The profit and loss account contains nothing other than that with which you will have reason for satisfaction. The account opened at the beginning of the year with £676,390, to which have to be added the various transfers from the underwriting accounts to which I have already referred, interest, dividends, and rents of £233,570, and a small amount of £144 connected with transfer fees. The total of the account is £1,232,733, and we have dealt with this sum in the following manner. The dividends paid to the ordinary and preference shareholders absorb £255,305, and our provisions for taxation, including National Defence Contribution, amount to £78,000; sundry expenses not otherwise charged amount to £51,591, and there is a figure of £46,798 on account of pensions and gratuities and contributions to staff life and provident savings schemes. After dealing with all these items, the balance to be carried forward which is in effect an unallocated reserve fund in addition to our general reserve fund of £3,000,000, amounts to £801,038, which is an increase of £124,648. In regard to the dividends paid to shareholders, both preference and ordinary, the total amount paid falls below the figure of dividends and interest earned, plus the annual contribution of a percentage of the profits accorded to the shareholders consequent upon our life department's operations.

The surplus over book values of the Stock Exchange securities is £199,897. The total assets of the Corporation now stand at £20,984,572, and our total premium income for the year is £5,329,697.

The report and accounts were unanimously adopted, and a final dividend of 5s. 10d. per share, less income tax, to the ordinary members was approved.

ROYAL EXCHANGE ASSURANCE

219th ANNUAL GENERAL COURT

FURTHER PROGRESS

The two hundred and nineteenth annual general Court of the Royal Exchange Assurance was held, on the 26th instant, at the Royal Exchange, London.

Lord Bicester (the Governor) said that in the Life Department their total sums assured amounted to £4,526,000, the net sum assured being £4,359,000. The premium income of the department was £1,400,000, a slight advance on the figure of the previous year, and the claims paid and outstanding amounted to £844,000. The gross amount of interest earned was £627,000, representing £4 14s. 1d. per cent. on the Life Fund against £4 16s. for the previous twelve months. The most important problems at present confronting that department were the investing of new money and the fact that they had to accept repayment of existing investments, whenever it was in the power of the borrower to do so by obtaining a lower rate of interest. The directors had taken steps to counter the full effect of the lowering of interest rates by placing substantial sums in short-term securities. Not only had that policy had the effect of avoiding any but the smallest depreciation on the capital of the Life Fund, but it was also providing them with money which they could invest at appreciably higher interest rates than had been available at the time when the money was originally received.

GRATIFYING FIRE RESULTS

They would be gratified again, he felt sure, with the result of the Fire Department, the total underwriting profit of which amounted to £158,000. After taking credit for £47,600, being the net interest received, there was available for transfer to General Profit and Loss account £206,000.

For a long time Marine business had carried difficulties peculiar to itself and the result for some years had been definitely disappointing. They had felt that nothing short of a comprehensive reorganisation of their Marine business would enable them to look forward to better results, and as a first step they had formed a close association and a common underwriting policy with the Sun Insurance Office, and that arrangement gave every promise of success. It was common knowledge that 1937 had been an exceptionally bad year for the Marine market. They were making a transfer of £150,000 to the Marine Fund, with the object of strengthening it and to cover the loss made as the result of past years, but which he was hopeful might be eliminated in the future, provided that the general conditions of Marine business were such that normal profitable trading could again be established. The Joint Hull Agreement had been well maintained and through its operation rates were gradually being moved towards the level necessary to allow a moderate profit.

ACCIDENT DEPARTMENT

The Accident net premiums at £1,228,000 showed an increase of £23,000 on the 1937 figure. The underwriting profit together with net interest amounted to £92,000, a figure well above the average earned by the department and, in the face of many difficult problems, he thought it would be agreed that that was a good result. The bulk of the premiums of their Accident business, at home and abroad, was derived from employers' liability and motor-car insurance, and the future of those classes of risks was still very uncertain. They had decided to make a further transfer of £100,000 to the General Accident Additional Reserve, following out the policy of strengthening their departmental reserves when suitable opportunities presented themselves.

After pointing out that the profit and loss account and balance sheet indicated a position of great strength and that they were proposing to pay a final dividend of 19 per cent., making 30 per cent., less tax, for the year, he went on to say that he could readily suggest that on the results mentioned, the Corporation had again experienced a satisfactory year's trading. The assets of the group as a whole had increased by some £1,500,000 to over £32,000,000, and while such progress was being made he did not think there was any sign of their 219 years of existence weighing heavily upon them.

It had been his privilege to have been associated with the Corporation since 1894, and was now in his twenty-fifth year as Governor. He did not remember, except for the period of the Great War, living through a year which, from the point of view of general business anxiety, had approached that of the twelve months under review.

The report was adopted.

GENERAL ACCIDENT FIRE AND LIFE ASSURANCE CORPORATION, LIMITED

A SATISFACTORY STATEMENT

The fifty-third annual general meeting of the General Accident Fire and Life Assurance Corporation, Limited, was held, on the 26th instant, at Perth.

Sir Francis Norie-Miller, Bt., the chairman, said that it was a great satisfaction to the board to be able to present so satisfactory a statement of accounts—in fact, the most satisfactory in the history of the corporation—in a year of great international disturbances that were generally injurious to business in the countries concerned. Their results evidenced the strong position which the corporation had attained, and he felt that they would go from strength to strength in the coming years.

Their fire account continued to be exceptionally satisfactory; the ratio of losses was 33.48 per cent., against 29.93 per cent. in the previous year. The net income showed an increase of over £11,000. The profit was a very substantial one and would provide about two-thirds of the dividend.

The accident and general account was extremely satisfactory. Their income was decreased by £135,000, but the claims ratio was lower by practically 1 per cent. They were able to transfer to profit and loss account the very substantial sum of £561,294.

STRONG FINANCIAL POSITION

With regard to the profit and loss account, they had carried forward £811,042; interest not carried to other accounts was £289,485, which was considerably in excess of the proposed dividend. Thus they continued to pay their dividend without calling upon their trade profits, with which they were able to provide more than ample reserves for every possible liability and to carry forward £827,825. The board looked upon the carry-forward as a dividend equalisation account, and it provided more than three years of the existing dividend.

In addition they had a general reserve of £2,000,000, £475,000 of excess reserves in the fire and accident accounts and a very considerable sum in other reserves. They had added £50,000 to their staff pension fund, bringing it up to £476,000, a sum sufficient to meet the requirements of the scheme.

While the average cost of claims in the motor department was rising in consequence of the unnecessarily high damages awarded in certain Courts, the accident frequency fortunately showed a substantial decrease, due, in his opinion, to the precautions taken by the authorities for regulating traffic. It only remained now for young drivers to show some respect for the law and restrain the insane longing for excessive speed.

He had attended every annual meeting of the corporation from the start. He had never attended one with more happiness, and he felt confident that even greater profits would be made by the corporation in future years. He trusted that the peace of the world might not be broken, but if it was then their large staff of men and women were prepared to give their all to see that Britain came out the conqueror. In the last war the women had done great work in carrying on the business in the absence of the men, and they would do so again if necessary.

DEPUTY-CHAIRMAN'S REMARKS

Mr Frederick Richardson (deputy-chairman) said that it was a great satisfaction to meet that day under a happy conjunction of events, and it must be very gratifying to their chairman and to them all to be able to congratulate themselves upon the best statement in their history at the first meeting that offered them the opportunity as shareholders of congratulating him upon his election to the high office of governor of their group of companies.

Speaking from a wide knowledge of their position in various parts of the world, he could truthfully say that they were very close to the point where, barring extraordinary events, they could hope to produce stable returns over a period. In other words, they could expect to maintain an average of the ups and downs.

Fortunately, their foreign activities were in the right places, though they must not blind themselves to the fact that programmes of national self-sufficiency had been gaining ground. There could be no greater contribution to world peace and to human progress than the growth of a community of economic interest and the dropping of barriers between nations of good-will.

The report and accounts, with the recommendation of a final dividend of 2s., making 3s. 6d. for the year, were unanimously adopted, and the proceedings closed with a hearty vote of thanks to the chairman, directors and staff.

THE ROYAL LONDON MUTUAL INSURANCE SOCIETY LIMITED

YEAR OF SUBSTANTIAL PROGRESS

The seventy-eighth annual general meeting of The Royal London Mutual Insurance Society, Limited, was held, on the 21st instant, at Winchester House, London, E.C.

Mr J. K. Wiseman, joint managing director, who presided, said: The directors again have the satisfaction of reporting substantial progress. The total income for the year amounted to £8,911,342, an increase of £371,918 over the previous year, the combined premium income of all branches amounting to £7,173,925, an increase of £264,040. The claims paid during the year, including annuities and surrenders, amounted to £3,381,423, bringing the total of claims paid by the Society since its foundation to the impressive figure of £49,750,000. The total assets amount to £44,133,320, an increase of £3,067,453.

The premium income in the ordinary life branch for the year (including consideration for annuities granted) amounted to £1,928,987, an increase of £92,498 over the previous year.

The total amount paid in respect of claims by death or maturity, annuities and surrenders, amounted to £1,012,575, an increase of £106,022.

The rate of interest earned (excluding the Auxiliary Life Fund), after deduction of income tax, was exactly the same as in the previous year, namely £3 19s. 5d. per cent.

The interim bonus will be continued for the time being at the rate of £2 per cent. per annum, the full rate allotted at the last two quinquennial valuations.

INDUSTRIAL LIFE BRANCH

In the industrial life branch the premium income for the year amounted to £5,147,425, which is an increase of £155,001 over the previous year. The funds of this branch at the end of the year amounted to £28,606,449, an increase of £1,935,484. Claims and surrenders paid amounted to £2,320,715.

The rate of interest earned on the fund last year was £4 9s. per cent. net, which was only 3d. per cent. less than in the previous year.

A regular bonus system has been introduced in the industrial branch on lines similar to the ordinary branch, the bonus at the last valuation, under tables which participate at the full rate, being £1 per cent. per annum, subject to the qualifying period having been completed.

The premium income in the fire account amounted to £78,953 and in the accident and general account amounted to £33,765; both accounts are in a strong position and offer a high degree of security.

In the profit and loss account the balance brought forward was £141,680. Interest, dividends and rents not carried to other accounts, and transfers from the fire and accident and general accounts, amounted to £18,690. The sum of £5,049 has been transferred to the general branch reserve fund and £10,000 to investments reserve fund. The general branch reserve fund, which now stands at £85,348, is a further reserve for the fire and accident and general business, the total reserves for which are on a very strong basis. After allowing for the reserve for income tax and National Defence Contribution, there is a balance of £140,321 carried forward.

In conclusion, I wish on behalf of the directors to thank the chief officials and the head office staff and all grades of the outside staff for their loyal and efficient services during the past year.

The report and accounts, seconded by Mr J. H. Skinner (joint managing director) were unanimously adopted.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to:—

WORLD AUXILIARY INSURANCE CORPORATION, LIMITED

DIVIDEND OF 7½ PER CENT.

The twentieth ordinary general meeting of the World Auxiliary Insurance Corporation, Limited, was held, on the 25th instant, at Winchester House, Old Broad Street, London, Captain the Rt. Hon. C. C. Craig, D.L. (the chairman), presiding.

The Chairman, in the course of his speech, said that with regard to the fire account the fund brought forward from last year amounted to £49,184. To that was added interest amounting to £2,459 and net premiums £87,524. After transferring £8,000 to profit and loss account, they had left a fund of £49,805, equal to 56.7 per cent. of the net premiums received during the year.

In the general accident and miscellaneous account, the fund brought forward was £126,600, and after transferring £10,000 to profit and loss account there remained a fund of £120,945, which was 165.3 per cent. of the premium income, compared with a fund of 161.3 per cent. brought into the account.

With regard to the marine account, the income showed no material alteration, but claims showed the unfavourable trend of marine business. Competition had developed to such an extent that concessions in hull conditions and reductions in rates had brought the business of marine underwriting to an uneconomic level.

The situation had been partly remedied by the procedure adopted in 1937, and he was glad to say that that improvement had been maintained and was reflected in the more favourable outlook for the marine account in their 1938 underwriting. Cargo business is not satisfactory under the present conditions, and cannot show any real improvement until world trading becomes more settled.

As to the profit and loss account, after paying sundry charges and reserving £10,000 for Government taxation, there remained a balance of £175,987, from which the directors recommended a dividend of 7½ per cent., free of income tax, on the paid-up capital of the company.

With regard to the balance sheet, the investments were shown at cost or under and their market value at December 31, 1938, was slightly below the book value, but they had an investment reserve fund of £50,000.

The report was unanimously adopted.

SAN PAULO (BRAZILIAN) RAILWAY COMPANY, LIMITED

RECORD TRAFFIC RECEIPTS

The ordinary general meeting of the San Paulo (Brazilian) Railway Company, Limited, was held, on the 25th instant, in London.

Mr Oliver R. H. Bury, M.I.C.E. (the chairman), said that the results for the year might, he thought, on the whole be regarded as satisfactory, showing as they did a small, though progressive, increase in the traffic receipts of the railway. The figures for passengers and goods were in excess of any previous year. The net profit, after deduction of London office expenses, interest on shares and pension fund Brazil, amounted to £344,427, compared with £410,637 in 1937, and it was proposed to pay a dividend of 2 per cent., free of income tax, on the ordinary stock.

All through the year they were working under the conditions of a strict control of exchange imposed by Decree Law of December, 1937, and it had only been possible for the authorities to sanction exchange in respect of imports. The position had recently been modified to some extent by the Decree published on April 10th. It appeared that 30 per cent. of all export bills were to be sold to the Bank of Brazil at the official rate, which would be fixed daily, giving authority for purchase of importation bills in the free market. Other remittances could be bought only through the Bank of Brazil, so the remittance of profits and other funds would still remain subject to the control.

Growing expenditure, coupled with further depreciation of exchange, had rendered it necessary to approach the Minister of Transport to increase their rates, particularly in those categories where the currency rate was below the actual cost of transportation, which categories formed a large and growing proportion of the total tonnage transported. A Commission had been appointed to investigate their appeal. It was still a cardinal feature of their working, as it was during 1938 and 1937, that they were carrying goods at unremunerative prices in several of the lower classifications.

With regard to the current year, it was reasonable to expect that the aggregate tonnage would equal that of last year, though it was possible that the yield in gross receipts might fall short of last year by 5 to 10 per cent.

The report and accounts were unanimously adopted.

ARMY & NAVY STORES, LIMITED

DIVIDEND OF 12½ PER CENT.

The annual general meeting of the Army and Navy Stores, Limited was held, on the 26th instant, in London.

Brigadier-General Sir Frederick Gascoigne, K.C.V.O., C.M.G., D.S.O. (chairman and managing director), in the course of his speech, said that when they met last year he warned the shareholders that the new year had not commenced in a promising way and they would not be surprised to hear that conditions did not improve. On the contrary, they got worse, culminating in the September crisis, and although the immediate danger was surmounted by the then efforts of the Prime Minister, a severe shock was dealt to trade and a feeling of insecurity persisted in the minds of many.

Furthermore, these stores, dependent to a large extent on the custom of those with more or less fixed incomes, were particularly sensitive to factors affecting those incomes, whether it be by way of increased income-tax or reduced dividends, or both. The consequent result was a drop in turnover, reflected in the reduced gross profit from the trading and miscellaneous accounts, which was down by £65,788. In view of the progressively good results of the past few years, it was a great disappointment to the directors that conditions over which they had no control should have called a halt to this steady progress. But it was gratifying that, owing to the economies that it had been possible to effect during the year, the net profit was down by only £47,378.

These economies had resulted from the regrouping of departments and offices made possible by those structural alterations that had already been completed and by other reorganisations which would have their full effect in due course, and augured well for the days to come when trade revived.

SOUND DIVIDEND POLICY

Though the times were bad no departure had been made from the usual generous provisions for depreciation. The liquid assets totalled £1,824,941 and the fixed assets totalled £1,431,579, so that together the total assets amounted to £3,256,521. In view of the reduced profit it would be agreed, he thought, that the board would not have been right to recommend the payment of the 2½ per cent. bonus which had obtained for the past two years, but they had felt justified in recommending a final dividend of 10d. per share, which, with the interim of 5d., would make a total of 1s. 3d. per share, or 12½ per cent., the same as last year, less the bonus.

Trade in India did not become easier as time went on, but they were holding their own and watching things closely. He was able to approve certain measures for bringing up to date their buildings in Bombay and Calcutta, and he received many appreciative comments from the inhabitants of both places—and also New Delhi—as to the useful service provided by the stores.

With regard to London, last year he detailed the plans they had in view for the partial rebuilding and rearrangement of departments. Those plans were being carried through according to time table, and the rebuilding of Howick Place, which he referred to last year as the biggest operation, would, they hoped, be finished before the Christmas trade began this year, and the three bridges would all be in use again. When completed the lay-out of the departments would be much more logical and convenient, and everyone would be able to find their way about with the greatest ease.

THE FUTURE

As to the outlook for the coming year, who would be so bold as to prophesy? So much depended on the turn international affairs took. They could only hope that the clouds would disperse and, being an optimist, he continued to hope with some confidence that this would be soon. If it did their company would be ready to receive and cope with its full share of the resultant improved trade. If trade did not improve they had the satisfaction of knowing that, so far as lay in their power, the society had been placed in a sound and economic position. The times were not normal, and it would be unprofitable for him to say much more. They did not know what problems there might be, and he could only ask the shareholders to rely on them to deal with those problems as they arose to the best of their ability. Meantime shareholders could help by obtaining all their requirements from the society and telling their friends to do the same.

As a final word, he would call to their minds that, as was so often the case, their meeting took place at Budget time. Onerous as was the prevailing taxation, they had got to pay the price of peace, and he felt sure that they were all prepared and willing to shoulder the extra burdens to preserve their independence and be in a position to help towards the maintenance of the peace of the world.

The report and accounts were unanimously adopted.

ORIENTAL TELEPHONE AND ELECTRIC COMPANY, LIMITED

INCREASED NET REVENUE

The forty-fifth ordinary general meeting of the Oriental Telephone and Electric Company, Limited, was held, on the 25th instant, at the Great Eastern Hotel, London, E.C.

Sir A. Henry McMahon, G.C.M.G., G.C.V.O., K.C.I.E., C.S.I. (chairman of the company) said: The results of the year's working show an increase in the net revenue from £114,147 to £117,731, and with the carry-forward from last year added, there is a balance of £145,576 available for disposal, after payment of the usual interim dividends, compared with £138,505 in 1937. Out of this we propose to pay final dividends for the year of 3½ per cent., less tax, on the preference shares and 8 per cent., free of tax, on the ordinary shares, which will absorb £52,223; to place £20,000 to general reserve; £10,000 to contingencies reserve; and to carry forward £63,353.

The costs of exchanges and equipment, as well as land and buildings, are both reduced this year in consequence of the sale of the Mauritius undertaking. Shares and debentures in subsidiary and associated companies have been increased in consequence of an addition to our holding in the Bombay Telephone Company, Limited. That company made an issue of shares at par, at the latter part of last year, and your company took up its due proportion.

I come now to the profit and loss account. On the credit side, profit on the working of branches shows an increase of some £7,000, whilst dividends and interest from subsidiary and associated companies is up by about £5,000. Income tax and National Defence Contribution together show an increase of nearly £4,000. This is partly due to the increase in the profits brought into assessment to income tax, as well as to the rise in the rate of tax and also to the fact that National Defence Contribution is chargeable on a full year's profits for 1938, instead of nine months only as in 1937.

SINGAPORE AND MAURITIUS

Singapore has shown a moderate increase this year and the number of subscribers has passed the peak which was reached in the year prior to the financial depression. The Government of the Straits Settlements has been unable to agree to the company's proposals for the introduction of a message rate system of charging. Your directors regret that an agreement could not be reached on this question, but they have since given the matter full consideration and, as the ground lost between the years 1929-1937 has been recovered, they have decided to introduce a modification in rates at an early date, which will result in a considerable reduction in revenue.

With regard to Mauritius the undertaking there was transferred to the Government on July 1 last. This branch has been worked at a loss for some years past and, with the transfer of the business, this charge will no longer have to be borne. The price which the Government of Mauritius offered for the undertaking was rather less than the figure which the board had hoped might be received for the plant and property, but, having regard to all the circumstances, your directors considered it would be in the interests of the company to accept the Government's offer.

INDIA, BURMA AND HONG KONG

I will now deal with our subsidiary and associated companies, and I will refer first of all to those in India and Burma, viz., the Bengal Telephone Corporation, the Madras Telephone Company, the Bombay Telephone Company, and the Rangoon Telephone Company. These companies have all paid their customary dividends and, whilst development has not been so great in 1938, in every instance, as in 1937, I think you will agree the increase in the number of exchange lines during the past year is very satisfactory.

With regard to the China and Japan Telephone Company and the Hong Kong Telephone Company, the latter has made distributions for the year amounting to 12 per cent., which has enabled the China Company to pay a dividend of 6 per cent. These rates are the same as those distributed in recent years. As to the growth of business in Hong Kong and Kowloon, this has continued at an even greater rate in 1938 than in the previous year, but this increase is abnormal and may not be expected to continue. It is due to the influx of Chinese business men and others into British colonial territory, owing to the unfortunate circumstances now prevailing in China.

The report and accounts were unanimously adopted.

BRITISH TIMKEN, LIMITED

BASIS OF BUSINESS BROADENED

The nineteenth ordinary general meeting of British Timken, Limited, was held, on the 21st instant, at Birmingham.

Mr M. B. U. Dewar (the chairman) said that two years ago he had informed shareholders that their factory was essentially a mass-production factory of a highly specialised kind, and as such a comparatively small fall in their turnover could have quite a large effect on the profits. Unfortunately, although they had been fully employed during the first few months of the year under review, the last half of the year had been one of continually decreasing demand. This company was a large supplier of bearings to the motor-car and commercial vehicle industry. Shareholders had probably seen from the registration figures published every month that registrations of motor cars and commercial vehicles for 1938 showed a reduction of over 10 per cent. on those of the previous year. That fall had had a material effect on the company's profit figures, and, taken in conjunction with the rise in cost of wages and raw materials in 1937, the full effect of which had been felt in 1938, accounted for the fall in their total profits.

BEARINGS FOR RAILWAYS

The board had, for the past few years, been taking all possible steps to increase the sales of the company's products in industries other than the automobile industry, and he was glad to say that they were meeting with considerable success, particularly as regards the supply of bearings for railway axle boxes and for rolling mills. Apart from the automobile trade, the company was a large supplier of bearings to almost every type of engineering industry as well as to the railways of this and other countries, and their efforts to develop and increase those sides of their business continued to meet with encouraging results.

During the past two years the railway side of their business—the supply of bearings for locomotive, carriage and wagon axle boxes—had been showing a steady increase, and the results which they had obtained gave them every reason for confidence that they would continue to enjoy a fair share of such business.

In January and February of the current year he had been able to pay a visit to South Africa, in which country their bearings were largely used in various types of mining equipment and on the South African railways, and it was interesting to note that there were now 294 locomotives running on the South African railways equipped with the company's bearings on the axles. In had been particularly pleasing to him to receive in South Africa excellent reports of the company's products.

In these days, when increasing attention was constantly being drawn to the necessity of maintaining this country's export trade, it would be interesting for shareholders to hear that no less than 30 per cent. of the company's turnover during 1938 had been for export, and, although he could not necessarily promise that that percentage would be maintained, it nevertheless did give an indication of the efforts that the company had made, and was making, to maintain and develop that most important part of their business.

THE OUTLOOK

As regarded prospects for the coming year, it was impossible to be other than extremely cautious in any forecasts. Nevertheless, for the first quarter of the year the sales of their products had been well maintained, particularly for the motor-car trade, and they could add their contribution to the almost general impression that, should the European political situation improve, there was every indication of a strong revival in trade. They naturally had in hand a considerable amount of work which could be classed as armament work, and, having regard to the importance of roller-bearing and ball-bearing production in times of danger, he was sure shareholders would wish him to tell them that they were not unmindful of their responsibilities in the direction of their employees and of their works.

Before closing his remarks, he must refer to the resignation of Mr Dallow, who, for the last twelve years, had been resident director and general manager. He had had the closest daily association with Mr Dallow for the past fifteen years, and he could assure shareholders that no little of the success that the company had achieved was due to Mr Dallow's genius for works organisation and statistical analysis, which in his (the chairman's) opinion, and in that of many others more competent to judge, was unsurpassed. It was with feelings of very deep regret that they wished him to-day "Good-bye" as far as their business association was concerned, and on behalf of the shareholders and themselves he would like to wish him a long life to enjoy his well-earned leisure.

The report and accounts were unanimously adopted.

GORDON HOTELS, LIMITED

MAJ.-GEN. GUY DAWNAY'S REVIEW

The forty-ninth ordinary general meeting of the Gordon Hotels, Limited, was held, on the 25th instant, at the May Fair Hotel, London, W.

Major-General Guy Dawnay, C.B., C.M.G., D.S.O., the chairman, in the course of his speech, said: The profit and loss account for the year, as you will see, stands at £27,785, as compared with £44,300 the preceding year.

The very depressed conditions under which the hotel business operated during last year are reflected by a reduction of no less than £144,000 in business done, a reduction of 15½ per cent.

The general conditions prevailing in the hotel industry throughout the year were uniformly adverse. The political situation became threatening very early in the year, eventuating in the Austrian crisis in March, which dealt the first very rude shock to the business. Then in May again there was apprehension of a European crisis, which caused a further decline in business, practically checking any influx of overseas visitors, and preventing any American season at which I have ever seen in this business. Our seaside hotels also suffered owing to the fact that depreciated foreign currencies attracted many potential clients abroad.

Our fall in apartments' receipts has been highest at the May Fair—nearly 30 per cent.—bearing out the general experience that the higher the class of hotel the greater the fall. At the Victoria and the Grosvenor the fall in apartments' receipts was 18 per cent. and 19 per cent. respectively, and at Brighton only 13 per cent. For the group as a whole the fall was 22 per cent.—a clear indication of the effect of the European situation, the fears of taxation, and the fall in Stock Exchange values—curtailing and rendering difficult hotel business.

You will hardly be surprised to hear that in the current year up to date there has been no improvement. So long as the European situation remains in its present state of constant tension, it is obviously impossible for me to hold out hopes of improvement in the prospects of the hotel business.

So far as our foreign hotels are concerned, they have rather more than maintained their profit.

IMPROVEMENTS TO HOTELS

In our report this year we have made special mention of the standard of maintenance of the company's properties, since we believe that this is one matter in which we have some real cause for satisfaction. Although our repairs and maintenance account for the year under review actually shows a decrease of over £8,600, the properties have been more than adequately maintained, and they are in better and more efficient condition than they have been for many years. In so far as the May Fair Hotel is concerned, the Lansdowne and Devonshire Rooms have been modernised and redecorated and have been provided with a new access, making these rooms one of the most up-to-date small banqueting suites in London.

At the Victoria Hotel the Grand Hall Restaurant has been renovated and is the subject of highly favourable comment from our clients. The same remark is applicable to the restaurant at the Grosvenor Hotel. So far as the seaside hotels go, I need only mention that we have completed the programme at the Hotel Metro-

pole at Brighton begun a few years ago, which has practically renewed the hotel throughout. Finally, at Monte Carlo we have installed additional bathrooms and couriers' rooms, which have proved a source of increased revenue to the hotel and are much appreciated by our clients.

VALUABLE PROPERTIES

I think it is abundantly clear, and I believe you will agree with me that, in the circumstances of the period through which we have passed and are passing, the results of the year under review do not reflect, and could not have reflected, the true earning power of those properties. The properties are valuable, and have a much greater earning power in anything like normal times than that shown in the accounts before you.

In conclusion, the chairman, referring to night club and bottle party competition, said: It is encouraging to note that the Home Secretary has said in the House of Commons that the Government is convinced that some amendment to the existing law is necessary; and that he held out hopes of the introduction of legislation to deal with the evils from which we suffer.

The report and accounts were unanimously adopted.

OXENDALE AND COMPANY (PROPRIETORS), LIMITED

EFFECT OF POLITICAL CONDITIONS

The annual general meeting of Oxendale and Company (Proprietors), Limited, was held, on the 25th instant, at Winchester House, Old Broad Street, London.

Mr A. Stanley Smith (the chairman) said that a year ago they were able to congratulate themselves on the steady and continued improvement in the trading profits of the operating company, which had advanced from £19,881 in 1931-32 to £53,937 in 1937-38.

It was therefore not altogether surprising that the net result of the year's trading should show a decline: Indeed, to many the surprise would be that the decline was so small. The combined turnover of Oxendale and Company, Limited, and its subsidiaries was little more than half of one per cent. short of the previous year's record. The reduction in the net profit was accounted for by the expenditure incurred in carrying out the policy of vigorous development.

With regard to the accounts of the operating company, the profit on trading, £47,194, showed a reduction of about 7.3 per cent. The net profit was £31,374, against £35,411. The reserve now stood at £71,000. As a result of the relaxation of prices a year ago they had been able to reduce their stocks in hand to £48,028 and in this connection he would like to pay a tribute to their staff of buyers who, by their foresight and careful management, had contributed greatly to their success. The accounts of Oxendale and Company (Proprietors), Limited, showed a net profit of £27,874, and after payment of the dividend on the 10 per cent. preferred ordinary shares it was proposed to pay a dividend on the deferred shares at the rate of 12½ per cent. per annum, less tax. The warrants for the dividend on the deferred shares would be sent out to the shareholders on May 16th.

It would be gathered that the company's business was flourishing. During a difficult year it had substantially maintained its volume of trade and had actually recorded a larger number of transactions than ever before. It was their endeavour to increase the number of their customers and extend the range of their activities while ensuring the stability of their finances.

The report was unanimously adopted.

(Continued from page 272)

of exchange amounts to £775,000, and is more than sufficient to provide for the difference between the book values of current assets (including investments) and liabilities and their market values at rates of exchange current on December 31, 1938. General reserve fund remains at £2 millions, and the profit and loss balance, after payment of the final dividend, is £828,000. British Government securities amount to £1,553,000 against £1,514,000, and Colonial and Foreign Government securities increased from £3,427,000 to £4,070,000. Debentures were reduced by £25,000 to £3,708,000, and preference shares increased by £165,000 to

£1,846,000. The dividend is at the same rate as in 1937, namely 70 per cent., and costs £255,000, compared with available interest earnings of £281,000.

	1937	% of Profit	1938	% of Profit
	£	Pre-miums	£	Pre-miums

Charges to profit and loss	73,772	...	116,959	...
	191,231	...	Dr 66,564	...

Total assets amount to £17,331,000. Loans amount to £1,477,000, against

£1,544,000, and British Government securities increased from £2,507,000 to £2,661,000. Colonial and Foreign Government securities also showed some increase to £3,049,000. Debenture stocks fell from £3,513,000 to £3,364,000, while preference and ordinary stocks increased by £155,000 and £92,000 to £3,096,000 and £391,000 respectively. General reserve and contingency funds amount to £600,000, and in the fire and miscellaneous departments, in addition to reserves for unexpired risks, there are reserves of £900,000 and £100,000 respectively. The dividend is 65 per cent., and costs £141,000, compared with interest earnings of £134,000.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On April 21st applications at £99 13s. 3d. per cent. for bills to be paid for on Monday, Tuesday, Wednesday, Thursday, Friday and Saturday of following week were accepted as to about 26 per cent. and applications at higher prices in full. £30.0 millions of Treasury bills are being offered on April 28th.

SHORTER COMMENTS

Company Results of the Week.

The experience of CHARRINGTON AND COMPANY has been more favourable than the majority of breweries, for net profits for 1938 are £826,497 against £762,883, and the dividend is raised from 15 per cent. to 17 per cent. In common with electricity companies as a whole, CALCUTTA ELECTRIC SUPPLY CORPORATION obtained a larger gross revenue, but coal costs increased and a larger charge for depreciation was necessary, so that net revenue fell from £508,774 to £495,572. The majority of rubber companies show a fall in net profits of one-half or more, while tea companies with a few exceptions, have experienced a setback, though of varying severity. CROSSE AND BLACKWELL again pay 2½ per cent., although net profits have fallen from £135,153 to £106,707. Sales were well maintained, but materials and labour cost more. Results of LILLEY AND SKINNER for the year to January 21st are satisfactory, for total profits of £69,097 are only £1,577 lower. HOPKINSONS, LTD., provide one of the best reports for the week, for net profits have increased to £165,310 against £127,834. Sales constituted a fresh record, and improved manufacturing efficiency kept price increases to a minimum. LONDON ELECTRIC WIRE COMPANY AND SMITHS report a decline in turnover, though their relative position in the trade has been maintained. Total profits of SIR LINDSAY PARKINSON AND COMPANY are £199,403 against £70,126, though profit on Government work has not exceeded 4 per cent. on cost. GARRARD ENGINEERING AND MANUFACTURING report that demand improved last year, and the dividend is increased from 20½ per cent. to 25 per cent. COURT LINE net profits have fallen heavily from £341,276 to £144,902, although the results were helped by favourable forward contracts arranged in 1937.

Courtaulds and British Celanese.—These companies have issued circular letters, suggesting that shareholders invite the support of their Members of Parliament for amendments (put forward by rayon producers, but rejected on March 27th) to the Cotton Industry (Reorganisation) Bill now in the Committee stage.

Consolidated Tin Mines of Burmah.—Directors recommend that 856,001 £1 shares be written down to 7s. 6d. each, and then consolidated into 5s. shares; fixed assets to be written down by £494,204, and intangible assets by £38,500. Meeting, May 25th.

Mawchi Mines.—Sales of tin in 1938, £678,847, against £861,214. Burma expenditure, £240,111 (£250,073); London Concentrate Account expenditure, £114,032 (£120,111); depreciation, £43,411 (£24,726); tax and N.D.C., £25,000 (£39,000). After these and other charges, balance is £195,584 (£274,787). Final

dividend 50 per cent., making 80 per cent. Carry forward, £62,938 (£56,094, after £50,000 to general reserve).

United States Steel Corporation.—Earnings for first quarter 1939, \$660,551, equal to 18c. per preferred share. Earnings for December quarter, 1938, were \$4,394,454 or \$1.22 per preferred. For first quarter 1938 there was a net loss of \$1,292,151. Regular quarterly dividend of \$1.75 on preferred (requiring \$6,305,000) is being paid.

Shell Union Oil Corporation.—Net income from operations for first quarter of 1939, \$478,266, against \$2,907,447 for first quarter of 1938. Gross earnings \$57,524,951 (\$59,312,316). General expenses \$46,451,530 (\$45,331,508). To depreciation, \$9,567,449 (\$9,826,044).

Charrington and Company.—Profits in 1938, £1,001,496 (£912,883) after debenture interest. Tax £175,000 (£150,000). To properties reserve, £100,000 (£50,000). To general reserve, £200,000 (£200,000). Ordinary dividend raised from 15 to 17 per cent. Carry forward raised from £247,841 to £247,951.

South Eastern Gas Corporation.—Accounts for year ended March 31, 1939, show net revenue £162,399 (£156,607). Ordinary dividend maintained at 6 per cent. Carry forward raised from £48,692 to £69,321. Only 3,703 ordinary shares of £1 each now remain unissued, and it is proposed to increase authorised share capital to £5,000,000 by creating a further 1,000,000 £1 ordinary shares.

Gordon Selfridge Trust.—Payment of a dividend on 6 per cent. cumulative preference stock for half year ending April 30, 1939, is postponed.

Pressed Steel Company.—Net profit, 1938, £235,055, an increase of £19,292. Final dividend 17½ per cent., making 27½ per cent. for 1938. For 1937, the interim of 14 per cent. was paid on £690,684 ordinary capital, and the final of 14 per cent. on existing ordinary capital of £828,821.

Court Line.—Profits on voyages, dividends and interest, 1938, £154,506 (£372,195). To depreciation, £83,000 (£150,000). Laying-up expenses, £8,294 (Nil). Dividend 10 per cent., against 25 per cent. for 1937, when interim of 5 per cent. was paid on £350,000 and the 20 per cent. final on £525,000. Carry forward is increased from £52,141 to £61,543.

Airedale Collieries.—Gross profit, year to February 28, 1929, £160,231 (£197,571). To depreciation, £33,732 (£338,28). To tax provision, £10,000 (£20,000). Net profit £114,099 (£141,343). Ordinary dividend reduced from 10 to 7½ per cent. on increased capital. To general reserve, £40,000 (£40,000). Carry forward, £41,575. A year ago £42,476 was carried forward, after placing £16,000 to staff contingency reserve.

Forestral Land, Timber and Railways.—Credit balance, 1938, £326,971 (after placing £50,000 to general reserve), against £510,555 (after £50,000 to reserve). To

dividend account, £25,000 (£150,000). Ordinary dividend 6 per cent., also bonus of 1 per cent. For 1937, dividend was 6 per cent. and bonus 3 per cent. Carry forward raised from £130,760 to £132,557.

Supervised Shares, Inc.—At the request of the Treasury sales of shares of Supervised Shares, Inc., will be suspended until further notice.

Gold Production in New South Wales.—The production of native gold for first two months of 1939 is estimated at 12,400 ounces fine, valued at £A94,641. For the corresponding period of 1938, output was 10,183 ounces fine, valued at £A88,113.

Garrard Engineering Company.—Profit for 1938, £47,701 (£40,412). Dividend, 16½ plus bonus 8½ per cent., making 25 against 20½ per cent. To reserves: Plant, £10,000 (Nil); tax, £5,000 (Nil); contingency, £5,000 (nil). For 1937, £20,000 was put to general reserve. Carry forward raised from £17,907 to £18,998.

Elektrolux (Stockholm).—Net profit for 1938, Kr. 8,901,465, a decrease of Kr. 250,700. Dividend rate maintained at 13½ per cent. Carry forward increased from Kr. 11,252,356 to Kr. 11,324,094.

Clan Line Steamers.—Ordinary dividend is maintained at 20 per cent. for 1938. Profits, after tax but before depreciation, were £723,566, compared with £712,098 for 1937.

Oxendale and Company (Proprietors).—Net profit for year to February 28, 1939, £27,874 (£30,410). Dividend on deferred shares reduced from 16½ to 12½ per cent. Carry forward reduced from £6,748 to £6,733.

Gordon Hotels.—Gross trading profits for 1938, £776,351 (£920,494). Working expenses, £416,046 (£456,428). Consumption expenses, £278,459 (£315,269). Income tax, £17,867 (£1,350). No interest is being paid on the 7 per cent. income debenture stock, which absorbed £25,470 in previous year. Carry-forward reduced from £44,301 to £27,785.

Cable and Wireless Traffic Index (1929=100).—March, 1939, index 74.6, compared with 70.5 in February, 1939, 69.0 in January, 1939, and 74.7 for March, 1938 (the index).

Amalgamated Anthracite Scheme.—Meetings held April 19th approved the amended capital reconstruction scheme.

Transvaal Gold Output and Native Employment.—Gold output, March: Witwatersrand, 1,049,270 fine ounces; other districts, 26,537 fine ounces; total, 1,075,807 fine ounces. February total, 979,128 fine ounces. Native labour, March 31: Gold mines, 324,518; coal mines, 16,609; total, 341,127.

Wall Paper Manufacturers.—Interim dividend 4 per cent. against 5 per cent. as before.

Ford Motor.—Dividend 5 per cent. as before.

Olympia Ltd.—The directors announce that the preference dividend for the half-year to April 30th has been postponed.

(a) Paid on larger capital.

£ Free of income tax.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are not redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

LETTERS TO THE EDITOR

--	--

has been forced upon us. Our only chance of preventing it from moving on to the bloodletting stage is either to acknowledge the Nazis as overlords of the world or else to win the war in its present silent stage. Everything else must be subordinated to winning the war.

There is, accordingly, nothing to do but to push on with the policy belatedly adopted by His Majesty's Government on March 17th. That policy, as the Prime Minister wisely repeats, is not one of encirclement. The guarantees against aggression are open to Germany as to the other nations, and there is nothing in the policy that can possibly harm Germany until the moment that she commits a new aggression. But that new aggression is so likely, and Herr Hitler, with his talk of the possibility of "limited" wars, takes so little trouble to make it seem less likely, that precautions must be taken. Since March 17th we have gone a very long way towards taking those precautions. But there are many who share Mr Attlee's uneasiness about the slowness with which the largest single step—the conclusion of an understanding, or alliance, with Russia—is being taken, and have felt apprehensive lest the dismissal of M. Litvinoff may presage the end of Russia's willingness to co-operate with the West. Apparently, that is not the meaning to be drawn from Wednesday's dramatic announcement. But there is clearly not a day to be lost in cementing the Peace Front.

Meanwhile, the storm clouds are darkest over the Polish Corridor. The open declaration of German hostility to Poland has united the Polish nation as at no time since its

rebirth. It is of the very first importance that everything should be done to support the Poles in their courageous stand. At the first breath of a repetition of the disastrous tactics that sent Lord Runciman to Prague in August, the whole Peace Front would collapse. It has been said that Danzig "is really not worth a war." No collection of houses and streets is worth a war. But what is vital is that at this moment Germany should secure nothing more, just or unjust, by the technique of menace. The world saw, in Czecho-Slovakia, the consequences of yielding to claims based on alleged "justice." Indeed, if it comes to justice, the Poles are entirely within their rights in claiming that the present temper and attitude of Germany call for a reinforcement, rather than a relaxation, of their position in Danzig. The atmosphere that Germany has created makes it impossible to reconcile one nation's rights with another's. Having made the appeal to force, Germany must be met with force. There is every sign that she is about to threaten the utmost force. The blow will descend if we flinch. It may be held if we do not.

The looming slaughter is not inevitable. It is not even probable, if we only have the resolution to make it clear that force will be met with superior force and that the new-born unity of the threatened nations is not to be disturbed by the ever-plausible, never-satisfied claims of Nazi propaganda. Peace can even yet be rebuilt if we will take as our watchword the double slogan: without substantial disarmament, no concessions of any kind; after substantial mutual disarmament, the utmost possible generosity.

Issues of Conscription

IT is pre-eminently a principle of right conduct in times of national emergency that no individual and no party should seek to press upon the people, in the guise of essential safety measures, policies which they actually sponsor for other and political reasons. It would be reprehensible to welcome the introduction of a limited measure of conscription for the armed forces as anything different from what it is, a distasteful necessity; and it is greatly to the credit of the Prime Minister that he has made no attempt to follow a certain section of his supporters, to whom compulsory military service has always seemed a desirable element in national organisation, even in peace time, and to present the Military Training Bill as a positive contribution to the improvement of character and morale.

Mr Chamberlain's quite genuine reluctance to make training for war a legal obligation has had no small part in the Cabinet's mishandling of the question as a political issue until the hasty and unprepared decision of last week; and it is embodied in the title of the Bill which is intended rightly to make only "temporary provision for rendering persons between the ages of twenty and twenty-one years liable to undergo training with the armed forces of the Crown." Conscription was introduced in 1916 because we were at war. It has been brought in again because we are no longer at peace. It is a temporary but essential expedient; and the sole questions to ask about the way in which it has been done are, not whether compulsion is good or bad in principle, but whether its introduction now was really necessary and whether the steps taken are likely to prove as fair and effective as possible.

These in fact are the grounds of the political opposition that the Military Training Bill, to which the Commons gave a second reading on Thursday, has aroused. The complaint that in calling upon Parliament to approve this new departure the Prime Minister was breaking pledges solemnly and repeatedly given will provide material for future historians akin to that enjoyed to-day by students of the tergiversations of Sir Robert Peel and Mr Gladstone. The

controversy illumines the fact that Mr Chamberlain has greatly strained his constitutional position by changing his mind without changing his Cabinet; and it underlines the truth that Mr Chamberlain and his colleagues have been constrained to act precipitately and blunderingly in this matter now because of their inept and myopic policy in the past. But it does not alter the fact that the Military Training Bill comes before the country to be judged on its merits as a measure of practical expediency. It is the accusation that the calling up of these young men (who are, perhaps unfortunately, not voting citizens) for six months' training is not necessary which has to be answered.

The deciding factor in favour of the Bill is this country's urgent need, in view of our obligations at home, in the Empire and on the Continent of Europe, for a much larger Army and body of trained reserves than those in authority had formerly calculated. It is presumably the wish of the Secretary of State for War and the Army Council for more numerous and more thoroughly trained soldiers than the voluntary system can provide that has tipped the scale. The contention of the Opposition that voluntary recruitment has not failed is quite correct; in April alone some 88,000 men were enlisted in the Territorial Army, leaving only another 122,000, six week's supply at this rate of recruitment, to be found. But this is no argument against the Bill; in numbers and in extent of training the Territorial Army is not enough to serve the nation's immediate needs. Indeed, the 200,000 militiamen to be trained in the first twelve months are themselves not enough to eke out the Territorials' part-time watch and ward over our anti-aircraft defences and furnish the trained core of a reasonably strong expeditionary force. Three years will pass before more than three-quarters of a million militiamen have been trained and transferred to the reserve and auxiliary forces; and it is presumably because of the undoubted difficulties that will arise in equipping and supplying the new Army that the Bill has been confined in its scope to a single class.

This question of supply serves as the second count in the

Opposition's indictment of the Government's proposals. It is bluntly stated that it will be impossible to furnish and outfit the men enlisted. If this is true, then it is not the introduction of compulsion but the organisation of supplies that is at fault; and the remedy lies in the full and proper functioning of the arrangements that have lately been placed in the hands of Mr Burgin. The characters "Taint Necessary" and "Sno Use" whom the cartoonist Low has lately found on the Government benches have seemingly crossed the floor of the House; but their complaints are no more valid or in order in Opposition than they were before. It is hard to believe that the needs of the militiamen in training (the cost of which is very modestly estimated in the Memorandum to the Bill) cannot be met with ingenuity and bold initiative in organisation.

The only true objectors to compulsory military training are those who are pacifists on moral or religious grounds; and it is not the least merit of the Government's measure that it provides for conscientious objectors to be included on a special register, instead of the military training register, and to be set to perform other work of national importance or non-combatant duties. It is to be hoped, with Mr Lansbury, that the local tribunals which will sit upon applications for this special treatment will be composed of men sufficiently young to appreciate sympathetically the very real fire for peace that inspires the pacifists of the latest generation, and that their task will be to ascertain facts about applicants' scruples and not to proselytise them by irrelevant stories of sisters or wives in danger of rape. The Prime Minister's strong denial of any intention to persecute pacifists was an impressive feature of Thursday's debate.

Colonel Wedgwood's admission a week ago that if the Bill had been introduced by Mr Churchill (who, incidentally, only regretted the limited scope of the proposed conscription), it would have met with a united House, was very revealing of the real reasons for the non-pacifist objections. It is a very easily understood reluctance to entrust Mr Chamberlain and his colleagues, in view of their past record of failure and dilly-dallying, with the power to compel. The Labour Party and the trade unions are, very properly, concerned about the industrial consequences of conscription under the present Government. It is surely for them to say so, rather than to oppose it root and branch. It is their duty, and that of the other Opposition parties, to welcome the very forthright provision in the Bill for the reinstatement of militiamen in their previous employment; to hold a watching brief for the hard cases that will inevitably occur, especially in the case of small firms; to examine carefully the remuneration (a shilling a day with allowances in some cases for dependants) and conditions of the men in training; and to make sure that any special adjustments to prevent military training from impairing university courses will also apply to technical and professional studies.

Agenda for Preparedness.—II

Full Employment

IN the most widely accepted economic doctrines of the moment, the concept of "full employment" is one of peculiar importance. Until "full employment" is reached, any increase in the monetary demand for goods has the effect, not of putting prices up so much as of attracting into employment resources of labour and capital that were previously standing idle. Until "full employment" is reached, so runs the theory, the creation of new demand by expansion of credit cannot result in what is commonly called inflation; on the contrary, it diminishes unemployment and, by increasing the national income, gives rise to savings that offset the original creation of

credit. But after "full employment" is reached, any further expenditure out of credit expansion or money creation will not increase production or diminish unemployment: it will merely enhance prices and start the revolving spiral of inflation. In the layman's language, "full employment" is the point at which the financing of government deficits by credit expansion ceases to be "sound finance" and becomes "unsound finance."

For a country moving into a war economy, it is, therefore, of great importance to discern when "full employment" arrives, for a great many things which were previously unnecessary then become urgent, while many things

As it stands, the Bill is a simple statement of well-contrived proposals. Male British subjects not ordinarily resident in a British Dominion, who are aged between 20 and 21, are uniformly liable, though in special cases the liability to be called up may be anticipated or put off; members of the Regular forces or, before April 27th last, of the auxiliary and reserve forces are exempted. Training is for six months and enlistment for four years, the balance of 3½ years to be spent with the auxiliary forces. Two details only of first-class importance were hard to settle, and both related to Ireland. In the Bill at present before the House, men domiciled in Britain are liable to serve. It is perhaps legitimate that the people and Government of an independent nation-member of the British Commonwealth should claim the right to contract out on behalf of their citizens domiciled in this country. Eire wishes this. But if this claim is conceded the concession should be bilateral; that is, the subjects of Eire in Britain, if exempted from military service, should no longer enjoy the material privileges of domicile here, in the shape of unemployment benefit and so on. They cannot expect to be permitted to make the best of both worlds. It has now been decided that the Bill will not apply to Northern Ireland. It is again an expedient concession to opinion in Eire to ensure that the Catholics of the Northern counties will not be brought forcibly into the scheme; and, by and large, it might be wise simply to make it possible for Lord Craigavon's burning loyalists to contract into the militia as volunteers.

that were right before become wrong. It was the perception of the changes in policy necessitated by the attainment of "full employment" that led to Dr Schacht's disagreements with the Nazi Government, and it is the non-perception of the change that is leading his successor into difficulties. For us in Great Britain, too, the attainment of "full employment" will be of great importance. Until it is reached, the present policy of financing three-quarters of the costs of re-armament by borrowing is economically justifiable. After it has been reached, the dangers of borrowing can be expected to increase rapidly. How close to "full employment" are we?

The impact of enormous orders for goods which are unimportant in peace-time naturally affects the accuracy of the accepted indicators of business conditions, which are designed to register the fluctuations in the activity of a peace-time economy. There is a risk of serious misconception in the fact that *The Economist* Index still stands 7 per cent. below its peak in the autumn of 1937. Similarly, because the official Index of Production stands about 8 per cent. below its 1937 peak, it might be inferred that there is 8 per cent. of productive capacity available before we regain the conditions of 1937; which were themselves probably less than "full employment."

But any such inference would be incorrect. The Board of Trade Index does not include the production of armaments, except in so far as they indirectly affect other industries, such as steel. This is equivalent to saying that the Board of Trade Index omits the most important factor in the present British economy. In the accompanying diagram an attempt has been made to surmount this diffi-

Both indices refer to mining and manufactures (i.e. excluding building and all service industries). They are corrected for seasonal fluctuations and for variations in the number of working days, and are based on 1929=100.

culty by the calculation of a new Index which, to distinguish it from the Index of Production, has been called an Index of Output. This Index has been based upon the fact that, while armament production is excluded from the Board of Trade Index of Production, armament workers are included in the employment returns. The Index of Output was therefore based upon the figures of employment in mining and manufacture, and makes allowance for the fact that there is a gradual increase from year to year in the average output per worker. It was adjusted in such a way that, as can be clearly seen from the diagram, it accords very closely with the Board of Trade Index for the years 1928-36. From the middle of 1937, however, there is a divergence, which should measure the effect of armament work. It will be noticed that, measured

on this basis, the output of the mining and manufacturing industries in the first quarter of 1939 was virtually as high as at the 1937 peak. Some of the shortages of men and material that were so apparent in the spring of 1937 have not reappeared. But this evidence would tend to indicate that they are not far off.

In any case, the total of the unemployment register, which stood at 1,727,000 on March 13, is a figure which injects more confusion than enlightenment into the discussion. Sir Ronald Davison has given his authority to some estimates of the number of men and women included in the total who cannot be regarded as available for work. Those who are on the register because of "normal and brief interruptions in their jobs" he puts at 500,000 (this is less than 4 per cent. of the insured population, and seems to be a very moderate figure). There are 110,000 men and women who have retired and are not seeking work, but sign on to the register to keep their pension rights alive. Sir Ronald estimates at 100,000 the number of young men who have grown inured to living on the dole and are not anxious to work. And finally there are 200,000 elderly unemployables. These deductions would reduce the total of 1,727,000 to 817,000. This figure must be still further reduced by the prospective net increase in the full-time armed forces, which, on the average of a year, may be not far short of 200,000. The available supply of labour is thus reduced to little more than half a million, considerably less than the lowest reasonable estimate of the additional labour directly required by this year's expansion in the defence programme, let alone the indirect effects of the expenditure.

This is the situation in its global form. But the problem with which we are faced is not one of demand for goods in general—that is, for labour in general. It is a greatly enhanced demand for specific varieties of goods impinging on the supply of specific varieties of labour. An unemployed textile worker in Lancashire, even if he is not included in any of the categories listed above, is not immediately available for, say, aircraft construction in the Midlands. It is possible, by a careful analysis of the Defence Estimates, to give some idea of the supply of labour available in individual industries in relation to the demands that can be expected to be made on those industries. For example, the increase between 1938-39 and 1939-40 in purchases of aircraft is estimated at £45 millions. Now the total number of unemployed recorded in the aircraft, motor car and railway vehicle industries combined is 16,500. At the time of the Census of Production of 1935 the gross output per head in these industries was £612 per annum, which increases in prices may by now have raised to about £700. Thus, even if all the 16,500 persons recorded as unemployed were immediately available for work, the gross value of their output in a year would only be about £11½ millions, as compared with a prospective demand of £45 millions. Similarly, the estimated increase in expenditure on arms and machines of all kinds is £24,200,000, while the potential gross output of all the unemployed recorded in the general and electrical branches of the engineering industry (i.e. omitting marine and constructional engineering) is only between £25 and £30 millions. These two are probably the largest instances in which the inevitability of "bottlenecks" can be statistically demonstrated. But such bottlenecks, large and small, will soon arise throughout manufacturing industry.

It is apparent from these data that a shortage of labour in a wide range of industries is very much nearer than appears at first glance. There is, however, another factor to be considered. "Full employment" may be reached even before all the available labour is absorbed, because of a shortage of fixed plant. There are undoubtedly shortages of some special varieties of equipment. Thus the problem of machine-tool supply has not been entirely

solved. But, in general, there is a considerably greater elasticity in plant than in labour, when industry is faced with a sudden access of demand, which is pressed regardless of cost. This is due to the fact that the great majority of industries work only a single shift in the day. If the labour is available, and overtime rates can be afforded, additional hours can always be worked. The two outstanding exceptions to this generalisation are, of course, coal and steel. There is no reason to anticipate a shortage of coal. The 1938 production of 228 million tons was 60 million tons below the record year of 1913, and though it might be impossible (and would at least take time) completely to regain this figure, there is obviously a wide margin of unused capacity. The theoretical capacity of the British steel industry is about 14½ million tons per annum, and the maximum that could actually be produced would be about 14 million tons. Working on Saturday afternoons and Sundays would add something to this total. Production in March was already at the rate of 13 million tons per annum, though most of it was for civil purposes. The highest annual production in the last war was 9,720,000 tons in 1917. There is a possibility of shortage here.

In general, however, the limits to production are set, in the short period, by the supply of labour and not by the

volume of fixed plant. And the limits are nearer than is generally recognised. The main conclusions that follow are twofold—direct and indirect. In the direct sphere it is urgently necessary to devise and put into force far-reaching and effective measures both for ensuring priority for Government orders and for organising an increase in the most vital varieties of labour. Of the two, priorities are more urgent than the dilution of labour. For there is no sense at all in engineering an artificial expansion of capacity, which can only lead to massive unemployment later, if there is any way of setting existing capacity free for war work. Indirectly, the imminence of "full employment" brings very much closer the point at which a re-casting of financial policies becomes essential if we are to avoid inflation. When the 350 million borrowing programme was first announced, there seemed to be some ground for hoping that "full employment" could be postponed until about next spring; this view was then expressed, with some reservations, in *The Economist*. The fuller analysis presented in this article compels a reconsideration of that opinion. Full employment, with the changes in financial and economic policy that it demands, will be upon us long before next spring. There is no time to be lost in preparing the new economic policy.

Price Cutting

(By a Correspondent)

WHEN, in 1937, the House of Lords, in the case of *Thorne v. Motor Trade Association*, decided that it should not be regarded as illegal if trade associations put names of members or others who broke certain rules upon a "stop list," or if they imposed fines for breaking rules relating to the maintaining of price lists, many trade associations must have been much relieved. Here was some assurance for them that there was little to fear from the traditional view that such arrangements might be regarded as being "in restraint of trade." Actually it was not the intention of the House of Lords to express in their decision any judgment about the desirability in the national interest of agreements to maintain prices. Nor can the Manchester magistrate's dictum that

If only the public would realise that in buying at these cut-price shops they are lending their help to criminal activities, they would think more carefully about where they buy.

be regarded as giving any authoritative sanction to the notion that price-cutting is immoral or inexpedient.

In fact, it seems that some people look upon statements of this kind as evidence that the selling of goods below recognised list prices should be condemned out of hand as a generally pernicious practice. Newspapers print articles about what they call the "cut-price racket"; and the tradesman who sells at cut prices is held up as an insidious danger to the "honest local tradesman" as well as to the customer who buys his goods.

The truth is, and it is sad to relate, that competition is losing its good old reputation. To administer the *coup de grace* the very name "competition" is given up, and the term "price-cutting," with its aroma of shady dealing, is used instead. This sort of indirect criticism is disingenuous and unfair in a world which has still much to gain from the processes of normal competitive trading and much to lose from their widespread suspension. It is, of course, undeniable that a good deal can be argued in justice against price-cutting of certain kinds. Goods acquired by fraud may be hastily sold at cut prices, and other forms of illegitimate trading may be bolstered in this way. But these are largely matters for the police, and can scarcely be said to dominate the general picture of cut-price selling.

Not least among the reasons for the outcry against price-cutting is the desire of certain trade associations to exercise complete control over trading in the goods in which they are interested. In groceries, in confectionery and in chemists' supplies there are powerful organisations which wage a ceaseless war against independent individuals who flout their price decisions. They track down the source of the price-cutter's supplies and seek to stop them. This is not very far from the oligarchical guild-regulations of the Middle Ages, and although in very many cases there is justification, it is hardly possible to argue convincingly that to-day as, supposedly, in those past centuries, the sole object of these restrictive regulations against "outsiders" is to protect the consumer against dishonest traders.

To come to the point: is the apparatus of inspection set up by trade associations really meant merely and invariably to detect illegal practices and frauds? It is very doubtful whether the case is so simple. One principal object of these devices is certainly to create the machinery for holding up prices against the consumer by enforcing an agreed price list, and it is done by means of a paraphernalia

THE WORLD OVERSEAS

This week the section of *The Economist* that is devoted to contributions by Our Correspondents in countries overseas and by other experts on the spot includes articles on:—

	PAGE
Bulgaria and the Balkans	303
The Causes of American Depression	303
French Financial Policy	304
Savings in Germany	305
The Outlook for Portugal	305
Canada's Wheat Problem	307

of boycotting clauses, fines and black lists. The crux of the matter is that these regulations often have little regard for the actual reasons, economic or otherwise, why the particular goods are being sold at cut prices.

For example, cigarettes used to be the main department of the price-cutter's activities. At the peak of this so-called "unfair competition," there were nearly 5,000 shops selling cigarettes at below list prices. The big tobacco firms spent thousands to track down the culprits and to stop their supplies. Even the most vehement critics of cut prices can hardly claim that it was entirely fraudulent trading that stimulated and made possible this flourishing business. Indeed, underhand practices were probably quite the least important cause of it. The plain fact is that there are apparently some retailers who are willing to be satisfied with a smaller margin of profit than usual in order to have a bigger turnover. And in itself this would seem to be a mark of healthy trading.

But this does not exhaust the matter. The consumer should not be left out of the argument. Why should he not benefit if some retailers think it feasible to content themselves with reduced margins of profit? Only if the fixed prices arranged by trade associations were demonstrably "just" prices, by some absolute standard, would it be reasonable to refuse the consumer this relief in every case. At first glance it seems rather odd that manufacturers' associations should be so keenly concerned that retailers should not sell below the marked price. It would appear that, if members of an association sell an article for 6d. to the retailer, they should not be interested whether he in turn charges 10d. or only 8d. for it. The reason is really not far to seek. Not all traders are in a position to renounce part of the profit margin offered by the list prices. Some are more efficient than others; and it is to protect the relatively inefficient firms among customers (including some quite large ones) that associations try to prevent under-selling by the more enterprising ones.

Competition, as Adam Smith pictured it, has gone when quasi-monopolistic associations of manufacturers control retail trade in this way. Recently Mr Henry Smith, in a remarkable book on "Retail Distribution," put it like this: the manufacturer would not consent to a policy which would lessen the total demand for his products in order to provide a monopoly profit for established retailers, unless

he were able to augment his earnings by a share in the monopoly profits which *via fixed retail prices*—the price for this co-operation—he can sometimes do. This is to the point. It is well known that the monopolist's aim is not to maximise sales or cheapness, but to maximise profits through the instrumentality of fixed prices. More often than not his interest involves restriction of the trade that competition might bring.

So the public is warned against the price-cutter. We are told that cut prices are only a bait. They lure us into the shop, and then clever salesmanship will persuade us to make other purchases. But is this practice really more reprehensible than other more obvious and better-known baits, such as subtle window-dressing during sales and all sorts of tendentious advertising? We are surrounded by baits, but the trade associations accept the vast majority of them as legitimate aids to business.

The fact is that there is price-cutting and price-cutting. "Cheap sales" can have all sorts of different explanations. A recent American Court decision summed up the position in this way:—

If all profitless sales of goods were always, or even usually, made by merchants for the purpose of injuring their competitors, so that it could be said that such sales had, in and of themselves, a sinister significance, we would not hesitate to say that the legislature was within its rights [in opposing them], but, in fact, as the Court pointed out, there may be quite other reasons, and it is unjust invariably to accuse the retailer who "cuts" a price of improper practices. It would be absurd and wrong to say that the competition of outsiders against combinations should always be upheld as justifiable. It may very well happen that a combination or association has been successful in carrying through the necessary reorganisation of a trade or industry, and that some stabilisation of prices, which may be essential, may be unduly weakened by the piratical activities of small producers. To protect the pirates by law would then mean "compulsory competition," which might be as bad as compulsory combination. But conditions like these do not appear to be present in the case of retail trade and its associations, and it must remain doubtful whether the power to boycott and coerce retailers who think they can economically serve the public at lower than list prices can be commonly considered sound social policy.

NOTES OF THE WEEK

Russia and the Axis.—The obvious embarrassments of transforming a policy of appeasement into a policy of collective security have given rise to a further crop of difficulties this week. Serious negotiations with Russia started some two weeks ago with the Russian offer of a three-Power military alliance with France and Great Britain in return for mutual obligations to defend the respective neighbours of all three countries in Eastern and Western Europe. This offer was not accepted by the Western Powers, on the score that the small Powers of Eastern Europe would prefer a less binding agreement. While the three Governments concerned were trying to find an alternative basis of agreement, news came from Russia of the resignation, or dismissal, of M. Litvinov, Soviet Commissar for Foreign Affairs. The exact portent of this completely unexpected move on the part of the Russian dictator is not yet known. Stalin has for some time been taking a more and more active part in the conduct of Russia's foreign relations, whereas M. Litvinov's successor, M. Molotov, has not hitherto been associated with issues of this nature. The immediate reaction in Warsaw is favourable, and Russia is thought to be returning to a traditional and imperial foreign policy. On the other hand,

the Nazis are also pleased, evidently in the hope that, even if Russo-German co-operation is out of the question during the joint lives of Hitler and Stalin, Russian isolation is not excluded, and that the delay of the Western Powers in reaching agreement will have well served the purposes of Germany. The absence from Russia of M. Potemkin, Vice-Commissar for Foreign Relations, does not exclude him from ultimate succession to M. Litvinov, and the progress and range of his conversations in the Balkans will be a sign of the policy which the Soviet Union intends to adopt. The mere appearance of a Russian emissary in Sofia has encouraged pan-Slav opinion in Yugoslavia and Bulgaria, and the relations between the Russians and the Turks are well known to be cordial, while with Great Britain the Turks have already reached agreement in principle. The conclusion of an effective Black Sea pact which is said to be in view would necessitate the inclusion of Roumania. The Roumanian Government may be less hostile to co-operation with Russia than is commonly believed in London. The Roumanians, nevertheless, maintain, as do the Poles, that they are not lacking in soldiers but only in equipment, especially in aircraft, and would therefore prefer Russian co-operation in material and air power

rather than in troops. In this matter, however, both the Poles and the Roumanians would follow a British lead.

* * *

Poland Stands Firm.—The country most directly menaced in the Hitler speech was Poland, at one time Nazi Germany's only friend. Herr Hitler revealed that Poland had refused a demand for the incorporation of the Free City of Danzig in the Reich and for an extra-territorial "Corridor across the Corridor" in return for a 25-year guarantee of Poland's frontiers (though knowledge of this *quid pro quo* is denied in Warsaw). This offer, said the Fuehrer, was made once only, and as an earnest of the perils of refusal he denounced the non-aggression treaty. Colonel Beck's reply is to be made on Friday of this week, and whatever may be its tone, it will be firm in substance. The Poles are willing to discuss a new arrangement to take the place of the League High Commissioner, but they will not cede any of their rights. Indeed, the Poles seem to be firmer than the Axis, for there are evident hesitations in Rome about the prospect of being engaged in war for Danzig, and Herr von Ribbentrop's visit to Lake Como may well have the object of allaying these fears. The official attitude of the British Government is that Poland's attitude is Poland's affair; and this is the only attitude consistent with the maintenance of the new understanding between London and Warsaw which is the vital link in the Peace Front.

* * *

The Northern Neutrals.—The German Government, selecting a leaf from President Roosevelt's book, has proposed to the four Scandinavian countries and the three Baltic States the conclusion of mutual non-aggression pacts. Latvia is reported to have accepted, and her two neighbours may follow suit. But the Scandinavian countries are more likely to refuse, holding that even pacts such as these would infringe their neutrality. At first sight this attitude might seem to be excessively purist. But "non-aggression," on Nazi lips, can have peculiar meanings. As Poland has discovered, the existence of a non-aggression treaty does not prevent the putting of demands, or the abrogation of the treaty when they are refused. And, of course, it would be "aggressive" to accept a guarantee of independence from Great Britain. The Nazi aim, in fact, is clear. It is to build a political vacuum round Poland to the North, which will prevent any friends helping her, but which Germany's own peculiar notions of international law will enable her to break and enter at any time. The same tactic is apparently to be attempted to the South, for it is reported that similar proposals are to be made to Roumania (guaranteed though she is), Yugoslavia and Bulgaria. Hungary is reserved for a different role, for she is, it would appear, to be tempted by the bait of Slovakia into an offensive alliance against Poland.

* * *

Budget Roundabout.—The Commons' Budget debates this week and last have been concerned with two Budgets, this year's and the next. The Chancellor's proposals for 1939-40 have been assailed only in detail: no serious indictment against the increased tobacco duties has been proved, beyond their mechanical inconvenience, and only in the case of the new film duties (discussed in an Industry Note on page 331) have what appear to be genuine and justifiable grievances been revealed. It is the long-term problem of emergency finance that has engaged attention, and its discussion by members gained in importance because Sir John Simon, in his Budget speech, had signally failed to give any lead at all in this matter. Broadly, emphasis was given to two aspects of the Budgets to come: on the one hand, there was a widespread call for the conscription of wealth which, except in so far as this can rightly be regarded as a just and essential counterpoise to the conscription of man-power, is no more than a call for extraordinary means of increasing revenue; and, on the other, fiscal machinery to mobilise all the nation's economic resources to the single task of national defence was

demanded. For the first cause, the Labour Party propounded a scheme for a recurrent annual levy on property which, fixed at one per cent. on estates of £50,000 and over, would, it was claimed, bring in £80 millions. This was to serve as a partial substitute for defence borrowing. Sir John Simon rejected the plan on the ground that it would discourage saving. Both sides discussed the proposal in an atmosphere strangely removed from the real problems facing us. The problem of the near future will be to limit and control spending, not to penalise accumulated capital. But, on the other hand, it is obvious that most taxes that have to be paid out of income reduce the capacity to save.

* * *

Actually, the two aspects of the forthcoming financial difficulties which the Commons have been discussing are really one. The prime means of raising revenue is the orthodox one of taxation; the way to direct the disposition of the country's resources according to national need is largely taxation, too. The issue which the Chancellor of the Exchequer has not yet faced is that men, money and machines, capital and labour, industry and trade must now, or very soon, be deliberately diverted on a large scale from their normal uses and be placed at the Government's disposal. This means, for instance, that sharp increases in taxation will be needed to curtail non-military expenditure. It means that the purchase of luxuries and non-essentials, at home or from abroad, will have to be restricted by sumptuary taxation and duties. It means, in brief, the clear-sighted adoption of devices that run counter to the tenets of sound economic policy in peace time; penal taxes, restrictive duties, the control of capital movements, the mobilisation of labour and organised priority for the State over all essential supplies. The core of this programme is financial policy, and it would be comforting to be able to believe that Sir John Simon had his war-time tax plans ready.

* * *

The Need for Economy.—It is a matter for congratulation that it should be possible for the people of this country to bear the burden of defence expenditure to the tune of at least £630 millions in a single year and, at the same time, to effect slight increases in the cost of social services. Nevertheless, to spend the gigantic sum of £1,323 millions from the proceeds of loans and taxes in a twelve-month, with all the difficulties of supply and delivery that will be attendant and with the prospect of supplementary defence expenditure never far distant, is to incur a heavy responsibility; and the Government would do well to give the closest examination to various proposals which are currently being made, not to curtail the social services, for that would be to acknowledge defeat, but to ensure closer control of the day-to-day expenditure of departments to eliminate waste. Precedent for this is not lacking. Sir Percy

Harris reminded the Ways and Means Committee of the Commons on Monday that twenty-two years ago, in the thick of wartime spending, a Select Committee was set up under the chairmanship of the then Sir Herbert Samuel to examine current expenditure and report upon possible economies consistent with the execution of the Government's policy. The Select Committee worked through sub-committees attached to the War Office, the Admiralty and the Civil Departments, respectively; it sat for two days a week all the year round; and it effected valuable savings in public spending without any diminution in public efficiency. Its like might well be seen again now. Parliament's control over the details of actual departmental expenditure is notoriously absent, being confined to the work of the Commons' Standing Committee of Public Accounts which belatedly considers the reports of the Comptroller and Auditor-General on closed departmental accounts. An Economy Committee of this kind is not needed simply because of the magnitude of our emergency expenditure. It would fill a clear gap in normal Parliamentary procedure.

* * *

Barter Approved.—On Thursday evening the Prime Minister announced that the Government had decided to accept the United States' proposal for negotiations to exchange American surplus supplies of wheat and cotton against rubber and tin, on a barter basis. Any agreement that can be effected between this country and the United States is *ipso facto* to be welcomed. Nevertheless, as was pointed out in these columns last week and admitted by Mr Chamberlain himself in the course of his announcement, there are serious objections to the use of barter transactions in world trade. It is the Government's hope that this particular bargain can be carried through without deleterious effects upon normal commerce, but its execution without appreciably influencing world markets and prices is bound to be difficult and complicated. And there are other countries than the United States that have wheat and cotton for disposal.

* * *

Assisting the Balkans.—None of this week's discussions in Parliament has had a clearer practical relevance to the balance of power in Europe than Monday's debate in the Lords on export credits. It is beyond doubt that Germany, by right of geography and normal economic evolution, has a natural claim to pre-eminence in the trade of South-Eastern Europe, and recognition of this fact is hampering to Britain's trade policy, which seeks at all costs to be fair. But it is equally true that German trading methods with their political implications scarcely invite the utmost consideration from peaceful powers; and, most realistically of all, it is unfortunately true that,

unless we are prepared to supplement the political guarantees against aggression we have begun to give in Eastern Europe with economic aid against penetration, those guarantees will lose much of their worth as contributions to the common front to safeguard peace.

* * *

Meanwhile, the first steps in a policy of collective economic defence are being taken by Sir Frederick Leith-Ross's mission in Bucharest. According to reports which have the appearance of accuracy, a British credit of £5 millions at 6 per cent. was offered. This was regarded by the Roumanians as very modest, even as a first instalment, and it certainly compares very unfavourably with the £16 millions of credits to Turkey at a lower rate of interest. Roumania is a larger country than Turkey and does a considerably bigger trade with Great Britain. A further credit of £2 millions to Greece is reported, though specifically as a first instalment, and Sir Frederick Leith-Ross is to go on to Athens from Bucharest. It would be the most short-sighted of policies to go a little way along the road of granting assistance and to refuse to go far enough to produce any effect. It is to be hoped that the danger of half measures is fully realised in Whitehall. It should be obvious, too, that credits are only an interim solution. The only permanently effective assistance that can be given to Roumania, Greece and Turkey alike is in the form of greatly increased purchases of their goods. Negotiations to this end are more difficult than the granting of credits and are reported to be moving slowly in Bucharest. But they must succeed if we are to achieve any reduction in these countries' present dangerous degree of dependence upon Berlin.

* * *

Serbs and Croats.—The failure of Prince Paul, Regent of Yugoslavia, to endorse the Serb-Croat agreement, the general lines of which were apparently accepted by the Prime Minister, M. Tsvetkovitch and M. Matchek, the Croat leader, on April 27th, has this week added serious internal tension to the already critical international position of Yugoslavia. Silence is maintained in Belgrade about the real causes of the breakdown—if, indeed, it can be described as a final breakdown—and M. Matchek himself ascribes it, rather generally, to the Regency being "influenced considerably by people opposed to any understanding with the Croats." It is believed that the Regent and the generals are disturbed by the proposals to "federalise" the Army. It is well known that Prince Paul has always been unwilling to make radical alterations in the Yugoslav constitution during his Regency; and that, in foreign affairs, he has, during the last few years, entrusted the conduct of policy to M. Stoyadinovitch, whose main purpose was to court favour in Berlin and Rome, and disentangle Yugoslavia from too close association with the status quo Powers in Central and Western Europe. The fact that these Powers now advocate understanding with the Soviet Union is not likely in any way to influence Prince Paul favourably. On the other hand, he has to deal with a Yugoslav public opinion which is very strongly pro-French and pro-British, and which harbours more than a memory of Serb Pan-Slavism. From the direction of official foreign visits, which are to be continued next week by Prince Paul himself in Rome, it would appear that Yugoslavia still hopes to maintain her precarious balance between the two Axis Powers. It is widely believed in Yugoslavia that the Axis does not function in the Balkan area and that profit can be derived from the divergence of interest between Rome and Berlin. On the other hand, it may rightly be doubted whether Italian objections in this, as in other matters, are of great concern to Germany. What is certain is that the breakdown of official negotiations between M. Matchek and M. Tsvetkovitch opens the way for German intrigues among the more radical members of the Croat national groups, as well as once more encouraging the pro-Germans in Belgrade. The risks to Yugoslav unity of seeking a Serb-Croat reconciliation are likely to be less than those of continuing in disunion when there are such ambitious neighbours just outside the gate.

The Latest Palestine Plan.—The situation in the Near East, in which the unrest in Palestine is so serious an element, may prove to have taken a decisive turn this week with the adoption of proposals by the Palestinian Arabs and representatives of the Arab States who have been meeting in Cairo. These proposals, as was to have been expected, guarantee the permanent superiority of the Arab over the Jewish element. They do not, however, insist, as the Palestinian Arabs insisted in London, that Jewish immigration should now cease. They propose that immigration should be limited to a total of 75,000 to be spread over the next five years, and that, if the Jewish element at any time exceeds one-third of the Arab element, immigration should immediately cease. Having thus guaranteed their numerical superiority, the Arabs demand that a new Government should be formed with Palestinian (i.e. Arab) heads of all departments assisted by British advisers, and that, in three years' time, a Constituent Assembly should meet and draw up a new Constitution. The resistance of the Mufti still has to be overcome, but it is said that the Arab States will withdraw their support if he continues to resist. On the other hand, they also convey that their co-operation with the Palestinians in finding a solution will be withdrawn if the British reject the proposals. It is hinted that the increasingly serious European situation may induce the British Government to accept this solution, in spite of its unfairness to the Jews, in order to secure the freeing of British troops in Palestine for the defence of Egypt and other threatened parts of the Near East. On the other hand, the Italian conquest of Albania has hardly encouraged pro-Axis feelings among Moslem communities in the Near East, though no doubt the relevant jokes from Hitler's speeches find adequate repetition and an appreciative audience for the German Arabic broadcasts. There are unconfirmed reports of renewed Italian assurances to Egypt, and Marshal Balbo is to visit Cairo, though there is no reason to believe that his visit is not, as announced, a private one.

* * *

Mr Gandhi's Tactical Victory.—The triumph of Mr Subhas Bose, recently elected president of the Indian National Congress in preference to the official candidate, has proved but a bubble. The majority of the old Working Committee having resigned, Mr Bose found himself unable, without Mr Gandhi's support, to form a new committee which would reflect his own Left Wing views. He thereupon himself resigned, and in his place Mr Rajendra Prasad has been elected Congress President. Mr Prasad is a moderate who has the full support of Mr Gandhi. The incident is a personal triumph for the Mahatma, since it was manifestly in order to retain his leadership that the Congress in effect reversed its previous vote. This is certainly not to be taken as a sign of remorse at the revolt of the rank and file against the other old leaders. There have been many signs of dissatisfaction with their oligarchic rule. For the moment the resentment against a clique is mingled, in the minds of many Congressmen, with hostility towards the moderate policies with which the clique has been identified, but it is hard to say how far either the earlier triumph of Mr Bose or his present chagrin bespeaks the majority view of the Congress on constitutional or economic issues. Pandit Jawaharlal Nehru, a member of the Left Wing but a follower of Mr Gandhi, resigned from the Working Committee when Mr Bose came in, but has refused to return with Mr Prasad. Never was Mr Gandhi more the personal dictator of Indian nationalist politics than he is to-day.

* * *

Difficulties in Newfoundland.—The latest annual report of the Newfoundland Commission of Government is more depressing than the last. The year 1937 was one of relative prosperity in this "special area" of the Empire, but in 1938 the recession in the United States combined

with special factors affecting the cod market to limit Newfoundland's income and depress the whole of its economic life. The Commissioners point out that the Island's exports amount to about £24 per head of the population, a very high figure for a poor community, and that the life and welfare of the people are therefore dependent on conditions outside their own control. In 1937-38 the improved economic conditions were reflected in the emergence of a budgetary deficit of only \$1,318,000, which was met by the British Treasury, whereas the estimates for 1938-39 showed a deficit of \$3,949,000. There is no visible prospect of a return to solvency. What is still more serious, there is no visible prospect of the establishment of the Island's commercial and industrial life on a permanently sound basis. Many new schemes of development are being pressed forward by the Commission, which has done its best in face of adversity to work upon a long-term programme, but these are still in the nature of public works and in some cases disguised relief. Meanwhile the continuance of Commission government, held necessary while Newfoundland is still subsidised by the British taxpayer, gives rise to growing dissatisfaction among a people long accustomed to self-government and nursed in the British democratic tradition.

Australia and the Pacific.—It is already clear that, however short or long Mr Menzies' tenure of office, he will leave his mark upon the external as well as the internal affairs of Australia. He has announced that diplomatic representatives of Australia will soon be appointed to Washington and Tokio, with the aim of maintaining closer contact with her neighbours and obtaining direct sources of information about the region of the world with which she is most intimately concerned. Australia has never hitherto followed the example of Canada and South Africa in appointing Ministers to foreign capitals, though not long ago she began to move along the same path by appointing in Washington a liaison officer to work with the British Embassy, much as the Australian liaison officer in London works with the Foreign Office. The long-term significance of the latest move will not be missed, more especially in the light of Australia's defence programme, which is also conceived on a regional basis. The Dominions have long regarded Europe as a sphere of vital interest for themselves only in so far as Great Britain is inextricably bound up with the fate of that Continent and they with hers. But this tendency towards isolationism from Europe has been accompanied by a growing realisation of their diplomatic and defensive responsibilities in their own regions. The result has been that the power and prestige of the British Commonwealth of Nations in the world as a whole have not diminished, but greatly increased.

Japan's Hesitations.—A serious political conflict in Tokio between the partisans of an Axis and a neutral policy accompanies an intensification of the military struggle in China itself. The exponents of the policy of co-operation with the Axis, though forced to press for a favourable decision before the initiative in European affairs passes more decisively to the so-called Democratic Powers, are handicapped by the military reversals of the Japanese forces in China. Though it is considered doubtful whether the Chinese advances can be maintained, not only military and aerial reinforcements have had to be brought up, but the Japanese Navy is also said to be standing off the South Chinese coast, and ports south of Shanghai have suffered seriously from aerial bombardment. The main Japanese action seems to be in the Chekiang province and serious fighting is taking place around the town of Nanchang. The Chinese troops have been forced to retire and the frequent reiteration by General Chiang Kai-Shek that the Chinese offensive has not yet begun would seem intended to prepare opinion for the inevitable reversal of the present Chinese advance—though reversal does not by any means signify that it has failed to serve its purpose. Meanwhile, in Shanghai, and in Japanese-controlled territory, anti-British agitation continues and "demands" have been forwarded to the British Ambassador by the puppet mayor of the Greater Shanghai City Government, Mr Fu Siao-en. In Tokio, however, it appears that the contrary policy is gaining ground and that the Navy, the industrialists and the civilians in the Japanese Cabinet are pressing strongly for a policy "in line with the democracies." Exactly what this means in relation to the obligations of the Anti-Comintern Pact it is hard to say, but that the policy of close collaboration with Germany and Italy advocated by the Army and by General Koiso, Overseas Minister, finds considerable disfavour in influential Japanese quarters it is impossible to deny.

Civil Defence.—Every week the progress made by the Government in planning protection against air raids becomes more evident. But every week, too, the enormous amount that has still to be done in practice to make these plans effective is equally apparent. The fact is, as the latest admirable bulletin of the Air Raid Defence League* shows, that the gaps which remain threaten to diminish dangerously the usefulness of the good work done. If only because "there is virtually no protection at all" in districts where "Anderson shelters" are unsuitable, evacuation on a much greater scale than at present contemplated will have to be organised in the case of target areas. To budget for some 200,000 casualties in the first twenty-four hours of war, as the Ministry of Health's hospital plans do, is, indirectly, to recognise the need for this. Clear directions about the transfer of all but businesses which can only operate in their present places are imperative; and all the problems of transport and food supply involved in the redistribution of population will be correspondingly enlarged and made more urgent. But the main problem is still to provide for the maintenance of essential activities in vulnerable places. For this, street shelters, shelters for flat dwellers, strong protection for vital services and indispensable workers and the actual erection of Anderson shelters, all at present lacking, are wanted at once. The policy of providing A.R.P. services equally in all places is wasteful and wrong. The time has come to concentrate on congested target areas, to arrange the evacuation of all the people and activities not absolutely needed there, and to make it possible for those left behind to carry on with their jobs in reasonable safety.

Reserved Occupations.—The original schedule of reserved occupations, which was put out in January, was designed to list the trades in which all or part of the workers could not be dispensed with for whole-time service in the event of war. The persons affected by the

* An Outline of Civil Defence. Air Raid Defence League, 20 Great College Street, S.W.1. 6d.

schedule were accordingly debarred from enrolling for services which, though part-time in peace, would be full-time in war, with the result that half the man-power of the nation was debarred from military service, unless the men chose to abandon their trades and enlist in the Regular Army or in the other professional fighting services. The utmost the reserved men could do was to train for defence work that would be part-time in war as well as in peace. The net effect of so comprehensive a schedule was seriously to hamper Territorial recruitment and the call for a drastic modification of the list was already loud when the decision to double the Territorial Army, together with the earmarking of young men aged between 20 and 21 for militia service, made immediate action essential. Sir John Anderson has announced that another 1,500,000 men aged between 25 and 50, or nearly a quarter of the potential man-power compulsorily reserved, will be free, so long as peace lasts, to enlist in part-time defence services that may be full-time if war comes. The trades removed from the list include textiles, clothing, boots and shoes, printing, pottery, journalism, civil and local government service and retail distribution; an additional 630,000 men aged 25-38 will be available if they wish for the Territorial Field Force; and over 870,000 can join the Territorial Home Defence Forces or take on important civil defence duties. This arrangement is merely for the duration of peace; freedom to enlist from these trades (which are still apparently to be reckoned as indispensable in war) will cease, except in retail distribution, on the outbreak of war, though the men who join up between now and then for duties that will be whole-time in war will still be taken away. The change is a step forward, but it is still doubtful whether all the occupations listed as essential are in fact essential, and there is room for further revision of the 3,500,000 men between 18 and 50 who remain on the list.

National Nutrition.—Last week-end, scarcely noticed in the conventional hubbub that surrounded the delivery of yet another Hitler speech, the British Medical Association performed a public service by bringing together doctors, farmers, economists, politicians and business men, all experts in their own lines, to confer on the essentials of a national food policy. The need for such a policy, in which the requirements of health, agriculture and industry would be considered in mutual relation, was easily proved by reference to sadly familiar facts: between one-third and a half of the children in this country lack an adequate diet; to reach an all-round standard of good nutrition our consumption of milk would need to rise by 80 per cent., of butter by 40 per cent., of eggs by 55 per cent., of fruit by 120 per cent., and of vegetables by 85 per cent.; and even if the B.M.A.'s own dietary, prepared to cover only the barest minimum nutritional needs, were made general, with no one consuming more, we would, out of our present consumption, have too little flour, cereals, cheese, vegetables and milk. The causes of this state of affairs were also agreed: as Lord Astor put it, it is partly ignorance, but mainly poverty. The wage system takes no account of family needs, and the connection between malnutrition and the size of families has been statistically established. Family allowances were called for, cheaper methods of distribution and a more positive reorientation of our agricultural policy (which took shape before knowledge about nutrition revealed the prime importance of protective foods, such as eggs, cheese, milk, fruit and vegetables). Two points were made quite clear: first, that cheaper foodstuffs must be made consonant with the imagination, by no means to increase fertility and output; could home production be made to meet national needs. The latter was Sir Arthur Salter's argument, too, for food storage against the risk of war: rationing plans are not enough; there must be some guarantee that there will be food supplies to ration. An appreciable increase in home production is essential, but imports remain of key importance in the food problem, and cheapness and ease in their purchase are paramount for war safety as well as for peacetime health and nutrition.

THE WORLD OVERSEAS

Bulgaria and the Balkans

(By a Correspondent in Sofia)

BALKAN politics are conducted on a system which blends unflinching optimism with the cunning of those who have grasped the art of bargaining. The politics of Bulgaria are no exception to this general rule. Ever since 1934, King Boris and his councillors have faced the bleakness of the Balkan Entente with a public hope that satisfaction will some time be given to Bulgaria's territorial claims, and sooner rather than late—a hope seasoned by a private afterthought that, with the pressure put upon the Balkans by Germany's rearmament and dynamic foreign policy, the rendering of that satisfaction will become a necessity.

Germany's growing strength, shown most strikingly in the fall of Austria, convinced the Balkan Entente at that time that a measure of appeasement must be added to their policy. There was a precedent for this in the renewal in 1936 of good relations between Bulgaria and Yugoslavia, and in 1937-38 between Bulgaria and Turkey. The Salonika Agreement of July, 1938, which revoked the military clauses of the Treaty of Neuilly, and gave legal standing to the skeleton rearmament which Bulgaria had already managed to secure, was intended as a first step in a policy of appeasement, which eventually would bring Bulgaria into a new Balkan Entente designed, this time, to tamp Balkan frontiers against Axis penetration. The prophets at this winter's Entente conference were freely giving out Bulgaria's early adherence.

That adherence is now a virtual impossibility; and it is more to point out the mistakes of the past than to recommend their correction now that it is worth while to recite the present needs of the Bulgarian Government. The claims on Yugoslav Macedonia are no longer considered "actual." (Mihailoff, the leader of IMRO, the Macedonian revolutionary movement, is at present in Rome; the chances of an independent Macedonia are part and parcel of common discussion; and there is a general tendency in Sofia to wonder "why we ever bothered about such a useless piece of land.") Claims for the revision of frontiers are narrowed down to a claim on Roumania for the southern part of the Dobrudja, and a claim on Greece for a corridor to the Aegean through Western Thrace. Economic necessity is pleaded for both claims; for Dobrudja because it is the natural wheat-growing hinterland of the port of Varna, now in economic ruin; for the Thracian corridor because, under the existing dispensation, Bulgarian seaborne trade can reach the Mediterranean only with Turkey's tacit consent.

The second aspect of Bulgaria's isolation in the Balkans is her economic dependence on Germany. With about 80 per cent. of her foreign trade in the hands of the Reich, Bulgaria is hard pressed to find free exchange for her simplest purchases elsewhere. At the moment, the authorities in Sofia are unable to pay Roumania for the modest oil imports of 1938; and although this particular sum will probably be found, the position is going from bad to worse. With each tightening of the screw the Bulgarian Government is led to wonder more and more whether those Bulgarians were not right who, after the Munich Agreement had proclaimed the peaceful revision of frontiers, turned away from their approval of Britain with the bitter reflection that "nothing is ever done for Bulgaria."

Seeking Neutrality

The Bulgarian Government's foreign policy is nevertheless still one of complete neutrality. The weight of public opinion behind that policy is still so great that it is unwise, as well as unjust, not to consider what may yet be done to establish that Balkan unity, in fact if not in form, which alone might keep the Balkans out of a European war. The necessary premise to that consideration is the certain fact that no Bulgarian Government will surrender the substance of its territorial claims for the shadow of Balkan unity—unless forced by circumstances which do not now exist, though they may not be far off. They hoped, naturally enough, that Lord Halifax would drop a hint to M. Gafencu on the subject of the Southern Dobrudja; and, also quite

naturally, they took no account of the difficulties in the way of such a step. The official Roumanian attitude is curiously negative: in private, the advantages of good relations with Bulgaria are fully seen, but the Roumanian Government is frightened to give a precedent, in the shape of territorial concessions, to Hungary, whose irredentist claims on Roumania are considerable. Anglo-French pressure on Roumania to hand over the Southern Dobrudja to Bulgaria would, if it succeeded, probably make it possible for King Boris to join a Balkan bloc: the only trouble then would be that, with Roumania's intense indignation, there might no longer be a bloc to join. Nor is there yet a sign that such pressure is in the offing.

Now that Sir Frederick Leith-Ross is not going to Sofia, it is academic to discuss the economic side of help for Bulgaria. In brief, economic help would have to take the form of credits for the purchase of raw materials and even armaments; the buying up by Britain of large quantities of grain and soft fruits, probably at unremunerative prices; and, on a longer view, the development in Britain, or in the Empire, of a market for Bulgarian produce. For it is immensely important to remember, and to repeat again and again, that no Balkan country, and least of all Bulgaria, is going to offend Germany, without the prospect of finding an assured and remunerative market elsewhere.

In the new strategic position produced by Yugoslavia's encirclement by Germany and Italy, Bulgaria could remain neutral in time of war only with the consent of the Axis Powers. It may be that the political grounds for Britain to help Bulgaria no longer exist. If this is indeed true, then we will have taken another step towards the view that war in the near future is inevitable, because Bulgaria is, geographically and in many other ways, a vital piece in the pattern of any Peace Front against aggression. But if we do cut our losses (as, shortsightedly, the surrender of Bulgaria might appear), we will have given over to the enemy a friendly and unoffending people.

May 1st.

Seeking the Causes of U.S. Depression

[FROM OUR NEW YORK CORRESPONDENT]

THERE is a legend of a Russian Grand Duke who declared his abhorrence of war because it distracted the attention of officers from perfecting parade formations and rendered the soldiers' uniforms untidy. In the same way, an economic reporter must deplore the sequence of international crises, since they introduce what scientists call "uncontrolled" elements into the test tube of economic developments.

A year ago, the American economy was in the depths of a severe depression. The ascribed causes of this depression were, first, an abrupt curtailment of Federal expenditure combined with a contraction of credit due to a reduction in excess bank reserves and the "sterilisation" of incoming gold; and, secondly, a punitive tax on undistributed corporate profits. To produce recovery a programme of lavish deficit spending was authorised; excess reserves were multiplied by a reduction in required reserves, and by the monetisation of the previously sterilised gold; and the tax on undistributed profits was reduced to a shadow.

A smart rebound in production ensued. But, before it was resolved whether this rebound was due to the credit policy, the spending policy, or the tax policy, or to all or none of these, the recovery, having run about five months, began to hesitate, and then to dip. This vexatious behaviour was belittled during the first quarter of 1939; but, when the quarter closed without disclosing any further evidence of economic vigour and with a violent decline in the share market, and when the second quarter opened with the economy not only

failing to show the "spring upturn" but sagging drearily, three questions inevitably arose. Were the diagnoses of the last depression correct? Were the remedies adopted relevant? Or is our domestic economy dominated by events abroad?

America and Europe

It is easy to infer an intimate relation between this country and Europe. The severe collapse in the share market in March, 1938, was contemporary with the occupation of Austria; the break in September, 1938, synchronised with the Czech crisis; the break in January, 1939, coincided with the fall of Barcelona and the accompanying tension; and the bad decline of March, 1939, coincided with the crisis following the occupation of Bohemia and Memel. One could argue that the failure of production to make a recovery in early 1938 was attributable to the international tension that found its expression in the stock market collapse of March, 1938; that the recovery of the summer and early autumn of 1938 was arrested by the September crisis, reflected more seriously in the share market, which dipped and quickly recovered; and that the slow recession in production since the year end, like the March-April collapse in shares, reflected growing disappointment over the deterioration of international relations. Indeed, a very convincing gloss on the behaviour both of the share market and the production index over the past year can be written exclusively in terms of foreign affairs.

Yet, if one attempts to examine the specific points of contact between our economy and Europe, this interpretation does not hold very well. Commercially, we have enjoyed throughout the entire period a large export trade. Indeed, during the acutely depressed months of 1937-38, our exports held almost at the best level of the 1937 boomlet. Financially, the data do not indicate heavy liquidation of our securities by foreign holders over this period; on the contrary, during the past twelve months the influx of European capital appears to have been almost continuous and in very large volume, although it seems that no large part found its way into immediate security purchases. Our direct commercial and financial relations with abroad in the past twelve months would seem to have been a sustaining rather than a weakening factor. Furthermore, business men, in discussing their own views of their own problems, rarely describe the latter in terms of international troubles. Their own accounts of their difficulties are usually stated in terms of domestic business. Yet the fact remains that, for a full year, our stock market has synchronised in its movements with the course of European events; and has been a pretty fair barometer of our economic evolution. In each of its moves it has run more or less parallel to the British share market; but its fluctuations have been more violent, and apparently of greater amplitude, than those of European markets; as, too, have the fluctuations of our index of production. All of which, as Alice remarked, makes it very confusing.

The recession in production has brought steel output from about 55 per cent. of capacity to about 50 per cent. Such a decline is not unusual at this season of the year. It is discouraging because it started from a relatively depressed level, and because it had been believed that the spending programme would at least maintain that level. While the common note is rather minor, the general expectation still seems to be that the decline in the second quarter will not be severe. The principal basis of this hope is, as usual, the spending programme which is generally believed not to have exerted its full influence yet. For more than a year now, we have explained all economic phenomena in this country (except the stock market) primarily in terms of the magnitude of the Federal deficit; and it is increasingly questioned if so simple an explanation is adequate.

April 25th.

French Financial Problems

[FROM OUR PARIS CORRESPONDENT]

FISCAL receipts in March totalled 3,947 million francs. This was an increase of 988 millions over the March returns in 1938; the proceeds of direct taxes have doubled; and the magnitude of the fiscal effort that is being made is evident. Nevertheless, if the receipts are compared with the estimates the result is hardly so satisfactory. Several taxes, and notably

the turnover tax, have fallen short; and the chief cause is the international tension which has damped down business.

Meanwhile, M. Reynaud has decided to transfer 5,000 million francs in gold from the Equalisation Fund to the Bank of France in return for francs. This spectacular step reveals that the Fund had run short of francs. Some francs had been exchanged against gold (owing to the repatriation of capital), but others had been transferred to the Treasury, which had been compelled to ask for the reimbursement of its advances to the Fund. The simple truth is that the Treasury's means were no longer adequate to foot the bill for re-armament and the new security measures.

Signs of Strain

Thus there are signs of strain. The short-fall in receipts, the transfer of gold to the bank and the increase in the note circulation from 110,000 million francs to 122,000 millions in only a few weeks show that there is a gap between the needs of the Treasury and the readiness (much though this has increased) of citizens to subscribe to bonds. These circumstances explain the new decrees of M. Reynaud, notably the two masterpieces of the new batch: the tax on payments and the three-year National Defence Bonds.

The aid that has been given to the Treasury by the short-term market explains how the Minister of Finance was able to keep his promise not to borrow on the capital market for six months, although the Treasury needed 3,000 million francs monthly. After this effort, the market expected a funding operation. But foreign fears are not favourable to a long-term issue, and M. Reynaud has chosen to continue his operations in the short-term market. This market will be cleared by the issue of the National Defence Bonds, with 4 per cent. interest paid in advance for the three years of their maturity and exempt from the income tax. Afterwards the market will be ready to absorb new bonds—probably shorter term "armament bonds." The new three-year bonds are welcomed in financial circles and will certainly meet with great success.

The Sales Tax and Prices

The "resurrection" (from May 1st) of the 1 per cent. tax on sales—another old wartime acquaintance—provokes reserved comments. It will be easily collected, and its yield will be considerable. But to collect 5,000 to 10,000 million francs in this way cannot be done without some effect on prices and the cost of living. The question is how great will the rise in prices be?

The Government has actually taken some precautions against increased prices. Foods, like bread and milk, are exempted from the tax, and its incidence on agricultural products will be smaller than on manufactured goods. Moreover, its effect on foodstuffs, at least at the beginning, will be opportunistically counterbalanced by a seasonal decline in prices which is exceptionally sharp this year. The more pronounced effect on manufactures will be tempered by the fall in costs which the new increase in working hours—with no overtime rates for hours up to 45 a week—will bring about. Other factors, such as the lowering of the tax on production and on patents, and the work of the committees for the control of prices, must also be taken into account.

Export industries are still protected by the margin which remains between French and world prices, in which a similar rise may be expected, and also by the abatement of the tax in favour of the final seller. Nevertheless, the extra burden of the sales tax, paid on successive stages of production, will no doubt be considerable.

There is some contradiction between this increase in the tax burden on business and the hope expressed by M. Reynaud (and supported by an official campaign in favour of increased consumption) that increased activity in the "civil sector" of the country's economy will aid the financing of the "military sector." The latest measures may not be the last, according to M. Reynaud himself. But it is now an open question whether the French financial system could stand a third batch of decrees without losing its equilibrium. Experts say that it is impossible to tell.

However that may be, increasing fiscal and financial efforts have been accompanied by an increase in production and better activity in the investment of capital. Total issues on the capital market actually amounted to 401 million francs in March, against 378 millions in February, 390 millions in January and 96 millions in March, 1938. Re-armament still frightens some capital, but this has become the common lot of every country and every currency. Moreover—with this re-armament—the chances of success for London and Paris, that is, the chances of peace, are now increasing every day.

May 4th.

The State's Claims on German Savings

[FROM OUR BERLIN CORRESPONDENT]

HERR HITLER'S answer to President Roosevelt in his speech before the Reichstag effected no real change in the tense political situation. The suggestion that the Reich considers the present relations between Poland and Germany as unbearable and expects an early settlement of the territorial questions in particular, may be regarded as the most important part of the speech. That the solution to the problem will be of a type to satisfy the prestige requirements of the National Socialist military State, and its over-exaggerated sense of honour (that is, that it will be carried through by military force) is obvious from the way in which Herr Hitler described his recent offer for a peaceful settlement as "occurring only once."

Poland is to a great degree mobilised already, thus making it clear that she is ready to defend herself with arms, and the Third Reich will have to undertake far-reaching preparations in order to effect a *coup*. Aggression against Poland now involves the danger of widespread international conflict, and it is not yet clear just when Germany will be prepared to "settle the Polish question." The fact that the harvest has still to be taken in is an important factor. And chief interest in Germany still centres on various crucial facets of her domestic economy.

Not least among the interesting and important aspects of the German economic scene are the growth in the people's savings and their relation to the State's financial needs. Last year the trend of German savings was closely associated with the State's financing policies. Between 1932 and 1938 the national income increased from Rm. 46,000 millions to Rm. 76,000 millions, and the Reich's tax receipts from Rm. 6,600 millions to Rm. 18,200 millions (including the levy on the Jews). Expenditure on unemployment relief was about Rm. 2,000 millions less than in 1932, so that the Reich had about Rm. 12,000 millions more to spend out of current income than six years before. Actually, Rm. 11,000 millions more was spent last year than was received. It was the various savings institutions that absorbed about a third of the Rm. 8,000 millions of Reich loans which were issued in the year; and the absorption of these loans was made easier by the expansion of the savings banks' capital structure from Rm. 4,000 millions to Rm. 10,200 millions, though this increase includes sums, which, since they arose from the liquidation of certain industrial branches, cannot be regarded as real savings capital.

The organisation of Germany's savings banks has grown with the annexation of Austria and the Sudetenland. At the end of 1938 the balance of deposits in the Austrian savings banks was Rm. 1,450 millions, and in the Sudeten German banks Rm. 800 millions. The total in all the Greater German savings banks was Rm. 25,000 millions, of which some 90 per cent. consisted of savings deposits, other deposits and current accounts.

In the old Reich alone, savings deposits increased last year by Rm. 2,000 millions; and the surplus of deposits over withdrawals grew much faster than interest and other liabilities. The increase would have been even more striking if large holdings had not been withdrawn during the September crisis. On the other hand, the growth in the number of employed workers; the extension of working hours; the promotion of employees to higher wage levels; the curtailment in the construction of private dwellings due to the scarcity of materials; the ban on issuing mortgages for savings banks and insurance companies; and the food shortage; all have led to an increase in saving.

Government Restrictions

The distribution of balances also corresponded with the State's financial policy; that is, the Reich laid claim to the moneys deposited with the various savings institutions and their other credit activities were restricted accordingly. The ban on loans on mortgages, introduced in the summer of 1938, was later modified to facilitate the construction of military dwellings, agricultural workers' dwellings, new buildings and Four-Year Plan construction. The savings banks met these claims for credit with ease. In fact, definite competition developed between the various banks. And it is worth while noticing, in passing, that the so-called

"black" capital market is gaining increasing importance. This market is fed by private capital which is not deposited in banks or savings institutions or invested in Reich loans or other securities, but is used surreptitiously for the financing of building; and this naturally injures organised credit, especially since more favourable terms are granted on the black market.

The dominating influence of State claims in savings bank business is shown in the fact that the security holdings of the banks increased last year by Rm. 1,700 millions by the purchase of Reich loans, while mortgage holdings rose by only Rm. 400 millions and bank holdings by Rm. 365 millions. In the entire Reich, the savings institutions lent a total of Rm. 1,200 millions to the real estate credit business, and Rm. 1,160 millions to the working capital credit business (mainly personal credits). Following the ban on municipal credits, loans to municipalities remained within narrow bounds; and on balance municipal debts to the savings banks were reduced by Rm. 100 millions.

★ ★ ★

Tax Abatement.—The "New Finance Plan," lately introduced by Herr Funk, provided that State expenditures were to be financed, not only by the issuing of tax certificates, but also by the levy of a tax on increases in income. Originally, only increases in yearly income up to Rm. 600 were to be exempt from the new tax; 30 per cent. of all increases above Rm. 600 was to be given to the State. The new tax aroused great indignation and opposition, not only in industry, which is already heavily burdened with the increased corporation taxes, but among people who had only just begun to earn more during the last two years. In a new decree, the Government has modified the tax appreciably. In 1939 and 1940, incomes up to Rm. 6,000 will be exempt; and increases up to Rm. 1,200 (instead of Rm. 600) will not be taxed, while for every third and subsequent child this allowance is raised by Rm. 900. Finally, the rate of tax on increases is reduced from 30 per cent. to 15 per cent.

May 1st.

Portugal Looks Ahead

[FROM OUR LISBON CORRESPONDENT]

HOPEFUL expectancy is the present characteristic of most business here, though actual transactions are limited. A firm market continues to rule for all State bonds, thanks to steady demand by small investors and the abundance of money in the market for which there is small outlet. The Lisbon Bourse offers little speculative scope, the Government is not short of funds and bank deposits are slowly but steadily on the increase. This condition leads to sharp competition among banks for all sound accommodation that may be sought.

In general terms one may say that Lisbon and Oporto, the two cities which embody the financial activities of Portugal, are at present over-supplied with banking facilities; but, taking the long view, Portugal's financial machinery, public and private, is well placed now either to promote national business expansion, if circumstances become favourable, or, should a storm break, to meet the

W. A. Bog, Esq., Vice-Presidents. Jackson Dods, G. W. Spinney, Gen. Managers

LONDON COMMITTEE { The Most Honourable The Marquess of Willington, P.C.

G.C.S.I., G.C.M.G., G.C.I.E., G.B.E. (Chairman).

F. R. S. Balfour, Esq., Sir Hardman Lever, Bart., K.C.B.

Sir Frederick Williams-Taylor.

London Offices: 47 Threadneedle Street, E.C. 2 (Edward Pope, Manager)

9 Waterloo Place, Pall Mall, S.W. 1 (J. H. Pangman, Manager)

The Bank undertakes banking business in all parts of the world, and with its numerous branches offers special facilities in Canada, Newfoundland and the United States

first shock. The property market—more specifically rebuilding in and about Lisbon, which gave an outlet to surplus funds in 1937-38—shares in the general quietude. Most of the new flats are occupied; and much of the eighteenth-century property in the city proper can be let only at reduced rentals.

Spain at peace, and in temporary need of a great many things which, in a comparatively short space of time she may supply from her own resources, offers opportunities to Portugal of an exceptional if brief character. Trade in cotton and woollen textiles, foodstuffs, livestock, and even certain forms of metal work, such as spare parts and castings, is said to be under discussion; while, already, petty business has begun to benefit the numerous small villages that fringe the Spanish border. There is even talk of Spain drawing on Portugal for labour—although one may mention that this is nothing new.

Great interest attaches to the State of San Paulo's readiness to receive 50,000 Portuguese agricultural labourers. A leading Lisbon daily, the *Diário de Notícias*, welcomes the proposal, stresses the need for effective guarantees, and stipulates that repatriation, if necessary, will be assured, that immigrants will be able to send their savings home unhindered, and, a point of wider interest, that Brazil will see fit to resume payment of the interest on her foreign debts.

No official pronouncement has yet been made but these provisions are irrefutably sound. The Portuguese peasantry have largely made Brazil; and they are Portugal's most valuable asset and could become her most profitable export. With an annual increase of 80,000 in the population and ever-improving mortality returns, emigration must become part of national policy. But such valuable "invisible exports" as are provided by the home remittances of emigrants must not be allowed to become "frozen credits" through one-sided restrictions and failure to meet obligations.

The Government may be relied upon to safeguard the rights of the emigrant labourer. The policy of the present administration has been to benefit the peasant. Wages, expressed in terms of money, have risen only slowly; but, in many other directions, only faintly covered by the phrase "social services," the peasantry have gained by the insistence of the Government on real reforms. The average labourer now feels himself to be a person of value to the community. Salazar's name is never heard without some expression of esteem; *é uma benção*, "he's a blessing," is the usual phrase. The closer one dissects the work of this professor of economics who, though not wholly a follower of Adam Smith, is testing a well-defined theory by practical application to the duties of statecraft, the more readily one agrees—especially if one compares the country to-day with the Portugal of 1910-1926!

April 24th.

Trade Policy in Greece

[FROM OUR ATHENS CORRESPONDENT]

A NEW problem confronted this country when the pound was divorced from gold in 1931 and foreign lending ceased in the London market. As Greece was relying on foreign—and especially British—financial assistance to carry out the programme of economic reconstruction drawn up in co-operation with the League of Nations, and, pending its execution, to balance the country's international accounts, the sudden withdrawal of all assistance from abroad very soon led to a heavy currency depreciation. Urgent measures were needed; and these consisted in a partial default on the foreign debt service, in foreign exchange control and restriction of imports and, later, in an effort to expand exports.

WHAT IS HAPPENING IN CHINA?

"The East Asia News Service issues a series of bulletins containing extracts from the Chinese, Japanese and other newspapers. The situation has aroused the attention of the whole world."

Write for specimen copies:

EAST ASIA NEWS SERVICE
7 VICTORIA STREET, LONDON, S.W.1

The following table shows the evolution of foreign trade since 1929—the last pre-crisis year.

(In thousands of tons and millions of drachmae)			
	1929	1932	1938
Imports:			
(a) Weight	2,773	2,375	2,741
(b) Value	13,276	7,870	14,761
Exports:			
(a) Weight	754	512	1,349
(b) Value	6,960	4,757	10,149
Import surplus:			
(a) Weight	2,019	1,863	1,392
(b) Value	6,316	3,113	4,612

This table shows the expansion of exports since 1929 and the reduction of the commercial deficit—the main aims of the Government. Bearing in mind that the drachma represented in 1937 only 41 per cent. of its gold value in 1929, it will be seen that the actual reduction in the commercial deficit is larger than appears from these figures. An important increase in the import surplus in 1936 and 1937 was the result of the rise in international prices and, also, of larger imports of essential foodstuffs, fuel and industrial equipment material. The increase in the bulk of imports since 1932 is due, principally, to heavy purchases of foreign minerals such as coal, metallurgical and chemical goods. Imports from the United Kingdom, Germany and the U.S.A. moved between 1929 and 1938 as follows:—

(Millions of drachmac)				
	Greek Imports from		Greek Exports to	
	1929	1938	1929	1938
United Kingdom ...	1,688	1,926	816	843
Germany	1,250	4,256	1,613	3,904
United States	2,088	1,070	1,118	1,731

Balance of Payments

According to figures contained in the annual report presented to the shareholders' general meeting by the Governor of the Bank of Greece, the country's balance of international payments for 1938 presented the following picture:—

	Gold frs.
Debtor balance from goods and services	36,951,000
Creditor balance from capital transfers	48,596,000
Creditor balance	11,645,000

The adverse balance of trade was gold Frs. 122,625,000 and, but for certain exceptional exports, would have been still higher. It should be noted, moreover, that out of the above creditor balance, only gold Frs. 2,375,000 (say £172,375) have been added to the bank's gold and foreign exchange reserves. The remaining gold Frs. 9,270,000, resulting from transactions with "clearing" countries, have reduced the country's debt on clearing accounts, a debt which at the end of 1938 was still gold Frs. 8,971,151.

The extent to which Greek trade is conducted by means of compensation and clearing agreements is illustrated in the following table:—

	1938 (per cent. of total)	
	Imports	Exports
Free exchange countries	38.4	34.87
"Clearing" countries	61.6	65.13

Over 34 per cent. of total foreign trade in 1938 was done with Germany, exports to which represented 40.12 per cent. of the total. Nearly 55 per cent. of the tobacco exported during the past year was purchased by Germany. The Governor's report indicated a continuation of a strict policy of exchange control and limitation of imports.

April 21st.

Defence Costs and Declining Business

[FROM OUR HELSINGFORS CORRESPONDENT]

FINLAND, fortified by a prudent and successful policy in finance and commerce during recent years, is facing a period of greater strain than for some time is rising, and business is falling about the Finance Accounts for 1938. Preliminary data show a considerably better result than had been possible to reckon on in advance. The Exchange had been possible even beyond expectation from the profits made at the peak of the trade cycle in 1937, before the recession which marked

last year set in. Owing to the fact that there is this cyclical lag in the case of State revenue, receipts were even larger than in 1937. Only the net income from the State railways, which reflects current business conditions directly, actually declined.

Altogether, revenue rose from 1937 by 12.7 per cent. and amounted to 4,862 millions. Of this total income and property tax produced 1,089 million marks; customs duties, 1,832 million marks; excise duties on tobacco, sweetstuffs, alcoholic beverages, etc., 477 million marks; the stamp tax, 265 million marks; the State Railways, 190 million marks; and the State forests, 268 million marks.

On the other hand State expenditure also increased. Among other things there were larger grants for defence. Nevertheless, there was a considerable surplus, and 350 million marks could be transferred to the Budget Equalisation Fund, which was 150 million marks more than the amount scheduled in the Budget. This Fund, which is intended for use in case of a depression, now amounts to 850 million marks, which gives the Government considerable scope for relieving unemployment, etc., without imposing any extra burden on the public finances.

The Cost of Defence

Expenditure on defence has grown to such an extent that, in the Budget for 1939, it stands at 1,172 million marks, or 22.5 per cent. of the total State expenditure. And, owing to the current political tension the Government has found it necessary to expedite the work of acquiring essential materials for defence. This was to have been done over a period of six years according to last year's plan. Now, proposals have been submitted to the Diet for a supplementary Budget, in which 350 million marks are set aside for this purpose, and the necessary funds are to be provided by borrowing.

The new calls for defence come just when the downward trend which marks world markets in spite of some recovery in the United States is affecting Finland, too. So far, Finland has a very creditable record in both public finance and commerce, all things considered; and, at the moment, some slight improvement is actually visible in the timber market. But this improvement will not exert any influence worth mentioning on timber felling during the 1938-39 season which has already been concluded in the southern parts of the country. Lumber work has been on an appreciably smaller scale than during the previous year; and, as yet, the market for the principal products of the paper and pulp industry shows no signs of improvement. It is the export industries that are most in danger.

There are signs of some falling back in industries supplying the home market, which are less dependent on the cyclical position abroad. These were fully occupied throughout 1938 in many branches, though some were more rapidly affected by the downward business trend. At the beginning of this year, however, output appears to have begun to fall off in all the more important trades, with the exception of foodstuffs and luxuries.

Even so, exports have so far been maintained at about the same level as last year, while imports have decreased considerably.

April 21st.

Canada's New Wheat Scheme

[FROM OUR OTTAWA CORRESPONDENT]

THE Government has now submitted to Parliament the balance of its new wheat marketing policy, in the form of a rather complicated scheme of crop insurance, which is intended to reconcile the Western grain growers to the reduction of the basic guaranteed price of wheat from 80 cents to 60 cents per bushel for the crop year 1939-40. Its chief features can be summarised as follows. On all wheat which passes through the terminal elevators there will be levied a charge of 1 per cent. to create a fund, which will be supplemented by contributions from the Federal Treasury. This fund will be used in what are described as emergency years—1939 is to be regarded as such and others determined by Order-in-Council—to make payments to grain growers in

the three prairie provinces at the rate of \$1 per acre on half of their cultivated acreage in townships where the average yield of wheat is from 11 to 15 bushels per acre, of \$2 per acre in townships with an average yield of between 6 and 10 bushels and of \$2.50 per acre in townships with a yield of less than 5 bushels.

These payments on an acreage basis will be subject to deductions of one-tenth for every cent by which the average price of wheat exceeds 70 cents per bushel from August to December in any year and, when the price reaches 80 cents per bushel, no acreage payments will be made. The Government is also empowered to vary the limits of the 10 cent range in succeeding years. When there is a total crop failure in a district, farmers will receive the \$2.50 payment, regardless of whether it is an emergency year and of what the price-level is. Wheat is to be used as a yardstick for determining crop yields, but payments will be made on all cultivated acreage, whether it is sown with other crops than wheat or left in summer fallow.

The township is to be taken as the unit of yield to avoid individual declarations and to prevent any encouragement being given to the farming of poor land; and large-scale farmers are excluded from the benefits of the scheme by the fixing of a maximum limit of 200 acres on which any individual farmer can claim the acreage bonus. To reinforce this plan, Bills have been introduced for the regulation of the operations of the Winnipeg Grain Exchange and the encouragement of co-operative marketing. The Wheat Board will not be abolished but will operate as a central selling agency for co-operative organisations, after the manner of the former central selling agency set up for the wheat pools.

Mr Gardiner, the Minister of Agriculture, who characterised the present system as uneconomic, inequitable and tending to stimulate the production of wheat at the expense of other grains, estimated that the new scheme, under the most unfavourable conditions, would not in any year cost the Federal Treasury more than 30 million dollars. This year it would have to find at least 48 million dollars for the operations of the Wheat Board and in addition 12 million dollars for the relief of totally indigent farmers.

Western Opposition

The avowed object of the scheme is to ensure some minimum return to every Western grain grower each year, and at the same time to reduce the burden thrown upon the Federal Treasury. It is assured of popularity with farmers who are cultivating sub-marginal land, or are living in areas very liable to drought, but it has had a very unfavourable reception from the main body of the Western farmers, who have not to face these abnormal difficulties. Their spokesmen maintain that the 60 cents basic fixed price will mean that the average farmer will not get more than 40 cents per bushel for his wheat on delivery at the elevator; that this figure is far below the average cost of production for wheat; and that the acreage bonus will not offer adequate compensation for the price reduction.

The organisation known as the Prairie Markets Conference has condemned the new scheme as unsatisfactory and is sending a delegation to Ottawa to interview the Cabinet. Protests have also been raining in upon the Western members at Ottawa, and there is a movement among the Liberal contingent, who have been telling Ministers that they might as well not run again to secure election, if the basic price is reduced to 60 cents, to organise obstruction against the legislation.

To meet the charge that it has been showing special favouritism to Western farmers, the Government has undertaken to pay a bonus of 2 cents per pound for cheese of a certain quality. It has also introduced legislation guaranteeing a fixed price, amounting to 80 per cent. of the average level of the preceding three years, for other farm products to co-operative organisations formed for marketing such products.

Letters to the Editor

Trade Aid for Allies

TO THE EDITOR OF THE ECONOMIST

SIR,—In your issue of April 27th (on page 182) you gave a complete account of the "agenda for preparedness," and pointed out, in respect of the economic aspects of the problem, that "the long and short of it is that we must be prepared to spend money on buttressing the economic independence" of the countries of South-Eastern Europe.

On the basis of some personal experience may I add that the only genuine means to strengthen the economic independence of the countries in question would be the purchase of their goods against free exchange at competitive, that is to say, *overrated* prices. You rightly said that "this is a wider matter than the mere defence of existing British trade, and it cannot be governed by purely commercial considerations."

Credits for armaments and other political purposes are wasted money, because you never know whether the arms will not sometime be turned against the creditors. From the British point of view, purchase of goods on a larger scale means spending money for political purposes, but getting value for that money to some large extent and collecting stocks partly for war storage. For the selling countries it would mean sounder prosperity than that based on exports against clearing balances, the consequence of which will sooner or later be the destruction of their home industries.

Even the difficulty of financing British imports at prices above world prices could be overcome if necessary. Should the countries in question agree, in cases of large purchases, to reserve some part of their free exchange proceeds so obtained for reimbursements of former liabilities, the foreign creditors might also be induced to create a fund, from which the difference between world prices and actual prices of the goods purchased might be drawn. It is probably merely a matter of negotiation.

I do not doubt that every country of Central and Eastern Europe would welcome any kind of help which would increase their exports against free exchange, on the basis of the prices paid at present by their biggest customers.

I am, Sir,
Yours faithfully,
STEPHEN KOPPANY.

London, E.C.2.

M. Reynaud's New Plan

TO THE EDITOR OF THE ECONOMIST

SIR,—May I point out a slight error that has slipped into your article of April 29th entitled "M. Reynaud's New Plan"? On page 248 you say that the population of France fell by one and a half millions between 1931 and 1936. There is a mistake in this statement that might give readers an unduly pessimistic impression of the French position. It is not the total population that has fallen but the *working* population, because of unemployment. Actually, the total population of France rose from 41,835,000 in 1931 to 41,907,000 in 1936.

Yours sincerely,
CHARLES RIST.

Versailles.

England and Germany

TO THE EDITOR OF THE ECONOMIST

SIR,—I am much obliged to you for publishing the letter I took the liberty to address to you (*The Economist*, April 15, p. 137). I do not expect you to be anything else than truly British, but I should very much like a better understanding from you for present-day Germany. We are a truly united people, everything being done for the working class, which is in our country surely better off than in any other country of the world.

Live and let live, but do not want the whole world for yourself. We do not want British, but German colonies taken from us under false pretences twenty years ago. Sir Edward Grey was glad to be out of Versailles, where he said "They are out for loot," and he criticised in particular the Allies keeping all the German colonies.

With regard to Czecho-Slovakia, Dr Benes himself did not want at Versailles the Sudetenland included in the new Republic, but the Allied Powers insisted, and from that day the Czechs have been faced with trouble. Are they not at present much better off without the fear of having to fight by French or Russian command sooner or later against their German neighbour?

I remain, dear Sir,
Yours faithfully,
H. WOLFF.

Cologne.

Inflation Ahead

TO THE EDITOR OF THE ECONOMIST

SIR,—In a leader on April 15th you envisage the possibility of inflation owing to the huge demand on industry for the Fighting Services. Among the alternative means of countering this evil, you mention the rationing of production and labour under Government supervision.

Is there not another, and more natural, way to regulate production so as to avoid a clash of civil demand with the Government's requirements? A rise in the rate of interest is surely the only really adequate way of curbing unessential investment. To pursue, at one and the same time, a cheap money policy to stimulate investment and a policy of restricting production in order to facilitate the Government's re-armament policy is contradictory and precarious.

I am, Sir,
Your obedient servant,
S. HERSZBERG.

Lódz, Poland.

Books and Publications

Administering Britain's Tariff

To the exiguous tariff literature of the last few years Mr McGuire's book* makes an important addition. It is almost the first attempt to deal comprehensively with the new fiscal order built up chiefly since the Great War—one of the several unregarded revolutions effected by Conservatism. The first third of the book is devoted to general and mainly theoretical issues relating to tariffs; from Chapter IX on "Departmental Organisation" the author deals with matters peculiar to the British tariff system. The closing chapter on "Trade Bargaining" examines the ways in which tariffs have been used since 1932 as a means of obtaining concessions from other countries; it includes an account of the Anglo-American Trade Agreement of last year.

The scheme to which Mr McGuire has worked is attractive; whether it is altogether justified by the result is another question. The political background presented gives no more than a bare sketch of the machinery of Britain's legal and legislative systems. The economic background consists of an unsuccessful attempt to expound the elements of theory in less than twenty pages.

There are very few writers who can deal clearly and adequately with the fundamentals of economics, or even of a part of economics, in twenty pages, and Mr McGuire is not one of them. His statement of the pure theory of international trade, for example, is apparently intended for a reader without previous acquaintance with this doctrine. It is so brief that the layman is unlikely to gain very much from it, while the advanced student is likely to feel that the really interesting problems have been left out. Again, in one or two places Mr McGuire's desire to be concise has led him into such odd statements as this (page 19):

Nevertheless it is incorrect to say that foreign competition will not injure an efficient domestic industry: a favourite free trade argument. The industry may be more efficient, but if its comparative costs are greater than those of its foreign competitor, it cannot continue.

Then what is the industry of higher comparative costs "more efficient"?

When we come to the descriptive part of the book, we enter a field which has been little worked. Here the author scores heavily. This is the substance of the book. Mr McGuire's practical experience in the Customs and Excise Department enables him to deal authoritatively with the technical matters which make up nine-tenths of the problems of a tariff in operation and about which the average student is quite uninformed. One of the most striking features of our system is the way in which very old methods of control and taxation have survived, with some adaptation, down to the present day; the thirteenth-century Customs procedure for the checking of wool exports, for instance, flourishes side by side with the seventeenth-century Excise procedure of entry into and inspection of premises where taxable commodities are made.

In one direction, however, there is a real and significant change: the decline of the control of the ordinary Member of Parliament over fiscal affairs. As Mr McGuire says (pages 233-4):

With the growing assumption by the Government of economic activities, it has become more the function of the ordinary Member of Parliament to scrutinise and criticise rather than to legislate. This further step of placing economic activities with an outside body [the Import Duties Advisory Committee] shifts the function of watching on to the Government in the first place, and the ordinary member tends to become a referee.

It may be added that the development of bilateral trade agreements is likely to reduce still further the power of Parliament reluctant to reject, and practically unable to amend, those results of secret and delicate negotiations by the Executive.

On debatable matters Mr McGuire preserves throughout

* "The British Tariff System." By E. B. McGuire. Methuen. vii + 312 pages. 10s. 6d. net.

the kind of impartiality that consists in setting arguments *pro* and *con* against one another and refraining from passing judgment. Perhaps it might not unfairly be called the Civil Service approach. His style, dry and impersonal, fits his method. No one will read this book for pleasure, but it will certainly be a standard work of reference on technical questions for everybody who is seriously interested in the subject. The needed economic analysis of the British tariff system has still to be written, but Mr McGuire's excellent description will serve as a useful prelude to it.

Shorter Notice

"Encyclopædia Britannica Book of the Year, 1939." Encyclopædia Britannica Company. 760 pages. £2 5s.

The growing intensity and pace of learning and its propagation are beyond the wit of the individual mind to master; but these very facts create the need for a compact, up-to-date and authoritative summary of recent progress, an object notably achieved in the second issue by the Encyclopædia Britannica of an annual supplement or Year Book. This is a truly remarkable compendium of information, and the list of contributors speaks for the adequacy of its treatment. It is a "Survey of the principal persons, events and developments in various spheres of knowledge and affairs during the year 1938." The variety of subjects dealt with in the Year Book is catholic, ranging from geophysical prospecting to staple fibre, from entomology and the year's pests to the new industry of plastics, and from politics to exploration. The latest knowledge in the human and scientific spheres is too often hidden in the Proceedings of learned societies, and such a summary as this is invaluable to those who either must or like to keep abreast of advancing knowledge.

WORLD FINANCE

1938-39

Paul Einzig

Author of "World Finance 1937-38." "Monetary Reform in Theory and Practice," etc.

A survey of the year's finance in which, as in his previous volumes, Dr Einzig emphasises the interaction of political and financial events. This volume considers the consequences of Austrian annexation and the dismemberment of Czecho-Slovakia, the struggle of the franc, trade revival, the flight of capital, gold dishoarding and rehoarding, war and re-armament finance, etc. 12s. 6d. net.

THE CENTRAL ELECTRICITY BOARD

The Report of the Central Electricity Board for the year 1938 was published on April 5th last. The results which it shows fully establish the economic justification of the "Grid." The success of such a large-scale example of public enterprise is sufficiently important to justify the following extensive examination of its purpose and its achievement, which is the work of an expert Correspondent. It is accompanied by a series of Charts on page 346.

Why an Electricity "Grid"?

FOR reasons which are discussed more fully later, certain savings are to be anticipated if an electrical transmission system is built to connect two or more generating stations situated in and serving different districts. In appropriate circumstances, the savings will be more than enough to meet the capital charges and (relatively modest) operating expenses of a system of interconnection. Furthermore, such a system may also make available a supply of electricity at various points between generating stations at a lower price than would otherwise be possible.

For many years it has been held that a network of transmission lines would be economically justifiable in this country. If the enlightened self-interest postulated by the *laissez-faire* economist had prevailed, the requisite system would have materialised without State intervention. But apart from the construction of transmission lines for the mutual assistance of neighbouring undertakings—for example, the line built in the 'twenties to connect the great Barking station of the County of London company and the Brimsdown station of the "Northmet" company—little progress was made. The great technical achievements of the industry were thus under-exploited. From the beginning of this century, for example, it was generally recognised that the London supply companies were too small for individual generation on an economic basis. In 1904, private legislation was promoted which would have brought about an effective pooling of their generation—and, despite the opposition of the companies, the Bill failed to become law only by the smallest margin. But it was not until the London Electricity (No. 2) Act of 1925 was passed that the London Power Company was made the joint generating entity of the eight "West End" companies, and belated economies began to be achieved.

Excessive individualism in the industry thus prevented any movement towards pooling of generation. So, in 1925, a Government committee under the chairmanship of Lord Weir recommended that a public body should be established to construct, own and operate a system of transmission lines connecting the major stations of the country, and that, to take advantage of the system, the equipment required to meet the electrical demands of the country should be concentrated in a comparatively small number of generating stations. These generating stations were to remain under the ownership and operation of the ordinary supply undertakings, with a public body acting as a wholesale jobber between their owners and also between the owners and other undertakings who were not to generate.

The Central Electricity Board is the public body set up by the Electricity (Supply) Act of 1926, which implemented the proposals of the Weir Committee.

The Economies of the Grid

If a transmission line is built to connect two generating stations, dual economies are to be anticipated, on capital and on revenue account.

On capital account there will be savings because the plant needed to meet the requirements of the two interconnected systems will be less than the sum of that needed to meet their requirements individually. In the first place, they need less spare plant against the emergency of the

breakdown of part of their generating equipment.* Secondly, it may well be that the time at which the systems experience their respective maximum demands will not coincide. A further capital economy made possible by interconnection is that, as load increases, it is possible to add new units of generating plant of a larger size than are likely to be convenient on a small isolated system. The capital costs of larger units per quantum of output are less than those of smaller units, and their technical performance tends to be better and running costs lower.

On revenue account, unless all the stations are of equal, or nearly equal, efficiency, there are economies to be effected by concentrating output during periods of reduced load on the more efficient stations, reserving the less efficient stations for periods of peak load. The degree to which such concentration can be carried is well shown in the Central Electricity Board's report for 1938, which relates that of the 162 stations under the Board's direction (excluding nine which were not in operation during the year), 43, or more than 25 per cent. by number but not by capacity, were run for less than 2,400 hours (100 days) in 1938. Moreover, even if stations are equally efficient, economies can be won at off-peak times by closing down some and running others at outputs nearer their economic optimum.

The Grid in Practice

It is not difficult to demonstrate the economies which arise in theory from an inter-connected transmission system; but to put such a scheme into practice, and to arrange the "terms of trade" to make it effective, constituted a formidable problem. The framework established by the 1926 Act, and the fabric built up on that framework by the Board and by the Electricity Commission, have taken the following form. The whole of England, Scotland and Wales (the sparsely populated North of Scotland is excluded) has been divided up into eight areas. For each area a "Grid Tariff" has been established, which consists of a scale of charges at which the Board is prepared, under certain circumstances, to give a supply of electricity to authorised undertakers, on terms which vary according to the four classes of undertakers.

Class 1.—If the Board is not in a position to give a direct supply, the undertaker (except in the exceedingly rare cases where he operates his own plant entirely independently) buys an indirect supply from a neighbouring undertaking on the terms at which that undertaking obtains its supply, directly or indirectly, from the Board, plus an appropriate amount to cover the operating and capital charges (the latter at prescribed rates) involved in its transmission to the purchaser.

Class 2.—If the undertaking does not own a "selected

* Suppose two systems have to meet a load of 50,000 kw. each. Operating individually, each system would be secure if its plant consisted of 4 sets of 12,500 kw. each and 1 set of 25,000 kw., a total of 75,000 kw., or for the two systems, a total of 150,000 kw. Each could suffer a mishap to its largest single unit without being crippled. Interconnected, they would have a greater margin of safety by operating jointly 7 sets of 12,500 kw. each and 2 sets of 25,000 kw. each, making a total of 137,500 kw., showing a capital saving of 8 per cent. With more stations in the pool a saving of greater proportion can be made with a gain, rather than a reduction, in the improbability of inadequacy.

station" (i.e. one of the generating stations selected on the strength of its economy of operation to be continued indefinitely) it buys from the Grid at the Grid Tariff. No undertaking can be compelled by the Electricity Commission to take a supply from the Grid unless it can be established that it will cost the undertaker less, over a period of seven years, than the prime costs of independent generation (excluding capital charges).

Class 3.—If the undertaking owns a selected station, the owner has to operate the station according to the directions of the Board in the matter of rate of output, etc.; to sell the output to the Board at cost (including overhead expenses, depreciation and interest on the capital involved at rates between 5 and 6½ per cent. corresponding—within those limits—to the average rate of interest or dividend paid by the owner upon his share and loan capital); and to buy back what he requires for his own purposes on one of three bases:—

- (a) the Grid Tariff;
- (b) the cost at which he generates, corrected for load factor, etc., and augmented by his share of the Board's expenses;
- (c) an estimate of the cost which he would have incurred if he had been generating all his own requirements.

Of these alternatives, the owner can make his own choice. It was originally anticipated that alternative (b) would become most generally applicable; but the loading added to the actual cost for the "share of the Board's expenses" has as a rule been such as to make either (a) or (c) more economical. Hence, while the owners of small or inefficient stations have frequently found that the Grid Tariff is their most economical price, the owners of large selected stations have mostly bought back their own requirements on basis (c)—that is, a hypothetical estimate. In a number of cases, the owner of a selected station or stations has installed plant adequate but no more than adequate to meet his own expected requirements, and the Board has, in effect, used the station more intensively, taking the surplus output on to the Grid at the incremental operating cost. The owner has received no benefit from the Grid, but the Grid has received, in the common interest, power generated at very low cost.

In establishing the Grid Tariffs, the Board had a delicate task, for on these tariffs more than on any other single factor hung the financial success of the whole scheme. The financial result to be expected if they were set too low would be obvious; on the other hand, if they were set too high, independent generation might continue to be a more economic source of supply, and the Board would not then obtain the full load that it required for success.

In fact, it appears that the Board has settled the Grid Tariffs with nice judgment, and the level of charges seems to have met the requirements of the majority of the cases for which it was designed. There was, however, a range of undertakings whose position was not met by any of the three clauses mentioned above, whose stations or load were too small to justify "selected station" treatment, but large enough to offer the possibility of independent generation at a lower cost (excluding capital charges) than the Grid Tariff.

Class 4.—Agreements of an *ad hoc* character have been made to cover these "Special Arrangement" stations, the general nature of which requires the Board to pay the capital charges of the station concerned, and to give a bulk supply to the owner at a price so calculated as to make the net cost of supply slightly lower than costs of independent

generation. As the capital charges on the station are amortised, the time will come when the Grid Tariff will be the more economical, and the station would, presumably, then be closed down entirely, and the undertaking become a normal Grid Tariff purchaser.

There was some doubt whether arrangements of this type were *ultra vires* the Board; they were obviously economic in the general interest, but the rather narrow provisions of the 1926 Act did not seem to cover them. The necessary powers were, however, conferred on the Board by the Electricity (Supply) Act of 1935.

Class 5.—There are two other types of agreement between the Board and owners of generating stations which should be mentioned, though it is believed that only one example of each type—of any size—exists:—

(i) There is a special agreement between the North Wales Power Company and the Central Board, designed to achieve the optimum use of the hydro-electric power station of that Company in conjunction with steam stations in Lancashire, etc., to meet the combined load of the area. This comes under the arrangements of the 1935 Act.

(ii) There is an agreement between the Board and the Grampian Electricity Company by which the surplus output of that Company's hydro-electric stations is taken by the Board.

The Grid Tariff

The general form of the Grid Tariff is of the two-part type—that is, an annual charge per kilowatt of maximum demand (calculated on the basis of the maximum amount of power taken in any half-hour of the winter months of the year) and a charge per unit actually taken. Certain corrections, however, are made to these charges:—

(i) **Power factor.**—Allowance is made for certain electrical characteristics of the power taken which involve the use of more generously dimensioned equipment than the amount of power by itself would indicate.

(ii) **Cost of coal.**—If the price of coal varies from that assumed in framing the tariff, the unit price is adjusted in the same sense. The size of the coal adjustment has been designed to cover more than the actual burden or gain of any changes in the price of coal to provide to some extent for changes in costs of other stores. Since the tariffs were framed, the price of coal sold to central stations has increased in much greater proportion than the general level of prices, so that the Board has received a windfall profit, perhaps a substantial one, under these adjustments.

(iii) **Rates on generating stations.**—As its operating account shows, the Grid is a considerable payer of rates directly. But indirectly it has an interest, probably of larger magnitude, in the rates payable by the owners of selected stations. The Grid Tariff is adjusted in proportion to the burden of rates falling upon generating stations, but on balance such adjustments may have worked out in the Board's favour.

The amount of the kilowatt charge per annum is not a flat rate, but arranged in a series of steps. The highest rate applies to the basic demand—i.e. the amount of the purchaser's requirements in the datum year. Further amounts are taken at lower prices, with two intermediate steps. The size of the intermediate steps is determined by a complicated formula, the ostensible object of which is to ensure justice as between undertakings which at the datum year had shown enterprise and success in developing their load, and undertakings which, at the datum year, had a considerable potential load not so developed.

The Board's Achievements

IN discussing the economies to be expected of the Grid, a distinction was made between capital and revenue savings. Those of a capital nature could be considered the more certain, assuredly the more easily predictable. But they were dependent on one vital condition—that the total load should continue to grow. It is hard to imagine an asset less easily liquidated than a power station, which has a

normal working life of twenty years or more. And it would have been little gain if the Grid had merely released from service certain types of capital equipment which had no more than a scrap value for other purposes. In order to realise the capital economies of the Grid, a growing load was essential; so that the amount of new generating plant, which would otherwise be necessary, could be reduced. In

this respect the Grid has been well served by fortune—or, at least, has not been betrayed by misfortune of a type which, though improbable, was not impossible. As the adjoining Table I shows, the total load of the country has continued to grow—not, indeed, with unchecked speed, but even in years of depression each year has seen an advance in the figures. The industrial recovery of the last five years must have been welcomed by the Board and has helped materially in demonstrating the full economic justification of the Grid at an earlier date than was, or might reasonably have been, expected. To this extent the Board was fortunate in the timing of its inception.

It is apparent from the preceding account of the relations between the Board and authorised undertakers that the position of the latter was protected so that they should be in no way worse off by reason of the existence of the Board. In a large number of cases—it might almost be said in every case—it was inevitable that the undertakers should receive an active measure of benefit from its operations, for it is impracticable to devise standard conditions applicable to a large number of cases of widely differing circumstances which shall be of disadvantage to none without, at the same time, granting a measure of advantage to many.

Further, in the negotiations with owners of selected stations with whom terms are settled by the Board on basis (c)—that is, hypothetical costs of independent generation—the owner of a selected station should usually settle on terms which give him some advantage. It is quite unlikely that the Board would have been able to settle without appeal to the Commissioners all but one of the large number of such negotiations that have occurred, unless it had shown some flexibility in its interpretation of hypothetical costs. Thus, it might have happened that the Board's existence might have been justified economically, and yet that the Board had been unable to retain, to meet its own considerable costs, a sufficiently large proportion of the economies due to its operations. In point of fact, the Board has now reached a position in which it is fully self-supporting, an achievement which is in large measure due to the ability with which it has been administered.

The management, in addition to its inherent economic problems, had perforce to commence work in rather a difficult psychological atmosphere. There were not wanting those who speculated on the possibility that the Board might fail and that its transmission lines might be handed to the authorised undertakers to deal with on individualist lines. Such feelings have by now been dissipated, and on this the Board must be congratulated. But the fact that in the early days, at all events, the Board had to meet no less hostility than ready co-operation adds to, rather than detracts from, the measure of its success.

Economies in Generating Plant

The following table sets out, for the last eighteen years, (i) the total installed capacity of all generating stations owned by authorised undertakers; (ii) the aggregate of (non-simultaneous) maximum demands on stations owned by authorised undertakers; (iii) the difference between (i)

and (ii), that is the approximate amount of reserve capacity; and (iv) reserve capacity expressed as a percentage of maximum demand.

TABLE I.—INSTALLED CAPACITY, MAXIMUM DEMAND, AND RESERVE CAPACITY
(in millions of kilowatts)

Year	Installed Capacity	Maximum Demand	Reserve Capacity	Reserve capacity as percentage of maximum demand %
1921-22 ...	2.756	1.639	1.117	68
1922-23 ...	3.091	1.830	1.261	69
1923-24 ...	3.407	2.075	1.332	64
1924-25 ...	3.724	2.298	1.426	62
1925-26 ...	4.422	2.558	1.864	73
1926-27 ...	4.682	2.701	1.981	73
1927-28 ...	5.258	3.235	2.023	63
1928-29 ...	5.802	3.369	2.433	72
1929-30 ...	6.600	3.601	2.999	84
1930-31 ...	6.946	3.801	3.145	83
1931-32 ...	7.195	3.951	3.244	82
1932-33 ...	7.366	4.156	3.210	77
1933-34 ...	7.837	4.802	3.035	63
1934-35 ...	7.785	5.297	2.488	47
1935-36 ...	8.100	6.044	2.056	34
1936-37 ...	8.398	6.609	1.789	27
1937-38 ...	8.913	7.284	1.629	22
1938-39 ...	9.349	8.081	1.268	16

These figures (which are set out graphically in the first chart on page 346) make an interesting showing. It will be seen that from 1931-32—when the existence of the Board first began to influence the situation—not merely has the proportion of reserve plant steadily decreased, but the absolute amount has actually decreased in every year. In 1938-39, the absolute amount of reserve capacity was smaller than in any year since 1922-23, when the maximum demand was less than a quarter of that of 1938-39.

From these figures it might be argued superficially that the ratio of reserve capacity has been reduced from more than 60 per cent. in pre-Grid days to less than 20 per cent. now, representing a saving of 40 per cent. on 8,000,000 kilowatts, which, capitalised at £15 a kilowatt, would represent a capital economy of £48 millions. Actually, this reckoning is too generous, for several reasons. First, the acquisition of smaller undertakings by larger undertakings, which has been going on continuously, clearly has the effect of reducing the proportion of reserve capacity which is necessary. Secondly, a large number of small undertakings have closed down their own generating stations, taking supply from their larger neighbours, and would have done so even if the Grid had not been established. Thirdly, the average size of generating units has probably not increased in so great a proportion as the total load, which increased five-fold since 1921. Finally, for various reasons the margin of spare plant in 1938 was less than was intended—or, probably, thought desirable—by the Board.

Presumably such factors as these have been taken into account, and, judging from the figures, fairly assessed by the Board in estimating that the Grid has produced savings of some £22 millions in capital expenditure on

reserve plant by 1938—a figure which represents nearly three-quarters of the capital expenditure on the construction of the Grid.

Overall Economies

A further diagram on page 346, which is reproduced from the 1938 report of the Board, shows the changes in national average costs of generation since 1922.

The report makes the following comment on this chart:—

“In the construction of this graph, the annual data have been adjusted to the average price levels and load factors ruling in the period 1927-30 inclusive, during which period price levels and economic conditions were relatively stable. The graph shows clearly the more rapid downward trend since the Board commenced trading on January 1, 1933. By the year 1937-38 (the latest year of account of authorised undertakers for which national figures are available) the adjusted average cost per unit sent out to local distribution systems was nearly 24 per cent. below the figure which would have been reached if the normal trend of improvement prior to 1932 had continued.”

The amount of the total savings thus disclosed—beyond that which the continuation of the normal trend would have shown and therefore reasonably attributable to the Board—amounted, on the basis of 1927-30 conditions and prices, to some £8.2 millions for the year 1937-38. These results are given *ex parte*, but the general tenor of the report suggests that they may be accepted without reserve. They fully justify the construction of the Grid.

Results in 1938

The figures for 1938 show a really satisfactory result. Without allowing for any easement, such as charging operating expenses to capital, grants received from the Minister of Labour, etc., the net resulting profit—before depreciation or amortisation—is equivalent to 7.42 per cent. on the total capital expenditure. The appropriate rate of provision for depreciation is obviously a matter of opinion; but if it is taken that 4½ per cent. is an economic rate of return on capital, there is available for depreciation 2.92 per cent., which, allowing for compound interest at 3 per cent., would amortise the whole capital expended in a period of less than 24 years, a period which is well on the safe side.

On this basis, therefore, it is fair to say that the results for the year 1938 show that the operations of the Board, after providing considerable advantages for at least some part of those with whom they trade, and inflicting disadvantages on none, have resulted in an economic return on the capital expended. The year 1938 was not, however, quite a normal year for the Board, and some of its special features deserve reference.

Reserve Plant.—Table I showed that the reserve capacity of plant in 1938 was only 1.3 million kilowatts, repre-

Those who remain sceptical may find even more convincing proof in the Board's accounts in the form which is set out in Table II opposite. In interpreting these results it must be remembered that the Board's constitution does not allow it to profit at other people's expense, for safeguards are inserted throughout the Act to ensure that its customers are not put in a worse position than they would be if the Board had not been established. The table is not presented in quite the same form as that used by the Board, which, in its report, deducts the cost of energy lost in transmission, etc., from cost of energy purchased and adds it to the cost of transmission. In Table II gross profit is computed, following the normal trading practice, after deducting from the proceeds of sales the whole costs of purchase without allowance for any proportion of power purchased which is lost by the wayside. This method has an incidental advantage in showing what are normally regarded as transmission expenses without any disguising addition.

The capital expenditure shown in the table (Item 16) is the total of capital expenditure as it would be regarded from the strictest economic point of view. It includes all costs of establishing the enterprise, including interest charged to capital and expenses prior to trading, but excludes discount on and costs of issue of capital.

It will be seen that in every year since trading began, turnover has increased; and that in each year since operations commenced on a really substantial scale—that is, from 1934 onwards—all the operating indices have gone down while the final return on capital has steadily increased.

sending no more than 16 per cent. of maximum demand. This might be taken to represent a crowning achievement of economy. But that is not a correct interpretation, and it cannot be doubted that the Board would view with concern the prospect of last year's experience being excelled or even equalled. The principal causes were two. First, pressure of the re-armament programme delayed the delivery of new plant, to such an extent that the installation of 123,000 K.W. of plant which was planned for operation for the winter peak load was not completed in time. Secondly, a very sharp cold snap was experienced just before Christmas, coincident with the normal maximum demand, with the result that while the volume of output required by authorised undertakers in the year was 4.7 per cent. less than the latter had forecast in the early part of the year, the sum of their maximum demands was 2.2 per cent. above their forecasts. If all the plant ordered for completion in 1938 had been available, and if the maximum demand had borne the normal relation to the output for the year, the margin, in place of the actual 16 per cent., would have been about 23 per cent.—a figure which can be regarded as about normal.

Secondly, in the course of the summer, a new 30,000

Total	62,056,959	Carried forward	39,491,117	Outstanding commitments on construction contracts estimated at £2,400,000.	

K.W. set "blew up," owing to a fault in an important forging built of a very up-to-date steel alloy—the sort of accident which is an inevitable concomitant of technical progress. There was reason to fear that two other sets of the same size, and another new set of 50,000 K.W. might be similarly afflicted, making a total of 140,000 K.W. which had to be withdrawn from service. In addition, one undertaker in Lancashire is reported to have had two large sets simultaneously out of action at Christmas time—a coincidence which is theoretically most improbable. With such a combination of adversities, the margin of reserve capacity must have seemed none too big last year—at all events, in some districts. The capacity of transmission lines is limited, so that surplus plant in Cornwall can help little to relieve a shortage in Aberdeen if plants and lines are near full load along the route.

It might be argued that the Board were running undue risks in 1938; and that they should avoid cutting things so fine in the future. This, however, would not be a fair argument. The object of having a margin of safety is not that that margin should never be called upon: there is no sense in a regulation that there must always be a cab waiting on the rank. However fine the unused margin may have been last year, the fact remains that all emergencies were met.

Output in 1938.—It has been mentioned that output in 1938 was 4.7 per cent. less than had been anticipated at the beginning of the year. Partly this may have been due to the course of industrial activity, but it was also partly due to the course of the weather. The cold snap in December was short lived, and it would, of course, have affected the output for the year in much smaller proportion than it affected the maximum demand for the year. Other factors counter-balancing this cold snap included prolonged periods of unseasonably mild weather in the spring and the autumn, with a reduction of sales for domestic heating. The effect of these spells must have

been particularly pronounced, since it is at such intermediate periods that secondary and occasional sources of domestic heat—for which electric fires are outstandingly economic—are particularly employed.

Effect on Earnings.—The abnormal conditions of 1938 which ran the maximum demand to within such a close limit of available capacity, must have been favourable to the Board, but to a degree which could easily be exaggerated. The cold snap would benefit the revenue of the Board, in the year's accounts, only in the case of undertakers buying at the Grid Tariff. The extra revenue attributable to this factor is estimated by the Board at no more than £75,000. Secondly, non-completion of plant due for delivery would save the Board little. In the accounting of the Board with owners of selected stations, interest is not capitalised in respect of plant under construction, so that there would be a saving of interest for which the Board is responsible only in respect of the particular item delayed—which may have been quite a small part of the total expenditure relevant to any complete unit. On the other hand, both these items, and a third factor (the double "outage" in Lancashire already mentioned) must surely become relevant in future discussions of hypothetical plant necessary for the undertakers' own requirements and may probably lead to a slight shifting of the balance of account in favour of the Board.

Against any small adventitious revenue for the year 1938 which could be attributed to the factors referred to above must be set the loss of revenue due to the abnormal weather. It is, however, impossible to give any quantitative estimate of this amount. On balance, it may be concluded that while the abnormal features of 1938 gave some slight assistance to the Board's earnings, the adventitious element was of secondary and, indeed, almost negligible magnitude. In some respects those very abnormalities will in future turn to the Board's advantage, though probably not to any very substantial extent.

The Board's Finances

BEFORE considering in detail the finances of the Grid, it is necessary to discuss an important matter not previously raised, namely, standardisation of frequency.

In the circumstances in which the electric supply of this country developed, it was inevitable, and probably advantageous, that different systems should make use of different voltages and characteristics of supply. Equally, the time was bound to come when uniformity became desirable. It is obviously inconvenient and costly to manufacturers and users of electrical appliances, that different specifications should be required for different parts of the country. In order to remedy the diseconomies, and quite regardless of the existence of the Grid, a policy of standardisation has been instituted and is being carried through, though at a pace which is majestic rather than precipitate.

One particular factor involved in standardisation of supply presented peculiar difficulties—frequency of current or the number of times per second that alternating current changes direction. The commonest frequency throughout the country, and one which on technical grounds is perhaps the most convenient, is of fifty cycles per second. Apart from a number of minor "sports," there were three large non-standard areas—Birmingham, Clyde Valley and Glasgow (both of which had a frequency of 25 cycles a second), and the large North-Eastern area, with a frequency of 40 cycles a second. Standardisation of frequency is a more serious problem than standardisation of voltage, both because the expense of a change is more costly, and also because it cannot well be carried through piecemeal, since the spreading out of the change over a long period might involve extreme inconvenience.

It is arguable whether considerations other than the institution of the Grid would, of themselves, have justified a change in the major areas of non-standard frequency. It is probable that the change-over in the Midland and the Scottish areas could be well justified by those other con-

siderations. In the case of the North-Eastern Area, a high degree of integration of generation on the lines of the Grid had already occurred and was being extended, so that the exclusion of that area from the scope of the Grid was by no means unthinkable. At least, it cannot be argued that the coming of the Grid was the major reason for standardisation of frequency, and it is possible to hold that it was only a minor cause.

Whatever the reasons which made standardisation necessary, the Central Board was a very convenient vehicle to finance it. In all justice, the non-standard undertakings could not be expected to pay for their own standardisation, and the financial method actually adopted, namely, capital grants to the undertakers changing over, financed by a levy on the whole supply industry to provide for interest and amortisation of those grants, seems appropriate. The necessary funds were raised by the Board as part of its

normal finance, and their service is met by the levy, which is collected by the Electricity Commission and paid over to the Board. In the earlier years this part of the Board's revenue—an assured amount equivalent to about a third of the costs of service of its loans—undoubtedly gave some confidence to discerning investors in its stocks. Table IV on the opposite page sets out the various stocks issued by the Board, and still outstanding, their dates of issue and the purposes to which they were allocated.

The first five stocks were all unfortunate in that they were issued at a high rate of interest (the first issue, though only carrying interest at 4 per cent., was costly, since it was issued at 83 per cent.) and made no provision for call at an early date. Such criticism is easy after the event, but not therefore necessarily invalid; and the Board's advisers might well have done better for the undertaking. The annual interest burden, before redemption commenced, was £2,278,750, equivalent to 4.26 per cent. on the par value of capital raised, and to 4.58 per cent. on the net amount of £49,719,707 actually received by the Board. The stock issued for standardisation, however, is not really an obligation of the Board. On the stock issued for General Purposes, the full interest payable was £1,577,625, which represents 4.28 per cent. on the gross amount, or 4.61 per cent. on the net amount of £34,137,180 realised. If the cost on the net amount had been 4 per cent.—an aspiration not totally unreasonable—the annual burden on the Grid would have been less by £212,138, while if 3½ per cent. had been achieved, the saving would have been £297,481 per annum, though this, perhaps, would have been asking too much.

The terms on which the Board borrowed provided for the charging of interest to capital during the earlier years to a rather generous degree. Actually, as is seen from Table V below, interest in respect of trading capital was first charged to revenue in the year 1936, a year earlier than was necessary; in 1937, interest was charged to revenue to a substantially greater degree than the obligations prescribed; while in 1938 the whole interest appropriated to trading, namely £1,577,625, was charged to

revenue, although the Board was obliged to charge only £453,500. Hence the actual full amount charged was some £1,124,125 in excess of that prescribed.

TABLE V.—EARNINGS AND APPROPRIATIONS, 1936-38

	1936	1937	1938
Total Profit (as per Table II).....	£1,701,606	£2,014,508	£2,754,368
Other Income:—			
Interest.....	13,025	30,204	57,152
Unemployment grants.....	354,239	226,558	267,143
From Electricity Commissioners.....	559,771	712,985	733,553
Total other Income.....	927,035	969,807	1,057,848
Total Income.....	2,628,641	2,984,315	3,812,216
Interest Payable.....	2,197,242	2,248,325	2,248,325
Less Charged to Capital.....	Cr. 288,972	Cr. 382,922	Nil
Balance of income.....	1,909,170	1,865,403	2,248,325
Redemption Funds.....	719,471	1,118,912	1,563,891
	493,855	785,095	1,134,850
Surplus.....	225,616	333,817	429,041

The provision for the repayment of moneys borrowed is based upon the allocation for amortisation of the assets on which the money has been spent, as prescribed by the Electricity Commissioners. In total the amortisation funds established are more than enough to cope with the due redemption of the various loans.

In connection with Table II, it was argued that earnings in 1938 were fully adequate to provide for the amortisation of the capital assets of the Board within their useful lives. From the table above it will be seen that the total earnings of the Board for 1938 showed a surplus, after interest payable but before amortisation or sinking funds, of £1,563,891. The annual amount necessary to redeem, by means of cumulative sinking funds, the whole of the stock issued for General Purposes by the respective due dates, is under £500,000. It will be seen, therefore, that the 1938 earnings of the Board are sufficient to pay the whole of its interest and sinking fund obligations, and that ample provision is made for the amortisation of its assets.

What of the Future?

ANIMADVERSION on the outlook for the Board must start from a consideration of the general outlook for electric supply. Any discussion must realistically take account of the possibility of war. If war occurs, ever-increasing supplies of electricity will be demanded for manufacturing armaments, and the generating capacity of the country will be taxed to its limit. If there were to be some falling off in civil industrial activity, the effect on the demand for power is likely to be somewhat mitigated, for the engineering industries are great users, and many peace-time industries which might experience a recession are but modest users, of power. If, however, from any cause there were a marked decline in industrial activity the electricity supply industry and the Board could not remain unaffected.

During the period 1929-33, in which the depression gathered full force, the volume of public electricity supply increased steadily, but it would be erroneous to deduce from this experience that the demand for electricity is subject to a natural law of perpetual increase. The experience of the United States and of other industrial countries in recent years furnishes adequate refutation of this idea. Several causes contributed to the maintenance of the growth of demand for electricity in those years of depression. At their opening, electrification in this country was in a relatively backward state. Again, domestic demand in those years was stimulated successfully, partly owing to the great volume of new housing activity. Between 1928-29 and 1938, industrial sales of electricity multiplied 2.12 times, while sales for domestic purposes increased by 3.62 times. If the domestic load had shown only the same growth as the power load, sales in 1937-38 would have been 3,000 million units, or 15 per cent., lower.

Such circumstances are not likely to recur, if industrial depression should come in the near future, and if no other

special cause were in operation at such a time, it would be wise to expect not merely a reduction in the rate of increase, but even a shrinkage in the total demand for electricity. One special factor, however, might well come into play: a general policy of railway electrification. It is difficult, however, to foresee how quickly or how extensively railway electrification would offset a falling general demand for electricity.

