part by some carry-over of orders from 1937-38, for the report states that new orders in 1938-39, although at a satisfactory level, did not reach the previous peak. A rise in production costs is causing some competitive difficulty; but the company has participated in the arms programme. The further increase in overseas business to a new record is gratifying, though import restrictions in New Zealand threaten to endanger the business recently built up in that country. Recent results are set out in the accompanying table and chart:—

	Years to March 31		
	1937	1938	1939
	£	£	£
Profit	1,604,512	1,772,181	1,776,099

Earnings %	23.7	24.9	23.5
Paid %	17½	20	20
General reserve	125,455	100,000	100,000
Carry-forward	749,294	799,934	807,220

Owing to increased taxation and pensions provision, earnings for the equity are some £43,354 (1.4 per cent.) lower than in 1937-38. The distribution of a 10 per cent. dividend plus a 10 per cent. cash bonus is repeated, and is still well covered, while the provision for general reserve is

COMMERCIAL SERVICE

The Bank has over 380 Branches in Africa, and Agents and Correspondents throughout the world. The closest touch with Trade and Industrial conditions is maintained, with special attention to Commercial and Credit Intelligence. This service is available to Exporters, Importers and others wishing to develop trade with South, East and Central Africa.

THE STANDARD BANK MONTHLY REVIEW contains information on all South, East and Central African matters of Trade and Commercial Interest. Copies will be sent post free on application.

maintained at £100,000. A strong position is again shown by the balance sheet, which shows an increase in holdings of securities from £185,690 to £643,632 following the

settlement of insurance claims. At a current price of 76s., the £1 stock units offer the moderate yield of £5 5s. 3d. per cent.

Bleachers' Association Problems.—With the passing of the dividend for the year to March, 1939, Bleachers' Association 5½ per cent. preference stock carries almost 29 per cent. of dividend arrears, due since the end of 1933. No payment, of course, had been expected, but stockholders have been dismayed at the further substantial loss of ground during the year to March 31. Total trading profits amounted to £332,422, before depreciation (excluding a credit of £15,000 from income tax reserve) compared with £459,547 for the previous year. After providing £140,000 for depreciation, compared with a total of £193,249 for 1937-38, debenture interest which absorbs £101,250, and was covered by a margin of £699 in the previous year, was short-earned by no less than £68,187—a heavier net loss than any recorded in the worst depression years. A year ago the preference units stood at 5s. 9d.; to-day, they are quoted at 6s. While the Association has commendably provided satisfactory sums for depreciation throughout the years of adversity, it has never been able to earn a satisfactory return on its £7,154,151 of fixed assets. And even with the present improvement in the textile trades, it is difficult to envisage an early recovery sufficient to justify the introduction of a capital reconstruction scheme.

Anglo-Iranian and Lobitos.—The full report of Anglo-Iranian oil expands the information given in the preliminary statement (discussed on page 671 of last week's issue of the *Economist*), though it does not completely explain the relatively heavy fall in profits. In amount the reduction of £2,090,803 in total profits is appreciably greater than the reduction of £1,345,617 shown by the preliminary figures, for some saving in taxation and royalty payments has been achieved. Production in 1938 was little changed compared with 1937, and the fall in oil stocks

from £3,119,607 to £2,992,649 suggests no considerable rise in physical stocks, such as might have followed a fall in sales. Falling prices have apparently had an unexpectedly severe incidence upon the company. The allocation of earnings is shown in the following table:—

	Years ended December 31		
	1936	1937	1938
	£	£	£
Total income.....	9,624,434	12,662,195	10,583,985
Royalty, etc.	2,580,206	3,545,313	3,307,479
Income Tax and N.D.C....	910,559	1,651,588	1,157,029
Extra depreciation	514,976	744,215	602,602
Fees, etc.	10,200	10,200	10,000
Pref. dividends	1,071,234	1,071,234	1,071,234
Ordinary stock—			
Earned	4,537,259	5,639,645	4,435,641

Carry-forward	492,135	517,411†	625,552

* And 50% capital bonus. † After £33,122 issue expenses.

The group's development continues very active. The report refers to considerable increases in the equipment of certain refineries, and the balance sheet shows a rise from £4,385,349 to £6,575,494 in buildings, etc., while stocks of stores and materials total £2,936,850 against £1,686,182. The reduction of one-fifth in the Anglo-Iranian dividend is an adverse pointer for the current year's results of Burmah Oil, and also for the miscellaneous receipts of the British Treasury. Lobitos Oilfields' full report shows that the repeated 15 per cent. distribution is covered by earnings of 27.2 per cent. against 29.5 per cent. Trading profits amount to £146,928 against £139,782, but total income on revenue account is £39,233 lower at £308,186, while profits from sales of investments amount to a mere £767 against £31,180. Anglo-Iranian £1 stock units stand at 73s. 9d., to yield £5 8s. 6d., and Lobitos Oilfields at 32s. 6d. to yield £9 6s. 3d. per cent.

Outlook for "Shell" Transport.—The satisfactory accounts of "Shell" Transport (reviewed in *The Economist* last week) were augmented by an informative commentary on the year's working—for "Shell" in particular and for the industry in general—by Lord Bearsted last Tuesday. The "second interim," which caused some mystification when it was announced, arose from the directors' decision, owing to the uncertainty of the times, to distribute such accumulated profits as were available, rather than wait until normal payment in July. Development work played an important part in the year's operations. The rise from £40,000 to £869,000 in "advances to a subsidiary" was due to financing of concessions by Shell Overseas Exploration. And in Venezuela, with whose Government Lord Bearsted reported continued good relations, Venezuelan Oil Development is carrying out a large investigation programme. Lord Bearsted foreshadowed an increase in the importance as an oil producer of Colombia, where recent legislation was described as "enlightened," but for Mexico he was only able to express the hope of an eventual settlement. Reports this week, which lack official confirmation, suggest that negotiations between the Government and the expropriated companies are progressing favourably, although a final agreement can hardly be imminent. Despite increased production from Illinois—a State that has no conservation law—and a small reduction in demand, crude oil stocks in the U.S.A. fell by nearly 31 million barrels in the year, but Lord Bearsted did not take an optimistic view of the oil outlook in the U.S.A. Stockholders will accordingly appreciate the group's considered development policy more highly in view of the more difficult times through which the industry has recently been passing.

Baltimore and Ohio Problems.—The results of the Baltimore and Ohio are representative of the difficulties of all American railroads in 1938. Freight traffic forms a very high proportion of the company's total receipts, and it was \$31,786,000 lower at \$115,426,000. Total operating revenue thus fell by 20.5 per cent. to \$134,722,000 against \$169,436,000. As the wages increase awarded in 1937 operated for a full year, expenses could not be reduced by the same proportion, and net operating revenue was \$10,839,000 lower at \$29,738,000. After charging other expenses, and crediting other income (which is only \$4,208,000, against \$6,555,000), the balance available for fixed charges of \$32,184,000 is only \$19,060,000. In 1937, a comparatively small deficit of \$721,000 was recorded, but last year fixed charges were short-earned by \$13,125,000. The position, however, will be relieved this year, for a plan for modification of interest on certain bonds became operative early this year under which some \$11,376,000 of annual interest becomes contingent on profits for eight years, though priorities are maintained. Earnings are now improving, and for the first four months net operating income amounts to \$4,968,000, against \$292,000 a year ago. But the resumption of preferred stock payments lies a long way ahead.

Zinc Corporation Position.—Ordinary and participating preference shareholders have experienced a severe cut in dividends in 1938, owing to the heavy fall in metal prices last year. Average prices of lead and spelter fell by roughly £8 a ton, or over 33 per cent., last year, but thanks to increased mining and treatment of a higher grade of ore mine receipts of the Corporation fell by 25 per cent., from £1,741,815 to £1,301,158. In the circumstances, such results must be regarded as satisfactory. Ore treated totalled 414,500 tons, against 390,360 tons, and production amounted to 82,826 tons of lead and 74,651 tons of zinc concentrates, against 76,627 and 63,908 tons, respectively, in 1937. As a result of this higher output, combined mining and milling costs fell by 1s. 9d. to 28s. 7d. a ton, though costs in 1937 were at a high level. Since total development expenses are lower and savings of £36,250 on royalty and £51,974 on taxation are recorded, the reduction in net profits from £457,909 to £181,369 is considerably smaller than the fall in total income. The additional participating dividend on the preference shares is reduced from 42½ to 15 per cent., while the reduced ordinary dividend of 30 per cent. against 85 per cent. for 1937 is barely covered by earnings. The outlook for the current year is rather more hopeful, for prices have been steadier, while the Lead Producers' Association was formed last autumn and a zinc cartel is now under discussion. The duty on foreign zinc has been raised by 17s. 6d., but Empire producers retain only 2s. 6d. of this advantage, since 10s. goes to Imperial Smelting and 5s. to a pool. Such a change, clearly, is of relatively small importance in the general price context. At the current price of 68s. 9d. the 10s. ordinary shares yield £4 7s. 3d. per cent.

Further Kaffir Interims.—The Kaffir interim season closed satisfactorily last week with the Anglo-American and General Mining announcements. "Sallies" distribution is 2s. 3d., against general expectations of not more than 2s., compared with 6d. last December. Thanks to its holding in South African Land, and to lower capital expenditure this year, Brakpan is paying 1s. 9d. against 1s. 7½d. Springs' payment of 1s. 3½d. compares with 1s. 4½d., but West Springs' payment of 1s. 4½d. against 1s. 3d. caused some disappointment in view of the profits trend. Daggafontein has repeated the December payment of 1s. 3½d. In the General Mining group, Van Ryn Gold pays 10 per cent. as against 12½ per cent. Current expenditure on surface equipment has been taken into account in the West Rand Consolidated distribution. The ordinary shares receive 1s., against 1s. 6d. in December and 1s. in June, 1938, while the deferred distribution is reduced to 56s. 8d., against 85s. in December, and 56s. 8d. in June, 1938.

Great Boulder Proprietary.—Few company disputes have become so acrimonious as the Great Boulder Proprietary Gold Mines controversy in recent months. Since opposition to the existing management was launched by the "Grundt" Committee at the beginning of March, shareholders have been deluged with circulars and counter-circulars, many of which have introduced regrettable personalities into the dispute. In the circumstances, it will be understood that the actual position of the mine and the financial condition of the company are of fundamental importance. It is pertinent, therefore, to study the annual report for 1938 in the light of the criticisms which have been levelled against the management. Last year's results were, in fact, considerably better than those for 1937. They do, indeed, suggest that some of the sting has been taken from the arguments originally put forward by the shareholders' committee. First, the company handled a considerably increased tonnage, although a smaller volume of tributors' ore was treated. Secondly, there was an increase of 2 per cent. in extraction (which at 90.18 per cent. may be considered not unsatisfactory); and, further, working costs were reduced by roughly 2s. 9½d. to 26s. 9d. Australian per ton. After higher depreciation and development allowances, the result is a net profit of £172,482 against £73,553, while dividends totalled 37½ per cent., against 25 per cent. It is noticeable that the board has taken some trouble to avoid the criticism of providing inadequate information regarding the mining position. Development footage was not maintained on the greatly increased level of 1937, but percentage payability improved. Hence, although a greater tonnage was mined, ore reserve at 1,213,496 tons showed a net improvement of 151,296 tons, although the grade was reduced by 0.4 dwts. to 6.5 dwts. Many mining companies show a position less satisfactory than this. At the same time, the best cannot be expected of any concern when controversy about the management's past and present activities is so acute. Inevitably, the average shareholder becomes dubious about the relative merits of the two sides of the argument. Nevertheless, it cannot be denied that a considerable body of opinion would favour a fuller degree of representation for shareholders on the board. The proceedings at the annual meeting were in progress as we went to press.

The Week's Company Profits.—The heavy industries are well represented in our usual analysis of profit and loss accounts, which appears on page 751, and contains 81 companies for which comparable figures are available. Total net profits of these companies (excluding banks) amount to £14,091,000, against £16,157,000, a decline of 13 per cent. Aggregate net profits of 1,403 companies reporting in 1939 to date amount to £192,949,000, and show a decline of 8½ per cent. below the £210,708,000 earned by the same companies in the previous year. The week's results are discussed in preceding Notes and on page 730 under the heading "Shorter Comments."

Company Meetings of the Week.—Reports of the week's company meetings begin on page 736 of this issue. Lord Bearsted's survey of the "Shell" Transport and Trading position is discussed in a Company Note on page 726, and Sir Herbert Lawrence's review at the Ottoman Bank meeting on page 722. At the meeting of General Mining and Finance Corporation, Sir George W. Albu referred to the policy of greater collaboration with

the Central Mining-Rand Mines group, as seen in the company's acquisition of 25,000 reserve shares in Rand Mines, Ltd. At the meeting of *British Electric Traction*, Mr J. S. Austen pointed out that if £100 of deferred stock were bought at £1,000, and if, instead of announcing a stock bonus the company were to distribute its income in cash, there would be enough to pay 5.89 per cent. on the £1,000. Sir Cyril Entwistle informed shareholders of *Decca Record* that turnover for the current year showed an improvement, and it was estimated that profits had been maintained at last year's level. Col. Charles E. Ponsonby informed shareholders of *Forster's Glass Company* that the year's sales, though down on the year, due partially to bad weather, were the second highest in the company's history. At the meeting of *Great Universal Stores*, Sir Archibald Mitchelson expressed satisfaction at the extensions made this year, and expected the full benefit to be more apparent in the future. Mr Harry Marland, at the *Griffiths Hughes Proprietaries'* meeting, declared that considerable expenditure had been made on research and advertising in the home market, from which the company hopes for appreciable benefit in the future. Sir Frank Newnes, at the meeting of *George Newnes, Ltd.*, having referred to the effect of higher paper costs and lower advertising revenue, declared the company to be in an excellent position to benefit from any general increase in

prosperity. Mr F. T. Jackson informed shareholders of *Telephone Rentals* that their English subsidiaries were able to give a favourable report on 1939 prospects, on the basis of business done in the first five months. At the meeting of *British Borneo Timber*, Sir E. J. Holberton reported rough timber production to be gradually increasing, while operations of the saw mills would soon, he hoped, be working full time again. Mr J. Davidson informed shareholders of *British Empire Trust Company* that depreciation of their securities was only 7 per cent., and this had been made good out of reserves. Col. Fenwick explained at *Willoughby's Consolidated* meeting that as a result of writing down shareholdings, their market value on June 12th was £278,029, against a book value of £274,857. At the *Charterland and General Exploration and Finance Company* meeting, Mr J. E. W. Lomas pointed out that taking quoted investments at their market price on May 31st, and allowing for other assets and liabilities, there was a surplus of £96,573 over the issued capital. Mr Kenneth O. Hunter informed *Siamese Tin Syndicate* members that for the first five months of this year estimated profit was £48,855, against £39,371 for the same period in 1938. At the *Bangrin Tin Dredging* meeting, he explained that the lower provision for mine depreciation was due to the longer working life of the mine arising from acquisition of the new area.

THE STOCK EXCHANGES

London

SETTLING DAYS
TICKET ACCOUNT
JULY 4 JULY 6

DESPITE occasional rallies, markets have remained on the whole subdued. Political factors alone are responsible, and dealers are attentive to any report which would justify a marking up of prices. Changes on the week have been quite small, and A.P.D. had little effect, but it is evident that the upward trend cannot be resumed until the political atmosphere is cleared.

In the *gilt-edged market*, the week opened in dull fashion, though absence of selling and some bear-covering brought a distinct recovery, with undated stocks in the lead. This more cheerful tendency was due to reports that an Anglo-Soviet agreement had been reached, and to the belief that the trouble in Tientsin might remain localised. This tentative optimism continued on Tuesday, but being unsupported by specific news, it gave way to renewed dullness. Selling pressure, however, never reached pronounced proportions. The dated stocks followed in the wake of the irredeemable issues, though in mid-week the short-dated stocks held firm. Home corporations were neglected, and on Monday were

somewhat heavy on news of the Hertfordshire loan. In the Dominion section, New Zealand issues became steadier after early weakness on reports of difficulty in arranging the new loan. The South African scrip attracted occasional support, reaching ½ premium on Tuesday.

In the *foreign bond market*, Japanese issues gave way in mid-week after a satisfactory start. The trend of Chinese bonds was downwards. Movements in European bonds lacked interest, while Brazilian issues were fairly steady.

Movements in *home rails* were somewhat erratic. A poor start was followed by recovery on professional support, a reaction, and then by a fresh spurt in anticipation of the traffics, but in the absence of solid reasons for the movement, there was some setback in mid-week, except in debenture stocks, which found some support. Argentine rails were quiet but on the whole firm.

The *industrial market* showed a subdued tone in mid-week after sporadic attempts at cheerfulness. Armaments shares weakened moderately on consideration of the new tax, aircraft issues being the most affected. Turnover was small in the iron and steel section, with irregular movements, and relatively modest price changes on balance.

Changes were not uniform. Thornycroft lost 1s. 9d. on Tuesday. Small losses were the rule in the engineering section. Coal shares were irregular, changes in quotations remaining small. Powell Duffryn were unaffected by the reduced dividend. Electrical equipment issues also moved irregularly and within narrow limits. General Electric rose slightly on the issue of the full report. Motor shares were an exception to the general trend, and rose comparatively strongly in the earlier part of the week, especially in the heavy section, though later on a more mixed showing was apparent. Aircraft issues were weak from the outset, and declined more sharply on details of the new arms profits tax. Further losses in mid-week were unimportant. Textile shares were unexciting but firm. Patons and Baldwins responded to the increase in profits, and other textiles were sympathetically affected in mid-week. Breweries became steadier after a hesitant start, and there was quiet support for the tobacco leaders until they succumbed to the mid-week reaction. Movements in store and provision and catering issues were varied, and mainly within narrow limits. Until a more hesitant tone became noticeable in mid-week, miscellaneous issues were fairly steady. There was some support for Dunlop on Monday.

In the *oil market*, the new account opened quiet and irregular, but a firmer tone developed on Monday afternoon on Continental support for "Shell," Royal Dutch and Eagle issues. Later, there was some investment demand for Burmah Oil and Lord Bearsted's speech promoted a further improvement in "Shell," but by mid-week withdrawal of Continental support and some profit-taking in Mexican Eagle left the market easier. Among *rubber* shares, after a quiet start, Anglo-Dutch and Rubber Trust led a short rally. On Tuesday the firmer tone developed under some public support, but in mid-week the market was quieter.

Among *mining* shares, Kaffirs opened quiet but some Cape and local support led to an advance in which South African Land were a firm feature. On

Tuesday, the advance was held on local and Paris buying, Randfontein being in request, but in mid-week a cautious attitude developed, which provided irregular price movements and a small turnover. On Monday, West Wits led a sharp rally among developing issues, followed by Western Holdings, but the general hesitancy in mid-week wiped out the earlier gains. Finance shares, apart from Paris support for Gold Fields on Tuesday, were featureless all the week. Among West Africans, Ariston were in demand early in the week but later eased on profit-taking.

ACTUARIES' INVESTMENT INDEX

The continued depression of the markets is shown by a further moderate fall in the Actuaries' index of 160 industrial equity prices, which on Tuesday, June 20th, stood at 62.2, against 63.8 a week ago and 62.8 a month ago. The corresponding average yields are 5.58, 5.48 and 5.65 per cent. A selection of the separate indices is given below:—

Group (and No. of Securities)	Prices (Dec. 31, 1928 = 100)	Prices 1939 High

New York

SENTIMENT was cheerful at the opening of Wall Street on Monday, though interest later slackened. Higher steel mill activity imparted a firmer tone to steel issues, while bear covering in such leaders as A.T.T., Chrysler and U.S. Rubber gave an initial stimulus to prices, reinforced by the latest news on tax revision and the Government's spending programme. The advance was resumed on Tuesday under the lead of rails and utilities, but business was restricted by the latest developments in the Far East. In mid-week, price changes were small. *Iron Age* estimates steel mill activity at 55 per cent. of capacity, against 52.5 per cent. last week.

Capital Issues

THE resounding success of the *Hertfordshire* loan has done much to compensate for the sad failure of the Australian issue a fortnight ago. The new stock offers £3 15s. to redemption, and it was priced some two points "below the market." Compared with the Essex loan, which is of identical date, but which stood around 100 when the Hertfordshire loan was announced, the latter's issue price of 96½ was bound to attract substantial support. Cash applications on Thursday are reported to have totalled £45 millions, but conversion applications in respect of £1,944,014 6 per cent. stock, 1940-60, were receivable until Saturday. Steady investment support was accorded the offer of 4½ per cent. preference shares of *West Kent Electric* at 20s. 6d., for the yield of £4 7s. 9d. per cent. compared favourably with the general level of electricity supply preference stocks. The prospectus relating to the issue of 150,000 10s. ordinary shares of *James Howden and Company* reveals a sharp rise in profits in recent years, although the record only extends for three years and ten months. The *Mount Isa Mines* debenture issue is made in conversion of the existing 4½ per cent. guaranteed sterling debentures, and is guaranteed by the Government of Queensland.

Sub-units in the following closed '15 Moorgate' Trusts can now only be purchased as and when offered for sale by existing sub-unit holders. Investors' General Trust, Investors' Gas & Electric Trust, Security First Trust, Investors' Second General Trust.

after depreciation, before tax: 1936, £72,025; 1937, £73,758; 1938, £67,447. In 1938: units sold, 114,725,668; revenue, £456,270. Proceeds to repay money borrowed (£110,000) and for working capital. Lists closed 9.15 a.m., June 20th. Over-subscribed.

Mount Isa Mines.—Issue of £500,000 5 per cent. five-year guaranteed sterling debentures at 99; principal and interest guaranteed by Government of Queensland. Redeemable at par June, 1944; third floating charge. Holders of 4½ per cent. guaranteed third mortgage sterling debentures may convert; would receive also £1 cash per £100. Total assets, £A5,869,677. Profits, after interest, before depreciation, years to June 30, 1936, £A22,583; 1937, £A98,434; 1938, £A47,867.

BY OFFER FOR SALE

James Howden and Company.—Offer for sale of 150,000 10s. ordinary shares at 16s. 6d. Boiler auxiliary makers; owns James Howden and Company (Land), Ltd. Combined profits, after depreciation, before interest, years to June 30: 1937, £30,298; 1938, £54,623; 10 months to April 30, 1939, £105,452. Combined net assets, £220,710. Montrose Trust take issue at 15s. 10½d., including expenses.

BY STOCK EXCHANGE INTRODUCTION

West Yorkshire Gas Distribution Company.—Messrs David A. Bevan and Company are taking £47,500 4 per cent. debenture stock at 99. Redeemable at par June, 1959.

BONUS SHARES

Silentbloc, Ltd.—It is proposed to capitalise general reserve of £62,500, and make a bonus issue of one new share for each share held on June 26, 1939.

Skefko Ball Bearing Company.—It is proposed that £300,000 (part of undistributed profits) should be capitalised, and that 1,200,000 5s. ordinary shares should be issued as a capital bonus in the proportion of three new shares for five held.

Rhondda Transport Company.—This company is to make a bonus distribution in the proportion of one share for four shares held.

ISSUES TO SHAREHOLDERS ONLY

King's Motors (Oxford).—Issue of 50,000 6 per cent. cumulative redeemable £1 preference shares at 20s. 3d., and 150,000 2s. ordinary shares at 5s. 6d.

Metal Box Company.—Ordinary stockholders as at June 15, 1939, are being offered one new ordinary £1 share, at 50s., for £7 ordinary stock held.

Davis and Timmins.—Issue of 20,000 5s. ordinary shares at 15s., in the proportion of one new for 17 held. New shares will rank for any interim dividend.

Yorkshire Copper Works.—Issue of 34,787 £1 ordinary shares at par; also a 10 per cent. capital bonus to ordinary stockholders, in the form of second preference shares.

DIVIDEND ANNOUNCEMENTS

Rates are actual, unless stated per annum or shown in cash per share. Rate for previous year refers to total dividend, unless marked by asterisk to indicate interim dividend.

SHORTER COMMENTS

Company Results of the Week.—Trading profits of BARCLAY PERKINS have fallen from £320,046 to £307,064, and since other receipts are lower by a similar amount, the dividend is reduced from 8 per cent. to 6 per cent. On the whole, heavy industrial companies show some decrease in profits. ALLIED IRON-FOUNDERS' total profits are £203,389, against £241,661, and the dividend is reduced from 10 per cent. to 9 per cent. A fall of nearly £49,000 in total profits is recorded by the BUTTERLEY COMPANY, while net profits amount to £167,355, against £194,904. TREDEGAR IRON AND COAL COMPANY maintain the 4 per cent., tax free, dividend, although a moderate reduction in profits is reported. Coal output was 97,610 tons lower at 2,297,243 tons. CHARLES ROBERTS AND COMPANY (whose report now includes a consolidated balance sheet and profit and loss account) record a moderate but satisfactory rise in profits, and the dividend is raised from 10 to 15 per cent. TRUST HOUSES show maintained net profits, and again pay 7 per cent. One of the most satisfactory reports of the week is that of CROSSLEY MOTORS, whose total profits are £105,746, against £64,046. The company is now benefiting from technical work done in the past. After experiencing a shrinkage in the volume of outward cargoes, ELDER DEMPSTER LINES show total profits of £826,841, against £1,035,503, but are again paying 9 per cent. ELDER DEMPSTER LINES HOLDINGS pay 8½ per cent., against 9 per cent., though the distribution absorbs a slightly larger cash sum. GLOBE TELEGRAPH AND TRUST total revenue is £273,043 against £280,359. A special bonus of 2½ per cent. on the ordinary stock is payable from the proceeds of the sale of Cable and Wireless 4 per cent. funded income stock. BRITISH PLASTER BOARD have had a very satisfactory year, for total profits of £564,810 for an 11-month period compare with £534,121 in the previous full year. THOMAS DE LA RUE AND COMPANY total profits are £289,991, against £223,523, although the report refers to disappointment with results shown by the plastic moulding section. Owing to lower prices, MARSTON VALLEY BRICK COMPANY total profits are £143,429, against £184,638, and the dividend is reduced from 17½ per cent. to 10 per cent. A moderate setback is recorded by METAL BOX COMPANY, whose total profits are £486,542, against £516,076.

MISCELLANEOUS

Powell Duffryn Associated Collieries.—Final distribution for year to March 31, 1939, of £215,000 (£305,000 a year ago), making for year £385,000 against £475,000, to be divided between Powell Duffryn Steam Coal and Welsh Associated Collieries.

Powell Duffryn Steam Coal.—Final ordinary dividend, 4 per cent., making 6 per cent. for year to March 31, 1939, against 5½, making 7½ per cent.

Welsh Associated Collieries.—Ordinary dividend for year to March 31, 1939, of ½ per cent., against 1½ per cent.

Mexican Railway Company.—Gross receipts for 6 months to end of 1938, 7,078,394 pesos (£393,244), a decrease of 674,797 pesos (£37,488) on second half of 1937. Deficit to net revenue, 647,202 pesos (£35,956) against 42,185 pesos (£2,343). Other credits, £21,704; interest and other charges, £103,764. Debit forward, £1,092,026 (£974,010).

Metal Box Company.—Profit on trading (including dividends received) after depreciation, etc., £482,715 (£508,179). To taxation, £145,500 (£158,000); general reserve, £100,000 (£100,000); superannuation, £16,501 (£15,000). Preference dividend, £1,092,026 (£974,010).

(Continued on page 731)

Industry and Trade

Cotton Spindles Board.—Those provisions of the Cotton Spinning Industry Act, 1936, which established the Cotton Spindles Board to deal with excess capacity come to an end in September next. The scrapping of redundant cotton spindles is provided for in the cotton Industry (Reorganisation) Bill, but it is not likely that this Act will be in force until next year. The President of the Board of Trade has therefore agreed that as the spinning employers are in favour of a continuance of the work of the Spindles Board, the necessary arrangements will be made for it to be prolonged for a further two years. In Lancashire there has been some disappointment that the Board has not been able to scrap more spindles in the three years of its existence. When the scheme was under consideration it was estimated that there were 10,600,000 redundant spindles in the cotton trade. In two years rather more than 4½ million spindles have been bought and broken up, but the fall in textile exports has been so drastic that trade has declined at a greater rate than the surplus capacity, with the result that last September it was estimated that there were then 14 million excess spindles. It is true that since last autumn there has been a definite revival of activity in the cotton industry, but this has been due mainly to work on Government contracts and to a slow increase in domestic civilian demand. Not until last month was there any noticeable increase in exports of cotton goods, and it is most improbable that the volume of exports will ever again reach a level to absorb the surplus capacity. It is, therefore, most important that the work of the Spindles Board is to be continued without interruption.

Prosperity in the Electricity Industry.—All activities in any way connected with the supply of electricity continue to enjoy a measure of prosperity which seems likely to continue for some time to come. The basic figure is that of the output of authorised supply undertakings, and this has shown a continuous increase since 1935. The rate of growth slackened slightly in 1938, but has been resumed in the current year, as is shown in the following table:—

	Output (Mn. kw. h.)	Increase % on previous year
1935	17,568	13.8
1936	20,220	15.1
1937	22,902	13.3
1938	24,376	6.4
1939 (first 5 months)	11,660	12.7

SHORTER COMMENTS

(Continued from page 730)

£49,481 (£51,188). Ordinary dividend and bonus, 17½ per cent. as before, absorbing £157,325 against £157,624. Carry forward £39,609 (£46,548). Total assets £4,340,776 (£4,344,280). Subsidiary companies, £2,019,020 (£2,167,637). Current assets, £1,306,113 (£1,247,593).

Edgar Allen and Company.—Trading profit for year to March 31, 1939 £141,998 (£122,045). Total profit, £156,272 (£132,937). To depreciation, £23,237 (£21,009). To tax, £46,000 (£39,000). To staff pensions, £5,000 (£5,000). Preference dividend, £10,875 (£11,250). Ordinary dividend 12½ per cent. absorbing £26,036, against 10 per cent. absorbing £20,829. To general reserve, £35,000 (£25,000). Carry forward, £37,673 (£34,269).

Philips' Incandescent Lamp Company.—Profits 1938-39, £1,803,000 (£1,801,507). Ordinary dividend maintained at 11 per cent. Liquid assets have increased from £1,320,000 to £1,510,000.

Globe Telegraph and Trust.—Net revenue year to May 31, 1939, £258,331 (£264,747). Ordinary dividend of 10 per cent., tax free, is repeated. To reserve £20,000, against nil. Carry forward reduced from £135,454 to £117,992. Investments at cost, £5,011,000; value on May 31, 1939, was £6,312,000 (£6,372,000).

Stephenson Clarke and Associated Companies.—Report for year to March 31, 1939, shows profits £607,865 (£589,358). To depreciation £185,890 (£186,574). Tax and N.D.C. £125,000 (£119,000). Net profit £220,585 (£208,908). Ordinary dividend maintained at 10 per cent., absorbing £102,406 against £91,719. To general reserve £50,000 (£50,000). Carry forward raised from £73,968 to £83,422.

Bank of British West Africa.—Profit for year to March 1939, £42,878 (£60,106). Ordinary dividend reduced from 5 to 4 per cent. Carry forward £50,592 (£55,714). Total Assets £9,860,306 (£12,538,551). Cash £2,275,422 (£5,865,566). Investments £3,411,449 (£2,439,603). Current deposits and other accounts £7,280,393 (£9,851,759).

Barclay Perkins and Company.—Gross trading profits for year to March 31, 1939, £307,064 (£320,046). Dividends from subsidiaries £84,448 (£101,771). Net profits, after taxation and interest, £212,432 (£244,200). Ordinary dividend 6 against 8 per cent. To reserve for contingencies £20,000, as before. To workpeople's fund £4,067 (£5,481). Carry forward raised from £65,044 to £70,513.

Tredegar Iron and Coal.—Profit for year to March 31, 1939, £83,380 (£88,467). To depreciation £10,000, as before. Ordinary dividend 4 per cent., tax free, as before. Carry forward £39,648 (£35,512). Total output of coal 2,297,243 tons, or 97,610 tons less.

Reynolds Brothers.—Net profit year to March 31, 1939, £184,308 (£172,671). Debenture redemption reserve £50,000 (£25,000). Reserve for Umwalumi Valley Estates £10,000 (nil). To reserve for Union and provincial taxes £18,794 (£18,350). Ordinary dividend and bonus 12½ per cent., as before. Carry forward £94,314.

(Continued on page 750)

exports to Japan, which fell from £13½ millions in 1929 to £4·2 millions in the worst year of the depression, declined still more in subsequent years, to £4·3 millions in 1937 and £1·8 millions last year. The table below gives details of the British imports from and exports to Japan of commodities whose value in 1937 exceeded £300,000:—

BRITISH TRADE WITH JAPAN						
	Unit	1937		1938		As % of total Imports or Exports in Group
		Quantity	Value £'000	Quantity	Value £'000

* Not available; percentage in last column worked on 1937 values.

With the exception of sawn oak and wood products, of which a considerable quantity is used by the building and furniture trades, and of raw silk, the goods imported from Japan could probably be obtained from other sources. Supplies of canned salmon, for instance, of which an unusually large quantity has been imported from Japan in recent weeks, could be drawn to a greater extent from Canada and Norway, although admittedly at higher prices. And even the complete disappearance of Japanese oak and raw silk would not cause serious harm to the British economy. On the other hand, Japanese imports from Britain, which are made up of many small items, are now confined largely to producer's goods.

The total share of Britain in Japanese trade is, however, small and if supplies could not be obtained from this country, other sources could probably be found. The next table summarises Japanese trade with the yen block, the United States and the British Empire:—

JAPAN'S FOREIGN TRADE (Million yen)			
	1936	1937	1938
Imports, total.....	2,764	3,783	2,663
of which from

* Kwantung, Korea, Manchuria.

† Canada, India, Ceylon, South Africa, Australia, New Zealand, Hong Kong, Straits Settlements, British Borneo.

An embargo on British exports to Japan would therefore have little immediate effect unless combined with similar measures by the United States or by other parts of the

British Empire, who supply Japan with her imports of vital raw materials such as rubber, cotton, wool, iron and tin. But, as the above table shows, Japan has a favourable balance of trade both with the United Kingdom and with the British Empire, so that a restriction of her exports would seriously reduce the amount of free exchange by which she finances her purchases from other countries.

Milk—Fresh and Canned.—At the annual general meeting of the Milk Marketing Board, Mr Baxter made two important statements. He drew attention to the increase in the sales of milk produced under accredited, attested or tuberculin-tested licences, which covered in 1938-39 42 per cent. of all milk sold through the Board. The steady progress in the production of cleaner milk is a matter on which the Board can rightly be congratulated, particularly since the withdrawal of the proposed Milk Bill has temporarily imposed on the Board the payment from its own reserves of the quality premiums. Mr Baxter also informed the meeting that, in his opinion, farmers could no longer rely on obtaining any higher prices for their liquid milk and that a further increase in profits would have to come from greater efficiency in the management of farms. In view of the continuously rising level of retail prices of liquid milk in recent years, consumers may indeed be grateful to know this opinion of Mr Baxter's; but they may also view with apprehension the announcement of the Board of Trade that imports of condensed milk will be regulated by a formal quota. This new step follows the breakdown during last year of the agreement between Dutch and Danish exporters and English manufacturers of processed milks over imports and prices, which had the effect of making the English market so profitable that supplies from New Zealand and Canada increased rapidly. The fact that a "voluntary" quota arranged by the English manufacturers (among whom is the Milk Marketing Board) has been supplanted by a quota administered by the Board of Trade might not be altogether disadvantageous to the public interest, but the publication last week of the annual quotas showed that a considerable reduction in imports is to be enforced. Compared with actual imports on an average of the last three accounting years ending in June, imports of whole and of skimmed milk are to be reduced by about 30 per cent. The consumer may feel, therefore, that the pressure of the Milk Marketing Board for higher prices has only been diverted from liquid milk to condensed milk, which is at present the only substitute for the very expensive fresh product.

Glass Research.—In the British glass industry, which at the Census of Production in 1935 had an output valued at more than £17 millions and employed about 46,000 workers, a scientific institution for teaching and research is a simple necessity. This fact received wide recognition soon after the foundation in 1915 of the pioneering Department of Glass Technology at Sheffield University and, subsequently, of the Society for Glass Technology, which has now an international character; and contact with industry was organised through the Glass Delegacy of Sheffield University, in which the industrial representatives are now the strongest element. The formal opening last week of the Department's new premises draws attention at a critical time to its value and activities. The effect of the German annexation of Czecho-Slovakia on exports of glass from the latter country to Great Britain cannot yet be finally assessed, but there are indications that it will be by no means negligible. There has been a considerable falling off in the past few months, as is shown in the table opposite. The decrease in imports from Czecho-Slovakia has not been offset by the increase in imports from Germany. There of course remains a possibility that the present decline may be due to temporary factors. It is in fact known that at the moment British importers are experiencing difficulty in obtaining deliveries on orders already given. But if any part of the reduction may

" Other countries	119,990	120,340
Total	637,022	573,004

be regarded as permanent, then quite the best way of filling the gap would be by increased home production. In an expansion of this kind the Department of Glass Technology could undoubtedly give valuable assistance—as could many Czech refugees. It is also worthy of note that during the War grants were made to the Department by the Ministry of Munitions for optical and glassware work. There was in fact an acute shortage of optical and scientific instruments in the early part of the War, and it is desirable that the Department should be encouraged to assist in ensuring that no such gap occurs in future.

Dry Docks on the Bristol Channel.—An outbreak of war directly involving this country would have as one of its immediate consequences a diversion of shipping traffic to the ports of the West of England and to those of the Bristol Channel in particular. These ports are relatively safer from attack from the sea or the air than are, say, London or Hull or even Liverpool. The National Industrial Council of Wales and Monmouthshire has therefore performed a valuable service in drawing attention in its journal to the fact that present dock facilities in South Wales are hardly adequate to the existing traffic, which is itself attenuated as a result of persistent depression. The immediate aspect of the question with which the Council is concerned is the necessity for improved dry dock accommodation at Barry, Cardiff, Newport, Swansea, Port Talbot, Pembroke Dock and Milford. The local authorities of the first six of the above-named ports, together with that of Llanelli, and the Welsh Parliamentary Party are petitioning the Government for assistance to build five new dry docks and improve ten others. In a memorandum prepared for this purpose, it is pointed out that, in addition to the potential usefulness of the suggested improvements in war time, they are an immediate necessity to the trade of the area. The existing docks were built before the War to accommodate small coal-carrying vessels, and until they are widened they are not suitable to take more modern types of tramp steamer. At present there are only twenty-two workable berths at Cardiff, Barry and Newport, and of these only seven will take vessels of 58 feet beam. If the proposed improvements are not made the sorely needed increase of trade at these ports will be positively handicapped. If they are made, recovery in South Wales will at least not be checked by remediable deficiencies, and work will certainly be given to local contractors and local workmen. It is not often that the precautions necessary for war and the provision of facilities for peaceful trading can be supplied by one and the same action. When they can, as in the present case, the opportunity should not be missed.

Revival in Textile Exports.—The textile trades were among the first of Britain's staple industries to feel the trade recession which began at the end of 1937. In the last few months there has been a revival in activity in

Lancashire and Yorkshire, due very largely to Government orders. Home demand showed a spurt during the hot weather at Whitsun and trade in cheaper woollen cloths has been fairly satisfactory. There has also been a very definite increase in exports of woollen, linen and pure rayon piece goods, due, as the table below shows, almost entirely to better trade with the Empire:—

British Exports of Textiles			
	January to May

The reduction of American duties on imported cloth is partly responsible for the larger exports to foreign countries

THE BALTIMORE AND OHIO RAILROAD CO.

SUMMARY OF ANNUAL REPORT FOR THE YEAR 1938

Report of the Company's operations for the year 1938 is being mailed to the stockholders. Stated briefly, the results for the year show a decrease of 20·49 per cent. in gross revenues, or from \$169,436,436 in 1937 to \$134,722,330 in 1938, and an increase in the net loss, after all taxes and other deductions, from \$720,695 to \$13,124,530. Total operating expenses of \$104,984,021 showed a reduction of \$23,875,495, or 18·53 per cent., compared with the year 1937. The expenses reflect an increase in wage rates which took effect in the latter half of 1937 and added about \$4,150,000 to the company's expenses in 1938. Railway tax accruals, at \$10,412,774, reflected a decrease of \$505,781. Tax accruals include \$3,709,108 pay-roll taxes covering unemployment compensation under the Social Security Act and the Carriers' Taxing Act of 1937 for the purposes of the Railroad Retirement Act.

CONDENSED STATEMENT OF OPERATING RESULTS

	Year 1938	Year 1937	Decrease
Railway Operating Revenues:	\$	\$	\$
From Freight	115,426,378	147,212,330	31,785,952
From Passenger	10,561,495	11,918,602	1,357,107
From All Other Sources	8,734,457	10,305,504	1,571,047
Total	134,722,330	169,436,436	34,714,106
Railway Operating Expenses	104,984,021	128,859,516	23,875,495
Net Railway Operating Revenue	29,738,309	40,576,920	10,838,611
Other Operating Charges:

Net Railway Operating Income	14,851,794	24,908,625	10,056,831
Other Income from Investments and Other Sources (Net)	4,207,959	6,554,711	2,346,752
Income Available for Fixed Charges	19,059,753	31,463,336	12,403,583
Fixed Interest and Other Charges	32,184,283	32,184,031	*252
Net Income	(D)13,124,530	(D)720,695	12,403,835

(*) Denotes Increase. (D) Denotes Deficit.

