## LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

and began to argue. When the Prime Minister met Parliament on Tuesday, he was unable to reveal very much of the diplomatic exchanges that were then going on. As a result the German version broadcast on Thursday night was the first to gain the public ear. But this German version was disingenuous to a degree. What appears to have been the actual sequence of events was as follows. On Tuesday, August 29th, the German Government consented to engage in direct negotiation with Poland, but only provided that a Polish plenipotentiary presented himself in Berlin, without previous definition of the agenda, within 24 hours. This was, of course, an attempt to repeat the technique practised on Herr von Schuschnigg and President Hacha, and the Poles naturally refused to negotiate on such unequal terms. At midnight on Wednesday, the 30th, after this offer had lapsed, the sixteen points of the public broadcast were informally communicated to the British Ambassador. They were not revealed to the Press until 8 p.m. on the 31st, two hours before the broadcast statement that, after waiting for two days for an answer, the German Government considered that the proposals had been rejected. What had been outstanding for two days was not the 16-point plan but the offer to receive a plenipotentiary for undefined and uncircumscribed "negotiations." The sixteen points, in fact, were never intended as a genuine offer, but merely as a propaganda device to establish Germany's "reasonableness" after there was no risk of its being put to the test.

In these circumstances, the nature of the terms is of little more than documentary interest. In brief, they provided for the immediate incorporation of Danzig in the Reich, for a plebiscite in the Corridor after twelve months (the Polish army and police being meanwhile withdrawn and "sovereignty" exercised by an international Commission, and the vote being restricted to persons resident in the Corridor on January 1, 1918) and, in case the Corridor voted for Poland, an extra-territorial "corridor across the Corridor" from Germany to East Prussia. As is very properly observed in London, it is for the Poles to pronounce on the acceptability of these terms, and the only comment that can be offered before they have spoken is that the terms are markedly less favourable than those of

the demand made in March, the making and rejection of which immediately preceded the British guarantee to Poland.

It is possible to regard this peculiar episode as the first evidence of German willingness to find a peaceful solution. The more probable interpretation, however, is that it is a clumsy attempt to put a more favourable appearance on what even the Nazis themselves regard as a dastardly business to which they are now all but irrevocably committed. With manoeuvres such as this in the air, we must be doubly careful to keep the issues clear. For example, there is much talk of the virtues of negotiation. To negotiate is, indeed, better than to snatch. But unjustified demands do not become right merely because they are the subject of negotiation. We must not grant Germany what she wants in return for nothing but her promise to negotiate. That is the method of Munich. We must be very careful not to slip into the fatal error of a year ago, when Germany was begged, not to abandon her unjustified claims, but merely to advance them by negotiation rather than by force. The real issue is that Germany is demanding, with no warrant other than her ambition, territory predominantly inhabited by Poles, which Herr Hitler himself freely admitted to be Polish when he concluded the Non-Aggression Treaty of 1934. Germany cannot be allowed to take this Polish territory either by threats or by force. To that resolution we must cling at all costs.

Not, of course, that Poland is the fundamental issue. Many of us wish that this final showdown were coming on the Czech rather than the Polish issue. But since it is in Poland that the line has been drawn, it is in Poland that we must take our immovable stand. German aggression and robbery, whether by force or by the threat of force, must stop here and now and stop for ever. That is the inflexible condition for any negotiations with Nazi Germany. It is undoubtedly a hard condition for Hitler to swallow. But he must swallow it whole if he wants peace. For the British people, with a quiet and unfurled resolution as strong as anything in their history, have determined that it is better to fight a war than to yield an inch on a principle that has become one of national honour and national safety.

## War and Post-War Economics

THE world has stared war so closely in the face this week that the time has come to pass over from discussion of the economics of preparedness to the economics of war itself.

It is a commonplace nowadays (though it was but dimly realised in 1914) that wars are won and lost in the workshop rather than on the battlefield. This war, if it comes, will be the first major conflict in the world's history which has been recognised from its first day to be a struggle of mobilised industrial power as well as of trained and regimented man-power. The Industrial Revolution has now been fully applied to the process of killing.

The table on the opposite page assembles a number of the statistical data which are most relevant to an assessment of the economic war potentials of the nations that now confront each other. The table is self-explanatory and well worth a detailed study. But some of its more obvious morals may well be pointed out. The alignment of the new war with which we are threatened is not yet certain. But it seems probable that the main allies on the one side would be the British Empire, France, Poland and Turkey, opposing Germany and Italy. The following table shows

some of the more important totals for the two sides so grouped:—

|                             | British Empire,<br>France and Colonies,<br>Poland, Turkey | Greater Germany,<br>Italy |
|-----------------------------|-----------------------------------------------------------|---------------------------|
| Total population...         | 685,000,000                                               | 142,000,000               |
| of which, white..           | 166,000,000                                               | 134,000,000               |
| Merchant shipping           | 23,900,000 gross tons                                     | 7,500,000 gross tons      |
| Iron ore production         | 23,600,000 tons                                           | 4,500,000 tons            |
| Steel production....        | 26,300,000 tons                                           | 27,300,000 tons           |
| Coal production....         | 403,100,000 tons                                          | 201,000,000 tons          |
| Automobile production ..... | 926,000                                                   | 439,000                   |

In white population and in steel production there is substantial equality between the two sides. But the white population of the Allies is backed up by many millions of citizens of other colours, while the steel production is based on a much greater output of domestic iron ore and coal. In the other respects, the democratic Allies are far in advance of their opponents.

The allied group would, in addition, be able to call, to a greater or less extent, on the resources of almost the whole world. The Axis Powers, on their side, would obtain some supplies from their near neighbours, Hungary, Roumania,

## The Economic Alignment

### SOME RELEVANT STATISTICS

(In order to show the maximum productive capacity of the different countries, the production figures in the table below are, in nearly every case, those of the highest annual output achieved in the period 1936-38. Where several countries are grouped, the year taken is that of the highest output of the largest producer in the group. The year used is indicated by a footnote except for minor producers.)

the Scandinavian and Baltic States. They might also be supplied by Soviet Russia—a contingency that is examined in another article in this week's issue of *The Economist*. Neither side would therefore be restricted to its own domestic supplies. But the democratic Allies would derive an enormously greater advantage from imports, in addition to their greater domestic resources. In short, their advantage for a totalitarian war in which full economic strength can be deployed, is overwhelming.

A bare comparison of statistics, moreover, fails to tell the full story. What is relevant to a calculation of a nation's war potential is not its total labour force or industrial capacity, but the margin that it has available after supplying the bare essentials of living at a subsistence level—the margin that is devoted in peace-time to building up a higher standard of living and can be diverted in war to the purposes of pursuing the conflict. In the old conceptions of grand strategy, war was thought of in terms of man-power. Even by 1914, this fundamental idea had been surprisingly little modified. An army had to be equipped, it is true, with its establishment of artillery. But how little even the most highly-organised military machine had realised the implications of industrial warfare can be seen from the fact that Walter Rathenau found at the German War Ministry in August, 1914, that no consideration had been given to the problem of assuring supplies of essential materials.

The nature of the new war is now widely realised. What is perhaps not so fully appreciated is the immense advantages that it confers on a wealthy nation. So long as man-power was predominant, a man was a man, whether rich or poor. But when the industrial power of a nation can be deployed in the line of battle, the importance of a man is not measured by his ability to tote a rifle, but by his ability to produce. The point can be most aptly illustrated by a comparison of the National Incomes of the United Kingdom and of Germany. The German National Income in 1937 (the 1938 figures are confused by the territorial changes) has been estimated by the world's most copious and authoritative statistician, Adolf Hitler, at Rm. 67 milliards. Since the population of the Reich in that year was 67 millions, the *per capita* income was Rm. 1,000 per annum. If the rate of exchange between the Reichsmark and the pound be taken at Rm. 16=£1 (which is about halfway between the official rate and the most important "blocked" rates and roughly corresponds to the purchasing power parity), this represents £62½ per head per annum. In the same year the corresponding British figure was about £110 per head per annum. The first charge on any national income, in war or peace, is the minimum subsistence of the population. It may very well be that the cost of what can be made to pass for minimum subsistence in Germany is less than in England, in spite of the higher cost of food resulting from agricultural protection. But on any reasonable estimate of minimum requirements, it is obvious that the margin that could in case of need be mobilised for war purposes is considerably larger in England than in Germany. The average Englishman, in other words, can, if he must, devote a greater proportion of his efforts to fighting a war than the average German. Or, to put the argument in still another way, the aggregate present National Incomes of Greater Germany and Great Britain are very nearly the same. But twice as many people have to be fed, clothed and maintained out of the German income before war production can begin.

This argument leads straight to the conclusion that the potential war effort of the wealthy democracies is far greater than that of their adversaries—but only on two rigorous conditions. The first is that their armed forces are, from the start, strong enough to protect their industrial machines from disruption by armed attack. That is the task of the Maginot Line, of air defence and of the British Navy. The second is that the democracies are prepared to mobilise their margin of superiority by reducing to a

minimum the resources of labour and equipment required for ordinary peace-time consumption. That is the task, only dimly realised as yet, of domestic economic policy. But if these two conditions are fulfilled, there is hardly room for doubt about the victorious outcome for the industrial democracies of an industrial struggle.

What, however, of the world after the fighting is over? If these are the economics of war, what are post-war economics? If the struggle is long, will not the world be left impoverished, with its present standards of living merely a bitter memory? There is no subject in which emotionalism has done more damage to cool reasoning, or in which careful analysis is more necessary. A war causes heavy loss of life and property and the post-war community is poorer by the wealth that would have been produced by the labour and equipment that have gone. But a community lives to only a small extent on accumulations of wealth from the past; much the greater part of a community's current consumption is what it currently produces, and war can permanently impoverish a country only to the extent that it harms its power to produce. There are three main ways in which war can affect post-war productive capacity. The first is by the physical destruction of capital equipment—the demolition of factories or the sinking of ships. But unless aerial bombardment is infinitely more destructive than seems arithmetically possible, the extent of damage to productive equipment is unlikely to be more than could be restored by one or two years' hard work. The devastation will certainly not be as severe as that wrought by artillery in the battlefields of Northern France, which was restored very quickly after the Armistice. Secondly, there is a risk of a permanent loss of the income from foreign assets sold. But the total income from overseas investments of the United Kingdom is only about 4 per cent. of the National Income. Thirdly and most seriously, there is a risk of permanent loss of export markets. This possibility should combine with the wartime need for foreign exchange to ensure that a determined effort is made throughout the war to give export trade a priority over all but the most vital war industries.

Thus it is possible for war, not merely to exact untold sacrifices of blood and treasure while it lasts, but also to leave the community less able to create wealth when it has passed. But the risks of this more permanent damage are, on a cool analysis, not very large. The history of the last war serves to buttress this conclusion. According to Mr Colin Clark's estimates, the net output of the United Kingdom per worker employed (that is, the production, and therefore the consumption, of the average Englishman) was a fraction higher in 1924 than in 1913. In other words, in the fifth year after the Armistice, the average Englishman had got back to the pre-war level, *even though his hours of work had in the meantime been reduced by one-tenth.*

This calculation, however, applies to the average worker in work. The most serious aftermath of war is not any substantial decline in the productive capacity of the economic system, but a legacy of disorganisation showing itself in unemployment and a reduction of actual production below capacity. But this difficulty carries its own encouragement, for there is no organic obstacle to its cure. The minimising of dislocation and preparations for a tapering off of abnormal demands should form part of any policy of war economics.

There seems, accordingly, to be little justification for the more exaggerated fears of what would follow a war. The exact words of Lord Baldwin's famous phrase are usually forgotten: "another war in the West would mean the end of civilisation as we know it." Undoubtedly a war would generate unpredictable turmoil, in which many of the characteristics of that moneyed Society from which Lord Baldwin sprang might well vanish. But those who fear anarchy can console themselves with the reflection that the world has never known a bloody revolution (as

distinct from a mere change of administration by unconstitutional means) except when two conditions were present: severe and long-standing class injustice and a well-entrenched revolutionary party. Neither is present in Britain. Even starving and defeated Germany in 1918-19 had very little disorder and the revolutionary ferment of the Nazis stems, by universal testimony, from the post-war inflation rather than from the war itself.

War would bring its political changes. The tide of State control, being once advanced, would never fully ebb, but to prophesy either Communism or Fascism is baseless hysteria. Great Britain would probably emerge from another war ordered and organised, but still a democracy. Moreover, war brings its good as well as its bad results. In Great Britain, the war of 1914-18 brought a great increase in democracy, both formally in the final extension of the franchise and informally in a wide blurring of class distinctions. It brought an immense freeing of social manners and customs which, though it had its less pleasant aspects, served in the main as a regenerating breath of fresh air. It brought great advances in social

progress, which would otherwise have required decades for their consummation: the emancipation of women, the establishment of a comprehensive educational code, the triumph of trade unionism, sweeping reductions in hours of work and a general raising of the conditions of life and labour for the worst-paid workers. War is undoubtedly bad in its effects for those whose interests are securely vested in the pre-existing social order. But it is highly doubtful whether the ordinary man has not had gains in wealth and welfare to offset against the greater insecurity of the post-war world.

It would be obvious folly to carry this train of thought so far as to suggest that, in the balance sheet of war, the assets exceed, or even equal, the debits. The anguish and the heartbreak and the destruction of war while it lasts are such that nothing can ever wipe them out. There are no net gains in war, only the avoidance of still greater disasters. But the facts and the arguments that have been advanced in this article may serve as an antidote to defeatism. There is no need to despair either of the outcome of the war or of its after-effects.

## Nazi Needs and Russian Resources

VISIONS of Russia as a large reservoir of man power and of foodstuffs and raw materials have long haunted and attracted the German general staff. On a superficial view, the Russo-German non-aggression pact has not only neutralised Russia's fighting machine but has opened the door to the treasures coveted by Germany. But this is only the superficial view. The political reactions to the pact in Japan and elsewhere have already shown it to be a double-edged sword; and Germany's economic gains through access to Russian resources can easily be exaggerated. It is hoped to include in next week's issue of *The Economist* a Supplement giving full details of the possibilities of Russian supplies to Germany. But any intentions in these hectic days must be subject to the very large possibility that they may remain no more than intentions. And, in any case, a general review of the subject can usefully be given in advance.

Four obstacles stand in the way of the German dream coming true. The first is the political obstacle—the reluctance that Russia, Soviet or not, must always feel to help a militaristic Germany towards the mastership of Europe. This might well rank as a permanent and unchanging interest of Russian policy. But, like other political principles, it is subject to the aberrations of politicians. Russia's interest might possibly be interpreted, for example, as being in favour of supplying Germany with just enough materials to fight a long and exhausting war,

provided she were defeated at the end—and that would be hardly more comforting to the Western democracies than a full alliance. The political obstacle must not therefore be regarded as entirely insurmountable.

The second obstacle is the financial. Russian materials will presumably not be provided as a free gift. A loan is possible, but hardly likely; indeed, in last week's commercial treaty it was Russia, not Germany, that was accorded a credit. The probability is, then, that Germany's purchases from Russia would be limited to what Germany could pay for; as she has neither gold nor foreign exchange, payment would have to be made in goods. Germany has no surplus available for export of the raw materials Russia needs to buy, so that the volume of trade would be limited by the quantity of machinery that a war-laden German industry could provide for export. The difficulties that German exporters are experiencing even now in fulfilling their export contracts suggest that the volume would not be large.

The third obstacle is that of transport. The chief possible means of communication between Germany and Russia are three. There is first the Baltic Sea, which they jointly dominate, but which is frozen at the Russian end for part of the year. Moreover, Leningrad is a long way from most of the sources of raw materials. Secondly, there is the Black Sea-Danube waterway, which can be cut by Roumania, Yugoslavia, Hungary or any nation whose fleet

has access to the Black Sea by way of Turkey. Thirdly, there are the railways, the most direct of which cross Poland. But even if the Polish obstruction is cleared, the problem is by no means solved. Russia's communications have been developed in the interests of domestic trade, not of exports. As the accompanying map of Russian industrial centres and communications shows, the distances from Germany to the chief sources of supply of materials are enormous. So far as railway equipment is concerned, the capacity of the lines has not kept pace with the traffic to be carried, in spite of the considerable progress that has been made between 1929 and 1937. The length of railway lines has been increased only from 77,000 kilometres to 85,000 kilometres, but the number of goods trucks rose from 475,500 to 645,900 and their loading capacity from 8.7 million tons to 15.7 million tons. If one-tenth of these trucks were to be placed at the exclusive disposition of the Germans and each truck was loaded once a month (an optimistic estimate in view of the distances) the total annual carrying capacity would be less than Germany's peace-time imports of iron ore alone. Nevertheless, the strain on the railways has been very considerable in recent years, despite the extension of the canal system, and provision has therefore been made in the third Five-Year Plan for heavy capital expenditure on the railways. In fact, Russia can hardly put many additional railway trucks at the disposal of Germany either for export by land or from her Baltic or Black Sea ports. Moreover, owing to the difference in gauge, German equipment would be useless. This transport difficulty could only be solved by years of expensive work on the Russian railways.

The fourth obstacle is that of the quantities available, which requires more detailed consideration. In recent years Russia has undoubtedly made rapid progress in the development of her raw material supplies, and her potential output is enormous. The output of coal, for example, rose from 41 million metric tons in 1929 to 133 millions in 1938, while the production of crude oil advanced from 14½ million metric tons to nearly 29 millions in the same period. Equally striking is the expansion in the output of iron ore, pig iron, crude steel and non-ferrous metals. The production of pig iron rose from 4.3 million metric tons in 1929 to 15.0 millions in 1938, and that of crude steel from 4.9 million metric tons to 18.2 millions. Industrial production has been quadrupled. Agricultural output has also been increased, though at a slower rate.

But this array of statistics is no measure of the extent to which Germany could make good her deficiencies in war by drawing supplies from Russia. It has been Russia's policy to render herself as independent as possible of foreign supplies, and to achieve a balance between the production of raw materials and foodstuffs and her domestic requirements. Thus, while Russia is one of the leading producers of grains, fats, iron ore, manganese ore, oil, timber and other materials, her exports form a comparatively small and declining proportion of total production. In fact, Russia has been in the habit of exporting only sufficient to pay for her imports of essential raw materials and capital equipment.

Russia is scarcely producing enough foodstuffs for herself and the standard of nutrition of her population is still comparatively low. In recent years the policy of the Russian Government has been designed to raise the standard of living rather than to expand exports. Her shipments of cereals have tended to decline, but the actual quantity exported each year has varied with the size of the crop. In an average year Russia's wheat crop yields about 30 million metric tons, but during the five years from 1933 to 1937 exports varied from 236,000 metric tons to 920,000 metric tons. Germany's import requirements are equally variable; in 1936 she was actually a net exporter to the extent of 12,000 metric tons, while in 1937 she imported 1,278,500 metric tons. In barley the position is very much

the same. A good Russian crop yields about 8 million metric tons, but exports between 1933 and 1937 varied between 105,000 and 567,000 metric tons, and Germany's import surplus between 58,000 and 552,000 metric tons. But as the chief grain-producing areas in Russia are in the south, shipments are made mainly from Odessa, the Black Sea port, and any large-scale diversion of exports by land or through the Baltic would therefore impose a very heavy additional strain on the transport system. Apart from wheat and barley, Russia is an exporter of butter, oilseeds and oil cake. The 1937 figures of Germany's total imports and Russia's total exports of these commodities are as follows:

|                | Germany's<br>imports from<br>all countries<br>(000 metric tons) | Russia's<br>exports to all<br>countries<br>(000 metric tons) |
|----------------|-----------------------------------------------------------------|--------------------------------------------------------------|
| Butter .....   | 87                                                              | 15                                                           |
| Oilseeds ..... | 1,471                                                           | 41                                                           |
| Oil cake ..... | 109                                                             | 38                                                           |

Thus the assistance that Russia could give would be of minor proportions.

So far as industrial raw materials are concerned, Russia has at present little to spare, except manganese, asbestos, oil, timber, and a little cotton (which is important for the manufacture of explosives). She exports only small quantities of iron ore, and the deposits are located in regions from which it would be impossible with present transport facilities appreciably to relieve Germany's shortage in the event of war. Pig iron takes less space, but, as in the case of iron ore, a sudden expansion in exports to Germany is impracticable, and, in any case, Russia has at present no exportable surplus. Russia has always been a leading producer and exporter of manganese and, if transport were available, she could easily supply Germany's import requirements. On the other hand, Russia is short of other steel alloys and of most of the non-ferrous metals, despite the enormous expansion in production.

It is very unlikely that Germany would be able to obtain vast quantities of oil from Russia, whose output has not kept pace with her own requirements. Russia has been compelled to curtail exports substantially, from about 6 million tons in 1932 to 1,100,000 tons last year. Moreover, Russia exports her oil through the Black Sea; owing to the shortage of railway tank cars—in addition to the general strain on the railways—it would be quite impossible to send large quantities overland. Despite Germany's efforts to reduce her dependence on foreign oil supplies, her peace-time import requirements are still about 5 million tons per annum and would be very much greater in war. In timber, on the other hand, Germany could probably secure her full requirements from Russia through the Baltic Sea.

The extent to which Germany could supplement her raw material resources from Russia is therefore strictly limited. So long as Russia maintains an attitude of strict neutrality, it might be possible for Germany to cover her deficiency in timber and, provided transport is available, in grains, manganese and a few minor commodities. And, since Russia's industrial equipment has been largely supplied by Germany, she would probably be willing to exchange these commodities for machinery and, possibly, the assistance of industrial experts.

The position might be different if Russia were anxious actively to assist Germany in the event of war, but apart from being compelled to give Germany credit, Russia could only supply Germany on a large scale if she were willing to reduce her own consumption of raw materials and foodstuffs—that is, to increase Germany's war potential at the expense of her own. But, even then, the volume of trade between the two countries would be severely limited by lack of transport facilities. In sum, it would take years of preparation before Russia could make good some of Germany's principal deficiencies, and it would then be possible only if she would grant large credits to her voracious new friend.

## Defence Measures

THE progress of civil defence in Great Britain was indicated until Monday of last week by a steady stream of detailed instructions and progress reports implementing the provisions of legislation already passed. The emergence of crisis with the announcement of the Russo-German Pact on Monday night, August 21st, was immediately followed by a quickening of the tempo of the bringing into action of such measures. The main civil defence events, culminating in the passing of the Emergency Powers (Defence) Act on Thursday, August 24th, were recorded in the last issue of *The Economist*, pages 390 and 391.

### DEPARTMENTAL INSTRUCTIONS

In continuation of the process of routine preparation instructions were issued to householders to get into touch with wardens and prepare to screen lights, museums were closed for preparations to remove valuable objects, the Board of Trade announced the designated persons authorised to receive applications for registration under the commodity insurance scheme.

By the end of last week preparation had almost reached the peak possible under ordinary legal conditions, that is, until Emergency Orders were issued. The Observer Corps ceased to be special constables and were placed under the Air Ministry; the completion was announced of the new system of A.R.P. communications in London whereby individual undertakings will communicate with wardens instead of with the central control; and preliminary warning to hospitals to prepare to accommodate war casualties was issued by the Ministry of Health. The public began to feel the pressure of individual obligations with the issue of instructions for the construction of light-locks at shop entrances, with official notice to attend to such details as the care of pet animals, and with the announcement of school evacuation rehearsals to take place on Monday, 28th. Parallel preparations in Government departments were indicated by the appointment of an agriculture adviser-designate to the Ministry of Agriculture and Fisheries; by the issue of the code for shelter in factories, mines and commercial buildings, together with the announcement of the commencement of the three months' period during which progress must be reported; by the publication of the rates of pay and allowances for the Auxiliary Territorial Service; by the announcement of the formation of an accountant branch of the R.A.F. volunteer reserve; and by the issue of the first Treasury Order under the Defence (Financial) Regulations, prohibiting the sale or transfer of certain foreign securities.

### EMERGENCY POWERS

On Monday, August 28th, the whole process of civil defence preparation entered a new phase with the issue of the first batch of 96 Regulations under the *Emergency Powers (Defence) Act*. Quicker and more drastic action by Order in Council was made possible by the Act, and its details were provided for in the new Regulations, a summary of which is printed below.

### THE DEFENCE REGULATIONS 1939

#### Part I. Provisions for the Security of the State

##### *Interference with Essential Services*

1-2. Misleading acts or misrepresentation concerning essential services, property, information or defence signals, and intentional interference with telegraphic communications are forbidden.

##### *Safeguarding Information useful to an enemy*

No person may

3. Without authorisation obtain, record or communicate information which might directly or indirectly be useful to an enemy.

4. Communicate with enemy agents.

5. Without authority be in possession of a camera or make photographs or sketches in areas to which restrictions are applied.

##### *Control of Means of Communication*

7. No unauthorised person may make signals to enemy vessels or aircraft, or make any signal for a purpose prejudicial to the defence of the realm.

8. The possession or control of wireless transmitters may by order be made subject to the issue of a permit by the Postmaster General. The use of transmitters may be prohibited or regulated. Force may be used to secure compliance with the regulation.

9. The use of homing or racing pigeons may be controlled and constables may enter premises to enforce the regulation.

10. Unauthorised persons are forbidden to possess or send outside the United Kingdom any means of secret communication (e.g. a code or cipher) or instructions for using such means.

11. The despatch by post or otherwise of packets or substances containing or recording information may be forbidden by order. Suspected travellers or consignments of goods entering or leaving the United Kingdom may be searched.

##### *Access to certain Premises or Areas*

12. Premises may be declared by order a protected place to which only authorised persons are admitted, and these may be subject to conduct regulations. Any persons in a protected place may be searched, detained or expelled.

13. Protected areas may be similarly indicated and aliens and non-residents excluded. Unauthorised persons may be removed by constables or members of the forces.

14. Byelaws may be made for protected places or areas or any other places in which they may be considered necessary.

15. Trespassing or loitering near premises, vehicles, vessels, or aircraft used in His Majesty's service is forbidden.

16. Highways and waterways over or near defence works and protected places may be stopped or diverted.

##### *Restrictions on Movements and Activities of Persons*

17. British subjects or British protected persons may not enter enemy territory, vessels or aircraft. The maximum penalties for breach of this regulation are five years' penal servitude or a fine of £500 or both.

18. British subjects may be forbidden to enter or leave Great Britain except at approved ports. Leave of an immigration officer may be required and regulations for the establishment of identity may be made.

19. Ships and aircraft may be prohibited from leaving port. Directions given under this regulation must be confirmed by the Secretary of State or the Admiralty within twenty-four hours.

### Part II. Public Safety and Order

##### *Public Safety (Evacuation, Billeting, Air Raids, etc.)*

21. Evacuation of any area may be ordered and arrangements for putting the order into effect may be prescribed in detail.

22. Billeting notices may be served on occupiers of premises requiring them to provide lodging, food and attendance. The price payable shall be determined by the Minister of Health. The maximum penalty for non-compliance may be a £50 fine or three months' imprisonment or both. Tribunals constituted by the Minister of Health will hear complaints about billeting notices.

23. Premises may be required by authorised persons for the protection of persons from hostile attack. Chief officers of the police may restrict the use of places of public resort.

24. Local or general orders may be made for the control of lights and sounds. These may include prohibition of the use of roads by certain classes of traffic, prevention of glare or noise, and the use of sirens as warning signals. Compliance may be enforced by constables or members of the forces.

25. Premises may be closed, isolated or demolished when they have been rendered dangerous by war operations, e.g. through gas contamination or unexploded bombs.

26. Suppliers may cut off electricity, gas or water from unoccupied premises.

27-8. Auxiliary firemen have the same powers as members of fire brigades. They may be required to serve outside the area of their particular local authorities.

29. Special fire brigade areas may be defined and other provision made for the co-ordination of brigades in a given area.

32. The Minister of Health may direct or take over the management of hospitals to secure adequate treatment for war casualties.

34. Local orders may be made prohibiting the keeping of explosives, ammunition or firearms. In areas to which such orders do not apply the chief officer of police may direct the safe custody or removal of such articles.

35. Persons and property in the vicinity of the production and transport of dangerous articles may be protected by order.

36. Special precautions must be taken for the storage of certain inflammable and other liquids.

##### *Public Order*

39. Chief officers of police may be required to carry out transfers of constables to enable one police force to assist another.

### Part III. Shipping and Aircraft

43. The Admiralty may by order assume general control of the movements, navigation, pilotage, anchorage, mooring, berthing and lighting of vessels, including seaplanes.

44. The Admiralty may control the use of lights, buoys and other aids to navigation, and no alteration may be made to these except by the Admiralty's permission.

45. The Admiralty may by order require the alteration of the structure or appearance of ships or the installation of apparatus considered necessary for the safety of ships and persons on board.

46. The Board of Trade may provide by order that ships may only sail under licence, which may limit classes of trade, voyages, cargoes, passengers, hiring and conditions of carriage. Coasting voyages may be regulated by licence. The Board may direct where ships may go and what they carry.

47. It shall be unlawful, except under Board of Trade authority, to transfer or mortgage or transfer any mortgage of any British ship or share in such a ship.

48. The provisions of the Air Navigation Act, 1920, are extended to prohibit the navigation of British aircraft outside (as well as inside) the United Kingdom. Commissioned officers of His Majesty's forces may order aircraft which contravene this order to be fired upon.

#### Part IV. Essential Supplies and Work

*General Provisions (Powers over land, property and undertakings).*

50. Any member of His Majesty's forces or other authorised person may do work on or place anything in any land. The doing of work includes the demolition or destruction of anything on the land concerned.

51. For the purposes specified in Regulation 50 the competent authority may take possession of land, do anything which a person having an interest in the land would be entitled to do, and require the owner or occupier to furnish information.

52. The use of land for the purposes of His Majesty's forces may be authorised by order.

53. A competent authority may requisition property other than land in or outside the United Kingdom, dispose of it as if the competent authority were the owner, and forbid the removal of requisitioned property. The Regulation does not apply to currency, gold, securities or negotiable instruments.

54. A competent authority may requisition British ships and aircraft, and transfer to itself the rights of third parties.

55. A competent authority may by order provide—

(a) for regulating or prohibiting the production, treatment, keeping, storage, movement, transport, distribution, disposal, acquisition, use or consumption of articles of any description, and in particular for controlling the prices at which they may be sold; (b) for regulating any undertaking engaged in essential work and controlling charges; (c) for requiring the keeping of particular records by undertakings; (d) for requiring the production of records and estimates; for any incidental matters including the entering and inspection of premises. Any competent authority may suspend or modify such a scheme, authorise charges in excess of other legal limitations, and carry on an undertaking as if an agent of the undertaker.

56. A competent authority may direct the operation of public utility undertakings, relax existing regulations, and require full information.

57. A Minister or other authority holding stocks under the Essential Commodities Reserves Act, 1938, has full disposal of those stocks.

#### *Agriculture and Fisheries*

The Minister of Agriculture and Fisheries may—

61. By order direct the preservation of agricultural land.

62. Control the cultivation of land to increase or maintain the production of essential commodities, and terminate licences for non-compliance with orders or misuse of land.

63. Authorise persons to enter upon land to kill game and ermine for the prevention of damage and increasing the food supply.

64. Control fisheries.

65. Vest existing fishing rights in himself.

68. The Board of Trade may by order restrict the felling and sale of trees, control prices of sale of trees for felling, and cause trees to be felled.

#### *Transport (Railways, Roads and Ports)*

The Minister of Transport may by order—

69. Take control of railways, require that property shall be placed at his disposal and that the undertaking shall be carried on as he directs.

70. Regulate traffic on highways, prescribe routes and prohibit the use of vehicles in certain classes or on certain roads.

71. Direct the maintenance and improvement of highways, bridges and tunnels by the competent authorities.

72. Modify existing vehicle licence regulations.

73. Modify existing legislation relating to Northern Ireland.

The Minister of Transport or the Board of Trade may—

74. By order control traffic at ports.

75. Order the removal of goods to relieve congestion at ports and on railway premises.

76. The Minister of Transport may by order regulate the movement and storage of ammunition, explosives and inflammable substances.

#### *Supplementary Provisions*

77. A competent authority may direct and make all necessary provision for the holding of an enquiry, and by summons require any person to attend and give evidence, and take evidence on oath.

78. A prosecution in respect of offences under Part IV may be instituted by the competent authority.

#### Part V. General and Supplementary Provisions

These include the following matters. False statements, obstruction and restrictions on disclosing information; entry upon and inspection of land, use of force in entering premises; attempts to commit offences and assisting offenders, offences by corporations, penalties, legal proceedings; revocation and variation of order, etc., interpretation, application to Scotland, Northern Ireland and Scilly Isles, and special provisions as to India, Burma and Southern Rhodesia.

#### *Penalties*

Regulation 92 provides that any person contravening or failing to comply with the Regulations or orders, etc., shall, subject to any special provisions contained in the Regulations

(a) on summary conviction be liable to a maximum penalty of three months' imprisonment or a fine of £100 or both, or

(b) on conviction on indictment to a maximum penalty of two years' imprisonment or a fine of £500 or both.

#### FURTHER DEPARTMENTAL INSTRUCTIONS

Monday, August 28th, was a day of impressive activity in civil defence. The Mediterranean and Baltic were temporarily closed to merchant shipping, and very shortly after the appearance of the Defence Regulations the Admiralty issued its first list of Orders for the control of shipping. At the same time the rehearsal of the evacuation of school children was successfully carried out; Army billeting regulations were issued; the announcement was made of grants payable for shelters in factories, mines and commercial buildings; the previous advice to buy reserve stocks of food was withdrawn to relieve pressure on shops; and a set of Finance Regulations under the Emergency (Defence) Act was issued. A point of detail concerning evacuation was the publication of emergency arrangements for the withdrawal of cash from trustee savings banks.

Announcements on Tuesday covered educational arrangements for evacuated children, the clearing of roads in the Metropolitan Police area, the obliteration of place name inscriptions visible from the air, the setting up of a Building Technical Advisory Committee to advise the Home Office on questions of camouflage, and arrangements for theatres and cinemas in war. The Prime Minister's speech in the House of Commons gave a summary of all the measures taken and revealed the fact that the whole A.R.P. organisation was standing by.

On Wednesday detailed instructions by the Ministry of Health for the equipment and management of hospitals in war time were issued; an appeal was made for volunteer midwives in reception areas; it was announced that wireless transmitters would be dismantled in war time under powers given in the Defence Regulations; and the construction of trenches for inhabitants of L.C.C. flats commenced. Activity in non-official quarters was indicated by the publication of instructions for railway passengers in air raids and the announcement of progress on the National Council of Social Service's scheme for citizens' advice bureaux.

#### EVACUATION AND MOBILISATION

Thursday's decision to evacuate three million people, including 1,300,000 school children, from vulnerable areas, produced a whole crop of subsidiary measures, the chief of which concerned the restriction of London's usual traffic facilities. On the same day came the largest single collection of effective emergency measures issued at one time; including the full mobilisation of the Fleet; the calling up of Army reservists and a number of R.A.F. Volunteer Reserve; the restriction of civil aviation over all territory east of a line from Poole past the west of Birmingham to Stonehaven and in certain areas west of that line; the issue of an important body of A.R.P. measures involving the calling up of 20 per cent. of the full-time personnel and including the requisitioning of public shelter, the opening up of trenches and the establishment of first-aid posts; and the prohibiting of the acquisition of more than a week's food supply.

## NOTES OF THE WEEK

**The Time for Evacuation.**—The impressive programme of civil defence measures which have come into operation, item by item, each day since war became likely is summarised on page 439. Outstanding have been the arrangements made for the swift evacuation from vulnerable areas of three million schoolchildren, teachers, children of pre-school age with mothers or other escorts, expectant mothers and blind or crippled persons—the so-called priority classes in the Government's completed scheme. For five days they were kept standing by; all the schools were opened daily; and the needed rail and road facilities were held ready. There was no cause at all for complaint about the country's preparedness here. But, as the days passed by without any resolution of the crisis, the actual time to begin evacuation became an issue of controversy. On Tuesday, in the Commons, Mr Greenwood made a strong plea on behalf of the Labour Party for evacuation of the priority classes to start at once; and, on Thursday, it was announced that transfer would begin on Friday. There were good grounds for the Government's reluctance to act precipitately. To take away well over a third of the evacuating areas' population at a single stroke, and to raise the population of the reception areas by something like a sixth in the space of some ninety-six hours, means dislocation and hardship. It will involve sweeping improvisations in the distribution of food and the direction of transport; and it was not certain that it might not engender some panic or unjustified dread. It will take four days in all to finish.

Nevertheless, none of these arguments could alter in the slightest degree the contrary contention (which has been held by the best unofficial A.R.P. experts for a long time) that evacuation is essentially a measure to be executed before hostilities begin—one which, therefore, should be taken even when the chances of avoiding war are still perceptible. The fears that premature evacuation might arouse are negligible beside those that might grow and spread in unevacuated districts if war came suddenly; and the hardship of families split asunder and of overcrowding counts for nothing beside the needless loss of life and limb that might then ensue. This is, indeed, the twilight hour between peace and war, to use the Home Secretary's phrase, and, if only because the roads and railways out of London and other cities are still free of abnormal traffic demands, it is a time well suited to the dispersal of the populations that stand in danger. It is true that some evacuation was already under way before the welcome decision was made to move the children; businesses were moving out of London; official records and treasures had been taken away; banks and financial institutions were all set to leave on the

instant. The "breathing space" was not being wasted. But it was hard to feel that this was enough: the evacuation that was going on only threw into relief the fact that the children and the disabled were still with us; and it reminded us of the further fact (again often urged in the past by experts) that it may well be needful for a time in war to expand the roster of evacuated persons (as has been done already by request in Paris) to include all those, adults as well as children, whose presence is not absolutely needed in specially vulnerable places. Such defects as remain in the provision of shelter underline the possibility that the total volume of needed evacuation may be swollen in the event of war; and already nine roads from London have been freed for private as well as public flight. It was simple sense to do what had already been arranged for the children sooner rather than later.

\* \* \*

**Defence of the Realm.**—It is a commonplace that no war is like any previous one. In the military sphere, even though the broad principles of strategy may remain unaltered from generation to generation, this is largely true. The generals who conducted the early operations of the last war according to premises derived from the experience of the Boer War were courting failure. But it is a generalisation that can be carried much too far. The Defence Regulations which were put out on Monday (see page 439) very properly echo, in their arrangement and in much of their substance, the various Orders issued between 1914 and 1918 under successive Defence of the Realm Acts. Now, as then, the Government has taken wide powers to maintain public safety and internal order, to suppress and prevent acts that might interfere with the successful conduct of war and to regulate civil activities in the national interest; the new Regulations repeat in many cases the very words and phrases of DORA and her offspring. Here, in great measure, the experience of 1914-1918 is clear gain. Twenty-five years ago, defence of the realm was improvised piece by piece; several Acts and a whole series of revised codes of regulation were needed to bring the scope of the Government's emergency authority to the stage it has reached this time at a bound. And a number of steps that were then proved unwise have been avoided; in 1914, for instance, it was enacted that offenders against the regulations should be tried by courts-martial; now, the right of civilians to trial by jury, which was in fact restored in 1915, is retained at the outset; and, if this right is restricted in future Regulations, it is only likely to be in the improbable contingency of invasion or in the exceptional instance of a district wholly devastated and disorganised by bombing.

**War-time Regulation.**—The thesis of the preceding Note does not prove that this week's Defence Regulations have any finality. In 1914 the period before war began was marked by five sets of regulations; the first two, on August 1st and 2nd, regulated (surprisingly perhaps to us who regard the achievements of modern science as specifically post-war) wireless and aircraft; the other three, on August 2nd and 3rd, came under Royal Proclamations declaring a partial financial moratorium, appointing August 4th, 5th and 6th as Bank Holidays and prohibiting the export of war-like stores. The Proclamation giving wide powers for defence of the realm did not appear until August 4th, when war was certain. This time the precautionary measures taken have been much more sweeping; but there can be small doubt that, if war comes, they will need drastic additions. As it is, the authority given to control persons and property in the event of air raids, for compulsory evacuation and billeting, for forcible obscuring of lights and so on, already exceeds the powers conferred upon police and other officials in 1915 when the last war's A.R.P. began. On the other hand, several steps which were taken in the last war under DORA and other Acts, and which will certainly be needed again in some form, have still to come, in addition to the expansion and strengthening of those already in force. The restriction, registration and, in the case of enemy citizens, the internment of aliens is inevitable in war; the institution of a Censorship (without the inefficient and delaying faults of the 1914 system when the War Office and Admiralty had separate censors and the services of professional journalists were firmly refused) will come at once; control of the liquor traffic, with the mixed motives of conserving food supplies, limiting drinking and restricting public assemblies, is probable; this week's announcement of the possible war-time closing of cinemas and theatres in London (which was not done in the last war, when public entertainment was an important bulwark of public morale) is a pointer to the rigid control of hours of opening in shops and businesses that air raids will make necessary; measures to expedite the transfer of persons, especially women, thrown out of work in luxury trades will be imperative. We are only on the threshold of a new order. The last war transformed Britain's social, political and economic life and organisation very radically. If war comes again an even greater transformation is likely; and it is in the interests of the defence of the realm, and largely by Government regulation, that the change will take place.

**Diplomatic Diary.**—It may be helpful in following the news to have a diary of the bewilderingly swift movement of diplomacy since the news of the German-Soviet non-aggression pact. At 8.30 on Tuesday evening, August 22, a Cabinet communiqué was issued announcing that Parliament would meet on Thursday and pass an Emergency Powers Act. On Wednesday, as a result of a Cabinet meeting on the previous day, the British Ambassador to Germany, Sir Neville Henderson, handed to Herr Hitler a Note in which the British determination to stand by Poland in case of aggression was most firmly reiterated. Two days later, on Friday, Herr Hitler handed Sir Neville Henderson a written communication (and also a good deal of verbal information, since Sir Neville was apparently asked to present the communication to his Government in person, and did in fact fly to London in a German aeroplane). In this the Fuehrer set out his claims on Poland, seasoning them with a number of hopeful comments on the future of Anglo-German friendship. It is gathered that in this communication (as in the one simultaneously conveyed to the French Government) Herr Hitler pointed out that his demands on Poland were not restricted to Danzig. On Saturday the British Cabinet considered this communication, and on Sunday they prepared a reply reaffirming their support for Poland. This was taken to Herr Hitler on the following day by Sir Neville Henderson. In the last hours of Monday a summary of Herr Hitler's verbal reply was received in London, and on the evening of Tuesday the written reply was available in London. In the small hours of Wednesday morning

Lord Halifax sent a preliminary answer to the British Embassy in Berlin for conveyance to Herr Hitler, and after a meeting of the Cabinet at mid-day a full reply was sent off. Those are the bare bones of what has been going on between London and Berlin. The same sort of timetable is applicable to the Quai d'Orsay, with the addition of personal letters exchanged between M. Daladier and Herr Hitler. The German Note to the French Government of August 25th (Friday of last week) made it known that Herr Hitler would "no longer tolerate the existing situation in Poland, and that he deplored that German blood and French blood might be spilt as the result of measures he might be compelled to take to settle the situation." M. Daladier, as one "front fighter" to another, then sent a letter to Herr Hitler "in favour of a mutual recourse to methods of free conciliation." To this Herr Hitler replied on Saturday that he could not accept these proposals as he saw "no possibility of being able to bring any influence to bear on Poland to make her adopt a reasonable attitude . . ." In the same letter he said: "I therefore raised a clear demand. Danzig and the Corridor must return to Germany."

**The French Make Ready.**—The French nation is now on a full war footing. The transformation has been carried out, swiftly and efficiently, in less than a week. Its text was given by M. Daladier on Friday of last week, when he broadcast to the nation: "French women and French men, I have no need to tell you your duty. I know that you are determined to ensure the safety of the country with every sacrifice." That sacrifice has been amply made. Over the week-end, in a spirit of grave determination, the men of categories 1, 5 and 6 joined their regiments, to bring the total number of Frenchmen under arms to about 3,000,000. Alongside this response the civil authorities have been putting through measure after measure for the amplification of home defence in all its manifold fields. On August 24th the requisitioning of cars and other vehicles became general, the municipal authorities began to replace street lamps with small blue electric globes, private individuals fell in with new lighting regulations; in Paris evacuation was begun; throughout the country a great many defence regulations went into force. On Saturday, the 26th, the whole of France east of a line drawn from Calais through Paris to the Mediterranean was declared out-of-bounds for all aircraft, and all civil aeroplanes, except those of regular air lines, were forbidden to fly over any part of French territory, metropolitan or African. An example of prompt attention to detail was the removal on that day of the stained glass from the windows of Chartres Cathedral. On Monday censorship of the Press, of broadcasting, and of films was decreed, the main object being to prevent the passing of information likely to be useful to an enemy. The Communist newspapers, *Humanité* and *Ce Soir*, had already been banned. At Strasbourg the Franco-German frontier was closed; in the Paris area all electric signs were prohibited. On Tuesday, for the third time, the Paris authorities appealed to everyone whose presence was not indispensable to leave the city; wartime control of telephones and telegraphs came into force; most of the daily newspapers appeared in reduced size so as to save on newsprint. A general decree was published prohibiting the export of essential foodstuffs, materials used in the munition industries or in the manufacture of medical supplies. On Thursday the railways came under military control; and the evacuation of school children from Paris, which in contrast to London had begun on the previous day, was already complete. And all this, of which the above is a mere outline of the more important measures, has been done with certainty that there is no other way, and with confidence that, if the worst comes, no one in France will fail.

**The Anglo-Polish Treaty.**—The Anglo-Polish Agreement for Mutual Assistance was signed at the Foreign Office on Friday of last week by Lord Halifax and the

Polish Ambassador. It consists of eight articles, the most important of which is the first. Article 1 states that, "Should one of the Contracting Parties become engaged in hostilities with a European Power in consequence of aggression by the latter against that Contracting Party, the other Contracting Party will at once give the Contracting Party engaged in hostilities all the support and assistance in its power." Subsequent articles develop the meaning of this statement of mutual assistance, Article 2 in particular stating that Article 1 shall apply in cases where a direct or indirect threat to one or other of the Contracting Parties is considered by the party threatened to be of such importance as to make it vital to resist the threat with armed force. Similarly, Article 1 shall apply whenever hostilities break out between one or other Contracting Party and a European Power which has "threatened the independence or neutrality of another European State in such a way as to constitute a clear menace to the security of that Contracting Party." In other words, if Poland goes to war with Germany over a small bordering State such as Lithuania, or if Britain fights for the independence of the Low Countries, mutual assistance is assured. In either case the decision is left with the Party threatened: the case of Slovakia shows nicely the kind of judgments which will have to be made. Article 3 refers to the mutual resistance which any attempt to undermine their independence "by processes of economic penetration" will meet from the two Powers. Other articles deal with the exchange of information. Article 7 states that no separate armistice or treaty of peace will be concluded by either of the Powers if they go to war. Article 8 stipulates that the Agreement shall remain in force for a period of five years, and that unless denounced six months before the expiry of this period, it shall continue in force indefinitely with the usual provisions for termination. The outstanding feature of the Agreement is the wide scope within which mutual assistance is to be given, and the fact that each of the two Powers is to be its own judge.

**The Patience of Poland.**—Of all the nations which now face the prospect of going to war, none can know with more clarity and precision the price they will have to pay than the Poles. Whatever the fortunes of war may be, the Poles will suffer first and worst, at least in terms of physical suffering. It might be thought that their knowledge of this would affect their spirit, would infect them with hysteria and urge them into the unreasoning and provocative actions to which hysteria leads. The German Press, with a wealth of detail, asserts that the Poles have lost their nerve. But the detail is spurious and the assertion untrue. For it ought to be recorded solemnly that the Poles, both their Government and the mass of their people, have accepted during the past weeks countless German provocations, by word and deed, official and unofficial, without the least attempt at reprisal. That is not a matter of opinion: it is a matter of observed and proven fact. The truth is not that the Poles have lost their nerve, but that under a withering fire of lies and threats their nerve has been tempered to a pitch that only a month ago few would have believed possible. During this week German provocations have taken an increasingly serious form, beginning with Herr Forster's assumption of dictatorial powers in Danzig on Thursday of last week and culminating on Tuesday with the complete military occupation of Slovakia. But it was not until the Government in Warsaw had received intimation of the contents of Herr Hitler's third note to the British Government, an intimation conveyed on Wednesday, that all Polish reservists were called to the colours. This means to say that, as far as mobilisation is concerned, the Poles took action after the Germans, for by Wednesday the older classes of German reservists had already joined the colours. Throughout the week the Polish Government has maintained its readiness to negotiate with Berlin, provided that negotiation would take place as between equals and without the threat of force. Its attitude has been wholly admirable, and in striking contrast to the arbitrary and belligerent tone understood to

have been adopted by the Fuehrer. In the war of nerves the Poles, unshielded by their rulers, have shown themselves doughty fighters.

**The Population of the Corridor.**—The map on this page shows the present frontiers of Poland and, shaded over, the portions of Polish territory which lay in Germany and Austria-Hungary before the war. It is not easy to determine accurately the number of Poles living in pre-war Germany. According to the *History of the Peace Conference*, the total number of Poles inhabiting the territories which were ceded outright by Germany to Poland were 1,844,000, and to this must be added 16,000 Poles in Danzig and a proportion of the

1,540,000 Poles inhabiting the areas which were subject to plebiscite. The Marienwerder and Allenstein plebiscite was decided in favour of Germany, and concerned a negligible number of Poles. The Silesian boundaries represented a far more complicated problem. It would appear that out of 1,245,000 Poles in Upper Silesia, 572,000 remained in Germany and 673,000 went to Poland. On the basis of these figures, counting all heads, the number of Poles in the areas which became Polish would be between three and four million. The *History's* figures are, however, based on German population returns; these were subject to considerable manipulation, and it is not surprising that the Polish estimate is a good deal higher. The Polish estimate of the present Polish minority in Germany is about 1,500,000; the German figure is smaller than this. On Polish official figures (census of 1931) the German minority in Poland is 741,000 (this does not include about 360,000 Germans in the Free City of Danzig); the German figure is larger than this. In the same way, there are no precise figures for the Polish areas of Galicia and Volhynia governed by Austria before the War. The Poles estimate the number of Polish-speaking inhabitants to have been between four and four-and-a-half millions; it is probable

that the Vienna authorities would have scaled down this figure. Even if the Danzig Germans are counted in, which, since they govern themselves, obviously they should not be, it is the fact that under the Versailles settlement many more Poles remained in Germany than Germans in resurrected Poland.

\* \* \*

**The American Attitude.**—The development of the European crisis has been followed in the United States with all the American public's latter-day absorption in diplomatic news, but, as in other democratic countries, with none of the hysteria of eleven months ago. President Roosevelt has sent appeals to the King of Italy, asking him to use his good offices, and to Germany and Poland, urging both countries to accept a peaceful method of settlement. At home, the efforts of the Administration have been directed, as they must, towards the preservation of neutrality. But the sympathies of the United States have peeped through the neutrality measures. Thus, while British, French and German liners have been forbidden to leave New York until they have been searched for possible offensive weapons, the German liners, whose haste was the greatest, have been subjected to the most rigorous search. The coincidence of "neutrality" with "preparedness" has also been emphasised by the creation of a War Resources Board under Mr Stettinius, the chairman of the United States Steel Corporation and son of the Morgan partner who held a similar post in the last war. The attitude of the public, as exemplified in the newspapers, has been unanimously in favour of the stand being made by Britain and France; not a voice has been raised in any contrary sense. There are still, however, great divisions of opinion when the practical form that this sympathy should take is under discussion. It has been asserted in well-informed newspapers that the Senate, if summoned now, would not hesitate to amend the Neutrality Act. But Mr Roosevelt has not issued the summons to Congress, and there is no direct evidence from the isolationists that they have changed their mind. As for the wider issue, the latest "public opinion surveys" show a widespread conviction that America would in fact be drawn into a general war. The number of those holding this opinion has risen, according to one survey, from 38 per cent. in January, 1937, to 76 per cent. to-day. But less than half of those polled favoured helping Britain and France with materials and only a quarter would send troops. Indeed, all that can be said with certainty is that American opinion is changing, that it is changing rapidly, and that it is moving in a sense favourable to the democracies. But it would be difficult to assess exactly how far it has already travelled along that road or how long it will take to reach any fixed point upon it.

\* \* \*

**Japan Changes Her Policy.**—With the first shock of the German-Soviet Pact over it is clear that the gains are not all on Germany's side. On Friday of last week the Japanese Government protested to Berlin that the pact was "a flagrant violation of the spirit of the Anti-Comintern Pact"; over the week-end it was known that Japan's whole foreign policy was to be refashioned. The Government resigned, and General Abe formed a Cabinet to do the refashioning, his aim apparently being to continue with the "creation of a new order in eastern Asia"—but without European engagements of any kind. Following on this change of policy, which is bound to have a certain demoralising effect on those Japanese whose ambitions have swallowed up their good sense, tension in China between British residents and the Japanese authorities is noticeably relaxed; it is even said that Japanese sentries are saluting British subjects where before they were more likely to strip them.

\* \* \*

Once given the fact of a German-Russian understanding the change need surprise no one. The Anti-Comintern Pact, hatched in Berlin, was never aimed so much at the Russians as at the British and French, and this the

German-Italian military alliance which has developed from it, and the Japanese military alliance that was hoped for, may be taken to prove. The line-up with Japan rested on shallow sympathies. While the Italians, through impotence to do anything else, may have adhered to the ostensibly anti-Russian spirit of the undertaking (though even they have built warships for the Soviets as recently as 1938, and their policy in Spain was never primarily anti-Communist), the Germans have never been at pains to conceal their true purpose. If the Anti-Comintern Pact was really designed as a basis for getting Japan into an anti-Russian alliance, the Berlin Government would scarcely have hindered the Japanese in their war with China by supplying Chiang Kai-Shek with arms and military advice. Up to a point, the Germans have managed to make the best of both worlds. That point was passed the moment that Herr von Ribbentrop went back on all his known public and private principles (except, perhaps, those peculiar to the Nazi moral code) in signing a pact with the Soviets. For the moment, Japan may be expected to lie low. But it would be a mistake to think that Japanese "isolation" means a new era of collaboration with Britain. There are no facts to support this thesis. The news that the blockade of Hong Kong is being intensified shows that dislike of Germany will not be exchanged for love of Britain. Japan's paramount aim is still to win her war in China; all that should be looked for at the moment is a modification of method and a renewal of Oriental patience.

\* \* \*

**Turkey Stands Firm.**—Turkey is fast becoming the small Power with a Great-Power reputation. While most of the small States have hastened to reaffirm their neutrality in all circumstances except a direct attack on their independence, Turkey has not hesitated to let it be known that the German-Soviet pact in no way weakens her allegiance to the Peace Front. For this the Turkish Government deserves our sincere thanks, all the more when it is realised in what a difficult position the pact placed them. The Germans at least have not been slow in realising the difficulty of that position, and one of Herr Hitler's first acts after the signing of the pact last week was to send Herr von Papen, German Ambassador to Turkey, hotfoot to Istanbul, presumably with the intention of pointing out to the Turkish Government that, in the interests of their Russian friendship as much as out of regard for Germany's growing strength, they should now break with the Western Powers. The argument is not without its barbs. The Soviet Union was the first State to treat with the Turkish Republic, and her non-aggression pact with Turkey was signed, in 1921, when the Republic was still struggling for independence. By continuing in the Peace Front, would Turkey risk offending Russia? Again, by the Middle Eastern Pact signed at the Saad-Abad Palace in Teheran in July, 1937, Turkey guaranteed her safety from aggression with Iran, Iraq, and Afghanistan; in Europe her only immediate fear is Bulgaria, and the Turkish army can easily cope with that. Germany has secured a leading place in Turkey's foreign trade, and is already supplying her with armaments. The temptation to withdraw within the framework of this security system might have been strong. But the arguments against withdrawal are decisive. For none of Turkey's international agreements gives her any *positive* security, *except* those she has signed with Britain and France. Another important factor in the balance of forces may have been the fact that the Soviet Union, as far as is known, has not supported the German argument, or given any sign that Turkey's present policy is displeasing to the Kremlin. That policy, indeed, is calculated to allay much of the Kremlin's anxiety for the continuance of the *status quo* in and around the Black Sea. By showing to what lengths the Germans are prepared to go to obtain their ends, the German-Soviet pact seems only to have reinforced Turkey's decision.

\* \* \*

**The Situation in Hungary.**—If the Communist International is hard put to it to explain last week's composition with Germany, then the Nazi "International" is

in no better case. The Nazis in Hungary have for long fought beneath the anti-Communist flag, and many of the seats they won in last May's elections were won on the strength of memories of Bela Kun. Pro-German sentiment in Hungary, already rare, is likely after last week's *coup* to become more than ever the generally accepted badge of poor patriotism. This does not mean—rather the contrary—that the Government itself will be allowed by the Germans more freedom of movement, though it may mean a more tactful application of the restriction which already exists. Count Csaky's sojourn in the Austrian Alps has brought no change to Hungarian policy: but the reason for that may after all only be that no change was desired by the German Government. Hungary is already a member of the Axis group—and even if it were intended to force Hungary's permission to the passage of German troops it would be bad strategy to make that permission public, or to force it before it was absolutely necessary. The Hungarian Government may in the meantime be expected to keep as much as possible to itself, but to miss no chance of improving Hungary's position *vis-à-vis* her neighbours, especially Roumania. In this connection it is significant that they have rejected a Roumanian proposal for a non-aggression pact—that is very natural, for to have accepted it would have weakened Hungary's position in a day of revisionist reckoning which, as far as they know in Budapest, may be still to come. At the same time, it is only fair to add that the Hungarian Government has safeguarded itself against a charge of being completely chauvinist by offering to negotiate a treaty with Roumania for the mutual protection of minorities. Roumanians point out that any such treaty, given the large Hungarian minority in Roumania and the negligible Roumanian minority in Hungary, would have a decidedly one-sided application. A minorities treaty would be worth concluding, it would seem, only if a large-scale exchange of populations were possible, or, conceivably, if the Hungarians would offer worthwhile guarantees of their respect for the integrity of a frontier which had been modified only slightly in their favour. And with Germany paramount in Budapest, it is hard to see what guarantees would be of the slightest value.

\* \* \*

**The Mediterranean Reaction.**—Both in Italy and Spain the Russo-German pact was received by official commentators as a brilliant tactical move "on the side of peace," but this did not hide the obvious embarrassment with which these two Catholic countries heard the news. Now that the Anti-Comintern Pact is ridiculously outmoded, and there can no longer be any excuse for "crusading against Bolshevism" in company with the Nazis, disillusion will be widespread among the idealists. In practical terms, too, the effects have been striking. There is, for instance, no denial either from Paris or Madrid of reliable reports that Colonel Beigbeder, the Spanish Foreign Minister, has assured General Pétain that Spain would remain neutral, and that the Spanish Ambassador in Paris has given M. Bonnet a similar assurance. It would seem that a corresponding assurance was given to the British Ambassador on Wednesday. Even if those assurances have not been given, the chances of Spain playing an actively pro-German rôle in wartime have shrunk very perceptibly. It may also be significant that Italian military precautions and civil defence measures are far behind those taken in Germany. In contrast with the Germans, Italians in England have not been advised to go home. Several of the conscript classes called up in Italy are not required to assemble until September 3rd, and it is only in the last few days that public opinion in Italy has been allowed to grasp the full dimensions of the danger. There can be little doubt of the Duce's anxiety that the peace shall be kept; and no doubt at all that, if the Italian public had their way, the peace would be kept.

\* \* \*

**Jugoslavia, Federal but United.**—The importance of the Serbo-Croat agreement—reached after long negotiation, but by negotiation for all that—has been marked in

every country in Europe. To Whitehall it has come with especial satisfaction as a sign that Jugoslavia is now united and therefore in a strengthened condition to defend her neutral status. In Jugoslavia itself there is widespread relief at this successful termination of months and years of domestic tension. The Government has been reformed, and under the continued leadership of M. Tsvetkovitch as Prime Minister now includes five members of the Croat People's Party, one of whom is Dr Matchek, who takes the rank of Deputy Prime Minister. A decree is shortly expected whereby the electoral law will be changed. New elections will then take place, after which the Skupshtina should be representative of the main trends of public opinion—and this for the first time since 1930. Federal status will be granted to a Croatia that is to include the present *banovina* (province) of the Save—that is, Croatia proper, together with the *banovina* of the Coast and certain portions of the *banovina* of the Vrbas. The *ban*, or governor, will be accorded special privileges. August Kosutitch, Dr Matchek's second-in-command in the Croat People's Party, is being tipped for this important post. It may be presumed that a similar federal status will sooner or later be accorded to Slovenia, and possibly to the Serb provinces of Slavonia and Voivodina. The Croats thus obtain the right of self-government which they have always claimed, and take upon themselves a share in the government of Jugoslavia for the first time since 1929. They do this, true, at a precarious moment, but on the long view it may not be a bad thing that the earliest days of federation, with the important and far-reaching decisions which will have to be taken in that time, are lived through against the background of a European crisis.

\* \* \*

**The Small Western States.**—On Saturday last German diplomatic representatives gave their Government's assurance that the integrity of Holland, Belgium, Switzerland and Luxemburg would be respected in case of war, and Denmark later received a similar assurance. Each of these small neutral States has looked this gift-horse in the mouth. Each of them, in varying degree, took military precautions immediately after they had received it. On Monday the Dutch Government decreed the mobilisation of the army and navy, and later in the week this mobilisation had accounted for about 500,000 men. Over the week-end the Belgians and the Swiss had extended their defence precautions; only the Danes, viewing their situation realistically, took no more than perfunctory measures. In the case of the Low Countries, the main anxiety has been to avoid being caught up in the war of the air through the passage of foreign military aircraft across their frontiers. All passage of civil and military aircraft has now been prohibited without special authorisation, but this, of course, is only a relative safeguard. In their turn, the British and French Governments have given corresponding assurances of respect for the integrity of these small States; the British assurance to Denmark states that "so long as Danish neutrality is respected by Germany it will, of course, be respected by the British Government"—a barbed reminder of the manoeuvres of 1914.

### The NATIONAL BANK of NEW ZEALAND, Limited

Established 1872

Head Office :—8 MOORGATE, E.C.2

Subscribed Capital - £6,000,000  
Paid-up Capital - £2,000,000  
Reserve Fund - £1,000,000  
Currency Reserve - £500,000

The Bank has branches throughout New Zealand and conducts every description of Banking business with that Dominion.