The Weir Report on Railway Electrification (not to be confused with the Weir Report which gave birth to the Grid) estimated that if the railways of the country were completely electrified (envisaging this as a twenty-year programme, though perhaps a shorter period might be possible, a more than proportionate part being accomplished within, say, the first seven or eight years) the energy required would be about 6,000 million units. This is the total of direct current at the voltage of utilisation; it would probably correspond to about 7,500 million units a.c. at high voltage, and would call for a maximum demand of perhaps 1½ million kilowatts. The present rate of consumption for the country as a whole is perhaps 23,000 million units a year. It will be seen, therefore, that railway electrification could make a considerable contribution to the maintenance of output during years of recession. But its effect on the Board's fortunes is less easy to predict. In the areas supplied by undertakings owning selected stations, the railways would buy their power direct from those undertakings. In other areas the supply would be taken direct from the Board. If this supply were taken at the Grid Tariff it would probably be a decidedly remunerative load; but more probably the price settled would be a low one.

Finding some such factor—and it is difficult to discern any other cause of any magnitude—it is to be expected that the total electrical load of the country would diminish

in depression. What part would this play on the fortunes of the Board? In respect of its trade with owners of those selected stations which have been built of no greater capacity than is necessary to meet their owners' requirements, the Board would suffer no loss. If the owner is buying at the hypothetical costs of independent generation, the plant necessary (however hypothetical) for one year's load cannot be deemed to be whisked away if next year the load falls. It is in respect of sales at Grid Tariff that the Board would suffer loss. Here it is possible to foresee a very substantial diminution of revenue with very little reduction of costs to set against it. In fact, some elements of cost would increase, since plant extension programmes, for a substantial part of which the Board is financially responsible, must be settled more than two years ahead. As, however, the Board treats interest on capital during construction of generating stations as a revenue charge, the potential increase in the financial burden is not so threatening as it would be if a less conservative policy were followed.

It is, however, impossible to make any measure of the potential loss to the Board due to a serious depression, the more so as no information is available regarding the volume of its trade transacted at the Grid Tariff. All that can be said is that the Board is likely, by the time depression comes, to have a comfortable lump of fat to sustain it through a period of adversity. The revenue account now shows a credit balance of £2,190,472. The surplus for the current year is almost sure to be greater than last year's figure of £492,041; and there are obviously also certain concealed reserves due to the conservative estimation of revenues not settled at the closing of the accounts.

The Board's Surpluses—A Suggestion

Let us now turn to consider the future through less gloomy spectacles. If the load continues to grow, the earnings of the Board will almost certainly continue to expand. Interesting questions will then arise. If nothing happens to change industrial prospects for the current year, it would not be surprising if the Board, after making increased provisions for replacement, showed a surplus for 1939 of £750,000, or, possibly, even £1 million. For the first three months of the current year the increase in the number of units sold has amounted to 13.7 per cent. It is probable that the smaller and less urban undertakings have contributed as fully as in the past to this increase, and their demand is particularly helpful to the Board's earnings, for they form the bulk of Grid Tariff consumers.

At this rate, it would not be long before the Board had accumulated a sufficient surplus to protect it against reasonably foreseeable depression without any alarm for its finances. Reasonable provision for such an emergency can be justly regarded as a first claim on surplus earnings. But after this point it would be obviously desirable to share some of the benefits among the authorised undertakings. It might, alternatively, be thought desirable to accelerate the amortisation of certain intangible assets in the Board's balance sheet, but such a measure would unreasonably prejudice the present to benefit the future.

If the growing surplus were to be devoted to the benefit of authorised undertakers the division of the benefit would hardly be effected without controversy. Grid Tariff consumers would probably be the most numerous and perhaps the most vocal claimants. On the other hand, owners of selected stations would say, with no less justice, that they are the greatest contributors to the Board's prosperity, and so far (their owners might argue) the Grid has provided no advantage to them. But yet another possibility presents itself. A great deal of the Board's trading is conducted on the basis of hypothetical plant and hypothetical cost. As time goes on, the element of hypothesis must grow larger and the foundation of reality proportionately less. It is hard to contemplate the indefinite continuance of this rather unreal state of affairs.

As at present constituted, the Board is inhibited from owning or directly operating any power station, unless it is established that no one else will undertake the responsibility. In the great majority of cases no harm has been done by this rule; the terms of the Board's arrangements give the owner of a selected station every incentive to

efficiency, and the proportion of cases in which efficiency of operation might have been bettered to a significant degree is not great. It is known, however, that there are cases where operating efficiency has been lamentably low; and other cases—not confined by any means to the smaller undertakings—where capital costs of construction have been extravagantly high.

If the Central Board were to take over (by purchase or lease—for financial reasons the latter would usually be more convenient) and operate selected stations, there would be no reason to expect that efficiency would in any single case suffer, if the Board retained its high standard of management. In many cases it would certainly gain, and in some cases gain considerably. At present a certain division of responsibility is bound to arise between the Board and the owners of selected stations, which might well have led to greater difficulties than have hitherto transpired; and the centralisation in the Board of direct responsibility for generation would have certain advantages by way of planned technical progress. It is assumed, of course, that if selected stations were taken over the necessary staff of engineers and operating personnel would also be taken over.

Evidently it is not practicable that the Board should take over selected stations on terms which give no financial advantage to their present owners. If, however, the Board were in a position to offer to lease selected stations from their owners and to give a supply in future on satisfactory terms, and the whole deal could provide a reasonable financial inducement to the owners, the situation would be different. Here, possibly, is a use for some part of any future surpluses which the Board might consider it could spare. Such a policy would need legislation, and financial reasons, if no other, would make it desirable for the Board to proceed gradually.

The advantages that might be expected can be briefly set out. First, a fairly immediate improvement, of modest size, should be seen in the efficiency and economy of generation by raising the standard of less efficiently run stations. Secondly, a better and more organised development of generating technique in the future should result. Thirdly, some improvement might well be encouraged in the standard of distribution. At present, the outlook of the chief executives of many large undertakings is warped by the ownership of generating stations—fascinating instruments which tend to divert attention from the more prosaic, but no less important, problems of distribution. Furthermore, the ownership of generating plant has biased the selection of chief executives for large undertakings—particularly municipal undertakings. If a municipality owns a magnificent generating station which is a source of pride to the council, it is very likely to choose for the control of its undertaking a man whose principal abilities are in supervision and management of generating plant. Such a man is not likely to be the man best fitted for running a large commercial undertaking—and he may even not be the best type for devising the distribution system. If generating stations were handed over to the C.E.B. the chief executives of more large undertakings might be recruited on grounds of outstanding commercial ability and not necessarily on engineering qualifications. This suggestion for the use of some part of the anticipated surplus profits of the Board should be to the advantage of the supply industry. But it would not exclude the use of part of the surplus to benefit those smaller units in the supply industry, the Grid Tariff consumers.

Conclusion

This survey of the Central Electricity Board has shown how it originated, how it has functioned, and what its future may be. It demonstrates that the results achieved amply justify the boldness of the project. No great claim has yet been made that it has contributed tremendously to the achievement of what is, after all, its principal aim, namely a "cheap and abundant supply of electricity." It has, however, already made a significant contribution to that object, and one that is certainly larger than is generally realised. There is no doubt that in the future its contribution will be even greater.

THE BUSINESS WORLD

Britain's Exchange Clearings—I

EXCHANGE clearing, in its present accepted meaning, is a comparatively recent addition to the machinery of international trade. It sprang up in Central Europe in 1931, as a corollary of the foreign exchange restrictions introduced in that year, while in this country it was first put into application as recently as in 1936. Originally, exchange clearings were instituted by creditor countries, mainly as a coercive measure to ensure the payment of outstanding debts due to their nationals from countries operating exchange restrictions. This initial aim has, however, gradually receded and the primary function has become the continuance and regulation of reciprocal trade, under conditions of exchange restrictions, by way of dispensing with the purchase and sale of foreign exchange.

Britain's first clearing agreement was that concluded with Spain, on January 2, 1936, followed in succession by the Anglo-Roumanian Agreement, signed on May 2, 1936, the Anglo-Turkish Agreement of September 2, 1936, and the Anglo-Italian Agreement, signed on November 6, 1936. The Anglo-Spanish Clearing proved a short-lived one, as political developments compelled both parties to suspend it in December, 1936, since when it has not been resumed. The remaining three clearings are still in operation, although all have been modified by supplementary agreements.

The Controller of the Clearing Offices issues regular monthly statements on the position of accounts, which are of great practical value for those trading with the countries concerned, as they convey, along with specific information, a fair indication of the "transfer risks" connected with prospective deliveries. According to the statements issued on March 31, 1939, the total sums liquidated through the three clearings since their commencement appear as follows:—

	Total deposited	Trade arrears cleared	Financial debts cleared	New exports cleared
Roumania* ...	9,831,579	1,616,602	2,140,100†	4,044,354
Italy	15,454,841	2,883,512	914,762	11,348,689
Turkey	2,679,617		£1,832,015	

* As from February, 1939, only the figures relating to the new agreement are published; the above figures cover both agreements.
† Including public debt service.

In order to consider the true meaning of the available figures, it is necessary to relate these to the respective agreements. In the following the agreements will be examined separately, in an order dictated by convenience.

Anglo-Italian Clearing.—Under the supplementary Agreement of March 18, 1938, the allocation of sterling deposits is as follows:—

- 46 per cent. to Coal Sub-Account, in payment of coal exports.
- 41 per cent. to Sub-Account "D," in payment of all other exports.
- 6.5 per cent. to Arrears Account "A," in payment of trade arrears.
- 6.5 per cent. to Arrears Account "C," in payment of financial debts.

The agreement represents what may be called the standard or orthodox type of exchange clearing. Except for the separation of coal exports from other goods on the British side, all exports and imports are treated globally

and uniformly. The rate of conversion is the official rate of sterling on the Rome Bourse, at present fractionally under 89 lire. Study of the monthly statements shows that the pace of liquidation in respect of current exports has been a fairly steady one for some time now, exports of coal being settled in about 15 days, those of other goods in about five months from date of deposit in Rome.

It must be added, however, that this relatively smooth working has been achieved only at the cost of a substantial contraction of British exports to Italy, which have had to be curtailed repeatedly. Actually, in the present position the initiative rests entirely with Italy, the extent of trade being determined by the value of Italian exports to this country, and these have been showing a falling tendency. It is apparent that at the prevailing "official" rate of conversion, the Italian currency is substantially overvalued in relation to sterling, a view that finds its confirmation also in the exchange discounts to which the various categories of lire are subjected in free markets. As a natural consequence, Italian exports tend to be diverted to countries whose currencies are equally overvalued, a point that will be enlarged on in a second article.

While, therefore, regarded purely as a payments agreement, the Anglo-Italian Clearing may be said to be working adequately, its effect on the reciprocal trade of the two countries is decidedly a restrictive one.

Anglo-Turkish Trade and Payments Agreement of September 2, 1936, modified by Supplementary Agreement of May 27, 1938, provided for sterling deposits effected in London to be allocated as follows:—

Ordinary Trade	Compensation Trade
70 per cent. to Sub-Account "A" in payment of outstanding and current debts, in chronological order.	10 per cent. to Sub-Account "A" (see opposite).
30 per cent. to Sub-Account "B," at the free disposal of Central Bank of Turkey.	30 per cent. to Sub-Account "B" (see opposite).
	60 per cent. to Compensation Account, in payment of new exports, outside chronological order. (Also available for arrears.)

In comparison with the Anglo-Italian Clearing, the Turkish Clearing presents two main structural differences. First, it allows 30 per cent. of the value of ordinary exports from Turkey to be released in free sterling, a not unusual practice in clearing agreements with economically weak countries. Secondly, it introduces the principle of compensation business, which does not imply, as often wrongly assumed, any direct barter of goods, but simply the payment of a special premium by the Turkish importer to the exporter, encouraging thereby the exportation of certain specified categories of Turkish products. What happens at the British end is that the values of the two operations are set against each other, outside the ordinary clearing, thus enabling prompt payment for the British exporter concerned. In other words, compensation business under clearing creates a flow of reciprocal trade at a special, free-market rate of exchange, alongside the normal exchange of goods regulated through the ordinary clearing at "official" rates.

The figures of the Anglo-Turkish Clearing provide no very encouraging reading. A steady accumulation of deposits in Turkey awaiting remittance has led to a sum of £1,790,000 standing unremitted on March 31, 1939. The figure compares with a total of £1,227,911 paid out

to British exporters through the ordinary clearing since its beginning and shows, moreover, an increase of £359,000 over the corresponding figure a year ago. The explanation lies, again, chiefly in the "official" rate of conversion, which is at present 590 piastres. Evidently, at this rate the Turkish currency is considerably over-valued, a fact for which nothing furnishes more convincing evidence than the premium paid (on sterling) in compensation trade, which is at present over 60 per cent.

So long as this official rate is maintained in the operation of the clearing, there seems little likelihood for improving its present position. Recent indications point to a growing portion of current trade being diverted to compensation channels, in itself quite a natural development. At the same time, the question of the amounts outstanding will have to be tackled sooner or later, as it seems hardly capable of solution within the framework of the existing agreement.

The *Anglo-Roumanian Clearing* marks a third stage in the evolution of clearing agreements. Compensation trade was provided for in the first agreement, of 1936, on lines essentially similar to those described above. Following the good results achieved by the experiment, a further bold departure was made in the second agreement, signed on September 2, 1938, which extended the principle embodied by clearing compensation, i.e. the freeing of the exchange rate, to all classes of goods. Virtually the Anglo-Roumanian Clearing stands now midway between a clearing system and a free exchange regime. While control over the operations is being maintained on both sides, the rate of exchange is allowed to find its natural level. The allocation of sterling deposits is at present as follows:—

Ordinary Trade	Compensation Trade
40 per cent. to Special Account, in payment of public debts service, banking credits, outstanding debts, and Government purchases (A).	0-30 per cent. (according to product) at free disposal of Roumanian National Bank.
40 per cent. to U.K. Goods Account, in payment of any goods of British origin (B).	Balance in equal proportions: for payment of United Kingdom goods, listed on Schedule "B" (D), and goods from any country, listed on same Schedule (E).
20 per cent. to U.K. General Account, for financial payments within the U.K. (C).	

Imperial Chemical Industries

INEVITABLY, the first comment on the 1938 accounts of Imperial Chemical Industries must be to congratulate the directors on adding the essential complement of a consolidated income statement to the consolidated balance sheet which was first introduced last year. The market reputation of a great concern can only be strengthened when the directors are clearly at pains to give the fullest possible information to their shareholders, leaving less room for whispers of great profits hidden away or of dark losses concealed.

The consolidated income statement, in fact, shows that the profit and loss account of I.C.I. itself has already been telling most of the story, so far as net profits and reserves are concerned—assuming, as is reasonable,

In addition there is a special regime for oil exports, allocating 50 per cent. to the Special Account, the balance to be used for approved payments of the oil companies.

The Special Account, appearing in the monthly statements under separate headings according to its subdivision, continues to be governed by the official rate on sterling, which is Lei 667. The four further categories of sterling, as shown above, are dealt in freely in the Roumanian market, the latest quotations being as follows:—

	Lei
Compensation rate for U.K. goods (D)	1,050
Ordinary rate for U.K. goods (B)	1,070
Compensation rate for goods from any country (E) ...	1,270
Rate for financial payments (C)	1,400

As was only to be expected, the new system has given a considerable impetus to Roumanian exports to this country. In the first quarter of this year, these exports reached the value of £1,350,000 or more than treble the corresponding figure for last year and the clearing accounts have marked a commensurate expansion.

On the other hand, the freeing of the exchange rate resulted in a remarkable, though not unnatural, development: the considerable discounts on the Roumanian currency have led to a slowing down of British exports, manifested in the accumulation of unused clearing balances at this end. On March 31, 1939, there stood to the credit of Roumanian banks an unused sum of about £400,000 in respect of British exports of the non-compensatory class alone, and while part of this sum is probably earmarked, payments being delayed only by details of procedure, this portion is likely to be more than offset by further sterling deposits on imports in transit or under clearance.

Recent experience confirms that the prevailing exchange rates are prohibitive for a wide variety of British goods previously sold in Roumania (mainly consumption goods) and while some automatic adjustment in the rates is bound to take place through the play of supply and demand, it is doubtful whether this can suffice to bridge the existing wide gaps.

Further consideration of some of the problems arising out of these Exchange Clearing Agreements will be given in a second article.

that this year's practice is typical of what has been normal in the past. The consolidated trading profits, less losses, of the group in 1938 amounted to £9,023,292, with a further £951,879 from associated (as distinct from subsidiary) companies, £321,135 from marketable and other securities, and £157,406 from property. Together with miscellaneous credits of £9,861, total income is £10,463,573. Since no comparison with earlier years is available, these income figures stand for the present as a statement of fact rather than as a record of movement; but they are far from exhausting the interest of the income statement. The consolidated balance sheet issued last year had already revealed the relatively small size of the fixed loans and debentures of the group. But the consolidated income statement shows the yet more striking fact that net debenture and loan interest, at £203,321, absorbs rather under 2 per cent. of the total available revenue. Sundry charges, of which the most important are £2,088,682 for obsolescence and depreciation (to which I.C.I. contributes £1,500,000), £514,438 for taxation, and £276,021 for miscellaneous expenditure, including A.R.P., reduce net consolidated income to £7,281,742, from which there is deducted a further £220,451 for dividends to outside shareholders and profits retained by subsidiary companies, before arriving at the figure of £7,061,291, which is the profit shown in the profit and loss account of the parent concern.

From that point onwards full comparison with earlier years becomes possible. The long-term movement of profits (which is shown in the accompanying chart) is considered in

greater detail below, but it can be said at once that, for a year of trade recession, the 1938 results are satisfactory.

They are compared with those of 1936 and 1937 in the following table:—

	1936	1937	1938
Earned for pref.	7,203,329*	7,510,707*	7,061,291*
Ordinary Stock—			
Earned	5,612,315	5,847,195	5,335,210
Paid	3,935,913	4,284,158	4,032,149
Earned %	12.4	12.5	11.6
Paid %	8	8½	8
Free reserves	1,500,000	1,500,000	1,125,000
Carried forward	665,142	556,179	621,245

* After provision to Central Obsolescence and Depreciation Fund: 1936, £1,000,000; 1937, £1,500,000; 1938, £1,500,000

Apart from the appropriations from the year's profit, there are, as usual, several transfers from reserve to write down asset values. Shares, debentures and advances in subsidiary companies are written down by £231,818 from Capital Reserve, which also contributes £53,182 against shares and debentures in associated companies. From Central Depreciation and Obsolescence Fund as much as £1,475,000 is applied in writing down interests in subsidiaries. The net effect is to leave shares and debentures in subsidiaries virtually unchanged at £76,710,937, against £76,697,315. Evidently the board intends to continue to write down the valuation of shares in subsidiaries over a considerable period. In the last three years no less than £9,790,959 has been transferred for this purpose from reserves, to which £6,165,959 was contributed by the Capital and General Reserves and £3,625,000 by the Central Obsolescence and Depreciation Fund. Writing down of assets on this scale must manifestly imply that the directors consider that subsidiaries should be valued at lower figures in the parent company's books. But it need not mean that there has been any previous inflation of values. When a large group is formed, its subsequent organisation into a single and more efficient whole may mean that the very arrangements introduced to improve efficiency will make some plant redundant, while other quite serviceable plant may be modified or changed to conform with the new production scheme. Cases of this kind would no doubt account for the transfer from Central Obsolescence and Depreciation Fund. The amounts written off out of Capital and General Reserve might be applied for other reasons; but much the greatest part of £6,165,959 so employed in the last three years originated in the surplus of £5,434,141 when the company's capital was reduced in 1936. It is reasonable to conclude, therefore, that this policy of transfers from reserve does not spring from doubts in the board's mind regarding the values at which assets are carried, but is rather a normal process implicit in its continued task of consolidating and strengthening the group.

But perhaps the most interesting movements of the year are to be found in the balance sheet. For illustrative purposes, the parent company's own balance sheet is preferable, since it provides comparisons over a longer period than the consolidated balance sheet (which is, however, summarised in the table below). Cash has risen from £1,684,630 at December 31, 1937 (when there were no Government securities to supplement it) to £3,999,767, plus £1,000,269 of Government securities at December 31, 1938. The improvement is due partly to the proceeds of 500,000 preference shares in African Explosives and Industries, Ltd., sold on the London market last July, partly to a decrease in sundry debtors, but mainly to a fall of £1,259,535 in marketable and other investments "arising from the sale of certain holdings."

That is a move to be heartily welcomed. Again, it is reassuring that market and computed values of the present portfolio show a surplus over book values, compared with a depreciation of £324,066 at the end of 1937. Rightly or wrongly, the market has often been ready to listen to rumours, however unreasonable, of large losses on these marketable securities whenever sudden falls occurred on Wall Street. More important, the relatively small cash holding of the company has in the past been an undeniable weakness in the balance sheet. In the parent company's account, cash stood at over £4,000,000 in 1931; and in 1932 and 1933 cash and Government securities amounted, roundly, to £7,000,000 and £8,000,000. But more recently the cash holding has been reduced to between £1,000,000 and £2,000,000, unsupported by Government securities. However well marketable shares may turn out as a trade investment over a long period, there can be no doubt that cash and Government securities are normally preferable for a great concern in a developing industry, which may at any time have to embark on large-scale capital expenditures. Normal depreciation and reserve allocations would, of course, provide some millions of cash out of profits which might suffice to finance capital expenditures in an ordinary year—though last year, when no major development was undertaken, saw capital expenditures of as much as £3,014,000. Manifestly a great concern should have ample cash resources beyond its ploughed-back earnings, and the strengthened cash position in the latest balance sheet represents a marked improvement.

Taking a wider survey of the company's progress than is offered by detailed study of the year's accounts, the movement of profits during the past decade must be considered satisfactory, even though the unfructified earnings originally represented by the deferred shares have not come up to expectations. In the table overleaf the Board of Trade Index of Production for the chemical and allied trades is compared with an index of I.C.I. net profits, first on the base of 1930 = 100, and then on the base 1935 = 100.

CONSOLIDATED BALANCE SHEET ANALYSIS (in £000's)
Imperial Chemical Industries and subsidiary companies

	Dec. 31, 1937	Dec. 31, 1938
Cash	2,693	5,766
Marketable and other investments	6,914	6,754
Total liquid assets	35,607	37,065
Creditors, loans, charges, tax, etc.	12,063	12,870
Total current liabilities	15,761	16,316
Surplus liquid assets	19,846	20,749
Land and buildings	23,857	24,037
Plant and machinery	32,399	33,474
Ships, rolling stock, etc.	1,226	1,242
Shares and debentures in associated cos.	7,436	7,091
Patents, mineral rights and goodwill	15,699	15,727
Total Fixed Assets	80,617	81,571
Obsolescence and depreciation	5,635	5,683
Minority interests	2,335	3,427
	92,493	93,210
Prior Charges—		
Debs. and secured loans of subsidiaries	5,889	5,725
Pref. stock (I.C.I.)	23,801	23,801
Net equity	62,803	63,684
I.C.I. ordinary stock	50,402	50,402

IMPERIAL CHEMICAL INDUSTRIES' PROFITS 1929-38

Next Week's Issue will include the
FIFTH ANNUAL SURVEY
of the position and prospects of
UNIT TRUSTS
published by *The Economist*

The Survey will review the developments of
the past year and will include articles on

Growth of Sales
New Trust Formations

Statutory Control of Unit Trusts
Management Costs

The Survey will also contain a directory of all unit trusts formed
in this country, and particulars of management companies.

	1930 = 100	1935 = 100
	Chemical and Allied Trades Production	I.C.I. Net Profits
1930	100	100
1931	95.9	76
1932	98.8	106
1933	101.7	134
1934	104.6	142
1935	110.6	150
1936	115.4	161
1937	124.5	168
1938	118.1	158

The movement of the two series of indices is instructive. The first series shows that after the setback due to the great depression, I.C.I. profits forged ahead much faster than production. By 1935, production was 10 per cent. higher than in 1930, but profits were 50 per cent. higher as a result, no doubt, of improved earning power resulting from reorganisation. But since 1935, as the second series

shows, the movement of profits has been closely parallel with the movement of production, which suggests partly that most of the fruits of reorganisation are now gathered, and partly that the directors have adhered to their declared policy to regard the group as a responsible national institution already earning a fair return on capital, and to pass on most of the benefits of improved efficiency to customers.

From the investors' point of view, I.C.I. ordinary stock emerges from this year's accounts, and over a longer period, as a sound industrial holding. The war equity of the group is almost certainly smaller than the public sometimes assumes. Indeed, some fall in profits might occur during a war, though any fear of a collapse in earnings can be ruled out.

At the current price of 29s. 10½d. the ordinary stock yields £5 7s. 6d. per cent., a reasonable, if unexciting, return for an essentially stable industrial equity.

Finance and Banking

The Collapse in Discount Rates.—Much of the substance has already departed from the widespread criticism of the authorities for their alleged new "dear-money" policy. This week the position in the short-loan market has eased appreciably, and there has been something approaching a collapse in discount rates—the three months' Treasury bill rate having fallen from 1½ to ¾ per cent. The turn of the month marked the turn of this credit tide. A further expansion of £6,376,000 in the note circulation was fully neutralised in its effect on bank cash by the appropriate increase in securities held by the Banking Department. On the other hand, the authorities allowed the May 1st dividend disbursements to have their full effect on the cash position, and thus the latest Bank return shows a decrease of £16,468,000 in public deposits and a corresponding increase of £16,789,000 in bankers' deposits. With their cash positions thus fortified, the clearing banks from the beginning of this week re-entered the market as buyers of bills. It was their competitive bidding for June and July maturities which provided the factor immediately responsible for the decline in bill rates. By Thursday the clearing banks, in order to satisfy their requirements of July bills, had been forced to reduce their buying rate to ¾ per cent. The money position has eased correspondingly. By Wednesday all clearing banks had brought back their rate for old loans against bills to ½ per cent., and by Thursday it was becoming more and more difficult to obtain ¾ per cent. for any bill money. The substantial sales of July maturities to the banks have liberated a corresponding amount of money, and the demand for fresh loans against bills has virtually disappeared for the time being.

Japanese Currency Manœuvres.—By all accounts the yuan, which is the new currency introduced by the Japanese in Northern China, is experiencing very heavy weather. Its complete introduction was to have been effected by March 10th, but it was subsequently decided to postpone the full plan until April 10th, and even now it is not completely in force. The Chinese themselves will have little or nothing to do with it, while the foreign banks regard it as inconvertible, and so are segregating it in special accounts, virtually on a clearing basis. Meanwhile it is only quoted at a discount of 30 per cent. compared with the Chinese dollar (instead of the hoped-for premium equal to that of the Japanese yen), and thanks to the sterling and dollar credits granted last year, the Chinese dollar has recently been very stable at about 8½d. It is true that remittances abroad are not always easy to arrange, but in the main the dollar is functioning successfully as the medium for financing China's external trade. The Japanese have recently drawn up regulations for the formation of a Reserve Bank at Nanking and the

introduction of their own currency in Central China, and it is clear that they wish to get into their own hands all the foreign exchange emanating from Central China's export trade. The new regulations, however, have not yet been promulgated, and recent reports suggest that the Japanese will move very slowly and cautiously. Their chief weapon is the hold they now have over the customs, while they may also make the reopening of the Yangtse conditional upon the acceptance of the new currency by both Chinese and foreign traders and bankers. On the other hand, their experience in North China is not encouraging, and, of course, any attempt to enforce a new currency or to obtain a monopoly of the proceeds of China's export trade would be bitterly resented in both Chinese and foreign commercial circles. These considerations may suggest to the Japanese the need for extreme caution, and no definite move has been made as yet, beyond the drawing up of the regulations. Meanwhile the Chinese dollar remains a stable currency, well able to finance such trade as is possible to-day.

A "Bear Squeeze" in Belgas.—The feature of the foreign exchange market during the past week has been the appreciation of the belga to a point well beyond that at which it began to pay to send gold from London to Brussels. The rush to buy belgas which, in little more than a week, has sent the rate from 27.85 to 27.50 to the £ has been caused largely by bears of the currency who have hurried to cover following the disappointment of their hopes of an early devaluation. The Belgian authorities have made the most of the opportunity given to them to teach the speculators a sharp lesson. The exceptional tightness of the credit position in Belgium has made it virtually impossible for the bears to borrow the belgas they had sold forward. They have therefore been forced to go to the spot market for their covering operations, and here the National Bank has for the time being had the whip hand and has been able to impose its own terms. Speculators against the belga had perhaps based their operations on the assumption that their losses were limited by the cost of sending gold from London to Brussels, basing their reasoning on the statutory obligation placed on the National Bank to buy gold at 6,615.46 belgas per kilo fine. They had not reckoned, however, on the fact that an import licence has to be obtained for importing gold into Belgium or had assumed that this licence would be granted automatically, as had been the case in the past. It served the immediate purpose of the Belgian authorities not to grant such licences and therefore no gold has gone from London to Brussels, though on paper the profit to be made on such arbitrage would have yielded up to 1s. per

ounce of gold. As the Belgian National Bank is at present engaged in transferring the bulk of its gold reserve from Brussels to London and New York, it does not wish to receive gold in Brussels, but prefers to acquire the foreign exchange with which, if it so wishes, it can obtain gold on much better terms in foreign centres. This not only serves its own immediate purpose of shifting the Belgian gold reserve abroad. It also castigates the belga bear more severely than if his losses had been limited by the gold point from London.

British Banks and Dollar Accounts.—Many Continental owners of refugee funds find it difficult to make up their minds whether they prefer to keep their money in London or in New York. Some of them, being desirous of eating their cake and having it, have opened dollar accounts with London banks. Most London bankers receive such accounts without much enthusiasm, for it is almost impossible nowadays to earn money on dollar balances.

American banks allow no interest on sight deposits, and at present it would not pay to employ such funds in swap transactions. The London banks, in order to be compensated for their trouble, have to charge a commission on dollar accounts, or alternatively they stipulate that owners of such accounts must also keep a sterling account with them, with a minimum balance. The dollar deposits are kept in the name of the London bank, but the foreign customer is informed with which American bank his funds are kept, and the London bank disclaims liability in case of the insolvency of the American bank in question. This arrangement was initiated in 1931, when there was a danger of losses through bank failures; at present the condition is a sheer matter of form, since the funds are usually kept with first-class New York banks. Most London banks also stipulate that the owners of the dollar balances are not entitled to draw dollar cheques. They also refuse to issue dollar cheques at the request of the owners of dollar deposits who can only dispose of their funds by means of mail transfer. In many instances the London banks prefer to introduce their client to an American bank branch in London rather than open a dollar account for him.

MONEY MARKET NOTES

Foreign Exchanges

THE immediate reaction to Hitler's speech in the foreign exchange market was favourable, and while Swiss francs, guilders and French francs were strong in terms of sterling, the pound itself appreciated against the dollar. On Saturday, however, its effect seemed to be wearing off, and sterling showed a slightly weaker tendency, the sterling-dollar rate again being pegged at 4.68½. On Tuesday, for the first time for some weeks, there was a noticeable improvement in the undertone; buying orders for sterling were received from several centres, which sent the rate up to 4.68½, although it closed a little lower at 4.68½. The better tendency, however, was not maintained, for the following day, after a firm opening, it relapsed to 4.68½, at which level it was held by the Control. On Thursday there was little change. The forward premiums contracted on Tuesday to 1½c. for one month and 2½c. for three months; on Thursday the three months' premium was only 2-1½c., as a result partly of official operations in the forward market. Swiss francs have also not maintained the improvement shown after Hitler's speech, when they fell to 20.82½, and have since risen to 20.85½-6½. Guilders, which benefited at the end of last week from the repayment of a Dutch credit to France, have since relapsed, and on Thursday were quoted at 8.78½ fl., against 8.75 fl. last Saturday, although they recovered in the late afternoon to 8.77½-¾ fl. Registered marks were weak on Thursday, and were offered at a discount of 65 per cent.

The Bank Return

THERE has been another big rise this week in the note circulation, which is now at its highest level of the year and is £4 millions above the Easter peak. The corresponding Bank return of last year also showed a rise; but it only amounted to £1.2 millions, so that the increase this year of £6.4 millions, taken in conjunction with last week's rise of £4.1 millions, must be put down to precautionary measures against international events, hoarding and, possibly, to bigger purchasing power as a result

of the Government's heavy armament expenditure. It is noteworthy that the level of the note circulation this week is not only £5 millions higher than a year ago, but is as much as £20.3 millions higher than in 1937, when it was expanding under the influence of the Coronation. The gold in the Issue Department has been valued at 148s. 5d. per fine ounce, compared with 148s. 6d., and as the value of the total gold holding is unchanged, there must have been a transfer of gold to the Bank from the Exchange Account. In the Banking Department the most interesting feature is the rise of £16.8 millions in bankers' deposits, which easily explains the relieved conditions in the money market. The bigger note circulation has not been allowed to affect bankers' deposits, for it has been offset by an

increase of £4.7 millions in Government securities and of £2 millions in discounts and advances, so that the sharp drop of £16.6 millions in public deposits, which is mainly, but not entirely, accounted for by the heavy dividend disbursements on May 1st, has had its fullest possible effect on the banks' cash.

The Money Market

THE return to more normal conditions in the money market is discussed in a Finance Note. It was preceded by a further fall in the average rate of allotment at last Friday's Treasury Bill tender to £1 4s. 3.67d. per cent., in spite of a decline in the total amount applied for from £66 millions to £63.5 millions. The market syndicate, as a result of the smaller applications, obtained a 31 per cent. allotment, against 26 per cent. in the previous

week; but its allotment was small enough to make market houses unwill-

ing sellers to the banks except at lower rates, and there is a tendency to hold bills in anticipation of a further fall.

The Bullion Market

THE turnover in the gold market has dwindled to very small proportions, amounting on Saturday to only £42,000. Sales from Continental hoards are nowadays always restricted when the international situation appears a little easier; but as offerings from these quarters—even though sometimes small—have been continuous in the last few months, while hoarding demand has been negligible in the same period, supplies in the hands of hoarders must have been reduced considerably. It is

significant, too, that the revival of political uneasiness on Wednesday, which affected the foreign exchange market, did not induce any noticeable

increase in Continental resales; for part of the larger turnover, both on that day and on Thursday, was accounted for by official offerings. The stronger tendency in the dollar, and the absence of any premium, encouraged arbitrage

demand which on Tuesday had to be supplemented by official buying in order to absorb the very small offerings; and on Thursday arbitrageurs only obtained about 60 per cent. of their requirements.

INSURANCE NOTES

Motor Union Insurance.—This company, controlled by the Royal Exchange, transacts a large motor insurance business, whose results are included in the accident branch. Accident premiums were slightly smaller at £1,552,000, and the underwriting results were definitely satisfactory for this class of business. Fire premiums increased from £195,000 to £201,000. The results of the last two years are given below:—

	1937	% of	1938	% of
Profit	£	Premiums	£	Premiums
Fire	27,914	14.3	30,337	15.1
General	114,709	7.3	139,170	9.0
Charges to profit and loss	142,623		169,507	
	90,028		80,897	
	52,595		88,610	

Assets total £3,090,000 and aggregate market values of securities £2,485,000, compared with book values of £2,396,000. The investment reserve stands at £254,000 and general reserve fund at £768,000, to which the directors propose to allocate £116,000 from profit and loss. The 37 per cent. dividend costs £54,000, compared with available interest earnings of £81,000.

★

Law Union and Rock Insurance. New sums assured in 1938 increased further from £2,606,000 to the record figure of £2,811,000. In addition, sums assured under staff life assurance and pension schemes amounted to £295,000 and deferred annuities to £68,000 per annum. Death claims increased from £453,000 to £529,000, but surrenders fell from £121,000 to £99,000. The net rate of interest on the life assurance fund was £3 11s. 7d. per cent., against £3 13s. 6d. per cent. Although mainly concerned with life assurance, this company, which is a subsidiary of the London and Lancashire, also transacts fire and accident business. Fire premiums last year fell from £441,000 to £429,000, and accident premium income increased from £260,000 to £265,000. The results of the last two years are given below:—

	1937	% of	1938	% of
Profit	£	Premiums	£	Premiums
Life	17,078	19.3	17,078	17.3
Fire	85,236	19.3	74,188	17.3
Accident & general	4,794	1.8	17,214	6.5
Charges to profit and loss	107,108		108,480	
	39,671		38,644	
	67,437		69,836	

Assets total £14,210,000, against £14,076,000. Of the life assets aggregating £11,859,000, loans increased from £3,267,000 to £3,637,000, while British Government securities fell from £3,194,000 to £3,016,000. Debenture stocks rose by £88,000 to £1,229,000, and preference stocks also showed a moderate increase. The dividend is again 16s. per share and costs £130,000, compared with available interest earnings of £45,000. The profit and loss balance shows a further reduction from £16,700 to £1,500.

London and Lancashire Insurance.—Total premium (excluding premiums in the life department, which is administered by the Law Union and Rock) increased by £20,000 to £6,753,000. Underwriting results for the last two years are given below:—

	1937	% of	1938	% of
Profit	£	Premiums	£	Premiums
Fire	366,720	13.2	324,194	11.8
Accident & gen'l.	100,629	4.0	43,827	1.7
Marine	35,852	2.5	66,236	4.6
Life	17,078	...	17,078	...
Capital redemption ..	1,060	...	1,335	...
Charges to profit and loss	521,339		452,670	
	227,486		197,533	
	293,853		255,137	

The departmental reserves are very strong, and amount to £3,502,000, £2,023,000 and £1,575,000 in the fire, accident and marine departments respectively, equivalent to 127 per cent., 78 per cent. and 110 per cent. of the 1938 premium incomes. Total assets in the consolidated balance sheet, excluding life assets, amount to £18,289,000, and general reserve stands at £2 millions. The profit and loss balance is increased from £2,680,000 to £2,880,000. The 50 per cent. dividend costs £537,000, compared with available interest earnings of £481,000.

★

Legal and General Assurance.—In 1938 the Legal and General issued 13,621 new policies for ordinary business for a total net sum of £7,294,000, compared with 12,658 policies for £7,267,000 in 1937, and 7,892 decreasing term and group assurance policies for £9,271,000 compared with 8,424 policies for £11,282,000 in the previous year. The sum received as consideration for immediate annuities fell from £1,648,000 to £1,159,000. Ordinary deferred annuity contracts, representing future payments of £108,000 per annum, were issued, compared with £117,000 per annum, and group pensions amounting to £1,789,000 were issued against £2,097,000 in 1937. The somewhat pronounced fall in group business, of which the Legal and General is well known as a pioneer, doubtless reflects the uncertainty of the times and is not due to diminution in the scope for this type of protection. In addition, new sinking fund policies assured £1,224,000 compared with £1,518,000. The net rate of interest on the life assurance and annuity fund fell from £4 6s. 7d. per cent. to £4 2s. 8d. per cent. Death claims increased from £858,000 to £972,000, but maturities showed a very large decrease from £1,446,000 to £689,000. Fire premiums increased from £338,000 to £365,000 and underwriting profits were satisfactory at 14.6 per cent. of the premium income; accident premium income was maintained at £207,000 and a satisfactory profit of £20,000 was secured. Total assets increased from £42,735,000 to £47,015,000. Loans and mortgages, including deposits at interest, increased

Silver has shown one or two fairly sharp rises, though the higher prices have not been fully maintained. Buying has not been large, but has been fairly general, while supplies have been very small.

from £14,927,000 to £16,432,000, while deposits on loan showed a large increase at £2,368,000 against £969,000. British Government securities amounted to £7,158,000 compared with £5,850,000, but Colonial and foreign government securities showed little change at £1,777,000. Debenture and preference stocks at £3,956,000 and £2,211,000, compared with £3,263,000 and £1,954,000, respectively, but ordinary shares showed a decrease from £4,343,000 to £4,080,000. Reversions and life interests, a form of investment which has been cultivated to a special degree by the Legal and General, showed some increase at £4,702,000. The dividend is repeated at 40 per cent., free of tax, and costs £100,000; in addition a bonus of £12,500, free of tax, as in 1937, has been declared. Interest earnings are available to the extent of £80,000 to meet these disbursements.

★

London and Provincial Marine and General.—This Company was acquired by the Yorkshire Insurance Company in 1913, and since the war it has transacted fire and accident business, the premium income from which is approximately equal to that from marine insurance. As a rule substantial transfers have been made from the marine account to profit and loss, but in 1938 no transfer has been made; the marine fund, however, increased during the year from £194,000 to £211,000 and now amounts to 180 per cent. of the 1938 premium income. Fire and accident premiums amounted to £113,000 against £116,000. The results of the past two years are given below:—

	1937	% of	1938	% of
Profit	£	Premiums	£	Premiums
Fire & accident	7,307	6.3	9,025	8.0
Marine	15,000	12.3	...	...
Charges to profit and loss	22,307		9,025	
	14,330		26,761	
	7,977		Dr. 17,736	

Total assets amount to £1,582,000. Investment and other reserve funds aggregating £700,000 and the profit and loss balance, after paying the 10 per cent. free of tax dividend on paid-up capital of £300,000, is £148,000. Interest earnings amount to £45,000.

★

British and Foreign Marine Insurance.—This Liverpool marine company, owned by the Royal, has a record of consistently successful underwriting. Last year, however, the 1937 account was closed with a loss of £37,600, equivalent to 8 per cent. of the premiums of that year. Marine premiums last year amounted to £512,000, of which 27.7 per cent. was absorbed by first-year claims, compared with £470,000 (32.5 per cent.) in 1937. There is a small fire (reinsurance) account, for which premium income last year amounted to £24,000, and underwriting profit to

Investment

The Fall Checked?—Investors might be pardoned for supposing that the markets had lost all power of recovery. This week's rally provides a partial assurance that recovery possibilities have not fallen into complete atrophy. In view of the building up of a formidable technical position, markets were due to respond to the first inkling of better news. And this week—at least, for the first part of the week—the news from Europe's storm

BRITISH AND AMERICAN INDUSTRIAL SHARE VALUES DURING THE PAST TWO YEARS

(July 1, 1935 = 100)
British: *Financial News* Index of 30 Ordinary Shares.
American: *Standard Statistics* Index of 50 Common Stocks.

centres has seemed better. The turn of British foreign policy appeared to be bearing some fruit, for although Herr Hitler complained a week ago about encirclement his speech slammed no doors, and may have tempted the more adventurous investor into feeling that a political respite was at hand. Whether this respite will be shorter in view of the departure of M. Litvinov from the Russian Foreign Ministry has yet to be seen. Viewed in relation to the movements of the past month, however, this week's rally has still to be treated conditionally. It is soundly based, so

far as home industrial equities are concerned, on two assumptions—first, that the political risk may now be discounted at a less extreme rate, and, secondly, that the exigencies of near-war finance will still leave an equity for investors to enjoy. On the first assumption, no mortal would care to dogmatise; and, for the second, many observers regard the Budget only as an interim consolation for the market. In Wall Street, the Albanian crisis over the Easter week-end settled a point on which chart readers had been divided—that a bear market had been in operation since last November. Wall Street does not make light of Europe's difficulties, and it is not receiving the expected assistance from the domestic industrial trend.

★ ★ ★

The Market and Foreign Investments.—If the Chancellor intended to clarify his desires regarding dealings in foreign securities, his answers to questions in the House of Commons this week failed to achieve their purpose. Piecing together the operative portions of Sir John Mellor's question and the Chancellor's reply, it appears that the latter can give no assurance that he does not propose to discourage transactions in foreign securities, where vendor and purchaser are both resident within the United Kingdom. This form of words also applies to the purchase abroad of securities of a British Dominion expressed in terms of the currency of that Dominion. Combining it with the information previously given, to which reference was made on page 261 of last week's issue, it seems that (a) the Chancellor hopes that there will be no British purchases of foreign securities and (b) may propose to discourage transactions in foreign securities between British residents in the United Kingdom. In answer to a supplementary question, Sir John Simon made it clear that he had the problem of capital exports in mind. The relevance of transactions between resident British nationals to the exchange position and the subjection of this type of business to a sort of vicarious frown remains unexplained. It is not surprising, in view of the different interpretations of the Chancellor's

£2,700. Total assets amount to £3,454,000, and apart from adequate departmental reserves, general and contingency reserves total £1,233,000. The dividend is maintained at 13½ per cent. and costs £134,000, compared with interest earnings of £125,000.

★

Marine Insurance Company.—Following a substantial increase in premium income in 1937 from £592,000 to £722,000, a further expansion to £743,000 occurred last year. First year claims and expenses accounted for 33 per cent. of the 1938 premiums, against 37 per cent., and second year's claims reached the same proportion—43 per cent.—as in the previous year. The 1936 account is closed by a transfer of £58,000 to profit and loss, equivalent to 9.7 per cent. of the 1936 premium income, compared with 14.7 per cent., 20.1 per cent. and 23.2 per cent. in the previous three years. Total assets amount to £2,631,000 and the reserve fund to £700,000. The profit and loss balance is reduced from £422,000 to £382,000 after payment of the dividend. The Marine is a subsidiary of the London and Lancashire; the dividend is again 40 per cent. and costs £174,000, against net interest earnings of £84,000.

★

Car and General Insurance.—This company is interested chiefly in

World Marine and General Insurance.—The premium income of this company, which belongs to the "Northern" Group, was somewhat smaller than in 1937. Fire and accident premiums fell from £124,000 to £113,000 and marine premiums from £135,000 to £129,000. The results of the last two years are given below:—

	1937	% of	1938	% of
Amount of Profit	£	Premiums	£	Premiums
Fire and Accident	7,007	5.6	5,324	4.7
Marine	15,000	11.1	10,000	7.7
Charges to profit and loss	22,007		15,324	
Less: Items debited to Profit and Loss account	3,363		10,500	
Net trading surplus	18,644		4,824	

Total assets show little change at £993,000, of which Stock Exchange securities account for £854,000, a sum less than the aggregate market value on December 31, 1938. There is a general reserve of £300,000. The dividend is again 40 per cent., free of tax, and costs £40,000 compared with net interest earnings of £27,700.

motor insurance, and the bulk of its accident premiums is derived from this source. These premiums increased by 10 per cent. last year to £1,506,000, and underwriting profits were satisfactory. Fire premiums were slightly smaller at £98,000, compared with £101,000. Marine premiums fell from £73,000 to £61,000, and the results were unsatisfactory; £32,500 has been transferred from profit and loss to strengthen the marine fund. The underwriting results of the last two years are given below:—

	1937	% of	1938	% of
Profit	£	Premiums	£	Premiums
Fire	15,597	15.4	19,673	20.1
General accident	76,668	5.6	88,272	5.9
Charges to profit and loss	92,265		107,945	
	78,351		70,921	
	13,914		37,024	

Assets total £2,317,000, of which Stock Exchange securities account for £1,658,000, against an aggregate market value on December 31st of £1,784,000. Investment reserve fund stands at £36,000 and general reserve at £560,000, to which £17,000 will be allocated from the profit and loss balance. The Car and General is a subsidiary of the Royal Exchange, and the dividend, maintained at 50 per cent., costs £38,000, compared with available interest earnings of £51,000.

suggestions, that a varying degree of effect is being given to them in the sections of the city concerned. Certain leading jobbers in the "House" have removed American securities from their investment lists. Brokers have ceased to recommend such purchases. But practice is by no means uniform and the view has, indeed, been propounded that the whole matter remains a question for the individual investor and that it is for professional dealers to facilitate the orders which they may receive. In some non-professional quarters there is a tendency to minimise the practical difficulties of understanding and giving effect to the Chancellor's intimation. Apparently, it is not realised that precise limitation on the lines which seem to be suggested would virtually close the London market in international securities, leaving the outside market still functioning. When the requests restricting exchange dealings came into operation a set of precise instructions was issued to the financial institutions affected. A similar step to ensure the correct and general implementation of the wishes of the Treasury regarding foreign security transactions would be widely appreciated.

Prevention of Fraud (Investments) Act.—On Friday last week the "Sharepushing" Bill received the Royal Assent, after a chequered legislative career. In many respects the Bodkin Committee would find it difficult to recognise the Statute which has emerged from their deliberations two years ago. Section 12 of the Act has taken immediate force. In future, misleading, false or deceptive statements, promises or forecasts, whether made consciously or recklessly, in connection with inducements to acquire securities, property, or speculative interests in commodities, may be visited with a maximum penalty of seven years' penal servitude. The provisions of the Act which regulate the business of dealing in securities do not come into force until the Board of Trade appoints a day. After this date no person will be allowed to carry on, or purport to carry on, the business of dealing in securities unless he is licensed by the Board of Trade, or is a member of a recognised Stock Exchange or association of dealers, or exempted by the Board of Trade. The new status of unit trusts, which was introduced into the Bill at a late stage, has been reviewed in recent issues of *The Economist*. Financial journals have reason to respect the provisions of Section 12, and *bona fide* security-dealing organisations may well feel that the net has been spread very wide to catch the small sharks which prey in financial waters. The virtues of the Act will be measured by its success in healing a financial sore without hampering the pursuit of legitimate business.

Capital Market Stagnation.—The value of capital issues in April was the lowest this year, both on our old and new bases, and insignificantly higher than in April, 1938. Encashments of National Savings Certificates more than offset the small new capital requirements calculated on the old basis. The new basis figures show a fall in United Kingdom non-Government borrowing from £5,784,000 to £1,932,000 between March and April, but Empire borrowing, up from £980,000 to £3,073,000, partially restores the balance. Figures on old and new bases are given in the following table:—

(£000's omitted) excluding conversions

	Old Basis					New Basis				
	U.K. Govt.	U.K. Other.	Brit. Emp.	For. Emp.	Total	U.K. Govt.	U.K. Other.	Brit. Emp.	For. Emp.	Total
Monthly av., 1938	6,325	6,424	2,025	235	15,009	6,325	14,146	1,761	528	22,760
Jan., 1938	200	4,197	Nil	Nil	4,397	200	10,547	1,320	30	12,097
Feb., 1938	150	12,001	4,095	Nil	16,246	150	13,900	5,422	Nil	19,472
Mar., 1938	300	4,266	80	2,399	7,045	300	10,194	140	2,399	13,033
Apr., 1938	Dr. 300	125	Nil	Nil	Dr. 175	Dr. 300	3,110	478	Nil	2,288
Jan., 1939	250	8,719	3,110	Nil	12,100	250	12,410	3,426	Nil	16,086
Feb., 1939	Dr. 250	5,819	350	Nil	5,619	Dr. 250	6,165	3,850	Nil	9,765
Mar., 1939	Dr. 450	1,499	26	200	1,275	Dr. 450	5,784	980	200	6,514
Apr., 1939	Dr. 500	285	3	Nil	Dr. 212	Dr. 500	1,932	3,073	Nil	4,505

The "new basis" figures include £1,015,000 of Ceylon 3½ per cent. stock, issued to redeem the 4 per cent. stock, 1939-59, and £617,400 3½ per cent. stock of the Uganda Government, for which permission to deal was given. The most important industrial placing consisted of John Summers' issue of 1,288,185 "A" ordinary £1 shares. Clearly, the Government's defence financing has little to fear in the way of competition from demand for new civil capital.

Foreign Bonds at New "Low."—Renewed political uncertainty is reflected in the new low level of 56.8 recorded by the index of 106 foreign bond prices compiled by the Municipal and General Securities Company in April. The 3.1 points drop in the European index is, however, much less severe than in the preceding month, for effects of the Albanian crisis were fortunately counter-balanced by President Roosevelt's message. Details of the index are given below:—

AVERAGE JANUARY-JUNE, 1934=100

End of Month	Europe	Near & Far East	Egypt	South and Central America			Complete Index	Unaffected Bonds	De-faulted Bonds
				States	Provinces	Total			
1938 April	(28) 88.9	(31) 77.3	(4) 98.5	(35) 69.8	(11) 51.4	(46) 64.9	(109) 75.1	(54) 78.3	(55) 72.1

N.B.—Figures in brackets denote number of bonds included.

Egyptian issues have fallen further, while South American bonds were disturbed by the possibility that the Chilean debt service might be suspended in order to release funds for repairing earthquake damage, and by the continued absence of any debt offer by Brazil. Eastern bonds, however, have proved relatively resistant.

Company Notes

Marks and Spencer Report.—Few surprises are contained in the Marks and Spencer full report to March 31st last, for the features of the year's trading were already known from the preliminary statement, discussed on page 262 of *The Economist* of April 29, 1939. In all essentials its excellent impression is confirmed by the report, which however, discloses that the stores' trading results cover a 53-week period. This point, however, does not seriously affect the general conclusions. Total profits amount to £2,380,610, against £2,106,507, and show a rise of 11 per cent. if allowance is made for the longer trading period. Equity earnings, as estimated in last week's issue, amount to £1,265,019, against £1,134,990 for 1937-38. The uninterrupted trend of profits is brought out in the chart appearing on the opposite page, which covers eleven years to March 31, 1939, and may be compared with last week's profits analysis for the past three years. Apart from the expected symptoms of expansion, the balance sheet contains no striking changes. Properties stand at £8,849,061, against £7,994,597, although some £431,046 was set aside for depreciation, and stock-in-trade is 9 per cent. higher at £1,642,629. The new loan of £500,000 at 4 per cent. appears in the balance sheet, and is secured by an issue of £550,000 4½ per cent. first debenture stock. This new issue (to which reference was made at last year's meeting) accounts for a rise from £3,265 to

£19,856 in general interest charged in the profit and loss account. In each of the past three years the allocation from revenue to general reserve has been kept at £150,000, together with the sum to be capitalised for the annual share bonus. When the latest bonus has been distributed the general reserve will stand at £2,150,000. The general

MARKS AND SPENCER PROFITS—1929-39

impression left by the report is that the continuance of regular share bonuses is fully justified by the maintenance of a high earnings ratio on an ever-increasing capital. Meanwhile, the group retains a large margin of available capital resources. Including the £500,000 of new loan finance, cash amounted to £935,341 at the date of the balance sheet, and net current assets to £757,000.

SUEZ CANAL COMPANY

NOTICE IS HEREBY GIVEN that the General Meeting of Shareholders will be held at the Salle d'Iena, 10, Avenue d'Iena, Paris, on Monday, 5th June, 1939, at 2 p.m.

Holders of not less than twenty-five shares who are desirous of being present or represented at the Meeting must prove at the Head Office of the Company, 1 Rue d'Astorg, Paris, before 2 p.m. on the 31st May, 1939, that they have deposited their shares with the Company or with any of the Company's appointed Agents.

Shares may be deposited in London with Messrs. N. M. Rothschild & Sons, who will in due course deliver a card of admission for the meeting.

Le Secrétaire Général,
MICHEL HOMOLLE.

Paris, May, 1939.

RIO TINTO COMPANY, LIMITED

DIVIDEND ON SHARES TO BEARER

HOLDERS OF SHARE WARRANTS TO BEARER are informed that they will receive PAYMENT of the DIVIDEND declared at the General Meeting held on the 28th instant, at the rate of Two Shillings and Sixpence per Share on the Preference Shares, less Income Tax, on and after Saturday, the 13th May, 1939, on presentation of Coupon No. 84 on the Preference Shares either at the Company's Office in London or at the Société Générale, 29 Boulevard Haussmann, Paris. Coupons for payment in London must be left four clear days previously for examination, and may be deposited forthwith.

By Order,
J. DAVIDSON, Secretary.

11 Old Jewry, London, E.C.2.
28th April, 1939.

GOVERNEMENT IMPERIAL DU JAPON

EMPRUNT

FOUR PER CENT. DE 1910
FRANCS 450,000,000

NOTICE IS HEREBY GIVEN that the COUPONS due 15th May, 1939, will be PAID on and after that date (Saturdays excepted) between the hours of 11 and 3 at The Yokohama Specie Bank, Limited, where lists may be obtained.

Coupons, which must be left three clear days for examination prior to payment, will be paid at the rate of exchange on Paris ruling at the time of their presentation.

For THE YOKOHAMA SPECIE BANK, LIMITED,
H. KANO, Manager.

7 Bishopsgate, London, E.C.2.
1st May, 1939.

Morris Motors Prospects.—The Morris Motors directors claim that, in view of the difficult trading conditions of 1938, the results are "very satisfactory." Those difficulties included falling demand for private cars, particularly in the earlier part of the year, higher costs and certain dislocations caused by the re-armament programme, and together they made a fall in trading profits inevitable. It amounts, in fact, to 19 per cent., for gross profits of £1,751,695 last year compare with £2,168,530 for 1937. The reduction in ordinary earnings, moreover, is roughly equal to the £417,000 fall in gross profits, since higher charges for depreciation and maintenance are offset by a lower taxation provision, as the following table shows:—

	YEARS ENDED DECEMBER 31ST		
	1936	1937	1938
	£	£	£
Gross profit	2,372,082	2,168,530	1,751,695

The course of profits over the past eleven years is charted at the head of the next page.

GENERAL MINING & FINANCE CORPORATION, LIMITED

(Incorporated in the Union of South Africa.)

ABRIDGED REPORT OF THE DIRECTORS FOR THE YEAR 1938. To be submitted at the Annual General Meeting to be held in Johannesburg on 6th June, 1939.

ACCOUNTS

Working profit for the twelve months ended 31st December, 1938, after deducting administration expenses, amounted to	£526,578 6 0
Unappropriated balance brought forward from 1937 was	132,149 5 8
Making the total available profit	£658,727 11 8
Which has been dealt with as follows:—	
Interim Dividend No. 25 of 10 per cent., equal to 2s. 6d. per share, paid to all Shareholders registered on the 24th September, 1938	126,457 18 0
Final Dividend No. 26 of 15 per cent., making a total of 25 per cent., or 5s. per share for the year	189,686 17 0
Amount provided for taxation	10,000 0 0
Amount placed to General Reserve	200,000 0 0
Leaving a balance of unappropriated profit to be carried forward of	£132,582 16 8

INVESTMENTS

The Company's investments are taken into account in the Balance Sheet at £2,835,097, which represents their book value after providing for such depreciation as existed at 31st December, 1938. All investments appear in the books at or under cost, but in no case above the market price ruling at the end of the financial year. The aggregate market value of investments largely exceeds the book value shown in the Balance Sheet.

The principal interests of the Corporation are in the following companies: Van Ryn Gold Mines Estate, Ltd., West Rand Consolidated Mines, Ltd., East Rand Proprietary Mines, Ltd., Durban Roadsideport Deep, Ltd., Phoenix Oil and Transport Co., Ltd., Metal Traders, Ltd., and Castor Lubricants, Ltd. The Corporation also holds various mining properties, real estate and leasehold property, etc.

Copies of the full Report and Accounts can be obtained at the London Office of the Corporation, Winchester House, Old Broad Street, E.C.2.

MORRIS MOTORS' PROFITS—1928-39

Although a 45 per cent. dividend is paid for the third year in succession, it is short-earned by over 10 per cent. on a strict calculation of earnings. In 1937, a dividend equalisation reserve was opened with an allocation of £200,000. To maintain the 45 per cent. payment, half of this reserve is drawn upon, together with £80,163 representing dividends declared by subsidiaries from profits earned before 1938, and the carry-forward is reduced by £32,676. Last summer, the assets of Riley (Coventry) Ltd. were acquired, but this acquisition can hardly have affected last year's results. These assets were acquired in the first instance by Lord Nuffield for £143,119 and 143,119 £1 shares in the new Riley company were thereupon transferred to Morris Motors for the token sum of £100, the difference between the par value of these shares and the nominal payment being represented by an increase in the capital reserves shown in the consolidated balance sheet. The total assets of the group, however, are slightly lower at approximately £13½ millions, owing mainly to a reduction in stock from £3,378,584 to £3,176,445. Until the Budget, the outlook for the current year appeared rather brighter. Stewart & Arden (the Morris distributors) announce that sales for the year to date are considerably in excess of those for the corresponding period last year. A substantial rise in profits, however, would be required if a 45 per cent. dividend is to be maintained out of this year's current earnings, and a current yield of £8 5s. per cent. on the 5s. units 30s. 6d. appears to recognise this fact.

* * *

Ford Profits.—The 11½ per cent. fall in Ford Motor trading profits, from £1,565,465 for 1937 to £1,388,744 last year, measures the effect of the sharp reduction in car sales in the home market. In this respect Ford Motor shared the common experience of other producers, but in addition the company's ancillary income from sales of pig iron was affected by the closing of the blast furnace for a period, owing to the existence of large stocks. Provision for depreciation is increased by £48,658 to £863,723, and after provision for other prior charges equity earnings show a sharp fall from £375,065 to £169,006. The directors however, have again recommended a 5 per cent. dividend,

though it is hardly more than half covered. Profits for the past three years are analysed in the following table, while an eleven-year record is provided by the chart. No credit has been taken for earnings of the Continental subsidiaries:—

	Years to December 31		
	1936	1937	1938
Gross profits, less directors' fees*	1,549,524	1,565,465	1,388,744
Depreciation	649,571	815,065	863,723
Taxation	174,209	229,641	231,979
Employees' funds, etc.	116,412	145,296	122,593
Exchange differences	Cr. 6,912	Cr. 176	1,453
Loan interest	4,477	574	Nil
Ordinary shares:—			
Earned	511,767	375,065	169,006
Paid	405,000	326,250	326,250
Earned (%)	7.6	5.7	2.6
Paid (%)	6	5	5
Carry forward	864,179†	912,994	755,750

* About £7,000 each year.

† After deducting £14,074 net adjustments.

FORD MOTOR PROFITS—1929-38

The 20.5 per cent. fall in debtors and amounts due from subsidiary and associated companies and the 41 per cent. in trade creditors, reflect the year's decreased turnover. Moreover, cash has increased by £863,239 to £1,567,596, and stocks have fallen by £385,876 to £1,725,725. During the year capital expenditure totalled £495,656, but plant, etc., is reduced by £464,223 to £4,630,234—a tribute to cautious depreciation policy. Since the accounts were closed, the Luxembourg holding company has been put into liquidation, and a new holding company has been registered in Guernsey to acquire its assets (except surplus cash of £610,000 and a loan of £898,000 due from Ford Motor) and liabilities for £3,000,000 in shares, which will be transferred to the Ford company. Thus the latter will obtain discharge of its loan, will augment its cash holdings by £610,000, and will control the Guernsey company. Meanwhile, the company is well placed to take advantage of any improvement in demand, but it has no direct stake in re-armament business, in the shape of a shadow factory, and may thus be exposed to the full effects of the higher horse-power tax. Competition in the low horse-power categories, the demand for which may be stimulated by the new duty, is already acute. The £1 ordinary shares quoted at 16s. 9d. yield £6 7s. per cent., compared with a yield of £8 5s. per cent. on Morris Motors. In view of the rather similar profits experience of Ford and Morris last year, the disparity in yields is striking.

* * *

Forestral Land Profits.—A fall of £207,866 in the total profits of Forestral Land Timber and Railways to £443,228 reflects the reduced demand for tanning materials

last year, though in comparison with the profits recorded between 1931 and 1935, the results seem less unfavourable. The total distribution is reduced from 9 per cent. to 7 per cent. on the ordinary shares, by the reduction in the cash bonus from 3 per cent. to 1 per cent., but shareholders do not feel the full force of the drop in profits. In 1937 available earnings represented some 16.1 per cent. for the ordinary capital, but equity earnings in 1938 represented no more than 8 per cent., at £215,020 against £441,134. The 7 per cent. distribution involves the omission of any allocation to general reserve—in 1937, £50,000 was set aside—and the transfer to dividend equalisation account is reduced from £150,000 to £25,000. This account now stands at £275,000, and represents 7½ per cent. actual on the ordinary capital. Each year's profits include varying amounts transferred from the Depreciation Account in respect of investments in La Forestal Argentina, but as these transfers (which amounted to £340,000 in 1938 against £400,000) correspond to amounts appropriated out of profits by La Forestal, they may properly be included in current profits. Despite the relatively wide fluctuations in profits in recent years, the group enjoys a satisfactory financial position. Reserves are substantial, and the consolidated balance sheet shows net current assets of over £4½ millions. Over half of this total, however, is represented by stocks, the rise in which from £2,273,065 to £2,663,934 is probably due to reduced demand. In view of the uncertain outlook for the current year the return of £8 10s. per cent. on the £1 shares at the present price of 16s. 6d. appears justified.

* * *

Canadian Pacific Prospects.—It is impossible not to commend Sir Edward Beatty's faith in the future of the Canadian Pacific Railway, and his insistence upon the advantages of unified railway control in Canada. But it is doubtful whether stockholders will find much positive encouragement from his speech in Montreal this week. Net earnings for the first quarter of the year show a welcome gain of \$220,000. But it seems that last year's final restoration of wage cuts was premature, that competition from other means of transport is increasing, particularly from inland shipping, and that savings from co-operative measures (some in effect and some only authorised as yet) between the company and the Canadian National Railways amounted to no more than \$1,989,000 at the end of 1938. Meanwhile, internal business conditions in Canada remain "disturbed, and in some respects depressed." Manufacturing and mining industries are reasonably prosperous, but the construction industry is lagging, and an improvement in Western grain prosperity still awaits a normal harvest, despite last year's larger crop. In such circumstances the board's decision to omit any dividend on the preference stock last year gains in significance.

* * *

The Week's Company Profits.—This week's company reports, 65 in number, show total net profits of £17,022,603, against £18,063,975 for the previous financial year, a fall of 6 per cent. The total profits of 955 companies whose reports have appeared this year amount to £130,499,000, and show a fall of 9 per cent., compared with the previous year's total of £142,938,870. Our usual analysis of profit and loss accounts appears on page 354, while the results are discussed in preceding notes and on page 330 under the heading "Shorter Comments."

* * *

Company Meetings of the Week.—Reports of company meetings will be found in this issue from page 335. Addressing the *Union Bank of Scotland* meeting, Sir A. Steven Bilsland expressed satisfaction that the bank's investments in the aggregate were worth more than their balance-sheet figure. The investment policy of *Atlas Assur-*

ance was discussed by Mr G. F. Hotblack at the annual meeting. In the past five years most of the new money in the life fund had gone into ground rents, properties, mortgages and other loans. At the *Caledonian Insurance* meeting, Mr Charles H. Scott Plummer pointed out that in the life department the expense ratio had fallen from 16.7 to 16.4 per cent. Addressing *London and Lancashire Insurance* members, Sir Frederick Pascoe Rutter stressed that the amount of interest earnings had been well maintained, and that the value of investments exceeded book values by more than £1,000,000. The issue of 21,513 new life policies, and a total of £16,565,154 new life sums assured were among the points mentioned by Mr Ernest E. Bird at the *Legal and General Assurance* meeting. At the *Equitable Life Assurance* meeting, Mr H. L. M. Tritton pointed out that the Society had obtained a substantial amount of new business from pension schemes. The results of the valuation of the continuous disability account were described by Mr Harold J. Morland at the *Friends' Provident and Century Life* meeting. The fund of £351,648 was over seven times the premium income. A plea for freer consultation between the Committee of the Stock Exchange and accountants regarding applications for permission to deal was entered by Mr C. J. G. Palmour at the *Institute of Chartered Accountants'* meeting. At the *Apollinaris and Presta* meeting, the chairman stressed that, in view of the restrictions hampering export business, it was more than ever necessary to develop sales of other articles. The satisfactory progress made by the Luipaards Vlei development programme was stressed by Sir Frederic Hamilton at the *H.E. Proprietary* meeting. At the *Hudson's Bay* meeting, Mr P. Ashley Cooper stressed the increasingly efficient management of the retail stores, from which increased earnings were to be expected. Mr H. E. Miller informed the shareholders of *Pataling Rubber Estates* of the special cultivation measures undertaken in 1938. At the *London Asiatic Rubber and Produce* meeting, Mr H. J. Welch reported on the directors' intention of using the 5 per cent. new planting quota in 1939 and 1940. Mr E. F. Slade informed shareholders of *Bekoh Consolidated Rubber* of the company's successful efforts to revise its production quota in 1938, and looked forward to increased profits. At the *Rio Tinto* meeting, the Rt. Hon. Sir A. Geddes voiced satisfaction with the results in a difficult year, and stressed the importance of the company's Rhodesian interests. Lord Elibank, at the *Southern Areas Electric* meeting referred to higher coal costs; consumers increased 8 per cent. last year. Mr John Lawson, at the *Olympic Portland Cement* meeting, stressed the burden of double taxation in transferring profits from the United States to Britain, but anticipated full operation of the American plant in 1939 on Government contracts. Members of *Gresham Life Assurance* were informed by the Hon. W. B. I. Barrington that new business on the Continent and overseas had more than made up for the decline at home. Reviewing the progress of *Gresham Fire and Accident Insurance*, Mr Barrington declared that employers' liability business had improved, but motor insurance business was still more difficult. At the *North British and Mercantile Insurance* meeting, Viscount Wakefield showed that in each of the past four years net new sums assured in the life department had exceeded £5 millions. Sir David Milne-Watson informed *South-Eastern Gas* shareholders that sales of appliances had been maintained, and several public lighting contracts had been obtained. Mr Henry S. Loebel disclosed at the *English and Caledonian Investment* meeting that 74.2 per cent. of holdings were within the Empire. *London Electric Wire* shareholders were informed by Mr W. J. Terry that export sales in 1938 increased by nearly 50 per cent.

MAY 9 MAY 11

THIS week the Stock Exchange has given welcome evidence of its inherent power of recovery. Although the tone of the market on Monday promised no improvement, the absence of any spectacular adverse news on Tuesday provided an occasion for a significant recovery, led by gilt-edged. It would be hard to analyse the reasons for which the market put stocks down on Monday and put them up on Tuesday, but the recovery had a snowball effect in mid-week, when home rails, in particular, made an excellent showing. The tone became somewhat unsettled on Thursday on M. Litvinov's resignation, although prices recovered most of their earlier losses.

Further weakness was evident in the gilt-edged market at the opening, concentrated upon the long-dated stocks. But lower bill rates and professional covering produced appreciable gains on Tuesday and Wednesday. Public support was not large, but professional covering produced a smart recovery in prices, both of "longs" and redeemable stocks. Dominion issues, particularly Australian stocks, responded to the better tone and professional dealers were being compelled to pay fairly dearly in order to cover their short positions.

The City of Prague default caused a sharp setback in Czech bonds, which were no higher than 30 in mid-week. German issues, after a heavy opening, rallied and maintained steadier prices, while Roumanian bonds failed to register any response to reports of British financial assistance. Japanese bonds improved, but movements in Brazilian issues were small and on balance downwards.

Home rail stocks showed substantial rallying powers this week. On Tuesday rail stocks improved in line with the rest of the market, but business remained very small. Wednesday's traffics, however, attracted greater support, and the market staged a useful technical recovery in which all the ordinary and marginal preference stocks showed sharp improvements. Argentine issues derived encouragement from the traffic returns.

Though there was no dramatic change in the industrial market, the tone, if not the turnover, improved perceptibly from Tuesday onwards. At the opening of business the tone was still hesitant, but though it became more cheerful as the week proceeded the volume of trading was not greatly increased compared with recent low levels. Iron and steel shares receded early in the week, and then recovered on moderate but persistent buying support. Tube Investments were especially popular. Coal shares became firmer, and Carlton Main rose sharply on the higher dividend. Both engineering and electrical equipment issues became steadier after early irregularity. Johnson and Phillips responded to the increase in profits. Motor shares also were considerably firmer after a disappointing start, and aircraft issues improved slightly in mid-week. Phillips and Powis displayed indifference to the recovery in profits. Textiles continued

dull and irregular, though there was some revival of interest in British Celanese in mid-week. Tobacco share prices again found difficulty in adjusting themselves to the increased tax. Monday's movements were varied and irregular, and though a moderately firmer tendency followed, uncertainty returned towards mid-week. Provision and catering issues made a mixed showing, while the stores group—helped by the Woolworth interim—became less hesitant as the week proceeded. Miscellaneous issues were dull to start with, but recovered smartly on Tuesday. The upward movement, however, lacked impetus, and further gains were usually of a modest size. Shipping shares were firm on the improved freight outlook.

Oil shares, after a dull start, responded on Tuesday to the more cheerful tone. Speculative buying of Mexican Eagles was in evidence. The improvement continued later in the week, as a result of support from the Continent. Political tension and uncertainty regarding the prospects of the automobile industry in the United States were jointly responsible for the featureless market in rubber shares, despite the sound position of rubber stocks and the improved sentiment in other markets. Tea shares were firm on Monday on public interest.

At the opening, mining shares drifted lower in a dull market, but on Tuesday the trend was reversed. Kaffirs were in demand following Cape and Paris support, while among diamond shares de Beers was a feature. Later in the week, movements were narrowly irregular. Tin shares lacked interest, and Rhodesian copper shares were featureless except on Tuesday.

ACTUARIES' INVESTMENT INDEX

The Actuaries' Investment Index of 160 industrial ordinary share prices shows little change over the week to Tuesday, May 2nd, at 59.5, compared with 59.4 for the previous week and 61.7 a month ago. Despite this stability, however, certain component indices have moved to new "lows" for the year. The average yield is unchanged on the week at 6.03 per cent., having risen from 5.83 per cent. since April 4th. A selection of the component indices is given below:—

Group (and No. of Securities)	Prices (Dec. 31, 1928 = 100)			Prices High 1939

New York

THERE were signs this week that Wall Street was devoting increased attention to domestic economic conditions, and was less preoccupied with Europe. The week opened dull and quiet, Monday's turnover of shares being the lowest since June 8, 1938. As the week progressed, rumours of Italian reservations regarding the Axis policy occasioned a firmer tendency. On Wednesday, dealers turned their attention to the domestic scene, and turnover recovered from Tuesday's abnormally low level. Rumours of a change of tax policy in Washington imparted an initial buoyancy and eastern public utility shares, in anticipation of increased revenue from the World's Fair, led the rally, supported by motor shares. Steel mill activity for the week is estimated by the Iron and Steel Institute at 47.8 per cent. of capacity, against 48.6 per cent. last week and is running at the lowest level since September 26, 1938. Later reports, however, of restocking orders and some European demand suggest the possibility of some improvement in the outlook.

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values calculated on closing prices (1926 = 100).

Paris

THROUGHOUT April the amount of business remained at a low level, and was confined mainly to professional operations. Despite its preoccupation with international affairs, the Bourse displayed a satisfactory undertone, and apart from weakness on re-opening after Easter, prices were mainly steady. The relatively good resistance shown by Paris recently is due chiefly to solid progress at home, both industrially and politically, and the behaviour of domestic and international stocks has contrasted. The healthy technical position, however, also played its part. The first week of April was dull, and after the Albanian crisis, satisfaction with the new French and British guarantees was counteracted by reports of military movements. In the second half of the month, the tone was more cheerful, but news of the French defence laws and British conscription were well received without producing any marked effect on prices.

Berlin

ANOTHER month of featureless and quiet trading has been reported by the Berlin Bourse, where the tendency has followed that of other centres. April began well, until business became still more dull on the approach of Easter. Then for about ten days there was considerable irregularity, and no pronounced trend one way or the other. During the last ten days, the Bourse was more cheerful and prices firmer, though there was renewed hesitancy just before the May Day holiday.

Amsterdam

BUSINESS here during the month may be divided into three periods. Before the Albanian crisis, there were signs of increased activity due to cautious local optimism and London demand. Following the Italian coup, sentiment was reversed; buyers were anxious to avoid further commitments and the earlier gains were more than lost. Prices were depressed in the middle of the month, owing to lack of support rather than large selling orders. Following Mr Roosevelt's note of April 22nd, a rally occurred in local and Dutch East Indies shares. In the "armistice" before Herr Hitler's reply the higher prices were more than maintained, owing to reduced selling pressure. On April 1st, the *Telegraaf* combined share index stood at 198.26 and on the 29th, the day after the Fuehrer's speech, at 196.79. Thus the balance of the month's irregular movements is slightly towards lower levels.

Canada

THE Canadian stock markets until the middle of April had an unhappy record and their fortunes went steadily from bad to worse. The German invasion of Czecho-Slovakia produced a disastrous slump which carried stocks to their lowest levels for the year in a few days and the descent continued almost uninterruptedly until mid-April. Confidence began to return, however, on the new turn of British and French foreign policy and on Mr Roosevelt's message, and in the latter part of the month prices were much firmer. But business is on a small scale, and the public still prefers to keep its resources liquid or in first-class bonds. The less hopeful business outlook in the United States also has reacted adversely upon Canadian stocks. The Bureau of Statistics' "Investors" Index for common stocks which stood at 108.9 on March 10th, had fallen to 97.1 for March 31st and to 96.5 for April 6th, and thus fell more than 12 points in less than a month. The bond market, however, has remained relatively firm.

SHORTER COMMENTS

Company Results of the Week.—

satisfactory rise in trading profits, from £148,562 to £168,180, is shown by IDEAL BUILDING AND LAND DEVELOPMENT, but owing to increased taxation its profits are only about £7,500 higher. Progress is shown by UNITED KINGDOM AS CORPORATION, whose net earnings amount to £128,937 against £110,188. Subsidiaries have spent large sums on newals, which should effect some cost reductions in future. Manufacturing profits: BABCOCK AND WILCOX are no less than £829,431 against £607,293. There is, however, a large additional tax provision; and as the board wish to be conservative in distribution policy, the dividend is raised only 2½ per cent. to 12½ per cent. The position of PHILLIPS AND POWIS AIRCRAFT has been transformed, and a trading profit after depreciation of £58,278 contrasts with a trading loss of £15,533 a year ago. The report of CLAN LINE TEAMERS is satisfactory; profits have risen moderately from £712,098 to £723,566, and the 20 per cent. dividend is maintained. Tea companies make a mixed showing. Thanks to a higher crop and a reduction in costs (which offset lower selling prices) UNUVA (CEYLON) TEA net profits are maintained at £104,866, though the dividend is reduced by 2 per cent. to 10 per cent. The drop in tea prices was more severe in the case of NUWARA ELIYA TEA STATES, whose net profits are £38,328 against £50,762. Most investment trusts continue to record a lower revenue. A somewhat sharp decline in income is shown by FOREIGN AMERICAN AND GENERAL and by SCOTTISH MORTGAGE AND TRUST, but ANGLO-AMERICAN DEBENTURE CORPORATION, on the other hand, has fully maintained its revenue at £96,448. Although total profits have fallen fairly sharply from £228,632 to £174,393, BARRY AND STAINES LINOLEUM are able to repeat the 12½ per cent. dividend. Satisfactory progress is shown by J. COMPTON, SONS AND WEBB, the uniform manufacturers, whose net earnings are £90,828 against £81,275. Good results are also reported by JOHNSON AND PHILLIPS, whose 12½ per cent. dividend is repeated from rather higher net profits. The full report of ENGLISH SEWING COTTON shows that total profits have fallen from £251,980 to £184,126, a fall which is moderated by the absence of any charge for debenture interest, since the 4 per cent. debenture stock was repaid in 1937. Despite decreased activity in the building industry, the profits of GEORGE WIMPEY show an increase to £194,313, against £158,189 for 1937. The dividend is maintained at 20 per cent., while the capital bonus costs £75,000 against £50,000. Trading profits and receipts from subsidiaries of GOODLASS, WALL AND LEAD INDUSTRIES improved from £266,569 to £275,416 in 1938, due rather to smaller variations in raw material prices than to increased turnover. The dividend of 6 per cent., plus 1 per cent. bonus, is maintained. JOHN WALKER AND SONS show a sharp increase of profits, after depreciation, from £194,313 to £875,077. The taxation provision, however, is much increased, and the 42½ per cent. distribution is repeated.

J. Lyons & Co.—Profits £1,011,980 against £1,011,000. Final dividend, Ordinary and "A" ordinary, 2s. 10d. per Share making total distribution 22½ per cent.

Boots Pure Drug.—Profits £776,292 against £762,625.

Bethlehem Steel Corporation.—Net profit for first quarter 1939, \$2,409,000, or 17 c. per common share, against \$3,658,000 or 56 c. for fourth quarter 1938, and \$994,000 or 13 c. per 5 per cent. preferred share in first quarter of 1938. Unfilled orders: March 31, 1939, \$192,040,000; December 31, 1938, \$162,774,000; March 31, 1938, \$99,934,000.

George Wimpey and Company.—Profits for 1938, £194,313 (£158,189).

Taxation, £40,000 (£30,000). Preference dividend, £11,500 (£9,000). Ordinary dividend maintained at 20 per cent. Capital bonus, £75,000 (£55,000). To reserve, £15,000 (£15,000). Carry forward, £20,456 (£26,808).

Celanese Corporation of America.—Net profit first quarter 1939, \$1,336,714, against \$114,274 for first quarter 1938. Consolidated statement shows profits for year to March 31, 1939, of \$6,294,292 (\$4,712,281). Depreciation \$1,470,582 (\$1,309,499). Interest on prior charge debt \$478,205 (\$207,229). Amortisation expenses \$15,911 (nil). Federal income tax \$627,378 (\$368,904). Net income \$3,702,215 (\$2,826,648).

Barry and Staines Linoleum Company.—Gross income for year to January 31, 1939, £174,393 (£228,632), including £169,887, against £212,154, from subsidiaries. Net profit £159,740 (£213,339). Ordinary dividend maintained at 12½ per cent. Carry forward £95,566 (£80,285, after £25,000 to special reserve).

Radio Corporation of America.—Net profit, March quarter 1939, \$1,448,000 (\$1,438,000), or 4 c. a share, as before.

Pennsylvania Water and Power.—Common stock earnings, quarter to March 31, 1939, \$531,790 (\$574,429); common dividends \$429,848 (as before). Surplus \$101,942, against \$144,581.

Malacca Rubber.—Profit for 1938, £41,723 (£88,069). Ordinary dividend passed (7½ per cent. in 1937). To estate reserve £20,000 (£10,000). Carry forward raised from £35,665 (after £3,000 for N.D.C.) to £42,076.

Consolidated Gas, Electric Light and Power of Baltimore.—Common stock earnings for year to March 31, 1939, \$4,865,441 (\$5,203,185). Common dividends \$4,202,629, as before. Surplus \$662,812 (\$1,000,556). Amount earned per common share \$4.17 (\$4.46).

Smith's Potato Crisps (1929).—Net profit for year to March 31, 1939, £182,435 (£164,032). Final dividend 20 per cent., and cash bonus 5 per cent., making 32½ per cent. for year (same).

Phillips and Powis Aircraft.—Trading profit, after depreciation and tax, 1938, £38,278 (1937, Dr. £15,533). Net profit £52,628 (Dr. £19,296). Debit balance forward £18,491 (£71,119). Stocks £228,505 (£133,694). Debtors £76,690 (£59,386). Bank overdraft £86,873 (£108,104). Creditors £81,210 (£55,524).

Macleans, Ltd.—Net profits in nine months to March 31, 1939, £190,526, against £212,931 in previous year. Ordinary dividend 25 per cent. for nine months (equal to 33½ per cent. per annum), against 30 per cent. for previous year. To reserves: general, £10,947 (nil); capital redemption, £9,205. Carry forward £3,731.

Cerebos, Ltd.—Trading profit for 1938, £455,619 (£446,505). Net profit £322,395 (£320,201). Ordinary dividend maintained at 40 per cent. To general reserve £50,000, as before. To Income Tax adjustment £7,500 (£3,750). Carry forward reduced from £106,553 to £96,448.

Nitrate Railways Company.—Dividend on ordinary and preferred converted ordinary shares for 1938, 1½ against 1 per cent. Net balance £35,066 (£15,532). Carry forward reduced from £186,493 to £185,334.

John Walker and Sons.—Profit for year to March 31, 1939, £875,077 (£855,342). Tax and N.D.C. £262,000 (£268,500). To warehouse rents reserve, £100,000; property reserve, £30,000 (£16,453); pensions, £20,000 (£10,000). Ordinary dividend and bonus, 42½ per cent., as before. Carry forward reduced from £134,198 to £132,913.

Egyptian Markets.—The company's concession having terminated, it is proposed to write off dead assets, and later to make a return of capital. Capitalisation of £78,615 reserve is proposed by issuing 262,050 6s.

"A" ordinary shares, in proportion of one "A" for each of 174,700 £1 ordinary now held and remaining £26,205 in "A" shares to holders of deferred shares in full satisfaction of their rights (except as to return of capital). It will then be proposed to reduce the capital by returning 23s. 6d. per ordinary share. The deferred shareholders would receive £26,205, plus £300 on cancellation of the deferred shares. Capital would ultimately be £21,837 10s. all in 2s. 6d. ordinary shares.

Chrysler Corporation.—Net income first quarter 1939 \$11,638,000, or \$2.67 per share, against \$12,126,000, equal to \$2.81 per share, for fourth quarter of 1938, and \$2,110,000, or 48 c. per share, for first quarter of 1938.

English Sewing Cotton Company.—Profit for 1938 £184,126 (£251,980). To depreciation £41,862 (£40,570). Directors' fees £7,200 (£7,707). Debenture interest nil (£10,738). Net profit £135,064 (£192,968), plus £50,000 transfer from dividend equalisation reserve, as before. Preference dividend £50,000. Ordinary dividend reduced from 10 to 7½ per cent. Carry-forward reduced from £130,469 to £115,533.

Goodlass Wall and Lead Industries.—Net trading profit and dividends received, 1938, £275,416 (£266,569) after depreciation and N.D.C. Income tax £89,876 (£74,490). Net profit £185,040 (£191,511). Preference dividend £68,312 (£70,668). To reserve £25,000, as before. To staff pensions £10,000 (£7,500). Ordinary dividend and bonus maintained at 7 per cent. Carry-forward £80,599, against £82,938.

Mufulira Copper Mines.—Profits March quarter 1939, £260,500 before taxation, compared with £345,500 for December quarter. For nine months to March 31, 1939, profits £807,500 (£770,500). Gross revenue for the quarter £640,000, against £769,000 for previous quarter. Costs £347,000 (£391,000).

Johnson and Phillips, Ltd.—Net profit for 1938, £133,487 (£126,024). Ordinary dividend maintained at 12½ per cent. To various accounts and reserves £32,000 (£35,000). Carry-forward £104,134 (£102,647). Bank overdraft has been reduced from £49,209 to £6,284.

Platt Brothers (Holdings).—Profit for year to March 31, 1939, £114,389 (£80,685). From debt reserve £3,714 (£39,404). Ordinary dividend maintained at 5 per cent.

British Controlled Oilfields.—Gross profit for 1938, £65,145 (£60,488). Depreciation £95,750 (£144,842). Net loss £30,605 (£84,355). Credit balance forward £1,309 (£31,914). Venezuela output 674,889 barrels (749,838). Market value of investment in Trinidad Petroleum Development Company increased by £404,687.

Ever Ready Company (Great Britain).—Net profit for year to March 31, 1939, £456,958 (£531,575). Ordinary dividend 30 per cent. (35 per cent.). Home market sales increased by 5 per cent.; receipts from overseas and subsidiaries fell.

Clan Line Steamers.—Trading profit for 1938 £692,234 (£712,099). Depreciation £344,797 (£269,935). Ordinary dividend 20 per cent. (same). To reserve, £200,000, as before. To pensions £25,000 (£90,000). Carry-forward £96,271 (£94,820), after crediting £31,332 profit on sale of vessels.

Babcock and Wilcox.—Profits, 1938, £829,431 (£607,293). Dividends received £114,318 (£108,597). Taxation and N.D.C. £67,830 (£52,872). To pensions £29,038 (£26,143). Additional provision for tax £193,000 (nil). A.R.P. £25,000 (nil). Ordinary dividend 10 per cent., plus bonus of 2½ per cent. (10 per cent., but no bonus, 1937). Carry forward £107,102 (£96,648).

General Motors Corporation.—Net earnings first quarter 1939, \$53,177,928, or \$1.18 per share (\$8,234,017 first quarter 1938, or 14 c. per share). Dividend 75 c. on common stock, against 25 c. this time last year.

Industry and Trade

Rush of Shipbuilding Orders.—Between March 28th (when Mr Oliver Stanley outlined the Government's plans for assisting the shipping and shipbuilding industries) and April 27th, the Board of Trade has been inundated with preliminary notifications from shipowners anxious to take advantage of the Government's scheme of grants for new ships to a maximum of £500,000 per annum for a period of five years. The notifications received by the Board of Trade during this period comprise some 190 vessels (150 tramp ships and 40 cargo liners) equivalent to a tonnage of 850,000 gross. Moreover, some 650,000 gross tons of merchant vessels are understood to have already been ordered. Never in its long history has the shipbuilding industry received so many orders during one single month. During the whole of 1938, for example, the tonnage of merchant ships ordered was only 300,000 gross. But as the industry's capacity is still about 2,000,000 gross tons, and since the tonnage under construction at the end of last March was only 597,000 gross, shipbuilders should have no difficulty, despite the heavy volume of naval work on hand, in meeting the expansion in demand, provided they can obtain the necessary labour, steel and other materials. But as the proposed grant is limited to £500,000 per annum, the Board of Trade decided last week not to accept any further preliminary notifications from shipowners and those which have already been sent in will now be examined for the purpose of ascertaining the number and tonnage likely to form the subject of formal applications for a grant when the scheme comes into operation. The grants proposed are 11s. per gross ton for tramps and 16s. 6d. per ton for cargo liners in the case of coal-burning (including dual-fired) vessels, and 10s. per ton for tramps and 15s. per ton for cargo liners constructed to use oil fuel only. The differentiation in favour of coal-burning vessels has already aroused criticism from shipowners. Moreover, the proposed rate of grants is subject to the proviso that the maximum sum of £500,000 is not exceeded.

From Grass to Crops.—The announcement made on Wednesday in the House of Commons by Sir Reginald Dorman-Smith is, on his own admission, to be regarded not as a war measure but as part of a long-term plan to increase the fertility of the soil. Farmers will be able to obtain a grant of £2 for each acre of permanent pasture (defined as fields which have been under grass for not less than seven years) ploughed up between now and September 30th. There is no doubt that a very large acreage of neglected and second-rate pasture can be made infinitely more productive by being brought under a regular crop rotation, providing both crops for sale and valuable fodder for livestock. The Government's grant, which will not cover the high costs of ploughing and sowing, would no doubt be a valuable inducement in this direction if it were available for a longer time, but it seems unlikely that in the five months between now and the end of September grass-land farmers will have time to acquire tractors, ploughs and seed drills, the trained men to operate these machines, and to get their fields ploughed and sown. The Government's policy is commendable, but the subsidy should be made available for at least another year. Meanwhile, plans for increased food production in time of war have made further progress with the appointment of the chairman of the county agricultural executive committees which would be responsible for the detailed administration of war regulations. The Minister also announced on Wednesday that reserves of fertilisers had been accumulated and that plans had been made to deal with the distribution of seeds, tractors and other agricultural requirements on the outbreak of war.

Opposition to Film Duties.—As usual on the imposition of new taxes, the new film duties have been vehemently denounced in the House of Commons this week, and members have gloomily forecast their destructive effect on the industry. Although the onslaught was not accompanied by alternative proposals for a more equitable basis of taxation, it elicited a sympathetic reply from the Chancellor, who declared himself disposed to consider revision in favour of those sections of the industry which might be severely hurt. The occasion for this revision would arise, of course, on the Committee stage of the new Finance Bill; and in the meantime discussions are proceeding between officials of the Customs and Excise Department, the Treasury, and the representatives of the film trade. There is some ground for believing that the news-reel companies can put forward a claim for relief. They are said to consume about 1,000,000 ft. of film stock weekly, on which the new excise duty would amount to £2,150. The news-reel revenue is believed to be £15,000-£20,000 weekly, but the gross profit on this is probably appreciably less than the new tax. If the claim can be substantiated that owing to the contracts with exhibitors charges cannot be increased—at least during the currency of the existing contracts—the news-reel companies are confronted with serious difficulties. There would be universal regret if this valuable item in the cinema programme had to be eliminated or curtailed or made less effective. A case is also being made on behalf of the British film industry. In considering the merits of this case a distinction must be drawn between increased costs of production and distribution. The length of all British films registered in the last quota year averaged 568,000 ft. for "long" films and 335,000 ft. for "shorts." The excise duty payable, after allowing for drawback on waste film, might amount to £7,600, or about £70 per "long" subject. The increased distribution cost would naturally be much greater; at 60 prints of 7,500 ft. each the amount of tax payable would be £965. The new imposts would therefore amount to about £1,040 on each subject. Whether the duty will be burdensome to the point of destruction depends on whether the whole or a substantial part of it can be passed back to the producer or paid by the distributor. But apparently the American companies will be chiefly affected. In the year ended March 31st last about 3,200,000 ft. of "long" films and about 800,000 ft. of "short" films were registered. It is estimated that the Customs duties on these will exceed £120,000 and the new excise duties £800,000. Moreover, it is claimed that there is no possibility of passing the tax on to the exhibitor or the public. Against this it has to be remembered that the

THE BANK AS EXECUTOR

This is one of the many services which

BARCLAYS BANK

LIMITED

tenders to its customers.

27 REGENT STREET, LONDON, S.W.1

remittances to American film companies are believed to exceed £7 millions, and that at least £2 millions of this represent profits from the British market, on which a negligibly small customs duty has been paid hitherto. It is difficult to see what relief can be expected or granted to these companies without abandoning the new source of revenue altogether.

Volume and Value of Trade.—Owing to the instability of prices, the official returns of the value of our overseas trade may disguise significant changes in its volume. The Board of Trade's quarterly indices of the average price and volume of trade, shown below, therefore throw additional light on the course of imports and exports:—

	INDICES OF AVERAGE PRICES AND VOLUME OF TRADE (1935 = 100)			
	Retained Imports Average		Domestic Exports Average	
	Price	Volume	Price	Volume
1938—First quarter	117.6	111.4	113.9	99.7
Second quarter	113.4	104.4	111.9	94.3
Third quarter	111.3	106.7	111.7	95.5
Fourth quarter	108.8	112.4	111.1	105.0
1939—First quarter	107.9	108.0	109.1	102.5

The declared values of retained imports and domestic exports in the first quarter of this year were 11 per cent. and 1.4 per cent. respectively smaller than in the corresponding quarter of last year. But as the average price of retained imports fell by 8.2 per cent. during this period, their volume showed a decline of only 3.1 per cent. Again, a decline of 4.2 per cent. in the average price of domestic exports between the first quarters of 1938 and 1939 concealed an increase of 2.8 per cent. in the volume of our shipments. In terms of volume, the increase in exports has been most marked in the non-ferrous metals, woollen and worsted, apparel, leather, rubber manufactures and vehicles (mainly because of the delivery of warships) groups. The average prices of imports have now been falling since the last quarter of 1937, and those of domestic exports since the second quarter of 1938. But in view of the recent improvement in the prices of primary products and the expansion of business activity in this country, an early reversal of the trend of import and export prices would not be surprising.

Higher Freight Rates.—The decline in tramp shipping freight rates was arrested last month, when *The Economist's* index, given below, showed a slight rise:

The Economist's INDEX OF FREIGHT RATES
(1898 — 1913 = 100)

	Average, 1913	Mar., 1938	Apr., 1938	Jan., 1939	Feb., 1939	Mar., 1939	Apr., 1939
European waters...	110.0	109.3	108.2	107.4	105.8	106.4	113.8
North America ...	113.1	110.6	114.0	111.6	110.7	111.3	111.3
South America ...	123.4	129.6	131.7	110.4	117.1	104.7	97.2
India	106.3	120.0	106.0	108.6	108.2	109.6	114.8
Far East and Pacific	117.4	111.8	109.2	97.8	98.7	94.6	97.0
Australia	127.9	111.6	113.0	111.3	110.0	108.3	107.7
Total	116.3	115.5	113.7	107.9	108.4	105.8	106.9
1913=100	100.0	99.2	97.7	92.8	93.1	91.0	91.8

The improvement, however, was far from uniform; advances on some routes were accompanied by declines on others.

	Index No.	Inc. or Dec. Points		Index No.	Inc. or Dec. Points
Home trade	105.3	+ 5.9	South America:—		
Bay—outwards ...	115.6	...	Outwards	65.0	— 11.3
Bay—homewards ...	130.6	+ 4.7	Homewards	129.3	— 3.7
Mediterranean:—			India—outwards ...	101.0	+ 11.8
Outwards	97.2	+ 19.8	India—homewards ..	128.5	— 1.5
Homewards	129.1	+ 8.3	Far East, etc.	97.0	+ 2.4
North America ...	111.3	...	Australia	107.7	— 0.6

Towards the end of April, however, the upward trend in freight rates became more general, and during the past week rates, especially from the River Plate, showed a marked rise, owing to the heavy movement of grain from Argentina. The demand for shipping space has tended to expand, and it is widely expected that the improvement will continue.

Fewer Pigs.—The latest figures published by the Ministry of Agriculture show that the decline in the number of pigs continues. The census taken in March is based on returns from only a sample of farms, but the figures thus obtained give a fairly reliable indication of the general trend:—

	No. OF PIGS IN ENGLAND AND WALES (000)				
	Breeding Sows	Boars	Other Pigs		Total
			Over 2 Months	Under 2 Months	
1936 December ...	480	34	2,580	962	4,056
1937 June	455	32	2,109	1,039	3,635
December ...	448	32	2,604	830	3,914
1938 March	453	31	2,147	1,104	3,735
June	433	30	2,216	885	3,564
September ...	449	33	2,546	1,168	4,196
December ...	447	32	2,533	1,842	3,854
1939 March	436	30	1,932	1,030	3,428

The decline in the number of breeding stock is the most serious feature of these returns, and is partly an expression of the dissatisfaction of many farmers with the existing marketing scheme. The allocation of bacon pigs between factories has given rise to many complaints, and the brisk trade in pork pigs over the winter months has diminished the supply and raised the price of bacon pigs on the open market to a level dangerously near that obtained by the contracting farmers. The decline in the number of pigs in the last eighteen months is exceptional, since it has coincided with a period of falling prices for feeding stuffs; the fact that the price of bacon pigs is now linked to that of a standard feeding ration has discouraged the speculative pig feeder. In so far as the production of bacon pigs is now concentrated on regular suppliers, who can contract for level deliveries of their pigs throughout the year, the trade is obviously on a sounder footing, even if it is not expanding in accordance with the intentions of the framers of the present Act.

Rise in Wholesale Prices.—The last fortnight has seen a sharp rise in the wholesale prices of many commodities. Sugar, tin, wheat and other cereals have all been marked up, and it is to these commodities that the rise in *The Economist's* complete index, shown in the table below, is largely due:—

SEPTEMBER 18, 1931 = 100									
Date	The Economist's Indices			Price of Gold (sterling)	U.S.A., Irving-Fisher	France, Statistique Generale	Italy, Milan Chamber of Commerce	Germany, Statistisches Reichsamt	
	British Complete Index (sterling)	Primary Products (sterling)	American (dollar)						
1936 Dec. 30	131.3	163.9	187.3	166.7	128.8	113.0	116.3†	95.4	
1937 Dec. 29	127.8	147.4	135.3	164.2	120.5	135.8	143.8	97.0

May 3	116.2	134.4	123.4	174.8	117.4*	154.0*	145.4	97.9*	

* These figures refer to April 29th.

† Monthly average.

Details of the constituent series of *The Economist's* complete index are given below:—

(1927=100)	Sept. 18, 1931	Apr. 26, 1938	Apr. 19, 1939	May 3, 1939
Cereals and meat...	64.5	85.5	71.2	71.1
Other foods	62.2	60.2	59.6	62.9
Textiles	43.7	54.0	53.3	54.0
Minerals	67.4	92.0	90.8	91.4
Miscellaneous	65.8	76.5	73.7	74.2
Complete index	60.4	73.3	69.2	70.2
1913 = 100	83.1	100.8	95.3	96.6
1924 = 100	52.2	63.3	59.8	60.7

In the index for cereals and meat, a fall in bacon prices offset the rise in wheat prices. Sugar, coffee and coconut oil were marked up among the groups of other foods, and among textiles, jute prices continued their advance. Tin and lead were dearer, while the price of copper showed a small decline compared with the previous fortnight. Among miscellaneous commodities, leather and linseed oil were dearer.

Copper Prices.—Since the middle of last month the price of copper (standard cash) has fluctuated around

£41 10s. per ton, which compares with the average of £45 per ton aimed at by the co-operating producers. The chief reasons for the comparatively unsatisfactory prices have been the political tension and concern over the copper position in the United States. Although copper is one of the most important war metals, the adverse effect on commercial consumption of the deterioration in political relations has outweighed increased armament purchases. The American market has been disturbed by a number of price reductions, which have reduced the United States domestic quotation from 11.25 cents to 10.25 cents per lb. (electrolytic) in the course of the past month. These reductions followed the consumers' strike, which lasted from the middle of October, 1938, until the end of March, 1939, and kept United States domestic sales during that twelve weeks' period at very low levels. The cuts, however, have stimulated buying, and in April, sales to United States consumers reached 60,223 short tons, against an average of 18,430 short tons in the preceding five months and 22,790 tons in April, 1938. As stocks in the hands of United States consumers are low, the improvement in demand may continue for some time, which would relieve fears that the European market might be weakened further by heavy American exports. Production and consumption outside the United States are virtually in equilibrium, while stocks, at under 190,000 short tons, cover consumption at the present rate for only seven weeks.

INDUSTRIAL REPORTS

THE demand for coal is well maintained; the seasonal decline in purchases for heating purposes is offset by increased industrial requirements and by the accumulation of stocks against an emergency. Total output is actually higher than a year ago. Most branches of the iron and steel industry are very active and some sections are already operating at capacity. Delivery dates, consequently, are lengthening. Preliminary notifications sent to the Board of Trade by shipowners anxious to take advantage of the proposed Government grant for the construction of vessels have been so numerous that the acceptance of further notices was suspended last week. The notifications received by the Board of Trade by April 27th comprise about 190 vessels of a tonnage of 850,000 gross; the majority of these are reported to have been ordered. The cotton and wool textile trades remain fairly busy; activity is sustained by Government orders.

There are no changes of note in either inland or export quotations.

Newcastle-on-Tyne.—With the exception of Northumberland steam smelters all classes of coal in this area are difficult to obtain, collieries having sold their output for several weeks ahead. There is no ease in the demand for Durham industrial coal, and producers of the popular grades of coking coal have sold their output well into the autumn. Gas works in the south of England continue to take their winter quantities, which are being stocked against an emergency. Whilst prices have so far shown no material change, there is now a tendency among collieries to increase them. Patent oven coke is a steady market; home demand is expanding and there are regular shipments abroad.

Glasgow.—Activity in the shipping market continues to be one of the outstanding features in the Scottish trade. The tonnages shipped last week advanced to 253,000 tons, compared with 237,000 tons in the previous week and only 189,000 tons in the corresponding week of last year. This increase is largely due, of course, to the international unsettlement, which has given a considerable fillip to buying from most of the nearer markets. Taken all round, the trade continues to enjoy busy conditions and output in all districts is well absorbed, with prices showing a strengthening trend. Industrial demands are keeping well up as a result of the growing re-armament activity. Irish trade is moving steadily.

Cardiff.—The recent improvement on the coal market is fully maintained. Last week shipments at the South Wales docks of the G.W.R. Company

totalled 453,500 tons, compared with 453,800 tons in the previous week and 400,526 tons in the corresponding week last year.

Business with France is a little more active and it is expected that by new arrangements under the coal-pitwood barter agreement exports will be increased. By these arrangements the validity of licences granted in the March quarter will extend to the end of the year instead of to June 30th, and that of licences granted for the June quarter up to the end of September; while the authorised quota of shipments in respect of arrcars amounts to 120,000 tons for the June quarter. The price of French pitwood under this agreement has been reduced from 22s. to 21s. 9d. per ton c.i.f. Inquiries from other foreign destinations are unusually active and there is practically no short-time working in the coalfield. Prices are firmer but nominally unchanged.

Iron and Steel

Sheffield.—The iron and steel market remains active, and in some sections it is not easy to secure acceptance of all the business offered. There are more inquiries for forge pig iron, and consumers are showing greater readiness to buy forward in foundry pig, while for basic there is an insistent demand. Transactions in hematite are heavier, and makers of special qualities are well booked. Business in finished iron is more active, and crown bars, which have been depressed for a long period, are beginning to show some improvement.

The demand for basic and acid steel billets is heavy, and users do not find it easy to place all their orders for early delivery. Business in small bars, strip and wire rods shows further expansion, and there is a heavy inquiry for structural steel.

Scrap merchants are unable to meet inquiries in full, and in some classes of

material there is a pronounced shortage. Some revision of fixed prices is expected shortly. Where the market is free prices show a rising tendency.

Crude steel production in the Sheffield district in March was 157,700 tons, compared with the peak output in November, 1937, of 160,400 tons. Production is being further increased.

★

Middlesbrough.—Shipments of pig iron, manufactured iron and manufactured steel during April amounted to 35,762 tons, a drop of about 3,000 tons compared with the previous month; but in view of the heavy domestic demand for steel shipments have been well maintained. A parcel of 3,087 tons of steel was shipped to Italy last month. Imports of ore last month amounted to 121,500 tons, compared with 104,000 tons in March.

At the end of December there were 21 blast furnaces in operation in this area; there are now 25 in operation, of which eight are producing hematite iron, 15 basic iron, one foundry pig iron and one ferro-manganese. The increased production of basic pig iron is all for use in the adjoining steelworks, and none of it comes on to the market. Foundry pig iron is in only moderate demand, for foundries have not yet benefited from the improvement in the iron and steel trade generally. East Coast hematite is in rather better request and makers' stocks are being slightly reduced.

The output of semi-finished and finished steel is being increased at a faster rate than that of pig iron. Owing to the scarcity of heavy steel melting scrap, shipments are arriving in the Tees from coastwise ports. Good Durham blast furnace coke is available at 24s. 2d. per ton at the ovens, whilst only odd cargoes of foreign ore are changing hands; most of the deliveries now coming forward are under old contracts. Freight rates from the Mediterranean and North Spanish Bay ports are firm.

★

Glasgow.—Throughout the West of Scotland intense activity is maintained, with production at the highest possible rate. Steel material of every description is in great demand, including ship-plates, bars for re-rollers and sections of every kind. In the sheet trade all mills are now in operation and bookings for both home and export users are again heavy, although makers are unable to accept business for prompt delivery and in almost every case require several weeks. Tube makers, too, remain busy and look forward to continued regular employment. Marine engineers in this district are particularly busy and in fact practically every engineering concern in Glasgow and neighbourhood has a great deal of work on hand and full time working is general and likely to continue.

★

Cardiff.—On Tuesday the authorised output quota under the tinplate pooling scheme was raised from 60 per cent. to 75 per cent. of capacity for the next two months, but as the steelworks are operating at over 90 per cent. of capacity it is regarded as rather doubtful whether the tinplate manufacturers will be able to obtain a sufficient supply of steel bars to enable them to increase

their present production to any appreciable extent. There are eight blast furnaces in operation, and steel furnaces are being worked up to the limit of the available supply of scrap. In view of these conditions there are possibilities of changes in prices at the end of next month.

★

News from Abroad.—Although the improvement of demand on international steel markets is making slow progress, business has on the whole remained satisfactory compared with the first few months of the year. In several cases the quantities for which quotations are demanded have increased, particularly where the port of destination is far from the exporting country, and where the danger of an interruption of supplies in case of an emergency is greatest. Thus, apart from Scandinavia, the Far East and South America have shown interest in increasing quantities. The exhaustion of stocks of many consumers has caused a number of urgent inquiries for smaller tonnages for prompt delivery. It is, however, often difficult to satisfy this demand because the delivery times of producers have materially increased during recent months.

It can be said that, up to now, the revival of the international steel trade has followed healthy lines and that the speculative demand, so conspicuous during the September crisis, has remained negligible, although prices are firmer and costs of raw materials are rising. Rebates on official prices have in some cases vanished altogether, and only in specific markets, where the American or Australian competition is effective, have concessions been made.

The problem of the agreement between the European Steel Cartel and the American exporters was again discussed at a recent meeting of the Joint Co-ordinating Committee in London. Although it was not possible to remove the differences completely, the agreement has been prolonged, and the hope was expressed that it will work more satisfactorily in future. Furthermore, general price questions were discussed in the light of the improved trade situation, but no alterations were made. The price problem will, however, again come on the agenda at the next meeting. Lastly, a number of questions concerning the internal organisation were discussed and certain alterations agreed upon.

Textiles

Cotton (Manchester).—World affairs have continued to have an adverse effect upon trade. There has been a further recovery in raw cotton prices, for the opinion is gaining ground that the export subsidy plan in the United States will be abandoned. Preparations for the new crop in the United States are now making better progress.

Sales of American yarns have been about equal to production. Varied reports, however, have been received as to delivery instructions and the position remains irregular. Rather more activity has shown itself in Egyptian yarns for home use. Many spinners are hampered by the scarcity of permits to export to Germany.

Inquiry in piece goods has broadened. Freer buying has taken place for India, and some makers in Blackburn and Preston have appreciably extended

their order lists. Fair buying has taken place for South America and the Northern countries of Europe. Home trade buyers have displayed more interest in prices. Further Government contracts have been placed and more looms are now engaged on this class of work. The opinion is gaining ground that lower prices are improbable.

★

Jute (Dundee).—Raw jute prices have shown considerable strength during the past fortnight, being about £4 per ton dearer owing to lack of rain in the jute-growing areas, while old crop supplies are now becoming extremely scarce, with imports into Calcutta small. The total imports into that centre for the ten months of the season ending April 30th were 8,700,000 bales, compared with 9,575,000 bales in the corresponding period of the last season. The Indian jute mills have bought in the ten months 5,400,000 bales, against 5,775,000 bales last season. The lack of rain for new crop sowings and growth of the plants already sown is a serious factor and may lead to another short crop in the coming season. Scattered showers have fallen at times, which have made sellers more ready to offer, but the market quickly recovered its strength. The advance has led to a corresponding increase in the prices of jute goods; in Calcutta the advance in the prices of jute goods was assisted by reports of negotiations between the British Government and the Indian jute mills for the placing of a contract for another 200 million sandbags for delivery after the end of June, when the present contract expires.

The full group of Daisee-2/3 has risen to £33 10s. per ton and good marks sold at £33 15s. and £34, April-May, with new crop quoted at £29 to £29 10s. October-November. Tossa-2/3 was advanced to £34 15s. for good marks and fours are quoted at £32 2s. 6d. for full group, May-June. Hessian yarns are named at 2s. 10d. for cops and 2s. 11d. for spools, while the price of Hessians is 3½d. for 10-oz. and 2½d. for 8-oz., with many sellers quoting ¼d. to ½d. more.

THE COMMODITY MARKETS

THE upward trend of the prices of primary products, which began in the middle of last month, continued during the past week. The improvement, moreover, was not confined to this country, for Moody's index of the prices of staple commodities in the United States (December 31, 1931 = 100) rose from 139.3 to 141.7 during the week ended last Wednesday.

Not all the sensitive commodities, however, participated in the advance. Rubber, for example, remained unchanged in price, and copper, lead and spelter were slightly cheaper than a week ago. On the other hand, raw sugar was again marked up sharply in price owing to the shortage of supplies, while wheat and cocoa were also dearer. Cotton rose in price on the growing belief that the proposal for an export subsidy in the United States would not find sufficient support. Crossbred wool, linseed oil and tin were also marked up slightly.

COMPANY MEETINGS

CALEDONIAN INSURANCE COMPANY

SATISFACTORY RESULTS DESPITE YEAR'S DIFFICULTIES

MR CHARLES H. SCOTT PLUMMER'S ADDRESS

The one hundred and thirty-fourth annual general meeting of the Caledonian Insurance Company was held within the company's office, Edinburgh, on the 4th instant.

The Chairman, Mr Charles H. Scott Plummer, in moving the adoption of the report, said:—

Ladies and Gentlemen,—As you have had the annual report and accounts for the year 1938 before you for some time, I assume I may take them as read.

LIFE DEPARTMENT

The net new life assurances granted during 1938 amounted to £2,102,749, the premiums thereon being £72,707, including £20,596 by single payments. The net new sums assured compare with £2,166,349 for the previous year, but are not exceeded by figures for any other year.

The death claims for the year 1938 were £239,171 compared with £228,895 in the previous year, but are still within the amount expected under the mortality table used in the valuation. Surrenders amounted to £67,350, against £94,147 in 1937, when, as explained by my predecessor a year ago, there was a special reason for the comparatively large amount involved.

The expenses for the year 1938, excluding those applicable to annuities, showed a ratio of 16.4 per cent., compared with 16.7 per cent. in 1937.

The average rate of interest on the combined life assurance and annuity fund (excluding reversions purchased) was £3 16s. 9d. per cent. after deduction of income tax, against £3 19s. per cent. for the previous year, the reduction being mainly accounted for by the increase in the rate of income tax from 5s. to 5s. 6d. in the £.

The valuation of our Stock Exchange securities as at December 31st last showed an appreciation over the values at which the securities stand in the life balance sheet. In accordance with our usual practice, in arriving at the market value in the case of all securities quoted in currencies other than sterling, the rates of exchange on London as at December 31st last have been used.

The directors have resolved that the rates of interim bonus to be paid in the case of policies becoming claims during the year 1939 should be £2 per cent. on whole life assurance and £1 18s. per cent. on endowment assurances and double endowments, in respect of each year's premium due and paid since the last triennial valuation at December 31, 1936. The rates of interim bonus paid during the year 1938 were £2 2s. per cent. and £2 per cent., respectively, but, owing to the reduction in the net rate of interest and to the uncertainty of the international outlook, the directors felt it desirable to make the small reduction referred to above in the interim bonus for the current year.

FIRE DEPARTMENT

The premium income for the year 1938 was £711,621, against £697,490 in 1937, and the profit was £51,782, compared with £65,472. The total fire fund at December 31, 1938, amounted to 110 per cent. of the premium income for the year.

ACCIDENT DEPARTMENT

The combined account shows that the total premium income for 1938 was £558,839, against £514,201 for 1937. The profit was £29,501, compared with £10,963 for the previous year. The total accident fund at December 31, 1938, amounted to 83 per cent. of the premium income for the year, after including the transfer of £30,000 from profit and loss account for additional reserve.

MARINE DEPARTMENT

The premium income for 1938 was £111,187, against £96,985

for 1937. The first year's claims in 1938 were £23,293, being 21 per cent. of the premium income.

After a transfer of £5,000 to the profit and loss account, the marine fund at December 31st last amounted to £190,907, representing 172 per cent. of the premium income for the year.

GENERAL RESERVE FUND

This fund, which is additional to the departmental funds previously mentioned, remains unchanged at £600,000.

STAFF PENSION FUND

The balance of this fund as at December 31st last, after crediting interest received and charging pensions paid during the year, was £130,218.

PROFIT AND LOSS ACCOUNT

The balance at credit of profit and loss account at December 31, 1938, including the sum brought forward from the previous year, amounted to £283,158. Out of this sum, the directors recommend that £20,000 be carried to the staff pension fund as at January 1, 1939, and that a dividend be declared at the rate of 15s. per share, subject to deduction of income tax, to be paid by equal half-yearly instalments on May 15th and November 11th next.

The dividend now recommended, after deduction of income tax, will cost £85,008, and, together with the allocation of £20,000 to the pension fund, will absorb £105,008, leaving a balance of £178,150 to be carried forward, as against £174,906 brought in from the previous year.

GENERAL BALANCE SHEET

From the directors' certificate appended to the general balance sheet you will observe that the Stock Exchange securities stand in the aggregate at less than the value at middle market prices at December 31, 1938. As in the case of the life department, in arriving at the market value of all securities quoted in currencies other than sterling, the rates of exchange on London as at December 31st last have been used.

NEW HEAD OFFICE BUILDING

My predecessor last year referred to the new head office building which was then in course of erection. I should like to add that the building is now nearing completion and that our removal will be effected before the end of this month. The official opening, however, will not take place until the end of June.

OFFICIALS, STAFF AND AGENTS

During the year Mr Neil M. Law, F.F.A., who was formerly chief actuarial assistant at head office, was appointed assistant actuary, and Mr Donald H. Young, who was formerly chief assistant in the foreign fire department in London, was appointed foreign fire superintendent.

Before concluding, I take this opportunity of expressing on behalf of the directors and the shareholders, our appreciation of the loyal and efficient work during the past year of the general manager, officials and staff at head office and branches, and the company's agents and representatives at home and abroad, including the marine managers and the underwriter.

I now beg to move, ladies and gentlemen, that the report be adopted, that the allocation of £20,000 to the staff pension fund be approved and that a dividend of 15s. per share, subject to deduction of income tax, be declared for the year 1938, payable in equal half-yearly instalments on May 15th and November 11th next.

The report was adopted.

ATLAS ASSURANCE COMPANY, LIMITED

SUBSTANTIAL PROFITS IN EVERY DEPARTMENT

MR G. F. HOTBLACK'S REVIEW

The annual general court of the Atlas Assurance Company, Limited, was held, on the 28th ultimo, in London.

Mr G. F. Hotblack (chairman of the company), after expressing regret at the retirement from the chair of Mr F. A. Johnston and paying a tribute to his services to the company over the past 44 years, and referring to the election of Sir Charles Arthur to the board, said: So far as the underwriting side of our business is concerned, nothing sensational occurred during 1938. There was only one really serious fire in this country, namely, the General Electric Company's store in Birmingham—which cost £565,000, and of which we had our share. Overseas the only costly disaster was the very severe hurricane in the New England States of America, which involved losses running into several millions sterling; we ourselves were reasonably fortunate, however, in having escaped with a relatively light loss.

INSURANCE COMPANIES' PROBLEMS

I do not think it is always appreciated how great are the difficulties with which insurance companies, with their world-wide interests, have to contend under present-day conditions. I expect many of you have first-hand knowledge of the problems which currency and financial restrictions in one part of the world or another involve, and I think I may fairly say that if our particular difficulties ended there we should consider ourselves reasonably fortunate. Unfortunately, however, this is not so in that a still bigger problem arises out of legislation. There are no fewer than 20 overseas countries or States in which legislation affecting the interests of British insurance companies is pending or in course of discussion in various legislatures.

FIRE ACCOUNT

In the fire department our premium income has declined by some £53,000, as against an increase the previous year of £42,000. The greater part of this falling off was in respect of our business in the United States of America and was in accordance with the general experience in that country owing to trade recession. The losses incurred were practically identical with the previous year. The profit emerging of £168,000 is some £5,000 less than that of 1937, but shows the satisfactory ratio of 9.6 per cent., as compared with 9.7 per cent. last year.

ACCIDENT DEPARTMENT

The accident department has an increase in premium income of £24,185, and shows a profit of £53,327, representing 8.1 per cent. on the premium income, as against 8 per cent. last year, a result which in these difficult times we regard as very gratifying.

In recent years we have been quietly and conservatively developing this department, and now it is a constant and substantial contributor to our annual profits. Twenty years ago our premium income was £125,000, whereas to-day it is over £660,000. Twenty years ago we transacted business in the United Kingdom, South Africa, and Australia only, but to-day our net is much more widely spread, and our income is drawn from many parts of the world, including countries as far distant as China, the Philippines, the Fijis, and Brazil.

Accident business, which includes motor and workmen's compensation business, is by no means easy to transact. New legislation both at home and abroad is constantly being introduced, and to estimate the effect of this in advance is always a matter of extreme difficulty.

As regards motor business in this country, the large awards now made by the Courts and the circumstances under which it has been decided that compensation is payable must inevitably place a strain on existing rates and result in an adjustment to a higher scale. One hesitates, therefore, to forecast what the future holds in store, but we shall continue to follow our conservative policy and to develop along sound lines in the belief that it is the only way to ensure a steady and constant profit on our turnover.

MARINE ACCOUNT

In the marine account the premium income was £157,061, or approximately the same as last year. Our experience as regards claims paid on the 1938 account and also on 1937 and previous years' accounts has been satisfactory.

The account is on a very sound basis and is producing regular

profits. In lieu, therefore, of our practice hitherto of making an occasional substantial transfer of profits to profit and loss we have decided to establish a substantial marine fund of a sufficient size in our opinion to take care of all contingencies and in future to make an annual transfer to profit and loss if and when profits are earned. The revenue account under review has been treated on those lines, and you will observe that the sum of £40,000 has been transferred to profit and loss. This particular figure of £40,000 does not apply only to the year 1938, but is substantially made up of the accumulated profits of previous years.

LIFE BUSINESS

The new life business during 1938 was £4,042,720, being £493,696 less than the previous year, due mainly to a reduction in the benefits formerly granted under a type of policy which, owing to altered conditions, had become comparatively unattractive to the company. Apart from the type of policy referred to, the new business was well maintained. A more serious feature was the fall in the net rate of interest earned on the life assurance and annuity fund from £4 7s. 10d. in 1937 to £4 3s. 2d. in 1938.

Under existing conditions the fall in the rate of interest, which has been going on for several years, is fully explained by the difficulty of obtaining satisfactory investments for a fund which has been growing at the rate of about £1,000,000 a year.

INVESTMENT POLICY

I find that during the last five years the life fund grew from £10,147,000 to £15,258,000, an increase of £5,100,000; also that during those five years our life investments in ground rents, properties, mortgages and other loans of various descriptions, including loans to local authorities, increased by £4,400,000. Most of our new money has therefore gone into investments of these types, and we think we have acted wisely because, although we have lent large sums of money at very low rates of interest, and although our average rate of interest has suffered as a result of our doing so, we have to a considerable extent escaped the fall in values which would have resulted had the money been invested in high-class Stock Exchange securities.

Moreover, much of this money has been lent for comparatively short terms, and we shall have the opportunity during the next few years of reinvesting it, probably on more favourable terms.

GROWTH OF PREMIUM INCOME

In other respects the life business developed on the lines with which we have become familiar. The premium income increased by £143,365 to £1,310,064, and consideration for annuities increased by £212,807 to £667,300. The fund increased by £1,212,021, and amounted to £15,258,639 18s. at the end of the year. The expense ratio reflecting the effect of the smaller new business was £12 5s. 10d. per cent., as compared with £13 10s. 6d. per cent. in 1937. The mortality experienced during 1938 was very light amongst lives assured and also (less profitably) light amongst annuitants.

The fall in the rate of interest and the increased hazards and uncertainties of life indicate the necessity of reviewing the bases upon which our scales of premiums are calculated. Such a review is in progress, and in the near future it will probably be found necessary to increase the premiums now being charged for some classes of policies, notably those for policies which do not participate in profits.

PROFIT AND LOSS ACCOUNT

Turning now to the profit and loss account, you will notice that the interest, less tax, is £120,246, which is £7,496 less than the previous year. After crediting interest receipts and fire, life, accident and marine profits, and debiting the various tax charges and expenses not charged to other accounts, we are left with £333,751 with which to deal. Out of this we have paid the usual tax-free dividend, costing £176,000, written £100,000 off securities, and transferred £25,000 to the staff pension fund, leaving the carry-forward at £359,572, or £32,752 more than the previous year.

The year 1938 has been a satisfactory year for us, with substantial profits in every department of our business. It is impossible for me to prophesy what 1939 holds for us in view of the menacing political position, and all I can say is that 1939 has started well so far as losses are concerned.

The report and accounts were unanimously adopted.

LONDON AND LANCASHIRE INSURANCE COMPANY, LIMITED

RESULTS OF A DIFFICULT YEAR

SIR FREDERICK PASCOE RUTTER'S REVIEW

The seventy-seventh annual meeting of the London and Lancashire Insurance Company, Limited, was held, on the 3rd instant, in London, Sir Frederick Pascoe Rutter, governor, presiding.

The secretary, Mr G. Albert Rutter, read the notice convening the meeting.

Sir Frederick, in his address, said:

You have not often heard from me the phrase "an anxious year, full of difficulties," partly because it is our constant duty to deal with difficulties and partly because I try to reserve the remark for the really crucial occasion; 1938 was such a year. It was really like old times when, in the 'seventies and 'eighties, we were struggling to lay the foundations of this company, which have proved themselves so solid, so impregnable. With the exception of 1906 and its catastrophe of San Francisco, I do not remember a more exacting year since I became your general manager, now over forty years ago. And, speaking for our company and ignoring for the moment the international anxiety, I am not discouraged nor even disturbed.

YEAR'S RESULTS

Our total premium income was slightly increased to £6,752,538, following a substantial advance in the previous year. The fire income of £2,755,527 showed a small decrease due to the United States, but this was more than made up in the accident department, where an increase of £36,422 brought our premium income up to £2,558,620. The marine income remained almost stationary at £1,438,392.

Summarising our underwriting profit, the fire department contributed £324,194, against £366,720; the accident department, £43,827, against £100,629; and the marine department, £66,236, against £35,853 in 1937. Therefore our total profit amounted to £434,257, or 6.43 per cent., compared with £503,202, or 7.47 per cent., in 1937.

Our fire business continues on the same high level which you have been accustomed to in the past. The United States has again become a difficult field consequent upon the important reductions in rates, and I do not anticipate much profit from that country until the necessary reaction comes about. In Canada our loss experience was good, but the twofold problem of competition and increasing costs is proving difficult of solution. In Australasia, South Africa and India we pursued the even and lucrative tenor of our way.

Our casualty departments produced a result which I confess was not up to my expectations. In America particularly we have had occasion to make revisions, and when this happens the particular year has to bear the brunt in the hope and anticipation that the fruits will be reaped subsequently. Accident business in this country has become still more exacting, the two anxious departments being still workmen's compensation and motor vehicle. In this connection there is one important matter which I must emphasise with all sincerity, and that is the growing inequity to which those liable to third-party damages are now being subjected.

LEGAL EXAMPLES

Permit me to remind you of a few of these remarkable cases. The House of Lords has enunciated the novel and revolutionary dictum that the legal representatives of a dead person can recover damages on account of the potentiality of that dead person's life. Last year £2,500 damages were awarded to a market woman who was shocked through seeing a collision between two motor vehicles, one of which she thought was going to hit her. There was the case of a child of three, undoubtedly badly injured, thrown out of a car after a collision. The father and mother got moderate damages; the child was awarded £6,500.

Finally there came the case of the corpse. It was in its coffin, proceeding to its last home in a Liverpool cemetery. It was followed by a coach containing four relatives. A tramcar jolted the hearse, the coffin slipped from its bearings, but still remained on the damaged vehicle. The mother, the uncle and the two cousins were all shocked, naturally. They claimed damages. The Liverpool Court turned them down. But the mourners importuned the Court of Appeal, and there every one of the four got damages. Nothing was said or done about the corpse, but the natural question has already been propounded by *The Economist*: "Why, in view of the House of Lords decision as to the value of the potentiality of a

person's life, were the rights of the innocent and insulted corpse so callously ignored?"

If this trend continues an increase in rates will become inevitable, because no business can continue at a loss. Higher rates must react on the motor trade, with consequent reduction of employment, and this must ultimately bear upon the dividends which insurance shareholders receive. These three factors must in turn affect the Government by the reduced yield from taxation, at a time when the country is financially hard driven.

As regards marine business, 1937 was the worst year for total losses since 1929, and that condition continued throughout 1938. Whilst the number of total losses was slightly less, the amount of tonnage lost was somewhat higher. There was a sensible diminution in the number of minor casualties, but any relief which might have been expected from this factor was more than offset by the increased cost of repairs.

INTEREST ON INVESTMENTS

The interest on our investments amounted to £481,363, compared with £485,110. May I emphasise what is welcome, that in such a year we have been able not only to continue the dividend to which you have become accustomed but, after making the fullest provision for every conceivable liability, the balance carried forward has been increased by £199,702, thus making our total reserve funds £12,416,831.

Concern regarding the question of finance has probably exercised the minds of your directors more during the past twelve months than in any other year. The paramount duty of those controlling the destinies of the company is to conserve our funds and try to avoid depreciation. For more than two years I have been apprehensive. "Safety first" in anxious times should be dominant; safety first therefore is what we have aimed at for some time past and what should be our motto to-day.

POSITION IN EUROPE

I am no pessimist, but I have been apprehensive because of two things. First, because of the deliberate declarations from Central Europe, not necessarily that might is right, but that might is the ace of trumps and therefore must win. And so it will often, but history has told us that in the long run it must fail. Secondly, what has obsessed me is the parallel between what has been happening and the Napoleonic epoch, when over and over again treaties, contracts, bonds, assurances were made not to be kept, but broken. And yet Napoleon in his exile did his best to make the world believe that after all he was a man of peace. But he did not say, as he really meant, peace on his own terms. Yes, "peace on his own terms." You heard that from Berlin on Friday.

What has been happening has afforded another glaring example of what has occurred before in history, but what is surprising is the past ignoring of portents which were so plain and ominous. Even so, I am in doubt whether there will in the near future be a world war after all.

Reverting to our own affairs, the feature which has pleased me is that the amount of our interest has been so well maintained, being scarcely less than it was in 1937. A further important consideration is the value of our investments, which stand at a figure a little more than a million pounds in excess of the book values.

STRONG POSITION

The future lies in the lap of the gods. We ought by this time to be well inoculated against crises, but we cannot control the way of aggressors, nor with our world-wide Empire can we shut our eyes to what may take place at any moment. But, speaking for our company, we were never more sound than we are now.

Whilst our dividend has necessarily been static for some years past, it is still a very handsome dividend. Our reserves are abundant, and if we could only be assured of the peace which our Prime Minister has been so assiduous in trying to bring about we might look forward with confidence to the future, in the belief that the quality of our underwriting and the fibre of our investment policy should bring their own just reward. (Applause.)

The report and accounts were adopted.

THE GRESHAM LIFE ASSURANCE SOCIETY, LIMITED

CONTINUED PROGRESS

The ninetieth ordinary general meeting of the Gresham Life Assurance Society, Limited, was held, on the 4th instant, at the head office of the Society, 188-190 Fleet Street, London, E.C.

The Hon. W. B. L. Barrington, the Chairman, presided, and, in the course of his speech, said: We are indeed fortunate to be able to submit a report which records a considerable increase both in the number of new life policies issued and in new life sums assured. In 1938 the Society granted 8,891 life and endowment policies, assuring the sum of £3,815,391 in net new sums assured, i.e. after deducting reassurances. These figures represent an increase of nearly one thousand policies and £277,000 net new sums assured.

In common with the majority of offices we have suffered some contraction in our new business at home, although actually the number of new policies was slightly greater, and it is perhaps remarkable that—in circumstances which closely paralleled those prevailing here—our business on the Continent and overseas should have more than made up for the deficiency at home.

For this we are indebted mainly to our organisations in France and in the Argentine. Our branches in Cairo and Athens also contributed to the increase in our overseas business. It is a significant tribute to the standing of British life assurance that in times of international disturbance so great a demand exists for the security and protection of a British life policy.

The net new premiums for the year, after deducting reassurances, amounted to £178,530, including single premiums of £13,409. The increase in net new annual premiums exceeded £10,000. The total net premium income in the life assurance fund amounted to £1,164,108, and the total income of the Society from premiums, interest, dividends and rents to £1,612,473. Death claims amounted to £236,793, a total well within the actuarial expectation.

THE ASSETS

The total assets, as appearing in the balance sheet, amount to £10,187,840 as compared with £10,430,134. At the end of 1937 we reduced the sterling book value of our Spanish assets consequent upon an adjustment in the rate of exchange for Spanish currency. During 1938 the margin between the rates of exchange which we employed for the conversion not only of Spanish but also of French and other currencies into sterling, and the rates actually ruling, widened so much that the directors have felt it desirable to make a further and more general adjustment to the approximate rates in force on December 31st last. This operation, by which the amount of the Life Assurance Fund is reduced by £763,227, accounts for the reduction in the amount of the total assets. Had we maintained the old rates of exchange the Life Fund would have shown an increase of over half a million pounds.

It will be appreciated that these adjustments do not represent a shrinkage in the general volume of business, but rather a contraction in its sterling equivalent. The average rate of interest earned on the Society's funds was £4 3s. 6d. per cent. net.

We have now begun the fifth year of a quinquennium, at the end of which the usual quinquennial valuation will be made. I do not propose, nor will you expect me, to attempt to forecast the result of that investigation, but I think we can look back with satisfaction on the steady progress which the Society has made during the last four years. This can be measured not only by the very considerable increase in new business but also by the efficiency and enthusiasm of the branch and agency organisation throughout our service.

The value of life assurance as the mainstay of the financial security of the individual and the family has been much emphasised by the uncertainties and anxieties which have clouded our national life during the past months. The September days of crisis brought home to us all, I think, the need not only for national preparedness but also for individual preparedness against risks which may be remote one day and imminent the next.

We have recently realised, as never before, the value of a life assurance policy free from any condition or restriction which might nullify its effectiveness just when protection was most necessary.

A new policy, introduced by the Society in the autumn of last year—the "Plus" policy—has proved particularly appropriate to present-day needs and in consequence it has found a ready market. It provides large cover at low cost—just what is wanted to-day—with the valuable option of conversion to endowment form at a later date. The society's Family Income plans, the Defender policies, continue also to make it easier for the family man to assure income as well as capital provision for his dependants.

The report and accounts were unanimously adopted.

GRESHAM FIRE AND ACCIDENT INSURANCE SOCIETY, LIMITED

PROGRESS OF THE DEPARTMENTS

The annual general meeting of the Gresham Fire and Accident Insurance Society, Limited, was held, on the 4th instant, at the head office, 188-190 Fleet Street, London.

The Hon. W. B. L. Barrington (the chairman), who presided, referred first to the loss sustained in the death of the late deputy-chairman, Mr Courtney Fooks, and continued: In the fire department the premium income amounted to £124,876, an increase of £2,192 over the previous year. It is pleasing to record this advance after the recession of the last few years. Following the elimination of certain unprofitable contracts to which I referred when addressing you in 1936, it has been our policy to develop this account patiently and to seek quality rather than quantity. The fire loss ratio in 1938 was 46 per cent., the lowest for more than ten years. Expenses at 44.7 per cent. were also lower, compared with 45 per cent. in the previous year. Contributions to fire brigades increased from £1,648 to £2,318, but this was mainly due to special payments made under the Fire Brigades Act, 1938. After providing the usual 40 per cent. reserve for unexpired risks, and for all outstanding claims, the fire account yielded a net trading profit of £8,451, which sum has been carried to the profit and loss account.

The premium income in the accident department amounted to £228,346, and also shows a small increase on the previous year. The claims experience over this account as a whole has proved more satisfactory than in 1937, the ratio of 49.9 per cent. being 2½ points lower, but the commission and expenses have increased to 46.4 per cent., compared with 44.9 per cent. After providing for all outstanding claims and the customary reserve of 40 per cent. of the premiums for unexpired risks, a profit of £8,905 is transferred to the profit and loss account.

I referred last year to two sections of our accident business which were adversely affecting this account, namely employers' liability and motor insurance, and whilst it is gratifying this year to record a substantial improvement in the former, the difficulties of successfully underwriting motor insurance have become even more pronounced. Despite the most careful selection, this class of business has proved more unsatisfactory than in 1937 and calls for serious consideration.

The continually increasing scale of compensation awarded to third parties, including claims for loss of expectation of life and compensation for shock, must inevitably lead to a readjustment of premiums, as such heavy liability was not contemplated when the existing premiums were calculated. We must hope that combined action by the offices and underwriters will be taken at an early date, in order that this section of our business may be placed on a better footing.

As might be expected, the Society has not escaped the consequences of the further general fall in the market value of securities during the year 1938. I am glad, however, to be able to say that the investment reserve not only provides ample cover for the depreciation shown at the end of the year, but leaves a substantial margin to meet any further eventualities.

INVESTMENT REVENUE

The net income received from interest and dividends once again reflects the increased burden of taxation, which continues to become a heavier charge on our profits. While our gross interest and dividend earnings are larger than in 1937 the net figure is less by £195. The underwriting profits transferred to profit and loss account are larger by £7,447 than in the previous year. On the other side of this account the sum provided for National Defence Contribution is £1,410, as compared with £1,000 for nine months of last year. After debiting the other items of taxation and directors' fees, the balance available was £36,093, and as stated in the report the directors have allocated from this amount the sum of £10,000 to further augment the general reserve, and £5,000 has been added to the staff pension reserve.

As you will recall, it was a matter for regret last year that it was not then possible to make a further addition to the general reserve, and I am therefore the more gratified on this occasion that the results are sufficiently satisfactory to enable us to continue the policy of the Board in building up strong reserves which in our view are inseparable from any sound insurance undertaking.

There is left a balance of £21,093 in the profit and loss account, and out of this amount the directors once again recommend payment of a dividend at the rate of 6 per cent., less income tax, to be paid on the 1st June next. This will absorb the net sum of £13,200, leaving a balance of £7,893 to be carried forward to next year's account.

The report and accounts were unanimously adopted.

FRIENDS' PROVIDENT AND CENTURY LIFE OFFICE

STRONG POSITION MAINTAINED

MR HAROLD MORLAND'S ADDRESS

The annual general meeting of the Friends' Provident and Century Life Office was held, on the 3rd instant, in London.

Mr Harold J. Morland, M.A., J.P., F.C.A. (the chairman), said: The new life assurances of the Friends' Provident and the Century together amounted to £2,654,749. The annuity premiums received were £1,020,056, and the sinking fund new business of the two offices together advanced substantially, the total being £1,301,985. The annual life premium income advanced by £21,915. The ratio of life expenses to premiums fell by 0.30 per cent. to 16.49 per cent. This ratio is very moderate, especially bearing in mind the large proportion of our business which is at the low rates of premium attributable to whole-life and without-profit policies. The mortality experience under life assurances was even more favourable than usual.

RATE OF INTEREST ON FUNDS

The gross rate of interest earned on our funds was £4 15s. 2d. The rate, after deduction of income tax, was £3 16s. 9d. per cent. As I have pointed out before, if we were to adopt the alternative method of improving the net rate of interest by the amount of income tax deducted from annuity payments our net rate of interest would be much higher, in fact, this year as much as £4 6s. 9d. per cent. It is this latter rate which should accordingly be borne in mind in comparison with the net rates of interest quoted by a number of other offices which adopt this method.

As at the close of 1938, the actuary conducted a valuation of the continuous disability account for the five years 1934-38. During that period the business has developed satisfactorily, and the fund at £351,648 is over seven times the premium income. After making ample reserves for all contingencies, the actuary was able to recommend the transfer of £20,000 to profit and loss account—that is, an average of £4,000 per annum for the five years.

After provision for all liabilities and contingencies there were available £40,993 underwriting profits with, in addition, £53,562 of net interest—that is, together £94,555, to which must be added the amount carried forward from last year. A dividend of 20 per cent. on the paid-up capital was declared, absorbing £65,250. Transfers were made to additional reserve in the general section of the accident account, £5,000; to the investment reserve, £25,000; and £20,000 to group contingency fund, after which there remained £111,785 to be carried forward on profit and loss account.

INVESTMENT POLICY

Further depreciation arose during 1938 in consequence of which it was decided to strengthen the investment reserve of the Friends' Provident by transfers of £400,000 from the life and annuity and £50,000 from the sinking fund revenue accounts respectively. It has been advisable during the year, on account of the uncertain international and trade conditions, to pursue an especially restrained policy in regard to new investments. The funds of the Friends' Provident exceeded 16 millions at the close of 1938, and those of the Century exceeded 5 millions.

Our actuary tells me that during the past year he has again had it impressed upon his mind that many people are reluctant to take out the life assurance cover which their dependants are in need of, because of the fear that through prolonged illness they may not be able to keep up their premium payments.

I would call the attention of our members and the many others interested in the office to the benefit which we offer, under which, in the event of the life assured breaking down in health for a prolonged period, his life assurances will be entirely freed from premiums during the whole period of the incapacity up to age 65.

Another phase of our activities which has been of much value to large numbers of professional men is the scheme originated by the Century in 1926 for loans to enable medical and other professional practices to be purchased. The amount outstanding on such loans now exceeds £1,000,000.

There is a further direction perhaps not often referred to in which life offices can be of assistance—namely, in the accumulation and investment of the reserves of public companies.

It is suggested that a modest part of the profits transferred to reserve each year might well be invested in sinking fund and/or endowment assurances which will accumulate outside the business without danger of depreciation, which is inseparable from investments in even gilt-edged Stock Exchange securities.

The report was unanimously adopted.

LEGAL & GENERAL ASSURANCE SOCIETY LTD

Established 1836

Life and Sinking Fund Policies for sums assured of over

£18,000,000

were effected during 1938

ASSETS NOW EXCEED

£47,000,000

At the Annual General Meeting, held on May 2, the chairman Mr. Ernest E. Bird, said that during the year 1938

21,513 New Life Policies were issued

The Total Net New Sums Assured amounted to £17,789,030

The Net New Life Sums Assured amounted to £16,565,154

The amount received by way of consideration for Immediate Annuities was £1,159,349

New Deferred Annuities effected amounted to £1,896,130 per annum

The Net New Life Premium Income was £953,354

The Net Fire and Accident Premium Income was £571,717

Total Income from all sources amounted to £8,480,650

A copy of the Annual Report and Accounts for the year ending 31st December, 1938, will be sent on request.

Branches and Agencies throughout the World

General Manager: Vernon E. Boys

NORTH BRITISH AND MERCANTILE INSURANCE COMPANY, LIMITED

NEW RECORDS ESTABLISHED

The 129th annual general meeting of the North British and Mercantile Insurance Company, Limited, was held, on the 4th instant, at Edinburgh.

The Viscount Wakefield, G.C.V.O., C.B.E., LL.D. (the chairman), said that in spite of recurring international crises, trade in 1938 was surprisingly well maintained. While, indeed, general business activity continued to fall even more rapidly during the early months of 1938 than in the later months of 1937, the fall was arrested in June. He ventured to suggest last year that the extent of the setback which was then apparent would not prove to be very serious, and he believed that there were now signs of a slow return to a higher level of trade activity.

In 1938 there was an all-round drop in security values, and they had reason to be thankful that they had always followed a conservative investment policy. The excess of market value of their investments over the values at which they stood in the balance sheet, while necessarily smaller than in 1937, was still substantial.

In the life department they had again had a satisfactory year, and the new business figures were remarkably consistent with those of previous years. For the past four years the net new sums assured had exceeded five millions, the average being £5,522,000 and last year's £5,327,000. In the middle of the year there appeared to be a fair prospect of achieving another record, but the crisis in the autumn had an adverse effect upon new business. On the annuity side a steady business continued to be transacted, and they were, he thought, unique in publishing a separate annuity account showing funds of well over £8,000,000 in respect of that particular class of contract.

With regard to the fire department, everyone concerned was to be congratulated on achieving a fire underwriting profit of £354,352 after providing the usual reserve of 40 per cent. for unexpired risks. That profit represented 10½ per cent. of the premium income and was only very slightly less in amount than the 1937 figure.

RAILWAY PASSENGERS ASSURANCE COMPANY

The accounts of the Railway Passengers Assurance Company, the subsidiary company through whom they transacted their casualty insurance business, again reflected excellent results both as regarded premium income and underwriting profit, each of which showed a new peak record in the history of the company. The premiums totalled £1,402,595, being £56,139 in excess of those for the preceding year. The profit amounted to £171,117, equal to 12.2 per cent. of the premiums, as compared with 10.62 per cent. in the preceding year's account. The net interest on investments at £105,692 was almost the same as for the previous twelve months, and the profit and interest together amounted to £276,809, thus showing an advance of over £28,000.

In the marine department the premium income for the year 1938 amounted to £298,045, which was almost identical with the corresponding income for the previous year. For several years past conditions in the marine market had been such that it had been extremely difficult for underwriters to make any profit at all. The board were satisfied that the reserve for 1937 and previous years was sufficient to cover outstanding claims. This year they had transferred £30,000 to profit and loss account from the profit of past years which were now closed.

Their subsidiary company, "The Fine Art and General," had again produced most satisfactory figures. Premium income exceeded £360,000, only fractionally less than last year, this consolidating the increase of over £13,000 shown in that year. The "Fine Art and General" showed a profit of £59,184, representing 16.44 per cent. of premium income and exceeding last year's result by nearly £5,000. This was the highest figure of profit ever achieved by the "Fine Art" company.

After making the customary allocations, including a further contribution of £15,000 to the Widows' Pension Fund and £42,750 for N.D.C., the aggregate balance carried forward was increased from £6,520,979 to £6,979,067 subject to dividends for 1938. The directors again recommended a dividend of 6s. 3d. per share, less income tax, one-half payable on May 15th and the other one-half on November 11th. This dividend, together with the preference dividend, would absorb approximately £557,078, in comparison with a combined total of net interest of £558,847.

The report was unanimously adopted.

EQUITABLE LIFE ASSURANCE SOCIETY

RECORD NEW BUSINESS

The one hundred and seventy-seventh annual general meeting of the Equitable Life Assurance Society was held, on the 3rd instant, in London.

Mr H. L. M. Tritton (the president), in moving the adoption of the report and accounts for 1938, said that the new business, amounting to £2,028,917, exceeded that of 1937 and was again a record for the society.

The average sum assured, a figure in excess of £1,000, was higher than in the previous year. The society had a special staff dealing with pension schemes for employees, and new business was obtained in large blocks from time to time. In 1938 the amount was substantial owing to new pension schemes and exceptional augmentation of old ones. That accounted for the great increase in deferred annuities, and the demand for that class of business was evidence of the public's appreciation of that type of Equitable policy.

The claims again showed how attractive whole-life policies in the Equitable were. During 1938 each £1,000 whole-life with-profit policy which had become a claim had produced on the average £2,201. The total amount of claims by death during 1938 had been less than the average of the previous five years, although the total sum assured at risk had increased. The examples of endowment assurances which had matured in 1938 showed an attractive return. It appeared that that class of business was increasing, while the whole-life business remained stationary.

The net rate of interest earned had decreased by a little over 3s. per cent. to £4 0s. 6d. per cent., partly owing to the difficulty of finding new investments with a remunerative rate of interest and partly to the increase in income tax.

The funds of the society now exceeded £12,000,000, and on December 31st last there was a margin in the value of Stock Exchange securities of 5 per cent. over book value, and there was a margin over the value of the assets as a whole, as compared with the book values, of about 8 per cent.—or about £1,000,000.

The expenses were under 7 per cent. of the premium income, practically the same as for 1937. Not one shilling was paid by way of commission for new business.

The report and accounts were unanimously adopted.

OLYMPIC PORTLAND CEMENT COMPANY, LIMITED

IMPROVED RESULTS

The twenty-eighth annual general meeting of the Olympic Portland Cement Company, Limited, was held, on the 28th ultimo, in London.

Mr John Lawson (the chairman) said that the net profits for the year, after providing for depreciation, amounted to £15,367 on deliveries of 428,958 barrels, compared with £13,000 in 1937 on 728,450 barrels.

Last year, when referring to the United States 10 per cent. withholding tax, he had warned the shareholders that the company would probably have to distribute future dividends under deduction of this tax, and this was now being done, with the result that, while the basic rate of 7½ per cent. was the same as last year, the net dividend received by shareholders outside the United States was 6½ per cent., save in Canada, where shareholders only responded for 5 per cent. withholding tax. He could not but regret the heavy burden of double taxation in the United States and in this country. With a view to the company being relieved of the obligation to deduct and withhold the 10 per cent. United States tax on dividends, the directors had continued their endeavours to obtain a permanent investment in this country for part of the surplus funds of the company. Negotiations were still in progress, but at the moment he could not put anything definite before the shareholders.

With regard to the Coulee Dam contract, as shareholders were advised in July, a contract was placed with the company for 600,000 barrels of cement for delivery over the twelve months to July 31, 1939. At the end of the year about 419,000 barrels had still to be delivered and from April till July, inclusive, shipments were expected to average 85,000 barrels per month. It had now been definitely decided to complete the High Dam, and when the present contract was delivered a further heavy call would be made on the plants in Washington. Their factory was therefore likely to be kept running full time for the remainder of this year.

Prospects for other business were satisfactory. All sales, apart from Coulee, for the first three months of this year totalled 213,000 barrels, which was an improvement on the preceding seasons.

The report and accounts were unanimously adopted.

THE UNION BANK OF SCOTLAND, LIMITED

SATISFACTORY RESULTS—STRONG POSITION

SIR A. STEVEN BILSLAND'S ADDRESS

The annual meeting of shareholders of The Union Bank of Scotland, Limited, was held, on the 3rd instant, Sir A. Steven Bilsland, Bart., M.C., chairman of the bank, presiding.

The Chairman, in the course of his speech, said that the total resources of the bank aggregated just over £40 millions, an amount which showed little change from last year. The steadiness of their figures for some time past had been an interesting feature. This year deposit and other balances, at fully £33 millions, showed a very moderate decrease of £218,000. Acceptances showed an increase of £93,000, while the total of notes in circulation was little changed. Their position continued to be one of great liquidity and strength. Cash and money at call and short notice amounted to £7,468,000, representing 22½ per cent. of deposits.

THE INVESTMENTS

The total of investments was just over £20 millions, an increase of £400,000 over last year. These investments, of course, consisted chiefly of British Government securities, with varying dates of maturity, and, to a large extent with definite dates of redemption. In cases where securities were purchased at a premium, it was the practice of the bank to provide a sinking fund in order that the individual stocks might be written down steadily to par value by the date of repayment. Their investments in the aggregate were worth more than the figure at which they stood in the balance-sheet, and, in view of the existing uncertain conditions and of the fact that on the date of the balance markets were greatly depressed, he was sure they would agree that this position was a highly satisfactory one.

Bills discounted showed a decrease of £616,000, partly on account of a reduction in our holding of Treasury Bills, which at the close of our financial year amounted to £605,000, as compared with £765,000 the previous year. In 1937 and 1938 they were very glad to be able to report increases in loans and advances amounting in all to two and a half millions and, although the addition of £283,000 now shown under this heading might appear small by comparison, this further increase in the facilities afforded was very welcome. The advances were numerous and well spread.

The profit for the year of £310,407 represented a decrease of approximately £2,000. Taking into account the fact that during the period under review increased taxation and rising salary and other costs had to be faced, he felt sure they would agree that the results were entirely satisfactory.

PROGRESS OF NEW INDUSTRIES

As regards the development of new industries, it was very gratifying to record that remarkable progress had been made in the past twelve months. The success achieved had shown that Scotland was as capable of developing new industries as other areas if facilities were provided for them. There was great need, however, for further progress in this direction and for recognition on the part of the Government that the special circumstances of Scotland required a wider application of the undoubted benefits of Government policy so far applied only in one area. Equally, it was essential that steps should be taken by the Government to deal with the urgent problems of the Highlands and Western Islands whenever the international situation made such action possible.

INTERNATIONAL SITUATION

Since the shareholders met a year ago, Great Britain and many other countries had passed through a most anxious time. Against their desires and from sheer necessity they had been forced to embark on a most extensive programme of armament, with resultant increase in taxation and further drain on the country's resources. They all deplored the folly which had made such action necessary and trusted that Europe and, in fact, the world, would be saved from a war which, while proving nothing, might, with the destructive power of modern weapons, very well threaten civilisation and would at best leave many of the existing problems that disturb international relations still to be solved. Under these circumstances, any prediction regarding the trade outlook was of no value, but he emphasised the necessity for doing the utmost to foster export trade, which formed such an important part of our national economy.

The report was unanimously adopted and a dividend at the rate of 18 per cent. per annum declared.

INSTITUTE OF CHARTERED ACCOUNTANTS

MR C. J. G. PALMOUR'S ADDRESS

Mr C. J. G. Palmour, president of the Institute of Chartered Accountants in England and Wales, delivering an address to the members at the annual general meeting of the Institute, held in London, on the 3rd instant, referred to the accounts for the year 1938. He then proceeded as follows:—

My predecessor referred last year to the subject of university training for the articled pupil. While I am convinced that pupils who live in a university town do obtain an advantage if they avail themselves of the educational facilities afforded, I cannot subscribe to the view that pupils who attend university lectures during the course of their articles should be given an advantage over those less fortunately placed to the extent of exemption from examinations or a shortened period of articles. Nor do I think it would be practicable to insist that all articled pupils, wherever they reside, should take a university course. Attention has from time to time been called to the fact that the Scottish societies require their pupils to attend a university course, but as fully three-quarters of the Scottish chartered accountants are in university cities no analogy can properly be drawn from those societies.

CO-OPERATION WITH STOCK EXCHANGE

The council were asked by the Committee of the Stock Exchange to consider a circular letter to be addressed to the secretaries of all companies regarding the method of announcing the declaration of dividends. The council deputed the vice-president, Sir Arthur Cutforth, and myself to attend these meetings and, after considerable discussion, we were able to agree the form the circular should take. The Committee of the Stock Exchange expressed their appreciation of our assistance in the matter. Further meetings were attended, the results of which have since appeared in the Press, in connection with the committee's consideration of the voting rights of Preference shareholders and the publication of consolidated statements of assets and liabilities of companies desiring permission to have their shares dealt in on the Stock Exchange. The Institute representatives, though in sympathy with the objects of the Stock Exchange, considered that matters of this kind should be dealt with by way of general legislation and not by way of rules applicable only to companies which in future apply to have their shares listed on the Stock Exchange.

I regret that the committees of the London and the Provincial Stock Exchanges do not appear to welcome the attendance of the accountant concerned when the elucidation of points arising on figures appearing in a prospectus becomes necessary.

LEGISLATION DURING THE YEAR

There has not been a great deal of new legislation during the past year affecting the profession.

Most members are no doubt familiar with the further provisions which were introduced with a view to tightening up the loopholes in the Income Tax Acts and, as a result of these provisions, opportunities for the legal avoidance of taxation are rightly becoming fewer.

It will be observed from the report that the provisions of the Prevention of Frauds (Investment) Bill have been under the consideration of the council. The Bill has not yet reached the Statute Book, but I have no doubt its provisions have been carefully studied by practising accountants and, from my consideration of it, I have formed the opinion that while not hampering legitimate financial business it will have a deterrent effect on the less reputable members of the financial community.

There has been a demand on the part of managers of unit trusts for the auditors to furnish certificates of yield for incorporation in advertisements and sales literature with the natural object of selling further units. In effect these certificates correlate present market prices of Stock Exchange securities to past dividends, and it is my considered opinion that where given they should be qualified in such terms as to leave the reader under no misapprehension, either as to the basis upon which they have been prepared or as to their inherent limitations.

The president also referred to the following matters:—
National Register and National Service;
The increased use made of the lending library scheme;
Proceedings at meetings of provincial societies; and
The Chartered Accountants' Benevolent Association.

HUDSON'S BAY COMPANY

INFLUENCE OF UNITED STATES CONDITIONS ON YEAR'S RESULT

The 270th annual general court of the Governor and Company of Adventurers of England trading into Hudson's Bay was held, on the 2nd instant, in London.

Mr P. Ashley Cooper (the Governor), in the course of his speech, said: Ladies and Gentlemen,—To-day is May 2nd, the 269th anniversary of the granting of our Charter. In these times of such unrest and anxiety, we should derive some reassurance from the fact that the old company has often before faced war and rumours of war, and yet has survived with life and vigour.

In my speech last year, I told you that our results during 1938 seemed likely to be dependent on the course of business in the United States; and, as this was unpredictable at that time, I felt compelled to refrain from making any definite forecast. In fact, American business conditions got steadily worse, until the closing months of 1938. It was impossible for Canada to remain unaffected by this, and almost every industrial activity declined during the year. That general results were not even worse was due very largely to the contribution which is now made to Canada's income by the various forms of mining; but even here, although production of the principal minerals increased, a fall in the prices of base metals resulted in a small decrease in total value.

LOWER TREND OF PRICES

The level of agricultural income in the West has, of course, a predominant influence on our operations. As you will have seen by the report, the wheat crop in the Prairie Provinces was very much larger than the year before, but, as crops in other producing countries showed similar increases, the world price of wheat declined sharply. As a result of this and of lower prices for other field crops, the general income of the Prairie Provinces was no greater than in 1937.

There is, of course, a third factor which is of the greatest importance to our company—the trend of fur prices in the world's markets. Here again, 1938 was generally a poor year. For the first six months prices declined and demand was, at the best, intermittent. Some improvement was shown over the second half of the year, but it was not very pronounced, or, at any rate, not sufficiently to counteract the previous decline.

You will see, therefore, that almost all the main influences on our trade have been against us and will not be surprised to hear that our profits have suffered.

Our profit on trading is £237,794, against £309,224. The net profit for the year is £110,503. This has enabled us to pay our preference dividend and 2½ per cent., less tax, on the ordinary shares.

The smaller profits of the retail stores department were a disappointment to us. In spite of the less favourable results, I am satisfied that the internal organisation of the retail stores department and the efficiency of its executives is constantly improving.