BALANCE SHEET

The balance sheet at December 31, 1938, shows total investments (less accrued depreciation) of \$1,078,104,478 and current assets of \$23,818,931. The total of interest-bearing debt and leased lines obligations outstanding was \$683,808,070. Current liabilities amounted to \$26,855,503. The capital stock outstanding was \$315,158,485 and corporate surplus \$60,337,728.

The report presents a condensed statement of the Plan for Modification of Interest Charges and Maturities, and points out that of the total of \$542,810,628 of securities affected by the Plan, voluntary assents have been received on \$469,481,178, or 86·49 per cent., from more than 57,000 holders.

of woollen and linen tissues, while China has increased her purchases of wool tops and Germany and Scandinavian States have taken greater quantities of worsted yarns. But this revival, while very welcome to the industries concerned, has not yet counterbalanced the very sharp drop in exports between 1937 and 1938, except for the single case of pure rayon tissues. The revival in this trade has indeed been very striking; production of continuous filament has increased steadily since last autumn, and the production of staple fibre reached in May a record monthly level of 5.7 million lb.

* * *

Cut in Cement Prices.—Prices of cement to the consumer were officially reduced by 1s. per ton last Monday. As wages were advanced by 2s. per week in May and the price of coal has increased in recent years, costs of production in the industry are showing a rising tendency and it seems difficult to account for a price cut at the present time on that score. Two months ago the Chairman of Associated Portland Cement Manufacturers, Sir Malcolm Stewart, suggested that a reduction might be made if the decline in demand gave way to an expansion. This decline has, in fact, now been arrested, largely owing to building in connection with defence work, and the Cement Makers' Federation states that it is hoped that the lower price will further stimulate the improvement so that increased production will be warranted. It is not impossible that a desire to discourage new undertakings has also influenced the Federation's decision, for although present capacity is sufficient for all normal requirements, the high profits of the past few years have attracted newcomers and reports of a possible new producer last November caused considerable anxiety in the industry. This question of a cut in prices was the subject of a good deal of discussion when the new quota agreement in the industry was under negotiation, as the smaller concerns whose costs are relatively higher were unwilling to agree to it. When the agreement on quotas and prices was eventually signed in April it was stated that there had been concessions on both sides so that the present reduction may be regarded as the outcome of that agreement. Actually it now appears that the producers are unlikely to lose over the new prices, for a good deal of the reduction will be borne by the merchants in the shape of smaller margins and discounts.

* * *

Anglo-American Barter.—During the last few days the negotiations between the Governments of the United States and of this country for the exchange of about one million bales of cotton against an equal value of rubber have proceeded further. At the end of last week representatives of the Liverpool Cotton Association attended a conference in London, held under the auspices of the Board of Trade, at which they took the opportunity to convey to the President of the Board of Trade their strong opposition and disapproval of the proposed scheme. Direct exchange between the two Governments would naturally cause a considerable loss of potential trade to the merchant firms in Liverpool and the existence of large stocks of raw cotton held by the British Government would provide a further element of uncertainty to a harassed market. It is, therefore, not surprising that members of the cotton trade should oppose the barter scheme, which does, indeed, present grave difficulties. The final decision must, however, be taken on wider grounds than the opposition of the cotton trade, and it is possible that the transaction might be carried out through the facilities offered by the recognised trade associations. It is understood that an extraordinary meeting of the Liverpool Cotton Association will be called as soon as the President of the Association can disclose any further information on the progress of the negotiations.

Labour in Gold Mines.—Gold production in South Africa has been at a very high level during 1939. For the first five months the total output was 5,194,677 ounces, an increase of 262,571 ounces over the production in the corresponding period of last year. This expansion is partly the result of the employment in the mines of an increasing number of natives drawn from the tropical areas north of latitude 22 degrees south. When the experiment was originally begun in 1933, in order to alleviate the labour shortage, only 2,000 of these natives were employed, but by the end of 1937 their number had increased to more than 10,000 and by the end of 1938 to more than 16,000. Most of the chairmen at the latest annual meetings of the Rand mining companies considered that the employment of these natives had been a success and were hopeful that the State restrictions on their recruitment would soon be reduced; the Rand labour organisation has already opened branches in the districts from which the natives are drawn, in anticipation of a further increase. It is true that the death rate, which is a rough measure of the health conditions, of the natives from tropical areas has improved in a striking fashion, falling from 18.18 per 1,000 workers in 1937 to 8.60 per 1,000 in 1938, but even at this level it is higher than the average death rate of natives working in the Transvaal mines, which fell from 7.59 per 1,000 in 1937 to 5.36 per 1,000 in 1938. There would, therefore, seem to be a strong argument for avoiding haste in increasing the employment of men from the tropical districts, particularly as the Governments of South Africa and Portuguese East Africa have prolonged for a further five years the Mozambique Convention for the employment of natives from the Portuguese colony in the Rand mines.

* * *

Italian Coal Imports.—Imports of coal and coke represent one of the largest items in the Italian import trade. In 1938, 12 million metric tons of coal and coke were imported, valued at 1,732 million lire, while the total value of Italian imports last year amounted to 11,124 million lire. The table below gives details of the origin of the Italian supplies of coal and coke in recent years:—

ITALIAN IMPORTS OF COKE AND COAL
(Thousand metric tons)

	1933	1934	1937	1938
Coal	8,790	11,781	12,573	11,817
From U.K.	4,747	4,614	1,999	2,233
„ Germany*.....	2,201	4,539	7,628	6,972
„ Czechoslovakia.....	1	...	705	540
„ Poland and Danzig	652	1,163	1,640	1,612
„ Russia	577	616	1	...
Coke	772	952	354	215
From U.K.	182	108	...	...
„ Germany*.....	253	414	199	115
„ Poland and Danzig	38	119	33	8
„ France	144	113	73	68

* Including Austria.

It will be seen that there has been a marked change in the relative importance of the different sources of supply between the pre- and post-sanctions periods. Since 1934, British exports of coal to Italy have been halved, while those from Germany increased by 50 per cent.; with the absorption of Czecho-Slovakia the importance of German coal will be further increased. Exports from Poland have also risen in the last two years, compared with the earlier period. In spite of this shift, however, the great bulk of Italy's supplies of coal continue to reach her through the English Channel, since both the Polish and German exports are shipped by sea from Danzig or Rotterdam. Only a very small quantity of Czecho-Slovakian or South German coal is sent overland on the long and arduous journey through the Alps by the Tarvis and Brenner passes.

INDUSTRIAL REPORTS

Iron and Steel

Sheffield.—Rather quiet conditions prevail in the iron market in contrast to the activity of the steel market, where pressure for supplies is difficult to meet in full. Business in forge and foundry iron is hampered by the absence of any pronouncement concerning prices, and buying is largely confined to small parcels for near delivery. Exceptionally, the demand for basic pig is very active, with forward business on a good scale. Hematite consumers are waiting for the lower prices which will operate next month. Bar iron demand is disappointing.

Supplies of heavy basic steel billets are inadequate. Producers are fully booked, and some have been compelled to decline further commitments for the present. Acid billets are also in rather short supply. Business in small steel bars, wire rods and structural steel is on a large scale.

Both Government and commercial orders continue at a high level, although international developments have hampered the latter during the last ten days. Steel production is being expanded to capacity, but demand is still ahead of supply. Some firms have enough orders on hand to keep them busy for many months.

*

Middlesbrough.—The full production of semi-manufactured and rolled basic steel is readily absorbed and is insufficient for re-rollers' demands. Further quantities are being imported from the Continent. Government requirements are receiving first preference but commercial orders are being implemented as far as possible without delay. Sheet mills continue to run to capacity and other departments are fully occupied.

Trade in Cleveland foundry pig iron shows little change, while East Coast hematite pig iron is in very poor request until the new prices come into operation on July 1st. Although some hematite furnaces are working on slack blast there is a tendency for stocks at makers' yards to increase.

There is no change in the position of heavy steel melting scrap, which is taken up as soon as it becomes available. The foreign ore position is unchanged and supplies of good Durham blast-furnace coke are available at the official prices.

*

Glasgow.—Business is moving fairly steadily. In the home market the household trade is quiet, but industrial demands are maintaining their improvement. In addition to the good trade with steelmakers and other buyers, there is a stronger demand from the railways. The shipping trade is also satisfactory on the whole, with a good increase continuing in respect of cargo business. Little change has taken place in prices during the week, but there is an easier tendency due to seasonal influences. There has been some short-time working in Lanarkshire owing to the contraction in household business, but most other districts have been steadily employed.

Glasgow.—Further contracts for Clyde shipbuilders are announced this week, the most important being that for the aircraft carrier which Messrs John Brown and Company, Limited, of Clydebank, are to build. In Glasgow and the West of Scotland steel plants are running to capacity except where supplies of raw material are inadequate. This difficulty is, however, being overcome by increased shipments from abroad. Pressure for delivery from users of every description of steel is severe, and it is practically impossible to buy material for early delivery. A large amount of new business has been placed within the past week and inquiries are numerous.

News from Abroad.—Most buyers, after having purchased considerable tonnages during the last few months, have sufficient stocks and turnover has been slightly lower, but current requirements for a number of products, particularly sheets, are still on a large scale. Belgian producers, who are doing the bulk of the export trade, expect that the favourable situation will be maintained for many months, and a number of works are already booked up almost to the end of the year. The Belgian works are anxious to foster their sales of finished goods, for current orders are for relatively large quantities of semi-products. The British demand for the latter has remained as keen as ever, and other countries, including Japan and Scandinavia, are buying in this market.

Prices have remained firm, and even in the Far East, where American offers cause disturbances in the market organisation, there has been an improvement in prices recently. Quotations for thin sheets, wire rods and castings have shown a particularly sharp advance. Low-priced American offers are effective in the market for ship steel. Although delivery times range from about seven to ten weeks, an official upward revision of the price level by the Cartel is less persistently canvassed than several weeks ago. Rebates on official prices are granted, if at all, to a limited extent on sections and merchant bars.

Textiles

Cotton (Manchester).—In some sections of the industry producers are very busy and early delivery is not easily obtained, but in other branches it is difficult to sell current output. The chief activity is in the coarser end of the trade. Comparatively minor fluctuations have taken place in raw cotton rates. Confusion with regard to the future action of the United States Government is still as great as ever, but it is probable that the export subsidy appropriation will be considered by the House of Representatives before the end of the week. The progress made with the scheme for the exchange of cotton for rubber between the British and United States Governments is discussed on page 734.

It now seems probable that the price agreement for 42's American welt, which expires at the end of this month, will be renewed, for at a meeting of the members this week there was only one dissident. The Executive Committee will report on the position after a further meeting on June 29th. The better demand in the yarn market has been maintained and a persistent inquiry has been experienced in the cloth market from home and export buyers. Fair prices have been fixed for Government contracts and some substantial orders have been given out.

*

Wool (Bradford).—Activity in the wool textile industry has been greater during the past fortnight than at any time within the past twelve months, due mainly to Government orders. More machinery is running and nearly all plants are working full time. Khaki requirements affect crossbred wools far

SIR HERBERT LAWRENCE'S ADDRESS

The annual general meeting of shareholders of the Ottoman Bank was held, on the 20th instant, at Winchester House, Old Broad Street, London, E.C.

General The Hon. Sir Herbert A. Lawrence, G.C.B., presided.

Mr W. Stewart McKim (secretary to the committee) having read the notice convening the meeting,

The Chairman said:—Ladies and Gentlemen,—I have been informed that this meeting is properly constituted, and I presume it is your pleasure that the report and balance sheet circulated among you should be taken as read. (Agreed.)

THE LATE MR BARRY

Only a few days after our last general meeting the bank suffered a most grievous loss by the death of Mr Barry. Mr Barry was appointed to the managership of the London office in 1898, and retained that position when he was elected to the committee in 1909. He identified himself completely with the bank up to the day of his death. He contributed greatly to the prestige of our establishment by his rare qualities as a banker, his judgment, and the respect which he justly enjoyed in the City. We shall always have a loyal regard for his memory.

The career of Monsieur de Cerjat, who does not offer himself for re-election, resembles that of Mr Barry in many respects and was also entirely devoted to the service of the bank. He joined the staff nearly 45 years ago, and, after rapid advancement, first in France and then in Turkey, was appointed manager of the Paris office in 1903 and a member of the committee in 1911. He fulfilled his functions with distinction and devotion, notably in the difficult days of the Great War. He resigned his executive office in 1923, but remained a valued colleague on the committee. In his retirement he carries with him our affectionate esteem.

Monsieur Roudy, whose resignation is announced in the report, had been for eight years a member of the committee, during which time we learned to appreciate the soundness of his judgment and his technical and administrative abilities. It is a pleasure to me on this occasion to thank him for the readiness with which he in all circumstances placed his qualities at our service.

THE PAST YEAR

There is, doubtless, no need to remind you of the serious events which marked the year 1938. The spreading of the Chinese-Japanese war, the continuance of the civil war in Spain, the suppression of an independent Austria, followed almost immediately by the tension between the German Reich and Czecho-Slovakia—from which a general conflagration promised to ensue, until the Munich Agreement detached the Sudeten territory—in short, the steady collapse of that order which was instituted in Europe by the treaties of 1919 without any sign of a peaceful means whereby a new equilibrium could be reached—all this is still in your minds. I should not have felt obliged to refer to these events at the beginning of my remarks if it were not a fact that in the world to-day political factors contribute at least as much as economic factors in determining the general conditions in which an institution such as this conducts its activities.

Certainly the industrial and commercial recession which has been felt since the middle of the year 1937 is not comparable either in duration or gravity to the great crisis of 1930. Barely a year after its appearance it was possible to discern in the figures of industrial production and foreign trade, as also in a better price tendency, some symptoms of a recovery, discounted by Wall Street, which was supported further by a universal abundance of crops. But though a rift in the political clouds during the autumn was enough to encourage the movement, it is hardly to be expected that it can continue so long as international anxiety prevails.

PARALYSING THREATS OF WAR

These continual threats of war paralyse all spirit of enterprise. Capital is everywhere disinclined to engage in long-term commitments. It turns, seeking an escape from recurring risks, from one currency to another, when it does not sterilise itself in gold. These sudden migrations of capital exercise a steady pressure on all currencies and in the end succeed in weakening the soundest of them. Last year the pound sterling, which is the currency of your balance sheet, experienced a depreciation up to 7 per cent. in terms of the dollar and of other foreign currencies which are, freely or artificially, maintained at their gold parity. The franc, which, as you are aware, is the currency in which a part of our assets are represented, fell by 18 per cent. between January 1st and May 5th, when the rate of 179 was fixed as a limit beyond which it should not be allowed to fall. The return of confidence brought about by the remarkable rally of France in the face of external danger later resulted in considerable repatriations of funds, and thus materially assisted the franc.

These threats of war are the sole cause also of the weakness and instability of the great stock markets. In particular, the heaviness of the best State funds may be explained by the prospect of large and continual borrowings rendered everywhere inevitable by the increase in expenditure on armaments.

BUSINESS DIFFICULTIES AND PROBLEMS

The business of our bank and its subsidiary and allied institutions is faced with difficulties of a special nature, working as we do in countries which are exporters of primary commodities and therefore dependent upon world prices. Moreover, some of the countries in the Near East export commodities for which sufficient markets cannot be found, even at world prices, in countries with a free exchange. As a result they have been forced to look to Germany—and to a lesser degree to Italy—to find a remunerative outlet for their products, and have concluded with those two totalitarian Powers a whole network of clearing agreements. The consequences for trade and the repercussions on currency questions, on which I dwell three years ago, are to-day recognised by all as one of the problems of the day which it is most necessary and most difficult to solve.

Meanwhile, until a remedy is found, these countries are more and more involved in the regime of restriction, control, and autarchy which the States in question have adopted as the means of mobilising permanently their resources of every kind. It is no more possible to

withdraw funds from Turkey than from Greece, Iran, Yugoslavia, or Roumania, or to make a transfer from one account to another without permission of the authorities.

EXCHANGE RATES OBSTACLES

Commercial operations with foreign countries are conducted by way of compensation, involving ever-widening differences between the exchange rates adopted and the official rates, and this is by no means one of the smallest obstacles to the regular service of the old financial debts. The consequence has been the progressive disappearance of all international credit in its traditional form, whether at short or long term. From the monetary point of view the practice of multiple rates is becoming general, implying varying purchasing powers, or, if you like, varying percentages of depreciation dependent on the goods bought and the identity of the parties to the contract. The prices of the chief agricultural and mining products have been driven by German purchases to fictitious levels, and their exaggeration in relation to prices on the free markets is the measure of an unacknowledged devaluation.

THE SEPTEMBER CRISIS

Again, it is not surprising that an alarm such as that of last September should have caused almost everywhere withdrawals from the banks. The most critical period, fortunately, only lasted some days and most monetary and banking systems were sufficiently flexible to withstand the strain without moratorium or accident. None the less, the fact remains that credit establishments were obliged to exercise the greatest prudence precisely at the season when the business campaign was at its height, which is normally the most productive part of the year.

In spite of so unfavourable an atmosphere, our profits, reaping the benefits of reorganisation carried out by your various managements, show a very perceptible advance on those of preceding years. In reality the results of our exploitation proper have been very much better than those shown by the published accounts, and have allowed us, without touching our reserves, to cover the depreciation in exchange and in investments which was caused by the circumstances which I have just mentioned.

Unfortunately—and this does not depend on ourselves—for certain groups where the efforts made have met with the best results, it continues to be impossible or almost impossible to obtain the transfer of profits earned.

But for this factor, which is of especial importance in such a field of action as ours, we should have been in a position to envisage a substantial increase of dividend instead of maintaining it at the previous figure, as will presently be proposed.

As my remarks on the general situation apply to all our groups, it will be possible to be brief in reviewing the conditions peculiar to each.

CONFIDENCE IN THE FUTURE OF TURKEY

For Turkey, the year 1938, the fifteenth anniversary of the Republic, will remain above all one of national mourning. In the name of all of you, I wish to express to the Commissary of the Government, who is present to-day, the respect and regret we feel for the great figure of Kemal Ataturk. Of the man and his work nobody is unaware. I may here be allowed merely to recall, as the most worthy tribute to his memory, that he was able to restore to the Turkish nation the deep sense of their national dignity. In this way and by no other means the new Turkey has been raised by its founder to the rank of a Great Power. At his departure no more worthy successor could have been found than his loyal comrade in the past struggles and the confidant of his thoughts. Our best wishes go to General Ismet Inonu in his responsible task. In his hands Turkey and her friends can view the future with confidence, whatever the uncertainties of the time.

Here I must add that to this bank, with its Franco-British committee and its roots established for over three-quarters of a century in Turkey, the arrangements in course of conclusion between Great Britain and Turkey and France and Turkey are a source of the keenest satisfaction. We all hope that the object which they have in view, the maintenance of European peace, will be attained and thus help to bring nearer the time when a solution to the economic problems of the world can be sought in a calmer atmosphere.

RECORD LEVEL OF AGRICULTURAL PRODUCTION

Agricultural production, especially that of cereals, reached record levels in 1938, thanks to irrigation works carried out by the Government. A fresh increase in livestock was also registered. In the industrial sphere, the plans already announced are in course of execution. Last year a mill for merino yarn was opened at Bursa,

and one for artificial silk at Guemlik. At Ismit a chlorine plant is in course of construction.

Out of the British credit of sixteen million pounds, to which I referred last year, ten million pounds was destined for productive equipment, and Turkey proposes to make use thereof to carry out a new plan, extending over four years, which includes the construction of ports and the purchase of ships. The German Government shortly afterwards opened to the Turkish Government a commercial credit of one hundred and fifty million reichsmarks.

So vast a programme of industrialisation entails heavy purchases of material abroad. This explains the fact that, whereas imports and exports taken together represented in 1938 a value higher than that of 1937 by 17 per cent., the percentage of increase amounts to 31 per cent. for imports and only 5 per cent. for exports. Thus there reappears a deficit in the trade balance, estimated at four million eight hundred thousand Turkish pounds, which really, under the system of clearings, does not signify an outflow of funds, but expresses an indebtedness in products of the country.

Railway receipts, which reflect home trade, increased by 25 per cent., though the length of railways under exploitation only increased by 3 per cent. Suspensions of payment, however, were more frequent than in 1937, and still more than in 1936, and accounts due from Anatolia seem less easy of recovery.

RESTRICTION OF PUBLIC PURCHASING POWER

It may be that the stagnation of trade in manufactured goods in particular denotes a certain restriction of the purchasing power of the population. The rise in the cost of living doubtless accounts for much; the public authorities are therefore concerning themselves with reducing prime costs, while in the matter of sales, any departure from fixed prices has been made illegal.

In a statement of accounts published by the Central Bank, the Bill Portfolio, from the end of one year to the end of the next, rose from fifty-one million five hundred thousand Turkish pounds to ninety-seven million four hundred thousand Turkish pounds. This may be taken as the cause for the expansion of the note circulation from one hundred and sixty-eight to one hundred and ninety-four millions between the same dates. This expansion has resulted in an easing of the money market and the official discount rate, which had been at 5½ per cent. since March, 1933, was reduced to 4 per cent. on July 1, 1938. Since this date also a law which directly affects the banking industry, restricts to 8½ per cent., as against 12 per cent. formerly, the interest charged on most lending operations.

NATIONAL DEFENCE EXPENDITURE

Although the requirements of national defence have now brought the Budget of public expenditure to the unprecedented figure of some three hundred millions of Turkish pounds, the estimated revenue to meet it has easily sufficed to balance this expenditure, and, though the revenue surplus is no longer what it has been in recent years, it has nevertheless been possible to effect reductions in taxation.

It will be readily understood that in Turkey, as elsewhere, it has only been possible to cover extraordinary credits by the issue of bonds or by internal loans. The external debt also will be increased by bonds issued for the purpose of indemnifying the electricity and tramways of Istanbul, a concern which was taken over at the turn of last year. Our establishment has been charged with the service of these bonds.

THE BUDGETARY SITUATION

While the budgetary situation in Turkish pounds remained as a whole satisfactory, the Treasury, in the early months of 1938, suffered a reduction in its balance of foreign currencies for the general reasons already explained.

It will be recalled that at the date of our last general meeting negotiations on the subject of Turkey's external debt had begun between the Turkish and French Governments. These resulted on July 18, 1938, in a revision of the Agreement of April 29, 1936. Henceforth the total amount of the coupons is payable in goods, and the task undertaken by the Société Commerciale Franco-Turque is correspondingly increased. Since the same measure is to be applied to the various repurchase annuities, the annual economy in foreign currencies to be realised by the Turkish Government may be estimated at the equivalent of five millions of Turkish pounds.

CO-OPERATION WITH NATIONAL AND FOREIGN BANKS

As you are aware, we ourselves, in February, 1938, helped the exchange situation by a readjustment of our temporary credit to

the Government. It may be said generally that the relations of the bank with the authorities continue to be those of close mutual confidence.

It is an evidence of the activity displayed by our general management for Turkey and by all the branches there, both in the way of increasing their resources and by obtaining better results through co-operation with the other national and foreign banks, that the results in local currency of the group rose this year to a level which affords the greatest satisfaction. It may even be difficult for them to maintain this standard in the near future if shocks such as those of September, 1938, and March, 1939, with all their repercussions and the precautionary measures which they impose, should constantly throw their programme out of gear.

POSITION IN EGYPT

In Egypt the past year was one of particular difficulty, owing not only to the world political situation but to the influence of a number of local factors.

The draft budget for 1939-40 estimates expenditure at forty-one million eight hundred and forty-seven thousand Egyptian pounds and revenue at forty million two hundred and forty-seven thousand. The latter figure includes three million Egyptian pounds, which is the estimated yield of the new income tax and other new taxation. It is proposed to meet the deficit of one million six hundred thousand Egyptian pounds by drawing on the reserve fund.

Foreign trade contracted sharply, and for the first time in a number of years shows an unfavourable balance. Imports in 1938 amounted to thirty-six million nine hundred and thirty-four thousand Egyptian pounds and exports (including re-exports) to thirty million one hundred and twenty-five thousand Egyptian pounds. In 1937 the figures were: Imports, thirty-eight million and thirty-seven thousand Egyptian pounds; exports, forty million six hundred and thirty thousand Egyptian pounds.

COTTON CROP

The heavy drop in the export figures was mainly due to the fall in quantity and price of the exported cotton, which was valued at twenty-one million one hundred and ninety thousand Egyptian pounds, against twenty-nine million and two thousand Egyptian pounds in 1937.

The 1938-39 cotton season has been a bad one for the cultivator, and it is estimated that the crop will only be some eight million cantars, compared with a record crop of eleven million cantars in the previous season. It is expected that this small crop, together with the one million five hundred thousand cantars carried over from the 1937-38 season, will be exported by the end of the current campaign. Exports during recent months have maintained satisfactory levels, and stocks of cotton in Alexandria at June 1, 1939, were only two million four hundred and seventy-five thousand cantars, as against three million and thirty-three thousand cantars at the same time last year.

Negotiations have taken place for the renewal with modifications of the Charter of the National Bank of Egypt. This is a matter of great importance to Egypt, and it is earnestly to be hoped that the decisions reached will enable the bank to continue its role of issuing bank and banker to the Government as successfully as it has done in the past.

Prices on the Egyptian Stock Exchange, as elsewhere, have been seriously affected and stocks and shares of all classes have fallen sharply.

It will be understood that in Egypt the year 1938 was extremely difficult from a banking point of view, yet our branches in Egypt were able to improve their earning capacity, although compelled to adopt a policy of caution.

PALESTINE

In Palestine unrest continued, with an increase of terrorism in the second half of the year. Periods of curfew and insecurity seriously interfered with trade, and Arab businesses in particular suffered greatly.

Imports, excluding military stores, amounted to eleven million five hundred and sixty-five thousand pounds, against fifteen million four hundred and thirty-five thousand in 1937, while exports were only five million pounds, compared with five million eight hundred thousand in the previous year. Currency in circulation stood at five million five hundred thousand pounds at the end of the year.

The citrus export season opened with prices at a satisfactory level, but prices realised after Christmas barely covered the cost of production and shipment. Towards the end of the season a distinct

improvement set in, and all things considered, the season has not proved at all a bad one.

From a profit-making point of view, our Palestine branches suffered from the stagnation of business in general and from the necessity of pursuing a policy of extreme caution. In Transjordan conditions and business remained more or less normal.

SITUATION IN IRAQ

In Iraq the political situation was quiet throughout 1938; the frontier treaty with Iran and a non-aggression pact between Iraq, Turkey, Iran and Afghanistan were both ratified.

Ordinary revenues for the year ending March 31, 1938, amounted to six million one hundred and eighty-five thousand Iraq dinars, and expenditure to five million one hundred and sixty-nine thousand Iraq dinars, while for the remaining nine months of 1938 the figures were: ordinary revenues, four million two hundred and forty-one thousand Iraq dinars; expenditure, three million eight hundred and fifty-three thousand Iraq dinars. The dinar is equivalent to the pound sterling.

Beyond the ordinary expenditure there is a "Five-Year Plan" for public works, involving more than eight million pounds. The sums already spent on this plan have exceeded estimates, and measures of retrenchment have become necessary. The general position, however, is considered sound.

OIL ROYALTIES

Oil royalties totalled about two million Iraq dinars. Imports in 1938 amounted to nine million three hundred and sixty-one thousand Iraq dinars against nine million five hundred and sixty-six thousand in 1937, but exports fell off badly owing to the depressed condition of those foreign markets which purchase Iraq produce. Exports amounted to three million four hundred and seventy-two thousand Iraq dinars, against five million five hundred and seventy thousand in the previous year, both figures excluding oil.

Wheat and barley exports were considerably lower, and a larger quantity of the 1938 crop remained in the country at the end of the year. Date exports were down in quantity and value, and the wool season was a bad one, owing to lack of demand from the United States of America. In spite of the reduced trade of the country, our branches had a very satisfactory year and handled a large portion of the available banking business.

EXPLOITING NATURAL RESOURCES OF IRAN

In Iran the Government continued to spare no effort in developing agricultural and industrial production and in exploiting the natural resources of the country. The greatest achievement, of course, has been the completion of the Transiranian Railway, running from the Caspian Sea to the Persian Gulf and covering a distance of one thousand four hundred kilometres. The cost of this enterprise, twenty-eight million pounds, has been met from revenue without recourse to foreign loans.

Foreign trade and exchange continued to be controlled by the Government, and the activities of our establishment have been limited to the purchase and sale of internal bills, the profits from which cannot at present be remitted from Iran.

PROSPEROUS YEAR IN CYPRUS

The Colony of Cyprus had a prosperous year, total revenues amounting to one million and twenty-three thousand pounds and expenditure to nine hundred and eighty thousand, compared with revenue nine hundred and sixty-seven thousand, nine hundred pounds, and expenditure eight hundred and sixty-three thousand, eight hundred in 1937.

Imports increased from £2,219,429 to £2,246,340, a rise of 1.21 per cent., while exports rose from £2,180,000 to £2,473,000, or by 13.45 per cent.

Crops did not come up to expectation, either in quality or in regard to the prices realised, and the greater prosperity was due to increased mining activity. Minerals exported were valued at £1,495,000 in 1938, against £1,127,800 in 1937 and £712,000 in 1936, while royalties and wages paid showed corresponding increases.

The higher wages earned reflected themselves in increased bank deposits, which are now estimated at about two million pounds in the Colony. Important water discoveries made during the year may prove of very considerable benefit to Cyprus. Our branches have participated to the full in the increased activity of the island, and have benefited accordingly.

Our offices in London and in Paris made their usual contribution to the profit and loss account, each in the measure permitted by the current conditions of its own money market. It now only remains for me to say a few words with regard to our affiliated banks.

AFFILIATED BANKS

The privilege of note issue granted to the Banque de Syrie et du Grand Liban was due to expire on March 31, 1939, and our filiate had been engaged for some time in negotiations with a view to its renewal. These negotiations resulted in the signing of two conventions, one with the Lebanon, dated May 29, 1937, the other with Syria on February 25, 1938. The former was ratified by the Lebanese Chamber and entered into force on April 1, 1939; the second has not as yet been ratified by the Syrian Parliament, but a decree of the High Commissioner has maintained provisionally the previous convention in territories outside the Lebanon. Following these agreements, the title of the bank has been changed to that of "Banque de Syrie et du Liban."

The extraordinary general meeting convened to make the alterations in the statutes necessitated by the change in name took the opportunity, with an eye to future possibilities, to authorise the increase of the capital up to sixty million francs. As a first step, the board of the bank at once increased the capital from twenty-five million five hundred thousand francs to thirty-eight million two hundred and fifty thousand francs by capitalising reserves and distributing one bonus share for each two old shares.

For the States of the Levant 1938 was a year of political stability and economic prosperity. Our subsidiary contributed to the latter with all the means in its power. New progress was witnessed in the circulation of its notes, which rose from four hundred and seventy-four millions of francs at the end of 1937 to six hundred and seven million millions at the end of 1938. The dividend for the year is fixed at seventy francs for each fully paid up share, against sixty francs last year.

YUGOSLAVIA

There are few countries whose balance of external payments has been so seriously affected as that of Yugoslavia, as a result of territorial changes in Central Europe. The extension of the German-Yugoslav Clearing Agreement first to Austria, then to the Sudetenland, resulted in depriving Yugoslavia of two of the chief sources of its free exchange. So far from being able, under these conditions, to take a further step towards a system of free exchanges, for the gradual return of which it had at one moment been possible to hope, the National Bank was compelled, in view of the paucity of its holdings of foreign currencies to strengthen existing exchange restrictions and to adopt the policy of being more and more sparing in the grant of transfer permits.

On closing its books and drawing up its balance sheet, the Banque Franco-Serbe, whose profits in dinars last year were more favourable than circumstances seemed likely to allow, was still without the necessary permission to repatriate these profits in francs. Although it is necessary in the meantime to hold them in suspense, our subsidiary was nevertheless able to pay the first statutory dividend of twenty-five francs per share; for 1937 a dividend of thirty francs had been distributed.

Similarly, the British-French Discount Bank, Limited, made satisfactory profits at its office at Athens and its agency at the Piraeus, but the transfer of those profits is subject to the exchange restrictions which still rule in Greece. The season was, however, favourable to wheat and tobacco, and the small deficit in the trade balance was partly compensated by invisible items, notably by some repatriation of capital.

ROUMANIA

In Roumania, our subsidiary, the Bank of Roumania, Limited, found trading conditions very difficult last year. Strict control of the exchanges and the various trade agreements militated against the free exchange of goods, while the low world-price of grain seriously affected the marketing of Roumania's bountiful harvest.

It is hoped that an increase in Anglo-Roumanian trade will result from the recent visit to Bucarest of the British Economic Mission and from the negotiations taking place between the two Governments.

The balance sheet recently published by the Bank of Roumania, Limited, discloses a position of high liquidity, and with its sterling resources unimpaired the bank is fully prepared to take its rightful place in assisting any revival of trade between Britain and Roumania.

BALANCE-SHEET ITEMS

Now, as regards our balance sheet, which is submitted to your approval, it shows a total of £25,765,000, almost the same figure as last year. It presents no special features beyond an increase in cash and a corresponding reduction in Government securities and bills in portfolio.

The strength of our cash position in each of the countries where we work has been consistently maintained at the high level the general situation required.

After deduction of all expenses and charges, and without taking into account profits which had not yet been remitted in the currency of the balance sheet at the end of the financial year, the accounts show a net balance of £76,741, which, with the sum of £37,498 brought forward from last year, makes a total of £114,239 at our disposal.

But I may repeat here what I said earlier in my remarks, that had it been possible to transfer into sterling all the profits earned in foreign currencies the balance available would have been substantially increased.

DIVIDEND MAINTAINED

Your committee proposes to distribute the same dividend of three shillings as for the past few years. If you are so good as to follow our recommendation, this dividend will be payable on June 26 in Istanbul, London, and Paris, free of all tax in Paris.

The report which you have before you gives details of the nominations on which you will be asked to vote. Monsieur Roudy having resigned his functions at the end of last year, we provided for his replacement, in accordance with Article 16 of the statutes, by nominating, subject to your ratification, Monsieur de Thomasson, who, like his predecessor, is a manager of the Banque de Paris et des Pays-Bas.

The committee further presents to you an administrator of the same establishment, Monsieur Oudot, to fill the seat which becomes vacant to-day by the decision of Monsieur de Cerjat not to seek re-election. I have no doubt that both these elections will have your unanimous assent, as also the re-election of those members of the Committee who have to retire this year in the ordinary way in accordance with the statutes.

TRIBUTE TO STAFF

Before ending I should like to express our special thanks this year to the staff of the bank who, in all ranks and in every group, gave proof of their devotion to the bank in the troubled days of 1938. I now beg to move: "That the report and accounts now read be received and adopted; that the dividend for the year ended December 31, 1938, be fixed at the rate of 3s. per share, and that this dividend be payable in Istanbul, London, and Paris on June 26, 1939." Before I put this resolution I shall be happy to answer any questions.

M. Charles Rist seconded the resolution, which, in the absence of questions, was carried unanimously.

The Chairman next moved: "That Monsieur Paul de Thomasson and Monsieur Emile Oudot be and they are hereby elected members of the general committee."

This was seconded by Sir John P. Hewett, G.C.S.I., K.B.E., C.I.E., and carried unanimously.

The Chairman then moved: "That Monsieur René Bechmann, Lord Hillingdon, Mr A. G. A. Jamieson, and Monsieur Charles Rist be and they are hereby re-elected members of the general committee."

Monsieur J. de Neufville seconded this resolution, and it was unanimously carried.

VOTE OF THANKS

Mr Gordon L. Jacobs: I am sure the meeting would like to thank the chairman for his very interesting speech. In the difficult days of international trading and international banking it is cheery to hear that perhaps more money has been made abroad and possibly, if the world returns to sanity, one day we may be able to get that money over here. Before putting the resolution I would like to express the very deep feeling of regret held at the passing of Mr Barry.

Mr A. Bradbery: I have very much pleasure in seconding the resolution.

The resolution was put to the meeting by Mr Gordon Jacobs and carried unanimously.

The Chairman: I wish to thank you on behalf of the committee for the remarks you have made and fully endorse every word you have said about the loss suffered by the death of Mr Barry.

The meeting then terminated.

"SHELL" TRANSPORT AND TRADING COMPANY, LIMITED

STRONG FINANCIAL POSITION: DISTRIBUTION MAINTAINED

The annual general meeting of the "Shell" Transport and Trading Company, Ltd., was held on the 20th instant, in London.

The Right Hon. Viscount Bearsted, M.C. (the chairman), in moving the adoption of the report and accounts, first referred to the loss sustained in the death of Sir Henri Deterding, who, he said, had been one of the prime factors in bringing the undertaking to its present pitch of prosperity.

Dealing with the operations of the year, he said that the balance of profit and loss account, after providing for the dividends on the first and second preference stocks, was £5,995,794, as against £5,954,330. Two interim dividends amounting to 3s. 6d. per £1 unit, tax free, had already been declared, and the board now recommended a final dividend of 6d. per unit, tax free, leaving £206,668 to be carried forward, as against £165,204 brought in.

The explanation of the directors' departure from their usual practice in declaring a second interim dividend was simple. In these uncertain times they had thought it an undue responsibility to withhold the accumulated profits from the shareholders until the normal date of payment in July. They had therefore decided to distribute at an earlier date such an amount as they knew they could safely rely on being available, and the third and final dividend brought the total distribution up to last year's level. He would again draw attention to the soundness of the financial position with assets of upwards of £53,000,000, whereas creditors amounted to only £230,363.

The Company's tanker fleet had continued to work to full capacity. During the year 24 new ocean-going tankers had been added to the fleet, and it was expected that during the current year a further 24 ocean-going tankers would be added, thus maintaining an appropriate ratio between owned and chartered vessels.

GREAT BRITAIN'S INADEQUATE ROADS

He made no apology for referring once again to the road problem. Year after year the roads of this country were not only falling further behind the best modern standards, but were also becoming increasingly and more dangerously inadequate for the traffic they were called upon to carry. Whereas at one time Great Britain was recognised as a leader in road improvement, to-day they had fallen sadly behind and had nothing to match recent developments in many other countries. Nobody who had visited foreign countries could have failed to have been impressed with what they were doing in the way of road construction, or to realise what improvements in our system of road communications were urgently necessary. They heard frequently references to the need for a "square deal" for one form of transport. This year motor users would pay more than £100,000,000 in taxation, or over 10 per cent. of the total national revenue, but the "bargain" which they got went from bad to worse. Inadequate road development was a false economy, as the roads constituted one of the few objects of public expenditure which could be described as directly remunerative. There was ample evidence that transport facilities created traffic. Not only was the state of the country's roads fast becoming the limiting factor in the progress of one of its healthiest industries, but their present inadequacy would prove a severe handicap in a time of emergency.

PRODUCTION

The group's total production had shown a falling off from last year, almost entirely due to Mexico. World production also showed a falling off, principally in the United States. The ascertained reserves in the United States were probably greater than ever, but restrictions on production had been widely put into force owing to decreasing consumption. One of the most remarkable occurrences in the United States in 1938 had been the new development, of which their Company had had its fair share, in Illinois, where new pools had been discovered. The outlook in the United States for 1939 could not, however, be described as encouraging, as, although gasoline consumption for the first four months showed an increase of about 5 per cent., industrial activity had not yet shown real signs of recovery, nor had the oil industry yet succeeded in finding an economic way of balancing production with demand for its products.

As to Mexico, the Company's financial interest in the Mexican Eagle Oil Company was comparatively small, but the group had a serious responsibility in the management of the affairs of that undertaking. A large part of the oil exported by the Mexican Government since the expropriation had apparently been disposed of

on a barter basis, but there was no doubt that the Mexican Government had derived less benefit than would have been the case had the oil companies been allowed to continue operating the properties. Although certain discussions had taken place between the Government of Mexico and a representative of the American, British, and Dutch oil companies concerned, it was too early to say that a settlement was even in sight.

The Company's operations in Venezuela had been conducted throughout the year under continued good relationship with the Government of that country, but certain legislative requirements had called for large expenditure, which had naturally added substantially to the cost of production there. Recently an increasing amount of exploratory and development work had been carried out in the eastern and central districts, which was beginning to bear fruit, and in order to participate in that important development they had acquired an interest in the concessions and assets of the Mene Grande Oil Company. They were also continuing active exploratory work on the concessions of the Venezuelan Oil Development Company. The group production in Venezuela last year was about 11,310,000 metric tons, compared with 10,280,000 in 1937.

NEW SOURCES OF SUPPLY

In order to ensure new sources of supply the board had turned attention to Colombia, where recent petroleum legislation of an enlightened character had offered encouragement to exploration and an indication of security in future years for production operations. Since 1936 an active campaign of exploration had been carried out, resulting in a number of concessions being obtained, and there was reason to hope that Colombia might take a more important place among oil-producing countries during the years ahead.

The Chairman concluded: "I should fail to do my duty to our excellent staff if I did not make some reference to their constant and unflinching devotion to the interests of the group. I would particularly refer to those who have carried on in China during the recent and, unhappily, still uncompleted troubles. We feel that their interests are in turn safeguarded by the companies who have provided both provident and pension funds for their ultimate security of livelihood."

"These are very troubling times, in which orderly development of purely business interests such as ours on purely business lines becomes increasingly difficult. I think I shall be expressing the feelings of you all when I express a hope that we may soon be able to return to a normal mentality. So-called 'war-prosperity' is a mere flash in the pan, bringing inevitable relapse as its aftermath, and as such can have no place in our aspirations."

The report, with the recommendation of a final dividend of 6d. per £1 unit, free of income tax, was unanimously adopted.