With danger pressing in on them from every side, it was natural that the sovereigns of Holland and Belgium should have associated themselves in a joint offer to exercise their "good offices" in the cause of peace. The Governments of Britain, France and Poland have accepted the offer; Germany has thanked Queen Wilhelmina and King Leopold for it, but does not appear to have formally accepted it. It is difficult to see in what way these "good offices" could be used unless Herr Hitler is looking for a graceful way of retiring from the adamant position he has hitherto held. But it is good that they should have been offered.

\* \* \*

**Shipping in War.**—Last Sunday the Admiralty took control of Britain's merchant marine and on Monday the Mediterranean and Baltic seas were closed to traffic. In the event of war the industry will presumably again be put under the control of a separate Ministry. In view of Britain's dependence on imports, it is scarcely necessary to emphasise the importance of the rôle which her merchantmen will have to play in war. Is the merchant marine in a position to fulfil its task in the event of war? The Government must have assumed that it is, for otherwise its half-hearted response to the demand for the accumulation of stocks of foodstuffs and raw materials would amount to criminal negligence. The immediate question is whether the merchant shipping capacity available to the Government is sufficient to meet the demands likely to be made on it at the outbreak of war. Superficially the position is much less favourable than 25 years ago; the number of vessels registered in the United Kingdom (including tankers) fell from 8,587 in June, 1914, to 6,722 in June this year, while their capacity declined from 18.9 million gross tons to 17.9 millions. On the other hand, the number and carrying capacity of the Dominions, the French and neutral fleets is now appreciably greater than in 1914. Thus, the combined merchant fleets of the Dominions, France, Greece, Holland, Norway, Sweden and the United States now comprise 3,774 more vessels and their capacity is greater by 15.3 million gross tons than in 1914, an increase which far outweighs the decline in Britain's fleet. On the assumption that Britain can tap the reservoir of neutral shipping, the supply of tonnage is thus considerably bigger, while modern shipping is much faster and more efficient, than twenty-five years ago. In a prolonged war, of course, the supply depends on the ratio between losses and replacements. But although it is impossible to estimate the probable rate of loss in war, the combined building capacity of Britain, the Dominions, France and neutral countries is also much greater than in 1914. Apart from the heavy cost involved in an increased reliance on foreign shipping, the total supplies of carrying capacity available to Britain at the outbreak and during a war is now much bigger in relation to probable needs than twenty-five years ago.

\* \* \*

**Engineers and Dilution.**—The full application of dilution of labour in this country can only come through comprehensive and planned measures. These require Government action, with the co-operation of the leaders of the whole body of organised workers represented in the Trades Union Congress. But detailed arrangements for the removal of artificial limitations on the classes of work which may be done by skilled workers, and for the introduction of semi-skilled men to perform subsidiary functions, are probably best made on an industrial basis. It is on the latter ground that this week's agreement between the Amalgamated Engineering Union and the Engineering and Allied Employers' National Federation is to be welcomed. But the reported terms of the arrangement indicate that the welcome should be a qualified one. Firstly, it is not a positive plan, but rather a schedule of the circumstances and manner in which concessions may be made. By its terms it will not be possible to supplement skilled man power unless it can be shown that skilled men are not available and production is prejudiced. Applications for

changes of practices are to be referred to local committees, and, in cases of disagreement, to national executive committees of employers and unions. All of which indicates that safeguards, whose necessity nobody denies, are being given an unjustifiable preference over positive measures of dilution; and that local agreement is being given precedence over national direction. Nevertheless, criticism based on the facts so far available can hardly reduce the gesture value of this decision on the part of a union with 400,000 members, which has always been the spear-head of resistance to dilution. The acceptance of the principle before the actual outbreak of war, and for application to commercial as well as armament engineering, is an impressive achievement. If this example is immediately followed and improved upon in other vital industries, there will be ground for assurance that industrial dislocation will be reduced to a minimum. The perfecting of the organisation of labour in war-time may then be regarded as an executive task.

\* \* \*

**More I.R.A. Murders.**—Few grave crises in modern English history have failed to find Ireland's extremer patriots only too ready to turn the national danger to their own advantage by methods of violence and intimidation. Close upon a century and a half ago, in the opening phase of England's drawn-out strife with Revolutionary France, there was riot, unrest and revolution across the Irish Channel. Twenty-five years ago, on the eve of the World War, it was civil strife in Ulster and not war with Germany that seemed most imminent; and there was bitter fighting in Ireland while the war itself was on. The pattern repeats itself now. It is several weeks since the Home Secretary revealed to Parliament the existence of a plot by the Irish Republican Army to intensify their dastardly campaign of sabotage by bombing in the event of emergency; and this anticipated new phase has seemingly begun. A week ago, five persons were killed and more than forty injured in an explosion in Coventry which shattered shops and tore up roads over a wide area; and at the peak of the external European crisis it has been necessary to close and strongly guard public buildings against an internal menace. The statutory powers given to the authorities to detain and expel suspected persons have been freely used; and the few I.R.A. members who have slipped through this net have now to face, not only the stern provisions of the new Emergency Defence Orders, but also the fury of the members of the public put immediately in danger. The appeal to lynch law is never tenable. It is hasty, indiscriminate and illegal. But its occasional appearance in English streets is an index of the harm the I.R.A. are doing to the Irish cause—which, before violence began, had a host of sympathisers in England. Yet it would be a wild error to attach too much importance to what these few fanatics are doing. Their activities have done nothing at all to shake the calm and even temper of the people during these days of crisis. They have failed utterly and completely in their disruptive aim.

\* \* \*

**Raising the School-Leaving Age.**—The first clause of the Education Act of 1936, which comes into force, ironically enough, on September 1st, the first day of evacuation from vulnerable areas, raised the school-leaving age to fifteen years. The next six clauses provide for exemptions from this main provision. They require local authorities to issue an employment certificate to the prospective employer of a child between fourteen and fifteen if they were satisfied that the proposed employment would be beneficial to the child; and they empower the authorities to permit a parent to withdraw a child of fourteen from school to assist in the home in circumstances in which exceptional hardship would otherwise be caused. The exemption clauses are perfectly capable of preventing the achievement of its main purpose. Considerable efforts have been made by those genuinely interested in the cause of education to salvage something from this legislative wreck. The

Board of Education has issued suggestions for procedure in the granting of exemptions; local authorities, and particularly those of Lancashire and the West Riding of Yorkshire, have framed regulations which should prevent the worst of the possible abuses of the exemption clauses; independent bodies, such as the National Chamber of Commerce and teachers' organisations have urged that children under fifteen should not be employed in any case. There is some assurance that the strictest observance of the letter of the law can, with constant vigilance, reduce the proportion of exemptions to considerably less than the 50 per cent. of applications indicated in Parliament as likely. But if the exigencies of war make the employment of child labour unavoidable there will no doubt be a return to the grudging spirit in which the Act was framed. Rather than that such a spirit should be given opportunity of expression in the actual working of the measure it would perhaps be better to repeal it outright. The period 1914-18 was one of steady and solid progress in education, and if a resumption of this progress can be expected in the immediate future a better measure than the Act of 1936 can hardly fail to appear in due course.

\* \* \*

**The Railwaymen's Claims.**—A week ago the Associated Society of Locomotive Engineers and Firemen only just escaped the wholehearted opprobrium of the entire nation by calling off their threatened strike at the eleventh hour. They agreed to discuss further their claims for higher pay and better conditions. But, unlike the other railway unions, they refused to follow the normal and reasonable procedure of referring the matter back to the Railway Staff Tribunal. They negotiated instead direct with the railway managers; and after extended and reluctant talks, they reached a provisional agreement at the week end. The engineers have not come out well from this episode. Their plea that the constitutional process of appeal to the Tribunal is unduly dilatory has no foundation in experience; and their contention that the argument

about their wages being generally higher than in most industries is really irrelevant carries only partial conviction. On any balanced assessment the claims of the impoverished members of the N.U.R. who earn less than 50s. a week, and indeed those of many of the railway stockholders, too, must take precedence over the demands of the relatively well-paid A.S.L.E.F.

\* \* \*

**Rationing in Germany.**—The past week has seen the resumption in Germany of rationing for the civilian population. The rationing includes not only some of the main foodstuffs but also clothing, shoes, leather and soap. The present allowances of important foods (as given in *The Daily Telegraph and Morning Post* of August 28th) are very considerably greater than those in force at the end of the Great War; but, compared with the British rations in existence at the end of the War, they show that, if war breaks out now, Germany will begin it little, if anything, better off—and considerably dirtier—than Britain ended the last. The following table compares the Hamburg weekly rations in January, 1918, with the existing scale and with the British 1918 allowances:—

ALLOWANCES OF CERTAIN FOODS PER HEAD PER WEEK

|                        | Unit  | Hamburg 1918 | Germany 1939 | U.K. 1918 |
|------------------------|-------|--------------|--------------|-----------|
| Meat.....              | oz.   | 9            | 25           | 32        |
| Fats.....              | oz.   | 2.5          | 15           | 12        |
| Sugar.....             | oz.   | 5.3          | 10           | 8         |
| Jam.....               | oz.   | ...          | 4            | 4         |
| Tea.....               | oz.   | ...          | †            | 2         |
| Bread.....             | lb.   | 4½           | †            | 6½        |
| Potatoes.....          | lb.   | 7½           | †            | 4½        |
| Soap.....              | oz.   | ...          | 1            | †         |
| Coffee substitute..... | oz.   | ...          | 2            | ...       |
| Milk.....              | pints | ...          | 2½           | †         |

\* Tea substitute. † Not rationed. ‡ Not rationed; estimated consumption.

Bread, potatoes and other vegetables are not yet rationed in Germany, while tea and coffee seem to have practically disappeared; the rations are for substitutes only.

## THE WORLD OVERSEAS

### Falling Productivity in German Industry

(From a Correspondent)

THE high level of German industrial production has been the most impressive single feature of the German economy in recent years. Even the most ardent critics of the Third Reich cannot but recognise the fact that the level of industrial output in Germany is more than twice as high to-day as it was when the Nazis seized power in the Reich—though it must be remembered that 1933 was a year of deep depression. What are the industrial omens for the Reich, now possibly on the brink of a European war?

It is common knowledge that, in the winter of 1932-33, there were no less than 8,000,000 workless people in Germany. About half of the industrial population was unemployed, even though the average length of a working day was then less than seven hours. Now, not only is unemployment practically abolished in Germany, but the Reich is suffering from a very serious labour shortage. Several millions of industrial workers are working for ten hours or even longer every day, and a great many members of the "petty-bourgeoisie," artisans, small shopkeepers, and so on, have changed their jobs and are now employed in industrial plants. Female work has been encouraged to such an extent that, in some places, the majority of the postmen, tram conductors, liftmen, etc., have been replaced by women.

There has been a vast increase in the work done in German industry, and, not unnaturally, industrial output has grown. The question is, has it grown commensurately with the growth in work performed? In the table overleaf we have

prepared three sets of indices. The first two, based on figures of the German Institute for Business Research, show, respectively, the total output of industrial goods and the total number of hours worked in German industry. It will at once be seen that, though the increase in output has been remarkable, it has perceptibly lagged behind the increase in working hours. The third index, that of the output per working hour, has shown a slightly falling trend since 1932.

The fall in industrial productivity may seem, at first glance, small, but it is surprising. Commonly, a rise in the scope of industrial employment, such as has taken place in Germany since 1933, is accompanied by an appreciably increased output per working hour—owing chiefly to a better utilisation of existing machinery; during the upswing period from 1925 to 1929 in Germany itself, for instance, output per working hour increased by about 29 per cent., and during the

OUTPUT OF GERMAN INDUSTRY, 1932 TO 1938  
(Indices—1932 = 100)

|       | Total output | Hours worked in industry | Output per working hour |
|-------|--------------|--------------------------|-------------------------|
| 1932  | 100          | 100                      | 100                     |
| 1933  | 112          | 115                      | 97                      |
| 1934  | 142          | 151                      | 94                      |
| 1935  | 163          | 164                      | 99                      |
| 1936  | 182          | 183                      | 99                      |
| 1937  | 199          | 201                      | 99                      |
| 1938* | 203          | 208                      | 98                      |

\* 1938 figures exclude Austria and are only approximate.

recent years of recovery from the great depression similar increases were apparent in some of the most important democratic countries. For instance, the rise in productivity per employed person in British industry between 1930 and 1935 was approximately 27 per cent. By the British standard, a German working hour should have produced at least 20 per cent. more in 1938 than it did in 1932; actually it produced slightly less.

Nor is this unfavourable comparison all. It must be taken into account that German workers are compelled to work much harder now than they did when a network of trade unions and other labour organisations existed. They are pressed harder in every hour they work. Even the German factory inspectors do not hide the fact that "the intensity of work is generally high," and the records of social insurance organisations clearly demonstrate how the health of German workers has been adversely affected by increased physical and nervous strain. The average worker is forced to visit his doctor more often to-day than in 1932 (the increase is 28½ per cent.), and the number of deaths per 1,000 working-class families has increased by 18 per cent.

There are several factors which have combined to reduce productivity in German factories. The German Institute for Business Research has occasionally pointed to the fact that several concerns which were badly organised and closed down during the great depression reopened after the recovery. Even under "normal" economic conditions this reopening of inefficient factories might well have checked any increase in productivity for, say, at least a couple of years. But this factor is certainly not important enough to explain the low standard of general industrial productivity during the last seven years—especially when the output of certain special industries, such as the metal trades, has considerably increased.

Actually, it has been much more important in recent German experience that a lengthening of the working day—especially if it is not accompanied by an improvement in real wages—tends to lead to lower output per person. Sometimes this can be counterbalanced by forced intensification of work, but, in the case of Germany, the physical deterioration has outweighed the effect of the increasing tempo of work. And, moreover, the efficiency of the high-paid technical staff seems to have fallen during recent years.

The unusually unfavourable movement of the productivity index in the first two years of the Hitler regime may be put down to the artificial acceleration of economic recovery by certain measures of the Government. Vast numbers of workers were given work for which they were not sufficiently skilled and vast sums were wasted by an all-powerful bureaucratic system. It is true that the position became somewhat easier in 1934 and 1935; but, since then, the drive for economic self-sufficiency has led to the production of substitutes for several important raw materials such as wool, rubber, oil, etc.; and almost invariably the manufacture of these substitute goods has required a greater amount of human labour *pro rata* than the output of ordinary goods. At the same time, while the output of iron ores and other minerals has been increased, it has been done by the working of pits which, from an economic point of view, must be regarded as inefficient and wasteful.

The rake's progress does not end here. The use of substitutes has, in turn, hindered the productive process of many normal industries using them as raw materials. Most of the newly-invented substitutes have proved to be far inferior in quality to the materials that they replace; and, to take one instance, the thread in textile factories is breaking much more often than it did before 1932; and the waste in metal factories has risen.

At the same time, the amount of work required for non-productive purposes, such as secretarial work, has vastly increased with growing bureaucracy. The output of consumption goods has suffered by the concentration on the war industries; the destruction of Jewish property has also had a bad effect on productivity; and so on. And, in fact, the potential decline of productivity is probably even larger than

would be suggested by the calculation above. There is a time-lag, and some of the worst effects will not be felt until later on. This holds true, for example, of the deterioration in the scientific standard of technical students and also, to a certain extent, of the many substitutes that are only just coming into use.

No less important is the fact that there are certain general factors tending to lower the productivity of the German industrial community as a whole, factors which will, therefore, find little reflection in our statistics of actual industries. Large amounts of money have been invested, for instance, in the construction of new streets and houses, and it has been found impossible to complete them. They are now exposed to destruction through rain and storm, while the Reich is preoccupied with more important military duties.

Nor is there the slightest indication that productivity will improve in the immediate future, and the latest reports from German mines and railways reveal that the decrease of productivity is still going on. Some years ago, when there were still very large reserves of labour-power available in Germany, the decline in productivity did not need to be taken too seriously, because it might easily have been made up by an increase in the actual amount of industrial labour employed. Now, however, when there is virtually full employment, a further decrease in productivity must necessarily result in a simultaneous decrease in total industrial output.

Thus, even if peace is preserved, the present industrial "boom" in Germany is bound to come to a halt very soon, unless the Reich initiates a profound change in its economic policy. But, if Germany should decide to wage a war, her already falling industrial productivity may prove to be the most fatal deficiency in her *potentiel de guerre*.

August 26th.

## Factors in French Confidence

[FROM OUR PARIS CORRESPONDENT]

DURING the period 1935-37, when the expatriation of French capital was at its height, London was one of the principal refuges. But, in the recent fall, sterling and the franc have gone side by side. French prices maintain their favoured position against world prices. Flight abroad, in fact, is not a way out of present difficulties, and short-term Treasury bonds are preferred to hoarding. The stay-at-home tendency has been strengthened by the fact that the situation of the Equalisation Fund has been strong in recent months. And, in addition to the gold stock of the Bank of France, the French "war treasury" now contains about 3,000 tons of gold.

The Stock Exchange continues remarkably calm. Unfavourable news or rumours, military measures of security, calls to the colours, mobilisation of staff and factories engaged on war work, control of the press, and requisitioning of buildings, vehicles and materials have had no pronounced effect on quotations. Transactions are certainly at a minimum, but if there are no buying orders, there are no selling orders either.

An examination of the changes of the last twelve months, in which the two main features have been the internal economic recovery and the increased external danger, produces three main conclusions. The first is that French prices are opposing a firm resistance to the huge re-armament expenditure and increased taxation. The index of the cost of living is 128.7 for the second quarter of 1939, against 128.2 in the first quarter and 119.1 in the second quarter of 1938. Wholesale prices are still falling.

|                        | May 20 | June 3 | July 8 | July 29 | Aug. 12 | Aug. 19 |
|------------------------|--------|--------|--------|---------|---------|---------|
| Wholesale Prices:—     |        |        |        |         |         |         |
| General Index .....    | 696    | 693    | 687    | 677     | 672     | 671     |
| Home products .....    | 715    | 715    | 711    | 704     | 699     | 698     |
| Imported products....  | 661    | 653    | 645    | 629     | 624     | 623     |
| Foodstuffs .....       | 652    | 645    | 629    | 613     | 600     | 599     |
| Industrial products... | 734    | 736    | 739    | 733     | 735     | 735     |

Secondly, increased production and business activity have produced improved returns of taxation receipts, which amounted to 6,500 million francs in July, of which 6,315 millions were ordinary receipts, against 4,393 millions in June

and 5,010 millions in July, 1938. Receipts for the first seven months of 1939 are thus 31,240 millions, against 24,787 millions in the corresponding period of 1938.

Thirdly, while the economic and financial situation of the country is improving, largely under the influence of the favourable price trend, the political work of internal re-organisation pursued by MM. Daladier and Reynaud will be rendered much easier by the recent downfall of the Communists. These were severely hit by the fiasco of the general strike of November, 1938, and have now received the final blow with the Nazi-Soviet pact. There is actually no doubt that, whatever may happen, the Socialists will make considerable capital out of the "felony of Moscow."

### The Price of Wheat

The legal price of wheat for the 1939 crop has been fixed at 197.50 francs per quintal. The price will, however, be applied only to the 60 million quintals, corresponding to the home consumption. The net price paid to the producer (162 francs in 1938) will be much lower than the legal price. It will be fixed in November, when the result of the crop will be exactly known. First estimates of this year's crop are about 75 million quintals, which will adequately cover an official consumption of 70 millions. If the imports of North Africa (3 million quintals) and the remaining surplus of the 1938 crop (18 million quintals) are taken into account, the whole surplus will reach nearly 26 million quintals. Of this 10 million quintals have been bought by the Government, and a surplus of 16 million quintals will have to be disposed of by the Wheat Office.

August 31st.

## Jugoslavia's Self-Sufficiency

[FROM OUR BELGRADE CORRESPONDENT]

JUGOSLAVIA is making a systematic effort to gain as much economic independence as possible. This does not mean complete self-sufficiency. It is an effort to distribute economic activities, foreign trade, production and investment in such a way as to obtain a balance which would save Yugoslavia from becoming too dependent on any one country or kind of production.

This is most obvious in foreign trade. Having lost our trade connections with Italy at the time of sanctions, without a corresponding improvement in our exports to Great Britain and France, Yugoslavia drifted at one time towards a position of entire dependence, for the sale of our goods, on Germany. This was the more so because Germany, having fixed an artificially high exchange rate for the Reichsmark, paid Yugoslavia prices above world parity, which, of itself, prevented the sale to other countries of many articles.

The dangerous corollary of this was a shortage of free-exchange and a weakening of the dinar. During the first half of last year no less than 63.57 per cent. of Yugoslavia's exports and 69.50 per cent. of our imports passed through clearings, and of these 41.98 per cent. of exports and 40.03 per cent. of imports represented trade with Germany. Towards the end of the year the position became even more disadvantageous when Czecho-Slovakia, a cash-paying country, was incorporated within the German clearing area.

But, this year, largely by means of quotas and trade permits, Yugoslavia has not only succeeded in reducing the percentage of exports through clearing to 61.14 per cent., but also in distributing this, so that the German share comes to 26.92 per cent., or, together with the Czech share, to 39.56 per cent. That is rather less than last year.

The direction of foreign trade has become much more systematic, and at the same time more elastic, since the creation on July 1st of a special free-exchange committee at the National Bank. This committee has introduced three important measures to further exports to non-clearing countries, and thus enlarge Yugoslavia's fund of free-exchange.

By the first, the National Bank gives up its right to buy at the official rate one-quarter of the free-exchange deriving from export sales. While an exporter could previously obtain 258 dinars for three-quarters of his pound sterling, and for one-quarter the official rate of 208 dinars, giving him an average of 245 dinars, he now obtains the full 258. This measure is complemented by a second, giving exporters the right to sell 33 per cent. of their free-exchange for so-called

"internal" dinars, quoted at 340 to the pound. In this way an exporter now actually obtains about 285 dinars instead of the previous 245, the difference being roughly equal to a 15 per cent. premium on exports to cash-paying countries. The third measure is the grant by the National Bank to these exporters of credit at 3 per cent., instead of the usual 7-9 per cent., thus making up a further premium. The eventual aim is to balance exports to clearing and non-clearing countries.

### Production Measures

Parallel with these efforts, others are being made to diversify production, partly within agriculture itself and partly by developing a modest industry and exploiting our mineral wealth. Hitherto much has been done to encourage stock-raising as against pure arable farming, and more recently great attention has been paid to the raising of industrial plants, of which Yugoslavia cultivates flax, hemp, jute, sugar beet, oil seeds, tobacco, poppy, sunflower, hops, cotton, fleabane, soya, sesame and castor oil. The area under flax has been increased from 11,000 hectares in 1934 to 14,300 hectares in 1938, and that of hemp from 37,700 to 57,800 hectares. About 170,000 hectares are now devoted to industrial crops; a further 7.5 million hectares are under the plough, 750,000 hectares under fruit and 213,000 hectares under vines. The total of cultivable land is estimated at 5 million hectares: it is clear that much is still to be done.

Foreign capital, which has practically ceased coming in since 1931, is to be attracted by a third branch of practical policy. The National Bank is now setting aside a special fund of free-exchange to guarantee a fair dividend to new foreign capital. By the term fair is understood a dividend equal to the interest on State bonds, i.e. between 7 and 8 per cent. Higher dividends will not be forbidden, but no special free-exchange will be set aside for dividends above the limit mentioned.

An interesting instance of this new effort towards economic independence is the combination of foreign credits with State ownership in the case of the proposed erection of two cellulose factories. Out of a French credit of about 600 million dinars, between 120 and 150 millions will be sunk in these two factories. The Yugoslav State will hold the majority of the

shares. But the sales agency will be in Paris, so as to enable the French to obtain repayment for their credit, and the Yugoslav Government to secure free exchange. Hitherto the production of cellulose in Yugoslavia has been 18,000 tons. These two new factories will produce 45,000 tons.

August 15th.

## U.S. Prices and Wages

[FROM OUR NEW YORK CORRESPONDENT]

IN the first half of 1939 (as in the previous year) the wholesale price index of the Bureau of Labour Statistics was remarkably steady, with a slow declining trend.

### B.L.S. PRICE INDEX (1926=100)

| First Half 1938    | Second Half 1938    | First Half 1939    |
|--------------------|---------------------|--------------------|
| January..... 80.9  | July..... 78.8      | January..... 76.9  |
| February..... 79.8 | August..... 78.1    | February..... 76.9 |
| March..... 79.7    | September..... 78.3 | March..... 76.7    |
| April..... 78.7    | October..... 77.6   | April..... 76.2    |
| May..... 78.1      | November..... 77.5  | May..... 76.2      |
| June..... 78.3     | December..... 77.0  | June..... 75.6     |

This index is not sensitive; but it is a little remarkable that a recovery movement as strong as that of the past year should have had so little influence on prices. The downward trend is most distinct in farm products, where the index fell from 71.6 in January, 1938, and 68.7 in June, 1938, to 62.4 in June this year. This index stood at 94.1 in March, 1937.

The cost of living, too, has moved downward. In January, 1938, the index of the National Industrial Conference Board was 87.5; in June, 1938, it was 86.7; in January this year it was 85.4; in June it was 84. In the highest months of 1937 this index stood at about 89, compared with a monthly average of 77.9 in 1932. There was almost no change in the cost-of-living index between 1923 and 1929, and it is now about 15 per cent. below the level of the 'twenties.

Yet, while the cost of living has fallen slightly since 1937, average hourly wages appear to have been maintained about the level reached during the remarkable upturn in 1936-37. The wage series compiled by the National Industrial Conference Board (for 25 industries) is the older of the two available, and shows the following annual averages:—

### AVERAGE HOURLY WAGE RATES (CENTS PER HOUR)

#### National Industrial Conference Board

|            |            |            |            |            |
|------------|------------|------------|------------|------------|
| 1929..59.0 | 1931..56.4 | 1933..49.1 | 1935..60.0 | 1937..69.3 |
| 1930..58.9 | 1932..49.8 | 1934..58.1 | 1936..61.7 | 1938..71.4 |

The National Industrial Conference Board reported average weekly earnings for 1929 as \$28.55, for 1937 as \$27.09, and for the first half of 1939 about \$26. That is, it would appear that, at the present time, industrial hourly wage rates were about 20 per cent. higher than they were a decade ago; but average weekly earnings were somewhat lower. Allowing for the fall in the cost of living, average weekly real wages are at least about equal to real wages ten years ago.

This introduces a perplexing problem. The working week in industry in 1929 was pretty well standardised at 48 hours. Legally it is now 44 hours, and will become 42 at the end of October. But many concerns have never been able to get back this high since the idleness of the depression, and others have adopted a more or less formal 40-hour (five-day) week. The average working week in 1937 was about 39 hours. The high hourly rates paid in a shorter week give a weekly money wage a little lower than in 1929 and a weekly real wage about the same as in 1929; and the worker gets some four or more hours of leisure—commonly in the form of a Saturday full or half-holiday. In addition, the practice of paid holidays has been extended.

The short week was adopted on the mathematical theory that it would employ more persons. On the evidence it can probably be stated, as categorically as any such statement can be made, that this theory has not been substantiated. The next question is whether the combination of high hourly wages and shortened week has increased costs of production. On this no categorical answer is possible. In some instances, technological innovation has fully made up for the shorter hours, enabling the individual workman or work-team to produce as much in 44 or 40 hours as previously in 48. But this has commonly required some additional investment in

equipment; and only the larger and more powerful firms have been able to do it.

This still leaves several questions open. One is whether the new technique applied to a longer week would not actually have cheapened costs and increased demand; another is whether the disparity in costs in these circumstances between the most efficient and less efficient units is not forcing a concentration of production, and driving the weaker concerns out of business—that is, increasing the number of marginal producers in a period of slack general demand.

In short, the simple facts are that we have had, first *de facto* and now *de jure*, a very short working week, coupled with high money and real wages. At the same time we have great unemployment, a persistently low and unstable level of production, and, on the average, low industrial profits.

August 21st.

## Canadian Uncertainties

[FROM OUR OTTAWA CORRESPONDENT]

MR MACKENZIE KING, Prime Minister of Canada, is still extremely nervous about the international situation and doubtful about the political complications which might confront him if war broke out in Europe while a general election was in progress in Canada. Accordingly he keeps postponing his decision about the holding of an election, and the voters are growing impatient. The business community, too, is complaining that trade is being hurt by the prolonged uncertainty. The public wishes to know where it stands.

In the economic sphere as well the outlook is far from certain. July witnessed a serious deterioration in the all-important wheat crop of Western Canada. Widespread and generous rainfalls in June seemed to have laid the foundation of a record wheat crop, but, during July, prolonged spells of severe heat, and the absence of any but trivial rainfall, produced a recurrence of drought, which, over large areas, has taken a heavy toll of the grain crops.

There is one curious feature of this year's wheat crop which has been puzzling both farmers and grain experts. What look like magnificent stands of wheat will give only very small yields because on many stalks only a few ears of grain are filled—and in many cases none at all. *The Winnipeg Free Press* reports a tract of 2 million acres in Eastern Saskatchewan which look as if they might yield 40 bushels per acre, but which in fact will be hardly worth cutting. The explanation given is that the abnormal moisture of June produced such a heavy growth of straw that, when no rainfall was forthcoming in July, the subsoil moisture reserves were drained away by the heavy stalks and never reached the ears of the grain to fill them.

Some relief from the drought came in the first week of August in the form of cooler weather and substantial rains. But, over a large area, the damage done is irreparable. As a result estimates of the Western crop, which, at the end of June, were placed as high as 500 million bushels, have now been sharply reduced; and *The Winnipeg Free Press* forecasts only 380 million bushels. This figure will admittedly be substantially above the wheat crop of 1938, and it will be about an average yield. But it is a great source of disappointment for the prairie grain-growers, who were counting on a bumper crop. The growers are guaranteed a price of 70 cents per bushel for No. 1 Northern, the highest grade, but the new crop is unfortunately not grading very well, and the average farmer, when he delivers his wheat at the elevator, may not get much more than 50 cents per bushel. And he will count that a very poor price.

Liberal politicians are afraid that their chances of saving their Western seats from the attacks of the Co-operative Commonwealth Federation and Mr Herridge's new democracy will not be improved by the serious decline in the fortunes of the Western grain crop. They are also alarmed about the activities of Mr Bracken, the Liberal-Progressive Premier of Manitoba, who, until recently their faithful and invaluable ally, now seems inclined to break away. As chairman of the Western Committee on Markets and Agricultural Rehabilitation, Mr Bracken was largely responsible for the pressure which forced the King Ministry, against its will, to raise the wheat price guarantee from 60 to 70 cents; and, some months ago, he concluded a barter deal with German interests, to which Mr Euler, the Federal Minister of Trade and Commerce, gave a very grudging acquiescence. Now he is organising a trade mission to Europe to do further barter deals—against the inclinations of the King Ministry and the likely wishes of Whitehall as well.

August 14th.

# THE BUSINESS WORLD

## Sterling Unpegged

NOT least among the measures of defence undertaken by this country during the past ten days of crisis are those intended to safeguard our financial sinews of war. Of these, three stand out as being of fundamental character. They are, in order of chronology if not of importance, the raising of Bank rate to 4 per cent. on Thursday of last week; the unpegging of sterling exchange which followed on the next day; and, over the subsequent week-end, the Treasury order requiring the registration of securities held in this country payable in certain foreign and Dominion currencies and, concurrently with this order, the virtual suspension of dealings in such securities. The increase in Bank rate breaks a record of over seven years' standing. The decision to let sterling go free in the foreign exchange markets represents the first complete withdrawal of the Exchange Equalisation Account from the foreign exchange and bullion markets since the Account was created in 1932. The compulsory listing of foreign securities is the first step to a possible mobilisation of external assets such as occurred in the last war. The importance of each decision—whether judged by its precedents or by the length of the tradition which it breaks—is self-evident.

The rise in Bank rate and the unpegging of sterling exchange must be viewed from the same angle. They both betoken a determination among our financial authorities to eschew as far as possible the methods of rigid financial and price controls at least in the preliminary stages of the national emergency. To have left Bank rate at 2 per cent. at a time when the country was plunging towards war and full employment would have called for the immediate application of strict control of all rates of interest (including equity profits), and of prices and wages, if the dangers of inflation were not to be blatantly courted. Similarly, to have kept sterling pegged in terms of dollars at the previous level of about \$4.68 would have called either for further ruinous losses of gold (£43.9 millions of gold were exported between August 24th and 31st) or complete and rigid control of the exchange markets. In each case such controls may yet have to be applied. A long war of economic attrition would certainly render them inevitable. But, pending the inescapable necessity of recourse to the economic technique of the totalitarian state, there is a sound case to be made for applying the methods of a comparatively free economic and financial system—methods which have helped us out of tight corners before now.

The exchange problem was the crux of the immediate difficulties. Sterling had already developed symptoms of overvaluation at \$4.68 to the pound before the onset of the crisis. The prospect of our re-armament borrowing alone promised an unavoidable intensification of those symptoms. Added to this, the increasing tension of the international situation was putting on our currency the added strain of a considerable exodus of capital from this country. Speculative activity against sterling was kept down to small proportions owing to the unofficial embargo on other than commercial forward operations, and the domestic export of capital was held within equally negligible limits. But there remained in London large masses of foreign-owned funds—a considerable part of them belonging to countries in the "sterling bloc"—whose departure for conversion into dollars could put a wholly undesirable strain on the remaining resources of the Exchange Equalisation Account. Those resources had to be

conserved in view of the grave emergency that has been developing. To have established a control of sterling exchange, with all its paraphernalia of blocked sterling balances and ultimately of differential rates of exchange, would have created problems which could not have been satisfactorily solved as long as our currency held its pivotal position in a system of Empire currencies. The only alternative was to let sterling go free, to desist for the time being from further official intervention, to keep intact the gold reserve held in the Exchange Account, and to let the depreciated value of sterling provide the deterrent—if one was required—to further withdrawals of capital.

The decision to choose this alternative was made on Friday of last week. Within the space of a few hours the sterling-dollar rate, which for nearly eight months had been held at \$4.68 to \$4.68½, had fallen to \$4.35. Since then the rate has fallen as low as \$4.10 and has recovered to \$4.40—all without the slightest measure of intervention from the Exchange Account. Despite these considerable fluctuations, the Tripartite Convention still holds. The code of the agreement merely requires that notice of any change of policy be given to the other members, and that notice was

FORESTALLS

but

SHELL for GO

duly given to the United States and France before the pound was unpegged. The forward market was similarly decontrolled, though subjected to an ever-increasing discriminatory scrutiny of operations by banks in the London market. The wish of the authorities that all speculative or hedging forward operations be discouraged has necessarily acquired greater weight during these critical days, and there have been times when that ban has been applied with such rigour that the forward market has virtually ceased to function. In spite of this restriction of dealings, the rates quoted in the forward market have moved against sterling, and the three months' premium on forward dollars has reached 6 cents. This widening of the forward premium can be tolerated with far greater equanimity with a 4 per cent. Bank rate than with the 2 per cent. rate, which for some months past has been persistently endangered by the yield obtainable on the dollar swap.

The fall in sterling has had its counterpart—though not a fully proportionate one—in the price of gold, which this week has risen to over £8 an ounce. The gold market has apparently been left as severely alone by the authorities as the foreign exchange market. In view of the uncertainties of the political situation and of such possibilities as cancelled sailings and an embargo on further exports of gold from this country, this abandonment of the gold market to its own devices might well have led to considerable confusion. That it has not done so says a great deal for the readiness with which the bullion market can adjust itself to abnormal conditions. There has been a considerable disbanding of gold, but every bar sold has found a buyer, though at prices which have ranged appreciably below the theoretical shipping parities to New York. Arbitrage operators, who have provided the main support of the market, have naturally allowed the risks they were running to reflect themselves in the price at which they bought, and though the price of gold this week has risen as high as 161s., it has ranged at a discount of up to about 5s. under the dollar shipping parity. Thus, provided the gold can be shipped to New York and is not called back when mid-way across the Atlantic, these arbitrage operations

should yield the profit which the risks they entail deserve.

To endeavour at this stage to assess the prospects of sterling is clearly a profitless pastime. Those prospects must in any case depend on the issue of war or peace, and then both on the range of transactions that will be allowed and on the readiness with which the authorities will be prepared to spend their reserves of gold and the foreign exchange mobilised through the holdings of foreign securities in this country. If sterling has appeared to find temporary resistance levels this week between \$4.20 and \$4.30, this should not be taken to indicate a purchasing power parity in that neighbourhood. The conditions under which the foreign exchange market has had to function during the week have been too abnormal to allow of such precise deductions. The pound may fall further, or, on the other hand, the rate may already have reached its nadir. All that can be said with complete confidence is that the Exchange Equalisation Account will not in the near future waste more of its gold in supporting the rate. And with almost equal confidence it can be said that there will be no return to the previously pegged rate of \$4.68—that level had become artificial well before the peg was withdrawn.

The fall in sterling is an international as well as a domestic problem. Its international character has already been reflected in the realignment of currencies formerly adhering to the fairly compact sterling *bloc*, of which the details will be found in a subsequent note. All that need be said of the incipient disintegration of the *bloc* is that it is unfortunate in so far as it may be the prelude to increased exchange instability, but that from the point of view of sterling it is not an unmixed evil. For some years past the British Exchange Equalisation Account had found to its cost that the adherence of certain foreign countries to the sterling *bloc* had been a factor of instability and not of strength. Many sterling *bloc* countries have panicked into and then out of sterling with the abandon of the most highly-strung speculator. Some of the hottest of London's hot money has consisted of the sterling reserves of the sterling *bloc*, and their partial disappearance will not be altogether a loss.

## The Crisis and Throgmorton Street

IN the nation-wide resistance to the "war of nerves," the Stock Exchange has played an important part this week. After several days of unrelieved tension, no trace of market confusion has to be recorded. Indeed, even on Tuesday—which might, without exaggeration, have been regarded as the eve of a second world war in a quarter of a century—security prices improved, and on Wednesday the atmosphere was positively buoyant. The absence of irretrievable political action, coupled with the existence of an extensive bear position, produced a sharp response in prices throughout the list.

Yet preparation has marched abreast with hope. The Stock Exchange Committee announced on Wednesday that, in the event of a decision to evacuate London, the "House" would immediately be closed, and the settlement of open bargains suspended "for a period which present intentions indicate may only be for a few days." The Committee's decision was taken, not for financial reasons, but rather in view of potential transport dislocation, during which members would be under no obligation to open their offices. Hence it became effective on Friday, when evacuation of children from vulnerable areas commenced. The Committee contemplates three sets of conditions after evacuation has been completed. So long as possible, the "House" will remain open. Secondly, when for the safety of members the "House" must be closed, business will be carried on as between offices. Thirdly, if business in the City becomes impossible, limited accommodation has been secured at Denham, which will

house the official departments which are necessary for business, "and may eventually provide a meeting place to serve the purpose of a market." Moreover, the Committee are considering the possibility of setting up an official department to undertake a large part of the clerical work involved in dealing under emergency conditions. It is evident, indeed, that the maximum centralisation of the machinery of dealing and transfer would be advantageous under crisis conditions, particularly as individual firms may be widely scattered. Many firms, however, have made emergency arrangements for the maintenance of contact with their clients through sub-offices, and for the safe keeping and duplication of essential records, and a central register of emergency addresses and telephone numbers has been opened by the Committee.

So much for emergency dealing organisation. The next steps concern the control of dealings themselves. Last week's issue of *The Economist* recorded the introduction of minimum prices in the gilt-edged market. This week has seen the issue of a Treasury Order, under the Defence (Finance) Regulations, which provides for the registration and restriction of transfer of certain classes of securities payable in foreign currencies. These comprise securities payable in the currency (either directly or by option) of any of the following countries:—

Argentina; Belgium; Canada; France; Holland and the Dutch East Indies; Norway; Sweden; Switzerland; and the United States.

Such securities may not be sold or charged without

Treasury permission. Secondly, they are to be registered at the Bank of England by holders within one month from August 27, 1939. The form S.1 provided for this purpose is to be completed in respect of each security and delivered (through banks or stockbrokers) to the Bank of England, and the registration certificate will be returned for attachment to the relative security. Subsequent transfers of such securities, if approved by the Bank of England, will be permissible, until further notice, to persons resident in the United Kingdom, but special application will be needed for proposed transfers to non-residents. For purposes of transfer, the original registration certificate must be returned, and the name of the new owner stated on form S.2. If no objection is raised to the proposed transfer, a new registration form, certified by the Bank of England in the name of the new owner, will be issued. Securities affected by the order will not be good delivery unless they are accompanied by a completed registration certificate. Finally, no action need be taken by non-resident owners.

Such, in brief, is the procedure for registration and transfer of so-called "foreign" securities. Actually, the classification adopted in the first instance clearly cuts across the usual definitions of foreign and domestic securities. Sterling obligations of foreign debtors are excluded; though obligations payable in foreign currencies, even if issued by British concerns, would come within the definition. These steps form an essential preliminary to plans for the mobilisation of overseas securities to finance the burden of war. Powers have in fact been taken, under the Defence (Finance) Regulations (though they have not been implemented), permitting the acquisition by the Treasury of all securities "which are likely to be marketable outside the United Kingdom," at not less than market values on the date of the making of the order. This machinery would not rule out the possibility that a scheme of lending securities to the Treasury might be introduced as in the Great War, but the fact that full powers of acquisition have already been taken suggests that outright purchase is the more probable, leaving the Treasury to deal with the securities at their discretion.

It is difficult to make any estimate of the total amount of securities in British hands as defined in the first order. Estimates made on a somewhat different basis, which were published in *The Economist* of August 12th, suggested that the total of readily mobilisable assets might be put at a provisional maximum of £1,172½ millions. But the authorities are to be commended for their prompt steps to prevent any wastage of essential assets through the unchecked sale of foreign security holdings. As we recorded three weeks ago, the first mobilisation scheme in the Great War was not in running order until the end of 1915. When it was terminated in 1919, it had handled securities to a total value of £622.6 millions. There is no reason, on what evidence is available, to suppose that a comparable total could not be achieved in case of need to-day, and much more promptly. Meanwhile, the formidable task of compiling the lists of securities affected has been proceeding this week.

To complete the story, similar figures for French overseas assets are needed. American sources put the total of French long-term investments in the United States at \$226 millions at the end of 1934, and this sum has since been increased to \$300 millions. The net capital movement to the United States from France from the end of 1934 to May this year was, however, as high as \$430 millions, of which \$312 millions consisted of short-term banking funds. The latter, being less easy to control, cannot be more than partially mobilised, but French financial resources, including gold reserves, have an important contribution to make to the mobilisation of economic strength.

Such measures towards the strengthening of external financial defence, however, have been allied with a measure of internal steadying power, in the form of minimum dealing prices in gilt-edged securities, home corporation and Dominion government issues. Both on Tuesday and Wednesday this week, however, dealings were maintained at prices appreciably better than the minimum levels. Details of selected stocks are given on page 472. It is scarcely useful, therefore, to discuss anomalies between minimum prices, which were fixed on the basis of the lower quoted

price on August 23rd, whereas Bank Rate was not raised until August 24th. Some adjustments of a one-way character occurred in this week's dealings. The rise in Conversion 4½ per cent. 1940-44 to 101½ reduced the redemption yield approximately to a 4 per cent. basis. At the same time, the long-dated and irredeemable gilt-edged leaders experienced an adjustment of yield from a 4 per cent. basis to 3½ per cent. But while adjustment of relative yields has been possible by an upward movement in prices, anomalies will return if dealing prices react (as they did on Thursday) or if minimum prices again become effective. The pegs have been inserted, but they cannot be regarded as immovable.

With the preoccupation of the crisis, however, investors have been able to give little thought to the consequences of the termination of cheap money, which was implicit in last week's Bank rate decision. In principle, it is an adverse development for gilt-edged and only of relative assistance to general equities. To labour this formal distinction would be foolish—the more so since even the events of the past week have failed to produce any startling rise in commodity prices. To this statement there is one important exception: the rise in the sterling price of gold. With sterling free to oscillate—as it did, on Monday and Tuesday, between \$4.10 and \$4.40—there can be no permanence in any gold price. After jumping from 148s. 5d. on Thursday last week to a record level of 161s. on Monday, the price dropped at Tuesday's fixing to 157s. and partially recovered to 159s. on Thursday. Such movements are not of prime importance in themselves. But they do illustrate the probability that gold has been established, if not permanently, at least for a considerable time, at a higher price.

The fact was not lost upon gold shares, but its significance was sharply diminished on Wednesday by the declaration of the South African Government of its intention to appropriate all gold premiums over 150s. per fine ounce with the avowed object of preventing speculation. Although legislation will not be introduced until 1940, the provisions will be retrospective. They are certainly drastic. The merits of the Union's taxation policy, introduced after the South African pound was devalued, are arguable, but at least it enabled the mining companies to obtain some benefits from the higher gold price by suitable modification of mining practice. The latest decision will leave the mining companies with no advantage, although the higher gold price is not due to any sovereign act of the Union. Meanwhile, the companies will be exposed to the risks of higher costs or forced to make detrimental changes in mining policy, or compelled to abandon development programmes.

If these interpretations are correct, one of the chief hedges against rising prices and domestic industrial war risks will have been removed by the Union's decision. By the fortuitous combination of control of overseas investment (which might, of course, be extended to cover gold shares), and the latest action of South Africa, therefore, the investor's potential field for war-time operations has been largely restricted to British and Dominion Government securities, home railways and home industrial shares. Control is already in being over a wide area of the investment field. There is little opportunity or incentive for major changes in investment policy. Whether this week's technical rebound and unexplained optimism are justified still remains in the balance. Thursday's reaction at least suggested doubt on that point. Whatever the outcome, the average investor has made his dispositions to cover the event of war and he will not be prepared to change them without conclusive evidence.

# Finance and Banking

**Bank Rate Adjustments.**—The money and discount markets are gradually adjusting themselves to the higher level of Bank rate. Few members of the market profess to understand or appreciate the "rationale" of last week's increase in the official rate, but that may be partly accounted for by the fact that the sudden jump in market rates has brought considerable loss to every house concerned. Such losses, however, are the inevitable accompaniment of any period of rising money rates and on balance are offset by the windfall profits that occur when rates are falling. Those profits should, of course, be placed aside in special reserves against just such an eventuality as has occurred. After three months have elapsed—assuming that there is no further increase in Bank rate—the market will have ceased to turn over its bills at a loss and some of the bitterness of the recent comments on official policy should have toned down. The open-market rate, which immediately shifted to  $3\frac{1}{2}$ – $3\frac{3}{4}$  per cent. after the higher Bank rate announcement, has this week remained approximately at this level. The tendency as the week proceeded has been for money and bill rates to ease slightly, and the movement of the latter has been helped both by the official buyer and by some of the clearing banks, which have taken November bills at  $3\frac{1}{2}$  per cent. The clearing banks have adjusted their short-loan rates to 3 per cent. for money against bills and  $3\frac{1}{4}$  per cent. for loans secured by bonds. The privileged position formerly held by Treasury One's as security for clearing bank loans no longer obtains. Similarly, the eligibility of Conversion  $4\frac{1}{2}$ 's as collateral for loans from outside lenders at privileged rates has disappeared. Under the conditions which have obtained this week the tacit assumption has been made to regard these bonds as a 1944 and not a 1940 maturity. This means that the houses which had in recent years decided to include them in the bill portfolio will probably have to re-transfer them to the investment item—a possibility which should be borne in mind when considering the next batch of discount company balance sheets.

**The Sterling Bloc.**—The decision of the British authorities to let sterling go free, and the considerable fluctuations in its value in terms of gold and the dollar which followed that decision, were bound to loosen the ties binding that already loose conglomeration of currencies known as the sterling bloc. By the end of this week it is possible to discern approximately how far the cohesion of this group has withstood the buffeting of recent events. The Empire currencies remain as firmly bound to sterling as they previously were. The Canadian dollar, of course, continues to move in rough accord with its United States namesake—but that was to be expected. The only currency in the Empire group whose behaviour might have given rise to some doubt was the South African pound, and here all doubt was removed on Wednesday by the announcement that the currency would remain pegged to sterling, an announcement which accompanied the more surprising news that the South African Government proposed to appropriate to itself any increment in the value of newly mined gold over and above 150s. per ounce. The depreciation of sterling was made the occasion for the application of a rigid control of the Australian pound and for drastic limitations of the sums that can be withdrawn for private and business remittances from the Commonwealth. These restrictions must be regarded as in the nature of precautionary measures. They are not urgently called for by the state of the London funds, which is still reassuring. Among the Scandinavian currencies, the Swedish crown was the first to break the link with sterling. All along Sweden has been the most restive member of the sterling group and has threatened resignation on more than one

occasion in the past. Finland and Norway soon followed Sweden's lead given at the end of last week. But Denmark, with her closer economic ties with Great Britain, is hesitating before taking the plunge, and the politically powerful farmers' organisations are pressing for the maintenance of the rate of Kr. 22.40 to the pound. The first three of these Scandinavian currencies have during the past few days been following a diffident course about half-way between the dollar and sterling. Japan adheres to the sterling bloc and the 1s. 2d. sterling peg with grim tenacity. The yen was in dire need of devaluation, and the depreciation of sterling gives the Japanese authorities a chance of satisfying that need without the slightest loss of face. Here is a cause for gratitude which may find its reflection in the political relations between the two countries. The most interesting of all exchange movements in the recent days of instability has been the complete correspondence between movements in sterling and French francs. After a slight appreciation of the franc from 176½ to 175½ the franc has been pegged rigidly at this figure. The franc is more definitely than ever before a member of the sterling bloc, and a most welcome member, given the weight of the gold reserve that lies behind it.

**The Clearing House Leaves London.**—The rapidity with which the higher Bank rate has become effective has been due not only to the prevailing political uncertainties but to the extreme scarcity of credit that was apparent during the first few days of the higher rate. For this tightness of money, which reached a point where the market was nearly forced to borrow at the Bank of England, two main causes are responsible. In the first place there was the additional demand for currency, shown in the expansion of the Bank of England circulation by £21,435,097 over the past week to the new high record of £529,498,805. Although part of this increase represented the precautionary building up of provincial tills by the big banks and therefore did not represent so much deduction from bank cash, enough of it found its way into public hands to have a marked effect on the bank cash position. The second and more interesting cause of the tightening of credit this week has been the removal to Stoke-on-Trent of a considerable part of the London Clearing House. The Country, Metropolitan and part of the Town clearings have this week been handled outside London and only the clearing of Town cheques paid into Town branches has remained here. The removal of this vast and intricate piece of machinery to a point 150 miles from London could hardly be expected to take place with perfect smoothness and in fact delays in clearing have occurred and persisted well beyond the interval that was anticipated. The increase of cheques in course of collection has tended to immobilise credit, and though in the aggregate this factor should have left the cash position unaffected, it has in fact played a considerable part in depriving the clearing banks of full command of the cash which the authorities—viewing the total of bankers' balances at the Bank of England—thought the banks had at their disposal. The fact that certain Colonial and Dominion banks have already evacuated to the country or the suburbs has also helped to retard the velocity of circulation of credit in the City and made for greater scarcity of funds. But as the week proceeded, the short-loan position eased considerably, and whereas up to 4 per cent. was paid for day-to-day money on the first two days of the week, balances were being offered at down to 2½ per cent. by Wednesday. Meanwhile, it is announced that the weekly figures of bank clearings will not be published for the time being, owing to the general dislocation of business.

**Irish Banks' Returns.**—The returns for the banks operating in Eire for the June quarter, published by the Currency Commission, are as shown in the following table.

|                                                                    | June, 1938     | March, 1939    | June 1939      |                |                |
|--------------------------------------------------------------------|----------------|----------------|----------------|----------------|----------------|
|                                                                    |                |                | In Eire        | Elsewhere      | Total          |
| <b>Liabilities:—</b>                                               |                |                |                |                |                |
| Capital, reserves, etc.                                            | 17,463         | 17,513         | 10,330         | 7,152          | 17,482         |
| Notes in circulation                                               | 8,975          | 8,939          | 5,147          | 4,001          | 9,148          |
| Current, deposit and other accounts                                | 162,626        | 159,084        | 114,434        | 43,429         | 157,863        |

The continued fall in deposits is an unhealthy symptom which undoubtedly reflects the difficulties of the farmers, who are still driven to depleting their savings to pay current outgoings. The fall cannot be explained by any withdrawal to invest in new issues such as occurred last year. The increase in cash reflects the desire to keep in an exceptionally liquid position in a period of grave international tension. The increase in bills is accounted for by the growing volume of Exchequer bills issued by the Irish Government. Government and other investments in Eire show substantial increases, and these items may be expected to expand still more in the future with the development of further borrowing by the State and local authorities. The shrinkage in the net sterling assets is surprising and disappointing in view of the improvement that has taken place in the balance of trade. It is to be regretted that the Currency Commission does not issue some explanatory elucidation of the tendencies disclosed by its excellent statistics.

**Insurance Preparations.**—As from Monday this week the provisions of Part II of the War Risks Insurance Act have been in operation. Traders have thus been able to register at a nominal fee, to cover stocks of goods in this country against King's Enemy risks in wartime. The principal insurance companies and Lloyd's have been authorised by the Board of Trade to receive applications for registration, and the goods of traders so registered will be held covered from the date of hostilities, subject to payment of premiums to be determined. Steps have been taken to prevent the granting of open contracts covering Pool war risks for short periods, which is contrary to the Pool understanding. Underwriters reinsuring with the war risks cargo pool have accordingly been reminded that no open contracts covering Pool war risks only should be issued for a period of less than three months. Lloyd's underwriters have decided to vest dollar premiums in an American trustee, in order to safeguard the payment of dollar claims. Further increases in non-Pool rates have been made this week by the joint committee of Lloyd's and Company underwriters, as a result of which the Mediterranean voyage additional premium has been further raised from 20s. to 40s. per cent., and Atlantic voyages, previously rated at 10s. per cent., are raised to 20s. outward and 30s. inward. Apart from the lamentable absence of a property war risks scheme, insurance preparations are in an advanced state.

**The Bank's Gold Revaluation.**—The elastic mechanism for revaluing the Bank of England's gold reserve and adjusting the note circulation, provided by the

Currency and Bank Notes Act of 1939, received its first serious test this week. The gold, which a week ago had been valued at 148s. 6d., was this week revalued at 158s. 6d. The surplus thus created amounted to £16,594,000. The authorities chose, in view of the exceptional demand for currency, to allow this surplus to swell the gold reserve of the Issue Department, thus creating an equal additional amount of notes, which were paid over to the Exchange Account in accordance with the provisions of the Act, and then were redeposited by the Account with the Bank of England. The simple result of these devious movements has been to increase the total of notes outstanding by £16,594,000, to swell Public Deposits by a like amount and to make the additional notes available for the strengthening of the reserve in the Banking department. How necessary such strengthening was is revealed by the latest Bank return, which shows the active circulation up by £21,435,000 to a new high record level. The rise in the circulation is all the more significant as there should at this time be some reflux of notes from holiday circulation and as during the past week there has been an appreciable return of Bank of England notes from Continental hoards. The reserve of unissued notes shown in the latest Bank return is £34,249,000, and had it not been for the transfer of £20,000,000 of gold from the Exchange Account to the Bank at the beginning of July and for the revaluation of the gold holding made last Wednesday, the reserve in the Banking department would have been exhausted and £2,000,000 in deficit. Public deposits, although they benefited from the gold revaluation to the extent of £16,594,000, are only £8,696,000 up on the week. This discrepancy is partly due to the effect of open-market purchases of securities made on official account. The Bank of England has also been a buyer of securities so as to neutralise the effect of the expanding circulation, and its holdings of Government securities has risen by £13,460,000 over the week. The net result of these movements is to leave bankers' deposits £1,989,000 lower at £90,143,000—a level which helps to explain the serious shortage of cash felt in the money market during the first part of the week.

Unexcelled in the North Atlantic for Speed and Reliability as well as Luxury and Service, the French Line offers you a short "Continental" holiday afloat by way of a change.

**Resolute Markets.**—It may be argued that the Stock Exchange has been deceiving itself this week, but the fact is inescapable that as the crisis has lengthened, hopes have revived, and with that revival prices have made a sharp response. Under present technical conditions, hope, however insubstantial it might be, was bound to produce that result. Trading has naturally been restricted to the

## BRITISH AND AMERICAN INDUSTRIAL SHARE VALUES DURING THE PAST TWO YEARS

(July 1, 1935 = 100)

British: *Financial News* Index of 30 Ordinary Shares.  
American: *Standard Statistics* Index of 50 Common Stocks.

minimum, and brokers' activities have been concentrated on the establishing of emergency sub-offices and the safeguarding of records. Even with imminent apprehension of war, American and British security prices are no lower, on the average, than in April and February respectively this year. Viewed against the political background, indeed, the stock market's behaviour during the past month has shown astonishing composure. The accompanying chart reveals,

indeed, that the rate of decline both in London and New York was in no way more severe than in earlier reactions this year.

The market, however, would be hard put to find positive reasons for this week's price movements, though some investors translated wishful thinking into new buying on Wednesday. The following table, which includes leading securities in all sections of the Stock Exchange list, shows the widespread extent of the gains:—

| Name of Security          | Minimum Price | Aug. 24, 1939 | Aug. 25, 1939 | Aug. 28, 1939 | Aug. 29, 1939 | Aug. 30, 1939 | Aug. 31, 1939 |

## MONEY MARKET NOTES

THE first tender for Treasury bills made under the 4 per cent. Bank rate resulted in a full allotment of the £30,000,000 on offer at an average rate of £3 14s. 5.44d. per cent. The market syndicate obtained only 4 per cent. of its applications for bills up to Wednesday of this week, but its applications were satisfied in full for other dates of the week. This meant an average allotment of about 55 per cent. The market had therefore few payments to make for bills over the first part of the week, a feature which accorded with the fact that there were no maturities on Monday or Tuesday. The banks have been small buyers of bills, taking Novembers at 3½ per cent., but their requirements were soon satisfied.

The dollar has ruled the foreign exchange market during the past week and has pulled with it every rate other than that of currencies in the sterling bloc—and even some of these. Belgas, guilders and Swiss francs have followed the trend fairly closely. So have currencies so nominally on gold as reichsmarks and lire. But in most cases the market has been almost nominal. Telephonic difficulties have placed a severe handicap on arbitrage operations, while the acceptability of "names" has also been a serious deterrent on business. Belgas have appreciated to 25.25, guilders to 8.07 and Swiss francs to 19.05. The French franc has been pegged to sterling at 175½ to 175¾.

The gold market, after being thrown

in confusion by the depreciation of sterling tended to settle down during the latter part of the week and the price has returned to within 2d. of the parity. The process of fixing has provided great difficulty owing to the vagaries of the dollar rate and the difficulty of dealing in large figures at a predetermined rate. By Thursday very little privately-held gold was coming out, and the market is likely to narrow considerably next week.

In silver, London has continued to dictate to New York, whose market price has day by day been adjusted to the London parity. After strengthening to 19½d. on Tuesday on further Indian buying, the spot quotation has fallen back to 18½d.

\* Above or below American shipping parity.  
† Price fixed on demand and supply basis. The discount shown has been calculated on the basis of the dollar rate at the moment of the fixing.

By mid-week sharp rises in gilt-edged had left minimum dealing prices as much as three points behind in some cases. But many of the improvements in equities were scarcely less spectacular. Thursday's news of evacuation of schoolchildren (with its corollary that the "House" was to close on Friday), however, introduced a note of sharp realism which checked the somewhat ingenuous recovery displayed in earlier dealings. Whether the issue be war or peace, however, the Stock Exchange and investors are well prepared. And the technical dislocation, if war comes, should be less profound than it was in 1914.

**Registration of Securities.**—The outline of the Order for registration of certain securities payable in free currencies, and the wider powers of restriction and acquisition under the Defence (Finance) Regulations, are discussed in a leading article on page 439. It remains to consider certain technical points which have arisen under the scheme. In the first place, the erroneous impression is held in some quarters that registration is voluntary. It must, of course, be emphasised that the onus lies on owners of securities payable in the currencies specified to make the return to the Bank of England within one month from August 27, 1939. In many cases that task will be undertaken by brokers and bankers, with whom owners of securities concerned in the order would be wise to co-operate. Secondly, there is no exemption of particular owners according to nationality, but only according to residence. Hence, only those owners who since the beginning of August 26, 1939, were not resident in the United Kingdom are relieved of obligation. Thirdly, securities of the classes mentioned are returnable, whether held in this country or elsewhere. Some confusion has been caused by the reported inclusion of certain bearer mining shares under the Order, and dealings were actually suspended for a time on Wednesday. But since dividends on such securities are not payable in any of the currencies specified in the first Treasury Order, their registration at this stage is clearly not called for. Again, certain lists, published unofficially, of securities supposed to come under the Order are inaccurate in certain important respects. The inclusion of "Shell" Transport bearer shares, for example, on the ground that arrangements exist for payment of coupons in foreign centres, ignores the fact that dividends are originally payable in sterling. But holders will appreciate that under the Defence (Finance) Regulations, the Treasury may prohibit dealings in any securities which in their opinion are likely to be marketable outside the United Kingdom, and since that possibility certainly attaches to mining and other shares, they may form the subject of later Orders.

**Wall Street's Doubts.**—Except on Tuesday this week, Wall Street displayed none of the confidence exhibited by London. Sensitivity to European news, however, is the more usual rôle of Wall Street, and in the past week such caution has had the more justification. Yet, as the following table shows, average prices at Thursday's close were higher than a week earlier:—

|           | Trading Volume (Shares) | Dow Jones Industrial Average |
|-----------|-------------------------|------------------------------|
| August 24 | 1,290,000               | 131.33                       |
| August 25 | 690,000                 | 133.73                       |
| August 26 | 520,000                 | 136.39                       |
| August 28 | 670,000                 | 134.66                       |
| August 29 | 480,000                 | 137.39                       |
| August 30 | 500,000                 | 136.16                       |
| August 31 | 460,000                 | 134.41                       |

In part, this achievement may be due to a better reading of domestic news. But probably the withdrawal of the threat of heavy liquidation from London, owing to this week's measures of control, has played an even greater part. With more favourable trade indications, officially underlined by the Acting Secretary of the Treasury, the Wall Street operator is fortunate in having double option, covering either war or peace.