CURRENT YEAR'S OUTLOOK

I was reluctant to give a forecast last year, and I find myself no better placed to-day. A predominant influence on our operations must be the extent and the speed of recovery in the United States. If the present slight improvement in that country continues, and even becomes more marked, Canada will benefit considerably. This, combined with another good wheat crop and the continuance of mining development (both of which seem likely), would promise a good year; but there would still remain to be solved the important problems of marketing the wheat and of effecting a real improvement in the financial position of the provinces. In view of these continuing difficulties, I am afraid that we must anticipate some decline in revenue at least during the first six months of this year. Similarly, we cannot feel too certain about the future trend of fur prices. If world conditions were peaceful, I think we could justifiably expect the market to go ahead; but every fresh crisis in Europe is a further handicap to our trade.

Nevertheless, the more that I see and know of Canada, the more confidence I feel in her latent powers and potentialities. The short-term view may, indeed, seem dark and discouraging, but I know that we, particularly in this old company, can take the long view and have faith in Canada's inevitable growth and expansion, which must prove stronger than the present uncertainties and difficulties. In this advance I know that the company will take a leading part as it has always done throughout its history.

The report and accounts were unanimously adopted.

H. E. PROPRIETARY, LIMITED

DESCRIPTION OF THE COMPANY'S HOLDINGS

The ordinary general meeting of H.E. Proprietary, Limited, was held, on the 28th ultimo, at Winchester House, London.

Sir Frederic Hamilton (the chairman of the company) said that the accounts must be regarded as satisfactory in view of the conditions which had prevailed over the whole period they covered. Profits, it was true, showed a substantial reduction from £107,000 to £64,000, but, as he had pointed out more than once in recent years, their revenue had in the past been largely derived from profits on realisations and only in a secondary degree from dividends. Last year, for the first time, the position was reversed. The value of the investments at December 31st last, taking the market prices of the quoted securities and the directors' valuation of the unquoted securities, was substantially in excess of the figures appearing in the balance sheet, and, despite the further depression which had occurred since the end of last year, that statement could be accurately repeated to-day.

They were proposing to pay a final dividend of 15 per cent., less tax, making 20 per cent., less tax, for the year, and there would then remain a balance of £78,305 at the credit of profit and loss account, which it was proposed to carry forward.

ASSETS

Referring to the company's main assets, he said that the South African H.E. Company had a capital of £150,000 in 600,000 shares of 5s. each, all of which were owned by H.E. Proprietary. It had a strong financial position, holding between £70,000 and £80,000 cash. The Nigel Reef on the West Spaarwater Company's property was struck some three weeks ago in the shaft at a vertical depth of 5,000 ft., showing an average value of ¼ dwt. over 15 in. A little earlier a pilot borehole which had been put out at a depth of 4,769 ft. below the collar of the shaft had intersected the reef at a depth of 4,964 ft., giving the very satisfactory value of 23 dwt. over a corrected channel width of 13½ in., equivalent to 310 inch-dwt. In view of the exhaustion of the company's funds and the impossibility of finding a large amount of further working capital under existing conditions, it was decided to close down all operations.

Consistent and satisfactory progress was being made by the Luipaards Vlei Estate and Gold Mining Company, Limited. The preliminary additions to the treatment plant were now being reflected in increased throughput and working profit, while the expansion of development operations had met with highly encouraging results. For the year to June 30, 1938, 593,000 tons of ore were milled for a working profit of £228,299, and during the nine months since that date the throughput had been 483,100 tons, for a working surplus, including sundry revenue, of £222,575. At June 30, 1938, the ore reserve was estimated at 2,542,000 tons of an average value of 4.9 dwt. over a stoping width of 43.1 in. The expansion programme of the company to provide an ultimate throughput of 100,000 tons monthly was now well in hand. The new vertical shaft, the Turk Shaft, had at the end of March reached a depth of 1,747 ft. The ultimate objective of this shaft was 4,500 ft., and was intended to provide haulage for the major portion of the mill tonnage.

Australasian interests included holdings in the Gold Fields Australian Development Company, the Wiluna Gold Corporation, Lake George and Blackwater companies. Of these by far the most important was the Gold Fields Australian Development. Here progress had been unspectacular, but in the main fairly satisfactory. The Moonlight mine had continued to treat rather over 100,000 tons annually at a profitable rate.

The interest held in the Anglo-Huronian Company remained unchanged. The cash and liquid investment position of this company was strong, but here again the general conditions had not encouraged fresh business or important commitments.

MOUSSEC

Moussec had again had a good year, and since the close of its financial year at the end of October last sales had shown a further steady increase. It could, he thought, confidently be stated that Moussec had now established its reputation as to what it was—a genuine refined and palatable wine possessing the stimulating qualities without the acid reactions which often characterised foreign sparkling wines. It was satisfactory to learn that it was now widely recommended by the medical profession in cases of convalescence, in which the reaction, of course, was of supreme importance.

The report and accounts were unanimously adopted and the dividend as recommended was approved.

ENGLISH AND CALEDONIAN INVESTMENT COMPANY, LIMITED

MR HENRY S. LOEBL'S SPEECH

The 12th Annual General Meeting of the English and Caledonian Investment Co., Ltd., was held, on the 4th instant, in London.

Mr Henry S. Loebel (chairman) in the course of his speech, said:

The Company's investments stand this year at a book figure less contingency fund of £1,006,927, some £26,000 less than the previous year. The value of the investments at 31st March last was £813,639. There is, therefore, a depreciation on the book figure of 19.20 per cent. This shows a slight improvement compared with the position at 31st March, 1938, when the depreciation was 19.23 per cent.

As an indication of the effect on the value of our investments of the disturbing events which took place in Europe in March last, I may tell you that the market value of our investments fell by approximately £38,000 between 10th and 31st March, the day on which our valuation was made.

At the date of the Balance Sheet, the Company's portfolio consisted of 256 holdings with an average book value of £3,930, compared with 254 in the previous year with an average book value of £4,060. Classified, according to security, the Company's investments were distributed as follows:—

Within the Empire.		
Corporation Loans, Bonds and Debentures ...	2.48	per cent.
Preference Shares ...	17.16	"
Ordinary Shares ...	54.59	"
Total within the Empire ...	74.23	"
Outside the Empire		
Loans, Bonds and Debentures ...	7.42	per cent.
Preference Shares ...	8.60	"
Ordinary Shares ...	9.75	"
Total outside the Empire ...	25.77	"
Grand Total ...	100.00	"

In continuance of the policy outlined by me last year, we have transferred a further sum of £5,000 from revenue to general reserve, increasing this item to £25,000.

The net revenue for the year amounted to £32,390, approximately £500 more than for the previous year. After allowing for income tax and a full year's dividend on the preference stock, there remains available a sum of £13,352 against the sum of £12,772 for the previous year. Expressed as a percentage, the earnings on the ordinary stock were 9.03 per cent. against 8.64 per cent.

Including the amount brought forward from the previous year, the amount available is £16,641. An interim dividend of 1½ per cent., less income tax, has already been paid on the ordinary stock and your directors now recommend the payment of a final dividend of 3½ per cent., less income tax, making a total distribution of 5 per cent. for the year.

WORLD CONDITIONS

Since our last annual general meeting, world conditions have gone from bad to worse. Germany has again been the main source of the world's troubles. Having achieved strength largely with money filched from the pockets of the investing public in England, America and other countries, Germany is wielding her power to the detriment of the rest of Europe, and has now made it abundantly clear that she feels herself free to dishonour her political as well as her financial obligations. Other countries, direct victims of Fascist aggression, are being forced to default on their bonds also, and all the European countries are forced to arm themselves on a scale which is straining their financial resources very severely.

In view of all these circumstances, it is not surprising that the trend of trade and stock markets throughout the world reflects profound uneasiness and lack of confidence. It is the present intention of your Board to adhere to their declared policy of keeping a very large proportion of the company's funds invested within the British Empire. As I have already stated, the proportion of our funds so invested was 74 per cent. on March 31st; this compares with 73 per cent. on March 31, 1938.

Bearing in mind the conditions ruling during the period under review, you will doubtless consider the company's results for the past year far from unsatisfactory.

At this time of acute international tension it is more than ever difficult to assess prospects, but, although the possibility of some reduction in our income during the current year should not be ignored, your Board see, so far, no reason to anticipate a reduction.

The report was unanimously adopted.

SOUTH-EASTERN GAS CORPORATION, LIMITED

INCREASED SALE OF GAS

The seventh ordinary general meeting of the South-Eastern Gas Corporation, Limited, was held at their offices, 84 Horseferry Road, London, S.W.1, on the 3rd instant.

Sir David Milne-Watson, Bart., LL.D., D.L. (the chairman), said that sales of gas had been adversely affected by the mild weather. It was most satisfactory, therefore, to record that, taking all the companies associated with the Corporation as a whole, there was a small increase in the sale of gas. The net result of the year's operations was that £162,399 remained to be carried to the net revenue account, compared with £156,607 in the previous year. An interim dividend of 3 per cent., less tax, was paid in September, and the directors recommended a final dividend of 3 per cent. The net revenue for the year would again have been sufficient to pay a dividend of more than 7 per cent. on the ordinary shares.

There were now only 3,703 ordinary shares of £1 each available for issue. In order to meet possible requirements in the future a resolution would be proposed to increase the authorised share capital to £5 millions by the creation of 1,000,000 additional ordinary shares of £1 each.

A report on the gas industry had just been issued by the Political and Economic Planning Group. That independent report stressed the great importance of the gas industry in the national economy, both in peace and war. It drew special attention to the large number of small units which still existed in the industry. The suggested scheme of reorganisation contemplated the formation of local gas undertakings into regional groups.

In spite of the uncertainties of the international situation, the sales of appliances last year had been maintained at a very satisfactory level and no less than six companies had record sales. Several public lighting contracts had been obtained, among which he might mention a seven-year contract with the Chatham Corporation and five-year contracts with the Boroughs of Slough and Windsor and the Urban District of Uxbridge.

The report was unanimously adopted and the increase of capital approved.

SOUTHERN AREAS ELECTRIC CORPORATION, LIMITED

INVESTMENT POLICY BROADENED

The Rt. Hon. Viscount Elibank, presiding at the sixth annual general meeting of the Southern Areas Electric Corporation, Limited, held in London on April 28th, said that, in common with many others responsible for operating electricity supply undertakings, 1938 was, in some respects, a difficult year for the company. As the result of new legislation affecting the coal industry, there had been an increase in the cost of coal. There had also been a rise in the maximum demands in all areas during the excessively cold weather in December last, adversely affecting profits. It was estimated that increased coal cost and maximum demand charges—under their bulk supply tariff—would have been £2,700 less had conditions in 1938 been more normal. Coincident with these increased costs were certain tariff reductions which operated during the year in some areas. Taking their undertakings as a whole, the lower average price per unit received during the year represented a reduction of £4,600 in the total revenue received from the sale of current, compared with what would have been collected had the 1938 charges been the same as those ruling in 1937. These two factors, which together cost the company £7,300, were mainly responsible for the profits for 1938 being £31,985, as compared with £37,953.

During 1938 the units sold increased by approximately 14 per cent.; the net receipts from the sale of current by less than 10 per cent. There was an 8 per cent. increase in the number of new consumers connected to the mains.

The issued share capital remained the same as last year, for they had financed further investments in the subsidiary and other companies by bank loans on favourable terms. They had taken an interest in another small electrical manufacturing company and had acquired a substantial interest in an electric cable manufacturing company. The directors were satisfied that in the general interest of shareholders their policy of broadening the basis of investments had proved, and would continue to prove, a sound policy.

The profits available for distribution amounted to £48,015, and a final dividend of 3 per cent., making 5 per cent. for the year, the same as last year, was now recommended.

The report was unanimously adopted.

APOLLINARIS AND PRESTA, LIMITED

INCREASE IN PROFITS

The forty-second ordinary general meeting of this company was held, on the 2nd instant, in London.

The Chairman, Mr John Douglas Broad, F.C.A., said that the moderate increase in profits for the year ended December 31, 1938, viz. £1,379, indicated progress, and the cash position was stronger by £5,233; there was no liability to the company's bankers here, and the directors' fees had been voluntarily reduced by 20 per cent. Had they been able to include sums due from Germany, the rise in profits would have been greater. The moratorium with the debenture stockholders and the debenture deferred interest certificate holders had been extended as the political tension, so damaging to their business, had persisted and in fact been accentuated during the past year.

Export business was so subordinated to restrictions and regulations that he sometimes wondered they were able to carry on business at all.

In present circumstances it was more than ever necessary to develop their sales of other articles. Their Presta waters, including grape fruit, orangina, tonic water, ginger ale, lemonade, etc., continued to progress, and the Presta sales during 1938 showed a large increase. Two further articles had been added—Presta Tomato Cocktail and Presta Passion Fruit Juice.

With regard to the future, the board was still optimistic, as was indicated by the fact that they had increased the payment to the debenture holders from 2½ per cent. to 3 per cent. per annum.

The managing director, Mr Francis J. Schilling, announced that the company have recently extended the scope of their already satisfactory business in natural mineral waters by their appointment as sole distributing and selling agents in the United Kingdom and Ireland for the leading French table water, Perrier. Major Percy C. Burton, O.B.E., on behalf of Perrier, had joined the board, and the directors believed that the agreement with Perrier would be to the benefit of the shareholders.

The report and accounts were adopted.

RIO TINTO COMPANY, LIMITED

A DIFFICULT YEAR

The sixty-sixth ordinary general meeting of the Rio Tinto Company, Limited, was held, on the 28th ultimo, in London.

The Rt. Hon. Sir Auckland Geddes, G.C.M.G. (the chairman), said that the year 1938 had been, as so many recent years had been, an extremely difficult one for the company in so far as its interests were in Spain. Fortunately, within the last few weeks the war had come to an end, and it was possible to review its effect upon their financial position. The accumulation of pesetas, received or due at December 31, 1938, was Ptas. 36,275,071. The total value of goods and sterling delivered to the Spanish authorities had passed £2,850,000. Certain difficulties in the way of export continued, notably the prohibition of export to France, which was particularly damaging to the company's competitive position.

Mining operations had proceeded regularly and without interruption, apart from a few difficulties and delays in obtaining supplies, which, in the circumstances, had not been excessive. Shipment of ores had been subject to some restrictions and had amounted to 1,282,972 tons as compared with 1,424,998 tons in the previous year. A new feature of their operations had been the recovery of gold in the form of a concentrate.

Their labour force in Spain had rendered excellent service throughout the year, and, apart from one or two departments in which the absence of young men had been felt, its efficiency had been fully maintained.

In spite of all problems, the results shown on the revenue account were, he thought, not unsatisfactory. It would be noted, however, that the net profit was well below the income received from Rhodesian investments. That indicated the drain upon their Rhodesian income necessary to meet the exchange requirements of the Spanish authorities.

With regard to their Rhodesian interests, since he last addressed them he had re-visited Nkana and Nchanga and was more than satisfied with the progress made by the Rhokana Corporation and the Nchanga Consolidated Copper Mines. He had also visited Mufulira, in which indirectly through the Rhokana Corporation they were interested, and that mine also was doing well.

The report was adopted.

LONDON ELECTRIC WIRE COMPANY AND SMITHS, LIMITED

POSITION FULLY MAINTAINED

The thirtieth annual general meeting of the company was held, on the 4th instant, in London.

Mr W. J. Terry (chairman and managing director) said that the company's cash was only £12,858 short of the total liabilities, quite apart from marketable securities, and the strong liquid position showed a favourable balance of £845,505, after deducting current liabilities from current assets.

Throughout 1938 trading conditions were difficult because of the uncertain international situation. The downward trend which started towards the end of 1937 continued throughout the first half of 1938, but during the latter part the demands of the trade remained fairly constant.

The sales of the company during 1938 were appreciably less than in 1937, which was a record year. Unspecified contracts carried forward into 1939 were lower than those brought forward at the commencement of 1938. Outstanding orders, however, bore a fair relation to current trade demands.

The export sales of the company during the year increased by nearly 50 per cent., although mostly at unsatisfactory price levels, due to inequitable competition through subsidised exports from foreign countries. The question of our exports was all the more vital because of the desire amongst nations to become self-sufficient.

It was well-nigh impossible to forecast the future. Their trading results for 1939 should parallel closely with those of last year if no world catastrophe occurred. With the present international situation, however—overshadowing everything—it was quite impossible to foretell what might happen in the near future. In the conditions which prevailed to-day there was naturally a general reluctance to embark upon entirely new enterprises for the employment of surplus funds, owing to a lack of confidence in the future.

It was proposed to recommend the same final ordinary dividend of 5½ per cent. as in the two previous years, making a total of 7½ per cent., less tax, for the year. Their company's financial position was intrinsically sound, and he could assure them that every effort would be continued by all to advance the company's interests.

The report was unanimously adopted.

PATALING RUBBER ESTATES, LIMITED

STANDARD PRODUCTION INCREASED

The 19th ordinary general meeting of The Pataling Rubber Estates, Limited, was held, on the 3rd instant, in London.

Mr H. Eric Miller (the chairman), in moving the adoption of the report and accounts, said that a year ago, when they were considering the satisfactory results of the 1937 operations, he said it was a matter for regret that prospects were much less favourable. The market price of rubber at that time was, in fact, less than 6d. per lb. Bearing that figure in mind, the average net sale price recorded for the 1938 crop, equivalent to 8½d. per lb., London landed terms, had worked out much better than at that time seemed probable. The strong financial position of the company enabled them to suspend sales while the market was unduly depressed, and this policy was gradually rewarded as a result of the drastic contraction in the permissible rate of export. Only a much smaller crop could be accounted for; the 1938 figure of 2,851,116 lbs. compared with 4,138,577 lbs. for 1937. Special cultivation measures were being continued in both the old and younger areas, and having the labour available to speed up this work they carried through a larger programme in 1938, the cost of which had been charged to revenue account.

The directors recommended a final dividend of 4½ per cent., subject to income tax, making 7½ per cent. for the year. The dividend was just half that distributed on account of 1937, and bearing in mind the fact that the present issued capital of the company was substantially less than the amount of money actually sunk in the estates, it could not be called a handsome return. Nevertheless, the earning of it redounded to the credit of the estates staff, who were competent and conscientious.

The Pataling Company had always enjoyed high repute and would give as good an account of itself as circumstances, beyond their control, permitted. In conclusion, he would add that, as a result of representations to the proper authority, the company's standard production for 1939 had been raised by nearly 100,000 lbs. to 5,281,301 lbs.

Mr D. S. Gardner, in seconding the motion, gave an account of his visit to the company's estates, and said it was a great pleasure to express the opinion that all the estates were in first-class order. The resolution was unanimously adopted.

THE LONDON ASIATIC RUBBER AND PRODUCE COMPANY, LIMITED

LOW CAPITALISATION PER ACRE

At the annual general meeting of the above company, on the 1st instant, the chairman, Mr H. J. Weich, said:—

In 1938 the rubber-growing industry experienced more difficult conditions than in the previous year.

Price.—Fortunately this company had forward sales of 756 tons of rubber at prices equivalent on the average to 11.3d. per lb. gross for rubber landed in London. The probability of an improvement in prices appeared strong enough to justify the board in keeping a considerable part of the company's output of sheet off the market. This policy was amply justified by events, and our average London equivalent price received for all grades during the year was nearly 2d. per lb. above the average London price for No. 1 sheet.

Crop and Cost of Production.—The crop showed a decrease of no less than 1,707,756 lb., and it was produced at about ½d. per lb. more, which is about the extra amount spent on cultivation.

The dividend recommended for the year, including the interim dividend paid in October last, amounts to 10 per cent. Our recommendations include a further allocation of £10,000 to the dividend equalisation reserve. The dividend is paid on a very low net capitalisation per planted acre.

Condition of Properties.—According to our visiting agent's reports, the estates are in first-class condition, and our colleague, Mr J. C. Henderson, has emphatically confirmed these advices.

Net Cost per Planted Acre.—Our total issued capital amounts only to about £31 12s. per planted acre. When allowance is made for surplus liquid assets, equal to £9 7s. per planted acre, the net cost of our planted areas is only £22 5s., without any allowance being made for the value of the reserve lands of over 16,000 acres.

Development of New Plantings.—The decision to allow rubber estates to plant during 1939 and 1940 new areas up to 5 per cent. of their previously planted areas, gives the company an opportunity

(Continued from page 334)

Metals

Copper.—The London market was quiet and demand below normal this week. Prices fluctuated within narrow limits and standard cash closed at £41 13s. 9d. per ton on Wednesday, 1s. 3d. lower on the week. Greater activity was reported from the United States. Domestic sales advanced from 28,678 short tons in March to 60,223 short tons in April, the highest total since October. As a result, the American Smelting and Refining Company raised its price to the official level of 10.25 cents per lb., while Phelps-Dodge quoted 10.50 cents per lb.

★

Tin.—Tin prices continued to advance and closed £1 15s. higher on the week at £225 5s. per ton, the highest official price since October, 1937. Owing to the shortage of spot supplies the buffer pool lent a considerable tonnage to the market. The total visible supply at the end of last month, at 32,585 tons, was 287 tons lower than at the end of March. Deliveries during April, at 9,420 tons, were 1,233 tons higher than in March, while supplies advanced to 9,635 tons against 9,063 tons in March. The outlook on the market is still dependent on the maintenance of United States purchases.

★

Lead and Spelter.—Although demand showed some improvement this week it was not reflected in prices. Lead declined by 1s. 3d. to close at £14 7s. 6d. per ton, while spelter was reduced by 3s. 9d. to £13 10s. per ton. Lead stocks in home warehouses fell from 13,536 tons on March 31st to 13,296 tons on April 30th. Spelter stocks fell simultaneously from 24,321

tons to 23,842 tons. In both cases the present level of stocks is below rather than above normal.

Grains

HIGHER freights, unfavourable crop reports in the United States and improved Continental buying led to a steady advance in wheat prices during last week; London May futures rose by 1s. 2d. per quarter to 23s. 6d. per quarter. Shipments from the Argentine are increasing in volume, with a corresponding fall in shipping tonnage available there, and more interest has also been shown in Australian wheat by European purchasers. It is reported from France that the Wheat Office will for 1939 guarantee the growers a minimum price only on that part of the crop sold for domestic consumption—a policy which should limit French exports of wheat in the coming season. The maize and barley markets have been firm in sympathy with wheat prices.

Other Foods

Provisions.—Bacon prices were reduced by 4s. to 5s. per cwt. at the end of last week, since when the market has been steady at the lower level. Veal and pork have sold well, with correspondingly firm markets for calves and small pigs, but other fresh meat has found a slow market.

★

Colonial Produce.—Sugar prices have risen very sharply during the past week. Centrifugals (96 degrees) for prompt shipment were on Wednesday quoted in London at 8s. 4½d. per cwt., a rise of 9d. on the week, and prices for refined have been marked up accordingly. There was also a firmer market for cocoa and for mild coffees.

of extending its planting by some 1,470 acres, and this we propose to do.

The 1939 crop will be reduced and will probably cost slightly more. No part of it has been sold forward.

The report and accounts were adopted unanimously.

BEKOH CONSOLIDATED RUBBER ESTATES, LIMITED

The nineteenth ordinary general meeting of Bekoh Consolidated Rubber Estates, Limited, was held, on the 28th ultimo, in London. Mr E. F. Slade, J.P. (the chairman) said: At our last general meeting we dealt with accounts covering a period of 18 months. To-day we are considering figures relating to the period of 12 months. In comparing the figures this factor must be remembered.

Our standard production allowance suffered at the hands of the Committee in a way that seemed to us unreasonable. In response to appeals for reconsideration, we happily received some redress. Our standard allowance for 1938 was 2,491,148 lb., for 1939 it is 2,487,048 lb., and the result of a further appeal is awaited with interest.

In spite of the fact that we were only allowed to export an average of 55 per cent. of our standard production during 1938, our cost per lb. only increased by less than ½d. per lb. This was brought about by constant care and attention, both in the East and in London.

The gross price secured for the whole exportable crop, including that sold locally, in 1938 was 7½d., as against 8½d. in the previous financial period. Here again credit must be given to our secretaries and agents in London for their management and the selling of our crop.

When we last met just over a year ago I told you that we must look forward to reduced profits. Unfortunately, this proved correct. I am aware of the dangers of prophecy, but I feel strongly that 1939 should show rather better results than 1938, provided, of course, that the even tenor of our way is not upset by international absurdities.

The report and accounts were adopted.

Fruit and Vegetables.—The supply of old potatoes is running out and although good samples maintain their value, the bulk of the inferior produce can only be sold at lower prices. New potatoes are also cheaper, with larger supplies from the Channel Islands.

Miscellaneous Commodities

Vegetable Oils and Oilseeds.—The markets generally have a steadier tone and prices in many instances were influenced by rising freight rates. The prospects for the new Indian linseed crop are promising and private estimates indicate an out-turn of 420,000 to 430,000 tons, against the final figure of 457,000 tons last season.

★

Rubber.—Business on the market has again been very limited and prices have fluctuated within narrow limits; standard sheet closed unchanged on the week at 7½d. per lb. The next meeting of the International Rubber Regulation Committee which is to be held on May 16th is at present a less important influence on the market than world politics, but America seems to be hoping for an increase in the exportable percentage.

★

Furs.—The London general spring sales continued in a slow manner. France showed very little interest and United States buying also declined as the sale progressed. Withdrawals, therefore, are on the increase, though prices have maintained the levels quoted during the first days of the sale. South-West African Persian lambs showed an advance of 5 per cent. on January and lynx furs were very firm. Business on the free market is practically at a standstill owing to the political uncertainty.

Electricity and the "Grid"

The first four diagrams are reproduced from the Central Electricity Board's report for 1938. Electricity production statistics for Italy, France and the United States refer only to public undertakings, and the amount of privately generated electricity is not recorded.

Finance

GOVERNMENT RETURNS

For the week ended April 29, 1939, total ordinary revenue was £10,009,000, against ordinary expenditure of £28,875,000. Thus, including sinking fund allocations, the deficit accrued since April 1, 1939, is £34,965,000, against £24,196,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On April 28th applications at £99 13s. 10d. per cent. for bills to be paid for on Monday, Tuesday, Wednesday, Thursday and Friday of following week were accepted at about 31 per cent. and applications at higher prices in full. Applications at £99 13s. 11d. for bills to be paid for on Saturday were accepted in full. £30.0 millions of Treasury bills are being offered on May 5th.

(a) Paid on a larger capital. † Free of income tax.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are not definitely redeemable the yield is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. The return on ordinary stocks and shares is calculated by reference to the "cum div." shares. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

is really not worth a war"; but the same newspaper, which no foreigner can be made to believe is wholly independent of the Government, continues to give great prominence to letters from high Government officials and others urging "discussions" with Nazi Germany and the making of "generous gestures" to Herr Hitler. The intentions of these people are quite admirable. But that it is possible for intelligent persons to believe, in May, 1939, that the offer of concessions to the Nazis will have any other effect than to make them redouble their demands, is merely proof that the emotion of hope is stronger than reason. As has been admirably argued by one of the contributors to the discussion, the policies of conciliating the aggressor and of restraining him cannot be mixed. We must pursue one or the other wholeheartedly. The Prime Minister's speech on Thursday emphatically declared for the policy of restraining the aggressor. Mr Chamberlain clearly recognised that the chief danger of war lay in German doubts of British resolution, and flatly declared that the use of force "would

inevitably start a general conflagration in which this country would be involved"—a decided improvement on the tortuous formula of last summer. The restraint of the aggressor is the Government's and the country's declared policy. There must not now be any sabotage.

After the events of last September, we are quite exceptionally lucky in being given a second chance to build up an Eastern Front of resistance to aggression. There will be no third chance. And nothing will ruin our second chance so quickly or so completely as the suspicion that we intend once more to undermine the resistance of our natural allies, to purchase our peace with their sacrifices, to persuade them to surrender their own defences and then leave them to the Nazis' mercies. A second Munich would not mean peace. It would mean the certainty of war, and the high probability of defeat for liberty and democracy. Danzig, the symbol of our last chance to stand on a line we have a chance of holding, is certainly worth the risk of a war, even with Germany.

Shelter and Exodus

WARS, like boxing matches, are won by attack. Equally, they can be lost for lack of an efficient guard against the enemy's own blows, and the important measures which will take up the time of Parliament until Whitsuntide, the Military Training Bill, the Reserve and Auxiliary Forces Bill and the Civil Defence Bill, pay due attention to this double need. The establishment of a conscript militia and the statutory provision for the calling-up of reserves and auxiliaries for supplementary peace-time training are together intended, not only to create the nucleus of a sufficiently large and sufficiently trained striking force, but also to make it possible to man anti-aircraft defences continuously. The Civil Defence Bill does the i's and crosses the t's of the duties that devolve upon employers and local authorities to protect the persons and property under their charge.

The ideal way to safeguard the civil population against air attack would be to set up an impenetrable barrier of airplane and artillery defences. In practice this is not possible and, although this country's anti-aircraft defences are now well advanced, it is to be expected, according to most experts, that some bombers could always get through. Their losses of machines and personnel would inevitably be heavy, however, and forecasts of the skies over London darkened by thousands of hostile aircraft have no basis in fact or sound reasoning. The enemy's supply of bombers must be limited and of pilots and other personnel even more so. No nation could employ all its planes in a single attack or even on a single front. No Government could risk the destruction of its air fleet in the space of only a few weeks. The problem is a limited one and a rough and ready notion of the limits can be had from a very simple piece of arithmetic. The number of first-line bombers and trained crews that Germany has available for bombing London, after making provision for all the other duties of the German Air Force, cannot be more than 1,500 at the most and is probably much less. The proportion of machines brought down by the defenders in an attack on a heavily-defended area like London can hardly be put at less than 10 per cent. of the machines taking part in the raid. Even if the German command were prepared to lose the whole of its first-line machines and men in the first month of war it could not contemplate losses of more than 50 machines a day—which means an absolute maximum of 500 machines sent over London a day. The probable figures are considerably lower. Now 300 or 500 bombers is a very large figure and they would do immense damage, but it is nothing like the continuous

mass raiding visualised in some nightmares. Moreover, the more severe the raids were to begin with, the shorter the time that intensive bombing could last.

The problem then is measurable. It is to provide for the eleven or so million inhabitants of the areas that are in direct danger (the areas scheduled by the Government for evacuation) sufficient protection to minimise loss of life and ensure the maintenance of the activities upon which war effort depends. People must be protected *in situ* or transferred to safer places. Shelter and evacuation are the two complementary parts of the Government's programme that should fit snugly together.

Actually there is still a gap between them. On paper the Government's shelter plans are completed with the newly-announced brick and concrete shelters. In time it may be possible to provide protection against blast and splinters for the seven or eight million inhabitants who are not, under the present scheme, to be evacuated. But it will take a long time and it places a heavy burden upon the steel and building industries. And, even when all the shelters have been made and sold and set up, the position will scarcely be satisfactory. Blast and splinter-proof shelter is, for many reasons, the only protection that can be generally offered; and it would cut down casualties in an air raid by at least one-half and probably more. But, in the absence of bomb-proof shelters, relatively impervious to direct hits, casualties would be disturbingly high. The Government proposes to take responsibility for evacuating only children, mothers and disabled persons. These have indeed prior claims to safety, but there are good grounds for asking whether the evacuation plans should not be recast and enlarged to take away the people and the businesses not absolutely needed in the districts where casualties will undoubtedly be heavy. The argument gains force when it is realised that, at this present time, when war is at least sufficiently a possibility to have become a premise of public policy, about six million people in target areas have no shelters at home or at work and no protection in the streets.

The official view has previously been that individuals or firms wishing to leave London or other vulnerable districts should do so of their own accord. Many tentative private arrangements for evacuation have been made, and business concerns have sought provisional accommodation in the neutral areas (where, in the Government scheme, there will be neither evacuation nor billeting). It has been assumed that it will be possible for these private plans to be executed on the outbreak of war by train or motor car.

This belief has now been shattered. It is the Government's opinion, announced the other day with strange casualness in an incidental *obiter dictum* by the Parliamentary Secretary to the Ministry of Health, that private evacuation in the first four days of any war will be impossible because of the other demands that will be made upon road and rail. There is an added complication in the fact that many children and mothers, nominally entitled to be taken out of danger under the official scheme, have made private arrangements to go to friends or relations.

The result threatens to be confusion. It would seem that there are two courses open for the families and firms that have made their own plans. Either they can evacuate themselves before the emergency arises; or they must wait, probably through the worst days of bombardment, until the roads and railways are opened to them. It is of course possible for children, mothers and disabled persons to abandon their private arrangements and rely upon the State to look after them. A circular sent out by the London County Council this week, urging persons in the priority classes to register themselves forthwith, seemed to suggest this solution. But the circular, like almost all A.R.P. literature to date, was verbose and obscure, and there is an entire lack of definite instructions on this matter from the authorities. Moreover, it would be wasteful and redundant for families with their own means of transport and their own private billets (allowed for, incidentally, in the Government's own billeting survey) to be thrust upon the already burdened official scheme and boarded out on strangers.

The Government must make up their mind. If persons other than children, mothers and disabled persons are to be encouraged or allowed to leave the danger centres they live in—and now that the scope and limitations of shelter policy are known this would seem to be imperative—their

removal must be organised. If individuals and firms are to be encouraged to leave before the danger of raids arises, this must be clearly stated—if only because the redistribution of population and business activities raises serious problems of transport, accommodation and food supplies which can only be solved by forehanded organisation. If private evacuation arrangements are to stand, then the official plans must be extended to cover them; the roads might, for instance, be opened on the outbreak of war, not to any and every private car, but for *bona fide* evacuation purposes to cars carrying official permits to carry so many passengers to approved destinations. The Government must know the likely load on the road system; they must know also the demands that private refugees will make upon accommodation and supplies in neutral and evacuation areas. They must have the whole process under control. A completely unco-ordinated exodus would breed congestion, ill-feeling and panic. But to prevent private evacuation altogether would be unfair and unreasonable, just as to force all evacuation into the official framework would strain the authorities' resources to breaking-point.

It is a lead in these matters that is anxiously looked for. Evacuation is an undesirable measure: it involves a heavy strain on transport and distribution; it means overcrowding; it dislocates trade and industry; and it ruins many small businesses. Carried too far, it would itself achieve the raiders' object of disorganising war effort. But these are reasons for planning, not for over-rigid restrictions; evacuation, even at its worst, is a less evil than casualties at, say, the rate of 100,000 a day in London. Moreover, it will not be a permanent migration. By no stretch of imagination can the constant bombing of London and other towns for months be expected. The refugees will come back. It is their going that now urgently needs a plan.

Agenda for Preparedness.—III

Conscription of Wealth

MUCH has been heard, within the last few weeks, of the conscription of wealth. It would not be an exaggeration to say that it has become part of the accepted war-philosophy of the nation. It is high time that some attempt were made to ascertain what it means. This is the more necessary since ethics, emotionalism and hard realism are all twined through discussion of the subject.

The moral issue is quite simple. Modern war requires, both in the preparing and in the waging, men and money. If the requirements of men are to be met by applying compulsion, then compulsion must be applied to money also. It would be more accurate to speak of *additional* compulsions. Compulsion is already applied by the State both to men and to money—to men in such things as compulsory education, vaccination and jury service, to money in the whole range of direct taxes. What most people mean in advancing the need for the conscription of wealth is that if there are to be new, additional and onerous compulsions placed on personal liberty, then they should be accompanied by new, additional and onerous compulsions placed on wealth. It is surely no answer to point, as the Prime Minister did on April 26th, to the existing direct and progressive taxes. Those taxes were in existence, and were presumably deemed by the community to be just, before the obligation of compulsory military service was imposed.

It is very important that this moral aspect of the matter should be properly disentangled. The Labour Party is the first to suspect, and would be the first to condemn, any attempt to impose conscription of men on the country for its own sake or to regard it as anything but a hateful necessity. Proposals for the conscription of wealth (as

for the conscription of men) should be judged solely by their efficacy in meeting the needs of the State. Confusion of thought on this issue was shown by the proposal for a levy on property put forward by the Labour Party last week. It may very well be that our existing tax system is unduly gentle to income arising from property as against income arising from effort and risk-taking. But that is an issue for peace-time. There is nothing in the needs of war finance or in the demand for the "conscription of wealth" that justifies a tax on property, as such. Just as it would be wrong to use the conscription of men to build an authoritarian State, so it would be wrong to use the conscription of wealth as a step to the Socialist State.

If this moral issue is clearly defined and appreciated, it is possible to examine the problems of war finance on a strictly practical basis. The practical meaning of the conscription of wealth is that policies can be judged not by whether they are likely to be pleasant or popular but solely whether they are likely to be effective.

The experience of the last war can give a first approximation to the financial problems of the next. In the calendar year 1918 the total expenditure of the State was £2,716,780,000 (the earlier years would hardly be relevant to the scale on which any future war is likely to be waged). It is difficult to estimate what the national income was in 1918. In 1913 it is generally estimated to have been about £2,250 millions. The level of prices, to judge by the indices of wholesale prices and the cost of living, was in 1918 about 115 per cent. above the 1913 level. This would give a figure of, say, £4,850 millions. But the nation was undoubtedly working harder in 1918 than in 1913, even though much of the output was of merely destructive

value. Perhaps the money valuation of the output of the nation can be put at £5,500 millions in 1918, which would mean that the State absorbed just half the national income. This is only a first approximation, and the proportion is likely to be higher in any future war.

The problem of war finance is, then, this: how can the State secure, for its own expenses, half or more of the nation's income? Perhaps it is more enlightening to state the matter the other way round: how can the State compel or persuade its citizens to spend only half or less of their total incomes on their own needs? It is worth noticing that it is the nation's *income* that is relevant, not its accumulated wealth or capital. The State is not interested, in war-time, in getting into its possession the land, factories, or houses of its citizens, but only in diverting into its own coffers half the income arising from these capital assets. Proposals for levies on capital values or schemes for appropriating any increases in capital wealth only really become relevant issues after the war if the methods of financing adopted during the war have allowed accretions of wealth to arise. During the war it is incomes in which the State is interested.

The dimensions of the problem can be visualised with the aid of a few figures. The present national income can be put at roughly £5,000 millions. If all the unemployed were absorbed and additional labour provided, as it would be in war-time, by working longer hours and recruiting persons not now occupied, the national income might be raised to, say, £6,000 millions at to-day's values. The total peace-time tax revenue of the State and local authorities can be put, for the convenience of round figures, at £1,000 millions. The war-time problem is to secure for the State the spending of £3,000 millions out of £6,000 millions instead of £1,000 millions out of £5,000 millions—or to leave to the public £3,000 millions out of £6,000 millions instead of £4,000 millions out of £5,000 millions. (All these figures assume, of course, that there is no change in the value of money.) If the national income rose by one-fifth, the yield of taxes would presumably rise in about the same proportion to, say, £1,200 millions. The gap left, to be raised either by increased taxes or by other means, would therefore be something like £1,800 millions per annum, or one and a half times the prospective yield of the existing taxes. These are the approximate orders of magnitude with which we have to deal.

There are two main methods by which the State can secure this proportion of the nation's annual income for its own purposes. One is to leave the money incomes of the individual members of the public substantially as they are at present, while the State creates additional supplies of purchasing power for itself. The new purchasing power competes against the existing incomes and, by driving prices up, compels the public to diminish its consumption and release resources for the State's needs. The rise in prices is not an incidental danger of this inflationary policy; it is its essence, since it alone secures that reduction in the public's consumption which must be the aim of all war-time finance. In the process, however, a number of private incomes are increased, and the price rise has to go on until, even with its larger money income, the public can only buy about three-quarters of its peace-time consumption. In the last war, prices were carried to double their pre-war level. If that happened again, the national income would become £12,000 millions, the yield of present taxation would be £2,000 millions, and the total State expenditure would be £6,000 millions, leaving £4,000 millions of money to be "created." Private incomes, after tax, would be £6,000 millions, which would buy as much as £3,000 millions to-day.

The technical problem can thus be solved by the inflationary method, which has the great advantage of being easy to apply. But this means of limiting public consumption is indirect, inefficient and grossly inequitable. More-

over, inflation may run away, with disastrous results, and it is a policy that cannot be reversed after the war is over. To say that a modern totalitarian war should be waged without any resort to inflation is probably a counsel of perfection. But it is a last resort.

The alternative method of war finance is to secure the necessary reduction in the consumption of the public in a direct and visible manner, by reducing in the desired proportion (i.e. something like a quarter) the present money incomes (after tax) of the individuals who make up the nation. This, again, can be done in two ways: by persuading the citizens to hand over a quarter of their net income in loans or by compelling them to hand it over in taxes. (There are also, of course, half-way houses such as forced loans, and the direct rationing of all forms of goods, so that the citizens have nothing to do with part of their incomes but to give or lend them to the Government, directly or indirectly.) From the point of view of the community, taxes are preferable to loans, since they do not leave behind them the onerous legacy of a vastly inflated national debt. Indeed, the higher taxes are during the war the less high will they need to be after the war is over. This would seem to be the point at which the principle of conscription of wealth becomes relevant; it dictates that if taxation is the more effective method it shall be adopted.

But is it really possible to contemplate raising an additional sum of something like £1,800 millions by taxation, out of a national income only slightly higher than at present? At first sight it is an utter impossibility—and, indeed, it is not necessary that every last penny should be raised in this way. But there are certain considerations, peculiar to war-time, that should be borne in mind. The first is that it is a categorical imperative of war finance to take away from the public, if not this sum of money, then at least the goods and services it represents. There is no choice about imposing these sacrifices but only about the method of imposing them. Secondly, in peace-time increases in taxation have to be managed in such a way that business confidence is not impaired. "Business confidence," when analysed, means a state of public psychology in which money will be freely spent, both on consumption goods and, more especially, on extensions to capital equipment. But this is just what has to be avoided in war-time. It can almost be said that, in war, the less "business confidence" there is the better. Thirdly, peace-time taxation has to leave sufficient incentive to effort in wealth-creation. This necessity does not disappear in war-time; but it is much smaller, partly on the idealistic ground that patriotism supplies a new incentive, and partly on the realistic ground that when demand for everything permanently exceeds supply there is very little risk in enterprise and less need to make risk-bearing worth while.

Whether these considerations add up to a conclusion that it is possible to finance almost the whole cost of a war by taxation is very doubtful. But they certainly add up to the conclusion that the greatest effort must be made to secure as much as is possible in this way and that we must be prepared, for this purpose, to contemplate doing what we now regard as the impossible. The principle of an Excess Profits Duty is now fairly generally accepted. It should be extended to become an Excess Income Duty, so that most, or all, of any increase in incomes during war should go to the Exchequer, either as tax or as forced loan. There must, obviously, be heavy increases in all forms of indirect duties, especially on anything that has a luxury, or even a semi-luxury, character. But the main burden would inevitably fall on direct taxation. There is a very widespread belief that the standard rate of income tax cannot be raised above 6s. in the £. But there is no logical foundation for any such belief, especially as regards war-time. Discussion in terms of the standard rate is, in fact, very deceptive. The effective rate of income tax on a married man with two children and an earned income of

£1,000 a year is now, with the standard rate at 5s. 6d. in the £, only 11 per cent. To double the standard rate to 11s. in the £ would reduce the net income of such a man, compared with his present position, by only an eighth, or by half the approximate proportion in which the consumption of the whole body of citizens must, by one means or another, be curtailed. Or again, we must ask the question (without at the moment implying an answer) whether the whole of incomes in excess of, say, £5,000 could be diverted to the Exchequer in time of war, either in tax or in forced loans. These are, of course, alarming possibilities, which could certainly not be applied without many provisions for hard cases. But it remains true that the necessary curtailment of consumption can be effected far more equitably by taxation than by any other means.

These are the problems of war finance. What can be done about them in the present phase of preparation? The

first necessity is to submit the problem to the same open discussion that is now steadily convincing the public of the inevitability of other distasteful and difficult measures. The second necessity is that a detailed plan of war-time finance should be worked out, so that inflation should not secure a hold while the discussion rages. It would immensely assist to end the dissatisfaction with conscription if it could be announced that such a plan was ready. And lastly, it would be prudent to make a beginning with setting up the legal framework for some of the new taxes (e.g. the excess income duty) that would be required. In the last resort, Great Britain's strength in war depends on the fact that we can, if need be, devote a higher proportion of our national income to the waging of war than any other European nation. The more clearly we show that we realise the full implications of this fact, the more convincing will be the deterrent that we offer to the aggressor.

Portugal's Progress

BRITAIN'S trade with our oldest ally has been flourishing ever since the merchants of Portugal supplied King Henry III with wax for his royal seal. Yet English acquaintance with Portugal and the Portuguese has been throughout our history remarkably deficient. Modern Portugal dates largely from the revolution of 1926, which installed General (now President) Carmona in power, and from the appointment of Dr Oliveira Salazar as Finance Minister in 1928. Portugal's stern financial and economic policy in the early years of the dictatorship would certainly have earned the praise of the strictest practitioner of Gladstonian finance. Fresh from his chair of economics at the ancient University of Coimbra, Senor Salazar proceeded to reform the financial administration and balance the Budget after more than a dozen consecutive annual deficits. In eight years the Portuguese national debt was reduced from £14.8 to £11.3 per head. Budget surpluses were recorded to a net total of about £10 millions, while between 1931 and 1936 the gold reserves of the Bank of Portugal increased from £2 to £8 millions. By the end of 1936 Portugal had not only revolutionised her finances, but had devoted a considerable amount of ordinary revenue to public works and economic development. The main structure of financial reform, involving heavy taxation, was completed during the depression. This was a remarkable achievement, though it owed much to Portugal's favourable economic relations with the rest of the world. Whereas Britain's exports fell off by a half between 1929 and 1932, Portugal's declined by a quarter, and Portugal, unlike Britain, was able to maintain a balance of payments as healthy as was her Budget. As H.M. Commercial Secretary in Lisbon has emphasised on several occasions,* Portugal is practically independent of international finance; her industrial output is disposed of mainly at home and in her colonies; the bulk of her people depend upon agriculture for their livelihood; and her principal exports, port, cork and sardines (covering something like half the total value) are not subject to intensive competition.

The bane of the country has been and still is poverty, with its companions, ignorance and inertia. At the date of the 1930 census two-thirds of the population was illiterate and in one rural area this proportion was over eighty per cent. Poverty is of the same order as ignorance. The wages of agricultural labourers are appallingly low, in some parts as low as a shilling a day. The removal of the *damnosa hereditas* of debt and the favourable international position gave the Government its first real opportunity to join battle

with these evils. The plan of the corporate State was foreshadowed in 1933 and the first phase of financial reform gave place to the second phase of economic reconstruction in 1936. But Senhor Salazar has not been a servile imitator of Mussolini. Portugal is a catholic and authoritarian, but not a totalitarian State. Indeed the idea of the State omnipotent is rejected as essentially pagan and as involving a worse absolutism than that which preceded the liberal era.

The theory of the corporate State requires control of each industry by its members, but in practice Senhor Salazar has to play more than a supervisory part. Broadly, economic planning under the corporate State has not been fundamentally different from similar experiments in Great Britain. The Portuguese wheat campaign, though started as early as 1929, well illustrates both the successes and the difficulties of the new system. Between 1925 and 1929 Portugal was spending over £2 millions a year on imported wheat. By 1934 a guaranteed price, technical assistance and good climatic conditions had brought about a harvest approaching double national requirements. And this success, of which the Italians might well be jealous, was repeated in 1935. The Portuguese peasants, like Joseph, gathered corn "as the sand of the sea." But Portugal, unlike Egypt, not being an isolated economy, had no need to store up corn against the lean years and in any case the cost was prohibitive. So the Government exported some hundred thousand tons at a heavy loss only to find that the 1936 harvest was below normal requirements.

Amid these difficulties, seemingly inherent in experiments in economic planning, it is well to record the great amount of economic development, roads, port and railway improvements, provision of electricity, drainage, etc., which is taking place. In roads, particularly, the progress has been startling. In 1928, 75 per cent. of the road mileage

commenced its advertising programme five weeks earlier than usual, with good results. If moves of this kind can be generalised, some immediate obstacles can be removed and the way cleared for an attack on the major problem posed by those workers whose wages are insufficient to enable them to take a holiday with their families in any case. Perhaps 60 per cent. of the employed population get less than £3 per week, and for these a week's holiday costing at an absolute minimum £3 8s. 6d. per adult at a seaside town and 35s. to 50s. at a holiday camp, exclusive of fares, is virtually an impossibility at present.

* * *

Poland.—Colonel Beck's contribution to the public statements on which Europe now waits each week caused considerable satisfaction to his allies. He neither made war inevitable nor peace dishonourable. To Poland's potential enemies, Colonel Beck's statement was less satisfactory, and seems to have resulted in a certain lull, if not hesitation. Herr von Ribbentrop, having conferred with Hitler and the Nazi leaders from Danzig, left for consultations with Italy. The result was the announcement of an Italo-German military pact; but it remains to be seen whether the price of this agreement was a German undertaking not to begin a war against Poland, for which Italy is known to have little appetite. Meanwhile in Poland itself the situation is stable. The Poles maintain (with obvious logic) that the next move must come from Berlin, while the Germans are openly hoping that a campaign of threats, accompanied by poisonous Press propaganda, will undermine the resolution of the Poles and induce their Western allies to put pressure on them to yield. A new Runciman, they say, is in sight. The Pope is also said to be interested and is credited with having skipped the intervening phases and recommended an immediate recourse to Munich—a conference of Great Britain, France, Italy, Germany, and the State whose rights are disputed. The Polish attitude to this new development has not been expressed, and though the Germans emphasise the superior "sincerity" of Papal over American proposals, it is likely that Herr Hitler will prefer to give the propaganda screw another twist. German "refugees" from Poland are being assembled on the German-Polish frontier at Rummelsburg, and there is already talk of the formation of a Freikorps to conduct guerrilla war on the Polish frontier guards. Poland appears to be sustaining this war with outward equanimity and has this week sealed her new friendship with Lithuania by an enthusiastic reception in Warsaw for General Rashukis, Chief of the Lithuanian Army. M. Potemkin has also had a friendly discussion with Colonel Beck on his way home from Turkey. M. Litvinov's departure has certainly enhanced the possibilities of Russian-Polish friendship.

* * *

Northern Neutrality.—Germany appears to have met with a rebuff in Scandinavia. The Foreign Ministers of Norway, Sweden, Denmark and Finland, who met this week in Stockholm, issued a rather vague communique after their meeting, and referred Germany's proposal for a series of bilateral non-aggression pacts back to their Governments. But it is credibly reported that three of the four countries consider that acceptance of the Nazi interpretation of non-aggression would be contrary to their traditional policy of neutrality. Denmark, the one exception, is hesitant, with a nervous eye on her extreme vulnerability to German action. Since the German offer was intended primarily to convert the Baltic into a German lake and secondly to throw discredit on Mr Roosevelt's peace offer, this rejection from traditionally neutral States was not unexpected. In an official communique, the Foreign Ministers "expressed the unanimous view that the international policy which their countries have logically taken up and intend to maintain, excludes them from being the object of any political combination." This naturally precludes the Scandinavian countries from participating in plans intended, either in

peace or war, to further the strategic interests either of the Axis or of the democratic powers. Their interest in all cases is that the Baltic should remain open and that their trade with Germany, as with the rest of the world, should be undisturbed. It is for this reason that Sweden and Finland want to fortify the Aaland Islands, which lie between their two countries and command the trade routes between Sweden and Germany. Germany is said to have given her consent to this proposal, though it remains to be seen whether this consent was conditional or unconditional. It is obviously in the German interest that these islands should not, in the event of war, fall into hands hostile to the Reich, but the rulers of Germany are not above exacting compensation for concessions to themselves. The Scandinavian countries' relations to Germany are not identical, and this refusal to be entangled by no means signifies the end of all efforts to entangle them. Denmark has a common frontier with Germany, and reports persist of day and night work on fortifications on the German-Danish frontier. Germany, having failed to secure the favours of the Scandinavian Powers *en bloc*, may still hope to secure the attentions of one or the other, and create dissension between them. It is for this reason that objects of dispute between the Scandinavian Powers, such as that between Denmark and Norway over Greenland, may loom once more into the picture in the near future.

* * *

The Serbs and the Croats.—Serb-Croat deadlock threatened last week to develop into an open breach. This disaster seems to have been prevented by a slight change in the somewhat rigid attitude hitherto adopted by the Regent. Negotiations for the federalisation of Yugoslavia opened on April 2nd and were said to have reached a satisfactory conclusion on April 27th. According to the Croats, a single agreement was signed by

M. Tsvetkovitch, the Prime Minister, and M. Matchek, the Croat leader. According to the Belgrade report (which M. Matchek publicly denied) draft solutions were elaborated by each of the two parties and presented to the Regent. The return from Belgrade of M. Shubatschich, the Croat representative, without a definite answer but with new proposals made by the Regent, was taken in Croat quarters to mean rejection of the Agreement of April 27th. The Croat newspaper which published this Croat statement was confiscated and the report was officially denied in Belgrade. Meanwhile, however, though M. Matchek's statement had not shut the door on further negotiation, the Croat National Assembly was called for May 7th-8th and foreign Press representatives were informed that "Sunday will start a new chapter in the history of South-East Europe." Exactly what this chapter may prove to hold has not been immediately obvious, though certain reports maintain that foreign aid may be sought by the Croats, and a Croat repre-

sentative is said to be visiting Italy this week. More satisfactory is the news that Prince Paul received M. Matchek in audience before his departure to Rome on May 9th. He assured him that the agreement had been accepted in principle and that negotiation would be continued on his return. Meanwhile, as if to point the urgency of Yugoslav solidarity, a German press campaign has been started against the "dastardly crimes" of the Slovenes, the chief of which, of course, is to separate Germany from the Adriatic.

* * *

Transition in the Areas.—Sir James F. G. Price, who now becomes Commissioner for the English and Welsh Special Areas following the resignation of Sir George Gillett owing to ill-health, finds confronting him a problem whose character is changing rapidly. Four years ago it was possible to regard the Areas question as twofold; on the one hand, it was the most important aspect of a presumably temporary maladjustment which manifested itself in high unemployment figures for the country as a whole, and on the other hand it covered the more permanent social problem of the older men and youths whose chances of employment in regions specialised to mining and heavy industry were practically nil. Now the first part of the problem is in the process of disappearing, partly, but by no means wholly, because of increased employment in re-armament. The figures for registered unemployed in the Employment Exchange areas which include any part of the Special Areas have been declining since January and on March 13th stood at 232,847. The figures for each area since September, 1938 (the date of the last Report of the Commissioner), are as follows:—

	West Cumbrian	Durham	Tyneside	South Wales	Total, Special Areas
Oct. 17, 1938	10,548	60,962	55,538	108,897	235,945
Nov. 14, "	10,789	61,772	55,690	115,124	243,375
Dec. 12, "	10,418	63,107	54,247	112,515	240,287
Jan. 16, 1939	12,414	68,480	62,183	111,657	254,734
Feb. 13, "	10,607	65,432	59,193	117,158	252,390
Mar. 13, "	9,638	63,326	56,459	103,424	232,847

If the iron and steel industries continue to take on men at the present rate, all but the core of old men and unskilled and partly-trained youths will have been absorbed in a few months, and so far as the Special Areas are concerned what was once the unemployment problem will have become the problem of the unemployed. This shift of emphasis to the long-range aspect brings out certain further considerations concerning the possible effect of any cessation of the present rising demand for labour in the iron, steel and engineering industries. Are we in fact laying the foundation for the Special Areas problem of the future? It is easily possible to exaggerate the part played by re-armament in the reduction of the general unemployment figure, but it is quite apparent that Tyneside and South Wales might find themselves even worse off than before in the event of a removal of the present military sources of demand. There is therefore a case for watching carefully any tendency for new labour to flow into these areas. And if dilution of labour is to come, it might well be tried first in the regions where the pool of unemployed is best defined and organised.

* * *

Work for Refugees.—Recent rumours of large numbers of irregular entries and evasions of the regulations regarding refugees, and of a consequent tightening of these regulations, appear to rest on a very tenuous basis; but the removal of the suspicion that Gestapo agents were arriving by the back door does not leave everything perfectly satisfactory in this matter. The present phase of the movement, which began with the wholesale persecution of the Jews and has received periodical new impetus as Herr Hitler has extended his influence both inside and outside the Old Reich, has

posed a large-scale problem. In its solution Great Britain has played a far smaller part than might have been taken by a country which once enjoyed the reputation of an asylum for the victims of political persecution. Between five and six million Jews and an indefinite number of others are potentially affected, and over 200,000 persons have already left their countries. Yet of these only 20,299 adults and 4,837 children were in Great Britain on April 24, 1939. The very smallness of the number puts to shame those who desire further restriction on the ground that to employ refugees is to take the bread out of the mouths of our own workers, and the economic argument in any case is fallacious. Whether or not refugees reduce the amount of available employment is a question which cannot be answered until they have been given an opportunity; and although it would not be difficult to find cases in which British workers might be displaced by foreigners, the probability is that the influence on employment of immigrants as a body is beneficial. Further, the majority of those leaving Central Europe have an industrial training and would undoubtedly be invaluable in the defence industries as and when shortages of skilled labour manifest themselves. It is a mistake, however, to assume that a problem of this magnitude can be solved by any piecemeal process. The main hope lies in large scale settlement schemes in countries like Northern Rhodesia, the Philippines, San Domingo, and Surinam, where there is still a considerable amount of free space and scope for industrial as well as agricultural activity. The offer made by the British Government at the end of 1938 of lands in British Guiana was a welcome step. It was followed by the setting up of a Commission which has now reported to the Advisory Committee on Political Refugees appointed by the President of the United States. The conclusions of the Commission are of a kind likely to be repeated in other areas, namely, that while the territory offered in British Guiana is not ideal for the large-scale settlement of Central Europeans, it is sufficiently promising to justify an experiment on a substantial scale involving a capital outlay of £600,000. There is no excuse either on economic or humanitarian grounds for further delay in the undertaking of projects of this kind.

The F.B.I. and South-Eastern Europe.—The familiar difficulties of the German economic system to-day are the starting point of an interesting discussion in the latest quarterly business review of the Federation of British Industries. The conclusions which the bulletin goes on to adduce from Germany's present straits are much more disputable than its account of the difficulties

WILLS & TRUSTS

In acting as an executor or trustee, the Westminster Bank aims at putting itself in the position of a private trustee. It is therefore its practice to employ the family solicitor, if there is one, or any other solicitor the client may name; by such means the Bank succeeds in combining domestic tradition with business efficiency. A book showing the advantages of corporate executorship and the terms of appointment may be had at any branch

WESTMINSTER BANK LIMITED

and Manchester

themselves. The point is made that the annexation of Austria and Czechoslovakia has not eased the Reich's problems, which is true in so far as it has greatly enlarged the adverse balance of trade. But it is not made clear that the economic worth of Germany's conquests depends upon the use to which they are put or, in other words, that if the annexations are proving disadvantageous it is in large measure Germany's own economic policy that is responsible. The same criticism applies even more to the next and somewhat insidious stage of the bulletin's thesis. In brief, its view is, quite rightly, that Germany needs foodstuffs and raw materials rather than mere manufactures; and the solution suggested is the formation of larger and "complementary" economic units in Central and South Eastern Europe. At first glance the proposition is unexceptionable: here as elsewhere in the world, it has been the lack of freer trading that has exacerbated economic difficulties. But when the F.B.I. go on to claim that it is the "multiplicity of independent nationalities" that is inherently to blame, and that the solution would be for the States of South Eastern Europe to "forgo a sufficient measure of national liberty" to make complementary economic union with Germany possible, a good argument comes to a bad end. It is natural and inevitable that the Reich should predominate in the trade of South Eastern Europe, and any free agreement to augment that trade would be economically desirable. The multiplicity of tariff barriers is an obvious obstacle to trade. But it is wholly unnecessary and vicious that the Reich's commercial status should carry with it the claim to restrict the political independence of any of its customers. Nor can South Eastern Europe be strait-jacketed to serve German raw material needs. To compel these countries for all the future to confine themselves to agriculture and to eschew all industrial development—which is the German aim—is to condemn them to continual poverty. The populations of the various States are rising rapidly, and the development of such of their own industries as can be made economic is necessary and desirable. "Can larger economic units be created in Central Europe without altogether sacrificing the liberty of small nations?" ask the F.B.I., hopefully. There is no economic reason at all why they should not; and the F.B.I. would be better employed in helping the British Government to make economic co-operation in Danubia and the Balkans possible on the basis of absolute political independence than in preparing tendentious arguments to be bandied about with gratification in Nazi circles.

* * *

Italian Economics.—The Italian national economy, like that of other countries, is being increasingly distorted by the pressure of re-armament and economic nationalism. With the announcement of additional expenditure of little under 300 million lire (about £3 millions), incurred in the invasion of Albania, and the approval by the Duce of new military credits, it becomes clear that the official estimate of a total expenditure of 25 milliard lire for the current financial year is going to be exceeded, perhaps to the tune of five to ten milliards. Although the prospective yield of taxation, following the level of money incomes, is on the increase and may exceed 25 milliards, it unquestionably will not be sufficient to meet this year's extraordinary expenditure. Some new special imposition is, therefore, to be expected. The cycle of special taxes on different types of property, land and real estate, joint-stock and private capital has now been completed, but it is possible that the Duce may decide that the occasion demands a general capital levy on lines similar to that imposed soon after the war. The Italian taxpayer already bears a heavy burden, but it must not be imagined that another special levy would prove the last straw. Indeed, so far as the mass of the people are concerned, autarky and compensated trade have now assumed a much more terrifying appearance than taxation. Foodstuffs have deteriorated in quality and quantity. Italian soldiers manning the frontier fortresses have on several occasions begged bread and soup from their French opposite numbers. Even worse—because the Italians are one of the world's heaviest coffee drinkers—

the unwillingness of Brazil to buy Italian goods has led to a scarcity of coffee. Last year's imports at 356,000 quintals were below consumption estimated at 400,000 quintals. So far the shortage has mainly affected private purchasers and bars, at least in the principal cities, have remained unaffected. But the "famine" is anticipated to get worse. The deficiency cannot be met from Abyssinia. The best Harar coffee is too good a source of foreign exchange to be consumed at home, whilst the remainder is of too poor a quality. Proposals are on foot for an admixture of barley and coffee, but this is hardly likely to prove popular. Against these unpleasantnesses may, however, be set the good employment resulting from war preparations. The official employment index reached a new high last February. Building in particular is very active. The index of construction activity, which reached a very low level during and just after the sanctions period, has been rising steadily during the last twelvemonth, and in February, 1939, was 33.3 per cent. above the figure of February, 1938, and 8 per cent. above the 1928 average. This is, of course, due not to house building, but to industrial and military construction. The industrial triangle—Genoa, Milan, Turin—where full employment must be close at hand, has become a magnetic attraction for the poorer people of the country, Neapolitan boatmen and Venetian gondoliers and all who have been hit by the disappearance of British and American tourists.

* * *

The Justice of General Franco.—The defiantly pugnacious attitude to foreign affairs which General Franco adopted with his adherence to the Anti-Comintern Pact is echoed on the domestic scene by the law of political responsibilities which is now in operation. This is the law which defines political offenders and the scale of their punishment. By its terms and its application must be judged the value of General Franco's justice and the measure of his clemency. An examination of the law leaves no doubt which way that judgment must lie. To begin with, the law is applied by tribunals appointed by the Government, and consisting of a president, two army officers, two Falangists, two magistrates, and a secretary; or, in some cases, of one officer, one Falangist, and one magistrate. These tribunals work alongside a consultative and, for certain purposes, administrative organisation with a strong political bias known as the High Administrative Court; the officials of this court are freely appointed by the Government. The law is retroactive to July 18, 1936, and supersedes all previous legislation. Included within its sanctions are all members of political parties and organisations connected with the Popular Front, whether they be Basque, Catalan or Galician, all who have held administrative responsibility under the Republican Government, all freemasons—in fact, all who have opposed the Nationalist movement. The sentences to be passed on this great mass of "politically responsible" Spaniards are divided into three groups: deprivation of office, exile or imprisonment, and forfeiture of property, and all of the three may be applied at the same time. The tribunals qualify the charges, when they have been proved, as grave, less grave or light, with varying sentences. With each sentence an economic penalty will be exacted. It is, indeed, very clear, as the preamble to the law states, that the tribunals will have to "act in accordance with the standard of the Nationalist movement"; and that Spain has now followed the other Fascist countries in tainting its conception of justice with the crudest of political considerations. The same conclusion follows from the articles of association of the new reconstruction credit company, which provide for the appropriation of fines paid by former anti-National subjects and of payments made to secure exemption from labour-conscription, while the expenditure of the new company will be confined to the "reconstruction" of Nationalist supporters. We may well ask if this is that "spirit of equity and justice that inspires all the Nationalist Government's actions" referred to in General Franco's telegram to Mr Chamberlain early this year.

THE WORLD OVERSEAS

Catalonia's Fight for Autonomy

CATALONIA'S two-centuries old struggle for regional self-rule has been won and lost in less than eight years. The regional Government, with its President, its Parliament and its wide local powers, established under the Republican constitution, fell with the capture of Barcelona by the forces of Franco. Catalonia, after eight hopeful though turbulent years, is now pretty much where it was in September, 1714, when Felipe V conquered the city after a long siege, abolished the Catalan *Generalitat* and, in the name of Spanish unity, made Catalonia strictly amenable to the Central Government. It has now been proclaimed by General Alvarez Arenas, General Franco's lieutenant for Catalonia, that Catalonia must abide within the "sacrosanct unity of Spain." The *Generalitat* Government is replaced by the provincial *diputacion* with a provincial governor. This was the form of rule for each of Spain's provinces under the monarchy, and also under the Republic for most provinces apart from Catalonia. The *diputacion* has no great authority in local matters, and in the past it was always under the thumb of the central Government.

The decree of General Franco's lieutenant further states that "the private use of your language—the Catalan—will be respected." What the Catalan wishes, however, is the right to use his language publicly and officially. Since all speak Catalan, frequently knowing nothing of Castilian, it would scarcely be possible to suppress the private use of Catalan without suppressing the people who speak it. But the suppression of its public and official use is considered to strike at the heart of things Catalan.

So the central yoke has been re-imposed. The struggles of the Catalans for the restoration of their self-rule, during the last two centuries and a quarter, have been turbulent. In the later days of the Monarchy, arrangements were made with the Madrid Government by which certain measures of autonomy would be restored; and, finally, a mild regional administration known as the *Muncomunitat* was obtained. This was abolished on the advent of the dictator, General Primo de Rivera.

During his dictatorship, which went so far as to prohibit the use of the Catalan flag and of the Catalan language in public, Catalonia became violently anti-Monarchical. When King Alfonso visited Catalonia an attempt was made to blow up his train. The separatists grew strong. Colonel Francesc Macia, an exile in France, organised a Catalan revolutionary army which planned to march into Catalonia from France. Catalonia joined up with the Spanish Republican groups, and between them was subscribed a pact known as "the Pact of San Sebastian," whereby all Republican parties agreed to give Catalonia self-rule in the future Republic.

Self-Rule under the Republic

The Republic came with the municipal elections of April 12, 1931. Catalonia proclaimed itself an independent State in free union with the new Spanish Republic. This went beyond the terms of the San Sebastian pact, and Catalonia was forced to retreat, to bide its time until the new Republican Cortes could decide its future status. The fight was protracted and bitter, for many sincere Republicans feared too much regionalism. But, in October, 1932, Catalonia was able to inaugurate its *Generalitat* Government and convene its Parliament. The Catalan patriot, Colonel Francesc Macia, became the new President with co-extensive powers with the Spanish President himself in Catalonia.

The Catalan autonomy movement was, and remains, sentimental, political and social rather than economic. Although Catalonia is Spain's most important industrial region, the region's so-called "economic interests," meaning industry and trade, have always been rather against self-government than in its favour. These interests usually had a good understanding with the powers at Madrid under the Monarchy, the Dictatorship and the Republic, and their industries were well protected with high tariffs. They felt, moreover, that regional rule would result in double taxation and feared local political influences in their businesses. The wealthy class of

Catalans tended to be grouped in the party known as the *Lliga*, which favoured a greater extension of local administration, and supported the Catalan cultural movement. But this was quite another thing from wanting real autonomy.

In 1934 the Catalan Parliament passed a law which brought the issue to a head. This law attempted to give the share-cropper peasants, called *rabassaires*, the right to obtain possession of the lands which they cultivated. This struck directly at the interests of the land owners, most of whom were members of the *Lliga*. Moreover, it was a blow to the traditional Catalan system of land tenure, whereby the land of any family or *Casa* constituted an indivisible patrimony handed from father to that son, usually the eldest, who might be proclaimed heir by the father. The landowners were furious, and the *Lliga* took up their case. Heretofore, it had been considered among Catalans that, however they might be divided internally, they must stand together. Now the *Lliga*, in collaboration with the Conservative Central Government then in power, which was openly hostile to Catalonia, brought the *ley de cultivos* before the Court of Constitutional Guarantees which declared it unconstitutional on what seemed political grounds. The Catalan Parliament passed the law again "without changing a comma or a period," and the Madrid Government did not dare to enforce the previous decision with the weapons of the law. Instead a compromise was sought.

Catalan Revolt

But revolt was seething in Catalonia. The Right Government at Madrid resorted to measures so harsh that, a few months after the land law incident, there came the Catalan revolt of October 6, 1934. President Companys declared Catalonia to be "a federal State within the Spanish Republic" and severed all relations with the Central Government. Then followed a bloody night, when the Catalan governmental buildings were shelled and the Catalan Government made prisoners and deposed. The autonomy statute was virtually suspended. The men of the *Lliga* obtained power and carried on until the elections of February, 1936, when the members of the deposed Catalan Government emerged from their various prisons and took over their offices again. They now proceeded at a soberer pace. Friendlier relations were established with the *Lliga*, and negotiations were under way for the participation of the *Lliga* in the Catalan Government, when the military revolt of July, 1936, which began the Spanish Civil War, broke out.

In the main, therefore, it is not economic self-determination that has inspired Catalan nationalism. But, although the economic issue has not figured greatly in the Catalan demand for self-rule, it was perhaps the prime factor a century or more ago in setting the ball of Catalan discontent rolling. There was a time when the Monarchy attempted to strangle Catalan industry. Catalonia was forbidden to trade with the South American colonies and with Cuba. The port of Barcelona was closed to the Spanish colonial trade. As a consequence Catalan industrial output overflowed into the rest of Spain, which became the chief customer of Catalonia. These prohibitions in time disappeared and Catalan trade with the colonies prospered. But the impact caused by this attempt to strangle Catalan trade remained to play its rôle in the move for Catalan self-rule.

But, now and in the future, it is the social significance that is the most important of all. The Catalans are a highly organised people. They have co-operative societies of all kinds running a wide gamut from consumers' leagues and tradesmen's and workers' guilds, to societies for the protection of health and for mutual assistance. The most serious question of all was and is the labour question. Barcelona was the home of the powerful labour syndicates of the Anarchists which were engaged in a three-cornered war with the employers and with the rival Socialist unions. The Central Government under the Monarchy intervened with high-handed methods, and was accused of hiring rival gunmen to wipe out the gunmen and leaders of the unions. The

dictator, Primo de Rivera, clamped the lid on labour activities with a ruthless hand. While there was a surface appearance of "social peace," as the term goes in Spain, there was a terrible seething under the surface. When the Dictatorship vanished the lid blew off and the labour war was renewed with greater ferocity than ever. To the credit of the first Generalitat Government it must be said that it tackled this problem with seriousness and sobriety and had gone a long way toward establishing stability in this field when renewed interference during 1934 and 1935 undid all their good work.

Catalonia's labour problem remains. It is the chief nut for General Franco's Catalan policy to crack. Unless the Syndicalists are killed off to a man they will persist as a powerful force. Catalan aspirations burn more fiercely than ever. The resentment of many of her people against what has now happened to them is bitter. They feel they have entered yet another phase of their long fight for a satisfactory freedom for their region. And, on all counts, it seems that the solution to the Catalan problem, if solution there be, must lie in a still distant future, under more liberal auspices than at present prevail.

March 28th.

America's Economic Problem

[FROM OUR NEW YORK CORRESPONDENT]

THERE are still no statistical signs of the recovery that most business men are still expecting. The Federal Reserve Board's preliminary indices of business activity for March show almost no change from the February figures: adjusted, the general index was unchanged; unadjusted, it was up a point. This was rather better than the data recorded week by week had previously suggested, but the main impression of standstill is unaltered.

INDEX OF INDUSTRIAL PRODUCTION (WITHOUT SEASONAL ADJUSTMENT)

October, 1938	97	January, 1939	99
November, 1938	104	February, 1939	99
December, 1938	98	March, 1939	100
Av. 4th quarter, 1938 ...	100	Av. 1st quarter, 1939 ..	99

The average of each of the last two quarters is just a hair's breadth away from 100 (the 1923-25 base figure), and the general characteristic of the period is that of a plateau reached after the steep ascent of the September quarter.

Using March, 1937, to illustrate the top of the previous cycle and June, 1938, the bottom of the downswing that followed, we get the following examples of the behaviour of various series.

BUSINESS INDICES (UNADJUSTED)

	March, 1937	June, 1938	March, 1939
Manufactures	122	75	96
Minerals	119	91	110
Residential construction	47	46	58
Non-residential construction	63	76	76
Factory employment	101	76.3	91.0
Factory payrolls	101	67.2	86.8
Freight car loadings	80	58	66
Department store sales	90	79	88

BUSINESS INDICES (1923-25=100)

(ADJUSTED FOR SEASONAL)

	March, 1938	February, 1939	March, 1939*
Industrial production (total)	79	98	98
Manufactures, total	75	97	96
Durable	54	83	79
Non-durable	93	108	110
Minerals	103	110	110
Construction contracts (total)	46	73	68
Residential	33	58	58
All other	56	85	76
Factory employment (total)	87.4	91.3	91.0
Durable goods	79.0	83.4	82.9
Non-durable goods	95.4	98.7	98.6
Factory payrolls (total)	77.1	85.4	86.3
Durable goods	67.4	78.4	79.9
Non-durable goods	87.9	93.2	94.5
Freight car loadings (total)	60	67	66
Miscellaneous	67	75	73
Department store sales	86	87	88
Department store stocks	70	68	68

* Preliminary.

Of the two elements (manufactures and minerals) that compose the index of production, the index of manufactures fell more severely between March, 1937, and June, 1938; since then the percentage recovery has been about equal in both, leaving a gap between the two at the present time. The following table shows the movement of the more important parts of the mineral index:—

INDEX OF MINERAL PRODUCTION (UNADJUSTED)

	March, 1937	June, 1938	March, 1939
Bituminous coal	112	51	77
Petroleum	171	156	172
Lead	77	65	70
Zinc	113	68	96

The higher level of the minerals index, compared with manufactures, is thus accounted for principally by the complete recovery in the production of crude petroleum—which is closely related to the demand for gasoline by private motorists. This illustrates the general character of the cycle. The cyclical decline from March, 1937, to June, 1938, was less severe in consumers' goods than in producers' goods; or, to put it another way, individual demand fell off less than corporate demand. Conversely, in the recovery, the demand for consumers' goods was restored to levels approaching those of the spring of 1937; while the demand for producers' goods was, and still is, laggard.

Department store sales, for example, were only a little lower in March, 1939, than in March, 1937—the interim decline having been only slightly more than 10 per cent. This is a fair measure of the demand of private individuals for the current necessities of life. But factory employment in general fell from 101 to 76 and has recovered only to 91; and payrolls fell off still more, then recovered more, but are still relatively low. And, when the employment series is broken down, it again shows the same characteristics—that is, in general, a greater fall in the case of consumers' goods than in producers' goods.

FACTORY EMPLOYMENT (UNADJUSTED)

	March, 1937	June, 1938	March, 1939
Durable goods	96.4	65.8	83.4
Non-durable goods	106	86.7	98.9

The classification of durable and non-durable goods is less significant for this analysis than consumers' goods and producers' goods; for automobiles are classed as durable goods, but are none the less characteristically articles of individual consumption. But the general impression is clear, in payrolls as well as in employment.

FACTORY PAYROLLS (UNADJUSTED)

	March, 1937	June, 1938	March, 1939
Durable goods	100.0	58.1	79.9
Non-durable goods	102.6	78.8	94.5

The same impression is obtained from the building figures, if it is remembered that non-residential contracts are swollen by public works.

To sum up, the demand of individuals for articles of personal and household consumption fell off relatively less than corporate demand for durable goods between March, 1937, and June, 1938, and it has since recovered to about the level of March, 1937. Briefly, the cycle of consumer demand was shallow, and the recovery statistically more nearly complete than in the case of producer demand. In contrast, the output of producers' goods (imperfectly illustrated by "durable"

goods in the indices), which reflects more closely the demand of corporate enterprises for repairs, replacements, maintenance, expansion, and was running at a fairly high level in early 1937, shrank precipitately in the ensuing twelve months, and has since achieved only a mediocre recovery so far.

The Role of Profits

Obviously the demand for producers' goods by enterprise must be closely related to profits, whether those profits are employed for self-financing or as a basis of public financing. Corporate profits were relatively high in the spring of 1937; they shrank dismally in the four quarters including the last of 1937 and the first three of 1938; and they made only a small recovery in the fourth quarter of 1938 and the first quarter of 1939. It is true that in the first quarter of 1939 they were substantially above the corporate profits of the first quarter of 1938, but they are still at no level to render effective the presumed potential demand of years of obsolescence and depreciation.

The relation of the profitability of enterprise to the demand for producers' goods, and through producers' goods to the demand for labour has been given comparatively little attention in American theoretical economics, which has always premised the general profitability of enterprise, subject only to relatively brief interruptions. That this premise was ever quite as valid as was presumed is open to question; but it seems more than doubtful if the "profit system" would ever have been adopted as a premise if the American experience had ever previously included so long a period of almost continuous and pervasive loss as that since 1930.

Stable Government in France

[FROM OUR PARIS CORRESPONDENT]

PARLIAMENT resumed its labours this week for another month. The new seven-year term of President Lebrun will then begin, and there is no doubt that M. Daladier will be re-invested as Prime Minister, with a comfortable majority in the Chamber. Circumstances are on his side: the international outlook has improved; the index of industry has risen 13 per cent. since September; and there are distinct signs of financial recovery. The Daladier administration and the Daladier decrees have created confidence.

Similarly, no immediate changes in the Cabinet are expected. Two new portfolios may be added: one for Armaments and the other, which will involve the supervision of the Press, the wireless and the cinema, for Propaganda (though probably under some other name). The fact is that, at present, there is no serious opposition to the Ministry and its policy; and, in the discussions of the latest decrees in Committee, critics will mainly confine themselves to requests for explanations and more precise definitions.

It is perhaps ironical that the programme which is being accepted *in toto* by public opinion is, at bottom, based on nothing more nor less than public works. It is not many years since the Popular Front Government, tempted by Rooseveltism, launched out upon a grandiose policy of public works to fight depression and economic crisis. Capital fled, and M. Blum was refused power to control credit and the exchanges: he fell. Now all is changed. The low level to which the franc fell, after a series of devaluations, and the decline in industrial production which followed the introduction of the forty-hour week, provided the conditions for a successful Liberal reaction in policy. And finally, oddly enough, the nation has come to accept as absolutely necessary a programme of military public works (or, in other words, armaments) much greater than any the Popular Front aimed at. The workers can swallow the higher taxes and increased cost of living because they are now working longer hours.

Public opinion is even ripe to support a certain amount of inflation, now that a further 20,000 million francs of gold has come back to the country. The last return of the Bank of France showed some signs of this inflation in the note circulation, which, at 127,000 million francs, was an increase of 17,000 million francs since the beginning of the year.

The short-term market, however, is in cautious mood. It has already made a heavy contribution to the needs of the State, and the chances are that appreciably more will soon

be required. The position is this: including the recent supplementary estimate for military expenditure, the Treasury will require 50,000 million francs in the course of 1939; 15,000 millions were borrowed in the early months of the year; 8,000 millions are to be raised by the new arms tax; and 6,000 millions will be obtained from M. Reynaud's first loan, which will be launched on May 15. This leaves a sum of at the very least 20,000 millions which will have to be found in the short-term market.

This is a considerable sum to raise at short-term in France. It is true that the French floating debt, which stood at 53,000 million francs on February 28th, is only half the British floating debt. But the Paris money market is very much smaller than the London money market—total deposits in the four biggest banks do not exceed 35,000 million francs (or about £200 millions). The banks, moreover, are faced with strong competition from the savings banks, which continue to pay 3½ per cent. to depositors; and the general public have still a deep-rooted inclination to hoard francs at home, a tendency encouraged by the existing economic tension and the renewed stability of the franc.

M. Reynaud therefore decided upon steps to ease the short-term problem. The first was the issue of three-year National Defence Bonds at 4 per cent., the idea being to lengthen the term of maturity of the Treasury's liabilities; and, so far, 1,000 million francs have been subscribed in four days. The second is to be the issue of 40-year 5 per cent. debentures at 98, giving a yield of 5.12 per cent., which has been called "the most favourable issue for the State in the last five years." This should bring in 6,000 millions of fresh money, but its chief aim is to convert the short-term liabilities of the Treasury into long-dated securities. Experts are calling for certain reforms in the money market to help in this task of freeing it for the Government's use: they want an appreciable extension of payments by cheque, compulsorily if need be; and they advocate definite restrictions on the competition between private banks and public savings institutions for money.

The strain of the Government's requirements is likely to be met. The outcry for control of credit and the exchanges has ceased, and together the increase in incomes, on the one hand, and in taxes, on the other, should make it easily possible to cover the immediate needs of the Treasury. But if another international crisis were to supervene, raising the Government's needs again and causing more hoarding, the position might become difficult. For the moment, however, there is no doubt that, in all domestic matters—and despite the Socialists' objections to the form of the new arms profits tasks and their protests against rising prices—the Government stands firmer than any French administration for a long time past.

May 10th.

The Position of Roumania

[FROM A CORRESPONDENT IN BUCHAREST]

THE return of M. Gafencu to Bucharest marks the end of a stage in the evolution of Roumanian foreign policy which began with the first German pressure on Czecho-Slovakia. King Carol has now made up his mind to stand with the Entente Powers; and he carries with him in this the great majority of his subjects. But there is no excuse for misunderstanding the fundamental aim of his policy: the keeping

THE COMMERCIAL BANK OF SCOTLAND LIMITED

Incorporated by Royal Charter and Act of Parliament

PAID-UP CAPITAL £2,250,000

RESERVE FUND £3,150,000

ESTABLISHED 1810

under all possible circumstances of Roumania's neutrality. Roumania will resist attack by Hungary and/or Bulgaria; and her neutrality, if she can keep it, will be qualified by a wholehearted sympathy for the democracies; she will not undertake commitments elsewhere.

The simple question "Will Roumania resist German attack?" can only be answered by asking in return: "Can the Germans invade Roumania without bringing in the Hungarians and/or Bulgarians as the spearheads of that invasion?" The odds are heavily weighted against any capitulation to German demands. From the strategic point of view, the attitude of Italy is perhaps of decisive importance, for upon that will depend the speed with which Britain and France can send that material assistance which Roumania would need, even in the first weeks of a war against a Hungaro-Bulgarian attack supported by Germany. Decisive help from Russia is not counted on in Bucharest; but, notwithstanding the strong anti-Russian prejudice to be seen even in Ministerial circles, Russian help would not be refused. Most Roumanians read M. Litvinov's resignation as a dismissal and a warning to all whom it may concern that the Soviets are not prepared to fight simply in defence of capitalist States.

It is because they are aware that they have made a decisive choice to stand with the democracies, and that, by this, they stand to lose certain short-term advantages, that responsible Roumanians have shown in the past week or ten days a certain impatience with the course of the negotiations carried on by Sir Frederick Leith-Ross and his colleagues. They have felt that their own willingness to accept a British guarantee with all its unspoken obligations should be marked with special appreciation by the British Government, and not by quibbling over the size of British credits. It is possible to sympathise with this view and to see how disastrous it would be for the Mission to leave Roumania without having achieved satisfactory results. But it must be questioned whether the British Government is really open to criticism on this score. Germany is, and will always remain, Roumania's economic mainstay; and, in making political moves against Germany, Roumania is justified in expecting help from her friends; but it would be a mistake to think that the British Government could try to compensate Roumania pound for pound for whatever losses she may suffer through her self-chosen foreign policy. As an independent State Roumania has made an independent choice.

May 7th.

Bulgarian Outlook

[FROM OUR SOFIA CORRESPONDENT]

EVENTS abroad exercise a dominating influence on public opinion in Bulgaria. Italy's penetration in the Balkans, on the one hand, and Germany's expansion towards the East, on the other, have obliged the country to face new conditions for foreign policy. The Government's view is that Bulgaria should remain neutral in the present disputes and endeavour to repair by means of peaceful negotiations the injustices of the Peace Treaty. As a central Balkan State, Bulgaria bases her foreign policy on the treaty for lasting friendship with Yugoslavia and the pact of non-aggression and friendship with Turkey. Relations of good neighbourship are maintained with Roumania and Greece, but the participation of Bulgaria in the Balkan Entente is excluded, so long as certain of her territorial claims are not satisfied by peaceful agreement.

Tension has of late increased mainly on account of the indifference with which Bulgaria's claims are regarded abroad. On the other hand, considerable anxiety is felt because of Bulgaria's economic dependence on Germany. All efforts for an expansion of Bulgaria's foreign trade with some of the West-European countries have failed to give any appreciable results, since all surpluses of fresh fruit, tobacco, eggs and animal products are absorbed by Germany in the first place.

Chief Office: BROAD ST. CORNER, BIRMINGHAM, 1

A Bulgarian delegation composed of the Minister for Finance, the Minister of Commerce, the President of the Chamber of Deputies, the Commander of the Army Staff and the Commander of the Air Force, visited Berlin on the occasion of Herr Hitler's 50th birthday. They were the personal guests of the Fuehrer and in Government circles no political significance was attached to this visit.

Business Marking Time

Meanwhile, business has been slack. During the first quarter of the year business activity showed a seasonal slowing down owing to the lack of available stocks for export. Last year's deficient crop of cereals, forage foods and other agricultural products has resulted in a diminution of exports to the tune of 40 per cent. in value, while imports have remained on the same level. Germany alone absorbed about 75 per cent. of Bulgaria's exports, against 60 per cent. in the first quarter of the preceding year. Wholesale prices have fallen a little, especially the prices of export products; but the general level is higher than last year. Traffic and turnover in wholesale trade have declined concurrently with a contraction of credit. Industrial production is still maintained at the level of last year.

Internal economic policy is engaged at present with discussions in Parliament on the bill for relief to debtors. The relief of 30 and 40 per cent. granted in 1934 to agricultural and other debtors is now considered insufficient. An amendment to the law of 1934 is proposed, according to which the Amortisation Office, established for the purpose of collecting the scaled-down debts, will extend the period of their repayment from 20 to 30 years — for debts of farmers, small merchants and artisans.

Debtors will obtain a further reduction in the form of the facility granted to them to repay their debts in bonds issued by the Amortisation Office. The market price of these bonds will not exceed 70 leva for those bearing a nominal value of 100 leva. As the bonds will be redeemed by the State at 70 per cent. of their nominal value, the holders of such bonds will lose 30 per cent. The Agricultural and Co-operative Bank of Bulgaria, a State institution, which holds nearly 60 per cent. of the country's deposits, will be the chief sufferer.

The lack of free foreign exchange is still acutely felt on the domestic market as a result of unsatisfactory developments in foreign trade. The premium on free exchanges, fixed by law at 35 per cent., has already exceeded 50 per cent.

April 26th.

German Arms and German Trade

[FROM OUR BERLIN CORRESPONDENT]

IN order to maintain armament production, the German Government is being compelled to take steps to ensure supplies of raw materials. Although, under the Four-Year Plan, domestic production of raw materials has been vigorously stimulated since the end of 1936, and although many domestically produced *ersatz* materials have been introduced as substitutes for raw materials formerly imported, the Third Reich is still largely dependent on supplies of raw materials from abroad.

Last year, in part owing to the favourable course of exports in 1937, Germany was able to import increased quantities of raw materials and foodstuffs; and the fall in world prices also proved of assistance. The present situation, however, is very different. Exports have fared badly during the past twelve months, and no appreciable reserves of foreign exchange have accrued to the Reich since the annexation of Austria. Extraordinary measures are now needed, therefore, to stimulate exports in order to acquire the wherewithal to purchase essential raw materials. Dumping, which has been carried on since 1933 and was intensified after the various currency devaluations abroad, has not sufficed to maintain exports, even though the dumping was helped by the grant of subsidies amounting on the average to 30 per cent. The export industries have been given preferential treatment in the allocation of raw materials, man-power and production capacity, and this also has not been enough.

The Third Reich intends to continue with its policy of expansion; and there is every evidence that the authorities are using all means in their power to acquire the raw

materials they need for that purpose. Germany not only intends to keep pace with other nations in arms output; she wishes to maintain her advantage, especially in the production of aeroplanes. Exports are of paramount importance because certain imports are essential.

Financial measures to assist exports have been easier to devise since the Reichsbank came fully under the control of the State. One of the main difficulties in financing exports has lain in the fact that the Reichsbank could only accept bills with a term of six months or less, while exporters often have to arrange for longer periods of payment. The necessity of discounting longer term bills with other banks meant higher costs to industry, and not infrequently it prevented the placing of orders. The Reichsbank has now been empowered to accept bills with a twelve-month's term. The greater risk involved can be carried easily by the Reichsbank or the State, and the risk is small compared with those export subsidies which are not covered by the special tax to promote exports which is levied on business.

Difficulties have also developed in the case of the bills lately introduced by the Reichsbank to cover foreign exchange risks. These are only accepted by the Reichsbank if the export proceeds are simultaneously turned over to it, but in many cases exporters have to use part of their export proceeds to meet current liabilities abroad. This applies specially to the so-called "raw material credit" transactions. For example, if an industry receives a *Tredefina-Gulden* credit, it is obliged to repay the credit with the proceeds for the export of finished goods. Only rarely will these proceeds happen to be in *Gulden*, and a risk coverage with the Reichsbank is out of the question. In order to overcome these difficulties, the Reichsbank has been empowered to accept these risk-covering bills, even when part of the export proceeds may have to be diverted to the payment of current liabilities abroad.

Measures taken in February and March to reduce export costs have been extended. The interest charged by the Reichsbank on transfers of foreign exchange has been reduced. Bills or cheques on foreign countries which are bought or collected by the Reichsbank on exporters' behalf are only insured on request, and the days of grace allowed in the purchase of these bills or cheques have been reduced to cut down the interest chargeable. And, finally, to facilitate the calculation of export transactions, the number of foreign exchange rates officially quoted has been increased. The rates for telegraphic payments to Sydney, Pretoria, Bombay and Calcutta, and Wellington will be regularly quoted from this week. The exchange rates for Egypt, Australia, South Africa, British India and Luxembourg will in future be quoted; and soon not only will the currencies of Argentina, Brazil and Uruguay be quoted, but also the rates for other South American countries as well.

Meanwhile, there is ample evidence of the great armament activity which inspires this feverish quest to increase exports. Last year the industrial traffic carried on goods road vehicles rose 17.4 per cent.—that is, from 8.9 million tons in 1937 to 10.4 million tons. The chief factor in this increase was the construction of fortifications, which from July, 1938, to March, 1939, absorbed 17.7 million tons of building material by road and rail.

Also as a result of armament activity, the consolidated debts of the Reich increased to Rm. 23,600 millions at the end of March, against only Rm. 22,800 millions at the end of January and Rm. 16,700 millions in February, 1938. Short-term debts rose from Rm. 5,270 millions to Rm. 5,900 millions within a month, the financial preparations for the annexation of Czecho-Slovakia being partly the cause of the rise. At the end of February last year short-term debts amounted to only Rm. 2,300 millions. By the end of April the currency circulation had increased to Rm. 10,726 millions, against only Rm. 8,092 millions at the same date in 1937, and of this sum Rm. 8,906 millions were banknotes (including Rentenbank notes), against Rm. 6,477 millions a year before.

May 8th.

Business Improvement in Argentina

[FROM OUR BUENOS AIRES CORRESPONDENT]

THE general economic position of Argentina shows some improvement. The first official estimate of maize production is 5,400,000 tons, which is considerably better than last year, although it compares badly with the average of the last five

years which was 8,323,179 tons. Argentina, however, has so far derived only moderate benefit from her bumper wheat crop, owing to the continued low price of wheat, and the difficulty of finding markets. Despite the establishment of the basic price, which is virtually an export subsidy, up to April 20th of this year only 1,096,645 tons of wheat had been shipped, whereas in the same period of the boom year 1937 almost three times as much was shipped. This difficulty in disposing of her produce has caused Argentina to favour barter arrangements such as the recent agreement with Germany whereby wheat and wool were exchanged against locomotives for the State Railways.

Revival in Exports

There has been some improvement in the volume of Argentine exports, but owing to the fall in prices this advantage has been lost. In the first quarter of the current year, exports amounted to 2,724,534 tons against 2,317,234 tons in the same period of 1938—an increase of 17.6 per cent. But the value of exports was lower by 2.1 per cent., being 384,116,560 pesos in the first quarter of 1939 compared with 392,286,418 pesos in 1938. Cereals and linseed were actually up by 18.5 per cent. in volume, and down by 18.3 per cent. in value. Nevertheless, the total value of Argentine exports in March was very encouraging, being the highest recorded since January, 1938.

The volume and value of Argentine exports during the last six months have moved as follows:—

	Tons (thousands)	Pesos (millions)
1938—October	895.6	118.8
November	769.4	114.4
December	798.3	128.7
1939—January	894.7	128.9
February	809.4	115.0
March	1,020.4	140.3

Imports Fall

Owing to rigid restrictions, imports have fallen considerably and in the first two months of 1939 were 26.6 per cent. lower in value than in the same months of 1938. In January-February there was an export surplus of 45,195,886 pesos, compared with an export surplus of only 3,946,790 pesos in the first two months of 1938. This artificial reduction of imports is reflected in Customs receipts which, up to April 19th of this year, were only 85,815,838 pesos, or 26,691,324 pesos less than in the same period of last year. The ultimate effects of this fall in revenue will be seen later in the State finances.

The imported articles which have declined most are textiles (down by 20,159,513 pesos, or 40.7 per cent. in the two months) and machinery and vehicles, including motor cars, imports of which have almost ceased (down by 16,716,966 pesos, or 43.2 per cent.). Among the suppliers of Argentina the United States has been the chief sufferer. In the first two months of 1938 Great Britain and the United States were almost equal, both supplying just over 46 million pesos worth of goods. This year Great Britain supplied 35,851,493 pesos and the United States only 29,055,236 pesos.

Canada's Choice

INTERNATIONAL crisis crystallises the problems latent in the relationship of the different members of the British Commonwealth with each other and with the world at large. These problems can only be understood in the light of the domestic problems of each of the Dominions. Professor Scott's book,* designed especially to show "the relation between internal forces and external policy," is a useful introduction to the peculiarly complex situation of the Dominion of Canada. Written originally at the request of the Canadian Institute of International Affairs for the second British Commonwealth Relations Conference, as the principal paper on Canada, it now appears in a second edition embodying substantial revisions made in the light of the September crisis, but unchanged in scope and aim.

Its aim, to provide a comprehensive survey of Canadian affairs, implies a wide scope, embracing the geography, population and economic structure of the Dominion, the various political parties, the French Canadian Nationalist movement, the growth of Canadian national sentiment, the country's defence problems, her international and intra-Commonwealth associations, the problems of neutrality and of co-operation within the Commonwealth, and the present objectives of her foreign policy. Throughout, an attempt is made to give all sides of the many controversial questions raised and to delineate impartially the tenets of the different

schools of opinion within the country. To have compressed all this, as well as an index and a useful bibliography, into 184 pages is a *tour de force*. Despite heroic condensation, the volume makes lively reading, though for its purpose it is necessarily a compilation of ascertained fact and a survey of existing views, rather than an essay in original interpretation or an attempt to break new ground.

Illuminating as the survey is in general, particular aspects inevitably raise questions. The large export trade of the Dominion is described as a measure of the success of "the policy of staple production for export." It might be regarded as a measure of the vulnerability of a still immature economy condemned to dependence upon a relatively few precarious primary exports. While it is shown that the whole economy is geared to the export of these staples, the growing importance of manufacturing is described in terms which obscure the dependence of a large proportion of industry itself upon the prosperity of the primary exports. The difficulties of the wheat industry and the significance of the development of pulp and paper, mineral production and the tourist trade are scarcely considered, with all that they imply in terms of a possible weakening of the East-West axis of the country and increasing dependence upon the United States.

To regret a lack of significant analysis in the section on the State and economic life is perhaps to demand bricks for which the economists have as yet provided only a fraction of the requisite straw, but the important fraction available, for example, in Professor Innis's analysis of Government participation in canal and railway finance is disappointingly not used.

The relationship of constitutional problems to the underlying geographic and economic structure of Canada is suggested, but not developed to reveal possible uncertainties in the thesis that "there is a conflict between the economic and the legal realities in Canada" because "the business leaders and modern science have been subduing geography, while the judges (in their interpretation of the British North America Act) have been expanding provincial sovereignty." It may be that Canada has survived as a nation only by virtue of a federalism sufficiently loose to cover the dual sectionalism of regions dependent on different staples, and of staple producing regions and centres of finance and industry.

An interesting chapter attempts to reduce the problem of diplomatic and military defence to concrete terms: where and by whom is the Dominion liable to attack? The conclusion that "there are to-day no powers which threaten to invade Canada" while "there are unusual geographical obstacles in the path of any invader" (which leaves an uneasy doubt about how long this will hold good in an era of rapid political and technical change) leads to the further conclusion that the "immediate defence of Canada is not at present beyond the capacity of Canadians acting alone provided they are content simply to safeguard their own territory," war with the United States being ruled out of consideration.

The problem of defence then becomes one of whether Canada is prepared to participate in military measures abroad. Evidence is given that the Dominion's present policy implies the prospect of such participation, and it is here that the battle is joined between isolationist and interventionist. This fundamental issue of policy is confused by the constitutional question whether Canada has legally the right to remain neutral if Great Britain goes to war. A forceful plea is made for a clear assertion of the Dominion's legal right to neutrality, so that the contending policies may then be decided on their own merits. For Canada the decision involves "grave internal problems, economic, racial and constitutional" and special external difficulties due to her unique position as both a North American and a British nation. For her there is a peculiar edge to the question, ever more pressing since Munich, which the foreword asks: "What are the members of the Commonwealth prepared to co-operate for?"

Shorter Notice

"Cause and Control of the Business Cycle." By E. C. Harwood. American Institute for Economic Research. vii + 224 pages. \$2.00.

This is the second edition, extended to include an account of recent developments, of a book which first appeared in 1932. The author analyses the cause of the business cycle on elementary lines, and finds the origin of a boom in an inflation of bank credit due to a mistaken readiness on the part of commercial banks to finance speculative undertakings, or to Government borrowing. The test for inflation in a given situation is provided by an Inflation Index which Mr Harwood has constructed from the difference between the banks' holding of "investment-type assets" and their "savings-type liabilities." It is not difficult for Mr Harwood to show that from 1924 to 1929 there was going on in the United States an inflation nearly as great as that of 1917-19 (despite the stability of commodity prices in the later period) and that his Index corresponds well with the curve of industrial production. Nor is it difficult for him to expose the fallacies of many of the panaceas popular in the United States throughout this decade. But the significance of the book lies less in this than in the fact that it is, in effect, an attack on the Roosevelt regime. Mr Harwood regards Government expenditure as unproductive, or at best as less productive than any private investment could be, so that the only way to recovery is to keep taxation and borrowing at a minimum. Yet he himself shows how misdirected—and therefore unproductive—a large amount of private investment was during the 1920's; and surely it is more desirable to put resources into a Tennessee Valley scheme than into a Florida land boom. The truth is that the economic problems of a modern community are not capable of complete solution at the level of discourse at which Mr Harwood's arguments are conducted. A useful diagnosis, it does not provide us with a remedy in which we can feel much confidence.

Britain's Exchange Clearings—II

IN the first article, which was printed in *The Economist* last week and contained an individual and statistical examination of Great Britain's existing clearing agreements, it was pointed out how closely their working is linked up with the rates of exchange—in clearing phraseology, rates of conversion—which are used. This interrelation can be demonstrated even more clearly by the trend of the trade governed by the clearings. In the following table, in order to obtain a true perspective, the yearly imports and exports for the last 10 years have been computed in averages for three periods: 1929-31 as the last years of free exchanges, 1932-35 as the period of exchange restrictions without clearing arrangements, and 1937-38 as the clearing period. (The figures for 1936 have been left out, as this year represents an interval of transition, all clearings having been set up during that year.)

AVERAGE BRITISH IMPORTS FROM AND EXPORTS TO CLEARING COUNTRIES, 1929-1938

(In £ thousands)	1929-31	1932-35	1937-38
ANGLO-ITALIAN TRADE (clearing governed by fixed rate, overvaluing Italian currency in relation to sterling):—			
British imports	15,650	9,067	7,467
British exports	14,338	9,512	5,873
ANGLO-ROUMANIAN TRADE (free-rate facilities from beginning, later extended to all goods):—			
British imports	3,700	3,480	4,036
British exports	1,890	2,066	1,650
ANGLO-TURKISH TRADE (mixed system):—			
British imports	1,863	1,171	1,292
British exports	2,222	1,333	2,040

As the above figures show, the normal economic effects of the rate of exchange operate in somewhat different ways under exchange clearing. A currency overvalued against sterling acts as a brake on sales to this country, the goods being diverted to other countries with an overvalued currency; this is the effect with free exchanges or with clearings. On the other hand, overvalued currencies ordinarily have the additional effect of attracting imports, so that under normal circumstances British exports should benefit by the overvaluation of other currencies in relation to sterling. But this second effect is largely neutralised by the operation of an exchange clearing, since it would inevitably lead to an unbalancing of the clearing and the piling up of frozen debts. This has actually occurred in the case of Turkey, while in that of Italy it has been averted only by a drastic curtailment of British exports to that country.

Conversely, currencies undervalued in relation to sterling have the effect of increasing exports to this country and of reducing British exports. In this case both effects prevail also under trade by clearing. While, however, in normal circumstances, the excess of imports into Great Britain would create a supply of sterling which would be used, by triangular exchange dealings, to finance British exports to third countries, the clearing mechanism is bound to tie up the surplus amounts—a process noticeable of late in the Anglo-Roumanian Clearing.

The difficulty lies, obviously, in arriving at a proper figure for the rate of exchange within a clearing agreement, i.e. that rate which ensures the maximum amount of

self-balancing two-way trade between the clearing partners. Whatever methods may be adopted for determining this rate, it is certain that the "official" rates, based on nominal and more or less fictitious parities of exchange, cannot provide such a level. Unfortunately, clearing compensation and even the complete freeing of the rate within the clearing, though bringing rates much nearer to their genuine level in the currency sense, do not furnish a solution of the trade problem. The direct action of the rate of exchange on the operation of a clearing, and consequently on the course of the exchange of goods under it, is of cardinal importance, but it would be a mistake to reduce the whole issue to a question of exchange levels. Evidently there are other forces at play as well.

In the first place, an important factor which affects the general working of clearing agreements, in particular of those between "creditor" and "debtor" countries, is the question of payments other than those arising out of current trade. The two main categories under this heading are arrears resulting from trade done prior to the establishment of the clearing and recurrent financial payments on public loan service. In addition to their direct effect of compelling the debtor country to keep the value of exports permanently, and sometimes considerably, over that of imports—an obligation which some countries can ill afford to perform in the present depressed state of the agricultural markets—they constitute one of the impediments in the way of a currency revaluation in the debtor countries. In fact, the avoidance of an increase in the public debt figure in terms of national currency ranks among the foremost considerations against a *de jure* recognition of the *de facto* exchange position.

Even more important, though less directly evident in the working of the clearings, is the issue of prices. Whatever advantages may be gained through a natural level of exchange, they can easily be outweighed by the effect of artificial prices. It is here that Germany's novel trading methods come into the picture and have to be considered against the background of British exchange clearings.

A practical illustration can be provided from the working of the Anglo-Roumanian Clearing. The first article showed how the new Agreement of last September has sent up the Roumanian rate of exchange on sterling and, concurrently, Roumanian exports to this country. The lei-sterling rate being enjoyed at present by the Roumanian exporter of non-compensatory products (which is the lower rate) works out at about 975 lei to the £; at the same time, the rate on Reichsmarks, under the German-Roumanian Clearing, is 41.50 lei. On the basis of the official sterling-Reichsmark parity of Rm. 11.65 = £1 there is, consequently, a premium of 102 per cent. on sterling, as compared with the Reichsmark. None the less, in spite of the huge stimulus thus given to Roumanian exports to this country, a variety of Roumanian products still cannot find their way to the British market, on account of the prices paid by Germany. Wheat, for example, which forms the bulk of present Roumanian exports to this country, can only be sold here because the price is subsidised by the Roumanian Government. Such a situation implies of course that, other things being equal, Germany has to pay roughly double the ordinary free-market price for Roumanian products, in terms of Reichsmarks. (It

The Brewing Trade

DURING the last twenty-five years, brewing has been a contracting industry. Production and consumption have fallen, the number of brewers has shrunk by three-quarters, and there were in 1938 fewer licensed premises than in 1913. In the table below are collected some statistics relating to the brewing trade for the last pre-war year and for 1938:—

GREAT BRITAIN: BEER AND BREWING

	Unit	1913 (or 1913-4)	1938 (or 1937-8)	1938 as % of 1913
Home production, less exports*	000 standard barrels	35,251	17,991	51.0
Imports	"	73	827	1,132.9
Consumption per head per annum*	pints	222.5	115.0	51.6
Brewers' "for sale" licences	No.	3,718	946	25.4
Licensed premises: "On" or "Off" licences	No.	88,739	74,326	83.8
"Off" only	"	23,632	22,109	93.6
Registered clubs	"	8,457	16,563	195.9
Excise duty, total yield	£m.	13.6	61.2	450

* 1913 figures are for Great Britain and Ireland.

Consumption has thus fallen by nearly one-half in a quarter of a century, and, be it noted, the beer drunk in 1938 contained less alcohol per pint than in 1913. There has been a slow but steady fall in the number of licensed premises and an equally steady but smaller increase in the number of registered clubs; it is probable, however, that members of registered clubs drink more wine and spirits than beer. Imports of beer have increased sharply though foreign beers are still only a fraction of the home production.

should be mentioned in passing that, in order to lessen this heavy burden, Germany has been trying for some time to raise the rate on the Reichsmark in her clearing agreement with Roumania, so as to narrow the existing wide disparity; however, her efforts have so far been unsuccessful.)

If one attempts to approach the question from a theoretical angle, by drawing a parallel between the British and German clearing systems, the most salient contrasts are these:—

GERMANY	GREAT BRITAIN
Clearings closely co-ordinated with centrally controlled foreign trade, and used as a means of controlling the direction of trade.	Clearings and foreign trade entirely independent of each other, the former being used only as a technical medium for the liquidation of completed transactions.
Import purchases directed by State organisations, at special Reichsmark prices, bearing no relation to world market values.	Imports only by individual importers, buying at world market prices.
Large debit balances on clearing accounts, giving strong bargaining power.	Mostly creditor on clearing accounts (the new position of the Anglo-Roumanian Clearing being a notable exception).
No outstanding debts owed by clearing partners, to handicap new business.	Trade arrears and financial debts present, in varying proportions, in all clearing agreements.

We have, consequently, on the one side Britain's essentially passive clearing policy, contenting itself with offering some measure of security to British exporters and creditors, and leaving the initiative for reciprocal trade in the hands of the clearing partners. On the other hand, Germany uses her clearings as a weapon for shaping a wider policy, which aims avowedly at drawing the countries of South-Eastern Europe into what may be called a Reichsmark *bloc*, a *bloc* to be based not so much on currencies stabilised to the Reichsmark as on the equally strong, if not stronger, link of stabilised agricultural prices. The implications of these aspirations are outside the province of the present survey, nor is it concerned with advocating possible counter-measures. It must become clear, however, even by a purely technical consideration of Britain's position under her exchange clearings, that the revaluation or freeing of the rate of exchange in clearing agreements, although helpful, cannot restore the equilibrium for two-way trade, as the gap created by the artificial price structure in outside competition remains unbridged and is bound to affect the volume of trade whatever the rate of exchange.

This being so, it follows, among other things, that from the British point of view there can be, under the prevailing circumstances, no such thing as a good or bad clearing; the results of each agreement need to be weighed against its underlying intentions. Similarly, the policy to be adopted must vary according to whether an expansion of British exports, an increase of British imports (as a measure of economic assistance) or the maintenance of a balance between exports and imports is the primary consideration.

To sum up the wider conclusions, it may be safe to say that exchange clearings, introduced as an emergency measure, remain, with all their subsequent improvements, a *pis aller*. Viewed as such, they render most valuable services in regulating trade between two exchange-controlled countries, a task which would otherwise become a matter of utmost difficulty. Between creditor and debtor countries—as in the instance of Britain's clearings—they may still be necessary for reasons that have been shown. However, in such cases their effect is distinctly restrictive on trade, the measure and direction of the restriction depending, to a considerable extent, on the rate of exchange by which they are governed. That exchange clearings by their very nature tend to confine international trade into bilateral channels is, of course, almost self-evident.

The general trend noticeable in exchange clearings points towards a relaxation of the restraining regulations, by freeing the rate of exchange and by introducing other facilities. It is quite possible that further evolution in this direction may pave the way for an ultimate abolition of exchange clearings—at least between creditor and debtor countries—in a not too distant future.

What is your Capitalised Value to your family?

IF you listed all your personal assets and converted them into cash what would be the total? Now assuming from a safe investment interest on this amount could be obtained at the rate of 3½% per annum tax free, what income would this produce?

This is the test which you should apply to your own resources, so that you will know exactly what the financial position of your wife and family would be in the event of your death—a contingency which it is unwise to ignore. Most men are disappointed and not a little perturbed after this self examination.

THE "SAFEGUARD" POLICY is specially designed to augment personal assets by providing an income (tax free and payable monthly) for your dependants in the event of death. If you survive the period of your family responsibilities the policy provides capital for your own retirement.

You are invited to make an enquiry for full details and for an illustration suited to your own circumstances. Rest assured you will incur no obligation by doing so.

Branches and Agencies throughout the World.

The Royal Commission on Licensing (1929-31) gave in its Report a number of reasons for the general decline in the consumption of intoxicants. Improved social conditions, the rise of rival amusements to the public-house, such as the cinema, the wireless, sports and travel facilities, the restrictions of hours and the high taxation which has increased the price of beer and other drinks, have all assisted in the change in national habits. And, as might be expected, the fall in the consumption of beer has hastened the process of rationalisation within the brewing industry.

As is shown above, the number of breweries has markedly declined. Of the total of about 1,020 breweries existing to-day, only half are of any commercial importance, and it is stated that 50 breweries account for one-half of the entire capital in the industry, whose total has been variously estimated at £400 millions to £500 millions. This process of absorption is continuing, but the necessary increase in distributive costs is becoming a more important factor with each extension of the territory served by a given brewery.

With this process of rationalisation, there has also been an extension of the "tied" house. It is impossible to say exactly what proportion of public-houses are tied to breweries, but the number must be very large, and probably amounts to at least three-quarters of the entire number of public-houses. The tied house is by no means an innovation, since the practice was condemned by a Parliamentary Committee in 1816. In the past fifty years, however, it has greatly increased in importance and one large Midland brewery controls 800 houses, while many others control between 300 and 500. It is usual for a brewery to control houses in its own area and to sell only its own beer in them; but there are several nationally advertised beers such as Bass, Worthington and Guinness which are stocked by all the better public-houses; in these cases the national brand is often bottled by the local brewery. Breweries gain control of public-houses either by purchasing them and installing a manager or by granting a loan on mortgage to the existing occupant or to the purchaser of the premises. The majority of tied houses are held by mortgages, but in recent years brewers have shown an increasing desire to gain more effective control through purchase. Control by mortgage is unsatisfactory in many ways, for unless the mortgagor misbehaves, breaks the law, or breaks his contract the controlling brewery can exert very little influence on the management of his house unless this is specifically provided in the deed. From the brewery's point of view, apart from the opening for investment of surplus funds, the house tied by a mortgage is in fact no more than a permanent retail outlet. Faced with a fall in sales, brewers, in common with other manufacturers, desire to control their retail outlets in order that they may organise them on up-to-date lines calculated to satisfy modern tastes and requirements. The expenses involved have, in many cases, been a heavy drain on reserves. Watney Combe Reid's reserves, for example, fell from £400,000 in 1930 to £325,000 in 1938, while the company still has on hand plans for spending a further £100,000 on rebuilding or altering its tied houses.

The policy of improvement of buildings, pursued by all the large breweries, was impeded last year by the refusal of the Weston-super-Mare licensing justices to approve certain alterations to a public-house on the grounds that the latter would extend drinking facilities in a way not contemplated by the Licensing Act of 1910. It was held that the whole licence should be surrendered and that additional payments should be made on the improvements; this new interpretation would, of course, have had an adverse effect on improvement schemes. Moreover, the new interpretation was a clean break with previous licensing practice by which benches used their discretion in such cases. The High Court upheld the local justices but their decision was reversed on February 8th by the Court of Appeal. Another recent judgment of the House of Lords (in Robinson Brothers (Brewers), Limited v. Houghton and Chester-le-Street Assessment Committee) has enabled assessment authorities to take into account, in making their assessments on public-houses, the increased value given to licensed premises by the competition of brewers for the limited and falling number of on-licences; this judgment

has reversed a decision given in 1898, by which rating authorities could assess licensed premises only on the basis of value as a retail establishment, and the reversal obviously increases the expense of the tied house.

Another problem which has beset the brewing trade in recent years arose from the activities of the Hop Control Board in the immediate post-war period. Hop growers have ever since been haunted by the memory of the high prices obtained by centralised selling at that time, and after one voluntary scheme came to grief, a compulsory scheme was formed under the Agricultural Marketing Act. By arrangement between the Hops Marketing Board and the Brewers' Society, each season's yield of hops up to the amount required by brewers is taken over by the brewers at prices which, although varying with the different qualities, are calculated to average £9 per cwt. By this agreement, originally concluded in 1934 and extended last year for a further five years, the average price of hops has been stabilised at £9 per cwt. and the production of hops is strictly limited to those farms that produced hops in the pre-scheme days.

Compared with the consumption of barley, the quantity of hops used in the brewing trade is small, as the following table shows:—

MATERIALS USED BY BREWERS PRODUCING FOR SALE IN 1936-37

Malt	9,066,803 cwt.
Unmalted corn	10,701 "
Rice, maize, grits, etc.	648,679 "
Sugar, glucose, syrups, etc.	1,835,881 "
Hops	270,592 "
Hop preparations and substitutes	374 "

The beer produced from these materials amounted to 23.6 million bulk barrels, which is equivalent to about 18 million standard barrels. By far the most important raw material is, of course, the barley used in making malt. According to the Census of Production for 1935, 7.8 million cwt. of home grown, 0.9 million cwt. of Empire grown and 3.4 million cwt. of foreign grown barley (making a total of 12.1 million cwt.) were used for making 10.1 million cwt. of malt. Of this, 9.0 million cwt. were made by brewers and maltsters, the rest being produced by distillers. The bulk of the malt made by brewers and maltsters goes into the production of beer, but some quantities are sold for use in the making of branded milk and malt powders. The fact, however, that hops cost on an average £9 per cwt. while malting barley in 1936-37 cost about 10s. per cwt., meant that expenditure on hops in this year was 40 per cent. of that on barley.

Rationalisation of production and improvement of public-houses are not the only ways in which brewers have met the problem of falling consumption. The frequent contacts between the brewing trade and the Government fostered by the long tradition of excise duties forced the brewers to develop a central organisation long before the war. In recent years an extensive advertising campaign has been launched both for "beer" and for various branded beers. It may be noted that the combination since 1932 of trade recovery, lower taxation (which enabled prices to be reduced by 1d. per pint) and high-powered advertising has brought about a partial recovery in the consumption of beer from the low levels reached in the trade depression:—

	1913	1929	1932	1938
Consumption ('000 standard barrels).....	35,324	20,416	14,125	18,818
Excise receipts (£ million)...	13.6	71.3	67.1	61.2

But although consumption and brewers' profits increased between 1932 and 1938, the larger consumption was not sufficient to compensate the Exchequer for the reduced rate of taxation, and the yield of the beer tax was in 1938 lower by £10 millions than in 1929.

It is impossible to estimate how much of the recent increase in consumption is due to heavier drinking by the working classes and how much can be ascribed to the use of beer among the wealthier classes. The Royal Commission of 1929-31 noted that beer was becoming a more respectable drink and is now taken by people whose fathers would never have tolerated it. An increasing proportion

is now sold bottled. The higher costs of production and of distribution of bottled beer make this change one of the most serious problems of the brewing trade; to encourage the use of bottled beer will add considerably to costs, while to discourage it may hasten the long-term fall in beer consumption.

There is no cogent reason to consider that the recovery in sales of beer since the depression of 1932 is a permanent reversal of the long trend established during the past half-century. The competition from other means of amusement is growing more, not less, acute, and in addition the development of motoring is a very potent factor in the cause of temperance. Modern trends seem to point to the gradual decline in the numbers of the "public-house" as such, and in the amount of drink consumed therein, and to the development, with the system of tied houses, of a type of restaurant where drinks are served.

But although brewing must be regarded as a trade which will continue to decline in importance, it is fortunate in one respect, that the reduction in sales has not been accompanied by a noticeable decline in profits. As computed for Income Tax purposes, declared profits of breweries (less allowances for wear and tear of plant) were in 1936-37 nearly three times as large as in 1913-14; even in the worst year of the depression, 1932-33, declared profits were 60 per cent. greater than in 1913-14. Although it is probable that the capital invested has increased during the period, declared profits of £28½ millions in 1936-37 show that the trade has been at any rate partially successful in warding off the usual effects of falling sales on income. Developments on the technical side of brewing and the economies of production in larger units have been important factors in maintaining the level of profits in the brewing trade.

Finance and Banking

The Bank for International Settlements.—The ninth annual general meeting of the B.I.S. was held at Basle on May 8th, under the chairmanship of Sir Otto Niemeyer. The report of the president, which was presented to the meeting, consists of the usual exhaustive analysis of world economic conditions, and it will be discussed at greater length in *The Economist* in the near future. The report begins on a note of restrained optimism. It alludes to the recovery in a number of countries during the latter part of 1938, and adds that this recovery spread to the field of international trade. During 1938 the volume of world trade, though not at a record level, was at least 15 per cent. higher than the maximum for any year prior to 1914. Much of the report is concerned with the growing

world demand for labour, due largely to re-armament. The report says generally that full employment is dependent upon a just equilibrium between costs and prices, and that cheap money has nowhere brought about a sustained revival in business. General economic needs rather than a desire to keep down the cost of national debts must determine the proper level of interest rates at all times. It now appears that the period in which European countries must cope with the problem of excess capacity is nearing its end. This raises the rival claims of the home market and the export trades. Also when the limits of productive capacity are approached, the nations must recognise that a reduction in the standard of living is inevitable as soon as the needs of non-economic production can no longer be met out of

a net increase in economic activity. In plain English, beyond a point no nation can have both guns and butter. As regards international gold movements, the report makes the important point that over one-half the United States' gold acquisitions of \$1,750 millions during 1938 are to be associated with her large export surplus, and less than half with the net influx of capital into New York. The business of the B.I.S. itself has in the present period of international tension consisted mainly of operations in gold and foreign exchange on behalf of central banks, but its attention is still directed to the promotion of regular intercourse in currency, credit and trade between the nations of the world. The report alludes to the changes in the German representation on the board of the B.I.S., consequent upon Dr Schacht's retirement, and pays a graceful tribute to Dr Schacht. Two other long-standing members of the board, Professor Bachmann and Professor Beneduce, have also resigned as a result of new commitments.

* * *

April Clearing Bank Averages.—For the first time this year the monthly averages of the English clearing banks show a rise in deposits. It only amounts to £1.8 millions; nevertheless, it means that the deflationary period of the transfer of tax money has come to an end. The fresh rise in advances, totalling £4.4 millions is, therefore, the more interesting, since it can no longer be explained by demand for credit to pay income tax. The corresponding month last year showed a fall of £1.5 millions; and this month's unseasonal rise, which brings the total increase since last November to £31.4 millions, can only be accounted for by industrial expansion. Another unseasonal movement is a fall of £7 millions in discounts; for the

* Amended figure.

increase in the floating debt after March usually tends to expand the banks' bill holdings. This April, however, political uncertainty restricted their purchases from the market, and the decline shown illustrates the difficult conditions experienced in the money market until recently. The fall in cash is rather misleading, since it is entirely due to a drop of £6.7 millions in the Midland Bank's figure. The other banks' cash is virtually unchanged or slightly higher, which seems to prove that the low level of bankers' deposits at the Bank of England in April, and the higher note circulation, are partly the result of larger holdings of till money.

* * *

Municipal Short Loans.—It will be remembered that a recent restriction by the clearing banks of the municipal bills which they would accept either for discount or as security for discount market loans eliminated all such bills other than those rediscountable at the Bank of England. The consequent curtailment of cheap short-term finance previously utilised by a number of local authorities has stimulated efforts by these authorities and by various finan-

cial agents acting for them to obtain alternative accommodation—equally cheap and not subject to the banks' ban. One result has been to encourage a new type of short-term borrowing by municipalities in the London money market. This is taking the form of loans repayable at seven days' notice. It is estimated that in recent weeks about £1,000,000 of such loans has been placed at a rate of 2 per cent. The lenders have been, for the most part foreign and colonial banks, to whom the rate offered has, even in recent weeks of stringency, appeared exceptionally attractive, given the short-term character of the asset. The only security offered for these loans has been the deposit receipt of the municipality. The possible extension of this type of business raises certain important questions. It is evident that the liquidity of such loans in times of emergency would depend wholly on the readiness of other lenders to take the place of the overseas institutions which under such circumstances would almost certainly exercise their right to recall these loans. The borrowers probably rely tacitly on their clearing banks for such recourse. But these institutions might be unlikely to comply, since in an emergency they would themselves be feeling some strain, and in view of the fact that the previous direct recourse of the borrowers to the money market had in fact been made at their expense. This short-loan method of municipal borrowing appears to possess all the disadvantages of the unlimited entry of local authorities to the discount market with none of the advantages which that method of short-term financing—given reasonable safeguards—did provide. The history of municipal finance over the past few years suggests very strongly that the clauses of the Local Government Authorities Act of 1933 relating to finance could with advantage have been more clearly defined. A state of affairs may even arise at which amending legislation will become an urgent necessity.

* * *

Exchange Precautions in Sweden.—A Bill was recently submitted to the Swedish Parliament which provides an object-lesson in one very necessary form of financial preparedness in the event of war. Every crisis in the last year has caused double confusion in the foreign exchange and bullion markets in London, because of the prevailing uncertainty as to the policy of the authorities with regard to gold holdings and foreign assets on the outbreak of war. The Swedish Government has wisely anticipated any such confusion in its own markets by introducing a measure which would centralise all dealings in foreign exchange and foreign securities in the Riksbank and authorised commercial banks, ensure the strict control of all such transactions and, further, prescribe that foreign exchange and foreign securities should, against cash payment in Swedish currency, be delivered to the Riksbank or to the authorised commercial banks. The Bill provides, too, for the prohibition of the import and export of foreign exchange and foreign securities. The measure would come into force not only if Sweden herself is actually involved in a war, but also if she is in danger of being so involved, that is, if a war between foreign countries causes panic on the Swedish market. But the Government envisages as well the embarrassment to Sweden of an inflow of funds as a result of a war that did not immediately concern her, so that extraordinary circumstances caused by a war will also be reason enough for putting the Bill into effect. Every contingency, therefore, seems to have been provided for; and the forethought shown by a neutral country in a time of peace might well be copied by other States which have more vulnerable markets than Sweden.

Next Week's Issue of
THE ECONOMIST
will include the
BANKING SUPPLEMENT
which is published annually in May, dealing with the progress of banking in Great Britain and abroad.

MONEY MARKET NOTES

Foreign Exchanges

THE chief features of the foreign exchange market this week have been the strength shown both by the guilder and the forward belga. The demand for guilders started about a fortnight ago with the repayment of French railway bonds; but that influence has now come to an end, and the present strength of the currency is partly due to commercial buying, but mainly to the closing of speculative positions. Political fears in Amsterdam in recent weeks caused considerable buying of pounds and dollars; and covering operations by bears in a narrow market are chiefly responsible for the big improvement in the rate, which on Wednesday dropped to 8.71½ fl., compared with 8.76½ fl. last Saturday, although on Thursday afternoon it was rather weaker at 8.72½-3 fl. The spot belga has remained at around the official selling rate of 27.50, but the discount on the three months' belga has contracted sharply. From being 32½ c. at the end of last week it was down to 20 c. on Wednesday. The reduction in the Belgian bank rate from 4 to 3 per cent., announced on Wednesday, has encouraged confidence in the belga. Swiss francs have also been firm and appreciated on Wednesday to 20.82½, against 20.85 on Saturday. The spot sterling-dollar rate has moved slightly in favour of the pound. The forward premiums on the dollar have continued to contract under the influence of Control operations, and on Thursday afternoon were quoted at 1½-1½ c. for one month and 1½-1½ c. for three months. Registered marks were strongly bid on Thursday, the discount narrowing to 62 per cent., against 65 per cent. earlier in the week.

*

The Bank Return

A FURTHER small rise in the note circulation is shown in this week's Bank Return, and the corresponding drop in the Reserve has brought the "proportion" down to the low figure of 19.7 per cent. The rise this week has been more than offset by an increase of £2.2 millions in Government securities. Nevertheless, bankers' deposits show a drop of £6.8 millions since there has been a switch-over to public deposits, where funds are starting to accumulate in preparation for the June 1st distribution on War Loan. The extreme ease in

the money market this week, however, and the competition for bills, suggest that the banks are not concerned at the fall in their deposits, and provide additional evidence to that disclosed in the April averages, that a large part of the increased note circulation has gone to strengthen till money, so that the banks' total cash holdings remain at a comfortable level.

*

The Money Market

DISCOUNT rates have practically returned to the so-called famine levels prevailing prior to the annexation of Czecho-Slovakia. Once the collapse in rates started, the market tended to withhold its bills from the banks in the hope of a further reduction, and on Monday the banks were compelled to cut their buying rates for July bills from 1½ to 1 per cent. On Wednesday most of the banks decided on another cut to ½ per cent., but even at this rate the turnover was not large. Now that a ready outlet for its bills is assured, the market is eager to take commercial paper, the rate for which has fallen accordingly. The three months' fine bank draft is generally quoted at ½ per cent., with 1½ per cent. accepted for the very best paper. Last Friday's Treasury Bill tender resulted in an average rate

INSURANCE NOTES

£3 14s. 5d. per cent., which compares with £3 12s. 11d. per cent. last year. Death claims fell by £38,000 to £413,000. Fire premiums showed some further reduction at £977,000, against £992,000, and underwriting results were less satisfactory. In the accident, employers' liability, miscellaneous and marine branches premium incomes were somewhat smaller at £24,000, £66,000, £264,000 and £405,000 respectively. The results in the miscellaneous branch were disappointing, particularly as certain rearrangements make it unlikely that the losses sustained in recent years in respect of poli-

from some outside quarters were discouraged. Total applications, therefore, fell from £63.5 millions to £60.7 millions, and the market syndicate obtained a 37 per cent. allotment against 31 per cent. at the previous tender. The comfortable credit conditions are also partly responsible for the fall in discounts, since the banks, now that their cash has been replenished by the May 1st dividend disbursements, are anxious to bring their bill holdings to a more normal level; while the ease with which the market can obtain loans, bill money being at the ½ per cent. minimum with bond money from outside quarters obtainable at ¾-¾ per cent., makes it less keen to sell.

*

The Bullion Market

THE suggestion, made in a Finance Note on April 22nd, that the new Government war risk scheme would tend to restrict arbitrage competition for gold has been borne out by dealings in the bullion market this week. In spite of the absence of any premium, arbitrage demand has been very small, except on Tuesday, when the price, which was barely on the dollar parity, gave arbitrageurs a slightly wider margin on which to work. The turnover was twice as high as on Monday, and, although supplemented by some official selling,

† At fixing. The New York price of silver remained at 43 cents per ounce -999 fine during the week.

supplies were insufficient to meet requirements, so that buyers were rationed. On Saturday, however, arbitrageurs were very loth to work at all, and the turnover at the fixing was only £36,000. After a sharp rise at the end of last week, silver prices have relapsed again as a result of larger offerings and smaller Indian buying.

cies issued in guarantee of loans by bankers to members of the medical profession have been repeated. Possibly the experience in motor insurance business is responsible for the unsatisfactory results in the miscellaneous branch. The reserve for unexpired risks is, as usual, 50 per cent. of premium income, but in the following table 40 per cent. is used in conformity with our usual practice. The allocation from the life department in 1937 followed the results of the quinquennial valuation as at December 31, 1936, and no further allocation is due to be made until the end of the present quinquennium.

	1937	% of	1938	% of
	Profit	Prem.	Profit	Prem.
Fire	115,841	11.7	85,003	8.7
Accident	4,815	21.6	2,110	8.7

Charges to profit and loss	73,772	...	116,059	...
	191,231	...	Dr. 66,564	...

Total assets amount to £17,331,000. Loans amount to £1,477,000 against £1,544,000, and British Government securities increased from £2,507,000 to £2,661,000. Colonial and foreign government securities also showed some increase to £3,094,000. Debenture stocks fell from £3,513,000 to £3,364,000, while preference and ordinary stocks increased by £155,000 and £92,000 to £3,096,000 and £3,391,000, respectively. General reserve and contingency funds amount to £600,000, and in the fire and miscellaneous departments, in addition to reserves for unexpired risks, there are reserves of £900,000 and £100,000, respectively. The dividend is 65 per cent. and costs £141,000 compared with interest earnings of £134,000.

★

State Assurance.—The State Assurance Company is a subsidiary of the Royal Exchange, and itself owns the British Equitable. It operates in all classes of insurance business except life, and its accounts include the transactions of the British Equitable. Fire, accident and marine premium income amounted to £536,000, £269,000 and £102,000, compared with £528,000, £246,000 and £101,000 respectively in 1937. The results of the last two years are given below:—

	1937	% of	1938	% of
	Profit	Prem.	Profit	Prem.
Fire	30,802	5.8	25,059	4.7
Accident	8,374	3.4	12,317	4.8
Marine	6,845	6.8	6,742	6.6
Life	1,814	...	1,860	...
Profit on investments	2,604	...	...	...
Charges to profit and loss	50,439	...	45,978	...
	47,954	...	49,930	...
	2,485	...	Dr. 3,952	...

New life business effected by the British Equitable last year increased from £835,000 to £871,000, and the net rate of interest was £3 18s. 2d. per cent., against £4 1s. 10d. per cent. Quinquennial bonuses to December 31st last are at the rate of 32s. per cent. per annum for policies effected after and 34s. 6d. per cent. for policies effected before March 1, 1923. These modest rates, which are calculated on the sum assured only, compare with 37s. 6d. per cent. and 40s. per cent. on the last valuation. Total assets of the State amount to £1,181,000, while those of the British Equitable amount to £2,172,000, of which £1,821,000 belong to the life assurance account. The State dividend is again 25 per cent. and costs £18,350, compared with interest earnings of £31,550.

★

Co-operative Insurance Society, Limited.—New sums assured of this society in its ordinary branch amounted in 1938 to £3,275,000, compared with £3,461,000 in the previous year; all the industrial-cum-ordinary offices shared

a similar experience in reduced new business. In the industrial branch there was a further large expansion in premium income from £4,664,000 to £5,124,000 and a slight increase in the new sums assured from £20,260,000 to £20,322,000. Expenses amounted to 33.65 per cent. of the premium income contrasted with 34.82 per cent. in 1937. The net rates of interest earned on the ordinary and industrial life funds were £3 15s. 11d. per cent. and £4 9s. 8d. per cent., showing reductions on the year of 3s. 11d. per cent. and 1s. 2d. per cent., respectively. In the ordinary branch the valuation of immediate profit assurances was altered from O^M to A¹⁹²⁴⁻²⁹; no doubt as a result of this change the amount set aside for future expenses and profits has increased to 27.7 per cent. of the annual premium income from 21.7 per cent. in 1937. In the industrial branch English life tables No. 10 (males), which was first adopted in 1937, is again used. The rate of interest assumed in both branches is 3 per cent. with 3½ per cent. for immediate annuities and 4 per cent. for deferred annuities. The reason for the large increase in the trading surplus in the ordinary branch is not obvious; the explanation may be that following a series of years in which the reserves were being continuously strengthened it has, on this occasion and under present conditions, been deemed more convenient to augment the investment reserve fund. The results of the last two years are given below:—

	1937	Ordinary Branch	Industrial Branch	1938	Ordinary Branch	Industrial Branch
Surplus earned during the year	262,464	276,958	291,701	569,203	92	150
Profit on investments	14,975	23,744	92	150	...	...
Brought forward	72,553	111,530	70,373	153,966	...	...
	349,992	412,232	362,166	723,319	...	...
Bonuses to policyholders	279,619	258,266	307,204	288,425	...	...
Investment reserve fund	...	...	...	250,000	...	...
Carried forward to next year	70,373	153,966	54,962	184,894	...	...
	349,992	412,232	362,166	723,319	...	...

In the ordinary branch the rate of reversionary bonus is again 36s. per cent. calculated on the sum assured, and the same bonuses as in 1937 appear to have been declared in the industrial branch. Fire premiums increased by £15,000 to £393,000 and accident premiums, including the premiums in the employers' liability and the general branch, increased by £33,000 to £390,000. In the motor department there was an increase of £32,000 to £1,084,000 and trading results were satisfactory. Including the above transfer of £250,000 from the industrial branch the sum of £308,000 was transferred to investment reserve fund, which now stands at £750,000. There is also a general reserve of £412,000. Total assets increased from £27,634,000 to £30,920,000. Loans and mortgages further increased from £5,797,000 to £7,278,000, but British Government securities were unchanged. British municipal and foreign and colonial government securities showed little alteration. On the other hand, debenture stocks increased from £8,617,000 to £9,884,000 and preference stocks from £2,444,000 to £2,735,000; only £20,000 is held in the form of ordinary shares. The aggregate market values of the Stock Exchange securities at the end of 1938 were in excess of the amount appearing in the balance sheet.

Friends' Provident and Century Life.—New life assurances of the Friends' Provident amounted to £2,483,000, compared with £2,680,000 in 1937. In addition, life policies for £171,000 were issued by the Century, mainly under its special schemes of life and disability insurance. A considerable annuity business is transacted and considerations last year amounted to £1,020,000, which, however, is about £200,000 less than in the previous year. Including the Century (whose share capital is owned by the Friends' Provident) sinking fund assurances were issued for £1,302,000, showing an increase of £346,000 on the 1937 total. The net rate of interest earned on the Friends' Provident life and annuity fund was 3s. 1d. per cent. smaller at £3 16s. 9d. per cent. If the amount of income tax deducted from annuity payments is set off against the tax on interest receipts, the net rate of interest would be £4 6s. 9d. per cent. compared with £4 6s. 7d. per cent. in 1937. Annuities paid, less income tax, amounted to £358,000 in 1938, compared with £293,000 in 1937. Death claims fell from £201,000 to £187,000, and as actual claims in 1937 were only 67 per cent. of the total expected by the A¹⁹²⁴⁻²⁹ table, the mortality experience last year would appear to have been very satisfactory. No indication is given of the annuity mortality experienced. The Century transacts all classes of insurance, including permanent sickness insurance, in which it was a pioneer. Fire premiums fell by £69,000 to £352,000, due to the cancellation of some unprofitable accounts in the U.S.A.; in each of the other branches small increases of premium income were registered. The results of the past two years are given below:—

	1937	% of	1938	% of
	Profit	Prem.	Profit	Prem.
Fire	Dr. 17,085	- 2.6	4,135	1.2
Accident	Dr. 2,098	- 8.2	577	2.1
Motor	Dr. 14,794	- 12.3	Dr. 3,318	- 2.7
General	30,752	30.4	19,751	19.0
Employers' liability	5,710	7.7	9,345	11.7
Marine	Dr. 2,762	...	Dr. 2,982	- 2.7
Disability	...	...	20,000	...
	5,713	...	47,508	...
Charges to profit and loss	9,802	...	29,498	...
	Dr. 4,089	...	18,010	...

The investment reserve of the Friends' Provident was increased by transfers of £400,000 and £50,000 from the life and annuity and sinking fund accounts, respectively, to meet further depreciation. After these transfers, investments appear at less than their aggregate value. Loans increased from £3,372,000 to £3,563,000, while mortgages on property in the United Kingdom at £1,326,000 and loans on professional practices at £834,000 showed increases of £90,000 and £106,000, respectively. British Government securities increased from £1,298,000 to £1,508,000 and Indian and Colonial Government securities from £152,000 to £269,000. Foreign government securities contracted from £314,000 to £265,000. Debenture stocks increased from £4,331,000 to £4,786,000, but preference stocks were smaller. The shares of the Century are valued as before, at £1,500,000, but other ordinary stocks fell from £2,125,000 to £1,812,000. The dividend which is raised from 15 per cent. to 20 per cent. costs £65,000, against interest earnings of £56,000.

Investment

Gilt-edged Disparities Removed.—In the market's recovery this week, gilt-edged stocks have been well to the fore. In a context of broadening interest in the industrial sections, and improved support for commodity and mining issues, the stronger trend of the Funds has stood out. But whereas the market generally has given rein to its feeling of slightly greater confidence in the political outlook, and to the rapid march of home industry towards full employment, gilt-edged securities have responded to the removal of special factors which, a month ago, had wrecked all traditional relations between the various sections of the market. A table reproduced in these columns on April 22nd showed that, between March 10th and April 19th, the gross redemption yield on such an "ultra-short" as 4½ per cent. Conversion had jumped from £1 18s. 9d. to £3 12s. 3d. per cent.—a level which was only a shilling or two per cent. below the redemption yield on the long-dated stocks. Strained credit supplies during the greater part of April and the fear that the banks might raise their lending rates produced a violent rise in bill rates, and this took full effect among short-dated gilt-edged securities. This week, bill rates have fallen to the scarcely remunerative levels which prevailed before the German invasion of Czechoslovakia, and there is no disposition to sell.

★ ★ ★

The effect of this sudden restoration of low money rates is shown in the following table, which sets out the movement of prices and yields in the various types of gilt-edged stocks:—

		April 19, 1939		May 10, 1939		Change

(a) Flat yield.

(b) By annual instalments, taken to 1946.

(a) Flat yield. (b) By annual instalments, taken to 1946.

The traditional margins between "shorts" and "longs"—measured by the yield differential per annum difference in life—are not yet fully restored, but the complete abnormalities which were evident among the "shorts" in the middle of April have been partially corrected. The falls in the short-dated list between the "highs" of March 10th and April 19th have been proved unduly large, as we suggested on April 22nd. And the corrective price movements since the latter date have been spectacular, particularly for 2½ per cent. National Defence Bonds. Jobbing operations for specialists in short-dated bonds must have been profitable during the past two or three weeks. But it is open to doubt whether the miniature monetary crisis after Easter was quite unavoidable. It certainly inflicted heavy strain on a gilt-edged market which stands in need of all the encouragement which the authorities can provide.

★ ★ ★

Industrial Profits in April.—By a coincidence industrial companies' net profits reported in April have fallen by exactly the same proportion as the March com-

panies—by 11.57 per cent. As in March, when the Courtaulds' results depressed the total, the exceptional severity of the fall is due to a single factor, which is the heavy fall in shipping profits, reported by Cunard White Star and Union Castle. The course of industrial net profits over the past two years is shown in the following table:—

INDUSTRIAL PROFITS 1937-39

Year and Month	No. of Cos.	Net Profits*	Inc. on prev. year	Year and Month	No. of Cos.	Net Profits*	Change on prev. year
1937		£	%	1938		£	%

* After debenture interest.

If the reduced shipping earnings are eliminated, net profits for the remaining 225 companies show a fall of 7½ per cent. from £24,666,000 to £22,900,000. Disregarding the unfavourable results reported by a limited number of large companies during recent months, industrial profits for the mass of companies are still running at a consistently lower level, from 5 per cent. to 7½ per cent. below those of the previous year.

Cable and Wireless Progress.—The reports of Cable and Wireless, Limited (the operating company) and Cable and Wireless (Holding), both of which have been issued during the past week, have sustained the pleasing surprise which greeted the Holding company's dividend announcement in April. Taking the two companies in order, the operating concern showed a fall in gross message receipts from £5,030,209 to £4,573,315—a reduction of approximately 9 per cent., compared with a fall in the traffic index of approximately 12½ per cent. For a year of depressed international trade, in which, moreover, the Empire flat rate scheme was in operation for eight months, these gross takings are very satisfactory. The flat rate scheme itself was estimated to cost £500,000 in a full year, but already the benefit of cheaper facilities is being felt in intra-Empire traffic. Mr Edward Wilshaw, chairman of the Operating company, disclosed at this week's meeting that traffic receipts for March this year were only a few hundred pounds less than for March, 1938, before the flat rate scheme was introduced. Although significant changes occurred in the level of individual expense items, the total, apart from the Beam Rental, was scarcely changed at £3,602,958. The Beam Rental, under the new agreement, was chargeable for only two months, and thus cost £41,667, against £250,000 in 1937.

BRITISH GENERAL SERIES 'C'

Managers: BRITISH GENERAL FIXED TRUST LTD., 36/37 King Street, London, E.C.2

The Operating Company's ordinary share earnings show a reduction from £1,256,919 to £1,001,205, of which 3½ per cent. gross dividend absorbs £975,000, leaving the balance carried forward at £27,467, compared with £1,262 brought in. The results of the Operating and Holding companies are analysed in the following table:—

Operating Co.	Years to December 31,		
	1936	1937	1938
Net message receipts	4,446,098	4,745,050	4,318,851

† After £300,000 to general reserve. * After £13,401 capital reduction expenses in 1937 and in 1938 £70,441 extra income stock sinking fund provision.

It was already known that the Operating company's dividend was fully covered without encroaching upon the special reserve of £300,000 set aside a year ago. But doubt still remained whether the Holding company had been able to maintain its payment at 4 per cent. without drawing upon the carry-forward. Here again the sceptics have been routed. Gross dividends received by the Holding company amounted to £1,397,280, towards which the three old cable companies contributed £971,584, and Marconi's Wireless Telegraph £308,426, against £184,590. The increase in the latter company's preference and ordinary distributions, coupled with the special dividend of 3 per cent., tax free (which accounts for £63,080 out of the total of £308,426), have been included in the gross dividends received by the Holding company in the table above. On this basis, earnings for the Holding company's ordinary capital amount to £351,950, compared with £275,324 required to pay the 4 per cent. ordinary dividend. On the stricter basis of setting £63,080 from the Marconi's special tax-free dividend against £70,441 extraordinary funded income stock sinking fund, earnings would amount to £288,870. But on either basis the results are very creditable.

— And Prospects.—Under the 1938 agreement the Operating Company's standard revenue has been reduced to £1,200,000. There is a considerable margin to be filled, however, before this amount is reached—net earnings for the preference stock last year amounted to little more than £1,000,000. The equity of Cable and Wireless (Holding) ordinary stockholders after standard revenue is reached is limited to one-third of surplus earnings. But there is, under present conditions, appreciable scope for improvement before the sliding scale comes into operation. Certainly, the group is providing every inducement to obtain increased traffic. The Empire flat rate scheme has been succeeded by the Empire press flat rate and the cheap social message. It may be hoped that international trade will improve and thus enable the group to enjoy a greater return on its enterprise. In the light of the results of both Operating and Holding companies last year, the current

price of 46½ for the Holding company's ordinary stock, at which it yields £8 11s. per cent., seems reasonable. Its recovery from the year's "low" of 35 is certainly well merited.

Stewarts and Lloyds Results.—The 6 per cent. increase in Stewarts and Lloyds' total profits is very satisfactory. Consolidated profits rose from £2,143,504 to £2,336,070 last year. Since the 12½ per cent. dividend is repeated (although it is payable on a slightly larger capital, owing to an exchange of interests under the Tube Investments agreements), interest in the accounts lies chiefly in the special allocations which have been a recent feature of the company's financial policy. The following table shows the allocation of profits in detail in the past three years, while the chart shows changes in distributable profits over an eleven-year period.

STEWARTS AND LLOYDS PROFITS 1928-38

In drawing the chart, last year's export trade provision has been treated as a charge, while in previous years the amount shown for reserves includes contingencies.

The main feature of the latest accounts is a special provision of £500,000 for a reserve for maintenance and development of export trade. So far, however, specific information is lacking on any changes in the export market

which may have necessitated such a provision. Fear that co-operation with foreign producers might become difficult has, in fact, been allayed. Hence the special provision may well imply—besides defence—a forward policy of development. Other reserve provisions, however, are on a smaller scale than those set aside in 1937. For 1937, £300,000 was placed to stock reserve, but last year the sum was reduced to £75,000, and no allocation is made to contingencies. Special depreciation is not provided for in 1938, but the normal depreciation allowance is nearly £135,000 higher at £508,388, and the share premium account of £315,104 is transferred to special depreciation. Changes in available equity earnings thus reflect financial policy almost as closely as trading profits. Regarding the year's provisions as expenses, deferred and liaison share earnings are virtually halved, but even on this strict view, the 12½ per cent. dividend is fully covered by earnings. The balance sheet shows a reduction in creditors from £2,524,047 to £1,345,032 (including provision for accrued liabilities), and a rise in stocks from £2,331,909 to £2,811,997, despite the provision of £375,000 for stock reserve in two years. On the report alone it is difficult to form an opinion of prospects for the current year, and Mr Macdiarmid's survey will be awaited with especial interest. At the present price of 43s., the deferred shares yield £5 16s. 3d. per cent.

Imperial Chemical Industries.—So far as the year has gone, the directors of Imperial Chemical Industries are more than satisfied with the volume of trade achieved by the group. The defence programme will give a stimulus to trade activity, but of a scattered rather than a general nature, and one to which Imperial Chemical Industries, in particular, cannot look for any abnormal effect. These were the two central points in Lord McGowan's appraisal of the current year's prospects at Thursday's meeting. They have to be related to the now well-known financial policy of the board, summarised a year ago by the chairman under the general proposition that the company should be made so strong financially that its stability should be unimpaired even by a major trade depression, and that dividend policy should aim at the maintenance of steady payments within narrow limits, through good and bad years alike. The security of that general policy depends upon adequate and readily realisable reserves. And the board "hope in due course to be able to build up such a reserve." In 1937—a year of "exceptional activity and profit," in the chairman's words—the dividend was raised from 8 per cent. to 8½ per cent. Last year the rate was reduced to 8 per cent. Are these rates to be regarded as the extremes of the "narrow limits" to which the chairman referred this week? That, certainly, has been the impression of the market for some time past. The original conception of Imperial Chemical Industries as a group with dynamic profits expectations is no longer widely held.

Lever and Unilever Prospects.—Mr D'Arcy Cooper's speech (read in his absence at last week's meeting) confirmed the suggestion made in a leading article in *The Economist* of April 29th that the profits of Lever Brothers and Unilever for 1939 might show relatively little variation from those of 1937. Making the necessary reservation regarding politics, the chairman forecast "another year of approximately £12,000,000 aggregate net profits." Hence, the dividend outlook may be regarded as satisfactory, for Limited's dividend was covered twice over on this basis of profits last year. In 1938, the group obtained an increase of £1,000,000 in profits from soap and margarine. Soap sales reached record levels, and sales of margarine and edible fats exceeded 800,000 tons for the first time in eight years. But, in addition to the improvement in turn-

H.M. STATIONERY OFFICE

LONDON, W.C.2: York House, Kingsway. EDINBURGH, 2: 120 George St. MANCHESTER, 1: 26 York St. CARDIFF: 1 St. Andrew's Cres.; BELFAST: 80 Clifton St.; or through any bookseller.

over, it is probably true that profits from manufacture were assisted by the relatively low prices of raw materials, which, on the other hand, affected the earnings and trading volume of the raw materials companies, of which United Africa is the most important. Mr D'Arcy Cooper also confirmed the suggestion that the opportunities open to the group to transfer profits in blocked currencies may be smaller during the current year. The Continental interests, of course, are the football of politics, although the changes of frontiers during the past twelve months have not greatly altered the balance of the group's resources between free and controlled exchange areas. Stockholders can have nothing but praise for the directors' efforts to establish new sources of earning power to replace those lost in the frozen wastes of Europe. The progress of the American business, which is under the wing of the N.V. branch, provides proof of their success.

* * *

Consumption Companies' Results.—Companies in the consumption goods trades do not always show the stability of profits that might theoretically be expected. But the results of four such companies available this week—a distinctly eueptic list—are certainly satisfactory. In only two instances, however, are the latest profits properly comparable with earlier years. *Cerebos* shows an exceptionally good earnings record. For 1938 total earnings amount to £455,619 against £444,022, and the 40 per cent. dividend is repeated. After remaining somewhat stationary for two years, *Smith's Potato Crisps'* earnings in 1937-38 showed a good rise, and it is satisfactory that the increase in 1938-39 from £166,649 to £185,074 has almost maintained the previous year's rate of advance. The whole of this increase in profits is available for ordinary shareholders, so that earnings for the equity amount to 46.3 per cent., against 37.7 per cent., and the 32½ per cent. dividend is repeated. The *Beechams Pills* report does not disclose how much of the rise in total profits from £600,908 to £723,663 is due to improved trading and how much to the Macleans and Eno Proprietaries acquisitions. The report stresses, however, that the latest results do not include a full year's dividend from either of the newly-acquired companies, and that substantial economies due to the reorganisation will be reflected in future accounts. The marketing of new lines is apparently contemplated, for it is stated that, during the coming year, large sums will be allocated towards initial marketing costs. For 1938-39, provision for development reserve absorbed £72,919 against £86,584. Dividends total 40½ per cent. actual, though the first interim was payable on £300,000 of deferred capital only. Owing to the 200 per cent. share bonus last August and to the issue for cash in connection with the Macleans purchase, the rate earned for the deferred stock is 52.6 against 135.2 per cent., but the amount earned is £375,650 against £296,982. The results of *Reckitt and Sons* also are complicated by the recent formation of Reckitt and Colman to amalgamate the business of Reckitt and Sons and of J. and J. Colman, in which Reckitt and Sons have a 65.6 per cent. interest. The first report of the new operating company discloses total profits of £1,580,149, and points out that although total sales increased both at home and abroad (56½ per cent. of total trade is in the U.K., and another 15½ per cent. in the Empire), trading profits were about £50,000, or 3½ per cent., lower. This is but a moderate decline, but owing to the retention of various reserves and the deduction of tax, the share accruing to Reckitt and Sons is £680,558. The company's

22½ per cent. dividend is repeated, and is covered by earnings of 23 against 26 per cent.

* * *

Ford and Morris Prospects.—The emphasis at the Ford and the Morris Motor meetings this week, regarding prospects for the current year, was placed somewhat differently. Lord Nuffield reaffirmed the belief of the Morris Motors' board that the past year's results had been very satisfactory, and explained that apart from general trading difficulties a special non-recurring factor had been at work, for the output of two new models had been restricted for a time owing to the inadequate supplies of certain essential materials. Profit margins were also affected by the higher level of material and labour costs and by the decision not to pass the increase on to the consumer in full, but this price policy has latterly stimulated demand—for the first quarter of this year a new delivery record has been achieved. At the Ford Motor meeting, on the other hand, Lord Perry expressed considerable concern regarding the effects of the sharp increase in motor taxation. Competition among producers of the lighter cars is already intense, and Lord Perry does not subscribe to the argument that increased horse-power tax will stimulate light car sales. In his view, Ford Motor, which depends on the production of small cars, will merely be relatively less affected than makers of the higher-powered cars. In the export markets, the outlook is not unhelpful. Exports in 1938 were lower than in 1937, but satisfactory improvement has occurred in certain markets. As for the company's technical development, Lord Perry pointed out that since the company's inception some £4,830,450 had been deducted from asset values for depreciation and obsolescence. This policy of financial conservatism was defended with some vigour, though discerning shareholders will feel that generous provision to meet the high costs of technical progress should be a matter for congratulation which requires no defence.

* * *

General Mining.—The results disclosed by the General Mining report for 1938 invite the question how so favourable an outcome was achieved in a year so unfavourable for finance company operations. The accounts show an increase of £6,843 in gross profits to £587,453, which is only £11,564 below the peak year 1936. Owing to the higher incidence of taxation, net profits are virtually unchanged at £516,578, representing 40.8 per cent. on the shares. Thus, the repetition of the total distribution at 25 per cent. again allows the allocation of £200,000 to general reserve, leaving the carry-forward virtually unchanged at £132,583. The report does not give any hint of the reason for this excellent showing. Nor will detailed study of balance sheet and revenue account provide any dependable conclusion. Indeed, the accounts are strongly reminiscent of the practice of some shipping companies before the Companies Act of 1929, for almost the whole of the earning assets are included within one balance-sheet item, while the whole revenue is shrouded in obscurity under the single heading "By realised profit. . ." The results of share dealings, the appreciation realised on old investments carried at a low book cost, dividends, interest, etc., are all lumped together, and there is no means of surmising to what extent current investment income, exceptionally prescient share operations during the financial period and the fruits of wise decisions of earlier years have respectively contributed. Nevertheless, the consistency of disclosed results in recent years has steadily enhanced the status of the Corporation's shares in the market, and the exchange of directors with the Central Mining-Rand Mines group has set the seal on an association which shareholders have assuredly welcomed. Among the corporation's particular interests, the improving position of West Rand Consols, East Rand Props., and Durban Roodepoort Deep, and the re-organisation of the capital of Phoenix Oil, are good auguries for investment revenue. It is believed in some quarters that this type of income is a predominant factor in the position, and perhaps the chairman may take the

opportunity offered by the general meeting to throw some light on this point.

* * *

Great Boulder Dispute.—The series of exchanges between the Board of Great Boulder Proprietary and the group of shareholders who launched the attack on the management some weeks ago will come to a head at the extraordinary general meeting to be held on June 23rd. This meeting has been requisitioned by the opposition which will propose a series of resolutions, the object of which is to remove three of the four members of the present Board, namely, Mr Claude de Bernales, Mr A. H. Collier and Mr E. P. Jones, and to replace them by new directors not yet named. Both sides have been working hard to get proxies and shareholders have been deluged with a great quantity of printed matter, the essential contents of which could have been condensed within a very much smaller compass. While some observers might not give the de Bernales group unreserved credit for all its activities in Westralian mining finance, it is more difficult, as the committee of shareholders has found out, to find any serious ground for criticism in the administration of the Great Boulder company, which, after all, is the matter which primarily concerns the shareholders. The fact that the leader and most substantially interested member of the Committee of Shareholders happens to be Mr W. Grundt, who was engaged in litigation with the company over a tribute dispute, could hardly be considered a happy start for the campaign, and the tenor of much of the opposition literature is aptly illustrated by the fact that it has been thought useful to reproduce in full a certificate given by the Norwegian Consul-General showing, *inter alia*, that Mr Grundt's family antecedents can be traced back in Norway to 1650. In so far as the committee raised specific criticisms relating directly to the administration of the mine, the Board has made a convincing and fully documented reply. They have also lately secured the support of Mr J. F. Thorn, general manager of the Lake View and Star, who testifies to the efficiency of the plant and management of the Great Boulder. In all the circumstances, the rank and file of shareholders are likely to require a more convincing case for evicting the present board than has yet been presented.

* * *

The Week's Company Profits.—Our usual analysis of profit and loss accounts, appearing on page 414, contains some 55 companies for which comparable results are available. They report net profits of £9,508,000 against £10,308,000, a reduction of 8 per cent., while the aggregate net profits of 1,010 companies reporting to date in 1939 are £140,007,000, or 8½ per cent. lower than the total of £153,247,000 earned by the same companies a year earlier. The week's results are reviewed in preceding notes and on page 387 under the heading "Shorter Comments."