CHARTERLAND AND GENERAL EXPLORATION AND FINANCE COMPANY, LIMITED

The ordinary general meeting of the company was held, on the 21st instant, in London. Mr J. E. W. Lomas (chairman and managing director) said the balance of profit and loss account with the carry-forward of £8,776 made a total of £52,463, out of which the board proposed a dividend of 10 per cent. less tax, leaving to be carried forward the sum of £7,974.

Investments at cost or at middle market price at May 31, 1939 (or at directors' valuation where there was no quotation) which ever was the lower, were entered at £427,967 as against £438,949 last year. Debtors at £6,870 showed an increase of £4,392 and consisted almost entirely of an amount of income tax which the revenue authorities had agreed to refund.

Turning to the profit and loss account, on the credit side the revenue from interest and dividends on investments at £27,988 showed a reduction of £5,817 against last year's figure.

For several years past they had had an item on this side of the profit and loss account, "Net profit on realisation of Debentures, Shares, etc." This did not appear in the present account as, after consultation with the auditors, it was agreed that it would be more appropriately grouped with depreciation. Therefore, this year the debit for depreciation amounted only to £1,725.

With regard to the position of the company at May 31, if they took the quoted investments at the market price at that date and the unquoted at cost, or at directors' valuation, they had a total of £437,566. After adding cash and debtors and allowing for creditors, they had a total of £456,573, which represented a surplus of £96,573 over the issued capital.

The report and accounts were unanimously adopted.

GENERAL MINING AND FINANCE CORPORATION, LIMITED

DIVIDEND MAINTAINED—STRONG POSITION

The annual general meeting of the General Mining and Finance Corporation, Limited, was held in Johannesburg on June 6.

Sir George W. Albu, Bart. (the chairman), who presided, said that the corporation's revenue earning capacity from investments, namely, dividends, interests, and fees, had been well maintained and the strong financial position disclosed was eminently satisfactory. The net profit earned for the year, at £526,578, was £1,021 below that of the previous year, but with a slightly higher carry-forward of £132,149 from 1937, the total available profit, at £658,727, was £433 higher than that of the previous twelve months. For the third successive year the dividend distribution had been maintained at 25 per cent. Another sum of £200,000 had been allocated to general reserve, which brought the total of the reserve up to £1,000,000, and £10,000 had been allowed for taxation, leaving an amount of £132,583 to be carried forward.

Investments in stocks and shares in British, South African, and other Government and municipal securities, including participations, had been brought into account at the book value of £2,535,098. All investments under that heading, for which share market quotations were available, appeared in the books at or under cost, but in no case above the market prices ruling at the end of the financial year. Consequently the aggregate market value of these items was, at the date of the balance sheet, and still remained, greatly in excess of the book value.

In pursuance of the policy of greater collaboration with the Central Mining/Rand Mines Group, the latter company had purchased from the corporation during the year a large share interest in the West Rand Consolidated Mines, Limited, the whole of the proceeds of which had been utilised in the purchase by the corporation of 25,000 reserve shares in Rand Mines, Limited.

Sir George then proceeded to deal briefly with the corporation's principal interests—namely, Van Ryn Gold Mines Estate, Limited, West Rand Consolidated Mines, Limited, East Rand Proprietary Mines, Limited, Durban Roodepoort Deep, Limited, Phoenix Oil and Transport Company, Limited, Metal Traders, Limited, and Castor Lubricants, Limited.

WEST RAND'S RECORDS

The Van Ryn Gold Mines Estate had milled an increased tonnage during the year, but the working profit had decreased owing to a decline in recovery. Two dividends of 12½ per cent. each, amounting to 2s. 6d. per share, had been declared for 1938. Development of the upper leaders continued to be vigorously prosecuted, but the value and percentage of payability of the exposures had shown a declining tendency. The ore reserve as at June 30, 1938, amounted to 989,690 tons, with an average value of 2.6 dwt. over 36 in.

Further advances had been recorded during 1938 in the operations at the West Rand Consolidated. The tonnage milled had increased by 76,000 tons to a total of 2,126,000 tons, and the gross profit had improved from £1,198,358 to £1,234,497. The development programme, though less than for the previous year due to native labour shortage, had been sufficient to show a slightly improved ore reserve, which figure calculated at December 31, 1938, amounted to 10,750,000 tons of fully developed ore—an increase when compared with the previous year of 120,000 tons—the average value and stope width showing no change.

Although there had been an improvement in the native labour strength since the year end, the mine was still considerably below its requirements, and the full tonnage capacity of 220,000 tons per month could not be accomplished until the supply showed a further increase. The tonnage milled for the first four months of the year 1939 had increased by 95,000 tons to a total of 781,000 tons, compared with the same period of 1938, and the profit for that period was £436,630, as compared with £395,170. Since the year end development had been continued at approximately the same rate as for the previous year, with sampling results well maintained.

Sir George, in dealing with the future of gold in relation to the world's currencies, said that it was impossible to prophesy with any degree of certainty, but quoted leading passages from the letter recently written by the Hon. Henry Morgenthau, Secretary of the United States Treasury, in answer to certain important questions put to him, to the effect that the danger that gold would no longer be used as a medium of international exchange was so remote as to merit serious consideration.

BRITISH BORNEO TIMBER COMPANY, LIMITED

A SATISFACTORY YEAR

The nineteenth annual general meeting of the British Borneo Timber Company, Limited, was held, on the 19th instant, at 1-4 Great Tower Street, London, E.C., Sir Edgar J. Holberton, C.B.E. (the chairman), presiding.

Mr S. G. Sandeman (representing the secretaries, Messrs Harrison and Crosfield, Limited) having read the notice convening the meeting and the report of the auditors,

The Chairman said:—I think you will agree that the results which are before you to-day are satisfactory; 1938 was a year of acute international disturbance, to the influence of which our markets in the Far East were specially susceptible. It is therefore gratifying to your board to be able to repeat last year's dividend and to put before you a balance sheet which reflects further strengthening of the company's position.

Our holding of Government securities shows a reduction of £11,500 as compared with the previous year, but, on the other hand, our cash on deposit and on current account in London and the Far East amounts to some £42,000—that is to say, £15,000 more than last year. This may seem an extravagant policy at first sight, as this cash is earning very little interest, but in times such as we have all experienced in 1938 the advantages of a liquid reserve of cash, especially in the Far East, appeared to outweigh the disadvantages, and the opportunity was taken to provide the cash by a sale of a portion of our long-dated Government securities.

In this way, and indeed in the whole policy which we have pursued during the year under review, we have endeavoured to prepare your company to meet whatever may be coming, while at the same time keeping all the channels open by which business may be extended as soon as trading conditions allow.

The addition of £5,020 to capital expenditure represented the cost of a new launch, a new lighter and additional jungle railway material. These improvements in our equipment were laid down in pursuance of the policy outlined above, and will, I trust, be reflected satisfactorily in the profits in due course. The balance from working account is £24,421. This is £7,422 less than the previous year's balance, due to our having to curtail operations, with the result that we had a smaller volume of rough timber to market at a rather higher cost.

MARKET CONDITIONS

Last year I mentioned that production had up to that time been maintained at the high level of the previous year, but that we could not rely upon a continuance. Shortly afterwards, the imports of timber into Far Eastern markets were severely curtailed, and indeed for some time there seemed some possibility that shipments might have to be suspended for an indefinite period. In order to avoid any unwieldy accumulation of stocks, it was therefore necessary to close down certain of our camps. This unsettlement of our markets continued until late in the year, when I am glad to say that a substantial renewal of trade put us in a position to take steps to raise production again. Fortunately, we were able to provide buyers with their immediate requirements as we had stocks in hand.

Last year I gave you, with, I may confess, some little pride, a short recital of this company's achievement towards fulfilling its purpose—the development of the timber resources of British North Borneo. I was then able to tell you that in the preceding decade, the yearly cutting by this company and its sub-licensees had risen from 2½ million cubic feet in 1927 to 7 million cubic feet in 1937. It was therefore a disappointment, both to us in London and to our organisation in the East, to have to slow down operations deliberately, but circumstances beyond our control left us no prudent alternative.

With regard to the prospects for the present year, the rough timber production is gradually increasing, and the forward position with regard to sales is at the moment satisfactory. The operations of the saw mills, which also had to be restricted, will, I hope, soon be on full-time working again. In this connection I should say that we may have to face fairly soon the cost of augmenting the present milling plant in order to meet the increasingly keen competition of the many varieties of cheaply manufactured sawn timber which are now being imported competitively into this and some of our other markets, diverted thereto, perhaps, owing to restricted opportunities for disposal in its usual outlets. It is satisfactory to reflect that we are in a position to undertake any expenditure necessary without impairing the financial strength of the company.

The report and accounts were unanimously adopted.

FORSTER'S GLASS COMPANY, LIMITED

ORDINARY DIVIDEND 6 PER CENT. AND
5 PER CENT. BONUS

The twentieth annual general meeting of Forster's Glass Company, Limited, was held, on the 21st instant, at Winchester House, Old Broad Street, E.C.

Colonel Charles E. Ponsonby, T.D., M.P., the chairman, said: The net profit for the year, after meeting all expenses, amounts to £44,420, as against £53,573 last year, a decrease of £9,153 on last year's record figure. Out of the available balance of £60,982 the directors have transferred £15,000 to reserve, bringing this account up to £90,000, and recommend a distribution of a dividend of 6 per cent. and a cash bonus of 5 per cent. on the ordinary shares.

The decrease in profits arises from numerous different reasons. The first item, of course, is the decrease in the volume of sales. Last year sales reached a record figure. This year the sales are reduced by between 6 and 7 per cent. on last year, but with the exception of last year are the highest in the history of the company.

Your directors are satisfied with the result of the year's work, as it has undoubtedly been very difficult, owing largely to the unsatisfactory international outlook which causes lack of confidence on the part of buyers. In addition, last summer was not a very good one from the weather point of view, and certain of the goods manufactured by your company are dependent on suitable weather conditions. So far this year the weather has been kinder, and we have reaped the benefit.

Costs have gone up slightly during the year, and in addition we have carried out certain work in connection with A.R.P. Your company has also done its best to encourage its members to join the various Territorial Forces, with a satisfactory response, and is undertaking various commitments in making up the wages or granting allowances to employees in camp or training. All these are additional and somewhat unexpected charges on the company, and in addition we have for some time granted all our employees holidays with pay.

Sale prices during the year have remained more or less constant, as it is realised that by keeping prices stable as far as possible sales are encouraged.

The report and accounts were unanimously adopted.

BRITISH EMPIRE TRUST COMPANY,
LIMITED

POSITION STRONG AND SOUND

The thirty-eighth ordinary general meeting of The British Empire Trust Company, Limited, was held, on the 21st instant, at the Great Eastern Hotel, London.

Mr J. Davidson (chairman and managing director), who presided, said: The accounts cover a period of most disturbed and adverse conditions. While war in Europe has been averted, fears of war at the end of April last, when the accounts were made up, were acutely present. The result was that, for the most part, quotations of securities reached at the end of April the lowest for the year under review. It is a relief to the directors that the shrinkage only amounted to approximately 7 per cent. on the total investments, which has been made good out of reserves, leaving your capital intact with a reserve of £250,000 and, after paying the dividends recommended, a carry forward of £20,146 7s. 3d.

Another unfavourable feature of the year has been the low interest rates which have prevailed on the best classes of investments. This arises from various causes, but is probably mainly due to the relatively high prices, and consequent low yields for good securities due to the desire of investors in times of danger to hold such securities in preference to higher yielding investments involving more or less serious risks of capital depreciation.

In spite of these adversities, however, the directors are able to recommend dividends of 6 per cent. on the preferred ordinary shares and 8 per cent. on the deferred ordinary shares. The position of the company, in spite of all the untoward happenings of the past few years, remains strong and sound, and I am certain that if the troubles which afflict the world can be peacefully resolved we will recover much of the depreciation we have suffered.

After giving information on the position of the Dominion of Canada, the chairman said: During the past few years I have referred to various financial troubles in Canada, resulting from the difficult times which have been encountered. A good many of these troubles have been solved satisfactorily, but a notable exception is the debentures and bonds of the Province of Alberta.

The report was unanimously adopted.

GRIFFITHS HUGHES PROPRIETARIES,
LIMITED

STRONG FINANCIAL POSITION

The fifth annual general meeting of Griffiths Hughes Proprietaries, Limited, was held, on the 21st instant, at Salford, Manchester.

Mr Harry Marland, J.P. (the chairman) said: The liquid financial position of the operating company continued to be very strong indeed. The liabilities, including provision for the final dividend and also for taxation on profits for the year, totalled £157,000, as against liquid assets of £640,000.

In the home market considerable expenditure had been made on research, investigation and special advertising. It was hoped that considerable benefit would be derived in the future from these expenditures.

The overseas markets, numbering well over 100, had given the board very considerable anxiety, due to the unsettled state of Europe and the currency depreciation and restrictions in many markets. He stated the board felt confident that, given conditions even approaching normality of two or three years ago, vastly improved results would be obtained. The overseas business had been built up during twenty-seven years' intensive development, and to-day comprised a vast organisation of experts of many nationalities, an organisation which was not only unique in the calibre and quality of its personnel, but was absolutely unrivalled in this class of business.

Regarding dividend—if shareholders agreed to the board's proposal—it would mean that in five years since the business was made a public company, £1,137,500 had been distributed in dividends, equivalent to 57½ per cent. of the ordinary share capital and 5½ per cent. annually on the cumulative preference shares. £180,000 had also been placed to the general reserve.

The report and accounts were unanimously adopted, and the payment of the final dividend of 2½ per cent., less tax, was approved. The retiring directors, Mr Alfred Marland, Mr E. P. Carter and Mr W. L. Coulter, were re-elected, the auditors, Messrs Deloitte, Plender, Griffiths and Company and Messrs J. B. Boyd, Wrigley and Company, were reappointed.

BRITISH ELECTRIC TRACTION
COMPANY, LIMITED

INCREASED PROFITS

The forty-third ordinary general meeting of this company was held, on the 16th instant, in London.

Mr J. S. Austen (the chairman) said that he would begin his speech in the usual way by telling the meeting something which they already knew, which was that their profits had increased by £36,000 during the past year, and that that would have been more like £46,000 if it had not been for the 6d. increase in the rate of income tax. Of course, they had not approached the phenomenal rise in profits recorded in the previous year, but he thought he might say that they had come reasonably near it.

He had something fresh to tell the meeting. If to-day they were to buy £100 of the deferred stock at a price of £1,000, and if the company were to discontinue the custom of a stock bonus every year and, instead of doing so, were to distribute the income in cash, there would be enough to pay them 5.89 per cent.—practically 6 per cent.—upon the cost of £1,000.

That was really a very important matter, because he had more than once told them that the market price of their stock was more than represented by the value of their assets, but he had never before told them that the price of their stock was justified by the income of the Company. He made no apology for talking about the price of the deferred stock, because he knew that there were some who had to sell their bonus shares, but he would still like to say to those who were fortunate enough not to have had to do so that a man who had originally held £100 of that stock and had kept every bonus which had been declared now had £570 of stock, which was worth about £5,700, and was getting a cash dividend equivalent to 28 per cent. on his original £100 holding. In that value the future prospects of the Company were discounted, as the phrase was, on the Stock Exchange, or, as they might more properly say, no account was taken of the possibility of an increase of profits or dividend.

The Chairman proceeded to refer to the relatively greater efficiency of smaller undertakings such as those controlled by the British Electric Traction Company, as compared with larger undertakings. The report was unanimously adopted.

DECCA RECORD COMPANY, LIMITED

IMPROVED POSITION

The tenth annual general meeting of The Decca Record Company, Limited, was held, on June 9, at Southern House, London.

Sir Cyril F. Entwistle, K.C., M.P. (the chairman) said that the accounts for the year ending March 31, 1939, showed a profit of £50,012, compared with £30,658 in the previous year.

The net profits for the past three years were:—

1937	...	...	...	...	£273
1938	...	...	...	...	£15,080
1939	...	...	...	...	£32,321

The directors recommended that £10,000 be placed to general reserve and £20,233 carried forward. In view of the necessity of strengthening the finances, no dividend on the ordinary shares was recommended, although the earnings for the year were equivalent to 16 per cent. on the preference shares and over 50 per cent. on the ordinary shares, both less tax. The board hoped that it would be found possible for the current year to pay a dividend on the ordinary shares, in which case the preference shareholders would receive their maximum 16 per cent.

They had received a dividend from their associated company in America of £20,344, an increase of £9,615. Their liabilities had been reduced by £53,460. Their investment in Decca Records Incorporated stood at £72,909, and the market value at March 31st was £100,446. The turnover of the Decca Record Co. for the current year showed an improvement, and it was estimated that the net profits had been maintained at the level of last year. It was their belief that after years of decline the record business in this country had at last taken a turn for the better and that a process of recovery was under way. Whilst they were not looking for a recovery as rapid as that which had taken place in America, they did believe that the business here would follow the American pattern and that the next few years would witness a steady increase in demand, and they were, of course, doing all in their power to bring back the record industry to a state of prosperity. They had had to fight very hard to achieve the results which they were now able to place before shareholders, and they were confident of their ability to maintain their position in the industry.

The report was unanimously adopted.

TELEPHONE RENTALS, LIMITED

RECORD ANNUAL RENTAL

The tenth annual general meeting of Telephone Rentals, Limited, was held, on the 19th instant, at Southern House, London, E.C.

Mr Fred T. Jackson (chairman and managing director) said that once more they were in a position to report that all their subsidiaries, with one exception, had traded at a profit. In spite of the fact that industries generally, apart from firms engaged on re-armament work, had not had as satisfactory a year in 1938 as in 1937, their operating costs had obtained results which could be regarded as most satisfactory in the circumstances. At previous meetings he had laid stress on the importance of putting forward extra selling effort in bad times, and he believed they had achieved a certain amount of success in this direction, as their annual rental had reached a new high record. Trade generally was on the downgrade when they held their last annual meeting. It was now definitely on the up-grade once more, and the result achieved was better than he anticipated a year ago.

As far as the prospects of their English subsidiaries were concerned, for the year 1939, they were able to give a favourable report, on the basis of the business done during the first five months of the year, and there was no reason to anticipate, as far as one could foresee, that there would be any falling off in earning for the current year. The Australian Associated Company earned a substantial profit for the year ended December 31, 1938, but it was still following a conservative policy in the distribution of profits earned. As far as one could judge from the first five months of 1939 in Australia, they were well on the way to another successful year there.

At previous meetings he had stressed the importance of shareholders who were interested in various businesses availing themselves of the various telephone and other services offered by the company. The board had been gratified by the responses which had been made to this appeal, but they thought shareholders could do more towards promoting the further growth of the business.

With regard to the accounts, there was a substantial increase in

the dividends received from subsidiary and associated companies, amounting to over £12,000, and a small increase on dividends and investments. The net profit to be carried to the appropriation account amounted to £121,561, as compared with £110,492, being an increase of £11,069. An interim dividend of 4 per cent. had already been paid, and the directors now recommended a final dividend of 6 per cent., leaving £44,675 to be carried forward as compared with £42,583 brought in. The general reserve now stood at the satisfactory figure of £170,000, which included the transfer of £30,000 from the profit and loss appropriation account. The total reserve accounts now amounted to £248,164.

In conclusion, the chairman paid a tribute to all those employed in the Telephone Rentals organisation for their loyal co-operation during the year under review.

The report and accounts were unanimously adopted.

WILLOUGHBY'S CONSOLIDATED
COMPANY, LIMITED

EFFECT OF CRISES ON INVESTMENT VALUES

The ordinary general meeting of Willoughby's Consolidated Company, Limited, was held, on the 19th instant, in London, Colonel H. T. Fenwick, C.M.G., M.V.O., D.S.O. (the chairman), presiding.

The Chairman, in the course of his speech, said: Owing to the return of 2s. per share which was made to shareholders on August 19, 1937, the issued capital was reduced to £560,251 4s., divided into 1,400,628 shares of 8s. each, whereas before it consisted of the same number of shares of 10s. each. The unissued capital is £189,748 16s. in 474,372 shares of 8s. each.

The net profit for the year is £23,223 12s. 11d. The board recommend the payment of a dividend of 3d. per share, equivalent to 3½ per cent., and carry forward a credit balance of £7,201 9s. 8d.

Next taking the credit side of the profit and loss account, it will be seen that the profits secured in Rhodesia for the year under review, namely the profit on land and stands sales, balance of land, farm and ranching revenue, rents from town buildings and stands, less expenses and depreciation, amounted to £20,013 which is some £900 less than the previous year.

Revenue from mining claims, less expenditure, is shown at £2,572, an increase of £686 over the previous year. Dividends and interest amounted to £21,237, or £4,700 less than the previous year, which can be easily accounted for by the fact that we had paid back to the shareholders £140,000 in reduction of capital and had that amount less for investment purposes.

On the assets side of the balance sheet, the most important item is property and outlay, which is £304,843 compared with £305,605 in the previous year. I now come to the question of stocks and shares owned by the company to which your directors have given considerable thought. At the end of the year under review there was but a small shrinkage in value, namely £1,955, but very early in 1939 there took place, as you all know, crisis after crisis, and the shrinkage gradually increased.

Your board then decided to do what was obviously the right thing to do and decided to write off the large sum of £25,000, which brought down the book value of our shareholdings to a reasonably accurate valuation. That this action was justified you will realise when I tell you that on June 12th, the market value of our shareholdings was £278,029, compared with their value in our books of £274,857. In nearly every balance sheet published you will see the same result. It is in my humble judgment one of the most important and solemn duties which a board of directors has to perform, namely, by all means in their power to keep the capital of their shareholders intact, even by the stringent and disagreeable method of lowering the dividend. As you all know, even since the issue of this report there has taken place another crisis, in the Far East. This position as regards the general shrinkage of values your directors have squarely faced and we can only hope that the months ahead of us will cause us less anxiety and trouble than the last nine months.

Now as to the general position of affairs in Southern Rhodesia, which next year celebrates her fiftieth year as a separate entity. During the nearly fifty years that have elapsed since the British flag was first hauled up at Salisbury much has taken place. At the moment the Colony, the youngest of British Colonies, is fairly prosperous. One of the best rainy seasons on record has taken place and that invariably makes for prosperity. Both exports and imports are on the up-grade, and I feel convinced that an improvement in the world's political situation is the only thing required to improve the material prosperity and happiness of all.

The report and accounts were unanimously adopted.

GEORGE NEWNES, LIMITED

DIVIDEND MAINTAINED IN DIFFICULT YEAR

The forty-second annual general meeting of George Newnes, Limited, was held, on the 22nd instant, at the company's head office, Tower House, Southampton Street, Strand, London.

Sir Frank Newnes, Bt. (the chairman) said: The net profit for the year amounted to £108,338 10s., as against £117,868 13s. 6d. for the previous year. The reduction in the profits was caused by the increase in the cost of paper and the lower advertisement revenues of some of the company's publications due to the unsettling effect of the international situation. The full effect of these factors has been partly offset by the varied nature of the publications and certain economies that have been made. The directors propose to pay a final dividend of 5 per cent. on the ordinary shares, making 10 per cent. for the year, to allocate to the sick and pension fund £3,000, to the development fund £3,773, bringing that fund up to £22,500, and to carry forward the balance of £51,314 1s. 9d. to next year's accounts. C. Arthur Pearson, Limited, Country Life, Limited, and the Newnes and Pearson Printing Company, Limited, each have their own sick and pension funds, and the total sum allocated to these funds since their formation twenty years ago is over £200,000.

The earnings of C. Arthur Pearson, Limited, show a welcome recovery, the net profit being £35,228, as compared with £27,729 for last year. The earnings of Country Life, Ltd., have been adversely affected by the conditions previously referred to, the net profit amounting to £18,076, as compared with £22,748. Newnes and Pearson Printing Company has well maintained its turnover, but its plant with its battery of high-speed rotary presses is still capable of handling a considerably larger output.

THE PUBLICATIONS

Sir Frank Newnes then referred to the widespread nature of the company's activities, ranging from high-class and exclusive periodicals to popular fiction weeklies, almost every field of periodical journalism being catered for. He said: "Tit-Bits" has just celebrated its 3,000th number, easily a record for a paper of this kind. "Home Notes" circulation is higher than it has been for many years past, and this small-size publication has more than held its own against the advent of large-size publications of recent times. "Woman's Own," a large-size weekly printed in photogravure, has been a great success and now has a sale of over 500,000 a week.

Our important sixpenny women's magazines, "Modern Woman," "Modern Home," "Woman's Sphere" and "Miss Modern," each enjoy a wide popularity with readers and advertisers. In the pocket-size market, "Men Only" has met with much favour. Last week we issued "P.T.O.," another pocket-size magazine, at sixpence. The title is an abbreviation of "People, Topics and Opinions," which aptly describes its contents. "Amateur Gardening" still holds its pre-eminent position in the horticultural field. Country Life, Limited, has acquired "Gardening Illustrated," a paper held in high esteem among horticulturalists. "Home Gardening" and "Smallholder" continue to do well.

Sir Frank concluded by saying that the company was in an excellent position to benefit from any improvement in the general trade and prosperity of the country.

The report was unanimously adopted.

THE ECONOMIST BY AIR

To meet the growing demand from overseas readers for The Economist by air, special subscription rates have been introduced applicable to those countries to which Letter Mail is now normally transmitted by air. These are as follows:

	12 months	6 months
Europe	£ 4 17 6	£ 2 8 9
Empire Air Routes	£ 6 10 0	£ 3 5 0

These rates include all supplements, but the latter will be sent by the surface routes and not by Letter Mail.

Unexpired subscriptions may be transferred to the new category on application to

THE PUBLISHER, THE ECONOMIST,
8 BOUVERIE STREET, LONDON, E.C.4

SIAMESE TIN SYNDICATE, LIMITED

DIVIDEND OF 40 PER CENT.

The thirty-second ordinary general meeting of the Siamese Tin Syndicate, Limited, was held, on the 21st instant, at Winchester House, Old Broad Street, London.

Mr Kenneth O. Hunter (the chairman) said that, taking their operations as a whole, the mining revenue for the past year had amounted to £267,442, compared with £434,020. After charging the cost of mining operations and making provision for depreciation and amortisation there remained a balance of £87,674 at the credit of mining revenue account, compared with £226,669 in the previous year. In the general revenue account was charged the cost of transferred quotas, and after charging administration and other expenditure in the East they had a balance transferred to profit and loss account of £74,379. To that they added their investment income, less London office expenses, directors' remuneration, and provision for National Defence Contribution, the result being a net profit of £71,128 transferred to the balance sheet. The amount brought forward from 1937 was £9,756, leaving a balance available to be dealt with of £80,884. Out of that an interim dividend had been paid towards the end of the year 1938, and a further 15 per cent. in February last, together absorbing with Siamese dividend tax thereon £48,464, leaving for appropriation £32,420. Out of that the directors recommended the payment of a final dividend of 10 per cent., making 40 per cent. for the year, requiring £15,000, leaving a balance to be carried forward of £17,420, subject to Siamese dividend tax on the proposed final dividend.

With regard to the working results for the present year, their output for the five months ended May 31 was 719 tons, with an estimated profit of £48,855, the figures for the same period in 1938 being 789 tons, with an estimated profit of £39,371.

During the year 1938 steps had been taken with a view to improving the plants at their mines and providing cheaper power for the dredges. Those steps had proved very successful and during the current year they looked for a further reduction in their costs. The saving effected was such that it would enable the dredges profitably to work ground of a lower grade than was formerly possible.

The report and accounts were adopted.

BANGRIN TIN DREDGING COMPANY, LIMITED

PAST YEAR'S OPERATIONS

The 19th ordinary general meeting of the Bangrin Tin Dredging Company, Limited, was held, on the 21st instant, in London.

Mr Kenneth O. Hunter (the chairman) said that their total mining revenue amounted to £142,374, compared with £192,334 for the year 1937. The dredges had operated 79 per cent. of possible working time, and had worked an area of 3,642,500 cubic yards, as compared with 4,002,500 cubic yards. The output was 1,121 tons, compared with 1,164 tons in 1937, costs being somewhat higher at 3.36d. per cubic yard as compared with 3.01d. Proceeds for 1938 averaged £127 0s. 2d. per ton, against £165 4s. 9d. in 1937, and that fall in the market value of output was reflected in the reduced mining profit of £59,516, compared with £89,948 in the year 1937. The provision made in mine working account in respect of depreciation was £10,343, against £19,467 provided in the previous year, the directors having taken into consideration the extended working life of the mine. That was due, of course, to the acquisition of the New Sydney Siam area.

They had brought in £9,225 from 1937, and after providing for the interim dividend of 5 per cent. paid during 1938, together with Siamese dividend tax thereon, there remained a balance of £37,658 to be dealt with. The directors recommended the payment of a final dividend of 5 per cent., making 10 per cent. for the year, and they proposed to transfer the sum of £5,000 to taxation reserve and a further £5,000 to general reserve, leaving a sum of £12,658 to be carried forward, subject to directors' additional remuneration and provision for Siamese dividend tax on the proposed final dividend.

With regard to the working results for the present year their output for the five months ended May 31st was 361 tons, with an estimated profit of £28,871, the figures for the same period in 1938 being 545 tons, with an estimated profit of £37,456.

He was glad to be able to speak now from first-hand knowledge of their property, to which he had paid a visit in January. He had found their dredges, power house, workshops and equipment in first-class order.

The report and accounts were adopted.

GREAT UNIVERSAL STORES, LIMITED

NEW RECORD IN PROFITS

ENCOURAGING PROSPECTS

The twenty-first ordinary general meeting of the Great Universal Stores, Limited, was held, on the 16th instant, in London.

Sir Archibald Mitchelson, Bart. (the chairman) said:—You, with your directors, will be gratified by the position presented to you to-day. In my speech at the previous annual meeting I ventured a somewhat optimistic forecast of the results for the year now under review. I think you will agree that that forecast has been amply fulfilled. Further, whatever I may have said in this connection last year, I may say that, after the closest possible discussion with our managing director, we are equally confident in regard to the prospects for the current year, subject always to there being no major crisis or other developments to upset the normal course of our affairs. Considerable extensions have taken place in the scope of his business during the past year, and we are satisfied with the

(Continued from page 735)

more than merinos, and there has been an unusual call for crossbreds from New Zealand. The British new clip is also being bought freely in the hope that the bulk of it will be wanted for the same purpose. Domestic wools are selling at an average of 1½d. per lb. more than a year ago. The rise would have been even more had not the War Office fixed prices for khaki requirements.

During the past fortnight prices have stiffened, particularly for merinos overseas, and this is stimulating home markets.

THE COMMODITY MARKETS

THERE is still no definite trend in commodity prices; the increase in tension in the Far East and the very low level of wheat prices have counterbalanced the upward pressure which might have been expected from the high level of business activity in this country and on the Continent. The raw cotton market is still disturbed by uncertainty over future subsidies by the American Government, and the rubber market has been overshadowed by political uncertainty. With the exception of spelter, metal prices are all higher than last week; the price of standard cash tin rose on Wednesday to £229 5s. per ton. Wool prices remain firm with an upward tendency and the futures market for raw sugar has also hardened. Moody's index of wholesale prices in the United States has changed little in the week ending last Wednesday, dropping by 0.2 to 142.1 (December 31, 1931 = 100).

Metals

Copper.—After an early spell of weakness, the market recovered and the closing price of £42 3s. 9d. per ton showed a net gain of 6s. 3d. on the week. The market still benefited from the favourable May statistics, but the pending seasonal reduction in copper consumption is keeping demand down and thus prevents a major recovery in prices.

Tin.—The price of standard tin gained £1 15s. during the week, to close on Wednesday at £229 5s. per ton. This is the highest tin price since 1913, and it is only 15s. below

the upper limit of the pool. The pool has neither sold nor lent any tin to the market this week, but sales are to be expected if the price should rise further. Demand is not very active, and consumers, in view of the pool's holdings, do not find it necessary to carry stocks themselves. Simultaneously with the rise in price the backwardation widened this week and has now reached £4 5s. per ton, an unusually wide margin, which, however, is still much lower than the average backwardation in 1935. The favourable employment of the Welsh tinplate industry has resulted in the suspension of production quotas until the end of this year. According to the International Tin Research and Development Council, world consumption of tin totalled 50,100 (last year 53,100) long tons in the first four months of 1939, while production reached 44,700 (57,800) tons.

Lead and Spelter.—Lead gained 3s. 9d. to close on Wednesday at £14 15s. per ton, while spelter closed unchanged at £14 per ton, after having been weaker earlier in the week. Both markets remained comparatively idle, but the lead price was supported by a rise of 5 points to 4.70 cents per lb. in the United States price basis East St. Louis. The poor building returns for May proved an adverse factor for both lead and spelter. As far as spelter is concerned, however, sentiment improved in the closing days of the week on information that a meeting was held in Paris a few days ago between zinc producers to discuss the revival of the international zinc cartel.

Grains

WEATHER conditions in North America have been ideal for the growing wheat crop and estimates of the probable output of Canada and the United States may be considerably increased. Shipments from the Argentine continue on a large scale, and with the political developments in North China, the sales of Australian flour to the Far East have been checked. Consequently, there has been no reason for an improvement in wheat prices and Liverpool nearest future remains below 4s. per cwt. Demand for maize, while not large, is sufficient to absorb the Argentine shipments at about 23s. per quarter. The market in imported feeding barley remains steady.

Other Foods

Provisions.—Flour prices were reduced by 6d. per sack last week, a consequence of the renewed fall in wheat prices. The trade in eggs has improved and prices, particularly of British eggs, rose sharply during last week.

Colonial Produce.—Prices for refined sugar have remained unchanged, but in the futures market for raws there was a sharp advance for near positions, reflecting the doubts of the market over the arrival of the new supplies authorised by the International Sugar Council. The price of Accra cocoa continues to decline slowly, with very little buying interest.

Fruit and Vegetables.—The cooler weather has reduced the demand for soft fruits and salads, but sales of English strawberries, now available in large quantities, are quite satisfactory, and are affecting trade in other fruits less than is normally the case. Trade in old potatoes is almost over, and new potatoes are being delivered in sufficient quantities to bring down prices to a reasonable level.

Miscellaneous Commodities

Oils and Oilseeds.—The low level of wheat prices and the unfavourable political developments have affected trade in these commodities. Indian linseed is cheaper and there is hardly any business in Plate; the outlook for the new crop in the United States is satisfactory. Large quantities of Egyptian cotton seed are on the market and prices have touched the low level of £5 per ton for spot supplies. Linseed and cottonseed oil are also cheaper.

Rubber.—The market has been overshadowed by political developments and little business has taken place in the past week. American consumption continues at a satisfactory level and with some buying from the Continent, prices on the London market have held up well.

GOVERNMENT RETURNS

For the week ended June 17, 1939, total ordinary revenue was £13,922,000, against ordinary expenditure of £16,445,000, issues to sinking funds of £245,000, and issues of £6,000,000 under the Defence Loans Acts. Thus, including sinking fund allocations but excluding issues from defence loans, the deficit accrued since April 1, 1939, is £122,593,000, against £91,741,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On June 16th applications at £99 15s. 9d. per cent. for bills to be paid for on Monday, Tuesday, Wednesday, Thursday and Friday of following week were accepted at to about 60 per cent. and applications at higher prices in full. Applications at £99 15s. 10d. for bills to be paid for on Saturday were accepted in full. £50.0 millions of Treasury bills are being offered on June 23rd.

* Advances made by the National Bank of Roumania under the previous and the 1938 Agreement £26,116. Under the provisions of Article 13 (4) of the Agreement £26,116 is considered to have been repaid from the sterling allocated to the National Bank of Roumania.

† This sterling is held by the Clearing Office in Sub-Accounts in the names of Roumanian authorised banks. To settle their debts due to United Kingdom creditors, Roumanian debtors must purchase this sterling from these authorised banks, at whose request the Clearing Office makes payment. The Clearing Office is not aware of the extent to which the unpaid balances may have been sold forward.

SHORTER COMMENTS

(Continued from page 731)

Metal Industries, Ltd.—Profit for year to March 31, 1939, £160,423 (£178,164). Taxation £41,869 (£43,998). Ordinary dividend 5, against 7½ per cent. To plant depreciation, etc., £6,198. Carry forward increased from £68,319 to £82,196. Work in progress, etc., £145,559 (£485,842).

Imperial Bank of Iran.—Net profits before tax on dividends for year to March 20, 1939, £92,922. Tax this year £24,750. Comparable basis of net profit £68,172 (£65,974). Ordinary dividend 9 per cent., less tax, against 6½ tax free (or 8-874 per cent., less tax). Balance forward £56,930 (£54,008). Deposits £3,355,430 (£3,740,552). Investments £3,167,940 (£3,056,518). Bills discounted £2,129,528 (£2,720,367).

National Bank of New Zealand.—Net profits year to March 31, 1939, £106,524

(£105,727), after contingencies (from which bad debts, exchange and N.D.C. provided). To premises, £10,000 and pensions, £14,000 (the same). Final dividend 2½ per cent., making 5 per cent., less tax, for the year against 4½ per cent., of which 2 per cent. interim, tax free. Carry forward £114,131 (£113,690). Deposits £13,298,385 (£13,908,667). Advances £11,921,749 (£12,702,613).

Anglo-Dutch Plantations of Java.—Profit for 1938 £198,621 (£424,290). Ordinary dividend reduced from 9 to 5 per cent.

Trust Houses, Ltd.—Profit for year to March 31, 1939, £196,018 (£192,340). Ordinary dividend 7 per cent., as before. To taxation £35,000 (£30,000). To debenture redemption reserve £15,138 (£14,711). To installations £10,000 (£10,000). Written off furniture, etc., £5,000 (£10,000). For A.R.P. £5,000. Carry forward £30,788 (£34,558).

Patons and Baldwins, Ltd.—Net profit for year to April 29, 1939, £361,885, against £260,666 (after crediting part of stock reserve). Preference dividends £64,761 (£68,156). Ordinary dividend again 10 per cent., tax free, absorbing £191,915. To reserve £75,000 (nil). To A.R.P. £30,000 (nil). Carry forward raised from £74,007 to £74,007.

London Tin Corporation.—Profit for year to April 30, 1939, £237,096 (£319,801). Income tax £15,924 (£6,849). Special provision of £120,000 made for writing down investments. Ordinary dividend reduced from 7 to 4 per cent., absorbing £144,729. Carry forward reduced from £143,046 to £99,489.

Witwatersrand Working Profit.—Total estimated working profit of Witwatersrand gold mines for April, 1939, amounted to £2,806,884, against £2,938,774 for March

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption, where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

THE ECONOMIST

TRADE SUPPLEMENT

New Series

SATURDAY, APRIL 29, 1939

No. 28

The Trend of Business

As a result of the deterioration in international relations an increasing proportion of the world's resources—the actual proportion in each country varies directly with its geographical or political distance from the danger zone—is being devoted to military purposes, while ordinary commercial activity is held in check. Broadly, total activity is maintained at a high level or expanding in those countries which, like Germany, Italy, France and England, are largely or entirely dominated by re-armament. In the United States, where the defence sector is still comparatively small, business is marking time, though political factors are by no means the sole reason for the absence of a revival in new investment in that country. In the majority of primary producing countries, business is fairly well sustained by the comparative stability of the prices of most raw materials which are required as much for ordinary commercial as for military purposes.

In Britain, as in many other countries, the trend of industrial activity is being increasingly influenced by defence expenditure, and most of the business indicators for March registered a further slight expansion in trade. For example, *The Economist's* index of Business Activity (which is adjusted for seasonal variations) rose from the corrected figure of 105 (1935 = 100) in February to 105½ in March. This is the third successive rise since December (when the index stood at 101), which has lifted the index to the highest level since March, 1938. Of the constituent series of the index, eight showed an increase between February and March, while one (relating to *postal receipts*) remained unchanged and four showed a decline. The figures reflecting productive activities are all higher on the month, those relating to exports of British manufactures, shipping movements and bank clearings alone showing a decline.

In the absence of information on the course of new commercial investment, it is impossible accurately to assess the part played by defence expenditure in the improvement in business since the beginning of this year. But that the expansion in activity was assisted by the speeding up of defence work is scarcely open to doubt. The industries producing and consuming steel, for example, have benefited considerably from direct Government orders for factories and other buildings, warships, aeroplanes, air-raid shelters, guns and a host of other mechanised equipment. The fall in unemployment in the engineering industry is due almost entirely to defence work. Even in the textile trades the increase in output can be attributed partly to direct Government orders. Moreover, the indirect effect of increased defence expenditure must have been quite appreciable. Again, it is impossible to explain the slight improvement in the demand for consumers' goods without reference to the growth of employment caused by the re-armament programme.

In some industries conditions at the beginning of the year were not unfavourable to an improvement in business. Stocks of semi-finished and finished goods, for example, had been allowed to fall to low levels, and a number of industries, such as iron and steel, had reduced their output below current consumption last year. Again, orders for new merchant ships had been held up pending the announcement of the Government's plans to assist the shipping and shipbuilding industries. Moreover, the rapid expansion of industrial production in the United States between May and December, 1938, had prevented a further fall in the prices of many primary products, thus sustaining the purchasing power of primary producing countries. A comparatively slight stimulus was sufficient, therefore, to set in motion a re-stocking movement in certain industries.

There is evidence that such a re-stocking movement has actually occurred in a number of industries, especially textiles. Thus, the reduction in unemployment between March, 1938, and the past month has been more marked in the textile trades than in any other group of industries. The proportion of insured persons aged 16 to 64 unemployed in all textile trades fell from 20.7 per cent. to 14.9 per cent. during the past twelve months, compared with a decline from

12.7 per cent. to 12.4 per cent. in all industries with the exception of agriculture. There are also indications of re-stocking by large consumers of coal, and part of the increased steel production may have been absorbed into stock. But it is unlikely that, in the absence of the increase in defence work, business would have shown much improvement since the beginning of this year. Even in the export trade the comparatively favourable returns of recent months are due very largely to exports of warships.