**European Bourses and the Crisis.**—Since the crisis gathered impetus from the middle of August, foreign markets, with the notable exception of the Berlin bourse, have followed the same course, with but slight variations, as London. In Amsterdam, the news of the Russo-German pact struck a market already depressed by Dutch political difficulties, the Mendelssohn affair, and a confused political situation in Europe and the Far East. The immediate reaction was one of unsettlement, accompanied by a precautionary marking down of prices rather than heavy liquidation, the *Telegraaf* combined share index falling from 199.3 on August 18th, to 193.74 on August 22nd. The downward drift of prices called for intervention by the Bourse Committee, but the reversal of sentiment during the past week, based on hopes apparently with no more explicit foundation than those which have reinvigorated the London markets, was followed by a recovery in the *Telegraaf* index to 197.30 on August 30th. Thanks to the general confidence in France's financial strength and to an excellent technical position, the Paris bourse displayed a firm tone immediately before the Russo-German pact announcement. Rumours (obviously instigated from foreign sources) of the effect of the Mendelssohn affair on the Government's credit had very little effect on prices, but following the pact prices were considerably marked down, the *Paris-Midi* stock index falling five points on the day to 211.3. But though the index touched 205.5 on August 24th, no attempt was made by the bourse to fix minimum prices—a gesture of confidence rewarded in this week's rally which raised rentes above the lowest while the *Paris-Midi* index rebounded to 213.7, despite France's extensive defence preparations. Sentiment on the Berlin bourse has provided a marked contrast to reactions elsewhere. Prices became increasingly buoyant as the campaign against Poland grew in intensity, reflecting the markets' complete confidence in Herr Hitler's ability to find a bloodless solution. Prices, after the announcement of the pact, moved irregularly, leading steel issues losing fractionally, but the apparently improved strategic position of the Reich was soon translated into higher prices; gains over the previous weeks being more than maintained in the majority of cases; but second thoughts have brought at least an equal degree of reassurance to the democratic bourses. The usual monthly tables of price movements on the leading bourses commence on page 461.

**Bank Rate and Building Societies.**—The adjustment of money rates to a 4 per cent. bank rate has already taken place, but the effect on the long-term capital market has yet to be tested. Meanwhile investors in savings institutions may be speculating, amid graver preoccupations, on the difference which the change may make to their interests. It may be expected that building societies will act as far as possible in collaboration in deciding what changes, if any, are to be made in mortgage and deposit

rates. But no action has yet been taken, at any rate among the larger societies, and it is clear that a general adjustment of rates would be inappropriate or difficult to arrange until the immediate crisis has passed. In recent years, mortgage agreements have frequently contained a clause allowing the individual society concerned to call upon borrowers to pay additional interest during any period when bank rate exceeds  $3\frac{1}{2}$  per cent., to the extent of the actual excess. Thus some societies would at present be entitled to require the payment of an additional  $\frac{1}{2}$  per cent. from borrowers to whom the clause applies, but it is an option which is regarded as a safeguard and not as an actual formula. Hence it does not necessarily follow that the right would automatically be exercised. The question, however, is linked in the long run with that of interest rates required to maintain an adequate volume of shares and deposits, and competition with other savings institutions or control of national savings, might eventually call for a revision of building society interest rates, whether paid or received. Until it is certain whether it is peace or war, and until the future price of new capital is more clear, it would be futile to guess what these changes might mean for building societies. But minor adjustments in new mortgage rates, at least, would cause little surprise, and they may, in fact, be forced upon the societies for reasons other than the change in Bank rate.

\* \* \*

**Capital Issues in August.**—Little significance attaches to new issue business in August. Last month £3,680,000 was raised (on our "old basis"), compared with £2,654,000 in August, 1938, or £7,457,000 compared with £5,192,000 on the "new basis" of computation. Comparative figures for recent months are given below:—

(£'000's omitted) excluding conversions

The increased total, compared with July, is due to the public offer of £3,000,000 debenture stock and the introduction of £1,500,000 preference shares of Eagle Oil and Shipping Company. In view of the immense sums which must be raised for defence in the near future, last month's figures may mark the termination of the protracted lull in activity which the capital market has so far experienced this year.

## Company Notes

**Richard Thomas Accounts.**—There has been a prolonged delay in the publication of the accounts of Richard Thomas and Company for the year to March 31st. At the beginning of August, they had already been delayed a month beyond their usual time, and the changes of the board—discussed in Notes on pp. 309 and 326 of our

issue of August 12th—caused further postponement of their issue. It was generally assumed that the accounts would make unpleasant reading for shareholders. They cover a year of depression in the tinplate trade, and of acute financial stress and uncertainty for the company. The accounts are not more satisfactory than had been expected, and are also difficult to interpret, for income and capital items are inextricably intermingled in the profit and loss account. It appears that the board has been conservative in charging against profits the losses involved in the running-in of the Ebbw Vale plant. According to the combined statement for the group, the company made a profit, after providing for a loss of £337,212 on the running-in of Ebbw Vale, of £780,888, compared with £2,139,517 for the previous year. Expenses, depreciation, taxes, interest and the proportion of profits attributable to shares held outside the group total £1,046,319, of which £200,000 represents the proportion of the year's debenture interest attributable to the reconstruction of Ebbw Vale and Redbourn. If all expenses arising out of Ebbw Vale are charged against profits, the result of the year is a net loss of £265,431, compared with a net profit of £859,586 in the previous year. If, however, the Ebbw Vale running-in losses and proportion of debenture interest are charged against capital, the net profit appears to have been £271,781. Such a decline of profit on the ordinary business of the company may be compared with the fall in the profit of Grovesend Steel and Tinplate from £339,019 to £262,365. It is plain, in fact, that apart from the direct losses at Ebbw Vale, Richard Thomas fared rather worse last year than the majority of steel and tinplate concerns.

\* \* \*

Little is to be gained from detailed analysis of the profit and loss account. For the sake of the record, however, the usual table showing the consolidated figures for the past three years is appended:—

|                              | Years to March 31st |           |              |
|------------------------------|---------------------|-----------|--------------|
|                              | 1937                | 1938      | 1939         |
| Gross profit .....           | 1,717,232           | 2,139,517 | 1,118,100    |

| Loss on Ebbw Vale .....      | ...                 | ...       | Dr. 537,212† |
| Preference dividend .....    | 202,822             | 202,822   | ...          |
| Ordinary shares:—            |                     |           |              |
| Earned .....                 | 561,245             | 656,764   | ...          |
| Paid .....                   | 353,492             | 164,063   | ...          |
| Earned (%) .....             | 23.8*               | 20.0*     | ...          |
| Paid (%) .....               | 15*                 | 5*        | ...          |
| Carried forward .....        | 816,460‡            | 355,050‡  | 376,904‡     |

\* On capital of £3,125,000 in 1937 and £4,375,000 in 1938.

† Of which £337,212 running-in loss, and £200,000 attributable to proportion of Debenture interest.

‡ In 1937, £165,000 transferred to contingencies reserve, £24,587 to doubtful debts, and extraneous credit of £12,450. In 1938, £772,306 put to reserve, £130,000 to contingencies reserve, and £51,805 to miscellaneous writing-off. In 1939, £107,492 drawn from contingencies reserve and £179,973 from general reserve.

The best that shareholders can find in these accounts is that the company's ordinary business, apart from Ebbw Vale, earned sufficient to cover the preference dividend. Consequently, if in future years Ebbw Vale only earns sufficient to cover its debenture interest, and other business is maintained, a balance should result for ordinary shareholders.

\* \* \*

**Financial Position and Prospects.**—From the balance sheet important conclusions emerge. The company's liquid position has improved; the volume of unsecured bank loans has been substantially reduced; and it is clear that the sums advanced last year by the banks

will cover all capital requirements very adequately. The following table shows the movements in some of the more important items:—

|                                            | BALANCE SHEET ITEMS AS AT MARCH 31 |        |                 |
|--------------------------------------------|------------------------------------|--------|-----------------|

| Old Debentures .....                       | 7,823                              | 7,813  | - 10            |
| Prior Lien Debentures .....                | ...                                | 3,479  | + 3,479         |
| Share capital .....                        | 7,426                              | 7,926  | + 500           |
| Reserves .....                             | 1,808                              | 1,369  | - 439           |

The most important point is the fact that, at March 31st last, the company had taken up only £3,479,000 of the new prior lien stock, of which it is entitled to take up £5,500,000. The accountants state that a further £526,000 is required to complete Ebbw Vale and Redbourn, making a total amount of £4,005,000, together with any additional working capital which may be required. Last year's estimates of the extra capital needed to complete the project thus appear to have been too high; the final cost of Ebbw Vale and Redbourn will apparently be £10,805,000 (these assets are shown above after deduction of £50,000 depreciation) compared with last year's estimate of £11,128,000. Since the money required for running-in Ebbw Vale has been provided out of profits, it seems that last year's estimates of the company's financial needs were at least £1,000,000 too high. For shareholders, this conclusion is encouraging, for the gap between earnings and ordinary dividends should be rather lower than had been expected. On the assumption that £4,500,000 of prior lien debentures will ultimately be taken up, preference share earnings would begin when profits total £1,400,000, and the  $6\frac{1}{2}$  per cent. non-cumulative dividend would be covered by profits amounting to £1,600,000. If profits reached £2,500,000—Sir William Firth's original estimate for a year of full operations at Ebbw Vale—earnings on the ordinary shares would represent 14.5 per cent. In the current year, demand is reasonably good, and for sheets very good. By all accounts, the new plant appears to be justifying itself technically. Hence, unless the board decides to repay prior lien stock very rapidly, the preference dividend should be covered comfortably. But prospects for the ordinary shares in the near future depend firstly upon the financial policy inspired by the Control Committee—which may be expected to be very conservative—and upon the extent to which the joint supervision of the Bank of England and the Iron and Steel Federation leaves the new plant to be exploited with the energy and imagination which it deserves.

\* \* \*

**Staveley and Sheepbridge Results.**—The preliminary results of Staveley and Sheepbridge Coal and Iron companies for the year to June 30, 1939, are reasonably satisfactory, considered against the background of general industrial profits. Both companies show a decline in net profit, but it is not of serious extent. Staveley Coal and Iron announce a net profit for 1938-39 of £461,291 against £498,568, the balance being apparently struck before further depreciation of workmen's houses and after directors' fees. In consequence of this  $7\frac{1}{2}$  per cent. decline, the tax-free dividend is reduced from 11 per cent. to 10 per cent. For Sheepbridge Coal and Iron the reduction in net profits represents no more than  $2\frac{1}{2}$  per cent. from £245,778 to £239,404, and the  $12\frac{1}{2}$  per cent. tax-free dividend is repeated. Thus for the second year in succession there is unexpected diversity in the experience of the two companies, that of Sheepbridge being the more favourable. The latter company's issue of shares last May to finance the Babbington Coal acquisition can scarcely have made much difference to the 1938-39 results, though this point

cannot be decided in advance of publication of the Sheepbridge accounts. Both Staveley and Sheepbridge have iron as well as coal interests, and Staveley also manufacture chemicals. The Staveley position is somewhat puzzling, and the report and meeting must be awaited before it is clarified. Total profits of £723,725 in 1937-38 included a profit of £93,000 on the sale of the Markham and Company interest. This exceptional profit puts the 1938-39 figure in a better light, and doubtless the increase in defence construction requirements since the reduction of the interim dividend last March has assisted the latest results. At current prices of 40s. and 42s. Staveley and Sheepbridge £1 ordinary units yield £7 18s. and £8 11s. per cent. gross respectively.

\* \* \*

**Triplex Report.**—The full Triplex report shows that the 1938-39 results are considerably better than the preliminary statement of net profits had suggested. Total income of £203,594 is 8 per cent. higher than for 1937-38, and though this figure is some way below the 1936-37 peak it is a satisfactory result in view of the decline in private car sales and the loss of the Austin contract which affected part of the year. On the other hand, production for aircraft has been increasing, and the company is doing other work for the arms programme. It is not disclosed whether any profits from Lancegaye Safety Glass are included in the Triplex figures, though the Triplex dividend for the full year is payable on the new shares issued in connection with the Lancegaye acquisition. The course of profits in the past three years is shown in the following table:—

|                       | Years to June 30 |         |         |
|-----------------------|------------------|---------|---------|
|                       | 1937             | 1938    | 1939    |
| Trading profit .....  | 250,820          | 167,789 | 192,604 |
| Total income .....    | 262,590          | 189,129 | 203,594 |
| Fees, etc. ....       | 23,302           | 20,921  | 19,968  |
| Depreciation .....    | 26,001           | 15,618  | 33,605† |
| Taxation .....        | 75,500           | 40,000  | 58,000  |
| Ordinary stock:—      |                  |         |         |
| Earned .....          | 137,787          | 112,590 | 92,021  |
| Paid .....            | 131,250          | 90,625  | 93,833  |
| Earned (%)‡           | 36.7             | 31.1    | 19.6    |
| Paid (%)              | 35               | 25      | 20§     |
| Carried forward ..... | 12,343           | 34,308  | 32,496  |

† Including £10,000 investment depreciation reserve.

‡ Earned rate before charging Employees Profit Sharing Fund, 1937, 42.6 per cent.; 1938, 34.9 per cent.; 1939, 22.5 per cent.

§ Paid on £654,254 of stock.

Earnings for the equity are £20,569 lower than for 1937-38 despite the higher total income owing, in equal measure, to increased taxation provision and to higher depreciation (including a special allocation of £10,000 for depreciation of investments). Miscellaneous expenses have changed little, for the special bonus to directors voted in respect of 1936-37 has been replaced by £5,000 for A.R.P. In the balance sheet, the principal change is a new item of £145,560 representing the cost of the Lancegaye acquisition. Both sundry debtors and creditors show a large relative increase, while stocks have risen from £68,000 to £112,768. The board have relieved the usual aridity of company reports by supplying a commentary, illustrated by cartoons, which describes the company's activities. From this new feature shareholders may learn that Triplex sales last year amounted to £850,000, of which the cost of materials absorbs 50 per cent., wages and salaries 20 per cent., overheads  $6\frac{1}{2}$  per cent., local and other taxation  $7\frac{1}{2}$  per cent., and power and light, etc., and depreciation 5 per cent., leaving 11 per cent. for profit. At the present price of 32s. 6d., Triplex 10s. units yield £6 3s. per cent.

**Debenham's Profits.**—The past year has been a notoriously difficult period for the high-class retail trade. In these circumstances, the reduction in Debenham's profits for the year to July 31, 1939, from £701,154 to £672,227 after taxation and N.D.C. must be regarded as satisfactory. Debenture interest and other charges absorb £144,856, compared with £146,042 last year, leaving net profits of £527,371, against £555,112. That the fall has not been greater may possibly be due to the company's dividends from provincial subsidiaries partially offsetting the disappointing trading results in the West End. The directors recommend a dividend of 20½ per cent. on the ordinary shares, as in the two previous years. But the lower trading profits and the gearing effect of debenture service and preference dividends (the latter again require £379,000) have lowered ordinary earnings from 40.7 per cent. to 33.0 per cent. With the provision of £50,000 to reserve, as last year, the fund will stand at £410,016, but the carry forward is slightly reduced from £251,703 to £245,907. The uneven experience of the subsidiary companies last year is reflected in the results of Harvey Nichols and Company, whose preliminary net profits figure for the year to July 31st shows a decline from £87,975 to £51,683, while the ordinary dividend is cut from 7 to 2 per cent. This fall is principally due, however, to poor results in the carpets and furnishings department and to a fall in rents from leasehold properties in London. The beneficial effect of the defence programme on provincial retail trade may assist the parent company's income in the current year, but the prospects of the London retail trade and the group's manufacturing business are more obscure. On these points the directors' report may shed some light.

**Allied Industrial Services Progress.**—The success of Allied Industrial Services in a field in which Initial Services has itself derived great advantage, is well illustrated by the latest accounts, and its impressive record since incorporation in 1934. For the year to June 30, 1939, profits, after depreciation, amounted to £205,609, com-

pared with £160,846 for 1937-38, an increase of 28 per cent. After provision for fees, taxation and preference dividends, a balance of £152,696 is available for the ordinary shares, compared with £112,901 for the preceding year. The ordinary capital was increased by the 87½ per cent. bonus issue distributed in December last year, from £100,000 to £187,500; hence the dividend of 50 per cent. recommended by the directors absorbs considerably more than the 70 per cent. distribution of the previous year, while earnings represent 93.3 per cent. against 129.2 per cent. General reserve receives £50,000 and £10,457 is carried forward. The balance sheet reflects the recent bonus distribution and the extensions of equipment briefly referred to in the directors' report. The share premium account has disappeared and the general reserve contains only the £50,000 allocated from this year's profit and loss accounts. Fixed assets have increased from £180,541 to £197,817, while goodwill remains unchanged at £56,000. That further extensions to the business may be in view is suggested by the increase in cash holdings from £102,039 to £171,261. Although the recent rate of expansion has set a hot pace which may not always be maintained, the prospects of the company, which is dependent for its expansion on increasing factory capacity and employment, are encouraging under normal conditions. The 5s. ordinary shares stand at 44s. 4½d. to yield £5 12s. 9d. per cent.

**The Week's Company Profits.**—Our usual analysis of profit and loss accounts appearing on page 474 includes 13 companies for which comparable figures are available. Net profits of these companies are £1,166,000 against £1,862,000, a decline of 37½ per cent. But this drop is due mainly to the Richard Thomas results, and there are several instances of higher profits. Aggregate net profits of 1,713 companies reporting in 1939 to date are £217,303,000, or 8 per cent. less than £235,905,000 earned by the same companies a year ago. The week's results are discussed in preceding Notes and on page 462 under the heading "Shorter Comments."

## THE STOCK EXCHANGES

### London

SETTLING DAYS  
TICKET ACCOUNT  
SEPTEMBER 5 SEPTEMBER 7

A WEEK ago the stock markets were brought almost to a standstill under the shock of crisis measures and through the desire to wait events. Although the future is practically as obscure now as it was then, the markets have recovered a little of their lost activity. Movements have been inconsistent and governed by momentary changes in sentiment, but the trend of the week has been towards revival, and it is significant that prices of gilt-edged stocks have ruled above the minimum prices which a week ago

were considered if anything too high. The decision on Thursday to close the Stock Exchange during the working of the official evacuation scheme, however, checked the mid-week optimism without bringing any major reversal of trend.

Fortified by an uneventful week-end, the gilt-edged market began on Monday in a normal frame of mind. Prices were above the minima, and though there was some selling, offerings were well absorbed, and the wide margins previously prevailing were narrowed. In the absence of further shocks, prices on Tuesday gained moderately on bear-covering and on public buying, the undated stocks in particular being responsive. This movement gathered pace to-

wards mid-week, so that Wednesday's dealing might almost be considered normal, though the redeemable stocks did not rise far above their minimum prices. The decision to close the Stock Exchange on Friday, however, had a sobering effect. Home corporation and Dominion stocks followed the general trend, India stocks showing good gains. Dealings in certain foreign bonds were, of course, affected by the Treasury order restricting operations in foreign securities. European bonds, however, took part in the mid-week revival, though the tone was more uncertain on Thursday. The main feature of the foreign bond section was a sharp rise in Japanese issues, with some recovery in Chinese loans also.

**Home rails,** especially the preference stocks, tended at first to advance on the better labour outlook and on hopes of revenue from emergency travelling, but there was no further advance as the week ended. Ordinary stocks were comparatively sluggish. London Transport "A" stock hardened. Argentine rail prices tended to improve, though there was not much business passing. Apart from their greater buoyancy, the trend in *industrials* was similar to gilt-edged stocks. Business was on a small scale on Monday, though there were several instances of improvement among leading equities. Later on there was a general recovery which was in marked contrast with the depressed conditions of, say, last Thursday week. But a tendency to take profits developed, and on

Thursday prices on the whole were a little weaker. At first, as a result of the Treasury order, dealings in American issues were suspended, though as time went on nominal prices were quoted for securities subject to the new registration rules. Iron and steel shares advanced on Tuesday and Wednesday, though there were slight declines as the week started. Engineering issues were rather more subdued than the "heavies," but responded to the better mid-week sentiment. The trend among coal shares was upwards, while electrical equipment issues went ahead after an uncertain start. Motor shares advanced sharply on Tuesday, though aircraft issues changed very little. The slight movements that occurred, however, were mostly upward. Textile shares were inactive and varied, but there was good support for rayon issues. Tobacco shares rose strongly almost from the outset, though there was some profit-taking in mid-week. Breweries began in irregular fashion and then advanced. Provision and catering issues tended to improve, while stores made a mixed showing. The miscellaneous section followed the general trend, the leaders being somewhat sensitive to mid-week profit-taking. Shipping issues were steady or a shade firmer.

After the week-end, dealings in *oil shares* were possible by negotiation and prices remained firm. On Tuesday, "Shell" received local support, but arbitrage business was at a standstill, while on Wednesday the Treasury order restricting dealings adversely affected Canadian Eagles and Royal Dutch. The easier tone generally on Thursday caused a fractional marking down of leading issues. The calm sentiment in the *rubber* market was assisted by the improved commodity price and a small demand for shares resulted in a sharp appreciation of prices. *Tea* shares followed the general trend.

In the *mining* market, Kaffirs spurred on Monday following the depreciation of sterling, though price movements rather exaggerated the demand for shares. The advance was halted on Wednesday by news of the South African Government's intended policy to check gold speculation, a duller tone developing on Thursday. Developing issues, after advancing on Monday, became listless in later trading, but took on a firmer appearance later in the week, led by Western Holdings, which spurred following the latest cable. Finance shares were active after the week-end, led by Central Mining, and later continued to follow the trend of producing mines. West Africans have been buoyant for the first part of the week, with profit-taking well absorbed, but an easier tone developed on Thursday. Base metals have been more active

this week. Rhodesian coppers advanced on Monday, while tin and lead-zinc issues have shown modest gains on balance.

### ACTUARIES' INVESTMENT INDEX

Last month's Actuaries' Index brings out the effect of the acceleration of the crisis in the last two weeks of August, both on fixed-interest securities and on ordinary shares. Since the end of July the index of 2½ per cent. Consols lost over four points, while more substantial falls were registered in industrial debenture and preference issues. The slight improvement in equities recorded in July has been completely lost, prices moving generally, but unevenly, downwards. On Tuesday, August 29, 1939, the index of 160 industrial shares prices stood at 57.9, compared with 61.4 a month earlier and 63.5 a year earlier. The corresponding average yields were 5.96, 5.64 and 5.97 per cent. The selection of component indices given below includes the usual monthly particulars of fixed interest securities:—

| Group<br>(and No. of securities) | Prices<br>(Dec. 31, 1928 = 100) |               |               |

### New York

THE trend on Wall Street this week has been on the whole indecisive, though the international situation continues to take precedence over domestic conditions. After the week-end prices moved irregularly, though in the late trading on Monday steels led a rally supported by copper and rubber shares. Traders, however, preferred to avoid the leading issues until the effect on Wall Street of the British Treasury's restriction on dealings in foreign securities becomes clearer. The market maintained its waiting attitude until news of the unfavourable German reactions to the Polish mobilisation came through, when steel issues led a movement to easier levels. Copper and oil shares, however, remained firm, and the bond market maintained its firm tone. *Iron Age* reports steel mill activity at 63.5 per cent. of capacity compared with 63 per cent. last week.

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values calculated on closing prices (1926 = 100).

## Canada

THE normal dullness of the holiday season has been aggravated by the continuing gravity of the international situation, and pessimistic cables from Europe sufficed to bring prices down, even early in August. Little investment buying of equity stocks was reported since investors are remaining faithful to good bonds, and the speculative public is keeping out of the market. Textile stocks have improved slightly following reports of greater activity, but prairie stocks have reacted on unfavourable news of the Western grain crop. Indeed, before the announcement of the Russo-German pact the tendency in all sections was downward. Reactions to the pact were neither as immediate nor as violent as in European markets, though stocks in companies liable to Government control in time of war were particularly affected. Last-minute efforts for a peaceful settlement were well received, and most prices made good the losses since August 22nd.

\* Free of income tax. (c) Per 25 Units. (a) Paid on larger capital. (d) Free of Indian income tax.

**BARROW BARNESLEY MAIN COLLIERIES.**—Final dividend on ordinary shares, 3 per cent. tax free, making 6 per cent. tax free for year to June 30, 1939, against 10 per cent. tax free.

**BOOTS PURE DRUG.**—Quarterly interim dividend maintained at 6 per cent.

**A. W. GAMAGE.**—Interim ordinary dividend maintained at 2½ per cent.

**INDIAN IRON AND STEEL.**—Ordinary dividend 15 per cent. free of Indian income tax, for year to March 31, 1939, against 35 per cent. for preceding year.

**NORTH-EASTERN ELECTRIC SUPPLY.**—Interim ordinary dividend maintained at 2½ per cent.

**RANSOMES AND RAPIER.**—Interim dividend on ordinary shares, 2½ per cent. tax free as before.

**TAYLOR WALKER AND COMPANY.**—Interim ordinary dividend unchanged at 4 per cent.

## SHORTER COMMENTS

**Company Results of the Week.**—A decline in the GOLDSBROUGH MORT net profits from £153,343 to £120,227 is due to the lower level of wool prices and also to drought conditions. Wool price movements, however, were more limited than in 1937-38, and the volume of wool handled increased. Satisfactory results are recorded by heavy

industrial concerns. **LOCHGELLY IRON AND COAL** are paying 12½ against 10 per cent., and report that despite idle conditions in the earlier part of the year, demand improved and has recently caused pressure for supplies. **BRIGHTSIDE FOUNDRY AND ENGINEERING** total profits have risen sharply from £118,667 to £185,160. No comment, however, is offered on the results in the report. Progress has also been made by **KETTON PORTLAND CEMENT**, whose net profits amount to £73,732, against £60,203. Plant has been increased by a third unit which came into production at the end of March. Unlike the majority of investment trusts, **SECOND ALLIANCE TRUST** report some increase in revenue. This is apparently due, however, to income from new money invested after the December, 1937, capital issue.

## EMERGENCY ADDRESSES

**Alliance Assurance Company.**—Head office (except Life department), and the St. James's, Strand, Wigmore Street and Fenchurch Street branches now at Kidbrooke Park, Forest Row, East Grinstead. Life office, Volvens, Ockley, Surrey.

**Anglo-French Banking Corporation.**—Offices will be transferred to West Witheridge, Knotty Green, Beaconsfield.

**Bank of Australasia, English Scottish and Australian Bank, Union Bank of Australia.**—Business of London offices now at Sandroyd School, Sandy Lane, Cobham, Surrey. Telephone Nos. 2901-2928 (28 lines). Nearest station, Oxshott (Southern Railway).

**Bank of London and South America.**—Registered office now at Lloyds Bank, Dunstable.

**British-American Tobacco Company.**—Head office staff is at Rusham House, Whitehall Lane, Egham, Surrey. (Telephone Egham 744.) Skeleton staff at Westminster House, 7 Millbank, S.W.1; registered office at Rusham House, but at present correspondence to be addressed to Millbank.

**British South Africa Company.**—British South Africa Company, Rhodesia Railways, Beira Railway Company, Rhodesia Railways Trust, and Victoria Falls and Transvaal Power Company, now operating from 23 Sutherland Avenue, Bexhill, Sussex.

**Charterhouse Investment Trust.**—This company, Charterhouse Finance Corporation and Charterhouse Industrial Development Company, will, in the event of war, have alternative offices at 71 High Street, Tunbridge Wells, Kent. Telephone Tunbridge Wells 2 and 386. Meanwhile, registered offices remain open.

**Commercial Bank of Australia.**—Business of London office is being conducted from: c/o Bryce, White and Company, Ltd., Deseronto Wharf, Langley, near Slough, Bucks. (Tele.: Langley 232.)

**Commercial Bank of the Near East.**—Business being transferred to 4 Regent Street, Teignmouth, S. Devon.

**Council of Foreign Bondholders.**—Business will, until further notice, be conducted at Horsgate, Cuckfield, Sussex. (Telephone Cuckfield 105.)

**Imperial Smelting Corporation, Zinc Corporation and New Broken Hill Cons.**—Registered offices at present remaining at 95 Gresham Street, E.C.2. In the event of war secretarial offices will be transferred to Sandroyd, Sandy Lane, Cobham. (Tel.: Cobham 2901-2928.)

**Lloyds Bank.**—The registered office is now at Salisbury.

**National Bank of New Zealand.**—Now at Bramley Croft, Hindhead, Surrey.

**Netherlands Bank of South Africa.**—Services being maintained at 201 Salisbury House, Finsbury Circus. Evacuation address will be Manor Dene, Manor Road, Thames Ditton, Surrey. (Telephone Emberbrook 1131.)

**Provincial Bank of Ireland.**—Business of London office now at Burghdown, Burgh Heath Road, Epsom, Surrey.

(Continued on page 463)

## Industry and Trade

**Industry and the Crisis.**—The emergency orders issued last Monday provide for the control of industry, agriculture, foreign trade and communications. Except in the case of shipping, control has not yet been actually assumed by the Government. But the transition of industry from peace to war-time organisation is proceeding swiftly and in orderly fashion. There is little of the confusion and haphazardness of 25 years ago; most important industries had already made detailed plans, and it only remains to bring them into operation. The crisis has naturally led to a severe shrinkage in ordinary commercial business, both at home and on the export markets. On the other hand, defence work has been speeded up and A.R.P. preparations are being rapidly pushed ahead. The sudden slump in the demand for some commodities and the increase in others required for defence has, of course, caused some dislocation; and there have been signs that the spurt in orders has led to a marking-up of prices. As the Government has rightly taken powers to control prices, steps should at once be taken to prevent any unjustified increases. While the industries ministering mainly to the ordinary needs of consumers at home and abroad have suffered a setback, operations in others engaged in the production of armaments and A.R.P. materials are being rapidly speeded up. Most branches of the iron and steel and metal-using industries are now working virtually at capacity. The engineering industry, in particular, is hard pressed, but pressure should be relieved as a result of the Amalgamated Engineering Union's consent to dilution, announced on Thursday.

**Rise in Commodity Prices.**—It is not easy to disentangle the effect of the various factors influencing the prices of primary products since the sudden increase in political tension at the beginning of last week. Until then the general level of prices had remained fairly stable, both in this country and in the United States, for the gradual upward movement in the prices of a number of industrial raw materials had been offset by the decline in those of wheat, raw sugar and other agricultural products. Reference to Reuter's and Moody's daily indices of the prices of sensitive commodities in this country and in the United States reveals the general trend:—

|           | U.K. Reuter's Index (Sept. 18, 1931=100) | U.S.A. Moody's Index (Dec. 31, 1931=100) |

Moody's index for the United States rose, but only slightly, between Monday and Thursday last week, but subsequently fell back to its starting point. Reuter's index also rose between August 21st and 24th, but the rise was more marked than in the United States. While the general upward movement was probably due to a slight increase in the demand for certain materials, the relatively bigger advance in this country may be ascribed to the increase in

insurance rates and to the risk of a temporary dislocation of shipping in war. But whereas American prices began to fall on August 25th, prices in this country continued to advance until August 28th; this divergence of price movements in the two countries can be ascribed chiefly to the unpegging of the pound and its sudden depreciation in terms of the dollar on August 25th. On August 29th, however, Reuter's index also took a downward turn which persisted on the following day and was probably caused by the growing belief on Tuesday and Wednesday that war would be avoided. On Wednesday, Reuter's index was 3 per cent. above the level of August 21st. Since Moody's index for the United States was unchanged on these two dates, the rise in British quotations must have been due partly to the rise in freight rates, but chiefly to the fall in the exchange value of the pound. The period since the depreciation of the pound, however, has been much too short to enable its full implications to be assessed. Judging by previous movements, commodity prices in this country are unlikely to advance in proportion to the fall in the exchange value of the pound, while they may actually decline in the United States, for a substantial proportion of the supply of primary products is derived from the sterling area. But fluctuations in the exchange value of the pound are only one of the factors affecting the prices of primary products. In so far as the recent advance in British prices was due to this factor, it does not necessarily signify a change in the long-term trend.

**Home-Grown Food.**—In view of the necessity of maintaining the supplies of food in this country, the estimates made by the Ministry of Agriculture of the size of the current harvest of important crops are of considerable interest:—

| CROP PRODUCTION IN GREAT BRITAIN (Million tons; excluding N. Ireland) |                           |      |                       |
|-----------------------------------------------------------------------|---------------------------|------|-----------------------|
|                                                                       | Estimated Production 1938 | 1939 | Total Supply 1937-38† |
| Wheat                                                                 | 2.0                       | 1.6  | 6.8                   |
| Potatoes                                                              | 4.4                       | 3.9  | 4.9                   |
| Sugar*                                                                | 0.3                       | 0.5  | 2.3                   |

| Oats                                                                  | 1.7                       | 1.7  | 1.8                   |

† Production plus net imports, from the *Agricultural Register*.  
\* Raw value, from Bulletin of the International Sugar Council

While the yield of cereals and of potatoes is not expected to equal the exceptionally high level of 1938, normal harvests of these products seem likely, which will provide for nearly the total consumption of oats and potatoes; unless the weather is again unfavourable, the yield of sugar from beet will exceed that of last year and may supply a quarter to a fifth of the peace-time consumption. The most serious deficiency is the hay harvest, which has been exceptionally poor in both the last two years. Combined with the shrinkage in the acreage of roots, this low yield of hay, for the second year in succession, may, if imports of feeding-stuffs are limited, affect the production of milk and meat during the winter and spring.

**The Commodity Markets in War.**—The controlling authorities of many of the commodity markets have this week made arrangements for carrying on the normal trade of the country in the event of war. In most cases, small emergency committees have been appointed which

(Continued from page 462)

**Queensland National Bank.**—Business of London branch now at 8 St. Mary's Street, Ross-on-Wye.  
**Rio Claro Investment Trust.**—Operating from 61 Banstead Road South, Sutton, Surrey, as from August 30.  
**Swiss Bank Corporation.**—In case of the outbreak of hostilities, most of the

Bank's services will be transferred to West Hall, Byfleet.

**Westminster Bank, Ltd.**—Chief office of trustee department has moved to 8a Christchurch Road, Bournemouth, to which all correspondence should be sent.

**Mercantile Bank of India** will conduct business from its London office until

obliged to evacuate; then at Courtlands, 82 Hurst Road, East Molesey, Surrey.

**Antony Gibbs and Sons** will, in the event of war, conduct business from Briggens, Ware, Herts. (Telephone Roydon 2107; telegrams, Gibbs Roydon; station, Roydon, L.N.E.R.). A skeleton staff will be at the present offices.

(Continued on page 471)

will take over the functions of the full managing committee on the outbreak of war. Trading is likely to be interrupted for a short period, and it is probable also that open contracts will be prolonged until the resumption of trading, while some markets may, as in 1914, allow settlements at prices fixed on the last quotation before the outbreak of war. The London Metal Exchange has announced that, if trading cannot be continued in London, it will be moved to Harrow. Trading at Spitalfields Market will, in the event of war, be restricted to the hours of 6 a.m. to 1 p.m. Owing to the evacuation of London, most commodity markets decided to close on Friday and Saturday. Arrangements have been made for the grouping of many retail shops and the pooling of their transport, according to the type of trade and locality, so that in the event of one shop being disabled or temporarily unable to obtain supplies, its trade can be continued in an orderly fashion.

**Redundant Cotton Looms.**—As expected, the nineteen district associations of the Cotton Spinners' and Manufacturers' Association have approved the scheme for the elimination of 60,000 looms which are considered redundant, at a cost of £700,000. It is understood that the levy on employers to carry out the proposals will be 4s. per loom per annum. In view of the European political situation, no immediate action in this connection is probable, but it is expected that the scheme will be dealt with under the Cotton Industry (Reorganisation) Act, 1939, copies of which have been available this week. The original Bill, of course, has been amended, but the general principle of this legislation has been maintained; the chief object of the Act is to provide for the elimination of redundant machinery and the establishment of minimum prices. The Bill received the Royal Assent on August 4th, and the Act will come into operation in three months from that day or on such earlier date as the Board of Trade may appoint. After two months from this date, no person will be allowed to carry on business in the industry unless he is registered in the General Register.

**Retail Trade in July.**—The course of retail trade in July was influenced both by the holiday season and by the incidence of the half-yearly sales. Comparisons between June and July are therefore invalid but the figures published in this week's *Board of Trade Journal* show that, in the stores reporting to the Bank of England, the value of daily retail sales in July was 1.2 per cent. higher than in July, 1938; this increase is somewhat smaller than that shown in previous months:—

INDICES OF DAILY VALUE OF RETAIL TRADE IN GREAT BRITAIN  
(Average Daily Sales in 1937=100)

|                   | Total | Food | Non-Food |         |           |
|-------------------|-------|------|----------|---------|-----------|
|                   |       |      | Total    | Apparel | Household |
| 1938 June .....   | 106   | 107  | 105      | 116     | 90        |
| July .....        | 105   | 102  | 109      | 114     | 113       |
| 1939 February ... | 91    | 103  | 79       | 73      | 78        |
| March .....       | 96    | 105  | 86       | 83      | 86        |
| April .....       | 108   | 113  | 103      | 108     | 93        |
| May .....         | 111   | 112  | 109      | 123     | 93        |
| June .....        | 103   | 105  | 109      | 111     | 88        |
| July .....        | 107   | 106  | 107      | 111     | 112       |

The improvement compared with a year ago was mainly due to larger purchases of foods, sales of other commodities falling a little below the level of July, 1938. As in previous months, the values of sales in Central and West End London showed a decline, while in all other districts there

was an expansion compared with July, 1938. During the current month there have been, of course, considerable purchases of tinned foods and other requirements for defence purposes, and trade in other commodities has suffered accordingly. But stocks of food and perishables, according to the *Board of Trade Journal*, were 13.5 per cent. higher at the end of July than a year ago and are ample to meet the emergency; the regulations against food hoarding issued on Thursday evening provide a further safeguard against the occurrence of local shortages.

**Output of Textile Trades.**—The provisional results of the limited census of production taken in respect of 1937 under the Import Duties Act are now being published, and last week's *Board of Trade Journal* contained a summary for the textile industries, shown in the accompanying table. The results of the 1935 census have been added for comparison. The gross output represents the value of the goods made and of the work done, and the net output has been calculated by deducting from the gross output the cost of materials, of fuel and electricity, and of the amount paid for work given out. As the trend of general business activity was upwards between 1935 and 1937, the expansion in the value of the output of textiles was to be expected. The extent of the expansion, however, was far from uniform, and the net output of the jute and lace

TEXTILE TRADES—GENERAL SUMMARY

\* Excluding Excise duty estimated at £2,091,000 in 1935 and £2,168,000 in 1937.

trades actually showed a decline. The most striking feature of the returns is the marked increase in the value of the output per employee in the majority of textile industries. On the average the output per head increased by nearly 9 per cent.; it showed an increase of no less than 30 per cent. in cotton spinning and doubling and one of 15 per cent. in weaving. The wool textile, jute, rope and twine and net and roofing felts trades, exceptionally, recorded a decline. To some extent the growth in the output per head may have been due to the fuller utilisation of machinery and to the rise in prices; but even if allowance is made for these factors, the increase in productivity within the short space of two years is remarkable.

## INDUSTRIAL REPORTS

THE reports from industrial centres which follow are naturally coloured by the impact of the political crisis. There has been a marked reluctance of home traders to place new orders, though a spurt has been noticeable in the demand for commodities required for protection against air raids. Export business has seriously declined in most industries, though here again urgent instructions have been given for the delivery of certain goods. The closing of the Mediterranean and the Baltic to British shipping has affected the trade with many countries. But while there has been a dislocation of civil business, defence work, especially on A.R.P., has been speeded up.

### Coal

**Sheffield.**—On the eve of the increase in prices for household coal there was a sharp spurt in demand for stocking purposes. Steam coal is in good demand for home industrial needs and for the railways. Gas coal is in better request, and there is activity in coking smalls. Coke is a steadily improving market, particularly blast-furnace qualities. On inland account South Yorkshire and Derbyshire hards are quoted 18s.-19s. per ton at pits.

The export market has a more satisfactory appearance, business in Yorkshire and Derbyshire seams being a good feature. New business in the former includes 10,000 tons for the Finnish State railways. There is a fair demand for coke, but bunkers are not much inquired for. Prices are unchanged.

**Newcastle - on - Tyne.**—With the stoppage of trade to various destinations the coal export business of the North-East is at a standstill. Home trade is, of course, good, but those collieries who rely upon trade to Germany and Italy are at the moment facing an embarrassing position, and there is every likelihood of a substantial curtailment of production until the outlook becomes more clearly defined. Surplus patent oven coke intended for the export market is being rapidly taken up by home consumers.

**Glasgow.**—The market this week has been dominated by the international crisis. The major effect has been a marked contraction in export trade. Shipments to the Baltic and Germany are at a standstill and the Mediterranean routes are closed. These developments have led to some congestion at several of the loading ports, but apart from this the market continues to operate freely, with the sales committees exercising rigid control over prices. They have, in fact, shown scarcely any alteration during the week. Active conditions continue to rule in the home market.

**Cardiff.**—The international political crisis has dislocated business at the South Wales ports, and in the foreign and coastwise trades the volume of shipment is less than it has been at any time since the spring. British ships have been prohibited from sailing ex-

cept under directions from the local Admiralty Routing Officer, and at the request of the Government shipping information is restricted. There has been a contraction of approximately between 10 per cent. and 15 per cent. in the loadings compared with those before the August holidays, and there has been hardly any pressure of new prompt business either for cargo or bunkers. The machinery for the control of exports in the event of war is in readiness in accordance with the regulations recently announced in Parliament and will function immediately in case of need. Meanwhile, there is a natural reluctance on the part both of colliery owners and foreign buyers to enter into new commitments. Prices are nominally unchanged.

### Iron and Steel

**Sheffield.**—The iron and steel market has not been greatly affected by the political crisis, and business continues on a good scale. The demand for forge pig iron is small, but business in foundry iron shows some expansion. There is considerable activity in basic iron, supplies of which are not too plentiful. Steady contract buying of hematite continues, and good deliveries under existing contracts are being taken.

Basic and acid steel billets are in good demand, and more business is on offer than can be readily accepted. Wire rods and small bars are very active, and business in structural steel is at a very high level.

All sections of local industry are fully employed, and steel furnaces are working to capacity; demand for special steels is increasing week by week.

**Middlesbrough.**—The political crisis is restricting civil business, but is having the effect of intensifying the pressure for delivery of steel for defence purposes.

Production of Cleveland pig iron has practically ceased and foundries continue to obtain pig iron supplies from other areas. East Coast hematite is in better demand and further shipments are being made to coastwise ports. There is very little demand for export.

It is expected that the output of finished steel in this area during August will be almost up to the previous month's figures. Semi-finished steel has been arriving from the Continent in fair quantities. Supplies of heavy steel scrap are regularly taken as merchants can obtain it.

**Glasgow.**—In the West of Scotland producers are being inundated with enquiries and orders for materials for A.R.P. shelters, materials for altering existing buildings to render them suitable for shelter purposes and for complete shelters of every description and size. Ordinary commercial business shows some decline, but in all branches production continues at the very high rate which has been ruling in recent weeks and work on hand will absorb all the possible output for a long time ahead.

**Cardiff.**—The international tension is restricting export business in the tinplate trade, and it is anticipated that in the event of war shipments will be permitted only under licence. The question of the revision of f.o.b. prices has been deferred for the time being, and the current schedule figures are to be continued up to the end of October. Shipments in the week ended August 24th were only 1,209 tons, compared with 3,193 tons in the corresponding period last year, and stocks in warehouse and in vans have increased from 1,704 tons to 5,292 tons. Inland business both in tinplates and sheets continues very active, and booked sales for the current year still amount to over 4.6 million boxes. The output in the tinplate industry has receded to about 66 per cent. of nominal capacity under the pooling scheme, but the sheet works as well as the heavier branches of the industry are fully employed. Prices are unchanged.

**News from Abroad.**—The political crisis has been the decisive factor in the international steel business. The uneasiness regarding transport facilities and costs, and the frequently prohibitive war risk insurance rates have caused dislocations, which have not brought business to a complete standstill, but have given rise to serious doubt as to the possibility of executing orders for the time being. In several instances orders have been cancelled, but generally the desire has prevailed on the part of buyers to secure delivery of old orders or to attempt to obtain quick delivery of new specifications.

Prices quoted for enquiries were firm compared with those in previous weeks, although in some cases reductions on official prices have continued to be granted on unorganised markets. Generally the price situation is rather unsettled at the moment, and it is quite likely that a reorientation will have to be considered when normal conditions are restored, if only because of the depreciation of the pound.

Holland and the Scandinavian countries have continued to show some interest in new engagements subject to delivery being possible. Business with non-European countries, i.e. with the Far East, South America and South Africa, was very quiet. Competition from America has further decreased because the domestic demand has improved and is expected to show a further increase in the autumn. Furthermore, the general price-level for domestic requirements has been advanced and export prices are expected to follow suit, including those quoted by the small independent producers.

### Textiles

**Cotton (Manchester).**—Normal business has been quite out of the question. Raw cotton prices have risen, principally as a result of the break in the value of the pound and wide fluctuations have occurred. The progress of the American crop is being over-

**LIQUEUR BRANDY**

MATURED AND BOTTLED AT CHATEAU DE COGNAC

shadowed by other matters, but in most parts of the belt the plants are doing quite well.

Yarn is dearer in sympathy with the rise in raw cotton prices. Some American spinners have sold fairly freely, but orders have been given out very irregularly. Only a slow movement has been reported in Egyptian qualities. Export business has been at a low ebb.

Manufacturers of cloth have experienced a limited turnover in descriptions suitable for shipment abroad. The question of delivery has been very uncertain and shippers have been hampered by the stiff increase in war risk insurance rates. In the home trade section there has been a rush for supplies of "black Italians," and other materials suitable for window blinds. Makers on Government contracts have been pressed to increase deliveries.

★

**Wool (Bradford).**—Wool markets have been disturbed by the international political crisis. The first sale of the new selling season in Australia was due to begin at Sydney last Monday, but the auction was postponed for one week. The home trade was instructed a week ago to restrict the export of wool, tops and raw materials generally as far as possible. The trade has felt for weeks that it was unsafe to ship goods freely to the Continent, and have loyally fallen in with the request of the Government.

The position in manufacturing centres has not altered a great deal. All mills remain busy. Consumption is fully maintained but new business is naturally restricted. Prices for all raw and manufactured commodities remain steady and firm.

★

**Jute (Dundee).**—Prices in all sections of the jute market are firmer. A good business has been done in jute yarns and cloth; an urgent demand for sandbags has arisen and all available supplies have been bought up. Manufacturers are working at capacity to cope with further orders and good prices are being obtained. Raw material prices have been irregular. Spinners have bought fairly freely during the past week. The full group of Daisee-2/3 has advanced to £21 17s. 6d. per ton with good marks at from £22 15s., while Tossa-2/3 is quoted at £22 17s. 6d. and four at £21 17s. 6d. October/November. Reports on the progress of the new jute crop have not been quite so satisfactory recently and the yield may not be as high as was expected.

The price of common 8 lb. cops has been advanced to 2s. 8d. for prompt dispatch with 2s. 7d. paid for October/November, while Twist was raised to 4½d. for 3-ply 8 lb. and sacking yarns to 3½d. to 3¾d. for 24 lb. weft and 4½d. to 4¾d. for 8 lb. chains. Rove is in good demand and £23 is lowest now for 48 lb. and £19 for 200 lb. with early delivery not easily obtainable.

In addition to the demand for sandbags the Government is in need of 160,000,000 yards of camouflage hessian strips of 2 in. and 3 in. widths. Prices are firmer at 3.79d. for 10 oz. 40 in. and 2.94d. for 8 oz. Calcutta hessians have also advanced sharply on an increased demand.

## THE COMMODITY MARKETS

TRADING in many commodities has been irregular or almost at a standstill during the past week. The combined effects of the political tension, the fall in the exchange rate and the prohibition of many exports except under licence are discussed on page 463.

Prices in the United States have also been subject to wide fluctuations, but the rise shown generally a week ago has not been continued. Moody's index of commodity prices fell slightly from 140.7 to 140.3 (December 31, 1931 = 100) in the week ended last Wednesday.

### Metals

**Copper.**—After advancing to £46 5s. standard cash copper reacted to £45 10s. per ton and thus closed on Wednesday 17s. 6d. up on the week. Demand was very brisk, due largely to the desire of traders, particularly since the unpegging of sterling, to hedge against currency losses. Foreign dealings were virtually at a standstill as a result of last week's export licensing order. Despite the higher price, producers have not formally raised the quotas, but it is likely that production was running ahead of the 105 per cent. quota this week. During the week N'Changa Consolidated Copper Mines, the very important Rhodesian developing mine, published its annual report for the year ended March 31st last. This report gave a number of details which show that development work is making very good progress and that experimental production will start before long.

★

**Tin.**—Despite the decline in sterling, the tin pool kept the cash price at £229 17s. 6d. per ton. The strength of the tin market was once again reflected in the larger demand for three months' delivery, which reduced the backwardation from £6 7s. 6d. at the end of last week to £3 2s. 6d. at the end of this week.

★

**Lead and Spelter.**—After touching £16 12s. 6d. earlier this week, the spot lead price closed on Wednesday at £16 10s. per ton, a net gain of 7s. 6d. Spelter, which at one time touched £15 15s. per ton, closed on Wednesday at £15 per ton, 12s. 6d. higher than a week ago. The movements were entirely a reflection of the political crisis and the changes in the sterling rate. The intrinsic position of the two markets has not changed this week, and the only item of news was the move to re-open the Trepcia Mine in Yugoslavia after its recent shut-down owing to labour difficulties.

### Grains

THE markets have been dominated by political developments and by the abrupt variations in the value of the pound. Consequently, c.i.f. business has been limited, and apart from a covering trade in futures there has been little trade by ordinary merchants. Early in

the week a number of vessels were chartered to load wheat at North American ports and the Plate in September, but here again trade has become very difficult. Maize prices are firmer than a week ago, but fluctuations in Chicago and the uncertain course of the pound continue to restrict trading in Liverpool and London.

### Other Foods

**Provisions.**—With the recovery in wheat prices due to the political situation, flour prices were marked up by 1s. a sack during the week. Trade in other provision markets has been seriously affected by the diversion of the purchases of the public from fresh to tinned foods and to other precautions against air raids. Dominion butters and all types of eggs improved in price, while trade in fresh-killed meat has been very slow.

★

**Colonial Produce.**—Markets have been irregular. The future quotations for raw sugar have fluctuated widely and prices for refined were marked up by 3d. per cwt. during the week. Prices of tea, coffee and cocoa have tended to improve, except for those qualities suitable for re-export, which is temporarily at a standstill.

★

**Fruit and Vegetables.**—Trade in London has been much reduced by the political crisis, which has not only led to a diversion of purchasing power away from fresh food, but has also caused a considerable evacuation of the residential areas. In these circumstances the heavy supplies of English plums and apples in London are barely cleared, even at very low prices. The flower trade is also nearly at a standstill, but dealings in potatoes continue steadily at unchanged prices.

### Miscellaneous Commodities

**Oils and Oilseeds.**—Business in these markets is practically at a standstill. There is no trading in futures and spot supplies, while exports are now prohibited except under licence. The demand for nearby linseed oil is strong, however, and prices have risen by £5 10s. per ton during the week. Shipments from the Plate continue as usual, but most of it is on American and Continental account. Reports of the new American crop remain favourable. The home demand for oilcakes continues to expand and prices are firmer.

★

**Rubber.**—The prohibition of exports except under licence brought a small decline in spot prices on Thursday, but with the fall in the value of sterling during the past week there was a revival in demand which brought the price of standard sheet to close on Wednesday at 8½d. per lb. Warehouse stocks fell by 5,087 tons during the week, but it is believed that much of this quantity was sold for export but not shipped before the prohibition of exports, so that its return to stocks is expected.

## GOVERNMENT RETURNS

For the week ended August 26, 1939, total ordinary revenue was £10,338,000, against ordinary expenditure of £17,002,000, issues from Defence loans of £2,000,000, and issues to Sinking Funds of £245,000. Thus including sinking fund allocations but excluding issues from defence loans, the deficit accrued since April 1st last is £152,461,000, against £130,240,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On August 25th applications at £99 1s. 2d. per cent. for bills to be paid for on Monday, Tuesday and Wednesday of following week were accepted as to about 4 per cent. of the amount applied for and applications at higher prices in full. Applications at £99 1s. 5d. for bills to be paid for on Thursday, Friday and Saturday were accepted in full. £40.0 millions of Treasury bills are being offered on September 1st.

## LONDON ACTIVE SECURITY PRICES AND YIELDS

Notes: Yields on British Funds, Dominion and Colonial Government and Corporation Stocks are based on minimum prices shown. Approximate dealing prices on August 29th and 30th are given in left-hand columns. In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

of the future will find the slightest reason for doubting that Hitler deliberately and wantonly provoked the new war.

After the first breach of the peace the rest followed automatically. There was a last-minute proposal by Signor Mussolini for a five-Power conference "for the purpose of revising the clauses of the Treaty of Versailles which are the actual cause of the trouble in the European situation." Throughout Friday and Saturday this proposal had the effect of delaying French and British action; but it also had the merit of demonstrating once again the democracies' desire not to neglect any possibility of a peaceful and honourable solution. But the Italian initiative broke down because Germany would not accept the Franco-British stipulation that the invading troops must be withdrawn. As it was, the House of Commons had shown in unmistakable fashion on Saturday afternoon that there was no shadow of desire to depart from Britain's obligations to Poland, which had been solemnly invoked. The collapse of the Italian initiative led immediately to the last diplomatic steps. The British and French Ambassadors in Berlin each delivered an ultimatum on Sunday and, satisfactory replies not being given, a state of war between Great Britain and Germany existed from 11 a.m. and between France and Germany from 5 p.m. on Sunday, September 3, 1939.

This was the beginning. What the end will be no man can tell. But if we cannot yet say where the road on which we have entered is leading us, we can at least record where we hope to go. What are the objects so essential to our national existence and well-being that we are prepared, as a nation and as individuals, to go through the valley of the shadow of death to reach them? What are we fighting for? The question can be answered, and truthfully answered, with abstractions, as it was admirably done by the Prime Minister on Sunday. "It is the evil things that we shall be fighting against—brute force, bad faith, injustice, oppression and persecution." But the ordinary man does not easily think in abstractions. His grim determination is based on concrete realities. He wants to live free to hold his own opinions, free to indulge in the luxury of argument and disagreement, free to spend his leisure hours at his own fireside or at his own pursuits, free to devote his productive powers to meeting the material wants of himself and his fellows, free to build up a higher standard of living instead of a higher standard of aggressive power, free to bring up a family without the haunting menace of insecurity. In the last few years, even the most thoughtless man in the street has realised that Hitlerism makes all these elements of civilised living impossible. It suppresses opinion; it monopolises leisure for the countless drills and displays necessary to the generation of "spontaneous enthusiasm;" it drains off for military purposes all production above the minimum necessary to keep the people alive; it propagates the nauseous doctrine that children are born for the cannon. Hitlerism has done these things to Germany for more than six years, and it has built up on this fundamental iniquity a superstructure of added brutality and senseless racial persecution. But in the last three years it has started doing these things to us too. It has started compelling us to devote our energies to re-armament, our leisure to drilling, our income to taxes; it has cast over our lives the shadow of doom. Hitler has proved that we cannot be indifferent to the ways in which other people govern themselves. He has convinced the easy-going, tolerant British democracy that it must go through another bout of agony if ever again Englishmen are to live in peace and wealth and contentment.

It has proved impossible, in the conditions of this week, to prepare the extended survey of Russia's resources in relation to Germany's needs which it had been hoped to include in this issue of *The Economist*. It is still hoped to publish it next week.

To say that we are fighting to make the world safe for democracy would be to invite derisive comment. But we are fighting, in the most literal sense, to safeguard democracy in those countries of Western Europe and overseas where it has taken root. And democracy in Britain and France will not be safe if they are faced with brutal dictatorships in any Great Power. Democracy and dictatorship cannot long exist side by side; if they do, the bad will drive out the good, either through a military conquest of the democracies or by forcing them, in self-defence, as we have been forced in recent years, not indeed to abandon democracy, but to divert it to evil purposes of organising for strength instead of for wealth. Many people have asked in these past years of strain what good a war would do. The answer is, of course, that a war does no good; but it has become the only way of preventing infinitely greater harm.

And why has it become the only way? That is a question that only history can finally answer. But one moral can be drawn now which history will not upset. We have had many chances of strangling in their infancy the forces of aggression and brutality which have now engulfed the world in war. As each issue has arisen, we have refused to meet the risks attached to the suppression of brute force. And, as issue has followed issue, we have seen the price of security rise, in a steady Sibylline progress, until now it has reached the most awful height that a nation ever had to face. Before we plunge into war, this lesson must be drawn from twenty-one years of uneasy peace: security cannot be attained by avoiding risks; a policy of limited commitments leads inevitably to the unlimited commitment of war; safety cannot be found without courage. Let us never again make the mistake of being involved in the maintenance of peace without being committed to its enforcement.

These considerations provide two of the pillars of the eventual peace settlement: it must bring the end of armed dictatorship; and it must provide for a world-wide system of enforcing peace. A third pillar must, of course, be the restoration of their independence to those people who have lost it, primarily the Czechs. But these three aims achieved, the fourth must be an avoidance of any merely vengeful or repressive provisions against Germany, which would provide genuine grievances for a new Hitler. If she is democratic, if she co-operates in the new international order, if she restores her unjust conquests, it will be to our interests at the end of this war (as we can now see that it was to our interest in 1918) to help her to unity, equality, wealth and self-respect. The only alternative policy would be one of permanent partition and garrisoning of a defeated Germany, for which the democracies have neither the strength nor the moral mandate.

These, then, are the four principles of peace: Democracy, an International Order, Restitution and Generosity. Their translation into precise details is a matter which cannot now be undertaken. But there are certain points to which it is essential that we should all now commit ourselves as publicly as we can, while our visions are still unclouded. There must be no annexations of German territory and no indemnities. There must be disarmament, but no expectation that Germany will remain disarmed while other nations are armed. There must be a genuine sharing of colonial benefits and responsibilities through the widest extension of the mandatory principle. There must be a new League of Nations, with the hesitations and half-commitments of the old removed. There must be an end of the more senseless forms of economic nationalism.

In the madness and the agony that is to come, we must cling fast to these principles. Only so can we be quite sure that, in defending democracy, we shall not betray it, and that the freedom for which we fight is that freedom for all men on which alone permanent peace can be built.

## Canada — Empire Arsenal

POWER to produce ranks high among the decisive factors in any major war. It has already been emphasised in this journal (September 2nd, pages 434-7) that Great Britain possesses a marked advantage over Germany in this respect. But it is the British Empire, and not Britain alone, which has declared war on Germany. To Britain's material advantage must be added the continuing contribution which can be made by the Dominions and colonial territories. Outstanding among these is Canada, who may well supplement her traditional part of Empire Granary with that of Empire Arsenal.

The logic of such a development is immediately apparent. Canada is reasonably safe from the hazard of air bombing, and at the same time the most accessible of the outlying parts of the Empire to Britain. Additional factors are that the extent and variety of Canada's natural resources render them of peculiar value in a war emergency, while the Dominion has made such progress in diversified manufacturing as to have laid a sound foundation on which to build war industries.

Just what Canada to-day might be capable of in this direction is faintly foreshadowed in her record of accomplishment during the Great War. The achievements of the half-million soldiers Canada raised and the 400,000 odd she sent overseas, as well as the thousands who served with the Royal Air Force, tend to overshadow the accomplishments of those who served no less in other fields.

Food production was augmented to make greater shipments possible. This was attributable to the efforts of patriotic Canadian farmers with a very depleted labour force, supplemented by town and city men who gave up their holidays to help bring in the harvests. Campaigns for increased food production resulted in the extension of the officially estimated area of farm crops from 33 million acres in 1914 to 51 million acres in 1918, an increase of 54 per cent. A vastly enhanced wheat and other food production developed out of the extension of a peace-time activity.

What Canada accomplished in activities new and strange to her was yet more remarkable. As a result of overtures from the Imperial War Office the Canadian Minister of Militia appointed a Shell Committee in September, 1914, to undertake the task of organising the supply of shrapnel to the British Government, and the first shipments were made in December, 1914. By May 31, 1915, about 400 establishments were engaged in the manufacture of shells. In November, 1915, the work of the Shell Committee was transferred to the Imperial Munitions Board, which was directly responsible to the Imperial Ministry of Munitions.

Canadian accomplishment in the subsequent years of hostilities received recognition in a report of the Imperial War Cabinet for 1917. "Canada's contribution during the last year has been very striking. Fifteen per cent. of the total expenditure of the Ministry of Munitions in the last six months was incurred in that country. She has manufactured nearly every type of shell from the 18-pounder to the 9.2 inch. In the case of the 18-pounder no less than 55 per cent. of the output of shrapnel shells in the last six months came from Canada, and most of these were complete rounds of ammunition which went direct to France. Canada also contributed 42 per cent. of the total 4.5 inch shells, 27 per cent. of the 6-inch shells, 20 per cent. of the 60-pounder H.E. shells, 15 per cent. of the 8-inch shells, and 16 per cent. of the 9.2-inch."

A further idea of what Canada was able to do for the British Army in the field by supplying munitions is furnished by the following figures of the value of production: 1914, \$28,164; 1915, \$57,213,688; 1916, \$296,505,257; 1917, \$388,213,553; 1918, \$260,711,751. In addition, as

a result of industries new to Canada established under the direction of the Imperial Munitions Board, shipbuilding contracts were awarded to the extent of \$70 millions, and some 2,900 airplanes were built. All this was accomplished by a country totally unprepared, with a substantial part of its man power actually in the field of hostilities, and having to learn a great deal about many lines of production. To-day, the possibility of hostilities has been anticipated and plans have been laid (only some of which it is reasonable to conclude have been disclosed) which could put Canada on a war footing as the arsenal of the British people. In every physical way she will be found better prepared and equipped to play the rôle than she was in 1914-18.

Primarily Canada will appear again in the part of emergency food provider. She will start out from a much more favourable position than she did in 1914. With her population but slightly augmented, the Dominion has added nearly 10 million acres to the area of possible food production on top of the artificially swollen figure of 1918. She is still able to export more than 80 per cent. of the wheat she raises, which in the record year 1928 amounted to over 500 million bushels. In 1938 the crop was 350 million bushels, and this year it promises to get near the 400 million mark.