* * *

Company Meetings of the Week.—Reports of company meetings will be found from page 393 of this issue. At the *Alliance Assurance* meeting Mr Lionel N. de Rothschild stated that, in valuing the life business, a rate of interest of 2½ per cent. had been assumed instead of 3 per cent. Addressing *Licenses and General Insurance* members, the Hon. Reginald Parker expressed satisfaction that in the life department the number of policies issued again showed an increase. Reviewing the experience of the life department of *Guardian Assurance*, Colonel Lionel H. Hanbury said that claims by death had been substantially lower than anticipated. Lord Middleton informed *Yorkshire Insurance* shareholders that the profit on the fire account was, apart from the exceptional results of 1937, the

best for ten years. At the *Central Mining and Investment* meeting, Mr F. R. Phillips discussed the importance of efforts to improve working efficiency, both in ore extraction and treatment. Apart from any question of profits, it was necessary to save labour, as increased tonnages from existing mines, greater development footages and production from new mines would all increase the demand for labour. Lord McGowan's survey of the *Imperial Chemical Industries'* position is discussed on page 383, and reference is made to Mr Edward Wilshaw's review of *Cable and Wireless* operations on page 381. At the *Calcutta Electric* meeting Lord Meston pointed out that income from the sale of current had risen by £900,000, in spite of large rates concessions. Sir Geoffrey R. Clarke informed *Calcutta Tramways* members that as saturation point was being reached on certain routes, consent had been obtained for the provision of various alternative routes. Mr Simon Marks, at the *Marks and Spencer* meeting, discussed the arrangements to borrow up to £2,000,000, of which £500,000 had been taken up and a further £500,000 is to be taken up at 4 per cent. Under favourable circumstances, the directors have power to replace the loan by a share issue, but the board have no such intention at present. Extensions and improvements to the *Spillers* undertaking were described by Sir Malcolm A. Robertson; the new mill at Newcastle is now in full production, while in London an extension of 16,000 tons had been added to the silos. The chairman's comments at the *Morris Motors* and the *Ford Motor* meetings are discussed on page 384. At the *Barry and Staines* meeting, Sir John N. Barran explained that while the previous year's turnover had almost been maintained, profit margins had been smaller. Mr Norman Holden informed *Mid-European Corporation* members that about 61 per cent. of the increase in depreciation was due to a more stringent method of valuing investments quoted on the German Bourses. Mr J. Leslie Wates informed shareholders of *Johnson and Phillips* that in view of the uncertainty regarding the Government's programme of electricity reorganisation, the board did not propose to make any issue of new capital. The increased capacity of the engineering departments carried out last year has already been overtaken, and a further increase may be necessary. Stockholders of *Anglo-American Debenture Corporation* were informed by Mr Richard S. Guinness that over 60 per cent. of last year's revenue came from fixed interest securities, while 62½ per cent. was contributed by British securities. The board had reduced holdings in foreign fields, when practicable, and re-invested chiefly in the United Kingdom and to a small extent in Canada, India and Africa. Mr John Ismay informed shareholders of *F. Francis and Sons* that the group's turnover to date exceeded that of the corresponding period last year. At the *Lunuvu (Ceylon) Tea and Rubber* meeting, Mr H. J. Welch stated that net prices for exportable 1939 teas to date showed an advance of approximately 1d. per lb.

THE market improvement which had already begun a week ago has come into greater prominence during the past week. Prices in virtually all sections have moved steadily upwards, and while the volume of business has not attained large proportions, public interest has improved noticeably. The absence of disturbing international news and the reduction in war risk insurance rates have assisted sentiment. A slight reaction occurred on Thursday. *Gilt-edged stocks* made a mixed showing at first, but gathered confidence as the week went on, and ended considerably higher, chiefly on the fall in money rates. A basic improvement was in evidence from the outset, but the market was puzzled about the progress of negotiations with the Soviet, and undated stocks receded on profit-taking, though they closed on Monday either slightly higher or unchanged. Later, there was less hesitation, and all stocks advanced strongly. The dated issues made a particularly good showing, and rose more steadily than the undated stocks. A small revival of demand for home corporation issues was evident, and Dominion stocks became more active than of late, with Australian issues improving towards mid-week. *Foreign bonds* also became more cheerful. Czech bonds were supported, especially on news of the formation of the debts committee, and Japanese issues rose. There was some speculative support for Brazilian bonds.

Home rails were unusually buoyant, until the traffic took the edge off the market's appetite. Preference stocks were well supported in anticipation of good traffic, though disappointment with the figures brought some profit-taking. The rise in guaranteed stocks, however, was unchecked, but ordinary stock prices became more hesitant after showing good gains. Argentine rails rose sharply, as the supply of stock was short, and demand was stimulated by good traffic, though profit-taking checked the rise. A marked increase in turnover, however, was always evident.

Industrial shares again showed satisfactory progress. Although there was not much business on Monday, the tone was good throughout, and activity increased as prices rose. Iron and steel shares advanced, with few exceptions, and public interest was more evident in mid-week, helped by news of the high rate of steel production in April. After a long period of neglect, coal shares improved. Engineering issues became firmer after some initial irregularity. Demand for electrical equipment shares was subdued, owing to the omission of the Callender's Cable cash bonus, but some good gains resulted from the mid-week recovery. Motor shares were quietly steady at first, rose after the Ford and Morris meetings, but did not hold all their gains. Aircraft issues were better than for many weeks, and with the partial assistance of the Rolls Royce results most shares rose. Textiles shared in the general improvement, though rayons were little changed, except for a firmer tendency in mid-week. Gains were recorded by the tobacco leaders,

and breweries went ahead on provincial support. Provision and catering issues rose, with Cerebos and J. Lyons prominent. There were a number of gains in the stores group, but they were on a rather smaller scale than in other sections. Marks and Spencer rose temporarily following the meeting. Miscellaneous issues reflected the general trend; Lever Brothers and Unilever were among the brightest features. Shipping shares maintained their firmer tendency.

A cheerful tone was maintained in the *oil shares market*. Trinidad Petroleum Development were active, and Continental demand was reported for Royal Dutch, Shell and Mexican Eagle. The latter responded to reports of impending agreement between Mexican, United States and British interests. Public demand for the leading rubber shares revived, and was especially concentrated on Anglo-Dutch and Rubber Trust issues. Professional support was evident later in the week, though business was not extensive. A moderate advance was recorded in *tea shares*.

Mining shares opened the week with modest improvements. Among Kaffirs, Rand Leases were a feature following the decision to increase output, and local support more than maintained the higher prices till after mid-week. Developing companies, after an uncertain start, improved under the leadership of Western Holdings, while finance issues followed the trend of operating companies. Among diamond shares, De Beers received early support, and business gradually broadened into a general moderate advance.

ACTUARIES' INVESTMENT INDEX

A rise of almost 2 points is shown in the week to Tuesday, May 9, 1939, by the Actuaries' price index of 160 industrial equities. On that date, the index stood at 61.4, against 59.5 a week ago and 60.5 a month ago. The average yield has thus fallen below 6 per cent., and stood at 5.82 per cent., against 6.03 and 5.91 per cent. respectively. A selection of the separate indices follows:—

New York

EARLY this week the report of an impending settlement of the coal strike imparted some buoyancy to Wall Street, after a rather dull opening. Steel shares moved up almost a point, supported late on Tuesday by other market leaders on news from London of reduced war risk insurance rates. Later, the continued deadlock in the coal industry dispute and the tendency to ascribe the recent recovery to Wall Street's technical strength rather than to public interest, caused a moderate setback which was not checked even by the improved stock and output prospects of the automobile industry. Throughout the week, the bond market has been firm, owing largely to support from the banks. *Iron Age* reports that steel mill operations are running at 47 per cent. of capacity, a decline of 2 per cent. on the week, and attributes the fall to delayed re-stocking orders by domestic buyers. Export demand, especially from South America, is well maintained.

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values calculated on closing prices (1926 = 100).

PUBLIC OFFER

Mid Southern Utility Company.—Issue of £150,000 "C" consolidated stock at 99. Maximum dividend 5 per

cent. Working profits 1938: gas, £29,832; water, £14,220; electricity, £45,744.

BONUS SHARES

Cornercroft, Ltd.—A scrip bonus of 25 per cent. is to be distributed to ordinary shareholders.

ISSUE TO SHAREHOLDERS ONLY

Kern Oil Company.—Chemical and Petroleum Investments has placed at Kern Oil Board's disposal sufficient of the 600,000 Kern 3s. 4d. shares for which it is entitled to subscribe to enable an offer to be made at 4s. each to all stockholders, in proportion of one share of 3s. 4d. for every £1 6s. 8d. held on April 27, 1939. Any shares not subscribed for will be taken by Chemical and Petroleum at 4s.

SHORTER COMMENTS

Company Results of the Week.—Owing largely to a special provision of £58,569 depreciation on investments and a loss on exchange of £59,094, BRITISH AND CHINESE CORPORATION have sustained a loss of £96,493, against a profit of £9,789. The Timothy Whites group appear to have experienced a satisfactory year, for total profits of TIMOTHY WHITES AND TAYLORS amount to £347,945, whereas the previous total profits of £430,332 covered a 66-week period, including two Christmas seasons. Most investment trusts continue to show more or less substantial declines in revenue, but the majority of those whose reports have appeared this week are able to maintain their dividends. The setback experienced by BRITISH MATCH CORPORATION is of a moderate order; total profits are £469,597 against £477,377. THE EVER READY COMPANY (OF GREAT BRITAIN), whose total profits have fallen from £579,022 to £506,892, report that while the volume of home sales rose by about 5 per cent., the reduction in net profits is due to price competition in the home market, lower overseas receipts, and a smaller revenue from certain subsidiaries. Excellent progress is shown by the GOOD-YEAR TYRE AND RUBBER COMPANY, whose net profits are £238,192 against £136,248, and whose tax-free dividend is raised from 15 per cent. to 22½ per cent. Plans for additional equipment and space indicate that still further progress is expected. Another company for whom 1938 has been a satisfactory year is PRESSED STEEL, whose net profits are £235,055 against £215,763.

MISCELLANEOUS

International Nickel Company of Canada, Ltd.—Interim statement for three months to March 31, 1939, shows net profit \$9,547,300, or 62c. per common share after allowing preferred dividend, against \$8,115,096, or 53c. per common share, for fourth quarter 1938, and \$10,113,765, or 66c. per common share, for first quarter 1938. Consolidated balance sheet, March 31, 1939, shows current assets \$81,762,548, including \$42,026,748 cash.

Callender's Cable and Construction Company.—Gross profits for 1938, £723,307, against £924,990. After general expenses of £168,298 (£178,113), repairs, etc., £40,992 (£55,828) and other expenses, net profit is £448,612 (£621,489). To depreciation, £60,000 (same); tax and N.D.C., £75,000 (£100,000); debenture interest, £13,500 (same); preference dividends, £56,000 (same). Ordinary dividend, 15 per cent., against 15 per cent., plus 5 per cent. bonus, absorbing £168,587 against £224,773. To reserve, £250,000 (nil). Carry forward, £390,548 (£565,023). Total assets, £5,261,926 (£5,500,358).

New British Fixed Trust.—The first accounts for 20 weeks ended May 5, 1939, and the distribution payable June 15, 1939, is 1½d. per sub-unit, tax free, or at the rate of £5 0s. 6d. gross per cent. per annum on initial price of 9s. 4½d. The progress report shows the composition of the fund, and dividends declared.

Timothy Whites and Taylors.—Trading profits for 1938, £347,701, including £15,000 from development account, against £459,841, including £30,000 from development, for 66 weeks including two Christmas seasons. To tax and N.D.C., £74,112. Debenture interest, £40,000 gross. Ordinary dividend 30 per cent., against 40 per cent. for previous period equal to 31½ per cent. per annum. Carry forward raised from £48,853 to £56,274. Properties have recently been valued at £2,199,209, an appreciation of £338,670 on balance sheet figure. Stocks £802,076 (£792,647). It is proposed to issue £500,000 5 per cent. debenture stock as early as possible.

Bent's Brewery, Ltd.—Shareholders have approved their company's offer to exchange 15 of its £1 ordinary shares for 50 £1 preference shares in Gartsides (Brookside) Brewery, Ltd., of Ashton-under-Lyne, and 23 ordinaries for 50 ordinary shares in Gartsides. Gartsides' shareholders also have option of 21s. 6d. in cash for the preference and 36s. 6d. in cash for the ordinary shares. Total payment in cash would involve £451,875.

Industry and Trade

Employment Again Higher.—The latest returns of employment and unemployment suggest that the deterioration in international relations since the middle of last March has not prevented a further increase in general business activity. The number of registered unemployed in Great Britain fell by 82,535 between March 13th and April 17th, while the estimated number of insured persons aged 16 to 64 in employment, exclusive of agriculture, rose by 99,000 during this period. As our seasonally adjusted indices of unemployment and employment show, the improvement last month was again more marked than usual at this time of the year. Indeed, the number of persons at work on April 17th was only 22,000 below the record of 11,707,000 reached in September, 1937. Moreover, the reduction in unemployment between March and

ment and wages due to the growth of Government expenditure, which has been accompanied by a slight decline in the cost of living, caused, in part, by the fall in world prices.

Recovery in Coal.—The position of the coal-mining industry has undergone a marked change since Easter and output is now again higher than a year ago. In the export districts, and also in some of the coalfields engaged predominantly in supplying the home market, demand has overtaken supply, and there is now a shortage of certain classes of coal for prompt delivery. The principal factors responsible for the improvement are (1) the increase in domestic demand, particularly in the iron and steel industry, under the pressure of re-armament and A.R.P. orders; (2) the replenishment of depleted stocks abroad; and (3) the limitations imposed on Germany's exports by the difficulties in the way of increasing production. The Central Council of Coal Owners has not yet decided on any additional allocations for the June quarter, but the principal coalfields are selling in excess of their quotas, and if current market conditions are maintained up to the end of the present month the applications for additional allocations are certain to be very considerable. For the March quarter the collieries were given inland and export supply quotas equal to 92½ per cent. of the actual supplies in the corresponding period in 1937, but the course of home demand has been more favourable than had been anticipated, and the supplementary allocations either voluntarily granted by the Central Council or conceded by arbitration exceeded 5½ million tons, of which 4½ million tons were in respect of inland supply and 750,000 tons for export. For the June quarter the original inland and export quotas corresponded to the actual disposals in the second quarter of 1938, when they totalled 37,834,455 tons and 10,733,860 tons respectively. The applications for supplementary quotas will be considered in the light of prevailing trade conditions, but it has been the policy of the Central Council to sanction quotas in excess of disposals. Thus, in 1937, which was a period of expanding trade, disposals to the domestic market fell short of the allocations by 3.2 per cent.; disposals in the export trade, in spite of an increase of 12½ per cent., fell short of allocations by 8.27 per cent. The margins between quotas and disposals were much wider last year. The margin between actual production and the potential producing capacity of the British coal-mining industry has been greatly modified by the abandonment of old mines and of many unremunerative sections of existing mines. It is estimated that in some of the coalfields the current rate of production is within 5 per cent. to 7 per cent. of capacity, and for this reason it is expected that the present spurt will be reflected more in rising prices than in any spectacular increase in production or exports.

Growing Demand for Steel.—In response to the growing demand for steel, production was speeded up further last month. While the total output of crude steel actually declined by 112,700 tons between March and April, the average daily rate of output rose by 1.7 per cent., from 43,366 tons to 44,091 tons. Moreover, as a result of the reduction in supplies of scrap, steel makers have been forced to use proportionately more pig iron; calculated on a daily basis, the output of pig iron rose by 4.2 per cent. between March and April, from 19,471 tons to 20,293 tons, while five additional blast-furnaces were put into operation during the past month. Meanwhile, there are no indications of a lull in the demand for steel. On the contrary, the latest reports from the principal centres

of the industry suggest that demand may continue to expand. The revival in the commercial section of the ship-building industry, for example, has given a further stimulus to consumption.

Whale Oil Strategy.—One of the weakest points in Germany's armour is the deficiency of fats, which contributed materially to her defeat in 1918. Despite great efforts to eliminate this deficiency, the annual fat deficit for food alone is estimated by Professor Karl Brandt, now of the Food Research Institute, Stanford University, at some 400,000-450,000 tons. The soap industry adds a further deficit of nearly the same size. In seeking supplies from other countries, the Germans have been handicapped by the fact that their *Lebensraum*, however widely interpreted, cannot make good the deficit, which is bound to be a source of serious weakness in war. Storage on a large scale appears the only way out, and the advantages of whale oil for this purpose are great, as few other fats will keep in bulk for long periods. The Germans have, therefore, sought both to produce whale oil and to acquire supplies from others, and in certain years they have taken a large proportion of the available world exports of whale oil. During 1937-38 their own catch yielded 90,000 metric tons and they acquired a further 107,000 tons from Norway. In 1938-39, however, world production dropped, and there is reason to believe that German calculations were seriously upset, both by the lower yield of the German catch (84,000 tons) and still more by the unexpected action of British interests in buying up almost all the whale oil on the market. This action may be suspected of being not entirely unconnected with the Essential Commodities Reserves Act, under which the Government is known to have bought whale oil last year. The practice of Government bulk purchase, started by the totalitarians, seems to have reacted this time very much to the advantage of their opponents, and the choice before the German Government appears to be either to replace whale oil by other imports which cannot be got by barter, and which require precious foreign exchange, or to draw upon such reserves as are already stored with the object of eking out supplies in case of war. At a consumption of 20 kilograms per head, even a reserve of 100,000 tons would only feed five million people for a year, whereas the German deficiency is equivalent to the whole fat requirements of 20 million people a year.

U.S. Barter Proposals.—Negotiations between the British and United States Governments for the barter of American cotton and wheat for tin and rubber from the British Empire are now proceeding in London. On the American side, the problems are simplified by the fact that large stocks of cotton and wheat are already held by the American Government and could be shipped to this country at short notice. The British Government, however, possesses no stocks of tin and rubber, the supply of which is controlled by the international agreements. The Government cannot buy any large quantities in the open market, as this procedure would result in a major rise of prices and

would also seriously reduce stocks in this country, a most unwelcome development at this time of political tension. If the consent of the two international control authorities were obtained, the tonnage of tin and rubber involved could be accumulated by the absorption of surplus stocks at the mines and plantations or by a special quota, probably for Empire producers only. As the acquisition will not be a trade transaction in the strict sense of the word, the Government would certainly be justified in fixing certain maximum prices which are nearer to production costs than current market prices. Even so, the transaction could be of great value to the tin and rubber producers of the Empire, provided guarantees could be obtained that, when the barter agreement was concluded, the stocks would not be allowed to disturb the free market; a similar guarantee would no doubt be required from the British Government in regard to the wheat and cotton it would thus acquire.

Department Stores in 1938.—The main topics discussed in the annual report of the Retail Distributors' Association for 1938 are the decline in trade, the progress made towards the regulation of wages and working conditions and the need for preparations for an emergency. The downward trend in the total value of department store sales, which began in the autumn of 1937, continued during the past year; by the end of 1938 sales had fallen back to the level prevailing in the spring of 1936, though the decline from the peak of 1937 was less than 5 per cent. There have been marked geographical variations. In Central and West End London, for example, sales showed a sharp decline; in provincial England and Wales, on the other hand, turnover showed little change, while in Scotland it actually continued to expand. An index measuring changes in the volume of total department store sales, calculated by adjusting the value of sales by means of a price index which will be published later this year, shows that the volume of turnover began to decline towards the end of 1936, i.e. almost a year before the value of sales took a downward turn. Moreover, like the value of turnover, its volume declined throughout 1938. In February, 1938, the conference of employers' organisations and trade unions in retail distribution submitted to the Minister of Labour a unanimous report recommending the establishment of statutory machinery for the regulation of minimum wages, hours and working conditions. As certain features of the scheme were criticised by the Ministry of Labour, an amended plan was submitted in February this year, and the report strongly recommends its adoption by the Government without further delay. So far as preparations for an emergency are concerned, the Council of Management of the Association appointed a special War Problems Committee at the beginning of this year to consider the steps necessary for preventing a serious interruption in the services of the department stores.

Government Cotton Contracts.—The methods adopted by the Government in placing contracts for the National Services have recently come in for a good deal of criticism in Manchester. The Government has now invited Sir Frederick Marquis, chairman of Lewis's, Ltd., to act as honorary adviser to the War Office on the production of clothing and textile stores generally. Sir Frederick is about to open an office in Manchester which

April 17	1,644	81.5	1,343	...	11,685	112½

April has been fairly widespread and was by no means confined to the industries on which defence expenditure is chiefly concentrated. For example, there has been quite a marked improvement in some of the consumption goods industries, and the volume of retail trade in recent months has been higher than a year ago. Some of the export trades have also experienced an improvement, reflected in the rise of 3 per cent. in the volume of domestic exports between the first quarters of 1938 and 1939. In a large measure, however, the revival of the consumption goods trades is a direct consequence of the increase in employ-

THE ECONOMIST BY AIR

To meet the growing demand from overseas readers for The Economist by air, special subscription rates have been introduced applicable to those countries to which Letter Mail is now normally transmitted by air. These are as follows:

	12 months		6 months	
	£	s. d.	£	s. d.
Europe	4	17 6	2	8 9
Empire Air Routes	6	10 0	3	5 0

These rates include all supplements, but the latter will be sent by the surface routes and not by Letter Mail.

Unexpired subscriptions may be transferred to the new category on application to

will act as a clearing house for the Government and the cotton manufacturers. He will have the assistance of a panel of six industrial advisors. There have been complaints of Government contracts being secured by agents, and it is being urged that all orders should be given direct to manufacturers. A substantial part of the weaving machinery in Lancashire is now engaged in producing khaki drills, ground sheets, tent cloths and other military supplies, but some manufacturers appear to be handicapped by the shortage of competent operatives.

* * *

Activity in the Shoe Trade.—During the last few weeks there has been a steady increase in activity in the boot and shoe trade. After a period of stagnation in the autumn, the flow of commercial orders was resumed in the early spring; the percentage of insured workers unemployed in the boot and shoe trade declined from 10.9 in December to 8.5 in March, when it was considerably less than in March, 1938. There was a small increase in the numbers unemployed in April, due probably to extensions of the Easter holidays. The increase in orders has naturally been welcomed by shoe manufacturers, but since the bulk of the trade has been concentrated on the cheaper footwear, where the retail price limit is rigid, and leather prices have been very firm, the profit margin has been small. Government orders for army boots have kept some sections of the trade busy, and the prospect of conscription has led to a considerable speculation in the heavy types of shoe leather which are necessary for work on army contracts. The operations of the Sole Leather Tanners' Association (whose formation

March	65	78	65	69
April	67	75	64	69

was recorded on page 503 of *The Economist* of December 3, 1938) have reduced the stocks of leather which overhung the market during the early part of 1938, and consequently supplies of heavy weight bends are at present scarce and prices have risen sharply. The latest indices of pelt prices compiled by the United Tanners' Federation refer to the end of April; they show a rise in the prices of pelt from English hides which has offset in the combined index the effects of lower prices of pelts from other hides.

* * *

Problem of Sugar Supplies.—During the past few days the Executive Committee of the International Sugar Council has been considering the problem of releasing additional supplies of sugar. It will be remembered that in July last the Council estimated the requirements of the

free market at 3,170,000 metric tons, and the export quotas then in force, when reduced by 5 per cent., provided a total of 3,498,000 tons. In order to balance the estimated supply and demand, various countries made voluntary surrenders of their export quotas amounting to 228,375 tons. The very poor yield of the European beet and the Indian cane crop, the failure of some countries to export all their quotas and the accumulation of large emergency stocks by Governments have combined to cause a shortage of supplies in the current season which is estimated at about 225,000 tons. As a result, raw sugar prices have risen from 6s. 4d. per cwt. at the end of December to 8s. 4½d. this week, and this rise, coupled with the higher duties, has now been reflected in higher retail prices. The British Government is believed to be urging the Sugar Council to provide additional supplies immediately. But only one producing country, Cuba, has a substantial surplus of sugar at the present moment, and the allocation of an extra quota of about 225,000 tons to one country is likely to cause difficulties among the members of the International Sugar Agreement. But immediate action is necessary, and as supplies of sugar are available the British consumer should not be penalised by unnecessarily high prices for an essential foodstuff.

* * *

The Indian Tariff Board on Sugar.—The Indian Government has at last made public the reports of the Tariff Board, dated December, 1937, on the future of the protection accorded to the sugar, paper and magnesium chloride industries. The Board, after noting the rapid development of the Indian sugar industry, pointed out that the situation on the sugar market had been completely transformed in the past few years, firstly by the International Sugar Agreement, which limited world exports, and, secondly, by the appearance of over-production in India. The Board stated that the progress made in manufacture since 1930-31 has been satisfactory, but total production costs still average more than Rs. 6 per maund of sugar produced, while Java sugar could be landed at Indian ports at a price of about Rs. 2.7 per maund. Taking into account the generally inferior quality of the Indian sugar, the Board consequently recommended that the existing duties of Rs. 7.4 per cwt., plus the excise duty of Rs. 2 per cwt., should be continued. The Government have, however, reduced, for a period of two years from April 1st last, the import duty by 8 annas per cwt., on the ground that the high prices for sugar now ruling on world markets makes a continuation of the previous rate unnecessary. The Government also proposes that another inquiry on the industry's prospects should be made before the expiry of the two-year period.

* * *

—And on Paper.—The Tariff Board also recommended a reduction in import duties on imported wood pulp and on those types of printing and writing paper which were given protection in 1931-32; and that the lower rate of duties should be stabilised for seven years. The Board noted that the Indian output of paper increased from 40,558 tons in 1931-32 to 48,531 tons in 1936-37, but this growth has barely kept pace with the increase in consumption, which is still more than double the home output. The technical progress of the industry has been rapid, and increasing use has been made of indigenous pulp, which supplied in 1936-37 three-quarters of the pulp used. The Government considered that the industry was sufficiently well established to withstand greater competition, and has fixed from April 1st the import duties on the protected classes of paper at 9 pices per lb., a reduction of 2 pices per lb. on the Tariff Board's proposed rates; the duty on imported pulp has been reduced from Rs. 45 per ton to Rs. 35 per ton or 25 per cent. *ad valorem*, whichever is the higher. These lower duties are to remain for three years only, in the place of the seven years recommended by the Board.

INDUSTRIAL REPORTS

THE latest reports from industrial centres point to further expansion in the activity of many industries. There has been a remarkable change on the coal markets, especially in South Wales. Only a few weeks ago the problem was to find outlets for production; now some districts are finding it difficult to meet current demand in full. The demand for steel also remains heavy. As our Cardiff correspondent points out in his report, the tinplate industry is handicapped by the scarcity of steel bars. The volume of new business in cotton textiles has not been heavy, but output appears to be well maintained. In the wool textile trade the cross-bred section, engaged on heavy khaki orders, is very busy, but civil demand for men's and women's fabrics is also expected to improve with the increase in employment and purchasing power.

Coal

Sheffield.—The market is strong, with a marked demand for industrial fuels. Works and public utility undertakings are acquiring considerable emergency stocks. Some collieries are almost fully sold in graded steams. Household coal moves more freely than is customary at this time of year. Merchants have received notifications from some collieries of reduction of 1s. 8d. per ton in the pithead price of most grades of household coal. Blast-furnace coke is in steady demand. Federated coke-makers' prices for patent-oven and graded coke for works and central heating are unchanged, but lower prices are mentioned for non-federated coke.

The improvement in the export market is maintained, with a fair volume of forward business. All grades of steams are in request, and cobbles and washed trebles are not easily obtainable in full quantities. The general level of prices is unchanged.

*

Newcastle-on-Tyne.—The North-East coal market, home and export alike, continues very firm and collieries are quite unable to meet the increasing demand for prompt large steams and industrial coal. It is evident that despite seasonal influences collieries will be fully occupied over the summer months. Prices are now tending to rise: Northumberland large coal of the better qualities has been advanced from 18s. 6d. to 19s. per ton, whilst Durham coking and bunker fuel commands a price of 19s. 6d. Patent oven coke is a firm market; export demand is particularly good.

*

Glasgow.—The Scottish trade remains active. Precautionary buying is still a feature of the shipping trade, and it is reported that buying orders have come from shippers who have been unable to cover themselves in England and Wales. The majority of the shipping collieries are now fully booked up for the remainder of this month and well into June. The home market also remains busy. The week's shipments were 253,000 tons, and the total for the year to date is now 3,714,000 tons, against 3,437,000 tons

last year at this date. No important change has occurred in prices, but the trend remains firm.

*

Cardiff.—Owing to a less favourable tonnage position shipments in the foreign and coastwise trades at the South Wales ports dropped from 453,500 tons to 399,300 tons last week, but they were still nearly 70,000 tons greater than in the corresponding period last year. The position on the Cardiff market is unchanged. Inquiries are active, particularly for steam coals, and collieries are not only fully employed, but heavily stemmed for the whole of the present month. The pressure of work in the iron and steel industry has strengthened the position of all classes of industrial coals, and the improved foreign demand for patent fuel is maintained. Prices are very firm at a slightly higher level than in April. Current foreign inquiries include 100,000 tons of coke for Yugoslavia, 15,000 tons of duff for Germany, increased supplies of small steams for French patent fuel manufacturers, and prompt steam coal cargoes for the United States.

Iron and Steel

Sheffield.—A high level of business is maintained on the iron and steel market, consumers showing greater readiness to place forward business. Stocks at works are declining despite heavier delivery specifications, and considerable eagerness is being displayed to replenish supplies. Business in foundry pig iron is good, and forge inquiries are much more numerous, while for basic iron there is an insistent demand. Both East and West Coast hematite is being well taken up, good contracts being placed. Although the position with regard to finished iron is by no means satisfactory, there is a rather better flow of orders to the bar mills, particularly for common and marked bars.

There is heavy pressure of business in basic steel billets, and some delay in delivery is reported. Wire rods, strip and bright drawn steel are in very active request, and structural steel requirements are now heavier than for some months past.

The market for iron and steel scrap is becoming more difficult, owing to the scarcity of supplies, particularly of basic steel and heavy foundry cast iron. Merchants are unable to accept all the business offering in these materials. Foundry cast iron fetches about 80s. per ton, and steelworks heavy cast iron about 62s. 6d. Heavy basic steel is quoted up to 59s. per ton.

*

Middlesbrough.—The fact that works are so busily engaged on Government orders has caused commercial users to realise that delay might be experienced in fulfilling their contracts and has therefore brought more buyers into the market.

Although the production of steel is being increased, quantities of semi-finished steel continue to arrive from the Continent, and it is understood that

supplies may be arriving in the Tees shortly from Australia.

There is still a very limited movement in the Cleveland foundry iron trade, although the shortage of iron scrap has brought more foundry owners into the market for pig iron supplies. The East Coast hematite position is improving slowly; current demand exceeds output. Heavy steel scrap remains very scarce and difficulty is experienced in getting sufficient supplies. Imports of foreign ore under existing contracts are maintained at about last month's levels. Blast-furnace coke is plentiful, although local consumption is increasing.

*

Glasgow.—Scottish steel works are taxed to the utmost to meet the many demands made upon them. Shipbuilders are now calling for fairly heavy tonnages weekly and, as work progresses on the large number of vessels now on the books of Clyde and other shipbuilders, pressure for this class of material will become greater. Users of semis are also making heavy demands. Re-rollers are all busy and obtaining maximum outputs from their plants, but are finding themselves handicapped to some extent by the difficulties of obtaining supplies sufficient to enable them to have reasonable stocks of material available. In almost every instance raw materials are being processed almost as soon as received at the works.

*

Cardiff.—The scarcity of steel bars is preventing the tinplate works from utilising fully the increased output quota under the pooling scheme, but the market is very firm and the unexecuted orders on makers' books now exceed five million boxes, representing nearly one-third of the current annual output capacity of the industry. Government orders are heavy but there is also an improved export demand, and for the unregulated market quotations are from 1s. to 1s. 6d. per box above the Cartel price. All the heavy branches of the iron and steel trade remain exceptionally active, but furnaces continue to be handicapped by the scarcity of scrap. A preliminary announcement concerning prices for the second half of the year is anticipated at an early date.

*

News from Abroad.—The steel demand on international markets for commercial and defence work has remained brisk. Although the political tension has relaxed, quite a number of consumers are anxious to build up stocks so as to be covered in case of emergency. Thus, Sweden has placed steel orders for air-raid shelters and is interested in much larger tonnages than for some time. The British demand for Continental semi-products and finished steel has further increased, and a supplementary quota of nearly 100,000 tons Cartel steel has been allocated, in addition to the regular supply under the agreement with the Cartel. South America, particularly Brazil and Argentina, has remained a keen buyer, all the more as Polish competition has diminished in these markets.

The Cartel has recently taken steps efficiently to counter American compe-

tion in several markets, as the recent negotiations with the American group have not resulted in a complete elimination of price cutting. The Comptoirs have now decided to abolish the price regulations for the markets of Japan, China and Manchukuo and to lower the prices for these markets by 5s. to 20s. (gold) per ton. It is noteworthy that this reduction goes substantially farther than the unofficial rebates hitherto granted in these markets. Although in other markets outside competition is less disturbing, similar measures to curb competition might be introduced elsewhere, if they are successful in the Far East. It remains to be seen what will be the reaction to these measures of those Cartel members who are opposed to price reductions and who are even contemplating increases in some uncontested markets.

Textiles

Cotton (Manchester).—Prices have tended to advance, partly owing to the rise in raw cotton and partly because of the increase in the production costs of spinners and manufacturers. Numerous buyers, however, have not had sufficient confidence to place orders freely. There is still much uncertainty about the Washington Government's ability to carry through the export subsidy.

It has been a disappointing week for spinners and sales have been comparatively small. Most of the demand has been for coarse American counts and medium Egyptian numbers. Some spinners have complained of poor delivery instructions.

There has been more activity in piece goods, but orders have been given out very unevenly. Further contracts have been placed by the Government in heavy materials, and most makers are now busy, production being fully sold up to the end of September. Healthy buying has continued to take place for India. Numerous orders have been secured for South America, certain Continental markets and the Dominions. Fair purchases have been made for the home trade. The number of unemployed in the cotton trade on April 17th was 70,097, 3,272 fewer than a month ago and 37,800 fewer than a year ago.

★

Wool (Bradford).—The outstanding feature of the third series of London wool sales was the call for medium crossbreds, especially slipes for khaki. Wools, especially of 46-48's quality, have been in exceptional demand and realised from 10 to 15 per cent. more than at the close of the March series. While other wools did not register a similar advance, all qualities sold very freely, and the carry-over was exceptionally small.

The marked improvement in employment throughout the country is paving the way for a much better civilian demand for men's and women's fabrics than was expected six to eight weeks ago, and this is causing a larger quantity of machinery to be employed in both the woollen and the worsted sections. The most disappointing feature is the relatively low prices of merino wool and its products, for these are still selling at prices considerably below current production costs.

THE COMMODITY MARKETS

ALTHOUGH the upward movement in the prices of primary products did not go much further in the past week, numerous commodities were dearer on Wednesday than a week ago. The four principal non-ferrous metals, for example, were all marked up a little in price on a slight improvement in demand. The market in rubber also showed a firmer tendency and interest on the market is now centred on the meeting of the International Rubber Regulation Committee on May 16th, when the quota for the third quarter of this year is expected to be announced. Raw cotton prices have been irregular, but the tendency was upwards. Wheat has remained firm, but raw sugar prices have not risen further; the raw sugar position is discussed on page 390.

In the United States prices continued to advance. Moody's index of the prices of sensitive commodities (December 31st = 100) rose from 141.7 to 143.8 during the week ended last Wednesday.

Metals

Copper.—The market was comparatively quiet throughout the week and prices closed 7s. 6d. up at £42 1s. 3d. per ton. In the United States some of the leading producers reduced their price from 10.25 cents to 10 cents per lb. in order to stimulate demand further. Sales in America have been better of late and the new adjustment in the price should keep interest awake.

★

Tin.—Tin prices moved within very narrow limits this week and the standard cash quotation closed only 5s. higher at £225 10s. per ton. Buying by United States consumers has subsided and consequently the daily turnovers of the L.M.E. fell to low levels. The scarcity of spot supplies, however, continues to maintain the price level. A certain amount of interest is shown in the Anglo-American barter discussions, which are discussed on page 389.

★

Lead and Spelter.—Prices of both lead and spelter gained 5s. this week, lead closing at £14 12s. 6d. and spelter at £13 15s. per ton. There is a certain amount of demand for spelter for A.R.P. purposes and also the building trade shows greater interest in the two metals. On the whole, however, the state of the markets is not encouraging, as production still appears to be on the high side. In the United States stocks of spelter rose in April by 2,395 short tons to 130,380 short tons, due to the decline of nearly 5,000 short tons in deliveries.

Grains

WHEAT prices rose further in the early part of the week but with a slackening demand a reaction took place, which still left prices higher than a week ago. The May estimate of the United States Department of Agriculture places the coming winter wheat crop at 46,173,000 acres and 543.9 million bushels, a decline of 10 million acres and 142 million bushels compared with last year. Sales of Australian wheat and flour continued to be made to the Far East, and a considerable quantity of wheat has also been shipped to Spain from the Argentine. Plate maize is now being

shipped in large quantities, and in the absence of competition from America and the Danube region, prices have been well maintained, although a decline was noticeable in the middle of the week.

Other Foods

Provisions.—Colonial butters were reduced in price during the week, while Danish was unchanged. The trade in fresh-killed meat remains slow, except for calves, which sell readily together with chilled imported meat.

★

Colonial Produce.—Wholesale prices of refined sugar, after the previous sharp rise, have not altered in the past week. The futures market for raw sugar has remained steady for near positions, but there was a fall in the quotations for December delivery from 6s. 7½d. to 6s. 3d. per cwt.

★

Fruit and Vegetables.—The warmer weather has stimulated the demand for salad vegetables and for certain types of fruit. English and French forced strawberries are now arriving at Covent Garden in small quantities. Trade in oranges remains slack, pending the arrival next week of the new South African crop.

Miscellaneous Commodities

Oils and Oilseeds.—A much improved tone has appeared in the markets for both seeds and oils, as buyers have come forward for considerable amounts. A good business has been done in linseed from Calcutta and Bombay at rising prices. Plate linseed has sold freely to the Continent, and Egyptian cotton seed is noticeably dearer, due in part to the rise in freights. Practically all classes of vegetable oils are dearer in sympathy with seed prices.

★

Rubber.—The market remains lifeless, although the tone is steady; only minor fluctuations have taken place in prices and standard sheet on the spot closed on Wednesday ½d. higher at 8d. per lb. The Regulation Committee is meeting next Tuesday.

★

Furs.—The London general spring fur sales have now come to an end. The position in the closing week was more or less unchanged compared with the preceding week. The following table gives the prices (in shillings and pence per skin) of leading furs at the Hudson's Bay Company's recent sales:—

COMPANY MEETINGS

MARKS AND SPENCER, LIMITED

MR SIMON MARKS REVIEWS THE PROGRESS OF THE BUSINESS

IMPROVED VALUES IN MERCHANDISE

94 PER CENT OF MANUFACTURED GOODS BRITISH MADE

CO-OPERATION WITH SUPPLIERS

CAREERS OPEN TO EMPLOYEES

The thirteenth annual general meeting of Marks and Spencer, Limited, was held, on May 9th last, at Winchester House, Old Broad Street, London, E.C., Mr Simon Marks (chairman and managing director) presiding.

The Chairman, in the course of his speech, said:—
The net profit for the past year amounted to £1,782,000, an increase over last year of £179,500.

ALLOCATION OF PROFITS

After deducting income tax, National Defence Contribution and dividends already paid there is left an available balance of £1,099,800, which the directors recommend should be appropriated as follows:—

	£
Transfer to staff benevolent and pensions fund ...	25,000
Debenture redemption fund ...	12,500
Properties contingency reserve ...	93,000
General reserve account ...	342,200
Payment of a final dividend on the ordinary and "A" ordinary shares at the rate of 27½ per cent., thus making 42½ per cent. for the year ended March 31, 1939 ...	528,600
By carrying forward to next year's accounts ...	98,500

ISSUE ON BONUS TERMS

The directors further recommend that £192,200 from the general reserve account be capitalised, and that a distribution by way of bonus be made to the holders of the existing ordinary and "A" ordinary shares of the company in the proportion of one "A" ordinary share for every ten ordinary and/or "A" ordinary shares held.

RESERVES

The general reserve will stand at £2,150,000, the whole of which is invested in the business.

The freehold properties depreciation reserve has increased to £313,000, and the appropriation of £93,000 will bring the properties contingency reserve up to £300,000. Freehold, leasehold and leased properties now stand at £8,849,000, a net increase of £854,500.

Furniture, fixtures and equipment, after depreciation, stand at the sum of £824,500, being an increase of £95,100.

Cash with the bankers and in hand stands at £935,000.

A REVIEW OF PROGRESS

There has been a progressive increase in profit each year. In 1927 it was £88,000, and this year £1,782,000.

In that period many things have changed—character and size of premises, the range and quality of the merchandise, and what is of the greatest importance, a personnel trained to deal with the manifold problems raised by the development of the business as a whole. We have acquired a goodwill amongst the buying public, based upon satisfaction in their dealings with us over a long period.

It has been our purpose to supply our public with the best values in material, design and finish. A real transformation in values has taken place due to our collaboration with many of the foremost manufacturers and producers of the country, with whom we are happy to say we maintain the most cordial relationship. Over 94 per cent. of the manufactured goods we sold last year were British made. We have put at the disposal of the producer a real contact with the consumer who purchases his goods, and, we have

given the consumer the advantage of the economies in production which spring from large-scale demand.

Our business is one which is mainly concerned with supplying the necessities of life to a vast consuming public, in wearing apparel, footwear of every description, and foodstuffs. To-day we are amongst the largest distributors of food in the country.

DEVELOPMENT

Our principal development in recent years has taken the form of increasing the size of existing units rather than of increasing their number. Your board is satisfied that this new class of store holds out corresponding possibilities for developing the scope and the activity of our business.

The increase of counter space is nearly 10 per cent. over the previous year. We now have a selling counter space measuring nearly 44 miles. During the year we opened ten new stores, including three removals, and have extended 23 existing stores. One unit has been closed. The total number of stores in operation is now 234.

The coming year's development at present deals with four new stores, two being replacements, and 20 extensions.

FINANCE

We have made arrangements to borrow up to an amount of £2,000,000. We have so far taken up an advance of £500,000, at a rate of interest of 4 per cent. The board may utilise a favourable moment to make an issue of share capital to replace the loan, but at present have no such intention. We are, however, taking up in the near future a further sum of £500,000 on the existing terms.

NATIONAL SERVICE

To date about 4,600 of our staff, that is to say some 25 per cent., have been trained in first aid or anti-gas, as wardens, fire fighters, or decontaminators. Each of our stores has been organised to meet an emergency in so far as medical supplies, fire-fighting and rescue equipment are concerned.

I think it is proper at this meeting to express appreciation of the public spirit which has induced so many of our employees to take up this most important work.

An expenditure of £20,000 has already been incurred in carrying out our present measures. Further obligations will devolve upon the company, which will necessitate the expenditure of considerable sums in the coming year.

In regard to recruitment for the Territorial Army, we have for some time past given every facility to those of our employees who have volunteered for service. We allow them the necessary time off for training and to attend camp with full pay, in addition to their normal holidays with full pay.

WELFARE AND STAFF

I have in previous years given some account of the welfare work carried out by your company for the benefit of its staff, which now numbers 18,500. All these activities have been maintained and extended. We attach the greatest importance to the general well-being of our staff. There has been a progressive improvement both in working conditions and wages, and working hours have been reduced to an average of 44 per week. Welfare work will cost the company £122,000 this year, as against £108,000 last year.

An organisation like ours gives opportunities for advancement to employees with the right capacity, not only to the male members

of our staff, but also to the women. In practice the vast majority of vacancies in the higher ranks are filled from people in the lower ranks. There is a real career open to those who possess initiative and ability.

The group life assurance and pensions fund provides for our senior employees a pension on retirement and protection for their families in the event of death or disablement.

I am glad to report that the staff benevolent fund is now carrying out some of the beneficent purposes which it was designed to meet. Voluntary pensions have been arranged for a number of our older and sick employees who have deserved well of the company by years of loyal and devoted labour.

I take this opportunity, on behalf of the board, of thanking each and every member of our staff for the devotion and loyalty which they have shown to the company.

Mr Marks then moved the adoption of the report and accounts.

MR I. M. SIEFF'S REMARKS

Mr Israel M. Sieff, B.Com., vice-chairman, in seconding the resolution, said:—

The results of the last year's trading are ample evidence of the

success of our development policy, and the benefits which have come from the close co-operation between the manufacturer and ourselves.

I want to take this opportunity of adding my expressions of appreciation to our suppliers for their readiness to work along those lines of mutual understanding. Without their active interest in our policy and methods it would be difficult to obtain the values which are essential to maintain the goodwill of our public.

I would like to join the chairman in his observations on the devotion of all ranks of our staff to the interests of the company, during a rather difficult year of international tension. We can congratulate ourselves on possessing a band of loyal workers, who look to our business for their future and their career, and who therefore are most anxious to forward the progress of the company.

The resolution for the adoption of the report and accounts was carried unanimously.

Resolutions were also passed re-electing the auditors and the director who retired by rotation, also approving the proposed capitalisation of reserves and the bonus issue.

It was announced that dividend warrants and allotment letters in respect of bonus shares will be posted on June 2nd to shareholders whose names were on the register of members on May 1, 1939.

happy event of war, make good to those employees, who might be called upon to serve with H.M. Forces, the difference between their salary or wages and the pay and other benefits derived by them while serving.

NEW MILL AT NEWCASTLE

During the year the new mill at Newcastle had been completed, and it was now in full production. In London an extension of 16,000 tons to the silos had just been completed, bringing the storage capacity at that mill up to 38,000 tons. Extensions and improvements were also being effected at the company's other mills, in accordance with the directors' policy to keep all mills and factories up to date in every respect.

In contrast to the previous year, the trend in the wheat market had, during the year under review, been in one direction, namely downwards. The explanation was that supplies had been in excess of demand, and it was noteworthy that the tension in international politics had had little effect on prices. On the other hand, the supply and demand position in the maize market had been far more evenly balanced.

Increased deliveries in the company's animal and poultry foods continued to provide ample proof of their popularity. Their cereal basis, including freshly home-milled wheat feed, provided an ever-increasing appeal to the enlightened feeder of to-day. Deliveries of all proprietary products had expanded during the year.

FOOD DEFENCE PLANS

Sir Norman Vernon, as a representative of the millers, had been intimately concerned from the start with the Food Defence Plans of the Government. The company had also been prominent in assisting the Government in the purchase of the reserve supply of wheat and in arranging to store it, and in spite of the wholly unwarranted statements which had been made, it was true to say that neither the company, nor the other millers concerned, had received any remuneration for their services. The company was happy to have been able to do their share in that work of national importance.

The Millers' Mutual Association, founded in 1929, which was designed originally to continue for a period of ten years, was, by the unanimous wish of the members of the Association, to continue until 1949. The provisions of the Wheat Amendment Bill, now before Parliament, had, after considerable negotiation in which the company's representatives had played a leading part, been agreed by the millers and the Government. During the year the wheat quota had been raised to the high level of 6s. 6d. per sack. That was due to the reduction in wheat prices, which involved the Wheat Fund in being called upon to make good a larger deficiency than ever before.

In October last, Mr Edgar Baker, the deputy chairman, who had been a director of the company for 35 years, retired under the age-limit rule, and his place as deputy chairman had been taken by Sir Norman Vernon. As a result of the acquisition of the ordinary share capital of Hosegood Industries, Limited, Mr. Laurence Hosegood had been appointed a member of the board.

The report and accounts were adopted.

SPILLERS, LIMITED

SIR MALCOLM ROBERTSON'S SPEECH

The Right Honourable Sir Malcolm A. Robertson, chairman of Spillers, Limited, presided at the annual general meeting of the company, on the 6th instant, at Cardiff.

Dealing with the accounts, he said that the increase in the issued share capital of the company had been occasioned by two factors, viz., the acquisition of the ordinary share capital of Hosegood Industries, Limited, and the issue of further co-partnership shares to the staff, in respect of the bonus for the previous year. On the assets side of the balance sheet there was a reduction in the cash balances, as compared with the previous year. He had explained in the previous year that that figure had been increased as a result of the decision to realise a portion of the company's gilt-edged securities, in view of the uncertainty of the political outlook, but that re-investment had commenced as conditions seemed then to have improved. Such improvement received a severe setback at the time of the crisis in September last, and the market had been subject to the effect of the recurring political crises since that time. Accordingly, the depreciation on the investments at January 31st was a little greater than that at the corresponding date of the previous year, and a further fall in prices had since taken place. That depreciation was, however, covered several times over by the investment reserve.

INVESTMENT POSITION

The substantial alteration in the amount invested in subsidiary companies was accounted for principally by the sale of the company's interest in the British Oak Insurance Company, Limited, and the purchase, already referred to, of the ordinary share capital of Hosegood Industries, Limited. The company's holding in the British Oak Company was disposed of on terms considered satisfactory by the board, and that company was now owned by the Union Insurance Society of Canton, Limited. The acquisition of the controlling interest in Hosegood Industries, Limited, had materially strengthened the company's position in the West of England and South Wales.

The trading profit for the year reflected an increase of some £64,000, as compared with the previous year, but the company had been called upon to bear for the first time the full effect of the National Defence Contribution, and the increase in the provision for taxation resulted in the net balance of £422,000, being only £11,000 higher than the previous year.

In addition to the heavy burden of taxation which the company, in common with other industrial enterprises was called upon to shoulder as the price of national security, it had now become necessary to spend considerable sums on Air Raid Precautions; and it had also been necessary to take such steps as would enable the company's business—an essential industry—to be conducted in the event of national emergency with as little dislocation as possible. At the same time the company had done everything possible to encourage and assist its employees to join the Territorial Army, or other organisations connected with National Service, and the board had announced that so far as lay in their power, they would, in the un-

MORRIS MOTORS LIMITED

Gross Profit £1,751,181

THE Thirteenth Annual General Meeting of Morris Motors Limited was held at Cowley, Oxford, at 10 a.m. on Monday, the 8th instant. Viscount Nuffield, the Chairman of the Company, presided.

The Secretary read the notice convening the Meeting and the Auditors' Report to the Members.

The Chairman said:—

The Report and Accounts for the year ended 31st December, 1938, have been in your hands for some days, and may I therefore presume that it is your desire that they be taken as read?

There is no change in the manner in which the figures in the Accounts have been set out. It enables them to be most readily understood and, therefore, as in previous years, I do not propose to comment upon them in any great detail.

TRADING PROFITS

The results of the year's trading are clearly shown, and in the opinion of your Directors are eminently satisfactory, bearing in mind the difficult conditions encountered during the year. These difficulties are so generally understood and appreciated that I think it unnecessary for me to enlarge upon them, but I would make a brief reference to a hindrance of a special and non-recurring nature.

During the year, two entirely new models were introduced into the programme of Morris Motors Limited, an 8 h.p. and a 10 h.p. In the earlier weeks of the production of these new cars, output was restricted by our failing to receive supplies of essential materials in the quantities anticipated. These shortages caused delays which are wholly reflected in the Accounts now under review, and the volume in which these two models have sold during the first three months of this year has created a new record for each class.

The net profit on Trading and Interest received for the year ended 31st December, 1938, totalled £1,357,220, after making full provision for depreciation and obsolescence of Assets, and all contingencies. In accordance with the Company's usual practice, investments in Government Securities and Corporation Stocks have been valued at the market prices ruling at 31st December, 1938. This has resulted in a depreciation of £75,218, which has been provided for out of Reserves for Contingencies. These Reserves, including those of the Subsidiary Companies, now stand at £395,950, a figure which the Directors are satisfied is sufficient to cover all contingencies.

I would also like to draw the attention of the Stockholders to the Consolidated Statement of Assets and Liabilities, from which it will be seen that the Reserves of the Group and the undistributed profits of Morris Motors Limited amount in all to £5,418,419, which, in the opinion of the Directors, is ample evidence that the strength of the Morris Group has been satisfactorily maintained.

CURRENT ASSETS

Last year I was able to draw attention to the excellence of the liquid position. It will be seen from the Assets side of the Consolidated Statement of Assets and Liabilities that the value of the liquid Assets has been more than maintained, being represented by the Market Values at 31st December, 1938, of investments in British Government and British Dominion Stocks and English Corporation Stocks, together with advances secured by First Mortgages on London Freehold and long Leasehold properties, the Company's holding in 44 per cent. Debentures in Pressed Steel Co., Ltd., and Cash; together totalling—£5,338,992.

I will next recount the Directors' proposals for the distribution of profits. It will be seen from page 10 of the Report and Accounts that the balance of profit available after adding the amount brought forward from last year, and after deducting Income Tax, National Defence Contribution and dividend on Preference Stock, amounts to £1,016,964.

To this sum of £1,016,964, the Directors recommend that there should be added £100,000 to be transferred from the Dividend Equalisation Reserve Account, making a total available for distribution of £1,116,964; out of which the Directors propose to pay a dividend of 45 per cent. on the Ordinary Stock, less tax at 5s. 6d. in the £, absorbing £864,562, and to carry forward to the next year the sum of £252,402.

I think you will agree that the Board were wise in their decision last year to create a Dividend Equalisation Account, as it has enabled them to maintain a 45 per cent. dividend declaration on the Ordinary Stock of the Company, in spite of the inevitable fall in profits due to difficult trading conditions.

SALES

You will recall that last year I made specific reference to the burdens which had been created by all-round increases in prices of materials and labour awards, and to the decision not to pass the whole of the burden on to the buying public, but rather, on the other hand, to improve our products by incorporating the Overhead Valve Engine and other attractive features.

Although our profit margin has been affected by this policy, I am glad to say that its adoption has fully justified our expectation that a

considerably increased demand for the Company's products would be stimulated thereby. The delivery figures for the first three months of the present financial year created a new record in the history of the Company, and I am hopeful, providing the international tension eases, that the Company will enjoy a greatly improved year in 1939.

Once again it gives me great pleasure to take this opportunity of extending our thanks and gratitude to a distributor and dealer organisation which has contributed very substantially to a satisfactory year's trading.

OVERSEAS TRADE

Despite the fact that the latter part of 1938 was an extremely trying period for any organisation interested in the world's export markets, I feel that it is a matter for congratulation that our Subsidiary Company, Morris Industries Exports Limited, held its position as the premier British Motor Exporting Organisation.

During the months which preceded the September crisis, we more than maintained the steady increase which has been enjoyed year by year, and, in view of the unsettled conditions during the last few months of 1938 our export sales for the year are particularly gratifying.

Given a year of peace in 1939, I think we have every reason to anticipate that the activities of our Export Company will again show a substantial increase.

This forecast is substantiated by my personal experience during the Empire tour from which I have just returned. Both the new Eight and the new Ten have received a splendid reception overseas, and it is manifest that our Dominions are displaying an increasing desire for home-manufactured goods, provided that such goods are suited to their requirements.

At this point, I would like again to record my very real appreciation of the welcome extended to me during my travels. The hospitality, kindness and helpfulness which were showered upon me by all with whom I came in contact will find a treasured and permanent place in my memory.

EMPLOYEES' SHARE IN THE COMPANY'S PROSPERITY

The Stockholders will, I feel sure, be pleased to hear that the disbursements made during the year to and on behalf of the employees under the "Holidays with Pay" and other Benefit Schemes exceed £115,000.

RILEY (COVENTRY) LIMITED

You will have observed from the Directors' Report that our field of activity was expanded during the year under review by the acquisition of Riley (Coventry) Limited. This old-established firm, the products of which have always enjoyed such well deserved reputation, will continue to trade under its former name and preserve its individuality. Mr Victor Riley remains the Company's Managing Director.

GENERAL

Having concluded my observations on the affairs of the Company during the past year may I make a brief reference to current matters. To my mind, nothing can be gained at the present time by obstructive criticism of the Government in its methods of grappling with a task which is perhaps heavier than any which has previously arisen in our country's history. Under a leader who has amply proved his entire ability to discharge the grave responsibilities with which his high office is loaded, our Ministers are deserving of the highest praise for what they have done and are continuing to do, and I feel that it is their right to be convinced that they can count upon the utmost goodwill and courageous co-operation from all of us in their efforts for the future of our Empire.

Once again I am desirous of expressing the Board's appreciation of the loyal and enthusiastic co-operation of all those charged with the administration of the Company's affairs, and by the Staffs and Employees of the whole Organisation.

Before moving the formal resolutions, I wish to refer to the grievous loss which I, personally, and your Company, too, have suffered by reason of the death of our Solicitor, Andrew Walsh. Mr Walsh, who was my own solicitor for many years, had been closely associated with the affairs of the Company from its inception. His attainments were such that his value to us was by no means confined to the legal work that he always so ably discharged, and I know that all my co-Directors, who knew him well, together with very many of the staff of the Organisation, will wish to associate themselves with this tribute to his memory.

I will now move:—"That the Report, Balance Sheet and Accounts presented to the Meeting be and they are hereby received and adopted."

Mr Oliver Boden, the Vice-Chairman, seconded the resolution, which was carried unanimously.

All the retiring Directors were duly re-elected to the Board and the Auditors, Messrs. Thornton and Thornton, of Oxford and London, were re-elected for the ensuing year.

MORRIS MOTORS LIMITED Cowley OXFORD

of many crudes was cut from 10 to 15 cents a barrel in spite of a substantial reduction in stocks. The results for the year 1938 of the leading oil companies in America clearly reflect the less satisfactory conditions which ruled in the industry throughout the year. Recently, the outlook appears in one respect to be a little more encouraging, inasmuch as crude oil stocks have been reduced to a level substantially lower than has been the case for a considerable number of years. On the other hand, there appears to be little inclination so far to restrict refinery runs to a level in better relation to demand, and while this condition persists it is difficult to make any confident prediction regarding the immediate future of the industry.

The oil profits and other revenue earned by Trinidad Leaseholds, Limited, during the financial year to June 30th last showed a decline compared with the previous year's record level, but they were, nevertheless, considerably in excess of any other former year. That company paid dividends amounting to 27½ per cent., or a reduction of 2½ per cent. on the previous year's distribution. Much of the very heavy construction programme which had been commenced two years previously was completed, and the new plants included in this programme were, with one exception, brought into operation by the middle of last year. I am pleased to say that sales of "Regent" motor spirits continue to be very satisfactory. The Tribunal constituted to investigate wage conditions in the Trinidad oil industry awarded certain increases in pay over and above those already given by the oil companies in 1937.

The production of the Cumarebo field of the North Venezuelan Petroleum Company was well maintained, and satisfactory profits were earned. As already stated, the company repaid capital to shareholders to the extent of 6s. 8d. per share. Considerable geological survey work was undertaken during the year.

Uramar Exploration Company, Limited, acquired the whole of the issued share capital of the Caracas Petroleum Company, and as a result of this fusion of interests operations have been considerably facilitated. The prospects of the company, which now controls a large area, appear to be promising.

As mentioned in the directors' report, the issued capital of Guarico Oilfields (Venezuela), Limited, was increased for the purpose of providing funds for further drilling. The results of the initial work so far accomplished have been encouraging.

ANGLO-SPANISH CONSTRUCTION COMPANY

The Anglo-Spanish Construction Company, Limited, was unable during 1938 to realise any of its Spanish Treasury Bonds, which are held in Madrid, and no repayment of debenture capital was made. The debentures remain 65 per cent. repaid. Railway services were maintained without interruption by the Santander-Mediterráneo Compañía. Revenue showed a substantial increase, and an appreciable surplus over working expenditure was revealed.

For two and a half years our interests in Spain have been carried on under war conditions. The war is fortunately now over, and General Franco's Government has been recognised by His Majesty's Government. In the difficult period of reconstruction ahead it is to be hoped that once again the maximum possible co-operation between our respective countries will be evolved and developed, resulting in mutual economic benefits and thus contributing in our view to political stability.

SANTANDER-MEDITERRANEO RAILWAY

The Santander-Mediterráneo Railway, in which we hold such a large interest, was from the first day of the war entirely in Nationalist territory. The service rendered by a reduced staff, handling more than twice the pre-war traffic, has been warmly acknowledged in all quarters.

You will remember that during the period of the Republic all our efforts were unsuccessful in obtaining any payment of the outstanding sums due for construction. We have a large stake in Spain. I can assure you that no effort will be spared to press our claims and to derive the benefit which in equity alone is due to us from the provision of an essential service.

A DIFFICULT YEAR

The year through which we have just passed has been a difficult one for business, and the outlook for the current year, while so many national and international problems remain unresolved, is necessarily obscure. The disagreeable fact remains, however, and will be well within your knowledge, that since the close of the last financial year there has been a further substantial fall in all classes of securities. Under existing conditions you will probably agree with me that it would be unwise, as indeed it is impossible, to forecast the future.

The report and accounts were unanimously adopted.

FORD MOTOR COMPANY LIMITED ANNUAL MEETING

AT the tenth ordinary general meeting of Ford Motor Company, Limited, held on the 9th instant in London, the Rt. Hon. Lord Perry of Stock Harvard, K.B.E., LL.D., in the course of his speech said: "It is the unanimous opinion of the board of directors that the extremely conservative policies they have consistently followed have proved to be fully justified and there is no one who could advance any unfavourable criticism regarding the up-to-date condition of the company's investment in buildings, plant and machinery and its capacity to maintain the position which is synonymous with the name of Ford as leader of advanced design and mass production."

As explained in the directors' report, it was considered desirable, mainly for geographical and political reasons, to transfer the activities of the holding company from Luxembourg to a less vulnerable environment. A new holding company has been formed in the Channel Islands and has acquired, as at the end of March, for £3,000,000 payable in shares, the whole of the assets and liabilities of the Luxembourg Company, excepting surplus cash and loan due from this company. The liquidation of the Luxembourg Company is nearly complete. The Guernsey Company will function as did the Luxembourg Company.

The gross trading profit for 1938 was £1,416,929, £160,617 lower than in 1937, of which decline £136,749 was attributable to the blast furnace and ancillary plant, and only £23,898 to automobile business. The net profit of £400,985, plus £912,994 carried forward, provides £1,313,979 available for distribution, subject to tax.

The light car maintains its popularity. Last year 88.2 per cent. of new cars registered in Great Britain were of 15 h.p. or under and, with the increased horse-power tax, it would seem certain that the percentage (but probably not the total) of small cars will increase still further in the future.

In October, 1938, we introduced the new 10 h.p. "Prefect." It made an instant appeal, and will, we believe, be an established favourite for some time to come. Our larger models continue to attract their special markets. The introduction of hydraulic brakes and development of stream-lining have been new and attractive features. Your company's products stand comparison with any in the market to-day.

A fortnight ago the British motor industry received a blow unparalleled in its history; I refer to the announcement of the new tax of 25s. per horse-power. This enormous increase in the already crippling burden of taxation cannot but affect the industry adversely. We will be relatively less affected than the makers of more powerful cars. The principle of assessing tax on the basis of horse-power is not only unscientific, but also unfair. Many of the best authorities believe that the law of diminishing returns will ultimately demonstrate the unwisdom of such opportunist taxation.

The year 1938 was not an easy time for the farmer, and our tractor sales showed a decline. We fully maintained our share of the commercial market. The proportion of our 4-cylinder units sold has increased, particularly among the heavier type of commercial vehicle. The company's sales of industrial engine units have largely increased. The average percentage of British costs in our entire range of vehicles is 95.2 per cent. Our "Eights" and "Prefects" are 99.9 per cent. British.

Our total exports in 1938 declined as compared with 1937; nevertheless there were some welcome improvements in certain markets. Our "Eights" and "Prefects" are assembled in Australia, New Zealand and Eire, and these markets have been well maintained.

If and when the present war clouds roll away, provided there is adjustment in the incidence of motor taxation and a rapid provision of adequate roads, all indications point to a great revival in our industry. Sales deferred in the past years of uncertainty will add momentum to normal replacement demands.

The report was adopted, and a dividend of 5 per cent., less tax, declared.

IMPORTANCE OF NYLON
LORD MCGOWAN'S REVIEW

The twelfth annual general meeting of Imperial Chemical Industries, Limited, was held, on the 11th instant, at Queen's Hall, Langham Place, London, W.

The Right Hon. Lord McGowan, K.B.E., D.C.L., LL.D. (the chairman), in the course of his speech, said:—Few of you will be without a clear impression of conditions at home in 1938. It was a year of trade uncertainty and political instability, culminating in the crisis last September. During 1938 world trade in general, and British activity in particular, received the backwash of the sharp industrial setback experienced by the United States in the closing months of 1937.

The channel of economic influence between the United States and the rest of the world lies in the great volume of raw materials which America consumes—some 40 per cent. of world exports in normal conditions. In 1938 the United States reduced her imports by no less than £225 millions below the level of 1937, and the sales to that country of the products of seven of the principal British countries overseas fell by £77 millions. Canada, Malaya, India, Ceylon, Australia, New Zealand and West Africa all lost heavily in purchasing power. It was not unnatural, therefore, that the United Kingdom exports to Empire countries decreased by £17 millions and to foreign countries by £33 millions.

REDUCTION OF EXPORTS

This fall was chiefly concentrated in the iron and steel industries and in textiles. Exports of cotton yarns and manufactures were almost £19 millions less; wool textiles nearly £9 millions smaller; and in manufactures of iron and steel there was a fall of nearly £7 millions. I may further note a decline of nearly £3½ millions in the exports of non-ferrous metals and their manufactures, and £2½ millions in chemicals, drugs, dyes and colours. Our own trade clearly reflected these conditions. It was also affected by the pronounced decline in the sales of motor cars, the registrations of private cars, etc., falling in the 1937-38 season by 14½ per cent.

The rayon industry was also depressed—home production fell by 11 per cent. These are merely examples of two major home industries which are considerable users of our products; but, interested as we are in almost all industry in the country, the general slackening off is reflected in the annual report which you have received. The explosives and metal groups benefited directly and indirectly from the Government's defence programme. The re-armament programme contributed to the maintenance of industrial activity in 1938, but our own direct participation, as I have said to you before, is comparatively small.

1938 ABROAD

In our export trade we have continued to experience many difficulties. There are still not lacking admonitions to British manufacturers to push and expand their export trade, but critics on these lines often forget the strict regulations of many importing countries. Licences to import or permits to acquire the necessary extrics. change for the remittance home of sales realisations are a constant barrier, not only to the expansion but to the maintenance of business. These documents, which can only be secured after compliance with a tangle of regulations, are often not obtainable at all because sterling exchange is not available, or, in other words, because the United Kingdom has not first bought a sufficient volume of the products of the country concerned. If this condition is not satisfied, no amount of sales effort is of any use. In short, exchange restrictions, quotas, clearing and payment agreements, continue to be the order of the export day.

THE SINO-JAPANESE WAR

Japan's competition in world markets has been materially affected by the demands on her domestic industries arising out of the Sino-Japanese war. As a consequence, our own exports have been on a higher level in many markets and have realised better prices. We are not inclined to regard this as a permanent phase, however, and expect to see the revival of Japanese competition in the near future. In Japan itself, the annual report records that our business has practically ceased. The trading capital that has thereby been released is, however, frozen in that country.

The war in China has reduced our business there by a half, and its continuance is likely to have further adverse effects. No one will doubt the necessity of upholding Britain's markets and interests in China against Eastern competition. The support which has recently been given by the credit guaranteed by the British Government has, I am sure, the entire approval of British concerns interested in that country. No doubt other means of assistance to a hard-pressed China can and will be found. They will be equally welcome.

The Civil War in Spain kept that market practically closed throughout 1938, while Palestine—almost another war area—gave us unsatisfactory results. In Italy, Roumania and Turkey, three countries with which the United Kingdom has clearing agreements, the slow progress of British purchases of their products puts a bar on the expansion of British exports unless more money is to be locked up in these clearings.

PROGRESS IN THE DOMINIONS

As last year, it is a relief to turn to the progress of our associated companies in the overseas Dominions. Canada was naturally affected by conditions in the United States, but did not suffer so severely. We were therefore well content with the results of our associated company there.

South Africa remained extremely active throughout 1938, so that African Explosives and Industries, our associated company, again had a good year. I paid a visit to South Africa in January and February, and had an opportunity on the spot of conferring with my South African colleagues on the board of African Explosives and Industries, Limited, on the future prospects of the company. I can assure you they are excellent in every respect.

Australian conditions generally remained very stable. The board of our subsidiary company there, Imperial Chemical Industries of Australia and New Zealand, was well satisfied with the year's results. Good progress is being made with the erection of the new alkali works at Adelaide, and work has commenced on a new synthetic ammonia plant. To provide in part for those developments, the Australian company last July made an issue of one million five per cent. preference shares of £1 each. It received a generous welcome from the Australian public.

India, in common with other primary producing countries, suffered last year from the fall in world prices for her products, with a consequential effect on the value of the rupee. On the whole, our exports to our subsidiary, Imperial Chemical Industries (India), Ltd., were satisfactory. That subsidiary promoted a new company there last March, which is now constructing factories in the Punjab and Bengal for the manufacture of alkalis. It has a capital of £697,500, of which £232,500 in preference shares was offered to and immediately subscribed by the public in India, with an option to subscribe at a later date £139,500 of ordinary shares.

From these facts concerning Argentina, Australia and India, you will gather that we have adopted the policy of enlisting the financial participation and support of local interests in our enterprise in these countries. It is mainly responsible for the increase of £1,093,000 in the "interest of outside shareholders," shown in the consolidated balance sheet. We believe this policy to be sound, and it is therefore one that we shall continue in the future as opportunities offer. National feelings, encouraged by Governments, have led these and other countries to insist upon the establishment of the chemical industry, rightly regarded as a basic necessity, within their own borders. Where we were concerned with the export of chemical products to such countries we have for some time recognised that when the demand had reached a point at which it was sufficient to justify the erection of a plant, it was wise to replace those imports by local manufacture. That step, however, has not been sufficient.

INCREASING BRITISH EXPORTS

Attention has been paid to methods by which British export trade can be increased, and rightly so, for depression in the export industries is the main factor in our heavy and serious unemployment problem. I would suggest that a bolder course might be pursued on export credit guarantees. The limits of liability have recently

company possesses very valuable estates, it is not hampered by debentures or preference shares, that its net cost per planted acre is much below the cost of replacement, that it has a very loyal and efficient staff, and its financial position is a strong one. Its own affairs were never sounder, and it has never been in a better position to benefit from any general improvement in the industries in which its capital is invested.

The chairman concluded by moving the adoption of the report and accounts.

Mr H. W. Horner seconded. A discussion ensued, and, after the chairman had replied, the motion was put and declared duly carried.

The retiring director, Mr H. J. Welch, was re-elected; the auditors, Messrs Turquand, Youngs, McAuliffe & Co., were re-appointed and the proceedings terminated with a vote of thanks to the chairman and directors, and also to the agents, visiting agents and staff in the East.

LICENSES AND GENERAL INSURANCE COMPANY, LIMITED

PROGRESS DESPITE DIFFICULT CONDITIONS

The forty-ninth annual general meeting of this company was held, on the 10th instant, at the registered office, 24, 26 and 28 Moorgate, London.

The Hon. Reginald Parker, the vice-chairman, who presided, in the course of his speech, said: It is satisfactory that despite international unrest we can point to progress for the period under review and realise that in totals we have gone beyond the previous year, both as to income and as to assets.

It will be subject for favourable comment to note that the number of policies issued in the life department during 1938 again exceeds that of 1937; the life fund shows a substantial increase. The evidences of 1939 so far mark a continuance of that progress.

In the fire account you will be pleased to see an increase of income of practically £8,000 and I feel confident in stating that a further advance will be seen in the coming year.

Of the personal accident account we can note a decided improvement. The employers' liability account has gone forward in income and in profit. Perhaps one might say a further word on the motor position. Here we show an increase of income, which is comparable with the increase shown for quite a number of years now, inasmuch as we seem to be able to make a yearly advance of a matter of £10,000. Claims are higher. Had it not been that several foreign agencies, formerly on very good behaviour, took the opportunity to make 1938 their bad year, the results would have been better. It is interesting to note that in spite of several years' successive income increase, the number of claims notified during 1938 actually reduced in volume. We are, therefore, able to view the future reasonably, and to express the thought that in this present year of 1939 we may see a fall in ratio.

There are two further factors in the accounts to which I must refer. One is marine, where in common with most underwriters a poor year has been experienced. We are advised that better results may be anticipated in respect of the 1938 and 1939 years of underwriting. We have nevertheless considered it wise to increase the fund by a transfer from profit and loss of £20,000 and so create a much stronger forward position.

The other matter is investment depreciation. The investment reserve, adequate last year, proving insufficient in 1938 with the added decline, we have brought into contribution a small portion of the general reserve.

With regard to the profit and loss, you will see the transfers made from the various revenue accounts. These bring in a resultant profit and loss balance of £26,184 12s. 9d., an equivalent of two years' dividend. The dividend will be the same as that paid for the last twelve years—a record of consistency which must be satisfactory to us all.

There is little more for me to say, excepting to register very definitely in your minds the confidence with which we view the future of your company. Despite the fact that the business world has been disturbed, we derive encouragement from the results of the opening months of the year, which lead us to believe that, with any degree of international comfort, 1939 should provide additional evidence of sound progress.

The report and accounts were unanimously adopted.

ALLIANCE ASSURANCE COMPANY, LIMITED

SATISFACTORY RESULTS

The annual general Court of the Alliance Assurance Company, Limited, was held, on the 10th instant, at the head office, London.

Mr Lionel N. de Rothschild, O.B.E. (the chairman), said that 1938 being the last year of the current quinquennium, the customary actuarial investigation of the financial position of the Alliance Life and Annuity Funds fell to be made as at December 31st last. The board had decided that the rate of interest to be assumed in the valuation of the life business should be 2½ per cent. instead of 3 per cent. as for many years past. In spite of the greater stringency in the method of valuation adopted, which included further strengthening of miscellaneous reserves, the opinion he had expressed a year ago that the results of the actuarial investigation would be quite satisfactory had been more than realised. A surplus of £2,461,112 was disclosed and a compound reversionary bonus of 38s. per cent. per annum had been declared on with profits policies in force on December 31, 1938. That was the same as was declared at the last quinquennial valuation, and in view of the difficult period, from an investment point of view, the still more stringent method adopted in the valuation and the substantial increase of the amount carried forward—from £223,337 to £354,812—he thought it would be agreed that it was a very satisfactory result.

The proportion of the profits in the life department accruing to shareholders amounted to £230,497, one-fifth of which sum, namely, £46,099, had been transferred to profit and loss account.

RECORD NEW LIFE BUSINESS

The new life business completed during the year amounted to £4,205,415, a record figure in the history of the company. That increase was due to a very large endowment assurance pension scheme.

The mortality experience was somewhat more favourable than in 1937. The premium income in the active Alliance Life Account had increased to £1,473,710 and the Alliance Life and Annuity Funds amounted to £22,508,744, an addition of £458,224 during the year.

In the Fire department the net premiums amounted to £2,211,252, being £35,152 more than in 1937. The claims, including contributions to fire brigades, had amounted to £769,148, being £23,359 more than in 1937, the loss ratio being 34 15s. 8d. per cent., which was extremely satisfactory. The result of the year, after increasing the additional reserve by £100,000, was a balance of £460,822, which had been carried to profit and loss account.

In the Accident department there had been a gratifying expansion in the business, the premium income amounting to £1,491,872, which was £65,116 larger than last year. The awards of damages to injured third parties were continually rising, and it was thought that the rates of premium would have to be increased.

The Workmen's Compensation business of the company had shown less favourable results than in the past, due in some measure to the increasing number of common law claims. The other branches of Accident business had shown satisfactory results, and there had been a welcome increase in the more profitable classes of business in that department. The surplus in the Combined Accident Account for the year amounted to £112,161. That sum, with interest, making a total of £175,903, had been transferred to profit and loss account.

MARINE POSITION

The Marine Premium Income was some £6,000 lower than in 1937. Hull premiums showed an increase, largely owing to the application of the Joint Hull Understandings. The position as regarded cargo business remained unsatisfactory, and it was hoped that underwriters would soon consider collective action to improve that business. The underwriting account for 1936 had now been closed and, after setting aside £11,585 to suspense account, the surplus, £73,355, had been carried to profit and loss account.

Turning to the profit and loss account, £100,000 had been allocated to reserve and £50,000 to the staff pension fund, and a slightly larger sum had been carried forward. In view of the many difficulties of last year, the results disclosed were extremely gratifying.

With regard to the assets, during 1938 they had experienced a further series of major international shocks, as a result of which practically no class of investment had been immune from depreciation. It was not surprising, therefore, that the margin between the market values and the book values of their Stock Exchange securities had again declined during the year; at December 31st last there was still a comfortable surplus.

The report was unanimously adopted.

CABLE AND WIRELESS, LIMITED

(The Operating Company)

FOUR MAJOR STEPS IN TWELVE MONTHS

MR EDWARD WILSHAW'S REVIEW

The tenth ordinary general meeting of this company was held, on the 18th instant, at Electra House, London.

Mr Edward Wilshaw, J.P. (chairman and managing director) said: My Lords and gentlemen, the results of the working of the company during 1938 show what is, in all the circumstances of that year, a very satisfactory profit of just over one million pounds. The dividend recommended is 3½ per cent., as against 3¼ per cent. paid last year, a difference of only £75,000.

The lower profit is mainly due to two causes, the reduction of rates on the introduction of the Empire flat rate scheme, and the contraction of world trade caused by disturbed international conditions. To gain a proper perspective, however, it would be well to look back to the years 1931 and 1932, when the profits were £75,000 and £80,000 respectively, as against the £1,000,000 this year.

The expenses show a reduction of £210,000, which is reflected in practically every item.

INCREASING EMPIRE TRAFFIC

The Empire flat rate was a big step designed to facilitate and develop Empire communications. Despite the fact that the introduction of the flat rate coincided with the beginning of a period of trade depression, it was followed immediately by an increase in the volume of Empire traffic practically everywhere, and this continued during a period when the volume of non-Empire traffic was falling. There seem, therefore, to be reasonable grounds for the belief that the flat rate scheme had the effect of diminishing the effect of trade conditions on Empire traffic, and it may be hoped that this in turn will diminish the effect of general world conditions on Empire trade.

It is gratifying to note also that since the commencement of this year this increase in the volume of Empire traffic has been more marked, and has shown a progressive increase each month, while decreases in the preceding year in respect of Empire/Foreign and Foreign/Foreign have been converted to an increase. In each of the first three months of this year the increase in the volume of Empire traffic was more than double that of the average for the eight months last year in which the Empire rates had been in force, and the traffic receipts for the month of March were only a few hundred pounds less than those for March, 1938, before the Empire rate was introduced.

EMPIRE FLAT RATE

Since the close of last year a further step has been taken by the introduction of a reduced Empire flat rate for Press traffic, which came into force on April 15th last.

These measures should help to stimulate those business and news activities which we already serve. There remains, however, the need to develop new sources of traffic which shall render us less sharply subject than heretofore to the effect of those recessions of world trade over which we can have no control, and in this connection the further step taken last week in introducing a cheap social message and introducing it by means of a free day was a phenomenal success.

Further, it should bring the component parts of the British Commonwealth of Nations nearer together and knit them more closely.

It is, of course, vital that the development of our service should keep pace with the wider facilities we are affording. Last September the company offered to install emergency wireless telegraphy and telephony sets at all cable stations within the Empire within its jurisdiction and where no wireless telegraphy or telephony existed. This equipment was also designed to communicate with ships at sea and aircraft. The company informed the Government that it was prepared to install these sets at its own cost and for use in case of emergency, provided the company was permitted to use them commercially.

These four major steps taken during the last 12 months have cleared and simplified a very complicated situation that had developed during a long period of years. Each of these steps is of major interest to our undertaking, and should also be of interest, since they will be of value, to the Empire as a whole and to each of its individual communities.

The relations with the Departments of his Majesty's Government and the Administrations overseas are of a most cordial character.

The report and accounts were adopted and the dividend was approved.

GUARDIAN

Assurance Company Ltd.

ANNUAL GENERAL MEETING— 8th MAY, 1939

Extracts from COLONEL LIONEL H. HANBURY'S Speech

LIFE DEPARTMENT

New life assurances were completed during 1938 for a net amount of £1,719,379 as against £1,815,725, for 1937.

Claims by death were substantially less than anticipated.

FIRE DEPARTMENT

The experience for the year was again very favourable. The net premium income amounted to £1,077,799, and the trading profit amounted to £171,642, representing 15.9 per cent. of the net premiums.

ACCIDENT AND GENERAL DEPARTMENTS

The net premium income for the year was £1,360,803, being £108,254 greater than for the previous year, and the trading profit amounted to £48,491, representing 3.5 per cent. of the net premiums.

MARINE DEPARTMENT

The premium income for the year amounted to £323,884 as against £330,753. After transferring £40,714 to Suspense Account in respect of 1937 claims, there was a loss of £10,886 which has been transferred to Profit and Loss Account. The fund at the end of the year was £527,888.

VALUE OF INVESTMENTS

Stock Exchange investments have been valued at or under middle market prices as at 31st December, 1938, less accrued interest, and at that time there was a margin in excess of a half a million pounds between the book values of these investments and their actual values.

PROFIT AND LOSS ACCOUNT AND APPROPRIATION

The balance on this Account is £207,713 after transferring £20,000 to Staff Pension Fund and £67,325 to General Reserve.

A dividend was declared of 11s. on each Ordinary Share leaving a balance to be carried forward of £109,129, as compared with £95,927 at the end of the previous year.

Changes have been made in the form of the Accounts. Interest and underwriting profits hitherto credited to the Fire, Accident and Marine Insurance Revenue Accounts are now carried direct to the Profit and Loss Account and the Additional Reserves in the Fire and Accident Insurance Revenue Accounts have been transferred to a General Reserve Fund, which, with the year's appropriations, amounts to £1,940,000.

ALL THE PRINCIPAL CLASSES OF INSURANCE TRANSACTION

ALSO

TRUSTEE & EXECUTORSHIP BUSINESS

Head Office:

68 King William Street
LONDON, E.C.4

YORKSHIRE INSURANCE COMPANY, LIMITED

RECORD LIFE BUSINESS

The annual general meeting of the Yorkshire Insurance Company, Limited, was held at York, on the 9th instant.

The Chairman (Lord Middleton) said that the year had unfortunately not brought about any lessening of our anxieties. We could, however, draw some satisfaction from the underlying determination of the people not to be stampeded but to preserve a calm judgment and support the Government in their efforts to bring about peacefully a more ordered state of affairs in the world.

Dealing with the life account, the chairman pointed out that the net new business secured amounted to £3,029,741, as compared with £2,855,127, and was again a record. The claims by death were higher, but the incidence of the claims was quite satisfactory. Notwithstanding the increase in the rate of income tax, the reduction in the net rate of interest on the fund was only 8d. per cent., whilst the management expenses ratio again showed a slight reduction. The life and annuity fund at the end of the year, after allowing £150,000 for depreciation of investments, amounted to £11,160,252, as compared with £10,780,646 at the close of 1937.

In the sinking fund account new policies were issued for £708,292, and the premium income showed a considerable increase, being £117,708, as against £68,290 in 1937. The fund at the end of the year was higher by £66,896.

The results in the fire account were again good. The loss ratio of 44.4 per cent., although higher than last year's ratio of 41.3 per cent., was still quite satisfactory. The profit was £120,702, and, apart from the exceptional record of 1937, was the best result for ten years.

Accident and general account premiums totalled £1,478,746, an increase on the previous year of £9,217. The underwriting profit represented 5.43 per cent., as against 1.62 per cent. in 1937.

The marine account premiums amounted to £437,201, an increase of £10,423 over those of the previous year. The amount of the fund at the end of the year was £594,026, being 136 per cent. of the 1938 premiums, and was more than ample to meet all liabilities.

The report and accounts were unanimously adopted.

JOHNSON & PHILLIPS, LIMITED

INCREASED PROFIT

The thirty-fourth annual general meeting of Johnson & Phillips, Limited, was held, on the 11th instant, in London.

Mr G. Leslie Wates, J.P. (the chairman), said that the figures for 1938 were not vastly different from those of the previous year. The profit was higher by some £4,500 at £205,638. The net profit was up by £7,700. The total income tax and N.D.C. paid during the year at home and in the Dominions had been approximately £50,000.

Last year he had debated at some length the question of their capital position and the relative merits of the policy of increasing their permanent capital or financing the business for the time being by bank overdraft. The crucial point was the Government's declared policy in relation to electricity distribution undertakings, and he understood that it was still the intention of the Government to proceed with their reorganisation. Accordingly, the board did not propose, for the time being, to make any issue of shares or debentures.

During 1938 they had been able to increase the output capacity of their engineering departments and might need to do so still further as the extra accommodation provided had already been overtaken. They had striven hard to maintain their export business and connections, and their overseas branches and agencies had been kept fully supplied.

Good progress had been made with their subsidiary electricity supply companies during the year. They now had 329 miles of high-tension line and 195 miles of low-tension line in operation. They had over 12,000 consumers, of whom 3,600 had been assisted with finance to enable them to wire their houses. The total of units sold during the year was in round figures 22,000,000. In 1934, they had had 5,944 consumers only, and had sold 8,600,000 units, so that it would be seen how substantially those companies had progressed during the last four years. He was glad to say that they were still progressing and putting on new consumers every day. Both Westmorland and Ringmer were agricultural areas, where their lines had to be taken over very considerable distances to give supply to villages and farms. That reduced the return on capital, but they considered they had a duty to perform and did not look merely at the financial results of extensions. They had practically 300 arms connected—a very gratifying figure.

The report was adopted.

CALCUTTA ELECTRIC SUPPLY CORPORATION, LIMITED

NEW ISSUE OFFER TO SHAREHOLDERS

Presiding at the annual meeting of the Calcutta Electric Supply Corporation, Limited, held, on the 8th instant, in London, Lord Meston (chairman) said that progress had been continuous and satisfactory. In 1937 they sold 348 million units. Last year they reached 365 million, and added over 100 miles of cable to their distribution network. Strikes and other troubles had the effect of reducing the corporation's sales of H.T. power. Otherwise the market for both domestic and industrial supplies was steadily expanding.

The accounts showed a capital expenditure of over £1,000,000 during 1938, mainly due to the new Mulajore station, and that meant realisation of temporary investments and the opening of a bank loan account. Income from sale of current rose by £90,000, in spite of large concessions in rates. The net result was that their divisible profits were £13,000 better than in 1937, so that they were enabled to recommend payment of the same dividend, allocating £25,000 to general reserve and an equivalent amount to the retiring gratuity fund. Ample provision had been made for the losses in selling their temporary investments, which had suffered from the political situation. As for the future, they required more capital for completing their development programme as well as for a new and important extension to the south of Howrah. They could not look forward to quite the same scale of profits as in their most prosperous years. In their new super-station they had given a hostage to fortune. They had no doubt as to its wisdom, but the expenditure would not give its full yield for some years, and the same was even more true of their costly interconnecting system. Although, therefore, they had maintained a 10 per cent. dividend this year, they could not hope to recommend a higher figure than 9 per cent. next year.

It was their intention to issue 475,000 new ordinary shares within the next few weeks, to be offered at par to the ordinary stockholders in the ratio of one new share for every £5 of stock held. The new shares would be converted into stock and rank *pari passu*, qualifying for dividends paid in respect of the full year 1939.

The report and accounts were adopted.

CALCUTTA TRAMWAYS COMPANY, LIMITED

INCREASED TRAFFIC RECEIPTS

The ordinary general meeting of the members of the Calcutta Tramways Company, Limited, was held, on the 9th instant, at 1 Queen Victoria Street, London, E.C., Sir Geoffrey R. Clarke, C.S.I., O.B.E. (chairman of the company), said:

The working of the undertaking for the year to December 31, 1938, has resulted in a profit of £112,113, after setting aside £80,000 to the depreciation fund. During the year the traffic receipts have shown a steady increase amounting to £12,950, helped, to a certain extent, by the shortage of rain during the monsoon, which resulted in the stoppages due to floods being less than in a more normal year.

On some of our routes, during office hours, we are running 50 cars to the hour, and we are still unable to carry all the passengers wishing to travel on our trams, although there is no doubt that the tramway service we provide enables us to deal with the transport of the very large number of passengers more expeditiously and more cheaply than would be possible with any other system of transport.

The mileage of the system has remained almost stationary for many years, namely, 37.7 miles of double track; the number of passengers carried has increased in the last 10 years from 73 to 106 millions annually, and the car mileage from 7,950,000 to 10,170,000.

Under present conditions, therefore, it is obvious that we are reaching saturation point on certain routes, and no great increase in our receipts can be expected. The only relief to the travelling public must come from the provision of alternative routes, and to this end we have obtained the consent of the Corporation and the Government to the installation of tramways on the Upper Circular Road from Shambazar to Sealdah and on the new road being built by the Calcutta Improvement Trust from Ballygunge.

The expenses of the undertaking have increased by £12,852, mainly accounted for by the cost of electric current due to the additional mileage run and the operation of the coal clause in our agreement with the Calcutta Electric Supply Corporation. Wages also show a considerable increase, largely due to a new system of grading adopted during the past year in our workshops.

The report and accounts were unanimously adopted.

MID-EUROPEAN CORPORATION, LIMITED

MR NORMAN HOLDEN'S REVIEW OF THE SITUATION

The fifteenth annual ordinary general meeting of the Mid-European Corporation, Limited, was held, on the 9th instant, at Winchester House, Old Broad Street, E.C.

Mr Norman Holden (chairman) said: The percentage of our investments in Germany, including Austria, is now 15.97 per cent., as against 16.76 per cent. last year and 33.84 per cent. in 1930; our percentage in the remainder of Europe is 13.09 per cent., against 14 per cent. last year and 29.36 per cent. in 1930. The total depreciation in the combined companies, including losses written off in Lothbury Continental Company, is £965,508, as against £827,159 last year. About 61 per cent. of the increase in depreciation is attributable to a more stringent method having been adopted in valuing investments which are quoted on German bourses. Under present conditions it is impossible to arrive at what is the true value of our investments in Germany. Our net revenue this year is, after debenture interest and income tax, £51,452, compared with £54,485. We have earned 4.30 per cent. (gross) on the ordinary, as against 4.47 per cent. (gross) last year.

As to the general situation, the important influences seem to be, first, international politics, and, secondly, uncertainty as to the effects of the heavy increase in Budget figures and their incidence on profits and earnings. My view as to the first is that after many unfortunate misunderstandings on both sides Germany and Great Britain are now beginning to understand each other.

As to the second cause of unrest, viz., the uncertainty of the incidence of taxation, I would make a plea to Government spokesmen to make up their minds whether they believe in the profit motive in economics or the socialistic and communistic theory of the inherent wickedness of the profit motive system. If they would do this, we might be spared a series of slogans that seems somewhat incongruous. "The people of this country will cheerfully carry heavily increased tax burdens." "No increased profits through or during war." "We can rely on English investors subscribing large amounts of new armament loans." "Wealth will be heavily taxed."

The report was unanimously adopted.

BARRY AND STAINES LINOLEUM, LIMITED

DIVIDEND MAINTAINED DESPITE DIFFICULTIES

The ordinary general meeting of Barry and Staines Linoleum, Limited, was held, on the 9th instant, at the offices, 6 Old Bailey, London.

Sir John N. Barran, Bart., chairman, reviewing the principal events of 1938, a year of exceptional difficulties, referred to the passing of the building boom, a general though not severe decline of trade in this country, and a far more decided decline overseas, especially in the United States. No dividend had been received from Canada or France, in which latter country economic and industrial unsettlement had been pronounced. Trade in Czechoslovakia had come to an abrupt stop. Elsewhere in Europe exchange, licence, and quota difficulties had increased.

He continued: But by far the greatest adverse influence has been the general political uneasiness in Europe, which culminated in the events of September last. The company, in spite of these facts, had almost achieved the previous year's turnover, and the fall in net profits had been due mainly to smaller profit margins, the absence of the dividends referred to, and writing down of some main raw materials which had fallen in value during the year. The directors, after a full review of all facts and figures, recommended the maintenance of last year's dividend of 12½ per cent. on the ordinary stock, after providing for a bonus to employees and drawing £15,000 from the carry-forward. This was amply justified by the financial strength of the company, especially the completion of the special reserve of £100,000, increase in the carry-forward by £20,000 in the previous four years, available for dividend equalisations, and the expansion of reserves and profit and loss balances by no less than £433,000 in the last six years.

The Kirkcaldy company was co-operating with others in the production, on a large scale, of anti-gas-proofed clothing, which would be distributed by British Protective Clothing, Limited, Manchester, and would in every respect be up to Government specification. The Runnymede Rubber Company was extending its activities, and had provided the flooring for the British Pavilion in the New York Exhibition.

The report and accounts were adopted.

F. FRANCIS & SONS, LIMITED

DIVIDEND INCREASED TO 10 PER CENT.

The thirty-eighth ordinary general meeting of F. Francis and Sons, Limited, was held, on Thursday, 11th May, at Southern House, London.

Mr John Ismay (the chairman), who presided, said:—I would like to point out that whilst this is only our second annual general meeting as a public company, 1939 is actually the seventieth anniversary of the inception of your business, which was founded originally by the father of your two present managing directors, and the history of your company shows a steady expansion over the whole of this period; and it was due to this continued expansion, both of your company and its wholly-owned subsidiaries, The Defiant Crown Cork Company, Limited, and The Defiant Enamelled Tile Company, Limited, that it was necessary to convert the company into a public one, in order to provide the necessary capital to enable further factory accommodation and the installation of additional plant and machinery to be carried out. These extensions have now been completed, and whilst the benefit of part of them are reflected in our accounts, in the case of the subsidiary companies, owing to delay in delivery of the plant, they did not get into regular work until close upon the end of their financial year and, therefore, derived no benefit, but actually suffered considerable inconvenience during the period under review.

We have every reason to be satisfied with the results of the past year, particularly in view of the exceptionally difficult trading conditions, of which you are all aware, due to circumstances over which we have no control. In proposing to increase the dividend to 10 per cent., we are still only distributing about 75 per cent. of the profits available for the ordinary shareholders, earned during the year, and we are increasing our carry-forward by nearly £5,000, after providing the necessary tax reservations.

With regard to the future, it is still impossible to forecast what may happen, but I am pleased to say that up to date the turnover, both for the parent company and the subsidiary companies, shows an increase over the corresponding period of the previous year and, unless anything untoward happens, we can confidently expect at least to maintain the dividend at the present rate.

The report was unanimously adopted.

ANGLO-AMERICAN DEBENTURE CORPORATION, LIMITED

The forty-ninth ordinary general meeting of this company was held, on the 11th instant, at Winchester House, London.

Mr Richard S. Guinness (the chairman) said that the immediate effect of the fateful events of the past year was only too apparent. Confidence and enterprise, so essential to well-being and progress, had been undermined. Capital expansion had been negligible, while profits and dividends had been restricted and a further general fall in the level of market values of securities had resulted. It was with satisfaction, therefore, that the Board was able to record the maintenance of their income over the past year. That, together with the fact that the average fall in the value of securities they held had been limited to under 4½ per cent., justified the statement that their investments were well spread and well selected.

Their gross revenue amounted to £147,407, an improvement of £559. They recommended that a final dividend of 8 per cent. on the ordinary stock be paid, making a total dividend for the third year in succession of 12 per cent. They were adding £3,760 to the carry-forward to bring that figure up to the substantial amount of £57,273.

The sources of their income were much about the same as in the past year. Over 60 per cent. of their total revenue was derived from fixed interest securities. Almost 62½ per cent. of their total revenue came from their holdings in the United Kingdom.

Markets had been so much influenced by political storms that quotations hardly reflected the intrinsic merits of a security. Thus the opportunities to vary their investments had been few but, when practicable, they had reduced their holdings in foreign fields and re-invested chiefly in the United Kingdom and in a small way in Canada, India and Africa. Their cash balances had increased, so that their resources were ample to take advantage of any improvement in the situation.

The report was unanimously adopted.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to the Reporting Manager of THE ECONOMIST, 8 Bowyer Street, Fleet Street, London, E.C.4.

Britain's Docks

In the above diagrams the amount of wet docks available (indicated by horizontal shading) is expressed in acres on a relative small scale, while the dry dock capacity (indicated by black shading), being expressed in feet for each dock, is made to bulk disproportionately large by comparison. This has been done, not only for convenience of representation, but also because of the key importance in any assessment of the capacity of British docks of the amount and location of dry dock space available. But it should be remembered that the acreage of wet docks is, of course, very much larger than that of dry docks.

Finance

GOVERNMENT RETURNS

For the week ended May 6, 1939, total ordinary revenue was £13,486,000, against ordinary expenditure of £32,640,000, and £245,000 issued to Sinking Funds. Thus, including sinking fund allocations, the deficit accrued since April 1, 1939, is £54,364,000, against £38,634,000 a year ago.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest securities allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

Security and Peace

THE immediate international outlook is still obscure, but the outlines of policy for all peace-loving Powers are crystal clear. It is their first duty to make themselves strong by arms and alliances to resist fresh aggression. Yet this is only the beginning of wisdom, for the goal is not war but peace. It is a double step that is needed: to mobilise all resources to be ready for the menace that cannot be set aside simply by hope and persuasion; and, at the same time, to work out a plan for peace which will meet the rightful needs of all nations with equity.

These are the focal points of a new book by Sir Arthur Salter.* It is necessary for the working of Parliament that its Members should be party politicians. It is the only convenient device for the registration of broad shades of public opinion. But it is none the less a saving grace that occasionally there can come to Westminster men of detachment and independence. Sir Arthur Salter is an independent Member, a liberal scholar and a skilled administrator; and he can speak freely and fairly the mind of those critics who in the past few years have seen the fatal consequences of the Government's indifference to realities and have counselled the very policies which have now been forced upon the Government by the pressure of facts.

It is a strange and not very encouraging fact that, at a time when a complete revolution in British policy is required—and, with the Peace Front and conscription, in-

disputably begun—the men to execute the new programme should be, so to speak, the Bourbons themselves. Only two months ago, the Government's own policy was swept away by the wind that blew out of Bohemia. Yet it is Mr Chamberlain's Government unchanged that is now to put into practice their critics' programme. Public opinion has prevailed in a very odd manner. In default of a new Government, a new policy has been pressed upon the old one; and it is perhaps a victory for the unfettered criticism that is the essence of Parliamentary democracy that such a recantation has been possible. But it is a *pis aller*: new measures need new men and new methods; and it is precisely to the drafting of this programme that Sir Arthur Salter, with no party ties, brings the weight of authority.

The twofold needs of the present situation, preparedness and peace, are Sir Arthur's theme. It would be hard to dispute the main outlines of his platform for preparedness. Logically, he asks what have been the faults of the past few years. First and most important, there has been the personal disinclination of successive Ministers to realise the danger that has arisen in Nazi Germany. It is a sorry story, beginning with the procrastinations of Mr Baldwin and ending with the lack of vision that has hitherto characterised the Government who still enjoy office. It is a tale of men in authority hiding all that is unpleasant; a story of men of eminent talents becoming the victims of their own persuasions that all might yet be well; and of

* "Security." By Sir Arthur Salter. Macmillan. 390 pages. 8s. 6d.

the unwillingness of Ministers and, above all, of the Prime Minister himself, to pay heed to the honest protestations of their critics. Mr Chamberlain has earned the credit of an honest, able and industrious governor; he has won, too, the reputation of narrow sight. It is precisely his reluctance to believe the worst of any but his Parliamentary opponents that has caused British policy in a crucial period to be moulded in a vacuum according to premises that were never sound. And it is a tribute to the insight and information of those very critics that he has been constrained to-day, at the eleventh hour, to turn to their advice to shape the programme that may yet save England and Europe.

The other failures of the crisis years have resided in methods rather than in individuals. It is over two years since the Government decided that the need to take precautions against hostile attack was imperative. Yet, throughout that time, the measures taken have been hamstrung by what Sir Arthur Salter calls "professional departmentalism." The Air Ministry, being a junior service without traditions, was denied the priority in supplies which was essential, if Lord Baldwin's pledge of parity in the air with Germany was to be realised. The provision of anti-aircraft equipment was slowed practically to a standstill because it was not a long-standing function of the War Office to provide for ground defence. Air-raid precautions were lacking in speed of development because the Home Office had no tradition of providing for them.

In sum, indispensable measures of security have, until the last two months' change of temper, been erroneously conceived and inadequately executed. There is time yet to make right this deficiency: great headway has lately been made and it is in proposals for achieving this end that Sir Arthur Salter's book carries greatest weight. His central point, and it is unquestionably true, is that modern warfare is fundamentally a contest between the economic resources and powers of organisation of contending countries. Preparedness is a task of wholesale economic adaptation; and to carry out this gigantic duty the appropriate machinery is needed. Sir Arthur asks for an Inner Cabinet to decide upon strategic needs and economic possibilities: and he rightly lays down that such decisions can only be made if the Cabinet is furnished, not only with the present Committee of Imperial Defence which combines all the traditions and jealousies of the fighting services, but also with a Minister of Defence to decide between sectional claims, an Economic General Staff to assess the resources and adaptability of the nation and a Ministry of Supply.

It is in the last suggestion that Sir Arthur touches the nub of the immediate problem. He calls for a full-blown Ministry of Supply because, when it is necessary, even at the outset, to turn more than a fifth of the nation's resources to the needs of defence and war, it is needful to co-ordinate and organise departmental needs, in order to make the most of the resources that are available. Sir Arthur's Ministry of Supply would do more than deliver the goods for a laggard War Office: it would standardise production methods; it would bring in new industrial capacity; and it would turn over existing plant to serve Government uses. In a sentence, it would do all those necessary things which the fighting services themselves, lacking technical knowledge and industrial outlook, are wholly unfitted to perform.

It is not possible to end proposals for the machinery of preparedness with an outline of new departments. Personnel, too, is important. It is Sir Arthur's view that the Civil Service should be reinforced with industrialists, with scientists, with professional men, with specialists of all kinds and with eager and adaptable young people. The complete re-shaping of our economy to the needs of war, the movement of population, the transfer of businesses, the protection of plant and property and the entire

reorientation of the ways and means whereby in peace-time the national income is won are tasks for all to share in different degree, citizens, statesmen and bureaucrats.

But it is not enough to describe the measures and the methods which are needed. At the end we come back to where we started, the need for persons in authority who can win trust and confidence in all quarters. It would be desirable and consonant with tradition that we should now have a National Government drawn from all parties to serve the common weal. The extremely small poll in recent by-elections shows how little interest there is in the party fight. But the stratification of political parties that has come upon British politics since 1931 makes a full coalition impossible. Sir Arthur Salter proposes a *via media*. He suggests that there should be set up a Committee for Public Safety, composed of a score or so of leaders of all parties and groups, to be consulted and informed by the Government in the making of policy. It is hard to see how this suggestion would in fact cut the knot fairly and effectively. Such a Committee would lack the first requisite of democratic rule, which is responsibility; and it is far easier to agree with Sir Arthur's further proposal that in default of a new Government some adjustment of the present one might ease the present impasse.

Yet, even if the plans were made, even if men and the methods to make preparedness real and effective were found, only half of the job would be done. It is peace that we seek. To live in a state of siege, which is what preparedness means, can only be a temporary and brutal state. It was the Athenians and not the Spartans who gave birth to Western culture, and we need, on top of these urgent measures for security, a constructive plan for peace. We need a peace policy to unite and inspire us, to enlist the sympathy and aid of other peoples and to influence the mind of the German people towards reason and understanding. Sir Arthur outlines such a plan. It is a programme which would deny the myth of encirclement; and it is one which would place in the forefront the rights of all nations, including the Reich itself. Its basis would be economic. It would recognise, too readily perhaps, Germany's pre-eminent place in the economy of South-Eastern Europe. It would recognise, too, that Germans have at least a right to equal entry through an open door into all the colonies of the world. It would recognise, finally, the obligation of our own and other Governments to give special aid to countries less fortunately placed in their quest for raw materials. It would pose the problems of colonies, of raw materials and of frontiers as world problems to be solved equitably by world conference.

It is not a plan that bears much obvious reference to present facts. It is not possible to make concessions to aggressor States without guarantees of good will, and no such guarantees are forthcoming. But it is by such a plan that the peace of the world and the future of civilisation will be designed. If guarantees can be gained from the nations that suffered humiliation and loss and ill-treatment in the post-war years, then it is the duty and the responsibility of the so-called victors in the last infernal conflict to avert the next by making plain their readiness to make concessions as open handed as the needs of the case require. The League of Nations, which fell among thorns, had two tasks: collective security and the revision of the *status quo* to meet legitimate grievances. It failed in both because of the sovereign inhibitions of its members. The tasks remain to be done. Collective security for the moment means defensive pacts and preparedness; we can do nothing else until substantial disarmament provides safety against aggression. But to redress grievances means generosity and fair play; and, before the temper of war-mindedness arises in our midst, it is needful that we should attach our honour and our interests to the fulfilment of this greatest of the world's present needs.

No Change in Palestine

THE statement of policy on Palestine that has been issued as a White Paper this week cannot be taken in isolation from its antecedents. This is its excuse and, at the same time, its condemnation. The burden of a perverse past weighs heavily on every line of it; and for these unhappy past twenty-two years of Palestinian history all parties in Great Britain must shoulder responsibility; for all parties, as they have handled the Palestinian problem by turns, have with one accord persistently refused to face the facts and to take action that has become increasingly difficult the longer it has been delayed.

The most unpleasant fact is that, under the stress of the war of 1914-18, we enlisted the help of both Jews and Arabs by making to these two peoples certain promises in regard to Palestine which were morally incompatible, even if they were technically reconcilable by a lawyer's ingenuity. The hair-splitting over the interpretation of the texts is still going on; the controversy regarding the Hussein-MacMahon correspondence is touched upon in the present White Paper; but these legal jots and tittles are of no importance by comparison with the moral crux; and the moral impasse at which we have arrived is now admitted in the Government's confession that the policy of the Mandate is, after all, unworkable.

Great Britain in Palestine has been caught out by succumbing to one of the characteristic weaknesses of the present age—and perhaps of human nature at all times. We have tried to adjust our morally incompatible commitments to the Jews in Palestine with our commitments to the Arabs at large by sacrificing the Palestinian fragment of the Arab race. Could not this poverty-stricken Arab community be doped with the economic prosperity which Jewish immigration would bring? And if the Palestinian Arabs did not, after all, show themselves amenable, could not so small, backward and weak a people be safely ignored, while the establishment of a Jewish majority in Palestine was carried through? In short, we invited the Palestinian Arabs to show their teeth if they could; and now they have duly turned nasty to the extent that is sufficient to push us into changing our policy. What is obstinately refused to the weak is tamely conceded to the militant. It is an Anglo-Arab version of the story of *Mein Kampf*.

The Jews rightly say that their reasonable expectations are disappointed by the new British statement of policy. For, while it is true that we did always take care not to promise to turn Palestine into a Jewish national State, we did at the same time give the Jews reason to believe that we were going to install them as "first-class citizens" of a Palestine which was to be managed primarily in Jewish interests, subject merely to certain minimum guarantees for the civil and religious rights of the non-Jewish part of the population. This Jewish hope is now blotted out. In face of the, now at last acknowledged, alternatives of seeking to expand the Jewish National Home indefinitely by immigration against the strongly expressed will of the Arab people of the country, or permitting further expansion of the Jewish National Home by immigration only if the Arabs are prepared to acquiesce in it, the British Government have now publicly opted for the second choice. True, they have qualified this decision by providing for a strictly regulated continuance of immigration over a further period of five years; but at the same time a limit is set, not only in time but in numbers. This additional immigration is not to bring the Jewish element in the population up to more than one-third of the total; and then, at some later date—if possible, within not more than ten years from now—Palestine is to become self-governing. In that event the Jewish community in Palestine, however carefully its minority rights may be safe-

guarded, will find itself in the unenviable position of weakness in which the Arab community has found itself from 1917 till now.

It was only to be expected that this British policy should be vehemently rejected by the Jews; but it does not follow from this that it will be altogether acceptable to the Arabs; for an Arab, scrutinising the White Paper, will see the possibility of many a slip between the cup of self-government and the lip that is thirsting for a status which is already enjoyed by the neighbouring Arabs of Egypt, Saudi Arabia and Iraq. To the Arabs of Palestine, the policy of the White Paper does not bring any substantial satisfaction forthwith. For the next ten years, at least, something like Crown Colony government will continue; and, for the first five of those years, there will be some continuance of Jewish immigration, and perhaps of Jewish land-purchase, as well. The Arab will also be incensed at seeing one-third of the total 75,000 additional Jewish immigrants being admitted "as a contribution towards the solution of the Jewish refugee problem" in Europe. The Nazi wave of Anti-Semitism, he will point out, was not foreseen at the time of the Balfour Declaration. Why, then, should Palestine now be forced, without being consulted, to make a contribution, under this head, on a scale which Great Britain would be chary of assessing upon herself?

When once the Jewish hopes of a National Home in Palestine has been blighted, as they have been now, it might have been wiser for the British Government to concentrate all their efforts on behalf of the Central European Jews upon the enterprise of providing some alternative National Home in British territory—either in British Guiana or elsewhere. The additional 75,000 Jews who are to be pumped into Palestine will make no appreciable difference to the political prospects of the Jewish community there. A minority amounting to a full 33½ per cent. of the total population of the country will not really be better able to hold its own than one amounting to, say, 30 per cent. The unavailing increase in Jewish numbers is likely to be more than offset by the increase in Jewish-Arab friction which this continuance of Jewish immigration will almost certainly bring with it. It would have been better to make a clean cut now.

The Government cannot fairly be blamed for being unable to wipe out, at a stroke, the legacy of impolicy that has been bequeathed to them by their predecessors; but they can and should be censured for persistently ignoring the urgent warnings of a Royal Commission appointed by themselves. The Government were warned by the Commission that almost any immediate settlement would be less disastrous than further delay; that there could be no solution without immediate self-government for both Jews and Arabs; and that it would be a pernicious piece of self-deception for us to act any longer on the assumption that the Jews and Arabs in Palestine were going to coalesce into a single "Palestinian" nationality. In the new statement of policy, all these now lamentably fulfilled warnings have been ignored once again. All the remedies are postponed to future dates—the stoppage of Jewish immigration until 1944, the grant of full self-government until 1949 at the earliest. There is no provision for self-government for Jews and for Arabs, but only for certain "Palestinians"—a "coming race" who are not to be found in Palestine to-day and are not likely to have arrived by 1949. The Royal Commission proposed to solve these problems by partition. A reader of the White Paper can only point out that no alternative solution is offered there; and, meanwhile, nothing is gained by postponing all action to future dates and by reiterating the word

"Palestinians." An American mandatory for Europe might as well hope to make his French and English lions lie down with his German and Italian lambs by constantly calling them all by the sedative name of "Europeans."

The worst of our British policy is that it puts a premium on obstruction. The Arabs have now succeeded in bringing Jewish immigration and land-purchase to a halt. They have shown that you cannot make a Jewish national home in Palestine without Arab, as well as Jewish, goodwill. But what about self-government in Palestine? Will it not take Jewish, as well as Arab, goodwill to make that? In fact, does it not take two to make a "Palestinian"? It is all very well for the Government to say, as they do in the White Paper, that the process of giving the people of Palestine an increasing part in the government of their country

will be carried on, whether or not both sections of the population choose to avail themselves of the opportunity to participate in the machinery of government. The authors of the White Paper are themselves compelled, nevertheless, to envisage the possibility that, "contrary to their hope," circumstances may be found to require the postponement of the establishment of the independent State, even when the ten years' term has run out. In other words, they shrink from handing over the Jewish minority to a nominally "Palestinian" Government which might in fact be a purely Arab government because the Jews had boycotted it.

It looks as if the White Paper might produce the result of putting the Arabs in the Jews' shoes and the Jews in the Arabs'; but for the problem of Palestine this mere reversal of rôles will signify, in effect, "no change."

Agenda for Preparedness—IV

Collective Security for Trade

SINCE the Prime Minister's speech at Birmingham on March 17th the policy of this country has been the construction of a strong union of peaceful states in Eastern and Western Europe to resist any further aggression by the Axis Powers. Even if Mr Chamberlain had not compared his problem with that of William Pitt, the comparison must have occurred to every mind; for, though we are still chary of the words, we are in fact building a Grand Alliance. The methods, too, are those of Pitt, and our unique contribution, now as then, must come from our economic strength. Until that is mobilised, we shall fight with our right hand behind our back.

It is in this framework that the Commercial Agreement concluded last week between the British and Roumanian Governments must be regarded. The main provisions of the Agreement were summarised in *The Economist* last week. They include a credit for £5 millions at 5 per cent.; an undertaking to buy 200,000 tons of wheat from the next harvest "if available at world prices"; adjustments to the Payments Agreement designed, somewhat optimistically, to provide rates of exchange between the lei and the pound "such as to attract exports to the United Kingdom from Roumania without making the cost of United Kingdom goods too high for the Roumanian market"; and the foundation of a joint trading organisation to stimulate trade between the two countries.

If it is to be regarded as an ordinary peace-time commercial agreement, the terms of the treaty are unexceptionable and even generous to Roumania. But though normal commercial considerations cannot be forgotten, there has never been any pretence that the sending of the British Mission or the conclusion of an agreement were ordinary peace-time measures devoid of any political content. Regarded as cement for a Grand Alliance, the virtues of the Agreement are less apparent. It might be objected that the amount of the credit is small—considerably smaller than that granted to Turkey last year—and that it cannot be repaid without an increase in Roumania's exports. It might be said that a promise to buy 200,000 tons of wheat, if available at world prices, is of questionable value, since Roumanian wheat is never available at world prices unless the Roumanian Government subsidises it. To these objections there are answers. One is that since Roumania has not made up her mind, and is unwilling to make it up, on the question of resisting Germany's further expansion, it would be rash to go too far. The measures necessary to keep a country on the fence are obviously different from those necessary to support a country that has definitely come off the fence. And secondly, the new trading organisation presents a flexible instrument for according further assistance if it should become expedient.

In any case, however, the Roumanian Agreement provides only the beginning of an answer to the problem of giving economic aid to our new friends. Most of the data of the problem will be found in the latest of the admirable series of publications of the Information Department of the Royal Institute of International Affairs. This compendium of facts on South-Eastern Europe* has been prepared in collaboration with the London and Cambridge Economic Service and half of it consists of an interesting economic survey by Dr F. C. Benham. Dr Benham has been assiduous in the collection of facts, which can be more conveniently found here than anywhere else, though his opinions, paradoxically, tend to be delivered without supporting evidence. Study of the facts reveals the very large degree of economic integration that already exists between Germany and the Balkans, and this makes it necessary to be quite clear about the objectives of British commercial policy in this part of Europe before we intervene.

It should not be our objective to push Germany out of these countries' trade, or even to reduce the present volume of her dealings with them. It has always been recognised that Germany is inevitably the most important factor in the Balkan market. To try to change this state of affairs, if it were possible, would harm the Balkan countries and would certainly constitute that strangulation of Germany of which Nazi propaganda accuses British policy. Our aim must rather be to provide the Balkans with alternative outlets for their trade which, though inevitably smaller than the German outlet, are yet large enough to prevent German economic domination passing over into political dictation. These countries must be put into a position in which they can afford to say "No" to Berlin.

It should be apparent that this object cannot be attained by ordinary trading methods. As a result partly of their own currency policy, partly of the pervasion of German trading methods, the price levels of the Balkan countries are badly out of line with those of the world market. For example, between the lei and the pound there is one exchange rate (about 800 lei to the pound) that makes British goods saleable in Roumania. There is another rate (about 1,200 lei to the pound) that makes it possible to sell Roumanian agricultural produce without loss in London. But there is no rate (pace the official protocol, which sets this as the objective of the agreed policy) which achieves both results at once. Yet both must be done at once, for the only trade that a country with exchange restrictions can allow is bilaterally balanced trade. This dilemma has arisen from Germany's habit of bidding more than the world price for Balkan produce. German-Balkan trade

* "South-Eastern Europe. A Political and Economical Survey." (London) Oxford University Press. 203 pages. 5s.

flourishes because Germany subsidises it in this form. If British-Balkan trade is to increase we must meet Germany's terms.

Various devices can be adopted to postpone this dilemma or alleviate its incidence. But they will not relieve us from the ultimate necessity of facing the bedrock fact that Anglo-Balkan trade will not be increased until we buy more goods from the Balkan countries, and that we shall not succeed in doing that until we bid prices that are, if not equal to the German offers, at least competitive with them after allowance for the fact that we can offer free exchange.

What, then, are the goods that these countries have to sell? The following table (which has been mainly compiled from the Royal Institute's publication) shows the most important exports from six countries. The six are Turkey, with whom we have a newly-born alliance, Greece and Roumania, to whom we have given territorial guarantees, Yugoslavia and Bulgaria, who are not yet securely in either camp. Poland has also been added, though it should be remembered that her position differs in at least three respects from that of the other five states: the nature of her exports is different, her trade is not dominated by Germany, and her currency has not become so thoroughly entangled in restrictions and disguised depreciation.

	% of Total Exports		% of Total Exports
<i>Poland*</i> —		<i>Bulgaria</i> —	
Timber & products	17	Tobacco, sugar, &c.	41
Coal	16	Livestock & animal products	19
Livestock and meat	13	Fruit & vegetables	18
<i>Yugoslavia</i> —		Cereals	11
Wood for building	14	<i>Roumania</i> —	
Live animals	10	Petroleum	46
Maize	10	Wheat	16
Animal products (inc. poultry and eggs)	9	Timber	12
<i>Turkey</i> —		<i>Greece</i> —	
Tobacco	27	Tobacco	46
Cereals	13	Currants & raisins	12
Raw cotton	7	Olive oil	6

* Polish figures relate to 1937, others to 1938.

This table reveals the commodities chiefly in question. Apart from Roumanian oil and Polish coal (both of which sell freely on the world market), the important items are cereals (especially wheat), tobacco, animal products, timber and certain varieties of fruit. All these are commodities that Great Britain imports in large quantities. The dimensions of the problem are shown by setting the volume of the trade in certain commodities between Germany and the six countries in question alongside the volume of Great Britain's total imports of the same commodities. This is done in the table at the head of the next column.

Land Registration

LAND registration, the registration with the State of titles to land, is a subject about which public opinion has undergone a tremendous change. It has been one of the principal topics of conversation amongst lawyers for many years. Nowadays, most of them discuss it calmly, and are even willing to explain the case for and against it to any intelligent layman. But at one time it was a painful subject amongst lawyers, only to be mentioned after the port had gone the round and men could say what they really thought.

To some laymen, on the contrary, the whole idea, stripped of its technicalities, seemed most attractive. They had had experience, often bitter experience, of the extreme complexity of the land laws and the expensive delays involved in the transfer of titles to land. They heard that dealings with registered land through a centralised public Registry would be simpler, quicker and cheaper than anything that could be achieved under the system of private

With the sole exception of tobacco (which is admittedly a difficult problem, owing to the fact that British smokers do not consume much "Turkish" tobacco), it will be seen that the total of German-Balkan trade is insignificant compared with British imports. If it is remembered, firstly, that the volume of Anglo-Balkan trade needed to serve as an insurance policy against German domination need not be anything like as large as the volume of German-Balkan trade, and, secondly, that measures of assistance may not be needed for all six countries included in the table, it should be apparent that, in general, the needed increase can be accommodated within the enormous international commerce of the United Kingdom without any substantial disturbance of British purchases from other countries. By the same reasoning, the fact that the total value of Germany's imports from these six countries, valued at the highest value of the currencies concerned, is only about £60 millions, suggests that the financial burden of subsidising an expansion of Anglo-Balkan trade (which would only have to cover a proportion of the value of a considerably smaller volume of trade) would not be very heavy.

As in so many other aspects of preparedness, the greatest difficulty in the way of granting substantial economic assistance to our newly-acquired and prospective allies—assistance without which they may not remain our allies for long—lies not in the technical details of the measures that would have to be adopted, intricate though they would be, but in our own unwillingness to depart from settled and established ways. Once the psychological handicap of our reluctance to undertake trade for any purpose other than an immediate profit is overcome, commercial policy provides a means of securing the Peace Front which will pay enormous dividends in political coin.

conveyancing. Above all, there would be the guarantee of the State for all titles that were registered. Future dealings would involve no trouble or anxiety; everyone, except the Chancery lawyers, it was said, must surely benefit by land registration.

This view was, of course, far too optimistic. Land transfer has never been a simple problem in this country, and it is never likely to be. Few would deny that the system of land registration has great advantages. But it is a complicated question—almost as complicated in its way as the old system of conveyancing. Yet all serious students of social or economic problems should understand the elements of land registration, and to do so they must know something of its history.

At the end of last century came the event which had been long dreaded by lawyers and long anticipated by the enthusiastic laymen. The first measure of compulsory registration was introduced. The Land Transfer Act, 1897,

gave a limited power of imposing compulsory registration of title by Order-in-Council. Advantage was promptly taken of this power, and Orders were made imposing compulsory registration of title in the Administrative County of London. That is to say, whenever any land or houses were sold in the County of London, the property would have to be registered at His Majesty's Land Registry, a large building at the south-east corner of Lincoln's Inn Fields. Subsequent dealings with that property would have to take place through the Registry. The lawyers looked glum, but refused to take the innovation too seriously. They prophesied that compulsory registration would not find favour, that the first experiment would also be the last.

But even lawyers may be wrong. For some years the County of London remained the only district in which registration of title to land was compulsory. But, ever since a great mass of new property law was passed in 1925, compulsory registration has been very much to the fore. Eastbourne became an area of compulsory registration in 1926, Hastings in 1929, both boroughs taking advantage of the so-called "local option" provisions of the Land Registration Act, 1925, empowering councils of counties or county boroughs to apply for an Order to make a compulsory area. So far only Eastbourne and Hastings have taken advantage of these provisions, but they are always available, and land-owners and other people who are supporters of compulsory registration should bear in mind that the power to introduce it does exist.

Which brings us to the most remarkable change of all. Laymen in general, and not merely a few enthusiasts, now take a serious interest in land registration, and some of them are impatient with its seemingly slow progress. This is not surprising. Everyone who buys his own house, whether it be large or small, is a "land-owner" and, as we have said, many land-owners have had bitter experience of the complications resulting from the system of "private conveyancing," in which all the transactions are usually carried out by lawyers. It seems natural to suggest that land should be dealt in as easily as stocks and shares, and that compulsory registration of title is the way to achieve that result.

NOTES OF THE WEEK

The Anglo-Turkish Pact.—The decision of the British and Turkish Governments to conclude a "definitive long-term agreement of a reciprocal character, in the interests of their national security," was announced simultaneously by the two Prime Ministers, in the Parliaments at Westminster and Ankara, last Friday, May 12th. Meanwhile, pending the completion of this definitive agreement, the two parties declare here and now that, in the event of an act of aggression leading to war in the Mediterranean area, they would be prepared to co-operate effectively and to lend each other all the aid and assistance in their power. The importance of this declaration leaps to the eye as soon as we envisage the unpleasant possibilities in concrete terms. If, for example, a German stroke against Danzig, which created a state of war between Great Britain and Germany, were to be followed by a German attack on Gibraltar or by an Italian attack on Corfu or Salonica or the Straits or Smyrna or Adalia, then Great Britain and Turkey would be found immediately standing shoulder to shoulder in defence of themselves and their friends (e.g. Greece and also Roumania, supposing that the German aggression on land were to extend to her as well as Poland). Recent international events, the Turkish Prime Minister remarked, had made it impossible for Turkey to remain neutral; she believed that her own security was now menaced, so she had made up

Unfortunately, it is actually not so easy as that. In spite of the recent attempts to simplify our law of land—attempts which have been successful, on the whole—it remains highly complicated, and is likely to remain so for a long time yet. The day is still far distant when land and houses can be dealt in as simply as securities on the Stock Exchange. The wise land-owner, in fact, should be grateful for the remarkable progress that has been made.

For it is remarkable. On January 1, 1937, Middlesex became a compulsory area, the preliminary move coming not from the county council but from the Lord Chancellor and the Privy Council. In June last year the Solicitor-General announced in the Commons that it was proposed to introduce compulsory registration in Croydon and in the County of Surrey generally. He added that the work of introducing compulsory registration was proceeding as fast as was practicable. Meanwhile, voluntary registration is proceeding quietly but efficiently all over the country. Between three and four thousand applications are made every year by land-owners, many of them in a small way. The vast majority are successful, and the property is duly registered.

Land registration is far more than merely "lawyer's law." If the layman is a county councillor, he will be concerned with any proposal for extension of the compulsory areas, as soon as it is made. If he is a Member of Parliament, he will be concerned with the proposals when it comes before the House for ratification. If he buys a piece of land or a house, he may find that it is in a compulsory area and that the deal requires registration. In fact, every responsible person is likely to come across the problem of land registration sooner or later.

But he should not expect too much. H.M. Land Registry is a highly efficient organisation, but it cannot perform miracles. Land registration may be cheaper than the older methods, in the majority of cases at any rate, but it must involve some expense. Finally, land-owners should realise that, even if every county in England and Wales were made a compulsory registration area, difficult problems in regard to land transfer would still arise. Lawyers would still be needed.

her mind to co-operate and, if necessary, to fight in alliance with, those equally anxious to preserve peace. The significance of this Anglo-Turkish Agreement can be gauged by its reception in different quarters. In the two countries entering into the agreement, the news has been received with universal and profound satisfaction. The agreement has also been publicly blessed, and this in warmly approving terms, in the Russian Press—a gesture which incidentally throws some welcome light on the tendency of Russian policy. On the other hand, the Axis Powers have not attempted to conceal their annoyance. The German Ambassador in Turkey, Herr von Papen, is known to have made unusually strenuous exertions to prevent the Anglo-Turkish negotiations from being carried through to success. The Turkish Government, however, believed themselves to be better judges of their own country's interests. The rather crude abuse and hectoring threats with which Turkey's decision has been castigated in Dr Goebbels' Press are hardly likely to convince Turkish statesmen that they have made a mistake.

Britain and Russia.—The negotiations for an Anglo-Russian alliance have been accompanied in the last seven days by three important events on the Russian side.

Only the first of these, the leading article in *Izvestia* for May 11th, is self-explanatory: both the Russian Note and the decision to replace M. Potemkin by M. Maisky, after the League Council's meeting had been specially postponed for a week, remain shrouded in that official air of mystery which has characterised the negotiations from the beginning. The *Izvestia* article is a notable exposition of Russian foreign policy, which seeks to explain the Kremlin's dislike of signing specific guarantees of Poland and Roumania, holding that in so doing the U.S.S.R. is placed "in an unequal position as regards security but with equal liability." What the U.S.S.R. wants, says *Izvestia*, is "a united pact of mutual assistance" concluded between Britain, France, the U.S.S.R., and Poland, or at least between the first three. "An arrangement should be made by which these, bound together on a basis of reciprocity by a pact of mutual assistance, should guarantee other Powers in Central Europe which are under menace of aggression." In this there is no reason to doubt the U.S.S.R.'s sincerity, however over-cautious its attitude may appear. It is to be presumed that the Soviet Note received in London on Monday was in the same sense as the *Izvestia* article and continued to combat the British thesis that a specific arrangement ought to precede a general one. The further point has arisen of British guarantees to the three Baltic Republics: the Kremlin argues that until these are made the British guarantees to Eastern Europe do not in fact cover the whole of the Russian frontier.

A Matter of Tactics.—Public opinion is meanwhile mystified. There is a general tendency to blame the British Government for the lengthy course of the negotiations. Others blame the Polish and Roumanian Governments. It is, in the circumstances, surprising that so few feel inclined to blame the Kremlin, especially after its juggling with personnel. In regard to Eastern European objections, it would not appear that those of the Roumanian Government, even if they have been proffered, can have had such influence as to prolong negotiations to their present length; how far the Polish Government is responsible cannot be estimated without knowledge of what passed during Colonel Beck's talks with Lord Halifax and M. Potemkin. But it seems very possible that the Polish objections would not now be as strong as a year or two, even a month or two, ago. Rather does it appear that a closer understanding between the two countries through a widening of commercial relations is in preparation. The objections felt by the British Government to an alliance are presumably matters of tactical expediency, for Sir John Simon has publicly stated that there is no objection in principle. It is possible, indeed, to have a good deal of sympathy with the British Government's viewpoint, since, with other things equal, a specific arrangement to attain a specific object is always preferable to a general alliance. The Kremlin's terms, however, leaving as they do far Eastern questions out of account, appear to meet the only main point at issue—namely, that East and West should combine in self-defence, and if so, they render objections of precedent and dignity on the one hand and doubts of Russia's military abilities on the other, of comparative unimportance. It would be a great pity if insistence on a point which, though perfectly justifiable, is confessedly purely tactical, should lead, at best, to further waste of valuable time or, at worst, to missing what will be our last chance of building a decisively strong Eastern Front. The British Government has some reason on its side; but it will have much more if it makes a minor concession to attain its major objective.

Militiamen.—The House of Commons has been seen at its best during the Committee stage of the Military Training Bill. When the Bill was first brought in, the

Opposition's dislike of conscription was raised to the pitch of indignant protest by its sudden and maladroit introduction. Since then, the Liberal party have agreed in conference not to oppose the Bill; and the Labour party, while still reflecting a deep-rooted distrust of compulsion (especially by the present Government), have contributed notably to the betterment of the Bill. The Government, too, have shown a due sense of responsibility in their anxiety to meet all reasonable criticisms and in their readiness to secure the economic position of the militiamen and to ensure the humane treatment of conscientious objectors. Each conscript will receive a written statement that his services will not be used in civil disputes. Every effort will be made to prevent bad employers from dismissing men liable for training before or after their six months' service; and, while the Government were unable to make identical provisions for the reinstatement of conscientious objectors drafted for six months into some work of national importance, the official attitude was made explicit in the statement that civil servants in this category would normally be re-employed. The increase of the militiamen's daily pay from 1s. to 1s. 6d. brings their net remuneration for short service not ungenerously close to that of the regulars, for whom soldiering is a career—and to whom the Bill has been of indirect benefit since they, too, are now to have special machinery and dependants' allowances at less than the present age limit of 26, to meet individual cases of family distress. While the problem of tiding over contractual and other obligations, which is peculiar to the militiaman as distinct from the long-term soldier, has not been solved in terms, the mood of the Government, no less than of the Opposition, has clearly been to make the utmost endeavour in administering the Bill to obviate all forms of hardship.

The Spirit and the Letter.—It has become apparent that the social, political and economic consequences of the militia scheme must depend to an unusual degree upon the skill and broadmindedness of its administrators. In every one of its three years the young men liable will be called up in batches of 20–30,000, and the onerous duty of spreading the calls in such a way as to minimise both hardship to individuals and dislocation in industry, trade and agriculture has been accepted. If there is still any major criticism of the Bill it is that to leave so much of its spirit to be translated into practice through the goodwill and common sense of departments and tribunals takes too readily for granted that to-day's open-minded tolerance would survive intact the temper and passion of days when war might be more obviously imminent. It is a sound rule in law-making that major objectives should, wherever possible, be stated in black and white. Some effort might even now be made to record, in the letter of the Bill, the Government's desire to give conscientious

objectors the greatest possible consideration, as well as their intention to make impossible, even before barrack accommodation is fully completed, the evils of overcrowding, in tents or hutments, which took so heavy a toll of life and health and cheerfulness among the soldiers of the last war.

Evacuation.—It cannot be said that the confusion which persists about evacuation in case of war has yet been appreciably diminished. Almost certainly it reflects a similar confusion in Government policy. Mr Herbert Morrison's broadcast account of the official plan for evacuating children, mothers and blind people from London, and of the arrangements for registering all persons in these categories on Friday and Saturday of this week, gave no hint of the Government's wishes with regard to those children, mothers and blind people who have made private arrangements for their transport and lodging. And the leader of the London County Council was minatory about possible attempts by unregistered persons to "gatecrash" the official scheme. It would seem expedient, in view of the prevailing uncertainty, for all persons in the priority classes to be registered forthwith, whether they have made private plans or not. But the matter cannot be left there. The Government's shelter and evacuation schemes, when fully in operation, will probably provide adequate protection for something like four-fifths of the population. But several millions in vulnerable places will still be exposed to intolerable dangers; and in the restricted areas of these target zones special measures are imperative. A limited supply of reasonably bomb-proof shelters (possibly of the concrete pill-box kind) could be made available for the protection of essential workers in exposed sites, but it is quite certain that very many more people and enterprises will have to be removed from these areas because they cannot be properly protected there.

The choice to be made is not between evacuation and no evacuation; it is between organised evacuation and a panic flight. The latest bulletin of the Air Raid Defence League suggests the creation of a new priority class of "non-essential adults in the worst target zones." It is for the Government to speak at once. Is the private evacuation of children, mothers, etc., to be allowed? Is the voluntary evacuation of adults to be encouraged? The report that eight one-way roads out of London are to be reserved for voluntary evacuees is out of date; it is part of last year's plans, when the Government still believed that private evacuation would be possible, without any organisation, on the outbreak of war. It is their view now that road and rail facilities will be fully occupied, for at least 48 hours, by the official scheme. So long as the present uncertainty is allowed to last,

there will be rising resentment. And the danger of panic if an emergency comes will be grave indeed.

Rolls-Royce for Clydeside.—The announcement of the decision to establish a new Rolls-Royce aero-engine factory on the Hillington industrial estate near Glasgow comes as a surprise to all but the very few people who have been concerned with the preliminary negotiations. These included Lord Provost P. J. Dollan, who may be presumed to have taken account of the possibility that a material slackening of re-armament would reduce the demand for engines of this type. The suggestion that such a development would produce a new and worse depressed area on Clydeside may be discounted to some extent, since the demand for aero engines in peace time would decline less steeply than that for the specifically destructive products of heavy industry. The present lack of diversity in Clydeside industry in any case requires new developments in the direction of light engineering. But it has been questioned whether an industrial estate like Hillington is the best place for a factory and aerodrome valued at £4,000,000 and supporting 10,000 specialists in a single branch of industry. So far factories built on such estates have been relatively small, but that is no ultimate reason why this should be so. The deciding factors should be the character of the product and local needs and facilities, rather than the scale of production as such. The Air Ministry and Rolls-Royce may be doing a permanent service to Clydeside in breaking through its former bias towards heavy industry and providing capacity for the production of aero engines which may ultimately be utilised for peace purposes.

France's Convalescent Finances.—M. Paul Reynaud has many merits as a Finance Minister, and one of them is that he never fails to see his fiscal and financial problems within their economic and psychological framework. The comprehensive report with which his measures were introduced last November (printed in full translation in *The Economist* of November 19, 1938) was an admirable example of this, and it has been succeeded this week by a further report addressed by M. Reynaud to the President of the Republic. The tale that M. Reynaud had to tell was one of success. This has been most striking in relation to the standing of the franc. From October 31, 1938, to January 31, 1939, the Exchange Equalisation Fund gained about 15 milliard francs (about £85 millions), and since M. Reynaud has stated that the inflow was not reversed even by the crisis of March, the gain may be presumed to be larger by now. The Exchange Fund, in fact, has sold 5 milliards of gold to the Bank of France to replenish its supplies of francs. This revival of confidence in the currency has had immediate effects upon the money market. Savings deposits have increased, interest rates have fallen (the short-term rates have been halved) and new loans have been floated, including the successful issue on Monday of this week of a Five per cent. 40-year Conversion Loan, the cash portion of which, amounting to 6 milliard francs, was subscribed in full at once. The yield of taxes is increasing; in the first quarter of 1939 the yield of indirect taxes was 21.4 per cent., and that of direct taxes 65 per cent., above that of the same period of last year. The Treasury, as a result, is in a comfortable position. In the wider economic and industrial sphere, improvement is much slower, but quite definite. Steel output, textile production and motor-car sales are all considerably higher. But the level of production in France is still low, whether it is compared with other countries or with French figures in past years. M. Reynaud has achieved remarkable success in his primary object of financial *assainissement*; the major attention should now be concentrated on the problem of production. The moral and economic recovery of France has already been an enormous reinforcement to the international policy of democratic strength and solidarity. It has helped to stem the retreat before the dictators. Its completion will help to turn the present stand into a renewed advance.

Daladier and Mussolini.—M. Daladier spoke in the Chamber at Paris last Thursday; Signor Mussolini spoke in Turin last Sunday; but the French Prime Minister's crystal-clear speech found no reply in the Italian dictator's rather turgidly nebulous oration. M. Daladier's points were all of them true and timely. He greeted the young Frenchmen under arms; he prophesied that a competition in standing nervous tension would be borne better by free peoples than in "countries of silence, constraint and servitude"; he underlined the outstanding fact that "only one international problem in reality is set before Europe, that of domination or collaboration"; he spoke of the financial, economic and moral revival of France, and of the solidarity of the French Empire; he hailed the free decision of the British people to introduce conscription for the common defence of the free peoples and of their ideals. Incidentally, he censured, in biting terms, the policy of our opponents. Does peace consist in invading the territory of other States, in constantly presenting fresh claims capable of bringing on a conflict, in condemning people to poverty, in imposing upon them unceasingly increased armaments, which would render useless the international collaboration that is offered them? On this last subject, all that Signor Mussolini had to say on Sunday was that the map had recently been changed in three continents, and not a square metre belonging to the democracies had been touched, so why were the democracies so excited? He went on to accuse the democracies of waging against the Axis "a white war, a war of economics." These words were uttered by the Duce at an exhibition of Italian autarky—i.e. of an Italian attempt to "cheat the foreigner" (in Signor Starace's classic description of the Italian people's enforced abstention from coffee) by refusing to do more than a minimum of business with him. On this showing, the democracies' "white war" (were it a fact) would be a form of collaboration with Italy in her economic policy. These, however, were not the really important words in the speech. The key-words were: "There are not in Europe at present problems so big and so active as to justify a war, which from a European conflict would naturally become universal." In those words the Duce was telling his countrymen that, if Italy went to war with France and England as Germany's ally, she must count on having America and Russia against her before the war was over. This was the meat; the rest was sauce to give the nasty gobbet a less disagreeable flavour.

The Tug-o'-War in Japan.—At Tokyo the civilian moderates who think that Japan has already bitten off quite as much as she can chew are still at grips with the military extremists, both the extent and the limitations of whose ambitions have been illustrated by the landing of troops on the international settlement island of Kiangsu, from which, later, they were forced by Anglo-American action to withdraw. Until lately, the civilians seemed to have been winning. Their success was registered in the inability of Messrs Ribbentrop and Ciano to announce that the coming military alliance was to be more than bipartite. Evidently the moderate element in Japan has been able to insist that the co-operation between Tokyo and the Axis shall not be carried to the length of definite military commitments of world-wide scope; and there is still no sign that this important decision of Japanese policy is going to be reversed. All the same, the Japanese pendulum seems to have been swinging in the other direction during the last few days. The reasons for this are obscure, and may be various. There is the oscillation in the internal balance of power, in Japan, between the several political forces; there is the fear of Japan's being left out in the cold if Italy and Germany now move much closer to one another without Japan's moving in step with them; and finally there is the Russian factor. The bogey of a Russo-German *rapprochement* at the expense of Japan as well as of the Western Powers made a momentary appearance in the Japanese Press, to be promptly dispelled by news of the progress of the Russo-British negotiations; and at Tokyo on May 8th the Foreign Minister, Mr Arita, declared that "Japan cannot treat lightly an *entente* between Britain and Russia, even if it does not apply to the Far

East." The answer surely is that, if Japan is anxious to see the *rapprochement* between Britain and Russia remain within the narrowest possible limits, her best way of working towards this end will be to refrain from any increase in her own commitments to the Axis Powers.

Scandinavian Independence.—It is always valuable to have an outsider's opinion. In refusing the German offer of non-aggression treaties Norway, Sweden, and Finland have confirmed an estimate of what would be the worth of those guarantees which had already been formed by the non-neutral world. If non-aggression treaties with Germany meant in fact what they meant in theory, then there would be no reason for the Scandinavian States, anxious to strengthen their neutrality, to reject the offer: in reality acceptance would be more likely to weaken Scandinavian independence of action, given the German view that a small country departs from "non-aggression" whenever it refuses to do Germany's bidding. For the proof of this, in an analogous case, it is necessary only to realise that the German Government denounced the German-Polish non-aggression pact for the sole and simple reason that the Poles subsequently had concluded a defensive alliance with Britain. As the Polish memorandum to Germany of May 5th made clear, "negotiations in which one country formulates demands, while the other is to be under obligation to accept them without any change" are not compatible with any State's interests. It is to be admired that three out of the four Scandinavian States (Denmark, having no choice, has agreed to open negotiations) have had the courage and the good sense to remain unquestionably neutral.

The Regent on the Rack.—The inconclusiveness of the negotiations which have been going on for some weeks past between the Croats and the Yugoslav Government (the Serbs) will not surprise, though it may disappoint, those acquainted with the character of the negotiators and the nature of their differences. The ground of disagreement has shifted from the general and constitutional issues to the more precise, and thus more ticklish, determination of federal boundaries and privileges. The first fine flush of enthusiasm for an early agreement has melted with the weeks of bargaining and the two parties are now at grips in that spirit of tenacity which is their more natural mode of expression. It is fairly sure that neither side is wholly to blame for the present deadlock, just as it seems unlikely that the Croats' accusation that the Regent was solely responsible for it was justified by the facts. For no man more than the Regent would be happier to see the business well settled: in Belgrade he is nagged by the Serbian oligarchy, outside Belgrade the continuance of deadlock

INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

does nothing to improve the Crown's popularity. And meanwhile his troubles have been made more heavy by the insistence of the Axis Powers upon a policy of more than friendship; even while he was visiting Mussolini in Rome the remains of the Balkan Entente, which his own enforced policy of neutrality had helped to invalidate, were forming up behind the Western Powers. The distress which this must cause him can be measured by the widespread disappointment in Yugoslavia that they too cannot move in the same direction. Despite the official denial, the report that the Yugoslav Government protested to the Turkish Government against concluding an alliance with Britain without first consulting its fellows in the Balkan Entente, has a ring of the real truth. For whilst it is virtually certain that the German Government is applying diplomatic pressure to Yugoslavia, the protest may also have been a means of explaining away to home opinion the unwelcome course of events. In the past twenty years Yugoslavia has more than once claimed, and not without reason, to be a leader of the Balkan countries; and now, when fateful decisions must be taken, Yugoslavia has no longer the freedom of making up her own mind. On no one more than Prince Paul will this fact be better impressed.

* * *

Airways Merger Terms.—The terms offered to shareholders of Imperial Airways and British Airways (which are discussed in an Investment Note on page 447) represent a reasonable compromise to a tangled problem, with the balance of advantage slightly in favour of the shareholder. It has long been clear that, sooner or later, Imperial Airways would be reconstituted as a public board. Hitherto it has been a company operating ostensibly as a private enterprise, but effectively as the chosen instrument of the Government's civil aviation policy, with the financial assistance which that policy involves. It would be fairer to regard the history of Imperial Airways as a warning for future reference than to re-open the story in an attempt to apportion blame for past mistakes. Many of its troubles have arisen merely because an attempt was made to graft on to the form of a commercial enterprise a scale of air transport which could not possibly have been contemplated in 1924 when the company was formed. The Empire Air Mail services and the Atlantic services are beyond the scope of any privately financed undertaking. Hence there is logic in the replacement of Imperial Airways and British Airways by a public corporation, financed on terms only available to the Government. In truth, Imperial Airways was a hybrid, for although it paraded in the garments of private enterprise—whose gaiety attracted buyers of the shares up to 67s. 6d. in 1936—it was wholly dependent upon subsidies to pay dividends and to maintain its capital assets. The steady increase in the rate of dividend paid between 1934 and 1937, from 6 per cent. to 9 per cent., in effect represented a payment from public funds to equity investors who undertook no fundamental equity risk. Two conclusions stand out from the company's history. First, where the Government (or the taxpayer) is the effective risk-bearer, shareholders in subsidised concerns should be subject to a form of dividend control. Alternatively, where the scope of a new public enterprise is clear from the start, and its cost falls upon public funds, financial economy suggests that it should be capitalised in the cheapest possible way—by the use of the Government's credit.

* * *

Trade with Aggressors.—There are several Members of Parliament who believe that the sale to Germany of certain raw materials which are essential to armament manufacture is inconsistent with the British Government's policy of preparing to resist any future Reich aggression. At the back of their mind is the fact (which is incidentally borne out by the figures presented by Sir George Schuster on page 435 of this issue of *The Economist*) that Germany is heavily dependent for some vital supplies upon British

countries. The present position is that the export of war material, finished or in the rough, that is, actual armaments, is carried on under licence; and no licences have been given in the last six months for sales to Germany, Italy or Japan. Raw materials, on the other hand, which are used for war and industrial purposes alike, can be freely traded, and it is sales of nickel, copper and brass that have lately aroused protest. It is not easy to decide what is and what is not legitimate commercial policy in a state of near-war; but it is very doubtful, to say the least, whether any attempt to impose even a limited blockade in peace-time would be either justifiable or expedient. It would certainly be a species of encirclement. The only good ground for limiting sales of essential materials abroad would be the possibility of a short supply here; and it might be reasonable, too, to impose some sort of quantitative limitation, or rationing, so that buying countries could only obtain the equivalent of their average purchases over a period of normal years. Control of both imports and exports will, admittedly, be imperative very soon; but it will be to serve and eke out the needs of our own economy, not to starve the requirements of others.

* * *

Nor is it only in the case of raw materials that these questions have arisen. The Government's recent plans to help shipping stimulated shipbuilding, but their intention to build up the merchant fleet, with the need for a war reserve in mind, has since been partly frustrated by the sale of seaworthy vessels abroad, sometimes to aggressor countries. The wish of the Board of Trade that official approval should be sought for such transactions has had no binding force. Here, where the very core of national security is concerned (for we have fewer ships to bring food for four million more people than in 1914) the Government have taken action. This week a Supplementary Estimate of £2,100,000 was put before the Commons to enable the Government to purchase a reserve of merchant ships; and the Bill which is to empower the Board of Trade to make these purchases will place a legal obligation on shipowners to offer their vessels to the Bable before they attempt to sell them elsewhere, at home or abroad. Here is a case where Government intervention was imperative, on the ground of a dangerous shortage; but it offers no precedent at all for the widespread control of trade for purely political motives.

* * *

Stopping Taxation Loopholes.—The Finance Bill published this week contains no mention of arms profit limitation, contrary to some forecasts. But there are several formidable clauses which aim at the reinforcement of existing statutes for preventing the avoidance of tax. It will be recalled that the Chancellor's Budget Speech anticipated such safeguards against the avoidance of tax through the exploitation of the one-man company. The Finance Acts of 1936 and 1937 have stopped the loopholes to some extent, and last year the Chancellor, in effect, put the taxpayer on good behaviour and threatened retrospective action if avoidance continued. Hence the taxpayer who is affected by the avoidance clauses in the present Finance Bill has at least had good warning. Section 19 of the Bill proposes an amendment of Section 105 of the Income Tax Act, 1918, to require from employers particulars of payments made after April 5, 1938, to employees in respect of expenses, of payments made on behalf of employees, and of payments made for services rendered, whether they arose in the course of employment or not. The clause also provides that, on request, any person carrying on trade or business shall make a return of payments exceeding £15 to any individual who is not an employee which are in the nature of commission for services rendered. This provision specifically covers payments made in the formation, acquisition, development or disposal of a trade or business.

Farming on the Dole.—The Government's new subsidies for sheep, barley and oats, announced in the House of Commons by the Minister of Agriculture on Thursday, are a sad retrogression from the high level set by its two previous actions in the agricultural world. The subsidies for lime and basic slag and for the ploughing up of second-rate pasture land were both measures which helped farmers to help themselves by improving the fertility of the land. But these newest subsidies are frankly doles. The simultaneous occurrence of a drastic fall in the prices of barley and sheep and a poor sugar-beet crop has undoubtedly severely affected the East Anglian arable farmers, whose financial returns in 1937-38, according to the latest survey made by the Cambridge School of Agriculture, were lower than in any year since 1932. But the Government's proposals are designed, not as temporary measures to meet accidental circumstances, but as a long-term policy. The basic yield of oats used in calculating the oats subsidy is to be raised from 6 to 14 cwt. per acre, with a maximum payment of £2 6s. 8d. per acre, or of £1 per acre for farmers who have received payments from the Wheat Commission; similar arrangements have been made for the barley subsidy. The Exchequer will also make good to farmers any deficiency below 10d. per lb. for sheep sold for slaughter, this standard price to be reduced progressively if the sheep population rises above 27 millions. The best that can be said of these measures is that they place the burden of supporting agriculture visibly on the purses of the taxpayer and not invisibly on those of the working-class household; and the standard price for fat sheep is, in fact, a fairly low one. On the other hand, only in one year—1932—in the last decade has the sheep population exceeded the basic number of 27 million, and the steady decline in arable land sheep and in the average age at slaughter makes it doubtful if a sheep population of this size is now economic.

Limited Access to Mountains.—The Access to Mountains Bill, which is now enjoying a smooth passage through the House of Lords, contains a quite remarkable crop of snares and reservations. While it is true that every possible step must be taken to preserve wild and open country from overcrowding and disturbance, it is equally essential to recognise that this end is best obtained by careful planning with the collective rights of the whole public always in view. No such end can possibly be the desire of the supporters of the dog-in-the-manger type of enclosure which is encouraged rather than discouraged by the present Bill. Originating as a measure to facilitate access to mountains and moorland it has actually developed in its passage through the Commons into a measure restricting such access. Access is to be granted by orders made at the request of the owner of land concerned, or by local authorities, or by organisations likely to be benefited. This procedure is unnecessarily expensive and cumbersome and can hardly be expected to have the effect of throwing open more land, since most of the owners will resist applications, local authorities will be unwilling to make them, and other organisations such as associations of rambles will be unable to face the legal expenses. Further, the Bill actually makes trespass a definitive offence—a principle entirely new to English law. In fact this measure, in its present form, is obviously more concerned with the feudal prejudices of landowners than with the rights of rambles, who are among the most considerate and appreciative of the townsmen who seek recreation in the country, and whose presence on moorlands involves far less interference with the enjoyment of others than the hordes of cars on or near the roads. Legally it is still not too late to prevent the passage of this Bill in its present form, but the House of Lords is hardly the body to rescue the community from the landlords. So the work must be done all over again—a tedious and expensive process, but one which must be faced.

ROLLS ROYCE
THE BEST CAR IN THE WORLD

"The name of Rolls-Royce is among the most valuable trade marks in the world. It stands for the best there is. Some thirty years of pre-eminence have surrounded it with so much magic that if ever second best were to be stamped

by Rolls-Royce it would still pass for best with most people. I saw for myself that the Company are not living on their reputation. Every refinement that experience and research can devise and money buy is still going into their work."

Poland under Arms

(By a Correspondent in Poland)

TAKEN in its political context, Colonel Beck's reply to Herr Hitler's speech of April 28th is of decisive importance to the development of Polish foreign policy. In Poland to-day its stout refusal to negotiate under threat finds an echo in every department of life, from the individual boycott of German goods, of German newspapers, of German films, to the absorption of scraped-up savings in the Air Defence Loan (of which the Jews subscribed only 7 per cent.) and the loyal declarations of the Ukrainian leaders. It is surprising to find how completely political energies have been taken up by the idea and realisation of national defence, to the extent of inhibiting, not simply the official programme of domestic reform, but also the dissatisfaction of the Opposition parties themselves.

Having taken its stand, the Polish Foreign Office is now in process of working out the details of its political strategy, of which the main lines were laid down in the Foreign Minister's speech. The British guarantee (which "should be regarded as a pact concluded between the two Governments"), the pact with France ("one of the most essential elements in the political structure of Europe"), friendly relations with Russia (left unsung), and the development of better relations with Germany, against which, as everyone said, no doors were slammed, are the important parts of that strategy. The only one which is not clearly defined is that with regard to Russia, for although officially Polish-Soviet relations rest on a non-aggression treaty and, latterly, on the commercial accord of some months ago, it is problematical how far Colonel Beck discussed with M. Potemkin the immediate questions of peace or war. If, as many in Warsaw suspect, those discussions were as frank and full as ninety minutes would allow, then one can only question how far it is still true that the British Soviet negotiations are being held up by Polish objections. The old distrust of Russia is no longer as strong as it was, and although it might reappear under appropriate circumstances, at the moment it is a pallid flame compared with the new distrust of Germany.

War Potential

The strategic aspect of Poland's relations with foreign Powers increases in relative importance with every worsening of the international situation. In a war against Germany the Poles would have to fight on an arc reaching from East Prussia to Western Slovakia: even if they were successful in holding Krakow and invading East Prussia, it is probable that they would be compelled to retreat eastwards to a line forming a chord of that arc. In that retreat they would lose the industrial areas of Kattowitz, Sosnowitz, and Teschen: an unspoken admission of this was made two years ago, when the Polish Government, in collaboration with the general staff, began to move the armaments factories eastwards to the so-called Strategic Triangle, marked on the map on page 465.

The best answer to the question "Will the Poles allow the passage of the Russian Army?" is that the Poles stand in no need of soldiers. The following table shows why:—

Per 1,000 inhabitants (1936)

	Live-births	Deaths	Natural Increase
Poland	26.2	14.2	12.0
Germany.....	19.0	11.8	7.2
England and Wales ...	14.8	12.1	2.7
France	15.0	15.3	-0.3
Italy.....	22.4	13.7	8.7
Roumania	31.5	19.8	11.7

Roumania apart, this means that the Poles have the youngest population in Europe. What they need are the mechanical sinews of war, and even here they are better placed than is often supposed. It may be true that they would require material assistance within the first few weeks of a European war: but it is claimed, by those in a position to know the facts, that within a year from now, given adequate and continuous supplies of raw materials, they will be manufacturing all the armaments they need except for certain specialised branches of artillery. The immediate pressing need is there-

fore the provision of raw materials and of aeroplanes, for although five aeroplane factories are in full production, an optimistic estimate would scarcely place the monthly total of new machines as high as 150. But it is worth noting that the latest Polish bomber ("Los") is claimed to have a maximum speed varying with the power of its Bristol Pegasus or Gnome-Rhône motors of between 260-320 m.p.h. and a range when fully loaded with bombs of over 800 miles, and thus can stand comparison with the latest German and British types (see *The Economist*, April 15, 1939).

As things stand, the Polish general staff has three advantages with which to offset its lack of munitions and mechanised striking power: the nature of the country, and the absence of roads along which tanks and armoured cars can advance, favour the use of cavalry: its army is composed of peasants whose needs are few and powers of resistance great; and the fact that Poland cannot, because of the scarcity of big objectives, be knocked out by attack from the air.

Danzig is a problem on its own, and one which may be crucial. No one in Poland is disposed to ask whether Danzig is worth a war, for they do not need a map to tell them that their communications with Gdynia can be defended only so long as the Danzig territory remains demilitarised. Negotiation should be feasible on the condition that the Reich Government is able to guarantee that the territory shall remain demilitarised, but not otherwise. It is clearly seen that the danger point will have been passed on the day that the Danzig Senate—all-powerful in a Free City which has already banned Polish newspapers, introduced the Nuremberg anti-Semitic laws, and declared the specifically Nazi nature of its government—votes itself a part of the Third Reich and appeals to the Fuehrer's fatherly goodness. If the Polish forces concentrated on Tszew then march into Danzig, whom will world opinion brand as the aggressor? The Polish Government would be wise to prepare itself by efficient propaganda against that day.

Financial Help Wanted

Economically, Poland is in a tight corner. Although during his visit to London, and since his return, Colonel Beck is understood to have made no request for financial assistance, there is in Warsaw a general feeling that either Britain or France ought to be ready at very short notice to bear part

of the burden of Poland's national defences, crushing in the real sense of that word, and, looked at from any point of view, it is difficult to see how the Entente Powers can do otherwise. Even without the precedents of help given to Turkey, Roumania, and Greece, the maintenance of an Eastern front is going to cost a great deal more money than the Polish Government can afford.