The latest evidence of the state of trade suggests that the effect of the renewed political uncertainty has so far not been very marked. Indeed, as an incidental result of the growing importance of defence orders, the margin of activity that is subject to fluctuations in market confidence has been considerably reduced. There has been a lull in the re-stocking movement in the textile industries, but the flow of orders to many others has tended, if anything, to increase. Apart from the swelling stream of defence orders, one of the features has been the placing during the past four weeks of orders for something like 300,000 gross tons of tramp and cargo liner tonnage. During the whole of 1938 the tonnage of merchant vessels commenced in British shipyards was only about 500,000 gross.

Indeed, there are no indications of a general setback in business activity in the near future. And Sir John Simon's Budget for the year ended March, 1940, adds emphasis to the view expressed in the February Trade Supplement that the increase in defence expenditure would be sufficient to offset in the course of this year all but the most catastrophic decline in private expenditure.

* Weeks ended June 15th. and June 22nd.

† These prices are for fuel oil for inland consumption—other than for use in Diesel-engined road vehicles—and do not include the Government tax.

British Industrial Developments

The following reports on British industry cover, in most cases, the period to the middle of April. In the remainder they relate to the month of March.

COAL

The increase in coal production between February and March was more marked than usual. Output rose from 19,174,000 tons in February to 21,829,000 tons in March; a year ago the production increased from 20,099,000 to 22,006,000 tons during this period. The quantity of coal raised last month was thus only slightly smaller than in March, 1938, the post-depression record. The incidence of the improvement, however, was uneven. Thus, production in the Lancashire, Derbyshire and Staffordshire districts last month was actually higher than a year ago. In most other districts output was only slightly lower, but in the case of South Wales the reduction was substantial, from 3,452,800 tons in March, 1938, to 3,174,400 tons in the past month. Exports last month were again slightly lower than a year ago, the figures being 2,911,600 and 2,966,200 tons respectively; shipments of coal for the use of steamers also declined, from 926,100 tons to 860,100 tons. There was a marked reduction in shipments to France, from 631,600 tons in March, 1938, to 315,800 tons in the past month, and shipments to Spain fell from 103,000 tons to less than 1,000 tons. The unsatisfactory position of the Welsh coalfield is due largely to the fall in exports to these two countries. On the other hand, exports to Eire, Sweden, Denmark, Germany, Holland, Belgium, Italy and Argentina showed an increase. Allowing for the seasonal decline in the demand for coal for heating purposes, the improvement has been well maintained in the first half of April.

IRON AND STEEL

Production in the iron and steel industry showed a further expansion last month. The output of pig iron rose from 516,000 tons in February to 603,600 tons in March and the production of crude steel advanced from 971,100 tons to 1,170,900 tons. While the output of pig iron last month was still 15.5 per cent. smaller than a year ago, crude steel production exceeded the figure for the corresponding month last year by 4.9 per cent. Moreover, the output of crude steel was only 7,400 tons below the record established in November, 1937. At the end of last year the steel furnace capacity of the industry was estimated at 14,483,000 tons per annum. On the basis of last month's output the margin of unused capacity was therefore already comparatively small. On the other hand, there is room for a substantial increase in pig iron production, for, while output in March was at the rate of about 7,200,000 tons per annum, the effective capacity of the blast furnaces last September was estimated at 10,024,000 tons per annum. As the heavy supplies of scrap accumulated in 1937 and early in 1938 have now been absorbed, the steel-makers will in future have to rely more on pig iron. Imports of iron ore, scrap and iron and steel materials last month were still appreciably smaller than a year ago. Imports of iron ore and concentrates fell from 621,800 tons in March, 1938, to 400,000 tons in the past month. The intake of iron and steel scrap fell from 104,800 tons to 5,800 tons, while no ships for breaking-up are recorded in the trade returns last month, against 50,500 gross tons a year ago. Imports of iron and steel materials last month were only 102,600 tons, against 276,800 tons a year ago. The decline in exports has been less marked, shipments having fallen from 176,100 tons to 167,900 tons. With the speeding up of defence work and the recovery of the commercial section of the shipbuilding industry the indications are that demand is likely to show a further increase.

GENERAL ENGINEERING

Activity in the engineering industry continued to expand in the past month. The proportion of insured persons unemployed in all branches of engineering fell by 0.5 per cent., to 7.4 per cent. between February 13th and March 13th. In general engineering alone the proportion of insured persons unemployed last month was 7.3 per cent., against 7.8 per cent. in February and 6.7 per cent. in March, 1938. The improvement in general engineering since the beginning of the year has been due almost entirely to the increase in defence orders. Moreover, it is generally expected that the prospect of a further increase in Government work will ensure the maintenance of the upward trend in production. As far as individual sections of the industry are concerned, there has been a slight setback in the textile machinery section, while the seasonal increase in the agricultural machinery branch has been less marked than usual. In most other sections activity has been well maintained and in some, including machine tools, activity is steadily expanding. The trade unions' demand for higher wages and improved working conditions is still under negotiation with the employers. The problem of the capacity of the industry in relation to plant and labour and the question of priorities are now being actively discussed by the industry. Imports of all kinds of machinery declined from 15,106 tons in March, 1938, to 12,946 tons in the past year, but their value actually increased from £2,228,300 to £2,340,100. Exports last month were smaller than a year ago both in quantity and value, the figures being 40,300 tons and £5,700 tons and £5,104,500 and £5,362,700 respectively.

ELECTRICAL ENGINEERING

In the electrical equipment industry activity also remains on the up-grade. Thus, the proportion of insured persons unemployed declined between February and March, from 5.5 per cent. to 5.1 per

cent. in electrical engineering and from 7.6 per cent. to 7.1 per cent. in the electric cable and apparatus section. Exports of electrical machinery declined from 2,555 tons (valued at £4,002,800) in March, 1938, to 2,286 tons (valued at £365,200) last month. During the same period, shipments of electric goods and apparatus fell from £1,196,300 to £1,130,400.

AUTOMOBILES

The new registrations of private cars in February increased by 23.5 per cent., compared with those in February, 1938, and production of private cars and taxis also increased, by 5,243 to 29,724, or by 12.2 per cent. Production of commercial vehicles, however, was lower in February than a year ago, and new registrations also declined by 11.9 per cent.:

PRODUCTION OF AUTOMOBILES IN U.K. (No.)					
	Oct.	Nov.	Dec.	Jan.	Feb.
Private cars and Taxis—					
1937-38	26,977	27,034	31,552	31,409	24,481
1938-39	24,867	28,226	31,108	32,286	29,724
Commercial Vehicles—					
1937-38	9,627	7,773	8,170	10,637	8,802
1938-39	8,328	8,270	7,650	9,691	7,434

In view of the increase in the motor tax, from 15s. to 25s. per h.p., it is doubtful if the same rate of increase will be shown in the remainder of the season, though the output of low-powered cars may be stimulated at the expense of larger models.

BUILDING

Constructional activity as a whole shows no signs of an imminent decline. Between February and March the proportion of insured persons unemployed fell from 20.1 per cent. to 16.0 per cent. in building and from 37.8 per cent. to 35.3 per cent. in public works contracting. Compared with a year ago, the unemployment percentage last month was only 1.8 per cent. higher in building, and it showed a reduction of 2.1 per cent. in public works contracting. Moreover, the value of building plans passed by a representative sample of local authorities showed a further increase in March; the figures for February exceeded for the first time since August, 1938, those of a year ago, and the increase in the value of plans passed between March, 1938 and 1939, was no less than 8.3 per cent. There was a slight decline in permits for dwelling-houses, but plans passed for factories and workshops were twice as high as a year ago, and those for commercial premises and public buildings also showed an appreciable increase. These returns do not include direct Government contracts.

CHEMICALS

A fairly active business has been transacted in the home chemical market during the past month. Trade in heavy chemicals and dyestuffs has shown some improvement, and, with the exception of the acetates of lime, which have been rather dull, demand for wood distillation products has increased and is now quite good. In the business is still scarce. A steady routine business has been transacted in pharmaceutical and other fine chemicals. Overseas trade in chemicals, drugs, dyes and colours showed some improvement in March compared with the same month of 1938, exports being greater in value by £137,457 and imports by £218,435. For the first quarter of 1939, however, exports show a decrease in value of £26,858, as compared with the corresponding quarter of 1938. Imports for the quarter exceeded those in 1938 by more than £400,000.

POTTERY

Employment in most sections of the trade improved in March; the percentage unemployed among insured workpeople declined from 23.4 in February to 19.8. A certain amount of short-time is still being worked in North Staffordshire. Exports of sanitary ware showed a marked improvement in March, when they amounted to 46,680 cwt. compared with 31,183 cwt. in March, 1938; exports of earthenware remain at a lower level than in 1938.

FOOTWEAR

Easter holidays interrupted factory operations in the past month, but the fine weather brought an increase in orders immediately after the holidays in anticipation of an increase in sales. Factories work-suitable for their trade are busy and report that supplies of leather for hides has weakened in the last few days, but leather prices generally are firm, with an upward tendency.

COTTON

There has been some contraction in the amount of fresh business in cotton yarn and piece-goods. Buyers have shown more caution in placing orders, chiefly owing to the further aggravation of the European political situation, and partly owing to the unbut spinning production remains at 60 per cent. of capacity, compared with 65 per cent. a year ago. Unemployed cotton operatives 102,728 at the same time last year. In certain sections of the principal activity being in cloth for Government contracts. A

favourable factor has been the reduction in the duties on cotton goods entering India, and some Manchester shippers have bought more freely in regular styles. Numerous orders have been secured for South America, but the off-take for the Continent has been poor. The Board of Trade returns for last month were encouraging. Exports of cloth at 132,680,000 square yards were larger than in any month since January, 1938, and the shipments of yarn at 13,313,000 lb. were the biggest since August, 1937.

JUTE

The advance in raw jute prices was continued during the past month, and after the Easter holidays full-group Daisee-2/3 was quoted at £28 15s. per ton for April-May shipment; supplies of old crop are now very limited, and reports of the condition of the new crop in India are not very satisfactory. Factories working on sandbags are extremely busy, but trade in other products is dull, except for linoleum hessians, for which a fair volume of orders has been placed.

LINEN

Apart from Government requirements, general trading is restricted. Prices of both yarns and cloth are very firm. Neither spinners nor manufacturers are disposed to enter into commitments of any magnitude under existing circumstances. There is no clarification in the position or outlook of raw material, and the latest developments in the international situation render problems of costs and supplies more difficult than ever. Exports of linen piece-goods to the United States continue to improve, though some of the shipments represent supplies held over from last autumn to obtain the advantage of the reduction in import duties on January 1st.

RAYON

Lack of confidence caused by the international uncertainty is still having a restricting influence, but benefit from the better business mentioned last month is still being felt. Fair seasonal buying is being experienced in the home trade, but overseas demand is cut down to "bare necessity" level. The hosiery trade has improved in recent weeks, and the full-fashioned section is reported to be working to capacity.

WOOL

The raw material markets remain firm, although supplies are now mainly miscellaneous oddments. Both Government and export demand is for crossbred yarns, and capacity is now well booked for some time ahead. Turnover in other yarns and cloths remains small,

however, and the retail trade in dress cloths is developing only slowly. Exports of tops in the first three months of 1939 amounted to 10.3 million lbs., compared with 7.4 million lbs. in the same quarter of 1938 and exports of worsted yarns increased from 5.1 million lbs. to 7.1 million lbs.

AGRICULTURE AND FISHERIES

The spell of fine weather in April has been of great advantage to arable farmers, particularly on heavy soils, and considerable progress has been made with spring cultivations. Reports indicate that the area of spring wheat sown will be up to the average, while contracts have been signed for nearly 350,000 acres of sugar beet, compared with 328,500 acres in 1938. Fat sheep have met with a good demand at livestock markets, and the supplies of early lambs have also sold well at prices equal to those a year ago. In the first quarter of 1939 a total of 4.3 million cwt. of wet fish was landed in Great Britain, approximately the same amount as was landed in the same months of 1938, while the total value of the catch showed a slight fall; the weight of herrings landed fell from 63,600 cwt. in the first quarter of 1938 to 42,800 cwt. in 1939.

SHIPPING

The freight markets were very slack at the beginning of March; The Economist index of tramp shipping freights (base 1913=100) declined from 93.1 in February to 91.0 in March. The fall was largely due to the continued weakness of South American freights, but in the last few days, after a reduction had been made in the minimum rates by the Administrative Committee, there has been a revival of activity in this market. Export of the new season's grain from the Argentine is now developing, although it is still on a smaller scale than usual. The American market is steady, with a considerable volume of chartering for scrap cargoes.

RETAIL TRADE

The latest statistics of retail trade, collected by the Retail Distributors' Association and published in the Board of Trade Journal, show that the value of daily sales, in the stores concerned, during March was 2.3 per cent. higher than in March, 1938. It is possible that, as Easter fell earlier in April this year than last, a higher proportion of Easter shopping came in March, so that the returns for this month may be somewhat exaggerated. The increase was concentrated on clothing and fancy goods, and was general in all districts with the usual exception of Central and West London, where a decline of 3.7 per cent. in the value of daily sales was recorded.

(a) Old quarterly Board of Trade indices linked on to new indices; figures in italics based on old indices. (b) Annual figures relate to year ended September.
(c) Figure for 1936 is average of August–December. (d) Indices shown in last month of quarter to which they relate. (e) Daily average. (f) Monthly figures are averages of quarterly returns. (g) Average of weekly figures. (h) Ordinary and Self-balancing revenue and expenditure. Annual figures are totals for financial year beginning in year shown. Monthly figures are cumulative. (i) Annual figures relate to end of year. (m) Average January to August: figures for September to December are not comparable owing to revised method of counting adopted in September, 1937. (n) Excluding Agriculture. (p) Four weekly figures: annual figures relate to year beginning March in year shown. Public Authorities only. (q) Annual indices, year beginning in July; quarterly indices year ended in quarter shown.

EUROPEAN COUNTRIES
(Bi-Monthly Table)

(a) Adjusted for seasonal variations. (b) Partly adjusted for seasonal variations. (c) Based on import surpluses of raw materials. (d) Monthly figures refer to end of month.
(e) All figures refer to end of year or month (except for a few monthly figures for Italy). (f) Monthly figures refer to 15th of month. (g) Since October, 1938, new territory.
(h) From January, 1938, base is corresponding month of 1937. (i) June and December figures include parcel post for preceding half-year. (j) Government notes of 5, 20 and 50 fcs. excluded.

MUNICIPAL AND GENERAL

The Pioneer Group of Unit Trusts

IN GREAT BRITAIN

Municipal and General have been the pioneers of every important development in unit trusts in this country.

- 1931: They launched the first unit trust.
- 1934: They launched the first flexible unit trust.
- 1934: They introduced the "cash" method of operation.
- 1938: They launched the first "cash" fixed unit trust.

All open "M & G" trusts are operated on the "cash" principle by which all money subscribed for new units, with the sole exception of the preliminary charge, must be used to buy investments for the trust. This puts the managers in the unequivocal position of being agents for the unit holders in the purchase of underlying securities and in the creation of units.

The Movement's Progress

THE present review of the unit trust movement is the fifth in an annual series published by *The Economist*. Since April, 1935, when the first Survey appeared, investments in unit trusts have increased more than fourfold, from £20½ millions to £83.8 millions. It might be thought that unfavourable market conditions during the past twelve months would have discouraged unit trust activity. But, even if sales have been disappointing for the movement as a whole, enterprise has not been quenched. As many as nineteen new trusts have been formed during the past twelve months, and only two more trusts are needed to bring the total number of British trusts in existence up to treble figures. Advance is still the slogan of the movement, even though it brings but scant reward at the moment.

For the discussions which follow in this Survey we have again selected leading questions of topical interest. The review of the appropriation—cash fund controversy in part recapitulates a similar discussion which appeared in the Survey of April 17, 1937, for *The Economist* was among the first publicly to draw attention to the important differences between these two methods of unit trust operation. In view of the unequivocal claims which have been made for both methods, we have attempted to present the two cases as objectively as possible, and to sift the importance of the advantages of, and objections raised against, each of them.

Writing twelve months ago, we interpreted the Government's attitude towards unit trusts to mean that the question of special legislation to govern unit trusts would not arise, if at all, for a considerable period. To-day that control is already in being. The story of the inclusion of unit trusts within the ambit of the Sharepushing Bill may become a classic example of legislative second thoughts. Yet the survey of the enacted form of control—the third which had been contemplated during the course of the Bill—which appears on a later page, suggests that the unit trust movement has won statutory recognition without having to pay the more exacting price which the Anderson Committee's stern, though perhaps not unfair, recommendations would have involved.

To the movement's credit, it has already introduced many of the improvements which the Anderson Report suggested. Stricter control over yields will in future be maintained by the Board of Trade, but to-day examples of artificial yield inflation (to which detailed consideration

was given in last year's Survey) are rare. Trustees and accountants are evidently playing an important part behind the scenes in this matter. In the past, paradoxical instances have occurred in which the price of a unit has fallen together with the published yield, without any radical change in the earning capacity of the trust. Such examples, fortunately in a small minority among unit trusts, have suggested the conscious or unconscious exploitation of yield inflation as a selling artifice. If a common basis for yield calculations emerges from the Board of Trade regulations it will be highly welcome to investment advisers, and equally salutary for the unit trust movement.

Pressure to obtain sales in a difficult year has been marked by a number of offers of units at a discount on the published price. One of the features properly stressed by unit trusts is the maintenance of firm dealing prices. To offer units at a discount suggests the existence either of excessive management charges or of adventitious profits which can be passed on to subscribers when it happens to suit the manager's book. The nature of these offers has differed. Some have been made, as of right, to existing holders; others, less happily, have been made through third parties. Re-sales of units from revolving funds may assist the managers to make a special reduction in quoted prices—they may, in short, share the turn from marrying re-purchases with re-sales with the investor. Or, in view of their expectation of regular half-yearly charges from new units, they may be prepared, in effect, to hand back part of the preliminary charge and price adjustments, in order to secure future income. But, in principle, objections apply to any special variation in quoted unit prices, and the extension of discount offers to the movement as a whole would be highly unfortunate.

To-day it is becoming increasingly clear that a unit trust is merely a convenient method of diversified investment for the smaller type of investor. It is not a new investment discovery by which a return out of relation with normal investment yields can be obtained; nor, as the past year's experience shows, does it hold out any attraction of guaranteed capital profits to unit holders. Capital profits may arise, and doubtless they are always welcome. But investors now have experience of the unit trust movement and its methods over a complete market cycle. And not the least important lesson which emerges is the impermanence of unduly high yields and the transience of capital profits.

Sales—Growth and Prospects

THE year 1938 was a testing time for the unit trust movement, for equity shares, having fallen substantially more than 20 per cent. in 1937, lost a further 16 per cent., measured by *The Financial News* ordinary share index. But the atrophy which affected the markets last year was not, at least after the first few months, primarily economic in its causation. At the date of our last computation of unit trust sales, March 31, 1938, the market effect of the invasion of Austria earlier that month had scarcely had chance to develop. The unit trust movement, like other investment media, has experienced the full consequences of acute political tension in the twelve months that have since passed.

Past experience, however, has shown that unit trust sales thrive with active investment markets. It is scarcely surprising, therefore, that last year's sales figures, despite the activity in forming new trusts, should show the effect of adverse conditions. Before discussing the figures in detail, however, it is desirable briefly to record the basis on which they are computed. As in previous years, the managers of unit trusts have kindly supplied us with figures showing the total cash value of sales, for combination into a total figure for the whole movement. Following the innovation in last year's survey, similar particulars have been furnished for re-purchases, by the managers, of units tendered for sale by holders. The difference between the two sets of figures gives the net cash invested in the unit trust movement, while the relation of re-purchases to sales provides a measure of the extent to which the movement has been called upon to meet selling by the public. In the case of one group, we have again been compelled to fall back upon an estimate. The information has been supplied in confidence, and no details can be given regarding the position of individual groups. A certain amount of information, however, has been made public. Thus the National group claims to be the largest group, with sales exceeding £23 millions. The Fifteen Moorgate group has stated that sales exceed £10½ millions, while the invested funds of the Trust of Insurance group exceed £11 millions.

In the first table below, cash sales and re-purchases are set out for the two years to March, 1938 and 1939, together with the totals outstanding at those dates. Certain adjustments have been made to the sales and re-purchases figures for 1937-38, reducing net sales for the year to March 31, 1938, from £11,030,000 to £10,310,000. These changes arise partly from differences in calendar dates, and partly from revisions suggested by the inclusion of re-purchases in the data.

During the year to March 31, 1939, total cash sales amounted to £7,975,000 (compared with the revised figure of £12,930,000 for the previous twelve months) and cash re-purchases to £1,600,000 against the revised figure of £2,620,000 for 1937-38. Thus net cash sales for the latest year showed a fall of 38 per cent. from £10,310,000 to £6,375,000. The increase, in fact, was the lowest since *The Economist* first compiled sales data for the period to

the end of 1934. Details are shown in the following table:—

UNIT TRUSTS' SALES AND RE-PURCHASES				
	Year to March 31, 1938	Total to March 31, 1938 (79 Trusts)	Year to March 31, 1939	Total to March 31, 1939 (96 Trusts)
Cash sales	£12,930,000	£88,000,000	£7,975,000	£95,975,000
Cash re-purchases	2,620,000	10,550,000	1,600,000	12,150,000
Net cash sales	10,310,000	77,450,000	6,375,000	83,825,000
Cash value of conversions	3,130,000	3,130,000	...	3,130,000
Net cash invested in unit trusts	7,180,000	74,320,000	6,375,000	80,695,000

The conversion proposals of 1937-38 received their quietus early in 1938, when offers to holders of Selective "A" and "B" certificates were withdrawn. Hence, the £6,375,000 net sales recorded for 1938-39 constitute a full addition to the net cash resources which remain placed with the unit trust groups for investment. Total cash sales, from the inauguration of the First British Fixed

Trust in April, 1931, to March 31, 1939, amounted to £95,975,000, compared with £88,000,000 to the end of March, 1938. Two trusts formed in March and April (Lombard and Orthodox) are excluded from this computation.

For so difficult a year, a slower rate of growth is not unnatural. It might, indeed, have been expected that the volume of re-sales to the managers would have rivalled that of 1937-38, in view of the general desire among investors for increased liquidity. In fact, the unit holder has been no less faithful to his original choice than in 1937-38. For the year to March, 1938, re-purchases by the managers accounted for 20.3 per cent. of their new sales. Last year the proportion was scarcely changed at 20.1 per cent. The unit trust movement can still claim that, despite two years of intense market depression, the threat of overwhelming re-sales by the public, upon which critics fastened in the earlier days of the movement, has not arisen. Moreover, the volume of actual liquidation of underlying securities on the Stock Exchange during the last two years has been smaller than the re-purchase figures would suggest, for part of these re-purchases have been married against re-sales by the normal operation of "revolving funds," and part held by the managers.

What relation have these figures to the economics of unit trust formation? A very rough bearing may be obtained by comparing the net unit trust sales at the end of successive periods since December, 1934, with the number of trusts formed. The following table shows that, until March, 1938, the average sales per trust formed

Previous surveys of the Unit Trust Movement were published by *The Economist* on April 6, 1935; March 7, 1936; April 17, 1937; and May 28, 1938. Copies of the 1938 Survey are still obtainable, but earlier issues are out of print. Regular features in each supplement include an estimate of sales, a review of unit trust development, and (except in last year's issue) particulars of management company control. In addition, major questions each year, such as the Board of Trade Committee's Report, management costs, flexible trust operation, and analyses of unit holders, have been discussed in the various issues.

WANT YOU TO KNOW—

1. That the YIELD on their Investments depends upon the dividends paid by the Companies whose shares are included in their Trusts.
2. That the PRICE is governed by the prices charged on the Stock Exchanges for these shares.
3. That all DIVIDENDS from these shares are distributed twice yearly by the **Midland Bank Executor & Trustee Co. Ltd.**
4. That the MANAGER and TRUSTEES are paid out of a charge which represents a small addition to the cost of the investment and in some Trusts an additional small deduction from Dividends.
5. That the INVESTMENTS in the Trusts are wisely selected with the object of giving you (in the Manager's opinion) the greatest degree of security of capital combined with a reasonable return on this capital.
6. That by SPREADING your investment in this manner you are adopting the principles employed by all wise investors.
7. That any INVESTOR may take advantage of our free Investment Service by sending in confidence particulars of present holdings so that we may be better able to advise as to how available funds should be allocated.

If you desire to know more about this type of investment, prices and yields, please ask for the KEYSTONE HANDBOOKS which set out the basis of all transactions and which can be obtained, free of cost, from any Stockbroker, Bank Manager or by sending a postcard to:—

Controlling Corporation:

BRITISH INDUSTRIAL CORPORATION LTD.

(Member of Unit Trusts Association)

24 THROGMORTON STREET, LONDON, E.C.2

ALLIED INVESTORS GROUP OF UNIT TRUSTS

Chairman: HARTLEY WITHERS

BRITISH INDUSTRIES FIXED TRUSTS

With full employment in prospect, and new creative energies derived from rearmament, British industry is in finer shape than ever in its history. The four Portfolios of this Trust give their certificate holders a wide-spread interest in the equity of our country's future.

An investment divided equally between all four Portfolios, and so spread over 102 securities, gives 8 dividends in the course of the year and a yield, at prices current May 10, of approx. 5½% gross per annum from cash dividends, plus ¼% from share bonuses and rights.

Trustees: MIDLAND BANK EXECUTOR & TRUSTEE COMPANY, LIMITED

CUMULATIVE INVESTMENT TRUST

Consisting entirely of ordinary shares in fifty first-class companies, adopts the principle of Reserve Fund accumulation with a view to augmenting year by year the investor's capital and income.

Estimated Yield: £5 5 0% (before deducting one-sixth for the Reserve).

Trustees: MIDLAND BANK EXECUTOR & TRUSTEE COMPANY, LIMITED

ELECTRICAL INDUSTRIES TRUST

Electricity is the most vital of mechanised aids offered to civilisation and its quickened pace may be measured in terms of speed, efficiency, cleanliness and public health. In the industries concerned with the supply of electricity and with manufacturing electrical equipment there are good opportunities for enterprise and profit.

Electrical Industries Trust provides a means of investment in the share issues of forty-one of the best electric supply and equipment companies. Approx. yield, 4½% gross from dividends, plus ¼% from recurring bonuses and rights.

Trustees: GENERAL ACCIDENT FIRE & LIFE ASSURANCE CORPORATION LTD.

METALS AND MINERALS TRUST

Metals & Minerals units at the price of 13s. 3d. xd., yield the equivalent of £5 11 9 per cent. per annum gross after the equivalent of £1 10 3 per cent. has been put to reserve to safeguard the investor's capital and to provide for equalisation of dividends.

Metals and Minerals Trust is concerned with the share issues of forty companies producing and investing in base metals, minerals, diamonds and gold undertakings—a "Commodity" Trust of particular interest.

Trustees: MIDLAND BANK EXECUTOR & TRUSTEE COMPANY, LIMITED

With the exception of Cumulative Investment Trust, where the yield from cash dividends is estimated, the approximate yields stated above are based on the last two completed half-yearly periods of the Trusts.

ALLIED INVESTORS FIXED TRUSTS LIMITED

Units or sub-units may be bought through any stockbroker or bank. Explanatory booklets (on which transactions are based) may be obtained on request.

showed continuous growth—at first very rapid, and then at a declining rate:—

GROWTH OF SALES AND TRUSTS

	End 1934	End 1935	March, 1937	March, 1938	March, 1939
Net unit trust sales... £	20,750,000	45,800,000	67,140,000	77,450,000	83,825,000
No. of trusts formed ...	32	53	72	79	96
Average net sales per trust	648,000	864,000	933,000	980,000	873,000
Increase compared previous total	...	25,050,000	21,340,000	10,310,000	6,375,000
No. of trusts formed in period	...	21	19	7	17
Index of growth (total sales per new formation)	...	1,193,000	1,123,000	1,473,000	375,000

Last year sales fell from £980,000 per trust to £873,000 per trust. This result is due partly to reduced business, but partly to the energy of the movement in forming new trusts last year under conditions which, in the event, were considerably less fruitful than their promise. It is impossible to isolate from the sales figures the contribution which new trusts have made to the increase in each successive year. But a comparison of the increase of net sales with the number of trusts formed within specific periods provides a crude guide to the success of new unit trust enterprise. These figures are calculated in the second section of the table above. The sales in each period per new formation (which have been roughly described as an "index of growth") include, of course, all sales, for new and old trusts. The latter may be expected to account for a rising contribution to annual sales as the number of established trusts increases, subject, however, to the important proviso that trusts "date." Again, many of the established trusts are closed. Thus, selling initiative lies with new trusts, which can frame their appeal to the public according to the mood or need of the moment. The figures for end-1935, and for March, 1937 and 1938, must, however, be discounted in order to isolate the contribution made by new trusts, and although the rate is unknown, it is probably not extremely high. But the results for the year to March, 1939, permit of no equivocal interpretation. Total sales, for new and old trusts, were equivalent to no more than £375,000 per new trust formed in the period, and it follows that the total average sales for new trusts were lower, and perhaps appreciably lower, than the average figure.

It is difficult accurately to determine the minimum sales which must be obtained before a unit trust manager "breaks even" on his heavy initial expenditure and begins to earn a net profit in respect of additional turnover. Much depends upon the spread of overhead expenses—an established group can usually handle the management of a further trust without any great addition to costs. But even for such groups, an average sale of less than £375,000 for new formations would provide no appreciable return—indeed, the critical figure which has to be attained before profits are earned is usually put at £500,000.

Sales and the Small Saver

It is invidious to compare a stripling of a mere eight years with the venerable savings institutions which have hitherto catered for the small type of investor. The majority of small savers are unwilling to undertake the risk of fluctuating investment values. Over a wide range, therefore, the unit trust movement is not directly competitive with savings deposit institutions, such as Post Office and Trustee Savings Banks, Building Societies and Savings Certificates. Again, these institutions owe much of their annual growth to the automatic accumulation of interest.

Hence a direct comparison of the rates of growth of these institutions with unit trusts (as set out in the accompanying table) would be somewhat unfair to the unit trust movement. But the figures have a bearing on the untapped market which the unit trusts may still be able to exploit. Hitherto (as a special analysis of unit trust certificate holdings in last year's Survey showed) the major response to unit trusts has been among investors who were in a position

to acquire up to 300 units. Expressed as a proportion of the total funds, however, holdings of up to 300 units represented only between one-third and one-half.

Thus, the large holding, which is also the economical holding owing to the fixed nature of management costs per transaction, is well represented in unit trust funds. But in encouraging smaller holdings there may be a divergence between the objectives of increasing sales and increasing profits. The trusts themselves recognise this point by insisting on minimum purchases for initial orders. But it is somewhat surprising that so little uniformity exists regarding these minima. As the directory tables beginning on page 14 show, the minimum number of units which may be acquired on initial purchase varies widely between five and 250, though the latter figure applies to a unit initially valued at 1s. 11d. The general minimum is about 50 units, though several groups permit a lower number.

From the management point of view, however, it is doubtful whether any order below £50 provides an oppor-

tunity for profit. If it is reckoned that the direct cost per unit holder per distribution is one shilling, and the trust is of 20-year duration with two distributions each year, the minimum total costs for which the managers must make provision out of their initial service charge (disregarding, for the moment, the question of annual charges) would amount to £2. Clearly, this would leave little margin on a £50 order on the assumption that the effective loading charge is 7½ per cent. counting in all adjustments.

There are, however, two mitigating factors. First, larger orders provide a surplus and thus assist the profit margin on smaller business. Secondly, the adoption of annual charge by recent flexible and fixed trusts to some extent indemnifies the managers against future costs. But if, for the sake of argument, it is assumed that the annual charge amounts to ¼ of one per cent., divided between the manager and trustee, the annual income to the former would amount to 1s. 3d. on a £50 holding, which would not cover the direct costs of two distributions.

Hence a dilemma arises between the desire to obtain bulk sales and the necessity to meet the relatively high individual charges on small orders—which, collectively, might provide a substantial source of new business for the movement. This dilemma, it would seem, is one of the limiting factors to the expansion of the unit trust movement. It may, further, be doubted whether the bulk of the small savers who make the fullest use of savings bank, building society and savings certificate facilities should be invited to undertake equity risks, for their demand is largely for safe security for cash at interest.

Perhaps the ingenious methods which have been evolved in the United States, by which unit trust organisation has been grafted on to regular savings instalment plans may at some future date be introduced in this country. Their development in the United States has not been free from official criticism—partly on the ground that a substantial fraction of the early instalments paid to the managers are diverted to meet management costs and are not deposited in the fund. Inevitably, such costs appear heavy in relation to a small fractional payment. But regular incremental saving plans, provided that they can be devised on an economic basis, both for investors and managers, may assist the movement to tap some part of small savers' funds which, at present, do not provide really remunerative business for unit trusts.

The Evolution of Legislative Control

ON April 28th the Prevention of Fraud (Investments) Bill received the Royal Assent. When its full provisions come into force on the appointed day, one of the strangest chapters in the history of unit trusts will have been closed. In order to trace what appears, in retrospect, to be the almost accidental decision to introduce specific legal control over unit trusts in this country it is necessary to go back to 1936, when the findings of the Stock Exchange and Board of Trade investigations into the movement were published. The reports of both committees found that unit trusts satisfied a public need, but both pointed to the dangers of uncontrolled development. The Stock Exchange sub-committee, reporting early in 1936, described its findings as an interim report, and considered that full protection for the public could only be achieved by legislation.

With the onus thus placed fairly and squarely on its shoulders, the Government, in March, 1936, appointed a Board of Trade Departmental Committee, under the chairmanship of Sir Alan Anderson, to inquire into the question of unit trusts in all its aspects. The Committee issued its findings in August, 1936. Its recommendations were sweeping, but they were welcomed by the movement itself, and the way seemed clear for legislative control—as *The Economist* pointed out at the time, there seemed nothing but the exigencies of Parliamentary business to prevent the passing of a Unit Trusts Act during the succeeding session. In fact, however, seventeen months elapsed before the Government's attitude was defined (though during the interval many of the Anderson Committee's recommendations were adopted by the movement), and it was not until December, 1937, that the then Parliamentary Secretary to the Board of Trade announced that the Government had no early intention of introducing legislation to regulate the movement.

Anti-climax though this decision was, the Government had apparently determined that no immediate case existed for control, for when the first version of the "Sharepushing" Bill was issued in the following summer it was found that the Bill not only exempted unit trusts but that it also accorded to their trustees, as trustees, a standing which they apparently did not possess in some of their other capacities. Both trustees and managers were exempted from the licensing provisions of the Bill, provided that the trusts were "authorised unit trust schemes" within the meaning of the Bill and that their trustees were approved by the Board of Trade. In their other capacities the trustees could obtain exemption only by order of the Board of Trade. The first version of the Bill, it may be remembered, was intended to test public opinion, and when it was re-issued last November many amendments and alterations were introduced. The position of unit trusts, however, was unchanged, and it seemed that, after all, there was to be no official regulation of the movement. Certainly there was not the slightest indication of the complete reversal of the Government's attitude that was, in fact, impending.

The first hint of a change in official policy was given during the Committee stage of the Bill in the House of Commons when the President of the Board of Trade announced that the Government was considering how the responsibilities of trustees could be increased, particularly in connection with the control of advertising. In December, 1938, Mr Stanley said that he would later introduce an amendment providing that trust deeds must satisfy conditions to be prescribed by the Board of Trade and which would enable the Government to indicate, both in existing and future trust deeds, the sort of conditions which were laid down by the Anderson Committee. Here was a *volte-face* with a vengeance, and it was not to be expected that either trustees or managers would allow the Government's attempt to assume the very wide powers it proposed to take to go unchallenged. It was not that the managers objected to regulations, or that the trustees were unmindful of their obligations. The managers had, to a substantial extent, followed the recommendations of the Anderson Committee; and many trustees had, in practice, already been

exercising considerable control over such matters as advertising. The truth was (as the Lord Chancellor later admitted) that the Government's amendment was an offence to any lawyer. It gave the Government complete control over the movement and full powers to vary trust deeds so that they should accord with its own prescribed provisions.

The matter was, however, rectified in the House of Lords. Lord Wardington, chairman of Lloyds Bank, Ltd. (trustees to the first unit trust formed in this country), made a vigorous protest against the blanket provisions, and the sequel was a schedule of six heads under which regulations may be issued by the Board of Trade. These include:—

1. Determining the manner in which the sale price of units and yield are to be calculated.
2. Regulating the mode of execution and the issue of unit certificates. In particular, for securing that no unit certificate shall be executed or issued in respect of any property until steps have been taken, to the satisfaction of the trustee, to secure that the property will be vested in him.
3. Securing that any advertisement, circular or other document containing any statement with respect to the value of units or the yield, or any invitation to buy units, shall not be issued until the trustee has had a reasonable opportunity of considering the terms, and shall not be issued if within a reasonable time he notifies his disapproval in writing to the manager.
4. The establishment of a fund to defray administration expenses and for regulating the application of that fund.
5. The audit and circulation to holders of units of accounts relating to the trust, including accounts of the manager in relation to the trust and statements of his remuneration in connection with the trust.
6. Requiring the manager (subject to any provisions as to appeal contained in the deed) to retire from the trust if the trustee certifies that it is in the interest of the beneficiaries that he should do so.

Short of a separate Bill devoted exclusively to unit trusts, it must be admitted that regulations under these headings should be reasonable and that they should go a long way towards meeting the recommendations of the Anderson Committee. With the exception of items (1) and (5), the regulations can hardly be said to break new ground—they will regularise the position and make compulsory for all what in the past has been the practice of the majority. The setting-up of escrow funds has long been established as common practice, and the trust deed which does not provide for retirement of the managers on the trustee's request is the exception rather than the rule in up-to-date practice. Regulations covering advertising also only extend to the movement, as a whole a practice which many trustees have followed for some time, although it is a definite break with the tradition that the trustee of a unit trust is merely a custodian trustee—officially, at least.

We thus come to regulations (1) and (5), and these embrace the points around which most criticism and controversy have centred since the movement's inception. Discussion in advance of publication of the Board of Trade's exact requirements is to some extent robbed of its usefulness. But it may be presumed that the Board of Trade will be guided, in part at least, by the Anderson Committee's recommendations. On this assumption, the possible form of the trust accounts to be published by the managers is discussed at some length below. The manner of determining prices of units and yields is not so complicated, although existing practice may well be upset in some cases. It may be presumed that the practice of using Official List quotations instead of actual dealing prices in the calculation of unit prices will be abolished. Few trusts, however, employ Official List prices, and there is general agreement

A GROUP OF UNIT TRUSTS DESIGNED TO SATISFY EVERY INVESTOR

The above prices were quoted on May 10th;
for current prices see the National Press.

1. This series comprises the Shares of 27 leading British Industrial Companies.
2. The Gold Share Trust has special amortisation features and expert technical advice.
3. The Trust of Rubber and Tin Shares covers over 100 Rubber and Tin producing companies.
4. An investment spread over the leading British and American Shares.
5. A Trust specially designed for capital appreciation and high yield.
6. The portfolio of this Trust consists of companies engaged in the production and handling of basic commodities.

Fully descriptive booklets of the above Trusts can be obtained from any Stockbroker or Banker, or direct from:

Patrick Nicholson (Managing Director)

LOMBARD INDUSTRIAL TRUST is the first of a series of Trusts to be formed under the management of Lombard Unit Investments Limited. It is the aim of the Managers to provide Trust investments which not only interpret the changing trend of world economy in their investment policy, but also incorporate such technical developments in Unit Trust structure as appear to benefit the investor.

Lombard Industrial Trust is a recognition of the opinion, widely held in financial circles, that rearmament finance, and the measure of inflation which it necessitates, makes first-class industrial ordinary shares the most attractive long term investment. The Trust was formed during a period when markets were under the strain of increasing political uncertainty and the prices of industrial securities of the 'market leader' class were falling to an extent justified neither by their dividend records nor by current reports from the industries they represented. However, in spite of existing political uncertainties, it must be assumed that British industry will continue on a profit-earning basis and that first class ordinary shares, which form the basis of this Trust, will prove satisfactory to their holders both as to income and to capital value.

The Trust is of the 'cash fund' type, is not rigidly fixed, and has the benefit of the services of three consultants in the determination of its investment policy. The Managers believe that it represents as solid and well balanced an investment in British Industry as can be devised.

Sub-units may be bought free of commission and stamp duty through any stockbroker or Bank

that the practice should be terminated. The second controversial point in pricing is the "rounding-up" charge. It is obvious that the "weight" of this charge must be related to the price of the sub-units or units—a 3d. "rounding-up" charge on a £1 sub-unit has a very different incidence from a 1d. "rounding-up" on a 2s. sub-unit. In the same way, the incidence of the dealing margin between bid and offered prices of high and low-priced sub-units may also vary greatly. But there seems to be an argument for meeting these points by introducing a sliding scale on the basis of which the charges could be adjusted according to the price of the sub-units.