War-power still depends largely on minerals, and since the signing of the Armistice there has been a great expansion of the Canadian mineral industry, the annual value of minerals produced having more than doubled. Canada is still producing 87 per cent. of the world's supply of nickel, a mineral in great demand for war purposes. In addition, she accounts for 11 per cent. of the world's copper, 11 per cent. of lead, and 9 per cent. of zinc. The iron and steel industry, which under war-time stimulus reached an output figure of over a million tons of pig iron a year, is presently equipped under peace-time demand to produce 1,500,000 tons annually. Upon the emergency war-time construction of aircraft has been built a substantial industry to meet domestic requirements, which is capable of considerable and rapid expansion. The investigation and development of natural resources, which proceeds unceasingly in Canada, have in the post-war period revealed new possessions of the utmost value to the Empire in war-time.

Before the crisis of September, 1938, the British Government revealed that it hoped to encourage the creation of war supplies industries which could be expanded substantially through obtaining Canadian Government co-operation and increased participation in defence expenditures. It made the placing of business in the Dominion contingent upon Canada's co-operating in the matter of expense through contributing to Empire defence. On this understanding the British Government undertook to supplement any Canadian Government orders with additional orders sufficient to make it worth while for Canadian companies to install additional machinery and make other plant changes necessary for development of armament manufacture. Much attention has also been given to the plant facilities of leading companies which obtained experience in armament production during the Great War and whose ability to handle war supplies work is known in Government circles as a result of plan surveys in recent years. It was revealed some time ago that plans existed for the rapid transformation of these factories from their peace-time occupations to the making of shells.

More immediate is the co-operation between Canada and Britain in preparations for war in the air. Geographical position alone would make this a logical development since

Canada is the only Dominion accessible by air to Great Britain without involving passage over any foreign country, while, though remote from any likely theatre of war, planes manufactured in Canada can be flown to Britain without extra fuel tanks. Federal and Provincial Government and commercial aviation requirements in the post-war period have developed a substantial manufacturing industry, to which Britain and the United States have contributed and which is capable of considerable expansion. The Commercial Air Transport and Manufacturers' Association, established in 1934, comprises sixteen operating companies, fifteen manufacturing companies and eight associate member firms providing equipment or service to the industry.

Plans recently concluded involve not only the placing of large-scale and long-term contracts with private Canadian plants for the manufacture of bombers but for the training of fliers from Britain in Canadian schools. Nine of the Dominion's leading industrial organisations have formed a central organisation and are building two plants for the construction of these bombers, existing plants being found insufficiently large for the contracts of the British Government. The preliminary order for long-range bombers involves an expenditure of nearly \$100 millions, which may be compared with the \$14 millions spent by the Imperial Munitions Board for the construction of planes in Canada in 1918. In addition, orders for training craft in large quantities are also anticipated from the British Government.

Individual manufacturers in Canada are to build parts for the bombing planes, and the ships will then be completed and assembled at the central plants, engines shipped from Britain installed, and the craft flown across the Atlantic. Pilots for the British flying service will in the first place be trained at the Government training school at Camp Borden, and thereafter as the plan expands other

training schools will be established for the purpose right across Canada. The success of both these branches of work would seem to be assured by the splendid records Canadian aviators and manufacturers have already made.

A new field in which Canada has recently acquired some potential importance is that of oil production. It would be a mistake to assume that the output of the Turner Valley field in Alberta will make more than a minor contribution to the Empire's oil resources. But it would also be a mistake to conclude that the present production of between 20,000 and 30,000 barrels per day represents a maximum. It is the opinion of experts of the Government Geographical Survey Department that another field of crude oil other than the Turner Valley, which is the main producing area at present, will be found in Alberta before long, and compared with the mere strip of twenty-five miles which comprises the Turner Valley producing field it has been estimated that 100,000 square miles in Alberta is favourable for oil development. The important thing is that oil in volume is to-day an actuality in Alberta, within the Empire, relatively inaccessible to enemy attack. As part of Britain's re-armament programme one may hope to see investigation and drilling continue at a very much accelerated rate.

Not alone by reason of her geographical position, but on account of the development which has taken place in the post-war period in mineral investigation and exploitation, in the progress of the various phases of aviation and in industrial expansion Canada is a greater Empire asset to-day than she was in 1914 and is capable of an enlarged service. The Dominion is revealed as occupying a place of new and greater importance in the scheme of Empire defence and in the prosecution of a war in which the Empire is involved. Quite apart from the organising of a militant force Canada's aid is invaluable. It is well this is being increasingly recognised.

## The Damning Documents

ON Friday evening of last week, some twelve hours after the German warcraft had launched their first bombs on Polish territory, the British Government published as a White Paper the text of the correspondence it had had since August 22nd with the German Government. These documents lay bare the diplomatic subterfuge with which the Nazis prepared for the invasion of Poland. And in proving beyond any doubt that, from the very beginning, the Nazis meant to have war, they also prove that the British Government meant to have peace, and did everything possible to keep the peace.

The main points in the British and German communications, which are taken in turn, are summarised below:—

1. Letter of August 22nd from the Prime Minister to the German Chancellor:—

It stated that measures taken by His Majesty's Government had been rendered necessary by military movements reported from Germany, and by belief evident in some quarters in Berlin that after German-Soviet Agreement Britain would not stand by Poland.

No greater mistake could be made. Whatever may prove to be the nature of the German-Soviet Agreement, it cannot alter Great Britain's obligation to Poland which His Majesty's Government have stated in public repeatedly and plainly, and which they are determined to fulfil.

It continued that "it would be a dangerous illusion to think that, if war once starts, it will come to an early end even if a success on any one of the several fronts on which it will be engaged should have been secured." War between the two peoples would be the greatest calamity that could occur. There was nothing in the questions arising between Germany and Poland which could not be resolved without the use of force, if only confidence could be restored to enable discussions in a different atmosphere from that which prevailed to-day.

2. Communication from Herr Hitler to the Prime Minister, handed to His Majesty's Ambassador on August 23, 1939.

Germany has never sought conflict with England and has never interfered in English interests. But Germany possesses certain definite interests which it is impossible to renounce. "These do not extend beyond the limits of the necessities laid down by former German history and deriving from vital economic pre-requisites." To these questions belong the German City of Danzig, and the connected problem of the Corridor. Germany was prepared to negotiate "on the basis of a proposal of truly unparalleled magnanimity." But Britain's guarantee had encouraged Poland "to unloosen a wave of appalling terrorism against the one and a-half million German inhabitants living in Poland." This was intolerable to the German Reich.

Britain's assistance to Poland could "make no change in the determination of the Reich Government to safeguard its interests." Germany, if attacked by England, would be found prepared and determined. "I have already more than once declared before the German people and the world that there can be no doubt concerning the determination of the new German Reich to accept, for however long it might be, every sort of misery and tribulation rather than to sacrifice its national interests, let alone its honour." There was information that the British and French Governments had the intention to carry out measures of mobilisation.

I therefore inform your Excellency that, in the event of these military announcements being carried into effect, I shall order immediate mobilisation of the German forces.

3. Supplementary Communication from Herr Hitler handed to His Majesty's Ambassador on August 25, 1939.

The Fuehrer said he desired to make a move towards England as decisive as that made towards Russia. He then made three points: that Poland's actual provocations had become intolerable, and it made no difference who was responsible; that Germany was "in all conditions determined to

abolish these Macedonian conditions on her eastern frontier and, what is more, to do so in the interests of quiet and order, but also in the interests of European peace"; that the "problem of Danzig and the Corridor must be solved."

The German Chancellor then said that, after the solution of that problem, he was prepared and determined to approach England once more with a large comprehensive offer. He accepted the British offer if:—

(1) His colonial demands which were limited and could be negotiated by peaceful methods were fulfilled, and in this case he was prepared to fix the longest time limit.

(2) His obligations towards Italy were not touched—he did not demand that England give up her obligations towards France.

(3) He also desired to stress the irrevocable determination of Germany never again to enter into conflict with Russia. He would, after entering into agreements with England, be ready to accept a reasonable limitation of armaments which corresponded to the new political situation, and which was economically tolerable. He renewed his assurances that he was not interested in Western problems.

4. Reply of His Majesty's Government dated August 28, 1939, to the German Chancellor's Communications of August 23 and 25, 1939.

The German Chancellor's proposals affecting the ultimate relations between Germany and Great Britain were stated in very general form and would require closer definition, but His Majesty's Government were fully prepared to take them, with some additions, as subjects for discussion and they would be ready, if the differences between Germany and Poland were peacefully composed, to proceed so soon as practicable to such discussion with a sincere desire to reach agreement. As to the settlement of the German-Polish dispute, everything turned on the nature of the settlement and method by which it was to be reached. On those points the Chancellor's message was silent. His Majesty's Government could not, for any advantage offered to Great Britain, acquiesce in a settlement which put in jeopardy the independence of a State to whom they had given their guarantee.

The next step should be the initiation of direct discussions between the German and Polish Governments on a basis which would include the safeguarding of Poland's essential interests and the securing of the settlement by an international guarantee. The British Government had already received from the Polish Government a definite assurance that they were prepared to enter into discussions on this basis. If such discussion led to agreement then the way would be open to the negotiation of that wider and more complete understanding between Great Britain and Germany which both countries desired.

5. Reply of the German Chancellor to the Communication of August 28, 1939, from His Majesty's Government. Handed to Sir Neville Henderson during the evening of August 29th.

After referring to "persecution of the large German national group in Poland," and stating that this condition of affairs was intolerable, the communication stated that "the demands of the German Government are in conformity with the revision of the Versailles Treaty in regard to this territory which has always been recognised as being necessary: viz., return of Danzig and the Corridor to Germany, the safeguarding of the existence of the German national group in the territories remaining to Poland."

The German Government was prepared to enter into direct discussions, desiring in this way to give the British Government and nation a proof of the sincerity of Germany's intentions to enter into a lasting friendship with Great Britain. In the event of a territorial re-arrangement in Poland they would no longer be able to bind themselves to give guarantees or to participate in guarantees without the U.S.S.R. being associated therewith. They never had any intention of touching Poland's vital interests or questioning the existence of an independent Polish State.

The German Government, accordingly, in the circumstances, agree to accept the British Government's offer of their good offices in securing the dispatch of a Polish emissary with full powers. They count on the arrival of this Emissary on Wednesday, August 30, 1939. The German Government will immediately draw up proposals for a solution acceptable to themselves and will, if possible, place these at the disposal of the British Government before the arrival of the Polish negotiator.

6. Telegram from H.M. Government to Sir Neville Henderson sent at 2 a.m. on August 30, 1939.

Careful consideration would be given to German Government's reply but it was, of course, unreasonable to expect that they could produce a Polish representative in Berlin to-day, and German Government must not expect this.

Documents 7 and 8 are telegrams from the British Government referring to the danger of frontier incidents.

9. Telegram from H.M. Government to Sir N. Henderson, sent at 6.50 p.m. on August 30, 1939.

The British Government could not advise the Polish Government to comply with German request for a Polish representative with full powers to come to Berlin to receive German proposals, a procedure which was wholly unreasonable. Adoption of normal diplomatic procedure suggested.

10. Reply of H.M. Government to the German Chancellor's Communication on August 29, 1939. This Reply was handed by Sir N. Henderson to Herr von Ribbentrop at Midnight on August 30, 1939.

After noting the various points so far established, the reply states that His Majesty's Government must make an express reservation in regard to the statement of the particular demands put forward by the German Government in an earlier passage in their reply. His Majesty's Government were at once informing the Polish Government of the German Government's reply. The method of contact and arrangements for discussions must obviously be agreed with all urgency between the German and Polish Governments, but in His Majesty's Government's view it would be impracticable to establish contact so early as to-day. His Majesty's Government fully recognised the need for speed in the initiation of discussion. They would suggest that a temporary *modus vivendi* might be arranged for Danzig.

11. Translation of a Message which was communicated to H.M. Ambassador in Berlin by the State Secretary in the evening of August 31st.

After a long argumentation, the following sixteen proposals were submitted:—

1. The Free City of Danzig should return to the Reich.
2. A plebiscite should be held in Polish territory north of a line Marienwerde-Graudenz-Kulm-Bromberg (inclusive) and thence running in a westerly direction to Shoenlanke.
3. Those who might vote included all Germans either domiciled there on January 1, 1918, or by that date born there, and similarly of Poles, Kashubes, etc. Germans who had left the territory should return to it to vote. The plebiscite area would be placed under an international commission as in the case of the Saar territory. Powers represented would be Italy, the Soviet Union, France and England. Polish authorities would evacuate the area within a period of the utmost brevity.
4. Gdynia would be excluded from the plebiscite area.
5. The plebiscite would not take place for twelve months.
6. During that period free transit traffic would be established.
7. The plebiscite would be decided by simple majority of votes recorded.
8. If the plebiscite area went to Poland, Germany would receive an extra-territorial traffic zone, and the same in the contrary case.
9. If the area returned to the Reich, latter declared its right to proceed to an exchange of populations.
10. Special rights for Poland in Danzig would be negotiated on a basis of special rights for Germany in Gdynia.
11. Both Danzig and Gdynia would be demilitarised.
12. The peninsula of Hela would in either case be demilitarised.
13. An international committee of enquiry would be set up to deal with minority complaints on both sides. Economic or other damage, etc., to be made good as from 1918.
14. Germany and Poland would conclude a minorities agreement.
15. In the event of agreement, Germany and Poland would immediately demobilise their armed forces.
16. Further measures to be conjointly agreed upon.

Document 12 is a telegram (acknowledged by Document 13) referring to Polish Government's action through its Berlin Ambassador and to need for *modus vivendi* in Danzig.

14. The concluding document is an explanatory Note upon the actual course of events. *Inter alia*, it points out that:—

the German reply in writing was handed to H.M. Ambassador at 7.15 p.m. on August 29th. Apart from the complete distortion of events leading up to the crisis, the German Government's reply demanded the arrival in Berlin of a Polish emissary with full powers during the course of the following day.

The reply of the British Government is self-explanatory. It was communicated by H.M. Ambassador to the German Minister for Foreign Affairs at midnight on August 30th. Herr von Ribbentrop's reply was to produce a long document which he read out rapidly in German. It was apparently the sixteen-point plan which the German Government have since published. When Sir Neville Henderson asked for the text of these proposals in accordance with the undertaking in the German reply of August 29th, Herr von Ribbentrop asserted that it was now too late, as the Polish plenipotentiary had not arrived in Berlin by midnight, as had been demanded by the German Government in their communication of the previous evening.

The Note points out that the Polish Government would authorise their Ambassador to inform the German Government that they accepted the British proposals for negotiations, and that:—

The Polish Ambassador in Berlin (M. Lipski) was not received by Herr von Ribbentrop until the evening of August 31st. After this interview the German Government broadcast their proposals forthwith. M. Lipski at once tried to establish contact with Warsaw, but was unable to do so because all means of communication between Poland and Germany had been closed by the German Government.

#### The Ultimatum to Germany

Speaking in the House of Commons on Friday, September 1st, the Prime Minister noted that the German Government's reply to the Polish acceptance of the British proposals for negotiation was that "without another word, German troops crossed the Polish frontier this morning at dawn and are since reported to be bombing open towns."

In these circumstances, he said, there was only one course open to us. His Majesty's Ambassador in Berlin and the French Ambassador had been instructed to hand the German Government the following document:—

Early this morning the German Chancellor issued a proclamation to the German Army which indicated clearly that he was about to attack Poland. Information which has reached his Majesty's Government in the United Kingdom and the French Government indicates that German troops have crossed the Polish frontier and that attacks upon Polish towns are proceeding. In these circumstances it appears to the Governments of the United Kingdom and of France that by their action the German Government have created conditions—namely, an aggressive act of force against Poland threatening the independence of Poland—which call for the implementation by the Governments of the United Kingdom and of France of the undertaking to Poland to come to her assistance. I am accordingly to inform your Excellency that unless the German Government are prepared to give his Majesty's Government satisfactory assurances that the German Government have suspended all aggressive action against Poland and are prepared promptly to withdraw their forces from Polish territory, his Majesty's Government in the United Kingdom will without hesitation fulfil their obligations to Poland.

If a reply to this last warning was unfavourable, and he did not suggest that it was likely to be otherwise, His Majesty's Ambassador was instructed to ask for his passports. In that case we were ready.

## Defence Measures

THE measures necessary to the defence of Britain are now coming into force with a rapidity and smoothness which constitute ample evidence of thorough and detailed preparation. In the last two issues of *The Economist* summaries have been published of the measures taken since the announcement of the Russo-German Pact on August 21st. These measures have so far been classified under the two heads of Departmental Instructions, representing detailed steps taken to implement existing civil defence legislation, and Emergency Powers, which were enumerated in the Defence Regulations published on Monday, August 28th, under the authority of the Emergency Powers (Defence) Act. Two new categories must now be added. They are Orders in Council made under the Defence Regulations, and New Legislation, of which there has been a considerable quantity since the summoning of Parliament on Friday, September 1st.

#### DEPARTMENTAL INSTRUCTIONS

An extension of A.R.P. measures on Thursday evening, August 31st, involving instructions to local controllers to assume duty, was accompanied by the issue of instructions to complete the distribution of civilian respirators and to protect essential A.R.P. buildings. All overseas telephone services were cut off.

By Friday the full machinery of civil defence was in operation. All A.R.P. personnel were called up for duty, as were the Police War Reserve; the use of sirens for other purposes than the giving of air-raid warnings was prohibited; a complete black-out was ordered to take effect at sunset; and the arrangements for evacuation were put into operation. While the exodus was in progress from the areas already scheduled, a number of new towns were added to the list. It was announced that a scheme had been prepared for issue by the Ministry of Health for the maintenance of essential buildings, other than dwelling-houses, in war time. The exigencies of emergency conditions necessitated the setting up of a censorship on letters to places abroad, but at the same time a number of arrangements were made for the adequate functioning of peace-time activities. These included appeals for helpers to assist in bringing in the harvest, and to those goods vehicle

#### The German Reply

The German reply to the British Note calling for the withdrawal of troops was handed to the British Ambassador in the form of a memorandum, and was a blunt refusal. The main points were as follows:—

The Reich Government and the German nation refuse to accept or even to satisfy the demands in the form of an ultimatum from the British Government. But for the intervention of the British Government a settlement satisfactory to both sides would have been found to the disputes between Germany and Poland. The German Government watched patiently the torture of the German population by the Poles for five months before taking matters into their own hands. The British Government rebuffed Signor Mussolini's peace proposal, although the German Government had been willing to accept it. British politicians have for years been preaching the annihilation and obliteration of the German nation. The German Government are determined to defend their freedom and independence, and will answer British aggression with like arms and in a like way.

The British ultimatum expired at 11 a.m. on September 3rd, and the French ultimatum at 5 p.m. on the same day. From then onwards a state of war existed between Britain and France on the one hand, and Germany on the other.

#### The Italian Mediatory Move

An official account of a diplomatic intervention by Signor Mussolini was issued in Rome on September 4th. On August 31st the Duce, it stated, informed the British and French Governments that he could call an international conference on September 5th for the purpose of a peaceful revision. The replies arrived on September 1st.

With the replies of the French and British Governments favourable in principle, the Italian Government informed Chancellor Hitler at 10 o'clock on September 2nd that there was still a possibility of calling a conference. Hitler replied that he must first know if the Note presented by Britain and France had the character of an ultimatum, since in that case all negotiation would be useless, and if he could count on a delay of 24 hours to consider and take his decisions on the subject. At a late hour in the afternoon there reached Rome from London and Paris affirmative replies on these two questions, and that a withdrawal of German forces was a fundamental condition of British and French participation in a conference.

operators who had not yet done so to register their vehicles in the emergency index or to join groups to ensure the fullest use of existing transport. A detail of civilian life was provided for by the issue of special instructions to pensioners and persons insured under National Health schemes.

Civil Defence preparations continued at an accelerated rate on Saturday, and the Lord Privy Seal made a statement emphasising the fact that still more volunteers were required if the work was to be completed with the maximum speed and thoroughness. Detailed instructions to vehicle drivers in air raids were issued and an appeal was made for the fullest co-operation of householders in making the black-out completely effective. The arrangements of the Ministry of Health for an emergency medical service were advanced one stage further by the issue of instructions to doctors enrolled for whole-time duty at specified hospitals to report at once and for certain members of the Civil Nursing Reserve to do likewise. Further rearrangement of peace-time activities included the restriction of Empire air-mail services; the ordering home of fishing vessels off the East Coast; the cancellation of all special excursion trains on the L.M. & S. Railway; the coming into force of the Board of Trade scheme for the insurance against King's enemy risks of certain goods owned by sellers; and the setting-up of a War Risks Insurance Office for cargoes.

The declaration of war on Sunday morning was received by a country whose civil and commercial life had in many respects already been placed on a war footing. It was immediately followed by a number of Government announcements which modified still further the normal functioning of peace-time activities. All cinemas, theatres and other places of entertainment were closed; gatherings involving large numbers congregating together were prohibited until further notice; schools in evacuation areas were closed for a period of at least a week; the general public were warned to keep off the streets; and special arrangements were made for reporting by the unemployed at Labour Exchanges. Special provisions concerning commerce and finance included the closing of banks for Monday, September 4th; special arrangements to maintain essential financial services applying to approved acceptors whose bills are normally discounted in the London Discount Market, supplementing the provisions of the Courts (Emergency Powers) Act; Treasury restrictions on fresh issues

of capital; a Board of Trade announcement that trading with the enemy becomes unlawful on the outbreak of war; the publication of the fact that British merchant vessels are liable to examination by the British Naval Contraband Control Service; the requisitioning of privately owned goods railway wagons by the Minister of Transport; and the closing of Billingsgate market, accompanied by alternative arrangements for the sale of fish. The first steps towards rationing were taken, with the appointment by the Minister of Supply of fifteen Controllers of Materials and the announcement by the Secretary for Mines of the arrangements for the pooling and utilisation of petrol supplies. Finally, a notice was issued requiring the registration of aliens.

Monday saw the Proclamation in *The London Gazette* of a list of articles to be treated as contraband of war. It included arms, fuel, means of transport, coin and bullion. Food and clothing were declared conditional contraband. The Controller of Clearing Offices made an announcement of the arrangements concerning the carrying on of Anglo-Spanish, Anglo-Rumanian, Anglo-Italian and Anglo-Turkish clearings. In the official sphere of civil defence it was announced that more stretcher-bearers and ambulance drivers were required in the London area, and that the Minister of Transport had authorised the issue of a special National Service driving licence to holders of provisional licences who might otherwise experience some delay in taking the necessary test. The duty of farmers in the growing of home food supplies was emphasised in a broadcast message by the Minister of Agriculture, and once again the appeal was reinforced in a practical manner, on Tuesday, by an arrangement with the War Office under which a certain number of serving soldiers will be enabled to assist in bringing in the harvest.

#### EMERGENCY POWERS

The first 96 Regulations under the *Emergency Powers (Defence) Act* were summarised in the last issue of *The Economist* on pages 439-440. A subsequent Order-in-Council has added 32 new Regulations and a Schedule concerning amendments to the Official Secrets Acts, 1911 and 1920. The new Regulations may be summarised as follows:—

#### THE DEFENCE REGULATIONS 1939

##### Part I.—Provisions for the Security of the State

###### *Interference with Essential Services*

1A. Interference with His Majesty's servants in the performance of their duties, or with other persons performing essential services, is forbidden. The regulation does not cover strikes, or peacefully persuading others to take part in a strike.

###### *Assisting the Enemy and Sabotage*

2A. The doing of any act likely to assist an enemy, or sabotage of any article used or intended to be used in His Majesty's service, are offences punishable with penal servitude for life.

###### *Safeguarding Information Useful to an Enemy*

6. Existing Acts concerning Patents, Designs and Trade Marks may be ignored by a Secretary of State or the Admiralty who wishes to restrict the publication of information, to require details or to use plans and documents. Applications for the grant of a patent or the registration of a design may only be made by permission of the Comptroller-General of Patents.

###### *Restrictions on Movements and Activities of Persons*

18A. The movements of suspected persons may be restricted by order.

18B. The use of certain articles by suspected persons and their employment and communications with other persons may be restricted by order. Orders may also be made for their detention. Objections to such orders may be submitted to advisory committees constituted under the Regulation.

18C. No person shall assist a prisoner of war to escape. Access to prisoners of war and their conduct, movements and employment may be regulated by order.

20. Aliens may not change their names or trade under other names than their own. Change of name by British subjects is made subject to new restrictions.

##### Part II.—Public Safety and Order

###### *Public Safety*

30. In the case of deaths occurring in consequence of war operations, the usual arrangements for burial, inquests and the issue of certificates may not apply.

31. Interim superintendent registrars and deputy registrars of births, marriages and deaths may be appointed.

33. Certain women may be exempted by order from Acts relating to midwives where circumstances require it.

37. A curfew may be instituted by order.

###### *Public Order*

39A. No person shall endeavour to cause disaffection among His Majesty's servants or have in his possession or control documents whose dissemination would represent an attempt to cause disaffection. The provisions of s.3 of the Police Act (which penalises the causing of disaffection among the police) are ex-

tended to special constables and members of railway and dock police forces.

39B. Propaganda likely to be prejudicial to the defence of the realm or of the efficient prosecution of the war is forbidden.

39C. Local or general orders may be made prohibiting the display of flags.

39D. Proceedings for an offence against the Unlawful Drilling Act, 1819, may, with the consent of the Director of Public Prosecutions, be taken under the Summary Jurisdiction Acts. The maximum penalties are three months' imprisonment or £100 fine or both.

39E. Public processions and meetings may be prohibited by order if they are likely to cause serious public disorder or promote disaffection.

40. The Secretary of State may appoint additional inspectors of constabulary.

##### Part III.—Ships and Aircraft

45A. The Board of Trade may by order regulate employment in British (other than Dominion) ships and aircraft.

45B. The Board of Trade may make limited or general orders prohibiting the employment of certain persons as agents abroad for ships and aircraft.

Amendment to Regulation 47. The provision that it shall be unlawful, except under Board of Trade authority, to transfer or mortgage or transfer any mortgage of any British ship or share of such ship, is withdrawn.

47A. Deserters from ships may be conveyed back by ships' officers, constables or commissioned officers of His Majesty's forces.

##### Part IV.—Essential Supplies and Work

###### *General Provisions (Powers over Land, Property and Undertakings)*

59. Orders may be made exempting factories, mines and quarries from the provisions of Acts regulating them.

60. Provision may be made by order for the safety and welfare of factory workers.

###### *Agriculture and Fisheries*

Amendment to Regulation 68. The functions of the Board of Trade under this Regulation (which concerns the felling and sale of trees) are transferred to the Minister of Supply.

##### Part V.—General and Supplementary Provisions

79. The finder of derelict articles believed to have been used or intended to be used by armed forces must report their whereabouts to the police, or, in the case of a document, deliver it. He may not otherwise tamper with the article.

80. Penalties under the Geneva Convention Acts, 1911 and 1937 (misuse of the Red Cross), are increased.

80A. Articles and information must be provided for authorised persons.

88A. Justices of the peace and superintendents or superior police officers may authorise entry and search of premises to obtain evidence of offences.

88B. Constables and members of His Majesty's forces in uniform may stop and search vehicles.

88C. Constables and other authorised persons have power to arrest without warrant.

##### ORDERS-IN-COUNCIL

Orders-in-Council under the Defence Regulations began to appear immediately after the issue of those Regulations and the earliest were mentioned in the last issue of *The Economist*. Since then a number of others have appeared. By a Board of Trade amending Order of Thursday, August 31st, the export from the United Kingdom to any destination of civil aircraft or aircraft engines is now strictly regulated. On Friday four important Orders decreed the complete mobilisation of all the forces, placed the railways under the control of the Minister of Transport, provided for a black-out at sunset and prohibited the export from the United Kingdom of a large number of commodities including flour, tinned meat, fruit, vegetables and sugar.

Over the week-end Orders made by the Home Secretary prohibited the landing or embarkation of British subjects except at certain approved ports and an amendment to the Aliens Order laid down certain new provisions affecting aliens at present in this country. The iron and steel industry was at the same time placed under the control of the Minister of Supply by Order and maximum prices were established. Four Orders by the Secretary for Mines regulated the export and wholesale and retail prices of coal, and laid down the standards for autumn rations for fuel and lighting. The last-named Order will be administered through local fuel overseers and local advisory committees of the supplying interests. The prices and distribution of a number of essential materials were placed under control by Orders made by the Minister of Supply. The materials concerned were iron and steel, non-ferrous metals, aluminium, wool, flax, hemp, jute, silk, rayon, timber, paper, leather, molasses and industrial alcohol. The Cultivation of Lands Order made by the Minister of Agriculture authorised a War Agricultural Executive Committee in each county to exercise on his

behalf the powers conferred by the Defence Regulations for the increase of home food production.

Monday's crop of Orders were almost entirely concerned with the control of commodities. The Minister of Supply authorised the control of supplies and prices of paper and paper-making materials by the Paper Control—a Department of the Ministry; the control of prices of rayon yarn by another Department to be called the Silk and Rayon Control; and the establishment of further controls for timber, non-ferrous metals, raw hides, skins, and leather, hemp and molasses and industrial alcohol. The prices of meat and flour were fixed by Order. The only Order not concerned with particular commodities was the Control of Traffic at Ports Order under which the Minister of Transport appointed a committee for each of the principal commercial ports to secure efficient operation.

Further steps towards the ordering of industry and trade for the efficient prosecution of the war were made through a series of Orders issued on Tuesday. Board of Trade Orders provided that ships may be built or repaired in the United Kingdom only under licence, and that flour and provender should be placed under the control of the Board. Particulars of the Wool and Jute Controls were covered in Orders from the Ministry of Supply. The Sugar (Provisional Prices) Order from the Food (Defence Plans) Department fixed the maximum wholesale and retail prices for that commodity. Finally, a Board of Trade Order authorised the setting up of Food Control Committees by local authorities other than county councils.

#### DEFENCE LEGISLATION

In the House of Commons on Friday night, September 1st, sixteen Bills were passed into law. These were the first items in a new category of defence measures—legislation to deal with war emergency. Those which are particularly relevant to civil defence are summarised below.

##### Compensation (Defence) Act

This Act lays down the principles of compensation in respect of action taken in the exercise of emergency powers and aims at securing that claimants will not gain advantage from the emergency.

##### Consolidated Fund Appropriation (No. 2) Act

This authorises the issue of £500 millions from the Consolidated Fund to supplement the spending authority of the Government.

##### Courts (Emergency Powers) Act

The general scheme of this Act is that in the main in a series of cases where people have rights against others they should not be permitted to proceed against them except with the leave of the court.

##### Currency (Defence) Act

The use of the Exchange Equalisation Account for purposes that arise in war is authorised by this Act. It also makes postal orders and certain bank notes legal tender, and constitutes advances by the Bank of England out of Government funds to approved banks and acceptors a prior floating charge on the assets of the borrower in favour of the bank.

##### Essential Buildings and Plant (Repair of War Damage) Act

This Act provides for the repair of buildings used for purposes essential to the welfare of the civil population, and the reinstatement of the plant of undertakings carried on for such purposes, where they are damaged by war.

##### Housing (Emergency Powers) Act

Similar provisions to those made in the last-named Act are provided for dwelling houses. Local authorities are empowered to do the necessary work.

##### Import, Export and Customs Powers (Defence) Act

The Board of Trade receives powers to regulate imports and exports. The control is extended to coastwise shipping and ships' stores.

##### Landlord and Tenant (War Damage) Act

The object of this Act is to modify the rights and liabilities of landlords, tenants and other persons interested in land damaged by war.

##### Regional Commissioners Act

The payment of salaries and allowances to Regional Commissioners and other persons appointed for the securing of the co-ordination of civil defence is provided for. When a Member of the House of Commons is appointed to one of these positions the disqualification which normally attaches

to a Member accepting an office of profit under the Crown will not apply.

##### Ships and Aircraft (Transfer Restrictions) Act

The object of this Act is to restrict the transfer and mortgage of ships and aircraft without the licence of the President of the Board of Trade or the Secretary of State for Air.

Other Acts passed on the same day (Friday) were the Armed Forces (Conditions of Service) Act, the Government of India Act (Amendment) Act, the Rent and Mortgage Interest Restrictions Act, the War Damage to Land (Scotland) Act, the Ministers of the Crown (Emergency Appointments) Act and the Prize Act.

On Saturday and Sunday, September 2nd and 3rd, further Acts were passed. They were:—

##### National Service (Armed Forces) Act

This is the Act which renders all fit male British subjects of the ages of 18 to 40 inclusive liable to be called up for service in the armed forces during the war emergency.

##### National Health Insurance and Contributory Pensions (Emergency Provisions) Act

The existing law is amended to secure that persons insured under the scheme of National Health Insurance and Contributory Pensions do not suffer any loss of rights under these schemes by reason of joining the Armed Forces or entering upon war occupations.

##### Personal Injuries (Emergency Provisions) Act

This provides for grants to be made in respect of personal injuries or death caused by air raids or other operations of war to the civil population.

The Isle of Man (War Legislation) Act, the House of Commons (Service in His Majesty's Forces) Act and the Pensions (Navy, Army, Air Force and Mercantile Marine) Act were also passed on Saturday.

On Monday the Education (Scotland) (War Service Superannuation), Royal Marines, Navy and Marines (Wills), and Military and Air Forces (Prolongation of Service) Acts were passed.

Six more Acts were passed on Tuesday. They were:—

##### Local Government Staffs (War Service) Act

Local authorities are empowered to make up the balance of the civil pay of their employees undertaking war service, including civil defence.

##### National Registration Act

The object of this Act is to put into operation the measures already prepared for the establishment of a system of national registration and to entrust the work to the Minister of Health and the Secretary of State for Scotland.

##### Teachers' Superannuation (War Service) Act

This enables teachers to retain their pension privileges when undertaking war service.

##### Trading with the Enemy Act

The powers of the common law relating to trading with the enemy are made the subject of Statute. Specific machinery for enforcing the law and the enumeration of offences are enumerated in the Act.

##### Unemployment Assistance (Emergency Powers) Act

Unemployment assistance is extended so that allowances can be paid to those who are at present outside the scope of the Act but may be in distress through circumstances caused by the war.

##### Unemployment Insurance (Emergency Powers) Act

The object of this Act is to modify the Unemployment Insurance scheme by regulation when need arises during the war.

Five Acts passed on Wednesday included:—

##### Import Duties (Emergency Provisions) Act

This Act suspends the statutory functions of the Import Duties Advisory Committee for the period of the emergency and gives the Treasury power to make Orders or grant licences or approve schemes.

##### Income Tax Procedure (Emergency Provisions) Act

The effect of this Act is to allow during the war any necessary modifications of the territorial basis of the division of functions which obtains under the existing Income Tax Acts.

The other Acts passed on this day were the Exchequer and Audit Departments (Temporary Provisions), Government and Other Stocks (Emergency Provisions), and Sheriff Courts (Scotland) Acts.

## NOTES OF THE WEEK

**The New Government.**—The outbreak of war was immediately followed by the formation of a War Cabinet. Of its nine members, six—the Prime Minister, the Chancellor of the Exchequer, the Foreign Secretary, the Minister for the Co-ordination of Defence, the Secretary for War, and the Air Minister—are those who have hitherto held the same offices. A seventh member, Sir Samuel Hoare, survives from the previous Cabinet, but in the new office of Lord Privy Seal. There are thus only two newcomers. But they are powerful reinforcements indeed: Mr Winston Churchill as First Lord of the Admiralty and Lord Hankey (who has sat in Cabinets longer than any man living) as Minister without Portfolio. There have also been some changes in the Ministry outside the War Cabinet (which is also, apparently, to be the only Cabinet). Sir John Anderson, exchanging offices with Sir Samuel Hoare, becomes Home Secretary and also Minister for Home Security. Mr Eden becomes Dominions Secretary (with the right to attend sittings of the Cabinet). Lord Stanhope replaces Lord Runciman as Lord President of the Council, and Sir Thomas Inskip (re-christened Lord Caldicote) replaces Lord Maugham on the Woolsack. Lord Macmillan is the first Minister of Information and Mr R. H. Cross is the Minister of Economic Warfare. Among the minor appointments, the chief change of note is the reappearance of Major Gwilym Lloyd George as Parliamentary Secretary to the Board of Trade.

In the main, then, and with the major exceptions of Mr Churchill and Lord Hankey, the new Government is the old Government. That this is so is due to the refusal of the Labour or Liberal Parties to accept the invitations that were sent to them to join the Government. These refusals were given on slightly different grounds: the Labour Party as a matter of principle, the Liberal Party because it was not intended to include its representative in the War Cabinet and the party, if it accepted, would therefore be in the position of being bound without having a voice in policy. These decisions cannot be criticised; but they can be regretted. It is an advantage to have an opposition criticising in detail; but it might be even more advantageous if this stimulus were given inside the administration, and if a team that is tired by eight years in office could draw on the fresh personnel in and behind the Labour and Liberal parties. It seems also to be a pity that a more rigorous selection has not been made within the ranks of the Government's own supporters. This Government has had its successes and its failures and both now seem to be equally rewarded. When one reflects on the opportunities that were missed in the field of foreign affairs in the early years of the Government's life (when the drift to war could have been arrested at a risk negligible compared with those we are now running) and on the inexplicable two-year delay in organising civil defence (which left us defenceless last September), the personnel of the War Cabinet is surprising.

**The Nature of a War Cabinet.**—The use of the term "War Cabinet" may, perhaps, lead to the conclusion that the present body is strictly analogous to that formed by Mr Lloyd George in 1916. But the Lloyd George War Cabinet had six members, only one of whom (Bonar Law, Chancellor of the Exchequer and Leader of the House of Commons) had any departmental responsibilities. This had two advantages: the members of the War Cabinet could devote all their energies to solving the problems that only a Cabinet can solve; and there was no preference to some departments represented in the Cabinet over the remainder. The new War Cabinet differs in both these respects. Only three of its nine members are free of departmental responsibility, and while the fighting forces are represented, many of the no less important Ministries are not. It will remain to be seen how this

system will work. The Government will be judged entirely by results and there is nothing lacking in the speed and vigour with which it is tackling its colossal task.

**The War in Poland.**—The strategic retreat of the Polish armies is proceeding, and, if the relatively small number of prisoners taken by the Germans and the relative slowness of the German advance are given their due significance, it will be seen that the retreat is far from being a defeat. Broadly, the Germans have developed a pincer movement by advancing simultaneously in the north and in the south; and on both these sectors they have developed subsidiary pincer movements to pinch off individual towns and strong points. In the north they have advanced along the railways (which, it should be remembered, were built

in the first place for military movements against the Russian Empire) from Chojnice and Schneidemuehl, and, at the same time, from the Danzig territory towards Tszew and from East Prussia towards Grudziadz (Graudenz). The effect of this has been to cut off the Polish forces operating in the Corridor; by Wednesday the pincers had closed on Bydgoszcz (Bromberg) and the Corridor had been cut by German troops. Another northern pincer movement began on the second or third day's fighting with a German

Crowns, Fmks, Zlotys.

advance from the Tannenberg area in East Prussia towards Mława and Przasnysz; on Thursday the Polish army, based on Ciechanów, were holding down this sector as well as the town of Toruń, menaced now from the direction of Bydgoszcz and Grudziądz. In the south there is the same story of hard-fought rearguard action. The Germans came in at three main points, the first push aimed at Czeszochowa, the second at Kattowice and the Upper Silesian industrial area generally, and the third from Slovakia through the Jablunka Pass. The terrain of the Moravian Gap favours an invading army, and by Thursday the advance had gone far across the frontier, taking in the whole of the industrial area and, on German claims, the city of Cracow. The main body of their troops is now as far as or beyond Łódź against determined resistance and skilful retreat. From all accounts it would seem that the Poles have not yet engaged the mass of their army or artillery, preferring to wait until they have established themselves on a line (formed partly by the Rivers Vistula and Bug) which they can hope to defend. So far the Germans have been advancing over relatively easy country, in the north across open heath lands only sparsely timbered, in the south along the ample roads and railways of Upper Silesia. They have taken the key railway junctions of Tszew and Bogumin, but these in any case could not be defended. The real difficulties lie ahead of them. They must now encounter on his own ground a resolute enemy with arms specially developed for the very circumstances which have come to pass.

**War at Sea.**—The first blow of the war struck on the water was a sensational one. At about 9 o'clock on Sunday evening the *Athenia*, a ship of 15,000 tons belonging to the Donaldson Line, with 1,400 passengers on board, was torpedoed by a submarine, which could only be German, and sunk. No warning was given by the assailant, but at the time of going to press it seems that, apart from those killed by the explosion, the majority of those who took to the boats have been picked up by various ships. Apart from the fact that more than 300 American citizens were on board, the outrage to the *Athenia*—the submarine's procedure was quite contrary to the international rules governing such attacks and subscribed to by the Third Reich—served to underline the urgency of putting a full and effective convoy system into operation. This is being done by the Admiralty with all speed. Meanwhile, a number of smaller British vessels have been sunk, while certain German merchantmen have been captured or, in cases where they were capable of being converted for use as armed raiders, destroyed. Thus, Britain's command of the seas takes the first strain of the conflict in the West.

**The War in the West.**—On the Western Front the French Army has begun operations and made limited

progress towards Saarbrücken. Industrial areas in western Germany have been bombed. The Royal Air Force have carried out successful reconnaissance raids over German territory, and by mid-week had released 12,000,000 copies of a message to the German people. On none of these raids were the planes engaged by the enemy. A daring daylight raid was made on the western mouth of the Kiel Canal on Monday, and heavy damage inflicted on two German battleships, though unfortunately with some loss to the attackers.

**The British Commonwealth at War.**—In the days that lie ahead it will be of spiritual as well as of material comfort to the British Government to know that they have the support and the approval of the free Dominions. They can justly remember that one important factor in deciding the Dominions to come into the war was the clear knowledge that the British Government had done all that was humanly possible to stop the outbreak of war. The declarations by the Governments of New Zealand and Australia have been unanimously approved in their own countries, and the speeches made by Mr Savage and Mr Menzies were simple statements of political necessity. "With gratitude for the past and confidence for the future," Mr Savage said, "we range ourselves without fear beside Britain. Where she goes, we go; where she stands, we stand." The precise legal position of Canada cannot be decided until Mr Mackenzie King has taken the decision of Parliament, which reassembled on Thursday, for it has come to be understood that it is for the Canadian Parliament, and not the Canadian Government, to decide whether the Dominion shall go to war. But in Canada, too, there is an equally clear knowledge of the issues at stake; defence measures are already in train, and volunteers are reported to be besieging the enlistment offices. The entrance of South Africa into the war provides a most effective justification, if one were needed, of the decision to oppose the aggression of Germany. For South Africa had seemed to be billed for the rôle of benevolent neutral; and it was with some surprise that London heard the news that General Smuts had replaced General Hertzog after the latter's defeat by 80 votes to 64 in the Union Parliament. General Hertzog's point of view was that the Union should give Great Britain all the assistance compatible with the maintenance of neutrality; and it was easy for General Smuts to show that a neutral policy could be maintained only at the outset of the war and to develop the thesis that it was better to make quite clear at the beginning where South Africa stood. The Indian Congress is still in a state of some confusion as to what must be done and how far Great Britain must be supported in this war against those who are the direct ideological opponents of all that the Congress stands for, as well as their potential oppressors. Mr Gandhi has told the Viceroy that his own sympathies are with Britain and France, and he is now in conference with the Congress Working Committee at Wardha. Offers of help from the Indian Princes continue to pour in. Eire alone of the Dominions has declared formal neutrality, as was only to be expected. But the maintenance of this neutrality will obviously present both material and psychological difficulties.

**Censorship.**—Since the outbreak of war, the British Press has been subject to censorship. The censorship is voluntary—that is, there is no obligation on any paper to submit matter to the Censor before publication. But the Defence Regulations which provide sanctions against those who publish information likely to be of direct or indirect value to the enemy are wide in range and severe in penalty, and prudence dictates a large measure of prior consultation. All this is as it should be in time of war. But censorship is a very delicate weapon, which can easily harm those who wield it. This is particularly true when one of the theatres of war is in the midst of the home population

The public itself sees and hears some of the actions of the war and when, in such cases, the official bulletins are both tardy and reticent, the effect is to encourage the growth of rumour, the great underminer of morale. The Censor faces risks either way: if he is too lenient, he risks giving away information to the enemy; if he is too severe, he risks undermining the confidence of the people. But in this sort of war the second is by far the graver risk.

**Mobilising Man Power.**—It was a grave error twenty-five years ago that no attempt was made in the very early stages of the war to allocate man power between the battle-front and home industry with any system. The war began with a rush of recruits, who were readily taken; and it was not until after the lapse of many months that it was realised that many vital war-time occupations had been seriously depleted unseen. This will not happen again. It is true that the National Service (Armed Forces) Act places all able-bodied men between the ages of 18 and 41, except clergymen and registered conscientious objectors, under the obligation of military service. Clearly it is envisaged from the outset that a Field Force of considerable size may be needed. But there are a number of factors which will curb indiscriminate and wasteful enrolment. There is first of all the fact that Britain's fighting forces have never before been so strongly manned on the outbreak of war. Apart from certain special needs for tradesmen and artificers, none of the three Services is inviting recruits for the moment. Recruitment will come, but at present no essential trade will be denuded of its personnel. Secondly, when the call is made it will be conceived in the light of industry's essential requirements; experience in the next few weeks will indicate what men are indispensable at home; and, in the background all the time, there is the peace-time Schedule of Reserved Occupations which, too fully but usefully, listed the trades from which men could least readily be spared. A war-time schedule is even now being drafted. Already the Government has stated in terms its appreciation of the vital need to man the home front adequately; and there should be no cases this time of coal-miners, munition workers and, say, aircraft employees having to be hastily combed out of the fighting line. Very many more men will be needed to fight; women and unskilled men will need to be drafted into war industries by dilution. But there is every chance that the best use possible may be made of the nation's inborn and acquired skills. There are practical proofs for this hope in two of the new war-time measures passed into law by Parliament. The National Registration Act will supplement the use of the Ministry of Labour files and the National Health Insurance records in the task of counting and ear-marking the man power available. The Control of Employment Act will give the authorities a specific power of regulation over the recruitment and movement of labour which, if used with planned discrimination, should be invaluable.

**Success on the Home Front.**—The first triumph of the war for Britain was the successful completion of evacuation. Plans for the transfer of three million children, mothers and disabled people had been long and carefully laid before Friday of last week when they were set in motion. Over the week-end, not only did the machinery of transfer work with outstanding smoothness, but it also stood the strain of last-minute improvisations and additions. The timetable for transfer was cut from four days to three without noticeable dislocation; new districts were added to the vulnerable areas to be evacuated with no apparent difficulty; and, most ticklish of all in the detailed operation of the scheme, persons who had previously declined to take advantage of the official evacuation arrangements were freely accepted at the last minute and absorbed into the exodus, with no more than the hitches that might have been anticipated in any attempts to cater for unallocated evacuees. The gigantic movement that this

basic item of civil defence implies is not yet fully finished. New areas and more people are brought in daily; and beyond the bounds of the official plans firms and families are still seeking greater safety than they could hope to secure in the exposed and crowded places where their activities are not absolutely needed.

**Revising Our Way of Life.**—Two things may be said of evacuation so far as it has gone. In the first place, the triumph of the local authorities, their officials, their teachers and their transferred women and children vastly enhances the power of the people to resist ruthless assault from the air. We can sleep more happily in our beds for the departure of our innocent and defenceless friends. In the second place, a social event of the first magnitude, one which will play no small part in moulding the future character of the country's life, has been begun. Evacuation in the widest sense has barely started. It is not enough that these people should have been taken so surely and so swiftly to places beyond the heat and burden of the days to come. They must have the full chance to live their lives completely in their new homes and novel surroundings. Nor is this merely a matter of housing and provisioning. In effect, the dream of the town and country planners is now possible. New communities can now be made in place of the knotted and congested urban clusters that a series of industrial and commercial revolutions have created; and there can be no doubt that this potentially health-giving redistribution of our people will be swollen more with the passage of weeks as more groups and individuals find that their presence and their work are not vitally needed in the danger zones. It is a chance to set up something of a new social order that confronts us; and it has a twofold guise. On the one hand, there are the folk who are finding a new life in new places; they will take time to find their feet and they will not always be congenial to their hosts. On the other, there are the aborigines of the reception areas; they will have something to suffer and something to offer, too. On both sides the need for generous toleration and open-handed communal co-operation is strikingly apparent. It will be the task of the authorities, central and local, to show the way; and in the plans that are already unfolding for the education of the refugee children there is hopeful earnest of the way in which the job will be done. The refugees may soon come back; but, whether they do or not, their going has opened the door to changed modes of life and thought which might be of unqualified benefit.

**Neutral America.**—The diplomatic actions of the United States Government since the outbreak of war, apart from an appeal to both sides to forswear the bombing of open towns, have been confined to the issue of proclama-

## INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

tions of neutrality. One of these fulfilled the usual obligations of a neutral under international law; another invoked the specific provisions of the Neutrality Act and prohibited the export of munitions or instruments of war, including aircraft, to either side. The official attitude of the United States is thus one of scrupulous neutrality. America is not, however, morally neutral, and if there were any doubt about the side on which American sympathies were enrolled it was dispelled by the torpedoing of the "Athenia." President Roosevelt has not yet summoned Congress in special session to repeal the arms embargo, but the public demand for the repeal is mounting and, since the President is known to favour it, he can be expected to choose the moment for summoning Congress when the opposition will be at a minimum. There is no doubt that America wants to keep out of the fighting; but there is even less doubt that she sees her interests wrapped up with the victory of one side.

**M. Molotoff Speaks.**—The Soviet Government, in one way or another, has now issued a full self-justification for the non-aggression pact with Germany. Most of the arguments were contained in M. Molotoff's speech to the Soviet Supreme Council on the ratification of the pact on Thursday of last week. They are worth recording if only so that they can be recalled and refuted whenever the British Government feels it wise to tell the other side of the story. According to M. Molotoff, the British and French Governments were not acting in good faith when they sent negotiators to Moscow. Their attitude was "frivolous" and "such as to discredit the conversations." The men they sent were "without authority to make binding engagements." M. Molotoff referred to what he called the contradiction in British and French foreign policy: "Britain and France were afraid of aggression and needed a pact with the Soviet Union to strengthen them. But a pact with the Soviet Union might strengthen the Union, and that did not suit them. That was the only explanation of the position of Poland (which, Marshal Voroshiloff has told us, offended by refusing the passage of Russian troops), which was acting on instructions from Britain and France." It was only "after the conversations with Britain and France had met with insuperable obstacles" that the treaty with Germany was discussed. Only then "could they try that means of safeguarding peace." On our side the facts have not yet been told. But it is difficult to accept M. Molotoff's version of what happened at Moscow during those five months of negotiation. If it is true, as M. Stalin has said, that the Soviet Union is on the side of the victims of aggression, then it seems strange indeed that the Soviet Union should have compounded with a nation which had just committed several aggressions and was even then on the point of another and most black aggression—simply because Poland, whether or not at the instigation of Britain and France (for that is immaterial) asked not for the men but only for the materials of war. That is a strange way of defending the right.

The meaning of the pact remains imprecise to the outside gaze. M. Molotoff warned his hearers against the tendency to read into the treaty more than it contained. The Soviet Union was not obliged to come into a war either

for or against Germany. It is clear that the Soviet Government attaches a good deal of importance to the commercial agreement signed on August 19th; this was referred to by M. Molotoff "as the best agreement they had ever had with Germany and the most advantageous with any country." He pointed out "that the credit clauses made it possible for the Soviet Union to order much-needed equipment, and Germany would order Russian raw materials." The troubled question of the ways and means of delivery between Germany and Russia was not touched on.

**Japan's Position.**—The sparse news from Japan in the past week confirms one's first impression that the Japanese governing class sees in the German-Russian non-aggression pact a warning against European entanglements, and in the European struggle an opportunity for Japan to continue her war in China without Western hindrance. The new Prime Minister, General Nobuyuki Abe, made several cautious statements to this effect in a Press interview on Thursday of last week, revealing, as was anticipated, that his viewpoint is a good deal more "moderate" than that of Baron Hiranuma, the retiring Prime Minister. "It requires further study," he said, "to decide whether the Anti-Comintern ties are to be kept alive or whether some better formula can be found to replace them." Evidently the Japanese are going to wait and see. The adoption of a conciliatory attitude towards British interests in China depended on Great Britain's abandoning her attitude "favourable to General Chiang Kai-Shek's regime"; but at the same time, with regard to the Tokyo talks, General Abe is reported to have said "that it would be rather narrow-minded not to respond to a conciliatory attitude on the part of the other party, even if the talks had previously resulted in deadlock." This statement was made before the outbreak of war: its meaning may now be expected to be modified by a lively expectation of British favours in return for Japanese "conciliation." Germany's fall from Japanese grace will not make the Japanese love the British any more; and it was natural that, when declaring its neutrality, the Japanese Government should have requested the British Government not to take any measures prejudicial to Japan's position in China. A modifying factor remains the Russo-Japanese tension in Manchuria; there, fighting has again taken place, and once again the facts are hard to come by. The Japanese are obviously alive to their increased danger from Russia. It is legitimate to guess that this will have a moderating effect on their conduct of foreign affairs.

**Inside Germany.**—One of the matters on which in the fog of war, it would be most reassuring to have certain news, is the state of affairs inside Germany. But it is a matter on which reliable information is hardest to come by. The Nazi leaders obviously have no great confidence in the people's support. Casualty lists are not being published and relatives of the killed are forbidden to wear mourning. Listening to any foreign radio is a serious crime. Serious discontent with the rationing regulations is also reported. Possibly more important are the evidences of economic strain in Germany. The Council of National Defence has issued decrees which open the way to indefinite increases in working hours, without any increase in wages. The income-tax on all incomes over Rm. 2,400 (say £150) a year, already severe, has been increased by 50 per cent., and special taxes of 20 per cent. on the retail price have been superimposed on top of the existing duties on "luxuries" such as beer and tobacco. Currency inflation—which has a direct bearing on public psychology—is proceeding apace. Paper money for 5 marks, 2 marks and 1 mark has been introduced owing to a shortage of small change. The note circulation of the Reichsbank increased in the one week to August 31st from Rm. 8,810 millions to Rm. 10,907 millions—an increase of 25 per cent., roughly equivalent to about £140 millions. An increase, on the other side of the Reichsbank return, of Rm. 2,132 millions in "bills of exchange, cheques and Treasury bills," shows that the Government is already financing itself by the printing press.

**On Guard in the Balkans.**—It was always clear that Italy's neutrality in case of war must considerably ease the difficulty which the Balkan countries might meet in maintaining their own neutrality. Now that Signor Mussolini has declared that Italy will take no military initiative, the Yugoslav Government, fortified by the knowledge that a united country is now behind it (the Serbo-Croat agreement having been enthusiastically received), is in no great danger of being forced off its neutral footing. Realisation of this will naturally have a stabilising effect on public opinion in Bulgaria; and the prospects for peace in the Balkans are correspondingly bright. Hungary's position is not yet entirely clear. Her declared policy, however, has for long been one of complete neutrality. It is reported that, during the past week or so, the Hungarian Government has in fact made an approach to the Yugoslav Government, and, given the latter's close relations with Roumania and the dependent attitude of Bulgaria, it would seem that a general Balkan *rapprochement* should not be excluded. From Bucharest there is news that Roumania is anxious to secure herself further by concluding non-aggression pacts wherever they are feasible; the effect of these could not be otherwise than beneficial. In short, there is some hope that the war may lead Hungary and Bulgaria to compose their differences with their Balkan neighbours, and that Balkan unity, for so long a mirage, may at last become a fact.

**Portugal and Spain.**—The Portuguese Government has announced Portugal's neutrality, adding that their "obligations in our alliance with Britain, which we wish to confirm on this grave occasion, do not compel us to abandon" that position. The only official statement so far made by the Spanish Government came on Tuesday, when it was decreed that all Spaniards must keep the strictest neutrality in accordance with international law. On Thursday of last week General Franco took another step towards the organisation of his regime by creating a Supreme General Staff under his own immediate orders, with General Vigon as its administrative chief. The new body's main duties consist in the submission of schemes for co-

ordinating the national forces in case of war and for their most efficient ordering and mobilisation; in discussing and submitting plans for the combination of army, navy and air force operations; and, thirdly, in supplying the supreme command with information concerning the military and economic strengths of other countries. In the preamble to the decree it is stated that a development of the military and economic strength is aimed at so as to ensure Spain's welfare in peace as well as "to guarantee our liberty of decision in the event of armed conflict."

**The Near and Middle East.**—It is no small thing that Britain goes to war, in comparison with twenty-five years ago, backed by the sympathies of the peoples of the Near East. If it is left to us and to them, there will be no war in the Mediterranean. Since the last war Egypt has emerged into full independence, and now, in accordance with the Anglo-Egyptian Treaty, fulfils her obligations to Britain willingly. Diplomatic relations have been severed with Germany, and the country is in a condition of armed preparedness. Behind Egypt stands the Arab world, its representatives only lately in conference with the British Government over the Palestine problem, its broad interests running in the same direction as theirs. On the other side of the Near Eastern bridge stands Turkey, allied to Britain (for although the formal alliance is not yet signed, the mutual declaration is fully binding and has received the approval of the Turkish Kamutay) in keeping the peace in the Mediterranean and in the Balkans. Attached to Turkey by non-aggression pacts are the Middle-Eastern Powers of Iran, Iraq and Afghanistan, a whole system of mutual security reached by peaceful negotiation. The existence of such a system does not, of course, guarantee the goodwill of those Middle-Eastern States towards us; what it does do, though, is to weight the scales heavily in that direction—so heavily, in fact, that unless long-standing grievances are also there, not the subtlest German propaganda will find ground to stand on. With Iran and Afghanistan we have no accounts to settle or to consider, and our treatment of Iraq, the scrupulous and successful rendering of the mandate, is one of the brighter parts of our imperial history.

## THE WORLD OVERSEAS

### Argentine Railway Troubles

(From a Correspondent)

AN airing has been given to the Argentine railway problem as a result of the occurrence of a "work-to-rules" movement among the employees of the British-owned Buenos Aires and Pacific Railway. "Working to rules" is a euphemism for imperfect co-operation in the normal working of the line. It was instituted in support of the claims of the workers for the immediate refund of amounts of wages provisionally retained under the award of President Justo of October, 1934. In consequence the Argentine Government invited the railway companies and the railwaymen's unions to make a statement of their case in order that the situation might be reconsidered in the light of present conditions.

All the privately-owned railway companies made a joint statement. They began by pointing out that the agreement of the year 1931 (when the companies and the workers agreed to reduce both wages and working hours in preference to dismissals of staff) was a result of a depression in the railway industry, which was then believed to be temporary. Later events, however, proved that many of the phenomena which made their appearance in the depression—including the devaluation of the Argentine currency—had come to stay. The agreement of 1931 was consequently modified by the presidential award of 1934, but its essential basis remained unchanged. A system of retentions from wages, to be refunded when conditions should permit, was substituted for the re-

duction of wages, and it was provided that no dividend should be paid to shareholders until the retentions had been fully repaid. Since that time not a single year had passed without some labour disturbance. The companies, on the other hand, had strictly fulfilled their side of the bargain, and as a result their shareholders had received no dividends since 1930, their reserves were diminishing, and their credit was being impaired.

### BANK OF MONTREAL

(Incorporated in Canada in 1817 with Limited Liability)  
Financial Agents of the Government of the Dominion of Canada in London  
CAPITAL PAID-UP ... .. \$36,000,000  
REST AND UNDIVIDED PROFITS \$40,183,254  
TOTAL ASSETS IN EXCESS OF \$860,000,000  
Head Office: MONTREAL  
H. R. Drummond, Esq., President.  
Major-General The Hon. S. C. Mewburn, C.M.G., W. A. Bog, Esq., Vice-Presidents.  
Jackson Dodds, G. W. Spinney, Gen. Managers.  
The Most Honourable The Marquess of Willington, P.C., G.C.S.I., G.C.M.G., G.C.I.E., G.B.E. (Chairman).  
F. R. S. Balfour, Esq., Sir Hardman Lever, Bart., K.C.B.  
Sir Frederick Williams-Taylor.  
London Offices: 47 Threadneedle Street, E.C.2 (Edward Pope, Manager)  
9 Waterloo Place, Pall Mall, S.W.1 (J. H. Pangman, Manager)  
The Bank undertakes banking business in all parts of the world, and with its numerous branches offers special facilities in Canada, Newfoundland and the United States

### THE BRITISH LINEN BANK

Incorporated by Royal Charter, 1746

Head Office: 38 St. Andrew Square, Edinburgh

OVER 210 BRANCHES IN SCOTLAND

LONDON OFFICES:

City Office: 38 Threadneedle Street, E.C.2

West End Branch: 198 Piccadilly, W.1

The companies presented the following table showing the continuous fall in earnings:—

| Year               | Net Receipts<br>(In thousands of Argentine pesos) | Exchange Loss | Available Capital | Interest per cent. on Capital |
|--------------------|---------------------------------------------------|---------------|-------------------|-------------------------------|
| 1927               | 177,276                                           | 370           | 176,906           | 6.15                          |
| 1928               | 176,625                                           | 382           | 176,243           | 5.85                          |
| 1929               | 156,870                                           | 1,779         | 155,091           | 4.85                          |
| 1930               | 113,252                                           | 13,258        | 99,994            | 3.01                          |
| 1931               | 118,950                                           | 34,312        | 84,638            | 2.47                          |
| 1932               | 95,716                                            | 18,007        | 77,709            | 2.29                          |
| 1933               | 74,780                                            | 13,466        | 61,314            | 1.80                          |
| 1934               | 110,581                                           | 55,216        | 55,365            | 1.63                          |
| 1935               | 104,599                                           | 49,900        | 54,699            | 1.61                          |
| 1936               | 103,242                                           | 44,043        | 59,199            | 1.75                          |
| 1937               | 105,854                                           | 39,614        | 66,240            | 1.96                          |
| 1938 (provisional) | 76,783                                            | 34,476        | 42,307            | 1.25                          |

These figures do not include results on the Cordoba Central Railway. It was pointed out that the amount shown as available is not the profit. Out of it must be paid the debt service on debentures, which for the British-owned companies represents, at 16 pesos to the £, the sum of 74,293,344 pesos annually. In view of the position, the railway companies could not do otherwise than recommend that the existing agreements be maintained. Nevertheless, they were willing to consider any new arrangement whereby the railways might be administered with order, economy and efficiency.