The first item on the bill is for foreign exchange, with which the Poles may sufficiently arm themselves. Given a plentiful supply of raw materials, the need for finished armaments is then broadly restricted to aeroplanes, tanks, and certain branches of artillery. The Germans themselves, with a striking lack of success, have already tried to fill this gap; the German-Polish commercial agreement of October 18th last was designed to supply Poland with machinery and equipment to the value of 120 million zlotys over a period of four years, but six months of the agreement have proved to the Poles that the terms on which the credit was granted are nothing like as good as they seemed. Deliveries from Germany have now fallen to a pace so slow that the agreement is regarded as virtually a failure; and the prevailing attitude to business with Germany was well brought out in Wednesday's *Gazeta Polska*, which announced that "the greatest care must henceforth be exercised in arranging export transactions with the Reich." Poland is not interested, the paper stated, "in presenting merchandise to Germany. We must be paid in goods that we need."

The agreement with Russia is a very different matter. With goodwill on the Russian side there exist conditions for a large extension in the amount of trade passing between the two countries, and the authorities in Warsaw are not without the hope of writing those conditions into the agreement.

Shortage of Cash

Apart from this urgent need for raw materials and for certain capital goods, there is the domestic shortage of cash. In normal times of peace the Polish Government spends, directly and indirectly, about 55 per cent. of its Budget on national defence; at present the proportion is higher than that. On top of this great outlay there is emergency expenditure on the mobilisation, variously estimated at between two and three million zlotys a day (at current rates, from £80,000 to £120,000). Unless financial help is forthcoming from abroad the Government will be able to keep up this level of expenditure during the coming months only by imposing fresh economies on what is already one of the poorest peoples in Europe. Meanwhile private firms are running into difficulties through the shortage of money in the banks (on which the recent Air Defence Loan is one more, and perhaps the final, drain) and through the caution which has prevailed on the London money market since September. In spite of this, the note circulation is soaring upwards, and there are signs that the National Bank may have to apply for powers to lower its proportion.

Help for Poland will therefore have to be of two kinds; and the sooner it is made the more it will benefit the Poles. The first kind must be the provision of raw materials and capital goods or the means to purchase these; and the second the easing of the internal economic situation by the tactical application of financial backing at those points where it is most needed.

Each of these problems, serious as it is in its way, must be qualified by the consideration that the Polish Government has behind it a nation united as never before and possessing a very high morale. This spirit of what might be called reticent belligerence showed very clearly in Colonel Beck's speech: Poland to-day is no longer sitting on the fence, but, having climbed down with a surprising dignity, is leaning against it looking towards Germany. Those who would accuse Poland of dangerous bellicosity should take notice that one foot is still placed on the bottom rung.

May 18th.

All-round Economic Improvement in France

[FROM OUR PARIS CORRESPONDENT]

IN April, exports further improved, in both volume and value, principally owing to increased exports of raw materials. At the same time, imports were still lower than a year ago.

In the first four months of this year the import surplus was no more than 4,843 million francs, against 6,255 millions in the corresponding period of 1938.

Relatively low French prices and increased hours of work have been the chief factors in this improvement, though it has been helped by recent trade agreements. In the first quarter of 1939 exports to democratic exchange countries rose by nearly 30 per cent. (principally to the United States, Switzerland, Holland and, most of all, the Northern countries), while exports to the totalitarian States fell by 16 per cent.

(Millions of francs)

	IMPORTS		
	April, 1938	March, 1939	April, 1939
Foods	1,002	1,031	1,157
Raw materials	2,276	2,276	2,253
Manufactured goods	610	685	715
Total	3,888	3,992	4,425
	EXPORTS		
	April, 1938	March, 1939	April, 1939
Foods	366	405	437
Raw materials	703	884	910
Manufactured goods	1,287	1,591	1,687
Total	2,356	2,880	3,034
Import Surplus	1,532	1,112	1,091

The increase in exports is very opportune at a time when it is imperative that heavy military charges should be spread over increased activity and rising income.

The Balance of Payments

If reductions in income from freight and interest on capital invested abroad are taken into account, as well as the progress of the tourist industry, it seems that the French balance of payments recovered its equilibrium in 1938. This is what MM. Rist and Schob conclude in the *Revue d'Economie Politique* for 1939:—

(In millions of 1928 francs)

	Credit	Debit
Commercial deficit (colonies included)	—	6,500
Freight receipts	1,000	—
Insurance receipts	350	—
Remittances of foreign workers.....	—	200
Tourist receipts	1,500	—
Interest receipts.....	3,750	—
Total	6,600	6,700

Increased Industrial Activity

The monthly index of industrial production rose further in March. It was 92, against an average of 82 in 1938, 88 in 1937 and 85 in 1935. This is the highest figure since the forty-hour week (for which a forty-five-hour week has just been substituted) was first generally introduced.

INDICES OF PRODUCTION (1928=100)

	March, 1938	October, 1938	February, 1939	March, 1939
General Index ...	84	81	90	92
Mines.....	96	93	95	98
Chemicals.....	96	94	106	108
Paper	157	157	175	167
Textiles	81	86	94	167
Leather	70	73	76	77
Metallurgy	73	66	79	81
Metals	83	72	85	89
Automobile	88	99	110	110
Building.....	59	62	67	73
Gas, electricity	133	122	126	73
Miscellaneous	109	103	111	110

The MERCANTILE BANK of INDIA

Branches and Agencies throughout the East

EVERY DESCRIPTION OF HOME AND EASTERN BANKING TRANSACTED

Enquiries invited

This renewed activity is due in great part to the war industries. One remarkable item, however, is building: this index has bounded up to 73, as a consequence of the repatriation of capital, the rise in the price of landed property and in rents and the new legislation to stimulate new building. This revival is especially welcome because building has been slack for a long time.

Record Car Output

Yet another industry that has gone ahead is the motor car industry. New records were achieved in the first quarter of this year with the production of 62,607 private cars and 7,075 commercial vehicles, against 48,063 and 6,496, respectively, in the same quarter of 1938.

Thus, the recovery in production is not solely the result of armament activity. And the general advance in activity has made necessary an improvement in coalmining. Daily output of coal has increased from an average of 1,234 kgs. in 1937, 1,221 in 1938 and 1,225 in March, 1938, to 1,265 in March this year. A third of the ground lost since 1935 in coal production has been recovered, and the improvement is a natural consequence of the abolition (by the decrees of November last) of previous legislation about overtime, limitation of the use of machinery, etc.

Nor should it be forgotten that the improvement in foreign trade and production, though obvious, is not as spectacular as the recovery that has taken place in monetary stability and credit conditions. The revival of the money market has just been underlined by the rapid subscription of the Reynaud Loan. And all these improvements lend additional support in turn to the whole structure of credit and business.

A Delicate Task

Nevertheless, France has scarcely got out of a difficult period of monetary and social troubles, which impoverished her severely. And though re-armament—which now employs 6,000 undertakings, against 2,500 in 1938—stimulates actual production, international tension, on the other hand, is hardly conducive to any appreciable advance in consumption.

Finally, France is a country of peasants and thrift, a country with relatively few wage-earners. It is not adapted to the violent ups and downs of the great industrial economies. It must go ahead slowly and quietly. This is why the immense effort that is now being put forward is being constantly held in control to prevent the balance of the liberal order from being upset. A monetary expansion, for instance, must be carefully adjusted to production lest it should provoke a dangerous rise in prices. Thus, the fresh monetary effort in the Reynaud decrees of November was counterbalanced by an increase of the hours of labour. The April decrees take a fresh step in both directions by the creation of the National Defence Bonds and the issue of a loan, on the one hand, and by the generalisation of the forty-five-hour week, on the other—in addition to other measures designed to mobilise the unemployed, to tighten up unemployment assistance regulations, to provide for refresher technical courses, and so on. These measures will have only a limited effect. The registered unemployed do not now exceed 384,000 in number, of whom 100,000 are women and more than a third of the rest men incapable of resuming work by reason of their age or other disabilities.

The problem of maintaining the huge re-armament effort on liberal lines is not a simple one. But the progress registered in only five months, a progress which M. Reynaud has just emphasised in his official report, suggests that the ways and means will be found to ensure the success of the task undertaken.

Trade and German Foreign Policy

[FROM OUR BERLIN CORRESPONDENT]

THE temporary slowing down of the Third Reich's campaign against Poland for the annexation of Danzig and the creation of a corridor through the Corridor may be attributed to the strong resistance of Poland now backed by the Western Powers. But, while the efforts of Great Britain, the United States and the Vatican for finding the basis for a peaceful solution of the Polish problem drag along slowly, the two dictator States, Germany and Italy, have consolidated their strength by making a firm military pact.

The Milan Agreement was part of the preparations for a new drive to secure satisfaction for the "natural claims" of the two seemingly never-satisfied nations. Despite Great Britain's growing opposition to aggression, political circles in Berlin are still convinced that in the end the Western Powers will give way, if only Germany and Italy apply sufficient military pressure, and leave Poland to its fate, just as they did Czecho-Slovakia. The view expressed in some quarters in both France and Britain that Danzig is not worthy to be the occasion of an international conflict has strengthened this belief in Germany and lent encouragement to the Nazi policy of ruthless demands.

A German success at the expense of Poland would have a very marked effect upon the balance of power in Europe. Danzig and the Corridor are, of course, less important to European strategy in themselves than were Austria and Czecho-Slovakia. But, just as the inclusion of Austria and Czecho-Slovakia in the Reich lessened considerably the political influence of the Western Powers in Eastern Europe and the Balkans, so might the annexation of Danzig and the Corridor signify the end of this influence. East and South-Eastern Europe would then be left to the complete political and economic mastery of Germany. However small its territory and population, Danzig represents probably the last rampart of the Western Powers against the advance of the Third Reich.

Germany's political expansion is already—and quite naturally—resulting in growing German economic influence in South-Eastern Europe. Germany's exports to Hungary, Roumania, Yugoslavia, Bulgaria, Greece and Turkey increased from Rm. 190.6 millions in 1933 to Rm. 675.7 millions last year for the old Reich alone; and the 1938 figure for Greater Germany was Rm. 797.3 millions. Since Germany now has the most important industrial districts of Czecho-Slovakia, German export pressure on the Balkans will increase, though it must be remembered that armaments will now absorb a considerable share of Czech industrial capacity, so that exports from Czech districts are not likely to be maintained at their former level.

The most important German exports to the Balkans—which in many cases compete there with English products—are textiles (woven and spun goods, artificial silk, cotton threads and piece-goods, silk goods, wool thread and woollens), motor vehicles, aeroplanes, rubber goods, paper, coal, coke and industrial goods such as machinery, electrical apparatus, locomotives, iron and steel goods, steel tubes, instruments, chemical and pharmaceutical products.

In the first quarter of 1939, German foreign trade has been perceptibly under the influence of recent political changes. Total exports declined from Rm. 1,360 millions to Rm. 1,262 millions, but exports to Northern and Eastern European countries actually increased. Exports to the four Northern States rose from Rm. 148.7 millions to Rm. 159.3 millions, and exports to South-Eastern Europe from Rm. 169.4 millions to Rm. 190.5 millions; while exports to the West European countries fell from Rm. 387.4 millions to Rm. 321.4 millions and exports to the United States and South America also declined considerably.

★ ★ ★

Standstill Agreement.—The standstill negotiations which began in Berlin on May 3 came to an end to-day. The new agreement consists mainly of a prolongation of earlier arrangements. The total of standstill debts at the end of February amounted to Rm. 777 millions. Great Britain, with Rm. 437 millions, was the largest creditor. The United States with Rm. 205 millions came second, and Switzerland was third with Rm. 67 millions. Between March 1, 1938, and February 28, 1939, the volume of standstill credits was decreased by Rm. 208 millions.

Turkey and the Axis

[FROM OUR ISTANBUL CORRESPONDENT]

LATELY, almost all the Turkish Press has expressed the general resentment felt in this country at the wanton aggression against other people's independence which has brought Germany to the door of the Balkans and Italy into their very heart. The Axis moves marked the end of the illusion commonly current with the man in the street that Turkey could manage to keep out of a possible war, or, at least, to maintain herself, so to say, on its fringe. There is general satisfaction that Turkey is now strong, and a number of military measures, such as the calling-up of the latest class before its time, have been generally welcomed.

How deeply public opinion was affected by the German-Italian threat on the Balkans may be inferred from the fact that pro-German propaganda, which had been very active, became for a time completely silent. Now it has assumed more insinuating forms; it makes great play with the traditional rule of Turkish foreign policy that this country is not concerned with foreign ideologies, but only with Turkish interests. This is to emphasise that the Turks are not in any ideological or political disagreement with the Axis; and, at the same time, to lay stress on the importance of Turco-German economic connections.

The prices at which transactions between Turkey and Germany are carried on have little relation to world prices; for a wide number of articles they are calculated to make it hard for other countries to compete with Germany. On the average, Germany purchases Turkish goods at about 60 per cent. above the world price level, and sells her own goods at about 30 per cent. in excess of world prices.

This clearly represents, to some degree, a measure of loss for Germany and a source of profit for Turkey. But it is not simply this advantage that compels Turkey to cling to German trade: it is the impossibility that the Turkish exporter experiences in seeking non-German buyers at prices corresponding to Turkish internal ones, and the Turkish Government cannot face a policy of extensive price deflation. The man in the street with some knowledge of trade wonders why the democratic countries which are apparently so desirous of political co-operation with Turkey do not make an effort to assist Turkey to extricate herself from these difficulties by buying more Turkish goods at higher prices, bearing themselves the cost. That cost has been calculated as follows (on the basis of 1938 figures):—

Total purchases of Turkish goods by Germany, Austria and Czecho-Slovakia ...	£T69,000,000
At world prices this would represent about ...	£T43,000,000
The excess paid by Germany thus amounts to ...	£T26,000,000
Total Turkish purchases of German goods ...	£T77,000,000
At world prices this would represent about ...	£T59,000,000
The excess paid to Germany thus amounts to ...	£T18,000,000

Thus, on this basis, the total German subsidy to Turco-German trade amounts to

£T8,000,000

The recent increases of Germany's share in Turkish foreign trade are, of course, more or less proportionate to the extent of Germany's territorial aggrandisement. The following figures relate to 1938:—

	Exports from Turkey	Imports to Turkey
Germany	47.0 per cent.	42.9 per cent.
Austria	0.5 "	1.2 "
Czecho-Slovakia ...	3.9 "	3.4 "

From this, the ordinary merchant in this country derives the impression that German economic influence and its political consequences might be counteracted at a cost of less than £1,500,000 per annum (£T58 = £). But some kind of organisation is necessary, and, since measures to increase Turkish sales to Great Britain are urgently needed, this ought to be done as rapidly as possible.

May 12th.

Uncertainty in the United States

[FROM OUR NEW YORK CORRESPONDENT]

PRODUCTION in April appears to have dipped below the March level. In part this is seasonal. In part, again, it reflects the coal strike in two ways: the production of soft coal has been cut about two-thirds; and reports are beginning to appear of curtailment (usually imminent rather than actual) in manufacturing enterprises unable to secure fuel. Beyond this, the dip appears to be somewhat greater than might have been seasonally expected.

There seem to be no signs of real weakness. Primary commodity prices, though sagging somewhat during a period when there has been much talk about business slackening, have not been really weak; and, indeed, over the past year or more, and particularly in the last nine months, fluctuations in primary commodity prices have been relatively narrow. To-day Moody's index of prices is almost precisely where it stood a year ago. This is in marked contrast to the wide oscillations of the index of production and the still wider movements of the index of share values—both of which, in the opinion of your Correspondent, have rather exaggerated the fluctuations in the economy as a whole.

The inflow of gold, which, since late last summer, has continued in amounts even beyond those to which we had become accustomed, has again become a theme of close discussion. For one thing, imports in the six months ended March were of the order of \$2,000 millions—far above current production. Secondly, because of these imports, excess reserves in the banks are now above \$4,000 millions, with every prospect of their rising in the not distant future, when the Treasury draws upon its general fund, either by drawing upon its deposits in the reserve banks or by monetising gold in the general fund. Thirdly, the situation has gained interest from recent discussions about extending the President's discretionary power over the value of the dollar. These three aspects of the question give rise to hours of discussion in financial circles; and the discussion goes on to include the general question of the future of gold in monetary systems and the specific question of the sterling rate, pegged for some time now at \$4.68.

The Role of Gold Imports

The statistical consequences of this gold inflow on our credit system are set out in some detail in *The Economist's* Banking Supplement (published with this issue), and it is necessary here to do no more than repeat that only a part of the recent incoming gold has as yet been fully monetised. Incoming gold is initially received into the general fund of the Treasury; the next step is to issue it to the reserve banks in the form of gold certificates, the Treasury being credited with a deposit, which is also part of the general fund. The third step is, of course, actual expenditure from the fund.

During the first half of the current fiscal year the Treasury borrowed in excess of its current expenditure; in the second half it is borrowing less and reducing its cash balances. As these are largely in the form of unmonetised gold or deposits with the reserve banks, deficit expenditures are directly and rapidly increasing excess reserves. Excess reserves were considered a problem when they were much smaller than now; yet there is every statistical prospect that the present figure of \$4,000 millions will increase to over \$5,000 millions within a short time.

THE BRITISH LINEN BANK

Incorporated by Royal Charter, 1746

Head Office: 38 St. Andrew Square, Edinburgh

OVER 210 BRANCHES IN SCOTLAND

LONDON OFFICES:

City Office: 38 Threadneedle Street, E.C. 2

West End Branch: 198 Piccadilly, W.1

On the other hand, the current rate of flow is in excess of current output. In other words, a previous accumulation or reserve of some sort is being drawn against. Conceivably this is the mere transfer and sale of privately accumulated gold in London—a transaction, so to speak, within the gold market and implying no strain on the exchange rate. On the other hand, it is also conceivable that it is the medium of a great movement of capital, originating outside of the gold market and using gold merely as a vehicle. In this case it would be analogous to a movement of gold under the old gold standard.

May 5th.

Reconstructing Polish-Russian Trade

[FROM A POLISH CORRESPONDENT]

THE history of trade between Poland and Soviet Russia can be divided into three quite separate periods. The first lasted from 1924 to 1930, when the Soviet economy was in a state of disorganisation caused by the Revolution and the process of changing the old capitalist structure into a Socialist economy. At that time Russian imports from abroad consisted of consumption goods, like sugar, textile materials, coal, metal products and so on. Poland had an export surplus, the balance being passive only in 1927-28, when large quantities of corn were imported from Russia.

At the end of the first period, that is, after 1930, the character of Polish exports to Russia underwent an important change. In consequence of the first Five Year Plan Russia's industry was greatly expanded, so that the Russian Government began to limit imports of consumption goods and to increase imports of engines, machinery, plant and iron.

The second period lasted for four years, that is, from 1931 to 1935. The course of Poland's trade with Russia during those years was as follows:—

POLISH TRADE
(in thousands of zlotys)

Year	Imports from U.S.S.R.	Exports to U.S.S.R.	Export (+) or Import (—) surplus
1931	36,039	125,257	+ 89,218
1932	19,343	29,051	+ 9,708
1933	17,697	59,945	+ 42,248
1934	17,740	25,477	+ 7,737
1935	14,942	11,086	— 3,856

On the Russian side, trade was solely in the State's hands, and for the most part Poland's rôle was to meet Russia's more sporadic needs rather than to satisfy the Soviet's regular requirements. A crisis came in 1935. There were various reasons for this. The most important was the question of granting credits to Russia. Russia requested 18 months' credit from Polish suppliers, which was an impossible condition. Poland's refusal to grant such credit led the Russians to place their contracts elsewhere, with other countries of better financial standing.

In the third period from 1936 to 1938 Polish-Russian trade fell away and there was a consistent surplus of imports into Poland.

POLISH TRADE
(in thousands of zlotys)

Year	Imports from U.S.S.R.	Exports to U.S.S.R.	Import (—) surplus
1936	16,200	9,010	— 7,190
1937	14,499	4,415	— 10,084
1938	9,850	1,403	— 8,447

Some decision had to be taken. Either Poland had to give up any prospect of a reasonable trade with Russia or a more able basis for that trade had to be found. The Polish Government chose the second alternative, and the result was trade agreement signed on February 19th this year.

The current year will be a trial period for the reconstructed trade with Russia. Upon it depends the future of Polish economic relations with the Soviets.

May 12th.

A Dismal Irish Budget

[FROM OUR DUBLIN CORRESPONDENT]

THE Minister for Finance introduced his eighth Budget in a speech of insipid gloom. Opening on a note of warning about the rapid growth of deadweight debt, he devoted the main portion of his speech to an explanation and justification of the unpalatable increases of taxation that he felt coerced to impose, and ended with a passage of unrelieved despair about the financial consequences of a European war. The change of tone from his other Budget speeches was very remarkable. Whereas in earlier years he was at pains to prove that the increase of debt was exaggerated by the Opposition, on the present occasion he made no attempt to minimise the gravity of the situation. Moreover, he indicated that further increases might be expected on account of borrowing that would be necessary in connection with housing, land settlement and the relief of unemployment.

It is impossible to disagree with the Minister's disclaimer of full responsibility for the exceedingly unpleasant message which he had to deliver to the Dail. As he said, it was not he who devised the elaborate schemes of expenditure for which he had to find ways and means. The Opposition are always calling for more and more expenditure, and the policy of the Minister's own colleagues is in its very nature expensive for the taxpayer. Actually the Budget probably made the best of a bad job. Expenditure on defence has arisen as a result of the European situation and even the most hostile critic of Mr de Valera would not accuse him of any share of guilt for the international tension which has led to re-armament. Old-age pensions have become more burdensome largely as a result of the change in the age-grouping of the population. It is difficult, perhaps, to justify increased outlay on education in a community marked by a rapid decline in the number of children. However, the fact remains that the social services, both for old and young, are becoming more costly, and the reversal of this tendency is neither possible nor desirable. The Irish citizen has no reason to hope for a diminution in the rate of growth of national expenditure, except, it is to be hoped, on defence.

Having made ample (possibly too ample) allowance for over-estimation in the supply services and having charged to capital account as many objects of expenditure as he decently could, the Minister had to find £1,180,000 from the proceeds of new taxation. This problem he solved by raising the standard rate of income tax from 4s. 6d. to 5s. 6d. in the pound and by increasing the duties on petrol and tobacco. The increase of income tax may have been a necessity, but it was an unfortunate one. Already indirect taxation and the cost of living were higher in Eire than in Great Britain and Northern Ireland, and the only fiscal advantage enjoyed by the resident in Eire was the lower income tax which has now disappeared. It is significant of the small additional taxable capacity of the country that the increase of a shilling in the standard rate should yield only £850,000 in a full year, and any further increase would unquestionably yield less. The taxable capacity of the direct taxpayer has been completely exhausted, and any future increases of revenue will have to be derived from indirect taxation which must necessarily hit the poor. Unless there is a substantial improvement in the national income during the next twelve months the problems presented by next year's Budget will be formidable indeed.

Meanwhile there is the more immediate problem of further borrowing. The Budget provides for £2,000,000 of capital and non-recurrent expenditure to be defrayed from borrowing, the finance accounts disclose that there are outstanding over £3,000,000 of Exchequer bills and ways and means advances which will presumably be funded, and the housing and land settlement programmes will call for abundant supplies of new capital. The Banking Commission reported categorically that savings in Eire were not keeping pace with investment and that much of the public expenditure of a capital nature was being financed by the realisation of external assets. While the strong creditor status of Eire prevents the emergence of any acute financial stringency such as might arise in debtor countries, it may at the same time mask the development of dangerous tendencies. It is comforting to know, as is clear from his Budget speech, that the Minister for Finance is alive to the perils of the situation, and it would be still more comforting if one could be sure that his orthodoxy was fully shared by all his colleagues.

Books and Publications

Dictatorship Dissected

IF a nineteenth-century Liberal were to revisit the world to-day nothing would surprise him more than the emergence of autocratic governments. Fifty years ago it was axiomatic among political thinkers that the tide of democracy was rising everywhere, and that it was only a matter of time before the last remnants of tyranny would perish. In the last ten years the political tide has set in the reverse direction, and in one country after another dictatorships have sprung into existence. A movement so widespread and so vigorous must command attention; even the most hostile critic of the dictatorships must be impressed by their virility and by the enthusiasm with which they are supported.

Mrs Spearman has performed a very useful service by the publication of her very interesting and illuminating analysis of this central phenomenon of modern politics.* The various dictatorships are shown to have arisen for different reasons, to be based on different philosophies and to have developed on different lines. Nevertheless they all exhibit certain common characteristics:

illegality, personal rule, the violent enthusiasm of at least a section of the people, the exaltation of the State and a depreciation of individuality, together with a worship of the personality of the dictator, invariably accompany modern autocracy.

The rise of a dictatorship is always evidence of a crisis of some kind, either the dissolution of long-established dynasties or the breakdown of democracy. The revival of autocracy contains two problems: the problem, essentially political, of the seizure of power, and the sociological problem of the change in public opinion which sanctioned its seizure. The dictatorships, once they have been set up, tend to develop on different lines. Mrs Spearman divides the European autocracies into three groups: first, the totalitarian governments of Germany, Italy and Russia; secondly, the Catholic dictatorships in Portugal and, for a short time, in Austria; and thirdly, the personal dictatorships, based on popularity or military success, in Poland and Yugoslavia. There seem to be three chief factors which influence in different degrees the evolution of different kinds of dictatorship—the kind of crisis, the kind of dictator and the national tradition.

Less is known by English readers about Portugal than about many of the other autocratically governed countries, and the description of Dr Salazar's regime is therefore especially useful. The experience of Portugal proves that a dictator in favourable conditions can govern without repression or cruelty. The secret of Dr Salazar's success is that he has accepted the Catholic morality, already strongly planted among the peasantry, as the basis of legislation. In Portugal, nationalism is not a very live force nor is the population educated up to the adoption of socialism, with the result that "there existed no other possible basis for a national revival than Catholicism." The Salazar government therefore has never been embarrassed, as Hitler and Mussolini have been, by a conflict between the ideologies of Christianity and the totalitarian State.

The fact is, as is shown very clearly by Mr Stewart,† that the modern State finds it increasingly difficult to reach a basis of accommodation with organised religion for the simple reason that it is evolving a religion of its own. It will be interesting to observe whether General Franco will follow the example of his Iberian neighbour or of his Fascist friends, in his attitude towards the place of the Church in Spain.

Mrs Spearman devotes a chapter to dictatorial economics in which she demonstrates that dictatorship must in practice, if not in theory, entail considerable interference with economic freedom. Too much independence of employers and trade unions might threaten the stability of the regime; a government that has come into power in a crisis must usually pursue an active programme of social improvement;

* "Modern Dictatorship." By Diana Spearman. Cape. 272 pages. 10s. 6d.

† "Dictatorship and Democracy." By W. D. Stewart. King. 121 pages. 7s. 6d.

and the very capacity to control economic life is a temptation to the exercise of such control. The corporative system is criticised on the grounds that it produces the evil of monopoly without its efficiency and that it raises costs.

In actual practice dictatorships have pursued much more disastrous policies than any democracy, and, even when their economics have not been disastrous, they have not been particularly successful.

The ultimate safeguard of democracy is the power to dismiss the government.

The question "Is Modern Dictatorship Successful?" forms the title of Mrs Spearman's last chapter. The price of dictatorship is shown to be partial or total loss of liberty, and its alleged advantages as a type of permanent government (apart from periods of crisis or revolution), namely, responsibility and continuity, are not admitted. (It is a pity that the discussion of this subject on page 263 is obscured by a serious misprint which completely inverts the author's meaning.) The practical conclusion for democratic readers to draw is that dictatorship is full of danger and that its approach can best be prevented by improving the working of our free institutions; as Mr Stewart puts it so truly, "if democracy is to survive it must be strengthened in its own rights and in its own merits."

Shorter Notices

"National Reserves." By L. St. Clare Grondona. Allen and Unwin. 190 pages. 7s. 6d.

As Mr R. F. Harrod points out in the preface which he contributes to this scheme for establishing commodity reserves, Mr Grondona has brought together three main ideas.

Revised and Enlarged after 3 years

THE HOME MARKET 1939

A BOOK
OF FACTS ABOUT PEOPLE

By Major G. Harrison and F. C. Mitchell and the
Research Staff of The London Press Exchange Ltd.,
with a Foreword by Frank Pick

*

WHAT THEY SAID
ABOUT THE 1936 EDITION:

'Should be of interest to many besides advertisers; for it gives in plain figures a striking picture of the significant changes that are occurring in the population of Great Britain.'
The Times

'Can safely claim to go further . . . than any single work yet put on the market'
Yorkshire Observer

'Boldly and finely done'
The Listener

'A pioneer work . . . Right to the end of this book of dispassionate statistics are stories which throb with the pulsing beat of a busy nation'

Daily Express

'As fascinating as a novel'
Sunday Express

DO YOU KNOW

- Which 7 principal urban cities now contain nearly half the people of Great Britain?
- That the average factory worker earns 64/6 a week?
- How much of these earnings is spent on food?
- That great numbers of young people are deserting some regions of Great Britain, and where they are going?
- That 75% of the families of Great Britain are working-class people?
- That nearly a third of the women who work are employed in two industries?

THIS BOOK TELLS YOU

Everybody who bought the original edition of *The Home Market*, and many more who did not, will want to get a copy of *THE HOME MARKET, 1939*. It is a new book, full of new facts and figures that dissect the people of Great Britain from every point of view as potential customers for all manner of commodities. Every table has been revised in the light of the latest statistical information, here assembled and collated as in no other publication.

12s. 6d. NET

GEORGE ALLEN & UNWIN LIMITED
40 MUSEUM STREET, LONDON, W.C.1

The steps proposed to prevent wide oscillations in the price of primary products would not only buttress the purchasing power of primary producers, but would also facilitate the establishment of strategic reserves; and the scheme would require the fixing, not of prices, but of a reasonable range of movement in prices. For the details and implications of the scheme, which have been very fully thought out (with a very shrewd perception of the reasonable criticisms that might be levelled against it), the reader is referred to the text, supplemented by 34 pages of appropriate statistical material. But the general idea is that a Corporation should be formed, sponsored by the Government but administered by practical experts. It should initially, in weak markets, buy up commodities, which may be surplus to world requirements, at a price fixed a year in advance, at some percentage, say 10 per cent., below a reasonable average, called the *datum*. This *datum* could be varied, always at one year's notice, thus imparting flexibility. The Corporation would sell normally, in strong markets, at a similar percentage above the *datum*. As Mr Harrod hints, the scheme as outlined may be too ambitious, and a moment's reflection will suggest a number of points that would require the closest scrutiny and investigation. Problems might arise in the initial creation of reserves and in the precise relation, not only between their commercial and strategic objectives, but also between the reserves and ordinary market operations. The scheme, Mr Grondona admits, might even necessitate processing cartels and further ramifications of control. But the fundamental idea of fortifying the purchasing power of primary producers is one to which no exception can be taken. It is one which embraces the proposals submitted last year by Professor Keynes to the British Association; and it offers a plan of action to solve a problem which is peerless in its complexity and world importance.

"Prix et Production en Agriculture." Jules Milhau, Institut Scientifique de Recherches Economiques et Sociales. No price stated.

A study of the elasticity of demand for certain horticultural crops in France, and the consequent possibilities of increased production. After a rather sketchy chapter on the general theory of elasticity of demand, the author analyses the market trends for cherries, peaches, nuts, beans and potatoes, and shows that the abrupt changes in relative price levels which occurred in 1929-33 had a very marked effect on the conditions of demand for these products. The importance of these and other studies on the demand for particular commodities lies in the fact that State intervention to secure a larger home production is only likely to be successful if demand is relatively elastic, so that the larger output can be absorbed without a marked fall in price.

GERMANY'S WAR MATERIAL IMPORTS

By Sir George Schuster, K.C.S.I., K.C.M.G., M.P.

PUBLIC interest has been increasingly turned during recent months to German trade and trade policy, to the effects of German policy on competition with our own trade, to the evidence which the trade figures supply of German preparation for war, and to the extent to which she possesses or controls essential commodities. As figures for isolated commodities may be misleading, the tables which accompany this article have been prepared to provide a convenient and comprehensive survey of the whole position as a general background to which reference can be made on particular questions. This has been the object, rather than to interpret the figures, or use them as a basis for making recommendations as to policy. Attention, however, will be directed in the concluding paragraphs to certain "high lights" in the picture presented and to certain broad conclusions.

Explanatory Notes

1. The tables have been prepared to provide a basis for comparison between:—

- (a) Germany's pre-war position—for which the year 1913 is taken.
- (b) Germany's position at the commencement of the Nazi regime (1933).
- (c) Germany's position during the period since 1936, when the effort of war preparation has been progressively intensified.

Figures for these years have been given of Germany's total imports and also of imports from certain selected countries, viz., the countries of the British Commonwealth, the democracies on Germany's western front (France, Belgium and Holland, with their colonies), Russia and the U.S.A. These have been selected because, if there were any economic "encirclement" of Germany, it is through these countries that (owing to their geographical position or political alignment) such a policy could most directly be applied.

2. The commodities covered are those given in *The Economist* note of April 15th, with the addition of pyrites, flax, jute, etc., coal and coke, together with wheat and maize, butter, lard, oil-seeds, and all other oils and fats. The commodities chosen are the main ones which can be regarded as connected with Germany's strategic programme. Steel and machinery have not been included, but the imports of these products are relatively small (compared with those of the crude ores and metals); and, in any case, the domestic exports from Germany far exceed the imports. Imports of ships (for breaking up) and of motor cars and engines of all descriptions have also been excluded.

3. The figures for 1913 represent the imports into pre-war Germany, i.e. including not only the Saar but also Alsace-Lorraine and those parts of Germany which were ceded under the Peace Treaties. Imports into Germany in the post-war years include imports into the Saar only since the date of its return to Germany, while, as regards the other territories now omitted, it must be remembered in making comparisons with pre-war figures that their import needs as parts of Germany are now excluded, but that materials taken from them which formerly figured as part of Germany's internal trade are now included in her imports. The boundary changes of 1938-39 have further complicated the picture: imports from Austria are included only up to the end of 1937, those for 1938 and 1939 being merged in internal trade. With the acquisition of Sudetenland last October, the ceded areas bordering Austria have come under the Austrian Customs, and those bordering Germany under the German Customs, so that imports into Germany since September include imports into the German-Sudeten regions. Figures which are only taken to the end of February, 1939, do not show the effects of the acquisition of Czechoslovakia in March.

The German colonies given to Britain and her Dominions and to France are, for purposes of comparability, included in the British and French Empires respectively in 1913 as well as in the post-war years.

4. Whereas the figures given in *The Economist* on April 15th represented imports less exports, the attached statistics are all

gross imports, since re-exports cannot be deducted on a country of origin basis. The country of origin shown in the German import statistics may mean country of production or of consignment or of purchase, or, more important still, country of clearing.

INCREASED ACCESS AND AUTARKY

The first point of major importance illustrated in the tables is that, in spite of what is often said about the freezing up of international trade or Germany's difficulties of access to raw materials, nevertheless, for all the important commodities covered by the tables—with the few significant exceptions dealt with below—the quantities which Germany imported in 1938 were substantially—and in some cases enormously—in excess of the imports of 1913.

The significant exceptions are wheat, textile fibres, and coal. These "exceptions," when examined, go far to "prove the rule" which can be derived from the trade figures as a whole; viz., that Germany has not had the slightest difficulty in access to raw materials, and that such difficulties as she has had in her trade have been the result of her own deliberate policy with its two-fold purpose: first, of concentrating her import power on materials essential for creating an enormous equipment for war; and, secondly, of making herself, in the case of certain essential commodities, as far as possible independent of supplies from sources which would be cut off in war. In the case of wheat, the reduction of her imports was due to her policy since 1928 of agricultural self-sufficiency, a condition which, as regards grain, she had practically reached by 1933 on the basis of normal harvests. Increasing imports of wheat and maize during the last three years have been for the purpose of building up war reserves.

In the case of the textile fibres—wool, cotton, flax and jute—the quantities imported in 1938 represented about two-thirds of those in 1913, and the reduction has, as is well known, been due to Germany's policy of developing the manufacture of synthetic fibres.

In the case of coal, Germany's 1938 imports were only one-third of the pre-war figure. Here, again, the reduction has been due to the deliberate policy of self-sufficiency, based on the exploitation of her own brown coal resources and the development of scientific methods for the utilisation of coal.

Smaller and less significant reductions of imports of zinc ore and lead are again the result of the development of internal resources. The only other decrease, compared with 1913, is in lard and dripping, and against this there must be set much greater increases in imports of other fats, or fat-supplying materials (butter, "other fats and oils," oil-seeds and nuts).

On the other side of the picture, 1938 shows very substantial increases compared with 1913 in imports of all metals and ores: imports of copper are up by 50 per cent., imports of copper ore are twenty-five times greater, imports of iron ore are nearly 70 per cent. higher, and of iron (pig and scrap) 250 per cent. higher. Again, mineral oil imports (refined and crude) are four times greater than in 1913, while rubber imports, in spite of synthetic production, are over three and a half times greater.

PURCHASES FROM PEACE FRONT POWERS

The second point of major importance brought out by the tables is the enormous quantity of Germany's imports drawn from the potentially "encircling countries," i.e. the

countries shown separately in the tables. In 1938 these countries supplied

- (i) between 40 and 50 per cent. of Germany's imports of the following commodities: wheat, oilseeds and nuts, "all other oils and fats," cotton, iron ore, lead ore, zinc ore, chrome ore and zinc;
- (ii) between 50 and 75 per cent. of the following: maize, wool, flax, jute, etc., coal, mineral oil (crude and refined), aluminium;
- (iii) 75 per cent. and over of the following: rubber (90 per cent.); manganese ore (85 per cent.); copper ore (80 per cent.); nickel ore (100 per cent.); iron: pig iron (80 per cent.); scrap (93 per cent.); copper (77 per cent.); nickel (75 per cent.); tin (92 per cent.); and coke (96 per cent.).

It is not the purpose of this article to suggest that the British Empire and the other named countries should combine to impose economic sanctions in peace-time on Germany. But the figures bring out two points with striking clearness:—How amazingly little justification Germany has for claiming that she has not access to raw materials, since she has drawn these enormous quantities of materials required for war preparation from the very countries which might have been expected to combine to prevent her building up power to threaten their way of life; and the great bargaining power that the British Empire and the other named countries would possess if they were to combine to use it for the establishment of a progressive international policy of peaceful trading.

BUILDING UP WAR RESERVES

The third point of major importance brought out by the tables is the intensification of Germany's effort to build up war equipment and reserves of essential commodities during the past two or three years. Under practically all headings there are very substantial increases since 1936, which are specially remarkable in the case of wheat and maize, and of all metals and ores (especially pig iron and scrap, copper, aluminium and nickel ore).

(a) Wheat, Maize, and Rye.

A short reference has already been made to Germany's policy as regards wheat imports, and the tables show the great increase in imports of maize since 1936. As regards wheat, the figures given in the tables do not bring out the full position, in order to appreciate which it is necessary to take into account the figures of home production. The figures on a crop-year basis (i.e. August 15th to July 31st) for home production and net imports are given in the following table (based on the reports of the Wheat Advisory Committee):—

GERMAN WHEAT POSITION			
Production		Net Imports	
Harvest Year	Millions of Bushels	Crop Year	Millions of Bushels
1909-13 (5-year average).....	118.1	1909-13 (5-year average).....	68.0
1932.....	183.8	1932-33.....	5.0
1933.....	205.9	1933-34.....	4.6*
1934.....	166.5	1934-35.....	10.1
1935.....	171.5	1935-36.....	0.3*
1936.....	162.7	1936-37.....	31.8
1937.....	178.6	1937-38.....	45.6
1938.....	214.7	1938-39 (Aug.-Mar.).....	29.9

* Net exports.

Notes.—(a) Figures above include Austria since 1936-37.
(b) Imports in the first three months of 1939 in metric tons amount to 121,793 tons. This does not include 100,000 tons of Argentine wheat recently purchased in a barter arrangement.

It will be seen that Germany's own wheat crop for the seven years 1932-1938 averaged 183.4 million bushels, and that her wheat consumption for the five years 1909-1913 averaged 184.1 million bushels. Therefore, apart from the effect of the recent inclusion of Austria, it looks as if she had attained an average state of self-sufficiency.

With regard to the stock position the following table shows the amount of wheat and rye in first and second hands (i.e. farms, mills and warehouses) on April 1, 1939. These apply to Germany, ex-Austria and Sudetenland:—

	April 1, 1938	April 1, 1939
(Metric tons)		
Wheat.....	1,750,000	3,313,000
Rye.....	2,094,000	4,347,000

The fact that all normal storage facilities were filled up and improvised storage had to be found for grain arriving in the closing weeks of 1938 suggests that very substantial quantities of cereals are held in reserve in Germany. It has been stated in trade circles that Germany has a reserve of grain equal to at least one year's requirements.

(b) Iron Ore and Iron (Pig and Scrap).

Taking the two headings iron ore and iron ore containing manganese together, German iron ore imports for 1938 were 9.6 million tons higher than in 1913. In this comparison the loss of Alsace-Lorraine must be taken into account; but it is still more notable that iron ore imports in 1938 were nearly 19 million tons higher than they were in 1933 and 34 million tons more than in 1936. Towards these last-mentioned increases the British Empire, France and Belgium with their Colonies have contributed 9 million and 800,000 tons. From these three sources Germany in 1938 drew about 45 per cent. of her supplies.

GERMAN IMPORTS OF IRON ORE (INCLUDING IRON ORE CONTAINING MANGANESE)
(Thousands of metric tons)

	1913	1933	1936	1937	1938
British Empire.....	178	224	442	1,200	1,718
France (and Colonies).....	4,428	1,240	8,499	7,829	6,856
Belgium (and Congo).....	127	49	826	2,020	1,979
Total of above countries.....	4,733	1,522	9,767	11,049	10,553
Total German imports from all sources.....	14,024	4,571	20,353	23,129	23,613

The figures for pig iron and scrap afford the most notable examples of intensive increase in 1938 and in the first months of 1939. Imports in 1938 were nearly four times as great as in 1936 and showed an increase of 1.15 million tons, of which increase no less than 1.04 million tons came from the British Empire, the United States, France, Belgium, and Holland with their Colonies.

GERMAN IMPORTS OF PIG AND SCRAP IRON
(Thousands of metric tons)

	1913	1933	1936	1937	1938	Jan.-Feb., 1939 (At the annual rate of)
British Empire.....	117	56	60	82	189	(491)
France and Colonies.....	54	33	122	110	254	(455)
Belgium and Congo.....	100	111	127	215	405	(682)
Holland.....	51	162	93	52	119	(132)
U.S.A.....	1	10	4	188	476	(472)
Total of above countries.....	323	372	406	647	1,443	(2,232)
Total German Imports.....	460	432	458	648	1,611	(2,422)

(c) Other Metals and Ores.

It is under these heads that some of the most notable increases in the last two years have occurred, and in many cases the chief part of the increase has come from the countries named in the tables. The following increases in imports for 1938 over 1936 may be noted.

Copper.—Increase 163,000 tons, an increase of about 85 per cent. Of this increase 109,000 tons came from the named countries.

Copper Ore.—Increase 171,000 tons, an increase of about 35 per cent. Of this increase 151,000 tons came from the named countries.

Manganese Ore.—Increase 196,000 tons, an increase of about 90 per cent. Of this increase 109,000 tons came from the named countries. (In this case 1937 was the peak year.)

Aluminium.—Increase 12.6 thousand tons, an increase of about 200 per cent. Of this increase about 11,000 tons came from the named countries.

Nickel Ore.—Increase 16,500 tons, an increase of over 90 per cent. The whole of this increase came from the named countries. This increase and the still greater proportionate increase in the first months of 1939 have been the subject of special comment. In this case, however, the whole of the increase represents supplies from a new source in the Dutch Indies, which is understood to be a very low grade ore.

(d) Mineral Oil.

Much is written about Germany's reliance on Roumanian supplies, but it is interesting to note that, over the last few years, she has been drawing increasing proportions from the U.S.A. and the Dutch Colonies. As regards refined mineral oil, total German imports in 1938 (3.64 million tons) were about 400,000 tons more than in 1936, but imports from the U.S.A. and the Dutch Colonies (2.52 million tons) were nearly 700,000 tons higher.

IMPORTS OF ESSENTIAL WAR MATERIALS, FATS, ETC., INTO GERMANY (PRE-1938 BOUNDARIES)*—YEARS 1913, 1933, 1936-38 & JAN.-FEB. 1939

THE BUSINESS WORLD

Is Bank Rate Obsolete?

BY a fortunate coincidence May witnesses the appearance both of the annual report of the Bank for International Settlements and Volume I of the League of Nations "Money and Banking, 1938-39." Both publications necessarily cover part of the same ground, but there are sufficient points of difference to make each invaluable. Paradoxically enough, the B.I.S. report is concerned with the world's broad economic problems in 1938; while the League volume deals with the narrower question of monetary developments during that year. The upshot is that the two publications are complementary in more senses than one.

Much of the ground covered has been the subject of close discussion in Great Britain; but the real value of both volumes is that they give an exhaustive account of what has been happening in all the important countries of the world, so that the reader no longer has to judge the past year by British experience alone. They also present certain important conclusions which can only be reached through a study of the world's affairs as a whole. Thus the B.I.S. report brings up to date the annual survey of gold movements. New gold production in 1938 it estimates at \$1,290 millions. Receipts of gold from Far Eastern countries are placed at the insignificant total of \$57 millions, and after allowing for gold absorption by industry and the arts, the Report concludes that about \$1,300 millions of gold was added to world monetary stocks during the year. Disclosed addition to monetary stocks during 1938 amounted to \$1,750 millions, thus leaving a discrepancy of \$450 millions compared with the previous total. The B.I.S. explains this discrepancy by alluding to the British Exchange Equalisation Account's gold losses during 1938, which are estimated at £200 millions, equal to \$900 millions. This estimate, which agrees closely with *The Economist's* previous calculations, means that a net \$450 millions of gold passed into undisclosed monetary stocks (outside Great Britain) during the year. The greater part of this amount, the B.I.S. believes, passed into various Exchange Funds, notably those of France, Holland and Switzerland.

Both Reports lay stress upon the importance to the pound sterling of the course of trade throughout the sterling area. The B.I.S. points out that in the "boom period" of the winter of 1936-37, the sterling area countries (other than Great Britain) accumulated about £100 millions of sterling assets. After the 1937 fall in raw material prices, these countries had to draw on their sterling reserves to meet their current needs, while they also reinvested part of these reserves in either gold or dollars. The League report contains a detailed table showing the central exchange reserves of fifteen sterling area countries. During 1937 the total rose from £222 to £256 millions, but during 1938 it shrank to £208 millions. The impression left by these analyses is that a substantial part of Great Britain's £200 millions gold losses during 1938 was not due to international movements of capital, but to the adverse balance of payments of the sterling area countries. This point is of some importance, as hitherto there has been a disposition to ascribe the whole of our 1938 gold losses to such capital movements as the French repatriations and the more recent exodus of funds to New York inspired by fears of war. There is also too great a readiness to assume that

little hot money now remains in London, and that we therefore need not fear any further serious inroads into our gold reserves. The answer here is that so long as our own balance of payments and/or those of the sterling area countries remain passive, we cannot assume that our gold reserves will remain intact.

The question whether outflows of gold are due to payments on capital or on income account obviously raises an important issue of future monetary policy, on which the B.I.S. Report contains some important comments. Before the war, the B.I.S. points out, flights of capital were exceedingly rare, and gold movements were almost always the reflex of changes in the balance of payments and indeed in the rhythm of business activity in the various countries. This fact made it appropriate to apply the lever of Bank rate alterations to check an undue expansion or to stimulate a recovery.

During post-war years flights of money became of importance even prior to 1931, a fact to which the Macmillan Report called attention. By to-day, the B.I.S. says, there has developed a body of opinion which does not admit the need of raising Bank rate simply because there is a deficit in the current balance of payments. Instead, that opinion argues that a deficit may occur even when the domestic economy is in a depressed condition, and it recommends that Bank rate should only be increased when business activity is expanding unduly. Even that limited use of Bank rate has largely been jettisoned. If in the late autumn of 1936 a warning had been given by a rise in Bank rate, business people would have become more hesitant, and as a result would have avoided the unduly large purchases of stocks, the raising of prices and the substantial increases in wages, which in many countries were both the prelude and the chief cause of the 1937-38 recession. The Report holds that there are strong arguments for resorting once more to timely alterations in Bank rate. An increase of one per cent., the B.I.S. says, does not as a rule materially increase costs for uses of credit and certainly not much for the holders of commodity stocks. Its psychological effect, however, can be very great—in many cases sufficient to check a tendency to undue expansion.

It is now seven years since Bank rate in this country was reduced to two per cent, and since then there has been no change. Indeed, only last week Sir John Simon repeated the Government's assurance that the policy of cheap money would be continued, and this is one explanation of the recent relapse in discount rates and rally in gilt-edged prices. Now at the time of its introduction in 1932, and for several years afterwards, the case for cheap money was overwhelming, for trade and industry then needed all the stimulus that could be given to them. Since then, however, we have had the 1933-37 recovery, the 1937-38 recession, and what looks like becoming the second recovery of 1939; and as the B.I.S. points out, this present recovery is a feverish movement, intermingled with re-armament finance and expenditure and lacking stability. It would be rash to conclude that because a 2 per cent. Bank rate has survived all these changes, and because it is still appropriate to-day, it can, or should, continue for ever.

Monetary policy is now determined by the Government

and not by the Bank of England. From a democratic standpoint that is right, but in actual practice the Government possesses a dual and at times a divergent interest. One of the first duties of the Treasury is to keep down unnecessary expenditure, and this duty is becoming more insistent with the growing cost of re-armament. This means that it is essential to borrow as cheaply as possible. The more the Chancellor has to borrow, the more difficult and the more important that duty becomes, and the more necessary he finds it to follow a cheap money policy. Yet heavy borrowing itself might create conditions in which a higher Bank rate would be inevitable. It is not suggested here that this is more than a possibility to be borne in mind. Suffice it to point out that the Government's duty to the taxpayer and its duty to the broad economic interests of the nation may not always agree.

Furthermore, it should not be forgotten that, for the purpose of turning slump into recovery, it is not so much the low level as the reduction of money rates that is relevant. Obviously, if money rates are already so low as to be irreducible, that particular stimulus cannot be applied,

and so it may be that if money were kept cheap at all stages of the trade cycle, we should be sacrificing some of its potential benefits. To-day the impression is that the demands of re-armament upon the available factors of production make the danger of a fresh depression remote, but if at some future date it becomes possible to relax our re-armament efforts, we may be hard put to it to prevent a sharp recession in trade and employment.

For these reasons, therefore, it would be wrong to regard a 2 per cent. Bank rate as immutable. It is not suggested that a change would be appropriate to-day or at any particular time in the future. The B.I.S. Report, however, has performed a useful service in reminding us that Bank rate may still have its uses. As the Report says, Bank rate may be a smoother, swifter and more certain weapon than the modern system of restriction, both official and unofficial. We remain to-day closer to the gold standard than many people realise, and we ought not to delude ourselves that we are approaching the monetary millennium or that we can abandon as obsolete all the weapons which, when properly used, served us well in the past.

Steel Shares in Perspective

STEEL shares, to those who have never invested in them, appear to epitomise all the essential qualities of an attractive investment. Peace, prosperity, and a rising standard of living mean more ships, more cars, more public and private buildings, more factories and machinery. The approach of war brings an urgently increased demand for armament machinery, munition works, internal combustion engines, battleships, steel shelters, and the like. And in wartime the industry's "market" is almost unlimited. Yet the fact that the Actuaries' Index of the average price of representative iron and steel shares (December 31, 1928 = 100) now stands at 56.8, against a cyclical peak of 86.3 in November, 1936, and that the average dividend yield has risen from 3.55 per cent. to 6.68 per cent., suggests that investors, at the moment, are chary of accepting the theoretical case for this threefold option without considerable qualification. What are the reasons for this conservatism?

The initial fall in steel shares from their November, 1936, peak would seem to have been largely due to fears of a cyclical recession, which have now been reversed. The movement was reasonable at the time, since steel production is extremely sensitive to fluctuations in demand from the capital industries, and, since the economies of a large output are considerable, even a moderate drop in the ratio of production to effective capacity has a disproportionately depressing effect on earnings. But increased re-armament has averted the threatened recession in British industry, and steel ingot production, which dropped from 12,984,000 tons in 1937 to 10,393,800 tons in 1938, was running in March and April last at a rate equivalent to an annual figure of 13,375,000 tons. To-day, there is widespread expectation that in a relatively short time demand may be near, or above, the industry's total effective capacity, which (allowing for normal stoppages, repairs, etc.) was put at 12,600,000 tons in July, 1936, 13,800,000 tons at the end of 1937, and has been estimated at approximately 14,500,000 tons to-day—though some authorities contend that, in practice, production could not be maintained at much more than 13,000,000 tons a year, for any length of time.

So far, therefore, as present steel share prices discount fears of cyclical under-employment in the near future, the shares are to that extent undervalued. It is generally agreed, however, that the reasons for this relative unpopularity go deeper. The public is becoming increasingly aware that, for steel producers, the advantages of near-war or wartime conditions for the industry may be largely offset by the disadvantages inseparable from close association with the armament industries. In the last war, the

exigencies of national defence forced the industry to increase its capacity far beyond peace-time requirements, and the combination of reduced profits and fixed charges (the legacy of the post-war funding of wartime capital commitments) reduced net profits and ordinary dividends on many of the larger companies' ordinary shares to vanishing point. Again, special Government legislation to tax arms profits

**'I'll be there on time
all right—I'm flying
by KLM'**

WELL EARNED and jealously guarded is the KLM record for punctuality. It is efficiency in all departments—in planes, in pilots and in ground staff—that keeps KLM schedules so precise, and ensures that by KLM you fly always punctual to the minute. Playing a big part towards this end are the famous Douglas air liners. These fast and luxurious machines have proved their supremacy in millions of miles of faultless flight. It will certainly pay you to fly KLM on business, on holiday, or to make your leave much longer.

is pending, and many investors fear that the industry may be caught between the upper and nether millstones—in other words, that it may have its surplus profits taxed away under near-war or war conditions, and be subsequently left with depleted and deficient earning power on a swollen plant capacity.

Obviously, all these dangers are substantial, but it may be questioned whether, in its present mood, the market is not somewhat exaggerating them. Despite the drastic incidence of E.P.D. between 1916 and 1920, the profits—and dividends—of steel companies increased substantially during the last war, and it is clear that, however strong the popular demand for limitation of armaments profits may be, the industry must be allowed some financial incentive for the attainment of increased output. The inevitable disadvantages of the disappearance of special demand, on the eventual conclusion of a war or the completion of the

dividends, since the difficult years of the 'twenties and the depression of 1931-33.

The politics of the steel industry will always be controversial, and its structure is still capable of extensive long-term improvement—by way, particularly, of an increase in the size of the average productive and administrative unit. And its finance, broadly speaking, will continue to leave something to be desired, so long as important (and, ultimately, indispensable) innovations of modern practice, like the setting up of continuous strip mills, require special facilities from the central banking authorities to ensure their completion. Nevertheless, much has been done since the 'twenties, to rehabilitate the finances of the best individual concerns. A good deal of "water" has been squeezed out, and the burden of heavy fixed charges has been appreciably reduced by the numerous schemes effected in the last ten years. And the industry's tactical position has been enormously strengthened by the progress made towards centralisation of production and price policy under a Federation in touch with the Import Duties Advisory Committee, and the concentration of its main effort on a highly protected home market. The immediate earnings prospect must be deemed satisfactory. Though the burden of taxation may be increased, no industry can work near capacity, even under conditions which may strain its existing organisation and make for expensive marginal production without, at least, some part of the resulting financial reward percolating through to its shareholders. The steel industry's post-re-armament problems may, undoubtedly, be formidable. But to estimate their probable dimensions is impossible at this stage; for much obviously depends on the nature of the post-bellum, or post-re-armament environment. For example, an eventual return to sanity in international affairs might offer an opportunity to the industry to expand its attenuated export trade.

For steel shareholders, as for property owners, there is no effective means of insuring against war risks. But investors who regard the more immediate outlook as fairly favourable can limit their liability, both as regards the approximate danger of discriminatory taxation and the ultimate possibility of reduced martial demand, by concentrating as far as possible on the shares of companies of large size, whose output is indispensable both for war and peace, but consists of the raw material for arms rather than finished armament products. A selection of such concerns, including both composite steel producers and specialists, is given in the second table. The results of the companies whose accounts ended last March or will be made up in June and September next, may be expected to show some reduction of earnings in their latest year, but the trend should be for increased profits in 1939-40. At present, the ordinary shares of Richard Thomas must be regarded as a fairly promising speculative lock-up, while the high "gearing" of Dorman Long ordinary shares makes them a better holding on a rising than a falling profits trend. Such shares as Guest, Keen, Tube Investments and, particularly, United Steel, seem best qualified as medium-term holdings at a time when the medium-term outlook is easier to assess than the long-term prospect.

re-armament programme, should be mitigated by the fact that the industry's internal organisation is better to-day than before the last war, and that the environment in which it would find itself would be very different from that of the 1920's. To indicate the changed conditions of the background for the steel industry to-day, it may be relevant to consider the figures in the first table, which is based partly on official data and figures already given in *The Economist*, and partly on a re-calculation of figures given in *The Economist's* quarterly analyses of industrial profits since 1924. The annexed chart (compiled from data from the same source) shows in striking fashion how representative steel companies have increased the return on their total paid-up capital and their ability to pay ordinary

Finance and Banking

The Standstill Agreement.—The German Standstill Agreement has been renewed for another year, up to February 29, 1940, on very much the same basis as before. This decision was generally expected, especially as out of the original sum of Rm. 6,000 millions involved in 1931, only about Rm. 770 millions are now outstanding. Of the present total, over Rm. 400 millions are due to British creditors, and over Rm. 200 millions to American creditors. Switzerland's share is Rm. 67 millions, and Holland's share Rm. 50 millions, leaving only about Rm. 50 millions due to France, Belgium and other countries. It is pointed out that the total amount of Rm. 770 millions is smaller than Germany's present trade, in both directions, with the British Empire, and so under normal conditions would easily be brought into active use against self-liquidating transactions. This is the basis of the tentative suggestion for the recommercialisation of outstanding bills drawn under the Standstill Agreement. Fundamentally, it would be much better for renewal bills, originating from transactions carried out many years ago, to be replaced by bills relating to current trade, but in practice the problem is not quite so simple. There has been a certain amount of recommercialisation in the past, but almost all of this has taken the form of import bills, which means that the creditor has to rely solely upon Germany for ultimate repayment. Export bills have the advantage of providing a foreign debtor. Apparently the Reichsbank is seeking to grant exchange permits to importers, on the condition that they take over and make use of standstill facilities—even in cases where the importer wishes to pay immediate cash. This enables the Reichsbank to conserve its foreign exchange, but it thrusts upon the importer a foreign currency liability, and does not relieve the standstill creditor of his existing commitments. The new Agreement contains several minor changes. Where less than 82½ per cent. of outstanding facilities are being made use of, the creditor can cut them back by a further 20 per cent., that is to 62½ per cent. Repayments under the Golddiskontbank guarantee, which last year were suspended, are to be resumed, and distributed among the creditors by a kind of clearing agreement. The flat fee of 15s. per Rm. 100 charged on purchases of registermarks is to be replaced by a sliding scale, whereby any cheapening of the cost of registermarks will be to some extent offset by an increase in the fee. These details represent minor concessions to the standstill creditors, but in the main the Agreement has undergone little alteration.

Thawing Frozen Credits.—Coinciding with the announcement of the renewal of the German Standstill Agreement, details have been published of the formation of a British company designed to take over and liquefy the most frozen of the assets covered not only by the German, but by the Hungarian standstills. This organisation is to be known as the Continental Assets Realisation Trust, Ltd. It was registered last December with a nominal capital of £100. This capital is now to be increased and will be issued to those holders of frozen assets in Central Europe who decide to make them over to the Trust. The Trust has started its activities with the £1,000,000 odd of German and Hungarian standstill claims previously held by the London Merchant Bank, now in process of liquidation. It has now made an open invitation to all standstill creditors to transfer to the Trust their claims outstanding and immobilised under standstill agreements. The invitation applies particularly to cash advances and acceptance credits of a non-commercial character. The Reichsbank has given its consent to any transfer of claims under the German Standstill Agreement which may be made to the Trust. The backing behind the offer made by the Trust must, of course, depend on the special facilities

and aptitude for "unfreezing credits" which the management bring to their task. Standstill creditors will only be induced to transfer their claims and exchange them for an equity holding in the Trust (a holding which must rank after the overhead charges), if they are satisfied that the degree of expertness with which they can handle their own frozen credits falls short of the likely achievements of the Trust in this direction. One aspect of the formation of the Trust which deserves attention is the fact that the transfer to it of the most stiffly frozen and least commercial part of the standstill debt will in fact tend to achieve that separation of commercial and non-commercial credits for which the German delegates have been pleading in recent standstill negotiations and which the creditors have until now successfully resisted.

* * *

Values for War Risks Insurance.—There was cause for dissatisfaction with the valuation basis for war risks insurance laid down at the inception of the newly-formed War Risks Cargo Pool. Briefly stated, the valuation was limited, in the case of cargo other than specie and bullion, to market or invoice value, plus freight and other charges, plus 10 per cent. for profit. In the case of gold bullion and specie the valuation was on the basis of the market value of the fine gold content in London on the day following arrival at the destination—or, if the gold did not arrive, the day following normal arrival date—plus ½ per cent. The basis for cargo other than bullion and specie, in that the profit allowance was arbitrary, departed from the normal marine insurance practice whereby insurer and underwriter usually come to an agreement on value including the trading profit—and state the agreed value in the policy. The basis for bullion and specie was subject to the criticism that ½ per cent. was an insufficient margin for arbitrage costs and profit. Both bases of valuation have now been revised and improved. A new ruling issued by the War Risks Cargo Pool provides that, for cargo other than bullion and specie, the usually accepted basis shall apply—that is, in the majority of cases, the value agreed by the parties and stated in the policy. The revised basis for gold bullion and specie increases the addition of ½ per cent. to one of 2 per cent. This increase in the arbitrage margin may be regarded as a compromise with the arbitrageurs, who argue that they need valuations in dollars, not sterling, since their profit arises out of forward sales of dollars in New York. The margin of 2 per cent. certainly makes the war risks insurance facilities offered by the Pool more effective for gold arbitrage while the change in respect of ordinary cargo brings the Pool's practice into line with that usual in the market.

National Bank of Egypt.—Full details of the recent agreement between the Government of Egypt and the Board of the National Bank of Egypt have now been

FOR ALL INSURANCE NEEDS

ROYAL INSURANCE COMPANY LIMITED

Head Offices:
LIVERPOOL LONDON
North John St. Lombard St.

Reserves in the fire and accident departments, in addition to the usual reserve of 40 per cent. of the premium income for unexpired risk, amounted to £4,870,000 and £2,666,000 respectively, while the marine fund is equal to 179 per cent. of the 1938 premium income. Total assets of the Commercial Union and its subsidiaries amount to £68,611,000, of which rather more than one-half represents life assurance funds, and general reserve fund amounts to £4,405,000. The value of Stock Exchange securities is in the aggregate below market values as at December 31, 1938. The dividend is repeated at 40 per cent. and costs £1,041,000, against interest earnings of £688,000.

Investment

Gilt-Edged Yield Fluctuations.—The recovery in the gilt-edged market, so prominent in the previous fortnight, has continued this week, though at a less impressive pace. Certain features of the recent behaviour of Government securities can profitably be examined after this rise. A Note in last week's issue of *The Economist* (page 381) showed that gilt-edged movements since early March were characterised by a relatively heavier depreciation in the shorter-dated stocks during the declining phase, and a relatively greater recovery compared with the "longs" in the upward phase which began on April 19th. But the disproportion between the fluctuations in redemption yields of the short and long-dated issues has been even more pronounced. Yet though this seemingly paradoxical movement has been most severe, it is by no means an isolated instance in the contemporary history of the gilt-edged market. Other instances which have occurred since last summer may be exhibited by employing a device for measuring yield relationships between securities of varying life. The succession of Government issues in recent years has provided a series of stocks covering a wide period with fairly evenly spaced redemption dates. In practice, it has been found that if yields on these securities are plotted at any one moment in regular order from the shortest dated stocks to the longest, the successive points appear to follow a fairly regular course. Hence it is possible to calculate a figure giving, simply, the average increase in yield for every year by which the life of redeemable stocks is lengthened. For various reasons, the high coupon stocks, whether they be "longs" like the 4 per cent. issues (Funding, Victory and Consols) or "shorts," like Conversion 4½ per cent. and Conversion 5 per cent. have to be excluded, leaving seven issues. These are set out in the table below, which shows net redemption yields of the group at each of the major turning points of the market since last August—with the exception of the momentary pre-Munich "low." Net redemption yields are used in preference to gross yields, but only because the relationship between the issues has been found to be of a simple linear order, and this choice in no way affects the argument.

NET REDEMPTION YIELDS PER CENT.

Stock	Aug. 23, 1938 High	Oct. 17, 1938 Low	Nov. 14, 1938 High	Jan. 30, 1939 Low	March 10, 1939 High	April 19, 1939 Low	May 17, 1939 High

Annual yield differential per cent.	9-6d.	6-7d.	8-5d.	5-0d.	8-8d.	Nil	6-5d.

* Redemption calculated to 1946.

The figure at the foot of each column gives the average annual yield differential at each date expressed in pence per cent.

Yield Differentials Compared.—What conclusions may be drawn from these results? They can only be summarised here, since their implications deserve more extended treatment. It is clear that every temporary downward movement in prices has been marked by a narrowing of the annual yield differential. In other words, as prices have fallen, the relative attractiveness of shorter-dated stocks, from a yield standpoint, has increased. Two tentative explanations of this puzzling phenomenon may

be advanced here. First, short-dated stocks are regarded by some investors as second line reserves after cash and may thus be more freely liquidated when prices are falling than the longer-dated securities, which are more firmly held as permanent investments. Secondly, all the downward movements in the past year have been the result of political scares accompanied by the contingent possibility of war. The view is widespread in the market (pace Mr Keynes) that in war time the Government may have to borrow, even on fairly short-term, at high rates of interest. Under these circumstances the shorter-dated stocks like National Defence 2½ per cent. and Conversion 2½ per cent. would be even more vulnerable than those of longer life—since the latter stand to benefit from any future drop in interest rates (presumably after the war is over), while the "shorts," both new and old, would be prevented from rising by the imminence of their redemption. That this interpretation possesses at least some measure of plausibility is shown by the second conclusion which emerges from our table. It will be seen that, with the exception of March 10th, every "high" has shown a yield differential smaller than the previous "high," and every "low" a differential smaller than the previous "low." This suggests that, throughout the period, despite substantial fluctuations, there has been a steady tendency for the annual average to decline as prices have moved to lower levels. The climax reached on April 19th, when the differential fell to zero for the first time, is thus merely the culminating point of a continuous movement. Whether it will persist in the future, bringing, perhaps, a yield premium on the shorter-dated issues at some time, remains to be seen. Until confidence in the willingness and ability of the authorities to reverse the downward trend in gilt-edged securities, which has now been sustained for many months, becomes more widespread, any drastic reversal of the present tendency seems improbable.

Unit Trust Management.—The fifth annual Unit Trust Survey, published with last week's issue of *The Economist*, included full particulars of management companies, tabulated on pages 32 and 34. All the concerns listed are private companies, and no information relating to profits is filed at Bush House. To a considerable extent shareholdings are masked by nominee registrations, but appreciable light can, in fact, be thrown upon management control, despite this deficiency in British company practice. In each case the date of registration of the company and the date of the latest Bush House return, upon which the table is based, is given, though certain particulars have been inserted from later information. It should, perhaps, be pointed out that paid-up capitals do not represent the full financial resources upon which many of the groups can call in case of need. To examine the scope of management changes over the last two years, the table may be compared with the similar table published in *The Economist* Unit Trust Survey of April 17, 1937. At that date twelve groups could be distinguished. To-day there are fifteen groups, owing to the creation of five new groups (of which one was in existence in April, 1937, but associated with other groups) and the merging of two formerly independent groups with other companies. The new groups include Brewery Trust Managers, which replaced London Management Securities as manager of Brewery Unit Trust in December last year, and has directorial connections with the Domestic group (formerly known as F.T.M., Limited). Similar connections are evident between the Domestic group and Proved Securities, now under the chairmanship of Mr Denys Lowson. Although registered in December, 1936, Proved Securities was formerly associated with Selective and Trust of Transport. The latter companies, together with their trusts, were brought into the British Empire

group under the management of Investment Managers and Secretaries. All the trusts in this group, however, are now closed; the Selective and Trust of British Transport companies have been put into liquidation, and their management functions have been taken over by the parent company. It may, perhaps, be mentioned that the capital of Investment Managers and Secretaries has been increased within the last few days to £25,000, and is held by the four Conversion Investment Trust companies, as to £10,430, £3,100, £1,900 and £9,570 respectively. Other new formations include Lombard Unit Investments, Limited, of which Mr Patrick Nicholson, formerly associated with the Fifteen Moorgate group, is managing director, and which has associations with Close Brothers, Limited. Orthodox Unit Trusts provides another example—though they are still quite rare—of a link between unit trusts and investment trust companies, for the chairman, the Hon. J. M. Balfour, is a director of the London Border and General Trust. Unit Investments, Limited, completes the list of new formations.

There are signs, viewing the management company changes over the past two years, of slightly greater concentration of interests among the management companies established by April, 1937. The changes in the Brewery, Domestic, and Proved Securities groups, for example, may prove significant, while the acquisition of the Protected group by National offers a further example. The scope for the merging of management interests, however, is not over-extensive. It is quite possible for a small group, whose trusts have not sold readily, to endanger its capital, and in such straits it scarcely represents an attractive purchase for a larger group. An unsuccessful group cannot be converted into a paying proposition, as a rule, merely by more substantial management connections. This factor may partly explain why consolidation has not proceeded further than our tables show.

Company Notes

Imperial-British Airways Merger Terms.—The announcement of the terms of the Government's offer to shareholders of Imperial Airways and British Airways (made after *The Economist* had gone to press last week) was anticipated by a sharp rise in Imperial Airways shares from 30s. to 32s. 6d. The payment offered to Imperial Airways is £2,659,086 (equivalent to 32s. 9d. per £1 share), together with interest at 4 per cent., since March 31, 1938, from which date the undertaking is to be taken over. To British Airways payment of £262,500 is offered, together with the repayment of £311,000 advances, equivalent to approximately 15s. 9d. per share. In this case, the undertaking is to be acquired as from September 30, 1938, from which date interest at 4 per cent. will accrue. It was generally expected that the Government would not offer less than 30s. per share to Imperial Airways shareholders, in view of the official part which was played in determining the issue price of 30s. per share for the issue of one million shares in June, 1937. The actual basis of the purchase, however, is a valuation made by independent accountants on behalf of the Government, which showed that the company and its full subsidiaries possess net tangible assets of not less than £2,484,000. In addition, a further payment of about £175,000 has been agreed to cover assets written down to a nominal figure (but which still have substantial value), together with "the value of the organisation built up by the company in this country and overseas," to quote Sir Kingsley Wood's explanation on Wednesday. The consolidated balance sheet of the company and its subsidiaries at March 31, 1938, showed net tangible assets, after deduction of £565,444 obsolescence reserve, of £2,329,000.

Imperial Airways shareholders, who must perforce accept the new basis on which the company is to operate in future, should find the terms offered satisfactory. There was some possibility—though perhaps not serious—that the price might be less than 30s. And certainly recent estimates had not suggested a price so high as 32s. 9d., on which the accrued interest to date amounts to just under 1s. 6d. gross. In recommending the terms for acceptance, the directors state that trading results for the year to March 31st last would not have covered a dividend in excess of the amount of interest allowed—which would be equivalent to 7½ per cent. gross on the shares, compared with 7 per cent. paid in respect of 1937-38. Considerable play has been made of the expectation of 10 per cent. earnings—such a rate is specifically mentioned in the Empire Air Mail scheme in connection with any adjustment of the subsidy. But no serious expectation could have been entertained that such a rate of dividend could have been maintained. Thus, in return for a share which last year might have provided 7½ per cent. from earnings and subsidy, shareholders will obtain a cash payment which, if invested in a gilt-edged security—such as stock of the new Corporation—at 3¼ per cent. would provide an equivalent income of 6.14 per cent. in perpetuity.

British Airways Reactions.—British Airways is not a public company and nothing is known directly regarding its assets and earnings. Hillman's Airways, however, holds 63,947 £1 shares of British Airways, which stand in the books at cost, although no dividend appears to have been received from them since they were transferred on the formation of British Airways in September, 1935. On the basis of payment of 15s. 9d. per British Airways share, the 5s. shares of Hillman's Airways (of which £123,832 is in issue) would rank for approximately 2s. The last dealing in

* * *

Cable and Wireless (Holding).—Lord Pender, in his speech to Cable and Wireless (Holding) stockholders on Wednesday, supported the view, expressed in last week's issue of *The Economist*, that the price of the company's ordinary stock was reasonable by giving his personal opinion that, on present indications, the 4 per cent. dividend should be repeated this year. During the past week, the ordinary stock has improved from 46½ to 48, so that the potential yield is still on the right side of 8 per cent. But an earlier feature in his speech may have been less welcome to stockholders. The directors of the Holding company have requested the operating company to discontinue the publication of the monthly traffic index. Since Lord Pender did not offer any alternative means of providing stockholders with fairly regular information regarding the group's activity, it is to be supposed that, in future, stockholders will lack any guidance to the trend of its business. With much that Lord Pender said regarding the index, it is possible to express agreement. Despite repeated warnings in the past, some persons have regarded the monthly movements of the index as a direct guide to the Holding company's results. In fact, of course, it merely gives an approximate indication of the trend of the operating company's gross receipts which, after providing for expenses, represent only one of three sources of income for the Holding company. Undue importance attached to the index has occasionally caused disconcerting movements in the Holding company's stocks. Hence, the directors have concluded that "in their opinion the index does not now give a true account of the actual position." This decision, however, will be received with regret by those stockholders and financial commentators who, taking the index as an approximate guide, and making due allowance for the other factors involved (such as investment income from the old cable companies and dividends to be expected from Marconi's Wireless Telegraph) have reached reasonably useful conclusions regarding the trend of the Holding company's income. If the suggestion is that monthly figures have become erratic, could the index not be issued at wider intervals so that abnormal movements would be smoothed out? Failing that, a quarterly statement of traffic or financial results would be of considerable service. The fact is that the monthly index, despite its faults and the occasional misuse to which it has been subjected, has hitherto been the only indicator of the trend of the group's business.

* * *

Siemens Brothers and Callender Cable.—Cable companies have a reputation for stability of profits. But the reports of Siemens Brothers and Callender's Cable and Construction suggest that this long-standing investment view calls for a certain degree of qualification. Siemens showed an appreciable setback in profits in 1937, but recovered in satisfactory fashion last year, when trading profits rose from £228,520 to £301,733. Thus, the 7½ per cent. dividend, which was slightly short-earned in 1937, was covered last year by surplus earnings equivalent to 3½ per cent. The bulk of this surplus—the dividend costs £183,750 gross, against available earnings of £246,733—is absorbed in an allocation of £50,000 to A.R.P. reserve. The company's plant has been fully occupied during 1938, and further extensions are in progress. Recent labour troubles, however, may affect the current year's results to some extent. The market received the dividend announcement of Callender's Cable twelve days ago with ill-grace, for it showed that the cash bonus of 5 per cent. paid in the previous two years had been dropped, leaving the divi-

dend at the traditional rate of 15 per cent. only. The report shows that gross profits were reduced by more than £200,000, from £924,990 to £723,307, and the bulk of this loss, sheltered by certain savings in expenses and in a reduced tax provision of £75,000 against £100,000, falls upon the ordinary stockholders. Equity earnings amount to £244,112 against £391,989, and are equivalent to no more than 24.3 per cent., against 40.5 per cent. in 1937. The earnings surplus of £75,525, together with £174,475 from the balance at profit and loss, is transferred to general reserve, and the balance of profit carried forward now stands at £390,548. The report refers to the effect of the foreign situation on orders, particularly for supertension cables, in the production of which the company holds a predominant position. Export demand and business in rubber cables have been maintained. The shares have fallen from 81s. a fortnight ago to a current level of 68s. 3d., at which the yield is still no higher than £4 10s. 6d. per cent. The market, having under-rated the importance of the "bonus" nature of the extra 5 per cent. payments in 1936-37, would thus appear to be regarding last year's experience as exceptional. Whether that view is tenable may perhaps be clearer after the chairman has spoken at the meeting on June 7th.

* * *

Odhams Press Setback.—The reasons for the decline in profits of Odhams Press should be already familiar to newspaper shareholders. In 1938 the cost of paper was substantially higher, and the expansion of revenue was insufficient to cover the additional expense. The report, however, records that net sales of the group's publications continued to be satisfactory. The extent of the decline in profits, from £507,266 to £430,399, is, however, somewhat severe, and the latest profits are, in fact, lower than in 1932. The following table shows the course of profits during the past three years:—

	Years ended December 31,		
	1936	1937	1938
Total profit	609,886	507,266	430,399
Taxation	66,104	67,456	40,026
Depreciation, etc.	92,352	87,008	86,303
Deb. and other interest ..	73,441	72,441	76,572
Other charges	142,350†	60,746	26,524
Preference dividend	70,500	70,500	70,500
Ordinary shares:—			
Earned	165,139	149,115	130,474
Paid	112,500	93,750	77,400
Earned %	24.2	22.3	19.5
Paid %	15	12½	10
Reserves	50,000	60,389	52,123
Carry-forward	86,177	81,153	82,104

† Including £85,000 reserve against subsidiary companies.

The fall in equity earnings was limited to £18,641, since last year's charge for taxation was much reduced and no payments of preference dividends under guarantee (which absorbed £29,614 in 1937) were required in 1938. The rate earned for the ordinary shares is thus only slightly reduced from 22.3 per cent. to 19.5 per cent., and the reduction in dividend from 12½ per cent. to 10 per cent. is thus due, not to any deficiency of earnings, but to the board's policy of fully maintaining the relation between earnings and distributions. Prospects for the current year are obscure, for there are few pointers towards an expansion of revenue and the reduced cost of paper is not large enough to make a real difference to profits. One hopeful factor is referred to in the report. Odhams (Watford) is making favourable progress, and increased demands for its productions are necessitating factory extensions. At their present price of 4s. 6d. Odhams Press 4s. ordinary shares yield £9 6s. per cent.—a return which marks their present lack of expansionary features and perhaps the investor's concern that an outbreak of free-gift competition was so narrowly averted a few months ago.

The New York Central Railroad Company

Extracts from the Report of the Board of Directors for the year ended
December 31, 1938

The Year's Business
The recession in business, beginning in the late summer of 1937 and continuing throughout the first eight months of 1938, was reflected in our revenues in each of those months. Commencing with October, there was an improvement in general business conditions, and this resulted in a somewhat more favourable showing in the latter months of the year. The total operating revenue for the year amounted to \$298,681,195.21, a decrease of \$67,544,951.25 (18.44 per cent.), as compared with 1937.
Revenue freight handled amounted to 98,593,108 tons, a decrease of 32,956,337 tons (25.05 per cent.). Freight revenue amounted to \$202,781,708.24, a decrease of \$54,759,743.34 (21.26 per cent.), due to the decrease in volume of traffic handled.
Revenue passengers carried totalled 48,215,444, a decrease of 2,956,385 (5.78 per cent.). Interline passengers decreased 365,182 (12.95 per cent.), local passengers decreased 1,725,709 (9.46 per cent.), and commutation passengers decreased 867,494 (2.88 per cent.). Passenger revenue amounted to \$60,313,893.49, a decrease of \$6,091,670.44 (9.17 per cent.).
Results for the year show a deficit of \$20,154,357.20, which was charged to profit and loss.

Profit and Loss Account		
Balance to Credit of Profit and Loss, December 31, 1937		194,657,969 49
Additions:—		
Credits from retired road and equipment	116,843 82	
Donations	16,945 98	
Miscellaneous credits (including \$1,120,270.42 in adjustment of advances to Pittsburgh, McKeesport and Youngbushen Railroad Company for equipment charged to income prior to July 1, 1937)	1,608,376 95	1,742,166 75
		196,400,136 24
Deductions:—		
Deficit for the year 1938	20,154,357 20	
Surplus appropriated for investment in physical property	409,790 70	
Debits from retired road and equipment (represents ledger value, less salvage recovered, of roadway property not required for transportation service retired during the year and charged directly to profit and loss account)	3,216,831 22	
Miscellaneous debits	309,043 85	24,090,022 97
Balance to Credit of Profit and Loss, December 31, 1938		\$172,510,113 27

Operating Expenses		
Notwithstanding increases of \$6,150,134 in wages, due to increases which became effective August 1 and October 1 of the previous year; \$234,211 on account of the application of full crew laws in Indiana and New York, and \$1,137,680 due to the advance in price of materials; the decrease in volume of traffic enabled economies in operation resulting in a decrease of \$46,498,056.08 in operating expenses.		
By groups, operating expenses for 1938 were as follows:—		
Group	Amount	Decrease
Maintenance of way and structures	33,054,305 35	8,130,285 40
Maintenance of equipment	59,475,859 44	19,501,512 62
Traffic expenses	6,624,833 82	153,840 19
Transportation expenses	123,265,821 18	16,293,021 08
Miscellaneous operations	5,346,833 09	375,169 77
General expenses	9,774,193 23	1,667,717 32
Transportation for investment—credit ..	39,463 31	27,490 30
* Increased Credit.		
Totals	\$237,502,382 80	\$46,498,056 08

Expenses for maintenance of way and structures decreased \$8,130,285.40 (19.74 per cent.), due to a more restricted programme of maintenance made possible by the smaller volume of traffic handled. Accounts reflecting the larger decreases were: roadway maintenance and track laying and surfacing \$3,573,102.44; ties, rails and other track material and ballast \$2,006,507.60; maintaining station and roadway buildings, fuel and water stations, shops, enginehouses, and power plants \$1,768,663.65; roadway machines and tools \$508,778.43; signals and interlockers, telegraph and telephone lines \$492,454.04; the net cost of maintaining joint facilities \$355,193.44; and there was a net decrease in sundry items of \$337,725.64. The foregoing decreases were partly offset by an increase of \$182,618.83 in superintendence due to wage increases heretofore mentioned; \$621,919.17 in the cost of maintaining bridges, trestles and culverts due to damages by flood; and \$107,601.84 in the cost of removing snow, sand and ice due to severer weather conditions.

Expenses for maintenance of equipment decreased \$19,901,512.62 (25.07 per cent.), due to a less extensive programme of maintenance resulting from the decrease in traffic handled. Traffic expenses decreased \$153,840.19 (2.50 per cent.). Transportation expenses decreased \$16,293,021.08 (11.67 per cent.), mainly due to a reduction in volume of traffic handled. The cost of miscellaneous operations decreased \$375,169.77 (6.55 per cent.). There was a decrease of \$255,032.17 in the cost of dining car operation due to fewer dining cars having been operated, \$91,601.48 in the cost of producing power sold, and a net of \$28,516.12 in other items.
General expenses decreased \$1,667,717.32 (14.58 per cent.). Pensions decreased \$1,046,714.22, practically all pension payments having been transferred under the Railroad Retirement Act to the Railroad Retirement Board effective June 1, 1937. Salaries and expenses of general officers and of clerks and attendants decreased \$370,371.78, due to reduction in personnel; general office supplies and expenses, stationery and printing \$169,968.42, and a net of \$80,662.90 in other items.

Railway Tax Accruals
Railway tax accruals were \$32,723,604.74, an increase of \$563,077.70 (1.75 per cent.). Accruals for various state capital stock taxes decreased \$5,707.72, due in part to a lower tax base, and in part to the fact that similar payments applicable to leased lines have been included in the current year as additional leased line rentals; gross earnings or income taxes due various states and City of New York decreased \$335,667.76, due to a decline in gross earnings; Canadian taxes decreased \$149,138.57, principally due to reduction in taxable income; Federal capital stock tax decreased \$163,020, due to a lower tax base; Federal excise taxes in connection with the Railroad Retirement Act decreased \$726,019.93, due to less taxable compensation paid; and other miscellaneous taxes decreased \$27,788.55. These decreases were offset by an increase of \$1,024,763.11, in Federal and State Unemployment taxes due to an increase of 1 per cent. in the tax rate; and an increase of \$943,657.12 for real and personal property and special franchise taxes, due mainly to higher rates.

Net Railway Operating Income
Net railway operating income amounted to \$15,582,475.75, a decrease of \$20,445,791.50.

Other Income
Other income amounted to \$15,173,666.33, a decrease of \$9,143,729.36. There was a decrease of \$239,172.72 in profit from separately operated properties. Dividend income amounted to \$5,455,252.05, a decrease of \$6,219,871.21. Income from funded securities decreased \$1,420,928.69. Income from unfunded securities and accounts decreased \$826,601.63.

Fixed Charges
Fixed charges amounted to \$49,230,764.25, a decrease of \$2,966,299.97. Rent for leased roads and equipment decreased \$2,690,823.82. Interest on the funded debt of lessor companies, payable by the company as rental and dividends on the minority stock of lessors, decreased \$2,035,236.52, due to the discontinuance of interest on certain lessor obligations held by the company, the retirement of maturing obligations, certain issues having been called for redemption and other issues refinanced at lower rates of interest. Rentals based upon earnings decreased \$703,418.91, as a result of decreased revenues, and there was a decrease of \$270,000 in cash rentals, due to the merger of the Kanawha and Michigan Railroad into the Toledo and Ohio Central Railway.

The foregoing decreases were offset in part by an increase of \$126,274.74 in Federal taxes and interest paid for account of lessors, and taxes amounting to \$63,762.29 assessed by the States of New York and Pennsylvania, formerly classed as railway tax accruals and now included in this account. Rentals paid for the use of various tracks and equipment increased \$106,665.25, and there was a net increase of \$17,129.75 in other items.
Interest on funded debt amounted to \$25,297,503.10, a decrease of \$1,106,565.16. There was a decrease of \$945,990.42 in interest on the company's 6 per cent. Ten-Year Convertible Secured Bonds, and \$9,436.11 on a five-year note to the Securities Corporation of the New York Central Railroad, which amounts were included in accounts of the previous year, as compared with none in the current year; a decrease of \$229,286.66 due to the reacquisition by the company, during 1937, of \$8,000,000, principal amount, of its 5 per cent. Refunding and Improvement Mortgage Bonds of Series C; a decrease of \$53,913.37, due to the retirement of \$1,426,000 of 3½ per cent. Ten-Year Secured Sinking Fund Bonds; a decrease of \$45,000 due to the payment of \$5,000,000 principal amount of Serial Secured Notes of Series B, which matured April 1, 1938; a decrease of \$278,987.51 in interest on equipment obligations due to the payment of maturing instalments, and a net decrease of \$123.43 in other items. The foregoing decreases were partly offset by an increase of \$433,693 in interest on the company's 3½ per cent. Fifteen-Year Secured Bonds on which interest was accrued for the entire year, as compared with eight months of the previous year; and there was an increase of \$22,083.34 in interest on the company's 2 per cent. Secured Notes, due September 12, 1941.
Interest on unfunded debt amounted to \$1,451,066, an increase of \$831,487.01.

Stockholders
The capital stock of the company at the close of the year was owned by 62,756 holders, with an average holding of 102.75 shares, an increase of 1,338 holders as compared with December 31, 1937. At the close of the year there were in the United States 60,929 holders, with an average holding of 96.25 shares, and abroad 1,827 holders, with an average holding of 318.8 shares.

\$20,000,000 Loans from Banks
In order to provide necessary funds to meet its cash requirements, the company borrowed during the year from the following banks the amounts indicated, totalling \$20,000,000:—
The First National Bank of the City of New York \$5,000,000
Guaranty Trust Company of New York

Wiggins, Teape.—Shareholders in Wiggins, Teape have so long been accustomed to regularly increasing profits that the 9½ per cent. fall in the parent company's total income for 1938 was bound to cause some disappointment. The report points out that the group experienced a decline in the volume both of home and export trade for the first time in six years, and that this setback, combined with the higher cost of raw materials, accounts for the decline in profits. The reduction in the group's income, from £1,236,546 to £1,142,284, is rather larger than the £53,488 fall shown by the parent company, for the latter's income has been protected by smaller charges by subsidiaries for taxation and bad debts. The effect of the lower profits upon the parent company's appropriations is shown in the following table:—

	Years ended December 31,		
	1936	1937	1938
Total profit	504,776	554,709	501,221
Taxation	36,130	69,606	57,195
Depreciation	28,761	30,249	30,078
Special obsolescence	15,000	15,000	
Other charges	33,663	33,350	31,196
Debt interest	67,881	67,144	66,364
Preference dividend	96,410	96,410	96,410
Ordinary stock—			
Earned	226,931	242,950	219,978
Paid	143,763	168,500	168,500
Earned %	16.0	16.1	14.2
Paid %	9	10	10
Reserve	85,000	96,322	53,000
Special credits	Cr. 2,369	Cr. 22,187	Cr. 1,561
Carry-forward	52,351	52,666	52,705

As a result of a saving of £12,411 in taxation, and the absence of any provision for special obsolescence, earnings for the ordinary stock are reduced by only £22,972 to £219,978, and the dividend, maintained at 10 per cent., is still covered by a satisfactory margin. The setback in profits has not checked the company's policy of extensions and improvements and large capital expenditure was again shown in 1938. Each year sees some increase in the group's fixed assets, which appear in the consolidated balance sheet at £4,950,788, against £4,758,656. A new factory has been built near London, and although it provides only for a transfer of activities it is improving the sales service. At present there is no obvious reason for expecting a marked recovery in earnings during 1939, but the company's satisfactory long-run prospects are undiminished. At the present price of 31s. 3d. the £1 ordinary stock units yield £6 8s. per cent.

New York Central Results.—For all American railroads, 1938 was a year full of difficulties, and the working of New York Central has resulted in a deficit of \$20,154,000, which is higher even than in 1932, the previous worst year, and compares with a net income of \$6,353,000 in 1937. Most of the decline is attributable to freights, from which revenue fell by 21.3 per cent. to \$202,782,000. Owing to some rise in rates, this fall was less heavy than the 25 per cent. drop in tonnage, but the railroads' applications for a further increase in rates in the early part of 1938 were not met in full. Although recovery set in during last autumn, it was insufficient to prevent a fall in the year's total operating revenue from \$366,226,000 to \$298,681,000. The fall in operating expenses from \$284,000,000 to \$237,502,000 was in almost comparable proportion, although wages accounted for an increase of \$6,150,000. Increased wage rates, granted in the latter part of 1937, were in operation for a full year, and an application by the railroads for a reduction was rejected after long negotiations. The greater part of the fall in operating expenses is, in fact, due to a large saving in maintenance expenses owing to the reduced traffic. Net railway operating income is \$20,446,000 lower at \$15,582,000, and there is also a substantial fall in miscellaneous income owing to lower receipts from dividends.

so that total income is practically halved at \$30,756,000. Fixed charges absorb \$49,231,000, and the final results show a drop of \$26,507,000 in net income. Improved conditions apparent towards the end of 1938 should assist revenue in 1939—net operating income for the first three months showed an improvement from a loss of \$1,799,000 to a credit of \$4,531,000, but the prospects of a return to dividends are not substantially nearer.

Rubber Profits and the Quota.—Recent rubber reports continue to show, broadly, that in 1938 profits were roughly halved. The sharp reduction in the average quota from 83½ per cent. for 1937 to 55 per cent. for 1938 is mainly responsible, though a moderate fall in the commodity and rising costs due to lower output have also played their part. It is but scant consolation that for some companies (Sialang and Kimanis, for example) forward contracts at satisfactory prices prevented profits from falling still further. The following table summarises the main features of recent rubber reports:—

Company (years to December 31)	Rubber		Total Profits *	Earned for Ord.		Div.	Present	
	Crop	Price		Amt.	Rate		Price	Yield
	'000 lbs.	d. per lb.	£	£	%	%	s. d.	%
Kepong (Malay) :								
1936	6,398	8.25	88,310	81,012	12.0	11½	} 2/7½d (2/-)	3.43
1937	9,334	8.50	131,841	114,712	16.2	13½		
1938	9,019	7.70	54,224	43,646	6.4	4½		
Kimanis Rubber:								
1936	414	...	6,587	5,341	2.9	3	} 1/8 (2/-)	6.00
1937	1,706	...	25,821	23,255	13.7	10		
1938	1,077	...	17,542	15,141	9.5	5		
Rembau Jelai :

* After estate and selling expenses.

† Years to following January 1st.

Special factors, however, have affected individual companies. In order to maintain the labour force, Kepong harvested a larger crop than the quota reduction warranted, so that the decline in profits is rather more severe than the average. The North Borneo company, Kimanis, experienced a sharp increase in costs—the Borneo quota averaged 45½ per cent.—but it was helped by forward contracts, while Scottish Malayan produces palm oil as well as rubber. Exceptionally, Sialang obtained a slightly higher average price, since part of the crop is marketed in special form on which a premium is obtainable.

This week's announcement of an increase in the export quota for the third quarter from 50 per cent. to 55 per cent. has been followed by a slightly firmer commodity price, which rubber shareholders have welcomed. But while they may fairly hope that profits in 1939 will be no lower than in 1938, any improvement is likely to be quite small. A 5 per cent. increase in quota is in itself small, and even if the 55 per cent. rate is maintained for the last three months of the year—American consumption is at a satisfactory level, but there are no signs of a sharp upward trend—the average for 1939 will be no more than 52½ per cent. against 55 per cent. Against this small implied drop in releases must be offset the increased standard assessments for 1939, so that at present the chances are in favour of only slight changes in output

for 1939. For many months the commodity price has fluctuated within narrow limits around 8d., and the smallness of the increase in quota encourages the hope that this level may be held. The net effect of these factors is the possibility of some improvement in profits, but too small to be of real importance to shareholders. To take one example, the difference made to Scottish Malayan by a 9½ per cent. rise in the company's standard assessment, a 2½ per cent. reduction in releases, and a 0.2d. per lb. increase in price is of the order of £2,500—a rise which is of only moderate importance compared with the possible variations in other items of revenue and expenditure. The outlook for rubber companies is not much clearer than it was at the beginning of the year—though this conclusion is hardly suggested by the yields shown above.

The Week's Company Profits.—The number of company reports published this week is 93—a considerable increase on recent weeks. They are analysed in the usual table on page 470, and show net profits of £8,200,528, against £8,669,143 for the previous year, a decline of 5.4 per cent. Since the sample is unweighted by any large company or group, this decline compares favourably with the recent trend. The aggregate net profits of 1,103 companies whose reports have been received this year amount to £148,208,000, a reduction of 8.5 per cent. from £161,916,000 a year ago. The week's results are discussed under the heading "Shorter Comments" on page 454.

NATIONAL BANK OF EGYPT

Notices have been issued convening an Extraordinary General Meeting of shareholders to consider the revision of certain of the Bank's statutes, in order to give effect to an agreement reached between the Government and the Board for a new charter.

These revisions do not, however, cover the whole field of the agreement. The following explanatory note is therefore issued, in order that the shareholders may have information regarding the general character of the agreement and may also understand the circumstances which have led to its conclusion.

The National Bank was founded in 1898 by Charter granted by the then Sovereign of Egypt as a purely commercial bank with a right of note-issue. There was no engagement by the Government that the Bank would act as the Government's banker, though in fact it has actually done so from the commencement. The Bank's notes were not compulsorily legal tender and before the 1914-1918 War the amount of the note-issue did not exceed £E.3 million.

By force of circumstances, mainly arising out of the war, the Bank's position and responsibilities gradually evolved. Its notes were made compulsory legal tender in 1914. It has done the Government's banking business throughout. It maintains the stability of the piastre-sterling exchange by a system of buying and selling sterling from and to the other banks. Its position has therefore approximated more and more to that of a Central Bank. It still continues to do a large amount of commercial business—inevitable in a country whose banking development is still in an early stage—but its smaller business with agriculturists has become relatively of much less importance than in its earlier years.

The Bank's responsibilities as well as its privileges—both its utility to the State and the services it is able to render to the business public—rest on no assured or statutory basis. This position is not satisfactory, either to the Government or the Bank. On the one hand, the Government feels that it has no guarantee that the Bank will always continue to act in the same spirit as at present and it considers that the framework and powers of an institution, designed to meet the conditions of 1898, are in some respects not suited to the needs of modern Egypt. The Bank on its side feels that it has no guarantee as to its own future, and that therefore (in view particularly of the fact that its present charter comes to an end in 1948) it is unable to take the long views necessary if it is to continue to render its present services to the Government and public of Egypt and build on the foundations already laid.

Discussions have from time to time taken place between the Government and the Bank in order to explore the possibility of granting a new charter, stabilising the Bank's position and at the same time making such modifications in its structure as, in the opinion of the Government, are required by the changes that have occurred in Egyptian conditions in the past forty years.

Discussions have from time to time taken place between the Government and the Board, of which the principal points are as follows:—

- 1.—The new charter will be for forty years with effect from its promulgation.
- 2.—The Government undertakes to maintain the existing legal-tender status of the Bank's notes.
- 3.—There shall be an Egyptian majority on the Board. In view however of the practical difficulties in the way of the immediate attainment of an Egyptian majority owing to the size and composition of the present Board, and also of the necessity for ensuring harmonious working between the Government and the Bank during the period of transition, seats on the Board will be ceded to Egyptians as and when vacancies occur by death or non-re-

Company Meetings of the Week.—Reports of company meetings commence on page 460 of this issue. At the *Commercial Union Assurance* meeting Sir Bertram Hornsby commented on the unsound open cover system on gold shipments. Sir Herbert Morgan informed the shareholders of *Smith's Potato Crisps* that recent capital expenditure had been financed from profits alone. At the *British Match Corporation* meeting Mr C. E. Bartholomew commented on the satisfactory state of the home market. The Hon. S. H. Dodwell explained to *Union Insurance Society of Canton* members how the company's interests had been expanded by the British Oak acquisition. Shareholders of *Liverpool and London and Globe Insurance* were informed by Mr A. E. Pattinson that underwriting results were the second highest in the company's history. At the *London and Manchester Assurance* meeting, Mr A. W. Dawes pointed out the attraction of a life annuity to the small saver in times of high taxation. Mr Walter Holman made a plea at the *Incorporated Accountants* meeting for stricter surveillance of expenditure during the rearmament programme. Lord Pender's address to shareholders of *Cable and Wireless (Holding)* is discussed on page 448. Mr F. M. G. Glyn informed the shareholders of *Rio de Janeiro City Improvements* that the alteration in Brazilian exchange regulations should enable the company to obtain sterling on better terms in future. Mr Walter MacLachlan, reviewing the numerous interests of *British-Borneo Petroleum*, referred to the promising prospects of the shareholding in Ultramar Exploration Company, which controls oil rights and interests over large areas in Venezuela.

eligibility, provided in any case that an Egyptian majority is attained by 1945. All directors will continue to be appointed as at present, i.e. they will be elected by the shareholders or, if co-opted by the Board during the year, their election will be subject to the shareholders' ratification. There will be no Government representation on the Board.

- 4.—Future Governors, subsequent to the present incumbent, shall no longer be ex officio President of the Board. After the departure of the present Governor, the President must be an Egyptian. There is no restriction as to the nationality of future Governors.
- 5.—The Board will appoint from among its members a Vice-President who must be an Egyptian so long as the functions of President and Governor are combined and are held by a non-Egyptian. The appointment of neither President nor Vice-President shall be subject to Government sanction.
- 6.—No person in receipt of a Government salary may be a director of the Bank.
- 7.—The local recruitment of the staff of the Bank shall be confined to persons of Egyptian nationality, the Bank retaining the right however, if it finds it desirable for technical or other reasons, to make recruitment from abroad, subject to the approval of the Minister of Finance.

The Government has no intention of using this right of approval to block all non-Egyptian recruitment, but desires merely to limit its extent to what is necessary for the proper working of the Bank and to prevent some future management from misusing it in such a way as to nullify or evade the provision regarding local recruitment.

- 8.—The London Committee will be abolished as such, but power will be taken by the Board to permit two of its members (or four until 1941) to reside abroad to assist the Bank in the conduct of its external business.
- 9.—The Bank shall continue to act as banker to the Government.
- 10.—The Bank will continue to do commercial business, but will follow a policy of gradually withdrawing from the smaller operations in which it at present engages. It will retain the right to undertake such smaller business should the public interest so require: for example, when in any place banking facilities are inadequate.
- 11.—Apart from the remuneration which the Bank receives in respect of the note-issue, the Bank shall continue to perform all the ordinary banking business of the Government free of charge as hitherto. In the event of the Bank being required to perform any special duties not falling within its present current work, such as the service of the Public Debt or the issue of loans, remuneration therefor will be dealt with by mutual agreement.
- 12.—The Bank will make short ways and means advances to the Government when required, up to a limit which has been agreed upon between the two parties.
- 13.—The shares of the Bank will continue, until 1948, to be in bearer form or nominative, with equal voting rights, as at present. After 1948 all shares shall be nominative, subsequent transfers being subject to the Board's approval.

Certain of the above points (Nos. 1, 3, 4, 5, 6, 8 and 13) require a revision of the statutes, a draft of which will be available at the places designated for the deposit of shares mentioned in the notice convening the Extraordinary General Meeting. The remaining points will be dealt with by an exchange of letters between the Government and the Bank, forming a contract between the two parties.

E. M. COOK, Governor.

THE STOCK EXCHANGES

London

SETTLING DAYS
TICKET ACCOUNT
MAY 23 MAY 25

In the absence of specific political news, markets are again inclined to mark time. But although turnover has shown little improvement—Tuesday was described as a completely "dead" day—prices were firmer in most sections, and some broadening of interest was apparent. Gilt-edged made useful progress, but home rails stocks failed to rise after the publication of impressive traffics.

Gilt-edged stocks opened brightly, following the moderate tone of Signor Mussolini's speech on Sunday and the lack of any further political shocks. But the market lacked real buying support, and the best levels were not always held. Inquiry from public investors again lifted prices towards mid-week, but the volume of orders never assumed large proportions. There was not a great deal to choose between the dated and the irredeemable stocks, though by mid-week the latter were the more favoured. An all-round advance occurred on Thursday. Home corporation stocks remained firm and quiet. Among colonial issues, modest gains were the rule. Australians in particular recording good advances.

Greek issues were prominent among foreign bonds, on hopes that the trade talks might result in an improved debt offer. Roumanian bonds were firm, and there was also some support for Bulgarians. Hope deferred gave Brazilian bonds a reactionary tendency.

Home rails were well supported on expectations of improved traffics, and in anticipation of the Square Deal report, though the market lost its impetus after the publication of the excellent traffics. Marginal preference stocks were in greatest demand, though the ordinaries were not entirely neglected. No interest was shown in debenture issues. Argentine rails were dull almost without exception, and failed to respond to the good traffics.

In the industrial market, the tone was again firm, and the trend of prices very slightly upwards, but in spite of more active dealings towards mid-week, turnover was on a limited scale. Iron and steel shares were a strong feature, and came into renewed demand after temporary hesitancy on Tuesday. Peace and Partners rose on the increased dividend and full report, while Stewarts

and Lloyds gained after the meeting. The improvement in coal shares which had begun in the previous week, continued with Shepbridge in the lead. Engineering issues lacked interest, but prices were steady or a little higher for choice. Electrical equipment shares hardened after an irregular start. Siemens were inclined to sag, but recovered before the meeting, and Electric Construction were supported. It was some time before motor shares responded to the better tendency of the markets, and until mid-week movements in quotations were small. Aircraft issues were again unexciting, though prices were satisfactory. Imperial Airways reacted on profit-taking, and then recovered. Textiles were steady, apart from a fall in Salts (Saltire) following the lower profits. Rayon shares were neglected. In the brewery section, small gains were the rule after a dull start, while tobacco shares went ahead under the lead of Carreras "A." The stores and provision groups made a mixed showing. Miscellaneous shares moved more or less in accordance with the rest of the market. Quotations did not always move consistently, but fractional gains were the rule. Shipping shares no more than held their ground.

Oil shares opened firm but quiet on Monday. Anglo-Egyptian "B" shares continued their recent advance in anticipation of a higher dividend, while Roumanian shares were in demand on hopes of changes in the legal status of foreign-controlled oil companies. In mid-week, after some hesitancy, a firmer tendency developed under the leadership of the Eagle issues and Royal Dutch. Rubber shares were depressed on Monday in anticipation of an increase in the rubber quota. Later, on the view that the increased supplies would be absorbed, professional support imparted a firmer tone, but public support was lacking. Among tea shares Ceylon issues received support early in the week. Later, prices advanced further, following several satisfactory dividend announcements and on the sound statistical position.

In the mining market, Kaffirs advanced on buying from Paris and the Cape, which was assisted by the limited supply of shares. Later in the week, lack of Continental support left the market quieter but prices were maintained, and interest developed in Australian issues. Interest in developing mines was evident in mid-week, Venterspost leading a short rally. Finance shares,

after a firm opening on Monday, reflected the general inactivity later in the week. Diamond shares, apart from a mid-week diversion in De Beers preference, attracted little attention, while copper shares were featureless. Tin shares improved fractionally during the week in sympathy with the commodity.

ACTUARIES' INVESTMENT INDEX

A moderate recovery is again shown by the Actuaries' index of 160 industrial ordinary share prices, which on Tuesday, May 16, 1939, stood at 62.1, against 61.4 a week ago and 59.5 a month ago. The corresponding average yields are 5.75, 5.82 and 6.02 per cent. We give below a selection of the separate indices:—

Group (and No. of Securities)	Prices (Dec. 31, 1928 = 100)			Price 1939 High

New York

SENTIMENT was more cheerful following Signor Mussolini's speech at the week-end, but the anticipated effect of the strike settlement on the profitability of the coal industry and the delayed pronouncement on tax policy from Washington weakened confidence. On Tuesday, uncertainty was increased by rumours of an intensified anti-monopoly drive against the utilities. Later in the week, a firmer tendency developed, but aircraft shares were weak on news of output difficulties and steel shares reacted to the cut prices offered for steel by the automobile industry. According to the American Iron and Steel Institute, the steel industry is working this week at 45.4 per cent. of capacity, a fall of 2 per cent. on the week and the lowest since September 12, 1938.

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values calculated on closing prices (1926 = 100).

OFFER OF RENEWAL

City of Sydney. — Holders of £1,000,000 5 per cent. debentures, 1939, are offered a continuation of interest of 5 per cent. per annum in the four years to June, 1943, when debentures will be repaid at par. Population, 1,279,608; owns real estate of £6,831,695; income in 1938, £1,331,433; loan debt end 1938, £10,981,304. Cash lists were opened at 9 a.m. May 17th and closed at 3.30 p.m. in accordance with the terms of the prospectus. Holders of the existing debentures have the right until 3.30 p.m. on May 22nd to have their debentures renewed for four years from 1st June, 1939.

BY TENDER

Newcastle and Gateshead Water Company.—Sale by tender of £60,000 5 per cent. consolidated debenture stock, at a minimum of 125. Water revenue: 1936, £378,355; 1937, £387,918; 1938, £397,652.

BONUS SHARES

House Property and Investment. —It is proposed to capitalise £50,000 of reserves and distribute one £1 ordinary share for four held.

Minimax, Ltd.—A share bonus of one share for every four held is announced.

Peebles Hotel-Hydro.—A 100 per cent. bonus for ordinary shareholders is proposed.

RESULT OF ISSUE

Mid-Southern Utility Company. —The issue of £150,000 "C" consolidated stock at 99 was substantially oversubscribed, but applications from existing shareholders will be allotted in full.

DIVIDEND ANNOUNCEMENTS

Rates are actual, unless stated per annum or shown in cash per share. Rate for previous year refers to total dividend, unless marked by asterisk to indicate interim dividend.

Industry and Trade

Steel Price Decision.—On December 9th, iron and steel prices for the first half of 1939 were fixed at slightly lower levels. The reductions were not uniform, but their extent is revealed by the Board of Trade index of iron and steel prices which fell by 5.9 per cent. between December, 1938, and January, 1939. Last Monday the British Iron and Steel Federation, with the concurrence of the Import Duties Advisory Committee, announced that, apart from a few minor adjustments, prices are to remain unchanged for a further period of four months. No special significance is attached to the reduction—from six months to four months—in the period for which prices have been fixed. The reason given for the change is that the end of the year, when buying is normally slack, is not an appropriate date for the introduction of a new price schedule. The minor alterations include a reduction of 5s. per ton in the price of hematite pig iron, designed to bring the price of this quality more into line with that of basic pig iron, and an increase of 5s. per ton in the price of acid steel billets (affecting less than 2 per cent. of the total output of crude steel) which have been relatively cheaper in relation to the cost of pig iron than other classes of steel. The Federation's decision to leave prices unchanged during a period of a rapidly expanding demand is to be commended, for although the profits of the industry are likely to show an increase owing to the expansion in turnover and the decision, consequently, does not involve it in any sacrifices, prices would probably have even increased at this stage under free market conditions. At the same time, the Federation has decided to substitute a running audit of costs of production for the occasional ascertainment made in the past. This will enable it to keep abreast of changes in costs and thus strengthen its control over the industry.

SHORTER COMMENTS

(Continued from page 453)

to £132,380. **B. LAPORTE, LTD.**, record a fall in sales, though business recovered in the latter part of 1938. Net profits, at £72,286, are only slightly lower than in 1937-38. One of the best reports of the week is that of **TILLING-STEVENS**, whose net profits are £53,975, against £35,336, and who resume dividends with a 7½ per cent. distribution. The large volume of orders on hand ensures working to capacity for a considerable time. **JOHN SUMMERS & SONS** net profits are £221,207, and after adding back certain expense items so as to reach comparable figures, the report points out that a profit of £599,426 compares favourably with the estimate of "not less than £500,000" put forward in the January circular. **IMPERIAL CONTINENTAL GAS** net profits have fallen from £427,686 to £415,786, but the decline is moderate, and the 10 per cent. dividend is moderate. **JAMES FINLAY & CO.** have had a satisfactory year, both trading profit and ordinary dividends received showing an increase, so that total profits are £298,954 against £251,680. Results of the Finlay group of tea companies make a mixed showing; crops were higher, but the average price obtained around 1d. a lb. lower. **KANAN DEVAN HILLS** profits actually show a moderate increase, and the dividend is increased from 16 to 17½ per cent. Some setback has been experienced by **AMALGAMATED TEA ESTATES** and **ANGLO-AMERICAN DIRECT** (though the former company is again paying 7 per cent.), while the decline in **CONSOLIDATED TEA AND LANDS** profits is rather more severe owing to a larger drop in tea prices.

MISCELLANEOUS

Burmah Oil Company, Ltd.—Profit for 1938, after taxation, £4,385,805 (£4,516,437). To depreciation, £370,559 (£354,152). Net profit, £4,015,246 (£4,162,285). To reserve, £600,000

(£960,513). Preference dividends, £300,000 (£300,000). Ordinary dividend 15 per cent. and cash bonus 6 per cent. making 21 per cent. for year absorbing £2,884,668, against 30 per cent. absorbing £2,747,302. To provision fund, £165,695 (£164,354). Carry forward raised from £637,271 to £702,154. Of year's total profit, dividends, etc., from investments account for 62 per cent.

British Electric Traction.—Net profits for year to March 31, 1939, rose from £446,472 to £482,398. Total revenue, £728,513 against £669,404. Final of 2½ per cent. again makes 5 per cent. for year on deferred ordinary, while usual 10 per cent. capital bonus is also distributed. Preference shares again receive 2 per cent. participating dividend. Addition to undivided profits, £211,447 against £185,323.

Fine Cotton Spinners and Doublers Association.—Profit for year to March 31, 1939, £247,141 (£349,445). Debenture interest, £110,000 (£110,000). To depreciation, £100,000 (£100,000). Debit balance reduced from £212,537 to £180,158. Total assets, £13,198,195 (£13,320,530).

Society of Incorporated Accountants.—At the annual meeting held on Thursday, Mr Walter Holman stressed the point that accountants have the right to say that, whether the cost of defence is met from borrowing or from taxation, it is essential that strict and continuous control should be exercised in all departments. Mr Holman foresaw the possibility that, to avoid competition between Government and private borrowing, some encroachment on the freedom of business might be involved.

John Summers and Sons.—After depreciation of £232,238 and bank interest of £38,590, net profits for 1938 before taxation amount to £328,598. Taxation absorbs £133,424, leaving £195,174. Surplus for year applicable to group holdings is £193,882. No dividend on ordinary shares. Carry forward £315,920.

Tilling-Stevens.—Profits for 1938 are £33,602, against £35,336 for 1937, after £20,373 (against nil) for depreciation. Last

Tinplates in Australia.—The scheme for the establishment of a tinplate plant in South Australia is regarded with considerable uneasiness in South Wales, which is the seat of the British tinplate industry. In recent years Australia has been the principal export market for British tinplates. The total tinplate consumption of the Dominion last year was approximately 90,000 tons, and practically the whole of this was imported from the United Kingdom. It is reported that the project under contemplation by the Broken Hill Proprietary Company and other South Australian interests involves an expenditure of between £2½ and £3 millions on a plant capable of employing 2,000 men. If a modern works of these dimensions were erected Australia would be able not only to supply the whole of her tinplate requirements but also to command a surplus for export to New Zealand, and possibly also to some of the Far Eastern markets. It must be recognised that Australia has set her heart on the exploitation of her great iron ore resources, and that in the production of finished steel products as well as in the manufacture of pig iron and steel she has made great progress since the Great War. Australia's present steel output capacity exceeds one million tons per annum, and she is already producing all her requirements of certain classes of finished steel. In 1913 Australia imported over 550,000 tons of bars, girders, beams, sheets, rails, wire and nails; by 1929 her imports of these products had been reduced to about 260,000 tons, and in 1937 they were less than 50,000 tons. The growth of Australia's iron and steel industry has been assisted by the imposition of high import duties, and it is frankly recognised that it is only with the aid of a high tariff that a tinplate industry could be established. By the Ottawa

year the capital was reorganised; 7½ per cent. is payable on new capital. Debit balance of £121,748 as at December 31, 1937, was extinguished under reconstruction scheme; credit of £16,910 now goes forward.

B. Laporte.—Profit 1938, £92,286 (£94,229). Final dividend of 17½ per cent. on 175,000 ordinary shares, making 22½ per cent. (same). To income tax reserve, £14,500; N.D.C. reserve, £4,500; pension, etc., fund, £5,000 (all same). To general reserve, £15,863 (£15,000); forward, £27,807 (£26,995).

Imperial Continental Gas.—Net profits for year ended March 31, 1939, were £415,786, against £427,686; gross revenue, £609,821, compared with £634,595. After usual dividend of 10 per cent., £526,155 is carried forward, against £516,369. Balance sheet shows investments and advances valued at £10,288,298. Current assets, £336,689 against £94,177.

Yorkshire Amalgamated Collieries.—Net profit of £245,607 in year to March 31, 1939, compared with £261,906. Ordinary dividend 7½ per cent. less tax for year against 5½ per cent., free of tax. To general reserve, £50,000 (£50,000); carry forward, £96,217, against £69,999. Constituent companies have made a larger provision for income tax and N.D.C., and depreciation has been increased on account of recent plant extensions.

James Finlay and Company.—Accounts for 1938 show net profit £228,323 (£224,971), after depreciation and taxation, and writing off £15,000 from buildings and machinery. Carry forward raised from £275,255 to £286,078. Ordinary dividend maintained at 12½ per cent.

British Cotton and Wool Dyers' Association.—Profit for year to March 31, 1939, after £46,683 (£55,399) for repairs, etc., £100,884 (£110,061). To depreciation, £44,330 (£35,000). Net profit, £25,222 (£43,925). Ordinary dividend reduced from 4½ to 3½ per cent. Carry forward reduced from £56,759 to £54,177.

Agreement the Australian Government undertook that tariff protection should be given only to those industries which were reasonably assured of sound opportunities for success, and that such tariffs as might be established should be "based on the principle that protective duties shall not exceed such a level as will give United Kingdom producers full opportunity of reasonable competition on the basis of the relative cost of economical and efficient production, provided that in the application of such principle special consideration may be given to the case of industries not fully established." It is within the discretionary power conceded in the last sentence that the Australian manufacturers have been able to develop their iron and steel industry in spite of the preference to British goods, and in the memorandum submitted last year to the Government by the Association of Chambers of Commerce the view was expressed unequivocally that "recognition of the principle that British manufacturers be given preference in the Australian market over foreign competitors does not mean that Australian secondary industries shall not be adequately protected against competition from the United Kingdom."

Engineers' Wages.—The engineers' trade unions, who from the commencement of re-armament have shown themselves fully alive to the key position which it confers upon them, have now succeeded in obtaining an increase of two shillings a week in the national bonus to all adult male workers, with proportionate changes for apprentices, boys and youths. The increase, which takes effect on June 5th, is a flat-rate addition to earnings, and will not count as an augmentation of the standard wage basis for the calculation of overtime and other special rates. It thus appears that the engineers are presented with a new bargaining point, namely the expansion of the base rate. Some such claim as this may be used as soon as the rapidly developing industrial situation permits of the commencement of further negotiations, and its chances of success and general approval are certainly greater than those of the demand for a shorter working week which were made last September, when the last phase of negotiation commenced. Over 1,000,000 workers benefit by the present increase, but the absolute numbers involved must be viewed side by side with the increasing amount of work on hand and the possibility that one of the earliest and most critical bottlenecks in re-armament may develop in engineering. Nobody questions the strength of the Engineering Joint Trade Movement's present bargaining position. The consent of the employers to the 2s. increase, after their resistance last December on the ground that the time was not propitious, is concrete evidence of that strength. It is also reflected in the table of wage rates prepared by Mr E. C. Ramsbottom and printed below:—

INDEX NUMBERS OF WAGE RATES
(Average of 1924 = 100)

End Dec.	1924	1928	1930	1932	1934	1935	1936	1937	1938
Engineering*	100	104	104	101	101	104	107	113	113
Shipbuilding & Repairing†	106	108	110	108	108	108	112	121	125

* Including railway engineering shops.

† Time workers.

But in present circumstances the engineers cannot have it both ways. If they are to continue to obtain wage concessions at more and more frequent intervals on the strength of the growing armaments demand, then they must also recognise the fact that that demand does not permit a shortening of the working week. If they continue to press for that reduction then they must face a counter proposal for an arrangement for which they have so far shown little stomach, namely the dilution of labour.

Wakes with Pay.—An addition of 350,000 to the number of persons receiving paid holidays in the year 1940 will follow from the agreement, announced on

Tuesday, between the United Textile Factory Workers' Association, the Master Cotton Spinners' Federation, the Cotton Manufacturers' Association and the Lancashire Cotton Corporation. The procedure in this case will be to accumulate in operatives' holiday accounts sums amounting to one-fiftieth of annual earnings. The scheme will be put into operation after this year's annual holidays, when the equivalent of 2 per cent. of the wage bill will be banked weekly to be handed to operatives for one week's holiday in 1940. The annual shut-down for holidays in the cotton industry is so ancient an institution that the present agreement is specially welcome, particularly in view of the curtailment of the exodus to the seaside which short-time working has brought about since the war. "Wakes" may now recover much of their former spectacular gaiety on the strength of the £500,000 which is estimated to be the annual cost to the industry.

Rise in Industrial Production.—The Board of Trade's quarterly index of industrial production provides further evidence of the revival in business activity since the beginning of the year. During the period of recovery from 1934 to 1937 the index showed only a slight seasonal rise between October-December and the first quarter of the following year. Between the last quarter of 1937 and the first quarter of 1938 the official index actually declined by 3.2 per cent., while the figure for the first quarter of this year showed a rise of 4.1 per cent. over that for October-December, 1938. Moreover, the index for the first quarter of this year was almost as high as the figure for the corresponding period in 1938. A comparison of the

BOARD OF TRADE INDEX OF PRODUCTION. (1930 = 100)

Group	Year 1937	Year 1938	1938		1939
			Mar. Quarter	Dec. Quarter	Mar. Quarter
1. Mines and quarries	99.8	93.9	104.0	96.4	100.6
2. Iron and steel	166.6	131.5	168.4	119.8	149.1
3. Non-ferrous metals	165.3	146.2	153.3	141.4	139.7
4. Engineering and shipbuilding ..	136.3	128.9	132.7	129.5	135.1
5. Building materials and building ..	153.2	145.4	146.1	134.8	127.6
6. Textiles	129.6	111.1	116.9	114.0	120.7
7. Chemicals, oils, etc.	124.5	116.3	121.7	119.5	121.6
8. Leather and boots and shoes ..	111.9	104.8	111.6	107.4	119.2
9. Food, drink and tobacco	119.9	121.4	116.0	123.4	118.5
10. Gas and electricity	161.2	168.0	186.0	197.3	206.8
Total of manufacturing industries (2-10)*	138.0	128.9	136.5	130.7	136.2
Total of all groups (1-10)*	132.8	124.1	132.1	126.0	131.2

* Includes also various industries not specified above.
† Revised figures.

group indices for January-March, 1938 and 1939, however, reveals a change in the relative importance of the principal industries. Thus, activity in the mining and quarrying, iron and steel, non-ferrous metals and building materials and building industries was still appreciably lower in the first quarter of this year than in the corresponding period of 1938. On the other hand, this year's figures for engineering and shipbuilding, textiles, leather and footwear, food, drink and tobacco, and gas and electricity are all appreciably higher than those relating to the first quarter of 1938.

Overseas Trade in April.—The value of British imports in April was £3.6 millions, or 4.9 per cent., lower than in April, 1938, due chiefly to the smaller number of working days. The same cause was mainly responsible for

the decline in the value of British exports by 5.6 per cent., from £37.3 millions to £35.1 millions:—

U.K. IMPORTS AND EXPORTS
(£'000)

	1937	1938	1939	Change between 1938 and 1939	Per cent.
April					
Total Imports	83,004	73,707	70,085	-3,622	-4.9
British Exports	43,027	37,266	35,149	-2,117	-5.6
Re-exports	7,274	5,011	4,580	-431	-8.5
Total Exports	50,302	42,277	39,729	-2,548	-6.0
Excess of Imports over Exports	32,702	31,430	30,356	-1,074	-3.4
Transshipments under bond	3,223	2,656	2,740	+84	+3.2
Four Months ended April					
Total Imports	312,545	318,552	288,262	-30,290	-9.4
British Exports	164,146	158,136	154,251	-3,885	-2.4
Re-exports	26,030	20,801	18,845	-1,956	-9.4
Total Exports	190,176	178,936	173,096	-4,840	-2.7
Excess of Imports over Exports	122,369	139,616	115,166	-24,450	-17.5
Transshipments under bond	12,511	10,889	10,776	-113	-1.0

On a working-day basis, imports showed a small increase between March and April, in spite of the very large imports of wheat and petroleum which occurred in the earlier month, while total exports were slightly larger, due to an increase in the value of re-exports. *The Economist's* index of the volume of exports of domestic manufactures, adjusted for seasonal variations, fell from 101 (1935=100) in March to 100½ in April, while the index of the volume of the intake of raw materials rose sharply from 98 to 117½, compared with 114 in April, 1938.

Cotton Price Agreements Revised.—The large stocks of raw cotton held by the American Government has brought a scarcity of supplies of certain grades for near delivery. In consequence, Liverpool quotations for near futures have been at a considerable premium over those for more distant months. This unusual development has seriously affected trade in American-type yarns, whose selling prices are fixed by the addition of specified margins to the Liverpool quotations for the nearest active month. In normal circumstances, the basis would have been changed at the end of April from May to July futures, but in view of the abnormal parities the change was deferred until the beginning of this week, when the committees of the yarn price agreements decided to change the basis from May to October futures, which stand at a discount of ½d. per lb. compared with the May quotations. The margin for coarse counts was increased by ½d. per lb., but as the prices of October raw cotton futures is lower than those for May, the selling price of yarn was lowered by ½d. per lb.; margins under the 56's and 42's weft agreements have been raised by ½d. and ¼d. per lb. respectively. This action had rather a disturbing effect upon the Manchester market, but it is expected that, when traders have become accustomed to the new conditions, there will be greater confidence in the market and an increase in turnover.

Prices Marking Time.—There has been little alteration in the general level of wholesale prices in Britain and the United States during the past fortnight. Our indices of the prices of primary products for the United Kingdom and the United States, as well as the more comprehensive indices for the two countries, are virtually unchanged on

the fortnight. The official German index is also unchanged, but the figures for France and Italy registered a slight rise:—

SEPTEMBER 18, 1931 = 100

* These figures refer to May 13th.

† Monthly average.

Details of the component series of *The Economist* complete index are given below:—

	Sept. 18, 1931	May 11, 1938	May 3, 1939	May 17, 1939
(1927=100)				
Cereals and meat...	64.5	87.5	71.1	70.6
Other foods	62.2	59.8	62.9	62.4
Textiles	43.7	53.2	54.0	54.3
Minerals	67.4	91.8	91.4	91.2
Miscellaneous	65.8	76.1	74.2	74.6
Complete index	60.4	73.2	70.2	70.1
1913 = 100	83.1	100.8	96.6	96.5
1924 = 100	52.2	63.3	60.7	60.6

The group indices for textiles and miscellaneous commodities recorded a slight rise between May 3rd and May 17th, but those relating to cereals and meat, other foods, and minerals are slightly lower. There have been no outstanding movements in any of the commodities included in the index, and in general most consumers have continued their policy of covering only immediate requirements.

Distribution of Overseas Trade.—Our quarterly statistical analysis of changes in the distribution of imports and exports will be found opposite. The proportion of Britain's total imports drawn from the Empire increased from 38.5 per cent. in the first quarter of 1938 to 40.2 per cent. in the corresponding period of 1939, due mainly to an expansion of 28 per cent. in the value of imports from Eire; the benefits obtained by the settlement of the Anglo-Irish dispute are also shown by an expansion of 6.5 per cent. in the value of British exports to Eire. Owing, however, to a very sharp fall in the value of exports to Australia, the proportion of our total exports taken by the Empire declined from 50.4 per cent. in January-March 1938, to 47.0 per cent. in the first quarter of 1939. The proportion of our total imports from, and exports to, other European countries increased slightly in the first quarter of 1939, compared with 1938. The recent purchase of Roumanian wheat is reflected in an increase of 279 per cent. in British imports from that country, while Russia, Sweden, Norway, Denmark, Poland and Greece all largely increased their purchases of British goods. The share of our total trade with foreign countries outside Europe, however, showed a decline. Imports from Turkey fell by more than half, while the cessation of Mexican oil exports has brought a reduction of British trade with that country to insignificant proportions. Imports from the United States declined sharply, from £37,453,000 in the first quarter of 1938 to £29,016,000 in the corresponding period this year, but our exports to that country rose by nearly 40 per cent., from £4,963,000 to £6,885,000.

INDUSTRIAL REPORTS

Coal

INDUSTRIAL activity is expanding on a broad front. The demand for coal from both domestic and overseas consumers is increasing; the revival of foreign demand is due partly to the fall in Germany's ability to export. The consumption of steel also remains on the upgrade; the industry's decision to leave the general level of prices unchanged until the end of October is discussed on page 454. Activity in the tinplate industry has risen sharply, and producers are arranging to supplement local steel supplies by bigger imports. The decision to establish a plant for the manufacture of Rolls-Royce aero-engines near Glasgow is discussed on page 424. The Government has introduced supplementary estimates of more than £2 millions and £1½ millions respectively to acquire reserves of merchant ships and agricultural machinery. Production in the cotton trade is well maintained, and the industry has decided to grant operatives holidays with pay.

Sheffield.—Activity in industrial coal is broadening, and some collieries are short of screened steams. Outputs are well sold. Smalls are moving freely, though some collieries hold considerable stocks of coking smalls. Electricity undertakings are accepting good deliveries, but gas coal demand is quiet. Lower prices have not expedited demand for household coal, which, however, keeps at a fairly good level. Blast-furnace coke is moving more freely. Other brands for central heating and works are subject to competition.

Export market conditions are more cheerful, and good inquiries are coming through for best hards, washed doubles and singles. Bunker coal is in rather better request.

Newcastle-on-Tyne.—The greater activity in the shipment of coal from

this area is shown in the figures from the Tyne; last week 305,831 tons were shipped, an increase of 50,167 tons over the figure for the same week a year ago. The market remains very firm, but the volume of prompt business actually negotiated is small owing to the lack of supplies. There is a keen demand for all classes of Durham industrial fuel from both home and overseas consumers, and in the Northumberland steam section large coal has a ready sale. Patent oven coke is in good demand from abroad, whilst in the home section local industrial requirements continue to increase.

Glasgow.—The Scottish market remains active. Buying on account of the public utility undertakings, including the London market, has tapered off, but the effect of this, as well as the seasonal slackening of the household trade, has been largely offset by the active export business. In practically all

districts the collieries are now fully booked up for shipment for some weeks ahead and even June business is proving difficult to arrange. This applies both to large coal and washed nuts. Industrial demand also continues strong. Prices remain firm.

★

Cardiff.—Inquiries on the Cardiff coal market have been a little less active this week, but the collieries are now well sold over the next few months, and prices of practically all grades are very firm. With the settlement of the dispute in the United States coalfield the American demand for prompt cargoes has faded away, but small orders have been placed by Dutch, Greek, and Malta buyers, and Germany is still inquiring for coking coals.

Shipments at the South Wales docks last week totalled 426,900 tons, compared with 414,605 tons in the corresponding week last year, while this week the tonnage position is slightly better than it was last week. Coke is scarce and the recent improvement in the patent fuel industry is being well maintained. The Executive Board has deferred until June its application to the Central Council for additional inland and export supply allocations for the current quarter.

Iron and Steel

Sheffield.—The iron and steel market continues active, and forward business is more readily placed than for some time. There is a very keen demand for basic steel billets, supplies of which are barely adequate. Acid billets are in good request, and transactions in wire rods and small steel bars are on a large scale. There is freer buying of forge and foundry pig iron, and the demand for hematite shows some improvement, although there are still considerable stocks.

Basic pig iron is a very strong market, but finished iron shows only slight development. The production of high quality steels in this district is reaching record figures, but the demand is unsatisfied. A great volume of Government work is coming to hand, as well as a steady flow of ordinary commercial orders, both on home and overseas account.

★

Middlesbrough.—Commercial business is increasing, and the announcement that steel prices are to be maintained until the end of October is satisfactory from the point of view of consumers, who are no longer kept in doubt. No announcement has yet been made as to any change in the price of foundry pig iron.

The production of basic iron continues to be absorbed at the adjoining steelworks, and none of it comes on to the market. The demand for steel continues to increase and production will show new records.

Heavy steel melting scrap is extremely scarce. New business in foreign ore is not mentioned, but imports under old contracts are keeping up to almost last month's levels.

★

Glasgow.—The demands made on the steelmakers continue to expand and, although there have been some additions to operating plant, makers are

quite unable to satisfy the delivery requirements of consumers. Shipbuilding materials are absorbing heavy tonnages and marine engineers are also heavy consumers. There is an exceptional amount of work on the books of West of Scotland marine engineers, orders being on hand for shipbuilders on the Clyde and in other parts of the country. Sheet rolling mills, galvanising plants and corrugating plants are all working continuously, but despite that orders are accumulating on books and delivery dates are lengthening. Re-rollers of angles, tees and channels in this district are supplying large tonnages for the Home Office shelters and they, too, are fully employed. Conditions in the tube trade are satisfactory and employment is regular. The scrap position is still causing anxiety.

★

Cardiff.—In the week ended May 6th the production of tinplates was 64.55 per cent. of capacity under the pooling scheme, but more mills have been brought into operation during the past few days, and manufacturers are making arrangements for foreign supplies of steel bars. In the heavy branches of the industry all the available blast-furnaces are working, but the production of steel continues to be handicapped by the scarcity of scrap. Imports are expected from the United States, but meanwhile prices for native supplies are very firm, and for cast iron machinery the current quotation has been increased to 76s. per ton. There has been a slight improvement in the galvanised sheet export trade, but the home market is absorbing the major part of the steel sheet production.

★

News from Abroad.—The improvement on international steel markets has made further progress. The tendency of consumers to increase their stocks, which had shrunk to very low dimensions, is one of the main features, but the demand for current requirements has also made further headway. Inquiries which, until several weeks ago were only too frequently used as a means to sound the market, are now as a rule leading to actual purchases.

It is feared in some quarters that the present situation may well lead to a scramble for supplies and seriously disturb the healthy development of markets. Already delivery dates are lengthening and producers are increasing their output in order to cope with the demand. It is noteworthy that blast-furnace operators are a little reluctant to follow suit until they are quite sure that the present demand will be maintained for a reasonably long time. The additional British purchases on the Continent and the reduction of British competition on international markets, due to the heavy domestic demand, have substantially contributed to the general improvement.

Prices are firm and secret concessions on official prices, which some time ago amounted to between 3s. and 20s. per ton according to product, have almost entirely vanished. This is particularly true of merchant bars, sheets and wire products. For sections, reductions up to 2s. per ton are sometimes made, for hoops occasional rebates up to 4s. have been observed, and thick plates, too, are sometimes sold below official prices. It is hoped that the recent official price concessions of 5s. to 20s. (gold) per ton

for the Far Eastern markets can soon be abolished, although American competition is still disturbing and has recently caused another price reduction for the Dutch market of 5 fl. per ton for merchant bars and 7s. for hoops. In other cases, however, prices are definitely rising. The Swedish producers, for instance, have increased their prices as a result of the international improvement, and it is expected that sooner or later the Cartel will have to consider similar measures, the more since costs for raw materials are steadily increasing.

Textiles

Cotton (Manchester).—Prices in the market have continued more in favour of sellers. Raw cotton prices have tended to advance. Although the amendment to the Agricultural Bill in the United States, providing for an export subsidy, has been rejected, it is reported that other methods are being adopted to get this plan through. The continued uncertainty is very irritating to traders. Officials at Washington are undoubtedly in a dilemma. Cotton legislation during the last few years has resulted in a hold-up of supplies, which has brought the price of American cotton above the world price and stimulated foreign production.

Only a limited business has been done in yarn. An event of importance has been the revision in the American price agreements, discussed on page 456.

Turnover in piece goods has been fair. There have been indications of some leading India shippers having satisfied their more important needs, but quite a number of useful orders have been booked. The business done for India during the last few weeks has been substantial. Fancies have moved off fairly well for Rangoon, Java and Singapore. Steady buying has taken place in finishing qualities for South America and the Continent. Some home trade buyers have purchased standard makes almost up to the end of the year. Activity on Government contracts tends to expand and producers of drills and balloon cloths are working at capacity.

The granting by the employers of payment for holidays, discussed on page 455, will mean a further increase in production costs.

★

Jute (Dundee).—As a result of very favourable weather reports and an increase of approximately 6 per cent. in sowings this year compared with last, new jute prices have declined. The highest price recently touched for old crop Daisee-2/3 was £33 15s. per ton for shipment, and now it is £30. Current prices are £30 per ton for old crop and £24 17s. 6d. for new. The difference in price is due to the present scarcity of supplies from last year's crop and the promising outlook for the new crop. The scarcity of old crop jute, however, is being mitigated to some extent by the fact that spinners holding substantial stocks are releasing these to their neighbours who are not so favourably placed.

Spinners are very busy and they are reluctant to reduce their prices, though business on the whole is slack. The orders which manufacturers are receiving for sandbags are taking up all the production of hessian yarns and prices

are firm at 2s. 10d. (lowest) for common 8-lb. cops and 2s. 11d. for 8-lb. spools. Twist is steady at 5d. for 3-ply 8-lb., and sacking yarns are selling at from 3½d. for 24-lb. web and 4½d. for 8-lb. chains. Rove continues firm at £23 (lowest) for 48-lb. and £19 for 200-lb., while carpet yarns are in some demand at from 4½d. for 14-lb. warp.

Manufacturers are so well employed that they should be able to maintain their prices for some time to come at 3½d. for 10-oz. 40-in. and 2.96d. for 8-oz. Calcutta goods have weakened in sympathy with raw jute and hessians are about 2s. down from the peak level.

THE COMMODITY MARKETS

THERE was no further rise in the general level of the prices of primary products during the week ended last Wednesday. The prices of some materials, including non-ferrous metals, wheat and raw sugar have slipped back a little, but those of others, such as raw cotton and rubber, have shown a further improvement. The event of the week was the decision of the International Rubber Regulation Committee on Tuesday to increase the rubber output quota from 50 per cent. of the standard tonnages in the second quarter to 55 per cent. in the third quarter of this year. Despite the prospective increase in supplies, prices rose slightly after the announcement. Raw cotton prices rose as a result of the rejection of the amendment to the Agricultural Bill in the United States providing for an export subsidy.

Moody's index of the prices of sensitive commodities in the United States (December 31, 1931 = 100) stood at 143.8 on Wednesday this week and last.

Metals

Copper.—The April statistics showed extra-U.S.A. consumption at 111,194 short tons, against 107,580 short tons in March, and at this level, the highest monthly consumption of this year, exceeded the mines output by about 13,500 short tons and the smelter output by over 3,000 short tons. Nevertheless, stocks outside America rose by more than 4,000 short tons to 190,209 short tons last month, as a result of larger exports from the United States, where stocks increased from 320,446 short tons at the end of March to 332,513 short tons at the end of April. This unfavourable development in American exports brought the London price of standard cash copper down by £1 1s. 3d. per ton to close on Wednesday at £41 per ton, the lowest level of this year.

★

Tin.—London quotations for tin declined by only 5s. to £225 5s. per ton this week, the smaller demand being offset by the absence of adequate free supplies. Shipments to the United States caused stocks in official warehouses of the L.M.E. to fall by over

400 tons to 11,941 long tons last week, the first time since the end of March that stocks have sunk below the 12,000 tons limit. Output in the tinplate industry is still rising and consumption is now running above production.

★

Lead and Spelter.—The price of lead lost 5s. to close on Wednesday at £14 7s. 6d. per ton, while spelter lost 6s. 3d., thus closing at £13 8s. 9d. per ton. Buying was at a disappointingly low level, owing to the uncertain political outlook and the high production of both metals.

★

Quicksilver.—Quicksilver prices were reduced from £17 18s. 6d. to £16 4s. per flask of 76 lb. this week. This setback was not surprising, as the earlier boom was based on unfounded fears of a shortage of Spanish supplies. It was reported this week (but not yet officially confirmed) that the Italo-Spanish Cartel has been revived and is trying to get into closer touch with the consuming markets.

Grains

THE improvement noticed last week in the grain markets was not maintained and the pressure of Plate supplies for immediate shipment brought a slight fall in prices for near wheat. The Canadian Bureau of Statistics stated last week that farmers intend to plant 25.3 million acres of spring wheat in the current season, compared with a sown area of 25.2 million acres in 1938. The wheat in the south-west American States is reported to be suffering from a deficiency of sub-soil moisture. Large shipments of Plate maize are due at British ports in the next few weeks and consequently the premium on spot and near maize has narrowed considerably; there have also been offers of South African maize. After several weeks in which offers of feeding barley were scarce, supplies have now been shipped from French North Africa and prices of barley as well as of maize are tending downwards.

Other Foods

Provisions.—Butter prices have again fallen in London, and New Zealand was quoted last week at 106s. per cwt. Stocks of butter in cold storage fell during the fortnight ending on May 6th to 381,200 cwt., which compares with 409,730 cwt. on the same date in 1938; cold-storage holdings of butter in Northern Ireland, however, amounted to 1,376 cwt., compared with 98 cwt. a year ago. The average deliveries of British margarine in the four weeks ending April 29th were 5 per cent. higher than in April, 1938. Bacon and egg prices were unchanged last week.

★

Colonial Produce.—Sugar prices have been steadily held during the past

week, pending the result of the Sugar Council's negotiations for increased quotas; the quotations for prompt raws declined by about 1d. per cwt. to 8s. 3½d. per cwt. At the Mincing Lane tea auctions, demand has been brisk and plain broken Pekoe Souchong was quoted on Wednesday at 11d. to 11½d. per lb.

★

Fruit and Vegetables.—New season's oranges from South Africa have appeared at Covent Garden and are selling at 10s. to 12s. per box. The Norfolk crop of bush fruit and early strawberries has suffered from night frosts but in other fruit districts prospects are good. Supplies of imported tomatoes have been plentiful, but are expected to slacken with the forthcoming increase in the import duty.

★

Milk.—The following table is compiled from statistics issued by the Milk Marketing Board:—

	Apr., 1938	Feb., 1939	Mar., 1939	Apr., 1939
Prices (per gall.)	d.	d.	d.	d.
Liquid	16-0	17-5	17-0	16-0
Av. manufacturing..	6-563	7-245	6-877	6-572
Av. pool	12-41	15-01	14-04	12-82
Contract sales (mill. galls.)				
Liquid	50-9	49-4	54-3	51-8
Manufacturing	30-9	14-4	20-2	28-5
Total contract	81-8	63-8	74-5	80-3
Used by farmhouse cheesemakers	1-6	0-5	0-7	1-1

Miscellaneous Commodities

Oils and Oilseeds.—After the revival in interest recorded last week, these markets have again relapsed into a dull condition, although prices are generally above those recorded a week ago. The Argentine surplus of linseed was officially estimated last week at 782,000 tons, compared with 801,000 tons on April 29th, and 702,000 tons in May of last year; English crushers are taking little interest in Plate supplies and quotations for forward shipments are easier. Little business has been transacted in Egyptian cottonseed and prices of linseed oil have lost all the advance of last week. Refined cottonseed oil ex Hull mill is now quoted at £20 10s. per ton, but even at this level, export demand is disappointing.

★

Rubber.—The market was inactive until the Rubber Committee's decision was made public; the 5 per cent. increase in export quotas was less than had been expected in some quarters and prices on Tuesday afternoon were marked up by ½d. per lb., followed on Wednesday by brisk trading both in London and New York. American stocks fell by 15,000 tons in April, consumption amounting to 44,166 tons, which was well up to expectations. The probable effects of the decision of the Rubber Regulation Committee on company profits are discussed in an investment note on page 450.

COMPANY MEETINGS

COMMERCIAL UNION ASSURANCE COMPANY,
LIMITED

IMPROVED LIFE PREMIUM INCOME

TOTAL ASSETS EXCEED £68,000,000

SIR BERTRAM HORNSBY'S REVIEW

The seventy-seventh annual general meeting of the Commercial Union Assurance Company, Limited, was held on the 16th instant at 24 Cornhill, London, E.C.

Sir Bertram Hornsby, C.B.E., chairman, said: The premium income at £5,379,391 showed a reduction of £71,257 as compared with the previous year. This reduction was in the main due to lower receipts in the United States. In the foreign field generally the volume of premiums increased slightly, while we have more than maintained our home premium income.

The net result of the operations of the year, after providing the customary 40 per cent. reserve, was a profit of £454,118. An amount of £425,000 has been transferred to profit and loss account, and the fire fund now stands at £7,021,593, or 130.5 per cent. of the year's income.

MARINE DEPARTMENT

The net premiums were £683,961, a decrease on the previous year of £19,614. The claims paid and outstanding amounted to £466,251, and the sum of £75,000 has been transferred to profit and loss account, leaving the marine fund at £1,223,734, or 178.9 per cent. of the premium income.

During the September crisis and again during recent months, the market has been faced with abnormal commitments in respect of gold shipments in one bottom across the Atlantic. Under the system which prevails of open covers being given for large amounts to many clients, the market is exposed to the risk of a loss of much greater magnitude than it should properly undertake. It is disappointing that the efforts made to improve this position have not so far met with success, and it is to be hoped that the matter will not be allowed to drop.

Although it does not come within the period under review, I would refer to the scheme which has been set up by the Government in co-operation with the companies and Lloyd's underwriters for the insurance of war risk on shipments to and from the United Kingdom under which the Government assume liability for King's enemy risk. The scheme will provide merchants and shippers with the protection they need to maintain the overseas business of the country.

ACCIDENT DEPARTMENT

The premium income at £8,157,200 was £16,027 less than that of the previous year. Claims paid and outstanding amounted to £4,406,138 and, after making the usual reserve for unexpired risk, there was a profit of £414,211.

From the revenue account of this department the sum of £400,000 has been transferred to profit and loss account, leaving the accident fund at £5,928,897, or 72.7 per cent. of the premium income.

The home motor business has been fully commented upon for some years past and there is little that I need add now. There is still uncertainty as to the measure of compensation, particularly in respect of loss of expectation of life, and the reduction in the number of accidents during 1938 was unfortunately offset to some extent by an increase in the number of persons killed and injured.

We may soon be faced with further legislation affecting motor business as a result of the recommendations of the Cassel Committee. Whatever that may be, it will be the continued policy of this company to give service to the motoring public.

We have transacted workmen's compensation business from the commencement of the first Workmen's Compensation Act, and although the profit is, at the best, very small, it is in the general interests of the great insurance enterprise of this country that the companies should continue to undertake it. A Royal Commission has been appointed to enquire generally into the subject of workmen's compensation in this country, and it may be that further legislation will be the outcome.

LIFE DEPARTMENT

Though the gross amount of new life business for the year reached a higher figure than ever before, more was reassured, and the net

total was £5,991,320, which is somewhat less than the record figure of the preceding year. The premium income increased by £67,817 to £1,989,310, of which £27,795 represented single premiums. Consideration for annuities amounted to £338,849, a decrease of £40,919.

The claims by death amounted to £599,347, or 89 per cent. of the amount expected according to the A 1924-29 mortality table, which is the table used in our valuation. That the favourable experience of recent years should be thus continued is a satisfactory feature pointing to the maintenance of a high standard of selection.

The interest income, after deduction of income-tax, increased by £11,602, to £981,252, but the net rate of interest earned fell from £3 16s. 3d. per cent. to £3 14s. 3d. per cent. owing to the increase in the rate of tax. During the year the amount of the life fund increased by £736,434, and stood at £27,269,268 at the 31st December last.

It is satisfactory to be able to state that despite the fall in security values which has been going on for some time, there was still at the close of last year a substantial margin between the market value of the Stock Exchange securities and the lower figure at which they stood in our books. After careful consideration of the different factors to be taken into account, we have decided to continue, for the present, the same rate of interim bonus as was adopted a year ago.

The new life business of our allied offices is included in the "Commercial Union" life fund, except that of the "British General," which has a separate fund. In 1938 the new life business in the "British General" amounted to £957,861 net, as compared with £897,434 in 1937, and is again a record for that office. Its triennial valuation at December 31st last disclosed a surplus (including £26,790 brought forward from the previous valuation) of £130,564, after strengthening the basis of valuation. From this surplus a compound reversionary bonus of 30s. per cent. for each year's premium paid during the triennium has been allotted to the policyholders.

PROFIT AND LOSS ACCOUNT

Interest, dividends and rents, after deduction of income-tax, amounted to £733,487, or £12,879 less than in 1937. The gross amount received before deduction of tax was, however, higher by £18,651 and the fall in the net figure was due to an increase of £31,530 in the amount of tax.

The transfers from the departmental accounts amounted to £900,000. Life and leasehold redemption profits contributed £103,451, which was some £10,000 more than in 1937; this arose from the increase in the divisible surplus declared at the quinquennial valuation of the life fund, the results of which were announced last year.

The transfer to general reserve fund was £225,000 against £275,000 in 1937, which in part reflected the smaller amount brought in from the underwriting accounts. Finally there remains a balance of £580,524 out of which the directors recommend that a final dividend for the year 1938 of 4s. per £1 stock unit, less income-tax, be declared. This will absorb £520,675, leaving £59,849 to be carried forward.

The total assets, excluding those of the life funds, amounted to £33,557,859, an increase of £1,018,895. Mortgages and loans showed an increase of £131,632, and investments an increase of £671,824, spread over the various headings, of which foreign Government securities showed an increase of £308,404. I would remind you that a very large part of the total under this heading consists of securities of the Government of the United States of America. Our holding of Ordinary stocks and shares showed an increase of £541,512, owing to the investment of a small proportion of the general funds in equities, restricted, however, to shares of the highest class.

The report and accounts were unanimously adopted.

INCORPORATED ACCOUNTANTS

MR WALTER HOLMAN'S ADDRESS

The annual general meeting of the Society of Incorporated Accountants and Auditors was held, on the 18th instant, at Incorporated Accountants' Hall, Victoria Embankment, London.

Mr Walter Holman, F.S.A.A., the president, in the course of his speech, said:—Perhaps the most important part of the Society's activities is that which concerns the educational standards required of its members and those who desire to become members, and this has figured prominently in the work of the past year.

During the year our examination syllabuses have been overhauled and the revised syllabuses will come into operation in May of next year. The purpose of the revision has been to make the tests by which admission to the Society is obtained more comprehensive, in view of the widening demands imposed on professional accountants by modern conditions.

Referring to professional organisation, hardly a week passes without complaints being received from members in various parts of the country of the activities of persons and corporate bodies and institutions who solicit professional business by unprofessional means. I can only say that effective action against this is possible only if undertaken by the profession as a whole, and the past year has produced evidence that united action is not an impossibility.

NATIONAL FINANCE

Political conditions are raising new and grave issues of finance in connection with the vast expenditure to which the nation is committed.

The decision as to the manner in which that financial burden is to be borne is a political one and is no longer open for discussion, but accountants have the right to say that, whether the cost is met out of the proceeds of borrowing or from taxation, it is essential that strict and continuous control should be exercised in all departments and in all directions. I know that the time factor is often of greater importance than economy, but while this may occasionally explain it can never altogether excuse extravagance and waste, and there is reason to suspect that both have been allowed to occur to an excessive degree.

This is not the only danger inherent in a large scale programme of non-reproductive expenditure. The risk of inflation is not to be lightly dismissed, since any considerable fall in the purchasing power of sterling would add seriously to the difficulty of borrowing on reasonable terms and tend to increase the real burden of debt on the return to normal conditions, to which we all look forward. Even if inflation can be avoided, continuance of borrowing is bound to create competition between the claims of Government and private borrowing, and I can foresee the possibility of some such encroachment on the freedom of business as has occurred in other countries.

You will gather that I cannot share the easy optimism of those who predict immediate universal prosperity if only confidence were restored and normal international relations resumed. The finances of the world have been and are on a war basis, and I believe they do disservice who ignore or disguise the fact that even if political improvement were soon to bring relief the re-organisation of national and international trade in order to re-establish it on a proper peace-time basis would be a long and painful process.

FINANCE BILL, 1939

So far as the Finance Bill relates to income tax and surtax, much of it is concerned with stopping up loopholes which experience has discovered in previous enactments relating to surtax on the profits of "one-man companies."

Two important extensions of previous provisions are introduced, the first that persons who receive or collect on behalf of others income from investments, will be required to give particulars of the names and addresses of the recipients and of the amounts paid to them, and the second that employers will in future be required to give much more extensive details of the payments made by them on account of expenses and of commissions paid.

While it is generally accepted that in present circumstances an extremely heavy burden of direct taxation must be borne by the whole community and that elaborate precautions must be taken to ensure that a small minority shall not escape their share of the burden to the detriment of their fellows, none the less the growth of the inquisitorial powers of Government Departments must be viewed with apprehension lest it be allowed to grow beyond the immediate and limited purposes for which it is designed.

The report was adopted.

THE LONDON AND MANCHESTER
ASSURANCE COMPANY, LIMITED

YEAR OF SOUND PROGRESS

MR A. H. DAWES'S REVIEW

The seventieth ordinary general meeting of the London and Manchester Assurance Company, Limited, was held, on the 17th instant, at the chief office of the company, London, Mr A. H. Dawes (the chairman) presiding.

The Chairman, in the course of his speech, said: Turning to the accounts, I think you will agree they reveal that the year under review has been one of sound progress. The premium income amounted to £3,452,536, an increase of £103,120 over the previous year. The assets of the company totalled £20,381,733, which is an advance of over one and a quarter millions on the figure for the preceding year. This is the first time that the assets have exceeded the twenty million mark. The interest earned on the invested assets was £4 11s. 11d. per cent. gross.

ORDINARY BRANCH

The amount of new sums assured written in the ordinary branch was £3,530,189. The premium income increased by £58,066 to £1,460,318. Consideration for annuities amounted to £27,382, which compares with £24,070 for the previous year. The purchase of a life annuity can never have been more attractive, for in these days of high taxation, making both ends meet on a small investment income is a daily worry. By investing in a life annuity one may double, or even treble, one's income with perfect security, and increase one's expectation of life (so our actuary informs me) from sheer peace of mind.

Claims by death at £171,718 increased moderately, but were well within expectation, whilst claims by survivorship of the endowment period rose from £443,067 to £528,963, showing a record increase, and incidentally revealing the increasing extent to which endowment assurance is being used for investment.

The ratio of expenses to premiums (adjusting as usual for single premiums) shows a reduction of 2.2 at 12.8 per cent.

The annual valuation of liabilities in this branch made by our actuary, Mr C. H. Ashley, on the same bases as in the previous year, discloses the record surplus of £794,164, including the brought-forward. We are proposing to repeat last year's bonus of £2 per cent.—a noteworthy achievement. This bonus will cost £350,296.

INDUSTRIAL BRANCH

In the industrial branch the new sums assured amounted to £6,784,741, showing an increase of £231,827 over the previous year. The premium income amounted to £1,890,962, being an increase of £40,697. Claims paid by death and maturity amounted to £811,568, an increase of £18,153. The expense ratio for the year, you will be pleased to know, fell by 1.42 to 36.84 per cent. The current sums assured under our industrial policies exceed £36,000,000.

The actuarial valuation in this branch also discloses a record surplus, namely £419,662, out of which we have provided for the repetition of our past performance in allocating the same rates of bonuses although none of the policies issued in this branch has any contractual right to participate in any of the profits of the company. Considerably over one million pounds has now been allocated to industrial branch policyholders out of profits since this concession.

The premium income of the fire and general branch at £97,661 shows a satisfactory increase of £7,041. The experience gained in this branch is proving of benefit to the company's interests generally.

ASSETS

Taking our Stock Exchange securities, we have no less than 83 per cent. invested in the United Kingdom and a further 12 per cent. in the rest of the Empire, thus leaving only 5 per cent. in foreign countries. Fifty-three per cent. of the amount of our Stock Exchange securities carries a definite date of redemption. The remaining assets are all in the United Kingdom.

The amount appearing under the heading of mortgages on property within the United Kingdom shows an increase of £161,888.

DIVIDEND

The directors are pleased to be able to recommend the same dividend as last year, 10s. per share, free of income tax.

I think we can claim to have had a satisfactory year, despite the drawbacks due to the uncertain political conditions. I will content myself by expressing the hope that this period of anxiety may give place to one of real peace and prosperity and that 12 months hence we shall be able to place before you even better results.

The report and accounts were unanimously adopted.

UNION INSURANCE SOCIETY OF CANTON, LIMITED

PURCHASE OF BRITISH OAK INSURANCE COMPANY

MR S. H. DODWELL'S ADDRESS

The ordinary yearly meeting of the Union Insurance Society of Canton, Limited, was held, on the 21st ultimo, in Hongkong.

The Hon. Mr S. H. Dodwell (chairman) presided, and, in the course of his speech, said:—I wish to refer to some important events that occurred in our affairs during the year. The first is the purchase by the society of the share capital of the British Oak Insurance Company, Limited. The primary object of this purchase was to extend the business of our group in the home and Dominion fields. This was particularly desirable as we have in the past been handicapped to some extent by the misapprehension that the society, having the word "Canton" incorporated in its title, is adversely affected by the political happenings in the Far East. That apprehension on this account is entirely unwarranted has been established by the statements made from time to time from this chair to the effect that the society's business is world-wide and the major portion of its investments and income is unaffected by Far Eastern difficulties.

While the above assurance was effective to a large degree, the acquisition of a home company will undoubtedly be very helpful in further emphasising the British character of the society.

A further step in the society's expansion was the decision to purchase the outstanding shares in the Beaver Fire Insurance Company. This company is incorporated in Canada, and there is every justification for the hope that in course of time it will develop into a very valuable adjunct to our business.

I now turn to the underwriting. The normal difficulties of this business were accentuated during 1938 by the need for increased care in selection due to the hazards inseparable from an involved international political situation.

SATISFACTORY FIRE ACCOUNT

In the fire field it is anticipated that underwriting during 1938 will have been satisfactory to the majority of companies.

I am pleased to say our own income in all sections shows an increase over the preceding year, and the results to date have been encouraging; profit being indicated from practically all fields. Our accident and general business has been well maintained, and the sections that have called for so much attention in recent years now show a distinct improvement.