Yield calculations are probably even more controversial than sales prices and dealing margins. There are obvious limitations in any yield calculation, but a number of primary principles can at least be followed. The inclusion of receipts of a capital nature—proceeds of sales of "rights" and of bonus shares—obviously distorts the true income return on a portfolio, while the calculation of yield on the total amount of dividends received in an accounting period, including all accrued income in the price of securities purchased full of dividend, has also been employed to show an artificially high yield. Such matters as allowance for reductions in interim dividend on the underlying securities, the problem of income from wasting assets, and the question whether manager's and trustee's remuneration is paid from income or capital are other points on which practice has varied widely in the past and on which there should be an official ruling. These problems should not be impossible of solution—some groups have already solved them—but the overriding consideration should, in any case, be that of conservatism. Unit trust certificates have sold very largely on yield in the past, and in view of the movement's preponderating interest in equities there is everything in favour of understating, rather than overstating, the return which the investor may expect.

What Form of Accounts?

Under paragraph 5 of the Schedule, unit trust managers are charged with responsibility for audit and circulation to unit holders of accounts of the trust, and of the manager in relation to the trust, including statements of his remuneration in connection therewith.

What form should these accounts take? No particular difficulty seems to arise concerning the trust accounts. These are in all cases provided with each distribution, and are printed as part of the dividend warrants sent to the unit holder. A typical form of account would set out the gross amount of dividends received and receivable per unit, the amount of British income tax deducted therefrom, and the net amount received or to be received. To this sum would be added any amounts received free of tax, other receipts (such, for example, as the cash value of rights sold) and the deduction from income (if any) in respect of the manager's and trustee's fees. The net amount distributable per unit (distinguished between capital and income) is then set out for each of the "groups" of units formed within the distribution period, to take account of net distributions and equalisation payments. For a flexible trust, the percentage constitution of the unit close to the date of the distribution is given. There follows a statement of the amount (if any) which has been released from escrow funds for trustees' and manager's remuneration, a certificate by the trustee that adequate provision has been made for future management expenses, and an auditor's report covering the income and the amount to be distributed.

This basis for trust accounts derives from the recommendations of the Anderson Committee, and presumably will provide a working model from which the Board of Trade will formulate their requirements. The adjustment of those deeds which do not fully cover the points mentioned should occasion no special difficulty.

The wording of the second part of the paragraph—"Accounts of the Manager in relation to the trust, and statements of his remuneration in connection therewith"—is more difficult to interpret. First, however, it is to be presumed that the Board of Trade will not require the disclosure of the actual size of the individual trust; an analysis of the accounts on the basis of some convenient

multiple, such as one thousand units, would seem to be sufficient, and it conforms with the existing practice regarding trust accounts. There are no direct precedents for the manager's account, but possibly the unit dealing account set out as Form C of the Anderson Report, may provide some guidance. This includes, as to values and the number of units represented thereby, the following items: Units in hand at the beginning and the end of the period; purchases and sales of underlying securities; sales and re-purchases of sub-units; agents' commission on sales and re-purchases; share of commission and brokerage received by the managers; and the amount included in the sales of units in respect of service charge and "rounding up."

Presumably, some modifications of detail would be required to this form. For example, it makes no provision for remuneration to trustees arising on the sale of new units. The opening and closing stock, again, would presumably have to include opening and closing stocks of securities (if any) purchased but not appropriated for the constitution of new units, in addition to the units in hand. A further point, however, may arise in connection with half-yearly charges. The real balance of gross profit cannot be finally decided until the end of the trust period, for the managers have an expectation of regular income from the half-yearly charge, while, on the other side, they must provide for trustees' fees and meet the cost of management and distributions. It is possible, therefore, that consideration may be given to the practicability of crediting the anticipated receipts from semi-annual charges over the full life of the trust (it would not seem necessary to discount these expected sums for the purpose, incidentally) and of charging against this sum an allowance for future management. It is understood that the normal half-yearly allowance for Inland Revenue purposes for future management is based on the minimum fee, if any, payable to the trustee, plus one shilling per unit holder's account. This sum, multiplied by the number of half-years unexpired in the trust period, and expressed per thousand units, should show how far the future management charge payable by the unit holder will leave the managers in profit. It is, however, an estimate rather than a strict account, whose usefulness would depend upon the light it throws upon the current gross profitability of the manager's operations.

It is desirable, in order to clear the air of controversy, that particulars of profit and cost should be given in the fullest possible detail. Whatever the precise form of the account may be, therefore, it would be highly advantageous if it supplied information regarding the manager's gross profits as they originate from four sources.

First, profits arise on the creation and sale of units. Hence the accounts should show the difference between the gross cost to the managers of permitted investments bought to be vested in the trustee and the proceeds of sale of units so created. Secondly, income arising from the management of trust property includes the management fee and any share which may be received by the managers of commissions payable to brokers on the purchase or sale of trust property. Thirdly, profits from dealing in units already in issue—that is, from the revolving fund—may be of importance. Finally, the liquidation of units provides a profit in respect of the difference between the bid price of units and the actual proceeds of the liquidation, which should approximate to the average amount of the downward price adjustment made in calculating the bid price.

Whatever form of account is finally adopted, these points deserve consideration. Although the Act only requires circulation of accounts to unit holders, they will, it will be hoped, be made available to the Press. The present trust accounts are not regularly released for publication to the Press, although managers are usually prepared to supply them on request. The resulting figures should then be comparable with the declared charges shown by the managers in their booklets. It will be evident, of course, that a considerable difference will remain between the management profits disclosed in the accounts and the actual net profit or loss made by the management group concerned. Operating expenses payable from the gross profit margin are heavy, and a substantial volume of business is required before reasonable net earnings are realised.

Management Charges

THE passage of the "Sharepushing" Act, which will require the future circularisation of accounts relating to the managers, has brought into the forefront of discussion the income which managers may draw from the four different functions which they commonly perform—creating and selling units, managing the trust property, providing a market for units already in existence, and liquidating the trust. It is not yet known what form of disclosure of the results of these operations will be required when the Act comes into force. It is already possible, however, to study some of the charges, since they are explained in trust deeds and booklets, and certain facts are also known regarding income arising at other points: the gross charge for making a market in units, for instance, is published in the margin between the bid and offered prices quoted by the managers, though this may vary at different times and for different trusts. Excluding brokers' commission, where it is included in the price, the margin between the bid and offered prices quoted for 77 trusts at March 31, 1939, averaged 5.03 per cent. of the offered price of units, the figures for individual trusts ranging from 2.60 per cent. to 14.71 per cent.

In our third Unit Trust Survey, published on April 17, 1937, a table was published showing the comparative charges on flexible trusts, calculated as a percentage of the initial price of the unit concerned. They were based on the annuity value of the preliminary charge, together with the average price adjustment, allowing for interest at 4 per cent. To this percentage the annual management charge was added in order to show the total effective charges (as stated, and arising from adjustments) per annum of the trust period. The figures published on that occasion included in management charges the brokerage payable on sales of units. In bringing the table up to date the oppor-

tunity has been taken to remedy this defect by slightly altering the basis of the calculations. In the tables given below the effective amount accruing to the manager and the trustee from the preliminary charge and (in those cases where it does not become part of the trust property) from the price adjustment has been reduced to an equivalent annual figure over the life of the trust, taking interest at 4 per cent., and expressed as a percentage of the net initial price of units, after deduction, where necessary, of brokers' commission. To this figure has then been added the amount of any stated annual charge, expressed in the same way as a percentage of the net initial price of units.* In some cases the annual charge may be taken from capital or from revenue at the discretion of the managers. The table shows what has been assumed from a reading of the trust deed. As the footnotes to the tables indicate, there are several different ways of computing the preliminary charge, ranging from a deduction of, say, 5 per cent. from the total selling price of units to an addition of 5 per cent. to the actual cost of underlying securities. The difference between these methods is not negligible for the effective charge on the second method is, in fact, less than 4½ per cent. of the selling price. Hence, to make a true comparison between one trust and another it is clearly necessary to take such differences into account. The inclusion, in most trusts, of the price adjustment in the computation of managers' charges is more important still; an average price adjustment of 1½d., for example, represents 2½ per cent. on a unit priced at 5s., and may provide more than a fifth of the manager's and trustee's total ascertainable revenue from a trust with a life of 20 years, and

* Credit for devising this method is due to Dr Charles H. Walker, from whose unpublished dissertation on Unit Trusts the accompanying tables are reproduced by permission of the author

Preliminary Charge: (b) Calculated on gross cost of securities plus accumulations.
(d) Calculated on selling price less price adjustment.
(e) Calculated on selling price.

Annual Charge: (f) Taken from capital of fund. In some cases the annual charge may be taken from capital or from revenue at the discretion of the managers; the table shows what has been assumed from a reading of the trust deed.
(g) Taken from revenue of fund.
Price Adjustment: * Becomes part of fund.

(c) Cash Trust.

correspondingly more from a trust with a shorter life. The charges for flexible trusts, shown below, cover a very wide range, from 0.303 per cent. per annum over 25 years on Scottish Bank Insurance and Investment Trust Units to 1.505 per cent. per annum over five years for the Trust of Rubber and Tin Shares. Among trusts with a life of 20 years or more the highest charge is 1.067 per cent. for Domestic (Second Series). Trusts with a short life naturally show higher annual charges since the preliminary costs are spread over fewer years, but comparison among groups of trusts with different lives is impossible on account of the small number (10 out of 38) of trusts with lives of less than 20 years.

Among the 28 trusts designed to run for 20 years or more, however, interesting comparisons are possible. The average annual figure for this whole group is 0.587 per cent., and the trusts are fairly evenly distributed about the average. Among individual managements, Trust of Insurance Shares show the lowest charges in the table, with an average for the five trusts in the group of 0.368 per cent. per annum. The Cornhill Trust is not included, since the whole of the management costs are borne by the Deferred Units.

Sixteen of the twenty-eight trusts are of the "Appropriation" type, and these show an average charge of 0.528 per cent., whilst the remaining twelve, "Cash" trusts, have an average of 0.666 per cent. It will be important to see, when management profits are published under the "Sharepushing" Act, whether the contention of proponents of the "Cash" principle—that lower disclosed charges of "Appropriation" trusts are balanced by undisclosed amounts which inure to the managers from the purchase of permitted investments and the sale of trust units—is justified.

Arrangement of the trusts in the order of their formation discloses a striking increase in charges in the past year. Details are given in the following table:—

FLEXIBLE TRUSTS WITH LIFE OF 20 YEARS OR MORE

Period of Formation	Total Ascertainable Charges per Annum		
	"Appropriation" Trusts	"Cash" Trusts	All Trusts
1934-1937	0.424 (9)	0.616 (6)	0.501 (15)
1938-1939	0.661 (7)	0.716 (6)	0.686 (13)
1934-1939	0.528 (16)	0.666 (12)	0.587 (28)

(Figures in brackets denote number of trusts included.)

It would be unprofitable to carry the chronological division of the trusts further, for the smallness of the samples would make the averages meaningless. It is, therefore, impossible to say, as yet, whether the trend towards higher charges has reached its peak. But the extent of the increases revealed by this analysis—the rise is more than 50 per cent. in the case of "appropriation" trusts—confirms the opinion expressed in our survey two years ago that for some managements the unit trust movement had not proved the happy gold mine which might have been imagined from its rapid growth in 1935 and 1936. The only available standard by which the charges may be

judged is the management costs of investment trusts, the annual expenses of which are generally taken to amount to rather less than 0.5 per cent. on the capital employed. Since the managers of a unit trust run the risk first of the failure of the trust to reach an economic size and then of its rapid liquidation through the surrender of units, overall charges for management of 0.6 to 0.7 per cent. per annum cannot be called excessive.

We have treated flexible trusts first because information on their charges is more readily available. The method of computing the price of sub-units was often omitted from the deeds of early fixed trusts, but to provide a comparison with the charges on flexible trusts we give a tabulation of a selection of fixed trusts. The first group contains trusts in which the remuneration of managers and trustees came only from a preliminary charge and a price adjustment:—

ASCERTAINABLE CHARGES OF FIXED TRUSTS
(No annual charge)

Trust	1 Maximum Life	2 Initial price	3 Stated pre- liminary charge	4 Av. per- mitted price adjust- ment	5 Total charges, less brokerage, as percent. of net price (col. 2 less brokerage)	6 Total charges as percent. p.a. of net price
	Years	s. d.	%	d.	%	%
Century	15	19 0	5b	+ 1½	3.95	0.355
British Empire Comp.	20	20 6	7b	+ 1½	5.70	0.419
Security First	20	20 9	7b	+ 1½	5.69	0.419
British Empire Cum.	20	18 6	7b	+ 1½	5.76	0.424
Provident Inv.	20	18 3	7b	+ 1½	5.77	0.425
Selective A & B	15	20 0	6b	+ 1½	4.82	0.434
2nd Protected	20	20 0	7½b	+ 1½	6.15	0.453
1st Protected	20	19 0	7½b	+ 1½	6.18	0.455
2nd Investors' Gen.	15	18 1½	6½b	+ 1½	5.33	0.479
3rd Protected	15	15 6	7b	+ 1½	5.88	0.529
Hundred Securities	15	20 6	7d	+ 1½	6.16	0.554
Investors' Gold	10	20 6	6b	+ 1½	4.81	0.593
Keystone	10	18 7½	8b	+ 1½	6.63	0.817
Keystone 2nd	10	17 3	8b	+ 1½	6.68	0.824

(b) Calculated on gross cost of securities plus accumulations. (d) Calculated on selling price less price adjustment.

Six of these trusts with lives of twenty years or more show an average charge of 0.433 per cent. per annum, or slightly more than the pre-1938 "appropriation" flexible trusts. Finally, in the past year several fixed trusts have appeared with annual charges, and these are listed as a second group below.

On the annual basis which we have adopted the charges for these trusts are somewhat higher than the charges on the earlier fixed trusts, and generally somewhat lower than those on flexible trusts of the same life.

In view of the complicated basis of charges, it would seem highly desirable that some basis of comparative charges should be officially devised for use in measuring the relative merits of two similarly constituted trusts. The annual charges shown in the preceding discussion are not the end of management income—adventitious profits on underlying securities, revolving fund profits, and profits on realisation of units are included among the additional sources of revenue. The regular publication of accounts relating to the managers may give an indication of the extent to which they supplement the annual charges described in this article.

ASCERTAINABLE CHARGES OF FIXED TRUSTS
(With annual charge)

Trust	1 Maximum Life	2 Initial Price	3 Stated Preliminary Charge	4 Average permitted price adjustment	5 Total Preliminary Charges as percent. of net price (col. 2, less brokerage)	6 Annual Equivalent of total Charges (col. 5)	7 Stated Annual Charge	8 Total Charges as percent. per annum of net price

If terminated before Apr. 6, 1944, managers to repay equitable part of initial charge.

The Year's Trust Formations

At the end of May last year the total number of unit trusts established in this country was 79, a figure which excludes British General "B" which, in October, 1935, was replaced by Series "C" with a similar portfolio. Between the creation of the first unit trust in April, 1931, and May, 1938, the output of new trusts had averaged rather over eleven per annum. This performance has been comfortably exceeded during the past twelve months, for no fewer than nineteen new unit trusts have been created within that time, excluding *Supervised Shares Inc.* and *First British Mutual Fund*. The former is an American trust company, and the latter, after meeting considerable criticism (see *The Economist*, October 15, 1938), ceased to trade last November and returned subscriptions in full.

Of the nineteen trusts, ten are flexible, while nine are either of the fixed type or have powers of strictly limited flexibility. The introduction of cash fund principle to the operation of fixed trusts is the latest development. Two trusts of this type have appeared, namely *New British* and *Lombard Industrial*. The *New British Fixed Trust* (Municipal and General group) introduced the new conception of a "unit of investment," which comprises, in its case, specified holdings in 33 industrial companies. As cash is received by managers it is invested in successive units of investment and the offered price of new sub-units is computed by taking the replacement value of deposited

property divided by the number of sub-units in issue and adding the preliminary charge and price adjustment. It must be realised that in trusts of this type (unlike the original fixed trusts) the managers are not required—indeed, the deposit of cash expressly rules out the possibility—to create complete new units of investment before selling new sub-units to the public. The price of the new sub-units is computed by the method employed for the flexible trusts, and units of investment are consequently built up according to the amount of cash received and to the policy of the directors in acquiring the required underlying securities. Within the limit of one complete unit of investment, therefore, the managers may pursue what is tantamount to a flexible investment trust policy, at least in the order of acquiring the specified number of shares for each investment in the portfolio. The *Lombard Industrial Trust*, which was formed in March this year by a new management company, *Lombard Unit Investments*, is of somewhat similar type. This trust is also operated on cash fund lines, and its unit of investment comprises specified holdings in 32 industrial concerns. The original unit, as vested in the trustees, was divided into 15,000 sub-units for the purpose of calculating price. Consequently, the price has been based on the replacement value of the deposited property, divided by the number of sub-units in issue, together with the preliminary charge and price adjustment. As in

Maximum size of Trust (Units)	Open or Closed	No. of Sub-Units to Unit	Minimum Purchase of Sub-units		Certificates, Bearer or Registered	Loading or Service Charge (%)	Management or "Escrow" Provision	Distribution Dates	Other Particulars	Trust

...	Open	...	50	10	Registered	Initial charge 6½% on price; semi-annual charge ½% for trustee, expenses of trust, and surplus to managers.	Provision made	15 Apr., Oct.	Cash Fund Operation. (a) Holding in any sec. limited to 2½% of trust and 5% of issue.	ORTHODOX Orthodox.

the case of the *New British*, the managers are required under the trust deed to acquire successive units of investment so that the acquisition of each unit is completed before any part of a further unit is acquired. There is, however, a proviso that if funds forming part of the deposited property permit of the simultaneous constitution of more than one unit of investment the requisite number of units may be acquired concurrently.

Fixity, however, has not been limited to portfolios. The latest unit trust, the *Orthodox Unit Trust*, maintains fixed proportions between various sections of its portfolio. Thus 20 per cent. of the fund must be in gilt-edged, 15 per cent. in debenture and preference shares, 10 per cent. in bank and insurance shares, 45 per cent. in industrial equities (split into nine sub-sections of 5 per cent. each) and, finally, 10 per cent. in gold shares. Within each section and sub-section, the managers are free to vary their investments within the range of the permitted list and of the permitted proportions. The *Orthodox* is the first trust in which diversification has been given such specific form.

The review of the series of conversion offers to unit holders to exchange into shares of managed trust companies included in last year's Survey on page 22 showed that, after an initial success, the attraction of such offers was short-lived. It was suggested in the course of last year's discussion that the result of an offer to vary a fixed trust into a flexible form would be of interest. This suggestion was followed in November by the offer from the National group to holders of *Universal Fixed Trust* certificates to exchange their holdings for *Universal Second* units, a new flexible trust with a wider range of permitted investments. The

"flexing" of this trust was performed quite simply (apart from the legal technicalities involved) by the execution of a supplemental trust deed. Out of a total issue exceeding £4,500,000 in the *Universal Trust* at the time of the offer, holders of units valued at some £1,200,000 elected to exchange into the flexible trust. A source of possible market inconvenience and danger to a fixed trust of this size is illustrated by the fact that the managers, by the date of the offer, had come to control 10 per cent. of the total issue of one of the shares included in the portfolio. From the date of the offer (November 22, 1938) until the closing date for acceptance (December 17, 1938) the two portfolios were maintained on an identical basis.

One of last year's innovations was the provision of savings facilities through the medium of unit trusts. Some trusts already formed a year ago had optional powers to reserve part of the trust income arising in any distribution period. This feature, however, has been carried a considerable step further in two new trusts in the *Proved Securities* group, *Four-Square* and *Bank, Insurance and Financial Shares (Second Series)*. The trust deed of the former gives the managers power to place any excess of earnings over 3 per cent. in any half-year to reserve, i.e. to increase the capital value of the trust fund by ploughing back earnings to that extent. The *Bank, Insurance and Finance (Second Series)* deed gives the managers power to reserve excess of earnings over 2½ per cent. The *Cumulative Investment Trust* (Allied group) specifically limits half-yearly distributions to five-sixths of the income received by trust.

The technique of reserve provisions has been applied in

a more developed form to the *Investors Income and Reserve Trust* (Fifteen Moorgate group). Unit holders in this trust have the option of retaining their holdings in the income section of the trust or in the reserve section of the trust. The former is, in general organisation, a fixed trust of the now familiar type. The reserve sub-units, which are based on the same fund of underlying securities, receive only three-fifths of the income attributable to them from the earnings of the fund in any half-year, and the balance is held in reserve. Amounts accumulating in the reserve fund are naturally kept aside from the trust itself and may be invested, at the discretion of the managers, in British Government and Corporation stocks with not more than five years to redemption at a price, including expenses, not exceeding par. If, in the event of a fall in market values, the aggregate value of investments (and cash) included in the fund should fall below the total sums due to reserve sub-unit holders, the managers undertake to apply the half-yearly charge of $\frac{3}{8}$ per cent. of the trust fund to offset any depreciation in priority to general management purposes. The savings appeal was also stressed in the formation of the *Savings Unit Trust* (Fifteen Moorgate group). Although this trust has not adopted any reserve provisions, the managers introduced the 2s. basis for the sub-units in order to enable investors to purchase additional sub-units from amounts received at half-yearly distributions.

A new group, Unit Investments, has been responsible for the issue of three trusts during the past year. The *British and Dominion Insurance-Bank Trust* represented a further addition to a field which, on the face of it, seemed already well ploughed. In December this group formed what may perhaps best be described as a duplex trust, the *Trans-Atlantic Unit Trust*, *Canadian Series*, and *United States Series*. In effect, these are two separate trusts, but (like the six Group Units in the Keystone group) they were constituted under one trust deed. Each of the trusts had a fixed portfolio limited to ten securities with short alternative lists of three securities for each series.

Expectations of market recovery in dollar securities, in fact, played a considerable part in determining the course of unit trust formations last year. In addition to the two trusts in the Trans-Atlantic series just described, the Allied Investors group formed *American Industries Trust* in July, 1938, while the British General group formed a mixed trust called *British and American Securities*. The American Industries booklet stresses the powers of the managers to "cash in" on capital appreciation by converting holdings of dollar securities into British Government securities or by realising the trust funds and distributing them to unit

holders as a return of capital. The British and American Securities Trust has an authorised list of investments in 26 British and 26 American companies, within which it is free, subject to certain limitations, to invest. The fund, however, must not hold more than 50 per cent. (by value) of its resources in shares of American companies at any time.

These various formations, holding interests in American securities, were assisted by the temporary removal, on February 1, 1938, of the Treasury's request that American securities should not be acquired for re-sale in this country. Each formation, however, appears to have been requested by the Treasury to limit its purchases of American securities to £500,000 sterling value—although total cash sales of units, after allowing for charges, etc., and for the inclusion of non-dollar securities, might of course exceed that figure. It is understood that, so far, the Treasury has not modified this request, despite the re-imposition of the foreign issues embargo on December 20th and the Chancellor's recent expression of hope that British investors would realise the undesirability of acquiring holdings of foreign securities for private investment. Hence, the trusts are still free to constitute new units. Their selling activities, however, have been limited by the official request that no Press advertising shall be carried out, although the merits of respective trusts may still be advocated by their sales representatives.

The National group struck out on a new line in introducing last December the shares of Supervised Shares, Incorporated—an American-managed investment company of the Boston type, which is not included in our directory table for this reason. To undertake the business of marketing these shares the National group formed a management subsidiary, London and Boston Securities, to purchase holdings in Supervised Shares, Incorporated, and to re-sell them in this country. The offer for sale of Supervised Shares, Incorporated, was fully summarised in *The Economist* of December 10, 1938. It was issued subject to an undertaking given by London and Boston Securities to the Treasury to discontinue the sale of Supervised Shares upon request from the Commissioners. It is understood that this request has recently been exercised.

Other trust formations last year include *Keystone Gold Certificates*, the *Gold Share Trust* (British General group) and *National Gold Share Certificates*. The Keystone group has, of course, specialised upon gold trusts, but in the case of the National and British General groups they represent a new departure. The list is completed by the inclusion of the *Commodity Share Trust* (British General) and *Domestic (Second Series)*.

Appropriation—Cash Fund Controversy

IN March, 1936, when the Government appointed the Anderson Committee "to inquire into fixed trusts in all their aspects" the day of the flexible trust was just dawning. Of the 56 trusts created at that date, only six had a flexible investment power. By July, 1936, when the Committee reported, the number of flexible trusts had increased by ten, and the fixed trusts by only one. During the Committee's deliberations, in short, a vital change was occurring in unit trust practice. It implies no disrespect to the Committee's work to record that their report gave only slight attention to flexible trust problems. Certainly, it laid down general criticisms regarding the dual rôle of certain management companies in acting at the same time as agents for unit purchasers and also as principals who stood to gain from transactions in the underlying securities of the trust. These references have real bearing on the appropriation-cash fund controversy, but of explicit direction there is none. The fierce light of publicity was to be shed on managers' profits, and that should suffice.

A general summary of the distinctions between the two methods was provided in the Unit Trust Survey of April 17, 1937. In view, however, of the growing discussion of the points which were then raised and of the forthright claims from each side, it is perhaps desirable, first, to recapitulate the nature and method of operation of the

two types, secondly to discuss their claims and objections, and thirdly to attempt to reach some broad conclusions.

EVIDENCE-IN-CHIEF

I. Appropriation Trusts

"Appropriation" is the name applied to the method by which a trust fund is built up by the deposit of securities with the trustee. To take the simplest case—that of the original type of fixed trusts—the fund grows by the appropriation of securities in quantities defined by the trust deed. As each block of securities is deposited, the corresponding number of sub-units may be issued. A state of mechanical equality is maintained between new and existing sub-units. When the method is applied to a flexible fund, however, differences arise. The fund is first constituted by the deposit of securities, and the managers hold the units issued against the underlying securities in readiness for sale. In other words, the managers will normally be long of units. On the exhaustion of the supply by sales to the public, the managers must proceed to augment the fund by appropriating further securities. In the case of a fixed trust, as we have seen, this is easily carried out by the deposit of a further block of specified securities. But for a flexible fund, it is difficult, if not impossible, to augment

each of the underlying securities by a given proportion for each holding.

The problem, accordingly, is to augment the fund, not by introducing specified proportions of the existing securities in it, but by depositing new securities bearing the same relationship to the existing value of the fund as the proportion which the number of units which it is desired to create bears to the total in issue. To put the matter simply, if the fund is valued at £1,000,000 and one million units are already in issue, the creation of a further 100,000 units involves the appropriation of securities valued at £100,000 to the fund.

When we turn to the precise technique by which appropriation is carried out, however, complications immediately arise. The appropriation method, it will be seen, works in specie, and authorised securities must be added to the fund upon an identical basis of valuation with that used for valuing the existing securities in the fund. But the process of appropriation is not identical with the process of costing the price of the unit at which managers are prepared to deal. For costing the price of units it is essential to value the fund, as it exists, by the replacement cost of securities contained in it and, after adding the necessary sums for accumulations and charges, to divide by the number of units already in issue. The resulting figure is then rounded off to, say, the next threepenny multiple, and the offering price of the units is thus produced. Correct pricing clearly involves the use of the closest prices at which purchases of the underlying securities can be made in the market.

Now, assuming that pricing is carried out accurately and conscientiously, how is the unit holder in an appropriation trust affected firstly, by the process of appropriation, and secondly, by transactions in the underlying securities? From the preceding summary, it will be clear that the process of pricing and the process of appropriation are quite separate. Pricing involves the costing of units already in existence, of which some are held by the public, and the balance held by the managers as their stock-in-trade. It is when that balance falls to a low level that appropriation is necessary to augment the fund. And the essential element in proper appropriation is not so much the absolute level of prices at which the existing fund and the new securities are valued, as the establishment of proper proportionate relationships between those prices. In theory, a completely arbitrary set of prices, at quite different levels from those used for pricing, could be used for appropriation, always provided that the proportionate relationship between new securities and new units is strictly maintained. In practice, the price basis used may differ. For example, the Trust of Insurance group, which may be considered the leading exponents of the appropriation method, employ market dealing prices for the daily costing of sub-units and middle Official List prices for appropriation. Can any disadvantage or advantage accrue to the unit holder from this difference in basis? The answer is that under certain conditions, differences may arise, though they are likely to be small. Further, they have no bearing on adventitious profits accruing to the managers. If the mean Official List prices are slightly higher than the dealing prices which have been employed in the costing sheets, and the securities to be appropriated form a relatively high proportion of the existing amounts of the same shares already in the fund, the fund tends to be increased to a somewhat smaller extent than would be strictly required to maintain proportionate accuracy. Conversely, if there is a consistent negative difference between the Official List mean price and market dealing prices, the fund may gain slightly more than the increment to which it is properly entitled—subject to the same proviso. But as the fund grows, and presuming that the actual shares appropriated outweigh neither in type nor amount those already in the fund, such differences become smaller. It should be noted, first, that they affect only those unit holders who are already participating in the fund; secondly, that the "watering" or "boosting" of the fund by this difference in price basis will be extremely small, in the majority of cases; and thirdly, that the employment of the market dealing prices (provided that they can be conveniently used) would avoid this complication. These differences on appropriation, so far as they develop, are, however, of a totally different order from

differences which may accrue to the managers on account of margins between the price paid for new securities and the prices at which they are included in the daily costing sheets. If, in an appropriation trust, the unit is over-priced, compared with the current market price of the underlying securities, the excess will accrue directly to the managers. If it is underpriced, the reverse will apply—the managers will bear the loss. Hence, the question whether managers of appropriation trusts are in a position to derive profits as principals from dealing in the underlying securities depends upon the existence of a consistent bias which raises the market dealing prices which are (or should be) used for the daily costs sheets above the actual prices at which the managers can obtain the underlying securities.

II. Cash Funds

At this point, it is convenient to leave the discussion of the appropriation method uncompleted, in order to examine the general basis, and rival claims, of the cash fund method. The essence of the cash fund is that the managers immediately make over to the trustee for deposit in the fund the actual cash sum realised from the sale of units, less the managers' initial service charge. In the case of the Municipal and General group, the price adjustment also accrues to the fund, but in several other instances cash fund managers retain the price adjustment in addition to their preliminary charge. Having made over the net cash proceeds of sales, therefore, the interest of the managers, as principals, ceases and the fate of the investors' cash is a fate shared in common with the rest of the fund. If the managers have made an error in costing the unit, that error will be reflected in the value of the fund, but it will not accrue to the advantage or detriment of the managers, as in an appropriation trust. Once the sales proceeds have been merged in the fund they may be invested, within the authorised limits permitted by the trust deed, either immediately or after an interval dictated by the managers' judgment and the investment opportunities which may be open. If, in the meantime, the market dealing prices of the underlying securities have fallen the cash sum originally deposited will purchase a greater number of shares. If they have risen, the unit holder will acquire a less than proportionate share in the underlying securities, compared with the position of the fund as it existed when he purchased his interest. Throughout, the fund is credited with cash from net sales and accumulations, and the costs of acquiring further securities fall exclusively upon the fund. Hence the managers have neither advantage nor disadvantage in purchases of the underlying securities for the fund. Nor are they interested in errors of prices, except in so far as they may incidentally affect the size of the preliminary charge.

The method of operation, it will be seen, has the merit of simplicity, uncomplicated by the dual process of pricing and appropriation. The daily value of a cash fund is easily computed, whether it is fully invested or not, though complications arise in the treatment of accumulated dividends. In the majority of cash trusts, both capital and income items are merged into the fund, and at each distribution date it becomes essential to segregate the two parts. In pricing the unit, capital and income rank equally—they are both part of the fund. Hence no adjustment in the price is required for accumulations. But at the end of the distribution period income must be segregated from capital.

The actual methods by which these adjustments are made by the Municipal and General group were examined in detail in our 1937 Survey, page 12. They involve the apportionment of dividends received during the distribution period over the number of units in issue at the different account days during the period. Adjustment is also made to cover cases where full dividends have been received on securities held for only part of the period, or, conversely, to allow for dividends which are estimated to be due for distribution, although they have not actually been received by the fund.

This complication, however, is incidental to the main differences of principle involved in appropriation and cash fund trusts. The respective claims for the two systems may now be summarised. For the appropriation trusts, it is

argued that the purchaser of a unit "obtains what he bought"—an interest in existing units or, in the case of newly-created units, an interest in securities strictly equivalent to existing units. Proportionate identities are maintained when new securities are appropriated. Further, appropriation managers claim that merely because they are put on risk in the underlying securities, they must exercise the greater diligence in pricing their units, and that if they benefit from adventitious profits on dealings in underlying securities, they are also exposed to the risk of loss, if the market moves against them.

For the cash trusts, it is argued that the immediate deposit of the net proceeds of sales (with or without price adjustments) removes any possibility that the managers will be in a position to obtain adventitious profits, and that this method thus satisfies the apprehensions of the Anderson Committee on the score of the dual capacity of the managers. Once the price has been determined, whether it is a fair and accurate price or not, the benefit or disadvantage applies to the trust fund and not to the managers. As for investment opportunities, cash fund advocates claim that the holding of cash enables the managers to take advantage of the market trend in order to invest the fund's resources most advantageously, although normally the amount of uninvested cash retained by the fund is likely to be small, since competition requires the maintenance of a comparable degree of earning power with other trusts, and careful buying to conserve or improve the capital position of the trust.

CROSS EXAMINATION

Now we may turn to counter-objections. In favour of the appropriation trust method, it has been objected that the unit purchaser in a cash fund may not "obtain what he has bought." His original subscription is based on the state of the fund (securities plus cash) at one given time. When it is invested the fund may differ from its original state. This difference is bound to arise unless the cash fund is kept fully invested from hour to hour, and that is unlikely in practice. Secondly, it is argued that merely because the managers have no interest, as principals, in what happens to the fund after new subscriptions have been made to it, their investment policy may be less perspicacious than that of appropriation fund managers. It has been expressed that the cash fund method is apt to put a premium on inefficient buying, and stress has been laid upon the risk that, where the managers have to operate in a narrow market, the manager of a cash fund who has money to invest may find the market putting up prices against him, whereas the appropriation trust manager is in a position to accumulate securities in advance of the public demand, at economical prices, which he can then constitute into new units for retention against future demand. It is argued, further, that cash fund managers who resort (as managers of both types of trusts frequently do) to reciprocal buying arrangements, may have to pass orders for underlying securities without the closest regard to prices paid, since these are at the charge of the fund. And in cases where the orders are passed to a small provincial market, and can only be satisfied by shunting back part or all of the business to London, one commission and a half may be paid. For an appropriation trust, the extra cost falls upon the managers; for the cash fund it falls upon the trust.

Further, to the charge of acting as principal in securities, advocates of the appropriation method reply that the managers of cash funds are not entirely able to rid themselves of this disability in respect of units already created which happen to form part of the revolving fund operated by the managers. In this respect, both systems are on an equal footing, for no cash fund has yet, apparently, succeeded in solving the technical difficulty of operating a revolving fund as a component part of the trust. Even where the prices of these units are calculated in strictest accordance with the trust deed, the profits on the revolving fund accrue to the managers. Again, looking at the problem from the point of view of the unit purchaser who has been excessively charged, incorrect pricing under either system involves a loss. In the case of appropriation trusts, the whole difference will go to the manager. In a cash trust of large size, the bulk of the difference will

accrue to the trust. But, in each case, the purchaser will lose.

Finally, the objections of the cash fund proponents to the appropriation method may be briefly summarised. They centre on the view that, if the unit is over-priced, or if the fund is valued on unduly high prices for valuation purposes, the managers stand to benefit from the price difference, though it is conceded that if under-pricing occurs they also stand to lose. It is also suggested that the opportunity available under the appropriation method to obtain additional profits from security dealings may be a factor in determining the choice of securities bought for the fund.

SUMMING UP

We have been at pains to set out the general claims and objections which have been applied to appropriation and cash funds. It now remains to attempt a summing up, based on the evidence, as objective as it can be made, which is given above. First and foremost, the importance of proper pricing in both systems is evident. If the best interests of the unit holder are to be served, it is imperative that proper pricing should be equally employed in each case. Secondly, both managers are on common ground, as principals, as soon as they set up revolving funds in order to re-sell units tendered back by original purchasers, and are not in process of adding to the size of the fund. Profits made from the operation of revolving funds are profits made as principals, though in units and not in underlying securities. The difference here is that appropriation fund managers may be "bulls" of newly-constituted units, whereas cash funds managers are not, and the exact consequences of this difference depend upon the relation between the turnover of newly-formed units and the turnover of revolving funds.

Hence, the true distinction between the two types distils, in the end, to the original method of pricing units. We have seen that, so far as the managers of appropriation trusts make adventitious profits on underlying securities, they arise in the pricing process, and not in the appropriation process. Hence, the important factor in appropriation trust management is to ensure that the prices used for costing are kept in strict relation to those at which the managers are in a position to buy further holdings of underlying securities. In shares with a free market, the margin between dealing prices quoted on the Stock Exchange and those at which business can actually be transacted is not likely to be wide. But what happens when the shares in question do not enjoy a free market? In such cases the claims of the appropriation method, which permits the prior accumulation of securities in the fund and enables the managers to obtain advantageous offers of stock, have been frequently stressed. In illustration of the point, we may quote extracts from the account of the operation of the Trust of Insurance Shares group by the managing director, Mr George Faber, in the Banking, Insurance and Financial Review published by *The Financial News* on April 3, 1939. After stressing the limited marketability of bank and insurance shares (and presumably investment trust shares would also be covered by his remarks) Mr Faber proceeded:—

"The maintenance of a free market in these various units (issued by the group of trusts with which the writer is associated) at close dealing prices even when Stock Exchange prices of some of the constituent shares have been quite nominal, accounts largely for their success. The technique adopted is entirely new.

It is based on the fact that although on any given day it is impossible to buy or to sell blocks of shares of all of the banks and insurance companies, dealings can always be transacted in some of them. The trust managers never create a demand for particular shares by bidding for them, but always wait till suitable shares are offered. They keep in such close touch with the market that they usually get the first refusal of any large blocks of shares, whose chief source of supply is deceased estates. The managers then buy the shares for the trust fund at an agreed price and, if it suits them, in large quantities. In this way the trust funds are built up, with a minimum of expense and in the desired proportions, without forcing up prices. Except in the event of war, when a moratorium would

"Good Advice is
Beyond Price"

OLD PROVERB

Good advice on investment matters should be based upon experience. Often experience is expensive. An investment that has proved its income capacity through good times and bad times is "beyond price."

FIRST PROVINCIAL UNIT TRUST Certificates

offer to the investor a choice of three alternatives: An investment in Unit "A" series comprising 26 cumulative preference shares (the soundness of which is unimpeachable) carrying a return of $4\frac{3}{4}\%$. A holding in Unit "B" series which produces a yield of $7\frac{1}{4}\%$ from 32 government and ordinary commercial securities: An investment in "Reserves" Certificates comprising 50 first-class British Commercial & Industrial Securities—all chosen for their strong reserves position, and yielding $6\frac{1}{8}\%$ or, a joint holding of "A," "B" and "Reserves" series producing the average yield of $6\frac{1}{8}\%$, the "spreading" principle being the same in each case. The Midland Bank Executor and Trustee Co. Ltd. act as Trustees for the Certificate Holders, and collect and distribute dividends earned for all Units.

The Rt. Hon. Lord Eltisley, K.B.E.

Randle F. W. Holme

The Hon. Charles R. Strutt

be declared, no stiffer test of marketability is likely to be encountered than that of last September. Free dealings in banking and insurance units took place throughout the crisis, even in the absence of prices for some of the underlying shares. Prices were obtained for as many shares as possible; the average percentage fall from the previous day was worked out for each group of shares and any shares not quoted were presumed to have fallen by the same proportion and the price of the units calculated accordingly.

This statement throws important light upon the mechanics of pricing in the case of appropriation trusts where free dealings in the underlying securities are difficult. The Trust of Insurance group, it would appear, has developed into an ancillary market for the shares which rank among the permitted investments of its several trusts. The managers . . . "usually get the first refusal of any large blocks of shares. . . . The managers then buy the shares for the trust fund at an agreed price and, if it suits them, in large quantities." It may be assumed that this method enables the managers to buy at much more advantageous prices than if they were compelled to take the buying initiative and approach the market with orders in their hand. But since dealings in these types of securities is frequently so narrow, it is necessary to reconcile the special buying opportunities available to the managers with the dealing prices which are called in the market for the same shares. Where the shares concerned are "put through the market," it is to be presumed that dealing prices are adjusted to the new basis promptly and adequately. Provided that dealing prices are so adjusted by the normal market mechanism, the unit purchaser derives benefit from the exercise of the managers' specialised buying function. In any other circumstance, scope for adventitious differences between cost of securities and prices employed for the daily valuation of units might arise.

How may these differences be limited? Are they extensive in practice? In the first place, they emphasise the necessity for the most scrupulous costing, and no better method of costing has yet been devised than the use of dealing prices certified by a member of the Stock Exchange on each daily price sheet, and established with diligent inquiry. Secondly, it is reasonable to suppose that the trustee, even though he may hold himself out as a mere custodian, would raise questions if a continuing and substantial bias in favour of the managers were to appear between actual purchase prices of underlying securities and the price which they employ in the daily costing sheets. Thirdly, the importance of regular appropriation cannot be over-stressed. So long as anticipatory purchases of securities are kept in reasonable relation with subsequent

sales, and are appropriated to the trust fund at regular intervals—it may be inconvenient to appropriate daily, but the best practice would certainly not allow appropriation to occur at greater intervals than a Stock Exchange account—the differences accruing to the managers in respect of underlying securities are likely to be minimised. There is a further safeguard, which has been adopted by the Trust of Insurance group. Purchases of securities for the trust are bought in the name of the trustees, and fall to be appropriated, at the longest interval, within one account. After appropriation the managers are bulls, not of underlying securities, but of units, as any manager of a revolving fund must be. Their profits, positive or negative, on the securities vested in the trust arise through differences in the original cost of acquiring the underlying securities and the prices at which the resulting units are subsequently sold.