In their reply to the Government's invitation, the Federation of Railway Workers and Employees urged that the agreement of 1931 and the Presidential Award should be discontinued on the ground that the original situation had changed. They stated that up to the end of June, 1939, according to the movement of the Railwaymen's Pension Fund, more than 32,000 employees and workers had retired, and therefore that the companies could no longer claim that they were overstaffed. The Federation declared the salaries paid to the Managers and Administrators of the railways to be unnecessarily high, and suggested that since the passage of the Transport Co-ordination Law economy might be achieved by other than the reduction of the wages of the workers.

The Transport and Communications Committee of the Federal Chamber of Deputies made a recommendation in favour of the workers' claims, but compromised to some extent by saying that the balance sheets of the companies should be taken into consideration. A Bill to annul the Presidential Award has been introduced in the Chamber of Deputies, and has been debated at length. Owing to lack of a quorum, the issue has not yet been voted.

## Investment, Earnings and U.S. Unemployment

[FROM OUR NEW YORK CORRESPONDENT]

THE flood of gold into the United States has proceeded unabated during the last eighteen months. Excess reserves in the banks have been swollen and the supply of credit has expanded. But the proceeds of this gold flow have not for

some months sought investment (as formerly) in the stock market. Thus there is ample evidence in the American market of a plethora of credit side by side with a dearth of capital. Whether this dearth of capital is the consequence of the absence of the formation of capital, that is, savings, or of the unwillingness of those with savings to invest them, is debatable. But some light is thrown on this triple question of the supply of capital, the demand for capital and the state of mind of investors by the evidence that can be drawn from the profitability of earlier investment; that is, from the course of corporate profits:—

#### CORPORATE PROFITS (INDUSTRIAL) 167 companies (\$000,000)

|                   |      |      |                     |                      |     |
|-------------------|------|------|---------------------|----------------------|-----|
| Quarterly average | 1928 | 301  | First quarter, 1938 | 74                   |     |
| "                 | "    | 1929 | 348                 | Second quarter, 1938 | 85  |
| "                 | "    | 1930 | 199                 | Third quarter, 1938  | 62  |
| "                 | "    | 1931 | 76                  | Fourth quarter, 1938 | 187 |
| "                 | "    | 1932 | 22                  | First quarter, 1939  | 153 |
| "                 | "    | 1933 | 46                  | Second quarter, 1939 | —   |
| "                 | "    | 1934 | 81                  |                      |     |
| "                 | "    | 1935 | 145                 |                      |     |
| "                 | "    | 1936 | 235                 |                      |     |
| "                 | "    | 1937 | 253                 |                      |     |

Using a smaller number of corporations, and reducing the figure to an index with 1926 as base, the Standard Statistics Company computes industrial corporate profits in the first half of 1939 at about 62-65 per cent. of 1926. Since the index of production in the first half of 1939 was only about 10 per cent. below 1926, the inference would seem to be that the profit margin has shrunk. The course of dividend and interest payments tells the same story and the annual record of monthly averages of dividends and interest gives another chapter of the tale:—

#### DIVIDENDS AND INTEREST (\$000,000)

|      | Monthly Average |      |     |
|------|-----------------|------|-----|
| 1929 | 944             | 1934 | 646 |
| 1930 | 950             | 1935 | 651 |
| 1931 | 826             | 1936 | 740 |
| 1932 | 668             | 1937 | 797 |
| 1933 | 591             | 1938 | 682 |

That is, the return on investment in 1938 was barely higher than in 1932; and ever since 1931, with the exception of 1936 and 1937, this return has remained very low. To an extent this may be attributable to refunding of fixed-interest obligations; but that influence is probably only minor. The distributed and undistributed earnings of corporations are the principal source of capital; and two things are clear: the supply of capital is greatly shrunken; and the capital-attracting power of American enterprise (effective demand) has lately been far from potent.

The trend of the return on investment funds can be illustrated by the following table:—

#### DIVIDENDS AND INTEREST (\$000,000)

|      | Interest | Dividends |
|------|----------|-----------|
| 1929 | 5,356    | 5,978     |
| 1930 | 5,575    | 5,801     |
| 1931 | 5,522    | 4,335     |
| 1932 | 5,277    | 2,745     |
| 1933 | 4,937    | 2,209     |
| 1934 | 5,074    | 2,793     |
| 1935 | 4,927    | 3,037     |
| 1936 | 4,847    | 4,807     |
| 1937 | 4,877    | 5,424     |
| 1938 | 4,812    | 3,708     |

It will be noted that, by a combination of default and re-financing, the interest return was lower in 1938 than in 1932, and made a new low. It is doubtful if it is running any higher now in 1939. Dividends in 1938 were considerably higher than in the four lowest years of the depression, and, as a consequence of the undistributed profit tax, were almost as high in 1937 as in 1929, although corporate earnings were lower. As the earlier table shows, in the first half of 1939 earnings were higher than in the first half of 1938; but the aggregate of dividends was little changed.

It is hardly necessary to amplify comment on the relation of corporate earnings (distributed or undistributed) upon employment. When earnings are low, there are neither the funds to invest in capital goods nor the incentive to invest them; and unemployment is heaviest in precisely those industries which can be activated only by the re-investment of corporate savings, distributed or undistributed.

It seems clear, therefore, that unemployment is intimately related to corporate earnings. But the reason for low corporate earnings is not readily discovered. Two reasons commonly

given are labour costs and taxation. There is one other consideration often overlooked because it is general and vague. Only in retrospect can one appreciate the shattering impact of the events of 1929-32. This was not a cyclical swing, but, in a way, a structural collapse. Inevitably the rebuilding process must have been long, tedious and discouraging. That seven years of fitful recovery should have brought our economy no further than it has done is irksome to the impatient, but it was probably inherent in the circumstances.

## Portugal's Financial Strength

[FROM OUR LISBON CORRESPONDENT]

THE Portuguese Government has issued its statement of accounts for the year ended December 31, 1938. Luminous but lengthy, and hard to present in *précis* form to anyone who cares for a lucid thesis on the practical application of economic theory to a country's finance and production, Dr Salazar's latest statement is most interesting. Remarkable that whether one reckons in escudos or in money of much greater value, the principles of national economy are the same, he again lays stress on his dislike of deficit financing and insists on official thriftiness as being the only way to permanent well-being.

Assuming the conto is worth £10, on this basis the accounts for 1938 close with an effective surplus of £2,428,840. This sum, added to previous surpluses, makes a gross total of £18,480,000. Out of this has been spent £6,730,000, leaving a balance actually in hand of £11,750,000 available for current expenditure without its being necessary to have recourse to loans or increased taxation. The floating debt has gone and bonds of the public debt, which in 1929 were carrying 6½ per cent. interest and were quoted round about 50, now average 3½ per cent. at a quotation of 95. The total, moreover, has been reduced by close on £7,000,000, and the saving on interest charges obviously has had much

| PORTUGUESE FINANCIAL STATEMENT, 1938           |           |            |                                                  |           |            |

| Treasury operations                            |           | 42,255,260 | Cash in hand Bk. Port. and agents                | 1,994,650 | 2,397,040  |
|                                                |           | 70,029,260 |                                                  |           | 70,029,260 |

to do with the flourishing state of the Treasury. Note circulation and the reserve legally carried by the Bank of Portugal both show a slight increase, the reserve being in the order of 43.5 per cent. in December, 1938. Of his reserve 27 per cent. was held in specie.

The balance of trade, after deducting war materials from the imports and applying a corrective of 55 per cent. to export values as calculated here, shows a deficit of close on £4,000,000. This is more or less the same as in 1937. It is more than likely that exact details, if they were obtainable, would show that Portugal's trade is as near to a state of equilibrium as any country can expect to reach in this disturbed time. One can only hope that Dr Salazar's closing words are not to be taken too literally. "For myself," he said, "it is by no means likely that I shall draw up any further statement of account. This is the tenth, and it ought to be the last. Ten, nay, eleven, years in the present times ought surely suffice to demonstrate the solidity of the foundations that we have laid." Perhaps this remark only means that in future the annual statement will be much compressed; if so, such members of the public as are interested in following intelligently the course of public finance will be the losers, and Dr Salazar spared what has been notoriously a severe task and one that he has accomplished almost single-handed. With entire success, as the results of the decade abundantly show.

September 1st.

## Turkish Trade

[FROM OUR ISTANBUL CORRESPONDENT]

COMPARATIVE statistics for the first five months of 1939 show that total Turkish exports in that period were almost exactly equal to those of the corresponding period in 1938. But within the totals considerable shifts have taken place.

|          |                        |                 |              |
|----------|------------------------|-----------------|--------------|
| Mohair   | exports increased from | £T999,000 to    | £T3,980,000  |
| Wool     | "                      | £T616,000 to    | £T1,276,000  |
| Opium    | "                      | £T370,000 to    | £T1,106,000  |
| Egg      | "                      | £T294,000 to    | £T 913,000   |
| Walnut   | "                      | £T 69,000 to    | £T 522,000   |
| Tobacco  | exports fell from      | £T13,388,000 to | £T11,525,000 |
| Cotton   | "                      | £T 4,037,000 to | £T 2,490,000 |
| Sultanas | "                      | £T 3,250,000 to | £T 1,064,000 |
| Wheat    | "                      | £T 2,803,000 to | £T 928,000   |
| Rye      | "                      | £T 1,244,000 to | £T 263,000   |
| Orange   | "                      | £T 367,000 to   | £T 190,000   |

Imports, which at the end of May 1938 amounted to £T64,208,000, were £T55,442,000 only; but thanks to this, the seasonal import balance fell from £T14,750,000 to £T5,600,000. An export balance may well be expected by the end of the year.

The fact cannot be overlooked, however, that the German share in Turkish import trade rose from 43 per cent. to 52.6 per cent. and in Turkish export trade from 35.6 per cent. to 50.2 per cent. Turkish exports into Great Britain amounted to £T1,647,000, or 3 per cent. of the whole; Turkish imports from Great Britain to £T3,184,000, or 5.7 per cent. of the whole. Although more recent official figures are not yet available, it may be inferred from the present material that Germany and Italy are now absorbing as much as two-thirds of Turkish export staples; and the possibility that these purchases may, for political reasons, fall off without others to take their place is a matter of increasing concern in the Turkish trading community. It is sincerely hoped that Great Britain with her immense resources will find ways and means to purchase Turkish goods at a price which will take due account of the discrepancy existing between world prices and those ruling on the Turkish home market. Such a development would add to the satisfaction already felt at Turco-British co-operation in the political field and also at the millions England is spending for Turkish re-armament.

August 31st.

## New Zealand Spends More

[FROM OUR CHRISTCHURCH CORRESPONDENT]

DURING the last four years of Labour Government the growth of public expenditure has been remarkable. Up to the end of 1937, while rising export prices continued to expand national income, the increased expenditure was financed by expanding tax revenue and internal loans. When export prices fell in the 1937-38 season and income tended to contract, the sources of internal loans dried up, and the Government resorted to the Reserve Bank, from which it borrowed

£NZ14 millions, mainly for public works, in the financial year 1938-39. In consequence over-importation occurred, some capital was exported, the banks' sterling funds fell to very low levels, exchange and imports were controlled, and the Government had to arrange for export credits in London.

In view of the need to restore sterling funds and the normal trading conditions dependent on them, and to repay in the near future the short loans raised in London, it was expected that expansion in State activity in New Zealand would be checked, provision made for meeting future commitments, and expenditure on public works reduced. There is no sign yet that these expectations will be fulfilled. The Budget of 1939, presented on August 1st by the Prime Minister, who is acting Minister of Finance while Mr Nash is abroad, provides for considerable increases in expenditure, both on current and capital account, and the estimates given of loan money required for the current year appear impracticable without further resort to Reserve Bank credit.

The extent to which taxation and budget expenditure have been swollen in the last decade is shown in this table.

| PUBLIC ACCOUNTS<br>(£NZ Millions)    |             |             |             |                      |

| Surplus + or<br>deficit - .....      | - .57       | + .28       | + .81       | + .02                |
| Special wage and<br>income tax ..... | ...         | 3.92        | 5.40        | 9.23                 |
| Total taxation ...                   | 17.84       | 25.48       | 37.71       | 41.55                |
| Taxation per head                    | £12 4s. 3d. | £16 5s. 6d. | £23 8s. 0d. | £25 10s. 0d.         |

The chief cause of this remarkable growth is increased expenditure on social services, including education, health and pensions. For 1939-40 social security benefits are to be added and the estimated total cost for social services is £NZ23.57 millions.

But the Government has failed to secure the co-operation of the medical profession, the estimated cost of medical benefits is only £NZ100,000, and the total cost of the new social security scheme is £NZ12.06 millions, compared with the Minister's estimate of £NZ16 millions when the Act was passed in 1938, and the actuarial estimate of £NZ17.85 millions.

The 1939 budget transfers expenditure on pensions, amounting to £NZ4.85 millions, to the social security account, but allocates £NZ2 millions from the Budget to that account, so that the net relief to the Consolidated Fund is £NZ2.85 millions. This relief is approximately offset by an additional £NZ2.9 millions required for employment promotion, since the revenue from the special wage and income tax now goes to the social security fund. An extra £NZ1 million is needed for defence, and reduced yields are expected from customs, income and other taxes. Consequently, additional taxation is imposed to yield £NZ2½ millions; income tax and death duties are increased; the petrol tax is raised by 4d. to 1s. 2½d. a gallon, of which 6d. goes to the highways fund, and the beer duty is raised from 1s. 3d. to 1s. 9d. a gallon.

The recent growth of expenditure of loan money on public works has been even greater than the growth of taxation.

In 1935-36 £NZ5.24 millions was spent on public works, including £NZ2.4 millions loan money and £NZ2.84 millions from revenue. In 1938-39 expenditure, excluding housing, was £NZ16.78 millions, of which £NZ12.48

millions was borrowed and £NZ4.30 millions came from revenue. The estimates for public works in 1939-40, again excluding housing, total £NZ23.29 millions, of which £NZ19.06 millions is to be borrowed and £NZ4.23 millions is to come from revenue. This year the Government has already raised an internal loan of £NZ4½ millions to yield about 4½ per cent., and it has arranged credits in London for the import of defence and other materials for Government use up to £5 millions sterling. But no adequate provision has been made for raising the remainder of the money which will be required. State, banking and private reserves have been greatly reduced of late by heavy borrowing, money is scarce, taxation and costs are high, the Government's commitments elsewhere are considerable, and it is difficult to see how the necessary funds can be raised from genuine savings.

If further inflation is to be avoided, a drastic downward review of present proposals appears to be imperative.

August 17th.

## Latvian Industry and the State

[FROM OUR RIGA CORRESPONDENT]

As in many other countries which used to be almost wholly agricultural, industry has developed very rapidly in Latvia during the last few years. This development has been directed by the authoritarian Government into strictly defined channels, most stress being laid on the processing of primary products.

The part played by the State in industry has grown so much that there are now hardly any important branches in which it is not represented by at least one leading concern. To secure orderly co-operation between these State-owned or State-controlled undertakings they have all been brought together under one "economic corporation." The objects of this union are to secure the conformity of all their activities to the general politico-economic plan, the adoption of a common policy with regard to wages, prices and sales, and the systematic adoption of measures of rationalisation.

Special importance is attached to the rationalisation of industry, which is fostered by a special institute founded in the spring of this year. Plans have already been adopted for the saw-milling, veneering, building and textile industries, under which, for example, the number of veneering establishments has been reduced from fourteen to eight. The saw-mills working for export are being reorganised and equipped with new and up-to-date machinery, and similar measures are being adopted for building.

The latest industrial developments have been much influenced by a law passed at the end of 1938 for the establishment of industrial and commercial "syndicates." The Minister of Finance may compel a syndicate to be formed, or the *entrepreneurs* concerned may themselves take the initiative, in which case the project must be approved by the Chamber of Industry or Commerce. The president of a syndicate is elected by the members, but their choice has to be confirmed by the Minister of Finance. The object of these syndicates is to secure co-operation in *all* matters, in which respect they are very different from cartels. The members' obligations are very far-reaching, and may even include the compulsory disclosure of secret processes; severe penalties may be inflicted for breaches of the law.

This brief description is sufficient to show that the law is designed to bring industry and commerce further under the influence of the State. In numerous trades syndicates have already been set up, and experience shows that control has, in fact, passed into the hands of State or semi-State undertakings.

\* \* \*

**Current Business Position.**—No great changes have been noticeable recently in the state of business. Employment continues to be good and there is even a growing shortage of special types of skilled labour. The last official estimates suggested a good harvest, but the subsequent dry spell has caused some deterioration. Exports showed a considerable increase in the first half of 1939, being 118 million lats as against 94 millions in the first half of 1938; imports rose from 111 millions to 118 millions. The rise in imports is largely due to increased purchases designed to cover the risk of war or blockade.

# THE BUSINESS WORLD

## Exchange Control

AS from Tuesday of this week the foreign exchange market in this country has been subjected to complete official control. The transition from a free to a severely regulated market was effected with a smoothness and efficiency which testify to careful and long preparation. There may be criticism of points of detail in the scheme which has been introduced, but the general principle which underlies it brooks no discussion. Steps had to be taken to mobilise and safeguard our vital reserves of gold and foreign exchange. Side by side with these measures the machinery of the foreign exchange market, the method of dealing, and the rates quoted had to be adjusted to the present war conditions. Let us consider the essential outlines of what has been achieved under both heads.

Under the Defence (Finance) Regulations, which came into operation this week, every holding of gold and certain specified foreign currency assets held by residents in this country must be offered through a bank to the Government and will be paid for in sterling at the prevailing rates. The currencies in question are United States and Canadian dollars, belgas, Swiss and French francs, guilders, Argentine pesos, Swedish and Norwegian kroner. The list may be added to from time to time. No exception to this obligation can be made except with official sanction. Such sanction will be given where the gold or foreign exchange now held is needed to pay a pre-war debt payable in gold or foreign exchange, for reasonable requirements in the normal course of business or for reasonable travelling and other personal expenses. The necessary applications for exemption will have to be made through a bank. The liberality with which such exemptions will be granted is indicated by the specific mention in the official explanatory comments on the regulations of the fact that no one owing money outside this country will be able to plead the foreign exchange regulations as an excuse for not meeting his foreign exchange liability. Sterling may be a controlled market, but the phenomena of blocked sterling balances and of transfer moratoria are not as synonymous with exchange control as totalitarian experience would seem to suggest; they have certainly made no appearance in our midst.

Every conversion of sterling into any foreign currency has been made subject to official permission. The reasonable requirements of importers into the United Kingdom will be met so far as possible. Importers have been given full details of the formalities that have to be completed in order to obtain foreign currency allotments, whether to pay for goods imported, freight, insurance premiums, etc. These formalities are not cumbrous and certainly avoid the rigidities and bureaucratic complications which have found their way into the system of import and *devisen* control evolved in Germany for some years past. They make special provision for transit trade, a sphere of activity which might well have been the first to suffer from any severe and unimaginative application of exchange control in this country.

In order to complete the edifice of control special provisions have been drawn up for limiting the amount of currency—whether domestic or foreign—which may be taken into or out of the country in the form of actual cash. On leaving the United Kingdom all travellers must declare any money—whether British or foreign—which they are taking abroad and produce their authority. Travellers

arriving in this country may declare the money they have brought in with them, and this declaration will be accepted as a justification for taking the same amount of money out of the country when the traveller leaves again.

These provisions, together with those for the listing and eventual mobilisation of foreign securities held in this country, make up a system of control which, superimposed on the ready co-operation of the banking system with the authorities, should get into its stride with the minimum of delay or friction. Experience is certain to suggest amendments here and there, and our traditional genius for adaptation will ensure that those amendments are made. Already it is evident that the strict letter of the regulations will work with excessive harshness in the case of temporary foreign residents in this country who, as the regulations stand, would have to sell to the Treasury the whole of the liquid assets held for them in their home country.

In evolving the machinery for dealing with the new controlled market the authorities have had to complete a revolution almost as startling as that embodied in the transition from a free to a controlled market. In the first place dealings in foreign exchanges are to be focussed ultimately on the Bank of England, which has become the ultimate buyer and seller of all foreign exchange traded in this country. The contact of the Bank with the market is effected through a list of authorised dealers. This list comprises the London clearing banks together with the Scottish and Northern Ireland banks. These are authorised to deal in all foreign currencies. In addition a list of banks has been published, authorised to deal in certain Colonial and Dominion and foreign currencies—the bank in each case being represented in the country concerned.

This list of authorised banks has given rise to a certain amount of confusion and criticism, some of it misconceived. It is understood that the restriction of the formal list to the joint-stock banks was done for administrative convenience, since their enormous network of branches,

## WILLS & TRUSTS

In acting as an executor or trustee, the Westminster Bank aims at putting itself in the position of a private trustee. It is therefore its practice to employ the family solicitor, if there is one, or any other solicitor the client may name; by such means the Bank succeeds in combining domestic tradition with business efficiency. A book showing the advantages of corporate executorship and the terms of appointment may be had at any branch

covering the whole country, will obviously be of great assistance in working a system of control which necessarily involves great attention to detail. The impression got abroad, however, that the private banks, merchant banks and acceptance houses of London were to be placed at a disadvantage by compelling them to pass their foreign exchange business through one of the authorised banks. The foreign exchange market in London owes its development and efficacy to the pioneer work accomplished by institutions of this character whose interests have always lain in foreign trade. In normal times they are able to give their clients a special service which cannot be matched by the larger institutions. If these specialists (who, incidentally, in the last few days, have had to instruct their new competitors in the intricacies of foreign exchange dealing) were to be compelled to pass all their business through a joint-stock bank, so that, far from being able to quote a finer rate to their clients, they would be able to quote a competitive rate only by forgoing all profit from the transaction, manifest injustice would be done. The case for including these specialist institutions is completed by the fact that they have large staffs of dealers who would otherwise be standing idle, while the often exiguous foreign exchange departments of the authorised banks are being overwhelmed—in more ways than one—with unaccustomed work. Actually, however, the *de facto* exclusion of these firms from the market in the first half of the week seems to have been due partly to a misunderstanding and partly to a clogging of the administrative machinery. It appears that all the established houses of this character will be allowed to deal direct with the Bank of England and will therefore be on an equal footing with the joint-stock banks, though the volume of business they get from abroad will inevitably suffer from the fact that their names are not on the authorised list.

As the market functions at present, the Bank of England publishes each day a list of parallel foreign exchange rates at which all buying and selling orders respectively must be executed. These orders normally reach the Bank through one of the authorised banks, which for their services receive a commission from the Bank and from the client. If a non-authorised bank deals it receives the commission from the client but deals "net" with the clearing or other authorised bank through which it hands on the business. No bank is allowed to carry its foreign exchange transactions. All these transactions must be canalised to the

Bank of England, and it is this institution which collects—for whose credit it is not yet certain—the considerable amounts represented by the abnormal margins between official buying and selling rates. Leading rates fixed this week have been 4.02 to 4.06 for U.S. dollars, 174 to 175 for French francs, 23.42 to 23.72 for belgas, and 7.57 to 7.64 for guilders. The dealing margins amount in certain cases to over 1 per cent., and are considerably larger than those which obtained in a free market. Since these rates are fixed, it is evident that the service which one bank can give to its clients in foreign exchange business is identical with that offered by all the others. Any special qualification for foreign exchange dealing disappears in this all-obliterating homogeneity.

The new mechanism of the foreign exchange market differs in one other important respect from the old. It obviates altogether the use of foreign exchange brokers, who have for about twenty years been the traditional intermediaries between dealers. Their disappearance was perhaps inevitable under the new arrangements, but it gains in significance and pathos—if such emotion is still authorised—from the fact that it was only a comparatively short while ago that the foreign exchange market, at the behest of the Bank of England, decided to ban all direct inter-bank dealing and to operate exclusively through the agency of the brokers. Their period of special protection has been short-lived. But their disappearance will be swamped and forgotten in the turmoil of far more fundamental changes.

The new official rate of exchange between the pound sterling and the dollar is, of course, the result of deliberate choice by the authorities. No explanation of the reasons for this choice has been given or could, indeed, be expected. But it has obviously been inspired by the desire to choose a rate which, for some time to come at least, corresponds to the real value of the pound sterling and at which it would be comfortably possible to "peg" it, if there were no abnormal transactions to be covered. It may be taken for granted that every effort will be made, in operating the British exchange control, to avoid the creeping paralysis of the German system, in which the "official" rate becomes more and more fictitious as the real value of the currency sinks lower and lower. As in the great majority of our defence measures, the aim is not to distort the real state of affairs but rather to protect it from the arbitrary assaults of these extraordinary times.

## The Stock Exchange in War

BY its decision to reopen the "House" on Thursday this week the Committee for General Purposes of the London Stock Exchange has underlined the essential difference between financial preparedness to-day and in August, 1914. It was not until October 14th that the end-July settlement was completed in 1914, and not until January 4, 1915, that restricted dealings were resumed. On this occasion the "House" has resumed after a closure of four working days, two of which were necessitated by the evacuation programme.

The Committee's resolution of September 4th, ordering the "House" to remain closed until further notice, thus gave the market two days to adjust itself to war conditions. Within a few hours from the outbreak of hostilities the entire organisation of security dealing has been put on a war footing. The steps can be briefly recapitulated. The Committee had already laid down the principle that the "House" would remain open so long as conditions permitted, but that if, for the safety of members, it must be closed, business would be carried on as between offices. The Government's order for the closure of establishments in which large numbers foregather was regarded at first as including the Stock Exchange building, and the same principle was applied to "Street" dealings on Tuesday, when business was partially resumed on an inter-office basis. But

that view has been negated by the Committee's decision to reopen the "House" for dealings up to 3 p.m.

Secondly, it has been ordered that the settlement of all bargains open for the September 7th Account is to be postponed to September 21st. Bargains done on August 31st which fall under the provisions of Rule 97 (in other words, Consol market stocks, in which dealings are normally for cash) have fallen due for settlement on the first business day after reopening of the "House"—that is, September 8th. But the suspension of open bargains authorised last week has been withdrawn as from September 5th. Hence, brokers were exchanging cheques on Tuesday this week (up to 12.45 p.m., as against a normal 1.45 p.m., in view of earlier bank closing) in respect of securities undelivered on the end-August Account Day (August 24th) or earlier, and for uncompleted cash deals to August 30th. This settlement, it may be added, was carried out without incident.

To complete these preparations, temporary regulations have been issued by the Committee, which will govern dealings until withdrawn. Minimum prices, as published in the Official Lists of August 31st, are continued and members are forbidden to deal, whether with other members or outside, at any lower price. The minimum prices, however, may be reviewed by the Committee at any time,

and securities may be added to or deleted from the list. Next, all bargains must be for cash, and may not be continued from day to day. New "time bargains" or options (except in connection with existing contracts) will not be allowed. Nor may dealings be transacted in any new issue until it has been approved by the Treasury, and dealings have been specially allowed by the Committee. Finally, brokers must satisfy themselves before executing any order that it is not on behalf of, or for the benefit of, any enemy, either directly or indirectly.

This is the basis on which dealings were resumed on Tuesday this week. But business was naturally on a basis of negotiation, and dealings in British funds were handicapped by the fact that the stock registers of the Bank of England had been moved to Hampshire. Dealers could not, therefore, transfer inscribed stocks by common form of transfer, as contemplated in the emergency rules. It was first suggested that certification of transfers might be undertaken by the Share and Loan Department. For this purpose it was proposed that the Bank of England (and other registrars of inscribed stocks which might be affected) would inform the Share and Loan Department of inscribed stock balances held by Consol market jobbers or their nominees, so that transfers might be certified by the Department. This scheme might have worked, in time, for jobbers' balances. But for client's stock, postal delays and the complications inseparable from inscribed stock registers made it unlikely that stock could be cleared, at the quickest, in less than a week. We understand that the Bank of England is accordingly considering the establishment of a receiving station in London for transfers, and may itself undertake the certification of transfers. This method, though itself subject to inevitable delay owing to the removal of the registers, would undoubtedly be more effective.

Clearly, the market's financial tasks and its physical problems in the future are calculated to test its capacity for war-time adaptation to the full. In this connection it will be recalled that last week the Committee announced that if physical conditions rendered business in the City impossible, limited accommodation had been secured at Denham which would "at the least house all the official departments which Members will recognise as necessary for the orderly conduct of business, and may eventually provide a meeting place to serve the purpose of a market." From this statement it is evident that the immediate transfer of the "House," with normal dealing facilities for brokers and jobbers in one centre, is not contemplated. The present policy of the majority of firms is emergency decentralisation, and not evacuation to a new dealing centre.

As a temporary measure, at least, the decision to reopen the "House" this week was therefore welcome. But what is to happen if, and when, to employ the Committee's phrase, "physical conditions render business in the City impossible?" In such circumstances, inter-office dealings would necessarily become inter-sub-office dealings conducted on the suburban belt by telephone and post. It is

already known that the Committee is considering the possibility of setting up an official department which would undertake a large part of the clerical work involved in dealing. Ostensibly this step will be taken to relieve the difficulties of members with reduced staffs. But would it ensure the maintenance of a tolerably free market?

It may be taken as axiomatic that the normal fine dealing prices sought by brokers from a number of jobbers in one market will not be maintained in extreme circumstances. The essence of the dual system of brokers and jobbers is to ensure the freest possible dealings at the most competitive prices. But under war-time conditions many of the market's traditional dealing liberties would temporarily disappear—indeed, the summary of events above shows clearly that many have already been withdrawn. The momentous question remains whether modification in the existing organisation of dealing can, or should, be effected. The London market already has experience of shunting organisations outside the "House," and it is naturally not predisposed in their favour. Moreover, these very organisations depend, in the last resort, upon the maintenance of an open market in London, on which shunters can close their positions in case of need.

Hence the necessity for an ultimate risk-bearer, who is prepared to take stock on his books, would still exist in war-time conditions. Yet this conclusion is surely subject to modification. In the first place, if it is conceded that fine trading prices cannot be maintained in a wide range of stocks, the extension of minimum prices, or of agreed prices between jobbers in any given market, seems an obvious consequence. Secondly, circumstances might arise in which jobbers would be virtually unable to make prices, although a certain volume of buying and selling could be maintained if a price basis could be established. It is conceivable that, in such circumstances, a form of clearing organisation might assist the jobbers in their task of maintaining dealings as adequately as possible. It might be advantageous if such a scheme could be established in blueprint form at least, to safeguard the machinery of security dealing. Full co-operation would, of course, be necessary between the Stock Exchange authorities and dealers, to ensure that the wider national advantage of dealing facilities was not secured at the disadvantage of particular dealers.

If such a scheme were found to be practicable in the first place and necessary in the second place, the limited accommodation at Denham might presumably suffice to house the administrative departments of the Stock Exchange, and also the majority of dealers. Limitations of space, together with the necessity for brokers to maintain contact with their clients, suggest that the system of sub-offices which the latter have established might compel a temporary divorce of dealers and brokers. That would be a sharp breach with tradition. But centralisation is not an imperative necessity for brokers, though it seems desirable for dealers, and is imperative for the administrative departments of the Stock Exchange.

## Finance and Banking

**Gold Reserve Centralised.**—The gold reserve in the Issue Department of the Bank of England was this week transferred to the Exchange Equalisation Account. This step was explained by the Chancellor of the Exchequer as being part of the general plan put into operation for strengthening our financial resources abroad. The centralisation of gold achieves this by making the whole of our reserve available for immediate use and by veiling its possible utilisation from prying eyes. We may assume that henceforth the periodic publication of the Exchange Account's gold holding will be discontinued. Had gold remained in the Issue Department and had it been necessary from time to time to replenish the Account by transfers from the Bank, obvious deductions could and would have been made as to the state of the Account. This will no longer be possible. The last Bank return in which

the gold reserve appeared showed it at £263,010,700, valued at 158s. 6d. per ounce. The transfer, as announced in the Bank of England's bullion statement on Wednesday, appeared as £278,965,228, which approximately represents the whole of the reserve valued at the higher price of 168s. an ounce which has been officially fixed this week. The transfer of the gold has, of course, had to be accompanied by a corresponding expansion in the fiduciary circulation from £300,000,000 to £580,000,000. It is interesting and somewhat reassuring to note that no use has been made of this opportunity to create an additional margin of notes available for future issue. Under the transfer the total note issue is in fact given rather greater rigidity than it would have possessed had the gold in question remained in the Issue Department. Under that system it was theoretically possible for the authorities to issue more notes as the

counterpart of a depreciation of sterling and of a consequently increased valuation of the gold reserve. This reversal of all orthodoxy is now definitely ruled out. If more notes are wanted, the fiduciary issue will have to be increased, and this will require Parliamentary sanction. At the same time the whole of our gold reserve will be discreetly and wholly at the disposal of the authorities. The measure therefore kills two very desirable birds with one stone.

\* \* \*

**Gold Under Control.**—The restrictions on the private export of gold and the official control of the foreign exchange market have caused a complete revolution in the method of dealing in gold and fixing its price. Instead of being fixed as hitherto by the free interplay of supply and demand the price of gold is now announced each day by the Bank of England. Since Tuesday, when the new regime began functioning, that price has been at 168s. per fine ounce. This figure is within 10d. of the theoretical shipping parity to New York, taking the dollar-sterling rate at the selling price for dollars of 4.06 and the dollar parity for gold in London at \$34.28 per ounce. The reduction in this dollar price from the former normal parity of \$34.77 is due mainly to the rise in the war risk insurance rate, which is now 30s. per cent., and also to the higher rates for money. All dealings in gold must be made at the fixed price. Such dealings must be effected through a list of seven authorised dealers, headed by the Bank of England and comprising all the firms previously represented at the gold fixing. These dealers are remunerated for their work by the commission which they are allowed to extract from their clients. The whole activity of the gold market is now restricted to the liquidation of the gold position held in this country largely on account of Continental interests. As this gold is sold it is automatically transferred to the Bank of England and goes to swell the reserves of the Exchange Equalisation Account. When this position is finally liquidated—and the process can take little more than a few weeks—the gold market will fall into complete stagnation, disturbed only by the satisfaction of the minute industrial requirements of the metal.

\* \* \*

**The New Banking Hours.**—Lombard Street is shaking down to war-time conditions with all its accustomed adaptability. On Monday the banks were closed to the public for a partial bank holiday which was, in fact, intended to clear the credit machinery of some of the congestion accumulated during the previous week of crisis. The clearing-house, still functioning at Stoke-on-Trent, was in dire need of a break to catch up with arrears and get itself in readiness to start functioning under genuine war conditions. From this point of view the "holiday" on Monday proved invaluable. On Tuesday the banks reopened, but with a new timetable. The banking hours are now 10 a.m. to 2 p.m. and 10 a.m. to 1 p.m. on Saturdays. In order to help the clearing arrangements, "closing time" is now much more rigorously adhered to than it was in former days. Now that the new clearing machinery is getting into its stride the banks are finding it possible to define

their attitude to the money market with greater precision than could be done last week. The clearing banks have, in fact, found that their extreme caution in making loans and buying bills last week was somewhat excessive and that had they been fully informed on their clearing position they could, in fact, have pursued a more liberal policy. That more precise knowledge and the consequent liberation of resources immobilised by mere lack of information have become apparent this week. Credit has therefore been in more abundant supply, there has been keener buying of bills, and discount rates—especially for short-dated bills—have broken so appreciably as to suggest a serious belief that the 4 per cent. Bank rate is likely to be succeeded at no very distant interval by one of a lower figure. The October bill has this week been bid down to  $3\frac{1}{4}$  per cent., and  $3\frac{1}{2}$  per cent. has been paid for November maturities. The official buyer has been available in case of need, but there appears to have been little or no need for his services. The new banking hours have caused some rearrangement of the normal money market routine—a considerable hastening of the daily round of calls and a postponement of luncheon to altogether unorthodox hours. But the normal machinery of the money market continues in all essentials to function as it did before.

\* \* \*

**Help for Acceptors.**—Immediately following the declaration of war the Treasury issued instructions directing that help should be given by the Bank of England to approved acceptors of bills of exchange who as a result of the emergency find themselves called upon to meet their liability while deprived of the necessary remittances from their clients. Provided such bills were accepted before September 3 last and provided the bills in question are normally discounted in the London Discount market, the Bank of England will advance the funds necessary to meet them at maturity. This special accommodation is to be made available at 2 per cent. over Bank rate with a minimum of 6 per cent. This is obviously a deterrent rate, but as such is fully justified by the nature of the transactions to which it will apply. The size of the problem involved by London's liabilities under acceptance credits is to-day but a minor fraction of what it was in August, 1914. Then the bill on London ruled supreme in a world of active international trade. To-day the international sterling acceptance is but a shadow of its former self. But the problem is complicated by the remnants of German standstill credits in the London market. The total amount of such credits owing to this country is now in the neighbourhood of £37,000,000. The service of this debt will be immediately suspended and the acceptors will thus be forced to take up on their own account such of their standstill paper as remains in the market. The greater part of this debt is in such strong hands that the process of its withdrawal from the market and its ultimate writing off should occasion no great difficulty. But in dealing with the balance the special facilities which are to be made available by the Bank of England should perform a useful function. For the acceptance houses which are forced to have recourse to them they will provide an expensive object lesson of the wisdom of cutting a loss while it still can be cut at a reasonable figure.

\* \* \*

**Government Cargo Risks Insurance.**—As was anticipated, the Government War Risks Insurance Office has been opened immediately on the outbreak of war. The office is responsible for the insurance of those cargoes against war risks at sea hitherto covered by the Government-sponsored "Pool," which reinsured underwriters for King's Enemy Risks on shipments to and from this country. The Pool's reinsurances of underwriters' risks continue in force for shipments previously insured, provided that the shipments take place within thirty days of the inception of the insurances. Contracts of the Pool are continued with the War Risks Insurance Office for seven days from September 4th, subject to certain conditions.

**FOR ALL  
INSURANCE  
NEEDS**

Head Offices:  
LIVERPOOL      LONDON  
North John St.      Lombard St.

After this, new shipments will be covered only by the Government Office or by the open market. The list of Government rates, which is given on page 511 of this issue, is regarded as very reasonable in the circumstances now prevailing. The homeward rates, as is to be expected, are rather higher than the outward. Under the Government insurance scheme payment of an additional premium gives the insured cover after the discharge of imports to a warehouse in the United Kingdom, or from the warehouse of origin to the ship in the case of exports. Further revision of the schedule of minimum rates issued by the Joint War Risk Rating Committee of the company and Lloyd's underwriters for voyages not included within the Government's scheme shows a general increase in rates applicable to vessels sailing after 11 a.m. on September 3, 1939.

\* \* \*

**War Insurance of Goods on Land.**—The Board of Trade has now assumed liability for the insurance against war risks of goods on land and ships under construction. Such insurance is compulsory on the owners of goods for sale (or which can be made up into goods for sale), where the value exceeds £1,000. To become insured by the Board of Trade under the scheme, application for registration must be made through one of the principal fire insurance companies or through underwriters at Lloyd's, who will issue policies and receive premiums on behalf of the Board. Where such application is made within ten days of September 3, 1939, cover will be obtained as from that date, but if application is made after the ten days' period the insurance can date only from the day the application is received. In either case, cover in respect of the first period will end three calendar months after September 3rd (one calendar month for ships under construction). The rate of premium is  $\frac{1}{2}$  per cent. per month for the period of three months from September 3rd and  $\frac{1}{2}$  per cent. for one month from that date for ships under construction. The minimum premium is thirty shillings.

\* \* \*

**Life Assurance ex War Risks.**—Life assurance offices have ceased writing new business at normal rates to include the war risk. During the prolonged "near-war"

period they granted cover against the war hazard without surcharge of premiums, but once hostilities had commenced they obviously had no option but to take account of the increased risk of mortality. The ordinary offices are inserting a new clause in policies written at normal rates, providing that in the event of death caused directly or indirectly in consequence of war the amount payable will be restricted to the premiums paid, or to the surrender value, whichever is the higher. It will be seen that the clause is wide enough to comprehend mortality of civilians through air raids. It may be assumed that, for the time being, though many of the offices are willing to give consideration to proposals for "unrestricted" policies—that is, policies without the clause mentioned above—they are not anxious to transact such business. Perhaps offices will later be able to devise methods of transacting a larger volume of unrestricted business than they would conceivably be willing to accept at present. A restriction clause is also being inserted on new policies by the industrial offices. In this case, the clause will usually include a scale setting out reduced payments in the event of death caused directly or indirectly through war.

\* \* \*

**Insurance Premiums in War Time.**—It will be recalled that an Order-in-Council last June gave militiamen, Territorials and reservists an extended moratorium on premium payments, both for ordinary and industrial policies. This Order thus safeguards a large part of the men in the armed forces if they are unable to maintain premium payments in war time. Holders of ordinary policies (apart entirely from this legislation or any further legislation which may affect the payment of premiums) have the benefit of the "non-forfeiture" clause which is inserted on the vast majority of ordinary policies. This allows for the payment of overdue premiums out of the surrender value of a policy, the sum payable in the event of a claim being reduced accordingly, unless the arrears are paid. A policy normally acquires a surrender value two or three years after inception, so that most holders of ordinary policies are protected by this clause. In the industrial branch a policyholder whose premiums come into default is entitled to a "paid-up" policy—a policy of reduced amount on which no further premiums are payable—if his policy is of given age—one or two years in most cases.

## MONEY MARKET NOTES

WHEN the foreign exchange market reopened on Tuesday market quotations ceased; the Bank of England has fixed buying and selling rates only for those currencies holders of which are required to offer to the Treasury, and consequently there are no quotations for the majority of currencies. The complete list of the Bank of England's rates will be found on page 509. The New York rate of 4.02-06, announced on Tuesday, has been maintained, but on Wednesday the Canadian dollar was fixed 7 cents dearer against sterling at

4.40-44. Belgas have also been adjusted from 24.16-42 to 23.42-72. On Thursday the French franc was raised to 175-176, and the Swiss franc was lowered slightly to 17.87-18.05.

The chief change in the Bank of England return this week is the transfer of gold to the Exchange Account, which has reduced the holding in the Issue Department to a trifling amount. There is another large rise in the note circulation, but bankers' deposits have benefited both from the big increase in Government securities and from the

reduction in public deposits, and, in spite of the withdrawal of notes, are back to a normal level for the first time for some weeks.

Silver remains an uncontrolled market, and the price has risen sharply, partly as a result of a natural adjustment in view of the lower rate for sterling. Now that the gold market is controlled, hoarders are tending to turn their attention to silver, and as offerings are limited the price has advanced every day. The New York quotation was raised on Wednesday to 36½c.

**Capital Market Control.**—Rigorous control over the capital market has been established under the Defence (Finance) Regulations. Treasury consent is now required for any capital issue, subject to certain reservations mainly of a technical nature. "Urgent necessity and special circumstances" must be shown before issues by undertakings outside British countries are sanctioned, while issues by concerns operating in this country or the Overseas Empire must be "advisable in the national interest." These restrictions will not ordinarily apply to issues required for the renewal of Treasury bills and short-term instruments, provided that application is made for consent, and special consideration will be given to applications for issues to replace long-term maturities. Until further notice, however, consent is not required for issues where the consideration (plus the consideration for other issues in the preceding twelve months) is under £5,000 or for the subdivision or consolidation of securities where no new money is involved. Other exemptions include shares in a private company issued to a vendor (provided that no part of the consideration is payable in cash); securities issued on amalgamation by exchange of shares if no new money is subscribed; and securities issued in execution of binding obligations entered into before September 3, 1939. Broadly speaking, control thus covers only new issues above £5,000 made for cash, and outstanding instalments on issues already made are not affected. Issues of shares as capital bonus are not specifically covered in the regulations, though it would not appear from the general tenor of the regulations that it is intended to restrict them. Even more important, no mention is made of the extent, if any, of Treasury control over the terms of a new issue. The Treasury will be advised upon applications for consent by the organisation of the Foreign Transactions Advisory Committee under its new title of the Capital Issues Committee. The marshalling of the capital market will be regarded as an essential step in a war-time financial system.

**The Railways in War-time.**—By an order of the Minister of Transport, the main-line railways, the London Passenger Transport Board and certain other railway undertakings have passed under Government control. An executive committee, consisting of leading railway and transport personnel, has been appointed to act as agents for the Minister. No details have been published regarding the basis of the terms of payment or compensation to the companies. The one change known to the market is the suspension of weekly traffics figures by the main lines and the Board. Doubtless it would be unwise to infer too much from Great War precedents, for the position of the railways has been vastly changed by the 1921 amalgamations. Nor does it follow that problems of sharply rising costs will arise in the same degree. In the 1914-21 period, however, the railway undertakings received fairly generous treatment (sufficiently generous, indeed, to arouse some controversy), which permitted the maintenance of dividend levels and was crowned by lump-sum compensation after the war amounting to some £60 millions. The war-time dividend record of a few pre-amalgamation companies is shown below:—

| Company                | Rates of Dividend per cent. |      |      |      |      |      |      |      |
|------------------------|-----------------------------|------|------|------|------|------|------|------|
|                        | 1913                        | 1915 | 1916 | 1917 | 1918 | 1919 | 1920 | 1921 |
| Gt. Eastern Ord. ...   | 2½                          | 2½   | 2½   | 2½   | 2½   | 2½   | 2½   | 2½   |
| Gt. Northern Defd. ... | 3                           | 2½   | 2½   | 2½   | 2½   | 2½   | 2½   | 2½   |
| Gt. Western Ord. ...   | 6½                          | 5½   | 5½   | 5½   | 5½   | 5½   | 5½   | 5½   |
| L. & N.W. R. Ord. ...  | 7                           | 6    | 6    | 6    | 6    | 6    | 6    | 6    |
| L. & S.W. R. Defd. ... | 17½                         | 12   | 11½  | 11½  | 11½  | 11½  | 11½  | 11½  |
| Midland Defd. ....     | 4½                          | 4    | 4    | 4    | 4½   | 4½   | 4½   | 4½   |

Governmental control of the British railways in 1914 as a single system was the more necessary in view of the

number of undertakings—compensation, in fact, was payable to about eighty different bodies. Government traffic was handled without specific payment and all inter-company accounting suspended. Although traffic receipts were not published, abridged accounts were regularly issued by the separate companies, and before control ended certain aggregate statistics were made available. In return, the Government, broadly speaking, guaranteed to controlled railways as a whole the net operating receipts of 1913 (£43½ millions), subject to certain adjustments. From the beginning of the war to the end of 1918, compensation actually paid totalled £95.3 millions (including provisional deferred maintenance but not "extra wear and tear"), and as the period of control was extended to August, 1921, the railways received £74.8 millions in 1919 and 1920. It was estimated that, at pre-war rates, the value of services rendered to the Government was £112 millions to the end of 1918, excluding boat and dock, etc., services valued at a further £10 or £15 millions. Considerable problems arose, however, regarding deferred maintenance and the changed earning capacity of the railways. After long discussion, the 1921 Railways Act provided for the payment of lump-sum compensation to a basic amount of £60 millions, which could be disposed of as the railways wished. The totals actually received were:—L.M.S., £22,197,000; L.N.E.R., £18,005,000; G.W.R., £10,540,000; Southern, £7,409,000; and independent lines, £1,927,000. For present-day stockholders, the situation is simplified by the amalgamations, but the transformation of railway economics since 1914 makes the outlook for individual companies decidedly uncertain.

**Wall Street's Response.**—On Tuesday, after the Labour Day closure, war seized Wall Street's imagination to such effect that the Dow Jones industrial average jumped 10 points and turnover almost reached six million shares. So frantic was the demand for so-called "war stocks" that a considerable time elapsed before a dealing basis was established. In U.S. Steel, for example, dealings commenced one hour after the opening of the market, shares changing hands \$8½ higher at 62. Copper and nickel stocks also shared in the jump. The market's course is summarised below:—

|                   | Dow Jones Industrial Average | Trading Volume (Shares) |
|-------------------|------------------------------|-------------------------|
| August 30 .....   | 136.16                       | 500,000                 |
| September 1 ..... | 135.25                       | 1,970,000               |
| September 2 ..... | 138.09                       | 1,790,000               |
| September 5 ..... | 148.12                       | 5,930,000               |
| September 6 ..... | 148.04                       | 3,940,000               |
| September 7 ..... | 148.32                       | 2,600,000               |

This enthusiasm, however, has not been fully maintained, for reasons which should be obvious. Wall Street does well not to forget the watchfulness of the S.E.C. to stem the possibility of a market boom. And if profits are to be made from such wartime supplies as do not fall within the prohibitions of the Neutrality Act, the United States Treasury will not overlook the fact. British investors, however, may welcome Wall Street's advance for one important reason—it enhances the value of dollar securities whose registration is now proceeding and whose mobilisation may be expected to follow at no distant date.

**The Week's Interim Dividend Decisions.**—The uncertainty of the times is apparent in a number of important interim dividend decisions announced during the last ten days. Problems of readjustment for insurance companies are reflected in the Prudential Assurance Company's decision to defer payment of its interim dividend, maintained at 25 per cent., tax free, since 1935. The

changed conditions in the life department resulting from war conditions (discussed in a note on page 497) and the desirability of maintaining liquid resources against the possibility of increased claims, have no doubt influenced the directors' decision. This decision, however, should not be unreservedly regarded as a pessimistic estimation of future prospects, but rather as an example, set by the largest investment institution in the world, of the necessity for proper financial dispositions in an emergency, leaving events to determine policy in the immediate future. General Mining, a company whose earnings record for many years has been above reproach, has decided to conserve cash resources and to defer an interim dividend payment. This decision may be taken to reflect a new crop of problems for the mining industry in war, particularly this week's developments in the bullion market and the Union Government's proposal to acquire any premium on gold in excess of 150s. per fine ounce. Shareholders of Cammell Laird will not be surprised that the 4 per cent. interim dividend is being maintained this year, particularly in view of the chairman's confident forecast of future prospects last March. The market has recently regarded the prospects of companies with a direct stake in defence work with small favour, for price control and special taxation limit the level of profits earned by heavy engineering concerns in time of war. But, for "the duration," Cammell Laird should be capable of at least maintaining earning power, and should suffer a minimum of disorganisation in the opening period of hostilities.

\* \* \*

**Second Alliance Trust.**—The progressive revenue of Second Alliance Trust has been further enhanced during the financial year to July 31, 1939. Income has increased by 6.5 per cent. from £216,519 to £230,161. In their report, however, the directors link the improvement in revenue with the fruits of the first full year's income from the new capital raised in December, 1937. Since taxation and interest together absorb £103,612 against £93,857, the amount available for the ordinary stock has increased only from £88,433 to £90,685, and the earnings ratio has declined from 31.4 per cent. to 30.9 per cent. on the larger capital. An ordinary dividend of 21 per cent. is again recommended, while a safeguard against uncertain current prospects is provided in the allocation of £30,000 compared with £25,000 to contingencies reserve, leaving £13,475 to be carried forward against £15,000 brought in. Three years' comparative figures are given below:—

|                           | Years to July 31 |         |         |
|---------------------------|------------------|---------|---------|
|                           | 1937             | 1938    | 1939    |
| Total income .....        | 213,859          | 216,519 | 230,161 |
| Expenses and fees .....   | 8,552            | 9,085   | 9,464   |
| Taxation .....            | 47,768           | 41,340  | 47,645  |
| Interest .....            | 52,903           | 52,517  | 55,967  |
| Preference dividend ..... | 24,084           | 25,144  | 26,400  |
| Ordinary stock:—          |                  |         |         |
| Earned .....              | 80,552           | 88,433  | 90,685  |
| Paid .....                | 53,476           | 59,087  | 61,600  |
| Earned (%) .....          | 30.1             | 31.4    | 30.9    |
| Paid (%) .....            | 20               | 21      | 21      |
| Contingent reserve .....  | 25,000           | 25,000  | 30,000  |
| Issue expenses .....      | 772              | 1,676   | 610     |
| Carried forward .....     | 12,330           | 15,000  | 13,475  |

Investments at book value stand in the balance sheet at £3,913,989 (apparently after writing off £30,000) compared with £3,923,003 a year earlier. At July 31st last the market value of the company's security holdings (which represent the bulk of the investments) showed a depreciation of 5.83 per cent., following a depreciation of 1.04 in 1937-38. In view of the trend of security values since the summer of 1937, this position must be considered satisfactory; moreover, the deficiency is more than covered by existing reserves. But the prospective strength of these securities in a war economy is more difficult to estimate in the absence of information regarding the division of funds between fixed-interest and equity securities and their geographical distribution.

**Whitworth and Mitchell Improvement.**—As compared with the depressing results of 1937-38, the latest report of Whitworth and Mitchell, for the year to June 30th last, shows a welcome recovery, which is enhanced by the resumption of ordinary dividends. Earnings in 1937-38, however, were at an exceptionally low level, owing partly to reduced turnover and more particularly to the fall in cotton values which necessitated considerable writing down of stocks. In relation to the company's previous profits record, therefore, the latest results are not a matter for enthusiasm—indeed, they are frankly described as disappointing in the chairman's review of the year's working which accompanies the report. The following table summarises the allocation of profits in each of the past three years:—

|                             | Years ended June 30th |           |        |
|-----------------------------|-----------------------|-----------|--------|
|                             | 1937                  | 1938      | 1939   |
| Trading profit .....        | 65,471                | 27,445    | 40,985 |
| Total profit .....          | 71,010                | 33,184    | 46,362 |
| Taxation .....              | 8,500                 | 8,000     | 6,300  |
| Depreciation and fees ..... | 3,689                 | 3,858     | 4,153  |
| Preference dividend .....   | 30,000                | 30,000    | 30,000 |
| Ordinary shares:—           |                       |           |        |
| Earned .....                | 28,821                | Dr. 8,674 | 5,909  |
| Paid .....                  | 25,000                | Nil       | 5,438  |
| Earned % .....              | 7.0                   | Nil       | 1.6    |
| Paid % .....                | 6                     | Nil       | 1½     |
| Carried forward .....       | 9,183                 | 509       | 980    |

The company has substantial cash holdings (the balance-sheet figure is little changed at £124,597) for which it has been awaiting a profitable outlet for some time. A dividend policy of distributing available earnings in full, as in the latest year, can thus be justified. Fluctuations in cotton prices in 1938-39 were on a more moderate scale than in the previous year, so that one of the special difficulties of 1937-38 was not repeated. But the chairman's survey discloses that turnover fell further, though to a slight extent, and although the cotton branch made steady progress, the rayon section had a difficult year owing to general overstocking of rayon goods. It is early as yet to foresee the effects of war conditions on the company, especially since the experience of the Great War is not necessarily relevant for rayon concerns to-day.

\* \* \*

**Eastwoods Profits.**—It is disappointing that for four successive years profits of Eastwoods, Limited, should show a decline. A preliminary statement for the year ended March 31, 1939, disclosed trading profits of £54,700 against £78,532, a level less than half the 1934-35 peak. Expenses were apparently roughly maintained, for net profits total £37,183 against £59,860. Allowing for the preference dividend and assuming that no provision is needed for special charges, the reduced ordinary dividend

of 8 per cent., against 12 per cent., is covered by earnings of 9.2 per cent. Hence the directors have followed a more generous distribution policy than in 1937-38, when earnings represented 18 per cent. on the ordinary shares. Comment on the results will doubtless be offered in the full report or at the meeting, but for the time being the reasons for the further set-back are not apparent. The fall in profits in 1937-38 was ascribed to higher costs (which were felt continuously during the year, while increased selling prices benefited only part of the period), to higher taxation and to reduced profit margins on the coal merchanting business. These were difficulties of adjustment, and investors might have expected rather greater stability in 1938-39, especially in view of growing defence construction requirements. At the Eastwoods Flettons meeting, at which the 1938-39 accounts, showing a drop in total profits from £67,329 to £53,759, were passed, reference was made to increased output, but on the other hand increased haulage charges were experienced owing to the shift of demand westwards. Moreover, stress was laid upon guarantees to the Government that selling prices would not be advanced on work

involving the expenditure of public money. Thus the latest results of the parent concern are somewhat obscure; possibly the Eastwoods group has suffered more, relatively to other building material manufacturers, from the decline in private building. The latest results present an important reservation regarding prospects which, in view of A.R.P. and defence requirements, might otherwise be reasonably promising.

**The Week's Company Profits.**—Our usual analysis of profit-and-loss accounts appearing on page 510 includes only 9 companies for which comparable figures are available. Net profits of these concerns are £638,000, or 13½ per cent. less than £737,000 earned a year ago. Aggregate net profits of the 1,722 companies reporting in 1939 to date are £217,941,000, against £236,642,000, a drop of 8 per cent. The week's results are discussed in preceding Notes and on pages 501 under the heading "Shorter Comments."

## THE STOCK EXCHANGES

### London

Note: All dealings are for Cash

INTER-OFFICE dealings were resumed on Tuesday, when the "Street" and then the telephone market were relatively active. Quieter conditions prevailed on Wednesday, after the reopening of the House on Thursday had been announced. Dealing has been largely restricted to negotiation on the basis of nominal prices. The following account summarises the main features of each day's dealings.

**Tuesday.**—Despite the attempt to carry on business, most prices remained nominal, and had little comparative significance with pre-war quotations. At first *gilt-edged* prices came back to their official minima (which were still in operation despite the closing of the House), and some business was transacted in the leading stocks, such as War Loan, while a little support was forthcoming for the undated issues. Among *foreign bonds* a demand for Japanese issues was reported, and quotations advanced. Unofficial quotations were agreed by dealers for *home rail* preference and debenture stocks. Little business passed in ordinary stocks, but L.M.S. ordinary and Southern deferred rose. There was no real activity in *industrials*, and though quotations were nominal, not all prices were lower than before the closing of the House. Heavy industrial shares showed no improvement, and there was scarcely enough business in shares in the consumption goods trades to test the trend, though there was an impression of steadiness. Certain textile issues including Courtaulds, improved slightly, Lancashire Cotton rising as much as 1s. 3d. to 11s. 6d. Little business was done in *oil* and *rubber* shares apart from a clearing-up of earlier positions, and commodity share dealings in general were affected by the ruling on cash transactions. Attempts to establish prices for *mining* shares were not followed by any measurable business. Kaffirs, if anything, weakened (especially the developing mines) on the course of events in South Africa, though other gold shares and most base metal shares were firmer. Rhodesian coppers were inactive.

**Wednesday.**—*Gilt-edged* stocks continued to be quoted at minimum prices, and there was a considerable reduction in business—partly owing to the practical difficulty of "certification" at the Bank of England's country office. Among *foreign bonds*, there was some enquiry for European issues, while Japanese bonds did not hold their earlier gains. Agreed prices for *home rail* senior stocks continued in operation, though there was virtually no business. Quotations for ordinary stocks were mostly lower. Business in *industrials* also was on a lower scale, members preferring to await the Stock Exchange reopening. There was not much change in iron and steel shares, though Stewarts and Lloyds received some support. Movements in aircraft shares were small and varied. There was again some improvement in certain textile and rayon shares, and the miscellaneous leaders were nominally better. *Oil* shares were no more active than on Tuesday, though the "Shell" group showed firmness. Among *mines*, there was no activity in Kaffirs, but West Africa gold and Rhodesian copper issues improved.

**Thursday.**—More normal business conditions were restored with the reopening of the "House" on Thursday. There was no great volume of business, but it was possible to deal more freely, both in *gilt-edged* and *industrial* issues. The uncertainty in delivery of *gilt-edged* stocks, resulting from the transfer of the registers to the country, was, however, a deterrent to business. Irredeemable issues, however, were dealt in at somewhat better prices, slightly above the fixed minima. Old Consols, for example, were quoted 62½ ex interest, against 61½ on Wednesday. In the *home rail* market, dealers maintained their negotiating basis. Advances in the *industrial* list were recorded by tobacco shares, Courtaulds, and Distillers. Shipping shares were described as "buyers only," but certain other groups, including retail stores, had not established a stable dealing basis by the close of the day. Commodity shares were generally firm; *oil* shares advanced, while *rubber* share prices made considerable progress on the sharp rise in the commodity. Some improvement was recorded in Rhodesian copper issues; Ashanti maintained their sharp mid-week advance. Kaffir issues, however, were listless.

### ACTUARIES' INVESTMENT INDEX

OWING to the closure of the Stock Exchange on Tuesday, September 5th, we are unable to publish the usual extracts from the Actuaries' Investment Index.

### New York

THE reaction of Wall Street to war in Europe had already been established before the week-end. After some hesitation on Friday, prices hardened on news of the firm stand of the democracies, and by Saturday prices had begun to advance rapidly, led by copper, steel and other armaments issues. Any belief that the bull sentiment had spent itself after the outbreak of war was quickly dispelled when the market reopened on Tuesday. In a market whose turnover was the largest in six years, a frenzied buying rush developed, the Dow Jones industrial average rising from 138.09 on Saturday to 148.12 at the close. On Wednesday more orderly conditions prevailed. Prices continued to advance until large-scale profit-taking caused a reaction in motor, steel and oil issues, which later spread to other sections of the market, the Dow Jones Index closing at 148.04. Bond issues have been rather weaker, but some demand for speculative rail issues and utilities developed towards mid-week. *Iron Age* estimates steel mill activity this week at 59 per cent. of capacity compared with 63.5 per cent. last week.

Owing to cable delay we are unable to publish the usual stock index figures compiled by Standard Statistics Company, Inc., of New York. Last week's figures are repeated below. (1926 = 100)

(a) Less tax at 3s. 4½d.  
(b) Paid on larger capital.  
† Free of income tax.

**BUSHTICK MINES.**—Final dividend 5 per cent., making 7½ per cent. for year to June 30, 1939, against 6¼ per cent. for preceding year.

**CAMMELL, LAIRD AND COMPANY.**—Interim ordinary dividend maintained at 4 per cent.

**TRIPLE FOUNDRY.**—No interim dividend to be paid, against 2½ per cent. a year ago.

### SHORTER COMMENTS

**Company Results of the Week.**—In view of the varied record of brewery profits, the increase in LICHFIELD BREWERY net profits from £28,894 to £34,470 is satisfactory. PERFECTA MOTOR EQUIPMENTS are maintaining the 17½ per cent. distribution. TRANSVAAL MATTRESS AND FURNISHING COMPANY have experienced a small setback in net profits, but again pay 12½ per cent. The sharp drop in BARROW BARNSELY MAIN COLLIERIES net profits from £96,913 to £54,212 has caused disappointment. It appears, however, to be due mainly to reduced output arising from technical reorganisation in the Barrow pits.