REVENUE AND PROFIT AND LOSS ACCOUNTS

As regards the revenue accounts, you will see in the marine section that the balance of the 1937 account on December 31, 1938—namely £39,930 10s. 8d.—has been transferred to the credit of the underwriting suspense account. This amount will not be sufficient to satisfy third and subsequent years' claims, but the underwriting suspense account has a balance sufficient to meet additional claims which may arise.

While it is difficult to forecast the result of the 1938 marine account, the position at December 31st was a balance in hand of £482,791 14s., representing 48.85 per cent. of the relative premium, and this can be regarded as satisfactory. In the fire revenue account you will note the transfer of £70,077 5s. 7d. to the profit and loss account, and a similar transfer is made in the sum of £11,273 16s. 4d. from the accident account. The last mentioned is particularly satisfactory in that for each of the past three years this account has suffered a loss.

In the profit and loss account the fall in interest as compared with last year is due in part to the decision that the newly acquired British Oak Insurance Company, Limited, should declare no dividend this year. The "British Oak" earned interest as in previous years, but it is considered advisable to conserve its funds for the time being. For a similar reason the Beaver Fire Insurance Company will declare no dividend for this year. The society's interest was also adversely affected by the depreciation in the sterling value of the currency of China.

There is an increase in the reinsurance fund, but the exchange and investment fluctuation account is reduced due to the writing down of subsidiary companies, including the writing off of the sum paid for the goodwill of the "British Oak." Depreciation of investments and the drop in the value of the Chinese dollar have also adversely affected the account.

The report, revenue account, and balance sheet were unanimously adopted.

CABLE AND WIRELESS (HOLDING), LIMITED

OPERATING COMPANY'S NEW SOCIAL TELEGRAM SERVICE

The tenth ordinary general meeting of Cable and Wireless (Holding), Limited, was held, on the 17th instant, in London.

The Right Hon. Lord Pender (the Governor) said that with regard to the accounts of their own concern, the dividends receivable from the subsidiary companies for 1938 amounted to £1,217,000, which might be compared with £1,231,000 in 1937. The dividends from the Eastern Telegraph Company had been reduced, partly because the dividend of the operating company had been reduced, and partly because the Eastern Company, being the largest shareholder in that company, had provided a greater proportion than any of the other cable companies of the 2,600,000 shares of Cable and Wireless, Limited, transferred to His Majesty's Government. The dividends of the Eastern Extension Telegraph Company and the Western Telegraph Company remained unchanged. The dividend of the Marconi Company had been increased from 9 per cent. to 12 per cent. on the ordinary shares and from 7 per cent. to 9 per cent. on the preference shares. In addition, £63,080 had been received on the account of a special dividend from the Marconi Company. The dividend from Cables Investment Trust was unchanged at £50,000, and this accomplishment was particularly noteworthy in view of the difficult nature of the year for all investment trusts. Administrative and general expenses, etc., showed a reduction from £72,000 in 1937 to £61,000 in 1938.

PROFIT AND DIVIDEND

The profit for the year was £1,203,671, which was only £5,000 lower than last year, to which was added the balance of £199,000 brought forward from 1937. The dividend on the 5½ per cent. cumulative preference stock had been paid, absorbing £922,000, and the directors now recommended a dividend of 4 per cent. on the ordinary stock, which required £275,000 and left £205,000 to be carried to 1939. This latter dividend was at the same rate as that paid in respect of 1937.

As to the group's large holding of investments, their own reserve fund investments had naturally not escaped the general decline, a book value of £12,446,599 being represented by a market value of £10,990,763 at December 31st last. The full depreciation was 11.7 per cent., but a part of this occurred during 1937, and the figure attributable to 1938 was about 6 per cent. On the other hand, there had again been an increase in the income from investments, which amounted to £554,000 compared with £547,000 in the previous year, and the yield on the book value was £4 9s. 1d. per cent., compared with £4 7s. 6d. in 1937. The income received from the Marconi Company in respect of 1938 was £123,000 more than that distributed the previous year.

He would like particularly to stress the new social telegram service, for the directors believed that it marked a facility which would be popular to the public and profitable to Cable and Wireless, Limited. Since the first of this month, the day when the new service began, it had been possible to send a social telegram of 12 words to most parts of the British Empire for the sum of 5s., and they were anxious that this new service should have the widest possible publicity.

THE OUTLOOK

He would not be expected to say very much about the future, for in the troubled times through which we were passing it would be rash indeed to speculate even from day to day. It was, unfortunately, a fact that we were now living in times without precedent, when the world was obsessed by a war consciousness which lurked uneasily in the background, dominating men's minds and hampering all business initiative. The position was only too well summarised by the Foreign Secretary, Lord Halifax, who, speaking in the House of Lords during the momentous debate last month, described the world as being "in the state in which conduct of peaceful commerce and industry and the development of ordinary life becomes impossible." This diagnosis was confirmed by our Prime Minister on the same day when he spoke of the intolerable state of things which kept the whole world "in a perpetual recurring series of alarms and crises, blighting commerce and industry, depressing social life and culture and poisoning every phase of human activity in every country." As far as he was personally able to judge to-day, however, he saw no reason why the 4 per cent. dividend on the ordinary stock should not be repeated in respect of the current year.

The report was unanimously adopted.

BRITISH MATCH CORPORATION, LIMITED

A SATISFACTORY YEAR

HOME TRADE WELL MAINTAINED

The twelfth ordinary general meeting of British Match Corporation, Limited, was held, on the 17th instant, at River Plate House, Finsbury Circus, London, E.C.

Mr Clarence E. Bartholomew, O.B.E. (chairman and managing director), said: We have, in the first place, to deplore the loss of our colleague, the Rt. Hon. Major J. W. Hills, who resigned his office shortly before his death in November last. He was a loyal and valued colleague, who had rendered fine service to this corporation and to the industry.

I need not detain you with a long exposition of the accounts. The comparative figures are in your hands. The results are, on the whole, similar to those of last year, but the net yield is somewhat reduced by the additional taxation which is forced upon us, and by the entire absence of dividends from our big investment in Brazil. Our business there has again been quite satisfactory, but the financial restrictions have rendered it impossible to remit any of the profits, and no credit has been taken for these in this year's accounts.

The total return to your corporation from investments in subsidiary and associated concerns is just over 9½ per cent. on the book values, as against just over 9¼ per cent. last year, which, in the conditions prevailing, we must consider satisfactory.

During the year our interests in the Argentine have been slightly increased, and we look forward to continued satisfaction with our investment there.

HOME TRADE

The home trade represented by Bryant and May and Masters' businesses has been well maintained.

In the latter part of last year, arrangements were made by Bryant and May, Limited, with Maguire and Paterson, Limited, of Dublin, and Maguire and Paterson (Northern Ireland), Limited, by which close co-operation in the Irish business is assured. This will, I am convinced, be to the advantage of all concerned.

Your holdings in Government securities have, of course, suffered a decline in their market value, but they are all fixed dated securities, and stand in the books substantially below redemption value.

You will have already noticed that the corporation is in a very sound liquid position, which will enable us to take advantage of any future opportunities which may present themselves.

EXCHANGE DIFFICULTIES

I must direct your attention once more to the difficulties caused by the uncertainty of exchange movements. Apart from Brazil, which is relatively the most serious in its effects on our profits, our returns, both directly and through our subsidiary and associated companies, are affected by the exchange position in Australia, New Zealand, the Argentine and Canada.

I was taken to task last year by a stockholder when I warned you that we must account ourselves fortunate if we can keep up our present revenues in view of the growing demands of taxation, not only here, but in other countries as well. His complaint was that my words might reduce the price of our stock on the Stock Exchange. I should like to say quite definitely, and with the full concurrence of my colleagues on the board, that we are concerned only with the lasting well-being of this corporation, and that we cannot consider the possible personal profits of any individual stockholder.

HEAVY TAXATION BURDENS

Once again I make deliberate mention of the effect of the heavy burdens of taxation. These were already serious enough before the necessity for more speedy re-armament caused increases, both at home and overseas. The need for these costly measures is not of our making, and—provided always that these many millions of pounds are expended without waste and extravagance—it is our plain duty to put forward every effort to increase our earnings, so as to contribute as much as we are able towards the financial requirements of the country and of the Empire which we hold so dear.

If we devote ourselves cheerfully and with confidence to these tasks, we shall assuredly help to hasten the return of less anxious times.

The report and accounts were unanimously adopted.

SMITH'S POTATO CRISPS (1929), LIMITED

ANOTHER RECORD YEAR

TOTAL DISTRIBUTION 32½%

The tenth ordinary general meeting of Smith's Potato Crisps (1929), Limited, was held, on the 17th instant, in London.

Sir Herbert E. Morgan, K.B.E. (the chairman), in the course of his speech, said:—I am glad to say that we have had another record year of progress and prosperity. I told you last year that we were still breaking records, and I am sure you are pleased that the result of our trading has so conclusively proved this.

As is shown in the profit and loss account, the trading profit for the year was up from £164,032 to £182,435. It has been necessary to make increased provision for taxation of £55,231, as against £44,507 last year, and, after this deduction, the net profit is £127,204, compared with £119,524 for the previous year. We propose to carry a further £30,000 to reserve, bringing this account to £190,438. We also propose the payment of a final dividend of 20 per cent. and a cash bonus of 5 per cent. (both subject to income tax), making for the year, with the interim dividend of 7½ per cent. already declared, a total cash distribution of 32½ per cent.

It is gratifying that we have been able to finance out of profits the substantial expenditure on our extensions without raising additional capital and without materially affecting our liquid position. You will notice that the small decrease of £12,000 in cash is offset by an increase of over £13,000 in stock. I may also explain that the increase in the figure of £116,918 for sundry creditors, etc., is mainly attributable to the inclusion in it of reserves for taxation as well as contingencies and does not indicate any abnormal increase of trade creditors.

EVER-GROWING TRADE

May I emphasise the fact that the improvement in our position is the result of additional turnover. This I always feel to be the soundest and surest method of improving profits. Our trade is ever-growing and our organisation spreading. Each year sees an addition to our distributing facilities and each year an increase in the number of wholesalers and retailers handling our products.

While we have opened a new factory at Lincoln and doubled the size of our factory at Stockport, this step has been more than justified by the increasing popularity of and demand for our products.

Naturally, during the year we have benefited from the prosperity which exists in many districts, and are fortunate inasmuch that in the majority of cases, in the centres in which we are situated, there has been a spread of employment and an increase of wages.

DISTRIBUTION ORGANISATION

We can now say every one of our factories and depots is placed in a strategic position. As you know, our goods are to be found in every village, hamlet, on every pier and beach, at every wayside café, in fact, wherever food is sold in all parts of the country (both those densely and those sparsely populated), yet our factories themselves are in the large centres of population. Therefore the bulk of our trade lies at our doors, resulting in substantial saving in the cost of delivery.

We serve practically every licensed house in the country and the association of your board and staff, not only with them, but with the whole of the distributing trades concerned with our business, is one of the happiest.

You will be interested to hear of Smith's Potato Estates, Limited, at Nocton. As you know, we grow a large portion of the potatoes consumed on these wonderful estates in Lincolnshire, and those we do not grow for our use are specially grown for us under contract, on farms chosen by us and from seed which we select. During the year our farms have been maintained in a high state of efficiency, and the result of our activities is satisfactory. Shareholders may be quite satisfied that our investment at Nocton is proving an asset to the company.

It is gratifying to us that our business in Australia has at last turned the corner and is making very satisfactory profits. While not a separate company, we have what is, in fact, a very large business in another product—"Nuts and Raisins." Year after year sees a steady increase in their sale.

In conclusion I would say that we look forward to the coming year with confidence, and, as usual, I am able to tell you that our business shows every sign of yet further improvement.

The report and accounts were unanimously adopted.

THE LIVERPOOL & LONDON & GLOBE INSURANCE COMPANY, LIMITED

103rd ANNUAL REPORT

A SUCCESSFUL YEAR

The one hundred and third annual general meeting of The Liverpool and London and Globe Insurance Company, Limited, was held, on Wednesday, the 17th instant, in Liverpool. In the absence of Mr A. E. Pattinson, the chairman, Mr A. Kentish Barnes, a deputy-chairman, presided.

The Chairman, in moving the adoption of the report and accounts, said that:—

Despite world-wide unsettlement, 1938 had been a distinctly successful year for the company. Underwriting profits, at £900,300, had only once been exceeded in its long history. Total premiums were over £10,000,000; fire and accident loss experience was favourable, and the ratio of commission and expenses was lower.

The year had produced problems on an unprecedented scale with international and business affairs so disturbed. In such conditions, however, insurance appeared to greatest advantage, contributing, as it did, to the peace of mind of those it served by exerting a steadying, stabilising influence.

The value of insurance to the individual could not be over-estimated. British, Dominion and American offices alone last year had paid in claims an aggregate exceeding £830 millions. When translated into cash payments to policy holders—at times when money was most needed to rebuild property and savings or to re-start life—something of the constructive force of insurance could be visualised.

1938 RESULTS

Net new life sums assured, £2,851,415 (against £2,886,475 for 1937). Whole-life bonus was maintained at 45s. per cent. per annum; Endowment Assurance bonus maintained at 40s. per cent. per annum; Interim bonuses at the same rates. Carry forward increased from £675,365 to £790,002.

Net premiums: Fire, £3,835,137 (against £3,925,852 for 1937); Accident and Miscellaneous, £4,865,529 (against £4,898,523); Marine, £345,657 (against £330,080).

Underwriting profits: Fire, £332,251; Accident, £536,911; Life, £28,000; Marine, £3,139. Total, £900,301.

Interest to profit and loss account was £407,981.

Profit and loss account, after providing for dividend, income tax, National Defence Contribution, etc., showed a balance carried forward of £906,205.

The report and accounts were adopted, and a final dividend of 13s. 6d. per share was declared, making 27s. per share, less tax, for 1938.

RIO DE JANEIRO CITY IMPROVEMENTS COMPANY, LIMITED

EXCHANGE DIFFICULTIES

The seventy-seventh ordinary general meeting of the company was held, on the 17th instant, in London, E.C.

Mr Francis M. G. Glyn (the chairman) said that the balance of the profit and loss account was smaller by some £18,000 in comparison with 1937. That was due mainly to the low rates of exchange ruling during the year. Maintenance costs in Brazil had also risen, due firstly to the fact that the system had been brought up to the highest possible state of efficiency and, secondly, to increased taxation. On the other hand, interest received had increased, and they had been able to provide in full for all necessary reserves. Their cash balances in Brazil amounted to the milreis equivalent of £254,000, and it was not possible to say when they might expect to obtain exchange for that amount. In view, however, of the strong financial position of the company, the board felt justified in declaring a dividend of 4 per cent., free of income tax.

In the agreement signed by the company and the Brazilian Government in March, 1937, the Government undertook to pay the company the difference between the provisional drainage rent of 218 milreis paid during the period November 30, 1933, to December 31, 1936, and the net rent of 340 milreis agreed upon. The Government

had complied in every respect with the terms of the 1937 agreement. The main problem confronting the company to-day was, therefore, that of obtaining remittances.

In a new decree, dated April 8th, the monopoly of the Bank of Brazil in exchange was ended, and commercial banks were now allowed to purchase exchange, 30 per cent. of such purchases having to be resold to the Bank of Brazil for Government requirements; the balance might be disposed of to importers, provided such importers had obtained the necessary fiscal authority. Foreign companies, therefore, were in no better position than before to obtain remittances other than for imports unless the Bank of Brazil supplied them from the 30 per cent. which was allotted to it. That should amount to some £18,000,000 sterling during the year, which presumably had to provide for all Government requirements, but there should be a substantial balance available for other purposes.

The report was unanimously adopted.

BRITISH-BORNEO PETROLEUM SYNDICATE, LIMITED

SOUND POSITION

The twenty-fifth ordinary general meeting of the British-Borneo Petroleum Syndicate, Limited, was held, on the 18th instant, in London.

Mr Walter MacLachlan (chairman and managing director) said that the revenue for the year amounted to £54,061, and the administration, management and other London expenditure to £3,753, leaving a net profit of £50,308. The directors recommended a final dividend of 5 per cent., and a bonus of 5 per cent., both less tax, making a total distribution of 15 per cent. for the year.

The revenue which the company derived from its investments and royalty interests—their stable source of revenue—continued to be very satisfactory, and, although the profits derived from the realisation of shares had continued to be limited by the prevailing conditions, the net earnings of the company had been more than maintained. As a result, while they had maintained their general reserve of £70,000 and had applied £10,000 in reduction of the book value of investments in view of lower market prices, they had at the same time been able to make an increased distribution to shareholders and to increase slightly the balance of undistributed profits.

The oil interests and investments appeared in the balance sheet at a cost, less amounts written down, of £261,468. They continued to hold a substantial interest in Apex (Trinidad) Oilfields, Limited; the operations of that company for last year had resulted in a record production of 562,942 tons of oil. After writing off £158,603 for amortisation of wells the net profit was £315,554, and dividends amounting to 40 per cent. had been paid. The production of oil for the first seven months of the current year had been 302,106 tons, making the total output to date approximately 6,678,000 tons, and satisfactory developments continued on the Apex Oilfield.

There was also a record production last year from the Seria Oilfield, in Brunei, and the company continued to derive substantial revenue from the royalty thereon. That royalty interest stood in the accounts at a nominal valuation.

They also had a shareholding in the Ultramar Exploration Co., whose authorised capital was increased in the year to whose £1,000,000, of which £882,212 had been issued. The Ultramar Company had acquired all the issued share capital of the Caracas Petroleum Corporation in exchange for shares, and now controlled oil rights and interests over very large areas in Venezuela. The directors considered the prospects of the company to be very promising.

The company's investments included securities and shares of British industrial companies, Home railway stocks, debentures and shares of mining finance companies and mining companies, and other interests of a similar nature.

In spite of the difficult times through which they were passing, the position of the company continued to be sound and satisfactory. The oil interests were flourishing and progressive, and they were quite satisfied to retain their general investments with the knowledge that improved conditions would be reflected in their market values.

The report was unanimously adopted.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to the Reporting Manager of THE ECONOMIST, 8 Bouverie Street, Fleet Street, London, E.C.4.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On May 12th applications at £99 16s. 7d. per cent. for bills to be paid for on Monday, Tuesday, Wednesday, Thursday and Friday of following week were accepted as to about 40 per cent. and applications at higher prices in full. Applications at £99 16s. 8d. for bills to be paid for on Saturday were accepted in full. £30.0 millions of Treasury bills are being offered on May 19th.

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

[illegible]

(a) Interim dividend. (b) Final dividend. (c) Dividends for full year. (d) Paid in £N.Z. (e) Allowing for exchange. (f) Flat yield. (g) Yield worked on 4% basis. (h) Yield on 4½% basis. (i) Yield worked on 12% basis. (j) Yield worked to average redemption—end 1959. (k) Based on redemption at par in 1946. (l) Based on redemption at par in 1959. (m) Based on payment of 21%. (n) To redemption at par, in year shown. (o) Yield worked at ¾% of face value. (p) Yield worked on a 10% basis. (q) Yield worked on 22½% basis. (r) Yield worked on a 5½% basis. (s) Yield worked on a 14% basis. (t) Yield worked on 2-0925% basis. (u) Yield based on 40% of coupon. (v) Yield based on 47% of coupon. (z) 1% paid free of income tax. † Free of Income Tax.

MONTHLY TRADE SUPPLEMENT

Agreement in Sight

THE Prime Minister's statement in the House of Commons on Wednesday can only mean that the long-awaited Anglo-Russian agreement is now in sight. Pending the promised announcement of the terms after Whitsun, we are unlikely to hear more details; but we already know, and have known for weeks and months past, that the details are of relatively little importance compared with the broad fact of achievement. With Russia, France and Great Britain agreed to present a common front against attacks upon any of their own number or any of the smaller European countries upon whom the first blow might descend, the aggressor will be made aware that he is now confronted with too great a combination of force for him to move with any prospect of success.

The reasons for the Government's long procrastination, now happily brought practically to an end, will probably remain obscure. We have the impression that the Polish and Roumanian misgivings, which have been hinted at in British official quarters, are a once genuine obstacle which has latterly become little more than a pretext, as Polish and Roumanian coldness and suspicion towards Russia have melted under the heat-rays of German menaces. On the British side, there has perhaps been some reluctance to alienate Franco Spain or to exacerbate Nazi Germany further by too close a contract with the Soviets; but a principal cause of delay may well have been an innate repugnance, in Conservative circles, to making an infrangible

agreement with a Communist Power. On the Russian side there has certainly been suspicion, too, and doubts about the unreserved determination of the makers of the Munich Agreement to stand firm now; and in spirit and psychology the Kremlin is very much further away from London than its physical distance of 1,500 miles.

It is to be hoped that this chapter of history can now be regarded as closed; for the obstacles, whatever they may have been, do appear now at last to have been set aside. This great and welcome change may be put down to three causes: the personal conviction of Lord Halifax that the agreement must be clinched at once; the active mediation of the French Government; and the rising pressure of British opinion, expressed in all sections of the Press and lately even on the Conservative back benches.

Mr Chamberlain's announcement is all the more satisfactory when read in the light of the statements, made Geneva on Tuesday, by Lord Halifax and M. Bonnet. By Foreign Ministers made what was, in effect, a public cantation of the policy of opportunism which has substituted for the policy of collective security by France and British statesmanship since the date of the Hoare Plan. The contention that the collective policy is tactically idealistic and the opportunistic policy realistic has been disposed of by the events in Anglo-

glad to accept it gratefully now that it has been uttered at last. Everything, said Lord Halifax, that the British Government have done since Germany's seizure of Czechoslovakia is in strict conformity with the spirit of the League Covenant.

The Government hold no less strongly than they have ever done to the ideals of international collaboration of which the League has been, and is, the symbol.

And "the purpose, in loyalty to which the League was founded, can never die."

The truth is that, even if the Peace Front is now consolidated by the conclusion of an Anglo-Russian pact, only the immediate and the negative part of our task will have been accomplished. When we have built our dyke against the waves, we shall still have to calm the troubled waters of European life. Our improvised co-operation for defence will not avail to save us from ultimate disaster unless we make full use of any respite that we may gain in order to build up a permanent association of the European peoples for living and working together in peace. To-day, said M. Bonnet at Geneva, the nations find themselves confronting the alternatives of domination or collaboration. The present danger is that Europe may be united politically by the intolerable method of Nazi domination; we are making ready to prevent that. But it is collaboration between the nations that we are really seeking. The war of 1914-18, did not, after all, teach us our lesson; now, when, little more than twenty years after the last armistice, we find ourselves in imminent danger of being overtaken by another war of a far more appalling character, no one can fail to realise that, under the new technical and psycho-

logical conditions of to-day, the old Europe is no longer viable. It is impossible any longer for Europeans to go on living, as they have lived for the past 400 years, divided absolutely in allegiance between some twenty local sovereign States which acknowledge no obligations and tolerate no curb upon their independence.

The only open question now is the way in which the necessary political co-ordination of Europe can be brought about, and the choice lies between the dictators' way and ours. The dictators' way is, in Signor Mussolini's latest words, for the Rome-Berlin Axis to "impose" peace. The way of the rest of Europe is, or ought to be, a collective system in which no country is to be subjected to any other country and no country is to be excluded, against its will, from participation. Between these two present alternatives, no good European can hesitate. The Italo-German way of unification means a peace-by-domination that would be intolerable to all but a small minority of Europeans. It could not last, and the accomplishment of the Anglo-Russian agreement may make the Hitler-Mussolini plan no longer practical politics. But the only conclusive way of putting out of court a bad solution of a pressing problem is to put a good solution in its place. As soon as the Anglo-Russian pact has been completed, we must consolidate the whole of the Peace Front into a real unity of European States, with much more than preparedness against aggression as their common task, and with places ready and open for Italy and Germany as soon as they are in the mood to enter. Here would be a solution without either victors or vanquished, masters or subjects; and this is the only line along which Europe can hope to find lasting salvation.

Prescription for Transport

IT is the modern practice for ailing industries to write their own prescriptions for recovery, and the report of the Transport Advisory Council on the "Square Deal" proposals of the main line railways could, without disrespect, be included within this category. The Council is not a body of disinterested assessors, weighing expert evidence; it is itself composed of transport experts and transport users. But in this prescription, the "second opinion" has qualified the recommended treatment. At an early stage in its deliberations the Council arranged for the railway representatives to enter into parallel discussions with trading and other transport interests to ascertain what measure of agreement could be reached. Its report (summarised on page 482) in large measure adopts the agreements which were actually reached.

The railways may regard the Council's findings as a vindication of their "Square Deal" claim. After considering the various bilateral agreements the Council concludes that

in existing circumstances a material relaxation of the present statutory control of charges is necessary to assist the railway companies in overcoming the difficulties which they claim to arise from that control and to establish conditions which in their view and that of other transport interests will provide a favourable approach to the ultimate objective of co-ordination.

This recommendation is followed by legislation—and the Minister of Transport's announcement on Wednesday that the Government has accepted it in principle—marks the end of the standard charges and classification by the Act of 1921, with the associated regulations for exceptional rates and agreed charges, equality of the standard revenue provisions. In this sense the "campaign" has been won. But it has been won for the railways' original claim was for rates and

transport. The report also introduces the overriding safeguard that any Act embodying its recommendations should be limited to five years, or a shorter period if a suitable degree of co-ordination can be effected. Five years, it would seem, will be none too long to achieve real co-ordination.

Uneasiness at the prospect of giving the railways unlimited charging powers was inevitable, after a century of restriction. Hence, new machinery has been proposed. Charges must be "reasonable" and the decision will lie with a tribunal which will take into account the public interest, variations in costs, alternative facilities, the financial position of the parties concerned, and charges made to a trader's competitors for the same services. Thus the railway companies will no longer be able to plead a shortfall of revenue below standard revenue in justification of any increase in rates. Regular conferences between the railways and trading organisations to discuss charges may provide a measure of agreement on charges. But, as the Council repeatedly emphasises, their success depends upon the exertion of the greatest goodwill. Even in discussions of principle, differences have arisen with the coal industry and with traders, on the question of publication. Agreement on charges will be no easier matter. Failing agreement, the railways may give one month's notice of any proposed increase and introduce it after this period. If, on appeal, the Tribunal fixes a lower charge, the differences must be repaid to the traders.

Thus the safeguards relating to charges comprise, first, the possibility of amicable agreement, and secondly, the right of appeal on the ground of "reasonableness." This does not mean that charges for identical services will necessarily be identical to all parties. And, since the further safeguard on this point is the publication of charges—on which the Council has declined to make explicit recommendations—importance attaches to the statement that the railways intend "to make their charges known on

appropriate commercial lines to all interested parties." That is the immediate protection against unfair discrimination between different transport users, though its interpretation depends upon the scope of the words "appropriate commercial lines."

These safeguards go far to allay natural uneasiness that the railways should be granted complete absolution from control. Their effectiveness will depend, in large measure, on the strength of the organisations representing the trader's interest. Their operation, however, will be determined by the speed at which the entire transport industry moves towards "the ultimate objective of co-ordination." Co-ordination is a blessed word. Among its manifold meanings, at least two almost contradictory ones can be distinguished. Co-ordination may mean such an organisation of transport that traffic always moves by the route and on the system which involve the smallest social cost; in this sense it would involve a decision that certain types of traffic are suitable for the rail and others for the road, and it would take away the more costly varieties of the trader's present freedom of choice. Or it may mean that the present competitors strike a bargain with the object not so much of maximising their joint efficiency as of stabilising their present positions. In this meaning of the word, the existing alternative and competing services would be left in existence, but they would merely cease to undercut each other.

The present proposals have elements of both conceptions. But since they are based on a road-rail agreement it is inevitable that they lean to the second meaning of co-ordination. Possibly, by a scheme of differential charges, traffic may be directed to the system best fitted to handle it. It will be interesting to see, in five years' time, how much progress has been made on these lines.

For the road haulage industry, the new proposals will involve considerable changes. It will not be possible to make agreements on rates with the railways unless the industry has some plenipotentiary negotiating body and unless the agreements, when made, can be enforced. A much greater degree of uniformity among the present large number of independent operators will thus be necessary and, as in the passenger branch, uniformity and regulation will almost inevitably lead to amalgamation. The larger road hauliers have clearly a lot to gain from an alliance with the railways, and the net result of the proposals may well be to restore the transport monopoly of the century in the form of a road-rail condominium.

For the railways, the fruits of the "Square Deal" will clearly be of a long-term order. In fact, the area over which they may be able to gain (though, in all probability, they will have to share that gain with the road hauliers) is limited to the higher classifications, where road competition has eroded the traffic offering to the railways. If neither side is in a position to offer large concessions to the other, the conclusion suggests itself that the transport user will have to meet a bigger bill. But while the roads may pursue their own rates policy, subject to agreement with the railways, only the railways may be compelled to justify their part of the bargain before the Tribunal. Moreover, the problem of heavy traffic on which, in principle, increased rates could be imposed, will still remain. The inability of the railways to reach agreement with the coal industry is symptomatic of the difficulty of contemplating changes in a rates structure for heavy goods on the basis of which the industrial organisation of the country has been built up. Heavy industry is tied to the railways, but the railways would hardly be wise in trying to make the traffic bear significantly higher charges.

The interim period provided by the "Square Deal" Report, however, may show whether the more remunerative traffic can be shared to better advantage with the road hauliers, so that the railways may make up the growing deficiency on heavy goods. The period may be too short to reveal any decisive result. Perhaps, when it has elapsed, more fundamental treatment may be needed. It may be that the tentative methods of negotiation which have arisen from the recent discussions will not function, even with the exercise of the greatest goodwill on all sides. Time will be needed to sketch even the outline of a co-ordinated rates structure for rail and road. Meanwhile, the transport user will enjoy safeguards, explicitly on the rail side and by implication on the road side. Out of this web of bilateral understandings a co-ordinated system of transport may emerge. But the reflection cannot be suppressed that it would emerge more quickly if full community of financial interest existed between rail and road. The ultimate problem is to ensure that transport pays its way, and offers a reasonable return upon its capital. Both of the principal partners would have difficulty in defining precisely what their capital investment is. But, so far as the transport user is concerned, it is fair neither to ignore the social investment in our highways nor to refuse to consider whether economic changes have rendered some part of past capital investment in the railways redundant.

The Other India

THE question whether Germany's old colonies should be kept or given back is an issue in world politics and strategy. The real colonial problem is very different: it is one of administration and economic development, not primarily of sovereignty. A century and a quarter ago, Britain did give back colonies taken in war; but the importance of the Dutch East Indies to-day does not lie mainly in the fact that they are owned by Holland and not by Britain, but in the way in which their sixty-odd million inhabitants are governed and the means that have been used to exploit their island riches.

Netherlands India, with its string of islands stretching from Sumatra, Java and Borneo through the Celebes and Moluccas to Dutch New Guinea, will bear comparison with our own mainland Empire. It mirrors the same problems of the relations in ruling between Europeans and natives; and there has been the same push-and-pull between the interests of native cultivators and Western traders and capitalists. Exporting 80 per cent. of the world's exports of pepper and 38 per cent. of the world's exports of rubber and 30 per cent. of the world's exports of coconut palm

products, and rich in petroleum, oil-seeds, vegetable oils, coffee, sugar, tea and tobacco, Netherlands India is a key country in the balance of world economic power (as the diagrams on page 522 show). Its protection against marauders is as important to the British in Singapore and Australia as it is to the Dutch in Batavia and at the Hague.

The Dutch Indian Empire, like the British, grew without design out of the exigencies of commerce; and its story for the last three and a half centuries has at last been admirably told by an English author.* For two hundred years, up to 1800, it was a trading company which flew the Dutch flag in the islands, and it was the profits of trade that they sought, not territorial sovereignty. Only in Java itself, in the pale around Batavia, did they take over territory. When the Dutch monarchy took over control in 1815, the colonies became a State business concern. Produce was paid to the administration in lieu of taxes: there was enforced planting of indigo, sugar and coffee.

But the Crown farm failed. Exports rose sixfold between

* Netherlands India. By J. S. Furnival. Cambridge University Press. 502 pages. 25s.

1830 and 1840, but they then stagnated. In Holland the middle-class became critical from 1850 and called for Parliamentary control, and *laissez faire*. It was in 1870 that the door was fully opened to private traders. And it was now made possible for capitalists to hire land from natives on lease for planting, though actual alienation of the State lands subject to customary native rights was still forbidden.

The dawn of the twentieth century saw in Holland, as in other European countries, a new Imperialism. Parliament's attention turned to the Outer Provinces, where the Dutch still held little more than an option with guards to keep trespassers away—even to-day two-thirds of the Netherlands Indian population is in Java and Madura, which is one-fifteenth of the area. In the rising industrial Europe and America there was need for raw materials as well as Java's staple foodstuffs; and there was oil in Sumatra and Borneo. And native welfare was now an aim.

The Netherlands India we know to-day is built upon the trials and errors of the nineteenth century. But it has been mainly made since 1900. A generation ago the colonies were ruled by

a Governor-General under Parliament's instructions, and he had a Council to advise him and a Civil Service, with native and European branches. Rule was direct through Dutch governors in the State territories free of native rights; and indirect through native rulers in the State lands subject to native custom. The principle was the dual one that like should

rule over like, but it was an arbitrary system, and Dutch officials had the last word everywhere. The new Imperialism and a new Nationalism dictated changes. The main structure of Indian government was retained, but local councils of Europeans and natives were set up with advisory powers in 1903; and in 1918 the first representative Parliament, or *Volksraad*, for central Indian affairs, was created.

Simultaneously, an economic transformation took place. The expansion was enormous: sugar production rose fourfold and tea tenfold between 1900 and 1930; agricultural exports rose sevenfold; and only between 1915 and 1930 rubber output was multiplied ten times. Between 1900 and 1930, too, tin production was doubled, coal production was raised ninefold and oil output was brought from 360,000 tons to 5½ million tons. It was a rich new seam that was struck, and, while the population of Java and Madura rose from 19.8 millions in 1880 to 41.7 millions in 1930, that of the Outer Provinces climbed from 7.6 millions in 1905 to 19 millions in 1930. The number of Europeans rose sixfold in fifty years and the number of Chinese was quadrupled in the same half-century. Foreign capital flooded in as well; and in 1929 over a quarter of

all capital in Javan and Sumatran agriculture, and more than two-fifths in crops other than sugar, was foreign. Total international capital in Netherlands India was 4,000 million florins, and over a quarter of it was invested in oil.

Netherlands India to-day thus presents a composite picture. Side by side with crowded long-developed Java there are the rich and newly developed Outer Provinces: minerals and raw materials of all sorts now supplement foodstuffs and spices in the balance of the colonies' trade. In 1937 of exports valued at 951 million guilders, rubber accounted for 298 millions, petroleum products for 16 millions, oil seeds and vegetable oils for 105 millions, tin for 84 millions, sugar for 51 millions, tea for 49 millions and tobacco for 41 millions. Side by side, too, there are three peoples: the Europeans, numbering about 50 per 1,000 natives in Java and 30 per 1,000 elsewhere, and strikingly evenly dispersed among production, industry, transport, commerce, the professions, public administration and the army and police; six times as many Chinese concentrated in commerce as merchants and shopkeepers and

in the plantations and factories as coolies; and nearly 60 million natives overwhelmingly dependent upon agriculture and mining.

The balance of peoples, production and occupations is not an easy one. "For the last twenty-five years, over this densely populated country, has swept a wave of colonisation such as it never experienced before; and at the

same time all kinds of nationalist waves are rolling in higher and faster"; and the crisis of 1929, which reduced the annual value of exports between 1931 and 1934 to one-fifth of the 1925 level, not only drove the Government to restrict the export and output of staple products, but also led to schemes for industrialisation to lessen dependence on world prices and to counter swiftly advancing Japanese penetration. Politically and economically Netherlands India is at a cross-roads. "India must now learn to manage her own affairs" is the official view, but the new Constitution of 1927 has failed to meet Liberal and Nationalist claims.

It is probably the wisdom of the Dutch official on the spot that has most marked Holland's rule in the East in the past. The burden is heavy: the islands are passing through something like a social and industrial revolution; and both in Java and in Holland itself Imperial defence has suddenly become a matter of immediate moment. Holland's record in colonial administration and development is at least no worse than that of other countries; in many ways it is better. But the need to defend her Empire has not arisen for more than a hundred years.

Cricket's Financial Problem

THERE is a crisis in cricket. Even the keenest admirers of the game fear that the time may not be far off when the values in English life which this dignified recreation so uniquely represents, with all its pleasant incidental characteristics, will have disappeared in the unthinking scurry of the present search for more facile amusements. The financial difficulties of many first-class cricket clubs are well known; and there are growing suspicions of faults in the game itself. This is no place to assess the status of cricket as a game or as an institution. But the expression of its *malaise* is economic: and some attempt to diagnose the precise nature of the present trouble in terms of pounds shillings and pence might not be out of order. Some of the existing troubles are beyond control, such as the English climate and the existence of amusements alternative to cricket; they are important, but hardly remediable by policy. Where cricket competes with other games it must stand or fall on its own merits. Nor is it likely that there is much to be gained by an attempt to convert the devotees of, say, dirt-track racing to cricket by transforming it into a raree-show with faster and more spectacular methods.

Two groups of difficulties remain: those directly connected with finance, and those which arise out of the nature of the game itself and express themselves in monotonous high scoring, undue caution and lack of enterprise—in a word, in bad cricket. If the rules are found to be faulty they can be altered: recent years have seen a modification of the leg-before-wicket rule and an experimental introduction of the eight-ball over; and the deficiencies which persist, such as those associated with over-perfect pitches and "timeless" Test Matches, can readily be cured by a process of trial and error. At bottom these technical questions, too, are economic: pitches are prepared to last a long time without wear because county secretaries want to make sure of three days' play and three days' gate money. That their calculations are probably unsound is shown by the sorry state of their balance sheets. It is quality not quantity that spectators want in their cricket, and it is the rehabilitation of good cricket according to the highest standards of the heroes of the past and the best players of the present that should be the best selling line. The game is as popular actually and potentially as ever it was. Hundreds of thousands of people play cricket regularly; and literally millions read about it. The Club Cricket Conference which co-ordinates the activities of many of the rank and file clubs had nearly 1,400 clubs affiliated to it in 1938, 1,205 being in the Home Counties. In South Lancashire and the West Riding of Yorkshire 180 to 200 teams play in 12 leagues, which are run on lines akin to the Association football leagues. And Test Matches are events of national importance. Demand is not lacking, but the game's entrepreneurs have failed to adapt their organisation and methods of finance to changing times.

Test Matches apart, the best standards of English cricket are set and maintained by the seventeen first-class counties. The matches played by these seventeen clubs produced £73,000 in gate receipts in 1937 and £115,000 in 1938. Cricket paid £20,000 in entertainment tax in 1937-38, as against £450,000 for football, £250,000 for horse-racing and £270,000 for other racing. These figures plainly indicate that the problem is a small one in absolute terms. But small concerns work on small margins and stand or fall by their revenue and expenditure position. That position in the case of the English county cricket clubs is unstable in the extreme. (The estimates in the next column are based on the accounts of fourteen out of the seventeen clubs.) The increase in revenue between 1937 and 1938 was due chiefly to a rise in gate receipts (for which the visit of

REVENUE AND EXPENDITURE OF SEVENTEEN COUNTY CRICKET CLUBS, 1937-38

	1937	1938
Revenue	160,000	244,000
Expenditure	169,000	221,000
Profit or loss	- 9,000	+ 23,000

an Australian team was largely responsible) from about £73,000 to £115,000. In 1938 gate receipts represented 47 per cent. of total revenue; a further 29 per cent. came from members' subscriptions; and most of the remaining 24 per cent. consisted of the share accruing to the counties from the profits of the M.C.C. tour in Australia in 1936-37 and the Australian tour in England in 1938. It is the proceeds from these tours which, in the case of the weaker county clubs, often make the difference between profit and loss on an ordinary year's working. Thus, in 1938 Gloucestershire made a profit of £648, largely as a result of the £446 received from the profits of Australian matches. Again, Kent turned a loss of £1,819 in 1937 into a profit of £2,003 last year, partly as a result of a grant of £2,009 from the same source. In fact, the finances of county cricket depend almost entirely for their final appearance on the profits of Anglo-Australian Test Matches.

Present expenditure cannot be cut, so new sources of revenue are required. This entails an advance on a wide front. In the first place, better cricket means better gates; natural pitches and play truer to Edwardian traditions might do something here, though on balance the game is sound enough as it is. In the second place, more might be done to swell the sums taken from club members in subscriptions. But still there might remain the need for new sources of income. The M.C.C. commission of enquiry recommended that a County Cricket Fund should be built up out of the profits of Test Matches now going to the county clubs. The suggestion received little support, since it would entail starving the straitened smaller county clubs, and might even lead to the collapse of some—though there is a body of opinion inside the game which holds that the number of first-class counties is already too large and that for the good of the game the number should be cut down to what it was before the war.

Yet the M.C.C.'s recommendation did contain the germ of an idea which might be the means of saving the situation. Such a centralised fund might indeed be set up, but there is no reason why it should depend on the profits of Test Matches. There are other sources that might be tapped. The number of rich men sufficiently interested in cricket to spend large sums of money on it is probably smaller now than it used to be, but there are still enough of them to provide the nucleus for an endowment fund. Their efforts could be supplemented by bequests, and in a host of ways it might be possible to capitalise the goodwill towards the game which exists among its regular following of leisured and retired people, its occasional following of Saturday and half-holiday enthusiasts, and the millions to whom the cricket reports are so pleasant a daily feature of the newspapers in summer time.

This is but one suggestion for stabilising the game's finances. The endowment method may seem fantastic, but at least it symbolises two facts: first, that cricket is our national game and has perhaps some claim to look to national sentiment and esteem for its survival; and secondly, and more realistically, that cricket needs money even if it has to go cap in hand to get it. In the end the acid test is that of the market place, and unless the struggling counties can make both ends meet by some or all of these devices, the time for them to draw stumps for good may be very near. If we want to keep first-class cricket we must be prepared to pay for it.

The "Square Deal" Report

THE following is a summary of the Report of the Transport Advisory Council on the proposals of the main line railway companies regarding the conveyance of merchandise by rail, dated April 4, 1939, and published on May 19, 1939.

Terms of Reference and Proceedings

The Council was instructed by the Minister of Transport, in a letter of December 12, 1938, to consider and report "as expeditiously as possible" on memoranda submitted by the Railway Companies' Association, which proposed:

that the existing statutory regulation of the charges for the conveyance of merchandise traffic by railway, together with the requirements attached thereto, including such matters as classification, publication and undue preference, should be repealed,

and to make recommendations. The Minister expressed the qualified opinion that there was a *prima facie* case for the relaxation of existing regulations provided that due regard was had to the ultimate object of the co-ordination of all forms of transport. (Para. 1.)

The railway companies indicated that they did not seek total abolition of statutory control of charges, and expressed willingness to negotiate with other transport interests for a co-ordinated system of charges and with trade interests to determine suitable safeguards. These negotiations proceeded concurrently with the investigations of the Committee. (Paras. 9-10.)

The railways reported in due course that:—

- (i) they no longer proposed that they should be relieved of their obligations as to the provision of reasonable facilities, or as to through rates or standard conditions of carriage;
- (ii) arrangements should be made for regular periodical meetings between the various trading associations and the railway companies for the discussion of railway rates and charges, trade prices and other matters of common interest; and
- (iii) they should be entitled to make such reasonable charges as they thought fit with a right to traders (failing voluntary agreement) to appeal against the charge made to a Tribunal, such as the Railway Rates Tribunal, on the question of reasonableness. (Para. 11.)

The memoranda embodying the results of the negotiations between the railways and the various transport and trading interests indicated a large measure of agreement, except in the case of the coal industry. (Paras. 12-14.)

Recommendations

The Council emphasises that any Act passed as a result of the Report should be regarded as an emergency measure and be limited in its duration to five years or less. (Para. 15.) The recommendations are set out below:—

1. Agreements with Trading Interests

Principles agreed in consultations between railway companies and trading interests are approved as forming a suitable basis for determining railway charges during the interim period of five years or less. These comprise:—

- (i) setting up of conferences to consider proposals by the railway companies for any general increase of existing charges;
- (ii) failing agreement on such proposals at the appropriate conference, the giving of one month's notice by the railway company(ies) of intention to bring the increase into force and the reference of the matter to a Tribunal for determination;
- (iii) giving of notice by railway companies of increases in individual charges with a right to the trader affected to take them to the appropriate conference and, if necessary, to the Tribunal;
- (iv) right of any trader or body of traders to challenge any charge or to apply for reduced charges before the Tribunal; and
- (v) the basis of the Tribunal's determination in all cases to be the reasonableness of the proposed charge. (Para. 29.)

These proposals are regarded as providing suitable protection for the coal industry also, and hope is expressed that further negotiations will be undertaken between the railway and coal interests. (Para. 31.)

2. Relaxation of existing Statutory Regulations

The main proposals under this head are:—

- (a) *Classification of standard charges* should be repealed. Railways would retain a voluntary system of classification.

- (b) *Exceptional rates and agreed charges* to be repealed.
- (c) *Publication*. No recommendation. Railways are willing "to make charges known on appropriate commercial lines to all interested parties," and have reached agreement with National Farmers' Union and British Iron and Steel Federation, but not with representatives of the traders' interests. Railways are prepared to accept any obligation regarding publication which is applied to all forms of transport.
- (d) *Standard revenue* provisions no longer appropriate to recommendations of Report.
- (e) *Equality of charge and undue preference* provisions to be repealed.
- (f) *Disintegration* provisions to be repealed.
- (g) *Rights of traders to apply to the Tribunal for new or reduced rates or agreed charges*. Existing statutory provisions considered inappropriate, but the right should be retained.
- (h) *Through rates and standard conditions of carriage*. No change.

3. Protection of Trade and Industry

In order to preserve fullest flexibility, proposed periodical conferences between railway companies and trading interests should be set up by Statute. (Para. 35.) In the event of conference failing to agree on proposals of railways for a general increase in existing charges, following procedure to be adopted:—

- (i) Reference to the Railway Rates Tribunal after one month's notice of increase by the companies. The Tribunal to fix reasonable charges after hearing both sides.
- (ii) The increased charges to come into force not less than one month after notice.
- (iii) Proposed increases in individual charges to be notified to traders concerned at least one month before the increases come into force. Traders may refer to the appropriate conference and afterwards to the Tribunal if unable to agree with railways.
- (iv) If rate is fixed lower than railways' charge put into force, difference must be repaid to traders.
- (v) Traders may appeal to the Tribunal for a reduction of charges.
- (vi) In determining the reasonableness of a charge the Tribunal shall consider
 - (a) Whether or not the charge is detrimental to the public interest.
 - (b) Variations in the value of currency.
 - (c) Cost of affording the service(s) in respect of which the charge is made.
 - (d) Existence of any alternative or competitive transport facilities and the charges made for like merchandise by such alternative transport.
 - (e) The effect of the charge on the financial position of the parties concerned, either generally or individually.
 - (f) The charge made to other traders for the carriage of like merchandise if it affects the trader concerned. (Para. 37.)

The Railway Rates Tribunal shall not be permitted to question any increase in railway costs as a result of the grant of improved remuneration or conditions of employment. (Para. 38.)

Protection of Other Transport

The main features of the agreement arrived at between the railway companies and the Liaison Committee on Road Transport Rates are approved. They are:—

1. Save in exceptional circumstances the railways will not during a period of two years after obtaining freedom from rate control raise objection to applications for carriers' licences under the Road and Rail Traffic Act, 1933.
 2. The setting up of a Central Consultative Committee to formulate the principles on which voluntary agreements can be reached for charges for carriage of merchandise traffic by road and rail.
 3. Owing to the large number of operating units in the road haulage industry, adherence to voluntary agreements cannot be relied upon, and must be enforceable. (Paras. 40-49.)
- Paragraphs 51 to 75 of the Report approve the proposals for further agreements between the railways and canals, coastal shipping (tramps and liners) and docks and harbours.

NOTES OF THE WEEK

Recovery and Policy.—It is an unfamiliar prospect that the economic signs foreshadow. It has been generally agreed for some time now that the demands of the Government's vast defence expenditure this year are likely, *inter alia*, to remove at no very distant date the burden of abnormal unemployment which laid heavy on this country even in the remarkable prosperity of two years ago. Now, as *The Economist's* monthly Trade Supplement, published with this issue, describes, the latest reports and statistics show that Britain is already in the midst of a vigorous trade recovery. It is mainly the great increase in Government orders that has brought this year's expected recovery in plain sight before the autumn date which seemed likely earlier this year. The heavy industries, iron, steel and engineering, are working at high and growing pressure; shipbuilding, under the influence of the Government's subsidy plans, is notably active; even the coal industry, chief heir to Britain's post-war *malaise* of maladjustment, is enjoying something like a prosperous period. Nor is the rising tempo of work confined to industries directly affected by the defence drive: revival in textiles, mounting car sales and wide evidence of increased consumers' purchases show that recovery is now progressing on a very wide front. But it is by no means a complete front: in markets sensitive to the troubled international outlook, in branches of trade similarly susceptible, like London's West End retail trade and in some sectors of private investment, there is still doubt and hesitation, engendered by the very fears which have stimulated the general recovery by making higher defence expenditure imperative. And it is only that a rise in prices cannot, in these conditions, be very long delayed. It is also unquestionable that the very vigour of recovery makes urgent and pressing the need for plans by the Government, industry and the trade unions to eke out the nation's resources of plant, goods and labour to the best advantage of national defence. Control and regulation of trade and industry are, admittedly, distasteful, but they cannot now be avoided for long if the defence programme and the Government's borrowing are to be carried through without dislocation, grave bottlenecks and the wastes of inflation. The boom that is apparently ahead is a challenge to preparedness.

A Ministry of Supply.—The Supply Bill was published on Thursday night. It proposes wide compulsory powers for the Minister: to secure priority for Government orders of "articles required for the public interest"; to examine contractors' records; to take over and manage recalcitrant businesses; and to fix prices. The thorny but vital problem of control over labour is left aside. But the full application of the Bill would be a valuable first step forward, though it is perhaps ominous that the Minister's powers are to be limited to Government departments whose supply functions are specifically transferred; the intention to restrict them mainly to Army supplies for the time being is apparently to be adhered to. Nor is it reassuring that the hampering principle of checks and balances is to be retained by making the Minister's exercise of these powers subject to the control of a Ministerial Priority Committee. But the Ministry is wanted at once, and time to deal with the Bill is sadly lacking.

Parliament's Timetable.—The bottlenecks arising from the pressing needs of national defence are not to be found only in industry. There is a bottleneck, too, in the process of Parliamentary legislation. It was only by the rigorous use of the guillotine that the Military Training and Reserve Forces Bills were forced into law before Whit-suntide; and there is a clutter of important measures still

waiting attention or lingering in Committee. The Cotton Industry Bill is making slow progress; the Building Societies Bill is only past its second reading; a Poultry Bill has been published and no more; and the Government are committed to various agricultural and other proposals which still need to be embodied in statutes. Nor is it merely a matter of actual Bills or proposals held up: the recommendations of the Royal Commission on Safety in Mines urgently require legislation; the passing into law of the Square Deal proposals for the railways will be a legislative task of no small magnitude; and somewhere in a dusty Ministerial pigeon-hole there are plans for the re-organisation of electricity distribution. Of more immediate moment there is the promised measure to restrict arms profits and there is the Supply Bill. It is true that Parliament may be able, by stringent self-denial, to work off the major Bills actually in hand before the summer recess. It is impossible for all the legislation begun or contemplated to be duly accomplished; and, in the autumn, there will be a heavy legacy of things undone for the new session—or for the newly-elected Parliament. It does not help that the Government's personnel, never outstandingly able, is by now weary, too. The pressure of Parliamentary business nowadays, even in genuine peace-time conditions, places too heavy a strain on Parliament's inherited procedure of law-making; and the present *impasse* serves to underline the urgent need for more expeditious methods. No sound reasons have ever been advanced why the time of Parliament should not be economised, and legislation speeded up, by the institution of functional Committees to deal concurrently with the details of even important measures. Parliament, no less than the Service Departments needs an efficient machinery of supply.

The White Paper in Palestine.—The White Paper on the future of Palestine was bound to disappoint all parties. We must regard it as so much to the good that, in Palestine and Parliament alike, the inevitable reactions have been not so very violent or distinctive. While the Arabs have shown no enthusiasm for the new plan, and some suspicion that they may be cheated of the benefits which they stand to gain by it ultimately, the Jewish demonstrations and disturbances have subsided, at least for the moment, after having been indulged in for only a single day. At Jerusalem on May 18th, a day of orderly demonstrations ended in a riot in which ten policemen were injured (one of them fatally) and 85 Jews (partly in faction fights among themselves). On Friday the 19th, General Haining, the British officer commanding in Palestine, sent a warning to leaders of representative Jewish

organisations to let them know that any further violence would be vigorously repressed. The Jewish threat to copy Arab resistance methods is, as we pointed out last week, a logical consequence of the history of Palestine since 1917. In Jewish hands, however, this weapon would be a boomerang, since its use would merely lead to an earlier stoppage of Jewish immigration and to the erection of an independent Palestine in which the only participating "Palestinians" would be Arabs. It is to be hoped that, on second thoughts, the Jews will turn their energies towards getting the most that they can—and it is surely much—out of a self-governing Palestine in which they will have one-third of the numbers and at least two-thirds of the wealth, skill, experience and ability.

* * *

—And in Parliament.—Meanwhile the debate in the House of Commons on Monday and Tuesday has resulted in a Government majority of 100 against the Labour amendment and of 89 in favour of the Government's own policy. At least 110 supporters of the Government must have abstained from voting; it was at once a victory and something like a semi-defeat for the Government—in face of a three-line whip. The policy of the White Paper is likely to be tried because no single Member who opposed it—neither Mr Morrison nor Mr Amery nor Mr Churchill—had any positive alternative to suggest. The abstentions of the Government's own supporters expressed merely chagrin at the bankruptcy of a policy for which the whole House is collectively responsible. Mr MacDonald's speech on Monday had at least the substantial merits of frankness and common sense. He was frank about the origins of the present crisis. "It was born in the tumult of war," when we were bidding for the support of Arabs and Jews alike. He was sensible about the limits of our right and power to coerce the Arabs. Under the mandate we were bound to encourage immigration "under suitable conditions." He did not think that conditions were suitable for immigration at the present time if that immigration, however advantageous it might be in certain other directions, was the direct cause of disturbance and hatred that threatened fatally, for a long time to come, the welfare of Jews and Arabs alike in Palestine. This was a point which none of the Colonial Secretary's critics ventured to take up.

* * *

Mr Chamberlain and the Czechs.—From the difficulties which beset the Czech Government in trying to administer territories over which it has no final authority—that authority being invested in Baron von Neurath, the "Reich Protector"—it is evident that the German Government has small concern to lessen the troubles and humiliations of the people which it now protects. The essential orders (essential from the German point of view) are given by the Army authorities; civil needs can take care of themselves. Alongside the retarding effect which the Protector's office is exercising on the civil government of Bohemia-Moravia, there have lately been domestic worries caused by the Czech Fascist Party, insignificant in everything but its capacity for mischief-making. General Gajda, its leader, who will be remembered as having been a German pawn, is said to have ambitions for the Ministry of the Interior; from the latest reports it would seem that President Hacha has managed to resist this fresh attack on the little dignity that remains to the Czech administration. Meanwhile, in the House of Commons, Mr Chamberlain

has given us good grounds to suspect that he wishes to accord some sort of recognition to the annexation of Bohemia-Moravia. Following on the intention to transfer £5-6,000,000 of Czech gold—held in London on account of the Bank for International Settlements—to which reference is made in our financial columns—Mr Chamberlain's firm refusal to give an assurance that he would not accord recognition without first consulting the House seemed a confirmation that such recognition sooner or later would be given. If it does not mean that, then the refusal was little short of official petulance of the worst kind; while if it really does mean recognition then Mr Chamberlain is reverting to a bad policy which is as inexpedient as it is wrong. There need be no question of the Government riding away from the issue on the plea that we must have consular representation in Prague; if a precedent is required then let us by all means create one. We have the German Government's example in the matter of precedents. When the Germans marched into Prague they woke up not only the inhabitants but the conscience of the civilised world. It may be that one day redress will be made in such a way that recognition will be permissible; the one thing that is certain is that recognition must not and ought not to be made now.

* * *

Poland and Danzig.—The regrettable incident of last week-end, in which a Polish frontier guard shot and killed a citizen of Danzig after his Customs post had been raided by a number of Nazis, has passed off without more serious repercussions than the Press comments customary to such an occasion. The German account of the affair was so improbable as to evoke memories of Czech "atrocities" last September and an anxiety that this might foreshadow raids on a bigger scale and martyrdoms even more magnificent. If the Danzig Nazis have since drawn in their horns, it is presumably at the command of Berlin; the Polish protest which asked for preventive measures, an inquiry, compensation, and a statement of guarantees that the Danzig Senate could prevent further outbreaks of this kind, showed a more vigorous indignation than they could hope to ignore or explain away. As so often in the past, the truth may be that Berlin is merely trying out the ground, and testing Polish nerves, and upon the diagnosis will depend the policy towards Danzig. It was just such an incident as this that was feared might open a campaign which could end only in the surrender of Danzig or in war. Feelings in the Free City are now in that state of nervous surcharge produced by constant uniformed parades and envenomed harangues, worked on by the propaganda of Germans coming in from East Prussia, exacerbated by the knowledge of the nearness of Polish troops, which would give Berlin *carte blanche* in directing almost any sort of manoeuvre, however suicidal. The chief condition for any appreciable relaxation of tension is genuine goodwill and the absence of provocation on the German side; but it may be hoped that the Polish Government, in its turn, while preserving its admirably firm attitude of the past week, will seek whatever incidental means are possible, conceivably through the office of the League Commissioner, of deflating this most dangerous state of tension. The last war, after all, was started by three shots from a revolver.

* * *

The German-Italian Alliance.—On Monday of this week Herr von Ribbentrop and Count Ciano signed a treaty in Berlin consisting of a preamble and seven articles. The vital clause is Article 3:—

If, contrary to the wishes and hopes of the contracting parties, it should happen that one of them is involved in hostilities with another Power or Powers, the other contracting party will come immediately to its side as ally and support it with all its military forces on land, on sea, and in the air.

The striking feature of this article is its absoluteness. Though the three preceding articles provide for consulta-

tion in crisis, it would appear that if, for example, Germany were to go to war over Danzig, after having heard, but decided to disregard, Italian objections, Italy would be bound automatically to fight on Germany's behalf.

Actually, the new treaty does not appear to alter the international situation very much except in so far as it seems to subordinate Italy to Germany. The effect of this subordination is difficult to forecast. Does Germany stand to win more by having Italy's resources officially at her disposal than she stands to lose by the surely inevitable recalcitrance of Italian public opinion against an arrangement which is so palpably humiliating, as well as perilous, for the junior partner in the Axis? It is dangerous driving to tilt one's axis too steeply when one is skirting a precipice. At the same time, Herr Hitler must be depressed by the conspicuous absence of the name of another hoped-for signatory. In 1914 Germany lost an Italian ally and gained a Turkish ally instead; in 1939 she has gained Italy, but has lost both Turkey and, seemingly, Japan. Last Saturday the Inner Cabinet of the Japanese Government decided not to enter into an alliance with Germany and Italy, but to maintain an attitude of benevolent non-commitment towards the Axis Powers. This decision marked a defeat of the army in Japan's counsels by the navy and the civilians. We cannot yet be sure that this Japanese decision will not be reversed; but, if it is not, it is of historic importance.

* * *

Evacuation Dilemma.—The Government's plans for removing children, mothers and blind persons from specially vulnerable places in time of war are still making halting progress. The groundwork for moving the priority classes to safety has been well done: transport and billeting arrangements have been completed in detail; and new provisions to prevent the forestalling of property and accommodation have been announced. But the scheme threatens to be seriously upset by the very problem for which critics have been anxiously seeking the Government's solution for many months past, namely, the status of private arrangements in relation to the official programme. The difficulty was brought to a head last week-end, when the response to the London County Council's appeal for the registration of all children, mothers and other persons in the selected categories was unexpectedly meagre. In part this was due to the old fault in A.R.P. of unsuitable publicity. In large measure, again, it was due to the natural disinclination to desert fathers and husbands and to break up families. Finally, it was due to the fact that very many of the persons concerned had made plans to stay with friends or relations in time of emergency and were in consequence reluctant to enter the official scheme, which involves removal to an unknown destination and the care of strangers. The position now is that, within the priority classes, there are three categories: those who have accepted to be moved by the Government; those who have made private arrangements but must look to the public transport services for conveyance; and those whose private plans include private transport arrangements as well. On Wednesday Mr Elliot told the Commons that any who wished were fully entitled to make personal arrangements for leaving, but that it would be impossible to provide special transport services for them. Those moving under the official scheme will have first call on road and rail, and if there is any surplus capacity (which, in the official view, is unlikely in the first 48 hours of emergency) private evacuees may use it. The onus of averting a panic flight is specifically placed upon private citizens, an attitude which is quite untenable, since only an ordered exodus can reasonably be expected to be orderly. The presumption grows that private persons are in fact to wait until the official evacuees have gone. If this is to be the case, then the Government must say so clearly, and they must be ready to revise their shelter programme accordingly. Better still, they might cast the net of their planning for evacuation wider by making some attempt to equate demand and supply in the matter of emergency transport facilities and equipment, and issue limiting instructions accordingly.

Germany and Lithuania.—This week's long-heralded trade treaty has surprised those who forecast that Germany would be able to extend her domination across Lithuania as soon as Memel had been yielded. Germany's share of Lithuanian exports is to be increased only to 30 per cent. (from 27 per cent. in 1938): when compared with the position of undisputed leadership which Germany held as an importer from Lithuania before the Memel troubles of 1934, this is very reasonable, and the allotted share is at least 5 per cent. lower than informed Lithuanian opinion was inclined to expect. The following figures show Great Britain's present leading place in Lithuanian foreign trade:—

	(In million lits)			
	Exports		Imports	
	1937	1938	1937	1938
Great Britain	96.6	91.8	59.3	69.2
Germany	36.7	63.0	48.0	55.0
Russia	11.1	13.3	17.9	14.9
Belgium	7.8	10.7	16.7	8.6

The success of the Lithuanian authorities in defending the present distribution of their country's trade may be in part because they could point to their urgent need for foreign exchange, not only to make purchases on the world market but also to settle their 133 million lits of foreign debt. Another support for the Lithuanian position is the intimate relations now developing between Lithuania and Poland. The German authorities are understood to have negotiated in a very friendly spirit: perhaps they remembered that Poland, immediately after the cession of Memel, offered special transport facilities to Lithuania for export through Gdynia; and, on the political side, that General Rashitkis, Commander-in-Chief of the Lithuanian Army, was lately well received in Warsaw.

* * *

Appeasement in the Balkans.—It was only natural that a new diplomatic alignment in Europe should strongly affect relations between the small States. From the British point of view the encouraging thing is that, in whatever direction one looks, the change has been for the better. The single exception may prove to be Yugoslavia; the Yugoslavs are troubled with the stress of internal politics and, when they look beyond their frontiers, they do not like the prospect; the Government is unsure both of its people and its neighbours. This week's meeting between the Foreign Ministers of Yugoslavia and Roumania was therefore of unusual importance. M. Cincar-Markovitch was probably instructed to find out to what extent the Roumanian Government considered that the Yugoslav attitude had been decided and Balkan neutrality endangered by the British guarantees and the Turko-British alliance; and it may be assumed that M. Gafencu took the opportunity of pointing out that Roumanian policy had changed only because Germany had advanced one step

further south-eastwards, and that the preservation of Balkan neutrality now lay largely in the hands of Belgrade. It is difficult not to sympathise with the Regent, anxious as he is genuinely known to be to keep Yugoslavia free from definite commitments on one side or the other, for he can draw closer to his Balkan neighbours only at the cost, which may be prohibitive, of Axis displeasure; while, if he goes in with the Axis, he stands to lose all that Yugoslavia has gained—which is nothing less than independence within favourable frontiers—during the last twenty years. One immediate step for the betterment of Yugoslavia's position does, however, seem open to him. That is to help on a genuine *rapprochement* between Bulgaria and the members of the Balkan entente. Like Turkey, which is now making fresh and welcome efforts to draw Bulgaria into the Balkan fold—in this case through satisfaction of the claim on Roumania and renunciation of the claim on Greece—Yugoslavia has no outstanding problems with Bulgaria, and is thus able to take the rôle of honest broker.

* * *

Price Insurance for Sheep.—No further details of the Government's scheme of price insurance for sheep have been published since the Minister of Agriculture made his statement last week. It is obvious that the proposals then outlined will need considerable amplification by the Livestock Commission before they can be put into practice. The immediate question for the public is how much this further aid to farming is likely to cost. The deficiency, if any, below a minimum price of 10d. per lb. for fat sheep (lambs are not included) is to be paid by the Exchequer, not on the actual weight of each sheep, but on a standard weight. Sir Reginald Dorman-Smith stated last week that, on the basis of prices in the last six years, the average annual cost is expected to be £900,000. *The Economist*, in the issue of January 28th, made tentative estimates of the cost of price insurance schemes for various agricultural products; it was there calculated that in the decade 1928-37 it would have cost the Treasury £2.3 millions, or £230,000 per annum, to have maintained a minimum price for fat sheep of 9½d. per lb., or £670,000 per annum for a price of 11d. per lb. The divergence between *The Economist's* estimates and the Minister's forecast is probably due to the fact that the former were based on the supposition that the minimum price set would apply in each year to the number of fat sheep which were estimated to have been sold for slaughter in 1936-37. The Government's guarantee, on the other hand, is to be related to a total sheep population of 27 millions in the United Kingdom, a figure which has only once—in 1932—been exceeded in the last fifteen years; in June, 1938, a total of 26.6 million sheep was returned. The minimum price is to be reduced by ½d. for each successive increase of 250,000 above the standard number of 27 millions up to 28 millions and thereafter by ¼d. for each additional 250,000. It is probable that this high figure has been chosen partly to safeguard a valuable source of meat in time of war, since sheep make the smallest demand among livestock on imports of feeding-stuffs. The taxpayer may therefore regard an appreciable new liability, at present still unlimited though estimated at £900,000 per annum, as part of the general bill for civil defence. But the extra charge will only be justified if the sheep proposals really constitute an integral part of an all-round food, farming and shipping policy for national defence. For the moment the size of the estimated cost can only be noted with some considerable reserve.

* * *

Road Plans.—"This is scarcely the time for economies in transport improvements," Mr Keynes's broadcast plea on Tuesday might have been a challenge to the new Minister of Transport, Captain Euan Wallace's recent statement on schemes to improve the trunk roads, for which the Ministry has now been responsible for two years, was welcome as an assurance that work will actually be begun

in the present financial year. But there is no evidence at all that anything like the rapid progress in trunk road betterment that is imperatively needed is contemplated even now. Captain Wallace said that schemes which would ultimately cost £15 millions had been "put in hand"; further information about the amounts actually to be spent this year on the fifty major schemes projected reveal that very little is likely to be accomplished in the near future. Only £517,000 will be spent in the current financial year. In the case of the St. Albans By-Pass, which will ultimately cost about £1,755,000, for instance, immediate expenditure will only amount to a very small fraction of the total sum. Similarly, of the £347,000 required for improvements to the Barnet By-Pass, only £26,000 will be spent this year. There are many reasons why large-scale work on new trunk roads should be commenced as soon as possible: the waste and danger of congestion and delay in peace-time are one reason; the all-important rôle of the country's transport equipment in any plan for preparedness for war is another. Captain Wallace has scarcely begun well. His excuse for previous delays, namely, that the Ministry of Transport only became responsible for trunk roads in 1937, is quite untenable. And his somewhat sceptical remarks about the value of the recent Alness Report on the prevention of road accidents simply run counter to all the best and most informed opinion on the subject. The Government's record in road policy since the last election has been consistently unsatisfactory. In 1935 they proclaimed a five-year plan to spend £100 millions; later it transpired that this meant no more than a promise not to stop spending something like the usual annual amounts on road improvements. If traffic chaos and road casualties have not spurred Ministers to action, surely the needs of national defence may. If there is any single type of preparation which ought to be completed before an outbreak of war, it is the building of roads. It may be too late now to do the job properly, because the pinch of what is virtually a war-time demand for labour and materials is not far distant. But it is not too late to do something, and if there is no war, we shall be no poorer, to say the least, for having better roads.

* * *

Italy's Financial Burden.—In his speech on the Budget estimates on Tuesday last, Senator Thaon di Revel, the Italian Minister of Finance, explained that, in view of new expenditure to be incurred in Albania and Libya and on armaments, he had had to abandon all hope of a return to normal finance. The table given below shows the latest estimates of Italian expenditure, which are considerably above those announced at the beginning of the year.

ITALY'S BUDGETS (Years to June 30)				
	Million lire		Estimates	
	1937	1938	1939	1940
Revenue.....	24,702	20,597	25,072	24,561†
Ordinary expenditure	23,413	23,770	32,500	32,000
			(25,035)*	(29,316)*
Extraordinary expenditure	17,519	8,000	6,500	?
Total expenditure	40,932	31,770	39,000	?
Deficit	16,230	11,173	13,928	?

* Earlier estimates published on page 12 of *The Economist* of January 7, 1939.

† Not taking account of new taxation.

Total expenditure this year is in the region of £400 millions, and next year it is likely to exceed the record reached in 1936-37. In order to cover the deficit the Minister announced that the whole system of taxation was to be reformed. This refers particularly to direct taxation on land, property and income: the State will now take a larger share of the increase in incomes and capital values than has taken place in the last two years. Even so, if the Minister's hope of a balanced account next year is to be fulfilled, the additional tax payments by the middle and wealthy classes will have to be very large indeed.

THE WORLD OVERSEAS

The Difficulties of Western Canada

(From Our Ottawa Correspondent)

THE three prairie provinces of Canada, lying between the Eastern boundary of Manitoba and the Rocky Mountains, are the Canadian counterpart of the deep-soiled land of Phiotis of which Homer sang, and their settlement and development in the opening years of the present century constituted one of the great sagas in the story of the British Commonwealth. Before the War they were pulsating with energy and optimism; the acreage under cultivation was expanding every year; railways were being built in all directions; new towns were being founded and old ones were growing rapidly; and anybody who suggested that this territory was not destined to hold at least eight million people by the middle of the century would have been denounced as a "knocker."

To-day, the bright dream of abounding progressive prosperity for the prairies has vanished through the ivory gate, and the present state of these three provinces and their future is a source of grave anxiety to everybody who has any interest or stake in them. The population is growing only very slowly, as there has been a substantial emigration; a considerable acreage has been withdrawn from cultivation; the business life of most of the cities and towns is stagnant; completely deserted villages are not unknown; public and private debts are a grave burden, and the bankruptcy of all three provinces has only been averted by generous succour from the Federal Treasury.

Extravagance in expenditure, foolish and wasteful administration and the impact of a series of disastrous droughts have made their contributions to the sad decline of this fertile region. But the chief factor is the unhappy plight of wheat-growing, which was the foundation of their prosperity and, from 1900 onwards, the most important stimulus to the notable economic expansion of the whole Dominion. Wheat-growing finds itself caught to-day in the meshes of economic nationalism, subsidised export competition and strangling political forces, over which it has no control, and its spokesmen maintain that, under these circumstances, it is entitled to obtain from the nation as a whole special assistance to tide over a grave emergency and avert a wholesale collapse of the Western economy.

Falling Wheat Prices

The case which its spokesmen present is reasonable. Canada's pact of Confederation had two definite objectives: the union of a group of struggling colonies, and national expansion. That expansion took the form of the development of Western Canada, which was responsible for the great Canadian boom of the first decade of this century and continued to provide a great stimulus to the general expansion of Canadian prosperity up till 1930. But, when the Great Depression came in 1930 and the sharp drop in the prices of farm products curtailed the aggregate income of the prairie region, its inhabitants were loaded with additional burdens because the tariff was raised to the highest level in Canadian history.

In a normal year, when drought or rust does not take a heavy toll of its grain, Western Canada has to find a market for at least two-thirds of its wheat, and the problem of marketing it has grown more difficult year by year. In the crop years 1937-38 the meagreness of the yield solved the problem; but, as the result of declining world prices, the crop of 1938-39, which was more than twice as large as its predecessor, will realise at ruling market prices some 30 million dollars less. It is estimated that, during the period 1931-37, there was a decline of \$2,540 millions (£520 millions) in the gross value of agricultural production in the prairie provinces compared with its value in the period 1924-30, and more than half of the decline can be attributed to the fall in agricultural prices.

This drastic curtailment of Western agricultural income has had disastrous local consequences. It has produced a general slump in Western business because few farmers,

even if they have a good crop, can buy more than the necessities of life; financial reserves have been wiped out, equipment and buildings have been allowed to deteriorate; and the gap between farmers' debts and their income has been seriously widened. Up to last year, the assistance given to the Western wheat industry by Canadian Governments was relatively small in comparison with the help given to grain-growers both in other wheat-exporting countries like the United States and Australia and in importing countries. Considerable sums were spent by the Federal and the three provincial Governments for the relief of indigent farmers who had suffered total or partial crop failure, but this expenditure would have been necessary even if prices had remained at remunerative levels after 1930. It is true that, in 1935, the Bennett Ministry intervened with a Wheat Board to support the market when prices began tumbling down to ruinously low levels, but the operations of the Board up to July 31st, 1938, at the end of last crop year, have resulted in a net loss to the Federal Treasury of \$2,954,335—a comparatively small sum in view of the magnitude of the business involved.

Future Federal Aid

Last year a major economic disaster was threatened by the collapse of grain prices, and it was only averted by the action of the Federal Government, operating through the Wheat Board, in fixing a guaranteed price of 80 cents per bushel for wheat on the basis of No. 1 Northern, the highest grade, delivered at Fort William. According to the Minister of Agriculture, this guarantee will at the end of the crop year on July 31st have cost the Federal Treasury at least \$48 millions. This 80 cents price, being equivalent this year to a farm price of about 57 cents for average grades, does not permit the payment of debts on the average farm unless better than average yields have been secured. But it has helped to tide the wheat industry over a grave crisis.

The price guarantee has not been popular in the Eastern provinces whose grain-growers are not eligible for it, and it has been vigorously attacked by Eastern politicians like Premier Hepburn, of Ontario. Nevertheless, it can be argued that its continuance, until better days dawn for the Western grain-growers, is justifiable in the larger national interest. Canada's national economy has to a very large extent been built up around its export industries, and of these the most important was the wheat industry, which, through exports of wheat, wheat flour and other milled products, has never in recent years provided less than 20 per cent. (and once as much as 38 per cent.) of Canada's annual export trade. Furthermore, the wheat industry has every year established very large foreign credits, which have been an essential factor in the liquidation of the country's external obligations and in the provision of new capital for an expanding country.

These considerations were recently submitted to a full meeting of the Federal Cabinet at Ottawa by a delegation of the Western Committee on Markets and Agricultural

Re-adjustment. This Committee had its origin in a conference summoned last December by the Government of Manitoba to consider the problem of markets for Western farm products and to discuss the general situation of Western agriculture. The conference decided that the most urgent need was the continuance of Federal assistance to the wheat industry; and a delegation was later sent to Ottawa. Its mission was hastened by the announcement made on February 16th by the Minister of Agriculture to the effect that the Government proposed to abandon the present system of a guaranteed price, discontinue the operations of the Wheat Board and substitute a new plan which would probably take the form of an acreage bonus. These proposals had a very unsympathetic reception in the West; and the delegation had the backing of Western public opinion and the Press when it presented to the Cabinet as its basic demands, firstly, the continuance of the Wheat Board for the crop year 1939-40, and, secondly, the maintenance of a guaranteed price at the 80-cent level. It also suggested subsidiary assistance for farmers growing coarse grains for sale and crop insurance.

The Government promised careful consideration to the demands of the delegation, but it is in a difficult quandary. A nice calculation of political considerations will probably play a large part in its ultimate decision. A general election must come within the next 18 months, and, in view of the political problems which now confront the Government in Ontario and Quebec, it does not want to give its Eastern opponents ammunition for accusing it of showing special favouritism to the West. But, on the other hand, its Western supporters have been warning Ministers that, if the change outlined by the Minister of Agriculture were made, there would not be a safe Liberal seat in Western Canada.

Cognisance must also be taken of the financial aspects of the price guarantee; the drain of 48 millions this year will end the tale of decreasing deficits, and, if in 1939 the prairie provinces had a crop of 500 million bushels, a guarantee of 80 cents might cost the Federal Treasury over \$100 millions. Some compromise is inevitable.

Financial Omens of American Recovery?

[FROM OUR NEW YORK CORRESPONDENT]

THOUGH business retains the general dullness of many weeks past, positive developments of unusual magnitude have recently occurred in the financial environment. Even for an economy subject to extensive and speedy fluctuations, these recent changes are unusual.

The rapid rise in Government security prices has been most noticeable. Since the end of January this advance has carried the yield of the average of such securities maturing more than 12 years hence from about 2.5 per cent. to 2.17 per cent., and the major part of this movement has occurred in the past two months. During approximately the same period, since January, the weekly reporting member banks have added about \$600 millions, or about 4.5 per cent., to their holdings of investment securities, and this addition has been only about half offset by the seasonal liquidation of loans. Demand deposits, adjusted, for the same banks have risen in this period by about \$700 millions, or about 4.3 per cent., and most of this rise has occurred in the past two months. Excess reserves of all member banks of the Federal Reserve System now total a little over \$1 billion above the level of about \$3 billions at the opening of the year. The monetary gold stock has risen about \$1.4 billions, or approximately 10 per cent., since the beginning of the year. And the expenditure of the Federal Government, and its deficit, have been high during this period, especially in April.

This statistical recitation is largely self-explanatory of the

forces which have been at work. The huge inflow of gold (\$900 millions in the first four calendar months of the year) equalled the major part of the advance in excess reserves. Treasury outpayments, utilising some of the \$1.5 billions net gold import of the last four months of 1938, account for the rest. Deposits were, of course, built up by this flow of funds into the banks. The rise in deposits was augmented by the bank purchases of Government securities resulting from the continued increase in idle cash and the need for earnings. Bank profits were lower in 1938 than in 1937, and those institutions which had been reluctant to acquire securities at what were comparatively high prices finally succumbed. The banks, incidentally, were further encouraged to make the move by the belief that idle funds would remain large for a long time to come, owing to the troubled European outlook, the consequent imports of gold, and the prospect of a long continuation of deficit operations by the Federal Government such as to cause a further reduction in its cash holdings.

Consideration of these recent changes suggests that they may go on. Gold is still arriving in this country in quantity. The deficit will continue at a high level for some months, and in substantial amounts through the next fiscal year; and the cash holdings of the Treasury are large. Bank earnings remain low and the demand for funds small. What do these developments mean? What are the implications of a sudden drop in the long-term rate of interest by 13 per cent. and of such rapid rises in the volume of the means of payment, in excess bank cash, and in gold?

Historically the answer is clear. Recovery movements in this country have been associated with such developments. The recovery from the post-war depression and after 1932-33, and the larger advances made since then, have seen movements of a similar character. Perhaps the most similar period in financial movements was that of early 1938. The Treasury's dewatering of about \$1.5 billions of gold in April, with the consequent assured rise in bank cash, was analogous to the recent gold inflow and Treasury outpayments. Federal expenditure and the deficit rose rapidly from January. Banks purchased securities in some volume with the rise in their cash holdings. Demand deposits rose from March, and the rate of interest fell from April.

Does this mean that further recovery is now fore-shadowed? Those who say not hold the view that the economy has been desensitised to this kind of change. This alleged imperviousness is said to result from world disturbances and/or the policies of the Government and their effects. These create a psychology of apprehension and distrust adequate to bar the historically to-be-expected response in the shape of recovery. And there is, in addition, they say, the burden of taxes, the discouragement of continued deficit finance, trade union disturbances and the like. Certain structural difficulties, such as those in the case of the railroads, are also present. But, in a broader sense, those financial developments set forth at the outset are only a continuation, after a brief and small hesitation, of the trend which started little more than a year ago. It is likely that revival is about to be resumed.

May 16th.

Economic Outlook in France

[FROM OUR PARIS CORRESPONDENT]

THE war industries are going ahead; and the output of aircraft is at last coming up to the mark. These industries are privileged; they are supplied with Government orders, and their employees work a 60-hour week. The lot of the civil sector of industry is much less favourable. The Opposition points to the rising cost of living and to reduced retail sales to demonstrate what they call "the failure of M. Reynaud." "Buy," says a daily Press campaign, "because hoarding provokes unemployment." But the point is that taxes are increasing quicker than incomes, and the burden of these charges is hampering both fresh enterprise in private industry and increased demand from consumers. The economic expansion that must bear the charges of re-armament is thus hampered by the weight of re-armament itself. M. Reynaud, in his recent official report, emphasised that the index of retail prices had increased by only 1.76 per cent. between November, 1938, and March, 1939, compared with 3.92 per cent. and 7.87 per cent., respectively, during the same periods of 1936-37 and 1937-38. Similarly, the index of

the cost of living rose by 1.50 per cent. between November, 1938, and March, 1939, against 5.93 per cent. and 2.82 per cent., respectively, during the same periods of 1936-37 and 1937-38. The index of retail prices even shows a fall of 9 points in March, against a fall of only a point in March, 1938, and a rise of 9 points in March, 1937. Moreover, the rise in the cost of living will be counterbalanced in the next few months by increases of earnings as the result of extra hours of work and by the seasonal decline in food prices. But there is no reason for immediate anxiety. Actually the rise in prices is slowing down, as the following table shows:

Date	Wholesale Prices			
	Imported Goods	Domestic Products	Retail Prices	Cost of Living
Nov., 1936.....	418	504	534	91.1
March, 1937 ...	506	554	576	96.5
Nov., 1937.....	506	637	664	110
March, 1938 ...	552	657	690	113.1
Nov., 1938.....	620	678	739	120.3
March, 1939 ...	631	709	752	122.1

Again, even if consumption does show a certain falling off, recent returns of the public saving banks show that the French people are still saving, and probably with renewed intensity since the franc recovered its stability. Thus the Government gains in new possibilities for borrowing what it loses by the decline of the yield of indirect taxation. And the hope may now be expressed that the strike of capital will come to a complete end, just as the flight of capital has done, in view of the Government's firm and confident policy. Already new means have been brought into the short-term market, which is a precious aid to the Treasury.

Actually, hoarding does not now lead to expatriation of capital as it did in the past. On the contrary, figures show that capital continues to return home and to bring a surplus to an already balanced balance of payments. The Minister of Trade laid stress yesterday on the persistent increase in French exports and on the fall of the import surplus "to a level which makes support of the franc easy and is lower than the surplus in the best pre-war years." The Department of Tourism, on the other hand, estimates at 71,483 the number of foreign visitors in Paris during the first four months of 1939, against 59,626 in 1938, and in the principal tourist places at 172,000, a figure which also shows an important rise.

May 23rd.

Germany's Raw Material Needs

[FROM OUR BERLIN CORRESPONDENT]

THE signing of the German-Italian military pact has shown the world that the two dictatorships refuse to renounce their so-called dynamic foreign policy. They will continue to work for the achievement of their so-called living rights and for the share they claim in the world's wealth. The closer co-operation between Germany and Italy has also an economic background. The dynamic policies of the two countries have set up economic disturbances which cannot be overcome by either of them alone. Foreign trade especially has been severely affected. Since a change in this unfavourable economic trend could only be brought about by a change in policy—which the Governments are unwilling to attempt for political reasons—their view is that the continuation of their drive for expansion remains the only way in which to achieve the increase in economic strength they now need to restore the balance of their finances and productive economy. It is a vicious circle.

In the case of Germany, the harmful effects of political expansion are shown in the foreign trade figures for April. According to an official report, Greater Germany's imports declined by almost Rm. 100 millions from the previous month's value. They amounted to Rm. 410 millions against Rm. 504.2 millions in March and Rm. 477.1 millions in April, 1938. This is not surprising: the unfavourable export position that has been evident for more than a year indicated long ago that a considerable cutting down of imports would be sooner or later inevitable.

The decline in imports of foreign foodstuffs and raw materials is extraordinarily damaging to the German economy—which is mainly employed in strengthening Germany's war potential. The autarky plan is not yet far enough advanced to allow Germany anything like freedom from

imports. Herr Funk himself has stated in a speech that the measures undertaken in the Four-Year Plan to guarantee a supply of raw materials to industry have not yet sufficed; and that Herr Hitler's words, "export or die," have a greater meaning to-day than ever. The trend of exports, on the other hand, shows how little special measures to promote exports and to dump goods have availed against a disinclination abroad to buy German goods for political reasons. Exports in April fell by about Rm. 45 millions to Rm. 435 millions; in March they still amounted to Rm. 480½ millions and in April, 1938, they were Rm. 453.6 millions. The return of the Czech gold deposited abroad, which even the Germans did not expect so speedily, will provide only a temporary easing of the straitened imports position.

The results of the Leipzig Spring Fair do not suggest any spectacular improvement in exports; and most of the large German shipping firms are reporting a decline in traffic. Outgoing ships, it seems, are nearly always insufficiently filled with cargo and passengers, while incoming ships have until lately been fairly well filled by German purchases. This unfavourable state of affairs has led to a partial renunciation by the Hamburg America and the North German-Lloyd lines of the North Atlantic Conference agreements on passenger fares. They say they will not begin a price war, but it may be expected that they will try and increase their cabin class passenger traffic by various price adjustments.

Metal and Oil Requirements

The situation is serious. A recently published study of Germany's metal provision shows that she is still heavily dependent on imports for armament production. Although domestic production and imports have risen, demand cannot be fully covered. The position is shown in the following figures:—

	SMELTING PRODUCTION				
	(in 000 tons)				
	1934	1935	1936	1937	1938*
Copper.....	53.0	56.6	61.6	65.5	70.0
Lead.....	120.0	122.3	139.0	162.4	185.3
Zinc.....	72.9	124.2	136.4	163.3	194.5†
Tin	7.0	6.5	6.7	7.0	...

* 1938 includes Austria. † The Sudeten territory is included in the zinc figures.

	ORE IMPORTS			
	(in tons)			
	1936	1937	1938	First Quarter 1939
Lead ores	99,297	126,788	141,288	37,497
Copper ores.....	482,471	555,577	653,931	170,874
Nickel ores	17,651	19,990	34,215	4,006
Zinc ores	120,641	146,262	185,003	27,744
Tin ores	1,563	6,623	6,141	1,522

	RAW METAL IMPORTS				
	(in tons)				
	1936	1937	1938	1939	1939

There is some movement from metal imports to imports of ores. This is due to the increased capacity of domestic foundries for finishing work, and it means a saving in foreign exchange. The heavy imports of 1937 and the high world prices then ruling placed a great burden on the foreign exchange balance, but last year the low world prices made possible large imports without any additional claims on foreign exchange. The point is that, although Germany is attempting to raise domestic production and to introduce substitutes, it is most unlikely that her import needs can be much reduced. Thus, the trade and foreign exchange position is vital.

German mineral oil imports tell the same story. With the announcement of the Four-Year Plan, Germany was told she must be self-sufficient in mineral oils within one and a half years. Since then there has been a considerable increase in the number of motor vehicles in use, especially in the number of army motor vehicles. In 1938, mineral oil imports rose to 5 million tons against 4.3 million tons in the preceding year; in place of only Rm. 230 millions, nearly Rm. 267½ millions had to be spent to buy it. Mineral oil imports have risen from 4.2 per cent. of total German imports to 4.9 per cent. In view of possible military needs large stocks have been kept, so that imports and actual consumption cannot be significantly compared. Owing to the enlargement of domestic refineries there has been a shift-over in favour of unrefined crude oil imports. The main countries selling to Germany are:—

	Total Imports (in Rm. million)	Mineral Oil Imports (in Rm. million)
Venezuela	30.3	8.2
Dutch Indies	77.4	76.8
U.S.A.	404.6	84.4
Roumania	140.4	36.0
Mexico	62.6	19.8
Iran	38.4	8.1

Mineral oil exports, which consist mainly of lubricating oils, are unimportant compared with imports; in 1938 they amounted to 195,000 tons valued at Rm. 19.1 millions.

May 23rd.

Developing British Guiana's Hinterland

[FROM OUR GEORGETOWN CORRESPONDENT]

WHEN the Royal Commissioners were in British Guiana they heard the complaint, from many witnesses, that steady economic progress was impossible while the Colonial Office made such frequent changes of Governors. In the absence of administrative continuity, a most curious procedure is followed. Each new Governor spends his first year and a-half in collecting reports from various *ad hoc* committees and commissions; in the second year he has a clear conception of the Colony's fundamental needs; in the third year he is promoted.

All the important economic committees set up by the present Governor, Sir Wilfrid Jackson, have now reported. The most important of the investigations has been that of the Hinterland Development Committee, whose report, recently issued, must influence greatly the findings of the Jewish Refugees Colonisation Commission. With sugar production limited by quota considerably less than the country's productive capacity, and agricultural prices low and likely to remain low, the development of the hinterland of British

Guiana has become an urgent matter. West Indians have always felt that if this area—some 84,500 square miles—could be systematically exploited, it would be able to absorb the surplus population of all the islands.

The Hinterland Development Committee recommended that surveys should be at once undertaken of the cheapest and most practicable methods of improving river transportation, and of the forest, mineral, pastoral, and agricultural resources of the near interior, the gold and diamond belt, and the far interior. And they advised the most active assistance possible towards the establishment of a wood pulp industry from wallaba. Until the surveys are undertaken, railway construction cannot be recommended, and Sir Walter Egerton's great scheme for a railway link between Georgetown, the Colony's capital on the Atlantic seaboard, and Manaos, the Brazilian town on the Amazon, must therefore be held in abeyance, as it has been since 1913.

The rivers of British Guiana are much impeded by rapids and falls; but, from the Corentyne on the Dutch border to the Cuyuni, whose source is in Venezuela, they form a series of channels penetrating far into the interior, throughout the whole length and breadth of the Colony. Down these waterways, the Hinterland Development Committee points out, have come many millions in gold and diamonds. Yet practically nothing has been done to improve the transportation facilities of these rivers. A few portages—and here and there a very badly designed haulage-way—these are all that has been accomplished. Many years ago, during one of the most spectacular gold rushes seen in British Guiana, Michael McTurk, prospector and explorer, put in a simple haulage at Great Matope Cataract; one mouldering beam now remains on the shore, and to this day old hands point it out and mention his name with gratitude, saying that this haulage often saved them a day's work going up the Cuyuni River. The blasting of eight rocks on the Essequibo River between Bartica and the Rupununi River mouth, about 200 miles to the south, would save unloading and reloading at seven points.

Up to 1934 the official view was that water transport could not, on account of the interruptions, compete with road transport. The invention of the propeller-lifting device, permitting the use of inboard engines, has enabled boats of more than double the capacity to be used; and, with the resultant increased power, some rapids can now be negotiated through which, formerly, boats had to be hauled. The effect of this is that these boats of doubled capacity do the round trip in less than half the time, and the cost of transportation by river is now no more than by road. The Committee clearly have in mind that, wherever aerial survey shows such action to be worth while, rocks should be blasted, haulage-ways provided and canals dug to link the rivers.

A Wood-Pulp Industry

All the recommendations of the Hinterland Development Committee are dwarfed by the statement that the establishment of a great wood-pulping centre offers the most immediate prospect of large-scale development. The raw material of the pulp and paper industry would be wallaba, a very durable wood which splits well, grows on otherwise valueless sand, and does not reach a sufficient size to make large supplies of sawn timber. British Guiana's wallaba forests satisfy the necessary conditions for a paper-pulp industry, and research has established that a paper of very high quality can be produced from wallaba. Paper of the same quality is now sold in New York at £20 16s. 8d. per ton.

In the one area (only 365 square miles) reserved for the research work already carried out, the Forest Department's survey gives a wallaba content of over eight million tons. Extracted under a system of natural regeneration of the cut forests, this stand (only a small portion of the available wallaba forests) could give a sustained yield of at least 75,000 tons per annum. At £20 16s. 8d. this would mean £1,562,500, almost the exact value of British Guiana's annual export of sugar, the present mainstay of the country.

With the development of a paper-pulp industry the industrialisation of British Guiana would begin. The extraction of greenheart (in which the Colony holds a world monopoly) from neighbouring forests would be rendered more economic; the development of hydro-electric power from the Colony's many waterfalls would be brought nearer realisation. With the subsidiary industries like the manufacture of rayon and the production of wood alcohol, paper-pulp would give British Guiana, on the banks of the Essequibo River and well within the interior, a new city capable of sustaining a population larger than Georgetown's 70,000. This is of immense importance in assessing British Guiana's contribution to the solution of the refugee problem.

May 5th.

Letter to the Editor

Full Employment

TO THE EDITOR OF THE ECONOMIST

SIR,—It seems that the statement in your article on "Full Employment" (May 6, page 295) that the lowest reasonable estimate of the additional labour directly required by this year's expansion of the defence programme is considerably greater than 600,000, and the forecast that "full employment, with the changes in financial and economic policy that it demands, will be upon us long before next spring" exaggerate the effects of the present re-armament programme. For this criticism there are a number of reasons:—

(1) Some proportion of the total additional expenditure of £250 millions will be spent on goods imported from abroad and on increased payments to the defence personnel. Although it is impossible to say what the proportion is, it could hardly be less than 20 per cent. Hence the additional expenditure on home-produced goods is unlikely to be more than £200 millions.

(2) It is probable that the value of output per head in the armament industries is considerably higher than the average output per head for industry in general. Your article estimates this as £700 for the aircraft industry; and although this is probably much higher than the average, £500 might be regarded as a reasonable estimate for the armaments industries as a whole. On this basis the additional employment required would be 400,000. (Were output per head much lower than this, past armament expenditure would have had a much more marked effect on employment.)

(3) We must take into account that the rate of armament expenditure in the last half of the past financial year was already much in excess of its annual average. Thus the total defence expenditure in the last quarter of 1938-39 when unemployment averaged 1.8 millions, was some £134 millions, which, when due allowance is made for the usual seasonal fluctuations in payments, must have corresponded to an annual rate of £470 millions. Thus, the excess of the average rate of expenditure in 1939-40 over that of the last quarter of 1938-39 will not be £250 millions but only £160 millions. This implies that, if the expenditure in the current financial year were evenly spread, the additional labour requirement, calculated on the same basis, would only be 275,000; or, assuming, on the other hand, that an even percentage rate of progression will be maintained, the level of expenditure in the successive quarters of 1939-40 should be £131, £148, £166 and £188 millions, respectively. This would imply that the additional labour directly required for armaments, over the average of the first quarter of 1939, and calculated on the same basis, would be 100,000 in the second quarter of 1939, 200,000 in the third, 320,000 in the fourth, and 450,000 in the first quarter of 1940. Unless, however, total armament expenditure will reach some £900-£1,000 millions in 1940-41, it is unlikely that this rate of progression will be maintained. (Assuming an even absolute rate of progression, the corresponding figure for the first quarter of 1940 would be 380,000.)

(4) So far we have not taken the indirect effects into account: the effect of increased incomes upon consumption. It will probably be agreed that these are not likely to be larger than the direct effects, and that they are likely to be at least three months delayed. On these assumptions the total increase in employment over the first quarter of 1939, apart from seasonal fluctuations, should be 200,000, 300,000 and 520,000 in the last three quarters of 1939 respectively, and 770,000 in the first quarter of 1940 (assuming an even percentage progression). Hence, even if we accept Sir Ronald Davison's figures as to the amount of available labour, general labour shortage is not likely to be felt before the second quarter of 1940.

(5) The calculation ignores such factors as (i) a revival of private investment, due to the increase in consumption—this would necessitate special restrictive measures on such investment—or, (ii) the inevitable further deterioration in our balance of payments, which, if countered by a further stimulation of exports, or the cutting-down of inessential imports, will make additional demands on home production; or, (iii) a further acceleration in the re-armament programme.

(6) There remains, lastly, the question of "bottlenecks." These, as everyone will agree, are likely to arise in connection with the direct expenditure on armaments, and not in con-

nection with the indirect expenditure. Hence, since the Government is in the position of a monopolistic buyer, such "bottlenecks" should be regarded as a factor limiting the scale of the expenditure itself, rather than as causing inflationary price-movements as a result of the expenditure. If the Government contemplates spending £630 millions in the present financial year, this should imply that it expects that to this extent "bottlenecks" can be overcome.

Yours faithfully,

NICHOLAS KALDOR.

[If the total available supply of labour in all industries is only some 600,000, it is unlikely that a demand for more than 200,000 or at the most 300,000 additional workers in the narrow range of the armament industries can be met without difficulty. This fact, and also the virtual certainty that expenditure will exceed the Budget figures, confirm our opinion that the point of "full employment" will arrive, at the latest, in the last quarter of 1939. This conclusion stands, even though "the lowest reasonable estimate of the additional labour directly required by this year's expansion in the defence programme" may be less than 600,000.—EDITOR.]

THE BUSINESS WORLD

America's Gold Policy

THE time may seem well past to recall the faint echoes of the gold scare of 1937. Yet they have been rumbling intermittently in the United States during the two years since it reached its climax. With every fresh wave of gold brought to the American continent by political unrest in Europe, the kind of questioning which lay at the root of the gold scare has been resumed. How long is this abnormal accumulation of gold to continue? Is the outside world getting out of a commodity which has ceased to have value and utility "on the back of Uncle Sam?" Is it not true that foreigners are getting shares of productive industries in the United States in return for gold which has become useless to them? It is fortunate that these doubts and suspicions have not been left to rankle. Instead they have been clearly expressed in a detailed questionnaire sent by Senator Wagner to Mr Morgenthau, Secretary to the United States Treasury. In his recent reply, Mr Morgenthau has provided the most concise statement yet published on the attitude of the present Administration towards gold policy.

The relevant questions put by Senator Wagner were: "Why does not the Treasury stop buying gold? Of what use to us is this large stock of gold? What action should be taken with respect to the gold situation? Is it true that the power to devalue the dollar operates to undermine the business man's confidence so as to deter him from making loans and investments in the United States?" The answers to these questions are a model of lucidity and sound reasoning and provide a contrast to the evasiveness which too often characterises the answers to questions on monetary policy in the House of Commons. Mr Morgenthau leads up to his statements on policy by explaining the origin of the abnormal gold inflow in the United States and shows that, up to the end of 1937, the inflow of capital provided the dominant factor in the net imports of gold but that, during 1938, the favourable balance of visible trade was primarily responsible.

Having established these influences governing the inflow of gold, Mr Morgenthau has no difficulty in proving that if, in order to stop gold from coming into the United States, the Treasury simply announced to the world that it would not buy gold for the time being, the foreign exchange and bullion markets would immediately be thrown into a confusion from which no country would benefit. To the related question whether the price of gold should be reduced below the figure of \$35 an ounce, Mr Morgenthau replies most reassuringly. If the drop in the price were modest it would merely create the expectation of further slight reductions, would lead to bull speculation in the dollar and thus intensify the inflow of foreign capital—the very phenomenon which the change in price was designed to arrest. If the drop in the price of gold were substantial it might lead to an outflow of gold from the United States, but only at the cost of an appreciation in the exchange value of the dollar of which "the effects on our economy would be little short of disastrous." Mr Morgenthau points out how seriously U.S. export trade has apparently been hit by the appreciation of the dollar by some 5 per cent. over the past year and, given the marginal character of export trade in the economic activity of the country, leaves it to the imagination of his questioner to decide how that activity as a whole would be undermined by a sudden 40 per cent. appreciation in the exchange.

Mr Morgenthau fully admits the unsatisfactory character of the alternative before the American authorities. "We

should like to receive less gold and even to get rid of substantial amounts of the gold we already have," he writes, but adds that there is no acceptable alternative to the policy the Government has been pursuing. All the proposals examined to deal with this gold influx have involved a remedy which was worse than the disease. "The best way to reduce our gold inflow," he concludes, "is for us to have full recovery so that our imports will rise more rapidly than our exports"—an unexceptionable statement of opinion which seems to belong to an almost vanished pre-nationalistic and pre-mercantilist world.

These answers are highly important. However "inconvenient" the inordinate inflow of gold may be, it will not be arrested by any tampering with the dollar price of the metal. If the U.S. Government desire to retain the powers now vested in the President to vary that price, it is because in the currency instability to-day such powers must be available as an answer to possible external developments. Moreover, they must be available in a form which can be used rapidly and without advertisement to the world, which would result if matters of the kind had to undergo Congressional discussion. In a world of potentially unstable exchanges, the power of varying the dollar price of gold is a factor towards stability. Far from undermining domestic and foreign confidence in the dollar, it has done the reverse—if we may measure confidence by the huge transfers of foreign funds to the United States and by the inordinately low yield basis on which long-term U.S. Government bonds are now valued.

The readiness of the United States to continue receiving the stream of gold which current trade and capital movements necessitate is based not merely on the dislike of the available alternatives. It also rests on a genuine appreciation of the value of gold and on the belief that it will continue to function as a standard of international payments. Mr Morgenthau admits that the United States has enough and more than enough gold to serve as backing for the note circulation. But he is unwilling to follow the arguments of those who suggest that this accumulation of redundant gold may proceed to the point at which the country will be "stuck" with enormous reserves of a metal which no one else wants. He is not misled by the bilateral trade treaties, clearings and barter agreements, adopted by countries operating with little gold or foreign exchange, into believing, as some preach, that gold is rapidly becoming obsolete. On the contrary, after viewing the clumsiness with which these devices operate, he concludes that "there is no one thing which demonstrates more effectively the superiority of gold as a means of settling international balances than the experience of these countries that have tried to get along without it." Though Mr Morgenthau does not develop the point, it has become clear that the utility of gold has never been so apparent as to-day, when the whole world is off the gold standard. Before the war, when half a century of the international gold standard had accustomed the civilised world to exchange stability, based on what was virtually a sterling standard, it might have seemed feasible to separate that stability from its metallic basis, and to make sterling itself the acknowledged, as well as the practical, currency standard. To-day, the position has altered fundamentally. There is no longer sufficient inherent confidence in any single currency to allow it to function as an international standard, independently of provisions ensuring its convertibility into gold. The fact that this convertibility may no longer be effective

on the basis of a fixed parity does not alter this fact. For example, the degree of exchange stability which the Tripartite agreement provides depends wholly on gold for its functioning. Were it not for the provisions which enable each adherent to the agreement to convert immediately into gold the currency of any other adherent acquired in the course of its official operations in the foreign exchange market, the whole technical machinery of the agreement would not even begin to function. So long as gold is the one commodity against which no tariffs or quotas will be raised, it will remain essential to the free functioning of any system of international trade and finance. It is on the knowledge of this fact, allied to a confident belief in the further development of a system of free multilateral trade, that the United States gold policy is based. It is not a *pis aller* reluctantly accepted for fear of even more unpleasant alternatives, but a constructive policy designed to consolidate

the position which gold holds in the economy of free nations. The assurances to this effect contained in Mr Morgenthau's letter should set to rest any rumbling echoes of the great gold scare. This does not mean that we have seen the end of rushes into and out of gold. But in future these are likely to be governed more by political than economic considerations. The anchor of the dollar price of gold seems as safely secured as it can be in the world of to-day. The recent flight from gold into dollars was in fact a compliment to the former, since it was based solely on the belief that, in the event of war, Governments would make it their first concern to acquire—forcibly if necessary—all privately held gold deposited in their countries. That kind of gold scare may occur again and need occasion no concern. But its more dangerous prototype should be a thing of the past, so long as the U.S. Treasury holds fast to its present views.

Wool into Cheap Clothes

THERE are two outstanding facts about the British wool manufacturing industry which make it at present a subject of major interest. The first is that about two-fifths of our export business in wool cloth has vanished in the course of the last ten years. The second is that our retained imports of raw wool have been rising steadily at least since 1928—the earliest year for which figures are available under this head. The curiously divergent nature of the two trends is illustrated overleaf; and it remains striking after allowance has been made for changes in visible stocks. Statistics relating to stocks have only been published since 1933 and the present returns cover public warehouses only, but since these include the great bulk now held the figures quoted can be regarded as accurate for all normal purposes. The full data for production, foreign trade and available supplies are set out in Table I.

What is the nature of the changes in the wool textile industry reflected in these figures? The history of the past few years has been by no means happy. The establishment of wool textile industries, often with British machinery, British managers and a nucleus of British operatives, in the Dominions, India, China, Argentina, Uruguay and other countries which once provided custom for the Bradford mills, has produced a situation in which there is a redundancy of plant in practically every section of the home industry. The consequences have been price-cutting, the removal of profit from the ownership of machinery and the introduction of schemes for eliminating surplus capacity. The fairly compact organisation of wool-combing has enabled that section of the industry to overcome most of its troubles arising out of redundancy, and a few tentative steps have been taken towards the buying up and scrapping of unemployable spindlage, but the manufacturers have made no progress whatever in this direction. At first sight, the evidence of lack of cohesion which such a partial and hesitant movement makes manifest might give rise to some uneasiness as to the future of the industry, and the examination of the decline in exports of woollen and worsted fabrics in isolation could cause uneasiness to become an alarm, not allayed by the fact that there is no reason to believe that foreign competition will decline in future.

It is obvious that such facts as the above call for action within the wool textile industry with a view to recovering such parts of the overseas market as are still capable of being salvaged by improved organisation. Whatever improvements may take place elsewhere it is still of paramount importance both in conditions of peace and of possible and actual war that our export markets should be maintained and if possible extended. Only when this is clearly realised is there any room for congratulation on the fact that the home market has recently been found capable of absorbing a greater quantity of woollen and worsted goods than would have been thought possible fifteen years ago. This is the central fact explaining why it has been possible for available supplies of raw wool to be

deliberately increased in the last ten years side by side with a fall in exports of cloth which in any other circumstances would have been catastrophic—and why, also, Yorkshire has been less depressed than Lancashire. Table II illustrates the development by setting out the figures for the home consumption of woollen and worsted finished goods in 1930 and in the period 1933-38.

More detailed figures as to the final articles into which these products are made up are difficult to obtain. The available information relates only to the value of articles in the wholesale section of the tailoring and dressmaking industry—which does not cover the output of firms employing ten persons or less. The particulars, which are for the years 1930 and 1935, are set out in Table III. The

table probably gives an underestimate of the actual increase of clothing output in that the Ministry of Labour's index of clothing costs, which has been used, is based on the fashions of 1901-02 and includes several products which are no longer widely used. Consequently, the index does not give full weight to the fall in prices caused by mass production in such clothes as men's suits. The increase indicated in Table III is sufficiently striking, and some addition may be made to it to allow for the increase in the output of knitted fabrics shown in Table II.

IMPORTS OF WOOL AND EXPORTS OF CLOTH (1928-38)

It is easy enough to discover where the major part of the new demand lies. The answer is provided by the appearance of any football crowd or of the stream of typists pouring over London Bridge in the morning. The change which has taken place in the last dozen years in clothing habits has affected to a remarkable degree the appearance which the British public presents to itself and to the world. Carlyle envisaged clothes as the ultimate outward covering of the soul, and on his ground a change in the soul might well be expected to reflect itself in a change of clothes. A people

which tends increasingly to patronise the cinema and the dog-track on week-day evenings and to take its pleasure on the road and at the seaside on Saturdays and Sundays will tend to array itself more festively and to seek more sartorial variety than did the nineteenth century labouring poor, who worked for a lifetime in the same suit of corduroy or fustian and always went to church on Sundays in dark serge of a lasting type.

Now most workers can and do afford at least one new suit a year, each being relegated in turn to working use as it loses its early smartness. The turnover increases and with it the number of branches of multiple outfitting firms, which now provide approximately 20 per cent. of the annual consumption of men's and boys' wear, as against 12 to 15 per cent. five years ago. Moreover, these figures are for *value*. The proportion for quantity would obviously be far greater since these goods are among the cheapest on the market. There are now more than 1,800 branches owned by the fourteen principal firms specialising in this department of demand. These include, in addition to undertakings like Burton's and Price's, which are mainly concerned with suits and overcoats, others such as Hepworth's and Alexandre, who have a greater interest in general outfitting, Home Bros. and Meakers, a large proportion of whose sales consist of hosiery, and Austin Reed catering for the same type of demand at higher income levels.

Women's clothes have undergone changes of similar importance. The growing ascendancy of rayon over wool and cotton for underclothes has been more than offset by the fact that with the increasing "fashion-turnover" dresses made of wool, cotton or mixtures are bought more often than formerly. These changes in the nature of the market for British wool textiles covers a social change of considerable importance. Those manufacturers who have kept abreast of the changes by forsaking the aristocratic warp tops and adapting their plant to the medium length wool required if the bulk orders are to be secured have done well, and there is no indication that further enterprise in this direction will go unrewarded. The absorptive capacity of the home market for cheap clothing is not exhausted yet, but this demand alone cannot keep the British wool textile industry in the leading place which is essential to national prosperity in peace and war.

Finance and Banking

Czech Gold.—Between £5,000,000 and £6,000,000 of gold belonging to the former Czech National Bank and deposited at the Bank of England through and in the name of the Bank for International Settlements has, on instructions from Prague, been transferred to the ownership of the Reichsbank. Knowledge of this transaction was disclosed in the British Press towards the end of last week, and on Friday last week the matter was raised in the House of Commons. The Prime Minister, who in the course of the debate answered the question on this subject put by Mr Lloyd George, availed himself of the excuse provided by the garbling of some minor details in press accounts of the story to assert that the "whole story is a mare's nest." To describe this answer as disingenuous would be charitable; at least there would be something lacking in expert advice which omitted to inform Ministers of the existence of assets other than those to which the Czecho-Slovakia (Banking Accounts Restriction) Act applies. Fortunately, the House and the press did not allow this attempt at sidetracking to succeed. The matter was again raised in the House this week and Government spokesmen have had to admit, though with obvious reluctance, the truth of the story. The Treasury were not directly concerned in the matter, since the gold was deposited here in the name of the B.I.S., apparently without reference to its Czech ownership, and was transferred on instructions from Basle without reference to the Treasury. Nevertheless the Government admitted, after first denying it, that they were aware of the true nature of the transfer, and the Bank of England through its close relations with the B.I.S. must certainly have known of the nature of the operation to which it was a party. The Bank had no alternative but to follow the instructions received from the B.I.S. whose assets, whether held for its own account or for that of others, were given unconditional immunity by the Hague Protocol of 1930 and again by the Brussels Protocol of 1936. Even though the gold in question was known to belong to the former National Bank of Czecho-Slovakia it could not be attached.

B.I.S. Immunity.—The most cursory examination of the position will, however, be sufficient to convince the impartial observer that this immunity, which was designed to give the B.I.S. the character of sanctuary essential to the satisfactory fulfilment of its most important functions, has on this occasion been used in a manner utterly contrary to the spirit in which the Protocols were conceived. The immunity has served the purpose of handing to Germany one of the most important prizes of her illegal and, as yet, unrecognised absorption of Czecho-Slovakia. The blame for this perversion of the functions of the B.I.S. rests with the B.I.S. itself. The circumstances of the case would have justified, if not a refusal to follow the instructions of the successors of the Czech National Bank regarding the transfer of the gold in question, at least some request for time to allow the legal difficulties raised by the non-recognition of the conquest to be cleared. As it is, the action of the B.I.S. has raised serious doubts regarding the usefulness of the rôle which it can play under the conditions created by the "white war" now being waged in Europe. The reparations functions for which it was specifically created have ceased to exist. It provides opportunities for consultation which may still be advantageous in any circumstances short of war. But the clauses in its Statutes which were intended to protect the assets of neutrals deposited in countries which went to war have served grotesquely to benefit an aggressor. In this respect, at least, its Statutes appear to call for radical reconsideration.

The New Travel Mark.—The main, and certainly the most ingenious, achievement of the Standstill Committee is the new formula for making up travel marks which will

become operative as from the beginning of June under the new agreement. Under the agreement now expiring, travel marks were made up as to 75 per cent. of registered marks—the source of which was the proceeds of the repayment of standstill credits—and as to 25 per cent. in dego marks—the source of which was the Golddiskontbank which made the foreign exchange proceeds of its sales available to the German authorities as consideration for allowing travel marks to circulate in former Austrian territory. The registered and dego marks commanded the same quotation. Included in the travel mark rate was a licence fee fixed at 15s. per 100 marks. The travel mark thus constituted was a comparatively simple compound. The new mixture, on the other hand, is one which must rank as complicated even if judged by the high standards of Germany's variegated currency system. In the first place, the ratio of registered to dego marks in the travel mark compound will no longer be fixed but will vary with the discount on registered marks. When that discount is 50 per cent. there will be 50 registered to 50 dego marks. When the discount is 60 per cent.—which is approximately the present figure—the ratio will be 60 registered to 40 dego marks. Dego and registered marks will no longer have the same exchange value. Until further notice, the dego mark will be quoted at 50 per cent. discount, while the rate of the registered mark will continue to move freely. The next complication is that of the licence fee, which will be on a sliding scale based on a figure of 15s. per 100 marks when the registered mark rate is 50 per cent. discount, and rising or falling by 4d. for every 1 per cent. of variation in the rate of discount. The greater the discount, i.e. the cheaper the registered mark, the larger will be the

COMMERCIAL SERVICE

The Bank has over 380 Branches in Africa, and Agents and Correspondents throughout the world. The closest touch with Trade and Industrial conditions is maintained, with special attention to Commercial and Credit Intelligence. This service is available to Exporters, Importers and others wishing to develop trade with South, East and Central Africa.

THE STANDARD BANK MONTHLY REVIEW contains information on all South, East and Central African matters of Trade and Commercial Interest. Copies will be sent post free on application.

licence fee. The result of this complicated formula will be to make travel marks somewhat dearer than they are now and to give their rate much greater stability than it has commanded in the past. The German authorities will probably obtain more foreign exchange as a result of the higher ratio of dego to registered marks, but will set aside part of these receipts in order to assist the re-commercialisation of standstill credits.

* * *

America's Balance of Payments.—The preliminary estimate by the Department of Commerce of the balance of international payments of the United States in 1938 is shown in the table to be found at the head of the following column. The sharp depression of 1938 evidently had a great effect on the balance of payments of the United States. Whereas in 1937 the balance on current account was negative by less than the purchases of silver, in 1938 it was heavily positive. On the trading items alone (i.e. omitting interest and dividends) a debit of \$398 millions was converted into a credit of \$466 millions. This was produced not by heavy purchases of American goods and services by foreign countries, but by a very heavy slump in America's purchases of foreign goods and services. Imports of merchandise fell from \$3,084 millions to \$1,961 millions and payments for freight, tourists' expenditures, personal remittances, etc., were all smaller. The two exceptions were American purchases of silver, which increased in 1938, and institutional (i.e. charitable) contributions which showed the response of American generosity to distress in Europe and Asia. In the capital account, the inflow was smaller than in 1937. But this is partly deceptive, for the year fell into two sharply-defined periods, one from January to July, during which there was a net export of capital, and the second from August to December, when there was a very heavy inflow of funds. The large residual item suggests, for the second year in succession, that there are

(All figures in millions of dollars; a plus sign denotes a credit or in-payment, a minus sign a debit or out-payment).

forms of capital inflow which cannot be traced. If the whole of this item can be added to the capital totals, it would appear that half the inflow of gold in 1938 represented capital and half was required to cover the current account. This heavy credit on current account is almost enough by itself to explain the weakness of sterling in 1938; it was certainly a factor of disturbance on the world's exchanges.

MONEY MARKET NOTES

The Money Market

THE result of last Friday's Treasury Bill tender had no immediate effect upon discount rates. The market syndicate maintained its bid at the previous week's level; and although its rate of allotment dropped from 40 per cent. to 28 per cent., total applications rising from £58.3 millions to £60.8 millions, it had every reason to be satisfied with its attempt to keep up the rate, for the amount of bills on offer this week has been raised to £40 millions. Moreover, the syndicate's bid gave a margin of about $\frac{1}{8}$ per cent. over the buying price maintained by most of the clearing banks. Later this week, however, three

* Viz. $\frac{1}{2}$ per cent. for loans against Treasury bills and other approved bills and British Government securities within six months of maturity. $\frac{3}{4}$ per cent. for loans against 1 per cent. Treasury bonds and other gilt-edged stocks within six months of maturity. 1 per cent. for loans against other collateral.

banks raised their buying rates for August bills from $\frac{1}{8}$ to $\frac{1}{4}$ per cent., and the other banks are said to be falling into line. This firmer tendency in the discount market can be attributed to the growing reluctance of the banks to add to their bill portfolios, which have probably now been restored to normal, together with the increase in the supply of Treasury Bills; half-year influences, too, will soon be making themselves felt. The rate for the three months' bank draft is firm at $\frac{1}{4}$ per cent. Credit

conditions remain comfortable. As shown in this week's Bank Return there has been a big fall in bankers' deposits; nevertheless, loans against bills have been readily available at $\frac{1}{4}$ per cent. The activity in the gilt-edged market has increased the demand for bond money from outside quarters, which on Thursday was available at $\frac{3}{4}$ - $\frac{1}{2}$ per cent.

The Bullion Market

A FEATURE of the bullion market this week has been a small but noticeable revival in the hoarding demand for gold, which is a good indication that a brighter view is taken of the international situation. Arbitrageurs, too, have been encouraged to work more freely in view of the new ruling of the War Risks Cargo Pool discussed in a Finance Note last week, although the firmer trend of sterling has been a factor working in the opposite direction. Sales have been mainly of newly-mined

The New York price of silver remained at 43 cents per ounce .999 fine during the week.

metal, but partly on official account. The resumption of shipments of Transvaal gold appears to be inducing the authorities to release gold even when they do not need to support the sterling exchange. Nevertheless, on Wednesday buyers had to be rather severely rationed.

The silver market has been quiet but fairly steady. India has been both a buyer and a seller.

The Bank Return

IN preparation for the Whitsun holiday the note circulation shows an increase of £1 million. In the pre-Whitsun week of last year the increase was £4.7 millions, but as that Return was dated June 1st, the larger expansion was due to end-of-the-month requirements rather than to holiday influences. The rise this year has not been offset, for though Government securities

show an increase of £0.5 million, discounts and advances and other securities between them show a net fall of £2.6 millions. At the same time there has been a big switch-over to public deposits, which are up by £8.7 millions

the week. For this the excess of payments for Treasury Bills over maturities, which now amounts to £10 lions weekly, and the accumulation funds for the War Loan dividend on June 1st, are probably responsible. Bankers' deposits as a result all these movements are down by as much as £12 millions to their lowest since April 26th.

Foreign Exchanges

ERLING has been firm in terms of dollars this week, and the sterling-dollar rate has moved up from 4.68½ on Saturday to 4.68 on Monday and

Royal Insurance Company.—New life assurances increased by £18,000 to a record figure of £5,177,000 and annuity considerations to £285,000, against £125,000. The net rate of interest on the life assurance and annuity funds fell from £3 17s. 3d. per cent. to £3 15s. 11d. per cent. Fire premiums showed a decrease of £110,000 to £5,429,000, but accident premiums, at £6,031,000, were greater by £85,000. Marine premiums amounted to £1,015,000, against £926,000, but the 1937 account was closed at a loss of £46,000, against a profit of £41,000 a year earlier. The results of the last two years are shown below:—

	1937	% of	1938	% of
	Profit	£ Premiums	Profit	£ Premiums
Fire	628,499	11.4	511,926	9.4
Accident, Employers' Liab. and General	490,761	8.3	566,920	9.4
Marine	40,927	...	Dr. 46,420	...
Life	50,000	...	50,000	...
Charges to Profit and Loss	1,210,187	...	1,082,426	...
	521,012	...	586,597	...
	689,175	...	495,829	...

Departmental reserves are strong; in addition to the usual reserve of 40 per cent. of the premium income for unexpired risk, additional reserves of £3,500,000 are available in both the fire and accident departments. The marine und amounts to £1,649,000, equal to 62 per cent. of the increased premium income of 1938. Paid-up capital consists of 5,599,930 ordinary shares of £1 each, 10s. paid, and the directors recommend that the sum of £699,991 5s. be transferred from profit and loss to reduce the uncalled liability to 7s. 6d. per share. Consolidated assets exceed £61 millions, and reserve fund stands at £1,500,000. The profit and loss balance, after providing for the 1938 dividend and the capitalisation of £s. 6d. per share, amounts to £2,107,000. Mortgages and loans increased from £4,910,000 to £5,588,000, while mortgages on property alone increased by £679,000 to £3,307,000. British Government securities fell from £13,951,000 to £13,241,000. Dominion, Indian and Colonial Government securities showed little change at £2,621,000, and foreign Government securities increased from £8,696,000 to £9,265,000. Debenture stocks amounted to £9,628,000, against £9,779,000, and ordinary stocks fell from £7,508,000 to £7,001,000, but preference shares increased from £4,629,000 to £4,825,000. Municipal, County and Public Boards Stocks (United Kingdom), which were reduced in 1937 from £1,343,000 to

4.68½ on Tuesday. At one time on Wednesday it was as high as 4.681- $\frac{3}{4}$, but official intervention is believed to have been responsible for the check that then took place, and the closing rate of 4.68½ showed no change on the day. On Thursday there was a reaction to 4.68½ in a very narrow market. Hopes of an early agreement with Russia, and a brighter view being consequently taken of the international situation, are probably responsible for the firmness of sterling. It has not been confined to the spot rate, for the premiums on forward dollars have contracted to $\frac{1}{2}$ c. for one month and 1½ c. for three months. The strength of the Canadian dollar has not been altogether maintained, for there are signs that the

INSURANCE NOTES

£884,000, recovered last year to £1,099,000. The dividend was repeated at 65 per cent., and costs £1,333,000, compared with available interest earnings of £1,193,000.

Sun Insurance Office.—The 1938 accounts of this office, the oldest insurance company in the world, cover the 229th year of its existence. Fire premiums increased by £25,000 to £2,259,000 and accident premiums from £1,860,000 to £1,885,000. Underwriting profits in the accident department were very satisfactory and showed a large increase on the 1937 record. Marine premiums remain practically unchanged at £586,000. In addition to the usual reserve of 40 per cent. of premiums for unexpired risk, additional fire and accident reserves amounted to £1,600,000 and £600,000 respectively, while the marine fund is equal to 174 per cent. of the 1938 premiums. The results of the last two years are given below:—

	1937	% of	1938	% of
	Profit	£ Premiums	Profit	£ Premiums
Fire	289,427	13.0	255,304	11.3
Personal Accident, etc.	131,824	7.2	159,343	8.4
Marine	424,251	...	414,647	...
Charges to Profit and Loss	417,213	...	418,169	...
	7,038	...	Dr. 3,522	...

Included in the profit and loss charges shown above are £100,000 transferred in 1937 to investment reserve and £150,000 written off investments in 1938, together with £50,000 written off properties in each year. Total assets amount to £11,269,000, while general and investment reserves stand at £1,000,000 and £342,000 respectively, and the profit and loss balance, after providing for the 1938 dividend, exceeds £1½ millions. Aggregate market values of Stock Exchange securities on December 31st last exceeded book values. The rate of dividend is maintained at 55 per cent., and costs £243,000, compared with net interest earnings of £260,000.

Alliance Assurance Company.—The results of the fire department of the Alliance have been consistently successful, and last year proved no exception. Premium income increased by £35,000 to £2,211,000. Accident

demand from tourists visiting the Dominion for the Royal tour is falling off, but the rate has been quietly steady at around 4.69½. The French franc has remained very steady at 176½. Tourist buying is fairly extensive, but is not allowed to cause any appreciation in the rate which has hardly moved since the beginning of May. Swiss francs, on the other hand, appreciated early in the week, as a result both of tourist demand and the easing of political tension, although on Wednesday there was a sharp reaction to 20.79½ fr., against 20.77½ fr. on Tuesday. The resignation of the Dutch Finance Minister has been partly responsible for the weaker tendency shown by the guilder, which on Thursday was quoted at 8.72½.

premiums amounted to £1,492,000, against £1,427,000, and marine premiums to £406,000, against £412,000. The departmental reserves are strong at 158 per cent., 90 per cent. and 280 per cent. of the premium income in the three respective departments. Underwriting results of the last two years are given below:—

	1937	% of	1938	% of
	Profit	£ Premiums	Profit	£ Premiums
Fire	432,613	19.9	422,224	19.1
Miscellaneous	146,315	10.3	125,569	8.4
Marine	37,009	9.0	37,649	9.3
Life	51,481	...	57,806	...
Sinking fund	...	...	14,763	...
	667,418	...	658,011	...
Charges to Profit and Loss	325,093	...	343,301	...
	342,325	...	314,710	...

In addition to the profit and loss items included above, £100,000 was transferred to reserve fund in each of the past two years. In the life department new sums assured increased from £3,836,000 to £4,205,000, and the rate of interest on the life assurance and annuity funds fell by 4s. 2d. per cent. to £3 9s. 8d. per cent. A quinquennial valuation of the Alliance life assets was made as at December 31, 1938, and the results are given below:—

	1929-33	1934-38
Surplus earned	2,431,095	2,436,446
Brought forward	380,960	823,337
	2,812,055	3,259,783
Allocations:— Policyholders' bonuses	1,789,846	2,074,474
Shareholders	198,872	230,497
Strengthening reserves	...	*600,000
Carried forward	823,337	354,812
	2,812,055	3,259,783

* Approximate.

The basis of valuation has been strengthened by the assumption of interest at 2½ per cent., against 3 per cent. The cost of this change is stated to be in excess of £600,000, the amount set aside five years ago for this purpose. The rate of bonus has been maintained at 38s. per cent. per annum on the sum assured and existing bonuses. Total assets amount to almost £42 millions, of which £27 millions belong to the life and annuity funds of the Alliance and its subsidiaries. Stock Exchange securities stand in the company's books at or below middle market prices, less accrued interest. General reserve amounts to £1,850,000 and the profit and loss balance to £749,000, after providing for the 1938 dividend, which, for the twelfth successive year, is 18s. per share and costs £458,000, compared with available interest earnings of £367,000.

Investment

Gilt-Edged Lead Recovery.—From the outset this week, gilt-edged have pointed the way for the rest of the market to follow. It would be wrong to deny the appearance of some faint stirring of investment interest. Yet, for the first half of the week at least, the impression prevailed that activity showed little, if any, expansion over the previous week. This week's gains have been the more spectacular since the market is so bare of stock. The original buying impetus required to produce an advance of half a point in War Loan on Monday was extremely small for a stock in which big transactions are normally needed to move the price significantly. But investment buying has been encouraged by the subsequent rises, which have developed into strides of up to a point where earlier in the week fractional gains of a quarter of a point were the general rule. The striking success of the Sydney loan, which closed at 1½ premium at the end of the first day's business on Tuesday, and the eager underwriting and subscription of the South Africa loan, provide a further illustration of the dramatic change in market sentiment. Such a startling rise in the funds is perhaps against the "book," for while industry is staging a rapid recovery the investor has yet to find the funds on which industrial expansion is largely based. Yet the suggestion that the authorities should seize the present "opportunity" to obtain at least the first part of their defence requirements may not be entirely conclusive. For undue eagerness, in a situation where the authorities have to foster the gilt-edged investor's confidence, might be taken as a sign that they were somewhat unconvinced of the permanence of the rise in gilt-edged. In fact, this week's advance is attributable to a batch of mixed influences—reassurance regarding the maintenance of cheap money, the consolidation of the "peace front," and the natural vigorous rebound of a market empty of stock as soon as a moderate volume of buying returns. If the present temper is maintained, however, the appropriate time for a defence issue may be nearer than the autumn.

"House" Firms as Unlimited Companies.—The proposed alterations to the Rules, to give effect to the decision to allow Stock Exchange firms to form themselves into unlimited companies, have been passed by the Committee for General Purposes for confirmation on June 5th. The new rules, 57b, 57c and 57d, are notable for the extreme care that has been taken to ensure that members of firms which elect to take advantage of the scheme will be personally charged with the same degree of responsibility to investors and to the "House," as if they remained as partners. Accordingly, while provision has to be made to allow new unlimited companies to become "corporate members" of the Stock Exchange, persons forming themselves into such companies must first be, and remain, members of the "House." The individual members are answerable for such companies' transactions exactly as if they were their own, and this safeguard applies both to financial and legal obligations and to compliance with the Rules, Regulations and practices of the "House." The mechanical processes outlined are simple. Firms proposing to convert into unlimited companies must give ten days'

notice to the Committee, together with their draft Memorandum and Articles. Unless the Committee objects, the firm may then register itself as a company. The individual members concerned must then apply for membership for the company, but no other proposal, or nomination or recommender or surety is required, nor will there be any election. The acceptance of the application will, therefore, be more or less automatic provided the procedure has been correctly followed. In the case of resignation by a corporate member, this will operate as notice of formation of a new partnership between the individual members. The whole objective has been to reduce the effective position of corporate members to the minimum level necessary to satisfy the accounting and taxation objectives of the scheme.

Railway Recovery.—A further impressive advance in home railway stocks this week follows less from the "Square Deal" report (discussed at length on page 478 and summarised on page 482) than from the current traffic trend. Making all due allowance for the unfavourable course of receipts twelve months ago, traffic gains of £617,000 during the past four weeks are clearly impressive. They have reduced the short-fall in gross receipts for the twenty weeks to date to £838,000, compared with £1,455,000 at the end of the sixteenth week. And the recent gains in coal and merchandise suggest that the rapid industrial improvement of recent weeks is not by-passing the railways. On the passenger side, the recent gains have not been impressive, though the trend shows improvement. With six weeks to go before the end of the half-year, the market is already framing its estimates of current railway earnings. The general basis of assumption is that the lines will "break even" on their gross takings, and after increases of £207,000 and £187,000 in the past two weeks, this assumption is by no means fanciful. In the following table, the shortfall to date is shown for each of the companies, the average weekly traffic gain for the past four weeks, and the average gain required for the next six weeks to "break even":—

	(In £'000's)		Average required gain, next six weeks, to "break even"
	Shortfall, 20 weeks to date, compared 1938	Average gain, past 4 weeks	
L.M.S.	362	54	60
L.N.E.	423	50	70
G.W.R.	17	41	3
Southern	36	10	6
4 main lines ...	838	155	139

For Great Western and Southern, the result is scarcely in doubt. Of the two Northern lines, L.M.S. should be able to put on the slight extra spurt to reach the goal, but the margin for L.N.E.R. is wider. The results, however, may not depend so directly on the traffic receipts as upon the volume of "savings" which the companies are able to retain for a half-year of improved working. The apparent unexpired savings accruing from 1938 amounted roughly to £700,000 for L.M.S., £1,000,000 for L.N.E.R., and £500,000 for Great Western. But these savings are, in effect, based on the maintenance of the volume of traffic at the level of the second half of 1938. In view of the improvement, it may be reasonable to assume that half of these amounts are realised. Hence, on the assumption that gross receipts "break even," the potential savings would be equivalent to extra earnings of 0.87 per cent. for L.M.S. 1923 preference, and 0.58 per cent. for Great Western ordinary. The position of L.N.E.R. for second guaranteed and first preference stocks cannot be readily established by this method, which only provides a rough basis for the current half-year. For the remainder of the year it will obviously become relevant to consider the traffic trend in greater detail.

G.W.R. and Electrification.—Great Western Railway stockholders will probably feel little surprise that the company has decided not to proceed with the proposal to electrify the main line between Taunton and Penzance. When Lord Horne disclosed that the project was under consideration, at last year's meeting, it seemed that the company had deliberately chosen a line superficially unattractive in order to make the examination the more stringent. The report of the consulting engineers, at least, shows that few of the requirements of successful electrification are present. The physical characteristics of the line, the wide variations in the traffic carried between the different seasons, and the cost of replacing no fewer than 164 steam locomotives by electric types at high cost, are decisive points on which the scheme is rejected. As much as two-thirds of the traffic consists of passengers, and the bulk is run during the summer, and even then is concentrated in the middle of the day and at week-ends. Railway stockholders may not regard this somewhat special case as the final answer on the question of railway electrification for mixed traffic lines, though it illustrates some of the difficulties which are involved.

Company Notes

Edmundsons Electricity Report.—The postponement until November of further examination by the House of Lords Select Committee on the effect of holding companies upon the utility industries will probably be welcomed by shareholders of Edmundsons Electricity Corporation, whose annual report for the year to March 31, 1939, has appeared this week. The method of presenting profits has been changed, but not to a degree which affects comparability. A fuller description of the items included in gross trading profit, which totalled £281,737 for 1937-38, shows that it includes profits from supplying engineering and contracting services to subsidiaries, from consulting fees on work carried out at selected stations, and from bulk purchases of consumers' goods supplied to subsidiaries. These amounts are shown at £155,313, after deducting administration charges not recovered from subsidiaries—an item which absorbed £31,938 from the previous year's trading profit. Thus a true comparison would suggest that trading profit has been reduced from £249,799 to £155,313. This fall, however, is more than made good from dividends received from subsidiaries (£695,955 against £569,891) and from other sources (£45,463 against £15,648). Total income is thus increased from £867,609 to £897,130. Such changes in investment income suggest either the rapid fructification of previous investment, or more liberal distributions from subsidiaries' profits. Following last year's 50 per cent. capital bonus, the dividend is proportionately reduced from 9 per cent. to 6 per cent. and it is covered by earnings of 7.3 per cent., as the following table shows:—

	Years to March 31st		
	1937	1938	1939
Trading profits	208,587	281,737	155,313†
Dividends and other income	589,563	585,872	741,818
Total income	798,150	867,609	897,130
Expenses, fees and interest	33,675	78,468	55,309
Taxation and N.D.C.	43,130	51,000	50,000
Debt service	200,978	203,022	203,022
Preference dividends	111,760	113,211	118,821
Ordinary stock:—

Paid	336,600	344,200	405,000
Earned %	11.6	11.8	7.3
Paid %	9	9	6
Reserve fund*	30,000	30,000	30,000
Carried forward	50,477‡	98,184	133,161
Issued ordinary capital	3,740,000	4,500,000	6,750,000

* Not including direct transfers of capital profits. † Net of administrative expenses not recovered from subsidiaries. ‡ After writing off £41,250 new issue expenses. § And capital bonus of 50 per cent.

The corporation has striven during recent years to effect a fuller consolidation of its interests. The number of companies within the group has been reduced in two years from 49 to 23, and in the same period certain interests have been sold, and others acquired, to unify the group's areas of supply. These changes, which could doubtless be justified on economic grounds alone, have also accorded with modern tendencies in utility finance. A series of uncoordinated units clearly stands in danger of disintegration if legislative action is threatened, as it was two years ago. That shareholders have not suffered is apparent from the dividend record from 1934, when 7 per cent. was paid, to this year, when 9 per cent. (on a comparable basis) is being distributed, though such rapid progress in the near future could hardly be expected. The £1 stock units stand at 25s. to yield £4 16s. per cent.

* * *

J. Lyons and Company Results.—Happy is the company which can claim new record profits each year, with so little apparent effort as J. Lyons and Company. The latest report, however, provides no exception to the practice of striking a balance of profits which does not exhibit the real variation in trading results. On a long view, of course, there can be no doubt of the substantial position and satisfactory progress of the undertaking, whose fruits for the shareholder are a small increase in disclosed profits, and a consistent 22½ per cent. dividend paid without variation for more than a decade, without large changes in the disclosed earnings cover. The results give the impression of a steady and sheltered business; in fact, the company's profits are affected not merely by its growing scale of operations, but by a considerable degree of competition and by changes in commodity prices. The course of profits in the past three years is shown in the following table, while the chart brings out the massive stability of profits over a longer period:—

	Years ended March 31		
	1937	1938	1939
Profit	1,024,329	1,024,460	1,025,690
Directors' fees	13,452	13,460	13,710
Prof. dividends	462,353	462,353	462,353
Prof. ord. div.	28,000	28,000	28,000
Ord., "A" Ord., and Proportional Profit shares:—			
Earned	520,524	520,647	521,627
Paid	417,661	417,661	417,661
Earned %*	29.9	30.2	30.2
Paid %*	22½	22½	22½
Reserve	100,000	100,000	100,000
Carry forward	42,203	145,189	249,154

* On Ordinary and "A" Ordinary, each Proportional Profit share ranks for one-fifth of dividend on an Ordinary share.

J. LYONS' PROFITS 1929-39

The latest report contains some comment on the year's working. It is stated that business done showed satisfactory progress, while the provision of still more substantial contingency reserves as a precaution against continued unsettled conditions suggests that trading profits rose by rather more than the mere £1,230 suggested by the accounts. Dividends are supported by the same earnings as before, and, as in 1937-38, a substantial addition is made to the carry forward, instead of making additions to reserve, which stands at £2,000,000. In a balance sheet devoid of any special features, the principal changes are an increase from £407,923 to £443,063 in investments in subsidiaries, and the disappearance from the assets of a £200,000 mortgage. Under peace-time conditions at least, the outlook for 1939-40 should be as favourable as the year which has just closed. At the current price of 5½ J. Lyons £1 ordinary shares yield £4 2s. per cent.

Coal Shares Examined.—The coal share group has again been active this week, and it would be difficult to deny the relative attraction of a group which, according to the Actuaries' Index, provides an average return of 7.17 per cent. This impression is supported by the satisfactory results which have recently appeared. They suggest that the regional selling schemes have now thoroughly proved their value to the industry in maintaining or raising prices. Again, current reports from the industry indicate a high level of activity which was not apparent even in the first quarter of this year. Hence, the profits recently reported may, if the present rate of output is maintained, be exceeded in the current year. A selection of such profits is shown below:—

Company (years to March 31st)	Total Profits	Earned for Ord.		Div.	Present	
		Amt.	Rate		Price	Yield
Pease and Partners—						
1937	302,777	160,492	16.0	5	} 12/3x (10/-)	10 4 0

Even last year, it will be seen, increased or maintained dividends were the rule. The gross 7½ per cent. dividend of Yorkshire Amalgamated is roughly equal to the former 5½ per cent. tax free distribution; Manchester Collieries have maintained the 5 per cent. payment; while Pease and Partners, to the market's gratification, added a 2½ per cent. cash bonus to their 10 per cent. dividend. The increase in the Carlton Main dividend is more than warranted by a sharp rise in profits. The experience of the different companies, however, has not been identical. Pease and Partners is a mixed undertaking, and reported lower sales and prices for pig iron and coke, but improved earnings from coal. The net effect is a fall of £41,385 in total profits, and a still sharper fall in earnings for the equity, since the provision for renewals and contingencies is £20,000 higher at £50,000, and £50,000 is allocated to reserve against investments in subsidiaries. In spite of these generous increases in special provisions, the increased distribution is well covered, and is less surprising in a year of lower profits if the exceptionally conservative dividend of 1937-38 is remembered. Yorkshire Amalgamated report a "somewhat lower" output of coal, but the fall in profits is only 6½ per cent., and is due also to larger taxation provisions by the constituent companies, besides higher depreciation on account of recent plant extensions. Lord Aberconway's speech this week, however, was distinctly optimistic, and referred to the possibility of a rise in prices. The substantial rise in Carlton Main total earnings follows a period of substantial reorganisation within the group. The repayment of £250,000 4½ per cent. debenture stock on April 1st implies an annual saving of £11,250 gross interest, which will take effect this year. The higher level of activity and the tendency towards fixed prices which have become evident imply that the 1939-40 financial period has begun well for collieries in general. Current share yields, in these circumstances, still seem relatively generous, even after the impressive gains of the past fortnight.

Imperial Airways Offer.—Last Monday, Imperial Airways shareholders ratified the directors' acceptance of the Government's offer of 32s. 9d. per ordinary share. Sir John Reith added a number of details to the general outline of the scheme, including the information that shareholders will be permitted to take up stock in the new corporation, at the price of issue to the public, from the sums which are due to them under the offer. These, presumably, will include the interest which is payable as from April 1, 1938, on the purchase price. The next step is to obtain Parliamentary sanction for the purchase. No information is, of course, available at this stage regarding the terms or which the corporation stock will be issued.

Griffiths Hughes Proprietaries Setback.—In each of the past three years, this proprietary medicine holding company, which became a public concern in 1934, has produced disappointment for the investor. For each of the years to June 30, 1935 and 1936, a 17½ per cent dividend was paid, but the rate was reduced to 11 per cent. in 1936-37, to 6½ per cent. actual for nine months to March, 1938, and has now been cut to 5 per cent. for the latest year. The Proprietaries' dividend for the nine months to March, 1938, represented 8½ per cent. per annum, and the reduction to 5 per cent. for 1938-39 evidently reflects a further deterioration of the operating company's affairs. Its record in recent years is not impressive. Profits amounted to £454,121 in 1935-36, but the following year they were almost halved at £234,026, while in 1937-38 they fell further to £162,196, and the preliminary statement for the latest year shows profits, before tax, of no more than £112,550, a reduction of 30 per cent. A rough impression from these figures

suggests that the holding company's dividend may have been short-earned to the extent of 1½ per cent., assuming that a full year's preference dividend has been charged. The unfavourable experience of the undertaking since it became a public concern points to the importance of keeping abreast of public taste, and stresses the importance of advertising in the fight for obtaining custom.

Tea Profits and Prospects.—The majority of recent tea company reports record some decline in profits and dividends. As compared with rubber producers, however, the reduction in earnings shows welcome moderation. The experience of the Finlay group of tea companies may be considered representative, and their results, together with those of Lunuva and of Nuwara Eliya, are summarised in the following table:

Company	Tea		Total Rev.	Earned for Ord.		Div.	Present

* Years to November 30th. † Years to December 31st. ‡ Per £1 share of unit.

The setback in profits is entirely due to the lower average price of tea, which fell by about 1d. a lb.—for Nuwara Eliya, a high-grade producer, there is a decline of nearly 2½d.—though the 1938 average does not compare unfavourably with that of 1936. Increased crop releases, however, ranging between 7 per cent. and 13 per cent., have done much to offset the effect of lower prices. And the companies listed above show that higher crops have provided savings in costs. Lunuva, for instance, reduced f.o.b. costs per lb. from 8.23d. to 7.81d., and the reduction in dividend is a precautionary measure, not necessitated by any fall in equity earnings. The experience of the individual Finlay companies varies, for different movements of prices or crop are complicated by inter-company holdings. Consolidated Tea shows the heaviest rate of decline in equity earnings—its average realised price was 1.6d. a lb. lower—and the fall would have been heavier but for higher dividend receipts. There is also some variation in dividend policy, since the Anglo-American Direct dividend cut is more severe than the fall in earnings, while the Amalgamated Tea Estates distribution is maintained although earnings are reduced. Exceptionally, the Kanan Devan dividend is increased—a result due to a more substantial increase in the crop and a more moderate fall in average prices obtained than the majority of companies. In this country, at any rate, tea consumption shows no signs of resuming an upward trend; London auction prices have ruled at a lower level than a year ago; and some small reduction in releases has been made for 1939-40. But if the immediate outlook lacks cheerful features, there is no reason to expect any substantial decline in profits for the current year.

A New Appointment

MR. NORMAN CRUMP

has been appointed
CITY EDITOR

of the

SUNDAY TIMES

and will contribute his first
article next Sunday, May 28th.

Mr. Crump, who has been an occasional contributor to the SUNDAY TIMES, has been engaged in financial journalism for nearly twenty years. His experience on the staff of *The Economist* and other responsible journals covers every main department of City affairs, and his knowledge and judgment inspire full confidence.

Communications for the City Editor should be addressed to the SUNDAY TIMES, City Offices, 52, Wool Exchange, E.C.2.

Phone: Metropolitan 3720.

The City pages of the SUNDAY TIMES contain the fullest lists of Saturday's Wall Street and Canadian closing prices.

Rand Taxation and Mining Development.—It is quite understandable that Rand mining spokesmen should emphasise the great burden of taxation borne by the industry. Mr P. M. Anderson, in his speech at the Union Corporation meeting, showed that the aggregate profit of the industry as a whole was substantially less than the amount accruing to it in respect of the increased price of gold over the old parity of 85s. The profit per ton milled in 1938 was only 3s. 5d. higher than six years previously, and of this increase no less than two-thirds was absorbed by additional taxation. The question of how far taxation may be considered excessive, in the sense of acting as a deterrent to new exploitation, is naturally one of great concern to finance houses. Mr Anderson seemed to suggest that this stage may already have been reached in some cases. He referred to the high capital cost—£3,000,000 or more, to bring one deep-level mine to full production—and to the proportion of failures, and drew attention to the fact that to-day there are a number of ventures in the developing stage that require further funds, but whose shares are quoted below par, and cannot procure additional capital by normal means. Mr Anderson, however, mentioned that the Union Corporation, as shareholders in Grootvlei and Van Dyk, had exercised rights to subscribe for its proportion of the new issues of those companies last year, and that the preferential subscription right had been exercised in the Marievale issue. Heavy as the incidence of taxation is, managements in general show no inclination to avoid bigger production programmes where the technical indications are known to be sufficiently satisfactory. Thus, Sir Patrick Jones announced at the Rand Leases meeting that the capacity of that company's milling plant would be further increased to 200,000 tons per month. Sir George MacKenzie, at the New Kleinfontein meeting, stated that, having regard to the level of economic working in relation to the taxation factor, it had been decided to incur the necessary capital expenditure to increase the tonnage from 85,000 tons to 100,000 tons monthly. West Rand Consols are going ahead with an increased capital expenditure programme. In such cases, the net economic stimulus, after providing for taxation on its present scale, appears to be sufficiently active, but it must be admitted that the flotation of new ventures at present would be difficult. Technically, there is every reason why West Driefontein should get its money and go ahead as fast as possible, though West Wits have found it necessary to defer the flotation until more favourable conditions prevail. Perhaps the impact of the taxation factor would be less burdensome if political factors no longer swayed the markets.

* * *

The Week's Company Profits.—Apart from the J. Lyons results, this week's profits figures are not influenced by large individual figures. The usual analysis of profit and loss account on page 530 shows that 48 companies for which comparable figures are available have reported net profits of £4,151,000 against £4,285,000, a reduction of only 3 per cent. Aggregate net profits of 1,151 companies reporting this year to date are £152,359,000, or 8½ per cent. below the total of £166,201,000 earned by the same companies a year ago. The week's results are discussed in preceding Notes and on page 504 under the heading "Shorter Comments."

THE STOCK EXCHANGES

London

SETTLING DAYS

TICKET ACCOUNT
JUNE 6 JUNE 8

ANOTHER week of all-round improvement has been experienced by the stock markets, with particular strength in gilt-edged but cheerfulness in other sections also. Foreign news has been raising hopes of at least a respite, if not a permanent improvement, in the political

situation, and in this mood the market has been better disposed to take note of more active industrial conditions.

Gilt-edged stocks went ahead almost consistently in a series of spurts, Old Consols, for instance, rising ½ on Monday, then ½, and no less than a full point in mid-week. War Loan and the undated stocks generally showed corresponding gains. Redeemable issues made a good showing, although they were less prominent than the perpetual stocks. A number of factors contributed

Company Meetings of the Week.—In this issue, reports of company meetings begin on page 512. Reviewing the *Royal Insurance* results, Mr A. Kentish Barnes pointed out that in the accident and general departments the premium income created a fresh record at £6,030,000, while the underwriting profit of £566,000 was also a record. At the *Sun Insurance* meeting, Sir William H. Goschen reported that underwriting profit in the fire account showed a ratio of 11.27 per cent. to earned premiums. Mr P. M. Anderson's discussion of the severity of taxation at the *Union Corporation* meeting is reviewed on this page. Mr F. E. Rebbeck informed *Harland and Wolff* shareholders that the Govan shipyard had produced a record output, but that at the end of the year the Diesel engine works were without orders for propelling machinery. Much of the company's engineering capacity, however, had been employed in other directions. In his address to *British and Chinese Corporation* members, Mr D. G. M. Bernard mentioned that the Corporation, together with other groups had been interested in a project for a railway from Szechuan to Burma, which the Chinese were anxious to build. At the *Welwyn Garden City* meeting, Mr Theodore G. Chambers discussed the industrial decentralisation. At the meeting of *Wiggins, Teape*, Lord Portal informed shareholders that the small recession in turnover was largely due to a reduced demand for the cheaper grades of paper. Mr W. J. Clarke informed shareholders of *James W. Cook and Company* that the capital of the company would be increased to pay off subsidiaries' liabilities to the banks. Mr Philip E. Hill, at the meeting of *Timothy Whites and Taylors*, looked forward to increased purchasing power and increased turnover for retail concerns due to the re-armament programme. At the meeting of *Telephone Manufacturing Company*, Mr F. T. Jackson informed shareholders that a factory had been changed over from the manufacture of telephone apparatus to armament work. Mr A. P. Harlow, at the meeting of *United Sumatra Rubber*, declared that cultivation and the drainage system of the estates had been improved. Mr E. D. Hewan informed shareholders of *Sungei Batu (Malaya) Rubber* that re-planting would be necessary, following the extension of the quota, to continue the policy of rejuvenating the estates. At the meeting of *Kepong (Malay) Rubber*, Sir F. Voules discussed the fall in profits, which was due to the smaller exportable crop and the lower market price. Mr R. Olaf Hambro referred with satisfaction to the exceptionally liquid position of *Hambros Bank*. In the late summer of 1938 it had been decided to reduce gilt-edged investments and increase Treasury bill holdings. At the *Associated Gas and Water Undertakings* meeting, Mr W. H. Bennett estimated that the improved efficiency of gas appliances of recent years represented 20 per cent. extra service. As an instance of the scope of the *Odams Press* undertaking, Lord Southwood informed shareholders that last year £3,000,000 was paid out in wages and salaries alone. At the *Industrial and General Trust* meeting, Captain E. C. Eric Smith pointed out that the balance-sheet figure for investments of £8,014,688 was still represented by market values. *Madras Electricity Supply* members were informed by Mr James Gray that almost every branch had contributed to the increased sales. Labour troubles which had hampered the activities of *Indian Copper Corporation* were described by Sir Godfrey B. H. Fell at the general meeting.

to this exceptional cheerfulness: steady public support, the lack of repercussions from the Danzig incidents at the week-end, the Chancellor's reassurance regarding cheap money, and prospects of an Anglo-Soviet agreement. Dominion stocks were firm, being helped by the success of the Sydney issue, though the terms of the South Africa loan slightly depressed comparable stocks. Australians went ahead smartly, and New Zealand issues also gained.

In smaller degree, many foreign

bonds reflected the general improvement. Among European issues, Czechoslovakian bonds were prominent on hopes that the debt service might be met. Japanese bonds were subdued, while Brazilians began the week badly, but recovered later.

★

After a slight and somewhat grudging response to the "Square Deal" report, *home rails* were dull early in the week, partly on profit-taking, but hopes, handsomely realised, of good traffics revived interest, and under the lead of Great Western ordinary, prices improved as the week proceeded. Preference issues received fair support, and the guaranteed stocks were firm. Although remaining quiet, Argentine rails were noticeably firmer than of late.

In the *industrial market* the trend of prices was again moderately but steadily upwards, with some broadening of interest after a quietly firm start. The heavy industries were the best supported. Iron and steel shares gained consistently, and became rather more active as the week went on. Ruston & Hornsby rose sharply on the good results. The satisfactory trend continued in coal shares, which were actively supported, while engineering issues renewed their rise after some hesitation on Tuesday. In spite of some return of interest in mid-week, electrical equipment issues were relatively neglected, and electricity supply shares improved quietly, helped by the Edmundsons report. Motor shares began the week irregularly, and then shared in the general improvement. Aircraft issues were belatedly affected by the market cheerfulness, but made a less satisfactory showing than many other sections. Textiles were unaffected by the upward trend and lacked features of interest, except for an impressive gain in Courtaulds after the April output figures. Provincial support helped breweries. Tobacco shares failed to make much headway, though they were very firm. Small gains were general in the stores group, in spite of a little profit-taking in mid-week. The tendency among provision and catering issues was a shade firmer. Useful gains were common among miscellaneous shares, though prices did not vary between very wide limits. London Brick gave way on the reduced interim dividend. Shipping shares were dull and uncertain.

★

Oil shares opened quiet but firm, with selective buying of Venezuelan Oil Concessions and Attock. On Thursday, the market blazed into activity on the announcement of final dividend payments by "Shell" and Royal Dutch. Rubber shares continued firm, but business was small, the public adopting a cautious attitude on the statistical position of the commodity. There was some demand for tea shares on Monday, especially for Indian issues. The tone continued firm in mid-week. In the *mining market*, Kaffirs were firm throughout the week, but changes of sentiment at the Cape were an unsettling factor. West Africans advanced under the lead of Ariston, interest being maintained well into the week. Apart from a rally in Venterspost and West Wits shares on Tuesday, developing issues drifted fractionally downwards. Among the finance companies, African and European issues were early in demand, prices hardening in mid-week. Diamond and copper shares were

neglected, but tin shares improved after Monday in sympathy with the metal.

New York

WALL STREET rallied strongly late on Monday under the leadership of utility and railroad stocks, but news of labour trouble in the Chrysler works at Detroit imparted an easier tendency on Tues-

day. Aircraft issues were a firm feature, however, on advice of new Government contracts. By mid-week second thoughts on the Roosevelt speech and the anticipated effect of Government spending on purchasing power led a general rally, led by consumption goods shares. Steel shares were also more buoyant on news of increased activity. *Iron Age* reports current steel mill activity as 48 per cent. of capacity against 45.5 per cent. last week. The improvement is due to the settlement of the coal strike and the heavy booking during the recent price-cutting period.

NOTE.—"Old Basis" includes only public issues and issues to shareholders only. "New Basis" includes all new capital in which permission to deal has been granted.

PUBLIC OFFER

Union of South Africa.—Issue of £5,000,000 3½ per cent. inscribed stock, at 96½. Redeemable at par July 1959, or from 1954 on notice. A Trustee Stock. Proceeds for defence and other public works. Net public debt, March 1938, was £225,000,000; total revenue 1937-38, £82,844,380.

BONUS SHARES

Newton Brothers (Derby).—It is proposed to distribute a 100 per cent. share bonus, which would raise the issued capital to £98,992.

ISSUES TO SHAREHOLDERS ONLY

Lancashire Electric Light and Power.—Issue of 300,000 new £1 ordinary shares at 22s. 6d. to Participating Preference and Ordinary shareholders, in proportion of one in twelve.

Sheepbridge Coal and Iron.—Issue of 133,852 £1 ordinary shares at 30s., in proportion of one new ordinary for ten fully-paid ordinary or preference held, or for 25 preference shares 8s. paid. The company has recently acquired the Babbington Coal Company, which owns five collieries in Derbyshire.

United Sua Betong Rubber Estates.—Issue of 91,553 £1 Ordinary Shares at £2, in proportion of one new share for every £10 of ordinary stock held on April 28th, 1939. As a result of this issue and planting extensions, capitalisation will be about £24 per planted acre.

Timothy Whites and Taylors.—Debtenture and shareholders as at May 19th are invited to subscribe at 99 for £500,000 5 per cent. Debtenture Stock, redeemable on or from December 1943 at 101½, from 1950 at 101, or from 1955 at par. Final repayment, December 1964 at par.

SHORTER COMMENTS

Company Results of the Week.—LONDON COUNTY FREEHOLD AND LEASEHOLD PROPERTIES report some decline in total net revenue, from £602,066 to £585,448, arising from additional voids and increased outgoings, but repairs reserve requires less owing to substantial modernisation provisions in the past. The reduction in UNITED SUA BETONG RUBBER net profits from £219,613 to £142,077 is in accordance with the general experience of rubber companies. Details of the new capital issue for planting have been issued this week. SALTS (SALTAIRE) trading profits are £147,075 against £165,126, while PORRITT & SPENCER pay 10 per cent., earnings for dividend being £84,031 against £90,337. TOBACCO SECURITIES TRUST, whose profits for six months to April 30 total £228,533, report that revenues are substantially the same as for the corresponding period in the previous year. Following the declaration of a £100,000 dividend by Rhodesia Railways, RHODESIA RAILWAYS TRUST net profits amount to £137,272, against £59,018. The railway's gross surplus for 1937-38 was little changed at £1,920,273. Trading profits of DENNY, MOTT & DICKSON are £66,151, against £78,436, but after crediting £10,000 from provisions no longer required, the 6 per cent. dividend is repeated. Total profits of THOMAS & EVANS are increased to £132,310, against £110,963. Sales have been maintained and activities extended.