Finally, the opportunity for realising profits from dealing in underlying securities depends, to some extent, upon the degree to which the managers pursue flexibility. A flexible trust which grows with the steady diversification akin to a fixed trust (though its range of diversification, of course, may be larger) can be distinguished from the flexible trust in which changes are few. This point has been well put by Mr W. Piercy: * "There is a flexibility which, in substance and underlying intention, amounts to nothing more than a certain plasticity in the Trust Fund, intended to enable a specialised Trust to be built up without undue difficulty in markets which may sometimes be narrow—no doubt also with an eye upon current variations in the valuation of securities during the period of building up the Trust. . . . It all depends on the emphasis which is laid upon the factor of 'Management,' so-called."

In the last resort, the answer to the appropriation and cash fund controversy depends upon the honesty and competence of the management concerned, encouraged by the watchful eye of the trustee. Each method has certain advantages; neither is perfect from every point of view. It is unlikely that the Board of Trade in devising conditions under the Schedule of the "Sharepushing" Act under which unit trusts are to trade, will seek to draw any vital distinctions between the two systems at the outset. But, as the Board's experience of unit trusts increases, it may happen that, at some future date, it will feel prepared to provide authoritative guidance to the investor on this important matter. The importance of devising informative accounts relating to the manager assumes great significance in this connection.

* In the preface to "Unit Trusts and How They Work" by Messrs Rosenheim and Merriman. (Pitman.)

Unit Prices and Falling Markets

AN earlier section of this Survey has related how, for the second year in succession, the unit trust movement expanded its net sales despite adverse Stock Exchange conditions, and, on balance, provided a welcome increase in the volume of business coming to the market. How have unit prices themselves fared? To examine individual price movements for one hundred trusts is a Herculean task, and one which would hardly permit general conclusions regarding the success of the movement, as a whole, in "beating the market averages." On the other hand, to assemble a miscellaneous collection of unit trust prices within a single index number would unfairly ignore the specialised character of many trusts. Again, if extensive changes occur in flexible trust portfolios, these may change the balance of the weighting in comparing price movements of trusts with a representative investment index.

Certainly, it is necessary to distinguish at least three categories—fixed trusts, open and closed, and flexible trusts. For each of these groups price index numbers have been calculated, in the first two cases on the basis December, 1935 = 100, and in the third case June, 1936 = 100. Actuarial perfection is scarcely possible in devising index numbers of this kind. In the case of closed trusts, an

adjustment is required to reduce all prices before closure to a "bid" basis; otherwise the index would be artificially depressed when closure occurred, by the shedding of the loading charge and the price turn on the underlying securities—a difference of the order of 2s. 6d. per £1 unit. Again, adjustments are required when, for any reason, the managers temporarily quote bid prices only. Moreover, the dealing margin may vary for open trusts, according to the condition of the market and the manager's position in units. Finally, the number of trusts in each category varies from time to time, and calls for the employment of the chain index method.

All these factors must be taken into account in preparing the raw material for the index numbers, and in the process a certain—though limited—arbitrary element is introduced, which is avoided in the *Financial News* and Actuaries' ordinary share indices. The results (which are compared with the latter indices) are set out in the tables at the foot of page 34.

Comparison between the closed and open fixed trusts is distinctly interesting. During the second half of 1937 the closed trusts began to display their superiority in resisting falling prices, and this superiority has again been

Domestic Investment Trust

(SECOND SERIES)

A Unit Trust based on a well-reasoned investment policy

TRUSTEE

MIDLAND BANK EXECUTOR AND TRUSTEE CO. LTD.

Domestic Investment Trust (Second Series) represents a specific investment policy, the Trust Fund being no mere haphazard selection of investments.

It is asserted that investment strength may best be found in enterprises whose business it is to supply the elementary needs of the vast bulk of the population of this country and to satisfy their normal desire for simple comforts.

The companies in which the funds of the Trust are invested are just such as these. They have been selected individually for their strength and are combined in this Trust to produce an investment of a high class which relies for its success upon no transitory fashion of consumption, but upon the regular shopping-list of every household.

The Trust is managed by

confirmed during the past twelve months. Compared with December, 1935, the *Financial News* and Actuaries' indices each showed a fall of rather over 26 per cent. on May 2, 1939. The closed fixed trusts declined during the same period by 22½ per cent., but the open fixed trusts were 33.4 per cent. below their end-1935 level at that date, and have shown a distinctly steep fall since the end of last year, compared with the general market trend. This difference of behaviour may well be due, in part, to the fact that the majority of the twenty-two trusts included in the open fixed trust index were formed in the latter half of 1935 itself, after three and a half years of almost uninterrupted market recovery. In the course of the next twelve months prices were carried to peak levels, but within little over eighteen months the market had broken through end-1935 levels; and it has been falling ever since. Hence it follows that a fixed portfolio originally based on the topical—and, presumably, generously valued—favourites of the second half of 1935 is likely to reflect the subsequent fall more extensively than more mature portfolios which

may have been set up anything up to two years earlier. When we turn to compare the behaviour of flexible trust prices with the market averages, there appears to be some support to the managers' contention that a flexible portfolio provides better opportunity for conservation of capital than a fixed portfolio. Yet the flexible trust index must be interpreted with a certain caution, for its constituents are significantly weighted by bank, insurance and investment trust share units, whose fluctuations are appreciably smaller and whose importance in the index is appreciably larger than certain lower priced flexible units composed of commodity and speculative industrial shares. The superiority of the flexible trust index over market averages, however, has noticeably declined since last September, when, like the fixed trust indices, it was particularly marked.

Conclusions on the basis of these index numbers must inevitably be qualified. Broadly, however, they establish that unit prices did not touch the market "highs," but except for open fixed trusts, they have not fallen quite so fast as equity shares in general.

Over 2,000 Branches in England and Wales

WORLD-WIDE BANKING SERVICE

The Barclays group of Banks has Branches in many parts of the Empire and elsewhere, and is represented by Agents and Correspondents throughout the World. This extensive organisation is placed at the disposal of customers desirous of transacting any description of British or Foreign Banking Business.

CHIEF FOREIGN BRANCH: 168 Fenchurch Street, London, E.C.3

EXECUTOR AND TRUSTEE BUSINESS UNDERTAKEN

Associated Companies:

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS).

Head Office: 54 Lombard St., London, E.C.3.

BARCLAYS BANK (FRANCE) LIMITED.

Chief Office in France: Paris.

BARCLAYS BANK S.A.I., Rome.

BARCLAYS BANK (CANADA), Montreal and Toronto.

BARCLAYS TRUST COMPANY OF CANADA, Montreal.

THE BRITISH LINEN BANK.

Head Office: Edinburgh.

THE UNION BANK OF MANCHESTER LIMITED.

Head Office: Manchester.

1839-1939

Hambros Bank Limited

41, Bishopsgate,
London, E.C.2.

Monetary Policy, 1844-1939

JUST over a century ago Mr S. J. Loyd, who later became Lord Overstone, issued a pamphlet in which he argued that the Bank of England should be divided into two departments, issue and banking. This suggestion was taken up by Sir Robert Peel and enshrined in the Bank Act of 1844. Since then the issue department has been concerned solely with the issue of notes, the total issue depending rigidly upon the fiduciary issue plus the value of the gold held by the department. The banking department holds as its Reserve or "cash" the surplus at any moment of the total note issue over the amount of notes in circulation, and with this as its basis acts as banker to the Government, the banking system and its other customers.

Let us glance back for a moment at the original implications of this system. In 1844, notes rather than cheques were the main medium of circulation. A bank's right of note issue was greatly prized, and abuses of that right during previous years had been flagrant and frequent. Even the Bank of England itself had not escaped periods of anxiety, and in 1839 (as in 1890 and 1931) had to obtain temporary assistance from the Bank of France. Peel's Bank Act established the principle of a fixed fiduciary issue. The prevailing argument then was that any import or export of gold ought to cause an equivalent change in the quantity of currency in circulation, whether that currency consisted of gold or notes. The simple fact of that change would force the banking system to adopt the remedial measures of varying either the supply of credit or its cost, and so would tend to restore equilibrium between Great Britain and the outside world. How far the whole of this theory was comprehended or accepted by the monetary controversialists of a century ago is beside the mark to-day. The point is that this theory provided until 1931 the basis of the whole of our subsequent open-market and Bank rate policy, and indeed our operation of the gold standard.

From 1844 to 1914 the pre-war monetary system developed smoothly enough, and can claim to have played a leading part in the enormous economic development of Great Britain in those years. But it did so more by good luck than good management, and indeed it was only able to work at all during these seventy years for two independent reasons. The first was the intermittent but, in the aggregate, considerable expansion in the world's monetary stocks of gold, due to the discoveries in California, Australia and South Africa. The second was the growth and consolidation of the British commercial banking system, which in the course of this period made cheques rather than gold or paper currency the chief medium of circulation. Without this new gold and other new forms of money, the system instituted by Peel's Act would have left the country hopelessly short of money to finance its economic growth.

In 1914 came the war, and during the next six years Peel's monetary system went temporarily by the board. In 1914 the currency in circulation (including the holdings of the commercial banks) amounted to £123 millions of gold and £29 millions of Bank of England notes of a total of £152 millions. During the war the fiduciary issue of the Bank of England remained at £18.4 millions, so to that extent the principles of Peel and Overstone were preserved. But immediately after the war it was necessary to create the new Currency Note issue, and by the armistice the total amount of paper currency in circulation was £358.7 millions, and by April, 1920, it was (after deducting Bank notes held by the Currency Notes Commissioners) £439.5 millions. Other deposits at the Bank of England, which included commercial bank cash, had risen from £42.5 to £122.9 millions, with equally striking increases in the banking department's securities. Further evidence of inflation is found in the drop in the banking department's Proportion from 52.3 to 17.5 per cent.

Such were the monetary effects of the war and its inflationary methods of finance. We may pass over the formal suspension of the gold standard early in 1919 and the

subsequent depreciation of sterling to \$3.20. Before, however, the war had ended the appeal from Philip drunk to Philip sober came in the form of the interim report of the Cunliffe Committee. This roundly called for the restoration of the former gold standard, and more specifically for the transfer of the Currency Note issue to the Bank of England with the fixation of the fiduciary issue at a level to be arrived at by experiment. Meanwhile the huge volume of unbacked notes was to be reduced, cautiously and gradually, while the opinion was hazarded that a gold stock of £150 millions would in the end prove adequate.

This was harking back to Peel and Overstone with a vengeance, but nevertheless the attempt was made to put the clock back by stages in this way. Soon after the war the Treasury minute was issued, laying down that the fiduciary Currency Note issue of any one year should not exceed the actual maximum of the previous year. This was tantamount to a progressive reduction, regardless of the nation's needs. In practice it drove the authorities into creeping round a corner, for on several occasions they had to place additional Bank of England notes behind the Currency Note issue in order to preserve the fiction of a progressive reduction in the fiduciary issue. By April, 1925, £54 millions of Bank of England notes were being used in this way. Fortunately the Bank gained gold during the early 'twenties, and so this device proved practicable. Nevertheless, between 1920 and 1925, the total note circulation (again omitting Bank of England notes held behind the Currency Notes) fell from £439 to £384 millions.

In May, 1925, came the restoration of the gold standard, or rather the establishment of the gold bullion standard, for notes and not gold were now to be the internal medium of circulation. Three years later came the amalgamation of the two note issues under the Bank of England, as the Cunliffe Committee had recommended ten years before. At the same time, the fiduciary issue was fixed—it is almost true to say "by experiment"—at £260 millions. The important new principle was now established that the fiduciary issue would be varied, under prescribed measures of control. This was the first permanent breach in Lord Overstone's doctrine, but his shade was simultaneously propitiated by the decision to give a greater wealth of detail in the weekly Bank return.

The keynote of these post-war years was the desire to restore as much as possible of the pre-war monetary system. This implied that the nation's supply of money had to be conditioned by the nation's gold stocks as well as by the nation's needs. Now, allowing for the gold coin in circulation in 1914, it is doubtful if the nation held any more gold in 1928 than in 1914. It certainly held less by 1931. Considerable relief was afforded by the increase in the fiduciary issue from a mere £18.4 millions in 1914 to £260 millions in 1928, but even so it is doubtful if the supply of gold available during 1925-31 was sufficient to maintain the then post-war volume of trade and level of prices; while the table shows that the quantity of currency in circulation fell from £372 to £352 millions. The absence of any real trade recovery during 1922-29, and the downward trend of prices during the whole period 1922-31 afford some proof that our monetary system was the becoming our master rather than our servant. On the other hand, some monetary discipline was needed to rescue the world from the currency chaos of the years immediately succeeding the war. This is one justification for the gold bullion standard regime of 1925-31.

In the summer and autumn of 1931 came the breal and in September Great Britain suspended the gold standard. As has been said, this is the real dividing line between the old and new monetary technique, though in accordance with British tradition the new technique was only evolve gradually and with many improvisations. The first need was for the restoration of confidence, badly shaken by the pound's sudden departure from gold. Hence the auster-

Budgets of the autumn of 1931 and spring of 1932, and the 6 per cent. Bank rate of the winter of 1931-32.

Out of the confidence engendered by this austerity and the consequent return of funds to London came the beginnings of our new monetary system. Looking back over the past seven years we can see that, while the framework of Peel and Overstone was preserved, it was supplemented by the important new mechanism of the Exchange Equalisation Account, which though under Treasury control is in many ways equivalent to a third department of the Bank. Moreover, the whole spirit of the new system was that the country must have the money it needed, and must not be circumscribed by the amount of gold put at its disposal or by the valuation in sterling of that gold at a price which had remained unchanged for more than a century. The fiction that a £1 note represented an immutable weight of gold (about 0.235 fine oz.) was abandoned, and so too was the concept that the size of the note issue must rise and fall with each change in the size of our gold stocks. These were the two fundamental ways in which we obtained our monetary freedom. The rest was mainly a question of machinery.

The first big change since 1931 has been the rise in the sterling price of gold from about 84s. 11½d. to about 148s. per fine ounce. This change, which also took place in the gold-producing and gold-hoarding countries, had several important consequences. First, it meant that for all practical purposes our existing stock of gold appreciated in value. This was a fact, even though it only received complete recognition in the Currency and Bank Notes Act of the present year. Next the rise in the price of gold gave

such a stimulus to gold production and gold dishoarding that for both the above reasons the world was relieved of the fears of an impending gold shortage that were so prevalent during 1929-31. Finally, the return of funds to London meant that Great Britain received a full share—perhaps too full a share—of the world's augmented supplies of gold. The result has been that even after allowing for last year's heavy losses, the sterling value of our gold stocks is now four times what it was in 1931.

The world in fact had learned and applied an all-important lesson. This is that the stock of monetary gold need not depend solely upon the physical quantities of gold available. It equally depends upon the value placed upon that gold in terms of sterling and other national currencies.

As a result of this increase in our gold supplies—from £136 millions in September, 1931, to £835 millions in March, 1938—we found that we could divide our store of gold into two portions, one to lie behind our note issue, the other to take care of external movements of funds into and out of the country. Originally set up for the sole purpose of "smoothing out" fluctuations in the exchanges, the Exchange Equalisation Account rapidly assumed this second function. For the past seven years the Bank of England has held part of our gold as backing to the note issue; and as in the past any change in the size of that gold reserve reacts directly upon the credit base. The Exchange Equalisation Account holds the other part, and finances its holding chiefly by the issue of Treasury bills to the banking system. Unless counter-measures are adopted, any increase in the Exchange Equalisation Account's gold holdings involves an equivalent increase in

¹ Includes gold and notes held by commercial banks. ² Includes Government securities and silver coin, less investment reserve account. ³ I.e. Bank of England notes held as backing to the currency note issue. ⁴ Newmarch's estimate. Peel's estimate was £30 to £35 million. ⁵ London bankers' balances were about £1,000,000. ⁶ After deducting notes held as backing to currency notes. ⁷ Valued at 84s. 11½d. and 140s. per fine ounce, respectively. The latter valuation is used in computing the total. ⁸ Estimate based on returns of nearest dates. ⁹ Revalued at 148s. 5d. per fine ounce. It is assumed that there was no change in the Exchange Account's gold other than the transfer of £5.6 millions to the Bank of England on March 1, 1939. ¹⁰ The figure of £20 millions representing gold in circulation is an estimate. This imparts the same uncertainty to the totals.

the issue of Treasury bills to the public—even though this last increase is frequently masked by the normal financial operations of the Government affecting the floating debt. Every decrease in the Exchange Equalisation Account's gold has the contrary effect. In any case, fluctuations in the Account's gold stocks do not affect the credit base.

This new machinery was not evolved all at once, and during the past few years it has had to be gradually strengthened and adjusted, wherever weaknesses or creaks appeared. For one thing it was quickly found that the Exchange Equalisation Account was too small to do its job. Twice it had to be enlarged, and in the meantime a considerable amount of gold spilt over into the Bank of England. This overflow had the advantage of enabling the Bank to create and maintain an adequate volume of internal credit and currency, and indeed it was so great as to call for a reduction in the fiduciary issue from £260 to £200 millions, but it was a haphazard way of achieving this object. Also it had the disadvantage that if ever gold began to flow out of the country the Exchange Account might have to recover its overflow from the Bank, in which case the internal supply of credit would once more be at the mercy of international movements of funds.

This danger became apparent during the gold exodus of 1938-39. As had been foreseen, the Exchange Equalisation Account lost so much of its own gold that it had to recover its overflow from the Bank. Now the Bank had used that gold to bring about the expansion in the credit base needed to carry out the official policy of cheap and plentiful credit, debt conversion and the establishment of an internal price level well above that of 1932. In 1938, just when the trade recession and the financial needs of re-armament made it more necessary than ever to maintain a sufficiency of credit, the Bank found that it was operating partly upon "hot gold" brought to London by "hot money," which was now rapidly departing to New York, Paris, and other centres. As the table shows, both the note circulation and deposits at the Bank had risen to heights surpassing those of the boom years immediately succeeding the war. Yet such had been the growth in internal activity between 1920 and 1938 that a supply of currency which reflected boom conditions in 1920 was no more than adequate eighteen years later.

On the other hand, one final adjustment was needed. The Bank's gold was still valued at its original price of 84s. 11½d. per fine ounce, whereas as soon as any gold left the Bank it automatically jumped to its real price of about 148s. Thus the Bank was both working with hot gold and also undervaluing all its gold whether "hot" or "cold." It was a simple matter to put both right without disturbing the equilibrium of the Bank. Early in 1939 the Bank sold to the Exchange Account £200 millions of gold at its own valuation, equal to nearly £350 millions at the real value of that gold. As a temporary measure the fiduciary issue was increased from £230 to £400 millions. (The Christmas increase from £200 to £230 millions was then in force.) Two months later, the new Act was passed laying down that the Bank should value its gold week by week at the current price. The normal fiduciary issue was simultaneously fixed at £300 millions. The net result was to reduce the Bank's gold from £326 to £226 millions, and (omitting the Christmas increase) to enlarge the fiduciary issue from £200 to £300 millions. During the two months'

interim, the Bank's gold stood at £126 millions and the fiduciary issue at £400 millions. Instead of £326 millions of undervalued gold, both hot and cold, the Bank was left with £226 millions of properly valued gold, most if not all of which it would hope to regard as cold.

It remains to see where we stand to-day. Most of the spirit of the 1844 Act has gone, and only the bare framework, warped out of all recognition, remains. The size of our gold stocks depends as much upon the price of gold as upon their physical volume, and as the price of gold depends in practice upon the course of the New York exchange, the paradox arises that the weaker the pound becomes the more does the sterling value of our gold stocks increase. This paradox, however, need be of minor importance, especially if the sterling value of any gold sale needed to support the pound is equally increased. Still, it does throw a responsibility upon those responsible for the conduct of our monetary affairs.

It is also argued that the size of our note issue and so of the internal credit base is no longer governed by the size of our gold stocks, and that if it is desired to enlarge the note issue the Bank has only to buy gold from the Exchange Account. This is true as far as it goes, but it makes the fundamental assumption that the Account can spare the gold. Now, if for reasons either of a capital outflow or a passive trade balance the Account is losing gold, then it will have less gold to spare, and so far from being able to sell gold to the Bank to facilitate an increase in the note issue, it might in time have to buy gold from the Bank to replenish its own reserves. If so, and the authorities were unwilling to contemplate a depreciation of sterling, they would have to choose between an increase in the fiduciary issue and a contraction in the note issue and so in the credit base. This would bring them back to principles of Overstone with a vengeance.

Again, it is argued that when the Exchange Account sells gold there is no reduction in the supply of bank cash. This is equally true, as far as it goes. But each sale of gold by the Exchange Account causes an immediate reduction in the banking system's holding of Treasury bills, and the banks have long learned to watch not only their 10 per cent. cash ratio, but also their 30 per cent. ratio of "liquid assets" (including bills and loans against bills) to deposits. So once more we have so far failed to shake off the Overstone doctrine that each change in our gold stocks must bring about a corresponding change in the total supply of credit. Currency may play a far less important part than it did a century ago, though the Bank's Reserve of notes remains the foundation of our credit base. Yet bank credit and deposits must still respond to changes in our gold stocks, and so while the form of our money may have changed, the control to which it is subject remains the same. We have admittedly a more generous and liberal monetary system than we had a century ago, though that is as much due to the thirteen-fold increase in our gold reserves since 1844 and the four-fold increase since 1920 as it is to our improvement of the machinery. Yet apart from the fundamental decision to permit a 75 per cent. increase in the sterling price of gold, we have not freed ourselves from the pre-war gold standard as much as some people think. The ghosts of Peel and Overstone can almost be heard murmuring, "*plus ça change, plus c'est la même chose.*"

millions—while the amount of bills issued to the market "syndicate" fell from £137 millions to £116 millions. Measured by *The Financial Times* index of Government securities, the fall between the beginning of 1938 and the height of the September crisis was 10.2 per cent., and though there has been some intervening recovery, prices are now (May 1st) as low as at the end of September. This figure probably overstates the extent of the fall in the short-dated securities held by the discount market, but as the three discount companies held bonds at the end of last year to the tune of nearly eight times their paid-up capital, the importance of the fall can readily be realised.

Judged by all external evidence, the market stood these strains and stresses with remarkable equanimity. The three discount companies repeated for 1938 the dividends they had paid for 1937. Their aggregate net profits were declared at £610,800, or an increase of £17,300 on the figure for the previous year. The artificiality of these "profits" may, however, be recognised from the fact that in the case of one company the declared figure, included in the above total, was only arrived at after a transfer of £300,000 from Investment Reserve Account. This was no doubt required to write down security values, and if the other companies did not reveal in their profit and loss accounts the impact of the depreciation of their securities, this does not mean that they were altogether free from the need to provide for such depreciation. In their case the provision probably came out of hidden reserves. The example of 1938 tends to illustrate a suggestion often made in the market, that by far the greater part of the profits distributed by the market since the war were made in those fabulous years 1922 and 1932, when the course of events in the gilt-edged market made an abnormal accretion of profits to the discount market an almost automatic process. The reverse was, in minor degree, true of 1938. No house in the market can have avoided a loss on its investments, and the provisions made for such losses must have cut appreciably into accumulated reserves—whether published or hidden.

The immediate prospect for the market suggests in some

respects an improvement on the conditions so successfully resisted last year, but in other respects hint at greater difficulties. The dearth of bills in the market is likely to disappear. In financing the tremendous deficit for the coming year the authorities are unlikely to repeat their past mistake of giving each defence loan the temporary character of a funding issue. If only to render the participation of the banking system in the coming medium- or long-term loan operations possible, part of the amount to be raised will have to take the form of Treasury bills, so as to restore the liquid assets, on the basis of which the banks can again expand their holdings of investments. The outlook, therefore, strongly favours a considerable expansion in the issue of Treasury bills during the coming year. As against this prospect of more bills and bigger profit margins there is an unpleasant element in the outlook, in the shape of the probable conversion of the 4½ per cent. Conversion Loan. This security forms so important a part of the discount market's stock-in-trade that its departure will be sorely felt. Indeed, so large is the holding of this security in the hands of the market that the Treasury in deciding on the conversion terms may well have to offer, as one conversion alternative, a security which will be suitable for short-term holders. But even so the market is bound on balance to be the loser by the operation.

It was perhaps the anticipation of this development which led the Bank of England recently to take steps to consolidate the present structure of the discount market by advising the smaller firms to amalgamate and by offering more than usually specific guidance for the conduct of their business—their capitalisation, the desirable ratio between bonds and capital, the wisdom of modest dividends and large reserve allocations, etc. The aim of the authorities is evidently to have a more compact discount market, not so open to the temptation of overtrading in bonds, and with each house possessing a capital structure which would make the discount market a real element of strength and give its endorsements on bills a financial value which they do not always possess to-day. In order to assess the merits

The Future of the Discount Market

Two developments have served to make the past year a severe testing period for the London Discount Market. They were the substantial contraction in the volume of Treasury bills issued to the market and the decline in the price of short-term gilt-edged securities in which the market is so largely interested. These developments were both products of the same cause—the growing international tension and the exodus of foreign funds from London which accompanied it. The impact of that outflow of funds on the foreign exchange market was taken by the Exchange

Equalisation Account, which lost gold, gained sterling and thus repaid Treasury bills previously issued to finance its gold holdings. Some of the foreign funds which left the London market had previously been invested in gilt-edged securities, and the sales from this quarter probably provided the main factor in the decline of gilt-edged prices.

The importance of these two developments can easily be seen from a few figures. In the year ended March 31st the total tender issue of Treasury bills declined by no less than £146 millions—that is, from £512 millions to £366

of this general objective it may be well to run briefly through the various functions which the discount market performs and to decide how each would be affected by the official proposals.

First in order of tradition is the importance of the discount market as a specialist in bills, in the proper assessing of names and credit risks. The importance of this function has been diminishing over many years with the growth of the bank acceptance and of the Treasury bill. Moreover, it may be argued that there is no inherent reason why clearing banks should not develop as fine a "nose" for commercial paper as the discount market has ever possessed. It remains a fact that the discount market has an accumulated experience which it would be difficult to transplant and—what is important from the present point of view—that it is often the small firm which has evolved the specialised knowledge of certain trades and which in this way carried on the traditional function of the discount market. Here is an argument for proceeding warily with large-scale amalgamations which might destroy the individual and highly personal character of much of the commercial discounting business still being done by the market.

The discount market provides a free market for bills. It would be easy for the banks to supplant that market as far as the absorption of bills was concerned. But the banks would miss the facilities of a large market in which they can at most times satisfy their requirements—often of large lines of bills and of special maturities. In providing a pool of discountable paper the market performs a most useful function, but it is one which could be performed as well by a smaller and more compact market.

The discount market provides an essential part of the machinery of credit control in this country. It is the medium through which open market operations are normally conducted, and it forms the link between the central bank and the whole commercial banking system. It could be replaced by putting the clearing banks in more direct contact with the Bank of England and instituting direct rediscounting facilities. Whether the resulting system would work better than the present one is a question on which it is impossible to give a confident answer. The present system has worked exceptionally well; it is the product of slow growth and adaptation, and its removal would create many problems of substitution whose solution even under the best possible circumstances would necessarily cause some initial friction. As far as the clearing banks are concerned, they do not hide their preference for the present system to the possible advantages of the more direct alternative, nor do they hide their preference for a discount market in which the personal and the competitive elements are better represented than they would be if they had to deal with four or five large companies.

The discount market provides the basis for a short-loan market. Every highly developed banking system requires a short-loan market. To this need one could apply the words of Voltaire: "If there were no God it would be necessary to invent him." We have seen the efforts made to "invent" short-loan markets in New York, in Paris, in every market having pretensions to being or becoming an international financial centre. The efforts made in the United States, for example, to dissociate the short-loan market from its highly volatile Wall Street collateral

should be a lesson of the value of our own short-loan market, secured as it is by the soundest and most liquid security in the world—the bill of exchange. Before tampering with the structure of the London discount market this is a function which should be borne in mind.

The discount market has over the past twenty years become an essential part of the gilt-edged market machinery. This is perhaps a function on which the critics will focus, and it forms part of the familiar case so often levelled against the market. None the less, it is a fact that any substantial contraction in the discount market's stake in the gilt-edged market would be definitely injurious to the latter. It must not be forgotten that the huge increase in the National Debt over the past twenty-five years has not been accompanied by a corresponding strengthening in the capitalisation of the gilt-edged market proper, i.e. the jobbers who deal in gilt-edged. By far the biggest "books" in gilt-edged are those run by the discount market, and time and again it has been found that the transaction of really sizeable orders in gilt-edged have been possible only by going outside the Stock Exchange and by dealing direct with a discount house. Admittedly this is a function which has been comparatively recently grafted on to the more traditional functions of the discount market. It brings with it certain responsibilities and a demand for stronger capitalisation which in some respects lend point to the requests for greater concentration made by the authorities. None the less, it would be a mistake to assume that in so far as this new function has led to overtrading in gilt-edged it has been the smaller house which has been guilty. The reverse has, on the whole, been the case.

Finally, the discount market, by giving its endorsement to the bills which pass through its hands, is said to improve the quality of this paper. There has always been a measure of artificiality about this claim, and it has become increasingly apparent since the bank acceptance and the Treasury bill have become so largely the staple of the market's trade. For even the biggest discount company to endorse a clearing bank acceptance is surely to gild the lily. None the less, this is a function to which the authorities appear to attach great importance, especially in connection with the considerable volume of dubious standstill paper remaining in the market.

This résumé of the functions performed by the discount market, in the light of current conditions, suggests that there is room for some simplification in its structure, that in certain important respects the basis on which the present structure of the market was raised has disappeared, and that in so far as the intrusion into gilt-edged is to be regarded as a permanent development there is a case to be made for strengthening the capitalisation of the individual firms in the market. But it also suggests that the market still performs extremely important functions, and that in the performance of these the accumulated tradition of the market and the personal element count for a great deal. These valuable intangibles will not readily stand rough and violent treatment. The market has reached its present development and efficiency by the slow process of gradual adaptation—typical of the evolution of most British institutions. There is probably a good case to be made for allowing the same process to continue its good work in moulding the future of the London discount market.

the share market scarcely left a ripple on the banking statistics or troubled the glassy surface of the tabulations of quoted money rates.

In the twelve months March, 1938,–March, 1939, we added \$2,366 millions to our gold stock; in addition, \$1,400 millions of gold was released (in April, 1938) from the Treasury, mostly from the Inactive Fund. For technical reasons, the incoming gold has not been monetised quite as fast as it arrived, and on March 31, 1939, some \$675 millions were "in transit" through the Treasury's

General Fund. But the net effect was that the gold certificates issued to the Reserve Banks increased by \$3,211 millions; member bank balances with the Reserve Banks increased \$1,813 millions; Treasury deposits with the Reserve Banks increased \$909 millions; money in circulation increased about \$400 millions; and excess reserves of

RESERVE BANK AND TREASURY ITEMS (£000,000)

	March 30, 1938	August 31, 1938*	March 29, 1939

Of which, excess	1,560	2,940	3,520
Treasury deposits with F.R. banks	292	720	1,201

* The interim date has no significance; it was the final date for the article on American Banking in the October 15, 1938, Supplement of *The Economist*.

the member banks increased by \$1,960 millions to \$3,520 millions. The increase of money in circulation was partly met out of increased issues of silver certificates; and the figures of excess reserves were augmented by about \$800 millions in the form of a reduction in required reserves.

It is not at all easy to grasp the significance of these magnitudes. In a single twelvemonth period we have added \$3,800 millions to our *effective* gold stock. Of this, about half (\$1,800 millions) was added to member bank reserves and the other half accrued to the General Fund of the Treasury in the form (1) of gold in "transit" (about \$700 millions) and (2) of an increase in Treasury deposits at the Reserve Banks. That is, only about half of the effective gold increment has yet entered the credit mechanism.

ITEMS OF THE REPORTING MEMBER BANKS (£000,000)

	New York City		
	March 30, 1938	Aug. 31, 1938	March 29, 1939
Total loans and investments	7,576	7,751	7,895
Total loans	3,158	3,007	2,864
U.S. and gtd. securities ...	3,263	3,664	3,845
Other securities	1,155	1,080	1,186
Reserve	2,958	3,425	4,390
Demand deposits	6,100	6,446	7,135
Domestic inter-bank deposits	1,956	2,500	2,651
	Outside New York City		
Total loans and investments	13,234	13,110	13,684
Total loans	5,613	5,263	5,327
U.S. and gtd. securities ...	5,671	5,780	6,277
Other securities	1,950	2,067	2,080
Reserve	2,797	3,260	3,125
Demand deposits	8,168	8,942	8,856
Domestic inter-bank deposits	3,127	3,458	3,815

Of the \$1,800 millions increase in member bank deposits with the Reserve Banks, \$1,400 millions went into the reserves of the New York City banks and \$300 millions into the reserves of the Reporting Member Banks outside New York City; the negligible remainder went to country banks. This is rather antithetical to the internal flow during the period of greater activity in 1936 and 1937, when there was a distinct movement of reserve balances away from New York. Statistically, the movement is recorded by the building up of the domestic inter-bank deposit account in the New York City banks and in the Reporting Member Banks. It will be recalled that in the 1936-37 period these accounts were drawn down. But the mere statistical record of the fluctuations of the internal balance of payments—between New York City and the rest of the country, and between urban and rural banks in the interior—throws little light on the nature of the forces influencing the flow. The general character is clear enough: New York is the depository of refugee money from Europe, represented by that part of the gold inflow classed as "flight money"; and is likewise the depository of funds from the interior of the country. It would hardly be accurate to say that New York is "borrowing" money from Europe and simultaneously "borrowing" money from the interior of the United States. Borrowing implies the hiring of money for use, and the New York banks neither pay anything for this money nor do they use it. Nor, in the absence of a money market, can they use it. To a great extent their function appears to be custodianship, not banking. As was said above, in 1937 New York experienced a withdrawal of funds to the interior, which proved to be disturbing; but against the repetition of such an episode the New York bankers are, at least in some ways, better fortified than in 1937. In early 1938, it seems that foreign balances were drawn down materially, not in the form of a gold export or a movement on the exchanges, but in payment for our sudden and large export surplus. This caused no perceptible disturbance. One can perhaps get little help from these only partly relevant analogies; but it is important to keep in mind that there is (and always has been) such a thing as an internal balance of payments as well as an external balance of payments; that New York is the focus or clearing centre of both; that this centre is without the buffer of a money market; and that the excess reserves of the New York City banks are only partially "excess reserves" in the text-book sense, and for the rest stand as the functional substitute for a money market.

While the year's record of the Reserve Banks could be written entirely in terms of gold, the chronicle of the commercial banks can be written in terms of gold and the Federal deficit. Over the period the demand deposits of the

American Banking

(By Our New York Correspondent)

OVER the twelve months March, 1938, to March, 1939, the record of American banking can be written exclusively in terms of gold and the Federal deficit; and almost exclusively in terms of gold. In that period our business index passed from deep depression to a violent advance of almost 30 per cent. and a subsequent recession of, say, 5 per cent. The share market averages between the end of March and the middle of July, 1938, rose over 50 per cent. and in March-April, 1939, lost about two-thirds of this rise. But the fluctuations of business and of

AGENTS AND CORRESPONDENTS THROUGHOUT THE WORLD

New York City banks rose \$1,000 millions, and their domestic inter-bank deposits by \$700 millions; while their loans and investments increased only \$300 millions. This increase in total loans and investments was entirely attributable to their purchases of the "fully guaranteed" securities, their holdings of which more than doubled in the year. A small decline in the holdings of United States obligations was matched by a small increase in holdings of other securities; and their total loans declined slowly but rather persistently by \$300 millions. The total loans and investments of the New York banks are now almost two parts investments and one part loans; and the investments, three parts investments in securities of the Federal Government and its agencies and one part "all other," including the issues of local governments. It is probably possible to say that well over 50 per cent. of the assets of the New York City banks are devoted to the Federal Treasury, to Federal agencies and to local government—that is, to the State rather than to private enterprise; and this drift has been strongly marked in the past year by the \$300 millions decline in loans and the \$600 millions increase in the securities of the Federal agencies. The increasing tendency in Wall Street itself to think of banks as "instrumentalities" of the State has abundant statistical justification, although the term "commercial banking" is still heard.

The chronicle of the Reporting Member Banks outside New York is not very different. Their total loans and investments rose by \$450 millions—proportionately a little less than in New York. Their total loans declined by the same amount—\$300 millions; but this, too, was proportionately less than in New York, and in the last six months they have actually increased a bit. These banks, however, added about \$300 millions to their holdings of Treasury obligations (the New York banks added none); and about \$250 millions to their holdings of the guaranteed securities (the New York banks added \$600 millions). That is, each group increased its holdings of "U.S. and guaranteed securities" by about \$600 millions, but the New York banks took exclusively the guaranteed issues, while the interior banks divided their investment almost equally between the two.

In the twelve months March, 1938, through March, 1939, the direct obligations of the Federal Government increased by about \$2,500 millions in spite of the liquidation of the Inactive Fund; but of this sum the direct obligations "in the market" increased by only \$900 millions. The Reporting Member Banks (in this instance, the Reporting Member Banks outside New York) took almost exactly one-third. But the "fully guaranteed debt" in the market increased by about \$800 millions (March-February) and the Reporting Member Banks increased their holdings by \$870 millions. That is, if one combines the direct and the fully guaranteed Treasury issues together, the Reporting Member Banks took a total of almost \$1,200 millions out of \$1,700 millions—approximately two-thirds. The preference of the banks for the

"fully guaranteed" issues over the direct issues is explicable by maturity—the Treasury issues of the past twelve months being almost exclusively long-term bonds (combined with a net retirement of notes and bills) while the fully guaranteed issues have been short-term. From the strict Treasury standpoint, the Treasury in the year funded a substantial fraction of its short-term debt; from the banking standpoint, the issues of large amounts of short-term, fully guaranteed securities enabled the banks to increase their proportion of long Government bonds (that is, to follow the conversions) and, by buying all the fully guaranteed offerings, restore the ratio of short-to-long in their combined portfolio. By this distribution, the Treasury was able to borrow almost \$2,000 millions from the market in twelve months, not only without disturbing the rate structure but on an actually rising market. The net effect on bank earnings was probably not unfavourable, as the guaranteed issues carry a slightly higher rate than the direct issue of the same maturity; and the long-term direct Treasury issues carry a higher coupon than the retired short issues.

As was said at the beginning of this article, in twelve consecutive months we have received over \$2,000 millions of gold; monetised or "assimilated" almost \$2,000 millions of gold; increased the direct and guaranteed obligations of the Treasury by over \$3,000 millions—all without any very perceptible rippling of quoted money rates. The following table gives some of the common rates:—

INTEREST RATES*

	Bankers' Acceptances	Call Loans	Treasury Bills (new issues)	Average 3-5 yr. notes	Treasury Bonds	Municipal Bonds	Corporate Bonds
Mar. 1938	$\frac{7}{16}$	1.00	0.074	1.01	2.64	2.99	4.36

* From the Federal Reserve Bulletin, compiled from various sources.

† Mid-week of March.

‡ "Rate negligible."

§ Average yield, bonds due or callable after 12 years.

During this period of heavy deficit financing the interest rate has steadily fallen. The volume of notes and bills in the market has been greatly reduced; and this has given the remainder a scarcity value. But the decline in the long-term rate from $2\frac{3}{8}$ per cent. to under $2\frac{3}{8}$ per cent. is not negligible; and it has been paralleled in municipal and corporate bonds. The decline in the yield on high-ranking second-rate bonds has been even more pronounced—Moody Baa rating dropping from 6.47 in April, 1938, to 4.84 in the middle of March, 1939.

English Banks on the Continent

(By a Correspondent)

COMPETITION on the Continent by English banks is represented by Lloyds and National Provincial Foreign Bank, Limited, Westminster Foreign Bank, Limited, Barclays Bank (France), Limited, and Barclays (S.A.I.). These are all offshoots of members of the "Big Five" of this country and are controlled by the respective parent institutions. They have been formed as separate companies in order not to attract taxation on the basis of capital and profits of the parent companies. Other London banks, such as the Standard Bank of South Africa and the Bank of London and South America, have branches in Europe, but mainly for facilitating trade between this country and other parts of the world. The Midland Bank, true to the policy of Sir E. Holden, has made no direct expansion external to this country.

English banking history on the Continent began with

the invasion of Lloyds Bank (France), which in 1911 was founded to take over the Parisian business of Armstrong and Company. In 1917 the National Provincial joined forces with Lloyds and their joint venture now has branches in France, Belgium and Switzerland. In 1913 the London County and Westminster (Paris), Limited (now Westminster Foreign Bank, Limited), took over the Banque Franco-Americaine. Barclays Bank is represented in France and Italy. The French connection developed in 1922 through the absorption of Cox and Company (France), Limited.

These penetrations were undertaken primarily to retain the foreign business of the English banks' clientèle, which had previously been conducted either through foreign agents or foreign banks with a London office. Paris has a large English population, and it was rightly thought that

business would accrue from this source. Business has furthermore been obtained from other foreign nationals in Paris, who at times preferred English institutions. It was assumed that a certain amount of native business would follow.

As the war progressed, and the franc, after "pegging" had ceased, began to depreciate, the funds of English bankers abroad increased. With the growth of franc deposits came discount and loan business. All banks of post-war formation in France, both French and foreign, profited largely by the special, though temporary, economic conditions which followed the Armistice. Further, the established traders who, owing to inflated prices, could no longer cover their banking requirements with their old friends, had recourse to the newer institutions, who were anxious to attract business.