### EMERGENCY ADDRESSES

**Central Argentine Railway, Ltd.**—The temporary address of this company is Hardwick House, Whitechurch, Reading, Berks. Telephone No. Pangbourne 255.

**Anglo-Iranian Oil Company, Ltd.**—The head office has moved to Research Station, P.O. Box 1, Chertsey Road, Sunbury-on-Thames. The registration department has moved to Britannic House, Llandarcy, Neath, Glamorgan-shire.

**Erlangers, Ltd.**—To continue at 4 Moorgate Street as long as practicable. If impossible, address will be 5 Lloyd's Bank Chambers, Basingstoke. (Telephone, Basingstoke 806 and 807.)

**Chase National Bank.**—Should evacuation be necessary, address will be Cyterswood, South Park, Gerrard's Cross, Bucks. (Telephone, Gerrard's Cross 2413.)

**Bank of England.**—Stock Transfer Offices now at Whitechurch, Hants, from where work will be conducted through the post.

**Equity and Law Life Assurance.**—Head office now at Langleybury, King's Langley, Herts.

**Philip Hill and Partners.**—Removed to Sunninghill Park, Ascot, Berks. (Telephone Ascot 646.)

**British Metal Corporation.**—London office is removing to Grand

# Industry and Trade

**Government Control of Industry.**—The change-over of industry from peace to war-time organisation has continued during the past week. The Ministry of Supply has taken over the control of many raw materials and industries, including non-ferrous metals, iron and steel, timber, paper, silk and rayon, leather, molasses and industrial alcohol. The railways were taken over by the Ministry of Transport, the Mines Department took charge of the regulation of coal supplies and prices and the shipbuilding industry was put under the control of the Board of Trade. Moreover, steps have been taken to secure priority for urgent work. Thus, on Wednesday, the Minister of Supply made an order, entitled the Priority of Work Order, 1939, under which contractors will be required to give priority to certain work in accordance with orders issued to them by Government Departments. A beginning has also been made to control imports and exports, and on Wednesday Mr Oliver Stanley, President of the Board of Trade, assured the House of Commons that the Government was alive to the importance of maintaining exports as far as possible. For the most part, the war-time organisation of individual industries had been worked out well in advance, so that the transition could be effected with the least possible dislocation. It is the policy of the Government to work in collaboration with industry by appointing leading executives in each industry to key positions. Some dislocation of trade was, of course, bound to occur owing to the difficulty in carrying on overseas business and as a result of the decline in domestic civil transactions, but there is no doubt that industry will soon adapt itself to the new conditions.

**Jump in Wholesale Prices.**—The majority of the commodity markets were closed after the outbreak of war and have passed under the control of the Government, which has announced its decision to fix maximum prices at which dealings can take place. It is therefore impossible, at this stage, to assess the effect of all the factors which have influenced the market this week. In the United States, on the other hand, the markets have remained open and there has been a hectic advance in the prices of the majority of primary products. During the week preceding Germany's invasion of Poland the course of prices in the United States was slightly downwards. Thus Moody's index of the prices of sensitive commodities (December 31, 1931 = 100) fell from 141.3 on August 24th to 140.3 on August 31st. On September 1st, when Germany launched her attack on Poland and war between Germany and France and England became inevitable prices jumped ahead in the United States. On September 1st Moody's index stood at 146.9, and by Wednesday, September 6th, it had risen to 168.8, an advance of 20 per cent. over the figure for August 31st. It is doubtful whether this advance, based on

the expectation of a sharp increase in demand, and/or a reduction in production, will be maintained. But, in view of the depreciation of the pound in terms of the dollar and the increase in freight rates to this country, there can be little doubt that the period of low prices in this country is past.

**Increased Food Production.**—In his broadcast on Monday evening the Minister of Agriculture gave the main outlines of the Government's policy for agriculture in war time. Already the county agricultural committees, whose members were appointed some time ago, have held various meetings and are ready to carry out the instructions of the Government. It is hoped to plough up a further 1½ million acres before next spring, but until the additional supplies of tractors, seeds and fertilisers can be distributed the farmers were urged by the Minister to arrange to plough up 10 per cent. of their grass land. The grant of £2 per acre for ploughing old pasture, which under the Agriculture Act was only available up to October 1st, has been extended to December 31st. The Minister also announced that, with the exception of hops, all restrictions on output had been removed. This applies to the levy of £5 per acre on potatoes planted in excess of the basic quota, but it is not yet known whether it will affect the limits imposed under the various price insurance schemes. The pending contract for bacon pigs has been scrapped; a fixed price of 13s. per score dead weight will be paid for all pigs not over 10 score in weight sold for slaughter (excluding sows and boars). It is perhaps a pity that the provisions for grading, which have helped to improve the quality of output, have also disappeared. The Food Controller has decreed that prices of fat cattle and sheep shall not until further notice exceed those ruling in the week ended on August 25th. Meanwhile members of the Women's Land Army and of the militia are assisting with the harvest, which has been delayed in many districts by bad weather and by the shortage of casual labour, since many of the Irish who make an annual visit to England at harvest time have returned to Ireland.

**Regulation of the Metal Trade.**—The prohibition of metal exports, except under licence, was enforced by the Board of Trade as early as August 23rd. It covers unwrought copper, unwrought lead, aluminium and aluminium alloys, nickel, including unrefined nickel and matte, tin in metallic form, unwrought zinc, non-ferrous scrap and old material and some minor metals. Licences are to be granted by the Export Licensing Department of the Board of Trade and in some cases licences have already been granted. The regulation of home supplies, introduced by the Ministry of Supply under the Defence regulations immediately on the outbreak of war, covers aluminium,

## SHORTER COMMENTS

(Continued from page 501)

**Sun Life Assurance Company of Canada.**—Temporary administrative offices at Carn Brea, Sundridge Avenue, Bromley, Kent. (Telephone: Ravensbourne 2499.) Skeleton staff maintained at the company's office at 2, 3 and 4 Cockspur Street, London, S.W.1. Branch office addresses remain as before until further notice.

**Ashanti Goldfields Corporation, Ltd.**—All communications to be addressed to the company at St. Hilda's School, Bushey, Herts. This applies also to Bibiani, Ltd.

**Union Corporation.**—London office of company and associates to remain open so long as possible for limited hours daily. All communications to be addressed to The Gables, Chequers Lane, Walton-on-the-Hill, Tadworth, Surrey, until further notice. Telephone: Burgh Heath 3750 and 3751.

## MISCELLANEOUS

**Thos. W. Ward, Ltd.**—Company has acquired Triumph Company, Coventry, including Gloria and Stoke works. Manufacture of Triumph cars to continue under D. M. Heally, General Manager of acquired concern.

**Gold Share Trust.**—Martin's Bank announces that this Trust has been terminated. The trustees will proceed to

liquidate the trust fund and distribute the proceeds to the unit-holders.

**Broken Hill, South.**—Net profits for year ended June 30, 1939, £350,007 (£402,501), of which £224,081 (£276,159) from mining, and £125,926 (£126,342) from investments. Total dividend for 1938-39, 40, against 80 per cent. Interim dividend of 10 per cent., declared for year 1939-40.

**Initial Services, Ltd.**—Dividend for year to June 30, 1939, is maintained at 25 per cent. The issued ordinary capital is £910,000 as increased by the scrip bonus of 10 per cent. a year ago. Profits at £336,042 (£305,156) constitute a fresh high record. To reserve, £50,000 (£32,800). To staff fund, £1,000 (£1,000). Carry forward, £10,603 (£16,218).

copper, lead and spelter, but not tin. There will be maximum prices for the controlled metals, but they have not been officially published so far. The purchase of the controlled metals for home consumption, etc., is prohibited except under licence. The exceptions from this general rule are those contracts which existed in writing when the regulation was introduced, contracts which are placed to fulfil Government orders and contracts which are placed for necessary repairs which do not require more than one ton of each of the controlled metals. Holders of metals are required to make returns of their stocks. A department called "Non-Ferrous Metal Control" has been formed at the Ministry of Supply to exercise control over base metals and Captain Oliver Lyttelton has been appointed Controller; the Hon. C. Cunliffe has been appointed Controller for aluminium.

**Iron and Steel.**—As was to be expected, the Ministry of Supply has taken over the control of the iron and steel industry. The outbreak of war has led to a complete dislocation of the international iron and steel markets. The interruption of international transport facilities has made impossible the delivery of goods on old contracts which are urgently required by consumers, but in many cases contracts have been altogether cancelled. It is noteworthy that these cancellations do not concern particularly large quantities because speculative purchases, a feature of the crisis of September, 1938, were not conspicuous during the last few weeks. Since the steel industries of the belligerent countries have been taken over by their respective Governments, and as in many neutral countries the possibility of carrying on trade, manufacturing and transport as usual is doubtful, new business has come to a standstill. The shortage of coke adds to the uncomfortable situation, particularly of the Belgian steel industry. The international steel agreements have, of course, come to a sudden end, and it is already clear that their re-establishment will have to take place, if ever, under completely altered conditions. The United States will be the chief steel supplier to neutral countries during the war, and steel plants all over the world will produce up to capacity. A limited international trade might develop in Europe under the direction of the governments, which will, however, chiefly concern steel raw materials and semi products.

**The Economist Price Indices.**—As it was impossible to calculate our price indices for Wednesday this week we have recorded them for August 30th, when market dealings were still normal:—

SEPTEMBER 18, 1931 = 100

| Date         | The Economist Indices             |                             |                   | Price of Gold (sterling) | U.S.A., Irving-Fisher | France, Statistique Generale | Italy, Milan Chamber of Commerce | Germany, Statistisches Reichsamt |

| 1913 = 100 .....    | 83.1                   | 96.8          | 95.0          | 96.4          |
| 1924 = 100 .....    | 52.2                   | 60.8          | 59.7          | 60.6          |

Owing to the depreciation of the pound in terms of dollars and the growing risk of war, the trend of the prices of primary products was upwards during the week ended last Wednesday. Our index for primary products in the United States, however, registered a slight decline. The complete index for this country also showed a slight advance. Compared with the beginning of the year, however, both the complete index and the figure for primary products for this country on August 30th show comparatively little change.

**Control of Shipping.**—At the beginning of August, the level of tramp shipping freights showed very little change from those ruling in the previous month. There was a noticeable improvement in the position at the River Plate, where an improved shipment of grain found a tonnage considerably reduced from the excessive levels of previous months. This improvement was sufficient to raise *The Economist* index of tramp freights from 90.4 in July (1913=100) to 91.6 in August, as is shown below:—

The Economist INDEX OF FREIGHT RATES  
(1898 - 1913 = 100)

At the close of the month the increasing tension in Europe led to a suspension of new chartering on many routes, coupled with extensive orders for wheat cargoes. On

August 27th the Board of Trade prohibited the transfer, without official consent, of British ships, and on the same day the Admiralty assumed control of the British mercantile fleet; the next day the Admiralty closed the Mediterranean and Baltic to British ships. During the following week there were extensive alterations to the insurance rates against war risk under the Cargo Pool Scheme, and on September 4th, after the outbreak of war, the Board of Trade opened an office at Lloyds for war risks insurance. At present the highest rate for cargoes to be shipped is 70s. per cent. for the homeward route from the Far East via Cape and from South America. The Board of Trade has also assumed control of the shipbuilding and repair trade; no ships may be built or repaired except under the Board's licence.

## INDUSTRIAL REPORTS

### Coal

**Sheffield.**—Developments in the coal market under control are awaited, and in the meanwhile there is a strong demand for both industrial and household fuel on home account. Blastfurnace coke is in request.

\*

**Newcastle-on-Tyne.**—So far as the export trade is concerned, business on the North-East coal market is at a standstill. Regulations have been issued whereby all coal exports are governed by licence and at the present exporters are communicating these regulations to buyers in neutral countries and it is expected that before long business will be resumed. In the meantime, collieries are obtaining considerable benefit from home trade, but those that depend upon export are having to cast coal. Patent oven coke is in active demand from inland consumers.

\*

**Glasgow.**—Export business is at present at a standstill pending completion of the new scheme being arranged between the Mines Department and the coal masters. Licences will in due course be issued enabling at least a partial resumption of trade. It is not expected that neutral ships will have any major difficulties in carrying out their charters beyond, of course, the risks possibly attendant in view of the new situation. No export prices are not yet being quoted, as these are subject to Government supervision. In the home market business is moving steadily and on an active scale generally. There is no shortage of supplies, and none is expected.

\*

**Cardiff.**—Organisations as well as individual traders have been occupied this week in the adjustment of commercial procedure to war conditions. The Orders which came into effect on Monday leave virtually untouched the production side of the industry, the exports are under direct Government control, while in regard to export prices there is to be no change in those now authorised by the Control Board except by agreement with the Mines Department. Although for the moment there is no Government restriction on outward chartering both British and neutral shipowners are suspending the arrangement of new charters pending the settlement of the emergency overseas transport arrangements, while in the ex-

port trade all shipments are now subject to licence. Naturally the international coal trade is almost entirely suspended and in Continental Europe distribution has been completely disorganised by the closing of the German market against British coals, of the French market against German coals, and of the interruption of the Polish exports through Gdynia and Danzig as well as on the German and Southern European frontiers. In South Wales production has not yet been affected, but shipments have temporarily been seriously curtailed by war risks and the new Government regulations.

### Iron and Steel

**Sheffield.**—Activity marked the iron and steel market up to the time of the declaration of war, but with the announcement of Government control there has ensued a pause while the market adapts itself to the new conditions. Licences are now necessary to acquire certain raw materials, except in particular cases. Maximum prices are established for the principal iron and steel products, and they are those current at the time of control.

For home dealing in iron and steel scrap no licence is required, but exports must not be made except under licence. There is a strong demand for heavy basic steel scrap at the controlled price, and most other classes are well taken up.

Sheffield industry is now quoting at its highest level for many years, and while, of course, national defence work is given priority, there is a valuable run of ordinary commercial orders to be completed, both from home and overseas sources.

\*

**Glasgow.**—In the West of Scotland work is proceeding intensively at the steelmaking and other establishments. At a few plants night shift operations had to be suspended for a short time owing to the difficulties of obscuration of light, but at most plants the required provisions have already been made, and it is expected that within a few days full night working will be in operation. The calling-up of men for the various services has, of course, caused some inconvenience at many works in this area, but there has been no slowing down of operations, and output is being maintained at the recent high levels. Stocks of raw material are sufficient for immediate re-

quirements. Enquiries and orders are confined almost entirely to the requirements of materials for the services and for A.R.P. work.

\*

**Cardiff.**—Work in the South Wales iron and steel industry has not yet been appreciably affected by war conditions. The output of tinplates in the week ended August 26th equalled 70.44 per cent. of capacity under the pooling scheme, and it is being maintained at about this level. Exports are now subject to licence, but prices and distribution are under strict control. The Cartel arrangements are suspended. Galvanised steel sheet makers are fully employed with A.R.P. orders, and iron and steel scrap is in great demand.

### Textiles

**Cotton (Manchester).**—Business has been dislocated by the outbreak of war. So far traders have not been able to adapt themselves to changed conditions. It is realised, however, that efforts must be made to carry on export trade. Since a week ago there has been an advance in raw cotton prices in Liverpool of about 1½d. per lb. The Liverpool market has remained open, but under controlled conditions. The vital factor in the situation is the small supply in Liverpool, the stocks of all kinds of cotton being only 567,921, against 1,162,000, bales a year ago.

A sharp advance has occurred in yarn prices. Quotations have been put up more than the rise in raw cotton rates, as the basis in Liverpool has been advanced and the war insurance rate for stocks is a heavy charge. Numerous spinners have withdrawn quotations, and most of the transactions have been of a special character.

The cloth market has been thoroughly disorganised. Most of the attempts at export contracts have been futile. Many merchants have asked manufacturers to stop deliveries for the time being until something is known as to shipping facilities. All attention will have to be centred on supplying the Government with materials for the National Services. Some firms have been asked to increase output, and the question of running two or three shifts has been raised. Home trade houses have pressed makers for the delivery of fabrics which are urgently needed to meet the requirements of the A.R.P. organisations.

## COMPANY MEETING

### ALLIED INDUSTRIAL SERVICES, LIMITED

#### INCREASED PROFITS

The fifth annual meeting of Allied Industrial Services, Limited, was held, on the 6th instant, in Bradford.

Mr W. H. Rhodes, who presided, said that the directors were able to report an increase in the company's business and profits, which this year, after providing for depreciation, directors' fees and other charges, amounted to £204,695. Adding thereto £1,511, being the profit-and-loss account balance carried forward from the previous year, less the amount deducted to provide part of the capital bonus distributed in December, 1938, £206,206 was available for allocation.

It was with deep regret that he had to record the loss which the board had suffered in April last through the death of his father, Mr W. Rhodes, who was one of the managing directors of the company and who for over thirty years had been chairman to the board of directors of Hill, Rhodes and Wilkinson, Limited, the predecessors of this company. During the past few months the board had put

into operation a scheme for holidays with pay, and it was their intention to extend that scheme so that during the next holiday season all the company's employees would receive holidays with full pay.

It was his custom at their annual general meeting to touch briefly on the trading prospects of the company for the current year. On this occasion he did not propose to comment beyond stating that since the commencement of the present financial year business had been satisfactory.

In conclusion, he expressed his thanks to the managers, staff and workpeople, who had respectively controlled and handled with painstaking care the multiplicity of detail in connection with the immense number of individual transactions involved in a business of such magnitude.

The report and accounts were unanimously adopted and a resolution was passed confirming the payment of the preference dividends for the two half-years to June 30, 1939, and the interim ordinary dividend already paid, and sanctioning a final dividend of 36 per cent. actual for the year, making 50 per cent. for the year, less tax.

The formal business was duly transacted, and the proceedings terminated with a vote of thanks to the directors and staff.

## THE COMMODITY MARKETS

WITH the outbreak of war, trading in most of the commodity markets was suspended. In some cases, notably cereals, petrol and various textiles, the complete trade, including stocks and dealings, have been taken over by one or other of the Government Departments. Current dealings in some commodities, such as foods and oils and oilseeds, are taking place at prices fixed by the Government or by the authority controlling the Exchange. At most Exchanges, arrangements have been made for the orderly liquidation of open contracts at prices fixed in relation to those existing before the declaration of war. Almost the only important exchange left uncontrolled is cotton, where dealings still continue for private account.

### Metals

THE London Metal Exchange closed after the unofficial evening market on Thursday, August 31st, as a result of the evacuation scheme. On Monday, September 4th, a short meeting of members was held, at which it was decided to re-open the L.M.E. on Wednesday for the registration of all open contracts up to and including September 6th. A settlement was planned on September 7th, but the liquidation of outstanding contracts was delayed, pending the fixing of settlement prices for copper, lead and spelter, about which negotiations are in progress. Dealings in these three metals are suspended but dealings in tin, which is not officially controlled for the present, were resumed on Wednesday, when about 750 tons of tin changed hands at the official cash quotation of £229 17s. 6d. per ton; the price has been pegged at this level by the buffer pool since the middle of July. The three months' quotation was fixed at £227 10s. per ton, so that the backwardation has shrunk to £2 7s. 6d. against £3 2s. 6d. a week ago. Dealings in tin will continue daily for a short session of 15 minutes from noon. The

price of nickel was raised on Wednesday from £180 to £185 per ton to £190 to £195 per ton, and that of platinum from £8 15s. to £9 5s. per fine ounce. The increases are due more to the set-back in sterling than to the increased war requirements, as supplies of both are drawn from Canada and are ample.

### Grains

DEALINGS both at Mark Lane and at the Baltic Exchange were suspended last Friday and on Monday private trading in cereals and cereal products was prohibited. In order to liquidate open contracts the Committee of the Liverpool Corn Exchange fixed contract prices at 4s. 0½d. per cwt. for October wheat and 5s. 1½d. per cwt. for October maize, with corresponding prices for other futures. All flour mills and trade in flour and other cereal products have been placed under the Food Controller, who has also taken over all holdings of wheat; the price for requisition has been fixed at 26s. 10½d. per 496 lb. for No. 1 Northern Manitoba, Vancouver, afloat and for shipment, with corresponding prices for other grades of wheat. Until further notice, the price of flour has been fixed at 22s. per cwt. delivered per sack of 280 lb. of straightrun, plus the levy imposed by the Wheat Commission.

### Other Foods

**Provisions.**—Prices for bacon, hams, lard, butter and cheese were stabilised for a fortnight from September 2nd at the level ruling the previous day.

\*

**Meat.**—By order of the Food Controller, meat prices from September 4th were not to exceed the average of the appropriate quotation in the week ending on August 25th. In London, the emergency arrangements for the decentralisation of the trade were put into force; thirty suburban depôts have been established from which butchers can take supplies, and dealings at Smithfield have been temporarily suspended.

**Eggs.**—Maximum egg prices were fixed on September 1st by the Committee of the London Provision Exchange.

\*

**Colonial Produce.**—The terminal market in sugar was suspended on September 2nd; prices for refined were continued at the level ruling on September 1st, but deliveries were restricted to daily needs. Open contracts were closed at fixed prices of 7s. 4½d. per cwt. for September. On September 6th the Food Controller fixed wholesale and retail prices for sugar; until further notice the price for granulated sold retail in cartons is 3½d. per lb., with corresponding prices for other grades. Futures dealings in cocoa and coffee were also suspended; open contracts in cocoa were closed at 20s. 9d. per cwt. for September delivery. The Mincing Lane tea auctions closed on September 1st, and dealings, confined to the supply of immediate requirements, were continued at existing prices. The Produce Exchange re-opened for spot dealings on Thursday.

## Miscellaneous Commodities

**Oils and Oilseeds.**—After a week of uncertainty, dealings in these products were suspended on September 1st; the trade is now under the regulation of the Food Controller, but the Produce Exchange re-opened for spot dealings on Thursday.

\*

**Rubber.**—The London market was closed on September 1st, and re-opened on Thursday with prices at a substantially higher level.

\*

**Petrol.**—Supplies and distribution of petrol have been taken over by the Department of Mines. For private vehicles, petrol rationing will be introduced on September 16th; meanwhile, existing brands of petrol are being amalgamated and will be sold as pool petrol at the price of 1s. 6d. per gallon.

## GOVERNMENT RETURNS

For the week ended September 2, 1939, total ordinary revenue was £11,788,000, against ordinary expenditure of £36,620,000, issues from Defence loans of £1,500,000, and issues to Sinking Funds of £1,894,000. Thus, including sinking fund allocations but excluding issues from defence loans, the deficit accrued since April 1st last is £179,165,000, against £146,152,000 a year ago.

\* Supply Services, after addition of issues under Defence Loan Acts; (a) after reductions of £290,000 in Finance Act; (b) excluding £502,430,000 to be met from borrowing (£342,500,000 in original estimates plus £159,930,000 from supplementaries); (c) that is, Budget provision (including margin for supplementaries) of £942,444,000 from revenue, plus supplementaries of £25,000,000 margin for supplementaries and £1,164,000 Ordnance Vote now included with Ministry of Supply.

After reducing Exchequer balances by £268,026 to £2,452,576, the other operations for the week (as shown in the next column) raised the gross National Debt by £27,956,000 to about £8,522 millions.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On September 1st applications at £99 1s. 2d. per cent. for bills to be paid for on Monday, Tuesday, Wednesday, Thursday, Friday and Saturday of following week were accepted as to about 59 per cent. of the amount applied for and applications at higher prices in full. £50.0 millions of Treasury bills are being offered on September 8th.

## LONDON ACTIVE SECURITY PRICES

The Stock Exchange did not reopen until Thursday, September 7th, and we are therefore unable to publish our usual table of London Active Security Prices and Yields. The abridged table below shows, for a number of leading stocks, effective dealing prices on the last two trading days before the outbreak of war, approximate closing prices on September 5th and 6th, when inter-office dealings were conducted, and market dealing prices on September 7th. It should be noted that prices shown for September 5th and 6th are in many cases nominal, and that dealing has been possible this week only by negotiation.

|                          | Mini-mum Prices | Aug. 30, 1939 | Aug. 31, 1939 | Sept. 5, 1939, Approx. closing nom. | Sept. 6, 1939, Approx. closing nom. | Sept. 7, 1939 |

The above rates to apply to cargoes in all vessels to be named at time of acceptance, or thereafter, but warranted sailing within seven days of acceptance of the risk, or held covered at the scale in operation at the time of sailing.

Ship to Warehouse, and vice versa, as per Explanatory Memorandum, 10s.

Rates may be amended daily or as frequently as is thought desirable.

have arisen would not seem to be the most direct way of ensuring the maximum possible production of war material. If this principle is maintained, the almost inevitable effect will be that programmes will be engaged in a constant struggle to catch up with schedules, without any scope for that steady increase of scope and foresighted anticipation of requirements which proved so necessary in the last war.

The same sort of doubts are aroused by the apparently settled policy of the Ministry to leave the control of each branch of industry in the hands of its existing trade association. Trade associations do not invariably bring to the front the ablest personalities of the industries they represent. Nor is it always true that the members of an industry are the most appropriate persons to initiate or carry through measures which must necessarily cut across their established practices and, in some cases, damage their established interests. It is difficult to avoid the suspicion that the Ministry of Supply is going about its task on the major hypothesis that the supply of arms is a limited business which should be carried through with the minimum disturbance to peace-time industry. But the only way in which we can win the war, since we have no preponderance of man-power, is by a crushing preponderance of material power. Our supply must be unlimited; the first item on the programme must be to produce as much as is humanly possible; and the system of supply should therefore be designed to provide both the maximum of imaginative anticipation of needs and the maximum of ruthless driving initiative.

A second field in which more needs to be done than has yet revealed itself in signs visible to the public is in the buttressing of our international trade. Foreign exchange is obviously one of the most vital of our war materials and drastic steps have very properly been taken to mobilise the realisable foreign assets of the public and to limit all non-essential demands for foreign exchange. But the most direct way of acquiring foreign exchange and the only way which does not involve some draft on the national capital is by the sale of exports. The maintenance of the export trades not only serves a war-time purpose; it is also an insurance against a severe crisis of readjustment after the war is over, since the production of goods for export is one of the very few ways in which an industry can continue at its peace-time occupation and yet make a direct contribution to the war. This fact has been recognised in principle, and the President of the Board of Trade promised in Parliament last week that producers for export would be granted "a high priority" in the allocation of materials and labour. This is admirable so far as it goes. But does it go far enough? Is it enough to say to the industrialist that if he will turn aside from the urgent demands (and the certain returns) of producing for the Government at home and take the hazardous and expensive initiative of increasing his export business, he will be granted a high priority? It is in the direct interest of the community that our export trade should not merely be maintained, but that it should be increased, notably at the expense of Germany. It would be very good business for the community, in the circumstances of the moment, to spend sterling in order to get a larger supply of foreign exchange. But none of these things will be done if they are left to the unco-ordinated and unassisted initiative of private traders. There should be a positive effort to increase exports, with the full drive of the Government's war-time powers behind it.

A third matter in which clarity of purpose is not yet visible is that of financing the expenditure of the Government. The general issue of taxing *versus* borrowing has often been argued in these columns and no more need be said, pending the production of the promised emergency Budget, than to express the hope that the Chancellor will not hang back from drastic measures of increased taxation out of any false hope

that there are other methods of finance which impose a lesser burden on the people. But whether or not the increase in taxation is sufficient, there must inevitably be borrowing on a very large scale, and the question arises at what rate of interest these loans are to be raised. At the moment, all rates of interest are under the influence of the doubling of the Bank rate on August 24th. That date was ten days before the outbreak of war, when the British financial system still retained many elements of freedom. In a free economy, a rise of interest rates is one of the recognised controls and an almost inevitable response to the need for very heavy borrowing by the Government. It chokes off borrowers other than the Government and stimulates the flow of savings. But since August 24th the economy has ceased to be free. Other borrowers are now being choked off by direct prohibition and the flow of savings can be stimulated both by patriotic propaganda and (more powerfully) by restrictions on consumption of all kinds. Moreover, high interest rates cannot in present circumstances play their traditional rôle of preventing inflation. The danger of inflation comes from excessive Government borrowing, and the amount of borrowing is unlikely to be significantly less however high interest rates are pushed. But it is obviously of the very greatest importance from other points of view that the cost of borrowing should be reduced to the minimum. High interest rates now will saddle the country with a very heavy burden of debt in the future and greatly impede the efforts that will have to be made when the war is over to stimulate a rapid revival of normal enterprise. The respective amounts of taxation and borrowing will have to be decided by the Government on a review of the widest considerations. But the decision once taken, every effort should be made to force interest rates down as low as possible.

To this very brief discussion of financial policy an addendum seems called for. The monetary history of the last war is by no means devoid of blunders by those in authority, and though outside criticism of official policy was often very wide of the mark, it was only through constant public discussion of the issues involved that the principles of sound policy slowly emerged. In this war, however, there is the very best reason for believing that criticism and comment will be hamstrung by lack of the necessary data. Already the publication of the monthly average figures by the London Clearing House has been suspended, without any indication that it will be resumed when the initial dislocations of the onset of war have been overcome. What is far more ominous, there are warnings that the publication of official and private figures relating to trade, production, prices, shipping and finance will be suppressed and that any expressions of opinion about the existence of inflation of currency and credit will need the prior approval of the authorities.

It is necessary to record, at the very outset, the most emphatic protest against any such attempt to impose a statistical black-out. Information likely to assist the enemy will, of course, be withheld. But it is difficult to see what assistance the enemy will be able to derive from public discussions of financial policy. He is far more likely to be assisted by the sort of mistakes that will be made in the absence of public criticism. And as for the morale of the home population, that is more apt to suffer from direct contact with rising prices than from a scientific measurement of the movement of the general price-level.

These fears are not illusory, though chapter and verse for them cannot be quoted in public. There is great need for an emphatic statement both by the Government and by other authorities that essential statistical data will not be withheld unless and until it becomes absolutely essential. No aspect of Government policy carries in it more seeds of danger to the stability of the social fabric than the management of the national finances. The public must be allowed to retain some control over its own destiny.

## Germany's Food Supplies

A FEW days before German troops marched into Poland, the carefully prepared system of rationing foodstuffs was set in operation. The rations, when compared with current consumption, as in the following table, show very clearly the weaknesses of Germany's food supplies:—

|                        | Rations per capita<br>(kg. per annum) | Actual consumption per capita,<br>1935-38<br>(kg. per annum) | Rations in % of<br>1935-38 |
|------------------------|---------------------------------------|--------------------------------------------------------------|----------------------------|
| All fats .....         | 22.2                                  | 26.05                                                        | 85.3                       |
| Milk .....             | 75.6                                  | 112.00                                                       | 67.5                       |
| Meat .....             | 40.0                                  | 45.45                                                        | 88.0                       |
| Sugar .....            | 14.56                                 | 23.1                                                         | 63.0                       |
| Coffee and substitutes | 3.28                                  | 4.4                                                          | 74.4                       |

NOTE.—Fats, meat and milk include the additional rations for children under 6 years of age, for expectant and nursing mothers, and for workers in heavy industries.

The more important high-quality foodstuffs are already rationed, and though bread, flour and potatoes have not yet been rationed, the ration cards have coupons for them, indicating more restrictions if the war should last longer than the official expectation. Further cuts in the meat and coffee rations have already been reported.

To estimate a country's food supplies in time of war is necessarily a difficult business because of the large number of unknown variables in the calculation. There is, for example, the normal hazard of good or bad harvests. There is the unknown magnitude of the effect on home production of the absorption of millions of men in the fighting forces and munition industries. There is the difficulty of knowing what imports will be available to a blockaded country. And there is the final mystery of stocks. An attempt will be made in this article, however, to assemble such data as are available.

**Cereals.**—Germany is better prepared now than in 1914 so far as bread grains are concerned, but in feeding stuffs she is fully as dependent on foreign supplies. On the average of 1935-38, the position was as follows:—

|                         | ANNUAL AVERAGE, 1935-38<br>Total Supplies,<br>Greater Germany<br>('000 tons) | Imports as % of<br>Total Supplies |
|-------------------------|------------------------------------------------------------------------------|-----------------------------------|
| <b>Bread grains:—</b>   |                                                                              |                                   |
| Wheat .....             | 7,521                                                                        | 12.0                              |
| Rye .....               | 9,983                                                                        | 3.5                               |
| <b>Feeding stuffs:—</b> |                                                                              |                                   |
| Barley* .....           | 6,363                                                                        | 2.8                               |
| Oats .....              | 7,784                                                                        | 1.5                               |
| Maize .....             | 2,029                                                                        | 73.6                              |

\* Including "mixed grains."

With the exception of maize, the position is thus not impossible. Moreover, abnormally high imports during 1937 and 1938 and last year's bumper harvest enabled the government to build up large stocks of grain, which were stated to have risen from 3.3 to 8.6 million tons in the twelve months to August 1, 1939. This year's harvest is good in bulk, but is believed to be poor in quality, because of heavy rain during the harvest time.

Germany can also draw on supplies of grain in adjoining countries. The countries to which a blockaded Germany has access can be divided, for this and later calculations, into three groups. Group A consists of Holland, Belgium, and the Scandinavian countries. The counter-attraction of trade with the outside world will be enough to ensure that these countries' exports to Germany are no greater than in peace-time. Group B consists of the Baltic states, whose normal commerce with Great Britain is cut off and which are also subject to heavy German pressure. Their exports to Germany may well increase, though Germany's difficulties in making payment may be a hindrance. Poland also belongs to Group B to the extent that it is

over-run by German armies and after the delay necessary to repair the damage of the invasion. Group C consists of the countries of South-Eastern Europe—Hungary, Yugoslavia, Roumania, Bulgaria—where the economic leverage of the Germans and of the Allies may be presumed to be more equal, and where the field is more open to bargaining. It does not seem at present likely that these countries will be willing to prejudice their neutrality either by refusing to sell to Germany or by selling her their total production. But the degree to which they will feel compelled to yield to German pressure for increased supplies will naturally differ from country to country.

Russia and Italy stand outside this classification. In the case of Russia there are serious transport difficulties in the way of supply to Germany (see *The Economist*, September 2nd, page 437). Italy is not a source of food supply to Germany, except in the case of vegetables (48 per cent. of German imports in 1935-38 came from Italy), fruit (23 per cent.) and rice (25.6 per cent.).

The cereal supplies available to Germany are set out in the following table. The first line for each commodity shows the amounts that Germany actually bought from the countries in question on the average of the years 1934-37—a basis more favourable to Germany than the average of 1935-38. The second line, in italics, shows, for Groups B and C and Russia, the total exports of the countries in question to all destinations:—

|              | CEREAL SUPPLIES ('000 TONS).                    |                                                  |                     |                       |                   |
|--------------|-------------------------------------------------|--------------------------------------------------|---------------------|-----------------------|-------------------|
|              | Exports of Neutral Countries<br>Average 1934-37 |                                                  |                     |                       |                   |
|              | Greater<br>Germany's<br>Imports                 | Group A<br>(Holland,<br>Belgium,<br>Scandinavia) | Group B<br>(Baltic) | Group C<br>(Balkans)  | Russia            |
| Wheat .....  | 906                                             | 15.2                                             | ...                 | 187.0<br><i>1,174</i> | 2.7<br><i>459</i> |
| Rye .....    | 332                                             | 18.2                                             | 1.4<br><i>15</i>    | 20.0<br><i>145</i>    | ...               |
| Barley ..... | 173                                             | 4.1                                              | ...                 | 45.7<br><i>350</i>    | 9.5<br><i>274</i> |
| Oats .....   | 118                                             | 8.6                                              | 0.2                 | 1.1<br><i>18</i>      | 19.0<br><i>89</i> |
| Maize .....  | 1,500                                           | ...                                              | ...                 | 204.0<br><i>1,226</i> | ...               |

It will be seen that the possibility of meeting Germany's normal import requirements depends upon securing the whole surplus of the Balkan countries. Even so, there would be a serious shortage of maize. Russian grain is hardly available, as it is shipped from Black Sea ports. Poland, in a normal year, exports enough rye and barley to meet German needs. In sum, the position would seem to be that Germany's supplies of bread grains will suffice for the next two winters. But feeding stuffs should be very short in the autumn of 1940 and bread grains later on. Any failure of the domestic harvest, as a result of bad weather or labour shortage, would accentuate the difficulties.

**Fats.**—Goering's alternative between guns and butter exposed a fundamental weakness in Germany's food position, for her supplies of edible fats depend upon imports to the extent of practically 45 per cent. The following table makes this point conclusively:—

|                     | ANNUAL AVERAGE, 1935-38                     |                        |                                      |
|---------------------|---------------------------------------------|------------------------|--------------------------------------|
|                     | Total Supplies,<br>Old Reich<br>('000 tons) | Imports<br>('000 tons) | Imports as<br>% of Total<br>Supplies |
| Butter .....        | 574                                         | 81                     | 14.1                                 |
| Lard and tallow ... | 576                                         | 40                     | 7.0                                  |
| Vegetable oil ..... | 635                                         | 603*                   | 95.0                                 |
| Whale oil .....     | 187                                         | 156                    | 83.5                                 |
| Total fats .....    | 1,972                                       | 880                    | 44.7                                 |

\* Oil equivalent of imported oilseeds.

If Germany were prevented from importing fats, and raw materials for producing fats, consumption would have to be reduced by nearly 50 per cent. Moreover, supplies of oil cake (a by-product of vegetable oil extraction) would be curtailed by roughly one million tons annually, and shortage of this important feeding stuff would clearly affect meat and dairy production. Nor has the incorporation of Austria and Czecho-Slovakia proportionately increased Greater Germany's home production of fats. Exports of butter and milk from Austria were very small, and 40.5 per cent. of Czecho-Slovakia's total fat supplies between 1934 and 1937 were either directly imported or manufactured from imported raw materials.

How far can these supplies be maintained in time of war? The answer is suggested in the comparison of Greater Germany's imports of fats and materials with the exports of the three neutral groups and Russia, first to Germany and secondly (in italics) to all countries:—

|                     | FATS SUPPLIES<br>( <sup>000</sup> tons) |                       |                                                    |               |             |
|---------------------|-----------------------------------------|-----------------------|----------------------------------------------------|---------------|-------------|
|                     | Greater<br>Germany's<br>Imports         | Exports of<br>Group A | Average<br>Neutral Countries<br>1934-37<br>Group B | Group C       | Russia      |
| Oilseeds .....      | 1,709                                   | 1.6                   | 0.3<br>18.6                                        | 54.0<br>200.6 | 0.5<br>39.0 |
| Whale oil .....     | 156                                     | 139.0                 | ...                                                | ...           | ...         |
| Butter .....        | 80                                      | 54.9                  | 17.5<br>41.3                                       | 1.8<br>2.0    | 1.5<br>26.0 |
| Lard and tallow ... | 59                                      | 12.0                  | 0.4<br>...                                         | 14.5<br>25.2  | ...         |

Blockade would clearly be most effective in preventing tropical supplies of vegetable oilseeds from reaching Germany. Even granted the deflection of total exports from countries in Groups B and C, and Russia, to Germany, little more than one-seventh of her normal requirements of oilseeds would be secured. Whale oil supplies, largely provided by Norway, could not be increased to make up the deficit. And the difficulties of maintaining adequate supplies of imported feeding stuffs could be expected to react fairly quickly upon the production of butter and lard and tallow, in which Germany is mainly self-sufficient—though only on the basis of a low standard of consumption. In the autumn of 1938 it was officially stated that stocks of all kinds of fats amounted to 462,000 tons, or 23 per cent. of the average annual supply. While present stocks may be higher, fat supplies are clearly the most vulnerable item in Germany's food supplies.

**High Quality Foodstuffs.**—Imports of high quality foodstuffs—meat, eggs, fish, vegetables and fruit—form a smaller proportion of Germany's total supplies than her imports of fats, but their interruption would impose a considerable strain on the German population. The following table relates average imports of such foodstuffs for 1935-38 to total supplies to the Old Reich:—

|                  | ANNUAL AVERAGE, 1935-38                                |                                   | Imports as<br>% of Total<br>Supplies |
|------------------|--------------------------------------------------------|-----------------------------------|--------------------------------------|
|                  | Total Supplies,<br>Old Reich<br>( <sup>000</sup> tons) | Imports<br>( <sup>000</sup> tons) |                                      |
| Meat.....        | 3,625                                                  | 734*                              | 20.2                                 |
| Fish .....       | 844                                                    | 235                               | 27.9                                 |
| Vegetables ..... | 3,473                                                  | 273                               | 7.9                                  |
| Fruit.....       | 2,426                                                  | 850                               | 35.1                                 |
| Eggs .....       | Mns.<br>8,125                                          | Mns.<br>1,452                     | 17.9                                 |

\* Including imported livestock killed in Germany.

Unfortunately, no detailed figures for these foodstuffs are available for Austria and Czecho-Slovakia, but Austria formerly imported a relatively higher proportion of meat and eggs. For a time, Germany's home supplies of meat could probably be maintained at the 1935-38 level, for the reduction in livestock which occurred during 1937 and 1938 has apparently been halted, while foot-and-mouth disease, which spread rapidly in 1937, now seems under

control. Old Reich livestock censuses of the past three years are shown below:—

|               | (In thousands)    |                   |                   |
|---------------|-------------------|-------------------|-------------------|

\* 22,480,000 at June, 1939, against 20,810,000 at June, 1938.

German food rationing is evidently based, at present, on the assumption that meat supplies will be better maintained than other vital foodstuffs. But as livestock is killed off and supplies of feeding grains and oilcake are reduced, it will be impossible to make up the deficit from European neutrals. In meat, the blockade may become highly effective at a later stage in the war.

Germany's prospects of increasing her imports of other high quality foodstuffs are illustrated by the following table:—

|                  | HIGH QUALITY FOODSTUFFS<br>( <sup>000</sup> tons) |                       |                                                    |                      |                    |
|------------------|---------------------------------------------------|-----------------------|----------------------------------------------------|----------------------|--------------------|

\* Manufactured and preserved meat only.

Germany's catches of fish are likely to fall considerably, for important fishing grounds will be closed to German vessels and adequate alternative supplies are not available. In vegetables Germany is largely self-sufficient, and in root crops—potatoes, mangolds and turnips—completely self-sufficient. Only a bad harvest, diversion of labour, or the loss of territory could create an acute shortage of root crops. Probably Germany could dispense with her fruit imports without undue privation, though they represent more than one-third of her supplies. The Balkan countries could increase their supplies of both fruit and eggs to Germany, but not on a large scale.

Under pressure of war violent economic changes are wrought. But even on the assumption that Germany could continue to import the same quantities of essential foodstuffs from all European neutral countries, shortages of feeding stuffs and fats would not be relieved. Between 1935-38 these countries supplied only 18.1 per cent. of total imports of maize and 3.95 per cent. of total imports of oilseeds to the Old Reich. Even if the Nazi dream of diverting the total exports of the Baltic, South-East European and Russian States to Germany were realised, the marked shortage of fats and the relative scarcity of high quality foods would still remain. And to obtain war time supplies Germany will be compelled to maintain a high level of manufactured exports. Finally, the severe rationing of sugar shows that Germany is self-sufficient in sugar only in time of peace. Actually, Germany is a sugar exporter, and her export capacity has been increased by the incorporation of Bohemia and Moravia. Czecho-Slovakia's free supplies, together with the 37 per cent. cut in German consumption, are equivalent to some 750,000 tons, which will be available for glycerine production. Germany has embarked upon war with a full granary, and an immediate stiffening of rationing may be averted. But in fats and foods other than bread the belt will have to be tightened much earlier.

## Defence Measures

THE past three weeks have witnessed a revolution in the civil life of Britain. The more obvious ways in which this fact has obtruded itself upon the public have amounted to little more than symptoms of the change. Such have been the transfer of large sections of the population, restrictions on lighting and transport, and the ubiquitous activity of the civil defence services. The basic reality is the transformation by means of a flood of new legislation, Orders-in-Council, and departmental instructions of the legal framework in which the civil and economic life of Great Britain is carried on. This fact can only make itself felt to the full as the war proceeds and the new measures come into complete operation.

In the last three issues of *The Economist* there has appeared a record of the various enactments and rules whereby the economy of the country has been placed on a war footing. This record, which is continued below, aims at reasonable completeness. The sheer number of new measures, and the necessity to catalogue them in summary fashion, have so far tended to obscure the fact that practically every item recorded has been sufficiently important to have required, in normal times, full exposition and commentary in this journal. It will be possible to resume this detailed treatment, which has already been accorded to some of the more outstanding of the existing measures, as the spate of new laws and orders dies down and those already passed come into full working. In the meantime the catalogue is continued, and in the case of most of the items the vital and far-reaching significance which they possess is allowed to speak for itself.

### DEFENCE LEGISLATION

Two Acts passed on Saturday, September 2nd, which were not mentioned in the previous record were:—

#### *Administration of Justice (Emergency Provisions) Act*

The object of this measure is to enable the administration of justice to be carried on in war time. It provides for the decentralisation of courts and records; revises the methods of bringing the commissioners of assize into being and of regulating the other courts; enables the Lord Chancellor to delegate some of his functions; reduces the size of juries and enables the period of remand to be extended.

#### *Administration of Justice (Emergency Provisions) (Scotland) Act*

On Thursday, September 7th, the following two Acts were passed:—

#### *Liability for War Damage (Miscellaneous Provisions) Act*

This Act relieves bailees of their liability in respect of goods in their possession which suffer loss or damage as a result of war.

#### *Police and Firemen (War Service) Act*

The appropriate authorities are enabled to supplement the pay of police and firemen, while they are serving in His Majesty's forces. Provision is also made for the continuity of their superannuation and pension rights.

### ORDERS IN COUNCIL

On Monday and Tuesday, September 4th and 5th, five Orders concerning commodities came into force which have not previously been mentioned in this record. They were the Cereal and Cereal Products Requisition and Control Order which requisitioned all existing stocks and cargoes arriving in this country in future; the Feeding Stuffs (Provisional) Prices Order; the Tea (Provisional Prices) Order and the Tea (Control) Order, the former of which prescribes the wholesale and retail prices of tea while the latter prohibits dealings outside the United Kingdom except under licence and provides for the taking over of all stocks by the Food (Defence Plans) Department; and an Order requiring particulars of existing stocks and further arrivals of imported canned meat.

It was announced on Thursday, September 7th, that a Ministry of Home Security had been set up by an Order-in-Council, made under the Ministers of the Crown (Emergency Appointments) Act, with Sir John Anderson at its head. On the same day the Priority of Work Order by the Minister of Supply was published. It required contractors and others to give priority to certain work in accordance with the orders of the departments concerned, but did not establish a complete schedule of industrial priorities. An Order by the Minister of Transport implemented the power given by the Defence Regulations to modify the restrictions placed upon hours worked by lorry drivers by the Road Traffic Act, 1930. The Order applied to motor vehicles employed on Government haulage work. Oils and fats were added to the list of commodities whose prices and distribution are controlled by Order. The import and export of pigeons were prohibited except under licence from the Air Ministry.

The Air Navigation (Provisional) Order, which became effective from September 2nd, was announced on Friday, September 8th. It provided that the registration of aircraft will not lapse upon change of ownership, destruction, withdrawal from use or a cessation of the right of the owner to register it. On the same day an Order came into force forbidding the use of sirens and other similar sound instruments except for air-raid warning purposes. Certain exceptions were made including the use of such instruments on railways and ships. The prices of fat cattle and sheep were fixed by Order.

Ships proceeding to sea from certain ports are required by the Control of Trade by Sea Order, of which notice was given on Saturday, September 9th, to obtain a licence from the Board of Trade. Two further Orders of the same day controlled the price of and trade in dried fruits; and the Board of Trade permitted the export of tobacco by an open general licence under the Export of Goods (Prohibition) (No. 2) Order.

A number of Orders announced on Monday, September 11th, dealt with commodities. One group concerned various aspects of the meat trade. The sale of fat cattle was prohibited outside livestock markets and their prices were fixed; maximum wholesale prices for butchers' meat were prescribed; and arrivals of imported chilled or frozen meat were requisitioned. The Potatoes (Provisional Prices) Order laid down maximum prices for potatoes for human consumption; and further Orders regulated stocks and prices of sugar.

The only two Orders announced on Tuesday were made by the Secretary for War and prohibited any person to have in his possession, convey or send into or out of the United Kingdom otherwise than by post any document or other article containing information unless a permit has been obtained from the Chief Postal Censor.

On Wednesday the Ministry of Food made an order prescribing the maximum prices for the sale of butter.

### DEPARTMENTAL INSTRUCTIONS

The type of civil defence activity which appeared first in the present emergency consisted of detailed instructions and orders of all kinds which were necessary to bring into operation the various measures which had been taken in anticipation of a war. The steady trickle of such measures which has been in evidence for some months rapidly broadened as the probability of war became plainer and has continued to flow since the outbreak. The following details supplement the record given in *The Economist* in the past three weeks.

On Thursday, September 7th, particulars of the functions of the new Ministry of Economic Warfare were published, and it was emphasised that those functions had been carefully planned and defined and the necessary organisation built up to perform them. This major item of information concerning central activity was accompanied by a number of particulars giving evidence of detailed steps. Progress was reported in the British Medical Association's scheme for providing sufficient medical services both for the forces and the civil population, and in the same department it was announced that the London Hospital had completed its arrangements to act as a clearing centre for air raid casualties. The regulations concerning the lighting of cars were made more stringent; it was announced that still more auxiliary firemen were needed; that the Police College at Hendon was to be closed; and that British subjects returning to parts of the Empire outside the British Isles and non-enemy aliens travelling to foreign countries were exempted from obtaining exit permits until September 16th. To strengthen British financial resources abroad and concentrate

all the Government's foreign resources in one reserve it had been decided on Wednesday to transfer the present reserve in the Issue Department to the Exchange Account and £280 millions was transferred forthwith. This move required an increase to £580 millions in the fiduciary note issue of the Bank of England.

Two political adjustments to reduce friction to a minimum were announced on Friday, September 8th. An agreement was made not to contest by-elections, the party previously holding the seat being allowed to nominate the new candidate without opposition; and liaison officers were appointed from among the leaders of the Labour Opposition to make contact with Government Departments. The appointment of a Director-General and Secretary to the Ministry of Economic Warfare was announced; particulars were published of the first meetings of the London County Council and City of London Emergency Committees; and the Ministry of Labour published a revised Schedule of Reserved Occupations, including several new classes. Further adjustments in civil life included announcements of the curtailment of train services on September 11th; of the reopening of certain schools in neutral areas on the same day; and of the necessity for travellers from Northern Ireland to Great Britain to obtain exit permits. Further particulars were given of the arrangements made by the London hospitals after the evacuation of September 1st to deal with war time requirements; and in the same connection St. Bartholomew's Hospital issued an appeal for wearable clothing to be given to casualties who require it. The Milk Marketing Board announced that the current milk contract and producer-retailer licences would remain in force until January 31, 1940. The Minister of Food informed the Press that rationing would not be necessary for three or four weeks; and an official statement summed up the whole food position.

Measures announced on Saturday, September 9th, affecting directly the life of the civil population gave particulars of 110 Citizen Advice Bureaux set up in the Metropolitan Police area; of a further registration for evacuation to take place on the following Monday and Tuesday; and of the reopening of cinemas, football grounds and other places of amusement in neutral and reception areas. Adjustments to commodity controls were facilitated by the announcement of the addresses of divisional petroleum officers to hear requests for additional rations; and of the new headquarters for the wholesale distribution of meat at Gerrard's Cross. Difficulties in working the present scheme for controlling the fishing industry were pointed out to the Minister of Food by the Grimsby trawler owners, who asked for a return to the normal methods of carrying with the sole safeguard of maximum prices. It was made known by the Customs through the Cardiff and Bristol Channel shipowners' associations that ships clearing from South Wales would only be allowed sufficient bunker coal for the outward journey unless they guaranteed to bring back cargoes to Great Britain or allied ports. Contraband

control bases were established at Kirkwall, Weymouth, The Downs, Gibraltar and Haifa.

On Monday the Ministry of Economic Warfare made an announcement clarifying the procedure concerning ships detained or seized by the contraband authorities. The Board of Trade suspended the Operation of the Sea-Fishing Industry (Regulation of Landing) Order, 1936, and thus removed the necessity for licences for the importation of sea fish and restrictions on the quantities imported. Rest days were restored in the Metropolitan Police and certain other police authorities decided to accept women who are willing to do police duties. Preliminary arrangements were commenced for the control of butter and cheese, and it was announced that arrangements had been made to deal with the special requirements for motor spirit and oil of those engaged in agriculture. Two developments dealing with the more unpleasant necessities of war-time civil organisation were the instruction by the Minister of Health to local authorities to suspend work on slum clearance and redevelopment schemes and to complete only those new houses which were in an advanced stage of construction; and the announcement by the Air Ministry that it would be necessary to withdraw the restrictions hitherto imposed on the use of air gunnery and bombing ranges.

The Ministry of Information announced on Tuesday that arrangements were being made to transfer from London between 7,000 and 8,000 members of the staffs of Government Departments. An official warning to persons suspected of profiteering was issued by the North-Western Regional Commissioner through the Town Clerk of Manchester.

It was made known on Wednesday by the Committee of London Clearing Bankers that publication of monthly statements of average weekly balances of London Clearing Banks will be discontinued. The uncertainty concerning the rates of payment for requisitioned vehicles used for Civil Defence purposes was to some extent alleviated by the publication by the Minister of Transport of a provisional schedule of payments. The closing to merchant vessels of an area in the dockyard port of Pembroke was notified by the Admiralty. A particularly welcome announcement concerned the relaxation of the lighting restrictions for motor vehicles and hand lamps used by pedestrians. A further extension of food control was represented by the notification of arrangements in progress for the grouping of butchers in retail buying committees.

Importers of Danish butter, bacon and eggs were requested on Thursday by the Minister of Food to appoint agents on their behalf at the principal ports at which cargoes are now being discharged. This was made necessary by the fact that ports other than the normal ones are now being used for this traffic. The National Camps Corporation were urged by the Minister of Health to push on at once with the completion of camps whose building was provided for in the Camps Act.

## NOTES OF THE WEEK

**A Free Commonwealth.**—In a most serious sense, it is true to say that the response of the Dominions to Britain's declaration of war is a vindication of the Statute of Westminster and the policy for which the Statute stands. The legal issues may be set aside, for it does not matter that some of the Dominion Governments have never ratified the Statute; the machinery was there, and if they have not used it in the past, no one could prevent them from using it now. But they have not used it. As in South Africa, where a Government that wished to remain neutral was thrown out of office by a substantial margin of votes, so in Canada, Australia and New Zealand it is the comprehensiveness of the response that is surprising. For years we have been told that the Canadians would never go to war again "for some European quarrel," that the bulk of the prairie people and of the French Canadians, if not the Canadians in the big cities, were dead set against intervention. That judgment was very wide of the mark. It was not only the Government and Conservative Opposition parties that supported the Canadian Government's motion for going into the war; the main body of the French Canadians themselves were behind M. Lapointe, the French Canadian Minister of Justice, when he offered his services and those of his French Canadian colleagues "without limitation" (on the understanding that there would be no conscription) and promised to devote "their best efforts to the common cause." In the sphere of administration the Government has brought in a war budget calling for £130 millions and has voted a war credit of £20 millions, the money to be raised on the principle of "equality of sacrifice and ability to pay."

Last week also saw the introduction of the Australian Budget for 1939-40, though in this case the estimates were made before the declaration of war and will therefore have to be revised. On the peace-time estimate a record total sum of £102 millions is asked for, and taxation is up accordingly. Expenditure on defence is up from £14 millions to £33 millions, but there is no alteration in the Commonwealth's borrowing programme. Public attention in Australia, however, is centred rather on the preparations being made for national defence and on the expected widening of the Federal Government to include parties now in Opposition. No final decision has yet been taken on the raising of a force to serve wherever it might be needed, though in this there is the example of New Zealand, where over 6,000 volunteers were enrolled in a special defence force, to serve in New Zealand or overseas during the first day's recruiting. It is understood that Mr Menzies is anxious to reconstruct the Government, and it seems that Sir Earle Page will retire from the leadership of the Country Party to facilitate this.

**Parliament and Publicity.**—Two features were outstanding in Wednesday's important meeting of the Commons—even apart from the House's united and inflexible determination to resist the aggressor to the end. In the first place, the Prime Minister, whose survey of the progress of the war was the *pièce de résistance* of the day, was extremely anxious that Members should know all that could be told about what was going on. In the second, the

Opposition, while fully appreciating Mr Chamberlain's position, were not disposed to abate in the slightest their constitutional duty to help to win the war by harrying the Government in the weakest places of its policy. Mr Greenwood was deadly effective: as Leader of the Opposition it was his duty to put his fingers on the weak spots, and he found them at the Ministries of Information and Supply. His strong words about the stupid *imbroglio* of Monday night, when news about British troops in France was jockeyed about between the Ministry of Information and the War Office, given to the Press, withdrawn and then put out again, drew no riposte from the Government benches, where the ill-working of official publicity so far was of necessity admitted. They were echoed by Sir Archibald Sinclair and accepted by Sir Samuel Hoare. Democratic processes were working at their best on Wednesday; and it is not the least sign of the truly representative character of the Commons that there emerged from that day's discussion the general view that what is most immediately wanted by the nation is more information, better information and information more skillfully handled and expressed. This is what every man and woman in the street has been saying ever since the war began.

**The French War Cabinet.**—Twenty-five years ago the Germans had come within fourteen miles of Paris, and the French Government, evacuated from the capital, had assembled at Bordeaux. To-day the French Army is advancing into Germany and the Government, firmly established with a War Cabinet, has no thought of leaving Paris. In the War Cabinet, M. Daladier has taken over, in addition to his duties as Prime Minister and Minister of Defence, those of the Minister for Foreign Affairs, and M. Bonnet has been relegated to the Ministry of Justice. M. Daladier will be assisted by three Under-Secretaries, M. Pernot, as Under-Secretary for Blockade, M. Champetier de Ribes, as Under-Secretary at the Quai d'Orsay, and M. Ducos as Under-Secretary for War and National Defence. The Prime Minister is currently in an unassailable position. He has the confidence of the country and may be trusted not to abuse it. Working under him he has an unusually large Cabinet, its leading Ministers unchanged with M. Reynaud at Finance, M. Bonnet at Justice (from Foreign Affairs), M. Sarraut at the Interior, M. Mandel in charge of Colonies, M. de Monzie at Public Works, and M. Pomaret at Labour. In addition M. Chautemps retains his post as Minister of State, and the two Defence Ministers, MM. Campinchi and La Chambre, are also unchanged. On the supply side M. Dautry, a newcomer, is in charge of the newly-created Ministry of Armaments, and another interesting appointment is that of M. Coulondre, fresh from his Embassy at Berlin, to be M. Daladier's *Chef de Cabinet* on the diplomatic side. Those who looked for a really national Government, with the inclusion of the Socialists, or at least of leading Radicals like M. Herriot, have therefore been disappointed; but, as was the case in London, their disappointment may only be temporary and need not be taken to heart. Like their British counterparts, the French parties not in the Government may prefer to hold a watching brief over the Government's conduct of the war, ready to step in whenever their presence is generally known to be needed, but also ready to offer the criticism without which no democratic Government, whether in peace or war, should feel entirely at its ease.

**The War in Poland.**—For the Germans this has been largely a week of consolidation and reconnaissance. It says a good deal for the powers of endurance of the Polish Army that they have taken advantage of this pause to hit back westwards from Warsaw and to extricate a number of divisions which had been caught up and passed by the German advance. One of those detachments is still holding out in the port of Gdynia, another is reported to have recaptured in its retreat the city of Lodz, a third is still in

the process of fighting its way out of the Corridor area into contact with the Polish troops north-west of Warsaw. Altogether the Germans seem to have taken far fewer prisoners and far less war material than was promised by the speed of their advance. For the moment they are held up north and west of Warsaw; their thrust from East Prussia by way of Mława and Przasnysz is held up in front of Pultusk, and the Polish Army still holds the fortress of Modlin. Elsewhere the tale is less encouraging. The second phase in the campaign is now opening, and once again the Germans seem to have secured their initial objectives and to be pressing hard towards the last lap in their advance before it reaches the waste lands of Eastern Poland. The phase took a double aspect this week. The first was a thrust in the north on the River Narew, which the Germans claim to have crossed to a point beyond the town of Łomża, important as a strategic base. From there they will be able to advance southwards along the left bank of the Narew as far as its confluence with the Bug, which now forms one of the Polish Army's main strategic supports, and eastwards until they cut the railway between Białystok, which by then they may have surrounded, and Brest Litovsk. The second aspect of the campaign is in the south, a determined advance north and south of the fortress of Przemyśl towards Lwów, which tank detachments are reported to have already reached, and the valley of the Dniester. The objective here is the cutting of railway communications with Roumania. Thus the Germans, held in the centre, are still trying to advance on both their flanks.

But the way is long, and now that the rains are beginning to bog the roads feet deep in mud, much of it will soon be impassable to heavy detachments of troops. If they mean to end the war in the east before the winter begins, the Germans must work fast; and one obvious though repellent sign of this was the order issued by the German High Command that resistance by the civil population would be quelled with "all the means at the German Army's disposal." "The German air arm," continues the order, "together with the heavy artillery, will carry through those military measures which are calculated to make clear in such places the hopelessness of resistance." The places meant by the order are, of course, the area of whole villages and towns wherever some Pole, in the tradition of all invaded peoples and without command from anyone, takes a gun and snipes at the invaders. This is the principle of "collective responsibility" applied on a most terrible scale. And if any neutral testimony were required of the German treatment of civilians, even before this order was made, there is the report of the American Ambassador in Poland, declaring that the German air force was "taking advantage of every opportunity, without regard to the danger for the civilian population which may be involved."