Standard Bank of South Africa.—Final dividend 7 per cent., plus 2 per cent. bonus, making 14 per cent. for the year to March 31st, against 15 per cent. Premises, £75,000 (same). Pensions, £150,000 (same). Carry forward £169,072 (£170,926).

Primitiva Holdings.—Net profits for the year to April 30th, £81,022 (£80,829). Dividend again 3½ per cent. Reserve, £10,000 (£10,000). Carry forward, £123,297 (£123,286).

"Shell" Transport.—Final dividend, 2½ per cent. tax free, making 20 per cent. tax free for year. Net profits, £6,795,000, against £6,754,330.

Royal Dutch.—Final dividend, 3 per cent., making 17 per cent. for year, as before.

Zinc Corporation.—Participating preference dividend for 1938 is 35 against 62½ per cent. Ordinary dividend 30 against 85 per cent.

Chloride Electrical.—Profits for the year to March 31, 1939, are £324,995 (£435,724). Final dividend 5 per cent., plus bonus 5 per cent. Year's distribution 15 per cent. (20 per cent.).

Wm. Cory.—Net profits for the year to March 31, 1939, £764,310 (£777,338). Final dividend 15 per cent., making 20 per cent. for the year (same).

Denny, Mott & Dickson.—Trading profits for the year to March 31, 1939, £66,151 (£78,436). Add £10,000 from provisions no longer required. Dividend maintained at 6 per cent. Carry forward, £37,213 (£37,209).

Rhodesia Railways Trust.—Total income for the year to March 31, £176,880 (£82,547); tax free dividend again 5 per cent.; tax and N.D.C., £34,843 (£18,651). Contingent reserve, £60,090. Carry forward, £236,481 (£259,587).

City of Moose Jaw.—Sinking fund trustees offer to buy the City's bonds at 37 per cent. of principal value.

Kapong (Malay) Rubber Estates.—At this week's meeting, Sir Francis Voules expressed doubt regarding the advisability of the suggested barter agreement between the British and U.S. Governments, since it involved having a large stock of rubber outside the control of the market.

Harland and Wolff.—Mr F. E. Rebbeck addressing shareholders at this week's meeting, disclosed that new orders for cargo ships under the Government scheme will partly employ the yards at Belfast and Glasgow, but regretted the exclusion of refrigerated tonnage from its provisions.

Witwatersrand Nigel.—The board have decided to erect an initial reduction plant capable of treating 6,000 tons per month. Cash resources are more than adequate to meet the cost and to bring the mine to producing stage early in 1940.

Investors Second General Trust.—The managers (Fifteen Moorgate Unit Trusts) announce that it was decided to close the Trust on May 20, 1939. Sub-units will be available for purchase only if sold back to the management by existing holders.

International Certificates Depository Co.—The Bourses of Basle, Zurich and Geneva have admitted to official quotation the deposit receipts issued by the company of General Motors and Union Carbide and Carbon common shares.

Investment-Trust-Units.—Distribution due May 31st will be at rate of 3.1657d. per unit net after tax, making for year 6.1685d. net, or a gross yield of 5½ 11s. 3d. on current price of 12s. 9d. Progress Report No. 4 shows composition of Fund, and states that 48 companies in which Trust holds equity shares maintained, 5 increased and 16 decreased their dividend, while 3 announced special jubilee bonuses. Total revenue available for equity of the 72 companies was £3,811,039, of which £2,936,174 was distributed.

London County Freehold and Leasehold Properties.—Net revenue for year to March 31, 1939, £626,489 (£640,676). To amortisation, £32,866 (£31,435). To maintenance reserve, £20,000 (£40,000). Loan interest, £210,654 (£205,965). Redemption, £6,259 (£5,954). To N.D.C., £14,000 (£14,000). Preference dividend £28,655 (£28,655). Ordinary dividend 10 per cent., plus bonus 1 per cent., as before per cent., £272,690 (£272,690). To reserve, £30,000 (£30,000). Carry forward raised from £130,852 to £134,042.

National Bank of Australasia.—Net profit for year to March 31, 1939, £351,24 (£347,401). Ordinary dividend maintained at 6 per cent.

(Continued on page 530).

Industry and Trade

Coal-mining Profits.—The output of coal in the first quarter of the current year was nearly 2½ million tons higher than in the last quarter of 1938, but 1.6 million tons less than in the first three months of last year. The improvement over the previous three months was due entirely to an expansion in domestic consumption. Cargo and bunker exports in January-March, at 10.7 million tons, were 1.4 million tons less than in the preceding three months and 633,000 tons less than a year ago. There was little movement in average prices. The Board of Trade index of coal prices in the first quarter of this year was within 0.4 per cent. of that for the preceding quarter, but it was 6 per cent. below the figure for the corresponding period last year. The relations between employers and workmen were not disturbed by any serious disputes, and although many working days were lost in the exporting districts through lack of trade, the aggregate duration in working days of all disputes in progress was only 92,000, against 207,000 in the corresponding period last year. Other factors which have influenced the profits of the industry in the first quarter were, on the one hand, the favourable reactions on costs of the abandonment of some of the older and more difficult mines, the suspension of work in unprofitable working places, and an appreciable rise in the pithead prices in some of the inland districts; on the other hand, there was an increase in the wage bill. The first quarter's joint ascertainment for South Wales and for a few of the smaller districts are not yet available, but those for all the principal English and Scottish coalfields have been published. They show a pithead credit balance of £5.1 millions, compared with £4½ millions for the December quarter and just under £4.9 millions for the corresponding period last year. The following are the comparative returns:—

CREDIT BALANCES OF PRINCIPAL BRITISH COALFIELDS

	March Quarter 1938	Dec. Quarter 1938	March Quarter 1939
Scotland	743,734	917,130	693,757
Northumberland	267,951	224,436	248,195
Durham	524,347	371,139	505,775
Yorkshire	1,104,702	1,019,302	1,317,417
Derbyshire, Notts, Leicester, Cannock Chase & Warwick	1,602,556	1,375,110	1,617,771
Lancs, Cheshire and N. Staffs	630,869	626,478	728,749
	4,874,159	4,533,595	5,111,664

The increase in profits is all the more noteworthy in view of the fact that the changes in wage rates due to fluctuations in the proceeds of the industry are estimated by the Ministry of Labour to have yielded an increase of about £54,000 in the weekly wages of over 500,000 miners. On the assumption that the trading results in South Wales and in the smaller English coalfields were no worse than in the December quarter of 1938, the credit balance for the industry as a whole in January-March was about £5½ millions, compared with just under £5½ millions in the corresponding period of last year.

Dearer Cotton Cloth.—The Central Committee of the Cotton Spinners' and Manufacturers' Association has decided to recommend its members—chiefly cloth manufacturers—to raise their weaving prices in order to cover the expenditure required under the provisions of the Civil Defence Bill and the recent concessions of a minimum wage for weavers and holidays with pay next year. It is stated that these extra charges mean an increase in weaving prices of over 8 per cent. It is estimated that this is equal to an advance in cloth prices of rather more than 2 per cent. The value of the cloth produced in Lancashire last year was about £70 millions; the increase in prices now recommended will result in consumers being asked to pay an additional £1,500,000 per annum on the basis of last year's output.

Wholesale Trade in Textiles.—The Wholesale Textile Association, in collaboration with the Bank of England, has now decided to publish indices of the value of wholesale trade in textiles. Although not all wholesale houses contribute to the returns, the sample is stated to provide a satisfactory indication of the course of sales. In addition to the index relating to total sales, the Wholesale Textile Association is publishing separate figures for domestic and overseas trade. The indices are based on the average monthly sales in 1937, and they are available from June, 1934, onwards. They should prove a useful addition to the list of statistical series available for this country. The index of total sales is given below:—

Index of Wholesale Trade in Textiles (1937 = 100)

	1934	1935	1936	1937	1938	1939
January	56	58	55	52	54	54
February	75	79	85	73	75	75
March	108	116	120	114	116	116
April	106	99	110	99	94	94
May	104	112	97	97	...	...
June	92	87	85	96	83	...
July	67	70	65	67	63	...
August	73	66	70	74	69	...
September	126	127	133	147	125	...
October	131	136	143	130	122	...
November	117	114	118	118	118	...
December	92	101	106	101	105	...
Year	94	96	99	100	93	...

Wholesale trade in textiles shows marked seasonal variations, centring round the spring sales (which reach a peak in March) and the winter sales (which reach their highest level in September and October). Winter sales, however, are usually much heavier than spring business. Between 1934 and 1937, sales rose by 5.3 per cent.; in 1938, however, they fell below the level of the preceding three years. But actual consumption in 1938 is unlikely to have shown as rapid a decline as sales; indeed, the retail trade returns published by the Bank of England show that retailers reduced their stocks last year. From December, 1938, to March, 1939, the indices of wholesale trade were again above the corresponding figures for the preceding year. Last month, however, sales fell below those of April, 1938, a reflection, presumably, of the deterioration in international relations after Germany's annexation of Bohemia and Moravia.

Increased Subsidy for Cereals.—At the end of February the Government announced that additional assistance would be provided to growers of cereals. Under the Agriculture Act of 1937 growers of oats and barley not in receipt of payments under the Wheat Quota Act were, in years when the average price of oats fell beneath 7s. 7d. per cwt., to receive a subsidy at a rate per acre equal to six times the difference between the average price per cwt. received and a standard price of 8s. per cwt., up to a maximum grant of £1 per acre. In the statement made last week the Minister of Agriculture revealed that the Government had decided to increase the subsidy per acre on oats from six to fourteen times the calculated deficiency beneath the standard price of 8s. per cwt., up to a maximum grant of £2 6s. 8d. per acre, and this increase will be applied retrospectively to the 1938 crop. The

Minister announced that discussions were in progress with the brewers and distillers in order to obtain their co-operation in maintaining a satisfactory level of prices for malting barley; it is possible that the example of the hops scheme, under which the brewers have agreed to pay for five years an average price of £9 per cwt. for their requirements, may be followed. For feeding barley, the Government propose to introduce a price insurance scheme related to a maximum amount of 18 million cwt., but in respect of the 1938 crop, growers of barley, whether for malting or feeding, will receive a grant on the same basis as growers of oats. Growers who receive payments from the Wheat Quota are also to be entitled to subsidies in respect of their acreage under oats and barley, but at the reduced rates of the original scheme. The additional cost to the taxpayer of these provisions is estimated at £2,920,000 in respect of the 1938 crop; the maximum liability of the Treasury in respect of the oats subsidy will be limited to £4½ millions per annum. It must be admitted that subsidies of this magnitude are a heavy and not altogether necessary burden on the taxpayer, but as a stimulation to the output of cereals they may partly be justified as war precautions.

Danzig and Gdynia.—The latest statistics suggest that the progress of Gdynia has largely liberated Poland from dependence on Danzig. Of the total value of Polish foreign trade last year 27 per cent. was consigned to, and 11 per cent. was carried by rail through, Greater Germany (including Austria and Czecho-Slovakia). Of the remaining 62 per cent., 47 per cent. passed through Gdynia and 14 per cent. through Danzig, while a mere 1 per cent. was sent by rail to Roumania, Russia and the Baltic States. The rapid growth in the importance of Gdynia is revealed by the following table:—

	POLAND'S FOREIGN TRADE					
	IMPORTS			EXPORTS		
	Percentages via			Percentages via		
	Danzig	Gdynia	Land Frontiers	Danzig	Gdynia	Land Frontiers
	By Weight					
1929	30.6	4.3	65.1	32.6	11.4	56.0
1937	21.7	40.0	38.3	34.1	47.7	18.2
1938	25.2	39.2	35.6	33.0	47.6	19.4
	By Value					
1929	25.5	2.0	72.5	24.9	2.5	72.6
1937	8.0	57.5	34.5	26.4	39.8	33.8
1938	7.5	53.8	38.7	23.5	40.9	35.6

What Danzig has primarily lost is that part of Poland's trade whose value is large in proportion to its weight. In tonnage Danzig has lost less than the construction of a rival port would have led one to expect. The importance of the Free City to Poland to-day is largely due to its position near the mouth of the Vistula. Thus, much of the grain, timber and coal exported through Danzig is brought there by water. These three commodities account for more than 80 per cent. of Polish exports through Danzig. In respect of grain and timber Danzig is still Poland's principal outlet, whilst coal exports amounted to nearly four million tons in 1938, even though those of Gdynia were then six and a half million tons. Poland has an indubitable economic interest in Danzig. Despite the growth of

Gdynia, that port could not conceivably deal with the 5,982,000 tons of goods transported via Danzig in addition to the 8,713,000 tons with which it deals at present.

Firmer Oil Markets.—With the season of maximum consumption now well under way, the American gasoline markets—upon the course of which British petrol prices are largely dependent—have lately shown a firmer tendency. Since the beginning of March, for example, the cheapest grade of U.S. motor gasoline has been advanced in price from 3.625-4.25 to 4.125-4.375 cents per gallon. Despite this improvement, however, gasoline prices, as well as those of other finished products, remain appreciably below the level of a year ago, when the corresponding quotation for motor spirit was 4.25-4.50 cents per gallon. This seems at first sight somewhat surprising, for whereas during the early months of 1938 the American economic machine was still running downhill, it has now climbed an appreciable distance out of the trough of the depression. Unmistakable evidence of the recovery of consumption is provided by the Bureau of Mines' statistics. In January-March, 1939—the latest period for which data are available—domestic gasoline sales advanced by 6.1 per cent. compared with the previous year, to 115 million barrels; exports by 2.8 per cent. to 11 million barrels; and total demand by 5.9 per cent. to 126 millions.

Since these are record figures, prices might have been expected to make a better showing. But the refiners have displayed a tendency to expand their operations in advance of the growth of demand, with the result that stocks have been allowed to accumulate. Although slightly below last year's level, gasoline stocks, at 84,294,000 barrels, are, nevertheless, well in excess of real requirements. To some extent this undesirable development may be traced to local over-production of crude oil—especially in the old producing area of Illinois—which has made it difficult for the refiners to avoid an unnecessary expansion of their runs-to-refiners to avoid an unnecessary expansion of their runs-to-refiners to avoid an unnecessary expansion of their runs-to-refiners. So far as the outlook is concerned, prospects on the stills. So far as the outlook is concerned, prospects on the stills. So far as the outlook is concerned, prospects on the stills. The effects of the general improvement in business activity, the consumption of motor fuel is expected to receive an additional stimulus this year from the international exhibitions at New York and San Francisco. If crude oil production and refinery operations are kept within reasonable bounds, the improvement in American gasoline prices may be expected to continue in coming months; and such an improvement would certainly raise prices on the world market. But the decisive factors for the near future must be sought on the supply side.

Delay in Sugar Negotiations.—According to the statement issued last week by the Executive Committee of the International Sugar Council, the delegations to the Council have agreed to the Committee's proposal that additional quotas amounting to 239,000 metric tons should be allotted to those countries which voluntarily reduced their quotas in July, 1938. The distribution of this amount is as follows:—

	Metric tons
Cuba	72,561
Dominican Republic	20,707
Haiti	2,170
Netherlands	62,606
U.S.S.R.	65,956
Australia	7,500
South Africa	7,500
	239,000

But the fact that these countries are now allowed to export these additional quantities does not necessarily

mean that they are able and willing to do so, and there is some doubt if, for instance, the extra supplies from Russia will become available before the end of the present quota year in September. The Executive Committee has also recommended that the increase in export quotas of 153,265 metric tons, to which the British Dominions and Colonies are entitled next year, should become effective for the current year, but since two delegations have objected to this procedure, the matter has been deferred until a meeting of the Council can be convened, which will not occur before June. One lesson which the events of the last few weeks have made clear is that the present constitution of the Sugar Agreement is far too inflexible and the procedure far too cumbersome to deal efficiently with the fluctuations of the sugar market. If raw material producers are to exercise joint control over the market for their products, that control must be capable of taking important decisions quickly in order to forestall rather than to remedy abrupt changes in market conditions. The fact, however, that some additional supplies will be released before the end of the present season sufficed to bring about a reduction this week in the spot prices for raw sugar on the London market, but the uncertainties about the size of the additional supplies and the probable time of their arrival has confused the market and some of the new quotations are purely nominal.

Dearer Antimony.—The Sino-Japanese war is seriously interfering with the trade in antimony. In past years China has supplied seven-tenths of the world's consumption, but in 1938 Chinese exports amounted to only 77,266 quintals, just over half the weight of antimony exported in 1937. In the first two months of the current year, Chinese exports totalled only 449 quintals, compared with 3,776 quintals in the same period of 1937, and, in addition, the exports consisted entirely of crude antimony. Apart from China, only Mexico, Bolivia, Yugoslavia and Czecho-Slovakia export appreciable quantities of antimony, and although output in the two first countries has increased sharply in recent years, the international market, supported by the armament demand for alloy metals, is still dependent on Chinese supplies. Prices have risen in the last few days, and Chinese regulus is now quoted at £52 10s. per ton against £51 per ton earlier in the month and £50 10s. at the beginning of the year. The rise is likely to continue if Chinese exports remain at their present low level.

THERE is some evidence of a seasonal decline in the activity of a number of industries, though output is generally above last year's level. The latest reports from coal-mining centres point to a seasonal decline in the demand for coal for heating purposes. But output is now appreciably higher than a year ago; the quantity of coal raised during the week ended May 13th was 4,879,300 tons, against 4,594,000 during the corresponding week last year. The iron and steel industry also remains very active and production in the engineering, shipbuilding and other consuming industries remains on the up-grade. Buying of textiles has recently been less heavy, but activity in the cotton and wool textile trades has been well maintained. A survey of the trend of general business activity, as well as details concerning the position of individual industries, will be found in the *Trade Supplement* published with this week's issue of *The Economist*.

Coal

Sheffield.—There is a strong demand for industrial steams, steelworks and engineering establishments taking

Lower Wool Consumption.—The Report of the Imperial Economic Committee on world consumption of wool in the year 1938 provides a wealth of statistical material illustrating the fact that this was a year of abundant supplies but of falling consumption. Estimated available supplies of raw wool in the ten principal consuming countries amounted to 1,610 million lbs. (clean basis)—a fall of 87 million lbs. from the record figure of 1937. The decline was more than accounted for by the reduced purchases of the United States and Japan, and there were actually considerable increases in the United Kingdom, France and Germany. The figures are given in the following table, which is reproduced from the Report:—

ESTIMATED AVAILABLE SUPPLIES OF RAW WOOL IN PRINCIPAL CONSUMING COUNTRIES

(In millions of lbs.—clean basis)

	1928	1934	1935	1936	1937	1938
United Kingdom ..	327	380	388	442	404	442
France	301	216	243	217	209	255
United States	307	246	312	317	393	248
Germany	216	213	189	169	169	209
Soviet Union	280	113	141	159	196	222
Belgium	47	27	52	63	64	62
Japan	59	95	126	116	138	63
Italy	81	98	82	39	67	53
Poland	36	27	32	39	34	40
Czecho-Slovakia ..	24	20	25	30	23	16
Total	1,678	1,435	1,590	1,612	1,697	1,610

The expansion of production which began in 1934-35 was continued, the total for 1937-38 being 78.6 million lbs. higher than in 1936-37 at 3,877.2 million lbs. (greasy basis). The effect of these changes in production and consumption on the price level had spent most of its force at the end of 1937 and there were few fluctuations in the course of 1938. Germany in particular took advantage of the relative cheapness of wool and increased her imports at a more rapid rate than any other country. An increase in the use of substitute fibres in Japan partly accounts for a heavy fall in her wool imports. Manufacturing activity continued to decline, the trade being hampered by stocks of dear goods ordered before the break in wool prices in September, 1937. International trade in wool manufactures fell sharply, affecting severely the United Kingdom, whose exports fell by about 25 per cent. This was by far the heaviest decline for any of the principal exporting countries and represents the least satisfactory feature of the British wool industry at the present time.

INDUSTRIAL REPORTS

heavy deliveries. Demand by public utility concerns and for household fuels shows some diminution. The market in blastfurnace coke is becoming more active, but central heating sorts are rather easier. Export demand is on a broader scale; both Yorkshire and Derbyshire steams are in good demand for South America. Best hards, cobbles and washed trebles are good features. All prices are firm and unchanged.

Newcastle-on-Tyne.—Whilst the coal market in this area remains firm, it is noticeable that certain classes of Durham unscreened coals which were unobtainable at the beginning of the month are now being offered more freely. Production of coal in this area is now approaching the autumn figures of 1937, but colliery holidays with pay which in this area are being spread over the summer months will lead to some reduction, and there is little doubt that in consequence the market will rule firm. Patent oven coke remains a firm market on a good demand from the Scandinavian countries.

Glasgow.—Chiefly as a result of the seasonal slackening of household trade, the market has become quieter this week and for the first time for some months past it has been necessary in one or two cases to curtail production. Industrial demands are keeping up well, and the tonnages moving off on shipping account are well maintained, although it is noticeable that foreign buyers are now displaying some reserve in fixing up new business. The Danish trade has been particularly good. The best market feature is screened steam coal in Fife, which is now about fully booked up until the end of June. Nuts are more plentiful. Prices generally show only minor changes.

Cardiff.—Conditions in the South Wales coal trade remain favourable. Shipments are being maintained at their recently improved level and the forward position of the collieries has been further strengthened by some new long-period contracts. It is reported from France that the replenishment of stocks to meet an emergency has led to the accumulation of large reserves by the

OTARD'S EST. 1795

LIQUEUR BRANDY

MATURED AND BOTTLED AT CHATEAU DE COGNAC

principal industries, but that it is probable that the patent fuel makers will place further business in South Wales for duff coals. For spot positions there is a scarcity of most classes, and exports of anthracite to Canada are reaching their normal seasonal level. There is an active inland demand for industrial coals.

Prices are firm, but on the average they have not been appreciably increased. There is a good market for coke and the patent fuel trade is also active.

★

Workington.—The coal trade is strong, chiefly because of the increase in Irish needs. Shipments from the West Cumberland ports to Ulster and Eire last week reached a total of 12,488 tons, the heaviest recorded for several years. The slackening in the local trade is offset by the better demand for coking coal. The Workington coking plant is operating at capacity for hematite pig iron smelters. Prices are firm.

Iron and Steel

Sheffield.—The market is satisfied with the stabilisation of prices over the four months from June 30th. Although there has been a slight easing of activity this is merely temporary, due chiefly to the impending holiday. Forge and foundry iron are being taken up in limited parcels, and it is thought probable that some announcement concerning their future prices will be made shortly.

Little surprise was caused by the reduction of five shillings per ton in hematite prices, for there are heavy stocks of this material yet to be cleared, and the new figures will doubtless stimulate business. Basic pig continues in heavy demand, but there is little change in the position regarding finished iron.

In the steel market the advance of five shillings per ton in the price of acid billets has had no hampering effect on business, while the call for basic billets is becoming heavier, and deliveries are subject to some delay. There is active business in small bars and wire rods.

Production of steel in Sheffield in April showed a further advance, and output is rapidly reaching capacity. The heavy engineering branches are fully employed, and the rolling mills working for hire are very busy.

★

Middlesbrough.—The demand for supplies of iron and steel by commercial users and by the Government is steadily expanding; the steel makers are doing their utmost to increase production in order to meet requirements. Specifications for shipbuilding steel are increasing, and other departments producing sheets and light sections continue to operate at capacity.

The demand for Cleveland foundry pig iron has not yet improved very much, and requirements are met from stock. East Coast hematite production continues to be equal to the demand; consequently the heavy stocks are not being reduced to any extent. Basic pig iron output is higher but this is all

required for use at the local steelworks.

The demand for heavy steel melting scrap continues and works are prepared to take delivery of any prompt parcels which merchants can offer. Small cargoes continue to arrive from coastal ports and a large cargo of scrap has come into the Tees during this week from New York.

There is no change in the position regarding blast-furnace coke, but imports of foreign ore are higher; the quantity imported up to May 22nd was 124,000 tons, compared with 98,000 tons during the same period in April.

★

Glasgow.—All plants are working to capacity and no effort is being spared in the endeavour to increase output. Specifications for plates and sections have been received for very heavy tonnages while for lighter material demand is also expanding. There is practically no class of material for which demand is not good at the moment, and steel-makers, re-rollers and manufacturers are all overwhelmed with work. The question of future supplies of raw materials is causing anxiety in all branches; users find it impossible to maintain stocks sufficient to meet even normal requirements comfortably.

★

Cardiff.—Active conditions continue in practically all branches of the iron and steel industry in South Wales. All the available pig iron furnaces are in blast, and in the tinplate and sheet re-rolling sections more mills have been brought into operation. In the March quarter the output of tin, terne and blackplates was 184,800 tons, compared with 178,600 tons in the March quarter of 1938, but the expansion in sheet production has been relatively far greater under the pressure of A.R.P. orders, and for the country as a whole the sheet production in the first three months of the year was 117,500 tons, compared with only 41,000 tons a year ago. Current statistics give the still much higher rate of between 225,000 and 250,000 tons per quarter. The question of the revision of tinplate prices is being considered this week by the International Cartel, but it is not expected that there will be any change for the September quarter.

★

Workington.—A marked improvement has taken place in the North-West coast hematite pig iron trade. Users on A.R.P. and re-armament work are not waiting for the price cut to take effect in July and are placing orders freely. Demand is in excess of the make, and substantial reductions of stocks are being effected, the expectation being that by August all the iron accumulated during last year will be cleared. Local absorption is above normal and deliveries to the Midlands, South Wales and Scotland are heavy. Prices are firm.

The outlook in the steel trade is much brighter. Orders on books will keep the rolling mills at Workington and Barrow in engagement for another two months, and in all probability to the end of the summer. Native ore, at 24s. f.o.t., is in better local request.

★

News from Abroad.—Demand on international steel markets has been

very brisk. Owing to very long delivery times for a number of products there is in many cases a scramble for supplies, and higher prices are paid for quick delivery. The price level, although much firmer than several weeks ago, is still subject to pressure from American outsiders, who are as keen as ever to book orders. This is particularly the case for shipbuilding steel. Stocks at producers' and consumers' yards are inadequate, and in some cases steel consumers are encountering difficulties in carrying on with their output programme.

Textiles

Cotton (Manchester).—Raw cotton prices do not show much change on the week, as after a further upward movement there has been an easier tendency. Buyers of yarn and cloth, however, have found prices very firm, chiefly owing to the increase in production costs. The rumour that arrangements have been made between the United States and British Governments for the exchange of 1,000,000 bales of cotton for an equivalent amount of rubber, has caused a good deal of discussion, but the report appears to be premature. It is understood that before the end of this week some official announcement may be made in Washington with regard to the export subsidy. Lancashire spinners continue to be seriously handicapped by the shortage of certain types of American cotton. Generally favourable advices have been received relating to the prospects for the new crop.

Inquiry in the yarn market has shown some improvement. There has been a persistent inquiry in piece goods. The demand for India, after showing signs of falling off, has revived again, and numerous orders have been obtained, especially in light bleachers for Karachi and Calcutta. Two weaving sheds in the Blackburn district have been restarted as a result of the recent substantial buying for India.

★

Wool (Bradford).—The outstanding feature is the remarkable steadiness of wool prices. For months prices have varied little, and it is doubtful if any member of the trade remembers such a long period of comparative stability. Present indications do not point to any important changes yet awhile. It is very doubtful if any profit can be made at current prices for either tops or yarns.

The trade is now dominated by military requirements, and crossbreds naturally figure most prominently. Yet prices are remarkably steady, with little evidence of any immediate change in an upward direction. Practically speaking, the War Office has fixed prices for its requirements. It refuses to pay higher prices, which means that buyers of the requisite wool and its products also cannot pay more.

Woollen and worsted mills throughout the country continue to enjoy a fair measure of activity, and more machinery is being run than at any time this year. It is estimated that machinery is now running at 80 to 85 per cent. of capacity, and there is more confidence among wholesale fabric buyers that the domestic trade in both woollen and worsted fabrics is going to be larger this summer than was previously expected.

(Continued on page 521)

ARGENTINE REPUBLIC

Extracts from the Message to Congress read by the President of the Republic, His Excellency Dr Roberto M. Ortiz, on 11th May, 1939

State finances have naturally felt the consequences of the economic recession due to the drop in income derived from taxes and the smaller amount of savings available for subscription to public funds. Faced with this situation, the executive power had advised Congress that no efforts would be spared in order to reduce the deficit to figures which would prevent any further detrimental consequences. These efforts have been successful. The expenditure to be met by cash payments in 1938, i.e. 995,6 million Argentine paper pesos, barely exceeded income collected by 15 million paper pesos, representing a proportion of only 1.5 per cent. For this it was necessary to make economies amounting to 48,1 million pesos in budget credits approved by the Legislature.

EXPENDITURE TO BE MET BY CASH PAYMENTS (In millions of Argentine paper pesos)

	Expenditure	Income	Deficit
From revenue	949,7	934,7	15,0
From special accounts	45,9	45,9	...
Total	995,6	980,6	15,0

We are aware that in questions of economy it is possible in theory to go much further. In this respect the problem seems relatively simple. But the serious consequences of dealing with this question from one point of view only must not be overlooked. After several years of drastic cuts in expenditure the increase in income as a consequence of new taxes and of economic prosperity enabled the country to satisfy certain necessary requirements with regard to public education, to provide the armed forces of the nation with the means of ensuring that efficiency which must be constantly maintained and to meet many other unavoidable requirements of the public administration. It is sufficient to mention such facts to understand the considerable difficulties which the application of a strict criterion in these fundamental services of the State would entail. It would be possible, of course, to economise in salaries and public service, but this would be at the cost of creating social problems which, as experience has shown, often have much more serious after-effects than a slight adverse balance such as that of the last financial year.

CREDITS AND EXPENSES OF THE 1938 BUDGET TO BE MET BY GENERAL REVENUE (In '000,000 of Argentine paper pesos)

	Credit granted by Law	Expenditure	Economies
General administration.....	12,574	710,4	27,7
Special annuities, pensions and military superannuation payments	738,1	49,1	3,9
State contributions to civil superannuation and maternity funds	53,0	17,3	2,5
Public debt service.....	19,8	170,8	14,0
Total	184,8	947,6	48,1

In order that the results of a judicious policy may not be imperilled, it is essential to observe the strictest moderation in regard to any fresh expenditure, which would perforce entail new or increased taxation. It is therefore advisable to wait for the situation to improve and for the yield from taxes

to increase before satisfying those requirements which, essential though they may seem, admit some reasonable postponement.

Loan Expenditure

Considerations of an economic and social order have also weighed in budgeting the expenditure to be met with the proceeds from loan transactions. The 171,5 million pesos expenditure on public works in 1938 demands the circulation of a considerable volume of purchasing capacity, a sharp drop in which would not only directly affect employees and workmen, but would also have repercussions on home manufacturing activities and the working population. It has, therefore, been essential to act with well-considered judgment. In most cases it has been a question of schedules of work that were being carried out, the suspension of which would have brought about well-known troublesome consequences. In the same way the 65,0 million pesos spent on armaments were due to previous undertakings payable during this financial year.

Total expenses to be covered by bonds amount to 270,4 million paper pesos, including other items which appear in the corresponding table with the two which we have already mentioned.

EXPENSES TO BE MET BY SALE OF BONDS

	'000,000 of paper pesos
Public works	171,5
Armaments	65,0
State contribution to funds	14,9
Grant to national roads department	10,0
Special laws	9,0
Total	270,4

It has been difficult to reduce this total in the financial year 1938, but the reductions which have gradually been made will enable the figure to be kept within the limit of 200 millions for 1939.

The proceeds from bond transactions at home, for the purposes of attending to this expenditure, amounted to 61,6 millions. No doubt considerable quantities of national securities could have been placed when one considers that the absorption of public funds on the market in 1938 amounted to 250 millions. But the Government deliberately abstained from doing this, so as to enable the Stock Exchange to recover from the over-saturation previously experienced, as well as to allow the provinces and municipalities to place on the market the securities required to cover their most urgent requirements.

Foreign Loans

For the purpose of covering the balance of expenditure it has been necessary, therefore, to resort to a two years' transaction with Swiss and Dutch bankers for the sum of 48 million paper pesos; to placing a medium term loan of ten years in New York for a total amount of 73,4 million pesos, of which 23,4 millions were taken for the National Treasury, the rest being for the Municipality of the City of Buenos Ayres. Even so, the Government has had to make temporary use of the resources of the Exchange Profits Fund and the available balance of other Exchequer accounts, enabling the country in this way to keep the floating debt within reasonable limits.

Presidential Message to Argentine Congress—continued

As regards the Exchange Profits Account, its total holdings and investments at December 31st last amounted to 160,4 million pesos, a sum which amply supports the operations of the Grain Regulating Board. By such means the need for negotiating the corresponding bonds has not been avoided, but postponed for better market conditions, and this is but another reason for circumspection when authorising further expenditure to be financed in this way.

The Year's Revenue

The Honourable Congress will observe from the table below that general revenue amounted to 934,7 million paper pesos, which exceeds by 16,1 million pesos the estimated income, but is lower than the previous year by 11,7 million paper pesos. The biggest shrinkage came, as is well known, from Customs dues, which dropped by 29,1 million pesos. On the other hand, income tax increased by 8,4 millions and inland revenue by 3,8 millions; this is without making reference to other changes of less importance, which are to be seen in the table.

GENERAL INCOME COLLECTED DURING THE
FINANCIAL YEARS 1937 AND 1938 AND ESTIMATE
FOR 1938

Item	1937 Collected	1938 difference between			
		Est. revenue	Collected	Collected in 1938 and 1937	Collected and est. for 1938
Customs and port dues	405,8	365,0	376,7	- 29,1	11,7
Unified inland taxes	162,8	162,5	166,6	3,8	4,1
Land tax	30,8	28,1	30,3	- 0,5	2,2
Income tax	99,5	107,5	107,9	8,4	0,4
Sales tax	34,9	33,8	33,6	- 1,3	- 0,2
Stamps	63,1	62,2	62,9	- 0,2	0,7
Patents	3,0	2,4	2,1	- 0,9	- 0,3
Oil and mining royalties and rights	2,4	6,0	7,0	4,6	1,0
Inheritance tax	15,9	16,0	17,2	1,3	1,2
Sundry grants	6,5	6,5	7,3	0,8	0,8
Posts and telegraphs	35,8	40,6	41,3	5,5	0,7
National charity lottery	15,2	16,5	15,4	- 0,2	- 1,1
Miscellaneous income	70,7	71,5	66,4	- 4,3	- 5,1
Total	946,4	918,6	934,7	- 11,7	16,1

It is worthy of mention that expenses not budgeted for scarcely amounted to 2,1 million pesos, of which 1,4 millions were authorised by Cabinet decisions and the rest by special laws.

The movement recorded of the National Consolidated Debt is shown in the following table:—

	Dec. 31, 1937	Dec. 31, 1938
('000,000 of paper pesos)		
External debt	932,5	993,7
Internal debt	2,816,7	2,990,2
	3,749,2	3,983,9
To be deducted:—		
Bonds in Treasury	6,2	132,9
	3,743,0	3,851,0
Provincial debt transferred to the Nation	27,1	45,6
General Total	3,770,1	3,896,6

Of the net increase of 126,5 million pesos, 18,5 millions correspond to debts transferred by Provinces and 54 millions to obligations of the Municipality of the City of Buenos Ayres, for which the country mobilised its own credit, so that of this increase only 54 million pesos remain for national requirements.

Briefly, it has been possible to overcome the difficulties of the Budget year without any undue complications. Judicious economies and the moderate use of credit and of the available resources in different accounts of the nation have made these results possible. The Executive do not anticipate that recourse will have to be made to increased taxation in the event of any possible financial difficulty. Everything leads us to presume that a drop in revenue collections is of a

cyclic character. Should this not be so, there will be time to propose to Congress any solution to meet the situation.

Stock Market Stability Restored

The strict limitation imposed by the Government on the negotiation of bonds and the working of the Securities Commission enabled the Stock market to regain its stability after an experience which will not be repeated. The Executive is prepared to act energetically so that the market shall function methodically without the influence of excessive issues. The market must not be given more than it can absorb. The Stock Exchange must submit to this fundamental principle, and this principle has been able to be imposed by the moral authority of the Committee, since it has no executive power and acts by means of simple recommendations towards a fair and orderly distribution of the transactions of bonds from the various sources of emission. In practice a collaboration of all the forces of the market has made up for the absence of a law governing the question of securities. The result is significant, and should it be considered necessary, the Executive will not hesitate in submitting appropriate measures to Congress.

All this has contributed to the prestige of public credit and to encouraging the confidence of investors, who must at all times be guaranteed the undisturbed possession of Government securities free of all risk. In this connection we must point out the timely intervention in the days of grave international tension last September in order to counteract a dangerous drop of a psychological nature in the stock market by purchasing large quantities of securities, which were sold when calm had been re-established. This intervention in the market thus constitutes a precedent which must be borne in mind should a similar future situation arise.

In the same way, in the matter of currency it has been possible to moderate the extent of fluctuations, thanks to the use of gold and currency reserves which had been accumulated with foresight, without any undesirable contraction in spite of the magnitude of the displacement of funds.

Grain Purchases

The Bank of the Argentine Nation has had to shoulder the financing of the large grain purchases by the Grain Control Board, avoiding any symptoms of monetary tension, thanks to the reserves which this institution had wisely accumulated in Central Bank consolidated bonds.

It has thus been necessary to make ample use of bank resources. But it would be unwise to make them bear the burden of a credit expansion, which might prove of serious consequences. It is absolutely necessary to proceed with all circumspection in this matter.

It is necessary to underline the need of financing purchases of what in accordance with the authority duly conferred by Congress. The Executive have abundant reasons for considering that their decision has helped the economy of the country to escape a severe blow. Opinions may differ on the prices paid. This is not the case with the purchase of the harvest by the board. This board has purchased a considerable part of it, and the agriculturalists are receiving the proceeds. However, the board must sell with restraint, not because they are carrying out a policy of holding up sales, which would be disastrous, but because the receptive capacity of the international market is limited. Forced sales would bring about a rapid fall in prices, since the chief exporting countries are in a position to grant heavy subsidies. It is easy to imagine the fate of producers and the consequences for the national economy in general had the State not intervened in the grain trade.

Exchange Control

The uncertainty which was already being felt in regard to wheat at the end of last year, and the tendency shown

towards a deficit in the balance of payments, due largely to heavy imports paid for by the free exchange market, induced the Executive to make use of the authority granted by Congress to establish a previous exchange permit in that market. Thanks to measures of this nature—in which the Exchange Control Commission efficiently collaborated—the adverse balance will be reduced to an amount which can be covered with a moderate part of the existing monetary reserves, which have been accumulated expressly for this purpose.

The realisation of the purpose of gradually reducing the mechanism of the exchange control must be postponed. It would be absurd to do this in the present circumstances. In the case of any European conflict the mechanism and experience acquired in this respect would be of the utmost importance. It has been, and continues to be, imposed by circumstances, and the country must bear with it as the lesser evil, until the time comes when it can be done away with. This control has been, and continues to be, of utmost necessity for the defence of the balance of payments, the currency, and the protection of our foreign trade. Argentina should not purchase more than what she can pay for in goods. Monetary reserves exist to face transitory instability, but not a chronic deficit in our international accounts. And it is only natural that by the mere force of gravitation our purchases should be directed towards countries which accept payment in kind. Such a procedure is not by any means of a preferential nature, every country may enjoy the same conditions, and they all know that Argentina can absorb enormous quantities of imported goods, providing that her sales abroad duly increase her international purchasing power.

We are not applying doctrines or systems of foreign economic policy. We are simply adopting an attitude which fully agrees with Argentine interests in these times and which we shall continue to uphold.

Foreign Trade

If the great nations, whose economic policy decisively influences world trade were to reduce their Customs duties and lessen their restrictions, events might then permit the choice of a system, and if such were the case there is no doubt Argentina would choose free trade. We are capable of producing increasing quantities of foodstuffs and raw material, and compete successfully in the world markets by reason of quality and low cost. The multilateral system of trade is the one that suits our interests best. It enables purchases to be made in the cheapest market, and it is not difficult to imagine the impetus which our exports would receive, especially our meat, if this sound economic principle were once begun with moderate reductions in those Customs duties which weigh so heavily on our agricultural products.

The policy in regard to exchange, limiting imports to the country's capacity to pay, has enabled national industry to benefit by the consequent demand for goods. It has been possible in this way to keep employment at a satisfactory level which would otherwise have suffered considerably. The country must seek in its own industry all goods that cannot be easily obtained through its foreign trade. Although this is one of the basic principles of our governmental task, we shall not lose sight of the interests of those countries with which we carry on an active and balanced trade.

Revenue Collection Reorganised

The re-organisation of the tax-collecting departments has continued during the year in order to improve and modernise their services for the benefit not only of the Exchequer but of the taxpayer. As regards Customs and receiving offices, Customs Police have been organised with the special task of suppressing smuggling, special attention to be given to the Southern territories.

The general revaluation of landed property in the capital and in the National Territories was finished at the end of last year. Taxpayers have been able to avail themselves of

the right of redress and the property register in the federal jurisdiction contains the true values of properties.

It has been necessary to intervene on several occasions in order to ensure the fulfilment of the Law of Unification of National Internal Taxation. It is hoped that these matters will be settled by common accord between the nation and the corresponding States in accordance with the spirit of law No. 12,139.

During the present ordinary sessions the new Stamps Bill will be submitted once it has been carefully studied by the chief representative bodies who are at present engaged on the task.

Mortgage Problem

With regard to mortgage moratoria, Congress has already established a clear, simple and easily applied system, which, since the last emergency, has facilitated an evident return to the principle of fulfilment of contracts. There is no doubt that the application of the law enables debtors to make arrangements and permits of the gradual payment of their debts, and there are numerous cases of debtors who have privately modified their mortgages on satisfactory terms. The possibility of access by small debtors to the National Mortgage Bank has proved beneficial and the financing of the cases submitted can be easily attended to. As was to be expected, the fundamental efficacy of the referred to law has given the market the assurance of a gradual and orderly liquidation of the mortgage problem, which has contributed towards re-establishing confidence and has enabled this market to function normally once again.

The National Mortgage Bank has played an important part in the preparation and application of the above law without affecting its ordinary functions, which have had to be carried out on a more restricted scale owing to the limitation of the receptive capacity of the securities market.

The Institute for the Mobilisation of Bank Investments has continued to carry out its task of liquidating the credits and property taken over by the banks. Up to the end of 1938 the total liquidation amounted to 52 million paper pesos. Apart from a few transactions of lesser importance which the Institute is studying at the present time, in order to complete the consolidation of small banks, it may be said that it has ended this work of liquidation with which it had been entrusted.

With the collaboration of the insurance companies the Superintendency of Insurance has continued its work with a view to placing operations on the sound lines which experience and technical knowledge advise. The Executive Power will duly submit to Congress a Bill which covers every aspect of the question.

Important operations have continued during the financial year 1938 in regard to the consolidation and transfer of debts of the provinces to the nation, based on the Law of Unification of Internal Debts. At the present time further operations are being studied in order to continue the programme which has been adopted, apart from solving the serious problems with which certain provinces have been faced, and which have also strengthened public credit in general.

Latin American Co-operation

At the initiative of the Government of the Republic of Uruguay, at the beginning of this year a conference of the Ministers of Finance of Brazil, Uruguay, Paraguay and Argentina was held at Montevideo. The conference, inspired with a practical sense and the spirit of collaboration, came to an agreement regarding important measures for the suppression of smuggling and clandestine passenger traffic. These measures have just been made effective by the Governments of Uruguay and Argentina. In economic and monetary matters they settled the bases for the closest co-operation between the countries mentioned with a view to expanding their mutual trade. Based on the principles approved at this conference, the Argentine Government had the satisfaction a short time ago of making the first exchange arrangements with Brazil, from which beneficial results are expected to accrue for both countries.

COMPANY MEETINGS

ROYAL INSURANCE COMPANY, LIMITED

94TH ANNUAL MEETING

SATISFACTORY RESULTS

FRESH RECORDS IN LIFE DEPARTMENT

STRONG FINANCIAL POSITION

REDUCTION OF UNCALLED LIABILITY ON SHARES

The ninety-fourth annual general meeting of the shareholders of the Royal Insurance Company, Limited, was held, on the 22nd instant, in Liverpool.

Mr A. Kentish Barnes, a deputy-chairman of the company, who presided at the meeting, said: My Lord, ladies and gentlemen, it is with the deepest regret that I have to announce the death only a few days ago of Mr Arthur Edward Pattinson, the chairman of the company. The speech which he was to have delivered to-day has been printed and circulated amongst you, and, as a tribute to his memory, I propose that on this occasion we should depart from our usual practice of reading the speech.

Mr Pattinson was appointed a director in 1917. He became a deputy-chairman in 1927, and for the past five years has been our chairman. Mr. Pattinson always took the deepest interest in all that pertained to the welfare of the company, and he brought to bear upon all our problems a wealth of knowledge and understanding. His great ability was happily combined with a broad humanity and a friendliness which everyone appreciated. He has been taken from us very suddenly. Up to Thursday, May 11th, he attended at this office to the daily business of the company, and after a very brief illness passed to his rest on the morning of Thursday, May 18th. We shall miss him in the councils of the company more than I can tell you. We owe to him a great deal for his services, and for the able way he led us and presided over the board, and I would like to ask you to stand for a moment in silence as a mark of esteem and affection to him and to his memory.

The chairman's address embodied the following:—

FIRE DEPARTMENT

In the fire department, premiums, at £5,429,000, are a shade lower than for 1937, whilst losses showed a slight advance to £2,317,000, representing 42.7 per cent. of the premiums, as compared with 40.4 per cent. in 1937. A profit of approximately £512,000 has been transferred to profit and loss account after providing the usual 40 per cent. reserve. The fire fund amounts to £5,671,000.

Our home business showed a slight increase in premiums, but losses were slightly heavier.

In the United States our fire business again showed gratifying results. Premiums were slightly lower, largely owing to trade conditions in the early part of the year. Towards the close of the year, however, there were welcome signs of increased activity, which will no doubt be stimulated by the important trade agreement recently concluded with Great Britain, and we look forward with every confidence to further progress. Meanwhile, various desirable lines of supplementary cover have been energetically developed and have afforded some offset to the reduced volume of ordinary fire business.

There were no serious conflagrations during the year, but the incidence of losses, although not excessive, was somewhat higher than in 1937. This upturn in the loss figures follows a five-year period of unusually low fire loss ratios, which have been responsible for a progressive reduction in rates, and the average rate is now lower than at any previous time in the history of fire insurance in the United States. Any increase in losses, therefore, has to be carried on a more slender premium basis, and proves a stringent test of underwriting. It is all the more creditable that our own business has yielded results well above the average—a tribute to the foresight and skill with which our affairs are handled by our United States manager, Mr Harold Warner, and his colleagues.

In Canada, premiums show some contraction, while losses were slightly higher. Nevertheless, we realised a profit which, if not up to the previous year's standard, is satisfactory.

Our business in Australia and New Zealand continues to show good results, and we are indebted to our management there for the care and zeal displayed in furthering our interests.

In the general foreign field, despite restrictive influences which continue unabated, we have maintained our business and shown a satisfactory profit.

LIFE DEPARTMENT

During the past year our new life business has been well maintained both at home and abroad, the net new sums assured having amounted to £5,176,000, which represents a small advance on the previous year.

The life premium income for the year amounted to £2,106,000, and shows an expansion of £69,000 as compared with the previous year.

Claims by death were greater by £83,000 and amounted to £790,000. Surrenders for the year at £237,000 were also higher than in 1937. The combined total of the life assurance and annuity funds amounted to £29,981,000, showing an increase of £1,153,000 over 1937.

Interim bonuses at the rate of 45s. per cent. per annum on the sum assured are being paid on participating life policies becoming claims by death or maturity during the current year.

Those who have preferred Stock Exchange securities for the investment of their savings would do well at the present time to consider the counter attractions of life policies as an alternative form of investment. Stock Exchange securities cannot avoid the ever-present risk of capital depreciation, whilst the interest yield obtained is subject to substantial reduction on account of the present high rate of income tax. On the other hand, our life policies give a capital sum at death or maturity, which is entirely free from risk of depreciation. As the premiums carry a substantial income tax relief for the policyholder, a high rate of income tax makes a life policy especially attractive as a means of saving. In addition to all this there is the invaluable benefit of life assurance.

ACCIDENT AND GENERAL DEPARTMENTS

The premium income in the accident and general departments shows a further advance and, at £6,030,000, creates a fresh record. The underwriting profit of £566,000 also constitutes a record, and the ratio to premiums of 9.4 per cent. must be regarded as satisfactory.

The results of our American casualty business were specially gratifying.

Our general foreign business has continued to make steady progress.

Of our home business, motor insurance constitutes the largest section, and a moderate increase in premiums is reported. There has been no relaxation in our strict standard of underwriting, but, despite this, the ratio of profit has been somewhat lower.

The fears I expressed last year in regard to the rising average cost of motor claims have unfortunately proved to be well founded. This figure has increased very considerably during the last few years and still tends to rise. Amounts which would previously have been regarded as fantastic are now not infrequently awarded. Although third party insurance is compulsory for motorists, and it is the fact therefore that an insurance company will be expected to discharge the motorist's liability, it should be realised that the motorist ultimately pays, and, if the present experience persists, there would seem to be little hope of avoiding an increase in the premiums for this class of business.

Workmen's compensation business continues to show steady expansion, but it is only with considerable difficulty that we are able to

secure any margin of profit, the ratio being slightly less than that of last year. As you are probably aware, the whole subject of the system of compensation for accidents due to employment is under consideration by a Royal Commission, and it is gratifying to us that one of our general managers, Mr F. J. Williams, has been appointed to serve as a member of the Commission.

MARINE DEPARTMENT

Our marine account for the year 1937 has closed with a loss of £46,400, against a profit on the 1936 account of £40,900. This result will not, I think, come as a surprise to you, as in referring to this department of our operations last year I indicated that the situation as regards the 1937 account was not a favourable one; 1937 has been an unsatisfactory year for marine insurance generally, and has resulted in heavy losses to marine underwriters both at home and abroad.

The question naturally arises as to what is being done to improve the position, and I would refer again with satisfaction to the efforts which have been, and are being, made by the Joint Hull Committee to improve the Hull insurance business. The re-armament programme, as we all know, brought about a large increase in the cost of hull repairs, and we were consequently faced with much heavier liabilities on a business which was already underrated. The upward adjustment of hull rates, which had become urgently necessary, was undertaken by the Joint Hull Committee, and the movement is being well supported. The effect of rate adjustments in connection with hull insurance is not immediately apparent, but there is every reason to believe that what has been done will reflect favourably on later accounts.

The cargo position has been largely obscured by the inclusion of war risk in the cargo premiums. The special arrangements which are now being made for the treatment of war risks will involve the separation, to a large extent, of war and cargo premiums. This will necessarily bring into evidence the meagre rates which, under the stress of competition, are now current for much of the cargo business, and I hope this will lead to efforts being made to improve the position.

Our 1938 account shows an increased premium, and the amount carried forward represents a better percentage than we had on the 1937 account. I hope that we shall be able to show a favourable result on the 1938 account.

PROFIT AND LOSS ACCOUNT

Turning to the profit and loss account, you will observe that the total underwriting profit from all departments amounts to £1,082,000. There was a fall of £46,000 in the amount of interest, this reduction being partly due to the increase in the standard rate of income tax.

The amount transferred in respect of the staff superannuation funds is £204,000, as compared with £153,000 last year, whilst income tax and N.D.C. require £250,000, against £285,000. The only other item to which I would draw attention is the transfer to uncalled capital reduction fund of £699,991 5s., and a formal resolution with regard to its disposal will be submitted to you at the extraordinary general meeting to be held immediately after the conclusion of this meeting. Your directors have constantly had before them the possibility of further reducing the uncalled liability on the shares as the growth of the company's funds renders such a course both feasible and justifiable having regard to the requirements for the provision of substantial reserves in the various departments of our business. After careful consideration the directors feel that they are free to recommend you to use for that purpose £699,991 5s. of the undivided net profits of the company to be devoted to payment of 2s. 6d. per share of the uncalled capital.

The balance carried forward amounts to £2,106,000. You will already have been made aware of our intention to propose to you a final dividend of 3s. 3d. per share, which with the interim dividend of a like amount paid in November last makes a total of 6s. 6d. for the year 1938, the same figure as for the previous year.

DOUBLE TAXATION

The burden of double taxation is a serious question for companies like ourselves with world-wide connections, and I am pleased to observe that the need for action in the matter has again been brought to the attention of the responsible authorities. Even in the case of our activities in the British Empire, the existing provisions do not, by any means, relieve us of double taxation, and the burden is, of course, more severe in our operations in the foreign field. The main difficulty in the way of reciprocal agreements with foreign countries is no doubt the question of cost, which naturally weighs heavily at a time like the present. I believe, however, that the general recognition of the principles, already admitted by the Government in the

case of income from the Empire, as well as from shipping, air transport and agency activities, would be a factor in the expansion of international trade, which would go a long way to pay for the greater part, if not all, of the cost of the additional relief. This is apart from the major benefits which development of international trade would bring, not only in the economic but also in the political sphere.

REDEMPTION OF DEBENTURE STOCK

The company's 4 per cent. debenture stock, which stands in the present balance sheet at £576,000, was redeemable on January 1st this year, and, with the exception of a few small items amounting to less than £1,500, the holders of which have not yet completed the necessary formalities, the whole of this sum has now been repaid.

SUPERANNUATION FUNDS

During the past year we have had under review the arrangements relating to the superannuation funds of the company, and it was decided to set up a trust and to transfer the funds under this trust to the chairman and deputy-chairman of the board of directors as trustees. The trust was duly approved by the Commissioners of Inland Revenue towards the close of last year, and you will observe that the superannuation funds no longer appear in the balance sheets of the company.

The results of this change are twofold. The establishment of the pension fund under a trust is of obvious advantage to the staff, whilst the tax relief obtainable under the Finance Acts is substantially increased under the revised arrangement.

INVESTMENTS

The events of the past year have had their inevitable effect on the value of our investments, and we have been unable to escape a depreciation in the market value. Notwithstanding this, I am pleased to say that at the end of 1938 the market values in the aggregate were substantially above the book values.

The report and accounts were adopted, and a final dividend of 3s. 3d. per share was declared, making 6s. 6d. per share, less income tax, for 1938.

An extraordinary general meeting of the shareholders of the Royal Insurance Company, Limited, was held immediately following the annual general meeting.

At this, the proposal to apply the sum of £699,991 5s. to reduce the uncalled liability on the shares, so that the amount paid-up on each share would be increased to 12s. 6d., leaving the sum of 7s. 6d. per share uncalled, was unanimously approved.

It was mentioned that it would not be necessary for the change in the amount paid-up to be endorsed on the share certificates. If, however, any shareholder particularly wished to have the alteration recorded, the certificates could be sent to the company, when the appropriate endorsement would be made thereon.

UNITED SUMATRA RUBBER ESTATES, LIMITED

IMPROVED ESTATE CONDITIONS

The thirtieth annual ordinary general meeting was held, on the 19th instant, of the United Sumatra Rubber Estates, Limited, at the offices of the company, 17 Mincing Lane, London, Mr A. P. Hadow presiding.

In moving the adoption of the report and the dividend of 1½ per cent., the chairman said the trading profit on rubber showed a very considerable decline compared with the previous season. The trading profit from rubber was £3,310, and there was a trading loss of £1,055 on copra, the net average price of which fell from £11 0s. 8d. per ton in 1937 to £6 7s. 6d. for 1938. Referring to the financial position, he said it was strong. There was no heavy expenditure to face, and it was on that account that the small dividend was recommended. He had visited the estates in December of last year and again in February this year. He found there a real improvement in the cultivation. On Seraph, their largest estate, the drainage was probably better than it had been in the history of the company. The appearance of the rubber and coconuts was quite satisfactory.

For the current year they had been given a standard production of 754,646 lb., which was slightly higher than for 1938, and, assuming that the increased quota of 55 per cent. recently announced for the July-September quarter was maintained for the remainder of the year, the exportable crop for 1939 should be about 400,000 lb. No forward sales had been made. The course of the market for rubber was very difficult to predict. Ordinary conditions did not prevail, and until the international political situation improved one could only go on hoping for the best.

The resolution was carried unanimously

UNION CORPORATION, LIMITED

THE GOLD MINING INDUSTRY

BURDEN OF HEAVY TAXATION

MR P. M. ANDERSON'S REVIEW

The ordinary general meeting of shareholders of the Union Corporation, Limited, was held in Johannesburg on the 10th instant. Mr P. M. Anderson presided.

The Chairman, in the course of his remarks, said:—The net profit for the past year amounted to £611,535, which compares with £682,855 for 1937. Having regard to the international uncertainties of the year and the consequent dislocation of business, I think you will agree that the profit was satisfactory.

A final dividend of 5s. 6d. per share has been declared, making, with the interim of 2s. 6d., a total of 8s., or £616,000. The amount carried forward to 1939—namely, £124,340—shows a slight reduction of £4,465. Although the dividend was 6d. per share less than last year, it was paid on an increased capital, and hence absorbed £21,000 more than the 1937 payment.

Before payment of the dividend we were able to settle finally with the British Inland Revenue authorities the amount of Dominion income tax relief to be allowed for the years 1928-33. As a consequence there is available accrued arrears of Dominion relief amounting to 2s. 5½d. in the £. Following the usual procedure, this additional relief will be passed on to shareholders with the payment of our final dividend for last year—and will save shareholders about 8d. a share in British income tax.

GENERAL RESERVE £2,000,000

The general reserve of the Corporation remains at £2,000,000. Exploration expenses for the year, amounting to £51,246, were charged directly to exploration reserve account—as foreshadowed in the directors' report last year and in my remarks at our last annual meeting. A handsome balance of £203,837 remains to be carried forward on exploration reserve account.

As shareholders in Grootvlei Proprietary Mines and Van Dyk Consolidated Mines, we exercised our right to subscribe for our proportion of the new issues of those two companies last year, and we have thus substantially augmented our important interest in them. Early in this year the directors of Marievale Consolidated Mines decided to increase the issued capital of that company to the full amount authorised, and the new shares were disposed of in accordance with the flotation agreement, which accorded the corporation and its associates certain preferential rights of subscription concurrently with any offer to shareholders. As a consequence of exercising our rights as preferential subscribers and as shareholders, our interest in this company also has been materially increased during the current year.

The response by the shareholders of these three companies to the new issues was highly satisfactory, and I feel sure you will agree that, under present circumstances, the companies were well advised to raise, before the present difficult times, the further funds required for their respective programmes.

INCREASED SHARE AND DEBENTURE HOLDINGS

In my address last year I anticipated that our share and debenture holdings would be materially increased. At the end of the year they had reached a total of £3,390,447 in our books. The increase amounted, therefore, to £617,241, largely as a consequence of our subscribing for additional shares in the Grootvlei and Van Dyk companies. In spite of this heavy new investment, the financial position of the Corporation remains a strong one.

After reviewing the Witwatersrand gold-mining industry as a whole, the Chairman then proceeded:—It is noteworthy that the aggregate profit for the Rand industry as a whole is substantially less than the amount which accrues to it in respect of the increased price of gold above the old standard of 85s. per ounce; and, further, that the profit per ton milled in 1938 is higher than the profit per ton in 1932 by 3s. 5d. The allocation of this surplus is interesting in that one-third of it went to shareholders as additional dividend while about two-thirds was absorbed in extra taxation.

TAXATION

Taken as a whole, the conglomerate beds of the Rand which constitute its ore are, and always have been, classed as relatively low

grade. The prosperity of the industry and its usefulness to the country are greatly enhanced by the ability to mine the resources of low-grade ore on a large scale and over a long period, the former in order to achieve economy in working and the latter to make bearable the amortisation of heavy capital expenditure. In these circumstances it seems a short-sighted policy to impose taxation on a scale as severe as that in force at present. It is on a scale that might be justified in the case of industries where the capitalisation is small and the return thereon relatively high; but the gold-mining industry is not in this category as it requires £3,000,000 or more of capital funds to bring one deep-level mine to full production, yet a higher scale of taxation is imposed on it than on any other industry in the country.

POSITION OF NEW MINES

The establishment of new mines is in any event a speculative business, one cannot expect 100 per cent. successes, and directly or indirectly the industry as a whole must bear the burden of failures. The levying of severe taxation further reduces the prospective return on outlay and may even reach a point where capital ceases to be attracted. Quite apart from the interests of shareholders in existing mines, if this industry is to continue over a long period new mines must take the place of those that become worked out.

There are to-day a number of ventures in the developing stage that require further funds, but their shares are quoted on the Stock Exchange below par and it will therefore be difficult, if indeed possible, to procure additional capital for them. No doubt many causes contribute to this prospect, but the general depressing effect of taxation is not the least of them. Even if the investor's aversion to placing his money where taxation is heavy were purely psychological, it would be unwise to ignore the warnings and protests that have been made from responsible quarters.

LARGER NUMBER OF EUROPEANS EMPLOYED

The number of Europeans employed by the mines at the end of the year was about 41,000, or nearly 3,000 more than at the end of 1937. The relations between employers and employees during the year remained satisfactory. Additional benefits were granted to European employees by the inauguration of a savings fund at a total cost to the industry of approximately £500,000 per annum, thus bringing the total benefits other than normal increases in wages to about £2,500,000 per annum.

The Chairman then reviewed the main features of the operating results of the gold-mining companies on the Witwatersrand under the administration of the corporation—namely, the Modderfontein Deep Levels, Limited (in liquidation), Geduld Proprietary Mines, Limited, East Geduld Mines, Limited, the Grootvlei Proprietary Mines, Limited, Marievale Consolidated Mines, Limited, and Van Dyk Consolidated Mines, Limited—and also dealt with the affairs of the Witthok Proprietary Company, Limited, and later those of South African Pulp and Paper Industries, Limited, all of which were fully reviewed in the addresses from the chair at the respective annual meetings held recently. He then proceeded:—

ORANGE FREE STATE AND SOUTH-WESTERN TRANSVAAL

Of the ground taken up under option some years ago, only the area in which encouraging gold values were disclosed by borholes in 1936 and 1937 is being retained for further investigation. This area is situated in the northern portion of the Orange Free State and adjoins the property of the Western Reefs Exploration and Development Company. During last year an extensive area in the Orange Free State, situated south of the Sand River, was acquired under option, and geological and geophysical investigations as well as drilling operations are being carried out with the object of locating gold-bearing horizons. The Western Holdings, Limited, with whom the corporation is collaborating, is carrying out similar work in an area north of the Sand River, and drilling operations have disclosed some excellent gold values beneath the Ventersdorp System. The

indications are that the geological structures north and south of the Sand River are similar.

OTHER INTERESTS

San Francisco Mines of Mexico passed through a difficult year. The political and economic atmosphere of Mexico was adverse to foreign-owned enterprise, although I am glad to say that recently there have been some signs of improvement in this regard. On the other hand, developments in depth at the mine continue to disclose ore of excellent grade and width, and if metal prices and operating conditions improve the company may well again give a good account of itself.

As you are aware, our copper interests are mainly represented by our shareholdings in Roan Antelope Copper Mines and Rhodesian Selection Trust. Although copper prices were at a low level during 1938, the earnings of these two companies were substantial, and the revenue derived during the year by the corporation from its shareholdings was accordingly satisfactory. The long-term outlook for these Rhodesian copper mines continues favourable.

The results of Bay Hill Trust must be considered satisfactory, having regard to the adverse reaction of the international tension on business and security prices.

The Chairman then moved the adoption of the report and accounts, which was duly seconded by Mr C. T. Pott, assistant managing director of the corporation, who is at present on a visit to South Africa from England, and carried unanimously.

TELEPHONE MANUFACTURING COMPANY, LIMITED

RECORD ORDER BOOK

The ninth annual general meeting of Telephone Manufacturing Company, Limited, was held, on the 22nd instant, in London.

Mr Fred T. Jackson (chairman and managing director) said that the net profit amounted to £40,542, as compared with £40,016 for the previous year. An interim dividend of 2½ per cent. had already been paid, and the directors now recommended a final dividend of 6½ per cent., less income tax.

The past year had been one of great development, and particularly during the last few months of the year, which would have a very important bearing on the future profit-earning capacity of the company. It had been necessary to change over the output of the factory from the mass production of telephone apparatus to armament work.

Intensive research and development work had been carried on with a view to placing the company in the front rank of their particular industry. The importance of this work had been recognised by a very large company in their own line of business, as a result of which they had been able to enter into an agreement with this firm for a period of years to distribute throughout the world the whole of the special apparatus manufactured by the company. The directors felt so confident of future demand for the company's apparatus that they had purchased a factory site out of London to cope with the contracts which they anticipated would mature when re-armament was finished.

At the end of the year the company had a record order book, and during the first three months of this year the contracts secured for future delivery were 108 per cent. in advance of the contracts secured in the first three months of 1938. It would, therefore, be appreciated that they could certainly look forward to a prosperous 1939 and 1940, which would not be affected to any extent by intensification of international complications.

It was proposed to increase the authorised capital of the company to £500,000, but no immediate issue of further shares would be made. Every one of the manufacturing departments had made progress during the year. The marine department had orders in hand showing an increase of no less than 105 per cent. compared with the same period in 1938. The condenser department was making considerable progress and was contributing its quota of profit. The clock department had increased its sales by 130 per cent. The plastic moulding department had also increased its output very considerably.

The report was unanimously adopted and the proposed increase of capital was approved.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to the Reporting Manager of THE ECONOMIST, 8 Boulevard Street, Fleet Street, London, E.C.4.

SUN INSURANCE OFFICE, LIMITED

EXCELLENT RESULTS OF 229TH YEAR OF OPERATIONS

The Annual General Meeting of the Sun Insurance Office, Limited, was held, on the 23rd instant, at its Head Office in London.

Sir William H. Goschen, K.B.E., in referring to the complexity of the problems which confronted insurance companies such as the Sun transacting a world-wide business, said that the year 1938 was marked by growing world unrest coupled with intensive re-armament. Such indeed had been the continued tension that the international situation had become a dominating influence in finance and industry. He felt that in view of the troubled times through which they had been passing the results of the past year as shown in the accounts were extremely gratifying. He was able to report a further expansion of premium in fire, accident and marine branches with the record aggregate net premium income of £4,730,456.

An amendment had been made in 1938 in the provisions of the Finance Act relating to National Defence Contribution by which a portion of the interest from the investment of funds of insurance companies transacting a general business had been excluded from the operation of this tax.

By the provisions of the Fire Brigades Act, 1938, the principle had been established that fire protection was a duty which the community owed to itself and that, as a public service, it should be paid for by all and be available to all without charge.

The statement by the Chancellor of the Exchequer in January confirmed the view of the companies that the risk of war to property on land was not in modern conditions an insurable proposition. The companies were, however, prepared to lend to His Majesty's Government any assistance in their power in the operation of any plans which they might see fit to inaugurate.

FIRE AND ACCIDENT ACCOUNTS

In the Fire account the net premiums increased by £24,884 to £2,258,755. Whilst the loss experienced at home was not so favourable as in 1937 the aggregate underwriting profit from the whole account amounted to £255,303, showing a ratio of 11.27 per cent. to earned premiums.

Premium income in the Accident account rose by £25,226 to £1,885,269, a substantial increase in business at home being offset by a decline in the premium income from the United States of America where the Sun Indemnity Co. of New York had had the best year, so far as underwriting profit was concerned, in the history of that company. Excepting one small section all branches had contributed to the highest figure ever transferred in the Accident account, namely, £159,343. The ratio of underwriting profit to earned premium was 8.54 per cent.

The publicity given to the heavy damages awarded to third parties had shown the importance of insurance protection and had resulted in an increased demand for General Third Party Liability insurance. The full effect had been felt in 1938 of the House of Lords decision in the case of *Rose v. Ford* and as a result of this and certain other factors the already narrow margin of profit on Motor insurance had been almost eliminated.

MARINE MARKET

Marine premiums showed a small increase for the year at £586,431. The Marine market passed from time to time through a period when unsatisfactory results were obtained. The year 1937 was one such period and the figures largely reflected the running off of the 1937 account. It had been felt prudent to make no transfer to Profit and Loss other than the interest on the fund which now stood at £1,017,706.

Of the total transfer to the Profit and Loss Account of £678,027, the sum of £576,353 came from the three revenue accounts; £100,000 had been transferred to the Pension Fund which in the interests of the staff had now been vested in Trustees under an irrevocable Trust Deed. Notwithstanding a satisfactory margin between the book values and market values of the securities held by the office it had been decided in view of the uncertainty of present conditions to write down the book value of investments by £150,000 and at the same time to write down House Property values by £50,000.

The Board recommended a final dividend of 1s. 6d. per share less income tax, the same as in 1938. Despite a fall of some £11,000 due mainly to reduced income from United States investments, the net income from investments at £260,007 well exceeded the total dividend cost for the year.

The report was adopted.

BRITISH AND CHINESE
CORPORATION, LIMITED

MR D. G. M. BERNARD'S SURVEY

The forty-first ordinary general meeting of The British and Chinese Corporation, Limited, was held, on the 24th instant, at 3 Lombard Street, E.C.

Mr D. G. M. Bernard (the chairman of the company), who presided, said: When I addressed you a year ago I spoke of the deplorable effect of the Sino-Japanese war which had been in progress about nine months. Since then hostilities have spread over a much wider area, and extensive damage has been done by air raids to cities far removed from the actual scene of hostilities.

The Chinese Government is pressing forward new construction in areas under its control. With French interests it is building a railway from Lungchow, on the Indo-China border, to Nanning as a section of a railway from Hanoi, in Indo-China, to the Canton-Hankow Railway via Kweilin. This railway will be of great value in maintaining the Government's communication with the outside world now that Japan holds all the principal ports.

Another railway which the Chinese are anxious to build is from Szechuan to Burma via Yunnanfu. This line, about 1,100 miles long, is intended to connect the provinces of Yunnan and Szechuan with the railway from Yunnanfu to Haiphong in French Indo-China and the Burma railway at Lashio. This corporation, together with a French financial group and the China Development Finance Corporation, have been interested in the project, and early this year despatched representatives to Chungking to discuss the matter with the Chinese Government and endeavour to evolve a scheme by which the finance could be provided to construct the railway.

SHANGHAI-NANKING AND SHANGHAI-HANGCHOW-NINGPO
RAILWAYS

Although the Shanghai-Nanking Railway has now been operating normally for a considerable time under Japanese control, the Japanese officials have persistently refused to allow the representatives of the bondholders to exercise any of their lawful rights in the management of the line or even to inspect it. They have continued to operate the railway in contravention of the terms of the loan agreement, and have appropriated the revenue which rightly belongs to the bondholders. It is the same with the Shanghai Hangchow section of the Shanghai-Hangchow-Ningpo Railway. The Japanese army's cynical disregard of the bondholders' rights is indicated by the recent report that a Sino-Japanese company, called the Central China Railway Company, with capital said to be subscribed by Japanese interests and the Nanking "Re-formed Government" in equal shares, has been formed to operate these lines.

The Chinese Government has expressed its inability to accept responsibility for the financial obligations of the railways which have fallen entirely into Japanese hands and, as no revenues of the railways are available, the loan services are in default.

On the Shanghai-Nanking Railway five half-yearly coupons amounting to £348,000, and nine instalments of amortisation amounting to £1,044,000 are at present in arrear, a total of £1,392,000. Of the Shanghai-Hangchow-Ningpo Railway Completion Loan two interest coupons amounting to £66,000 are in arrear.

The annual reports of these two railways for the year ended June 30, 1937, have been compiled in abridged form, and show that these lines were in a very prosperous condition at the time of the outbreak of hostilities.

CANTON-KOWLOON RAILWAY

When Canton was occupied on October 21st the whole of the Chinese section of the Canton-Kowloon Railway fell into the hands of the Japanese forces. They adopted the same policy as in Shanghai and refused access to the line to the railway officials for inspection or for resumption of working.

Before the Chinese evacuated the railway they removed as much as possible of the rolling stock. Four of the major bridges were destroyed, three of the large spans of the bridges over the East River were dynamited and dropped into the river. The terminal station at Canton was damaged and looted. It is estimated that the damage thus caused but excluding the damage to the major bridges would cost \$1,300,000 to make good.

Previous to the Japanese occupation of Canton the railway had been prospering and the monthly payments for the loan service reserve account had been resumed. Simultaneously with the fall of Canton, a special emergency committee, which was prepared beforehand, was formed. This committee consists of representatives

of the joint agents of the corporation together with the engineer-in-chief and the chief accountant. It is in control of the nucleus staff which has been retained as on the Shanghai-Nanking Railway. It also holds the funds of the railway and safeguards as far as possible in the circumstances the interests of the railway and the bondholders.

PEKING-MUKDEN RAILWAY

This line continues to be under Japanese control and the British officials are not permitted to exercise any authority. Even the name of the railway has been changed, and the Japanese now call it the "Tientsin Railway." The conditions of the loan agreement are ignored: a Chinese accountant has taken over the work of the British chief accountant and the earnings are paid into a Japanese bank. The service of the 1898 loan has been met as usual, but no payments have been made since August, 1937, towards the area of the Shanghai-Fengching Railway Mortgage Redemption loan.

In surveying the appalling situation in the country to-day, it is sad to reflect that before the hostilities broke out in August, 1937, China had entered upon a period of prosperity not experienced for a generation, and the outlook for railway enterprise was most promising. However, let us take comfort in the fact that China has marvellous recuperative powers, and when hostilities are over it will only need one or two good harvests to put the nation once more on the road to prosperity. To hasten that recovery it will be essential for China to receive assistance from abroad in both money and materials to restore her railway communications, and trust this country will be found ready to play its part in the reconstruction.

THE CAPITAL POSITION

At our meeting last year I referred to the question of increasing the amount paid up on the corporation's shares by capitalising a portion of the reserves, and I mentioned that power to do this would be taken in the new articles of association then being prepared. These articles were duly adopted at an extraordinary general meeting of the company last summer. However, I feel sure you will agree that the time has not yet arrived when we can draw upon our reserves for this purpose.

The report and accounts were unanimously adopted.

HAMBROS BANK, LIMITED

EARNING POWER MAINTAINED

The twenty-seventh annual meeting of Hambros Bank, Limited, was held, on the 25th instant, in London.

Mr R. Olaf Hambro, the chairman, who presided, first expressed deep regret at the death of Mr K. A. Wallenberg, an outstanding character in the political and economic life of Sweden, and a good and loyal friend to this country. To fill the vacancy on board they had appointed Mr Axel Wallenberg, who brought considerable knowledge of industry and international commerce, and preserved the valued connection with the Wallenberg family.

Thanking all those friends all over the world who had sent kind messages on the centenary year of the bank, he said it was quite clear that the expansion of their activities depended largely on peaceful international conditions, and in such times as the present they had to confine themselves to meeting the financial requirements of old-established customers. A glance at the acceptance account would show that that was being done, the percentage of that account being 72 per cent. on Scandinavian and British account.

The balance sheet showed an exceptionally liquid position, which had been brought about by the decision during the late summer of 1938 to increase the cash position by the reduction of the gilt-edged investments, and to the corresponding increase in their holding of Treasury bills.

Regarding the profit and loss account, in view of the prevailing crisis and the state of the Stock Exchange at the time when quotations for various stocks certainly did not represent, in either direction, whether for buying or selling, the marketability of those stocks, the board had decided not to disturb the profit and loss account by writing those down out of the profits earned, but to earmark against what they believed to be a purely temporary valuation, sufficient to meet them from the contingency fund.

The earning power of the business had been satisfactorily maintained in a difficult year, and at the same time a strong liquid position was disclosed, which shareholders would agree was no mean achievement.

The report and accounts were unanimously adopted, and a final dividend of 10 per cent., making 18 per cent. for the year, was approved.

HARLAND AND WOLFF, LIMITED

IMPROVED RESULTS

MR F. E. REBBECK'S ADDRESS

The annual general meeting of Harland and Wolff, Limited, was held, on the 24th instant, in the Council Chamber of the Federation of British Industries, 21 Tothill Street, Westminster, London.

Mr F. E. Rebeck, D.L., J.P. (chairman and managing director), in the course of his speech, said:—Last year it was possible to present the balance sheet in very simple form. This year we are able to show for the first time a comparison with the preceding year, omitting shillings and pence. It is now so clear that no detailed explanation is required.

You will remember we were unable to provide for depreciation for 1937; but the results for 1938 are such that we have been able to make the necessary provision for depreciation for both years. Your directors also propose to inaugurate a reserve fund with an appropriation of the sum of £100,000. It is, I admit, a small amount for a company with an issued capital of almost £7,000,000, but it is at least a beginning, and I feel sure that this policy of strengthening the company's financial position will have your approval. This leaves a balance of £45,227 at the credit of profit and loss account to be carried forward.

You understand, of course, that the preferential but non-cumulative dividend of 4 per cent. to the "A" shareholders would have required over £200,000 gross. As, however, no dividends are being paid, the position of the company is improved accordingly.

It must be borne in mind that the improved results for 1938 were realised notwithstanding that our shipbuilding activities were considerably restricted during the year owing to the general lack of orders for new tonnage.

RECORD OUTPUT AT GOVAN

At our Govan shipyard we had a record output for that establishment, but this work fell off rapidly towards the end of the year, and resulted in Finnieston Diesel Engine Works being without orders for propelling machinery. We were fortunate, however, in having a large proportion of our engineering capacity, both at Belfast and Glasgow, employed in other directions, including a considerable amount of national defence work for the Admiralty, War Office and Air Ministry.

The repair works generally had a better year in 1938 than in 1937. This applies also to our Scotstoun works and Clyde foundry, and to our structural steel departments.

The work in hand includes some notable ships, such as an aircraft carrier and a cruiser for the Admiralty, the R.M.S. "Andes," a high-class passenger liner which is the largest passenger ship to be launched during the current year, and three refrigerated cargo liners. We have recently been entrusted with two additional important contracts for the Admiralty—a submarine depot ship and a Fleet Air Arm supply and repair ship.

The complete suspension in the placing of orders for merchant ships would probably have continued for a long time had it not been for the action of the Government in developing their scheme for the assistance of shipping and shipbuilding; but the building scheme only applies to cargo vessels—passenger liners and refrigerated tonnage being excluded. Therefore it does not help in the provision of work for our large passenger shipbuilding yards, which are specially equipped for this class of work.

We have received orders for a number of cargo ships under the new scheme, which will partly employ our cargo shipbuilding yards at Belfast and Glasgow. It is not easily understood why refrigerated vessels should be excluded from the Government scheme, especially when one realises how essential they are to the well-being of the country, and particularly in times of emergency.

THE OUTLOOK

You will not expect me to say much about 1939. For the first quarter of the year the results are satisfactory; but for the next few months we are bound to feel the effect of the shortage of tonnage to which I have already referred. Furthermore, as regards the current year I would observe that the present disturbed state of world affairs has necessitated the introduction of the Civil Defence Bill, and you will readily understand that the provision of adequate protection for the personnel employed in our establishments will call for considerable expenditure during the year, only part of which will be recoverable.

The company's technical departments have been maintained at their usual high standard, and the works and plant have been kept in good repair, and improved by the addition of modern plant where necessary.

The report and accounts were adopted.

ASSOCIATED GAS AND WATER
UNDERTAKINGS, LIMITED

SUCCESSFUL YEAR

The sixth ordinary general meeting of this company was held, on the 25th instant, in London.

Mr W. H. Bennett, M.Inst.Gas E., chairman of the company, said:—As a result of the year's working the accounts show a net profit of £75,150, an increase of nearly £16,000. Although it would permit of the payment of a dividend at a higher rate, your directors think it advisable, in view of the present state of world affairs, to recommend adherence to the usual rate of 5 per cent. per annum on the ordinary capital. If this recommendation is approved the sum carried forward will be £22,760, compared with £17,564 brought in.

During the year under review controlling interests were acquired in the gas companies at Bideford, Bridgwater, Taunton, Wellington (Somerset), and Godalming, bringing the total number of Associated undertakings up to 23, including the subsidiary gas undertaking at Langport of the Taunton Gas Company.

All but one of these acquisitions are in Devon and Somerset, thus bringing our gas undertakings in the West Country to seven. In our Southern group of sixteen gas and gas and electricity undertakings, the addition of the Godalming Gas Company is of interest, since the boundary of its area of supply is continuous with those of our associated undertakings at Guildford and Haslemere.

The returns from our associated undertakings continued to show, despite the abnormal conditions brought about by the international situation, satisfactory increases in the sale of gas, electricity, coke, by-products and appliances. Our companies realised record outputs of gas and coke during the sudden spell of extreme cold towards the end of 1938. Virtually without warning their gas-making plants and distribution systems had to cope with gas outputs up to 43 per cent. above those of the days preceding the cold weather.

FAVOURABLE PROSPECTS

A few years ago there was much ill-informed sales resistance to gas, but the continued virility of the industry has made a marked impression upon the public, which, by large-scale co-operative publicity, has been kept acquainted of the merits of gas service. The nature and scope of that service has been substantially extended as a result of the facilities afforded by the gas holding companies.

Our associated undertakings are situated in urban and rural areas throughout Southern England—from Ilfracombe (Devon) in the West to Edenbridge (Kent) in the East—in which the population is largely residential and less affected than in other parts of the country by industrial recession on the one hand or artificial trade expansion on the other. Moreover, the majority of our subsidiaries are situated in districts not as exposed as others to the perils of war, which gives yet further security to your investment.

Expenditure on National Defence places a direct and indirect burden on gas and electricity undertakings. The indirect burden—taxation and increases in the cost of raw materials and labour—cannot be avoided and is common to all. The direct burden—the cost of protecting our property and employees from aerial attack—involves expenditure, varying according to the vulnerability of each undertaking, which is the more uneconomic because it is non-revenue earning.

PRICE OF GAS

Current economic conditions and the considerably enhanced cost of coal, materials and wages have frustrated, for the time being, the application of the company's policy of reducing the price of gas and of introducing further tariffs benefiting consumers and leading to increased business. We have had to be content with avoiding, or postponing as long as possible, increasing the price of gas, in which endeavour we have been successful in that in the majority of our undertakings the price of gas has not been increased. This, despite the fact that favourable coal contracts entered into some time ago have now expired and our raw material now costs, under a State nurtured monopoly, approximately 20 per cent. per ton more. It is still to be hoped that relief will be accorded to the gas industry in its claim for equitable price treatment as the consumer of over 18 million tons of coal per annum and, therefore, the indirect employer of 75,000 miners.

From the consumers' point of view it should be remembered that, whilst the actual price of gas has remained stationary or shown slight increase, the improved efficiency of gas appliances of recent years represents not less than 20 per cent. extra service. To this advance in utilisation must be added substantial progress in carbonisation and distribution which has been of consumer benefit.

The report and accounts were unanimously adopted.

WELWYN GARDEN CITY, LIMITED

DIVIDEND AGAIN INCREASED

The nineteenth ordinary general meeting of Welwyn Garden City, Limited, was held, on the 24th instant, in London.

Mr Theodore G. Chambers, K.B.E. (the chairman) said:—The accounts before you reveal that the financial position of the company is steadily improving, and the directors have much pleasure in recommending that the dividend for the year be increased to 5 per cent.

Our gross revenues have increased from £86,148 to £99,674, in part due to the larger income accruing from freehold house property, but to a more important extent by reason of the excellent progress made by our subsidiary undertakings, the revenues from which have risen from £21,622 to £32,539. The net effect upon our profit and loss account is a rise in the profit carried to the balance sheet from £25,004 to £29,960. This sum, added to our carry-forward from the last financial year, provides a balance of £39,336, from which it is proposed to set aside £500 as a reserve for income tax and national defence contribution. The dividend of 5 per cent. will absorb £26,815, thus leaving £12,021 to be carried forward to the current year.

WELWYN COMMERCIAL BUILDINGS, LIMITED

The profit of this company for the year compares favourably with the estimates given in the prospectus published just over a year ago in connection with an issue of preference share capital at that time. After meeting the fixed dividend on the preference shares and a dividend of 10 per cent. on the ordinary shares, sundry reserves and the balance of profit carried forward have also been increased. There is every indication that the development of this business is likely to be continuous and may legitimately demand an appreciable expansion of the issued capital in the early future.

Welwyn Stores again had a successful year, which augurs well for the future of the business in the extensive new premises which will be opened on June 26th. Those shareholders who have visited the town during the last few months cannot, I think, have failed to have been very greatly impressed with this new and important central building. That part which consists of the stores premises will place our departmental stores in the enviable position of being, I believe, the largest establishment of the kind in Hertfordshire, so that apart from the widespread effect of this building on the general appearance and "atmosphere" of the centre of the town, it will doubtless also become a very attractive shopping centre for a considerable area of the surrounding county.

DECENTRALISATION OF INDUSTRY

In my speech to the shareholders last year I referred to the steady growth of public opinion in favour of some policy of decentralisation of industry and in particular to the effects of this policy upon Welwyn Garden City.

As a result of the crisis last September a further concentration of public thought has been given to decentralisation, as was shown subsequently by the increased number of industrial inquiries, and there can be little doubt that the development of our industrial area will be accelerated during the next year or two. There can be little doubt that the form of development of which we can reasonably claim Welwyn Garden City as one of the outstanding examples, is to-day very widely regarded as one of the important solutions of many of the difficulties arising from unplanned and unrestricted town and city development.

Apart from our industrial expansion, many important London businesses have under serious consideration the merits of Welwyn Garden City for the permanent accommodation of their staffs under ideal conditions in new offices at Welwyn Garden City.

In conclusion, I would again remind shareholders that the further progress of the business, which it has been our pleasure to reveal to you, is in great measure a reflection of the enthusiasm and hard work of our large staff. We now have some 1,300 employees of every kind, and I do not think I exaggerate when I say that there is almost as much reason for pride in our staff and their spirit as there is in the steady improvement of the business.

During the year two important steps have been taken for the benefit of the staff. First, arrangements have been made for the establishment of a general staff association for the whole undertaking which is being provided with a small sports ground. Secondly, the directors have decided in the immediate future to set up a Staff Benefit Fund on a contributory basis.

Coupled with these provisions, the position has now been reached whereby all members of the staff, with the exception of the general employees in our building enterprise where the problem is a national one, receive holidays with full pay every year.

The report and accounts were unanimously adopted.

INDIAN COPPER CORPORATION, LIMITED

EFFECT OF LABOUR TROUBLES

SIR GODFREY B. H. FELL'S ADDRESS

The fifteenth ordinary general meeting of Indian Copper Corporation, Limited, was held, on the 25th instant, at 20 Aldermanbury, London.

Sir Godfrey B. H. Fell, K.C.I.E., C.S.I. (the chairman), said that the balance carried down to the appropriation account was £69,535, as compared with £211,424 in the previous year. They recommended the payment of a dividend at the rate of 4 per cent. per annum actual, which would take a sum of £34,195, leaving £40,619 to be carried forward. They considered it would be unwise to recommend a more liberal distribution on that occasion having regard to the general uncertainties of the present times and in particular to the doubt whether, until labour changed its present attitude, it would be possible for the Corporation to carry on operations successfully.

When they met on May 6th last year he mentioned that a lightning strike had taken place at the mine on April 21st, involving the complete cessation of operations. The strike lasted twelve weeks. In the end the workmen agreed to return to work on the undertaking that the Local Government would appoint a Conciliation Board with the object of arriving at a settlement of the points at issue between the management and a section of the employees. The award confirmed the grant of certain benefits already given to the workers at Moubandar by the directors the previous May. In addition, it included a scheme for payment of bonus, as of right, to all employees, the amount of which would depend upon the rate of dividend declared, and an increase of 1 anna a day to the wages of all labourers drawing less than Rs. 1/8/- a day.

With regard to the bonus, the directors had already spontaneously sanctioned the payment of a bonus to the workmen on the results of the corporation's operations for the years 1936 and 1937, and had offered in point of fact to authorise in future a still more liberal scale of bonus, dependent upon results.

MANY STRIKES

They had yet to see how far the sacrifices they had made would secure industrial peace. There had so far been very little sign of willingness on the part of some of their workmen to accept the award in the spirit in which it was accepted by the corporation. Apart from minor incidents, including two lightning strikes and three slow-down strikes, and constant threats of strikes or "hartals," a slow-down and stay-in strike occurred in the boiler house on April 22nd, involving the shutting down of the mine and concentrating mill. That strike collapsed after four days, the Union leaders admitting that the men were in the wrong, but characteristically urging, nevertheless, that their demands should be conceded. This the general manager refused, as also the later demand of the other workers for pay during the period that the mine and mill were closed down as the direct consequence of an illegal strike by some of their fellows.

That was the position at the end of April, but the situation grew worse every day after that. On May 8th, a gang of rioters tried to rush the pay-table when wages to the mill hands were being paid, yelling out "Loot and strike." That attack was staved off. A day or two later, a European employee was attacked with an iron bar while on his way to his bungalow in the dark and severely injured. Worse, however, was to follow. As a result of a slow-down strike in the drill-sharpening shop, a ringleader was dismissed. Two days later a gang of men fell upon the mine mechanical engineer in the drill shop and inflicted on him injuries which no one but an exceptionally strong man could survive. The men used red-hot drills seized out of the fire as their weapons.

The directors had instructed the general manager to make the most serious protest to the Premier of Bihar, and to inform him that unless the Government were prepared to take immediate action to support them and to insist upon all the workers abiding by the terms of the recent award, they intended to close down the mine and the mill.

CURRENT YEAR'S PROSPECTS

In conclusion, the Chairman said that the shareholders would wish to hear something of the progress of the corporation's operations during the current financial year. Production to the end of April this year totalled 1,950 long tons of copper, 2,711 long tons of Yellow Metal Sheet and 504 long tons of Yellow Metal Circles. Mill-heads had averaged 2.16 per cent. copper, and the sales position was quite satisfactory.

The report was unanimously adopted.

WIGGINS, TEAPE AND COMPANY (1919), LIMITED

LORD PORTAL'S ADDRESS

The twentieth annual general meeting of Wiggins, Teape and Company (1919), Limited, was held, on the 19th instant, at Winchester House, Old Broad Street, London, E.C.

Lord Portal, D.S.O., M.V.O. (chairman of the company), said: Ladies and gentlemen, the report and accounts have been in your hands for the requisite period, and I propose, with your permission, to take them as read. (Agreed.)

On the occasion of our last annual meeting I was able to report an increased volume of trade done by your company and its subsidiary companies for the fifth consecutive year. This year I regret I have to report a small recession. This is not to be wondered at bearing in mind the less satisfactory state of trade enjoyed generally in this country. This recession in trade affected the output of our mills, especially during the last six months of the year, when a certain amount of short time was worked. I am glad to say, however, that this year trade has been much better and our mills have been busy, and in some cases a measure of overtime has been worked.

I have referred to the deterioration in general trading conditions during the year 1938, with the consequent smaller demand for paper. This particularly affected the demand for our cheaper grades of papers. In view of the conditions prevailing, it is, I think, a remarkable fact that the sales of our high-grade papers for the year 1938 showed only a small decline compared with the sales for the year 1937, and I suggest points to the very strong position your company enjoys in the home market due to the excellence of the service we are able to offer to our customers.

SUBSTANTIAL RESERVES

I would draw your attention to the total amount of the various reserves appearing in the summary balance sheets of our group of companies. After providing for the payment of the final dividends, the reserves and profit and loss balances amounted at December 31, 1938, to the substantial sum of £1,046,046, and the depreciation reserves amounted to £954,145.

As I have already indicated, our paper mills this year are exceedingly busy, and I am glad to say that our aggregate sales to date are in excess of those for the corresponding period of 1938, and the outlook is quite promising. However, with world conditions as they are, it would be foolish to play the rôle of a prophet. All I can say is that if trading conditions continue as they have been for the past few months we can look forward to being able to place before you next year a satisfactory balance sheet.

You will see that we recommend a payment of a final dividend on the ordinary stock of 5 per cent., less income tax, which brings the dividend for the year 1938 up to 8 per cent. In addition, we are recommending the payment of a bonus on the ordinary stock of 2 per cent., less income tax. Then we propose that £10,000 be transferred to income tax equalisation reserve. We also propose the transfer of £53,000 to general reserve, bringing that account up to £713,000.

The chairman then moved the adoption of the report and accounts. Mr L. W. Farrow (deputy chairman) seconded the motion, which was unanimously passed.

The dividend and bonus, as proposed, were approved; the retiring directors were re-elected and the auditors were re-appointed.

ODHAMS PRESS, LIMITED

DIVIDEND OF 10 PER CENT.

The nineteenth annual general meeting of Odhams Press, Limited, was held, on the 24th instant, in London.

The Right Hon. Lord Southwood of Fernhurst (chairman and managing director) said that the net profits for the year amounted to £260,067, as compared with £340,192 for the previous year. Last year he drew attention to the considerable increase in the cost of paper and labour which would take effect in 1938. As paper was their chief raw material, that heavy increase had naturally affected the earning power of the company. In addition, the international tension had also had effect on the company's revenue. By expansion of trading and economies, the directors had been able to reduce the adverse effect of those factors to a considerable extent, and in the circumstances, the result of the year's trading was not unsatisfactory.

Copyrights showed an increase of £66,245, the greater part of which was represented by the acquisition of a group of journals and by special expenditure on the development of the new periodical "Woman." It had become the leading journal in the field of popular women's weeklies. Increased facilities for rapid and high-grade colour printing at their Watford company's works had made it possible for that and other of the company's publications to set a very high standard of production. The important new building being erected at the west side of Endell Street was nearing completion, and would, in due course, enlarge the company's productive capacity and enable them to centralise a number of outlying departments. The particulars given on the back page of the printed accounts showed the very broad basis on which the company's business was constituted. Shareholders would no doubt be interested in learning that the amount the organisation paid out last year in salaries and wages alone was approximately £3,000,000.

The directors were satisfied that the business of the company was on a thoroughly sound basis. With a return to normal international conditions and a reasonable reduction in the price of the company's chief raw material they were certain that the company would return to a period of increasingly progressive profits.

The report was adopted and a final dividend of 5 per cent., making 10 per cent. for the year, was approved.

INDUSTRIAL AND GENERAL TRUST, LIMITED

A SPECIAL JUBILEE BONUS

The fifty-first ordinary general meeting of the Industrial and General Trust, Ltd., was held, on the 25th instant, in London.

Capt. E. C. Eric Smith, M.C., presided in the absence through indisposition of Mr W. Sandford Poole, the Chairman, and read a speech prepared by Mr Poole, which stated that the international events of the past year had seriously affected trade, which always declined when confidence was shaken, and bad trade had naturally been reflected in the revenue of trust companies. Their revenue had also suffered from the continued complete default of Brazil and the partial default of other foreign borrowers. A valuation on 31st March last showed that the £8,014,688 at which investments stood in the balance sheet was still represented by value. Although the surplus was quite small, it was satisfactory that, in spite of depressed markets, not only their capital but also their reserves and carry forward were intact.

Revenue showed a decrease of £25,110, but allowing for taxation and smaller collections of arrears, the actual fall in the year's income was no more than £11,038 and was accounted for, mainly by the Brazilian default.

The trust was incorporated on 6th April, 1889, so that the meeting marked the completion of their record of fifty years. The booming times of the year in which they commenced were followed in the latter part of 1890 by a severe commercial and financial crisis. As a result the Trust suffered substantial losses and in 1894 a reconstruction of capital was carried through. The subsequent history of the trust had been one of steady recovery and development.

The net revenue, after providing for debenture stock interest and management expenses, amounted to £283,828. To mark the Trust's jubilee a special grant was being made to the staff, and in addition to paying a dividend of 12 per cent., their fiftieth birthday was being celebrated with a bonus of 2 per cent. less tax.

With regard to the outlook, they might have some further diminution in their revenue during the coming year, but he was not without hope that, given peace in Europe, any setback might not be very serious.

The report was unanimously adopted.

KEPONG (MALAY) RUBBER ESTATES, LIMITED

RESULTS OF A DIFFICULT YEAR

The thirty-fourth annual general meeting of The Kepong (Malay) Rubber Estates, Limited, was held, on the 23rd instant, in London.

Sir Francis Voules, C.B.E. (chairman and managing director), said that during the year under review they had produced a crop of 9,019,171 lb. Their sales of rubber had totalled 6,592,156 lb. The average gross price realised for their exportable rubber sold was 7.7d. per lb.

When prices dropped to under 5d. per lb. they had refrained from selling, holding unsold at that time about 400 tons of their exportable rubber, of which the portion afterwards sold had fetched as high as 8½d. per lb. They were still holding off the market a portion of their exportable crop in London warehouse amounting to 514,476 lb., which had been valued for account purposes at 7d. net.

As a result of the year's working they had earned a profit of £43,646. They proposed transferring £10,000 to reserve and, after allowing for the dividend of 4½ per cent., less tax, they proposed to carry forward £15,913. The profit was, of course, disappointing, and was accounted for by two adverse factors, the smaller exportable crop and the lower market price. Actually, in 1938 they had exported only 5,500,000 lb., as against over 9,000,000 lb. in 1937. The f.o.b. costs, however, were satisfactory, being 3.92d. against 4.04d. in 1937.

As to the current year, it had recently been announced that for the September quarter the release had been fixed at 55 per cent. of assessment. Provided that the price was maintained at its present level, that increase in export was very welcome, and should permit of better results. With regard to the suggested barter agreement between the British Government and that of the United States, with every desire to fall in with any reasonable proposal from America, he saw great difficulties in carrying through such a proposal. Taking the long view, he doubted the advisability of having a large stock out of the hands of the industry, which would mean, directly or indirectly, that the control of the market would be in the United States of America.

The report was unanimously adopted.

TIMOTHY WHITES AND TAYLORS, LIMITED

A DEBENTURE ISSUE

The tenth ordinary general meeting of Timothy Whites and Taylors, Limited, was held, on the 19th instant, in London.

Mr Philip E. Hill (the chairman) said that, as pointed out in the report, the previous accounts submitted had covered a period of sixty-six weeks, which included two Christmases. As the company's trading was always most active in the last three months of the year, the figures now presented covering only one Christmas period were not comparable. To obtain a true comparison they must go back to the previous year, and that showed that their profits had increased by over £33,000. When they remembered the devastating effect which the crisis of last September had had on all retail trade he thought shareholders would agree that the results shown were satisfactory.

Last year he referred to the fact that the continued expansion and modernisation of their business would in due course necessitate the provision of further capital. After careful consideration the directors had decided to make an issue forthwith of £500,000 of 5 per cent. redeemable debentures. It was not proposed to make a public issue, applications being limited to shareholders and debenture holders of the company in accordance with the promise made at the last meeting. In connection with that proposed issue the company's properties had been revalued, and that revaluation showed an appreciation over book value of over £338,000.

The directors had decided to recommend a final distribution of 22½ per cent. on the ordinary shares, less tax, making with the interim dividend already paid a total of 30 per cent. for the year.

His confidence in the future of the undertaking remained unchanged. The defence programme to which we were by sheer necessity committed entailed vast expenditure. That expenditure would be largely in the form of wages. Unemployment would diminish, the purchasing power of the public would increase, and that increase should undoubtedly be reflected in the turnover of all shops which catered for the requirements of the workers, among which could be numbered all the shops owned by this company and its subsidiaries.

The report was adopted, and a separate meeting of preference shareholders approved the proposed debenture issue.

JAMES W. COOK AND COMPANY, LIMITED

DISTRIBUTION OF 12½ PER CENT.

The forty-second annual general meeting of this company was held, on the 19th instant, in London.

Mr W. J. Clarke (chairman and managing director), in the course of his speech, said:—I am glad to be able to show you improved results, which happily bear out the report of the state of our business that I gave you this time last year.

The gross profit on trading shows a considerable advance, £125,127 9s. 4d., as compared with £98,979 7s. 1d. The amount standing to the credit of profit and loss after payment of the interim dividends amounts to £74,907 13s. 4d., as against £53,179 4s. 5d. All these figures I hope you will agree are eminently satisfactory. The increased profit is due to increased business and to the extra expenditure incurred in providing plant.

We earnestly hope that we will be permitted to pursue our business in peace, for we still maintain that given peaceful conditions we can with pleasant anticipation look forward to the future, as one happy feature about these accounts is that we have not noticeably benefited by the re-armament policy which has been imposed upon us.

We think the time has come when it will be proper to increase the capital of the company in order that the liability of the subsidiaries can be discharged to our bankers and that we can obtain fresh resources in order to secure funds for the general purpose of the business and in order to be able to take advantage of opportunities that present themselves for further development.

As you know we have been able to maintain a 10 per cent. dividend for many years. It might be said that with our obligations the dividends of the ordinary shares should remain at what is a good rate, but having regard to increases in taxation and other considerations, it is felt that if we can afford it a modest increase in return to shareholders in the form of a bonus should be granted on this occasion.

The report and accounts were unanimously adopted and a final dividend of 7½ per cent., less income tax, making with the interim dividend 10 per cent. for the year, together with a bonus of 2½ per cent., less income tax, was approved.

MADRAS ELECTRIC SUPPLY CORPORATION, LIMITED

FURTHER EXPANSION

The ordinary general meeting of the Madras Electric Supply Corporation, Limited, was held, on the 24th instant, in London.

Mr James Gray (the chairman) said that the number of consumers connected and units sold during 1938 had increased by 9.3 per cent. and 8.4 per cent. respectively. Those increases approximated closely to the expansion experienced in recent years and almost every branch had contributed to the improvement. The revenue account had improved by 1 per cent. only, due to the reduction in tariffs granted voluntarily in 1936, but which had not become fully operative until January 1, 1937. After deducting interest, depreciation and renewals (£50,000), income-tax (£22,602), investment reserve (£10,000), etc., the net revenue balance was £74,863, and £41,566 was brought forward. The directors proposed to pay a final dividend of 5½ per cent. actual on the ordinary shares, making 8 per cent. for the year, free of income-tax.

With regard to the paragraph in the directors' report stating that the Madras Government had represented that another reduction in tariffs was necessary, on April 25th last the Government had submitted a revised list of charges which they considered should be adopted, but the reductions were so drastic and the manner of giving effect to them so unusual that the directors could not acquiesce. Alternative proposals had been submitted by the company, and it was hoped that they would receive full and sympathetic consideration as the directors shared a desire that a settlement would be reached without the necessity of an *ad hoc* inquiry. Under those circumstances it would be impolitic for him to say more on the subject then, but he wanted to confirm that if the demands of the Government became obligatory in their entirety they would have a serious effect on the revenue of the Corporation.

The Madras Government had recently passed an Act which imposed a tax of As.½ per unit on all units of electricity sold at a price of over As.2 per unit, and had intimated that the whole of the tax would have to be borne by the Corporation instead of by consumers as in other parts of India. That also was under discussion.

The report was adopted.

SUNGEI BATU (MALAYA) RUBBER ESTATES, LIMITED

MR E. D. HEWAN'S REVIEW OF THE YEAR

The twenty-sixth annual general meeting of Sungei Batu (Malaya) Rubber Estates, Limited, was held, on the 23rd instant, in London.

Mr E. D. Hewan (chairman), in the course of his speech, said:—Our profit and loss account shows a profit for the year of £7,643, against nearly £17,000 in 1937. This severe contraction was, however, only to be expected in view of the very unsatisfactory conditions which existed last year. As I mentioned when addressing you just twelve months ago, we were then working on a much reduced quota, which for the whole of 1938 averaged just 55 per cent., as compared with 83½ per cent. in 1937. This, of course, resulted in higher costs and greatly restricted the possibilities of making profitable use of our mature areas. With so much rubber held off the market, one might have hoped to see a general improvement in prices, but this was not to be. World stocks were too high.

(Continued from page 508)

THE COMMODITY MARKETS

THE movement of the prices of primary products was somewhat irregular this week. The absence of an expansion in business activity across the Atlantic and the seasonal decline in raw material purchases at this time of the year are mainly responsible for the uncertain price trend.

Raw sugar prices have fallen a little as a result of the strenuous, but not altogether successful, efforts made by the International Sugar Council to increase market supplies. Wheat prices, on the other hand, are scarcely changed on the week. The prices of non-ferrous metals moved within narrow limits. Raw cotton prices rose towards the end of last week, but reacted again this week. Rubber prices remained virtually unchanged in a quiet market.

Moody's index of the prices of sensitive commodities in the United States (December 31, 1931 = 100) rose from 143.8 to 144.9 during the week ended last Wednesday.

Metals

Copper.—The London price for copper moved within narrow limits this week, and the price of standard cash closed on Wednesday at £41 2s. 6d. per ton, a net gain of 2s. 6d. on the week. The market remained inactive, especially as reports from the United States were discouraging. Buying on the other side of the Atlantic has again declined to low levels and the outlook for consumption is judged with considerable reserve.

★

Tin.—At times during the past week there was a larger demand for tin, the price of which gained 15s. to close on Wednesday at £226 per ton, but on the whole trading continued to be slow. Supplies are still short and the market is becoming increasingly dependent on the buffer pool. According to the International Tin Research and Development Council world production of tin reached 33,400 tons in the first quarter of this year, a decline of 23 per cent. on 1938. Simultaneously, consumption fell by 13 per cent. to 35,700 tons. Supplies thus remained short of requirements, although the restricting coun-

tries exceeded their quotas in the first quarter of 1939 to the extent of 1,310 tons.

★

Lead and Spelter.—The quotations for near lead lost 1s. 3d. to close on Wednesday at £14 6s. 3d. per ton, while in contrast spelter closed at £13 17s. 6d. per ton, a net gain of 8s. 9d. on the week. The demand for spelter is still supported by the high A.R.P. requirements for galvanised sheets, while the lead market suffers from the low rate of building and the maintenance of high supplies. According to the Metallgesellschaft the world's lead smelter output totalled 383,003 metric tons in the first quarter of this year, against 405,399 tons a year before. The decline was chiefly due to the lower output in Mexico caused by the long strike at the Monterrey smelter. The British import duty on foreign zinc was increased on Friday from 12s. 6d. to 30s. per ton. Empire suppliers will pay to the Imperial Smelting Corporation 10s. per ton on their imports to this country, from which the I.S.C. will refund to British exporters of zinc products the sum of 17s. 6d. per ton.

★

Aluminium.—Although prices for aluminium have been unchanged in recent weeks, demand for the metal is at a high level. The Aluminium Information Bureau announced this week that the British consumption was nearly 34 per cent. higher in the first quarter of this year than in the corresponding period of 1938. Part of this increase was due to higher armament requirements, but there was also an expansion in civilian orders.

Grains

THE reports of rainfall in the United States and Argentine, combined with a quiet demand, led to a dull wheat market during the past week, though prices were not much changed. The American wheat belt is still short of moisture, however, particularly in the hard wheat areas, and it is now thought that the latest official estimates of the forthcoming harvest will have to be considerably reduced. Lack of rain is also reported from Canada, where grasshopper infestation is now mentioned. Plate wheat continues to be shipped at the rate of about 400,000 quarters a week, but the demand from the Far East for Australian flour is reported to have slackened off for the time being. Larger

These factors, together with the general feeling of uncertainty, due to the political situation, which began to make itself felt after the spring of last year, all had their adverse effects on the rubber market. As a result the average price in London of the commodity over the year was only 7½d. per lb. for standard sheet, as against 9½d. in 1937. Such a price, combined with an average export quota of only 55 per cent., could only have one result—namely, a large decrease in profits as compared with 1937.

You will see from the report that we recommend a dividend for the year of 5 per cent., requiring £4,125; a transfer of £350 to income-tax reserve, and £3,000 to development reserve, leaving £9,780 to be carried forward into the 1939 accounts.

I mentioned last year that, under the new International Agreement, estates are permitted to open up new areas to the extent of 5 per cent. of their planted areas. In our case this allows us to open up 102 acres, and it is expected that this work, which is now in progress, will be completed during the current year. We will then have little suitable land uncultivated and must rely on replanting in order to continue our policy of rejuvenating the estates.

The report and accounts were unanimously adopted.

supplies of Plate and South African maize are due to arrive shortly, and the discount on near maize has been considerably reduced. Little business has been done in feeding barley, and large supplies are available from Tunis.

Other Foods

Provisions.—The usual seasonal trend in butter prices was apparent in London last week, when Dominion butters improved 2s. to 3s. per cwt. in price while the price of Danish fell by a rather larger amount. Egg prices were also lower, in the face of a poor demand.

★

Colonial Produce.—The raw sugar market was easier after the week-end, when it became known that some additions to the export quotas had been made but there was considerable uncertainty in the market. Prices for refined were reduced by 3d. per cwt. on Tuesday. Tea prices have been well maintained at recent auctions.

★

Fruit and Vegetables.—Asparagus is now reaching the London market in good quantities and sells readily. New potato prices have fallen steadily in the past week and there is little demand for old crop.

Miscellaneous Commodities

Oils and Oilseeds.—Demand for these products remains dull; sales of oilcakes are falling off and crushers are apparently well supplied. Prices of both linseed and linseed oil have eased, since American interest for Indian shipments has also declined. Black Egyptian cottonseed sells at £5 7s. 6d. per ton for spot and near positions and £5 15s. has been quoted for July delivery.

★

Rubber.—Trade was inactive at the end of last week, but a rather better tone after the week-end brought the spot price of standard sheet up to 8½d. on Wednesday. Stocks of rubber outside the regulated area were reduced by 11,000 tons in April to 411,212 tons, due mainly to a sharp fall in American holdings.

GOVERNMENT RETURNS

For the week ended May 20, 1939, total ordinary revenue was £13,606,000, against ordinary expenditure of £18,016,000 and issues to sinking funds of £245,000. Thus, including sinking fund allocations, the deficit accrued since April 1, 1939, is £64,058,000, against £40,188,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On May 19th applications at £99 16s. 7d. per cent. for bills to be paid for on Monday, Tuesday, Wednesday, Thursday and Friday of following week were accepted at about 28 per cent. and applications at higher prices in full. Applications at £99 16s. 8d. for bills to be paid for on Saturday were accepted in full. £49.0 millions of Treasury bills are being offered on May 26th.

SHORTER COMMENTS

Sena Sugar Estates.—Net profit for 1938, £94,984 (£128,642). Ordinary dividend reduced from 9 to 8 per cent.

Goldfields Australian Development Company.—Total income for 1938, £6,490. General expenditure, £8,860. Net profit, £67,630. Written off development, estimates, etc., £21,814. N.D.C., £400. st dividend of 7½ per cent. absorbs 7,500. Carry forward £7,916.

Tobacco Securities Trust.—Net revenue for half-year to April 30, 1939, 28,533 (net revenue previous year, 27,152). Ordinary interim dividend intained at 5 per cent. Carry forward, 09,177. It is proposed to hold the annual meeting in January each year in ure. Next accounts will be for full year October 31, 1939.

Cable and Wireless Traffic Index.—Traffic index for April, 1939, is 75.1 against 74.6 for March, and 71.5 for April, 1938.

Attock Oil Company, Ltd.—Net profits for year 1938, £309,345 (£56,885) before £180,000 (£40,000) depreciation of plant. Ordinary dividend 7½ per cent. (dividend passed since 1928); new shares issued September, 1938, do not rank for this dividend.

Rhodesia Railways Trust.—Net profit for year to March 31, 1939, £77,183 after £60,090 to contingencies reserve. Net profit for 1937-38, £59,018. Ordinary dividend 5 per cent. tax free.

Bank of Scotland.—The present capital position of the Bank of Scotland is: Authorised capital, £4,500,000; issued capital, £2,400,000. Up to December, 1937, issued capital stood at £1,500,000 with

capital callable, £750,000. In December, 1937, £150,000 stock, £100,000 paid was issued, and £800,000 was then applied from reserve to cancel uncalled liability on issued stock. The particulars given on page 22 of last week's Banking Supplement should be amended in this sense.

City of London Real Property.—Net revenue from rents for year to April 12, 1939, £343,271 (£367,730). Total income £379,025 (£393,708). Mortgage and debenture interest, £39,791 (£38,403). Sinking fund, £27,166 (£26,418). Profits, £302,901 (£319,997). To reserve for N.D.C., £16,000 (£15,000). Debenture discount written down by £3,000 and issue expenses by £2,111. Ordinary dividend maintained at 4 per cent. Carry forward increased from £217,804 to £230,157.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are denominated in pounds at a certain date the yield includes any profit or loss on redemption; where stocks are denominated in foreign currencies the yield is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

May 17, 1939											
May 24, 1939											

Here in Great Britain our latest recovery has been astonishingly rapid. Two factors in particular have conspired to modify, if not exactly to falsify, the forecast of December. In the first place, the activity of British heavy industry in the latter months of last year was considerably (and unnecessarily) depressed by the long wait for the cheaper steel prices that came into force on January 1st. In four months *The Economist* index of the volume of steel available from home production and imports has jumped from 82 per cent. to 146 per cent. of the 1935 average. And secondly, it could not be foreseen in December how rapidly the expenditure of money on defence would increase. The amount spent in the first three months of 1939 was 25 per cent. larger than in the December quarter, and 50 per cent. more than the average for 1938. Moreover, the Estimates for 1939-40 show that defence expenditure in the current year is going to be more than half as large again as in 1938-39. The actual effect of last year's speed-up and the anticipated effect of this year's vast expansion have combined to bring forward by several months the industrial upturn expected for the summer.

The mere speed of the recovery of the last few months should, in itself, give rise to caution in prophesying its continuance. To judge by the weekly returns of the Government's expenditures, they cannot be far from their peak. Over the year as a whole, the Budget Estimates foresee an increase of 30 per cent. in expenditure on the Supply Services, civil and military, and the Chancellor of the Exchequer has stated that the recent expansions in the army are not likely to upset his figures. But the increase of Supply Service expenditure in the first eight weeks of the financial year has been over 37 per cent. To put the figures in a different way, the increase of expenditure expected over the whole year is about £240 millions, or approximately £4½ millions a week. But the average increase in expenditure in the eight elapsed weeks has been about £4½ millions. Expenditure will, of course, continue to increase during the year, but it may be that the rate of increase is no longer rising.

The indirect repercussions of defence expenditure, however, mature more slowly. The great increase in Government spending has been having its direct effect on the metal-using industries ever since January 1st. But it is only quite recently that the indirect effect on other trades has become visible in such items as, for instance, the record purchases of motor cars in March. The rise in motor taxation may have discouraged this particular form of expenditure, but further stimulus to all forms of consumer spending can be

expected in a period of rising employment, at least so long as there is no substantial increase in the cost of living.

The effects of re-armament finance are thus not by any means confined to the munitions industries. The "multiplier" does, in fact, multiply. But it does not pervade every part of the national life, and one of the most peculiar features of the present situation is that some of the industries which are normally foremost in revival are very quiescent. The reason for this is obvious enough. A normal revival is the result of the collective decision of the public, induced by "confidence," by lower rates of interest or by other causes, to spend its hoarded money on capital goods. But this time the stimulus is coming from another quarter, and the industries that depend on "confidence" are in a backwater. The industrial capital market is fast asleep and Throgmorton Street is little better than a depressed area. The volume of purely peace-time building, in so far as it can be judged from the statistics of plans approved by local authorities, is still on the decline. And though the export trade has shown surprising resilience, it can hardly be said to be prosperous.

It is in this distorted development that the chief danger of the present situation lies. If one group of industries—those making armaments—is very active and prosperous while another group is dull and depressed, it is only natural that a shift of resources of labour and capital from the latter to the former should take place. Such shifts are, in fact, already in progress. But all of the present expansion in the armament industries will sooner or later have to be undone. Our unemployment problem ever since the war has been largely due to the impossibility of shrinking industries once they have grown permanently too big. Unless we are very careful, we shall be storing up just such trouble for ourselves for that seemingly remote but quite inevitable future, when we begin to spend less on armaments.

The problem is not soluble in its entirety. But it can be reduced in size if all possible measures are taken to see that an emergency expansion in certain industries is either solved by emergency means—by overtime, by the recruitment of specifically temporary labour (such as women workers) and by dilution of a temporary and reversible, rather than of a permanent character—or else that it is avoided altogether by contracting the civil side of an industry's work as rapidly as the defence side is expanded. It is literally true that the more rapidly we solve our unemployment problem to-day the more obstinate it is likely to be in the future.

Japan's Choice

IN her present continental adventure Japan is subject to the Nemesis that lies in wait for every gambler, be it an individual or a nation, who is playing for very high stakes. As the game drags on the player finds himself compelled, time and again, to make the painful choice between cutting his losses up to date or hazarding yet more of his dwindling assets. The possible penalty of failure continues to grow in bulk until it dwarfs the possible reward of success.

Japan is confronted by this choice once again to-day. Among the Japanese themselves there is perhaps little disagreement over the question of their desiderata. They want a military, political and economic predominance for Japan in a vast zone of Eastern Asia which includes, at a minimum, the whole territory of China and all enclaves of foreign territory, foreign leaseholds, concessions and settlements, and foreign economic assets and interests therein. Whether Japan's coveted empire also embraces continental territory belonging to Russia, and continental and insular territory belonging to France, Great Britain,

the United States and the Netherlands, is a question that is not yet quite practical politics, though no doubt it would immediately come on to the Japanese agenda if once the first objective of conquering China were successfully attained. This first objective, at any rate, is hardly a matter of controversy in Japan; and the present acute dissension between the Navy and the civilians on the one side and the Army on the other is not over the scope of Japanese aims, but over the extent of the risks which it may be politic to incur for the sake of trying to translate aspirations into accomplished facts.

The Army, having already staked its own prestige on the China war, is evidently pressing its naval and civilian colleagues to consent to the staking of the whole of Japan's national welfare, and even existence, on this issue. If they can see any chance of a military decision that would break the Chinese resistance, they will take it, even at the price of themselves, entering into a partnership of unlimited liability with the Rome-Berlin Axis, or at the price of incurring a long-distance blockade or an embargo by the

affronted Western Powers. The Japanese Army to-day is, in fact, in the mood of the German High Command when it forced its Government to impose the unlimited submarine blockade. In Japan, however, there is evidently more political independent-mindedness and also more individual moral courage than there was in Germany in 1914-18 or is in Germany to-day. So far, the Army have not succeeded in getting their way. Their political opponents have, for the present, effectively vetoed an "all-in" alliance with the Axis; and Japanese action against the Western Powers in the Far East, provocative though it is, still stops just short of making an irreparable breach. The Japanese are still trying as hard as they can to bluff the Western Powers into letting their Far Eastern interests go by default. Within the last few days, for instance, they have stopped and searched a British, a French and a German liner in Far Eastern waters with the manifest intention of establishing a blockade *de facto* without formally declaring it; but when the protests were firm and immediate the Japanese promptly retreated and disavowed the intention of stopping regular shipping. Again, they are maintaining their claim to inherit all the Chinese Government's rights in the foreign settlements in China; and at Kulangsu—which is to serve as a precedent for Shanghai—they are refusing to withdraw their landing party. In fact, they are skirting the verge of a rupture as close as they can; but they are still flinching from going right over the edge.

It is, however, unlikely that Japanese policy will continue to hover in this indeterminate position very long; for time, after all, is not on Japan's side. The strain of the China adventure has just been brought home to every Japanese man and woman, in a way that even the least sophisticated cannot fail to understand, in a warning that food and other prime necessities of daily life may be severely rationed in the near future. However long the final choice may be postponed, a moment ultimately must come when the adventure will have to be abandoned if it is then still floating in its present limbo between success and failure. And already to-day Japan has to decide whether she shall play for safety by anticipating this moment and cutting her losses now, or whether she shall stake the whole of her national resources and prospects on a last attempt at a knock-out blow.

The Japanese military gamblers can point to the example of General Franco. The Spanish war lord, they can argue, refused to despair of victory in a war which was coming to look more and more like a stalemate; and in the end he was justified of his temerity, since the Spanish Republican resistance eventually collapsed with a suddenness and a completeness that were no less surprising than its previous hardihood and tenacity. Is it not well worth staking a great deal on the chance that the war in China may go the same way as the war in Spain? No doubt the Japanese soldiers are well aware of the greatness of Franco's debt to Italo-German military and technical aid; and hence the Japanese Army's eagerness for a thoroughgoing alliance with the Axis. Even if Italy and Germany did not go so far as to send arms and airmen and technicians to help Japan in the Far East, they might perhaps at least be induced, in consideration of a Japanese alliance, to forgo the profits that they are now making by selling arms to China! To these arguments of the soldiers their Japanese opponents can

retort by bringing up the less suspicious precedent of the disastrous end to the Greek military adventure in Turkey in 1922. Franco not only received from the Axis material assistance on a scale which Japan could not seriously expect; he also had the advantage of fighting in a confined arena in which his enemy could be, and eventually was, cornered and destroyed. By contrast, the present Far Eastern arena offers to the weaker combatant an almost unlimited field of manoeuvre, and in the hinterland of China lies a friendly Russia. On this showing, is not the present Japanese adventure, if pushed to extremes, more likely to end like the Greek adventure in 1922 than like Franco's adventure in 1939?

To this plea for prudence the Japanese Army may perhaps reply that it cannot be acted upon without renouncing almost all Japan's gains on the continent that have been so hardly won by her sacrifices up to date. So long as the genuine Chinese Government remains in being in the interior, the puppet Chinese Governments which the Japanese have set up in the occupied territories will be impotent to gain any hold upon the allegiance of their countrymen; and, even behind the Japanese lines, the countryside will remain in occupation of Chinese guerrillas taking their lead from Chungking. In such circumstances, the Japanese militarists may argue, Japan could only liquidate her continental adventure by way of a bargain with President Chiang Kai-shek, which could, and would, be driven very hard indeed by the undefeated champion of China's independence.

On these grounds, the Japanese Army may be resolved to make a final bid, however great the risk, for a decisive victory; and, though they have not yet carried their non-military colleagues with them, we cannot be sure that they will not gain the same fatal ascendancy in their country's counsels that Ludendorff gained in Germany in 1916-18. If the Japanese Army does succeed in extorting a free hand for itself, where may we expect to see its supreme effort made?

We may guess that, in this event, the Japanese Army will aim at cutting the last communications between the Chinese stronghold in Szechwan and its sources of supply for war material; and this indicates two lines of advance: an advance from Eastern Inner Mongolia towards Sinkiang—that is, from the north to the north-west—and an advance from Canton towards Yunnan—that is, from the south to the south-west. On this south-western front, the Japanese object would be to cut, at their points of entry into Chinese territory, first the railway from Haiphong, in French Indo-China, and then the new road from Burma to Chungking. Both the distance to be covered and the mountainous nature of the terrain would be likely to render this military operation particularly arduous, while the proximity to French and British territories would have what, from the Japanese point of view, would be the untoward effect of making France and Great Britain realise, more vividly than ever, the solidarity of their interests with China's. But we cannot assume that these formidable objections to the suggested plan of campaign will give the Japanese militarists pause; and it is therefore not out of the question that the final and decisive struggle in the present Sino-Japanese war—which ever way the scale may ultimately incline—will be fought somewhere in the trackless watershed between the upper basins of the West River and the Yangtze.

Powers for Supply

NOT until the Government's precise intentions have been revealed, in the promised White Paper and in next week's Parliamentary discussions, will it be possible to appraise the Ministry of Supply Bill fully and fairly. Meanwhile, the measure has sharply surprised the Government's critics. It has become a commonplace for Mr Chamberlain, first, to resist all important proposals for new measures, on the ground that they are needless and undesirable, and then, after months of obdurate and dangerous delay, to adopt them in part at least, commonly in haste and with misgivings; and it is by this familiar route that the establishment of a Ministry of Supply has come into sight. When the Prime Minister announced on April 20th the Government's decision to set up such a Ministry, he made it plain that the Minister's powers would initially be limited, and his statement scarcely prepared Parliament and the people for the remarkably wide powers of compulsion over industry envisaged now in the actual Bill. This time it appears that the Government, compelled once more to act by the pressure of events and public opinion, contemplate going much further than some of their critics had hoped for; and already, in quarters most vocal in their earlier appeals for a Ministry of Supply, fears are expressed that it is the Government's intention to institute an economic dictatorship.

Such fears are probably ill-founded. In general the institution of a Ministry of Supply, if belated, is timely and welcome and, in spite of the sweeping powers which may, in emergency, be given to Mr Burgin or his successor, it is far from likely that any undue coercion of private enterprise is for the present projected. Of the need for a Ministry of Supply, armed with full powers to secure the prompt execution of Government orders without the disorganisation of industry or inter-departmental friction and rivalry, there can now be no doubt at all. The magnitude of the defence programme already in operation necessarily means that certain essential raw materials and types of labour, employed for both civil and armament purposes, are likely very soon to be in short supply. It means, too, that at a very early date there will be an imperative need for new or converted industrial capacity to work on Government orders; and it means that the accumulation of stores of materials, plant and equipment is imperative. To satisfy these inescapable requirements is the clear task of a Ministry of Supply; and it is no criticism of the Government's Bill that it outlines wide powers to achieve these objectives. Unless the nation's resources can be controlled and directed by some central authority, to the end that the defence programme may work smoothly and well, grave bottlenecks, costly delays and expensive increases in price will inevitably arise. The minimum duties of any Ministry of Supply are twofold: first, to ensure the prompt delivery of all goods needed, directly and indirectly, for national defence; and, secondly, to obviate so far as possible the likely inflationary consequences of the Government's gigantic spending.

It is not yet certain how far the published Bill promises these powers to Mr Burgin now, though it is obvious that the measure makes possible the authorisation of duties unprecedented in times of nominal peace. The authority to be given to the Minister of Supply, in fact or *in posse*, falls into two categories. On the one hand, there are certain so-called permanent powers—for the most part, it would seem, to be held in reserve for the present—which involve practically blanket authority to secure the supply of "any articles required for the public service," such supplies including not only the normal present requirements of the Service departments, but also all materials needed for the maintenance of essential industries in war-time, reserve

stocks of materials, plant and machine tools and, in brief, all articles required by any Government department for the discharge of its functions. These are the full powers of a war-time Ministry.

On the other hand, there are certain temporary powers to expire, like conscription, in three years' time. These temporary powers are themselves far-reaching. Under them the Minister will be authorised to compel contractors for any of the Government services to deliver goods ordered or to carry out works required; and, moreover, it will be possible for the Minister to compel suitable firms to accept Government orders and to adapt their production and plant accordingly. In the case of contractors, industrialists and business men who show themselves unwilling to accept the Minister's fiat as binding, the new authority will be empowered to put in "controllers" to operate concerns in the national interest, and there will be similar powers to force undertakings to store the plant and commodities likely to be needed for the defence of the realm. With the similar authority to require protection against air raids for essential businesses in war-time the temporary powers of the Ministry add up to formidable powers of coercion. They include the power to requisition and commandeered space for the storage of essential reserves and to fix prices—though, inevitably perhaps in nominal peace-time, the machinery of arbitration proposed to settle prices in case of dispute between contractors and the Ministry is much less arbitrary, and very much more cumbersome, than the obligatory costing by Government accountants practised in the last war. Price-fixing carries as a necessary corollary provisions for compensating industry for expenditure undertaken solely to meet the Government's requirements. A grant of 27½ per cent. will be made towards the cost of A.R.P. work—the proportion being chosen as equal to the standard rate of income tax. This is not over-generous, but just, seeing that though the work will be done upon Government instructions the object will be to protect private property. On the other hand, criticism has fastened on the fact that industrialists are not to be guaranteed against loss on plant which they build for the Government.

In sum, the temporary powers of Mr Burgin will enable him to secure priority for Government orders, not only in production, but also in storage. But this in itself may not prove sufficient; the Minister will be enabled to compel industrialists to give priority to defence work, but he will apparently have no authority to work out the schedule of priorities he is to enforce. He is to be an agent and not a director. Moreover, it is to be remembered that, in the last war, it was not primarily by the use of its priority powers that the Ministry of Munitions ensured full and prompt supplies, but rather by its complete control over raw materials, which gave the Ministry a compelling sanction to require industrialists to work to orders.

It was Mr Chamberlain's statement of April 20th which gave some clue to the probable extent of the use of the wider permanent powers, which might, in the very broad interpretation of clause 18, include control over all essential raw materials. Quite explicitly he stated that, in the first instance, the new Ministry of Supply would be restricted to the problems of Army supply which have become so enormous in recent weeks, with the doubling of the Territorials and the creation of the militia. According to the Bill, the extreme permanent powers detailed will only be given to the Minister in cases where the supply functions of Government departments have been specifically transferred by Order in Council; and the presumption is, according to the Prime Minister's speech, that the Ministry will at first be confined to dealing with supplies for the expanding Army, to the accumulation of essential reserves and food-

stuffs (in place of the Board of Trade under the Essential Commodities Reserves Act, 1938), and to the supply of materials to other departments, such as Civil Defence, according to the former responsibility of the War Office. In fine, unless the Government's conversion has been more whole-hearted than Mr Chamberlain forecast just over a month ago, the immediate focus of the Minister's authority will be Mr Hore-Belisha's overtaxed department and the supply functions which it already exercises; and the immediate general duty will be to secure priority for Government orders.

An important point is that the term "priority" can have one of two meanings. In the first sense it can mean that Government orders should have priority over the demands made by domestic or export business upon industries; and in this sense the new Ministry will apparently have authority *ab initio* to requisition the use of plant and materials, which will be a notable step forward. Secondly, it can mean priority between the claims of different Government departments; and it is here the new Ministry's powers may prove to be deficient. Priority between the service departments is, so far as can be judged at present, to be secured by the magic process of "consultation"; and there is to be a Ministerial Priority Committee to which the Minister's powers in this respect are to be strictly subject. Central control may very well be frittered away in fact by inter-departmental "co-ordination."

Yet it is sheer nonsense to say, as Dr Dalton said at Southport, that the projected Minister's powers are "meagre," and it is equally false to describe them as dictatorial powers calling for extraordinary watch and ward. Immediately, they are designed, with some wisdom, to meet the needs of the expanding Army. Potentially, they are devised to satisfy the requirements of all the competing Government departments. The doubt is whether they are to be too restricted at first, not whether they are too complete. Practical expediency may well have dictated that the new Ministry should be confined, in the first place, to Army needs. But if so, there is still need for a body to plan,

before war breaks out, and to exercise, after the outbreak, the fullest control over the apportionment of the nation's resources. There are some grounds for uneasiness. It is the avowed official view that it will be desirable for the Minister to hold most of his powers "in reserve," and to proceed by voluntary co-operation, in spite of the fact that present problems are mostly too large and pressing to be solved simply by "gentlemen's agreements." It is scarcely promising that Mr Burgin, with little reputation for enterprise and initiative and more direct knowledge of the verbal compromises of the law than of industrial problems, should have been chosen as the Ministry's chief, with only a small staff. It is a sign of half-heartedness that all the evidence should point to a sharp limitation of the Minister's powers at the outset of his work.

The real test of the new Bill will be the extent to which and the way in which it is applied. But it is a distinct tribute to the practical wisdom of the Government's critics that the remarkably wide scope of the needed Ministry should have been drafted in such unmistakable terms. The Government seem at last to have realised that the institution of a Ministry of Supply, which they have opposed on the ground that it would slow down output at the outset and injure the export trade, is imperative for precisely opposite reasons; it is to speed up supply that it is wanted; and it is the fact of re-armament, not the efficient provision of arms, that threatens exports. The Government have for the moment evaded the delicate task of securing the best allocation of scarce skilled labour. They have done this for obvious political reasons, but control over labour cannot be avoided, and it is the duty of employers and trade unions to step in here and now to assist in this essential apportionment. Meanwhile, the Government have adumbrated the outlines of an indispensable measure, and it is for the Opposition to help to make it workable and really effective, rather than to meet it with resistance or party scorn. The substance of the Supply organisation needed is in the Bill, though it may be the shadow only that it is intended to display at first.

The Fight for Roumanian Trade

FOR those who regarded from afar, the German-Roumanian trade treaty was a nine-days' wonder: even without the sinister rumours of an ultimatum by which it was said to have been preceded, the notion of Roumania's economy being fitted into Germany's without so much as a by-your-leave from the rest of Europe, was sufficiently abrupt and disturbing. Upon a nearer view the treaty seemed less wonderful: and a close inspection has convinced most neutral observers that as a means of binding Roumania to Germany the treaty "simply wasn't true." But even if due allowance is made for Roumanian reluctance to become an intimate part of Germany's *Lebensraum* and for an inherited ability to procrastinate until all's blue, the fact remains that the emissaries of the Reich are losing no time in trying to realise the provisions of the treaty.

They have obtained mining and oil-drilling concessions in the Bucovina, in Transylvania, the Dobrudja, and the Roumanian plain. They are preparing to manufacture artificial textiles in the Danube Delta, to erect flour mills at Braila, to develop and reorganise communications, to build a power station on the Bega canal at Timisoara, to direct the marketing of Roumanian produce, to penetrate into every branch of commerce. Under the terms of the treaty Germany is awarded "free zones" within which her industrialists may manufacture what goods they please; and, since the treaty mentions no localities, the establishment of "free zones" wherever it would suit Germany's book is not ruled out of the possibilities. Important contracts

had been made even before the signing of the treaty. Some six months ago the Roumanian Government concluded a contract with the Muehler Industrie A.G. of Magdeburg for the construction of wheat silos to the value of 15 million Reichsmarks, or about 615 million lei. On May 13th the Director of the German Forestry Department and the Roumanian Minister of National Economy signed an agreement granting to Germany certain rights in the exploitation of State forests, and in view of the uneconomic stripping of timber which has been done in the past this is likely to prove of importance. Obviously the gains are not all on one side.

In negotiating with Roumania the German authorities (as has been pointed out in previous articles in *The Economist*) have two strong suits: the leading position which they already hold in Roumania's foreign trade—at least 45 per cent. passes through German hands—and the high prices which they are willing to pay. Even so, there is in Roumania a growing realisation, though one restricted to those who deal in foreign trade, that this very policy of high prices, on the surface so favourable to the Roumanian producer, is likely to secure for the Germans one of their principal aims: that is, the stunting of Roumania's industrial development. In a country with a natural increase of 11.7 per thousand per year, its economy adjusted to cereal farming and its urban development small, a gradual trend towards industrialisation promises to be the only relief of an over-population which is becoming ever more acute. It is the Germans' aim, however, that Roumanian

shall remain a country given over to arable farming and the incidental production of minerals and oil: there is no place for industrialisation in their scheme of things. Nor is there offered any solution for the problem of rural unemployment, for the future of those who have drifted, and are drifting, into the towns.

It is interesting to speculate upon what may be the far-reaching effects of German trade policy. To begin with, the policy of high prices is not the simple benefit it seems. According to indices of prices compiled by the *Argus* newspaper of Bucharest from statistics published by the Roumanian Ministry of Finance in July, 1938, the terms of trade which German price policy allows are nothing like as favourable as export prices suggest. Based on 1912, with imports calculated c.i.f. and exports f.o.b., this index shows the average of all import groups at 4,146, and the average of all export groups at 2,432.

Another significant fact is the steep rise in the Roumanian cost of living. According to the Central Institute of Statistics, this increased in Bucharest by 25.7 per cent. between February, 1937, and February, 1939, and by 49 per cent. in comparison with July, 1934. It is an observed fact that the *per capita* consumption of meat and sugar, textiles and articles of clothing is declining, and this trend is borne out by available indices of real wages.

It is very evident that the German policy of buying large quantities of produce at high prices, supported as it on the Roumanian side by generous export subsidies to the free-exchange countries, is having the double effect of creating a shortage in the home market and (all the more, therefore) of an increase in the cost of living. This increase falls hardest upon the towns, and in turn the effect of this is to stifle urban activity or, in other words, industrial development. The Germans would thus seem to be achieving their end of keeping Roumania a purely agricultural country, while enjoying the advantage of satisfactory terms of trade and without incurring the odium that would fall on them if the effects of their policy were generally realised in Roumania and elsewhere. To present the full scope of that policy it is necessary to add that one of the Roumanian Government's dearest wishes is to secure as soon as possible a measure of re-armament. At the same time, the budgetary situation will not allow a policy of free spending, even if, as is manifestly not the case, the Roumanians could put their hands on the necessary foreign exchange. Germany, therefore, is able to offer the additional bait of an immediate supply of armaments. If it wants to buy elsewhere the Government is forced to make rigid economies at home; to some extent this is being done, and it is not surprising that the burden of taxation is becoming heavier, as the table at the head of the next column, compiled by the Trade Cycle Institute of Bucharest, shows.

Alongside this crippling effect on the towns the policy of high prices has a parallel but contrary effect upon the countryside. The Roumanian peasant's purchasing power is becoming stronger, and although it will be a long step before he feels himself in circumstances which the most

imaginative could describe as "easy," the time is approaching when the Government will have to busy itself with the

DEVELOPMENT OF PRINCIPAL SOURCES OF TAXATION
(Millions of lei)

Year	Direct Taxes	Indirect Taxes	Stamps	State Monopolies	Administrative
1934-35	3,610	6,711	2,180	4,580	1,721
1935-36	4,132	8,742	2,428	4,841	2,188
1936-37	4,434	11,504	3,126	5,021	1,796
1937-38	5,176	13,251	4,076	5,416	2,245
1938-39	7,869	14,586	4,896	5,459	1,395
% Increase of 1939-40 over 1938-39	+7.9	+10.6	+6.4	+16.1	+24.7

supply of cheap consumers' goods.

In recent years the development of Roumanian industry has been comparatively rapid in spite of uncertain political conditions at home and abroad. According to indices compiled by Professor Madgearu, and lately published as part of a valuable historical survey,* the production of consumers' goods has increased considerably since the economic crisis:—

Year	Manufactures	Textiles	Leather	Metal Goods	
				Semi-manufactured	Steel Sheets
1929	100	100	100	100	100
1932	81.8	129.2	115.4	50.5	66.1
1937	137.4	170.1	132	156.1	135.3

It may be presumed that Roumanian industrialists will do all they can to maintain this rising trend, and that the measures of economic help which the British Government is in course of granting, notably those concerned with the development of an Anglo-Roumanian trading organisation, will play a useful part to this end.

But it is clearly necessary to the German plan that the trend shall not continue and that the Roumanian peasant shall be supplied with the consumers' goods he should soon be able to pay for, from factories situated either in the Third Reich or in German "free zones" inside Roumania. There is, however, one important snag in carrying out this intention. It is not only in her imports that Germany sets her prices high. Roumania is compelled by the clearing mechanism to import from Germany to the value of her exports and advantage is frequently taken of this to exact high prices for German goods. The steep rise in the peasants' purchasing power may thus be largely offset. If that is so, then the end-products of close relations with Germany may be a lower real standard of living in the country as well as in the towns—unless Roumania can persuade Germany to adjust her prices to straitened Roumanian pockets. Since the Government is an urban institution, this course is likely to be chosen. If the Germans refuse to lower prices then there will follow widespread discontent and that sabotage of time-tables at which the Roumanians can be past-masters, while if the Germans do agree to lower prices then Roumanian export prices will also fall. Eventually, this will mean that Roumanian exports will be able to compete, unsubsidised, on world markets. If the speculation is not entirely fanciful it may be true to say that the German authorities, having forced Roumania into her present position of economic dependence, will be themselves forced to weaken their hold, or, alternatively, drastically to strengthen it.

* "La Politique Economique Extérieure de la Roumanie (1927-38)." By Virgile Madgearu. Centre de Hautes Etudes Internationales, Bucharest.

NOTES OF THE WEEK

Britain and Russia.—In admitting that the latest British proposals recognised the "principle of complete reciprocity" M. Molotov is generally thought in his speech on Wednesday to the Supreme Soviet Council to have committed the Soviet Government to the signature of a defensive alliance with Great Britain. His speech was not decisive, however, and the greater part of it was taken up with voicing once more Soviet doubts of British sincerity and the fear that we may be seeking to deflect rather than to resist aggression in Europe. M. Molotov recalled Stalin's precept that they "must be cautious and not allow our country to be drawn into conflicts by warmongers who are accustomed to have others pull the chestnuts out of the fire for them." The Soviet Premier laid down three basic conditions: that the mutual assistance pact in prospect should be of "exclusively defensive character" in contrast to the offensive character of the Italo-German military alliance; that British, French and Soviet guarantees should be given to the States of Central and Eastern Europe "including all the countries bordering on the U.S.S.R. without exception" (in Europe); and that the measures and procedure for rendering assistance should be made precise. To all this, in effect if not specifically, the British proposals are understood to have agreed, conditionally on the military measures to be taken being in harmony with the principles which direct Article 16 of the League Covenant. The single specific exception, as far as can be seen, is that no guarantees have been offered to the Baltic States of Latvia, Estonia and Finland, through which the Soviets fear German attack. In regard to this M. Molotov said that "the Soviet Union cannot assume obligations to the five countries mentioned (for which Anglo-French guarantees have already been provided) unless it receives the guarantee in regard to the three countries situated on its north-western frontier." Which five countries M. Molotov had in mind is not clear from his speech; presumably he was thinking of Poland, Roumania, Turkey, Greece, and Belgium. It is important to note that the Baltic States have made it clear that they would prefer not to be guaranteed, since they wish to remain neutral under all circumstances short of an attack upon themselves. Estonia and Latvia are at present negotiating a non-aggression pact with Germany which they regard as complementary to that signed many years ago with the Soviet Union. They would probably be prepared to welcome a triple declaration recognising their neutrality on the part of Britain, France, and Russia; but they would be reluctant to go further than this.

It must be admitted that the British Government has given the Soviets every excuse for feeling suspicious; but it is difficult not to feel that M. Molotov's speech, so far as it was more than a preparation of an entirely uninformed public opinion for a new step in foreign policy, took up a bargaining stand that cannot be justified by the facts. It is, after all, essential to the spirit and intention of the Peace Front that no coercion should be applied to small States which would prefer to conserve their neutrality, if they can, outside it: Finland, Estonia and Latvia come into this category. If the British proposals contained ample guarantees of mutual assistance—and they are reported to have been very full and precise on this subject—then the Soviet Government is opening itself to the charge of exaggerated caution. Since there is no question of what Baltic statesmen have referred to as "preventive aggression"—an occupation of their territory by the Peace Front powers in order to prevent German invasion—there is a lack of substance in M. Molotov's plea that these States could not defend their own neutrality if attacked, and must therefore be guaranteed. If, on the other hand, the British proposals did not contain sufficient guarantees of mutual and immediate assistance were the U.S.S.R. attacked, then M. Molotov would hardly have conceded

that the principle of reciprocity had been recognised by them. The British Government have gone a long way to repair the errors of the past. The Soviet leaders would be ill-advised to try to extract too much purely Russian advantage from the strong bargaining position in which the mistakes of British diplomacy have admittedly placed them.

Common Sense at Southport.—Last year certain changes were made in the mode of election to the Executive of the Labour Party with the object of increasing slightly the influence of its non-trade union elements. The Whitsun conference of the party at Southport showed that there has in fact been little or no alteration in outlook and policy; as a body the party remains slow moving and conservative, and its decisions on important issues are still determined by the cautious common sense of the trade unionists, seen last week-end at its very best in Mr Bevin's appeal for a constructive colonial policy. At Southport the conference was faced with difficult decisions, and, on balance, they were wisely made. Labour's complaint against the Government in the last year or so has been that their foreign policy has lacked strength and firmness; yet, now that a programme of collective resistance to aggression has been begun, the members of the Labour Party do not find it easy to accept the new policy's full implications. Reluctantly in past years they have come to recognise the need for drastic re-armament; with similar misgivings last week-end they decided not to oppose conscription by extra-Parliamentary means or to boycott the Government's national defence schemes. Their decision was grudging but their judgment was sound. In fact, the keynote of the conference was distrust of Mr Chamberlain and his colleagues rather than real dislike of their policies.

Opposition Unending.—There was no inclination on the part either of the Executive or of the great majority of the rank and file at Southport to face the fact that the present odd situation, in which the Government, permanently ensconced in office, is the only medium whereby the Opposition's own policies can be put into practice, is largely Labour's own fault. The due operation of the Parliamentary system depends upon the permanent possibility that the Opposition may be chosen by the electors to replace the Government in office; and at present there is no chance at all of this happening. The doctrinaire platform of the Labour Party has too restricted an appeal for the party's duty to win a majority from time to time to be carried out; and the leaders of Labour, in their refusal to co-operate with other political groups to put forward a policy with which they admittedly agree and which would gain the support of a very large part of public opinion, are seemingly content to escape the responsibility of Government and to retain as a sinecure the task of Parliamentary criticism. The never-ending Cripps episode is only important because it illustrates this complacency. It was not surprising that the Southport conference voted overwhelmingly against Sir Stafford, even though all he asked for was the democratic right to put forward his own opinions about the Popular Front within the frame of party membership; the Executive had made the issue a matter of confidence; and the volatile nature of Sir Stafford's past programmes and allegiances, illustrated once more by his request after the conference's vote to be re-admitted into the party on the Executive's own terms, was too well known for his present position to be made the occasion of a grave party split. Yet Sir Stafford has his finger on the reasons for the party's fatal impotence, and it is at moments like these, when Labour's somewhat dictatorial leaders place rigid doctrine and strict ritual above all

other more important considerations, that it is least possible to take His Majesty's Opposition seriously.

* * *

The New Army.—It has taken only a few weeks to carry through a revolution in Britain's military arrangements without precedent in peace-time. This week-end the first 200,000 men aged between 20 and 21 who are liable for militia service under the Military Training Act will register at local employment exchanges. Next week the medical examinations will begin and on July 1st the first notices for service will be sent out. Simultaneously the calling up of Territorials and Reservists for extended training will commence, and from next month onwards this country will wear a war-like guise never before seen except in actual war-time. The country's response to these unfamiliar changes has been impressively willing and resolute; and not the least reason why no bitter struggle has been waged to preserve intact the voluntary system and to resist the break with tradition that the new militarisation represents has been the Government's insistence on the fact that this phase, though absolutely necessary now, is to be only temporary until the danger passes, and their striking readiness to recognise and meet all cases of hardship and difficulty. Conscientious objectors are not to be persecuted but provided for simply by being required to spend their period of compulsory training on work of national importance instead of in camp or barracks. Agricultural labourers and miners will only be called up when their absence will be least injurious to their industries. Students are to be enabled to put off their training until immediately after graduation or, in future years, to anticipate it by serving before entering college. The conditions of militiamen are to be carefully safeguarded: wisely it has been decided to put none in overcrowded tents but to instal them in hutments until barrack room is ready; sensibly, too, it is intended to allocate their types of training as closely as possible to their capacity, experience and interests.

* * *

Only in one minor way is the making of the new Army, militia and Territorial, encountering appreciable day-to-day difficulties. Large firms which have hitherto willingly paid wages to Territorials in training are not unnaturally alarmed at the greater commitments now involved; and some have chosen to invent rather disingenuous reasons for limiting their liability. One of the oddest is the decision to pay wages to employees in camp only if the branch of service they have joined involves personal risk in war, a criterion which involves startlingly confident forecasting of the strategic disposition of the Territorial Army in the next war.

* * *

Staffing the Forces.—The institution of militia service, the doubling of the Territorial Army and the lengthening of training for all reserve and auxiliary forces represent the Government's decision, not only to man home defences continuously and with trained personnel, but also to build up the nucleus of a very considerable Expeditionary Force for use in Europe. Their net effect is to require sweeping changes in army organisation because of the demands they create for training and supplies, and on Wednesday a number of very significant and important appointments was announced. The two posts of Inspectors-General of the Forces, which existed before the war, are to be revived. General Sir Edmund Ironside, as Inspector-General of the Oversea Forces, will be responsible for the higher training of the Regular and Territorial Field Forces, for liaison with foreign staffs and for preparing the dispatch of an Expeditionary Force abroad; he may very well command that Force. General Sir Walter Kirke, as Inspector-General of the Home Forces, will be responsible for the basic training of all troops at home and, especially, for the militia. Within the War Office itself a new department will be created to make reports and returns to enable the Army Council "to obtain a clear view of the main

present and future requirements," and Mr H. A. Fortington, as Director-General of Progress and Statistics presiding over this department, will have a key position in the vast reshaping of military arrangements which the creation of a New Army has made immediately needful. The Army to-day is, in quite a new sense, the spearhead of Britain's armed might at home and overseas, and it is welcome that wholesale changes can so readily and speedily be made.

* * *

American Neutrality Laws.—The long debate inside and outside Congress on the revision of the existing Neutrality Act had, by last week, reached such a state of deadlock between the manifold plans and the even more numerous opinions, that the Secretary of State judged the moment ripe for intervention. Mr Hull's plan has five points: (i) prohibition of American shipping from entering combat zones; (ii) prohibition of American citizens from travelling to those areas; (iii) goods to be sold only for cash; (iv) prohibition of loans or credits to belligerents and the collection of funds for them; (v) licensing of exports of arms by the Munitions Control Board. This, it will be seen, is "cash and carry" in its full form. It differs from the existing Act in permitting the export of actual munitions to those who can pay for them and take them away, but it resembles the existing Act in refusing to accept any distinction between aggressors and their victims. The fact that "cash and carry" would benefit France and Britain against Germany and Italy is as incidental as the fact that it would benefit Japan against China. Whether this plan will reach the statute book is by no means certain, but it is a salutary check on British estimates of the trend of American policy to realise that nothing less strictly neutral than this has a chance of successfully running the legislative gauntlet. Policy, in fact, is still a long way removed from articulate opinion. Mr Hull himself demonstrated this in a speech which was delivered at almost the same time as the presentation of his neutrality plan. For though Mr Hull proposes to treat innocent and guilty alike, he yet tells the American public that there can be "no more disastrous illusion" than that isolation would solve the great domestic problems of the United States. American opinion is manifestly changing. But it has yet to convince Congressmen, who occupy a position in which they are much more anxious to avoid disapproval from strong minorities than to seek the favour of the majority—at least until it is unmistakably expressed. Any change in American foreign policy will have to follow the course of the movement to repeal Prohibition: it will be very slow and reluctant until the end, when it may well be accomplished overnight.

* * *

While America is thus trying to avoid entanglement in international conflict, war has broken out with renewed violence on two fronts at home. The latest attempt by the Administration to suspend the bitter mutual hatred between Business and the New Deal never looked very hopeful from the day it was given the dubious label of "appeasement." But it has now broken down. The Chamber of Commerce of the United States on the one hand, and the President on the other, have both reverted to their former stands, and though the Secretary of the Treasury, Mr Morgenthau, is still hopeful of finding some way of modifying some of the aspects of existing taxation to which business men take the most violent exception, it is becoming clear that there will be no general truce before next year's election. Conflict has also been resumed on the labour front. The recent coal strike and current trouble in the automobile industry hold out the prospect of endless strikes arising, not out of any disputes over wages or conditions of work, nor even out of the general principle of collective bargaining, but merely out of the desire of each of the warring factions of American Labour, the A.F.L. and the C.I.O., to oust the other. It is reported that these quarrels are leading to public disgust with labour. But there is scope for plenty of foolishness before public opinion effectively imposes its ban.

Turkey's Part.—In the now rapid and cumulative organisation of the Peace Front the Turks are playing a part of an importance commensurate with the key position of their country and with the upstandingness of their national character. In opening a congress of his party at Ankara, on Monday, the President of the Republic, General Ismet İnönü, spoke frankly and bravely. The Turks, he said, would never admit the right of big coalitions of Powers to overthrow smaller nations. To secure the independence of these latter had been, he declared, the purpose of the foundation of the Balkan Entente; and he then went on to speak of Turkey's relations with the three European Great Powers which, on this capital point, see eye to eye with their smaller neighbours. Turkey's relations with Russia, he said, were warmer than ever before—and this was a great deal to say, since Turkey and Russia have been allies since 1921, and it was the Russian alliance, more than any other external factor, that helped Turkey to save her national existence in the dark days after 1918. He spoke with equal warmth of the Anglo-Turkish agreement which is already an accomplished fact, and of the Franco-Turkish agreement which is on the eve of being concluded.

* * *

This speech by the head of the Turkish State gives us glimpses of the Turkish Government's diplomatic activity in several spheres. In the Balkans, Turkey has been doing much, in an unobtrusive but no doubt on that account effective way, to hold out a life-line to her partner Jugoslavia in her now dangerously exposed position. At the same time, Turkey has been using her influence with her neighbour, Bulgaria, who may perhaps be inclined to lend an ear to Turkish counsels, since these two Balkan neighbours have been in friendly relation ever since the close of the First Balkan War. Turkish warnings, if any, will convince the Bulgars that, if they were to repeat the diplomatic error of 1915, they would be courting a repetition of the military and political disaster of 1918. (The news that Russia is sending a trade mission to Sofia seems to show Ankara and Moscow working in concert.) As for the coming Franco-Turkish treaty, agreement in principle has, it appears, already been reached, and the transaction will be clinched as soon as the Sanjak of Antioch and Alexandretta (or, as the Turks now call it, the district of Hatay) has been handed over by France to Turkey in full sovereignty. This is rather a delicate business, since Hatay is part of the French mandated territory of Syria, and the Turkish element in the local population, though numerous and important, is only one of several elements which, all alike, have a claim to be assured of fair treatment. Juridically, the transfer cannot be implemented without the consent of the League of Nations. It is devoutly to be hoped that this affair of Hatay is not going to delay the conclusion of a Franco-Turkish agreement which will be the last link in a network knitting up France and Great Britain with Turkey and Russia.

The Problem of the Unemployed.—In his introduction to the recently published Report of the Unemployment Assistance Board for the year 1938, Lord Rushcliffe, the chairman of the Board, states that "It would be beyond the competence of the Board or the Advisory Committees to attempt any survey of the underlying economic causes of unemployment. Their concern is with the unemployed themselves, or rather with that section of the unemployed numbering at one time nearly 600,000, whose unemployment is chronic or prolonged." It is precisely the fact that the Board's aim is thus restricted which gives the present Report its main interest and importance. For it is the difficulty of providing occupation for a large class of youths who have never been trained in industry and of older men who are not readily accepted by employers which constitutes the most immediate knot to be untied in the unemployment complex. The main problem of the long-term causes of unemployment still exists. Indeed, it is very necessary at the present time to see that it is not aggravated by ill-considered measures to avoid the immediate danger of a shortage of skilled labour in re-armament—such as the importation of men into areas whose present industrial activity is almost entirely dependent on Government orders. But this is a matter which simply requires vigilance and the prevention of further mistakes. For the satisfaction of the needs of the present long-term unemployed more positive action is necessary.

* * *

The number of persons who have been unemployed for so long a period that they are not entitled to draw unemployment insurance benefit and are therefore applicants to the Board for assistance actually increased from 581,437 to 588,771 between December 13, 1937, and December 12, 1938. Over four-fifths were persons over the age of thirty whose numbers and proportion to the whole population cannot be expected to decrease, but it is stated in the Report that practical reasons have led to particular attention being given in the past year to the special difficulties of the 100,000 male applicants aged thirty years and under. These difficulties are indeed acute. About 58 per cent. of the young men included in the inquiry had no employment or less than six months' employment in the three years preceding October, 1938. A small proportion of the total number were kept in a state of fitness for employment at Government training centres, instructional centres and local training centres, but except in the first-named case attendance did not materially improve chances of employment. There are further difficulties in the cases of men whose efforts to obtain work have slackened as their determination has been undermined by persistent unemployment, of the few who do not want work and, perhaps worst of all, the 8 or 9 per cent. of young applicants who were handicapped by mental or physical defects. The whole question of unemployment through ill-health requires particular attention. As many as 22 per cent. of the applicants for admission to instructional centres were rejected

on grounds of physical unfitness. Most of these have no access to remedial facilities, and the Board has no power to help them. This gap in our public health services might easily be filled by enlarging the amount of assistance obtainable through National Insurance Approved Societies or local authorities, or by enlarging the powers of the Unemployment Assistance Board itself. The question of the health of the unemployed is one of the few problems connected with unemployment to which a solution is clear.

* * *

Labour in Depression.—It is a false picture of a country's economic situation that is gained by concentration solely on unemployment figures. In 1938 Britain was in depression and, as the annual report of the Minister of Labour, which was published this week, shows, the average level of unemployment was some 166,000 higher than in 1937. Employment, too, revealed the recession: it was on the average 120,000 lower than in the previous year. But closer study of the employment figures gives remarkable results. Despite the depression, employment, which is a better index of economic activity than unemployment is of economic decline, was higher in 1938 than in any other recorded year except 1937. It was 2,130,000, or 20 per cent., higher than in 1924 and 2,000,000 higher than in 1932. The ground gained in the astonishingly steep recovery between 1933 and 1937 was not lost in the setback which followed, and the capacity of our economy to provide an increasing amount of work for its members, which promises now to raise employment to new record levels, was a conspicuous feature of the depression we have now left.