A separate history attaches to the movement in each country. The French provincial expansion was the natural outcome of Paris experience. A clientèle had been built up, success had come quickly and, with the prospect of Allied victory, conditions seemed ripe. Optimism in post-war trade was high and the banks went to the provinces to prepare to obtain their share of the business which it was thought would follow.

Belgian expansion was not begun till 1919. Conditions were much the same. It was surmised that the German banks, which before the war had had a large share of all banking business, would not be allowed to return, and this seemed to afford opportunity for English institutions.

Spain, being a neutral, assumed an importance impossible but for the war. Her exports increased and immense profits were made at the expense of the Allies. Here there seemed a field for English infiltration, fostered by governmental influence, and the Westminster extended to Madrid, and later to Barcelona, Bilbao and finally Valencia. Things went well at first, but taxation and tariff restrictions suddenly and rapidly altered the whole complexion of things, until the Westminster decided that it was useless to continue. It might be mentioned that the Spanish did not employ their easily earned profits too wisely; mark speculation dissipated much that might have formed a useful basis for new business or served to retain that recently built up.

Barclays (S.A.I.) was formed in 1925. The expansion had not been achieved without difficulty of administration, law, staff and premises. With regard to administration, that of Lloyds and National Provincial and Barclays is centred in Paris with a supervisory Board in London. The Westminster and Barclays controls are in London. The problem of staff has been solved differently by the various banks. Some have a larger English staff than others. Some incline to English managers, but there is the difficulty

that Englishmen, even those who have been in the country concerned for years, cannot be possessed of that delicate turn of language which is so often required in dealing with foreign customers. As for premises, a central position is necessary with fixity of tenure. Further, the foreigner is used to more elaborate buildings and furnishings than exist here, and moreover likes the security of strong-room safes, etc., to be apparent. Owing to the system of renter safes, he sees the vaults in part, whereas the English customer does not. Want of complete knowledge of code law has been troublesome, but the principal foreign branches have their own solicitors' department and thus obtain legal advice at first hand and with a minimum of delay.

As for results, the War and the subsequent depression have proved that the time for expansion was ill-fated, through no fault of the institutions concerned. But they have successfully weathered the storm, thanks largely to the potential strength they possess in the parent institutions. With the rehabilitation of Europe, if ever it comes about, there should be a steady growth of business, but should the economic reconstruction of Europe be much longer protracted, it may be found a difficult matter to progress.

In brief, the four out of the five great English joint stock banks represented on the Continent compete with the native bankers for all classes of business normally transacted on the places where they are established, but more particularly for international business, for international agency accounts, and for the accounts and business of their countrymen whether resident or domiciled abroad. They specialise particularly in exchange in all its ramifications; in the keeping of currency accounts in any currencies which are still free; in the opening of confirmed, unconfirmed and acceptance credits; in the use, in this manner, of the normal banking machinery by which commodities are moved through one country to another; in accepting deposits both of the currency of the country in which they are established and in other currencies; and in the granting of loans against securities (agricultural advances and loans against property are relatively unknown) as well as discounts in all these various currencies.

They thus perform services of great value to English merchants, exporters and importers, and they make a contribution of no mean value to the oiling of the wheels of international commerce upon the smooth and efficient working of which so much of the prosperity of this country depends. Finally, in so doing they presumably obtain some remuneration for their work, which like all other commercial houses they would not undertake without profit. Unfortunately, the absence of any information as to the exact size of those profits precludes the formation of a complete judgment as to whether or not the British banks' Continental activities are justified.

Banking in France

(By a French Correspondent)

To those who believed with M. Blum in March, 1938, that a policy of "conscriptio" for industry and capital was the only possible way out of the deadlock in which France found itself, the financial history of France during the last year is bewildering. What happened is, however, not so difficult to explain. The country became fully conscious of the gravity of the external dangers when the Anschluss with Austria took place, and it coincided with the coming into power of a Radical Government which was determined to put a stop to social disturbances and currency depreciation. The limit for the depreciation of the franc fixed in May was low enough to leave a fair export premium to the French manufacturers, which is even now estimated at around 10 per cent. There was therefore no more reasonable prospect of further depreciation on purely economic grounds, and, in fact, the franc has remained stable in relation to the pound for the whole year. The policy of "putting the country back to work" was greatly facilitated by the large benefits which the working classes had received during the previous year and by the experience earned by the workers' delegates who, for many months, had considered themselves not as intermediaries, but as leaders. Furthermore, the rise in wages was checked, thanks to the coming into force of the arbitration procedure and to the slowing down of the rise in prices. This evolution towards social peace became evident after the failure of the general strike in November. The Government had shown that the law was not established for the exclusive benefit of one class.

After the fixing of the sterling-franc rate at 179, a large repatriation of capital had taken place; much of this benefit was, however, lost in the following months, partly due to fears of international complications. The September crisis found the Exchange Stabilisation Fund short of gold and imposed a terrible strain upon the banking community. The crisis, however, was overcome a few weeks later, when M. Paul Reynaud was called to the Finance Ministry, and since then capital has been flowing back into the country, at a slower pace than on previous occasions, but in a much more continuous and steady manner. The stability of the Government, of social conditions, and of the currency, coupled with the constructive reforms effected by the decree-laws, have undoubtedly yielded good results. But, it will be objected, the Government is still obliged to borrow 45 to 50 per cent. of its expenditures. It is true that the problem of public finance is far from being solved, but the numerous steps taken during the last six months have shown clearly that the Government is no longer indulging in the easy policy of announcing that, circumstances being exceptional, the Central Bank will be called upon to supply the full amount of the deficiency. Furthermore, the Treasury has established, in the form of a callable loan to the Exchange Fund, a reserve of ready cash which allows it to choose the most favourable moment for the issue of loans.

It was stated above that the French banking community stood the test in September remarkably well. This was largely due to the liberal assistance provided by the Bank of France, whose dominance has been increased by the events of 1938, partly because it has provided the Treasury with roughly 30 milliards of loans, or rather because, thanks to the revaluation of its gold, a large part of these loans could be erased, but mainly because the bank had to provide the market with abundant funds in the month of September. During this crisis alone about 25,000 millions were given out by the Central Bank, mainly in the form of bank notes. The Government drew 10,000 millions, while the demands of the public upon the commercial and savings banks were the largest since 1914. The moratorium which had been resorted to at the beginning of the Great War was considered by many as a likely danger, in spite

of the repeated assurances on the part of official quarters that such a measure would never be applied again. Even those who did not indulge in similar fears found it necessary for practical purposes to keep an unusual amount of currency. These heavy withdrawals were easily met by the banks, thanks to the assistance of the Bank of France, which took all possible forms from discount to collateral loans, from 30-day repurchase loans to open market purchases (the latter having been authorised by law since June). After Munich and after the appointment of M. Paul Reynaud as Finance Minister, hoarding practically disappeared. The savings and commercial banks recovered all the deposits they had lost, and over one-half of the currency issued in September flowed back to the Bank of France. The balance which did not return probably represents the amount needed for current transactions in a country where cheque payments are not as developed as in the Anglo-Saxon countries. It should be remembered in this connection that from the end of 1935 to the end of 1938 the sight liabilities of the bank only increased by 55 per cent., while prices increased by 85 per cent. Finally, as evidence of the recovery, the discount rate was lowered to 2 per cent. in December, a rate which had been abandoned since the beginning of 1937.

Three points deserve a special mention in connection with this crisis. The first is that the old custom of the French banks of granting credit as much as possible on collateral of eligible paper proved very effective in ensuring their liquidity. Rediscount was, of course, the essential means by which the banks—all the banks—asked for the Bank of France's assistance, and the Governor could note with satisfaction in his annual report that all the paper discounted in September had been of good quality; in fact, the provision appropriated at the end of the year against bad debts was no larger than usual. The second point of importance is that there was no notable export of capital. The reasons for this may perhaps be found in the 1914 precedent, when the dollar went to a heavy discount against the currencies of the belligerent countries, but more probably in the belief that in war time local currency is the only useful one to have, and that war risks were fairly well spread all over the world. It is also worth mentioning that the banks incurred heavy expenses during that crisis because nearly all of them had to organise special premises for the safekeeping of securities in case of war. In most cases new premises had to be bought in remote centres in the provinces.

During the months of March and April, 1939, a new and considerable increase in bank-note circulation took place which was clearly due to hoarding in view of war threats. There does not seem, however, to have been any withdrawals from the commercial banks, on balance, although savings banks suffered a decline in their deposits. In other words, the "circuit" by which the spendings of the Government came back to the banks and increased their deposits was interrupted by the hoarding of important amounts of bank-notes and not by export of capital. On the contrary, sales of gold on the part of individuals are reported to be continuing at a regular rate, while no strain could be observed on the foreign exchange market. The natural result was renewed tightness on the money market and some difficulty in placing Treasury bills. There seems to have been some hesitancy on the part of the monetary authorities as to the wisest course to follow. The first step taken by the Bank of France was to buy in March in the open market roughly 900 millions of short-term paper, but after a month it was realised that open market purchases were, under the circumstances, a one-day operation, and the rates for Treasury bills were raised by about $\frac{1}{4}$ per cent.

The experience of the past year shows clearly that the

French banking system is able to bear very heavy pressures, not only because it is sound in itself, but because the Central Bank is ready to lend its assistance liberally in case of emergency, while letting money rates play their normal rôle whenever possible. The tendency to hoard francs and the steadiness of the exchange, which permitted large gold purchases, have changed the aspect of the French

monetary problem. The question is no more how to prevent inflation from causing gold exports. Now that the leakage abroad has ceased, the question is rather how to centralise the plethora of liquid funds in the banks and thereby to facilitate the financing of the Treasury. The present task appears certainly easier to achieve than the former.

German Banks in 1938

(By Our Berlin Correspondent)

EVER since the banking crisis of 1931, when the German State and the Reichsbank had to come to the rescue of the commercial banks of the country, the German banking system has been in greater or less degree under the influence of the State. Although it has been possible for the State to dispose, in recent years, of the shares it took over in return for its support to the capital of the banks, they have remained in other ways in decisive dependence on the State. This is particularly true of the banks' liquidity, for which they rely entirely on the Reichsbank, and the financial policy pursued by the Third Reich since 1933, with its management of the money and capital markets, is naturally reflected in the balance sheets of the banks. Industrial activity in Germany is predominantly based on the public works of the State; the recovery of recent years has been a domestic recovery, or, more strictly, an armament recovery.

After their seizure of power the National Socialists inaugurated a large programme for the creation of work, to which without much delay were added armaments, auto-roads and a huge building programme to supply the needs of the army, the party, the State, the cities and, later, fortifications. This public works programme was further extended by the Four Year Plan for self-sufficiency. This programme required much larger sums than were available to the Reich from its current income from taxes and duties of all kinds. Credit was therefore expanded for the purpose of paying for the Government projects. Large quantities of so-called armament bills were issued. In order to conceal the extent of the re-armament from foreign eyes and to avoid any excessive burden on the Budget, formally so-called, these bills were issued through a number of dummy corporations, in particular through the Metallforschungs-G.m.b.H., which, having a status in German law equivalent to that of a British private company, was under no necessity to publish its accounts.

Official data on the extent of capital expenditure by the State are not available, and the volume of funds injected into the credit system by this programme of expansion can only be estimated. The debt of the Reich has more than doubled since 1933 to Rm. 27 milliards. The grand total of all public debts can be stated to be Rm. 60-70 milliards, which is also more than double the figure of 1933. There are still some Rm. 12-13 milliards of armament bills that have not yet been funded. This growth of debt is all the more remarkable as the yield of taxes has risen from Rm. 6.85 milliards in the financial year 1933-34 to about Rm. 17½ milliards in the past year. A growing portion of the capital expenditure could thus be financed out of revenue; but the growth of debt can be understood from the fact that the annual financial requirement of all public bodies has been officially placed at between Rm. 35 and 40 milliards.

The financing of expenditure by short-term bills naturally gave rise to the need for large-scale consolidations. This development of the policy started in 1935 with the issue of Reich loans. At first the pace was slow and the technical possibilities of the money and capital markets were very carefully explored before each issue. But recently the frequency of issue of Reich loans has greatly increased. Including the four loans issued in 1938, the Reich has issued loans for Rm. 14½ milliards altogether.

The national savings in 1937 were Rm. 6.9 milliards and the Reich loans of Rm. 3 milliards absorbed less than half. But in 1938 the national savings are put at about Rm. 10 milliards; including the new loan, the Reich has borrowed at long-term Rm. 7.63 milliards, or nearly three-quarters of the national savings.

The Government of the Reich was compelled, as the result of its financial policy and its constant need to fund floating debt, to reserve the capital markets almost exclusively to itself. A control of issues was introduced, and the capital market was virtually closed so far as the demands of private industry and commerce were concerned. (One of the tasks entrusted to Herr Funk when he replaced Dr Schacht was to open the capital market once more to private issues.) The ban on issues last year was suspended only for issues in connection with the self-sufficiency plan, re-armament, work-creation or social measures, which were considered to be in the direct interests of the State, and for which the State itself would have to provide funds if access to the capital market were not allowed.

In circumstances such as these, the banks were inevit-

The Wisdom of Making a Will

If you have not yet made a will or desire to revise existing arrangements for the care of your estate, of whatever size, the facilities of the Midland Bank Executor and Trustee Company should appeal.

The Company, formed by the Midland Bank in 1909, acts as Executor or Trustee under a will, solely or jointly with a private person. It also acts in many additional capacities, including that of Trustee under a marriage or other settlement.

A 28-page booklet entitled

"THE SERVICE OF THE MIDLAND BANK
EXECUTOR AND TRUSTEE COMPANY"

sets out the advantages secured by the appointment of the Company, fully describes the facilities offered and quotes the moderate fees charged. A copy of this and of three brochures entitled

"THE WISDOM OF MAKING A WILL",
"THE CARE OF YOUR INVESTMENTS"
and "GIFTS TO CHARITIES"

may be obtained upon application at the HEAD OFFICE in Poultry, London, E.C.2, the LONDON WEST END OFFICES at 125, New Bond Street, W.1 and 16 Regent Street, S.W.1, or at branches in the leading provincial centres. Copies are similarly procurable at any branch of the Midland Bank.

MIDLAND BANK
Executor and Trustee
Company Limited

ably called upon to play their part in the financial plans of the State, and the calls upon them grew with the expenditure of the State. The characteristic feature of recent years, from the point of view of the banks, has been a steady increase in the liquidity of the finances of industry. This arose not only from the vast sums being poured into industry by the State but also from the considerable reduction in stocks of materials. In the earlier years of recovery, when production could be increased with the existing capacity, industry had little need of capital, and the banks accordingly opened comparatively few new credits. Moreover, since industry used its inflowing funds to repay its debts, there was a considerable decline in the total advances of the banks. This item (Debitoren) for the five big Berlin banks stood at Rm. 5.65 milliards in the prosperous year 1929 and was still as large as Rm. 4.38 milliards in 1932, but at the end of 1937 it was only about Rm. 3 milliards.

Another consequence of this financial liquidity was that the deposits of the banks rose from 1935 onwards. Current and savings accounts of the five big Berlin banks were Rm. 6.16 milliards at the end of 1935, Rm. 6.34 milliards at the end of 1936 and Rm. 6.78 milliards at the end of 1937. Savings deposits in other institutions were also swollen by the decline in unemployment; they are about Rm. 20 milliards.

The liquid condition of industry, the ban on new issues and the limitations imposed on capital expenditure by the shortage of raw materials, combined to make it difficult for the banks to find remunerative outlets for the funds entrusted to them. The chief possibility was the purchase of the short-term bills and long-term loans of the Reich Government. The Big Five's portfolio of bills and cheques increased from Rm. 1.75 milliards in 1933 to Rm. 2.62 milliards at the end of 1937 and to Rm. 2.66 milliards at the end of March, 1938. In this way the banks were brought into intensive collaboration with the financial plans of the State. In 1929, it is true, the bill portfolio stood at above Rm. 3 milliards. But these were then in the main genuine commercial bills, which play a very small part in the present holdings. If, for example, it is assumed that the Reichsbank has exactly the same number of genuine commercial bills to-day as in the year 1928-29 (Rm. 2.6 milliards), it would follow that its portfolio contains about Rm. 5½ milliards of Treasury bills.

In spite of the considerable increase in recent years of German exports, the big banks' advances against goods have shown very little movement. Imports rose from Rm. 4.2 milliards in 1933 to Rm. 5.4 milliards (for the old Reich) in 1938 and exports from Rm. 4.87 milliards to Rm. 5.3 milliards (in 1929 imports were Rm. 13.4 milliards and exports Rm. 13.5 milliards). Imports of Greater Germany in 1938 were Rm. 6.1 milliards and exports Rm. 5.6 milliards. The advances against goods of the Big Five in 1929 were Rm. 1.97 milliards, but they have fallen to Rm. 584 millions in 1933 and Rm. 275 millions in March, 1939.

With the attainment of the limits of capacity, and especially with the addition of the Four Year Plan, the financial picture underwent some alteration. The rise of costs consequent upon the increased exploitation of resources and the necessity of undertaking new investments for the sake of achieving autarky, reduced the liquidity of industry and gave rise to a greater demand for bank credit. In 1938, however, this demand was approximately offset by the increasing liquidity of other branches of industry, whose production was restricted by shortage of raw materials or other causes. The so-called "Four Year Plan industry," on the other hand, has a high demand for funds which it has not been able to get from the capital market because of the ban on issues and for which its own resources are insufficient. This has been the chief cause of the noticeable increase in the number of new credits granted by the banks during 1938.

The most important event of 1938 for the banks, however, was the change in the Government's financing plans that occurred in March. In spite of the strict supervision and control exercised to prevent the consequences of credit inflation from appearing, the danger of unlimited issue of armament bills was apparent. Any rise in prices

was prevented, but a divergence between the quantity of money in circulation and the available supplies of consumption goods began to be more and more noticeable. Public works, on the scale of those in Germany, cannot be carried through without affecting the supply of consumers' goods, especially if an increase in imports is prevented.

To prevent the unbridled growth of the national debt, and to exercise an effective control on expenditure, the issue of armament bills was stopped in March, 1938. But it was impossible to do without all forms of short-term paper, as the expenditure of the State was considerably more than could be met out of the current revenue. Accordingly, from April onwards, "delivery certificates" with a six-months' maturity and a discount rate of 3 per cent. were issued. The issue of these undiscountable documents was to be kept within the limits of what could be paid off out of revenue at maturity or out of funding loans. After the transitional period of six months, therefore, the issue of short-term paper was to be entirely suspended and the finances of the State were to rest entirely on tax revenue and long-term loans. Political events interfered with this plan and much larger quantities of delivery certificates were issued than was intended. The difference between the old and new methods of financing has thus remained merely technical. Whereas the old bills were discountable at the Reichsbank, the delivery certificates can only be "lombarded" (i.e. accepted as security for loans). Moreover, the issue of bills did not appear in the statistics until the banks took them into their discount portfolios, while the delivery certificates have to be revealed in the returns of the Ministry of Finance.

The recent balance sheets of the banks clearly reflect the influence of the new financing methods. Industrial firms, which had been compelled in the summer to sell large amounts of securities on the Stock Exchange in order to obtain funds, use the delivery certificates they receive from the State as security for loans from the banks. The advances (Debitoren) of the big Berlin banks, however, have not risen; at the end of November they remained at Rm. 3.2 milliards as in March. But in the same period their holdings of Treasury bills and undiscountable Treasury paper rose from Rm. 426 millions to Rm. 1.18 milliards. Holdings of ordinary bills and cheques fell only

BALANCE-SHEET ITEMS OF THE FIVE BIG BERLIN BANKS
(Rm. millions)

	Nov., 1937	March, 1938	Nov., 1938	March, 1939
Cash, balances at Reichsbank, postal cheques.....	136	158	186	172
Bills	2,690	2,598	2,390	2,367
Treasury bills and certificates	455	426	1,185	1,479
Securities	897	871	1,270	869
Of these, Reich loans.....	333	303	714	438
Advances against goods	283	295	296	275
Debtors (i.e. advances)	3,076	3,190	3,193	3,413
Creditors (i.e. current accounts)	6,142	6,086	6,864	6,892
Savings deposits	635	712	789	967

from Rm. 2.66 to Rm. 2.46 milliards; this small decline is due to the fact that the Reichsbank is issuing so-called "Blockwechsel" (block bills) to the banks in replacement of their "Sonderwechsel" (special, i.e. armaments, bills). The heavy burden placed on their balance sheets by the delivery certificates is unwelcome to the banks, since it impairs their liquidity. As the delivery certificates can only be lombarded, the Reichsbank requires a rate of interest 1 per cent. higher than is required on the discount of a bill. For this reason the banks offer to the Reichsbank part of their remaining holdings of bills and keep the delivery certificates in their portfolios until maturity. To avoid too heavy commitments in delivery certificates the banks have been taking the "Solawechsel" of the Golddiskontbank, a subsidiary of the Reichsbank, in increasing quantities.

There have been few significant changes in the banking position during the first quarter of 1939. As the foregoing table shows, the bill portfolios have only slightly increased,

though the proportion of genuine commercial bills to armament bills can hardly be much higher. The very heavy requirements of the State for funds have led to increases in the holdings of Treasury bills and undiscountable Treasury certificates. On the other hand, advances show an increase, reflecting industry's growing need for credit, especially as the result of re-armament and the Four Year Plan. Concomitantly with the increases in Treasury paper and advances, holdings of securities have fallen. The public demand for investments, which for once has not been exhausted by Reich loans, made it possible for the banks to

unload some of the securities they had bought in their efforts to maintain price-levels on the Bourse. Deposits, especially savings deposits, have continued to increase. This reflects the fact that the growing shortage of consumers' goods is impeding the full spending of consumers' incomes.

The "New Finance Plan" announced by Dr Funk, Minister of Economics and President of the Reichsbank, has not yet affected the banks' balance sheets, as the new tax certificates have only been issued since May 1st. The loans of the banks will presumably tend to increase.

South American Banking

(By a Correspondent)

BANKING and foreign exchange policy in the South American countries is largely dependent upon the course of external trade. Here the low level of commodity prices, the urgent need for foreign markets for South American produce, and the commercial methods of the totalitarian countries have led to the continued canalisation of South American trade through special agreements, compensation arrangements, quotas, etc. In Brazil, Chile, Peru and Central America, Germany has made considerable headway by the use of Askis marks. Germany and Italy often sell subsidised goods at under cost price, while Japan and Italy have dumped cheap textiles. There is thus considerable need for more positive British action, and the recent extension of the Export Credits Guarantee Department's maximum commitments from £50 to £75 millions has received a general welcome. Simultaneously there is the development of the American policy of granting long-term credits. This is mainly a drive against the totalitarian countries, but it is to be hoped that the offering of fresh finance will not cause Latin Americans to display greater indifference towards external debt already in default.

Meanwhile the steady recession in South American export trade since early 1937 has resulted in an adverse trend in the trade balances of the various Republics and the maintenance in many cases of foreign exchange, import and other restrictions. Consequently, the banking industry is still burdened with difficulties in moving funds, and also with heavy and unremunerative extra routine work. Business has also become increasingly competitive, and interest and commission rates continue at a low level. Nevertheless, internal conditions in South America show notable resistance to the present crisis, and the monetary regimes in general are to-day more capable of quick adjustment to adverse conditions. In particular, the Central Banks, where established, have shown themselves able to cope with the alternating waves of prosperity and depression inherent in primary producing countries in such a way that the internal systems of credit have not suffered seriously.

This is particularly true of Argentina, which, during 1938, experienced a sharp reversal of the prosperous conditions of 1937, this reversal being due to bad harvests of wheat, linseed and maize. Owing mainly to a consequent contraction of about 40 per cent. in her exports, Argentina had in 1938 a passive trade balance equal to some £3,500,000 sterling, compared with an active balance in 1937 of no less than £44,000,000 sterling. To redress this position, the Argentine Government on November 8th raised the "official" selling rate of exchange from 16 to 17 pesos to the pound (the "free" rate rising correspondingly), and, with the official buying rate still fixed at 15 pesos, the margin of profit gained by the Exchange Profits Fund was correspondingly increased. This enabled the Government to guarantee minimum wheat and linseed prices to farmers during the 1938-39 season. The peso has also been supported by heavy shipments of gold, mainly to New York, which are also probably derived chiefly from the official exchange profits. Also, since December 1, 1938, imports have been rigorously controlled by a comprehensive system of prior permits, so that, despite the sluggish export movement this spring—due to the surplus world stocks of wheat—an active trade balance had re-emerged

by the end of March, 1939, of over 73 million pesos (say, £4,300,000 sterling), against a passive balance twelve months previously of 22 million pesos.

Although Argentine imports from all countries this year are necessarily much reduced, Great Britain remains the chief supplier, and the ratio of British imports to total imports tends to rise, whereas there is a sharp fall in the proportion representing Italian, Japanese and American goods. In fact, trade between Argentina and the United States is virtually at a deadlock, although the trade balance is again swinging in favour of the Argentine, and, under the import control system, this may again lead to increased imports of American goods. While the United States is anxious to conclude a Trade Agreement with Argentina—particularly so as to assist in consolidating Pan-American political policy in face of the Berlin-Rome-Tokio triangle—existing difficulties in the path are aggra-

vated by the American import restrictions upon Argentine meat, and more fundamentally by the fact that both countries produce the same products which form the basis of their key industries, and so cannot be economically complementary to one another. The reverse is the case with Argentina's trade with Britain, which gives rise to the belief that, should a new Anglo-Argentine Agreement be drawn up this year—as seems the general opinion—it will be possible to arrange terms satisfactory to both nations.

Generally speaking, the Argentine outlook inspires restrained optimism, if nothing better. The Government is attempting to enforce substantial economies so as to prevent the recurrence of a budgetary deficit. Confidence in the inherent soundness of the financial position is evidenced by the immediate success of the \$US25 millions loan floated in New York in November, 1938, and the internal loans for 150 million pesos issued in March, 1939. Treasury bills continue to be placed by tender in Buenos Aires at low interest rates. The banking situation continues liquid and normal, and the claim that the Central Bank has proved a very useful defensive monetary weapon is supported by the fact that, during the past difficult eighteen months, business turnover, as indicated by bank clearing figures, has been sustained, commercial failures have remained low, the cost of living has been relatively stable, and unemployment is not at all serious. Moreover, the Institute for Liquidating Bank Investments, formed as part of the financial reforms a few years ago, has made steady headway in thawing out the frozen assets (mainly real property) then acquired and has thus relieved the banking industry of a serious and unwieldy burden.

In Brazil, the regulations of December, 1937, made obligatory the deposit of currency funds with the banks, for account of the Bank of Brazil, against the supply of exchange cover to meet the cost of imported goods. This sterilisation of large deposits naturally caused some concern, particularly in regard to the seasonal financing of crops. Such deposits, however, will now no longer be necessary, as the Decree of April 8, 1939, has abolished the foreign exchange monopoly of the Bank of Brazil. Although control is not altogether relinquished, the irksome formalities and delays in obtaining exchange for payment of imports should henceforward be removed. Brazil has, in effect, reverted to an exchange system similar to that in force from February, 1935, to November, 1937, exporters being now obliged to sell 30 per cent. of their bills to the Bank of Brazil at the official rate, while the milreis will again be allowed to find its own level in a "free" market, consisting of the balance (70 per cent.) of the available exchange. The net result will be to give exporters a rather higher return in their own currency, while imports will cost more. This is not altogether undesirable, as it may help towards an improvement in the trade balance.

The new Exchange Decree is probably linked with Brazil's Commercial Agreement with the United States of March 9, 1939, which provides, *inter alia*, for a request to the United States Congress for authority to provide up to

\$50 millions of gold for a proposed Central Bank of Brazil, repayment to be made from Brazil's future gold production. Admittedly this undertaking appears hedged with many reservations, and it will probably merely amount to a book entry earmarking American gold on Brazil's account—perhaps somewhat similar to the gold earmarked under the 1937 Agreement, which was allowed to lapse without the gold being used. The new Agreement, however, is welcome, as it may assist in the modernisation of Brazil's banking fabric and in stabilising the milreis.

The future of these reform schemes in Brazil, and indeed of the Republic's economy as a whole, will, however, depend upon the emergence of a substantial trade balance. The outlook in this respect is not encouraging: Brazil had in 1939 an active balance of only £29,000 (gold), against nearly £2,000,000 (gold) in 1938. In pursuit of a policy of internal development of transport and industry, imports—especially of machinery, railway material, etc.—continue at a high level, while, on the export side, the notable increase in shipments of both coffee and cotton has been more than offset by the fall in the prices of both these commodities. Furthermore, there has recently been a slowing down of coffee exports compared with the rapid expansion which followed the Government's change of policy in November, 1937. While, therefore, the new foreign exchange measures have created a good impression, it remains to be seen to what purpose the Government's quota will be applied. There are some hopes that it may be used for the partial resumption of the foreign bond service, but unless the trade balance improves, either some of the quota must be diverted to finance imports or there may be a curtailment of free exchange available to cover imports and other non-official remittances.

With regard to the powers in respect of the nationality of foreign banks' shareholders provided in the new Federal Constitution, President Vargas has stated that it did not suit the economic situation of the country to apply this principle hurriedly. It was not intended to be a political measure impeding the influx of foreign capital or discrimination against capital held in Brazil.

Internal conditions in Chile have stood up well to the world crisis, due largely to the orthodox policy of the Central Bank. Unfortunately, the country now has the problem of finding the enormous funds needed to reconstruct the devastated areas left by the January earthquake. In Peru the position of the Central Bank is strong, while the coming cotton crop promises to be satisfactory. It is hoped that the crop will be normally disposed of in order to relieve the foreign exchange market, which is now showing signs of strain, though still free from restrictions.

In Colombia, Ecuador and the Central American "coffee" countries of Guatemala, Nicaragua and Salvador, crops have been generally favourable and are being regularly disposed of, with a consequent growth of freedom both in the foreign exchange markets and for import trade. The Central Banks in these countries continue to show a strong position in gold and other reserves held against sight liabilities.

Trading Abroad

Few traders can remain unaffected
 to-day by the constantly changing
 restrictions now adopted by so
 many countries abroad in the settle-
 ment of international indebtedness.
 The Westminster Bank has there-
 fore created a central Exchange
 Restrictions Department, from
 which any Branch may obtain at
 short notice the latest information
 for the benefit of a customer
 trading overseas

Westminster Bank

PROVINCIAL BANK OF IRELAND, LIMITED

The directors' statement for the half-year ending December 31, 1938, states that, including £40,171 brought forward from last account, there remains a profit of £77,715. Out of this the directors have declared a dividend for the half-year at the rate of 12½ per cent. per annum, less income tax, which will require £24,469. They have added to reserve fund £5,000, written off bank premises account £8,000, and carried forward £40,246.

BANK OF BRITISH WEST AFRICA, LIMITED

The directors' statement of accounts for the year ended March 31, 1938, states that after providing for current charges (including contributions to the staff profit sharing fund and the provident fund), rebate on bills and appropriations to contingency accounts, out of which accounts provision has been made for all bad and doubtful debts, there remains a balance of profit for the year of £60,106. To this must be added £55,608 brought forward from last year, making a total amount available of £115,714. Of this sum £24,000, being an interim dividend of 2 per cent., has already been distributed, less income tax, and the directors now recommend the payment of a final dividend of 3 per cent., absorbing a further sum of £36,000, less income tax, making a total distribution for the year of 5 per cent., less income tax. This distribution will leave a balance of £55,714 to be carried forward.

THE BANK OF AUSTRALASIA

The directors state that, after providing for rebate on bills current, for British, Australian and New Zealand rates and taxes, and making a transfer to the credit of Contingencies Account, out of which account provision for all bad and doubtful debts has been made, the net profit for the year ended October 10th last amounted to £310,049. To this has to be added £205,830 last brought forward from the previous year's account, making a total of £515,879. From this, £126,000 was paid as an interim dividend on September 30th last, and the directors have now appropriated a further sum of £162,000 to pay a final dividend of 4s. 6d. per share, less income tax at 4s. in the £, making, in all £288,000, equal to 8s. per share, less tax, and representing for the year a distribution at the rate of 8 per cent., less tax. There will remain £227,879 to be carried forward to the next account.

THE NATIONAL BANK OF AUSTRALASIA, LIMITED

According to the report of the directors for the year ended March 31, 1938, the net profit, after deduction of all expenses, etc., including £139,427 for income, land and note taxes, amounted to £347,401, add balance brought forward from previous year £157,540, making available £504,941. From this sum the following appropriations have been made: Interim dividend at the rate of 6 per cent. per annum on the £10 and the

£8 shares, paid in November, 1937, for the half-year ended September 30, 1937, £150,000; reduction of bank premises account £50,000, and it was recommended that a dividend be paid on the £10 and £8 shares for the half-year ended March 31, 1938, at the rate of 6 per cent. per annum £150,000, and to carry forward £154,941—£504,941. (All the figures given are in Australian currency.)

THE NATIONAL BANK OF NEW ZEALAND, LIMITED

The directors' statement of the bank's affairs as on March 31, 1938, states that the net profit for the year, after appropriations to contingency accounts, out of which full provision has been made for bad and doubtful debts, exchange, N.D.C., etc., amounts to £105,727; to be added £112,797 brought forward, making an available total of £218,524. The interim dividend at the rate of 4 per cent. per annum, free of income tax, paid in January, 1938, absorbed £40,000, £14,000 has been placed to

pension and gratuity funds, and £10,000 has been transferred to premises account, leaving £154,524 available for distribution. The directors propose to allocate this amount as follows:—In payment of a dividend at the rate of 5 per cent. per annum for the half-year ended March 31, 1938, making 4½ per cent. for the year, less United Kingdom income tax (at the rate of 3s. 8d. in the £, after allowing relief for Dominion income tax), £40,833; balance to be carried forward, £113,690.

INDIAN BANKS

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

The directors' report for the year ended December 31st last showed a net profit, after providing for all bad and doubtful debts and including a transfer from contingencies account to meet depreciation on holdings of Government securities, of £514,094, inclusive of £178,785 brought forward from the previous year. The interim dividend at the rate of 10 per cent. per annum paid in September last absorbed £150,000. The

amount now available is therefore £364,094, and the directors propose to pay a final dividend at the rate of 10 per cent. per annum, less income tax; to add £35,000 to the officers' pension fund and to carry forward the balance of £179,094. A contract has been entered into for the purchase of the undertaking of the P. and O. Banking Corporation Ltd., with effect from February 1, 1939.

THE EASTERN BANK, LIMITED

The directors state that the net profit to December 31, 1938, after providing for income tax and national defence contribution, and after appropriations to the credit of contingency account, out of which account full provision for bad and doubtful debts has been made, and including the balance brought forward from the last account, amounts to £192,792. An interim dividend at the rate of 3s. a share was paid

in September, absorbing £30,000, and the directors now recommend a final dividend of 4s. a share, less income tax at the rate of 3s. 9.551. (after allowing for relief in respect of Dominion income tax). They propose to set aside £40,000 on account of contingencies, leaving a balance of £82,792 to be carried forward to the next account.

Telephones: MANSION HOUSE 6543 (9 lines).

MERCANTILE BANK OF INDIA

The directors' report for the year ended December 31, 1938, shows that the balance of profit and loss account for the year amounts to £192,443, and the amount available, after adding £173,327 brought forward from last account, is £365,770. From this sum has to be deducted £63,000, being the interim dividend of 6 per cent., less income tax, on the "A," "B" and "C" shares paid in September last. The directors have added

£12,000 to the officers' pension fund, written £20,000 off freehold banking premises, and made an additional allocation of £30,000 to contingencies account. They now recommend a final dividend on the "A," "B" and "C" shares of 6 per cent., less income tax (making 12 per cent. for the year), leaving a balance of £177,770 to be carried forward.

P. & O. BANKING CORPORATION, LIMITED

The directors report that the net profits for the year ended March 31, 1938, after providing for taxation, bad and doubtful debts and valuing investments at or below market rates, amount to £85,228 which, with £52,971 brought forward from last year, gives an available balance for disposal of £138,199. The

directors have transferred £5,000 to the Officers' Pension Fund. Out of the balance of £133,199 they propose to pay a dividend of 4 per cent. less income tax, absorbing £81,284, carrying £51,916 to next account. The bank was absorbed by the Chartered Bank of India, Australia and China on January 31, 1939.

THE NATIONAL BANK OF INDIA, LIMITED

The directors' report for the year ended December 31, 1938, shows that the net profits, after providing for all bad and doubtful debts, amount to £444,063 and, adding £249,817 brought forward from the previous year, the available total is £693,880. An *ad interim* dividend at the rate of 16 per cent. per

annum was paid on September 22nd last, absorbing £160,000, and the directors now recommend a further dividend at the same rate less income tax. They propose to add £50,000 to the staff pension funds and to write £75,000 off house property account, leaving a balance of £248,880 to be carried forward.

BANK OF LONDON AND SOUTH AMERICA, LIMITED

The profit for the year ended September 30, 1938, after deducting all expenses and charges, and after providing for bad and doubtful debts and legal reserves in South America, amounts to £466,476. To this sum has to be added £169,000 brought forward from last year, making a total of £635,476. The interim dividend of 2 per cent. paid in June last amounted to £80,800.

From the unappropriated balance the directors recommend the following allocations:—To final dividend of 3 per cent., payable December 14, 1938, subject to income tax, £121,200; to contingency reserve, £260,000; to profit and loss carried forward £173,476.

THE BANK OF ROUMANIA, LIMITED

The report for the year 1937 states that the balance of the Bucarest profit and loss account of Lei 2,179,688, which cannot be remitted, has been passed to the lei provision for bad and doubtful accounts in Roumania, and the equivalent, namely, £3,186, has been released from the sterling reserve for doubtful

debts, contingencies, etc. After meeting all London office expenses, directors' fees and payments on account of the Bucarest branch, as well as depreciation of investments, there is a deficit of £8,278.

BANQUE COMMERCIALE DU CONGO

The report of the board of directors for the year 1937-38 announces a net profit, including an amount brought forward of Frs. 13,345, of Frs. 1,713,363, out of which a dividend of 8 per cent., free of tax, has been paid. Before this figure was arrived at, a sum of Frs. 1,978,751 was deducted, which, together with

a transfer of Frs. 1,000,000 from the available reserve, forms a provision against the depreciation of the holding of Government securities. Owing to a change in the presentation of the balance sheet, the figures are only approximately comparable.

BRITISH AND CONTINENTAL BANKING COMPANY LIMITED

The report of the directors for the year ended September 30, 1938, shows a net profit of £17,082. Deducting directors' fees of £1,448 and adding the balance brought forward from last year of £3,768, there remains an available total of £19,401.

The directors propose to appropriate this balance as follows: Transfer to additional reserve account £10,000; payment of a dividend of 7 per cent., less income tax; to be carried forward, £4,326.

BRITISH OVERSEAS BANK, LIMITED

The directors' report states that the profit, after allowing rebate of interest and providing for all bad and doubtful debts (other than provided for out of contingencies account) for the year ended October 31, 1938, amounts to £29,823; balance available from last account, £71,601, making a total of £101,424, which has been appropriated as follows: To contingencies account, £20,000, leaving a balance to be carried forward to next

year of £81,424. As a result of conditions ruling in several of the countries in which the Bank has done business, some of the assets have become difficult of immediate realisation. Arrangements have therefore been made for the provision of a deferred deposit of sufficient amount, together with the liquid assets, to cover the Bank's liabilities to creditors and depositors.

THE HONGKONG AND SHANGHAI BANKING CORPORATION

The directors report that the net profits for the year ending December 31, 1938, together with \$3,383,004 balance brought forward from last account, after paying all charges, deducting interest paid and due, and making provision for bad and doubtful accounts and contingencies, amount to \$18,679,626. They recommend writing off bank premises account the sum of \$1,000,000. After deducting \$1,000,000 the interim dividend of

£2 10s. per share, paid on August 8th last, viz.: £400,000 at 1s. 2½d.—\$6,453,781, and remuneration to directors, there remains for appropriation \$11,145,172, out of which the directors recommend the payment of a final dividend of £3 per share, viz., £480,000 which, at 1s. 2½d., the rate of the day, will absorb \$7,744,538. The balance \$3,400,634 to be carried to new profit and loss account.

THE IMPERIAL BANK OF IRAN

The profits for the year ended March 20, 1938, after making provision for expenses of management, general charges in London and at chief office and branches, income tax, N.D.C., Exchange, and bad and doubtful debts, amount to £65,974, to which has to be added £53,034 brought forward from last account, making a total of £119,008. The assets and liabilities of the branches in Iran have been converted at the rate of

exchange of Rials 80½ per £ sterling, being the rate on March 20, 1938. This is the same rate as last year. The directors now recommend payment of a final dividend of 7s. per share, and a bonus of 2s. per share, making with the interim dividend of 4s. per share a total for the year of 13s., free of income tax. This leaves a sum of £54,008 to be carried forward.

THE NATIONAL BANK OF EGYPT

The report for the year ending December 31, 1938, shows the following statement: Gross profit for the year, after providing for depreciation on the bank's buildings and furniture, for rebate of discount, and for doubtful debts, amounts to £951,733. After deducting from this for directors' fees £16,978, and for current expenses £460,114, the remainder is divided between the statutory dividend of 4 per cent., amounting to £120,000, and an additional dividend of 11 per cent., amounting to £330,000. By adding the balance brought forward from last year, £239,445, there remains £264,085 to be carried forward.