**The Western Front.**—Here the Allies are still in the stage of preparation. For the comfort of the hard-pressed Polish Army it should be added that the preparation seems to be both swift and efficient. On Tuesday the Supreme War Council, consisting of Mr Chamberlain and Lord Chatfield, Minister for the Co-ordination of Defence, and, on the French side, of M. Daladier and General Gamelin, Chief of the National Defence Staff, held discussions "on French soil." On the same day the news came out, from a French source and later (though after culpable vacillation on the part of the authorities) from

## BRITANNIC ASSURANCE COMPANY LIMITED

(Established 1866)

Motor and General Insurances transacted

Chief Office: BROAD ST. CORNER, BIRMINGHAM, 1

the Ministry of Information, that British troops were already in France, and it would seem that the first detachments crossed the Channel nearly ten days ago. The Royal Air Force has now made five reconnaissance flights over German territory, dropping on the way well over 12,000,000 copies of messages to the German people,

with the loss of only one machine interned in Belgian hands. Another raid on the same scale of daring as that carried out on the German battleships lying at the western end of the Kiel Canal was made during the week on the Hindenburg Bridge between the mainland and the German air base on the island of Sylt off the Schleswig coast. Damage was done, but it appears that the bridge itself was not hit. On land, the French Army continues to feel its way across German territory towards the main bulk of the Siegfried Line. French troops have now advanced into Germany on the whole stretch of the front between the Rivers Rhine and Moselle. The town of Saarbrücken is reported to be partially surrounded and to have been evacuated by most of the civilian population. German counter-attacks are being held all along the line, and both sides are active with aircraft and artillery. Here the R.A.F. is taking its share of the fighting. The preliminary rounds have undoubtedly gone to the Allies.

**Business as Unusual.**—The first object of civil defence measures is to enable the nation's necessary business to be carried on in conditions of war; and it is by no means sure that this aim has so far been kept fully in view. The present intensity of the black-out imposed upon the whole country is an undoubted contribution to security against air attack. But it is equally an invitation to citizens to suspend their activities entirely in the hours of darkness, and there are grounds for the fear that, when the days shorten into winter, much business which ought to be carried on may in fact be immobilised. A good deal can be done to make the most of daylight by adjusting shop and office hours to fit week by week; and there is no doubt that many of the major and minor casualties in black-out hours up to now have been due to careless and unnecessary use of the roads and pavements. Nevertheless, some relaxation of the black-out rules, by the use of specially dimmed road lights to be put out by a master switch in the event of an air-raid warning, is imperative if winter darkness is not to be a dead loss to much of national business. The technique of picking out the roads for traffic and pedestrians has hardly begun to be elaborated. In like manner, the very radical curtailment of suburban train services, for some unexplained defence reason, may mean material dislocation of business travel. But national security is the first consideration and it is

only ill-counsellors who gird too drastically against inconveniences. An undoubtedly serious blow has been the curtailment of public entertainment, and it is wholly to the good that in many districts outside of precise danger zones cinemas have been opened again. A new provincial life has been given to the theatre, and sport, too, will find its attenuated revival curiously redistributed geographically. But it still remains an unwarranted risk to throw open places of public congregation in vulnerable centres without very careful thought about the possible consequences. The fact is that much of the pressure for a return to normal is due to the absence of air raids so far. This is irrational and must not influence public policy in any way.

**Crisis in Evacuation.**—The physical task of evacuating women and children was accomplished *à merveille*. The process of settling the evacuees is not going along so well. Householders with refugees billeted in their homes are finding it hard to feed growing children adequately with the allowance given; and in a number of unhappy instances they are finding it harder still to deal with the lawlessness and quarrelsomeness of crude and nerve-swept guests. Even more serious are the few cases where dirty or diseased persons have been moved indiscriminately into clean homes in healthy towns. And, on the other side, not the least grave feature is the number of women and children who have returned home because of distaste for their new surroundings or, more understandably, because of anxiety for the men-folk and grown-up children they have left behind. It should, of course, be realised that the majority of failures which have lately been given so much publicity are still not representative of evacuation as a whole. But this is not enough. In the short run view, it is vital to control the drift back to the towns and to mitigate and end the misery of refugees and their foster-families. In the long run, it is even more vital to make the newly swollen centres true communities with a real place and interest for all the inhabitants. It must be made quite plain that the new order in the evacuation areas is erected upon a fifty-fifty basis. There should be no undue sense of obligation or deprivation on either side. Financial arrangements should be re-examined. Strict and stringent standards of health and hygiene should be at once imposed throughout the reception areas. It should be made clear to evacuees where their duty to themselves and the country lies; and that the families they have left are being cared for. An extension of facilities for communal meals would be invaluable, socially and economically, in both reception and evacuation areas. Unless a planned series of such steps is begun at once a golden chance to pluck progress out of national danger will be thrown away.

**Congress Recalled.**—Mr Roosevelt's canvass of the state of American public opinion has resulted in a summons to Congress to meet in special session next Wednesday. There is to be a meeting between the President and the leaders of the isolationist Opposition on the preceding day, but there is little expectation that Mr Roosevelt will be able to convert them to his views. Senator Borah has already undertaken to resist an amendment of the Neutrality Act to the utmost, and he is not a man who changes his mind easily. The opposition to the repeal of the arms embargo rests on two separate lines of thought. There is the school represented by Senators Borah and Nye, who hold that the war is no direct concern of America's and that if she allows herself to become the arsenal of one side she inevitably becomes the target of the other. And there is also the less logical and less high-minded argument, represented by Senator Barbour, that America's interest in resisting German militarism will be adequately looked after by the Allies without more assistance from America than they are now receiving. The strength of these schools of thought must not be underrated. It seems probable that they are a minority of the whole public, but they are a large, vocal, sincere and persistent minority. Indeed, the outbreak of war has

brought to the surface all America's latent isolationism and distrust of Europe to an extent that has surprised many observers. The prospect is that comfortable majorities will be found in both Houses of Congress for a repeal of the arms embargo—but not until there has been a debate that will certainly be lengthy and may well be embittered. Meanwhile the attention of the American public has been concentrated on the extraordinary behaviour of the security and commodity markets. Prices have risen with astonishing rapidity and many of the munitions industries, notably steel, have been swamped by a sudden rush of orders. This movement has been wildly exaggerated and must lead to an equally sharp reaction later.

**Neutral Problems.**—The sort of conditions which the neutral countries of Europe may expect to have to bear are gradually emerging from the flux of wartime regulations issued by the belligerent Powers. Although the British Government, for technical reasons, has not declared a blockade of Germany, contraband laws are already in force which mean that neutral shipping is liable to search and, possibly, to detention. The German Government, so long as its warships are able to keep the sea, will doubtless do all it can to reply in kind to these measures; German submarines have already introduced a "blockade" of the Allies. The stringency of contraband laws is likely, in this war as in the last, to become harsher as the months and years pass, and on their side the small neutral States are taking all the precautions they can to make sure that they do not run short of essential commodities. On the one hand they have to consider, with an extreme nicety of judgment, the course of their neutrality through the warring antagonism of both sides in the war; on the other hand, they have to ensure supplies to their own nationals. The answer to the first set of problems is in treating both sides as nearly as possible in the same way; the answer to the second is in the regulation by licence of all export, import, and transit trade. The Scandinavian countries, Holland and Belgium, for instance, whose representatives met at Brussels this week to discuss common difficulties, have each imposed strict licence regulations on their foreign trade, while trying at the same time to carry on the bulk of their peace-time business.

In the Balkans the problem of commercial neutrality wears a rather different aspect. Each of the Balkan countries does most of its foreign trade with Germany; each, therefore, must continue to cultivate good relations with Germany. At the same time, the danger of Germany's trade predominance has long been felt throughout south-eastern Europe, and, while continuing to cultivate those good relations, the Governments of the Balkans will presumably seek to use what occasions they can find to alleviate that danger. One of the first occasions to present itself is already in the making through Italy's neutrality and corresponding wish to regain the hold on Balkan trade which she lost to Germany during the period of sanctions. As the war wears on, Germany will make increasingly strong demands on Balkan produce, and her capacity to pay, either in cash or in kind, will obviously descend in inverse ratio. Italy is the largest available alternative market. Italy should therefore benefit.

**The Japanese Wait and See.**—Japanese second thoughts on the German-Soviet non-aggression pact have confirmed the state of mind in which the Japanese Government denounced the pact "as a violation of the spirit of the Anti-Comintern Pact." Berlin's soothing words have not turned away Tokyo's wrath. That must be the plain conclusion to be drawn from the various statements of policy made by the new Prime Minister, General Abe, one of the most salient of which came out last Sunday when General Abe said that there might be in future some

sort of readjustment of diplomatic relations with the Soviet, United States, British and French Governments. "Japan will not hesitate to resume the ruptured Anglo-Japanese talks if Britain breaks the deadlock by showing sincerity." This appears to be saying rather more than might have been expected, and to be not far from tantamount to an admission that Japan cannot win her war in China without the withdrawal of Anglo-French-American support from the Chinese Government. There is even a hint that the Japanese Government may be willing to cut

its losses and come into an Entente with the Allied Powers—always provided that those Powers do not entirely baulk its aims in China. But it would be poor diplomacy to read too much into what the Japanese Government may think fit to say at this moment. The Japanese Army has been deceived by the Germans, and is very bitter about it; the Japanese Navy has never been in complete agreement with the anti-British policy of the Army, and now, doubtless remembering the profitable years of 1914-1918, is likely to be less than ever anti-British; the Government itself is in the hands of a "moderate" group pledged to make good the diplomatic damage and indignity done by Germany's defection. All told, the Japanese are in a mood to reason rather than declaim. The mistake on our side would be to think that they are thereby less attached to their plans for Chinese conquest and hegemony.

Another sign of this turn towards "moderation" (a good deal may be read into the inverted commas) is the number of changes announced for the Japanese High Army Command in China and Manchukuo. It is significant that the fire-eaters are being sent northwards. General Itagaki, the Minister of War, who resigned with the Government that went out of office with the announcement of the German-Soviet Pact, has become chief of staff of all the Japanese forces in China. There are reliable reports that the Army in Manchukuo is being strengthened against the need for men on the Soviet-Manchukuo frontier, where spasmodic fighting has taken place over the last few months near Nomonhan and the Khalka River, and the Russians are now said to have broken through. This tightening of military precautions in the north coincides with a marked slackening of hostilities on the main China front. Mr Wang Ching-wei, lately expelled from the Kuomintang, is at last forming a puppet Government with which Tokyo will presumably sign "peace terms."

**Contraband Control.**—In the absence of a formal blockade of Germany, the administration of the law of contraband is a matter of critical importance both for relations with neutrals and the efficiency of British shipping. The primary requirement is clarity. It must be known beyond shadow of doubt, to all those responsible for the dispatch and carriage of cargoes, what the law is and how it will be administered. Official pronouncements so far

have been quite plain. First, on the outbreak of war, the Admiralty announced that all British merchant vessels were liable to examination by the British Naval Contraband Control Service; stated what classes of ships would not be detained for other purposes than the establishment of their identity; and indicated the control bases on various routes. Strict observance of these rules will ensure the minimum of interference with British ships. Next arms, fuel, means of communication, coin, bullion and evidence of debt were proclaimed absolute contraband and foodstuffs and clothing conditional contraband. The full list is available and leaves little room for misapprehension. The Ministry of Economic Warfare, in whose province these matters fall, has also made clear the procedure in the case of cargoes and ships which are detained or seized. In fact, all that can be done at the moment has been done. It cannot be expected at the outset that all neutrals will accept the new restrictions as anything other than an unpleasant necessity. Argentina, for example, although her sympathies in the war are unmistakably on the side of Great Britain and France, has already emphasised her long-standing argument that food for civil populations should not be considered contraband. But neutrals can become reconciled to the necessities of war, so long as the measures enjoined by those necessities are equitably administered; and they may even accord them a judicious welcome when, as is often the case, they carry with them the possibilities of economic advantage. An intelligent administration of the contraband laws can temper a not entirely ill wind to a by no means shorn lamb.

\* \* \*

**Employees and the War.**—The fear of widespread unemployment which marked the early weeks of war in 1914 proved largely ill-founded; but it would be foolish short-sight to rely entirely this time on some "hidden hand" to effect the transfer of workers from non-essential to war-time trades without considerable delay and suffering. Conditions are now very different. Air raid fears and air raid precautions have heaped up a novel volume of

worklessness. City shops have cast off thousands of employees. City offices have done the same or gone off to other towns with shortened staffs. The entertainments industry, now of a massive size in terms of workers, has come almost to a halt. And, with the progress of public and private evacuation, old markets have dwindled, and the new ones to replace them have scarcely begun to be organised. On the other hand, there is no call yet for a rush of recruits for the forces—the principle is, very soundly, that men should wait until they are called for—and even the defence and armament trades, since they have been working at pressure for many months already, are not yet making the greedy demand for hands they made twenty-five years ago. In short, there is a very grave short-term problem of dislocation. Nor is it one which has been unforeseen. But the short-term problem has been obscured by an even more obvious long-term fact. When the war-economy reaches full speed, which ought to be as soon as possible, there will be no problem of surplus labour. It has long been taken for granted, and rightly so, that the labour situation in war must rather be one of marked shortage. The forces will grow greatly, more greatly than the new Schedule of Reserved Occupations put out last Friday seems to envisage. The munition trades will expand. The Civil Service will swell. And, moreover, although it is wholly to the national advantage that many non-essential or luxury occupations should have been voluntarily cut down so swiftly, not a few of the trades and businesses that have hastily slimmed to the limit will have to extend their activities again if the nation is to carry on with reasonable convenience. It is the first shock that is most staggering: all of which adds proof that what is needed is a far-reaching labour plan to tide over the current transition with the minimum of loss and misery, and to set the new model war economy smoothly in motion at the earliest date. There is some Government direction of the shape which employment should take for the national interest in the war-time Schedule of Reserved Occupations. What is needed further is guidance as to how the new pattern is to be achieved in practice and aid in the process of transfer.

## THE WORLD OVERSEAS

### The Soviet Census

(From our Moscow Correspondent)

SO far as the outside world was concerned, the principal characteristics of the census of the Soviet Union which was taken in 1938 were that the results were never published; and that, shortly after its completion, many of the members of the census committee were shot or exiled on charges of spying, and "sabotaging the census." At least a partial reason for this was that the number of answers to questions of literacy, and religious beliefs, which, from the standpoint of the Bolsheviks, were unfavourable, was large. Be that as it may, the entire census was retaken in 1939, and preliminary results were published in August.

The population of the entire Soviet Union is 170,467,186, representing an increase of about 23,000,000 since the last census in 1926. Table I shows the number of men and women and the number of city dwellers and country dwellers, according to the census of 1926 and that of 1939.

TABLE I  
POPULATION OF THE SOVIET UNION

| Year                | Men        | Women      | Total       | City       | Country     |
|---------------------|------------|------------|-------------|------------|-------------|
| 1926                | 71,043,352 | 75,984,563 | 147,027,915 | 26,314,114 | 120,713,801 |
| 1939                | 81,664,981 | 88,802,205 | 170,467,186 | 55,909,908 | 114,557,278 |
| Percentage Increase | 15         | 16.9       | 15.5        | 112.5      | 5.1*        |

\*Decrease

The most striking item in these figures, and one which is of tremendous importance in the Soviet Union of to-day, is the 30,000,000 new city dwellers. These ex-peasants left their villages to go to construction camps and industrial centres, to build and run the new mills, mines and industries that the Union has acquired since the beginning of the first Five-Year Plan in 1928. They generally came in response to recruiting campaigns for industrial labour power. Others came to escape from the bad conditions prevalent in many villages in all parts of the country during and immediately after the collectivisation of agriculture. Others came because they wanted to learn trades and become workers, or even professional men. A few came as functionaries and leaders.

In any case, the results on the national economy were far-reaching. Thirty million men and women who were used to making most of the things they consumed suddenly attacked the market, with their newly acquired money in their pockets, and demanded manufactured foods, factory-made furniture, electric lights, radios, and, most difficult of all, manufactured clothes and shoes.

Soviet light industry, given second or third place in the capital allocations (after heavy industry and transport) could not, and cannot, yet begin to meet that demand. Russia is still to-day a country of hungry buyers with their pockets full of money, ready to take almost anything even at high

prices. Far from disappearing, this tendency for the peasants to flock to the villages is becoming more marked according to a definite plan. At the eighteenth party congress in March of this year Stalin made an appeal for two million peasants every year to join the ranks of industrial workers. These are now being recruited in villages all over the Union.

Figures of the increase of population during the last twelve years in the U.S.S.R. by districts and by republics (city dwellers and country dwellers being shown separately) illustrate the very rapid increase in the number and proportion of city dwellers—who are, of course, mainly industrial workers—in several of the outlying districts and republics in Central Asia. In Turkmenia, for instance, the city population has increased by 203 per cent. since 1936; in Kazakhstan by 328 per cent. during the same period. The power projects, State cotton farms, and textile cities in Turkmenia, and coal, nickel, zinc and other mining and industrial enterprises in Kazakhstan are taking their workers from the nomadic, primitive native populations of these remote areas.

The Soviet Union has two cities with a population of over a million—Moscow, whose 4,137,018 inhabitants more than double the 1926 figure, and Leningrad, with 3,191,314, against 1,690,065 in 1926. There is then a large gap before the next group of cities is reached. There are nine with populations between 500,000 and 900,000—Kiev, Kharkov, Baku, Gorky, Odessa, Tashkent, Tblisi (formerly Tiflis), Rostov-on-the-Don and Dnepropetrovsk. The size of most of these cities has nearly doubled since 1926. Some of the 70 cities with populations between 100,000 and 500,000 have increased in size by thousands of per cent. since 1926, and several, like Magnitogorsk and Karaganda, are completely new since that time.

The figures of birth-rates and the relation between births and deaths are extremely interesting. Births exceeded deaths in 1937 in England by 21 per cent.; in Germany by 62 per cent.; in the United States of America by 30 per cent.; in Italy by 38 per cent.; and in the U.S.S.R. by 115.7 per cent. In France deaths have been exceeding births for several years. Table II gives the absolute and relative birth-rate for several cities in the U.S.S.R. and in other countries.

TABLE II

| CITIES      | Year | Births (absolute) (thousands) | Average births per 1,000 |
|-------------|------|-------------------------------|--------------------------|
| Moscow      | 1938 | 117.2                         | 28.5                     |
| Leningrad   | 1938 | 83.8                          | 27.4                     |
| Kiev .....  | 1938 | 22.5                          | 27.4                     |
| Kharkov...  | 1938 | 22.4                          | 27.7                     |
| Baku .....  | 1938 | 26.9                          | 33.9                     |
| New York    | 1936 | 99.4                          | 13.5                     |
| London ...  | 1936 | 56.3                          | 13.6                     |
| Paris ..... | 1936 | 32.5                          | 11.5                     |
| Berlin ...  | 1936 | 59.5                          | 14.1                     |
| Rome .....  | 1936 | 34.0                          | 21.7                     |

#### The Soviet Family

The Soviet Press, in commenting on this high birth-rate, claims it to be the result of the great attention and assistance which is given to the Soviet family by the Government. It is true that steps have been made in this direction recently; large sums have been spent on construction of maternity wards, nurseries and other children's institutions. Bounties have also been granted to mothers with seven or more living children, and the laws requiring a father to assist in the support of illegitimate children are being strictly enforced. Still, in the opinion of the writer, the most important factors contributing to the high birth-rate are the new anti-abortion law and its strict enforcement, crowded living quarters, particularly in the cities, and the comparative illiteracy in matters of hygiene and contraception of large sections of the population.

An interesting note on family life is that there were 35.8 per cent. less divorces in 1938 than in 1936, while there were more marriages. This is partly due to the rise in the price of divorces since 1937. They used to cost three roubles (the price of a packet of good cigarettes, now the price is 50 roubles the first time, 100 the second, 200 the third and so on).

The development of the population of the city of Moscow is interesting. Before the war there were 1,481,000 inhabitants, but by 1917, due to the stimulation of the war, the figure had risen to 2,165,000. During the three years of the civil war, however, there was nothing to eat in the big cities, and the population of the capital fell to 952,000 (1920). By 1926, with the re-establishment of peace and order, it had risen to just over 2,000,000, and in the subsequent twelve years, as a result of industrialisation, centralisation and natural growth, it went up to well over 4,000,000. Despite the fact that during the second Five-Year

Plan the State spent 16.3 billion roubles on living quarters, the situation is not improving very rapidly. The phenomenal growth in the number of city dwellers has a very dark side. Living quarters in Moscow, for instance, are unbelievably crowded. People marry, divorce, even commit murder for a room or a part of a room.

August 26th.

## War and U.S. Markets

[FROM OUR NEW YORK CORRESPONDENT]

IN spite of long months of increasing tension the New York financial community had persisted in the hope that the European conflict would not eventuate in war. This was shown not only by the conversational comments commonly made in late August, but also by the behaviour of the markets—often a better indicator of opinion than actual verbal expression. But war did come; and all three organised markets—bonds, shares and commodities—expressed their surprise at the actual outbreak of hostilities in varying ways and degrees.

The bond market declined. Last spring a combination of circumstances lifted gilt-edged to unmatched high levels. By the end of June long-term Government securities were selling at prices giving a yield only a little over 2 per cent., and first class corporate and municipal bonds were correspondingly appraised; while short-term interest rates were at vanishing point. The supply of funds (in this instance, of bank credit) had been increased by nine months' enormous gold imports, and the demand for funds had been extremely low. Corporate and municipal new issues were relatively small; and, while commercial loans were expanding, brokers' loans were contracting. At the same time, although the Federal deficit was larger and the aggregate of Federal debt increasing rapidly, actual demands upon the market were nil, for the deficit was financed (a) by sales to the Trust Funds, (b) by U.S. Savings bonds, and (c) by drafts on the Treasury cash balance. In the six months ended June 30, 1939, the Federal debt "in the market" did not increase. At the same time, the banks, with great excess reserves and hard pressed for earning assets, became heavy buyers of securities, especially Government securities.

In short, in the first half of 1939 there was a sellers' market in gilt-edged bonds. At the same time there was an undercurrent of business improvement, in part probably financed by the sale of securities (especially Governments) by non-bank holders to the banks in lieu of borrowing therefrom. This left a vulnerable position, susceptible to shock of any kind. The outbreak of war brought the shock; it came in the form of the break in sterling from its long-pegged level of 4.68 and the advance in the Bank of England rate. The result was a slide of several points in Government bonds, although this was promptly cushioned by buying by the Federal Reserve Bank; and there was a more severe decline in gilt-edged corporate securities.

Nevertheless, although this decline is worth noting for purposes of record, it has so far been quite trivial in extent. In sum, the first week of war carried the gilt-edged market back to the level of last December.

Technically, the position of the stock market was much

stronger than that of the bond market. The shadow of Europe had hung heavily over the share market ever since March, and indeed longer. The flow of European capital into American shares almost completely ceased some months ago.

The stock market had not followed the increase in corporate earnings during the first half of 1939. The relation of prices to earnings was unusually low in the share market—the precise antithesis of the situation in the bond market where the relation of price to coupon was unusually high. This relation of price to earnings in shares became more exaggerated in the first two months of the third quarter, when business was definitely moving upward through July and August, but share prices were moving down, because of persistent though light liquidation by persons who preferred cash to shares.

Thus, in an opposite way, the share market was as vulnerable as the bond market and the prospects of "war orders," superimposed on a belated recognition of business improvement, induced convulsive buying. In the vernacular of the street, the shock of the past week caught the bond market technically over-bought and the stock market technically over-sold. The uprush centred, as would be expected in the raw material shares—oil, steel and non-ferrous metals—which had been greatly depressed.

### Sharp Rise in Commodities

Advances were marked in stocks whose earnings are determined by the price of a raw material produced. A hesitant and irregular advance was in motion in a number of commodities—notably non-ferrous metals—from early summer; and in a few others the rise can be dated from late August. But, on the whole, primary commodity prices were low, and the lethargy of the commodity markets was often cited as evidence of the unlikelihood of war. By and large, except for a flurry in the summer of 1938, and scattered price rises in the early summer of 1939, there has been a buyer's market in primary commodities since March, 1937. Inventories had been expanded in the winter of 1936-37; and some losses were incurred in the subsequent liquidation.

On September 1st the buyers' market in commodities suddenly became a sellers' market; and the response was galvanic. It was not that large orders were immediately placed by belligerents; the anticipation that such orders might be forthcoming was sufficient to provoke buying—with the prompt discovery that the primary commodity market, like the stock market, was "over-sold." The first week of the war lifted Moody's commodity price index to a point which represented the recovery of one-third of the loss registered between 1937 and mid-August, 1939.

In short, the behaviour of the bond market, the share market and the commodity markets, each indicated surprise; and the variation in their behaviour shows how each was caught off its guard.

The present situation presents few analogies with 1914. In August, 1914, the dollar broke—the Federal Reserve System was just in process of establishment—and the mechanism of exchange was disrupted by transitions. The share market was closed until November, and by the year-end prices were little changed from those of the previous August. Nor was the response of commodities immediate; indeed, commodities remained somewhat inert right into 1915. In short, the principal immediate repercussion of 1914 was felt through the foreign exchange market. In 1939 the principal repercussion was in commodity markets; and it was through these that it was communicated to the share market.

September 8th.

## In the Eastern Baltic

(FROM OUR TALLINN CORRESPONDENT)

IN the three small Baltic States, Estonia, Latvia and Lithuania, people have taken the outbreak of war with a good deal of calm. The Lithuanian Government, with an eye to the protection of its neutrality, has called up several classes, and the Latvian Government, with the same intention, has taken similar measures. These are not extensive. Perhaps the most worrying aspect of the war, from the point of view of these small States, is the complete upset of foreign trade. In Estonia, for instance, it looks as if some 25-30 per cent. of all trade with foreign countries, and 95 per cent. of that transported by sea, is menaced by the hostilities. With Finland and Sweden the regular steamship lines are being maintained, thus accounting for about 10-15 per cent. of Estonia's trade; and with Germany even the "tramp" traffic is undisturbed.

The most serious case is the breaking-off of trade with Britain, for Britain takes about 30 per cent. of Estonia's foreign trade (and a correspondingly important part of Latvia's and Lithuania's as well), and is the main supplier of raw materials to these small States. This trade was done largely in British bottoms, and the lack of these will make a profound difference. There seems some chance of continuing this trade with Britain via Sweden and Finland. Several shipments destined for Britain and for overseas have already been despatched to Stockholm.

For want of the necessary refrigerating space, a part of the Estonian butter destined for England has been sent to Germany, although generally speaking there is no intention of increasing deliveries to Germany, since it is desired to avoid unbalancing the clearing accounts. Of late this clearing has fallen back from 8.5 million Estonian crowns (£1 = 18.2 crowns) to about 4 millions.

More exports to Germany must be balanced by more imports from Germany. But there is an assumption here that Germany is not now in a position to increase her exports of manufactured products to Estonia. It is even questioned whether Germany will be able to deliver coal or iron.

It is possible that a delegation will shortly go to Berlin to clear up the precise position with regard to the exchange of goods. At the time of writing, a good deal of confusion is common; there is a general hope that some new means of carrying on trade with Britain will be found with the help of the Scandinavian countries.

The tense political situation has naturally had its effect on the money market. Withdrawals from the banks were to be expected; but no major difficulties have been met with. The new monetary policy of Sweden and Finland is followed here with great interest, and the Eesti Bank has been in close consultation with the Government with the idea of bringing the currency into line with the pound sterling. But it is further argued that Estonia is too small a country to indulge in monetary experiments, and that a preliminary attachment to the Swedish crown would cause fluctuations against the pound sterling which might be of considerable damage to business interests.

September 6th.

## Canada Prepared

[FROM OUR OTTAWA CORRESPONDENT]

THE Government has summoned to Ottawa the chief officials of the Canadian Wheat Board to discuss a war-time policy. Mr McIvor, the chairman of the Board, has announced that it has sold all its wheat from last year's crop and it has now large stocks on its hands from the new crop. The presumption is that the Board will hold all stocks of Canadian wheat for the exclusive use of Britain and her allies, and that it will deal with allied purchasing commissions which would be created by the Governments of Britain and France. It is also understood that the Government has reached an understanding with the gold-producing companies, whereby production in their mines will be maintained at current levels.

During the last war so many people enlisted from the mining camps that the staffs of mines were depleted and production fell off. It is now considered to be in the national interest that there should be no diminution of the valuable supply of liquid assets provided by gold and that potential buying power of this kind should be maintained. Again, the Canadian dollar has weakened in sympathy with sterling, and the continuance of exports of gold to the United States at their present level would help to keep it up. In recent months large quantities of gold have been stored by governments and other interests for safe keeping in the vaults of the Bank of Canada, and although no official statement has been issued about the amount of this earmarked gold it is estimated to be about 700 million dollars.

It is now being taken for granted that the Government will assume control of certain vital industries on the outbreak of war. A large number of Canadian plants are now engaged in producing war materials and munitions, and some fresh orders have recently been placed by the British Government.

The western grain crops are being harvested under favourable conditions and a good deal of the wheat has already been threshed. There is a wide variation in grades, but the threshing returns from many fields are better than was expected, and the latest estimate was raised to 449 million bushels. Farm crops in the eastern provinces are also up to the average, and for minor crops like tobacco and apples there is the promise of satisfactory yields. At present the

farmers are complaining about the fall in prices of most of their products, but war usually raises them. Anyhow, Canada will be in a position this autumn to send large supplies of foodstuffs to Britain.

### Business Activity

The waning of the summer finds Canadian business at almost exactly the same level as a year ago, which is a very satisfactory situation; indeed, the general economic index of the Bureau of Statistics for the week ending August 19th, 108.3, was just fractionally below the figure for the parallel week of 1938, 108.5. The Bureau's business survey of the first half of 1939 gives the index of the physical volume of business for this period at 116.2, as compared with 110.1 for the parallel half of 1938, which represented a gain of 5.5 per cent.; the index of manufacturing production at 118.4, as compared with 111.5, showed a gain of 6.2 per cent. The most discouraging feature was a severe fall of 10.7 per cent. in wholesale prices, for which the index fell from 82.2 to 73.4. Since August began the general index of the Bureau has not varied, and given below are data about its three major components with parallel figures for last year:—

| Week ending      | Car Loadings | Wholesale Prices | Bank Clearings | General Index |
|------------------|--------------|------------------|----------------|---------------|
| Aug. 5, 1939 ... | 76.9         | 72.3             | 90.7           | 108.3         |
| " 12, 1939 ...   | 76.7         | 72.1             | 89.7           | 107.7         |
| " 19, 1939 ...   | 76.9         | 71.9             | 94.7           | 108.3         |
| " 26, 1938 ...   | 72.5         | 75.8             | 95.5           | 108.5         |

The latest employment bulletin of the Bureau, covering up to July 1st, showed a further expansion of employment with 1,126,216 workers on the pay-rolls of reporting firms—a gain of 26,118, or 2.4 per cent., for the month of June, which is slightly larger than the average June gain since 1920. The number of persons on public relief in June was placed at 848,000, a decrease of 4 per cent. from the figure for June, 1938.

New construction is being well maintained, and the value of new contracts placed in July was \$22,129,700, which had not been exceeded in any July since 1931. Activity in the mining industry is being maintained at a high level, and the exports of copper, nickel and zinc in July were respectively 469,353 cwts., 172,757 cwts. and 340,735 cwts., as compared with 472,184 cwts., 145,765 cwts. and 273,806 cwts. in June, 1938. The asbestos industry is enjoying almost a boom, and its exports in July totalled 41,450 tons, which was almost treble the figure for July, 1938. In the manufacturing field, conditions are variable; there have been seasonal recessions in motor manufacturing, the clothing trade and the production of furniture, but the cotton mills have increased their scale of operations and are having the novel experience of getting orders from Britain. The flour mills are fairly busy. The plants engaged in canning fruits and vegetables are at the height of their seasonal activity, and the packing plants are reasonably busy.

September 2nd.

## Australia's Oversea Trade

[FROM OUR SYDNEY CORRESPONDENT]

OVERSEA trade is of the greatest importance to Australia's economy. In the past, internal stability has been very susceptible to influences of export prices and the balance of payments: high prices for exports, increased deposits, reduced overdrafts, improved banking liquidity and promoted industrial activity. Growth of secondary industry and cessation of overseas borrowing have made Australia less sensitive to external influences. In spite of the fact that the value of exports fell from £A162 millions in the financial year 1936-37 to £A158 millions in 1937-38 and to £A140 millions in 1938-39, business activity has continued at a reasonable level.

Notwithstanding the drought which afflicted a large part of the Eastern States, the volume of exports was well maintained except in the cases of lead, meat and—particularly notable—wheat. The serious fall in export prices was the main reason for the drop in the total value of exports. The Bank of New South Wales Australian export price index (base 1934-35=100) fell from an average of 116 in 1937-38 to 94 in 1938-39. The chief factor in this fall was a drop of over 40 per cent. in the average price of wheat in the latter period, compared with the former. Wool, also, showed a marked decline from an average of 13.2d. per lb. in 1937-38 to 10.5d. per lb. in 1938-39. The fall in wool prices was to some extent offset by an increase in the volume exported, but the value of exports declined by £A4.4 millions.

The value of gold exports showed an important rise during the twelve months from £A15.9 millions to £A17.9 millions,

moving up to supplant wheat as the second most important of Australia's exports. A further notable increase occurred in exports of iron and steel, which rose during the year by nearly 100 per cent. to £A2.3 millions. The important growth of Australia's heavy industries is evidenced by the British purchases of Australian steel for air-raid shelters.

As was to be expected after the adverse balance of payments in the financial year 1937-38, imports declined considerably in 1938-39 from £A143 millions to £A128 millions. In contradistinction to exports this fall in value is almost entirely due to decreased volume. The Commonwealth Bank has computed an index of Australian import prices, and this gives valuable information indicating that the fall in the prices of imports since the end of June, 1938, has been negligible. The index (base 1932-3=100) stood at 106 in the second quarter of 1938 and had dropped to only 105 in the first quarter of 1939. This index, covering the period since 1928, is an excellent record of the difficulties imposed on a primary producing country through the excessive fluctuations in the prices of primary products compared with the prices of manufactured goods which must be imported. Since 1928 the Australian export price index mentioned above has varied between a low point of 81 in 1932-3 and a peak of 130 in 1936-37. During the same period the import price index has only varied between a low point of 97 in 1933 and 1934 and a peak of 118 in 1931.

The main items contributing to the fall in imports were metals and machinery (including motor cars), which fell from £A47 millions in the financial year 1937-38 to £A39 millions in 1938-39. Textiles also fell considerably by 16 per cent., but most items contributed to the downward movement. The decline in imports, however, was not sufficient to compensate for the drop in export values, with the result that the balance of trade declined, the excess of exports in 1938-39 falling to £A11.6 millions compared with £A14.9 millions for the previous financial period.

Great Britain still remained the most important country in Australia's overseas trade; the total trade with the United Kingdom being £A117 millions, or about 44 per cent. of Australia's trade with the world. The United Kingdom took proportionately less of Australia's exports, her share declining from 55 per cent. in 1937-38 to 47 per cent. in 1938-39, but her share of Australia's import trade did not vary, amounting to 40 per cent. of the total in each of the two financial years. Next in importance was the United States of America, with a total of £A38 millions. The major item in this trade was the export of gold from Australia, which turned an excess of imports of £A11 millions in 1937-38 into an excess of exports of a little over £A1 million in 1938-39. Next in order of value of total trade with Australia was Canada, with £A11 millions.

It is too early yet to give an accurate estimate of the movement in Australia's balance of payments in the last financial year. Imports of capital have probably been slightly less than they were in the preceding twelve months. The balance of trade, however, as mentioned above, showed a deterioration of £A3.3 millions. External interest on Commonwealth Government and Local Authorities' debt remained at £A27.5 millions. A preliminary rough estimate for the financial year just past would thus give us an adverse balance of something more than £A15 millions. Australia's London funds were estimated to be £A78.4 millions in June, 1938, and were probably more than £A60 millions in June last.

August 28th.

### Mercantilism in Practice

It has been said that one of the more surprising things about the cumbrous administrative system of the late seventeenth and eighteenth centuries is that it managed to work at all. How, precisely, it did work has scarcely been investigated, and many important departments of State are still without a historian. Dr Hoon has made a careful and judicious analysis of the organisation of the customs between the completion of the Merchantist system for the control of trade by the Navigation Act of 1696 and Pitt's Consolidation Act of 1787, which drastically simplified and modernised the customs. Her book,\* along with Professor G. N. Clark's recent *Guide to English Commercial Statistics, 1696-1782*, makes it possible to understand clearly one of the more important branches of administration and provides a much-needed background to the critical study of the customs records, where most of the raw material for the history of English trade in a period of great importance is to be found.

In the Boards and Committees of this period, which spread the function of administration over the governing class and provided for continuity in personnel and policy, are to be found the prototypes of the modern Government departments. It was Parliament and the Cabinet, and not the civil servants, who were responsible for the worst features of the system, a tangled and multifarious scale of duties, expensive sinecures and burdensome fees, which placed a great burden on the merchants and put a premium on confusion, inefficiency and fraud. To the single fixed rate of duty, established in 1660, for each article liable to pay customs, successive enactments had added many additional charges, until, by 1784, there were no fewer than 100 distinct duties levied.

The system placed an almost intolerable burden both on the official accountants and on the merchants. Yet many offices in the service were held by men who took no part whatever in the administration. The offices were granted for political services and the work was done by ill-paid deputies. By 1784 fifty-seven patent officers—customers, controllers and searchers, acted through 299 deputies. The deputies had to get at least £20 *per annum*, but at Chester between 1762 and 1764 three officials holding sinecure offices took an average of £101 13s. 4d. in salaries and £1,891 16s. 8d. in fees between them each year.

Although Dr Hoon is concerned primarily with administration she gives much information on how trade was carried on in the eighteenth century. The general picture which emerges from her work is that of a cumbrous system of administration, badly in need of drastic pruning, endeavouring to adapt itself without altering in essentials to a steadily increasing stream of trade. But the Industrial Revolution was forcing forward the need for reforms in the customs organisation and a new chapter in the history of this branch of the Civil Service begins immediately after the date at which this study terminates.

\*"The Organisation of the English Customs System, 1696-1786." By Elizabeth Evelyn Hoon, Ph.D. D. Appleton. Century Co. 1938. 18s.

"Government and the Governed." By R. H. S. Crossman. Christophers. 306 pages. 8s. 6d.

Mr Crossman gives his latest book the sub-title "A History of Political Ideas and Political Practice." His object is to demonstrate the connection between the two. He concludes that the connection is close when the ideas are the expression of a genuine understanding of current economic and social trends; and if not, not. Mr Crossman is no believer in the dynamic quality of ideas unless those ideas themselves receive their impetus from events. He takes as the starting point of his historical study the breakdown of the mediæval compromise between a world-wide Church and territorial princes and the realistic interpretation of this event made by Machiavelli. He then traces the interconnection, or lack of connection, between political philosophy and political practice down to the present day. The first five chapters, which bring the story down to the French Revolution, are a clear and highly condensed statement of a brilliantly thought-

out analysis. The remaining four chapters, which cover the Industrial, the Russian and the Fascist Revolutions and take in National Liberalism, Imperialism and Socialism on the way are less compact and less convincing. They provide a concrete demonstration of what the reader begins to suspect before he has finished the earlier chapters—that the task which Mr Crossman has set himself could only be treated satisfactorily in an encyclopedia.

"Reclaiming the Zuider Zee." By V. J. P. de Blocq van Kuffeler. An article in the July issue of the quarterly review of the *Amsterdamsche Bank*, N.V.

The Chief Engineer and Director in charge of the reclamation works on the Zuider Zee has written an interesting summary of what has been done, what is still to do, and the expenditure which is in question. When the works are complete the area of Holland will have been increased by 7 per cent. and the arable land by 10 per cent. The writer touches on the unemployment situation, which has been very favourably affected by the works. The review is written in English.

### Books Received

*Stock Exchanges Ten-Year Record.* Compiled and published by Fred C. Mathieson & Sons. 590 pages. 20s.

The thirty-first issue of this reference book continues a series which is invaluable to all interested in the long-term market history of the principal companies known to British investors. For each security, the highest and lowest prices and the dividends paid are given for each of ten years, as well as the amount of capital outstanding at the beginning and end of the ten-year period.

## THE BUSINESS WORLD

### Merchant Shipping

THE Navy's job in war is to keep the sea routes open to Britain and her allies and to close them to the enemy; the rôle of the merchant fleet is to carry on Britain's overseas trade and, if necessary, to assist that of her allies. The successful fulfilment of these functions is vital to victory and, as in the Great War, Germany will do her utmost to impede it. On the other hand, an earnest of the seriousness with which the British Government is setting about its task can be found in the decision, announced by the Prime Minister on Wednesday, to set up a Ministry of Shipping in the immediate future.

So far as the merchant fleet is concerned, the problem has two aspects; the one is quantitative and the other financial. Quantitatively, success depends (a) on the relation between the initial "stock" of the shipping capacity at the disposal of Britain and her allies and the demands likely to be made upon them and (b) on the ratio between losses and replacements. Financially, success depends on the degree of efficiency of the machinery set up by Britain and her allies to economise space and to control freight rates. It must be noted at the outset, however, that these equations cannot be stated in precise terms, for they contain a number of unknowns which only experience can fill in.

The initial "stock" of carrying capacity likely to be available to Britain and her allies is not simply the aggregate of the shipping tonnages registered in the respective countries, but it includes vessels of neutral countries which can be bought or chartered. The following table shows the present position compared with 1914:—

STOCK OF STEAM AND MOTOR TONNAGE  
(a) ALLIES

|                 | June, 1939 | Thous. gross tons | Change from June, 1914 | Thous. gross tons |
|-----------------|------------|-------------------|------------------------|-------------------|
|                 | No.        |                   | No.                    |                   |
| United Kingdom  | 6,722      | 17,891            | - 1,865                | - 1,001           |
| Dominions ..... | 2,255      | 3,111             | + 719                  | + 1,479           |
| France .....    | 1,231      | 2,934             | + 206                  | + 1,012           |
| Total .....     | 10,208     | 23,936            | - 940                  | + 1,490           |

|                  | No.        |                   | No.                    |                   |
| Denmark .....    | 705        | 1,175             | + 129                  | + 405             |
| Greece .....     | 607        | 1,781             | + 200                  | + 960             |
| Holland .....    | 1,523      | 2,970             | + 814                  | + 1,498           |
| Norway .....     | 1,987      | 4,834             | + 331                  | + 2,876           |
| Sweden .....     | 1,231      | 1,577             | + 143                  | + 562             |
| Total .....      | 6,053      | 12,337            | + 1,617                | + 6,301           |
| U.S.A. (Sea) ... | 2,345      | 8,910             | + 1,232                | + 6,883           |

Taking first the Allied fleets, it will be seen that the decline in Britain's aggregate tonnage since 1914 has been offset by an increase in that of the Dominions and France. On the other hand, the growth in the number of vessels registered in the Dominions and France has not sufficed to compensate the marked reduction in Britain's fleet. For example, the number and tonnage of handy vessels between 1,000 and 4,000 gross tons (excluding tankers) registered in the United Kingdom has declined between the end of 1913 and the end of 1938 from 2,706

vessels of 6,908,000 gross tons to 1,006 vessels of 2,154,000 gross tons; the fleet of vessels exceeding 4,000 gross tons, on the other hand, has increased from 1,598 vessels of 9,511,000 gross tons to 1,602 vessels of 11,289,000 gross tons. Moreover, the aggregate tonnages given in the table include vessels like the "Queen Mary" and the "Normandie," which offer easy targets, as well as tankers, and small vessels unfit for ocean traffic. The decline in numbers and the consequent increase in the average size of vessels has been due chiefly to technical progress and to changes in the nature of trade. While the present fleet available to the Allies thus has a bigger capacity and is faster and more efficient than in 1914, the reduction in numbers has rendered it more vulnerable to enemy action in that the tonnage lost by the sinking of one vessel is now likely to be bigger, on the average, than 25 years ago.

So far as the fleets of the principal neutral countries of Europe and of the United States are concerned, the tendency to self-sufficiency since the Great War has contributed to a marked increase in both numbers and tonnage. In the aggregate, the number and carrying capacity of the fleets of the Allies and of the principal neutral countries are now far greater than twenty-five years ago. Indeed, the present supply of shipping in relation to peace-time requirements is excessive. On the assumption that Britain and her allies will be able to draw on this reservoir of neutral tonnage, their position would be much more favourable than twenty-five years ago. It cannot, of course, be taken for granted that Britain will in fact be able to draw on this neutral tonnage to any marked extent. But even if neutral vessels cannot be brought under Allied control, they are not likely to be kept off the seas, especially if freight rates are rising; moreover, even if these vessels are only available for trade between neutral countries, which is unlikely, their operation will reduce the pressure on the world's freight markets, and it will enable British vessels to be withdrawn for the trade of the United Kingdom.

The present supply of shipping tonnage in the Allied and neutral countries is thus very much greater than at the beginning of the Great War. But, judging by a comparison of the shipping tonnage launched in 1913 and 1938 (the best of the five years 1909-13 and 1934-38), the aggregate building capacity of Britain, her allies and neutrals is much smaller than twenty-five years ago. Launchings in both Britain and France have shown a serious decline, and there has been virtually no change in

those of the Dominions, which remain comparatively small. The principal neutral countries in Europe, on the other hand, have substantially increased their output, but not sufficiently to offset the decline in Britain and France. As the table below shows, the tonnage launched by the Allies in 1913 was almost double that launched in 1938:—

| MERCHANT TONNAGE LAUNCHED<br>(Thous. gross tons) |        |       |
|--------------------------------------------------|--------|-------|

| Total                                            | 215    | 619   |
| U.S.A. (sea)                                     | 228    | 195†  |
|                                                  | † 1937 |       |

These figures, however, probably convey too pessimistic an impression of the position, for, as a result of technical progress, it should be possible, in the United States, for example, to increase output fairly rapidly; what can be done was demonstrated by that country in the Great War, when it increased its output of merchant vessels from 157,000 gross tons in 1915 to 821,000 gross tons in 1917, 2,602,000 gross tons in 1918 and 3,580,000 gross tons in 1919.

It is, of course, impossible at this stage to estimate the probable rate of loss of shipping tonnage. According to the figures given in Sir Arthur Salter's book on Allied Shipping Control, no less than 12.5 million gross tons of allied and neutral shipping were lost in the Great War—7.7 million gross tons by the Empire and 4.8 million gross tons by other countries. But while losses between August, 1914, and November, 1918, exceeded replacements by 3.1 million gross tons in the Empire (by 63,000 gross tons in 1915, by 687,000 gross tons in 1916, by 2,353,000 gross tons in 1917, and by 242,000 gross tons in 1918), the aggregate volume of construction in allied and neutral countries in the five years from 1914 to 1918 exceeded the tonnage lost in war by about 2.2 million gross tons, mainly as a result of the remarkable expansion of output in the United States. It can be taken for granted that Germany will spare no efforts in an attempt to blockade Britain and her allies by sinking their ships, either on the high seas by submarines and raiders or in port by bombers. Experts hold that the convoy system—which effectively countered the intense German submarine campaign in the Great War—will keep losses within reasonable proportions. But past experience is not necessarily a guide to the future, and the success of the convoy system nearly a quarter of a century ago cannot be used as an excuse for complacency. Steps have already been taken to introduce the convoy system as quickly as possible; but its organisation requires some weeks, and substantial losses must be expected before it is functioning efficiently. The number of British ocean-going vessels so far reported sunk—in ten days—is fifteen and their tonnage is 89,705 gross. This rate of loss is considerably bigger than at the beginning of the Great War and about two-thirds of the average rate in the worst three months of the war.

While it is therefore impossible to estimate the prospective rate of loss, it is no easier to compute probable requirements. A proportion of the available tonnage will no doubt be required for military purposes, for the shipment of men and their equipment. And in view of the loss of effective carrying capacity through the introduction of the

convoy system (due to the delay in assembling some 25 ships and the reduction of their speed to that of the slowest vessel) and the possibility that shipping may have to be diverted from some of its customary trade routes, the task will be to cut the coat according to the cloth. Efficiency in the utilisation of merchant tonnage therefore becomes of the utmost importance. In the Great War the policy was to solve the problems as they arose; the Ministry of Shipping was not set up until December, 1916; the Tonnage Priority Committee and the Inter-Allied Shipping Committee were not appointed until January, 1917, and requisitioning was not made general until February of that year.

The first step of the new Ministry must be to take a census of available shipping capacity. Next, a co-ordinating committee should be set up to allocate shipping space in accordance with a well-thought-out and flexible priority system to cover the trade in all essential commodities; this priority or licensing Committee will have to work in close collaboration with the Defence Departments, which will require tonnage for the transport of men and their equipment. It will probably be necessary to set up similar machinery in France so that the two countries can work in close collaboration, as they did in the later stages of the Great War. It is debatable whether Government action should stop at this point; on general grounds there is much to be said for going further and converting the Priority Committee into a central purchasing agency, responsible for the purchase and import of all important commodities.

On the other hand, it is hardly necessary, or even desirable, to nationalise the shipping industry. The blame for the enormous rise in freight rates on the free market and the consequent jump in profits during the Great War cannot be laid at the door of the shipowners. Freight rates rose because shipping space was scarce. In the autumn of 1914 the Admiralty Transport Arbitration Board, composed of officials and leading shipowners, formed a panel from which arbitrators were selected to determine the compensation to be paid for the ships requisitioned by the Government. Those panels worked out the "Blue Book" rates, which, with some later modifications, were the standard rates for requisitioned tonnage throughout the war. Although these freight rates were somewhat in excess of market rates when first introduced, open-market rates subsequently rose to six times the Blue Book figures. The experience of the Great War has shown how freight rates and profits can be kept at a reasonable level without the need for nationalising the industry. Official rates should be fixed without delay by agreement with the shipping industry. As in the Great War shipowners should be allowed to use any space surplus to the Government's requirements at the rates ruling on the free market, but only on condition that the difference between the rates paid by the Government and those obtained on the free market is handed over to the Treasury.

This brief examination of the shipping position in war indicates the magnitude and urgency of the task confronting the Governments of the allied countries, but especially the British Government. On the one hand, the aggregate effective capacity of the fleet will be lowered in war by the introduction of the convoy system and diversion and the tonnage available for carrying on trade will be reduced by the additional demand for the transport of troops and their equipment; on the other hand, the rate of loss cannot be foreseen. It follows that tonnage will have to be economised and imports controlled by a system of priorities; but this can only be done by a central co-ordinating committee, which should be set up without delay. But while the maintenance of our overseas trade will be the chief task of the authorities, steps should also be taken to keep costs down to a minimum by a system of financial control.

## Investment and War—Retrospect

THIS week the Stock Exchange has been attempting to find an appropriate dealing basis to fit wartime conditions. To the general relief of brokers and jobbers, the "House" reopened on September 7th. Seven days of official wartime dealings have now been recorded, and the normal investment machinery is attempting, with some success, to resume its vital work. True, the broker's day is attenuated, for the "House" has closed this week at 2 p.m. But the concentration within limited dealing hours of such business as arises has its advantages; an idle market is not infrequently a weak and erratic market.

The root fact, however, is that dealings have been promptly resumed on an official basis. There has been no repetition of the experience of 1914, when the "House" remained closed for more than five months. That fact is welcome, for investors, both as savers and as taxpayers, will shortly be faced with a financial task of a magnitude which can only be handled with the assistance of a normally functioning Stock Exchange. The scale of this task will be larger than in 1914-18. At the same time, the risk from the air is a new factor, whose effect upon the purely technical aspects of security dealing is unpredictable. And although the investor has long been familiar with the broad consequences of the transition from a peace to a war economy, the air risk adds its quota to industrial dislocation, and thus reduces any attempt precisely to assess the possible trend of wartime earnings for individual companies, or even industrial groups, to sheer futility. Already the economics of threatened war taxation and the actual burden of war risks insurance have taken their toll of brewery, tobacco, and consumption goods shares generally, in this week's thin markets.

No two wars are alike, and of all instances of "jobbing backwards," the presentation of closely-drawn analogies from the war of 1914-18, are likely to be misleading. It is precisely because the unknowns are so many and their force so great that few conclusive arguments regarding wartime investment can be developed from the experience of the Great War, to illumine the prospects in this Greater War. Consequently, what follows in this article is only an attempt to set a wartime scene, based on a description of what actually occurred in the security markets between 1914 and 1918. The application of history to present circumstances—if indeed history provides any workable inferences—and the working out of investment principles which may be applied to the present war must be left to a succeeding article.

Fixed interest securities are commonly reckoned the most vulnerable investment category in wartime. The validity of this presumption may be tested by reference to the following table, which sets out the average price of Old Consols between 1913 and 1922:—

| AVERAGE PRICE, 2½% CONSOLS, 1913-22 |                                    |      |                                 |
|-------------------------------------|------------------------------------|------|---------------------------------|
| 1913                                | 73 <sup>21</sup> / <sub>32</sub>   | 1918 | 56 <sup>1</sup> / <sub>8</sub>  |
| 1914                                | 74 <sup>27</sup> / <sub>32</sub> * | 1919 | 54 <sup>1</sup> / <sub>16</sub> |
| 1915                                | 65 <sup>1</sup> / <sub>2</sub>     | 1920 | 47 <sup>1</sup> / <sub>32</sub> |
| 1916                                | 58                                 | 1921 | 48                              |
| 1917                                | 54 <sup>11</sup> / <sub>16</sub>   | 1922 | 56 <sup>1</sup> / <sub>2</sub>  |

\* Seven months.

In relation to wartime financial needs, the fall in 2½ per cent. Consols between 1914 and 1916 cannot be regarded as catastrophic, though the decline was stayed by the institution of minimum prices for a time. And the steadiness of gilt-edged during the last three years of the Great War was surely remarkable. Acute weakness did not develop, in fact, until 1920. It was inevitable that the gilt-edged yield basis should rise over the period, but the actual wartime rise was limited from 3½ per cent. to 4½ per cent. Five per cent. was not an effective market rate during the Great War period.

The experience of the general investor in these years can best be illustrated by indices of various security groups,

based on the *Bankers' Magazine* indices, which first appeared in *The Economist* of May 14, 1938:—

INDEX OF SECURITY PRICES, 1914-20  
(July 20, 1914 = 100)

|                              | July 30, 1914 | Jan. 20, 1915 | Dec. 1915 | Dec. 1916 | Dec. 1917 | Dec. 1918 | Dec. 1919 | Dec. 1920 |
|------------------------------|---------------|---------------|-----------|-----------|-----------|-----------|-----------|-----------|
| British and Indian Funds ... | 94            | 91            | 84        | 76        | 75        | 81        | 71        | 63        |
| Foreign Government Stocks    | 94            | 90            | 76        | 71        | 71        | 74        | 60        | 49        |
| British Railway Ord. Stocks  | 95            | 94            | 80        | 76        | 72        | 78        | 71        | 59        |
| American Railway Shares ...  | 92            | 94            | 109       | 109       | 69        | 81        | 87        | 91        |
| Commercial and Industrial    | 94            | 85            | 73        | 83        | 88        | 100       | 112       | 76        |
| South African Mines .....    | 84            | 75            | 75        | 80        | 80        | 93        | 125       | 76        |

These indices do not suggest that industrial equities afforded so conclusive a war-hedge as many investors are apt to believe. Commercial and industrial shares as a whole did not recover their level of July 20, 1914, until the end of 1918. And in the early stages of the war they suffered a fall no less serious than that experienced by gilt-edged stocks and home railway ordinary stocks in 1917. In the last war, at any rate, timing was the essence of investment success. There was no automatic guarantee of capital security, based on the protective qualities of equity investments. And if the story is continued until the collapse of the post-war boom in 1921-22 the tenacious holder of equities, particularly those in over-expanded war industries, and in export industries bereft of markets, suffered severely.

Within this general context, however, excellent profits were to be garnered in the industrial markets. Stock Exchange shares, which sank to 50 during the war, stood at 121 when peace was concluded in June, 1919. The movement of many industrial prices during the Great War is obscured by the widespread distribution of capital bonuses, particularly in the later stages of the war. Yet there was a definite pattern of spectacular capital gains and wartime adversity among leading equity shares during the Great War. Its character is indicated in the following table of prices (selected at random), which covers the period from May, 1914, to June, 1919:—

|                      | May 2, 1914                     | July 30, 1914                  | Jan. 4, 1915                    | Nov. 12, 1918                   | June 24, 1919                   |
|----------------------|---------------------------------|--------------------------------|---------------------------------|---------------------------------|---------------------------------|
| Breweries            |                                 |                                |                                 |                                 |                                 |
| Allsopp              | 14                              | 11                             | 3                               | 48 <sup>1</sup> / <sub>2</sub>  | 82 <sup>1</sup> / <sub>2</sub>  |
| Watney, deferred     | 25 <sup>1</sup> / <sub>2</sub>  | 31 <sup>1</sup> / <sub>2</sub> | 13                              | 107 <sup>1</sup> / <sub>2</sub> | 172 <sup>1</sup> / <sub>2</sub> |
| Miscellaneous        |                                 |                                |                                 |                                 |                                 |
| Aerated Bread        | 41 <sup>1</sup> / <sub>16</sub> | 4 <sup>1</sup> / <sub>2</sub>  | 4 <sup>3</sup> / <sub>16</sub>  | 3 <sup>1</sup> / <sub>8</sub>   | 4                               |
| Associated P. Cement | 5 <sup>5</sup> / <sub>8</sub>   | 5                              | 4 <sup>3</sup> / <sub>16</sub>  | 7                               | 7 <sup>13</sup> / <sub>16</sub> |
| J. & P. Coats        | 8                               | 7                              | 6 <sup>1</sup> / <sub>16</sub>  | 7 <sup>3</sup> / <sub>4</sub>   | 8 <sup>5</sup> / <sub>8</sub>   |
| Courtaulds           | 2 <sup>3</sup> / <sub>8</sub>   | 2 <sup>5</sup> / <sub>16</sub> | 2                               | 8                               | 10 <sup>3</sup> / <sub>4</sub>  |
| Dunlop               | 1 <sup>15</sup> / <sub>16</sub> | 2 <sup>3</sup> / <sub>16</sub> | 1 <sup>3</sup> / <sub>4</sub>   | 4 <sup>1</sup> / <sub>16</sub>  | 7 <sup>1</sup> / <sub>8</sub>   |
| Harrods              | 4 <sup>1</sup> / <sub>2</sub>   | 4 <sup>1</sup> / <sub>16</sub> | 3 <sup>15</sup> / <sub>16</sub> | 3 <sup>3</sup> / <sub>8</sub>   | 4 <sup>1</sup> / <sub>16</sub>  |
| J. Lyons             | 6 <sup>5</sup> / <sub>8</sub>   | 6 <sup>1</sup> / <sub>4</sub>  | 5 <sup>9</sup> / <sub>16</sub>  | 5 <sup>1</sup> / <sub>16</sub>  | 5 <sup>5</sup> / <sub>16</sub>  |
| Armaments            |                                 |                                |                                 |                                 |                                 |
| Armstrong Whitworth  | 13 <sup>1</sup> / <sub>32</sub> | 2                              | 1 <sup>15</sup> / <sub>16</sub> | 13 <sup>1</sup> / <sub>32</sub> | 17 <sup>8</sup> / <sub>16</sub> |
| Vickers              | 11 <sup>1</sup> / <sub>16</sub> | 1 <sup>3</sup> / <sub>4</sub>  | 1 <sup>25</sup> / <sub>32</sub> | 2                               | 17 <sup>8</sup> / <sub>16</sub> |
| Shipping             |                                 |                                |                                 |                                 |                                 |
| Cunard               | 1 <sup>9</sup> / <sub>16</sub>  | 1 <sup>3</sup> / <sub>8</sub>  | 1 <sup>3</sup> / <sub>4</sub>   | 5                               | 3 <sup>1</sup> / <sub>8</sub>   |
| P. & O. deferred     | 288                             | 280                            | 265                             | 430                             | 500                             |
| Royal Mail           | 102 <sup>1</sup> / <sub>2</sub> | 79 <sup>1</sup> / <sub>2</sub> | 86                              | 147 <sup>1</sup> / <sub>2</sub> | 165                             |
| Oil and Rubber       |                                 |                                |                                 |                                 |                                 |
| Burmah               | 4 <sup>3</sup> / <sub>4</sub>   | 3 <sup>5</sup> / <sub>8</sub>  | 3 <sup>7</sup> / <sub>8</sub>   | 7 <sup>3</sup> / <sub>4</sub>   | 11                              |
| Shell                | 5 <sup>3</sup> / <sub>16</sub>  | 3 <sup>7</sup> / <sub>8</sub>  | 3 <sup>7</sup> / <sub>8</sub>   | 6 <sup>5</sup> / <sub>16</sub>  | 9 <sup>9</sup> / <sub>16</sub>  |
| Anglo-Dutch          | 2 <sup>5</sup> / <sub>32</sub>  | 2 <sup>1</sup> / <sub>32</sub> | 1 <sup>7</sup> / <sub>32</sub>  | 1 <sup>27</sup> / <sub>32</sub> | 2 <sup>1</sup> / <sub>2</sub>   |

It may seem odd that the most spectacular gains during the period were registered by two groups which, at first sight, would seem to have had most to lose—brewery shares and shipping shares. The initial shock of war upon the brewing industry was profound. By January, 1915, Allsopp ordinary could be bought for £3, and Watney deferred stood at 13. The former increased in value 27

times by the time peace was signed, four and a half years later, and the latter 13 times. It is tolerably certain that this experience will not be repeated over the next few years, for the brewing industry, unlike 1914, is now a system of completely consolidated units. The bidding for shipping shares which has been evident at certain times during the past week is evidently based on the assumption that history may repeat itself. If it does, holders of shipping shares will enjoy the paradox that an industry which has been afflicted by unremunerative operations through many years of peace may become prosperous when its tonnage is being destroyed in time of war.

These instances, however, rank among the oddities in the list. Conclusions drawn from movements of the remaining shares are less impressive. For example, the behaviour of typical consumption goods shares—Aerated Bread, Harrods, and J. Lyons—was not outstanding between 1914 and 1918. And it is perhaps for shares such as these that the basic conditions of the two wars will show the minimum of change. It was not until the latter stages of war that Associated Portland Cement (whose current importance in war-time is generally acknowledged) broke through its pre-Great War levels, and not until 1919 that J. and P. Coats (whose war-time experience was one of disturbed export markets) regained its pre-war price. On the other hand, both Dunlop Rubber and Courtaulds, after experiencing the check common to almost all industrial

shares during the initial stages of hostilities, made most impressive strides in their later stages.

Possibly the behaviour of the two representative shares in the armaments group between 1914 and 1919 justifies the caution with which the prospects of similar shares have been assessed in these columns during the past year. Armstrong Whitworth were lower at the end of the war than in July, 1918, and Vickers only fractionally higher. Oil and commodity shares, in fact, afforded a far better war-time hedge than the shares of companies most closely concerned with the manufacture of arms. Of all the tentative conclusions which emerge from this survey of investment trends in 1914-18, that is likely to stand.