* * *

A Small Advance in Education.—The amount of progress which the Board of Education was able to show in 1938 for its estimate of £51,002,330, an amount which represented an increase of only £1,463,371 over the previous year, is commendable. The Report of the Board issued on Wednesday of this week records a further reduction in the number of schools on the "Black List," as having unsatisfactory premises, by 116 to a present total of 844, a fall in the number of classes having over 50 pupils by 546, a slight increase in the number of pupils in grant-aided secondary schools and a further reduction of the proportion of uncertificated teachers. In addition to these changes, which really represent the partial rectification of old abuses, there were signs of positive educational advance in the provision of better accommodation for technical education, and the adoption of recommendations of the Spens Committee on Secondary Education to the effect that candidates at the School Certificate examination should be given a wider choice of subjects, and that the "credit" system of marking should be abolished—a change which will probably entail the issue of a new type of certificate providing clearer information to prospective employers than the present Matriculation certificate. School medical and other welfare services show a slight all-round improvement, but the figure of 614,806 children provided with free meals or

milk, although representing an increase of 79,506 over the previous year, looks singularly unimpressive beside the 5 millions of the total elementary school population of England and Wales; and it should be improved forthwith by the persuasion or coercion of the handful of backward local authorities who still fail to exercise their powers to provide either free milk or meals for necessitous under-nourished children. In sum, the progress recorded in this Report represents a very slight advance when compared with the enormous amount which remains to be done before we can claim to have a satisfactory educational system. Progress towards the standard of 50 children in a class is only valuable as a preliminary step to classes of 30—an end to which the continuing reduction of the total school population will contribute. Improvements in senior elementary schools should be carefully compared with the much less satisfactory state of affairs in junior and infant schools. The adoption of one of the minor recommendations of the Spens Report must not obscure the fact that nothing has yet been done to fulfil its general proposal of secondary education for all. Finally it is unlikely that education will ever be extended at a satisfactory rate so long as it is necessary for the Board of Education to spend a considerable amount of effort in pushing forward reluctant and incompetent local authorities to the fulfilment of their legal duties.

* * *

Withdrawal of the Mercenaries.—The German "volunteers" have left Spain and arrived in Germany, to be received by Field-Marshal Goering with more than mercenary honours. The Italians are understood to be leaving over this week-end: it is a bitter comment on the double-dealing of the dictators that troops whose presence in Spain they long denied should now be triumphantly welcomed home. Without having any direct knowledge of the contest of wills which has resulted in these decisions, we may perhaps tentatively congratulate General Franco on having succeeded in evacuating, at so early a date, so considerable a proportion of his foreign auxiliaries. We may suspect the existence of long-standing Italo-German plans which cast these troops, and Spain herself with them, for an important rôle in coming attempts to achieve the ambitions of the Axis by force of arms on a world-wide arena. The Spanish Nationalists' interest in keeping out of a world war is as obvious as their allies' interest in implicating them, and General Franco himself is reported to have said on Tuesday that Spain would not indulge in any "mad adventures." But it is still too early to predict with confidence what may be the final outcome of this tug-o'-war. In the announcement of the imminent withdrawal from Spain of the Italian infantry there are three items of news which are not reassuring. In the first place, according to Italian reports, the whole of the military equipment of the Italian forces is to be left behind. This is a clear breach of the Mussolini-Chamberlain agreement, and it can have no good purpose since it is not to be imagined that a country in Italy's present financial straits will have made so handsome a gift to a foreign country without at least the expectation of some valuable *quid pro quo*. The second disquieting point is that the Italian airmen in Spain are to stay on for a time, after the infantry have left, in order to put their machines and other war material in order for handing over to the Spaniards. The third point is that no less than four battalions of Spaniards are to accompany the Italian infantry to Italy for the ostensible purpose of taking part in a victory parade in Rome. Since the numbers seem disproportionate to the alleged object, it is feared that the ultimate destination of these Spaniards may be Libya. One can see that, from the Italian point of view, one good turn deserves another. If Italian "volunteers" in Spain helped the Spanish Nationalists defeat the Spanish Republicans, why should not Spanish "volunteers" repay the debt by fighting for Italy in Africa? By one means or another the Axis Powers, if they do go to war with the rest of us, may be expected to exert themselves with might and main to pull Spain in after them, as Germany did succeed in pulling Turkey in after her in

1914. Turkey's experience then is no doubt one of the causes of her present, very different, policy. Here is a lesson for Spaniards to read and take to heart.

* * *

Moderation Fails in Hungary.—Hungary's political course was set with the signature of the Munich Agreement. Those who had thought that moderate Hungarian opinion in time might be able to shift that course away from the Axis received a final disproof with this week's general election results. The extremist parties in more or less complete sympathy with National Socialism have increased their representation in Parliament from three to 43 seats, partly by the recent disenfranchisement of Hungarian Jews (which accompanied the new electoral law under which polling is secret for the first time), and partly by alarmingly strong support from the working-class of Budapest. Out of the total number of 260 seats, the Government won 180—leaving over 30 to the Left and agrarian opposition parties—but this apparent strength is heavily qualified by divisions within its own ranks. It is notorious that an influential section of the Government group sympathises with the extremist parties. This section will therefore have to consider whether to compromise with the moderate elements which compose the Cabinet or, if that will not satisfy them, to strike a bargain with the Nazis. A number of them, and notably M. Imrédy, the late Prime Minister, have already shown readiness to borrow the Nazi programme as the instrument for their assumption of power; now that the Moderates have suffered a serious defeat it would not be surprising if these Nazi sympathisers within the Government party came out openly for an extremist programme on the twin points of land reform and anti-Semitism. Meanwhile, the Government, scarcely affected by the elections, continues to strike up gallantly for a programme which, although differing little in substance from that of the extremists, is at least to be carried out according to Hungarian notions of decent conduct. To the extremists they oppose, first of all, a tentative scheme of land reform and anti-Jewish laws tempered by dislike for these measures; secondly, complete adherence to the Axis and the argument, used only this week by Count Csaky in the course of a speech at Sopron, that "Germany is not willing to sacrifice Hungarian friendship for the sake of propagandists who meddle in our internal affairs." But however well-meaning the Government may be at heart, moderation inside Hungary is likely to disappear just as surely as moderation in Hungarian foreign policy has disappeared.

* * *

The Londoner's Fares Increased.—The Londoner—and for the purpose of the London Transport Act of 1933, that description applies to any person living up to 30 miles from Charing Cross—will pay more for his travel from June 11th. Last Friday's decision of the Railway Rates Tribunal to grant the application of London Transport and the main line companies for a basic 5 per cent. increase in charges in the London area will hardly be welcomed by the traveller, although, as the recent proceedings before the Tribunal suggested, it was difficult to contest its inevitability if transport services are to be efficiently maintained in the area, and are to provide a reasonable return upon their capital. The general principles upon which fares will be increased must also be regarded as reasonable. The Board inherited numerous anomalies from its constituent undertakings, and opportunity will be taken to smooth them out. Not all adjustments in fares are upwards, moreover. In the process of eliminating halfpenny fares on the Board's railways, for example, some 34 fares will be reduced and 100 increased. Some existing long fares—such for example, as the penny stage of 2.16 miles on one of the Board's tram routes—will be adjusted. On the other hand, passengers on the Stanmore branch of the Metropolitan system will enjoy an appreciable reduction in rates. The general intention is to increase season ticket rates only

where they are unduly low in relation to ordinary fares. The Tribunal's judgment wisely recognises the hardship which the fare increases will inflict upon a substantial number of travellers, although it does not regard this point as one which should affect its decision. This view, expressed on the first occasion on which proceedings have been taken under the London Transport Act of 1933, is of considerable importance. Yet, regarded in a broader context, the cost of travel has important social and economic implications. If it is true that London should pay for the transport facilities which it demands, it is no less true that higher transport costs may tend to deter travel in the London area. Marshall's clerk, who had to weigh carefully the expenditure of a further penny in addition to his usual threepenny fare and decided to walk, is no figmentary figure in London to-day.

* * *

New Forest Planning.—The special problems which arise from the necessity to co-ordinate planning schemes in contiguous districts have given rise to an important innovation in the New Forest area. Following an initiative taken by the Forestry Commission last November, an informal committee was set up, consisting of the planning officers of six local authorities, together with representatives of the Ministry of Health and the Forestry Commission. The report of the committee, which will shortly be published, represents an advanced step in the evolution of a national planning scheme. The main significance of the experiment lay in the fact that its subject was an area in which many preliminary difficulties had been removed through the fact that the New Forest is permanently secured as an open space. The committee was therefore able to turn its attention to the more advanced problems of (1) preserving the character of the Forest, (2) limiting the growth of villages within its boundaries, (3) making all possible allowance for the healthy growth of neighbouring urban areas such as Southampton and the belt of small seaside resorts between Christchurch and Lymington, and (4) making adequate provision for through traffic crossing the Forest. All these are legitimate claims which must be met, and the committee's conclusion that their co-ordination is only fully obtainable by a single permanent planning body must command immediate assent. The present temporary committee has also made a number of incidental contributions to planning as such by specifying the categories in which supervision must be applied as (1) buildings, (2) vehicles and road works, (3) people, (4) overhead wires, and (5) advertisements, and by stating unequivocally that in order to check these potential dangers to rural peace there must be no unplanned alteration of the present conditions. This will involve definite undertakings not to widen roads which carry local traffic only and to limit development and building in villages and hamlets—in short, rural stabilisation.

THE WORLD OVERSEAS

The Difficulties of Germany's Railways

(From Our Berlin Correspondent)

THE Reich Railways, which, with the liquidation of the restrictions placed on the German Reich by the Peace Treaty, were transformed from a private undertaking to an undertaking *sui generis*, may be said to represent the largest traffic enterprise in the world. They have now reached a critical period in their working; and last year their operation was considerably affected by the annexations of Austria and the Sudetenland, and by the military measures which were then taken. Their capacity was heavily overtaxed, not only by the inclusion of these territories but also by increased construction in Germany itself, mainly of fortifications, and by the carrying out of the Four Year Plan. The result was traffic disorganisation, a severe shortage of carriages and wagons, delays and accidents (which were increased by floods in Silesia and heavy snowfalls). At times the shortage of wagons was so acute that the provision of fuel for cities and industry was endangered; the Reichsbahn reckons that there are 70,000 wagons too few at the present time. In order to minimise the difficulties, the Reichsbahn has discontinued numerous services, curtailed international traffic and confined many lines to carrying fuel wagons only.

The Reichsbahn system was increased by 17.4 per cent. in length, that is by 9,500 kilometres to 64,000 kilometres in all, by the taking over of the former Austrian Bundesbahnen and the Sudetenland railways, and by the inclusion of three privately owned companies. Since the newly acquired lines must be developed, and since domestic traffic shows a rising tendency in connection with the Four Year Plan, the Reichsbahn has been compelled to arrange an extensive building programme which will cost approximately Rm. 3,500 millions. In 1940-43, the Reichsbahn plans to acquire 6,000 new locomotives, 10,000 passenger carriages and 112,000 goods wagons and luggage vans. The present rolling stock of 25,209 locomotives (812 electric), 2,170 Diesel engine cars, 68,942 passenger carriages, 22,028 luggage vans and 650,229 goods wagons is quite insufficient for current traffic.

The increase in passenger kilometres worked last year was 17.7 per cent., and 12 per cent. in the Old Reich territory alone. For the first time, the proceeds of passenger traffic increased more than actual passenger operations; they rose by 20.7 per cent. The trend was different in goods traffic. The number of ton kilometres worked rose by 17.5 per cent., and for the Old Reich territory alone by 10.1 per cent. But proceeds increased by only 14.2 per cent. Receipts per ton kilometre fell sharply from 3.68 pf. to 3.56 pf., and, compared with 1929, receipts per passenger kilometre decreased by 21.5 per cent. and per ton kilometre by 21.9 per cent. The total receipts of the Reichsbahn in 1938 were still Rm. 200 millions lower than those of 1929, although Austria and the Sudetenland were included.

Special Rates and Fares

The reasons for the decline in receipts since 1929 were the lowering of the rates and charges during the depressed years, the many specially low rates for Government traffic (for the Four Year Plan, winter relief, and the Reich motor roads) and the loss of high-paying freights to road transport. It is mainly the carriage of bulky goods at low rates that the Reichsbahn has retained. Last year 70.6 per cent. of the goods carried and 72.7 per cent. of the passengers were transported at specially reduced rates; and of the proceeds from passenger traffic 60.2 per cent. came from special rates, and of those from freight traffic 50.5 per cent.

Receipts from passenger traffic and luggage in the Old Reich territory and the Sudetenland rose from Rm. 1,186.2 millions in 1937 to Rm. 1,332.5 millions in 1938, and from goods traffic from Rm. 2,393 millions to Rm. 3,153 millions. Miscellaneous receipts rose from Rm. 295 millions to Rm. 329.8 millions, so that the total receipts increased from Rm. 4,420.2 millions to Rm. 4,815.4 millions. Counting Austria, total receipts were Rm. 5,153.5 millions, of which

Rm. 1,432.3 millions came from passenger traffic, Rm. 3,355.5 millions from goods traffic and Rm. 345.7 millions from other receipts. But, while total gross receipts rose by 8.9 per cent., total expenditure rose by 9.2 per cent. In the Old Reich, including the Sudetenland, the cost of management rose from Rm. 2,209.4 millions to Rm. 2,462 millions, and the cost of maintenance from Rm. 1,004.5 millions to Rm. 1,136.5 millions, while only Rm. 786.7 millions were spent on renewals, against Rm. 791.2 millions in 1937. Including the payment of a tax of 3 per cent. of net receipts up to Rm. 4,000 millions, total expenditure was Rm. 4,505.1 millions, against Rm. 4,124.9 millions the year before.

The point is that renewals and replacements have fallen seriously behind. The system has been extended and renewal expenses have declined. Fresh investment is imperative, and the Reichsbahn can only finance a small part of the necessary programme from its own resources. The issue of a railway loan of at least Rm. 750 millions is expected in the autumn.

Not least among the railways' burdens are payments to the State. In addition to the 3 per cent. tax on net receipts under Rm. 4,000 millions, amounting last year to Rm. 120 millions, the Reichsbahn had to pay 9 per cent. of its net receipts over Rm. 4,000 millions to the Reich Treasury; this charge was Rm. 73.4 millions last year. And total payments to the Reich Treasury rose from Rm. 412.5 millions in 1937 to Rm. 480.1 millions—which is very remarkable when it is considered that many foreign railways need and receive actual Government subsidies.

Despite all these difficulties and charges, the Reichsbahn accounts ended 1938 with a surplus which had increased from Rm. 295.3 millions in 1937 to Rm. 310.2 millions (if a deficit of Rm. 58 millions on the Austrian system is not included). But there was no margin for anything like adequate repairs and renewals, and the surplus is far from representing a healthy and efficient state of affairs. If the railways are to play their needed part in the economic development of the Greater Reich, both for civil and military purposes, a very large investment programme must be financed and quickly carried through; and in the present circumstances of high employment and shortage of resources this will not be easy.

June 1st.

Fresh Government Spending in Sight

[FROM OUR NEW YORK CORRESPONDENT]

WHILE some of the signs which in the past have usually portended recovery have begun to appear, especially in monetary matters and in commodity prices, the latest weekly indices of business activity still show a tendency to sag. The prevailing view in financial circles is that the second half of the year will be better than the first, but the improvement that is anticipated is expected, by almost everybody, to be only "mild" or "moderate."

The Government is plainly dissatisfied with this state of affairs, and the indications are that new efforts at economic stimulation will be made before long. The present Administration has never been contented with a rôle of inactivity, and its recent passivity has already lasted for a considerable period. In the absence of some quite considerable change in the business situation, economic action by Washington at an early date seems almost certain.

A new programme of public expenditure is the action now being generally discussed. No details have yet been revealed, and probably they have not yet been decided, but various suggestions are being made. They include the lowering of

interest charges to home builders, purchase and lease by the Government of railroad equipment, a new public works programme of housing, etc., increased outlay on social security measures, a more vigorous programme of loans to small businesses, advances to home builders and the construction of public power generating plants. One rumour has even suggested that some portion of the \$1.8 billions of unutilised gold assets in the Stabilisation Fund might be used in this programme, but the President has shown a strong unwillingness to take such a step. These are unofficial guesses.

There are several reasons why moves by the Government to activate the economy should be under close consideration. One of the most obvious is political. Next year the Presidential election will be held; and, rightly or wrongly, the Administration and the party in office will be to a considerable degree judged by the state of business at the time of the nominating conventions and the elections. Whether or not Mr Roosevelt desires a third term (and there are reports that no decision has been reached) he would be only human if he at least desired to have sufficient influence to have a voice in naming his successor. Thus the President would doubtless like some assurance that business will be "good" next year. Extensive emphasis has been laid during recent years on the relationship between business activity and Governmental expenditure, and there is therefore a good political case for a fresh expenditure programme very soon.

Another more exclusively economic reason for renewed Government spending lies in the fact that State expenditure will fall away after the summer peak unless new plans are made. So far there are no signs of activity in the private field which might be expected to offset this forthcoming diminution in public spending and common sense seems to suggest that necessary steps should be taken to ensure the maintenance of investment and spending by public means.

The Failure of Appeasement

The fact is that a chief reason why fresh Government intervention in support of business should take the form of renewed spending is the apparent failure of other devices to assist recovery. A few weeks ago considerable attention was given to the so-called "appeasement" programme of the Government, which was intended to win over business men from their mistrust of the Administration. The long illness of Mr Hopkins, the new Secretary of Commerce; the intervention of the war scare; Chamber of Commerce resolutions reported annoying to the Administration; and the apparent impossibility of finding a formula satisfactory to a sufficient number of people: all these are given as reasons for the undoubted fact that "appeasement" has come to a standstill. It is true that a Tax Bill with some provisions pleasing to business is still likely to come before the Senate, but it is improbable that its scope will be very broad; and, similarly, various promised measures dealing with the railroad problem will at best be of relatively minor significance. Again, the high hopes that accompanied the settlement between the Tennessee Valley Administration and the Commonwealth and Southern about the latter's Tennessee property have lately been replaced by reports of further anti-utility moves by the Government. From all these signs it is plain that all the essential elements in the Government's policy of appeasing business have failed or not been successful enough to make any appreciable change. This being the case, Government expenditure to sustain business and employment, until effective means can be found to deal with the tax problem, the railroads, the utilities and so on, is widely called for.

The final and most elaborate and abstruse argument for fresh public spending is based on what is called the "mature economy" theory, which has been outlined in evidence before the Temporary National Economic (Monopoly) Committee. The theory is a variant of the oversavings theory: according to it, maturity in the economy means a lack of investment opportunities adequate to absorb savings; savings accumulate and economic stagnation results. Hence the Government must borrow and activate these funds. Whether or not so intended, the popularisation of this concept through the testimony and statistics presented to the T.N.E.C. during the past week could well serve as an introduction for a new expenditure programme.

Already it is reasonably clear that Congressional appropriations in the present session will substantially exceed the Budget estimates made by the President in his annual Budget Message last January. Although the appropriation for relief has not yet been made, it can hardly be smaller than that asked by the President; and the agricultural appropriation will be somewhat larger. There is thus reason to suppose that the deficit for the next fiscal year (beginning July 1st next) will be as large as that for the current fiscal year—now

expected to be about \$3.5 billions, compared with the estimate of \$4 billions made in January. The addition of a spending programme now would mean that next year's deficit would exceed this year's by a considerable margin.

May 22nd.

The End of France's Popular Front

[FROM OUR PARIS CORRESPONDENT]

M. FAURE, General Secretary of the Socialist Party, who favours the breaking-off of relations with the Communists and a policy of disarmament and appeasement, secured a majority of votes at the Nantes conference of the party against M. Blum, though a compromise resolution on the closing day modified this decision. And the *Union Socialiste Républicaine*, too, pronounced the Popular Front dead at their conference. M. Jouhaux, leader of the trade unions, admits that membership has fallen by 20 per cent. from the high levels of 1936; and, in general, there is a marked decline in militant labour politics.

The Communists refused to enter M. Blum's Cabinet after the Popular Front's electoral successes. And now the Socialists, victors of 1936 and the strongest party in the Chamber, have themselves put away the Popular Front. The two parties, Socialist and Communist, are more than ever electoral competitors. The position is oddly mixed. The financial policy of the Socialists failed, and the foreign policy advocated by the Communists has now been put into operation. The Socialists have a strong position in the Chamber, but their credit is not high and they are deeply divided. In three years their greatest political victory has been transformed into political defeat.

The truth is the success of the Popular Front platform in 1936 was mainly due to an explosion of protest against the financial deflation which the Moderates had failed to stem by devaluation or, at least, reflation. But the devaluation of 1936, which was not deliberately contrived, dismayed the middle classes and turned them against the Popular Front; and the "vicious spiral" of prices and wages did the same for the workers and the peasants. In September, 1938, the Socialists lost the battle of the general strike against the decree-laws. Eight months later they proved unable to do what they had done in 1936, that is, to become the rallying point of discontent. This powerlessness of the Left, coupled with the united sentiment of the country in face of foreign dangers, might well change M. Daladier's decision to postpone the elections of 1940. Meanwhile, the Socialists have put off until the autumn the conclusion of their Nantes conference.

Stock Exchange Revival Possible

If the Popular Front is dead, its great bogey, the Stock Exchange, is not very much alive. Since M. Blum went back into Opposition, M. Reynaud, who promised last year to collaborate with him in a Government of National Union, has made a great reputation as an able Minister of Finance. M. Reynaud lives on the errors of M. Blum: he measures the success of his financial policy by making statistical comparisons with the record of M. Vincent Auriol. Still, he is perfectly justified in emphasising that, whatever the reason, the franc is now stable in spite of much heavier military charges, and the public feels for the Minister of Finance that mixed sentiment of caution and surprise which the magician provokes. Hoarding goes on, for the public still hesitates, and the Stock Exchange is inactive. Transactions are very few. The share indices, apart from food, etc., still show a rise of up to 30 per cent. compared with 1938, while foreign stocks a fall of 15 per cent. Annual reports of industrial

companies, just published, show that important headway was made in 1938; and they say that in the first few months of 1939 there was a further increase of sales in both volume and value. The outlook for profits is promising, while the monthly statistics of new financial issues show a distinct improvement.

The creation of new companies and, still more, the increased issues of debentures are symptomatic. Provided that fresh international tension does not arrest business again, there is the chance that some companies, which have up to now financed their increased activity (mostly war orders) from repatriated capital, may re-enter the market in order to increase their financial resources which the depreciation of

the franc has depleted. This is all the more likely now that the attraction of lower rates of interest has been supplemented by the recent measures of M. Reynaud, which lowered taxes on issues which were intended for the improvement of industrial plant.

Meanwhile, whatever grounds there are for new hopes, the main fact is that the vicious sequence which led from budgetary deficit to Treasury crisis and monetary crisis has ended. The franc is now strengthened by the decrease in the import surplus (it was the equivalent of 83 tons of gold in the first four months of 1939, against 138 tons in the same months of 1938 and 216 tons in 1937) and by the increase in tourist receipts and by the return of capital. M. Reynaud's announcement of the funding of the short term foreign debt was helpful psychologically, too, and other steps taken by the Government, such as the strengthening of police powers over foreigners, the measures to arrest the declining birth rate and the rising strength of the Peace Front have fostered market confidence.

In such conditions, a revival of the Stock Exchange, where many stocks of first standing still yield 5, 6 and 7 per cent., cannot be excluded—that is, if there is no fresh international crisis. But, even if there is a crisis, so long as it does not actually end in war, its effects will probably be confined to the Stock Exchange, which will be a great and remarkable advance from the time when a political crisis immediately led to a monetary crisis.

New Elections and New Policies in Hungary

(FROM OUR BUDAPEST CORRESPONDENT)

AFTER prolonged discussions in both Houses of Parliament, the Jewish Bill finally passed into law on May 5th. On the intervention of the Heads of Churches in the Upper House against certain provisions of the original Bill, the two Houses finally reached a compromise. The amendments refer chiefly to the definition of a Jew; under the new provision Jews who have been converted to Christianity will be regarded as Gentiles after twenty years, provided that the conversion took place prior to January 1, 1939. The main provisions of the new law are the limitation of Jews to 12 per cent. of the total number employed in industrial or commercial undertakings and 6 per cent. in intellectual occupations. In addition, Jews are entirely barred from holding leading positions in companies, from being editors of journals or theatre directors. In the Whitsun elections, the electoral rights of Jews were regulated according to the new law, and only those had voting rights whose ancestors were in Hungary before 1867.

Parliament was dissolved on May 3rd, and the new elections took place at Whitsun, when, according to the provisions of the new Electoral Law, there were for the first time secret ballots both in town and country districts. The results of the elections brought a great majority to the Government Party, which won 180 seats from 260, but the "Arrow-Cross," the Hungarian Nazi Party, have won large successes by gaining 43 seats. The opposition, consisting of the farmers, socialists and liberals, obtained only 32 seats. The result shows an impressive advance for the Nazi sympathisers.

In the course of an election speech, the Prime Minister, Count Teleki, stated that Hungary would strengthen her economic ties with Germany and Italy. He emphasised that as Germany is Hungary's biggest customer, the Hungarian economy must accommodate itself to a certain extent to the requirements of the German market. But both the Prime Minister and M. Kunder, Minister of Commerce, gave, however, the most emphatic assurances that Hungarian industry would be safeguarded and that the reorganisation of the productive structure would not imply a concentration on agriculture at the expense of industry. And in another election speech the Foreign Minister, Count Csáky, stated that Hungary was anxious to maintain good relations with the Western Powers.

Industry and Agriculture

There can be little doubt that after the rapid industrialisation of the post-war era, the relative importance of agriculture must, under the new situation in Central Europe, again come more into the foreground. A reorganisation of agricultural production will in any case be necessary, since the present disproportionate subsidy on wheat production (maintaining the internal price of wheat at 20 pengös, or 16 shillings per quintal) cannot be continued for ever.

The internal industrial situation has shown a distinct improvement for which the Government's five year investment policy is no doubt partly responsible. This provides for an annual public investment of 200 million pengös (i.e. some 3 per cent. of the national income) covered partly by a capital levy and partly by an internal loan. In the current Budget year, moreover, the extra Government income under the plan will reach 400 millions—140 millions by capital levy and 260 millions by the internal loan. The industrial improvement is best reflected in the figures of raw material imports, of which pig iron and scrap, copper, and coke have risen considerably.

Total imports in the first quarter of 1939 reached 122 million pengös, against 95.8 millions in the first quarter of 1938, while exports increased from 133.6 millions to 142.5 millions, leaving an export surplus of 20.5 millions for the quarter. On the export side the main increase was in agricultural items, while industrial exports, apart from textiles and iron goods, fell off slightly or remained stationary.

The most notable industrial development in recent years has been in the production of mineral oil. The exploitation of oil in Hungary began in 1937, by a subsidiary of the Standard Oil Company in South-Western Hungary. The oil proved of very good quality, and while production amounted to only 221 tons in 1937, reached 4,280 tons in 1938, and is still rising fast. In the last quarter of 1938 home production was already 35 per cent. of total home consumption, and it is generally believed that this year it may reach 50 per cent.

With the re-incorporation of Ruthenia, Hungary obtained a further 572,000 hectares of forest, which reduces Hungary's timber import requirements by some 15 million pengös per annum. The Ruthenian salt mines save another 3 million pengös of salt imports and make the country entirely self-sufficient in salt.

Hungary has prolonged the existing commercial treaties with France, Roumania, Sweden and Switzerland, and is negotiating for further agreements with Greece and Poland. Important negotiations are also proceeding with Germany to accommodate German imports without clashing with Hungarian industrial interests.

The Hungarian National Bank has now issued further instructions regarding the transfer of dividends to foreign holders. Every foreign shareholder can, by means of additional exports, now obtain 39 Swiss francs in lieu of each 100-pengö dividend claim. The transfer must be claimed within six months of the declaration of dividends. The dividends that can thus be transferred are estimated at about 4 million pengös per annum; and it is hoped that this will be interpreted abroad as a gesture showing Hungary's desire to fulfil, as much as possible, her financial obligations.

May 31st.

Rising Interest Rates in Holland

[FROM OUR AMSTERDAM CORRESPONDENT]

THE prevailing political uncertainty in Europe has necessarily left its mark on financial and economic developments in the Netherlands. In particular the position of the money and capital markets was strongly affected, these presenting an aspect quite different from that of the critical days of last September. Money rates did tighten decidedly at that time, but the movement was of brief duration and it entailed no further consequences. Now, however, the money and capital markets have assumed quite a different appearance. This is evident from the fact that the Dutch Investors' Front, embodying the large institutional investors, such as assurance companies, savings banks and so on, have recommended to their members a temporary rise of $\frac{1}{4}$ per cent. in the interest rates at which they are prepared to participate in private and mortgage loans.

In view of the lack of buying interest in the bond market, a pronounced decline in the price of State loans and bonds has taken place during the last few weeks. Taking the bond market as a whole, the interest yield has consequently risen by $\frac{1}{4}$ to $\frac{1}{2}$ per cent. Whether this change is likely to be permanent, and whether rates will continue to pursue their present upward course, cannot be foreseen, the movement being attributable to causes of a more or less abnormal nature. It is certainly not due to any increase in the demand for credit for industry and commerce. A number of less welcome influences are responsible—the withdrawal of refugee capital, pressure on the foreign exchange market and the desire for liquidity in view of the precarious international situation. Of these the flight of capital is probably the most important. Taking into account the fact that, as long as international tension continues, expenditure on defence will make further governmental loan requirements almost inevitable, the drastic *volte-face* in the capital market can hardly be wondered at.

It should not be overlooked that interest rates have actually been displaying a slightly upward tendency since the beginning of January. Throughout that time no conversion loans or new issues of any consequence have been brought on to the market apart from occasional loans privately negotiated with some large institutions. The firmness of quotations for bill discounts and prolongation money has also been attracting attention. Prolongation rates even rose to $2\frac{1}{2}$ per cent., but subsequently fell back to 1 per cent.

Smaller Gold Stock

The weekly returns of the Netherlands Bank show considerable movements. A few details are set forth below. These returns, it may be added, are nowadays not as informative as they used to be prior to the establishment of the equalisation fund and the omission of the amount of gold deposited abroad.

NETHERLANDS BANK (Millions of guilders) Weekly Returns					
	Sept. 28, 1936	Sept. 27, 1937	Sept. 26, 1938	April 17, 1939	April 24, 1939
Gold stock	670	1,265	1,480	1,248	1,226
Balances on current account:—					
Of third parties	51	588	608	462	448
Of the State	49	78	159	13	8
Bank note circulation.....	772	833	1,052	1,041	1,037

Note.—Sept. 27, 1936 = suspension of gold standard. Sept., 1938 = September crisis. April, 1939 = April crisis.

It will be seen that the stock of gold and the balances on current account are now decidedly smaller than in September.

In the following table the items for loans and the gold stock are shown week by week since they first fell back on February 27th.

	Loans (In millions of guilders)		Gold Stock (Millions of old guilders)	
	Total	Decline	Total	Decline
February 27th	234	30	1,431	30
March 6th	219	15	1,416	15
March 13th	214	5	1,411	5
March 20th	189	25	1,386	25
March 27th	174	15	1,335	51
April 3rd	174	...	1,309	26
April 11th	173	1	1,295	14
April 17th	175	+2	1,247	48
April 24th	174	1	1,226	21

During the last few weeks, the demand for dollars has slackened considerably, thanks to fears of immediate hostilities having subsided. In conformity with this, the release of gold by the Netherlands Bank has been on a smaller scale.

May 10th.

Chilean Exchange Rates

[FROM OUR SANTIAGO CORRESPONDENT]

THE economic life of Chile is completely in the hands of factors beyond her control. This is shown in the latest figures published of the country's balance of trade. During the first half of 1937, when the value of minerals, ores, and agricultural produce was high in international markets, the percentage of imports in the total trade was 25.6, the percentage of exports being 74.4. During the corresponding period of 1938 (a time of low values for Chile's exports), these percentages had changed to 41 for imports and 59 for exports. These percentages have drawn still closer together, and the export surplus at the end of 1938 was small. The figures for the first quarter of the current year, however, show a welcome improvement.

The diminution in the export surplus has reached a stage which is having a serious effect on the exchange market. Recent reports from the Exchange Control Board give an estimate of £1,000,000 as representing the value of commercial debts which have become frozen once more due to lack of exchange instruments.

As is natural, the result has been a contraction in the foreign buying power of the country as a whole, and the rationing of foreign money has become essential. This shortage cannot be blamed entirely on decreased values of Chilean commodities on international markets, but must be ascribed partly to the policy of the Exchange Control Board in its insistence in the maintaining of a fixed parity for export drafts (25 pesos per U.S. dollar). This has the effect of stimulating imports. Had export exchange been allowed to follow the market trend, it would still have been impossible to check the decreasing volume of exports owing to international

factors, but on the other hand, a dearer unit would have been a valuable incentive to check an increasing importation of goods.

At the moment it is the Exchange Control Board's constant endeavour to correct this state of affairs and the new "prior permit" system is a step in the right direction. By this system, importers must first state their requirements to the Board, which can either accept or refuse permission to import. The importer must also state when he considers cover will be required. Under present circumstances this is a vast improvement in the control of imports, since the Board has it in its power to reject merchandise when it considers it unnecessary, or when stocks of any given article tend to accumulate. No goods are allowed to enter the country without this prior permit. The Control Board can now at any time tell the exact amount of the requirement of commerce for foreign exchange instruments.

An instance of the refusal of the Board to allow certain imports is shown in the calling for of a reduction in the country's imports of tea, which were recently reduced by 30 per cent., priority to import being given to firms dealing exclusively in this article to the detriment of the large importing houses of general merchandise.

The Need for Simplification

The time would appear to be ripe for a simplification of the multiplicity of rates of exchange extant in Chile. At the moment there is the official rate of exchange on the basis of 1.5d. gold, which is more in the nature of a Government rate, inasmuch as it is only used by the Government for national expenditure, such as diplomatic and consular services, and payment of re-armament requirements. Copper and nitrate companies' working expenses must be liquidated at this rate, and the difference of 20 per cent. between it and

the export rate accrues to the State. The compensation rate, that is the rate obtaining between Chile and those countries which have a commercial treaty, is based on 30 per cent. over the official rate (1.15d. gold); the export rate, at which most transactions take place, is fixed by the Exchange Control Board at 1.16d. gold. Another special rate for foreign drafts sold by the public to the commercial banks, the product of which may be used in certain specified instances, i.e. for so-called luxury goods, travelling expenses, etc., with the permission of the Board, is termed whitewashed exchange. This rate varies about 0.95d. gold per peso. Finally, there is the so-called black rate of about 0.85d. per peso. This is not officially recognised by the authorities.

There is a definite current of opinion in favour of the simplification of these rates, which are so bewildering to people outside of Chile. The mere existence of a control in any shape or form gives rise to an illegal or black rate. By allowing the pegged export rate to slip away gradually until it more nearly approximates the whitewashed rate, which is the real barometer of the market, the position would at once become simplified to a large extent, and though such a step would inevitably increase the cost of imported goods, it would through such action act as a deterrent to imports, since the average buying power of the man in the street in Chile is low.

There is little doubt but that this is at the back of the minds of the authorities, and with any real and sustained demand and an increase in the value of the goods that Chile exports, the simplification of exchange, so essential to the commercial life of the country, will be accomplished.

Whatever the outcome of future deliberations, there is little doubt that the official rate will be maintained, as from this source the Government receives valuable cheap supplies of exchange by way of indirect taxation of the copper and nitrate industries.

Letters to the Editor

The Conscription of Wealth

TO THE EDITOR OF THE ECONOMIST

SIR,—There are certain remarks in your article on "Conscription of Wealth" in the issue of May 13th which should not, I feel, be allowed to pass unchallenged. I refer especially to your curt and summary dismissal of the Labour Party proposal for a levy on property.

In discussing financial policy, it is surely essential to distinguish clearly between the actual war situation and what has been aptly termed the "near-war" situation. It is evident that we are now in a "near-war" situation but not in an actual war situation. The Labour Party proposal for a levy on property was specifically put forward, as the Debate speeches showed, to deal with this situation, and not with a full war situation.

It was put forward for two reasons. Firstly, because, as the article itself agrees, there is a *moral* case for the conscription of wealth. As you rightly say:—

What most people mean in advancing the need for the conscription of wealth is that if there are to be new, additional and onerous compulsions placed on personal liberty, then they should be accompanied by new, additional and onerous compulsions placed on wealth.

The proposal was advanced, secondly, because, contrary to the view expressed in your article, it is in fact a highly practical method of meeting the financial problems created by the "near-war" situation.

The policy of borrowing as much as £400 millions has generally been justified precisely because we are not yet at war, and because there is still a considerable amount of unused resources. It is felt that, if any attempt were made to raise this £400 millions by increasing direct taxation, the effects on industry might be disastrously deflationary. This argument has undoubtedly a great deal to be said for it, but it calls for a rather closer analysis. In the first place, the actual effects on employment resulting from the spending-out-of-loans policy depends to a very considerable extent on the method adopted for borrowing the money. It will hardly be contested that if the Treasury attempts to raise the full £400 millions by borrowing from the public, without any assistance from the banking system, the effect on interest rates will be extremely severe. On the other hand, if the bulk of the £400 millions is raised, directly or indirectly, from the banking system, the effect of the whole measure is likely to be far more inflationary.

Secondly, even if it be admitted that borrowing is desirable this year because of the need for industrial expansion, it is very doubtful whether the same need will exist next year, by which time unemployment will probably have fallen very near its minimum level. But there is every probability that the expenditure on defence next year will have to be just as heavy as this year. Shall we be justified in continuing to borrow next year, as well as this year? In the third place, it is an unfortunate feature of the borrowing policy that it necessarily increases the National Debt, and places a heavier *budgetary* burden on the future.

The Labour Party proposal for a levy on property is precisely designed to avoid the difficulties of a large-scale borrowing policy, without involving the deflationary effects of a policy of raising income and sur-tax. The proposal is in its essence extremely simple. It involves a levy on the value of property held by individuals possessing more than a certain amount of property, say, £20,000 worth. The rate of the levy would be graduated on the same kind of scale as existing death duties, but would not, in the average, exceed more than perhaps 2 per cent. It has been estimated that the number of individuals who would be affected by it would be not more than 120,000. The levy would be paid for the most part by handing over securities to the State, and the State would then proceed to realise these securities on the market, in precisely the same way as it would have sold new securities, had a policy of borrowing been adopted. An alternative method would be for the State to hold the securities raised by the levy and to issue new securities.

There can surely be no doubt that the proposal diminishes the need for increasing the National Debt. Is there anything particularly undesirable about its economic effects? It seems clear that these will be very much the same as the economic effects of borrowing by issuing new securities. The extent to which it is or is not inflationary will depend on whether the securities which the State sells are taken up by the banking system or not.

The comment in your article that "it is the nation's income that is relevant, not its accumulated wealth or capital," and that "the State is not interested in war-time in getting into its possession the land, factories or houses of its citizens, but only in diverting into its own coffers half of the income arising from these capital assets" seems to me largely irrelevant. In the first place, as I have said, the proposal was not put forward for war-time but for a "near-war" situation; and secondly, it is perfectly clear that the property acquired through the levy, which would mostly be paid in securities, would have to be sold again by the State in order

to raise the funds for current expenditure. The sales of these securities would, if the volume of money were unchanged, simply absorb existing savings. Nobody has ever suggested that the State should solve its budgetary problem by getting land and factories and houses into its possession.

There remains the somewhat complex question of the effects of the levy on consumption expenditure as compared with the effects of borrowing or raising income and sur-tax. I should expect the levy to cause a bigger reduction in consumption than borrowing would, and a smaller reduction in consumption than in taxation. The reason is that the levy would fall more heavily on the very wealthy than an increase in income and sur-tax, while, as compared with borrowing, it would involve a net loss of assets to the individuals who pay it.

I suggest, therefore, that the property levy proposal, although not perhaps so adequate a weapon in full war-time conditions for cutting down private consumption as increases in taxes on income, has very much to commend it, especially at the present time. It is equitable, it diminishes the need for increasing the National Debt, and its economic effects are in no way undesirable.

May I add, in conclusion, one last word on the problem of war finance proper? I am in entire agreement with you that every effort must be made to avoid the financing of the war by inflation. I also agree that it should be possible to increase taxation to a far greater level than most people care at present to contemplate. But I would suggest that, if you are considering increasing taxation on the scale suggested in your article, there is much to be said for the view that it would be simpler to place the whole income tax-paying class on an allowance basis and, instead of first of all allowing them to receive incomes and then taking away half, to deduct the half which you want at source.

I am,
Yours faithfully,

HUGH GAITSKELL.

London, N.W.3.

Full Employment

TO THE EDITOR OF THE ECONOMIST

SIR,—In forecasting the probable effects of this year's re-armament programme, Mr Kaldor (in his letter published on May 27th, page 491) appears to neglect certain factors.

(1) He takes for the basis of his estimate the probable value (£500) of the *gross* output per head and not the *net* output; hence his figures for additional employment refer solely to the industries *immediately* concerned with the products the Government actually buys; while the indirect effects in the industries producing raw materials and semi-finished products needed for re-armament are lumped together with the indirect effects in consumption goods industries. On this basis his estimate for the total indirect effects is too low. He ought to take at least three rather than two as his "combined multiplier."

(2) On the other hand, he does not appear to take into account that the cost of capital equipment (not furnished by the Government) is paid for as part of the price of the finished product; hence part of the current expenditure is amortisation with respect to past capital investment. Assuming that the bulk of factory construction in the armaments industries is already past, the effective increase in defence expenditure will not be so great as the official figures would suggest. (In my opinion the influence of this offsetting factor will not be strong enough.)

(3) His last point seems to pre-suppose that bottlenecks only arise in industries which supply armaments exclusively. But bottlenecks are just as likely to arise in the higher stages of production where Government demand competes with private demand; moreover, certain types of skilled labour and machinery in which shortages are likely to be employed by both armament and civil industries.

Yours faithfully,
T. BALOGH.

University College.

The "Square Deal" Report

TO THE EDITOR OF THE ECONOMIST

SIR,—With reference to the summary of the above report on page 482 of *The Economist*, May 27th, under No. 3, "Protection of Trade and Industry," you quote the following:

"In order to preserve fullest flexibility, proposed periodical conferences between railway companies and

trading interests should be set up by Statute. (Para. 35.)"

I am taking the liberty of pointing out that this is not quite correct. A reference to the report, para. 35, reads:

"The parties do not contemplate, nor do we recommend, that these conferences should be set up by Statute. The success of the proposal will depend in large measure on the spirit in which the parties approach the discussions which they are designed to foster, and we think it better to leave the position as flexible as possible."

It is agreed there is a large measure of opinion which feels that these conferences should have statutory authority, but the Transport Advisory Council have not made a recommendation to that effect.

Yours sincerely,
W. H. GREENALL.

Manchester.

[Owing to a printer's error two words were omitted from the sentence quoted, and the meaning was thereby changed to give the erroneous impression which our correspondent rightly criticises. The sentence should have read: "In order to preserve the fullest flexibility, the proposed periodical conferences between railway companies and trading interests should *not* be set up by Statute."—EDITOR.]

Shorter Notices

"History of the London County Council, 1889-1939." By Sir Gwilym Gibbon and R. W. Bell. Macmillan. 720 pages. 21s.

The past fifty years of London's Government have much around which an absorbing history might be built. Politically, there were the energetic years of the Liberals, the stolid years of consolidation by the Conservatives and the new era of the Labour Party. There has been the constant struggle between Council and Parliament and between Council and other local authorities. Economically and politically, there has been the evolution in the idea of local government to the present concept of public utility and active intervention to make people's lives happier. The trouble is that this new idea of service is still confined within the administrative framework of fifty years ago. It is therefore a pity that Sir Gwilym Gibbon and Mr Bell have not dealt with the jungle of London's various governing authorities or contrasted London's virile growth with the inability of the Council to grow administratively and the consequent diminished interest in its activities. The authors' appendices and the fairly full account given of each of the individual services of the Council will provide the specialist and the research student with invaluable condensed information. But the administrator will want to know still more.

"Member-Bank Borrowing." By Robert C. Turner. Ohio State University. Columbus.

This is one of the best contributions to the subject of central banking that has appeared for some years. Professor Turner takes as his field of study the Federal Reserve system, and concerns himself with the more important aspects of member-bank borrowing. His raw material is set out in a very full statistical appendix, including figures for bank rates on rediscounts and other rates in each Federal Reserve district for each month from 1922 to 1938. In an analysis of some 150 pages only, illustrated by charts, Professor

Turner isolates the main points at issue. The working banker just borrows; but it is interesting to observe from the correlations established in the present work that there are well-defined patterns of behaviour on the part of member banks in respect of borrowing, though Professor Turner takes good care to demonstrate that these patterns must not be over-simplified. The two theories submitted by the author to his strict statistical tests are the "profit theory" and the "need theory" of borrowing. The first holds that member banks borrow at the reserve banks whenever it is profitable to do so; the second that they borrow only of necessity and repay their borrowing as soon as possible. Professor Turner's general conclusions require more than a review to be examined at length; but they are very important. Whether bankers' behaviour approximates most closely to the one or the other of these theories is of profound significance to those in charge of attempts to control the credit system of the United States.

"Tin Statistical Year Book, 1939." The International Tin Research and Development Council. 200 pages. 8s.

The latest edition of this Year Book gives data on tin production, tin consumption, stocks, prices, etc. In addition it contains interesting historical information about the tin industry. Tin consumption is compared with world population, and it is shown that the increase in world tin consumption during the last 130 years has been much larger than the growth in population; per capita consumption has risen considerably. Details are given about the quantities of tin produced at mine or smelter. In Europe mine production amounts at present to less than 2 per cent. of the world total, while European smelter production accounts for about 80 per cent. of Europe's tin requirements. About 70 per cent. of the total world mine production comes from Asia and Oceania, while consumption in these parts does not exceed about 9 per cent. of the world total. In North and South America, on the other hand, consumption is double their mine production.

The History and Mechanism of the EXCHANGE EQUALISATION ACCOUNT

By LEONARD WRIGHT

8s. 6d. net

With a Foreword by the Hon. FRANCIS RODD

"This new book, both detailed and comprehensive, provides a standard for reference and a stimulus for thought. As a first instalment of a story which is not yet complete Mr Wright's book possesses all the value of a standard work, with the additional merit of being a compact and handy volume . . . a definite contribution to current economic literature."

Norman Crump in *The Financial Times*.

THE BUSINESS WORLD

Electricity Shares and the Government

NOT surprisingly, the past year saw a slackening in growth of the electricity industry. Total units generated by authorised electricity undertakings increased by 6.4 per cent. from 22,902 million units to 24,376 million units. For the previous three years, the average annual increase exceeded 14 per cent. The 1938 figures, however, cannot be regarded as unfavourable for a year in which *The Economist's* Index of business activity fell from 111 to 101.

Despite the smaller increase in consumption, the further rise in the price of coal, and increased rates, the experience of the company undertakers was generally satisfactory. Excluding the London groups, only three large companies—Bournemouth and Poole, Shropshire, Worcestershire and Staffordshire, and Mersey Power—failed to increase their net earnings. The largest percentage increases were shown by North Metropolitan and Clyde Valley—a residential and an industrial company, respectively. The experience of the so-called industrial companies was not greatly different last year from that of the other company undertakers. In the industrial areas the increase in units generated was below the average for the whole country, but the industrial companies were probably able to pass on a larger proportion of additional fuel costs since power contracts usually contain a "coal clause."

Average fuel prices for selected "grid" stations were 20s. 3d. per ton last year against 18s. 3d. per ton for 1937. This increase involved an additional burden for company undertakings of between £300,000 and £350,000. Much of this additional burden was, of course, passed on to the consumer. Companies operating under a sliding scale, however, could only pass on higher fuel costs by limiting the scope for additional dividends above the standard dividend. So far as the investor is concerned, however, the increased cost of fuel has merely restricted the gains in net potential revenue.

In the following table the net revenues of fourteen major companies (not subject to the London Electricity Acts) are summarised for the past three years:—

RESULTS OF 14 ELECTRIC SUPPLY COMPANIES*			
	1936	1937	1938
Net revenue	£6,465,273	£7,178,977	£7,491,309
Fixed charges and preference dividends	1,826,692	1,890,443	1,931,450
Net revenue, after fixed charges	4,638,581	5,288,534	5,559,859
Depreciation	2,556,938	3,102,331	3,324,641
Ordinary dividends (net).....	1,835,875	1,843,334	1,845,117
Balance to reserves and carry forward	245,768	342,869	390,101

* N. Met.; Bournemouth & Poole; Midland Elec.; Midland Counties; Shrops., Worcs. and Staffs.; Northampton; Brit. Power & L.; Mersey Power; Elec. Distr. of Yorks.; Yorks. Elec.; Lancs. Elec.; Clyde Valley; Scottish Power; N.E. Elec.

Net revenue increased last year by £312,332 (4.4 per cent.) compared with £713,704 (11.1 per cent.) for 1937. The bulk of this increase is again absorbed by higher depreciation, while free reserves are increased by only £47,232. Net ordinary dividends are reduced, but on a gross basis, adjusting for tax, an increase of £87,209 would be shown,

the greater part of which arises from the 50 per cent. increase in Clyde Valley Electric ordinary capital. No company reduced its dividend, although the Shropshire, Worcestershire and Staffordshire dividend of 5½ per cent. entailed a substantial draft on the carry-forward. The Mersey Power Company also maintained its dividend, which requires £39,718, but only by cutting its depreciation charge by approximately £21,000.

Amounts shown above for depreciation include sums appropriated by certain companies to "Depreciation and Reserve" funds. They may, therefore, include a certain proportion of free reserves. It is difficult to see the advantages of this duplex form of appropriation, which leaves the extent of true distributable earnings and free reserves in some doubt. We have attempted, in the notes on electricity company results which have recently appeared in these columns, to overcome this lack of uniformity by calculating "standard" depreciation charges, based on the depreciation scales prescribed by the Electricity Commissioners for use under the Electricity Supply Act, 1926. An element of approximation is unavoidable in calculating

What is your Capitalised Value to your family?

IF you listed all your personal assets and converted them into cash what would be the total? Now assuming from a safe investment interest on this amount could be obtained at the rate of 3½% per annum tax free, what income would this produce?

This is the test which you should apply to your own resources, so that you will know exactly what the financial position of your wife and family would be in the event of your death—a contingency which it is unwise to ignore. Most men are disappointed and not a little perturbed after this self examination.

THE "SAFEGUARD" POLICY is specially designed to augment personal assets by providing an income (tax free and payable monthly) for your dependants in the event of death. If you survive the period of your family responsibilities the policy provides capital for your own retirement.

You are invited to make an enquiry for full details and for an illustration suited to your own circumstances. Rest assured you will incur no obligation by doing so.

standard depreciation charges, but they do afford a rough indication of the adequacy of the provisions made by individual companies. In the aggregate, the depreciation charges shown above exceed the standard depreciation charges by some £150,000.

The experience last year of companies which operate entirely or partly under the London Electricity Acts, was generally less favourable than that of the extra-London companies. Since the scope for sliding scale benefit depends upon a combination of reduced prices and reduced costs, the London companies were more seriously affected by increased generation costs. Excluding County of London Electric and South Metropolitan (for which detailed figures relating to the London section of the undertakings are not available), all London companies, with the exception of City of London Electric, experienced a reduction in net equity earnings, though all the companies (except London Electric, where the amount was practically unchanged) became entitled to additional sliding scale benefit. For London Associated Electricity, the fall in the operating companies' earnings was so acute that no appropriation for sliding-scale benefit was actually made. In fact, this company and the London undertaking of Metropolitan Electric failed to earn even their 7 per cent. standard dividends. Generally, the results were well below expectations. This generalisation does not, however, apply to the County of London Electric, whose figures showed the largest increase in equity earnings of any company—from £820,479 to £1,037,502—though it is impossible to estimate what proportion of the addition was actually distributable.

So much for the financial results of the industry in a year affected by slower growth and substantially higher costs. Its future remains clouded by legislative uncertainties. The Government's tentative proposals for implementing (in significantly altered form) the recommendations of the McGowan Commission, aroused opposition from company undertakers and local authorities alike, and they have long been pigeon-holed. Uncertainty still exists, however, because the problem of reorganisation has only been deferred and not solved. It has recently been intensified by the appointment of a Select Committee of the House of Lords, under the chairmanship of Lord Sankey, "to consider to what extent the efficacy of the statutory regulations imposed on gas, water and electricity undertakings regarding the raising of capital, the borrowing of money, the charges to be made, or the relation between dividends and prices charged, may be impaired through the control of such undertakings by another company." The setting-up of the Committee suggested that the Government was still anxious to deal with at least one aspect of electricity reorganisation—the control of supply companies by holding companies, certain aspects of whose activities received pointed comment in the McGowan Report.

The Committee, however, has now suspended sittings until November. Presumably, this fact implies some change in the official view of the holding company problem; it certainly involves further delay, whose importance to the investor may be measured by the fact that the majority of the twenty largest companies control important subsidiary companies. Hence the majority, on a narrow definition, might be regarded as holding companies. It would be hazardous, in these circumstances, to attempt to anticipate the outcome of the Committee's deliberations upon the structure of the electricity supply industry.

Two other outstanding problems, with serious investment consequences, would also be involved in any reorganisation of electricity distribution—the co-ordination of many local undertakings (on more efficient and tactful lines, it may be hoped, than were adumbrated in the Minister's draft proposals two years ago) and the purchase rights of local authorities. Of these two questions, the latter is undoubtedly the more pressing. During the next few years, purchase rights in respect of a large number of important undertakings will become exercisable. Further disintegration of existing supply systems is undesirable, and since the Commissioners' consent is necessary before purchase rights can be exercised, it is probable that franchises will be extended on terms which provide for restriction of profits. On a question of such importance, Parliament should lay down definite lines on which extensions of

tenure are to be conceded, and the Government's original proposals did, in fact, deal with this matter. Without guiding principles, each extension of tenure will be decided after negotiation between the local authority and the company concerned, with the Electricity Commissioners exercising supervision. In existing conditions, it is probable that supervision is less effective than the Commissioners themselves would desire; in any case, it is difficult to strike a *via media* between the aspirations of some local authorities, and the feeling among certain companies that the right of purchase has become somewhat theoretical.

In recent negotiations there has been a natural tendency to use the London 1925 Acts as a working model. From the point of view of the consumer, this may involve the fixing of the standard dividend at a relatively high level. The rate of 7 per cent. provided in the London 1925 Acts was appropriate when 5 per cent. War Loan was quoted at par, but conditions have changed violently since that time. On the other hand, a disproportionately low standard rate might one day react unfairly upon new franchises with a life of up to forty years. Moreover, it has yet to be seen whether the sliding scale under the 1925 Acts will provide an adequate incentive to enterprise in the later stages of the franchise. Perhaps a sliding scale commencing at a fairly low rate—say one-twelfth of consumers' benefit—and gradually increased at, say, five-yearly intervals to perhaps one-third on additional increments of consumers' benefit would meet this point. Finally, the 1925 Acts ignore differences of capital structure; an undertaking mainly financed by ordinary shares may thus enjoy higher charging powers than one whose capital is mainly represented by prior charges at a low rate of interest, while the "incentive" provided by the conventional sliding scale also depends largely upon the capital structure.

The Midland Electric Corporation for Power Distribution provides an example of extended franchise, which is of particular interest to investors. The undertaking was subject to purchase by the local authority in 1932, at fair market value of the assets, without allowance for goodwill. The new order, issued in 1933, provided for a 40 years' extension of tenure to 1973, when the undertaking will again become purchasable on the basis of net depreciated assets, without goodwill. During this period, the Corporation is entitled to pay 6½ per cent. on the agreed capital attributable to the undertaking (other than Loan Capital) and may also distribute an additional ¼ per cent. for every reduction of 2½ per cent. in prices below the standard tariff, while 6 per cent. may be paid on any further capital supplied from free reserves. Up to 1943, an additional ½ per cent. may be paid when prices do not exceed the standard tariff. In effect, therefore, the company is allowed 7 per cent. on its capital for the first ten years and 6½ per cent. thereafter, plus 6 per cent. on additional capital invested from free reserves. In 1938, prices charged were 22½ per cent. below the standard tariff, so that the company was entitled to distribute an additional 2¼ per cent. Provision is made to vary the standard tariff, at intervals, to meet unavoidable changes in operating costs, or any change in the various classes of supply. In this case, at least, the shareholder has not suffered, for the dividend on the increased capital has been 9 per cent. for the past three years, as against 8 per cent. paid for some years previously.

This example might suggest that electricity shareholders need feel little misgiving regarding maturing purchase rights. This order, however, was negotiated in 1932, and future negotiations might be less favourable. On this point, at least, the need for general principles, carrying the full force of Parliamentary approval, is urgent. The problem of the holding company, and the long-range question of reorganisation of distribution may perforce be left to a later date. When that day comes, two points must be borne in mind: first, that reorganisation must be synonymous with increased efficiency, which is not necessarily the same thing as a geographical parcelling-out of supply areas; and secondly that the part of those who have financed the industry—both investors and ratepayers—should be recognised, and not obscured by an excess of zeal to benefit the consumer at the expense of long-term development.

Sea Fishing

IN the past seven years there have been three official reports on the sea fishing industry and four Acts of Parliament—a degree of Government activity which rightly indicates that all is not well with this important trade. The fishing industry has, indeed, been the victim of abrupt changes in the conditions of both demand and supply and of the stability of its own structure and technique.

Before the war over half of the British catch consisted of herring, the greater part of which was exported to Russia and Germany. The extent of the fall in the volume of herrings caught and in exports of cured herrings can be seen from the following table:—

	1913*		1929		1937	
	'000 cwt.	£'000	'000 cwt.	£'000	'000 cwt.	£'000
(i) Fresh fish:—

(iv) Consumption per head of all kinds of fish (excl. shell fish)	1b. 39.36		1b. 42.59		1b. 49.81	

* Including Hare. † Included with cured fish. ‡ Not available.

Increased consumption of meat in Continental countries and national self-sufficiency have been the chief reasons for the very drastic decline in British exports of herrings, but there has also been a fall in home consumption. The trouble of cooking herrings and of disentangling the flesh from the bones has steadily reduced their popularity, although consumption of fish of other types has increased considerably since the war, and reached in 1937 nearly 50 lb. per head. The place of the herring has been taken by cod, which is the fish most favoured by fish fryers to complement chips.

Because the herring and the white-fish sections of the trade are distinct, this change in the public's demand has very severely affected the herring fisheries. Redundant boats, mostly over-age and badly equipped as the result of the long depression, excess curing capacity and the decay of the main herring ports in East Anglia and East Scotland—the problems of the herring trade are fundamentally the same as those of any industry which is faced with contracting markets. In this case, however, they have been accentuated by the small size of the fishing and curing units; many herring boats are worked by their joint owners, and units who operate more than a few boats are extremely rare. The Herring Industry Board has stated that in 1937 the average earnings of English steam drifters were £2,780 and of Scottish drifters £1,588: to meet wages and running expenses alone the former required £2,700 and the latter £2,200 per annum. In 1933 it was estimated that 94 per cent. of all drifters were more than 10 years old and 60 per cent. more than 20 years old.

The serious plight of the herring industry led in 1935 to the setting up of the Herring Industry Board, on the recommendations of the Sea Fish Commission of 1932. The Board has been able, through money provided by the Exchequer, to give grants for re-equipping boats or building new ones, and it has done much good work in the way of market research. It has also limited the length of the catching season. But local jealousies have so far rendered any reorganisation of the market difficult, and led in 1938 to the substitution of an appointed Board, with an

advisory council composed of the trade's representatives, for the original elected Board.

With the shift-over in public taste from herrings to white fish, it might be thought that the white fish or trawling section of the industry would have flourished as the herring fleet suffered. But the white fish boats have been afflicted by a change in the technical conditions of production. The excessive and unco-ordinated fishing over past years in the North and Irish Seas (known as "home" waters), or alternatively, as some experts hold, the limited food supply for an increase of fish population has led to the landing of an increasing proportion of smalls, as is shown in the next table:—

	PERCENTAGE OF TOTAL LANDINGS OF WHITE FISH CLASSED AS "SMALLS"		
	1913	1933	1935
Cod	24	46	32
Haddock	43	85	83
Plaice	42	70	72
Hake	17	63	69

One result of this development has been the depression of market prices, since a two-year-old cod weighing 2 lb. does not fetch one-third of the price of a 6-lb. cod, owing partly to the greater waste in gutting and heading. Consequently, there has been a steady pressure to extend the range of operations to more distant waters in the Bear Island and Barents Sea areas. It has been estimated that in 1906 70 per cent. of the fish landed were caught on voyages that lasted less than a week, while in 1937 this proportion had fallen to between 35 and 40 per cent.

As a result of the longer voyages involved, the small slower type of trawler has become progressively less efficient, and rebuilding has become progressively more important. In 1934 the Sea Fish Commission found that only 18 per cent. of all trawlers were less than 10 years old and the majority of the new boats were registered at Hull, where the development of the distant fisheries has been prosecuted with vigour. Nearly half of the Hull fleet were in 1935 under 10 years of age, but a considerable number of older boats displaced have been sold to other ports, where they were still in commission. The increase in the number of regular fishermen insured against unemployment is also an index of the increasing use of the larger boats employing a crew, as against the smaller boats worked by two or three self-employers.

A further result has been the intensified problems of storing fish until landed. The traditional method, of packing fish in ice, is not effective for more than a week or so, and in summer months much fish has been landed in imperfect condition. It was partly to meet this problem that the Hull trawler owners agreed in 1932 to a voluntary embargo on northern fishing in summer, and in subsequent years a similar prohibition has been enforced by orders issued under the Sea Fishing Industry Act, 1933. But even outside the summer months the average quality of the fish landed has deteriorated owing to the inefficiency of the older methods of preservation. The Sea Fish Commission suggested that solutions to this problem might be found, firstly, by brine freezing, if this could be made commercially practicable, and secondly, by the employment of "factory" ships, which would act as fish stores and carriers for a number of trawlers.

The industry also suffers from an inefficient system of distribution, established in the days when speed in handling fresh fish could only be obtained by a multitude of dealers each concerned with only a small quantity. The margin between the value of fish landed at ports and its retail price has widened considerably in the last twenty-five years, as the table opposite shows.

On leaving the trawlers, fish is first handled by the port wholesalers, whose true function is to find markets and make up fish in suitable quantities and of the kinds demanded. There has, however, been a quite excessive increase in the numbers of port wholesalers since the war

	All food prices; retail*	Av. price of fish landed at ports†	Fish prices; retail*
1914	100	100 (1913)	100

† Sea Fishing Statistics.

with the result that the quantity handled by each has fallen considerably at Fleetwood, Milford Haven, Aberdeen and Grimsby. Hull is the single exception to this tendency, probably as a result of the port's comparatively recent development by fairly large concerns. The port wholesaler deals partly with retail shops and partly with inland wholesalers, who are concentrated at Billingsgate. As long ago as 1882 complaints were made that the Billingsgate market was unduly cramped by the narrow network of streets and by the distance from the railway termini. The actual working of the market has also received strong adverse comment at the hands of various post-war inquiries. Doubts have been cast—with how much justification it is difficult to say—on the price list, which, it was suggested, was inflated in order to enable distributors to justify prices to the public. On stronger ground were the complaints of the excessive number of "bummarees," i.e. the secondary wholesalers, who break up and mix different kinds of fish in lots required by the retailers.

In 1934 the White Fish Commission made the following estimate of the price structure of fish distribution:—

Price paid by port wholesaler to—		
Trawler owner.....		100
Wages	8	
Carriage and packing	11	
Other expenses and net profit	4	
	23	
Price paid by inland wholesaler to—		
Port wholesaler		123
Wages	8	
Carriage and packing	6	
Other expenses and net profit	7	
	21	
Price paid by retail fishmonger to—		
Inland wholesaler		144
Wages and salaries	27	
Carriage and packing	6	
Rent and rates.....	9	
Other expenses and net profit	10	
	52	
Consumer to retail fishmonger		196

It will be noted that the margin for net profit is nowhere great, but that total wages at each stage make up nearly 45 per cent. and carriage and packing 30 per cent. of the

difference between the prices paid to the trawler owner and by the consumer. A vertically organised concern, such as Macfisheries, which owns trawlers and shops, would no doubt be able to effect reductions on the average shown above. A prominent chain of variety stores has given evidence of this possibility. Kippers of a somewhat different quality from those sold by fishmongers have been placed on the market by this firm at a price considerably below that charged by other retailers, as a result of savings effected by direct contact with curers. Similarly, a fish frier probably saves by buying fish (usually cod) in bulk as well as in shop expenses, as compared with the fishmonger.

Retailers are, broadly speaking, of two kinds: fishmongers and fish friers. It is estimated that there are about 16,000 fishmongers and between 25,000 and 30,000 fish friers in Great Britain. The latter have for many years been of great importance in Lancashire and Yorkshire, where one-third of them are still situated, but it is only in the last ten years that they have spread in the South of England on a large scale. It has been estimated that the fish friers take about one-half of all the white fish landed.

A first step towards a reorganisation of the distributive side of the industry was the passing in June, 1938, of the Sea Fish Industry Act. A White Fish Commission has been established with powers to register producers, distributors and processors, to submit marketing schemes to poll, to set up a marketing board and to initiate co-operative schemes for inshore fishermen whose activities could not be usefully included in the scope of a marketing board. Hitherto, only the registration has been carried out, but in March, 1938, a deputation of the British Trawlers' Federation pressed the need for action on the Minister of Agriculture and Fisheries.

After many years' delay two competent organisations—the Herring Industry Board and the White Fish Commission—have at last been set up to deal with the problems of the fishing industry. Foreign competition is negligible, as imports have been limited by quota since 1933 to 1½ million cwt. per annum. On the production side, both of the main sections need new equipment, fewer but larger boats and better methods of storing and handling their catch. On the distribution side, any improvement must involve a reduction in the numbers of port wholesalers and an increase in the dispatch of fish direct from ports to the principal towns in bulk instead of in the separate lots of each wholesaler. Any attempt to improve the finances of the industry by raising retail prices through restricted catches would only aggravate the problem of redundant capacity by preventing the continuation of the rise in consumption. To raise prices at ports by reducing the present distributive margin will naturally create considerable hostility among those distributors whose livelihood is threatened, but if the consumption of fish is to be expanded to the benefit both of the fishermen and of the population, a reform of distributive methods is essential.

Finance and Banking

The Czech Gold.—The debate on the adjournment of the House of Commons on Friday of last week was very largely taken up with the affair of the Czech gold. The Government's previous attempts to withhold the real facts have had an effect directly opposite to that which was presumably intended. The indignation that is naturally felt at the prospect of Germany deriving any benefit from her aggression has been inflated to the dimensions of a political storm, and the Chancellor of the Exchequer felt impelled, at the end of the debate, to undertake a re-examination of the legal aspects of the matter. The gold is believed to be still physically in London and the Chancellor's inquiry is, in plain language, a search for legal means of keeping it here. The whole affair is unfortunate and has seen one blunder after another. But it is doubtful whether a decision to retain the gold in London would not be the last and biggest blunder of the series. Such a decision could only

be made possible by a very peculiar reading of the legal position, which would certainly violate the spirit of the undertakings that were given to the B.I.S. when it was set up, even if it could be accommodated with their letter by some such unworthy casuistry as the suggestion that the Bank of England is not bound by the British Government's promise to give immunity to the B.I.S.'s assets. And if Great Britain is prepared to twist the law for the sake of a single case (however worthy that case may be), what is likely to be the effect on London's reputation as a financial centre?

The truth and the common sense of the matter seem to be that the decision was the B.I.S.'s, and that once Basle had accepted the instructions it received from Prague, the Bank of England had no real option in the

matter, however distasteful it might be to see Czech gold go to Germany. (The attacks made on the British members of the B.I.S. Board are, incidentally, based on the assumption, which there is some reason to believe is false, that they knew anything about the decision until after it had been made.) That the decision made in Basle contravenes British notions of the duty of a prudent banker was apparent from the debate in the Commons. That the affair has still further restricted the scope of the B.I.S. cannot be gainsaid. The statutes of the B.I.S. have been shown to have a painful imperfection. But even as no more than a central bankers' club, the B.I.S. is a body which it is well worth while keeping alive, in spite of one blunder—which, in the nature of the case, is highly unlikely to be repeated, since the central bank of every State threatened by aggression has now had warning. The greatest need of the moment is to prevent anti-aggressive ardour from destroying all sense of proportion.

Big Credit Displacements.—The incidence of Whitsun in the last week of May has accentuated the usual month-end disturbance in the credit position. The expansion in the note circulation over the week-end appears to have been rather below normal proportions, while the movement was rather late in starting—probably because the clearing banks had already fortified their provincial tills during the preceding weeks of international tension. The latest Bank return shows that on Wednesday evening last, by which time there had probably been some reflux of holiday currency from circulation, the note issue was £5,211,000 higher than a week previously. The post-Whitsun Bank return a year ago showed an increase of £5,800,000. The comparison favours the 1939 figures, since the latest Bank return was dated May 31st and thus reflected the additional requirements of cash which always make themselves felt at the end of the month. The money market had anticipated that the withdrawal of currency from the banks and the accumulation and immobilisation of funds in Government accounts preparatory to the War Loan dividend disbursements on Thursday would cause a perceptible tightening of credit. No such tendency was apparent, though, under the influence of these two factors, bankers' deposits at the Bank of England had by the close of business on Wednesday fallen to the precarious total of £82,391,000. The discount market probably averted the development of any stringency by postponing its payments for Treasury bills during the past week until the turn of the month had been safely passed. This meant that though the market syndicate at last Friday's tender had obtained the generous allotment of 74 per cent. of its applications, the task of taking it was deferred until resources had again been swollen by the distribution of War Loan dividend on Thursday. The result of this uneven incidence of Treasury bill payments during the week was to leave the Treasury rather short of funds on the final day of the month. In order to mobilise in public deposits the resources required for the June 1st dividend payments, the Government was probably forced to raise money on Ways and Means advances at the Bank, and such operations may be responsible for the £5,000,000 increase in Government securities shown by the latest return.

French Consolidation Loan.—A much-needed process of consolidation in the French Government's external debt was brought to a successful conclusion towards the end of last week. It took the form of the placing with a group of Dutch banks, headed by the Mendelssohn house, of 155,000,000 guilders of 4 per cent. 6 years bonds, and with a Dutch-Swiss group of a 100,000,000 guilders 3½ per cent. 6 year loan which is being issued to the public at 97½. These two operations provide funds which will replace a heterogeneous mass of short-term indebtedness incurred for the French railways and the Treasury mostly at periods of financial stress in France and without due care for the

proper sequence of maturities. As part of this indebtedness coming to maturity in recent months has been repaid, the placing of the medium term loans has, in fact, provided the French authorities with some new money in the form of guilder balances. The selling of guilders from this source has been the most important factor in this market during the past week and has been almost wholly responsible for the slight depreciation of the Dutch rate in London. The loans to France have not, however, operated solely against the guilder. A substantial part of the 255,000,000 guilders has, in fact, been placed outside Holland. The bonds have been offered on a fairly large scale in the London market and it is evident that the subscriptions for both types of medium security have involved a demand for guilders which has gone some way towards offsetting the selling of the guilder proceeds from French official quarters. It is very interesting to note that the new bonds do not incorporate the gold clause. In its place they include a dollar clause. The substitution is an interesting reflection of the recent growth of international confidence in the immutability of the dollar—gold parity.

Building Society Finance.—Mr Walter Harvey's address from the chair at the annual conference of the Building Societies Association this week frankly discussed a number of current building society problems. Mr Harvey expressed the movement's welcome of the Government's Bill on Building Societies. It is not, as he recognises, perfect in its present form. The question of agency commissions, for example, will need close consideration in Committee. Although the societies will be able to contract out of warranty for properties on which they make mortgage advances, the warranty clause is not regarded as futile, since it will put the mortgagor on independent inquiry, and relieve the societies of any public misconception of their functions. Mr Harvey castigated those societies—and the number has tended to grow—which habitually trade on bank overdrafts. This practice fully deserves the adjective "pernicious," for the societies concerned are likely to be faced with the recall of bank accommodation at the very time when their financial circumstances may be strained. The steady fall in the proportion of liquid assets held by the movement has attracted considerable comment in recent years, and many societies could not show even half of the general proportion of 10 per cent. of liquid assets to total assets. Mr Harvey suggests that depositors in particular might obtain increased protection if 25 per cent. of total deposit liabilities was held in cash and realisable securities, and earmarked as special security. Whether such segregation is workable in practice would require careful examination. Meanwhile, there is everything to be said for improving the liquidity of those societies, which are, in effect, fully invested.

MONEY MARKET NOTES

The Bank Return

THIS week's Return, being dated May 31st, shows the full effect of the preparation for the War Loan dividend payment on Thursday. Thus public deposits are up by £12.8 millions, while bankers' deposits show an almost exactly corresponding fall to the low level of £82.4 millions. The note

Issue Dept.	June 1, 1938	May 17, 1939	May 24, 1939	May 31, 1939

circulation has expanded again, by £5.2 millions, the further increase being due partly to the Whitsun holiday, and the fine weather accompanying it, and partly to end-of-the-month requirements. The withdrawal of currency has reduced the Reserve to the low figure of £26.9 millions, and the "proportion" stands at only 17 per cent.

Foreign Exchanges

HOLIDAY conditions have prevailed in the foreign exchange market for the greater part of the week, and the amount of business done has been small. Sterling has been firm, the rate advancing from \$4.68½ at the end of last week to \$4.68½ on Tuesday and \$4.68½ on Wednesday, an improvement which has taken place without any direct assistance from the Control. The Canadian dollar has been firm in terms of sterling, closing on Tuesday at 4.69½, which was only 1½ c. above

the London-New York rate. The new arrangements for dealing in travel marks came into force on Thursday. Previously it was possible to obtain about 24½ travel marks for £1, but under the new Standstill Agreement, described in a Finance Note last week, they have become dearer, and on Thursday were quoted at about 21.80 to the pound.

The Money Market

CONTRARY to expectations, all the banks did not come into line with those which raised their buying rates for August bills to ½ per cent. in the middle of last week. This may have been one reason why the market syndicate raised its bid by one penny at the Treasury bill tender, which, together with the fall in total

Treasury bonds and other gilt-edged stocks within six months of maturity. 1 per cent. for loans against other collateral.

applications of £2.5 millions, secured it the remarkably large allotment of 74 per cent. As pointed out in a Finance Note, the syndicate evidently concentrated its payments on the last three days of this week, so that any stringency which might have been felt, in view of the low level of bankers' deposits at the Bank of England, was thereby averted.

The Bullion Market

DEMAND for gold has come almost entirely from arbitrageurs, while sales have consisted of newly-mined gold and

official supplies. In view of the strength of the pound and the inclusion of a premium of ½d. in the price, the bigger arbitrage demand on Wednesday, when the turnover rose to £472,000, compared with £245,000 on Tuesday, was rather surprising. Even more surprising was the encouragement given to arbitrage, and therefore to the pound, by the Exchange Account, which is understood to have provided the bulk of the supplies. This is contrary to its former policy of only releasing gold when sterling was in need of support. Shipments

of gold, presumably on official account, to Canada have in recent weeks been running at a very high level, amounting in the five weeks to June 1st to £30.9 millions. These shipments are in accordance with the policy, initiated last year, of keeping part of the national gold stocks overseas in case of war. On the other hand, shipments from South Africa to the United Kingdom have also been big, totalling in the same five weeks £10.7 millions, while a further £1.2 millions is due to arrive on June 9th. These shipments are in excess of the current production of the Transvaal mines, so that presumably some of the gold earmarked since last September is being transferred.

INSURANCE NOTES

to £3,608,000 is recorded, and an increase in British Government securities from £3,912,000 to £4,218,000. Debenture and ordinary stocks showed some increase, but preference stocks fell from £1,766,000 to £1,722,000. General reserve remains at £2,500,000, investment reserve increased from £1,961,000 to £2,210,000 and the profit and loss balance, after providing for the final dividend, amounts to £1,479,000. The dividend is maintained at 60 per cent., and costs £437,000, compared with available interest earnings of £366,000.

Caledonian Insurance Company.

—New life assurances in 1938 amounted to £2,103,000, compared with the 1937 record figure of £2,166,000. The net rate of interest fell by 2s. 3d. per cent. to £3 16s. 8d. per cent. In other branches premium income increased in the fire branch by £14,000 to £712,000, in the accident branch by £45,000 to £559,000 and in the marine branch by £14,000 to £111,000. The additional reserve in the accident department has been increased by a transfer of £30,000 from profit and loss. The underwriting

results for the last two years are shown below:—

	1937	% of Profit	1938	% of Profit
Fire	65,472	9.4	51,782	7.3
Accident, employers' liability, general, motor	10,963	2.1	29,501	5.3
Marine	10,000	...	5,000	...
Life	12,871	...	12,872	...
Charges to profit and loss	99,306	...	99,155	...
	72,565*	...	53,178	...
	26,741	...	45,977	...

* Includes transfer of £25,000 to general reserve.

Assets amount to £11,891,000, while life department assets increased from £8,258,000 to £8,547,000. There was no marked redistribution of Stock Exchange securities, which stand in the balance sheet at less than market values on December 31st last. The fire, accident and marine funds amount to 110 per cent., 83 per cent. and 172 per cent. respectively of the 1938 premium income. General reserve fund remains at £600,000, and the profit and loss balance, after payment of the 1938 dividend, amounts to £178,000. The dividend, which is at the rate of 75 per cent., costs £85,000, against interest earnings of £75,000.

Investment

How Far Recovery?—April was a month of idle disillusionment for the investor; but May has marked a recovery similar in pace, though not similar in origins, to that of February. Sentiment has fluctuated with the progress of the formation of a comprehensive anti-aggression front, and the market, perhaps a little prematurely, made a truly capitalistic response to the anticipation of a firm pact with Russia. The political background has thus improved sufficiently far for the investor to take stock of economic realities. And those realities at the moment are pointing to a vigorous industrial recovery. In its early stages, at least, the month's recovery was assisted by the stringent technical position, and only modest buying was needed to produce a sharp response in prices. It could hardly be claimed that buying has since got into full stride. As this week's movements have shown, there is considerable readi-

British: *Financial News* Index of 30 Ordinary Shares.
American: *Standard Statistics* Index of 50 Common Stocks.

ness to take profits, and the large institutional buyer has apparently still to be tempted. Yet investment brokers have not complained at the turnover recorded in the last ten days. For the recovery in gilt-edged, the shortage of stock operated as the proximate cause, but to a degree which, in view of the market's defence responsibilities, showed surprising vigour. Indeed, the *Financial News* index of fixed interest securities (1928=100) must take honours in precedence to the ordinary share index, for it has recovered from 114.9 on May 1st (the lowest point recorded since the occupation of Czecho-Slovakia) to 120.5 on May 31st, while the more volatile industrial average has advanced in the same period from 78.4 to 84.6. The latter figure, however, is sufficiently near the March "high" of 88.0 to open up the possibility of a chartist "bull market," provided that no untoward political event disturbs the tentative strengthening of investment confidence.

Revival of Trustee Borrowing.—After the spectacular success of the South African loan last week—the scrip closed at 7½ premium on Thursday, but touched 1½ on Tuesday—the market has welcomed the Northern Ireland issue of £2,500,000 3½ per cent. stock, 1950-54, at £98 10s. per cent. The special financial responsibilities of the British Government towards Ulster are, of course, fully recognised by investors, and Northern Ireland investors provide much support for their own issues. But the feature of greatest interest in the prospectus is perhaps the revival of annual drawings, at par by a cumulative sinking fund of 2½ per cent. per annum, operating half-yearly, commencing in September. It is calculated that drawings will extinguish approximately half of the issue by the date of final redemption. Hence, calculation of the redemption yield involves striking an average between the mean expectation of life of half the stock so repaid, and the full life of the remainder. On this basis, the theoretical average life of the loan would be slightly over 11 years,

and the redemption yield £3 18s. per cent. to the nearest 3d. multiple. The stock will not attract a large premium over par, in normal circumstances, owing to the risk of repayment by drawings. And although, in this case, the sinking fund provisions undoubtedly added to the attractions of the issue (which was quickly subscribed on Thursday) not all trustees welcome the responsibility of re-investing capital sums received from drawings. After the rapid gains of the past ten days, a natural profit-taking movement has caused fractional losses in the gilt-edged list. But the readiness of the market to welcome new trustee issues—though they have been arranged on attractive terms—is a welcome sign, for it may presently be faced with the more serious task of absorbing an instalment of this year's heavy defence borrowing.

London Fares and the Investor.—On Friday last week, the Railway Rates Tribunal handed down its judgment on the joint application of London Transport and the main line companies for a basic increase of 5 per cent. in passenger fares in the London Pool area. Its unqualified assent was marked by a spectacular jump of 8 points in London Transport "C" stock to 80, and by gains of 4½ points and 2½ points in Southern preferred and deferred stocks to 75½ and 17½ respectively. The consequences of the judgment were already well known to all transport stockholders. They were set out in detail in a leading article in *The Economist* of April 1, 1939. Briefly summarised, the estimates suggest that, in a full year, London Transport will obtain £732,000, Southern Railway £300,000; L.N.E.R., £71,000; L.M.S., £60,000; and Great Western, £16,000, after giving effect to the pooling scheme. On the basis of last year's results of London Transport, the realisation of this estimate would imply that the standard dividend of 5½ per cent. for the "C" stock would be earned with a margin of approximately £114,000. For the Southern Railway, the expected increase, again on the basis of last year's results, would suffice to make up the deficit of £131,871 on the full 5 per cent. preferred ordinary dividend which was paid, and leave a surplus equivalent to just over one-half per cent. for the deferred stock. In terms of the preferred stock alone, the increase represents more than one per cent. Although the increases will be effective for three weeks of the current

Phoenix Assurance Company.—New life assurances amounted to £4,967,000, compared with the previous record of £4,921,000 for 1937, and the net rate of interest fell by 3s. 10d. per cent. to £3 16s. 5d. per cent. Fire and accident premiums total £2,731,000 and £3,899,000, against £2,746,000 and £4,061,000 respectively. The accident results were the best for many years. Marine premiums increased by £686,000 to £741,000, but no transfer was made last year to profit and loss. The results of the last two years are given below:—

	1937	% of Profit	1938	% of Profit
Fire	272,654	9.9	239,138	8.8
Pers. Accident, Emp. Liability & Gen.	191,433	4.7	304,872	7.9
Marine	20,000	2.9	...	...
Life	40,000	...	40,000	...
Charges to Profit and Loss	524,087	...	584,010	...
Investment reserve	333,109	...	372,937	...
	190,978	...	Dr. 38,927	...

Consolidated assets increased from £36,942,000 to £37,708,000 and life assets alone from £19,291,000 to £19,630,000. Among the life assets a slight decrease in mortgages and loans

year of London Transport, and for the same period in the current half-year of the main lines, no great change is to be expected in the potential earnings position of the Board, which was examined in detail in our earlier article. If there were any large-scale forestalling of the increase by renewal of expiring season tickets before June 11th on a longer basis, the figures might, however, be affected. But the general indications suggest that for the current year the Board may not pay more than 4 per cent.

* * *

Rules for "Outside" Dealings.—The Board of Trade has published this week draft rules for the conduct of business of licensed dealers in securities under the Prevention of Fraud (Investments) Act. Although they are stringent in detail, their general effect will eliminate the notorious abuses which have been exploited by certain untrustworthy outside dealers. All offers made in writing (a description which covers telegraphed or advertised offers) must state the stock exchange on which quoted securities are dealt in, or give particulars of the manager and trustee of a unit trust, or, in the case of unquoted securities, be unaccompanied by a written statement conforming with the prospectus requirements of the Companies Act or in the form outlined in the schedule to the Rules. The latter requires full particulars of capital, dividends, and management personnel, and if they are not available, a statement to that effect must be included. Hence the investor will necessarily be informed whether the security is quoted and, if it is not quoted, will be provided with sufficient information to form a general view of the quality of the investment offered. No licensed dealer may deal with any person as the result of a call, unless the call was made by request; and calls arising from unsolicited communications are not deemed to have been "requested." These rules do not apply to transactions with professional dealers, nor to clients who have done business with the dealer at least three times within the past seven years. Detailed contract notes are to be issued, and accounting records maintained, and kept for seven years. No margin or option transactions may be made by a dealer except as an agent, and such deals must be supported by a corresponding transaction with a member of a recognised stock exchange. Nor may instalment payment facilities be offered unless payments are to be made at intervals not exceeding one month, and involve not less than 10 per cent. of the total consideration. These rules have been issued in draft, and representations may be made to the Board of Trade regarding them up to June 30th. As they stand, they will provide far-reaching safeguards for the investor against the activities of any would-be sharepusher who manages to obtain inclusion in the list of licensed dealers.

* * *

Capital Issues and Trustee Borrowing.—Offers of capital to the public and to shareholders reached the highest total since January at £5,774,000. Although this figure contrasts favourably with the stagnation in April, the comparison is greatly assisted by the £5 millions South African 3½ per cent. loan. Apart from the resumption of trustee borrowing, the general degree of capital market activity is scarcely better than in recent months. Computations of capital issues on "old" and "new" bases are given below:—

(£'000's omitted) excluding conversions

	Old Basis					New Basis				
	U.K. Govt.	U.K. Other	Brit. Emp.	For- eign	Total	U.K. Govt.	U.K. Other	Brit. Emp.	For- eign	Total

The Sydney issue has not been included in these totals, which exclude conversion operations, while the Northern Ireland loan will appear in the June total.

Foreign Bonds Recover.—Foreign bonds have shared in the May market recovery, with particularly emphatic advances in the European list. The index of bond prices computed by Municipal and General Securities Company (January-June, 1934=100) shows an advance of one point during the month to 57.8, but the European index has jumped practically 8 points, from 63.4 to 71.3. Movements in the component series of the index are shown below:—

AVERAGE JANUARY-JUNE, 1934=100

End of Month	Europe	Near & Far East	Egypt	South and Central America			Complete Index	Under- faulted Bonds	De- faulted Bonds
				States	Pro- vinces	Total

April.....	63.4	59.1	74.0	54.2	41.4	50.8	56.8	63.4	52.1
May.....	71.3	59.9	78.6	52.2	40.3	49.1	57.8	64.8	53.0

N.B.—Figures in brackets denote number of bonds included.

Egyptian bonds have made a partial recovery to the March level. In the Far Eastern group the fall in under-faulted Chinese issues has been more than counter-balanced by a recovery in Japanese bonds. Uncertainty, however, still prevails in the South American market, where doubts concerning Chile's intentions towards future service, and disappointment at Brazil's continued silence have depressed prices to the lowest levels of the year.

Company Notes

John Brown Profits.—The results of John Brown, like those of other companies closely concerned in the defence programme, show no spectacular advance for the year to March 31st. Net profits, according to the preliminary announcement, have increased by the relatively modest amount of £23,709 from £526,973 to £550,682 and the dividend is maintained at 17½ per cent. tax free. Earnings are equivalent to 23.3 per cent. net, compared with 22.2 per cent. for the previous year. Thomas Firth and John Brown, in which John Brown holds some 75 per cent. of the £1,100,000 "A" ordinary capital and the whole of the £450,000 "B" ordinary capital, actually showed a slight reduction in net earnings for 1938, although it paid 17½ per cent. tax free, as in the previous year. The possibility of any considerable element of directorial control of profits, however, is hardly suggested by the formula in last year's report of John Brown, which showed that total profits had been struck after providing for "all expenses, remuneration of management, etc." The group now holds a controlling interest in Westland Aircraft, jointly with Associated Electrical Industries, and has undertaken rapid extension of aircraft production, while a large sub-contracting scheme has been set up. Hence, its interests, direct and indirect, in defence work are now very considerable. The preliminary statement does not disclose to what extent, if any, payments on account of the "Queen Elizabeth" were taken into the latest year's profits. Meanwhile, the shares, which rose slightly on the dividend announcement to 33s., yield £7 14s. 6d. per cent. on a gross basis, and appear to recognise the prospect of some degree of special taxation under the Government's arms profits proposals.

* * *

Boots Pure Drug.—Boots' shareholders ceased last year to expect surprises in their final dividends, when the directors left the company's jubilee unmarked, and the 24 per cent. on the ordinary shares, with a 5 per cent., tax free, bonus, is strictly according to the years-old

formula. Nor does the report for the year to March 31st give any indication confirming the hope of a capital bonus distribution. Net income last year is slightly higher at £951,946, against £941,372, but the report offers no explanation of the increase. In 1937-38, however, a year of record turnover, £36,000 was provided for special depreciation before striking net income. Ordinary dividends (equivalent to 30.9 per cent. gross) again absorb £464,000, and are covered by earnings of 49.0 per cent., against 43.3 per cent. The directors ceased after 1936-37 to make allocations to general reserve, when the fund reached £2,000,000, but the addition of £265,000 to contingencies reserve suggests that their caution has in no way been modified. Three years' comparative figures are given below:—

	Years to March 31st		
	1937	1938	1939
Net Income†	967,412	941,372	951,946
Directors' fees	6,471	6,500	6,500
Depreciation and renewals	168,276	180,348	174,406
Pref. and pref. ord. divs.	96,750	96,750	96,750
Ordinary shares:—			
Earned	695,915	607,774‡	674,291
Paid	464,000	464,000	464,000
Earned (%)	50.0	43.3	49.0
Paid (%)	30.67	30.9	30.9
General reserve	100,000	Nil	Nil
Contingencies reserve	50,000	Nil	265,000
Other reserves	70,251	122,133	48,549
Carry forward§	316,987	346,730	248,724

† Trading profit plus income from investments, etc., less staff pensions and taxation; in 1938 less £36,000 special provision.

‡ After £50,000 to taxation reserve.

§ 24 per cent., and 5 per cent., tax free, bonus in each year, excluding 3½ per cent., cash distribution from capital profits in 1938.

§ Includes £7,233, £8,102, and £5,251 in respective years from works development reserve fund.

The balance sheet shows that "sundry creditors and provision for contingencies" have been increased from £864,204 to £1,005,359, while depreciation reserve is £37,127 higher at £917,685, and the contingencies reserve has now reached £500,000. The assets side shows a slightly less liquid position, while shares in subsidiaries are somewhat lower at £929,521, against £946,441. Analysis of the subsidiary trading concerns' accounts for 1937-38 shows that the net book worth of the subsidiaries was £2,767,000, and this sum, which is attributable to the parent company, forms the basis of the long-standing expectation of a capital bonus. The parent company, in 1937-38, apparently received only £12,000 in dividends from subsidiaries, out of available earnings of £165,922. Hence the company could well afford an increase of share capital and a more generous dividend policy. Whether this statement of possibilities justifies the unusually low yield of £3 12s. per cent. on the ordinary shares, now quoted at 43s., is another question.

* * *

Edmundsons Electricity Consolidation.—The trend of consolidation of the Edmundsons Electricity group (to which reference was made in last week's issue of *The Economist*) was further discussed by Sir Thomas Royden at Wednesday's meeting. The final objective is a group consisting of the parent company and ten—perhaps fewer—directly-owned operating subsidiaries. The group is still expanding at a satisfactory rate, though its activities have been hampered by legislative uncertainty. It has, in particular, special concern in the proceedings of the House of Lords Committee, whose examination of the activities of holding companies in the utility industries has now been postponed until November 16th. And the Wessex company, which desired last year to increase its capital, has so far failed to obtain the sanction of the Electricity Commissioners for a new issue. Whatever case may exist for the reorganisation of utility "empires" controlled by holding companies, or indeed, of electricity distribution generally, no case can be made out for administrative delay which impedes the development of the electricity industry. If imme-

diately legislation is impracticable, there is much to be said for Sir Thomas Royden's view that the present status of municipal and company undertakings should be preserved until Parliament can deal comprehensively with the industry.

* * *

Associated Newspapers Setback.—The difficulties of newspaper companies last year are sufficiently well known for some decline in profits to cause no surprise. In the case of Associated Newspapers, however, the reduction in profits for the year to March 31, 1939, appears distinctly severe. The report draws attention to depressed trade conditions, and to the increased cost of newsprint, which was operative for the full year as compared with only part of 1937-38. Following the announcement of the halving of the deferred dividend from 25 per cent. to 12½ per cent., the accounts show a 43 per cent. reduction in total profits from £793,198 to £452,353—a level which is considerably below one-half of the profits recorded from 1934 to 1937. No special factors which might have contributed to the decline are mentioned in the report, but the latest results can hardly be welcome to shareholders, even when full allowance is made for the adverse experience of all newspaper groups last year. The force of the reduction of £340,845 in total profits is borne in full by the deferred shareholders, whose earnings, at £378,266 represent 14.1 per cent., against 26.3 per cent. No allocation is made to publicity reserve, which received £50,000 a year ago, but £100,000 is placed to reserve for contingencies (which is not shown separately in the balance sheet), by drawing upon the carry forward to the extent of £67,401, which stands at £457,730. Despite the sharp decline in profits for the latest year, the 5s. shares, quoted at 9s., still yield little over 7 per cent.—a return which is lower than the current yield on a number of comparable newspaper shares.

* * *

Satisfactory Oil Dividends.—Recent oil dividend announcements show that 1938 proved more favourable for the leading companies than the market had feared. In 1938, world production of crude oil was reduced to 1,983 million barrels, against 2,032 million barrels in 1937, while prices were reduced in the autumn. The moderate reduction in world production, however, has not necessarily affected some of the smaller companies, and the price reduction in the U.S.A. only affected the last quarter of the year. Hence the year's average price level was relatively satisfactory, although it was lower than in 1937. All doubts regarding the significance of the enigmatic "Shell" Transport "second interim" declaration in April were set at rest last week by the declaration of a final dividend of 2½ per cent. tax free, making 20 per cent. tax free for the year as in 1937,

27 REGENT STREET, LONDON, S.W.1

while profits are provisionally announced at £6,795,000 against £6,754,330. The profits experience of Royal Dutch has evidently been similar, for the 17 per cent. dividend is repeated, by the declaration of a final dividend of 3 per cent. in addition to interims of 14 per cent. These declarations greatly cheered the oil share market on the eve of the holiday. Indications of the Venezuelan Oil Concessions results are equally welcome. The year's dividends on the preference and ordinary shares are 16½ per cent., against 22½ per cent. on a smaller capital. During 1938, the share capital was raised from £4,798,249 to £7,197,373 by a cash issue, and the latest year's dividend should absorb approximately £1,214,500 gross, against £1,079,600 in 1937. The company's vigorous development policy may make the dividend an imperfect guide to actual earnings, for Lord Bearsted disclosed that, up to June last year, production was running 20 per cent. ahead of 1937—a satisfactory situation in view of the apparent stability of world output at that time. Increased production may also prove to have been a factor in the results of Anglo-Egyptian Oil, whose 12½ per cent. dividend on the "B" shares is repeated. Since production from the Hurghada Field is declining, the company has been active in opening up new sources. Production from the important Ras Garib well No. 3 began at the end of 1937, and storage and transport facilities were expected to be ready by July last year. The market has welcomed these announcements, and oil shares are firm, pending the issue of the full reports.

* * *

Burmah Oil Report.—The results of Burmah Oil, and the resumption of dividend payments by Attock Oil, are no less encouraging. Burmah Oil shows higher total profits, despite political disturbances which interfered with drilling and production. Supplies for marketing remained fully adequate, but political unrest affected costs. In such circumstances, a 12 per cent. reduction in trading profits is not surprising. The 20 per cent. rise in investment income (due to the legacy of larger distributions by Anglo-Iranian and "Shell" Transport from the previous year) puts the investment revenue above trading profit for the first time. The following table shows the allocation of profits in the past three years :—

	Years ended December 31,		
	1936	1937	1938
	£	£	£
Trading profit	2,598,225	2,856,436	2,520,092

† And 50 per cent. capital bonus. * Of which £500,000 to Fields Expenditure Equalisation reserve. ‡ After £30,392 issue expenses.

Owing to the substantial rise in taxation charges, ordinary earnings are slightly lower than in 1937, but as a result of the 50 per cent. capital bonus distributed last June, the 1938 dividend of 21 per cent. (which disappointed the prophets of a 22½ per cent. payment) absorbs £137,366 more than the 30 per cent. distribution of 1937. Perhaps the main feature of the 1938 accounts is a special addition of £500,000 to the fields expenditure equalisation reserve. Extensive areas are now being surveyed and drill tests may be involved later. If this allocation were charged as an expense, earnings for the equity would be reduced to 22.4 per cent.

Attock Oil Dividend.—The market's expectation of satisfactory results from Attock Oil have not been disappointed. A moderate dividend for 1938 was foreshadowed last September, when an issue of 300,000 £1 shares was made at 25 per cent. premium to finance the new refinery, and again in a progress report at the end of January. The 7½ per cent. distribution (on the old capital of £1,500,000), while satisfactory itself, greatly understates the improvement in profits. Net profits amount to £309,345 against £56,885, but depreciation absorbs £180,000 against £40,000, leaving earnings of £129,345, equivalent to 9.1 per cent. on the old capital. For 1937, only 1.1 per cent. was earned, and no dividend had been paid since 1928. Last year's new issue has yet to achieve the earnings stage. In 1938, output amounted to 535,475 barrels, against 250,754 barrels in 1937, and 110,026 barrels in 1936. Yet in some wells, production was mechanically restricted owing to the limitations of refinery and storage capacity. The market's conviction that the company faces a brighter future—marked by a yield of no more than £2 9s. per cent. on the £1 shares at 62s. 6d.—does not seem misplaced.

* * *

The Week's Company Profits.—This week our usual analysis of profit and loss accounts, appearing on page 579, comprises 41 companies for which comparable figures are available. Total net profits amount to £7,906,000 against £8,713,000, a decline of 9 per cent. Aggregate net profits of 1,192 companies which have reported in 1939 to date, are 8½ per cent. lower at £160,265,000 compared with £174,914,000 earned by the same companies in the previous financial years. The week's results are discussed in preceding Notes, and on page 563 under the heading "Shorter Comments."

* * *

Company Meetings of the Week.—Reports of company meetings commence on page 567 of this issue. Sir Thomas Royden's speech at the *Edmundsons Electricity* meeting is discussed in a Note on page 559. At the meeting of *John Summers and Sons*, Mr R. F. Summers informed shareholders that the issue of 4½ per cent. debenture stock was sufficient to cover the installation of the new strip mill and to leave a working margin. The mill is expected to be in operation by the end of this year. Mr J. F. Taylor reported to shareholders of *Pease and Partners* that bank loans had now been paid off and the concern was in a strong financial position. At the meeting of *Gold Fields Australian Development*, Mr J. A. Agnew informed shareholders that, at the present rate of milling, there was a four years' supply in the ore reserve. Mr E. F. Slade, at the meeting of *Batang Consolidated Rubber*, declared that the directors aimed at acquiring a new rubber area involving an increase of capital. At the meeting of *United Sua Betong Rubber*, Sir John Hay stressed the principle that the regulation scheme makes an essential commodity available to all countries, and ruled out specific favours to one country. Sir Thomas Royden informed shareholders of *Imperial Continental Gas* that a larger distribution from the Belgian interests might be made this year, coupled with increased revenue from Edmundsons Electricity and a reduced debenture liability. At the meeting of *London County Freehold and Leasehold*, Sir W. J. M. Burton pointed out that the company's properties were spread over a wide area, and were consequently less vulnerable to air attack. Mr W. Arthur Addinsell informed shareholders of *Holyrood Rubber* that the company's planting rights have been transferred to Edensor Rubber, in which Holyrood is interested. At the *Ever Ready Company (Great Britain)* meeting, Mr Magnus Goodfellow disclosed that sales in April and May were substantially in advance of the same months last year, both in volume and value.

THE STOCK EXCHANGES

London

SETTLING DAYS

TICKET	ACCOUNT
JUNE 6	JUNE 8

THE markets reopened after Whitsun in cheerful mood, but as the week progressed the advance lost some vigour, although investment sentiment remained confident. Special importance, therefore, need not be attached to the rather more hesitant tone apparent towards mid-week. Profit-taking towards the end of the account was the main factor at work, while the market's mood was further subdued by knowledge of the delay in reaching an Anglo-Soviet agreement.

Gilt-edged stocks began briskly with a renewed rise in prices, due to shortage of supply accompanied by persistent, if scattered, public buying following the complete uneventfulness of Whitsun in the international sphere. Both perpetual and medium-dated stocks showed gains of up to ½ a point. But already in late dealings on Tuesday a little profit-taking was apparent, and it became more pronounced as the end of the account approached, the undated stocks being most affected. In comparison, however, with the upward tendency of the past few weeks, the reaction was very moderate. News of the Northern Ireland loan caused momentary hesitation, on the generosity of its terms rather than distaste for the issue, which was quickly subscribed on Thursday. Home Corporation issues were unexciting but steady, while, among Colonial issues, New Zealand issues were favoured on Mr Nash's visit and resisted the mid-week irregularity. The section was affected on Wednesday, however, by somewhat heavy selling of the South African scrip before the 3½ per cent. call.

Foreign bonds were quiet and movements diverse. Japanese bonds were supported, but Chinese became rather weaker. Greek loans were in demand in mid-week on hopes of an improved debt offer.

*

At first, *home rails* advanced strongly on further consideration of the Square Deal, on the increase in London area fares, and on hopes of good Whitsun traffics. Profit-taking, however, set in owing to fears concerning the labour position. London Transport "C" began the week with a further rise after last Friday's spectacular leap, on the fares increase, but slipped back later. Argentine rails shared in Tuesday's general cheerfulness and remained fairly firm.

A similar trend was evident among *industrial shares* over the week. Moderate gains in prices prevailed but some profit-taking began in late dealings on Wednesday, and on Thursday there were a number of slight losses. Until mid-week, iron and steel shares were very firm, and the trend of prices was moderately upward. John Brown, however, were unaffected by the small increase in profits and the maintenance of the dividend, while Indian Iron and Staveley were exceptions to Wednesday's firmness. Strength was also shown by the engineering section, North British Locomotive, in particular, responding to news of good contracts.

The general advance among coal shares continued, and electrical equipment issues were firmer for choice. With a few exceptions, motor shares moved upward, while the revival of interest in aircraft manufacturing issues continued. Brewery shares were hardly so satisfactory as other sections, for prices moved only slightly on Tuesday, and the trend then became irregular. Apart from the mid-week hesitation common to most sections, tobacco shares were firm. The stores group made a good showing, and the tendency was also firmer in the provision and catering section. Textile issues, for a change, were among the more interesting groups. Moderate gains were general on Wednesday, support persisted towards mid-week on the better industrial prospects, and the section was practically exempt from the general hesitation on Thursday. Until profit-taking brought a slight but widespread reaction on Thursday, miscellaneous issues moved to higher levels. Shipping shares were quietly supported.

*

Oil shares continued their recent advance on Tuesday. Anglo-Iranian were firm in anticipation of the dividend, while Burmah Oil, "Shell," Royal Dutch and Venezuelan Oil Concessions received support. Later in the week, the close of the account affected business, but in a firm market Anglo-Egyptian "B" advanced further. Among *rubber shares*, the commodity's sound statistical position imparted a consistent firmness. On Tuesday, Rubber Trust and Anglo-Dutch were in demand, but later the advance became general on public support.

Among *mining shares*, Kaffirs, especially East Geduld, received early support on Tuesday from the Cape. Later in the week, local and Paris support more than maintained the advance. Developing mines were also favoured, with Western Holdings and West Wits in the lead. Finance shares, at first narrowly irregular, became firmer in mid-week. Among *West Africans*, Arison continued to forge ahead, the advance becoming general by Wednesday. Greater activity was evident among copper shares, less popular issues sharing in the improvement, while tin shares advanced, with Mawchi in the lead.

ACTUARIES' INVESTMENT INDEX

The appreciable revival of May is fully reflected in the Actuaries' security indices both of fixed interest stocks and of industrials. Gilt-edged in particular have recovered sharply from their low levels of April, and are now about the

same as in January, while industrials make an equally good showing, and after rising nearly 5 points in as many weeks, are well above January levels. The index of 160 industrial equity prices stood at 64.3 on Tuesday, May 30th, against 59.4 five weeks ago, and 64.0 a year ago. The corresponding average yields are 5.53, 6.03 and 5.94 per cent. We give below a selection of the component indices, and also the usual monthly particulars of fixed-interest securities :—

New York

WALL STREET opened confidently on news of federal arbitration in the automobile strike, anticipated higher steel mill activity and Mr Morgenthau's tax plans. Chrysler and U.S. Steel were outstanding. The market was closed on Tuesday. The advance continued on Wednesday with more cheerful foreign news, steel and railroad shares being particularly active. But though the Dow-Jones index of industrial averages gained a point on the day's trading, the later advances were not held. The *Iron Age* estimates this week's steel mill activity at 52 per cent. of capacity against 48 per cent. last week. Steel scrap prices have also hardened on the week.

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values calculated on closing prices (1926 = 100).

Paris

THE Bourse made a promising start in May, though rentes and mining shares continued weak. M. Litvinoff's resignation and the impending new Government loan imparted a more cautious attitude, but optimism soon revived. Trading was thin, however, and chiefly on professional account, but M. Reynaud's review of France's finances and the increasing confidence in the country's preparedness resulted in the over-subscription of the new loan, which, in

turn, encouraged a harder tone in rentes. Home industrials and international issues, after uncertainty in the middle of the month, finished on a firmer note.

Berlin

THE first half of the past month witnessed an upward tendency, but subsequently gains were lost in idle and rather featureless markets. Steel, shipping and electrical shares led an upward movement in the first week, but shipping shares quickly lost ground. The middle of the month brought rather quieter markets and prices drifted downward, relieved only by a short rally in electrical stocks. Though the tone remained rather undecided, prices were firmer towards the end of the month.

Amsterdam

THE month opened quietly, and political factors were responsible for a downward drift of prices. As optimism on the political outlook developed, prices recovered, Fokker Aircraft, Unilever N.V., and Royal Dutch rising several points. In addition to local industrials, commodity shares and American issues received support, and by the middle of the month the *Telegraaf* composite share index had improved from 195.53 to 204.56. Later less favourable business reports, and the delayed negotiations between Britain and Russia tended to curb activity, and earlier gains were reduced. The resignation of the Dutch Finance Minister and Danzig incidents further unsettled the bond and share markets, but on the Royal Dutch dividend and rising hopes of an Anglo-Soviet agreement, the market concluded the month on an active note.

Canada

THE Canadian stock markets remained in a very nervous and reactionary condition till nearly the end of April, but since May began there has been a gradual recovery, although the volume of trading has remained low and the public is still very cautious. The formation of an anti-Fascist bloc has revived confidence, however, and an advance in commodity prices has been a helpful factor, but the markets were sluggish

until the fourth week of the month. The shares of breweries, manufacturers of refrigerators, dairy corporations, etc., which benefit by hot weather, were in demand early in the month, but later the initiative passed to gold and steel shares, an upward movement developing over a wide front. The Bureau of Statistics "Investors" Index for common stocks, which stood at 97.2 on April 21, rose to 99.0 for May 4 and further to 100.4 on May 11. For the week ending May 11 the index for long-term Dominion bonds was 116.4, against 117.2 for the corresponding week in April and 118.2 for the corresponding week in 1938.

BY OFFER FOR SALE

Government of Northern Ireland.—Offer for sale of £2,500,000 3½ per cent. stock at 98½, redeemable at par March, 1954, from 1950 on notice, and by half-yearly drawings from 1939, by sinking fund of 2½ per cent. at par. A trustee stock. Annual yield from taxation, about £14,000,000. Issue is part of £3,000,000, and has been taken by Glyn Mills and Company and Baring Bros. and Company.

BY STOCK EXCHANGE INTRODUCTION

Bentley Engineering Company.—Issued capital, 5,000 "B" £1 ordinary, 40,000 £1 ordinary shares and 60,000 6 per cent. £1 cumulative preference shares. Hosiery machine builders of Leicester. Combined profits of company and T. Grieve and Company, after depreciation: 1936, £18,323; 1937, £27,575; 1938, £36,866. Total assets of company, end 1938, £211,632.

(Continued on page 563)

Industry and Trade

European Coal Exports.—The outstanding feature of the European coal trade during the first quarter of the current year was the sharp decline in German exports, illustrated in the following table of the cargo and bunker exports of the principal European coal-exporting countries.

	January-March		Change	
	1938	1939		
	Th. metric tons	Th. metric tons	Th. metric tons	Per cent.
United Kingdom	11,507.6	10,864.0	- 643.6	- 5.6
Germany	8,248.4	6,137.9	- 2,110.5	- 25.6
Poland	2,645.0	3,680.0*	+ 1,035.0	+ 39.1
Holland	898.7	920.5	+ 21.8	+ 2.4
France	180.5	265.6	+ 85.1	+ 47.1
Belgium	851.2	1,116.2	+ 265.0	+ 31.1
	24,331.4	22,984.2	- 1,347.2	- 5.5

* Including 876,000 tons from the Karwin mines.

The total production of the United Kingdom, Poland, Germany, France, Belgium and Holland in this period closely approximated the output in the same quarter of 1938. There was a decrease of 1.6 million metric tons in the United Kingdom, an increase of 900,000 tons in France, and the inclusion of the Karwin mines improved the figures for Poland by about 1,940,000 tons at the cost of a corresponding decrease in the production of Czechoslovakia; but in Germany, Belgium and Holland production was maintained at practically the same level as a year ago. Continental import restrictions (particularly in France and Belgium) and a reduced world demand were responsible for a decrease in the volume of international trade, while a less active demand in France, Belgium and Holland for metallurgical coals, and alterations in competitive price relations, led to some changes in the direction of demand

(Continued from page 562)

PRIVATE PLACING

Kenward and Court, Ltd.—There have been issued £50,000 of 4½ per cent. first mortgage debenture stock, of which part in conversion of £19,400 5 per cent. stock, and balance placed privately.

BONUS SHARES

British and Colonial Furniture.—This company proposes a scrip bonus of 400 per cent. to ordinary shareholders by capitalising £440,000 of undivided profits and distributing 1,760,000 5s. ordinary shares.

East End Dwellings.—This company proposes to capitalise £169,440, part of general reserve, and to distribute a scrip bonus of one new £10 ordinary for each £10 share held.

CONVERSIONS AND REPAYMENTS

Brazil 4 Per Cent. Sterling Stock 1936.—All outstanding amounts of this stock (£365,900) will be repaid at par plus interest on July 1st. No transfer registered after June 9th. (Service of this loan was excluded from suspension of foreign debt payments).

Bombay Port Trust.—The £500,000 4 per cent. sterling debentures, 1909, outstanding will be repaid July 1, 1939.

SHORTER COMMENTS

Company Results of the Week.—WHITEHALL ELECTRIC INVESTMENTS have experienced a moderate fall in net profits from £228,680 to £210,073, and again add the profit to the balance carried forward. Consolidated profits amount to £306,005, against £348,027.

away from Germany and the United Kingdom to Poland and Belgium. Among the principal Continental coal-importing countries Germany and Holland increased their foreign purchases by 155,000 tons, but France reduced hers by 1½ million tons, or 25.4 per cent.; Belgium by 296,000 tons, or 23.2 per cent.; and Italy by 374,000 tons, or 12.5 per cent. Among the exporting countries Poland, Holland, Belgium and France improved upon their position in the March quarter of 1938, but British trade declined by 5.6 per cent. and that of Germany by more than 25 per cent. The decrease in British exports was due primarily to a reduction of 727,000 tons in our supplies to France, while the loss in German trade was accounted for by shortages of 722,000 metric tons in deliveries to France, of 484,000 tons to Italy, of 422,000 tons to Holland, and of 401,000 tons to Belgium.

Cloth Orders for Lancashire.—At a meeting in Manchester on Tuesday attended by 160 representatives of the cotton trade, Sir Frederick Marquis, the honorary adviser to the Government on textile supplies for the defence forces, explained the procedure to be followed and emphasised the necessity for speeding-up production. The meeting decided to set up a committee, comprising representatives of every section of the cotton industry, to advise the Government on the question of fixing prices for new business. It was announced that further Government contracts totalling 20 million yards of cotton fabrics were to be placed immediately with Lancashire firms. It was also officially announced that the dyeing prices of cotton fabrics affecting most of these Government

dividend is being paid. As a result mainly of higher wages costs, MILLARS' TIMBER AND TRADING COMPANY net profits have fallen from £131,250 to £98,652, and the dividend is reduced from 10 per cent. to 7½ per cent.

MISCELLANEOUS

Coast Lines, Ltd.—Net earnings, 1938, £287,869 (£299,590). Tax and N.D.C., £17,000 (£8,000). Preference dividends, £194,250 (£194,250). Ordinary dividend, 3 per cent., absorbing £60,000, against 4½ per cent., absorbing £90,000. To reserve £70,000 (£100,000). Special credits £66,117 (£110,127). Special debits, nil (£15,875). Carry forward raised from £105,204 to £116,540.

Thames Grit and Aggregates, Ltd.—Net profit year to March 31, 1939, £18,663, a fall of £6,205. To investment depreciation reserve £3,000. Last year £5,500 was placed to a special reserve. Ordinary dividend reduced from 10 to 7½ per cent.

Chloride Electrical Storage.—Profit for year to March 31, 1939, £324,995 (£435,724). To depreciation £12,024 (£10,260). Staff pensions £12,000 (£12,000). To tax £29,000 (£65,000). Preference dividend £3,720 (£3,720). Ordinary dividend 15 per cent. (£163,306), against 20 per cent. (£217,390). To general reserve £100,000 (£100,000). Subsidiaries' staff pensions £10,000 (£15,000). Carry forward reduced from £89,149 to £80,669.

Associated Biscuit Manufacturers.—Total income year to March 31, 1939, £57,546 (£50,065). Ordinary dividend 3 per cent., against nil. Carry forward reduced from £21,881 to £20,687. Cash £18,198 (£22,871).

Olympia, Ltd.—Net revenue, 1938, £94,236 (£101,552). Tax £17,095 (£21,424). N.D.C. £2,800 (£2,150). Dividends have been paid on preference shares to October 31, 1938. Carry forward raised from £47,998 to £49,236.

(Continued on page 577)

contracts had been advanced by 10 per cent. as from Thursday, June 1st. The increase, which is designed to cover the higher costs of production caused by the Factory Act and the Civil Defence Bill, was arranged before it was known that additional Government contracts would be placed. The Cotton Manufacturers' Association recently advanced their weaving prices by 8½ per cent. to cover expenditure under these two Acts, so that tenders for the new batch of Government orders are likely to be at a considerably higher level than in the past.

The Higher Zinc Duty.—The announcement of the increase in the duty on import of foreign zinc from 12s. 6d. to 30s. per ton was made too late last week to be given more than a brief notice in *The Economist*. The decision of the Import Duties Advisory Committee has confirmed the arrangements proposed by the Empire zinc producers and the Imperial Smelting Corporation some months ago, to which reference was made on page 230 of *The Economist* of October 29, 1938. The main object of the rise in imports duties is to improve the financial position of the Corporation, whose profits in the twelve months ending June 1938 barely exceeded £100,000, compared with £257,000 in the previous year. This object has been secured by the agreement of the Empire zinc producers to pay to the Corporation 10s. for each ton of Empire zinc imported into this country, and as imports of Empire zinc amounted in 1938 to 108,000 tons, the Corporation stands to gain about £54,000 per annum. In addition, the Corporation will obtain a further £55,000 per annum from the higher price which it will be able to charge for its own production, which is now limited to 60,000 tons per annum. It will, however, contribute together with the Empire producers to a fund from which exporters of zinc manufactures will obtain a rebate of 17s. 6d. per ton of zinc content. This very large increase in the preferential duty is likely to complicate dealings on the London Metal Exchange, since in 1938 one-third of the total zinc imports came from foreign sources, mainly Belgium. In order to avert any pressure on the London Exchange, the British zinc producers have given the Government an undertaking that they will make every attempt to revive the international zinc cartel which came to grief at the end of 1934. The new scheme seems a cumbersome method of ensuring dividends to the holders of ordinary and preference shares in the Imperial Smelting Corporation. If the continuation of zinc smelting in this country is considered desirable for defence purposes, and if it cannot pay its way without economic support, an annual grant from the Treasury seems a more logical method than a combination of discriminatory import duties and high rebates.

Diamond Difficulties.—Sir Ernest Oppenheimer, the leader of the international diamond trade, has made two important speeches on the diamond position in the last few days. At the De Beers meeting at Kimberley he pointed out that, in the absence of war, the volume of the world diamond trade should show a considerable improvement this year. In 1938, the world turnover was only slightly in excess of £4 millions compared with £9.3 millions in the preceding year. In the second half of last year, however, there was a certain rally, which made headway in the first months of 1939. Total sales so far this year are in the vicinity of £2.5 millions and, if the political tension in Europe does not increase, the full

year's sales may exceed £6 millions. This prospective rise in sales, however, does not justify the maintenance of mining at last year's rate, as the producers have accumulated substantial stocks. In 1938, South Africa's production totalled 1,238,608 metric carats, while sales amounted to only 518,744 carats, the lowest level since 1911. Consequently, at the annual meeting of the Consolidated Diamond Mines of South-West Africa this week, Sir Ernest announced that the activities at Bogenfels had been discontinued since the end of 1938 and that a complete stoppage of mining will be effected in the near future. In spite of political uncertainties and the trade depression, however, the international sales organisation set up since 1933 has enabled the diamond syndicate to maintain prices without much difficulty.

Retail Sales in London.—For the last eighteen months, the value of retail sales in Central and West London has been steadily falling, while in other districts of Great Britain the trend in value has been upward. This divergence is illustrated in the table below, taken from the statistics of the value of retail trade compiled by the Bank of England and the Retail Distributors' Association:—

	VALUE OF RETAIL SALES (Average Daily Sales in 1937=100)				
	1938	1939			
	Av.	Jan.	Feb.	Mar.	Apr.
Great Britain—					
All departments.....	102	98	91	96	108
Food	104	98	103	105	113
Non-food	100	98	79	86	103
London: Central & West					
All departments.....	93	100	65	79	88
Food	96	92	79	85	93
Non-food	93	101	63	78	88
London: Suburban—					
All departments.....	103	98	98	98	109
Food	106	100	107	107	115
Non-food	100	93	84	84	100

The latest figures for April, which were published in this week's *Board of Trade Journal*, show the same divergence; in Great Britain as a whole, the daily value of retail trade in April was 1.3 per cent. greater than in April 1938, while in Central and West London, there was a fall of 7 per cent. compared with a year ago. In suburban London, on the other hand, retail sales have increased slightly more than the average for the country as a whole.

Improving Timber Market.—During the greater part of 1938 the large stocks of timber accumulated in this country during the boom of 1937 combined with the falling demand for building timber to produce a very depressed market. The low levels to which prices sank in the summer of 1938 in this country—the largest importer of timber—led the European Timber Exporters Convention (which was formed at the end of 1935 by the principal suppliers of softwoods) to introduce in September, 1938, a further cut in exports; an even lower level was arranged for 1939, as is shown in the table below:—

	EXPORT QUOTAS ARRANGED BY E.T.E.C. (000 standards)			
	1937	1938	1939	
Sweden	820	Feb. 739	Sept. 691	656
Finland	1,005	904	845	804
Russia	950	901	842	760
Poland	313	276	258	250
Latvia	127	110	103	102
Czecho-Slovakia ..	96	82	77	...
Austria	275	235	...	...
Jugoslavia	168	144	134	134
Roumania	246	229	214	197
Total	4,000	3,620	3,164	2,002

Supplies on world markets were also diminished by the political changes of the last twelve months, since the exports of Austria and Czecho-Slovakia have now been absorbed into the internal trade of Germany. For 1939, therefore, a much closer balance between supplies and demand was possible, but the political uncertainties of the early months of 1939 damped down the British demand for imported timber. But the low level of imports in 1938 led to a gradual absorption of stocks; the Timber Trade Federation estimated that stocks of sawn and planed softwoods in first hands fell from 880,000 standards on January 1st to 625,000 standards on May 1st, while stocks in the London docks fell from 103,224 standards to 91,702 standards in the same period. Consequently, the revival even on a small scale of commercial buying at the end of March led immediately to a hardening in timber prices. In the last few weeks, a very considerable volume of orders has been placed by the Government for Army huts and by other authorities for civil defence purposes, with the result that importers have run short of the timbers required for these purposes. Prices of good Finnish whitewood (2½ by 7 u/s), for instance, rose by £1 to £14 15s. per standard between January and May and prices for similar specifications have risen accordingly. Current prices are still below those ruling a year ago, and it is to be hoped that they will not be pushed up so rapidly or so far as to bring about another speculative boom on the lines of that in 1937.

Rise in Wholesale Prices.—The upward trend in wholesale prices noticed early in May was continued in the past fortnight. The rise was not evenly spread; movements in wheat and cotton prices have been irregular and the rise in *The Economist* wholesale price index, given in the next column, from 116 to 116.7, is largely due to the increase in the prices of non-ferrous metals.

* * *

Rise in Wholesale Prices.—The upward trend in wholesale prices noticed early in May was continued in the past fortnight. The rise was not evenly spread; movements in wheat and cotton prices have been irregular and the rise in *The Economist* wholesale price index, given in the next column, from 116 to 116.7, is largely due to the increase in the prices of non-ferrous metals.

INDUSTRIAL REPORTS

ALTHOUGH business has been interrupted by the Whitsuntide holiday, activity was maintained at a fairly high level. Most of the coalfields report quieter conditions owing to the warm weather, but industrial demand is still on a large scale, and the quantity of coal raised during the week ended May 20th was 4,904,600 tons, compared with 4,496,300 tons in the corresponding week last year. Iron and steel works are becoming increasingly busy, and it is now difficult to obtain supplies of many materials at the required delivery dates.

The Lancashire cotton trade has benefited from a further large Government order for cloth to be delivered by the end of August. The returns of the daily value of retail sales in April, discussed on page 564 of this week's *Economist*, show a seasonal increase over the figures for March.

Coal

Sheffield.—With industry making but a brief stoppage over the holiday, the demand for coal is fully maintained, and the outlook is satisfactory. All industrial steams are in request on inland account, but household demand has eased. Small coal is not easily disposed of in full, and gas coal is quieter

than of late. Some revival of demand for coking qualities is noted. Blast-furnace coke is a stronger market, but the call for central heating coke is irregular. Export inquiry continues on a satisfactory scale, and best steams and screened gas coal are well taken up. Forward buying is improving, but exporters express the view that business would be still more active if prices, especially of small coal, were lower. Rather better demand exists for bunkers. Prices generally are unaltered.

Newcastle-on-Tyne.—Inquiry for Durham coking coal continues to be the feature of this market. Belgium is a keen buyer, but with most collieries already fully booked for this class of fuel it is not easy to obtain offers. Other grades of fuel are steady, but there is not the persistent inquiry which was experienced some weeks ago, and certain brands of unscreened steam offer more freely. The patent oven coke market is firm, but the International Coke Cartel have decided to reduce f.o.b. prices by 1s., thus making ordinary grades 26s. per ton.

Glasgow.—The market has been quieter this week. Home trade has been affected by the warmer weather, and in the household trade there has been a

† Monthly average.

Prices of primary products in America have risen more sharply, owing mainly to the improvement in grain prices in the last few days on reports of further crop deterioration, but the Irving-Fisher complete index has remained unaltered. Details of the component series of *The Economist* complete index are given below:—

	Sept. 18, 1931	May 25, 1938	May 17, 1939	May 31, 1939
(1927=100)	1931	1938	1939	1939
Cereals and meat...	64.5	88.3	70.6	70.6
Other foods	62.2	58.1	62.4	62.1
Textiles	43.7	52.1	54.3	54.2
Minerals	67.4	89.0	91.2	92.1
Miscellaneous	65.8	75.0	74.6	76.0
Complete index	60.4	72.2	70.1	70.5
1913 = 100	83.1	99.4	96.5	97.0
1924 = 100	52.2	62.4	60.6	61.0

All the four main non-ferrous metals were dearer than a fortnight ago, and in the miscellaneous group prices of linseed, linseed oil and rubber also showed a rise.

*

Cardiff.—On Monday work was suspended at the collieries and loading operations at the docks, and there was considerable absenteeism on Tuesday. There has been a lull in current business, but the collieries are well sold, and with a favourable tonnage position active shipments were expected in the latter part of the week. Exports in the foreign and coastwise trades last week totalled 410,100 tons, compared with 394,598 tons in the corresponding week last year, and since the week ended April 16th there has been an increase of nearly half a million tons in the volume of trade compared with the same period last year. There is very little spot coal available, with the exception of certain classes of smalls, and dry sized grades are exceptionally strong. The pig iron furnaces are absorbing practically all the available supply of colliery coke, while the recent improvement in the patent fuel trade has been firmly maintained. Prices are unaltered.

Iron and Steel

Sheffield. — The market has been less active after the holiday, but the undertone is strong, and full activity is certain within a few days. In the iron section the heaviest pressure is for basic pig, consumption of which is expanding very rapidly. Substantial forward contracts are being arranged. Forge and foundry are rather quiet, users covering only their known requirements. So far the cut in the quotation for hematites has done little to expand demand, although there is a steady call for special qualities. Finished iron continues rather dull.

A shortage of basic steel billets exists, and users are unable to place business for early delivery. Acid qualities are also active, structural steel business is good, and makers of wire rods have good orders.

The scrap market is very firm for most classes of material. Supplies of heavy basic steel are becoming more difficult, and the position will not be eased until imported material becomes available. Heavy cast iron for foundry use is in active demand, and there is steady buying of wrought iron for shearing.

★

Middlesbrough. — Although no market was held this week owing to the Whitsuntide holidays, most of the steel-makers have kept their plant working. Users of semi-manufactured steel are calling for increased supplies, and deliveries are expected to arrive in this area very shortly from Australia. The sheet mills are employed at capacity, and specifications for shipbuilding material are coming in more freely. Shipments of pig iron from the Tees tend to increase.

Blast-furnace coke is on offer at 24s. 2d. per ton f.o.t. at the ovens in Durham, and it is not expected that the recent announcement of the reduction in the export price will affect the home market. The demand for heavy steel melting scrap is maintained, with supplies scarce.

★

Glasgow. — Clyde shipyards have now a very heavy tonnage on their books, while work is in progress on a number of vessels, and the shipbuilders are looking forward to a long period of great activity and steady employment for their workers. Marine engineers and boiler-makers in this district have work on hand for vessels being built at yards in all parts of the United Kingdom. At the steel plants demand for many kinds of material continues to expand. Sheet makers are utilising a very large proportion of their output for sheets for air-raid shelters and for huts, but there is much business being done in other sheets, although makers find it impossible to give the deliveries required by users. Engineering shops of all types in the West of Scotland are busy and are absorbing considerable quantities of sheet material.

★

Cardiff. — Work was suspended on Monday at the steelworks and the re-rolling branches of the iron and steel

industry, and owing to the exceptionally fine weather there was only a partial resumption on Tuesday. Of the existing melting furnaces 96 per cent. are now in operation, and in the week ended May 20th the tin works were operating at nearly 68 per cent. of capacity, compared with only 35.5 per cent. in the corresponding period last year. Shipments of tinplates in the twenty weeks ended May 20th were nearly 25,000 tons less than a year ago, but they are expected to improve substantially when the restrictions imposed some time ago by the Cartel, owing to the export of supplies in excess of the quota in the December quarter of 1938, have been removed. In recent weeks there has been a substantial increase in the volume of the world export trade. Prices show no change.

★

News from Abroad. — It seems that the buying movement on international steel markets has reached its climax for the time being. Demand has remained very keen, but in several cases the inquiries are not as genuine as before, as it is obvious that the quotations and delivery times offered by the producers would not suit the buyers.

An unusually high percentage of the turnover is at present taken up by semi-products, as the British works are in the market for record tonnages. The demand for several finished products, such as sections and merchant bars, is comparatively quiet, so that sellers frequently grant concessions on these products in order to attract buyers. Generally, however, unofficial price concessions are very few, and even reductions against American competition are less conspicuous than before. The Cartel is exercising a strict control of the American offers so as to ensure a smooth working of the prolonged agreement with the American exporters. This provides for a stricter application of the system of fines against quota excesses than under the old agreement. On the market for thin sheets the position is very tight, many consumers being unable to secure urgent requirements at reasonable delivery times.

The Comptoirs are occupied with quota adjustments and clearing. Special quota problems have arisen as British producers, being extremely busy for the domestic demand, have cut down their export business in several instances and claimed the compensations provided for in the Cartel agreement. General price questions will probably be discussed, too, but an all-round increase is thought to be unlikely, although it has been demanded by several producers in view of the favourable situation.

Textiles

Cotton (Manchester). — Business has been upset by the Whitsuntide holidays, but the feature of interest has been the decision of the Government to place further cloth contracts, totalling 20,000,000 yards. These fabrics have to be delivered by the end of August, and should result in the re-starting of idle looms. Some nervousness has been caused by the slightly easier tendency in raw cotton prices. The shortage of desirable grades and qualities in Liverpool and Manchester

has caused further embarrassment, and complaints have tended to increase.

The yarn section has been very quiet. Both American and Egyptian spinners have reported a comparatively small turnover, with the exception of coarse and medium qualities, which are being used for the manufacture of fabrics under the defence programme.

In the cloth section there has been some price-testing for export, but sales have been isolated. India has purchased limited lots, and South America has provided a fair business, but Egyptian turnover has been poor. Little support has come from the Continent. Fancies and standard goods have been in request for the Dominions. In the home trade section there have been larger clearances from the retail establishments; light summer fabrics and made-up goods have been sold on a big scale.

★

Jute (Dundee). — "Bulls" and "bears" in the raw jute market in Calcutta are still pulling against each other, but the latter are gradually gaining and prices for both old and new crop are easing. The prospects for the next crop are very favourable from all districts, and there should be a good supply to meet all requirements. It is likely that the Indian jute mills will restrict their production from August 1st next in order to reduce the huge stocks of hessians in Calcutta. At the end of April stocks were 481,000,000 yards, and it is hoped to reduce them to about 150,000,000 yards by scaling up a percentage of looms. In spite of this announcement, prices for Calcutta hessians have declined in the past fortnight. It is stated that no further orders for sandbags are likely to be placed with Calcutta mills.

The value of new crop full group Daisee-2/3 has been reduced to £23 17s. 6d. for October/November shipment. Old crop Daisee-2/3 is quoted at £30 7s. 6d. The quality of the jute arriving here is very poor on the whole and many arbitrations are being held, with fairly heavy allowances given for inferior quality. Yarns are quiet at 2s. 9d. for common 8 lb. cops, but cloth is maintained at 3½d. for 10 oz. 40 in., and 2½d. for 8 oz.

THE COMMODITY MARKETS

THE improved tone on the stock exchanges during the earlier part of the week was responsible for upward movements in some commodity markets. The four main non-ferrous metals were all dearer; the decision to raise the British duty on imports of foreign zinc has removed one uncertainty from that market, and steps are being taken in America to restrict the output of copper. The rubber market has also been firm, and prices of linseed and linseed oil were marked up. Cotton price movements have been irregular, and in spite of reports of crop deterioration in the American hard wheat belt, wheat prices on the international market were barely changed on the week.

(Continued on page 572)

COMPANY MEETINGS

EDMUNDSONS ELECTRICITY CORPORATION, LIMITED

BENEFITS OF CO-ORDINATED CONTROL

INCREASING SALES AND NUMBER OF CONSUMERS

SIR THOMAS ROYDEN ON THE GROUP'S PROGRESS

The forty-second ordinary general meeting of Edmundsons Electricity Corporation, Limited, was held on the 31st ultimo, at Thames House, Millbank, London, S.W.

Sir Thomas Royden, Bt., C.H., the chairman, in the course of his speech, said:—Ladies and gentlemen,—You may recall that last year I mentioned to you the policy of co-ordinated control of all the companies in the Edmundsons' Group, which had been initiated two years earlier. On that occasion I explained to you that this policy was predicted upon "three basic principles of physical integration, corporate simplification, and a fixed objective of commercial achievement and physical growth." I will not repeat what I have previously said to you regarding the obvious advantages to be derived from this policy, but I am pleased to inform you that its application has been continued during the past year as rapidly as has been consistent with orderly procedure and an exact compliance with statutory obligations.

During the past year 18 separate subsidiary and sub-subsidiary companies have completed their liquidations, and six subsidiary companies of the Shropshire group are now in process of liquidation. A comparison between the organisation chart appearing in last year's report with that in the report now under consideration will give you in graphic form a complete picture of the changes that have been effected during the past year. This policy of consolidation will, of course, continue until we reach our final objective, when the group will consist of Edmundsons, the parent company, and 10— or possibly less—directly owned operating subsidiaries.

We have continued our intensive commercial and selling activities with objectives and quotas established after careful study, and it is gratifying to be able to report that these objectives have been attained in each of the numerous fields of commercial endeavour.

GROWTH OF THE UNDERTAKING

The following figures will give you an idea of the growth of your company during the past year:—

40,000 new consumers were added, bringing the total number up to 418,100; an increase of 11 per cent.

210,300kw. of additional load was connected, bringing the connected load to 1,270,300kw.; an increase of 20 per cent.

81,658,000 additional units were sold, thereby increasing the total for the year to 817,591,000 units; which represents an increase of output of 11 per cent., after excluding 72,781,000 units exported to the Central Electricity Board.

The increase of 11 per cent. which I have just mentioned compares with an increase of 6.4 per cent. in units generated throughout the United Kingdom during the same period of time.

I am pleased to add that during the first four months of 1939 the increase in number of consumers, connected load, and units sent out shows a highly satisfactory improvement over the corresponding period of 1938. It is, moreover, reasonable to assume that if fairly stabilised political and economic conditions are maintained during the remainder of the current year the final results for the year 1939 should prove to be satisfactory.

Satisfactory progress has been made in the installation of the 225,000kw. of additional generating capacity in our several selected stations, which, as I reported to you last year, had been directed by the Central Electricity Board.

UNCERTAINTY CAUSED BY PENDING LEGISLATION

Unfortunately the prospective legislation relating to the proposed reorganisation of the electrical industry, to which I referred last year

in some detail, has not made any progress. While it is not my desire or intention to be critical of the Government because of its failure to attempt a solution of this highly complex problem, frankness compels me to state that the uncertainties regarding the future are multiplying to a regrettable extent the difficulties that confront us daily in the problem of producing and distributing satisfactorily the electrical supply which is so essential to the economic and social welfare of the country.

A recent attempt at piecemeal, and, in my view, undesirable, legislation through the instrumentality of a Committee of the House of Lords at the moment appears to have hung fire, and the Committee in question has decided to adjourn any further hearing on the matters before it until November 16th next.

In any event, this method of approach to this really vital problem only adds to the confusion. Pending legislation on the subject it would be a help if the Government would give public expression to the view that the present *status quo* of municipal and companies' interests should be maintained. Unfortunately, the authorities concerned have not thus far taken any action on this important phase of the problem and, as a consequence, the disintegration predicted is proceeding. We, and doubtless other companies similarly placed, are losing from time to time valuable and important undertakings, which logically and from every practical point of view should be retained as components of those larger companies of which they have been a part.

CAPITAL REQUIREMENTS OF STATUTORY COMPANIES

As a result of conflicting views between the industry and the Ministry of Transport relating to the exercise by the Electricity Commissioners or the Minister of Control over the terms and form of new capital requirements of all statutory companies, we are confronted with a serious difficulty.

Our Wessex company has been expanding rapidly during the past few years and, as a result of the large expenditure involved, found itself last October in the position of having reached the limit of its authorised capital powers.

Application was made in the usual way to the Commissioners for approval of an extension of the capital of this company in accordance with the terms of what is known as "The Wessex Act." At the time the application was made the Wessex company could have raised, and was prepared to raise, debenture capital at approximately 3½ per cent. The right to raise this capital is still being withheld, and we do not know when, and if, it will eventually be granted. In the meanwhile, owing to changes in market conditions and the price of money, the cost of this capital to-day as compared with the prices ruling last October would be approximately ⅔ of 1 per cent. higher, which means in simple language that over a period of, say, 30 years (the normal life of the debentures in question) the additional cost would be in excess of £150,000. Moreover, we have been advised by eminent counsel that this arbitrary action by the authorities concerned is *ultra vires*.

INCREASED PROFIT

The profit and loss account shows a profit, after providing for income tax, loan interest, debenture stock interest and redemption provisions, of £588,798, which compares with last year's profits of £535,119, an increase of £53,679.

A substantial proportion comes from capital sources, and a very large part arises from the sale of merchandise through the numerous showrooms of our subsidiaries to the general public, and from

trading without outside parties. Capital extensions during the year amounted to approximately £2,500,000, and the merchandise and goods purchased and sold amounted to about £1,750,000. The major part of the management and administration of our subsidiaries is also undertaken by Edmundsons, and it is from all these varied and extensive services that the item of profit in question arises.

In pursuance of the policy announced to you last year of transferring important sub-subsidiaries to direct subsidiaries of Edmundsons, controlling interests have been acquired in the South Wales, Cornwall, East Anglian, and Stroud companies. This was responsible for a considerable increase in the item "Investments in Associated Companies" a year ago, but it was not accompanied by an increase in Edmundsons' income, as the transfers in question were effected ex-dividend. This year the dividends on these new shareholdings are brought into the account, and are the chief cause of the substantial increase in Edmundsons' income from "Dividends and interest receivable from subsidiaries." This increase amounts to £126,000, but, of course, a similar increase cannot be anticipated next year.

"Dividends, interest, and discounts receivable from other sources" of £45,000 shows a considerable increase over last year's figure of £15,000, but you will observe that this year we have included cash discounts which amounted to nearly £26,000. A year ago the corresponding figure was included under the trading profit, but this transfer is not entirely responsible for this year's increase, as our major outside investment last year did not receive the full year's interest while this year it has.

RESERVE AUGMENTED

You will remember that last year the capital was increased to £10,000,000 by the creation of a further 3,000,000 £1 ordinary shares, and you will also remember that 2,250,000 shares were issued to the then shareholders as fully-paid shares by capitalising reserves to that amount. The issued capital has therefore been increased by £2,250,000 and the reserve reduced by a similar amount.

After allowing for the withdrawal from the general reserve of £2,250,000, the reserve has again grown during the past 12 months. It is our recommendation that you should approve the transfer of £30,000 to reserve out of this year's profits.

The investments in subsidiary companies show an increase of nearly £600,000. This is made up of an increase of £1,000,000 in debenture stocks which we have taken, as to a further £250,000 in the B.C. and H. Company and £750,000 in the East Anglian Company. As against this, shareholdings have declined by nearly £420,000 in consequence of the liquidation of subsidiary companies.

The amount owing from subsidiary companies has increased by over £500,000, due to the expansion of the various subsidiary companies' undertakings.

If you refer to the consolidated statement of assets and liabilities as of December 31st last, you will notice the growth of the fixed assets of the associated undertakings from £23,250,000 to £25,500,000. This figure shows graphically the increase in the size and importance of the group which Edmundsons controls.

In conclusion, it is my privilege to give expression to the feeling of real appreciation that we stockholders feel of the valuable services rendered to the association by our managing director, Brigadier-General Wade H. Hayes, and the other members of the staff.

The report and accounts were unanimously adopted.

OFFER TO NEW READERS

Any reader who makes his first acquaintance with this journal with this week's issue is invited to fill up the attached:

To The Publisher, Economist Newspaper Ltd.,

8 Bouverie Street, E.C.4.

In order to test the value of your publication I should like you to forward it to me by post for the next four weeks. If I then decide to become a subscriber, it is understood that there will be no charge for the copies thus received, but otherwise I shall be willing to pay 4s. to cover the cost.

Net Trading Profit for year to 31st	
March, 1939	£456,958
Total Reserves and Carry Forward	£1,091,136
Dividends on Ordinary Stock	30%

POINTS from the Speech of MR. MAGNUS GOOD-FELLOW (Chairman) at the Annual General Meeting of THE EVER READY COMPANY (GREAT BRITAIN) LIMITED ON June 1st, 1939

While the Report and Accounts before you show a reduction in the Profits earned and a reduction in the Dividend the Directors propose should be paid to you, yet if the difficulties of the past year and the strength of our position at the end of it be taken into account, we should not be dissatisfied with the result.

COMPETITION

The price competition on the home market has been an important factor in the health and strength of our business, and I shall devote a little time to explaining the happenings during the year under review. We have, for many years, had to meet competition of two kinds, from Companies who sell their goods at reasonable prices equivalent to our own, and from Companies who sell their goods at lower prices, regardless of cost, for the purpose especially of attacking our market. During the first three months of the year under review, this second form of competition interfered considerably with our sales and it became necessary to deal energetically with it. I need not emphasise the care and consideration we gave to the matter, sufficient it is that we reduced the prices of various goods, and with the loyal assistance of our friends in the wholesale and retail trades, we not only arrested the fall in sales, but by the end of the year we had achieved the increase of 5 per cent. in volume referred to in our Report to you. This increase in the volume of our sales would, under normal trading conditions, have earned a total Profit equal, at least, to that of the previous year, but various unforeseen increases in costs and distributing expenses encountered throughout the year, contributed to the fall in Profit already reported to you—when the final accounting came to be made.

PRESENT YEAR'S TRADING

Our competitive policy continues to be successful, sales during April and May—both in volume and value—are substantially in advance of the sales of a year ago, and I am hopeful that we shall not only maintain our present position this year, but that we shall achieve an improvement.

ACCOUNTS

In dealing with the Balance Sheet, the Chairman pointed out that the Issued Capital has remained constant at £1,210,402, and that Reserves and Carry Forward have risen by some £88,000 to £1,091,136. The surplus of Current Assets over Current Liabilities amounts to £351,000 in the Accounts under review, as compared with £284,000 at the end of the previous year.

FUTURE PROSPECTS

The continued threat of war, with the consequent possibility of damage to our manufacturing plants, has caused us not only to participate in the various Governmental A.R.P. plans, but, in addition, to put in hand the re-equipment of two old factories previously closed as obsolete. We hope thereby to be in a position to manufacture and supply our goods during any period of emergency. I think I have conveyed to you to-day the strength of our trading and asset position, and that I view the future of our business with hope and confidence.

IMPERIAL CONTINENTAL GAS ASSOCIATION

RESULTS OF A DIFFICULT YEAR

SIR THOMAS ROYDEN'S REVIEW

At the general meeting of the Association, held on the 2nd instant, the chairman, Sir Thomas Royden, Bt., C.H., said that no reminder was necessary of the way in which his hopes of improved political and trading conditions had been disappointed. The state of uncertainty in which we had been living had proved an effectual obstacle to progress of any sort. Nevertheless, sales of gas by the French and Belgian companies were approximately the same as in 1937, while sales of electricity showed only a very slight decrease. The division of the Association's gas and electricity interests were: Belgium approximately two-thirds gas and one-third electricity; France half gas and half electricity; while in England they were confined solely to electricity. All indications pointed to the progressive development of electricity sales, but the future development of gas was less certain.

THE EXCHANGES

The course of the exchanges between this country and France and Belgium respectively had given less cause for anxiety. During the year, the Belgian franc had shown an appreciating tendency, which in a time of general trade depression had caused some embarrassment to the Belgian exporter. The economic structure in Belgium, however, was sound and would respond very quickly to a definite improvement in world trade; it was still possible to restore equilibrium by a comparatively small reduction in costs, which policy the new Government was apparently determined to pursue. The Belgian Finance Minister had recently stated that to think of devaluing the currency at the present time would not only be a crime, but an absurdity.

It would appear that, if present conditions continued, there was no immediate difficulty in holding the French rate of exchange at around its present figure. The position in France had undergone a remarkable change owing to the measures taken by the present Government as a consequence of the international situation; the 40-hour week had been replaced by one of 45 hours. The 9 per cent. increase in electricity production for the first quarter of 1939 showed from the Association's special point of view the progress France was making.

The Compagnie Continentale du Gaz had carried through a reorganisation of its Lille undertaking, the two sections, gas and electricity, now working more closely together. It had taken a share in a scheme promoted by the French Government for developing the existing inter-connections between electric generating stations, so that Lille would be able ultimately to import hydro-electric current at low cost when there was a surplus and to export current generated from coal when the situation was reversed. The Compagnie Industrielle d'Eclairage had won its lawsuit against the Principality of Monaco, which had been ordered by the Court to reinstate the company in full possession of the gas undertaking.

POSITION IN BELGIUM

In Belgium, additional Communes had adhered to the Inter-communal Scheme of Provinciale, which gave them a participation in the administration and profits. The Coke-Oven Works of the Cokeries du Brabant continued to be operated on lease by a group of coal owners and others. Magec had reported a diminished turnover in the sale of gas and electrical apparatus owing to unsettled political conditions. Interbrabant, the electrical generating company in which the Association held a substantial minority interest, was engaged upon enlarging its plant. Distrigaz, which retailed coke-oven gas in bulk, continued to progress and was now confronted with the problem of obtaining sufficient supplies to meet the growing industrial demand. Contimeter, which manufactured meters and other gas and electrical appliances, had recently placed upon the market a gas water-heater which was being favourably received. The Société Chimique de Selzaete had increased the throughput of its works by an arrangement with one of the leading Belgian gas groups to undertake the distillation of their tar.

Abair Engineering specialised in air conditioning work and held the sole British rights for the Capillary Cell system, the advantages of which were becoming widely known. During 1938 an A.R.P. section was inaugurated to undertake comprehensive schemes of A.R.P. protection in accordance with Home Office recommendations.

Turning to the accounts, the fixed assets of £95,975 consisted entirely of freehold and leasehold premises in London and Belgium, the small gas undertaking at Graslitz having been sold in July last. The Association was now a 100 per cent. holding company, with its investments concentrated in England, Belgium and France. The latest valuation of the investments in subsidiary and allied companies showed a comfortable surplus over the book figure of £9,517,000. There had been an increase in the number of Edmundsons Electricity Corporation shares held owing to a 50 per cent. bonus issue made by that company to bring the issued capital into line with the real asset value. The dividend, however, had been reduced from 9 per cent. to 6 per cent., and it was, therefore, from the previous issue of one new share, at the price of 30s. for each five held that an increase of income was being obtained.

Advances to subsidiary companies showed a decrease of £262,000; deposits by them an increase of £76,000, and one of the Belgian subsidiaries had bought from the Association certain minor Belgian investments to a value of £55,000. The availability of these funds, plus the proceeds of some land sales, had enabled the Association to repay a bank loan of £61,000; to increase its cash by £289,000; to pay out £127,000 in the purchase of its debenture stock for cancellation and to have a surplus for investment as and when opportunities offered. Sterling assets amounted to 27 per cent. of the whole, while sterling liabilities had been reduced by the equivalent of a further 2 per cent.; after deducting the remaining sterling liabilities, £100 stock was represented, at current market values, by £45 of sterling assets. The Association having had cash available for investment, earning on deposit only 1 per cent., decided to make an offer to the debenture stockholders of £100 per £100 stock, which was costing 3½ per cent. This offer was accepted by approximately three-quarters of the stockholders, and there was now practically a clean equity.

Out of the total of £507,000 under sundry creditors and provisions, only £57,000 was actually owing to third parties.

INCOME FROM DIVIDENDS

The Association's income from dividends, etc., had fallen by £25,000. The special distribution from reserves made last year by the Compagnie Continentale through the realisation of French Government and other securities had been brought into this year's revenue to the extent of £58,000. In addition, an ordinary dividend had been received of a sterling value of £85,000. The Belgian investments had yielded £315,000 as against £325,000 last year, the average rates of exchange on the respective dates of payment being Frs. 139 and 147. An extra £7,000 had been received from Edmundsons Electricity Corporation, but the final dividend of 3½ per cent., just declared, would be brought into next year's accounts, the effect of which, if the company maintained the previous interim dividend, would be to increase next year's income from this source by a further £11,000.

The Belgian companies having considered that in the event of war their normal financial relations with the Association might be difficult, thought it proper to reinforce their financial positions; e.g. Contibel had placed to reserve Frs. 19,155,000 (£137,500), as against Frs. 10,535,000 (£71,500) last year. Actually there was a comfortable margin in the consolidated earnings of the group over the amount proposed for dividend, but although the gross franc earnings showed an increase on last year, the net earnings, after providing for depreciation and taxation, declined by approximately £45,000.

PROFIT AND DIVIDEND

The net profit for the year of £415,786, out of which it was proposed that £406,000 should be applied in payment of a 10 per cent. dividend, less tax, would permit the carry forward to be increased by £9,786 to £526,155.

The board regarded a substantial carry forward as a reserve against the interruption of foreign dividends in the eventuality of war.

Possibly a larger distribution would be able to be made from Belgian sources next year, whilst there would be the increased revenue from Edmundsons and the smaller debenture liability.

The report and accounts were adopted.

JOHN SUMMERS AND SONS, LIMITED

PROSPECTUS ESTIMATE EXCEEDED

MR R. F. SUMMERS ON THE OUTLOOK

The annual general meeting of John Summers & Sons, Limited, was held, on the 25th ultimo, at Winchester House, Old Broad Street, London.

Mr R. F. Summers (the Chairman), in the course of his speech, said: Ladies and gentlemen, although this is the forty-second annual meeting of the company it is the first one of a public nature. It is also the first annual meeting since my appointment as chairman of the company. My father, Mr Henry Summers, owing to his advancing years, asked to be relieved of the burden of his office at the end of last year. He is still as keenly interested as ever and his experience and advice are still readily available to us in his capacity as President.

Having dealt in detail with the accounts, he continued: If depreciation and Bank interest be added to the net profit before provision for taxation, the total is £599,426, which compares very favourably with the estimate of £500,000 which the directors gave in the circular dated January 9, 1939, and the estimate of £570,000 in the debenture prospectus.

The reorganisation of the capital and the issue of £2,000,000 4½ per cent. debenture stock are now virtually completed, and the directors are satisfied that the new money which has been raised will amply cover the cost of the installation of the new strip mill and leave a satisfactory working margin.

ALLIANCE WITH UNITED STEEL COMPANIES

As a result of the arrangements with the United Steel Companies two of their directors were to join your board, and one of your directors was to join their board. Captain R. S. Hilton and Mr J. Ivan Spens have been appointed directors of this company. Your managing director, Mr N. H. Rollason, has been appointed to the board of the United Steel Companies, Limited. I feel that this alliance between the two concerns should have far-reaching results and be of great benefit to your company, and I hope to the United Steel Companies as well, and may be looked upon as a logical development towards increased efficiency and co-operation within the steel trade in this country.

THE STRIP MILL

Your directors felt that in order to maintain the pre-eminent position of your company in the sheet trade it was essential to install the latest type of continuous hot and cold mills, which for some time have been unanimously recognised in America as the only method of producing the quality of sheet which is now being called for by our customers. We have had further confirmation that cold reduction is now almost essential by the results that we have obtained from the cold strip mill which we have now been operating for the last two or three years. The quality of product from this mill is identical with that which we expect to obtain from the continuous cold mill, and our customers who have had the material from this strip mill are extremely pleased with the way in which it behaves in their plants. We anticipate that the mill will be in operation towards the end of the current year.

AIR RAID SHELTERS

On the steel side of the business all our companies are at present working to capacity, and have been doing so now for several months. This position is, however, in certain measure due to the Defence Programme upon which the Government has embarked, and the company is supplying a large proportion of air-raid shelters for the Home Office and other Government Departments. The sheet trade as a whole is working in the closest co-operation with the Home Office in connection with the supply of these shelters, and have willingly agreed that the cost of their production should be the subject of an examination by independent auditors, in order to remove any possibility of criticism that undue profits are being made out of a national emergency. This full-time working has, of course, had a beneficial effect on our costs of production, and the estimated profits for the first quarter of this year show a considerable improvement over the similar period of last year. I am hopeful that the results which will be put before you at the next meeting may be considered satisfactory.

It would appear that whatever may happen in international affairs the programme of re-armament and civil protection must be carried to its conclusion, in which case it seems likely that the steel production of the country will be maintained at a high level for some time to come.

The report was adopted.

GOLD FIELDS AUSTRALIAN DEVELOPMENT COMPANY, LIMITED

SATISFACTORY RESULTS

PROGRESS AT MOONLIGHT

The sixth ordinary general meeting of this company was held, on the 31st ultimo, at the Chartered Insurance Institute, 20 Aldermanbury, E.C.

Mr John A. Agnew (the Chairman), after dealing with the accounts, stated that the chief features of interest in the Moonlight mine had been the deepening of the Adelaide shaft by 271 feet to a total depth of 1,145 feet, the completion of driving on the 830 feet level, and the sinking of two winzes from the latter to the 1,030 feet level. At that horizon some 700 feet had been driven, and in addition a winze to the 1,230 feet horizon had been sunk to a depth of 158 feet.

Development of the main ore-body between the 630 feet and 830 feet levels had continued throughout the year with very satisfactory results. The sub-levels had revealed higher values and greater widths than anticipated, while on the 830 feet level final results on both the main and a branch shear which was disclosed at the north end of the ore-body, showed a length of 650 feet of ore averaging 4.9 dwts. over 118 inches. From that level Nos. 1 and 2 winzes had been sunk to the 1,030 feet horizon. The No. 1 winze had averaged 4.3 dwts. for 200 feet and cross-cutting and sub-level drives therefrom had disclosed values of from 3 dwts. up to 7.6 dwts. per ton over exposed widths of from 42 inches to 162 inches. The No. 2 winze from 29 feet to 213 feet had averaged 5.3 dwts., and there again the values exposed at various sub-levels had varied greatly, averaging from 2.6 dwts. up to 9.2 dwts. per ton. Diamond drilling at the 930 feet horizon had exposed 217 inches of ore averaging 4.1 dwts., which indicated that the width of the ore body at that depth was just as great as that shown in the upper levels.

Wiluna Gold Mines, Limited, had recently been doing a considerable amount of drilling in the Bulletin area which adjoined the Gold Fields Australian company's Horseshoe Wiluna lease. The testing of the Bulletin shear which ran into the Moonlight lease had indicated payable values continuing towards the boundary, and in recent months the Moonlight company had drilled 3 holes to cut the same shear in that property. Those all disclosed payable values ranging from 4.3 dwts. to 5.6 dwts., the latter value being over a true width of 6½ feet, and indicated that that area would be worth exploring more thoroughly at some future date.

ORE RESERVES INCREASED

The ore reserve position again showed a satisfactory increase, the total at the close of the present year being 433,900 tons, averaging 5.45 dwts. per ton. That represented a net increase of 25,000 tons over last year's figure, notwithstanding the fact that over 104,000 tons were extracted during the year. The reserve position was very sound, with over four years' supply of ore at the present rate of milling.

Turning to treatment operations, 104,594 tons averaging 5.8 dwts. per ton had been crushed and selectively floated, and treatment of the gold-bearing arsenical and antimonial concentrates thus produced had resulted in a total recovery of 26,259 ounces of fine gold, the overall extraction of 86.2 per cent. being slightly higher than in the preceding year.

OTHER INTERESTS

They retained their interest of 20 per cent. in Yellowdine Investments, Limited. Its subsidiary, Yellowdine Gold Development Company, Limited, had treated during the year a total of 52,618 tons of ore and 13,765 tons of accumulated residues, for a recovery of 29,559 ounces of fine gold. During the year they had received dividends amounting to 40 per cent. He understood that it was the intention of the management to declare a further dividend in the near future. The total dividends so far received were equivalent to 145 per cent. on their investment.

At their Kintore property they had crushed 4,206 tons of ore for a recovery of 3,241 ounces of fine gold, equal to an extraction of 15.4 dwts. per ton. The working profit had amounted to £19,772, Australian currency, and they had already recovered more than sufficient to repay all their expenditure in connection with that venture.

On the whole the results of the year had been quite satisfactory. At the Moonlight mine they had again increased their ore reserve and although the lowest exposures so far showed a distinct lowering in grade, it was possible that, like the vertical sections immediately above, improved values might be shown on opening up.