SWISS BANK CORPORATION

After deduction of expenses and taxes, and making provision for bad and doubtful debts, etc., the net profit for the year ended December 31, 1938, amounts to S.Fcs. 8,455,761, which together with the amount carried forward from last year, viz.,

S.Fcs. 1,574,185, makes a total of S.Fcs. 10,029,946. The board propose to pay a dividend of 5 per cent. on the paid-up capital, which will absorb S.Fcs. 8,000,000, and to carry forward S.Fcs. 2,029,946.

THE ECONOMIST

TRADE SUPPLEMENT

New Series

SATURDAY, MAY 27, 1939

No. 29

The Trend of Business

BETWEEN May and December last year the general level of business activity showed little change. Throughout this period *The Economist* index of business activity, for example, varied within narrow limits between 101 (1935=100) and 104. Early this year there were signs of improvement here and there; there was a marked revival in the iron and steel industry and indications of a re-stocking movement in the textile trades. On the whole, however, there was not then sufficient evidence of a change in the long-term trend.

The evidence of the state of trade in industrial centres which has come to hand during recent months, however, has dispelled any remaining doubts concerning the course of business activity. Indeed, the latest reports and statistics show that Britain is now in the midst of a vigorous trade recovery.

The Economist index of Business Activity, which is adjusted for seasonal variations, has risen from 101 in December to 106 (revised) in March; in April it advanced to 109, the highest level since February, 1938. The course of employment has been even more favourable, for by April 17th the number of insured persons at work in Great Britain (exclusive of agriculture) had recovered to within 22,000 of the record of 11,707,000 reached in September, 1937.

The Economist index, which has been designed to provide an indication of the course of trade in normal conditions, appears in fact not to have registered fully the growing influence of the increase in defence expenditure on employment since the spring of 1938. The reduction in London's financial turnover, reflected in the fall in the index of *Town Clearings*, for example, is due largely to the uncertain political outlook. The index of *building activity*, again, excludes direct Government contracts which have accounted for a growing share of constructional activity. Moreover, the marked fall last year in the index relating to the volume of *merchandise carried by the railways*, due to the severe recession in heavy industry, probably exerted too much influence on the complete index of Business Activity.

There can be no doubt that the rapid increase in defence expenditure has been the dominating factor in the vigorous expansion in economic activity since the beginning of this year. In calculations of the effect of re-armament on industrial production in recent months, it would be misleading to represent Government orders as a smoothly ascending curve. What appears to have happened is that the volume of defence contracts placed with industry has shown a very considerable increase in the past few months. This rapid speeding-up in re-armament, of which industrial reports provide a good deal of circumstantial evidence, has not been brought out sufficiently by the figures of actual Government expenditure, due to the time-lag

between the placing of orders and the date of payment. The expansion in business activity, however, has not been confined to those industries upon which defence expenditure is largely concentrated. The sudden recovery of the commercial section of the shipbuilding industry is, of course, a direct consequence of the Government's decision to assist that branch of activity. But Government orders do not fully explain the remarkable revival in the textile trades, where the percentage of insured persons out of work on April 17th was 7.1 lower than a year ago. Nor can the recovery in private car sales (the number of new cars registered in March was 10.7 per cent. greater than in the corresponding month last year) be directly ascribed to Government orders.

There has been, in fact, a remarkable improvement in the activity of the consumption goods trades, accompanied by a steady increase in consumers' purchases. The growth of purchasing power may be traced in part to the increase in

defence expenditure, which has tended to sustain employment and wage rates. At the same time there has been a continuous decline in import prices. The Board of Trade index of the average import prices of food, drink and tobacco, for example, fell by nearly 10 per

cent. between the third quarter of 1937 and the first quarter of 1939, while the Ministry of Labour's index of wage rates advanced by 2.4 per cent. during this period.

The increase in the production of certain industries, such as textiles, however, has been more rapid than can be explained solely by increased expenditure by consumers. But there is a strong presumption that enhanced purchasing power coupled with the belief that prices have touched bottom, has given rise to a re-stocking movement which has been all the more marked because the surplus stocks accumulated in 1937 had been largely absorbed by the end of last year.

Despite the uncertain political outlook, there is every indication that the expansion in business activity will continue, subject to a seasonal decline during the summer months; the volume of defence work and the demand for consumers' goods were still increasing, and there are no signs, as yet, of a marked advance in prices before the early autumn.

In contrast to the rapid expansion of activity in Britain, business in the United States continues to mark time, and it is now doubtful whether any further improvement will take place before the autumn. In Germany and Italy, industrial activity is sustained by military preparations, and France continues to make headway with the increase in defence expenditure. In most other European countries re-armament is assuming a growing importance. In the majority of primary producing countries activity has been well maintained, though some of them have been forced to curtail imports as a result of the fall in the prices of their exports.

British Industrial Developments

The following reports on British industry cover, in most cases, the period to the middle of May. In the remainder they relate to the month of April.

COAL

The coal-mining industry has made further headway last month. There was an improvement on the home as well as the export market. The expansion in home demand is a reflection of the increase in industrial activity and, to a minor extent, of the accumulation of stocks against an emergency. The recovery in export demand is due very largely to the decline in German competition; in the first quarter of this year, for example, exports from Germany were 26 per cent. smaller than in the corresponding period last year. Production last month was 17,705,000 tons, compared with 17,826,000 in the corresponding month last year. The number of working days last month, however, was one day less than in April, 1938; calculated on a daily basis, output was nearly 4 per cent. higher than in April, 1938. A feature of last month was the revival in the South Wales coalfield due to the improvement in exports and to the expansion of the activity of the iron and steel and related industries. More recently there has been the usual seasonal decline in the demand for coal for heating, but requirements for other purposes, both at home and in importing countries, are now well above the level of a year ago.

IRON AND STEEL

In response to the growing demand for steel, production was speeded up further last month. While the total output of crude steel actually declined by 112,700 tons between March and April, the average daily rate of output rose by 1.7 per cent., from 43,366 tons to 44,091 tons. Moreover, as a result of the reduction in supplies of scrap, steel makers have been forced to use proportionately more pig iron; calculated on a daily basis, the output of pig iron rose by 4.2 per cent. between March and April, from 19,471 tons to 20,293 tons, while five additional blast-furnaces were put into operation during the past month. Meanwhile, there are no indications of a lull in the demand for steel. On the contrary, the latest reports from the principal centres of the industry suggest that demand may continue to expand. The revival in the commercial section of the shipbuilding industry, for example, has given a further stimulus to consumption. On May 15th the British Iron and Steel Federation, with the concurrence of the I.D.A.C., announced that, apart from a few minor adjustments, prices are to remain unchanged for a further period of four months to the end of October. No special significance is attached to the reduction—from six months to four months—in the period for which prices have been fixed. The reason given for the change is that the end of the year, when buying is normally slack, is not an appropriate date for the introduction of a new price schedule. The minor alterations include a reduction of 5s. per ton in the price of hematite pig iron, designed to bring the price of this quality more into line with that of basic pig iron, and an increase of 5s. per ton in the price of acid steel billets (affecting less than 2 per cent. of the total output of crude steel) which have been relatively cheaper in relation to the cost of pig iron than other classes of steel.

GENERAL ENGINEERING

The engineering industry continued to make progress in the past month. For example, there was a reduction in the percentage of insured persons unemployed between March and April in all branches of the industry separately listed in the Ministry of Labour Gazette. The indications, moreover, point to a further steady increase in activity due to the growing volume of defence orders. Although the armaments sector of the industry is growing, commercial business is also fairly well maintained. If the volume of orders continues to increase, it will not be long before certain sections of the industry will be faced with a shortage of skilled labour. In April, imports of machinery were above, but exports below, the figures for the corresponding month last year. Thus, imports increased from 10,757 tons in April, 1938, to 12,741 tons in the past month. There was an increase in the imports of machine tools, especially from Germany. The larger part of these imports of machine tools is coming in duty-free under Section 10 of the Finance Act of 1932. There was also a heavy increase in the intake of rolling mill machinery, from 596 tons in April, 1938, to 3,412 tons in the past month. It is understood that this machinery is required for increasing the capacity for the rolling of steel sheets. Exports of machinery, on the other hand, fell from 39,619 tons in April, 1938, to 34,220 tons in April, 1939. The decline, however, was far from general. There was a substantial reduction in shipments of lifting and electrical machinery, of internal combustion engines, and textile machinery, but an increase in the exports of machine tools (mainly to Russia), and mining machinery. Meanwhile, the engineers' trade unions have succeeded in obtaining an increase of 2s. per week in the national bonus to all adult male workers, with proportionate changes for apprentices, boys and youths. The increase will take effect on June 5th.

ELECTRICAL EQUIPMENT

Most branches of the electrical equipment industry continue to work at high pressure. In the electrical engineering section the percentage of insured persons unemployed fell from 5.1 on March 13th

to 4.7 on April 17th. In the electric cable, apparatus and lamp sections the proportion of insured persons unemployed rose slightly from 7.1 per cent. to 7.4 per cent. during this period. Exports of electrical machinery declined from 2,140 tons (valued at £375,852) in April, 1938, to 1,295 tons (valued at £252,627) in the past month. During the same period exports of electrical goods and apparatus declined from £1,050,906 to £922,705. On page 2 of the *Trade Supplement* of April 29th we inadvertently stated that exports of electrical machinery in March, 1938, were valued at £4,002,800; the correct figure is £402,800.

AUTOMOBILES

The seasonal peak in new car registrations and in production was more than usually pronounced in March. New registrations of private cars totalled 39,267, against 35,470 a year ago, while production of private cars and taxis reached 46,824 units, compared with 42,138 in March, 1938. It is expected, however, that the increase in political tension since the end of March, coupled with the heavy increase in the horse-power tax in April, will be reflected in an exceptionally large fall in production for the latter month. Sales of commercial vehicles continue at a lower level than last year; in March production amounted to 9,194 units, against 11,765 a year ago.

BUILDING

Constructional activity continues to be well maintained. In fact there has been an improvement in the past month, though this is partly due to seasonal factors. The proportion of insured persons unemployed last month was only 1.6 per cent. higher than a year ago in building, while the figure for public works contracting showed a decline of 3 per cent. Total constructional activity, in fact, is still almost as high as a year ago. There have been considerable changes both in the geographical distribution and in the nature of constructional activity since last year. Unlike those of February and March, the returns of the value of building plans passed by 142 local authorities in April show a reduction from those of a year ago; the decline was 8.5 per cent. There was actually an increase in plans passed for factories and workshops, but a decline in the figures for dwelling houses, commercial premises, and public buildings.

CHEMICALS

There was a fair volume of business in most sections of the chemical market during the past month. Quite an active interest was shown in heavy chemicals, and there was an increased demand for dyestuffs. Trade in wood distillation products continued on a good scale. Towards the end of the month, increased business was reported in pharmaceutical and other fine chemicals, and trade in coal tar products showed some slight improvement. The trade returns for April showed a decrease in the export trade in chemicals, drugs, dyes, and colours as compared with the same month of 1938, the fall in value being £18,584. This was mainly due to the decline in exports of coal tar products. Imports were greater than in April, 1938, by £352,483.

POTTERY

There has been little development in the past few weeks; business in Staffordshire, while on a larger scale than earlier in the year still leaves much to be desired. Employment declined slightly in April, compared with March, the proportion of insured workers unemployed rising from 19.8 to 20.0 per cent. Exports of sanitary ware continue on a larger scale than in 1938, and totalled 161,791 cwt. in the four months ending in April, compared with 148,402 cwt. in the corresponding period of last year. Exports of earthenware are less satisfactory; there has been a noticeable decline compared with last year in shipments to South Africa, Australia, and Canada.

FOOTWEAR

The speculative activity in the leather market noticeable in recent weeks has somewhat died down, particularly when it became known that the War Office was not expecting deliveries on all new contracts in the current year. Government orders for Army boots keep many firms well employed, and more orders have come in for sports and women's shoes at medium or low prices. The general restriction of New Zealand imports is an unwelcome step to shoe exporters; in 1938 New Zealand took 41,188 dozen pairs of leather boots and shoes from this country.

COTTON

Demand for yarn has been irregular and some spinners have expressed dissatisfaction with delivery instructions. Spinning production at the end of April was 62 per cent. of capacity, against 60 per cent. a month ago and 55 per cent. a year ago, but more

business has been done in cloth than in yarn. Further big contracts have been placed with makers of cloth suitable for the defence services, and manufacturers of heavy materials are now very busy. An increased demand has been shown for piece goods for India, substantial orders having been placed, especially in bleaching and printing styles. Steady buying has also occurred for South America, Scandinavia and the Dominions. Home trade houses have bought standard makes fairly freely. The statistics relating to unemployment continue to improve, the latest total being 70,097, against 73,369 a month ago and 107,897 at the same time last year. The trade returns have been rather disappointing; shipments of cloth last month amounted to 108,100,000 square yards, compared with 114,593,000 square yards in April last year, and yarn exports totalled 9,501,200 lb., compared with 10,141,600 lb.

JUTE

The improved prospects of the new crop brought a sharp fall in the prices of raw jute from the high levels which ruled early in May. Prices of old crop Daisee-2/3 for immediate delivery are now about £33 15s. per ton. Apart from sandbags business is slack, although there has been an improvement in exports to the United States. The orders for sandbags are responsible for the steady fall in the numbers unemployed in the jute trade, the proportion of insured workers unemployed falling to 19.2 per cent. in April, compared with 36.3 per cent. in April, 1938.

LINEN

Flax values are strongly maintained at high levels, as supplies are restricted and sellers reserved. Government contracts have led to extensive transactions in yarns, principally for the heavy sizes, the demand for which exceeds supply. Private trading is confined to near requirements. There is more enquiry for cloth from overseas markets, but prices so far obtainable remain below replacement costs.

RAYON

New business in rayon is not being placed in the volume hoped for, but both producers and manufacturers have fair orders on hand.

WOOL

Staple fibre is in fair request and there is a big business still being done in exports to the United States. The hosiery trade is fairly well employed and the price agreement in the locknit section has caused an increase in demand. Export business generally is poor.

AGRICULTURE

Low temperatures at night have checked growth of both crops and pastures, but the improved conditions of the last two or three weeks have been of considerable assistance. Lack of rain in April delayed the planting of the potato main crop in many districts, and sowing of roots has also been held up. The fall of lambs in lowland flocks and mortality rates are about normal; the condition of hill flocks is poor in places owing to the shortage of keep last autumn. Reports on horticultural crops are satisfactory; there has been little frost damage so far except in isolated patches.

SHIPPING

The *Economist* index of freights showed a slight rise between March and April, and the improvement then shown was continued into the early part of May. The larger movement of Plate wheat helped to relieve the congestion in that market, and the steady sale of Australian flour to the Far East has been a useful stimulus; the American coal strike, which led to delay in clearing American ships requiring bunkers, also induced a small volume of chartering from this country. Later in May, however, this spurt of activity died down and, particularly in the Mediterranean, the volume of chartering has been small.

* For method of construction and earlier figures (1924-1936) see Supplement to *The Economist* of July 25, 1936. This Supplement is now out of print, but a record of the complete index was given in *The Economist* of November 5, 1938. † Annual indices represent averages of monthly figures. ‡ Revised. § Provisional.

Business Developments Overseas

BRITISH EMPIRE

AUSTRALIA.—Mills at the ports continue to ship flour to the Far East and a few cargoes have also been sold to Europe. Weather and soil conditions are good in the main farming areas, according to a cable from the National Bank of Australasia, and wool prices remain firm at overseas markets. The Stock Exchanges have been depressed by the European international situation, but industry otherwise is little affected; the building trade is generally active.

CANADA.—Business activity showed an improvement in March and early April, which was spread over most industries. The output of steel reached 95,697 tons in March against 77,179 tons in February, and production of mines was well maintained. The lumber trader has benefited from an increased export demand, and in the first three months of the current year the log scale in British Columbia was 60 per cent. higher than in the corresponding period of 1938; exports of shingles have also increased. Partly in consequence of the greater activity in the lumber trade, the value of exports in March was 3 per cent. greater than a year ago, in spite of the marked fall in prices during this period. In spite, however, of the steady improvement in business trends, the political uncertainties in Europe and the delay of further recovery in the United States tend to damp down any large extension in business commitments; construction contracts awarded in March were valued at only \$9 millions against \$10.4 millions a year ago, and sales of new motor vehicles continue below last year's level.

SOUTH AFRICA.—The uneasy state of international politics is reflected in the uncertain tone of some branches of business connected with foreign markets. Internal trade has been well maintained, however, particularly in the building industry, though at Johannesburg the delay in replacing the labour agreement which expired at the end of 1938 has affected turnover. The maize crop is now officially estimated at 27.9 million bags, and shipments to Europe have now begun. Hide prices have improved recently owing to an improved demand from abroad.

INDIA.—Speculative activity in the limited supplies of old crop jute has been met by a considerable volume of sales from reserves held at mills; the absence of any proportionate rise in the prices of jute manufactures induced mills to sell part of their holdings against new crop purchases. Trade in cotton piece-goods and in yarns remains depressed, although normally there is a seasonal expansion at this time. The foreign trade statistics for the past financial year (April-March) show a decline of Rs. 21,44 and Rs. 18,14 lakhs respectively in the value of imports and exports, so that, allowing for re-exports, the favourable balance of trade on merchandise account rose from Rs. 15,42 to Rs. 16,86 lakhs.

EUROPE

FRANCE.—The latest evidence shows that the Government's efforts to increase the speed of the wheels of commerce, accompanied by an increasing defence expenditure, have been successful. Production is now expanding fairly rapidly. For example, the official index of production has risen without interruption from 85 (1928=100) last November to 92 in March. The improvement in March was fairly general, and even building activity, which had long remained at a low level, is rapidly increasing. The indications point to a further expansion in activity, and the improved outlook is reflected in the recent rise in the prices of industrial securities. In recent weeks the number of persons in receipt of unemployment benefit showed a further decline from 395,347 on April 1st to 184,445 on May 6th. The trend of wholesale prices has been slightly upwards during this period.

GERMANY.—There has been no relaxation in military preparations, and industrial activity and employment continue at a very high level. The seasonally corrected weekly index of business activity calculated by the German Institute for Business Research (1936=100) rose slightly from 125 in the last week in March to 127.8 in the last week of April. During the same period railway car loadings increased from 163,400 per day to 168,300 per day, while the output of coal in the Ruhr district advanced from 424,900 tons per day to 447,800 tons per day. Moreover, there has been a further increase in the volume of money in circulation between the last weeks of March and April from Rm. 9,543 millions to Rm. 10,740 millions. There has been little change in the prices of industrial and fixed-interest securities. The official indices of wholesale prices and of the cost of living also show little change. Increasing domestic requirements of certain materials are now hampering exports. For example, during the first three months of this year German exports of coal showed a decline of 25.6 per cent. from the figures for the corresponding period last year.

ITALY.—Italy's economic activity, like Germany's, is now guided by the aim of achieving the highest possible military efficiency with existing economic resources. Full employment has been reached in the industrial centres of the North, though other parts of the country have not felt the benefits of war economics to the same degree. The general index of production recorded a new high of 116.3 (1928=100) last February, compared with 108.7 and 107.5 averages for the years 1937 and 1938 respectively. In particular, the metal, engineering and electrical industries are very active, and a shortage of building materials has resulted from great constructional activity,

presumably in the building of factories and fortifications. Against this may be set the failure of a revival in certain sections of industry catering for private consumption and for export. Imports in April (including trade with the colonies) at 807 million lire compare with 851 million lire in March, 1939, and 958 million lire in April, 1938. Exports, on the other hand, are up: 734 million lire last April compared with 667 millions in the previous month and 646 million a year ago. Expansion is to some extent held back by lack of confidence, itself a product of the operation of the co-operative system but the continuance of heavy budget deficits and large-scale expenditure favours the maintenance of a high degree of activity.

SWEDEN.—Export prices in the timber trade have shown a firmer tendency in recent weeks. Much of the Swedish quota has already been disposed of, and the greater activity in the British market, mainly on account of A.R.P. work, has brought a considerable rise in f.o.b. prices. A small improvement has also been noticed in the wood-pulp markets, and both the home and foreign demand for steel is good; the production of both pig iron and steel increased in March, after a lull in the two earlier months.

GREECE.—Favourable weather conditions were prevalent during April, and crop prospects are generally bright. Industrial activity was fairly brisk, but owing to the international events foreign trade was adversely affected. Prices on the Athens Stock Exchange fell heavily under the pressure of the international tension, but recovery part of the losses towards the end of April. The foreign exchange position continues to improve, although the note circulation shows an important temporary expansion, due mainly to the fear of war.

UNITED STATES OF AMERICA

As was indicated in the last *Trade Supplement*, the general level of business activity has shown very little change. Industrial production in April was slightly lower than in March; the decline is partly seasonal, but it appears to have been slightly accentuated by the coal strike. The course of the *New York Times* index of business activity suggests that the first half of May has brought practically no change; the index was 86.1 for the week ended April 15th and 85.3 for the week ended May 13th. Most observers hold the view that the near future is unlikely to witness any significant changes in business activity. While there are no indications of a market decline, a sustained expansion in business appears to be unlikely during the next few weeks, though some improvement is still expected later in the year.

LATIN AMERICA

ARGENTINA.—The tone of the Buenos Aires grain market is much more optimistic, owing to the improved demand for wheat from the European Continent. A further 200,000 tons of wheat have been sold to Spain against a barter transaction. Due to the severe restriction in imports, the favourable balance of trade amounted at the end of March to 65 million pesos, compared with an adverse balance of 22 million pesos twelve months earlier. The control of imports benefits Lancashire and Yorkshire articles in the Argentine market, but pending agreements with Italy and Japan may soon restore competition from those sources.

URUGUAY.—Exports, especially of wool, are on a very reduced scale, with offers of exchange correspondingly small. The new system of distributing exchange cover by "individual quotas" for importers, still awaits clarification, but there is an impression in trading circles that the new system does not provide the same certainty of obtaining exchange cover as ruled under the former system of obligatory prior import permits.

CHILE.—Imports and exports, especially the latter, were much reduced in the first two months of this year, as was also the export surplus. Therefore, exchange markets for sterling and dollars continued stringent. The Reconstruction Finance Bill became law on April 29th and provides, *inter alia*, for the raising of foreign loans up to an equivalent of 2,000 million pesos for reconstruction work necessitated by the recent earthquake disaster, and for development purposes; the raising of loans from local banks up to 500 million pesos to finance the building of houses in the devastated area; and the increase of income and other taxes, including a special tax of 10 per cent. which is to be levied in certain cases upon the profits of mining concerns. In this connection the United States Government has officially invited the Chilean Finance Minister to Washington with the object of discussing plans. It is expected that dollar credits will be granted through the American Import-Export Bank in return for trade advantages in favour of the United States.

THE FAR EAST

The rising prices of both foods and raw materials is beginning to disturb public opinion, and it is believed that further Government measures will be introduced. An agreement has been reached with various shipping companies to reduce freight rates on important commodities by 7 per cent. for large vessels and by 5 per cent. for small, although there has been a very firm tendency in the freight increased demands, and the Government is encouraging an expansion in the number of ships. Owing to the large issue of Government bonds, the note circulation fell below 2,000 million yen in the middle of May, the lowest figure for the past six months.

British Industrial Developments

The following reports on British industry cover, in most cases, the period to the middle of June. In the remainder they relate to the month of May.

COAL

Production in the coal-mining industry continues to increase and total output in May was higher than in the corresponding month a year earlier for the first time since May, 1938. The quantity of saleable coal raised last month, at 19.9 million tons, was 3.9 per cent. higher than a year ago. Unemployment has also improved during this period and in May was 4.9 per cent. below last year's level. The improvement is due to a revival of both home and export demand and all districts have shared in it. Additional quotas have been granted to the principal coalfields for the current quarter for both inland and export supply. Exports rose from 2,710,593 tons in April to 3,867,587 in May compared with 3,323,086 tons in May, 1938, while coal shipped for the use of steamers advanced from 802,410 tons, to 942,793 against 845,869 tons last year. There was a very large increase in shipments to the United States, owing to the coal strike in that country, but exports to many other countries were also higher than a year ago. Although the demand for coal for heating purposes has shown the usual seasonal decline, industrial requirements are still increasing and activity in the coal-mining industry is expected to be maintained at a high level.

IRON AND STEEL

Production showed a further increase last month, and the output of steel ingots and castings reached the highest level ever recorded. Total output of crude steel amounted to 1,218,100 tons last month compared with 1,170,900 tons in April and only 957,000 tons in May last year. Production was thus about 40,000 tons above the previous record reached in November, 1937. The output of pig iron also increased during May, when it reached 692,100 tons compared with 608,900 tons in April and 633,900 tons in May last year. The present production of steel represents an annual rate of about 13,660,000 tons, while the capacity of the industry is estimated at 14,700,000 tons per annum. Thus there is still room for a further expansion in output, but the problem will be so to supervise the distribution of raw materials and orders that the best possible use is made of available capacity. Supplies of scrap are quickly taken up, but ample provision is being made for future requirements and there are reports of recent substantial purchases in America. A large proportion of orders is for commercial work, though there is greater pressure for delivery for work on Government account. There is as yet no indication of the situation of 1937 arising again, when consumers placed duplicate orders to ensure their requirements, and some sections of consumers have voluntarily agreed to insert clauses in their contracts stating that their orders are genuine. Thus the larger current output contains less of the speculative element than did the smaller output of 1937, and activity may be expected to continue at a high level.

GENERAL ENGINEERING

Activity in the general engineering industry continues to expand. All sections showed an improvement in the unemployment position during May, when the proportion of insured workers unemployed fell by 1.1 per cent. to 6.0 per cent. This figure is not far above the low record of September, 1937, and there is danger of bottlenecks developing in some of the skilled grades. It is hoped that these may be overcome by careful planning and dilution. The proportion of Government work in the industry is increasing, but the volume of civil work is substantial, and most firms are considering how best they can maintain contact with civil customers—particularly in the export trade. Exports of machinery rose from 34,220 tons in April to 37,425 tons in May compared with 37,238 tons in May, 1938, while imports fell from 12,741 tons in April to 10,871 tons in May, against 10,132 tons a year ago. Exports of machine tools showed an increase, as did agricultural machinery, though this was largely seasonal. The Amalgamated Engineers' Union have accepted the employers' offer of a 2s. increase in the national bonus, but they have announced their intention of demanding a 10s. rise in basic wages in six months' time. They have also, in effect, agreed to dilution when all skilled workers are employed.

ELECTRICAL EQUIPMENT

The electrical equipment industry made further progress last month. In the electrical engineering section the proportion of insured persons unemployed fell from 4.7 on April 17th to 4.0 on May 15. In the electric cable, apparatus and lamp section unemployment fell during this period from 7.4 per cent. to 6.3 per cent. Exports of electrical machinery declined from 1,960 tons (valued at £330,997) in May, 1938, to 1,343 tons (valued at £242,310) in the past month, which was, however, an increase over the figure for April. Exports of electrical goods and apparatus rose from £1,098,113 in May last year to £1,106,669 in May, 1939.

AUTOMOBILES

Registrations of new private cars in Great Britain for 1939 totalled 25,645, only four less than in April, 1938. The influence of the increase in the car tax can be seen in the decline in new registrations of the larger cars, while sales of 8 and 10 h.p. cars were larger than a year ago. Sales production and exports of goods vehicles continue at a lower level than in 1938, but exports of private cars have increased.

BUILDING

The high level of activity in the constructional trades continues; unemployment showed a further improvement during the past month. The proportion of insured persons unemployed in May was only 0.2 per cent. higher than a year earlier in the case of building, while in public works contracting there was a decline of 4.6 per cent. on the year. Compared with April, 1939, unemployment in these two sections was 1.9 per cent. and 2.5 per cent. lower, respectively. The returns of building plans passed by 142 local authorities in May showed a reduction from those of the corresponding month last year. The decline from the corresponding month a year earlier in the total value of plans approved, at 19.4 per cent., was much larger than in April. The value of plans passed for dwelling houses was 38.4 per cent. below last year's level, but there was an increase in those for all other buildings.

CHEMICALS

Most sections of the home chemical market have been fairly active during the past month. A very fair demand was received for industrial chemicals, business in this section being on a better scale than during the same period of last year. Business in wood distillation products has been fairly active and stocks of all products are diminishing, although this has not, as yet, resulted in any appreciable price alterations. Conditions in the coal tar products market are improving slowly, but business is still rather difficult. Trade in pharmaceutical and other fine chemicals has been moderately active during the month. The value of exports of chemicals, drugs, dye and colours in May increased by £493,173 and imports by £767,184 as compared with May, 1938. The only items for which export showed an appreciable reduction in value were ammonium sulphate and coal tar products. Considerably increased exports were recorded for sodium compounds, drugs and medicines, dyes and dyestuffs and painters' colours and materials.

POTTERY

In the past few weeks activity has improved, particularly in North Staffordshire, although short time is still common. Unemployment in the industry declined considerably in May; the proportion of insured persons unemployed fell from 20.0 on April 17th to 16.8 on May 15th. Improved home demand was largely responsible for this fall, but exports of sanitaryware continue at a higher level than the fall of 1937, in spite of a recovery in May, exports of earthenware totalled only 187,854 cwt. in the first five months of the current year against 207,919 cwt. in the corresponding period of 1938.

FOOTWEAR

The spell of fine weather over Whitsun and again in June stimulated the sales of lighter types of footwear, and a considerable volume of repeat orders have been secured by manufacturers. Tanneries supplying the cheaper grades and those working on arm contracts are extremely busy, but sales of medium- and high-class footwear are still unsatisfactory. The very firm tone in the leather market, which is likely to continue, is giving rise to complaints from manufacturers, as they are not able to obtain corresponding advance in the prices of their output. In some districts footwear orders for autumn delivery are now being placed, in order to forestall any further rise in leather prices.

COTTON

Prices have tended to move on to a higher level, partly owing to the advance in raw cotton rates and partly due to the increasing cost of production, which have to be met by spinners and manufacturers. Manufacturers have been advised by their employers' association to put up weaving charges by about 8 per cent., owing to the cost of the Civil Defence Bill, the New Factory Act and holidays with pay. Yarn demand has been rather more encouraging, there being free buying in coarse American counts and medium Egyptian number. Spinning production at the end of May amounted to 64 per cent. capacity, compared with 62 per cent. a month earlier and 50 per cent. in May, 1938. Cloth demand has broadened on both home and export account. Useful support has come from India, South America, the Continent and the Dominions, but Egypt has again been a disappointing market. Substantial orders have been placed by the Government in drills, ground sheets, tent cloths and linings and makers are very busy. Further contracts are pending.

Increased business has been done in home trade fabrics; the hosiery at Whitsuntide resulted in a rush for light printed materials, and trade in household goods has also improved. There has been a further improvement in employment; the number of cotton operatives unemployed in May totalled 63,354, against 70,097 a month ago and 127,549 a year ago. Export trade returns show a slight improvement. Compared with May, 1938, shipments of cloth rose from 109.9 million square yards to 119.7 million square yards, and yarn exports from 8.4 million lbs. to 10.6 million lbs.

JUTE

New crop reports are still satisfactory and estimates of the area now indicate an increase of 6 to 12 per cent. on that of last year. Little business has been done in raw jute, most spinners preferring to wait until the trend of prices for the new crop is more definite. British imports of raw jute in the first five months of the current year amounted to 115,931 tons, compared with 88,600 tons in the corresponding period of 1938; exports of piece-goods showed some improvement over the very low levels of last year, but were only two-thirds as large as in the first five months of 1937.

LINEN

Raw flax remains extremely firm at top prices. There are no fears of Soviet fibre, Baltic stocks are cleared, and Irish markets are closed for the season, so that buyers are mainly dependent on Belgium for necessary supplies. The situation is further complicated by adverse weather conditions affecting the new crops in various districts. Civilian demand for cloth is quiet, but the extensive Government contracts recently placed will keep both spinners and weavers working to capacity for a considerable period ahead. Overseas trade on the whole is well maintained, though new business from the United States is rather disappointing.

RAYON

The spell of fine weather during the early part of the month resulted in much stock clearance. New business is not uniformly good, but deliveries against old contracts continue at a fair level.acetate deliveries are considerably delayed. Export business is poor

except to the Dominion and Colonial markets. Exports of rayon piece-goods in the first five months of the current year totalled 27.4 million square yards, compared with 25.3 million square yards in the same period of 1938, the expansion being entirely due to increased purchases by the Dominions.

WOOL

End-of-season buying in the wool-producing countries remains active, but supplies are scarce until the new clip becomes available. Government orders are responsible for much of the activity in the spinning trade and some spinners in this section are booked up for months. Stocks of khaki and Air Force cloths are non-existent and questions of supply and price are now under discussion. There has been a fair volume of buying of the cheaper cloths from the home trade and a more confident tone is noted. Exports of both woollen and worsted piece-goods to the United States have increased from the very low levels of last year.

AGRICULTURE

Cold and dry weather prevailed during the early part of May, but was succeeded by a warm spell. The sub-normal rainfall in May and April has hindered crop growth, but the rains in the early days of June were very beneficial. Hay making is now in progress in the South, and the crop is expected to be about average in quantity. The condition of the corn crops is generally satisfactory. The shortage of labour is a serious hindrance to farm operations and is likely to be intensified during harvest.

SHIPPING

The spurt in chartering for the grain trades at the end of May was not long-lived, but it was of sufficient size to raise the *Economist* index of tramp shipping freights from 91.8 (base 1913 = 100) in April to 95.6 in May. At one time there was an appreciable premium over minimum rates for the Plate market for June and July loading, but with the extension by one month of the cancelling date for vessels making the outward voyage in ballast, the premium has disappeared. Eastern and Mediterranean markets are dull.

UNITED KINGDOM—THE ECONOMIST INDICES OF BUSINESS ACTIVITY*

* For method of construction and earlier figures (1924-1938) see Supplement to *The Economist* of July 25, 1938. This Supplement is now out of print, but a record of the complete index was given in *The Economist* of November 5, 1938. † Annual indices represent averages of monthly figures. ‡ Provisional.

Business Developments Overseas

BRITISH EMPIRE

AUSTRALIA.—Wool prices remain firm with an upward tendency. Crop conditions for the coming season have been improved by good rains in most districts, but the recent fall in international wheat prices is likely to have repercussions on rural incomes. Building activity is well maintained, according to a cable from the National Bank of Australasia, but the recent recession in general trade exceeds the normal seasonal decline. Sales of motor vehicles and other semi-permanent goods have fallen off.

CANADA.—Much-needed rains fell early in June and have greatly improved the conditions of the growing wheat plants. More rain is needed in some districts, but the worst fears of a crop failure have been removed. Export trade has been hindered by the unusually prolonged winter conditions in the St. Lawrence, but wheat exports have continued at a high level. The fall in international wheat prices is a serious matter for the Federal Government, which has provided a guaranteed minimum price to the farmers. General business conditions are little changed, a further revival being checked both by fears of war in Europe and by the American trade situation. Mineral production improved in April and the revival of timber prices in Great Britain has stimulated the exports of logs from British Columbia. Employment is well maintained.

INDIA.—The decline in the Indian cane sugar crop led last year to a very considerable increase in sugar imports, which totalled 35,679 tons in the fiscal year 1938-39 against 14,389 tons in 1937-38. A sugar exchange is being established at Cawnpore. Trading in jute has been restricted by the fall in the prices of jute manufactures and by the uncertain relationship between prices for the old and new jute crops. The condition of the new crop is reported to be satisfactory, although rain is needed in the Daisee area.

EUROPE

FRANCE.—The improvement noted in recent months has been continued. The number of unemployed in receipt of benefit, which fell from 395,347 on April 1st to 384,445 on May 6th, declined further to 371,444 on June 3rd. The general index of production reached in April the highest level since May, 1931. In the first five months of the current year merchandise imports were valued at Frs. 20,694 millions and exports at Frs. 14,833 millions compared with Frs. 19,438 millions and Frs. 11,661 millions in the same period of last year. Further, it is expected that much of the tourist trade that formerly went to Austria and Germany will be diverted to France this summer. The industrial revival is still, however, largely based on Government expenditure for defence and private business remains hesitant. After a short revival in May, the Stock Exchange again relapsed in June.

GERMANY.—The shortage of agricultural labour is threatening to impede the gathering of the harvest and both university students and older members of the Hitler Youth have been co-opted to assist on the farms. This temporary expedient, however, will not solve the pressing problem of increasing the permanent labour supply in agriculture, which has been depleted by the demand for men to build fortifications and public buildings. The slaughter quota for fat cattle has now been reduced to 70 per cent. of the basic level, a step which, while conserving the herds, will increase still further the shortage of beef. According to the estimates of the Institut für Konjunkturforschung, the number of unemployed persons in Germany fell to 94,000 in April, compared with 423,000 a year ago, while the total number of employed rose in April to 20.7 millions. The level of deposits in savings banks continues to increase slowly with the rise in employment. Work on fortifications, motor roads and State buildings is being pressed forward to the exclusion of private buildings. The index of the number of hours worked per day has risen from 118.1 in April, 1938 (1936 = 100) to 126.3 in April, 1939.

NORWAY.—Although the level of freight rates relapsed again after a spurt early in May, the amount of Norwegian tonnage employed continues to expand. The amount of laid-up shipping fell from 123 vessels at the end of April to 62 at the end of May. Fisheries have been generally satisfactory; catches of cod off Iceland have been considerably larger than last year and exports of canned fish have also increased. Unemployment showed the usual seasonal fall between April and May and is slightly less than a year ago; the index of industrial production is considerably higher than last year, when there was a fall, instead of the usual rise, in the spring.

HOLLAND.—The new import quota on condensed milks imposed by Great Britain is another serious blow to Dutch agriculture. Exports to this country had already been much reduced under the voluntary quota in operation from 1933, and will be still smaller in future. Exports to Great Britain of condensed skimmed milk, for instance, will be limited to an annual total of 800,000 cwt., a

reduction of one-third on actual exports between July, 1937, and June, 1938, while exports of milk powder will be reduced by nearly half this level, and limited to skimmed milk powder only. The outflow of gold continues, though at a diminishing rate, and interest rates, which have been rising for some time, declined slightly in May. The political tension in Europe continues to retard private business activity.

SWEDEN.—There has been a considerable improvement in the outlook of the export trades. International demand for iron and semi-manufactured steels has strengthened in the last month. Timber prices in Great Britain have risen sharply, with large Government demands for army huts and A.R.P. works; but most of the exporting countries included in the regulation scheme have sold the greater part of their allotted quotas of soft woods, so that a further rise in prices is not impossible. The market for wood pulp has also improved. General business activity, apart from these export trades, is little changed. Unemployment has shown the usual spring decline and is slightly lower than a year ago. Prices, both wholesale and retail, have been very steady in the past few months.

UNITED STATES OF AMERICA

There are still no actual signs of any marked recovery in business, and the new tension in the Far East is not encouraging to confidence, which is still shaken by labour troubles and political disharmony between the Administration and business men. Nevertheless, the underlying currents that for some time now have been presaging some measure of revival seem to be gathering force. Reports from a number of industries are more cheerful; steel output is rising; and in a number of consumer goods trades, such as motor cars, sales are growing. The prospect of a new Spending Programme is heartening many people, while the Tax Bill's swift progress in the legislature has been widely welcomed by business. The sharp upturn so long looked for is most unlikely in the near future, but definite signs of recovery in the indices may not be long delayed.

LATIN AMERICA

ARGENTINA.—Shipments of grain and linseed have been considerably better than of late, but stocks are still large. Attempts are being made to stimulate the internal consumption of wheat as a substitute for maize, the export price of which is more satisfactory. The recent rains have improved the agricultural outlook and ploughing and sowing of the new crop of wheat, linseed and oats are proceeding actively. Retail business in Buenos Aires in May was encouraging, whilst the recent Government measures restricting imports have favoured British goods, particularly cotton and woollen piece-goods. Increased competition, however, may shortly be forthcoming from Italy under the recently-signed Italo-Argentina Trade Agreement. Reflecting the maintenance of general business despite current difficulties, total cheque clearings in Buenos Aires in the first five months of 1939 were 16,370 million pesos against 16,167 million pesos in the same period of 1938.

BRAZIL.—The success of the various reform measures, including renewal of the foreign debt service, depend upon a large export surplus, but the balance for the first two months of 1939 was adverse to the extent of £5,000 (gold), although this compares with an adverse balance of £1,351,000 (gold) twelve months previously. The new free exchange market—representing 70 per cent. of export exchange—appears to be working smoothly, although bills are somewhat scarce and rates for foreign currency tend to advance. The spot coffee market at Santos has shown decreasing activity due to lessening overseas interest, although it is reported from the interior that forward business in the coming crop has been considerable.

CHILE.—In the exchange market, conditions continue stringent for "export" sterling and dollars and, under the new import permit system, preference is being given for imported goods lying in the Customs House or already cleared. The Control Board is restricting imports of cotton and woollen piece-goods, and this action is reflected in a sharp decline for these articles in the trade returns.

THE FAR EAST

JAPAN.—State control over industry and commerce is becoming more complete and more detailed with the prolongation of the war. The canned fish industry has been placed under the control of a single central organisation, in order to stimulate exports. The shortage of shipping to meet the demands both of the Army and of ordinary trade has led to the introduction of priority classes among important commodities, but it is believed that the Government are contemplating more drastic measures of control over tonnage. The inland distribution of petrol and other oils is also to be centralised in the hope of restricting domestic consumption. Measures are also being contemplated to control the prices of silk yarns, which have risen sharply in recent months as the result both of poor silk production last year and of the restricted production of cotton piece-goods for the home market. The Government recently disposed of its stocks of silk yarn accumulated since 1928, in an unsuccessful attempt to stop the rise in prices.