Selectivity and timing are thus of the essence of successful investment operations in war. On this occasion, unlike the Great War, economic control has already been established over so wide a sector of British industry that the opportunity of accurate selection has been correspondingly reduced. The discovery of "war babies," which produce essential manufactures, but which escape the full rigour of industrial control—and also unduly close public interest in their profits—will be an even more difficult process in this war than in the last. Investors can, in fact, only attempt to establish certain guiding principles of war-time investment, in to-day's changed conditions, and endeavour to apply them to individual groups of securities. Those principles, and their application, will form the subject of future articles.

## Finance and Banking

**Exchange Regulations.**—The foreign exchange market has had an exceptionally busy week. The turnover has been considerable, though this fact has to some extent been veiled by the new method of direct dealing with the Bank of England. The compulsory sale to the authorities of gold and foreign exchange assets held by residents in this country is already in full swing, and during the past week the Exchange Account must have gained considerable quantities of exchange. The energies of the market have, however, been devoted not so much to coping with a comparatively heavy turnover of business as to the elucidation of the new regulations and their attendant official forms. The details of the regulations as given to the market at the beginning of last week bore evident proof of painstaking preparation. But closer investigation and the submission of the regulations to the test of practical experience revealed both gaps and certain misunderstandings. Some of these were inevitable, while others could have been avoided had more expert and specialist advice been taken in their preparation. The Defence Regulations applying to dealings in gold and foreign exchange are clear-cut and their objectives understandable. The various forms issued in order to comply with the formalities demanded by the regulations are self-explanatory and to the point. The difficulties arise in the interpretation of the regulations as applied to the special cases that must inevitably arise when dealing with a mechanism so intricate and sensitive as an international foreign exchange market. A few questions will illustrate the types of points that have arisen. Should banks sell to the authorities the foreign exchange balances held by them for account of non-resident clients? May a bank transacting international business retain that part of its foreign exchange assets which is essential to the normal conduct of foreign exchange business? May a non-resident convert his sterling balances into foreign currency? On such points diverse answers have been obtained from official quarters. But this diversity of opinion is gradually disappearing, and in almost every case the final and decisive answer has been that dictated by a spirit of liberality, which, it may be hoped, will continue to characterise the functioning of our financial markets even under the temporary regime of controlled exchanges.

**The Decline in Bill Rates.**—The 4 per cent. Bank rate with which the war was heralded is already losing much of its reality. The weight of credit in the short loan market has this week driven the rate for loans from non-clearing banks against the security of bonds to  $2\frac{1}{2}$  per cent., or  $\frac{1}{2}$  per cent. below the rigid rate at which the clearing banks will lend against bills. The clearing banks' rate is a pegged rate. That for outside money is free and is therefore the better indicator of conditions in the credit situation. That it should have fallen below the level at which the clearing banks lend against the preferable security of bills is the first indication we have had that Bank rate and the money market rates pegged upon it are already out of touch with the true state of the credit position. The same indication has been provided by the trend of discount rates, which this week has been steeply downward. The hot Treasury bill which was issued a week ago at just under  $3\frac{1}{2}$  per cent. has this week been bid down to  $3\frac{1}{8}$  per cent. The banks have returned to the discount market with an appetite for bills which has not been seen for some months past, and have taken October and November bills freely at 3 and  $3\frac{1}{8}$  per cent. respectively. As the market syndicate obtained the bountiful allotment of 94 per cent. of its applications for Treasury bills last Friday, it has been a fairly ready seller, and the turnover in the discount market has grown to proportions unprecedented in recent times. The market is still suffering an appreciable loss on the shorter bills which it is selling, but that loss is being rapidly made good by the excellent margin of profit already earned on the bills discounted and then resold since the rise in Bank rate.

**Cancellation of Credits.**—One of the most serious sources of difficulties in the new regulations is the suggested cancellation of credit facilities to foreign customers. As originally announced, this cancellation appeared unconditional and was to apply to all revocable foreign credits, irrespective of the ends which they served. These instructions, which were intended to prevent all leakages of capital from this country or the provision of sterling facilities which might be used as the basis of speculative

attacks on the currency, have already had to be modified. Banks have been officially notified that the restrictions on sterling acceptance credits are to be interpreted so as to put the least possible hindrance in the way of essential imports into the United Kingdom or of exports from the United Kingdom and other sterling countries and, moreover, that the regulations are intended to maintain as far as possible the normal functioning of the London money market. External credits financing the movement of goods to and from ports outside the United Kingdom and Empire countries may only be opened after previous permission has been obtained through an authorised dealer. These instructions still leave unaffected many sterling facilities granted to non-resident clients of banks, the sudden cancellation of which might have undesirable results. For example, there are loans secured by various sterling securities held by foreigners whose cancellation would call for the massive liquidation of the collateral, a process which cannot be desired under present circumstances. In other words, there is in the present position ample scope for the exercise of imagination and liberal discretion.

\* \* \*

**Emergency Problems.**—The discount market is being spared most of the difficulties that have swooped on the foreign exchange market with the advent of exchange control. Its only concern with the new regulations arises through the discounting of sterling bills remitted on foreign account. When paying the proceeds of such discounts to the banker of the foreign customer in question the form E.I. has to be filled and the declaration duly signed that this transfer is not contrary to the Defence (Finance) Regulations. There has been some doubt whether the onus of filling in this form and signing the appropriate declaration fell on the discounter or the banker holding the account. The general consensus of opinion appears to be that the discounter should complete these formalities and satisfy himself that the payment accords with the regulations. Another difficulty has arisen concerning the nomination of Treasury bills deposited by the market as security for loans from clearing banks. These bills are now duly nominated, and when deposited as collateral for loans a declaration is deposited by the borrower undertaking that he will duly endorse the bills at maturity. The rapidity with which Treasury bills travel in the market has, however, resulted in bills nominated in the name of X being deposited as collateral for a loan granted to Y. The lending banks have not yet decided how to fill this loophole in the present arrangements. Clearing delays are still causing some difficulties and anomalies. Here is an amusing example of the latter. A discount house borrowed £50,000 from a Scottish bank and in the normal course drew a cheque on this institution and paid it into its account with a London clearing bank. The loan was recalled next day and the amount plus one day's interest duly repaid by a London clearing bank cheque. The original cheque on the Scottish bank, by following the devious route to Stoke-on-Trent, was not debited to its account until two days after it had been drawn. Thus the Scottish bank obtained one day's interest on money which, in fact, it never lent. The loser was the discount house, which did not get definite credit for its loan until the day after the loan was repaid.

\* \* \*

**Bank Averages for August.**—The Committee of London Clearing Banks have announced that until further notice the publication of monthly statements of average weekly balances of London clearing banks will be discontinued. "Until further notice" may be taken as the equivalent of "for the duration." Although no official statement of the August averages is being published, the individual clearing banks have now issued their respective monthly returns and by combining these the statistics of the banking position can be brought up to the outbreak of the war. The movements as between the months of July and August are of comparatively small dimensions. The feature is a

rise of £10,300,000 in acceptances, engagements, etc., to £132,436,000 at which level this item is higher than at any time for the past nine years. Cash is £2,000,000 lower and short money has fallen by £3,600,000 representing the calling in of funds during the critical final days of the month. Bills discounted have risen by £1,100,000. The

*Note.*—The figures for August, 1939, have been compiled from the individual bank returns and some details are not strictly comparable with those for the preceding months.

liquidity ratio has thus suffered slightly as between July and August. Nevertheless the banks extended their advances by £3,400,000 and their investments by £2,300,000. For our future observation of changes in the banking position we shall presumably have to depend on the banks' half-yearly balance sheets which it is to be hoped may be spared from the black-out which is descending on financial statistics. Monthly figures of the principal London banks were first published in 1891, their publication being prompted by the agitations which followed the Baring crisis. They were discontinued after July, 1915, and then resumed in their present form of weekly average statements in January, 1921.

\* \* \*

**Tripartite Agreement Safe.**—The Tripartite Agreement has during the past fortnight been subjected to the severest test of its chequered existence. Once again this resilient convention has emerged unscathed from the trial. Despite the depreciation of sterling and French francs by some  $13\frac{1}{2}$  per cent. and the introduction of exchange control in the United Kingdom and France the agreement continues to be effective. Mr Morgenthau announced this week that the United States did not regard the new rates for sterling and francs as involving "competitive devaluation," and that consequently the Tripartite Agreement remains in force not only among the three original members but with the other signatories, namely Holland, Switzerland and Belgium. The United States Treasury remains ready to purchase gold at \$35 per ounce from Britain, France and other sellers. The importance of this announcement can hardly be overstressed. The maintenance of the agreement provides the machinery by which a reasonable stability of exchange rates between the allied currencies and the dollar can be achieved despite the abnormal pressure to which the European exchanges are going to be submitted during the period of hostilities.

\* \* \*

**French Exchange Control.**—Control of the foreign exchange market was imposed in France at the beginning of this week. All operations in the French foreign exchange market must now be made through the intermediary of the Bank of France or some other authorised bank. The main point of difference between the control system as established in Great Britain and that which is now in force in France is that the latter does not provide for the compulsory sale of gold and foreign exchange assets held by French nationals. On the other hand the export of

all capital from France is forbidden except with the authorisation of the Finance Minister. The import and export of bullion has been made subject to licence, and all operations by French nationals concerned with the transfer or negotiation of bullion must receive official sanction. Similarly, the buying, selling or transfer of foreign securities are made subject to official permission. The decree laws by which the control of exchanges in France was introduced specify that the retention abroad of the proceeds of French export trade is deemed to be equivalent to the export of capital and therefore prohibited. The same applies to the income derived from French investments abroad. The withdrawal of French currency by travellers leaving France is to be limited to 5,000 francs and remittances to French residents abroad will be restricted to 10,000 francs a month. The regulations have hardly been tested yet by actual experience, but they appear to have been drawn up in a workmanlike manner.

**Commodities War Insurance.**—As soon as war broke out the Government made the commodities war insurance scheme compulsory and fixed the rate at 30s. per cent. for three months. This in itself has caused some criticism, as the premium automatically due from firms with large stocks of saleable commodities is very high, and many of them, if left with a free choice, would prefer not to insure. In addition to this central difficulty others have arisen from the ambiguous wording of the Act and from misunderstandings in the minds of merchants at the time they registered—many firms finding themselves liable for premium on stocks far more valuable than those they actually hold. It is difficult, too, to co-ordinate the commodities scheme with the sea war risk scheme. Under this sea insurance transit from warehouse to ship's side can be insured for an additional premium of 10s. per cent., and many firms are in doubt whether the commodities scheme for which they have registered covers goods in transit to the ship or whether they should pay this additional premium to the Government's sea insurance scheme. Doubtless the two schemes will shake down in time, but clear guidance on the doubtful points would be welcome. Firms with large stocks are, incidentally, finding it difficult to get their exact value, and if they overstate the value no return of

premium is allowed. That is an embarrassment of some importance. Other questions turn on the position of contractors who are paid as work is completed and on goods commandeered by the Government, which still have to be insured, although the merchant ceases to have possession of them. The cost of insurance falls most heavily on concerns whose rate of stock-turn is lowest, and whose average stocks are consequently high. But since, unfortunately, the possibility of loss depends upon the volume of goods at risk, it is difficult to make actuarial adjustment for this type of hardship. But there is no reason why the "declaration" policy should not be introduced for the scheme to take account of variations in stock values.

**War Marine Insurance.**—Some congestion at the Government War Risk Office during the first week of its existence was inevitable, for a spate of business coincided with the transfer of a large part of the war marine risk cover to the state. Brokers are now more familiar with the new organisation, and the Government office is functioning as an integral and efficient part of the market. Underwriters work side by side with the Government office, concentrating on risks which are not eligible for State insurance. Evidence of their intention not to allow war risks business to pass from the London market is provided by Wednesday's new schedule of open-market rates, which shows some considerable reductions on those in force since the last schedule was issued on September 3rd. Moreover, very favourable treatment has been given to cargoes sailing in neutral ships; for the majority of such shipments north of Cape Finisterre a reduction of 25 per cent. is granted on the basic rate, while for most sailings south of that point the reduction is 50 per cent. While the open market has thus strengthened its competitive position, it has at the same time rationalised its machinery by setting up joint underwriting arrangements. Two groups of company underwriters, comprising many of the principal companies in the market, are transacting their business on a group basis and are housed in two offices at Lloyd's building. With practically all company underwriters thus working in only two groups, the procedure in the marine market has been greatly simplified.

## MONEY MARKET NOTES

THE wide margin for U.S. dollars was narrowed on Thursday to 4.02-04. On that day sterling broke in neutral centres, falling below \$4 in New York. There has been some fluctuation in the quotation for Montreal. Last Saturday it appreciated to 4.32-36, but on Tuesday it showed a big setback to 4.40-46, improving again on Wednesday to 4.38-44. On Wednesday the Bank of England fixed lower rates for some Continental currencies also; belgas being quoted at 23.30-60, against 23.50-80, and Swiss francs at 17.65-84, against 17.75-94, while both Swedish and Norwegian crowns were fixed 10 points lower.

Silver began the week with a weaker tone, some speculative reselling on last week's rise bringing the price for both cash and forward down to 20½d. On Wednesday, however, renewed bear covering, coupled with continued buying from India, in a market almost devoid of sellers, cause a sharp rise of ½d. in the spot price and of ¾d. in the forward to their highest levels for about two and a half years. The New York market price has moved in accordance with the London price.

The Bank Return shows some indication that the expansion in the note cir-

ulation is slowing down, for the rise on the week is only £3.6 millions, compared with over £20 millions in each of the preceding two weeks. The rise has not been offset by an increase in the holding of Government securities, which is unchanged, so that bankers' deposits have suffered somewhat, the effect of the withdrawal of notes having been mitigated to a certain extent by a transfer from public deposits.

In the money market a feature of the week has been a heavy demand for Treasury bills from the Stock Exchange, with the result that the "hot" bill has been bid down to 3 per cent.

# Investment

**Gilt-edged and the Minima.**—Stock Exchange business this week could not be described as robust. Turnover has again been strictly limited, and prices have moved adversely—where they have been allowed to move at all. Industrial share prices, as measured by the *Financial News* ordinary share index, have now fallen below the low levels recorded before Munich last year, and in January this year. In gilt-edged, it has become more difficult to sell at minimum levels, and there has been a tendency, particularly in the longer-dated stocks and especially in War Loan, for dealers to insist on sellers taking their turn. And since investors who required additional cash could not obtain it readily through the gilt-edged market, they have been compelled to sell industrial securities instead. There is, in fact, a danger that the existing level of minimum prices may become quite unreal. The advantage of minimum prices is that they help to stem panic selling; their disadvantage lies in the cessation of business if the basic level of prices actually falls below the fixed minima. Minimum prices, in short, are only useful as a flexible instrument of market control. And their rigidity, based on a level of prices before Bank rate was increased which now contains numerous anomalies between the short- and long-dated stocks, has congealed the gilt-edged market at a time when ready marketability, in both directions, is far more important than the maintenance of a notional level of prices.

**The Industrial Trend.**—Possibly the authorities concerned are willing to permit the present rigidity to continue for a short time in the expectation that Bank rate may be reduced. Such action should stimulate the market in a general sense, though it would not counteract the special factors which have affected the industrial markets this week. Equity investors are pursuing a waiting policy until the shape of the emergency budget is clear. They have also been conscious this week of the heavy burden

ence has ranged from copper shares early this week to oil and tin shares on later days. In sum, the reaction of the market to war conditions, though not yet severely tested, is opening out on rational lines. When technical adjustment has been made to the cut in contingencies and their increased cost, it is to be presumed that price movements will be more disciplined, and that a reasonably fluid two-way cash business will be established.

**Technical Dealing Adjustments.**—Part of the market's trouble in the first stages of war has been to adjust the normal routine of dealing to the new circumstances. These difficulties are steadily being overcome. In the gilt-edged market, arrangements are now working for the certification of jobbers' (and certain brokers') balances of inscribed gilt-edged stocks by the Bank of England in London. For the certification of deed stocks the Share and Loan Department is maintaining its normal services. The only delay which will now arise through the transfer of the stock registers will occur in transfer of clients' inscribed stocks. Postal delays, in addition to the complications of detail which not infrequently arise in inscribed stock transfers, will inevitably occur in such cases, but it is difficult to see how they could be alleviated at present. A certain measure of elasticity has been introduced by the sanction given to sellers of British funds to make delivery in registered form. Secondly, members have welcomed the publication on Wednesday this week of precise terms of settlement under the present regime of cash dealings. If securities deliverable by deed are not delivered within

### EXECUTOR AND TRUSTEE BUSINESS CONDUCTED

**COMMERCIAL SERVICE**  
 The Bank has over 380 Branches in Africa, and Agents and Correspondents throughout the world. The closest touch with Trade and Industrial conditions is maintained, with special attention to Commercial and Credit Intelligence. This service is available to Exporters, Importers and others wishing to develop trade with South, East and Central Africa.

**THE STANDARD BANK MONTHLY REVIEW** contains information on all South, East and Central African matters of Trade and Commercial Interest. Copies will be sent post free on application.

which the compulsory stocks insurance scheme will impose upon industry—the potential effect of which upon leading companies is examined on page 534. Yet some buying orders have been received to offset the further taking of profits. And the heavy falls in certain consumption goods shares—brewery, tobacco and retail trade issues were severely hit early in the week—have not been extended. The market appears to be governed by the right instinct in marking commodity share prices higher, though its prefer-

eleven days, the issuer of the ticket may buy-in on the eleventh day (or subsequently) after the issue of the ticket. Secondly, a deliverer of securities transferable by deed who does not receive a ticket by 12 noon on the fifth business day after the bargain may report the matter to the manager of the buying-in and selling-out department, who may recommend to the committee that selling-out should take place. These cash dealing rules are less stringent than those adopted during the Great War, and, coupled with the postponement of the settlement to September 21st, they tend to increase the open position, at least for the moment.

\* \* \*

**Incidence of War Insurance on Stocks.**—The burden of insurance of traders' stocks against war risks (to which reference is made on page 532) caused a substantial setback in the price of many industrial shares earlier this week. As fixed in the first instance, the premiums are at the rate of 6 per cent. per annum—a figure which takes no account of the rapidity of stock-turn, and thus affects different traders in quite unequal degree. If the rate is maintained, the absolute cost to many industrial companies will substantially reduce net profits and dividend expectations, for the burden will either fall directly on the companies concerned, or will affect their trading if it is passed on to consumers. While these would be preferable alternatives to total loss through war destruction, investors are clearly wise in taking the cost into account. In the following table the stocks disclosed in the latest balance sheets of a number of important industrial undertakings are set out, and the war risks insurance premium based on these stocks is compared with the net profits available for ordinary shareholders in the latest year:—

(Amounts in £'000)

| Company                   | Latest Stocks | War Risks Insurance at 6% p.a. | Latest Equity Earnings | Proportion absorbed by War Risks Insurance |
|---------------------------|---------------|--------------------------------|------------------------|--------------------------------------------|
| Guinness .....            | 2,341         | 140                            | 1,485                  | 9.4                                        |
| Dorman, Long .....        | 1,698         | 102                            | 361                    | 28.3                                       |

| Woolworth .....           | 3,254         | 195                            | 4,712                  | 4.1                                        |

† Approximately consolidated figures.

For a number of reasons these calculations are not precise. Stocks are frequently taken at arbitrary values below cost; sometimes they are shown after reserves; and in some instances (for example, Imperial Tobacco) they are combined with stocks held abroad and other current asset items. Moreover, the treatment of subsidiaries' stocks varies widely. Nor can comparison of the cost of war risks insurance with equity earnings be exact without complicated adjustments for income tax. But the size of the burden is indicated sufficiently accurately for general purposes by the table. Where the rate of stock-turn is highest—for companies such as Marks and Spencer, Woolworth, Associated

Portland Cement and London Brick—the proportion of equity earnings absorbed by war risks insurance at the present rate is lowest. For companies compelled to carry large stocks—Patons and Baldwins is an outstanding example—the cost threatens to be intolerably heavy. And the uneven incidence of the premiums is well illustrated by the different concerns representative of the iron and steel and motor industries.

\* \* \*

**Richard Thomas Prospects.**—Sir William Firth's account of last year's difficulties of Richard Thomas and Company and his reference to the company's prospects at last week's meeting were commendably detailed and frank. In relation to the company's present trading position, the results for the year to March last belong to the limbo. Liquidation of surplus stocks, reduced demand for sheets and tinplate, and the completion and running-in of the Ebbw Vale plant seriously affected last year's profits, although Sir William was able to show that profits for the three years to last March were reasonably close to the original prospectus estimates, despite the lack of any contribution from the Ebbw Vale plant. Of the technical success of the new mill there is no doubt; it produces a vastly superior product at substantially lower cost. On the capital side, the group's position is now secure. A sum of £1,017,335 was needed as at March 31st to complete the development programme, and £1,910,590 of prior lien debenture stock remained available. To-day the company still has £1,129,000 of the stock to draw upon, apart from accruing profits. But certain financial problems still await a final solution. For example, the company owns 265 old-type sheet and tinplate mills, which stand in the books at £1,600,000 net. This figure is much lower than their replacement cost, but over the next few years much of it must be written off. Secondly, depreciation is expected to be increased from £440,000 to £650,000 for the current year, and the eventual figure may even be higher if the auditors' present review of a proper depreciation provision calls for an increase. Moreover, a sum of £267,429 must be restored to general reserve, and the agreed provision of £100,000 made to reserve, before earnings may be distributed. These provisions must substantially increase the earnings necessary to provide a surplus for preference shareholders and a full 6½ per cent. dividend, which were roughly computed in *The Economist* of September 2nd. Indeed, shareholders—and particularly equity shareholders—must continue to exercise patience, even in war conditions, when the plant will be able to give a full account of its capabilities. The company's steel capacity accounts for 10 per cent. of the total ingot capacity of the country, and half of it is capitalised at the very low figure of 25s. 3d. per ton. In present circumstances that fact can be regarded as a national advantage, whose value for Richard Thomas shareholders is likely to be displayed in future years.

\* \* \*

**D. Gestetner Results.**—The attainment—by a comfortable margin—of a new high record in profits during 1938-39 is a most satisfactory result for D. Gestetner shareholders. Total profits are 6 per cent. higher at £250,210, and the 40 per cent. dividend is well covered by earnings, whereas a year ago it was slightly short-earned. The preoccupations of the past fortnight have not prevented the company from issuing its annual report with customary promptitude, and the progress made may in part be due to inclusion within the financial year of some five months of striking industrial recovery. On the other hand, though the report does not specify the amount of any special charges, the balance of profit is presumably struck after allowing for some exceptional expenditure. An extensive A.R.P. scheme was put in hand during June, and as no value has been placed on assets in enemy countries, Poland and Eastern Europe, it is to be presumed that these items have been written off from 1938-39 profits.

The allocation of profits in the past three years is shown in the following table:—

|                             | Years to August 31 |           |           |
|-----------------------------|--------------------|-----------|-----------|
|                             | 1937               | 1938      | 1939      |
| Profit .....                | 237,623            | 236,722   | 250,210   |
| Depreciation .....          | 15,072             | 15,248    | 17,862    |
| Taxation .....              | 30,000             | 35,000    | 35,000    |
| Other expenses .....        | 8,942              | 8,749     | 8,900     |
| Preference dividend .....   | 18,375             | 18,375    | 18,375    |
| Ordinary stock:—            |                    |           |           |
| Earned .....                | 165,234            | 159,350   | 170,073   |
| Paid .....                  | 129,094            | 161,367   | 161,367   |
| Earned % .....              | 54.9               | 39.5      | 43.0      |
| Paid % .....                | 40*                | 40        | 40        |
| General reserve .....       | 45,683             | ...       | ...       |
| Special credits (net) ..... | Cr. 11,427         | Cr. 1,285 | Cr. 3,010 |
| Carry-forward .....         | 21,615             | 20,884    | 32,600    |

\* Also 25% capital bonus, absorbing £80,683 from general reserve.

The balance sheet reveals no outstanding changes, though the fall in stock from £109,961 to £94,777—despite the general expansion of business—suggests a more rapid turnover. All company meetings during coming months will be awaited with exceptional interest, in the hope of obtaining the chairmen's opinion of prospects under war conditions. This is especially true of miscellaneous industrial concerns such as D. Gestetner, whose outlook can hardly be assessed on broad considerations. With the growth of official work, the company's domestic prospects may be favourable, but the fate of its important export trade is more problematical.

\* \* \*

**Prices Tailors Setback.**—Though the postponement of a final dividend on Prices Trust Company ordinary shares is to some extent a precautionary measure, the operating results of the undertaking are disappointing. The fall in Prices Tailors total profits for the year to June 30, 1939, is as much as 21 per cent., though the 1937-38 earnings were exceptionally high and included an adjustment of provision for stock depreciation not required. After a reduced charge for taxation, the actual payment made to Prices Trust is only sufficient to cover the interim dividend of 12½ per cent. already paid on the latter company's ordinary shares, assuming that the Trust's expenses were similar to those for 1937-38. In the following table we show the allocation of Prices Tailors profits in each of the past three years. Figures for 1938-39, however, are only approximate, since they are based on the preliminary profits statement.

|                                | Years ended June 30 |         |         |
|--------------------------------|---------------------|---------|---------|
|                                | 1937                | 1938    | 1939    |
| Profit .....                   | 521,788             | 572,576 | 452,000 |
| Taxation .....                 | 115,000             | 170,000 | 150,000 |
| Depreciation and fees .....    | 94,215              | 90,597  | 97,500  |
| Pref. and pref. ord. div. .... | 41,594              | 40,563  | 39,875  |
| Ordinary shares (tax free):—   |                     |         |         |
| Earned .....                   | 270,979             | 271,416 | 164,625 |
| Paid .....                     | 192,000             | 200,000 | 70,000  |
| Earned % .....                 | 154.8               | 155.1   | 94.1    |
| Paid % .....                   | 109.7               | 114.3   | 40.0    |
| Spec. renewals reserve .....   | 10,000              | 10,000  | 20,000  |
| Contingencies reserve .....    | ...                 | 30,000  | 20,000  |
| Carry-forward .....            | 226,415             | 257,831 | 312,457 |

It is clear that the omission of a final dividend by Prices Trust (a year ago a final of 37½ per cent. followed the 12½ per cent. interim) is due to policy rather than necessity. Even allowing for the allocations of renewals and contingencies, current earnings on the operating company's ordinary capital would be £124,625, or equivalent to 71 per cent., against an actual tax-free dividend of 40 per cent. If these earnings had been distributed in full to the Trust—a supposition admittedly at variance with previous policy—the latter would have shown earnings of roughly 28½ per cent. on its ordinary shares, compared with the 12½ per cent. dividend actually paid. The group's prospects in war conditions depend on the resultant of reduced real purchasing power and the extent of Government work.

**Initial Services Progress.**—Shareholders of Initial Services were informed at last year's meeting that, despite the bonus issue of 331,200 5s. ordinary shares in September, 1938, the dividend should be maintained in 1939. This confident forecast—repeated in July this year on the offer for sale of part of the company's issued ordinary capital—was substantiated by last week's preliminary profits statement. The accounts, published this week, show that trading profits for the year to June 30th increased by 10.7 per cent. to £340,876, against £307,659. Taxation provision requires £93,234 compared with £84,729, but since other charges show little change, earnings for ordinary shares amount to £209,807, against £187,428, and represent 31.8 per cent., against 30.9 per cent. on the lower capital. The profits distribution for the past three years is given below:—

|                           | Years to June 30 |         |         |
|---------------------------|------------------|---------|---------|
|                           | 1937             | 1938    | 1939    |
| Trading profit .....      | 277,499          | 307,659 | 340,876 |

† Plus capital bonus of 10 per cent.

‡ After writing off £1,344 in 1938 and £339 in 1939 for new issue expenses.

The balance sheet reflects the expansion in activity over the year. Freehold properties stand at £137,849 compared with £107,306, while stocks and equipment have increased from £123,029 to £132,662. Investments in subsidiary companies also show an advance from £574,200 to £604,200. At the meeting a year ago the chairman declared that the business, although dependent to some extent upon general conditions, was not subject to wide fluctuations. Though this statement may require some modification to meet war conditions, there should be ample scope for the company's activities. The chairman's views on immediate prospects will be awaited with interest. The 5s. ordinary shares are quoted at 19s. 4½d.

\* \* \*

**Johannesburg Consolidated.**—The variety of Johannesburg Consolidated's interests and the inclusion in total earnings of capital profits have resulted in an irregular profits record, and a year-to-year changes in earnings of much of their significance. For the year to June 30, 1939, total profits of £632,305 compare with £744,989 for 1937-38 and £1,172,990 for 1936-37, the balance in all three years being struck after providing for contingencies. After expenses, net profits for 1938-39 amount to £616,129 against £720,380, or 15.6 as compared with 18.2 per cent. The 15 per cent. dividend is repeated, but there is no allocation to reserve, which thus remains at the impressive figure of £3,050,000. Putting aside all the unknown factors, the setback in profits may be explained solely by reference to the known results of the gold-mining companies in the group. Owing to lower-grade mining, the value of gold recovered by these companies in 1938 fell from £18,275,364 to £17,299,989, while working profit

fell to £6,094,109 against £7,395,229. The principal change in the balance sheet is a decline from £6,375,553 to £5,988,976 in stocks and shares, whose market value is still much above book values. An interesting summary of the company's development since its registration fifty years ago supplements the annual accounts.

**Modder East Position.**—Mining companies whose financial year ends in June are now reflecting the benefit of the rise in the value of gold which began in the latter part of 1938. Thus the Modder East report shows that the company obtained a virtually unchanged gold recovery of 270,538 fine ounces, but enjoyed a gold price of 146s. 8d.—some 7s. higher on the average than in 1937-38. A fall in yield per ton milled of 0.281 dwt., and in working revenue of 9d., was offset by an 8 per cent. increase in the tonnage and a further fall in working costs to 17s. 3d. The net effect was a drop of 3d. per ton working profit but a rise of £37,367 in its total amount. The main features of the past three reports are summarised below:—

## THE STOCK EXCHANGES

### London

Note: All dealings are for Cash

THE re-opening of the House has not resulted in any marked revival of activity. Dealings in many securities remain largely a matter of negotiation; it has become more difficult to sell gilt-edged stocks at minimum prices; the closing of positions is more evident than any improvement in business. But dealers, at least, are beginning to work out the implications of a war economy for different classes of securities. The potential effects of war taxation and stocks insurance have found their mark. And commodity shares have naturally fared relatively well.

In the gilt-edged market, conditions were exceptionally dull. Buying support was absent, and on the week gilt-edged stocks at their minimum prices, to which quotations fell early in the week, did not attract buyers. In any case, the imminence of a War Budget is a factor of uncertainty which is likely to prevail until the worst is known. Home corporation and Dominion stocks showed no increase in activity.

Among foreign bonds, there was considerable demand for South American

issues, with Chilean bonds prominent, and, to a smaller extent, Argentine loans. Japanese bonds were firm, and among European issues, German loans lost further ground. With the curtailing of carry-over facilities, there was some selling of home rails. New business was restricted by absence of knowledge of the financial arrangements between the Government and the companies during the period of control. Dealings in prior charges were on the basis of unofficial minimum prices. Argentine rails were in demand, and a short supply of stock caused substantial rises.

Though movements were not uniform, industrial share prices as a whole moved downwards (in some cases to new "lows"), and business was on a small scale. The incidence of possible future taxation and increased costs were the leading considerations. Iron and steel and heavy industrial shares were quiet and irregular, but towards mid-week the decline became more widespread. Electrical equipment issues made a mixed showing at first, and then lost ground in common with other sections. There was lack of uniformity in the motor section, but aircraft issues became steadier after an early setback. Textile and rayon shares were perhaps

Capital expenditure has played an important part in recent years in distribution policy. The chief items in the programme, however, are now complete, and the consulting engineer's report points out that future requirements should be on a modest scale. Thus in contrast with 1937-38, when exceptionally heavy capital requirements required a draft on the carry-forward to the extent of nearly £40,000 to permit the maintenance of the 30 per cent. dividend, last year's increased distribution of 37½ per cent. is covered by a small margin. Available ore reserves again showed an increase, to 6,468,500 tons, with a fall of 0.2 dwt. in value. Kaffir shares have recently been subdued by the Union Government's proposal to expropriate any gold premium over 150s. per ounce, but even if the proposal were carried out in full rigour Modder East should be capable of further progress in the current year.

\* \* \*

**The Week's Company Profits.**—Our usual summary of profit and loss accounts, appearing on page 549, contains 18 companies for which comparable figures are available. Net profits amount to £1,506,000 against £1,897,000, and thus show a fall of 20½ per cent., which, however, is largely due to the Calico Printers' results. Aggregate net profits of 1,740 companies reporting in 1939 to date are £219,447,000, and show a fall of 8 per cent., compared with £238,539,000 earned by the same companies a year ago. The week's results are discussed in preceding Notes and on page 545 under the heading "Shorter Comments."

\* \* \*

**Company Meetings of the Week.**—Reports of company meetings commence on page 542 of this issue. Sir William Firth's address at the Richard Thomas meeting is discussed on page 534. At the Second Alliance Trust meeting Mr James Prain declared that, while the revenue outlook was uncertain, the directors would strive to avoid sharp fluctuations. Mr H. E. Miller informed shareholders of Bajoe Kidoel Rubber and Produce Company that the rejuvenation and replanting programmes of recent years should enable the company comfortably to weather war-time difficulties.

## New York

WALL STREET forged ahead after the week-end, with war stocks in the lead. Bullish sentiment was assisted by rumours of impending abrogation of the Neutrality Act in its present form,

\* Approx. total recorded in S.E. List. \* July 1, 1935 = 100. † 1938 = 100.

while the news of higher steel mill activity provided a firmer background to steel shares, which gradually influenced other industrial issues. In the bond market, Government issues were a shade easier. Though Tuesday saw profit-taking on a large scale, a rally in the late trading more than wiped out earlier losses. Steel issues were again predominant, but rails also joined the general upswing. The Dow-Jones industrial average had then advanced since Saturday from 150.91 to 155.92. In mid-week, however, prices reacted on further profit-taking, assisted by rumours of impending federal invocation of the anti-trust laws to control profiteering. *Iron Age* estimates steel ingot production this week at 71 per cent. of capacity, compared with 59 per cent. a week ago. A considerable volume of forestalling orders is now being placed.

By courtesy of the Standard Statistics Company, Inc., of New York, we print below the following index figures of American values calculated on closing prices (1926 = 100). As they were not received in time for last week's issue, figures for the week ended September 6 are given as well as those for September 13.

Compared with the previous year, the ore reserve shows a decrease of 671,300 tons, and the value and stope width are lower by 0.2 dwt. and 0.2 inch, respectively.  
The full Report and Accounts (with Plan of Workings) may be obtained from the London Secretaries, A. MOIR & CO., 4 London-wall Buildings, E.C.2.

# Industry and Trade

**Employment in August**—The latest pre-war returns of employment and unemployment relate to the position on August 14th. Between July 10th and August 14th the number of registered unemployed showed a further reduction of 24,000 to 1,232,000. The estimated number of insured persons aged 16 to 64 in employment in Great Britain has shown a slight decline for the first

## EMPLOYMENT AND UNEMPLOYMENT IN GREAT BRITAIN

\* Estimated.

time since last January, due, presumably, to the calling up of militiamen and reservists, of which 50,000 were in training on August 14th. There has been a reduction in unemployment in all the administrative divisions with the exception of the Midlands. So far as individual industries are concerned, unemployment showed a further decline in building, public works contracting, coal mining, and in the engineering, shipbuilding and cotton trades.

**War and the Marketing Boards.**—The agricultural marketing boards were established to assist British farmers, notoriously disinclined to co-operative action and weak in bargaining power, to exercise monopoly powers over the output of selected commodities. These experiments in agricultural and economic organisation have aroused much interest and a lot of criticism, but the interruption of war, which has converted the boards from producer-controlled monopolies into Government agencies, will vitally affect their development. *The Economist* recorded last week the suspension of the bacon pig contract; the trade in fat pigs as in fat cattle and sheep has been taken over by the Ministry of Food, which has ruled that all animals sold for slaughter must be sold through a recognised auction, at prices not exceeding those laid down; meat prices are also subject to maximum levels. The Chairman of the Potato Marketing Board has been appointed Potato Controller, under the Ministry of Food, and maximum wholesale and retail prices are in force. Similarly, the Milk Marketing

Board has been taken over by the Ministry of Food. The prices and conditions of the existing 1938-39 contract have been prolonged until the end of January, 1940, when the redistribution of the population and the probable depletion in the ranks of dairymen will necessitate a complete revision of conditions in the trade. It is probable therefore that the necessities of war will bring about that reorganisation of the distributive side of the milk trade which the Government had attempted (and failed) to carry out in times of peace.

**Restriction Schemes in War.**—The outbreak of war has completely changed the basis of international commodity control. The demand for many controlled products will be raised materially by the war, while at the same time normal trading will be completely disorganised. In certain schemes (the International Steel Cartel, the nitrate agreements and the sugar scheme) both Germany and members of the Peace Front have taken part. The working of these schemes will probably be interrupted or at least limited, although so far no formal announcements to this effect have been made. Among the remaining schemes a distinction must be drawn between private arrangements between international producers (like the copper and lead agreements) and the official schemes of the Governments of the leading producing countries (like the tin, rubber and tea schemes). The detailed text of the private schemes has not been published, but it is known that these agreements do not contain special war clauses. Probably restriction will be lifted if demand warrants it. Incidentally, it is rumoured that the co-operating copper and lead producers are already working at full speed without special regard to the existing quotas which have not been formally raised or lifted this week. The rubber and tin schemes contain special clauses according to which members who are involved in hostilities may give notice of their withdrawal from their obligations. In tin this would cover all obligations, but in rubber it would not affect the prohibition on new plantings and on exports of planting material to non-restricting countries. So far these clauses have not been invoked, and it is learned that the British authorities are anxious to keep the schemes intact as long as possible. This is confirmed by various substantial quota increases made since the outbreak of war. On September 1st the International Tin Committee announced an increase in the quota for the second half of this year to 60 per cent., and on September 12th the tin export quota for the third quarter was raised further to 80 per cent. In rubber the quota for the last quarter of 1939 was raised from 60 per cent. to 70 per cent. late last week. Both in tin and rubber the increases were announced by the chairmen of the respective committees after correspondence with the delegations and not by special committee meetings. This practice of rapid quota decisions should prove effective for the time being and as the quotas can be raised within the framework of the control schemes to levels which allow virtually free production, a discontinuation of restriction schemes may well be allowed.

**Coal Mining Profits.**—The output of coal in this country declined from 61.4 million tons in the first quarter to 56.9 million tons in the second quarter of this year. This decline is due to the seasonal shrinkage in the demand for coal for heating purposes. Compared with the second quarter of 1938, however, the output in April-June this year shows an increase of 2.8 million tons. The increase is due mainly to the revival of the export trade; shipments of coal, coke and patent fuel (including bunkers) rose by 2.1 million tons to 13.8 million tons, while home con-

sumption, at 42.4 million tons, was only 0.7 million tons higher than a year ago. Prices showed a slight reduction between the first and second quarters in both the inland and the foreign trades; the Board of Trade price index for coal fell by 3.1 per cent. during this period, while the average f.o.b. value for coal cargoes declined from 20s. 6d. per ton to 20s. per ton. On the other hand, costs of production per ton showed an increase between the first and second quarters, partly because of dearer materials but partly also because of the time-lag in the effect of wage changes under the monthly or quarterly ascertainments, and also, in a measure, owing to the drop in production. While the audits for a few of the smaller coalfields are not yet available, those for the principal districts of the country show that for the industry as a whole the credit balance in the second quarter was approximately £2.3 millions, compared with nearly £5.6 millions in the first three months and £1.6 millions a year ago. For the principal coalfields the profits were as follows, with those for the corresponding period last year in brackets:—Scotland, £297,718 (£361,882); Northumberland, £170,881 (£166,344); Durham, £450,800 (£258,374); Yorkshire, £648,885 (£198,737); Lancashire, Cheshire and North Staffordshire, £169,672 (£302,626); South Wales, £198,313 (£108,275). There was a credit balance of £128,025 in Derbyshire, of £90,373 in Warwick, of £25,727 in Forest of Dean and of £10,509 in Leicestershire. The only important coalfield to show a loss was Nottinghamshire, where the debit balance amounted to £17,334. Yorkshire and Durham were relatively the most profitable trading districts in the quarter, and probably the chief reason for this was the substantially increased demand from Germany and some of the Scandinavian countries, and from Italy for north-country coking coals.

**Control of Wool Textiles.**—The control of the wool textile industry which has been in operation since September 4th is following a logical sequence so far as circumstances permit. The first step was a standstill order until such time as fixed maximum prices could be published. Meanwhile a census was immediately organised, the return being asked for within five days' time. In spite of the publication of the fixed maximum price schedule on September 7th, difficulties of procedure still exist and hamper trade. In the first place, the scale of prices does not apparently allow for the compulsory war risk premium which falls on stocks in process of manufacture. This particular matter is being dealt with, but no ruling can be expected for some time. It is realised, of course, that a reserve fund of some magnitude is necessary for the proper functioning of such an insurance scheme, but the premiums should be considered in relation to the prices fixed. Further, tops which do not conform exactly to the standard grades have to be appraised and a price established in relation to the few qualities already covered. This appraisal of "off-standard" tops is to start immediately, but as this implies a considered judgment on virtually every top which is produced in the trade, some time is likely to elapse before a free market re-appears. Negotiations for the purchase of the entire Australian and New Zealand clips for the duration of the war will begin shortly, and the relationship between the fixed maximum prices for tops and the price which the Dominion interests may have in mind for their product is giving rise to much speculation. The fact that the top prices now announced are much lower than those which were operative from 1916 onwards is really irrelevant, and will have little or no bearing on present negotiations except perhaps as a precedent in the matter of margin above production cost. The maximum price now fixed for 64's warp oil-combed tops—26½d. per lb.—is just about on a par with the rates ruling at the last Brisbane sales of the 1938-39 season. Whether such a basis will satisfy Australian wool-growing interests remains to be seen.

**World Wheat Stocks.**—The bumper harvest in most wheat-producing countries in 1938 has led in the past twelve months to very low wheat prices. With the outbreak of war, the existence of large wheat stocks becomes an asset rather than a liability, and their position is of considerable importance. The following table is taken from the estimate of the end of season stocks compiled by the *Corn Trade News*:—

| Million quarters | August 1, 1938, net carry over | August 1, 1939 |                                   |                | Probable exportable surplus, 1939-40 |
|------------------|--------------------------------|----------------|-----------------------------------|----------------|--------------------------------------|
|                  |                                | Visible Stocks | Requirements of holding countries | Net carry over |                                      |
| U.S.A.....       | ...                            | 31.5           | 25.0                              | 6.5            | 10.5                                 |
| Canada.....      | ...                            | 12.5           | 5.0                               | 7.5            | 44.0                                 |
| Argentina.....   | 4.4                            | 22.5           | 5.5                               | 17.0           | 36.0                                 |
| Australia.....   | 5.0                            | 6.5            | 2.5                               | 4.0            | 16.0                                 |
| Europe*.....     | 4.0                            | 30.0           | 25.0†                             | 5.0            | 12.5‡                                |
| Total.....       | 13.4                           | 103.0          | 63.0                              | 40.0           | 123.0                                |

\* Including quantities on passage. † Including about 20 million qrs. of war stocks. ‡ Danube and Russia.

The stocks held by the main exporting countries at the end of the season, together with the very large war reserves in Europe are together nearly equal to a normal year's imports of wheat. The greater part of the surplus is at present held in the Argentine and in North America, where it will presumably be available for the Allied Powers; the Russian harvest is believed to have been poor in 1939. According to these estimates of Broomhall, therefore, the Allied Powers are assured of an adequate supply of wheat for the next year, providing it can be shipped as required.

Leaving a balance unappropriated of.....

£265,801 6 8

The available ore reserve has been re-estimated, and is as follows:—

|                       | Tons              | Value, Dwt. | Stoping Width, Inches. |
|-----------------------|-------------------|-------------|------------------------|
| Main reef.....        | 849,800           | 3.7         | 66.3                   |
| Main Reef Leader..... | 3,938,800         | 4.4         | 51.7                   |
| South Reef.....       | 3,009,800         | 4.2         | 49.1                   |
| Bird Reef.....        | 3,448,000         | 3.2         | 74.2                   |
| <b>Total.....</b>     | <b>11,246,200</b> | <b>3.9</b>  | <b>57.2</b>            |

In addition there are 1,398,100 tons of payable ore, valued at 4.1 dwt. per ton, contained in shaft and safety pillars not at present available for stoping.

Compared with the previous year, the available reserve shows an increase of 61,800 tons, the estimated stoping width is less by 0.8 of an inch, and the average value is 0.2 dwt. lower.

The capital expenditure on equipment amounted to £52,637. It is anticipated that the capital expenditure for the coming year will be on about the same level.

The Full Report and Accounts (with Plans of Workings) may be obtained from the London Secretaries, A. MOIR & CO., No. 4 London Wall Buildings, London, E.C.2.

## INDUSTRIAL REPORTS

SOME dislocation in industry has been caused by the beginning of Government control, but towards the end of this week more normal conditions were beginning to prevail. Statistics of production are no longer available and most prices are being fixed.

An explanation of the arrangements concerning priority of work was issued during the week. Priority is not to be exercised over the whole field of industry and there will be no general issue of priority certificates in connection with Government work. Such certificates will only be issued where there are difficulties arising from an immediate shortage or non-availability of production capacity, labour, raw materials, transport or any other cause. If necessity is proved, the appropriate Department will receive authority from the Ministry of Supply to issue priority certificates.

The raw materials which are controlled by the Ministry of Supply are: Aluminium, hemp and flax, iron and steel, jute, leather, molasses and industrial alcohol, non-ferrous metals (lead, zinc, tin and copper), paper, silk and rayon, sulphuric acid, sulphate of ammonia, other fertilisers, timber and wool.

## Coal

**Sheffield.**—The market is quietly adapting itself to the new conditions. Stocks carried by industrial concerns are very substantial, and good consignments are coming forward from collieries. The inland market is strong. Household demands are considerable, and utility concerns are still accumulating such stocks as are available. Coking smalls are in demand. Export business is in a state of suspense, shipments being confined to neutral countries. Prices are steady.

**Glasgow.**—New export business is still waiting for the revised price lists. It is expected, however, that this side of the trade will be encouraged on as wide a basis as possible. Meantime, the granting of the necessary shipping licences is proceeding. There is strong pressure for supplies in the home market. Industrial consumption remains at a high level, while the public utility undertakings are increasing their stocks. The priority regulations are now in operation, but all consumers are securing adequate supplies.

**Cardiff.**—The shipment of coal in the export trade is now under strict regulation, and in the inland trade distribution is governed by a system of priority. The three principal executive functions are discharged by the Control Board, a Coal Supplies Officer, and the local Fuel Overseer, and the trade is rapidly adjusting itself to the emergency conditions, which in the home trade affect transport arrangements as well as coal production and distribution, and in the export trade the employment both of allied and neutral tonnage. In the allocation of supplies for export, preference is naturally being given to France, whose requirements

from this country have been greatly increased by the cessation of imports from Germany, which last year supplied France with coal, coke and patent fuel totalling, in terms of coal, over 7 million tons. Shipments to neutral countries are being regulated primarily by economic considerations affecting immediately the conduct of the war, and both British and neutral shipowners are only permitted sufficient bunkers to take their vessels to their destinations unless owners guarantee to bring homeward cargoes to the United Kingdom or allied ports.

## Iron and Steel

**Sheffield.**—Business is now dominated by Government control, and freedom of dealing is virtually suspended. There appears to be no difficulty in regard to pig iron supplies, and there has so far been little interruption in deliveries under existing contracts. Consumption of foundry and hematite is on a very heavy scale. Basic pig requirements are increasing, and although prices of this material are not so far controlled, they are not running up unduly. Finished iron is taken up more readily, with the exception of crown bars.

Steel materials of every description are in great request, billets, small bars and strip being especially active. Ordinary business naturally ranks after Government orders, and deliveries are subject to considerable delay. Production of steel in this area is at a record level, but efforts are being made still further to increase output. The heavy sections are working at high pressure, and the lighter trades are fully employed.

**Glasgow.**—In all branches of the trade in this district workshops are extraordinarily busy and output is being maintained at very high levels. The bulk of the steel production is passing into the hands of manufacturers for Government departments. In Glasgow and district there are many manufacturers who at the moment are almost entirely occupied with such work. They expect, however, to make adjustments shortly which will enable them to undertake at least a limited amount of their ordinary commercial business. Meantime, it seems to be generally accepted that arrangements will be made to ensure satisfactory deliveries of all essential materials.

**Cardiff.**—The heavier branches of the iron and steel industry are employed up to their maximum capacity. As the needs of the re-armament firms have increased, the manufacture of tinplates and of some other re-rolled products is limited to the quantity of steel bars currently available, the distribution of steel being determined by the order of priority which became operative last week. Iron and steel scrap is in great demand at controlled prices. Sheet works are particularly active in meeting the demand for A.R.P. supplies. Shipments of tinplates are permitted only with licensed authority.

**News from Abroad.**—Although it is not yet possible to obtain a reliable survey of the changes and probable developments on international steel markets under war conditions, it can be said that, for the time being, export trade in Europe has come to an almost complete standstill. This is only natural if it is remembered that transport costs and facilities are not even approximately determinable and that, moreover, no European country has at present steel material available for export. The belligerent countries require their whole output for domestic consumption and the steel industries of neutral countries, particularly of Belgium and Luxembourg, are largely disorganised at the moment. Prices are firm, but producers generally decline to quote for export, and even f.o.b. offers are scarcely obtainable.

On the other hand, the demand from a number of neutral European countries, especially Scandinavia, and from overseas is keen, both for prompt delivery and for later shipment. Consumers are anxious to ensure as far as possible their future steel supplies and are prepared to pay comparatively high prices. As was to be expected, the United States has taken advantage of this state of affairs. She has already secured substantial orders which would normally have been placed with European producers, and are extremely active in offering steel material to all parts of the world, including the neutral European countries. American export prices have been substantially increased, but are accepted by buyers without much difficulty. As long as the new freight and insurance rates are not definitely fixed, sales are being made on a f.a.s. American port basis. The restrictions of American exports under the arrangement with the European Steel Cartel have, of course, been abolished, and the Cartel, whose activity is now restricted to the Western European countries, is even endeavouring to assist in the maintenance of American supplies to steel-importing countries.

## Textiles

**Cotton (Manchester).**—During the past week Sir Percy Ashley, of the Ministry of Supply, has met representatives of the several sections of the cotton industry to discuss working conditions. In regard to the raw cotton supplies in this country, it is recognised that some Government action to ration users and give priority to spinners and manufacturers engaged on Government work will be necessary. It is understood that small sectional committees are being set up from which representatives will form a Control Board.

Raw cotton business has been hampered by the control of operations in futures in Liverpool, but this market is now working more normally. Prices have advanced in spite of the increase, due to the higher yield per acre, in the United States Department of Agriculture's estimate of the cotton crop at 12,380,000 bales, against 11,412,000 bales a month earlier, which caused a sharp decline in New York.

The yarn market has been irregular and many spinners have refused to quote, but during the last few days there has been more business at prices much higher than a fortnight ago. Cloth prices have advanced by about 30 per cent. since the end of August, calico printing prices by 12½ per cent. and dyeing prices by 20 per cent.

## RAW COTTON delivered to Spinners ('000 bales)

\*

**Jute (Dundee).**—There has been little business, since stocks of cloth and bags have been practically cleared out. No dealings are permitted in raw jute. Spinners will not sell to buyers at the maximum prices fixed by the Minister of Supply under the Control of Jute Order, 1939, dated September 1st. These are 2s. 8d. for common 8-lb. cops and 2s. 9d. for 8-lb. spools, but buyers can only buy if the yarn is to be used for Government work. Other yarn prices fixed are 4½d. for 8-lb. sacking chains and 3½d. for 24-lb. sacking weft, with 3-ply 8-lb. twist at 4½d., 14-lb. carpet warp a 4½d., 48-lb. Rove at £22 10s. and 200-lb. Rove at £18 10s. These rates are all cheaper than those ruling prior to the outbreak of war, since when raw jute prices have risen in Calcutta, the equivalent rate for Daisee-2/3 at that centre being now £31, c.i.f. Dundee. The controlled maximum price for Daisee-2/3 in the Order is £24 10s., with Tossa-2/3 at £25 5s. The Association of Spinners and Manufacturers has instructed its members that from Monday, September 18th, 5 per cent. must be added to all invoices, including those for existing contracts. Considerable opposition to this order is expected from merchants.

## THE COMMODITY MARKETS

CONTROL over the most important commodity markets has been extended. Maximum prices, both wholesale and retail, have been fixed for most provisions, but have not yet been determined for other commodities, such as cereals and oilseeds. Trading in these commodities is therefore still suspended. The rapid rise early in the week in many American prices, coupled with the depreciation of sterling and the fear of rising costs of transport and insurance, has led to higher prices on the markets, such as rubber and cotton, which are not controlled. The extent of the rise in American prices is illustrated by the course of Moody's index which rose from 140.3 (December 31, 1931 = 100) on August 30th to 168.8

on September 6th; during the past week the spurt was checked by profit-taking and on September 13th the index stood at 167.9.

## Metals

TRADING in copper, lead and spelter on the London Metal Exchange remained suspended throughout the period under review, as the negotiations between the market and the Government have not come to an end yet. Maximum prices for licensed sales to consumers, however, were published on Tuesday. They are £46 per ton for rough copper, £49 10s. for refined copper, and £51 for electrolytic copper, £16 12s. 6d. per ton for foreign lead and £15 per ton for foreign spelter. These prices are, of course, based on quotations immediately before the discontinuance of trading at the end of August, but not on the present artificial state of supply and demand. A settlement was held on the London Metal Exchange on Monday which covered open contracts up to September 1st.

\*

**Tin.**—The market, which reopened on Wednesday, September 6th, was very active up to and including Tuesday last. The turnover of this period reached 4,200 tons, while the settlement price for both cash and three months' forward was stabilised at £230 per ton by the pool. On Tuesday the International Tin Committee announced an increase in the quota for the third quarter of this year from 60 per cent. to 80 per cent. of the standard tonnage, which will raise supplies during the quarter by slightly over 10,000 tons. The decision was unexpected and had its basis probably in the heavy re-stocking movement in the United States and the large demand on the London market. The heavy demand on the United States market has led to a serious disparity of quotations. While the London price has not changed since August 31st, the New York quotation for Straits tin (September) has advanced from 48.85 cents per lb. on August 31st to 70 cents on Wednesday of this week. It was probably due to this movement that the London Metal Exchange announced on Wednesday of this week that London tin dealings would be interrupted on the request of the Government until Monday next.

## Grains

ALTHOUGH the Baltic Exchange and Mark Lane opened on Monday for private dealings in spot grains, trading was very limited, as the Port Grain Committee has not yet published the list of fixed prices. In Liverpool, a fair trade was transacted at the end of last week in spot wheat and maize, subject to the prices to be fixed by the Grain Committee. The Canadian Government has published a forecast of 449 million bushels for the present wheat harvest, the fourth largest on record. Wheat deliveries in the United Kingdom are small, as traders and farmers are waiting for the publication of the fixed prices.

## Other Foods

**Provisions.**—There has been a steady trade in flour for immediate delivery at the fixed prices of 22s. per 280 lb. for National straightrun, delivered; the quota payment has been reduced by 1s. per sack to 4s. 6d. per sack. Official prices for bacon, hams, lard and cheese, announced on Monday, were unchanged from the "standstill" prices in force last week. Prices of colonial butters were also unchanged, but those of Continental and Baltic countries were raised by 4s. per cwt. Maximum egg prices were fixed by the Committee of the London Egg Exchange. These prices are given in the usual table of wholesale prices. Retail prices for butter have now been fixed by the Ministry of Food at 1s. 5d. to 1s. 7d. per lb.

\*

**Colonial Produce.**—The market in cocoa remains nominal, but such trading as occurs is at considerably higher prices. The tea auctions remain suspended and, owing to the removal of tea from the London warehouses to safer storage, merchants have difficulty in securing regular supplies. Trading in sugar continues at the prices fixed by the Ministry of Food.

## Miscellaneous Commodities

**Oils and Oilseeds.**—Trade at the controlled prices, of £29 12s. 6d. per ton for linseed oil ex London and £19 10s. per ton for cotton-seed oil ex Hull, is very limited. No oilseed prices have yet been fixed.

\*

**Rubber.**—Trade in London reopened on September 7th with prices about 1½d. to 2d. per lb. higher and this level was maintained fairly steadily during the past week. The International Rubber Regulation Committee has raised the export quota for the last quarter of the year to 70 per cent. of the basic tonnages. Prices in New York, after a sharp rise early in the week, closed at a slightly lower level.

## COMPANY MEETINGS

## RICHARD THOMAS AND COMPANY, LIMITED

## IMPROVED FINANCIAL POSITION

## EFFICIENCY OF NEW PLANT

## LOWER PRODUCTION COSTS

## SIR WILLIAM FIRTH'S ADDRESS

The ninetieth ordinary general meeting of the shareholders of Richard Thomas and Company, Limited, was held, on the 8th instant, at Southern House, Cannon Street, London, E.C.

Sir William Firth (the chairman) presided.

Mr T. Griffiths (joint secretary) read the notice convening the meeting, and Sir Harold G. Howitt (of Messrs Peat, Marwick, Mitchell and Company, the auditors) read the report of his firm.

The Chairman said:—Ladies and gentlemen,—It was decided to postpone the annual general meeting until after the August holidays, when it was found impossible to hold it at the usual time, owing to various changes then pending in the composition of the board.

These changes have since been announced in the Press, and I should like to make a few observations in regard to them. The responsibility for the appointment of the board rests, as you know, for the time being with the committee of control, of which I am happy to be a member. The committee has also considered it to be its duty to give close attention to the question of the higher personnel of the company, realising that management is more than ever of importance since the erection of the new plant at Ebbw Vale.

## THE MANAGING DIRECTORSHIP

So great and varied are the problems before us that it is essential if matters of policy are to receive due deliberation that I should be afforded some relief in the task of conducting the company's affairs. It has therefore been decided that a full-time chairman as well as a managing director should be appointed. I have, as you already know, relinquished the managing directorship, and for the present Mr James, your deputy chairman, in whom I have found a valued and experienced colleague, has agreed to take over that position—for this step he has received the kind permission of his colleagues on the board of the Lancashire Steel Corporation.

It had been intended to announce the change in the managing directorship at the general meeting, but when unfortunately it became necessary to accept the resignation of Sir Charles Wright and Mr Beale it was decided, with Mr James's permission, to make and to announce the new appointment at once. During the association of Sir Charles Wright and Mr Beale with the company we have obtained the agreement of the tinplate industry to satisfactory quota arrangements for the manufacture of tinplates at Ebbw Vale.

## POLICY OF CO-OPERATION

In dealing with the many problems which still are before us, and in the other trades with which we are associated, it is as necessary and desirable as before to develop a policy of co-operation with the rest of the industry, and the wide experience and counsel of the new directors will be of great value in all these matters. On your behalf I extend a warm welcome to the Earl of Dudley—who unfortunately is unable to be present to-day—to Sir James Lithgow and to Mr A. C. Macdiarmid, all of them persons eminent in the steel trade. At a later date the company will announce the appointment of a whole-time finance director to take the place of Mr John Adamson, whose resignation from the board was recently announced.

With your permission I propose to take the directors' report as read and to confine my comments to such items as seem to me to be of major importance. I shall deal as usual with the group figures and not the separate figures of the parent company.

## PROBLEMS CONFRONTING THE BOARD

The year under review has been a disappointing one to our shareholders, as indeed it has been an anxious one for your directors, who were confronted with three problems:—

(a) The liquidation of surplus stocks accumulated as an insurance against the risk of war.

(b) A demand for both sheets and tinplates much below the average of recent years.

(c) Supervision of the completion of the development work at Irthlingborough ore fields, the completion of the Ebbw Vale plant, the training of the workpeople, and the running in of the plant there.

Liquidation of our stock of ingots and pig iron increased our percentage of idleness and decreased our gross earnings, which after taking care of Ebbw Vale losses and running in expenses and transferring an amount from the special reserve for contingencies, sufficient to meet losses on stocks and forward contracts, etc., fell to £888,380, representing a reduction as compared with the previous year of £1,251,137.

## A PERIOD OF LOWER PROFIT MARGINS

The comparison, however, is a little misleading, because neither year was normal. The previous year was a period of exceptionally good demand, while the year under review was a period of sub-normal demand, lower prices and lower profit margins.

Sight should not be lost of the fact that operations only approximated 25 per cent. of the total plant we now own, and only 50 per cent. of our original plant. The gross profits, disappointing as they are, were earned by assets representing not more than 50 per cent. of the total capital in the business, and the balance of the capital not only contributed nothing to the profit picture, but incurred heavy starting-up and running-in losses.

Despite the disappointing result, it is not without interest to note that the profits for the three years ending March last, after taking care of these heavy starting-up expenses and losses on stocks and extraordinary and capital expenditure written off, and excluding credits extraneous to the period, totalled £4,469,197, out of which £1,200,000 has been set aside for depreciation. These figures compare with the prospectus profit estimate for the three years of £4,750,000 and a depreciation allocation of £1,050,000.

If it is realised that the prospectus estimate of profits did not take into account the nine to twelve months' delay in the delivery of machinery by contractors, but did take into account a contribution from the new plant which did not mature, it will be recognised that the actual profits earned during the three years falling short of prospectus estimate by only £281,000 was not altogether an unsatisfactory performance. In making this three years' comparison, I am, of course, not overlooking the fact that the prospectus trend was upwards over the period, a result which has been spoiled by delays and circumstances beyond our control.

## ADVANTAGES OF THE NEW PLANT

It may be thought that in view of the poor demand experienced during the year under review, even if the new plant had been ready at contracted dates, the total profits for the three years would still have fallen short of the estimate; this, however, would be incorrect, because since the close of the year under review it has been proved

that the new works are capable of producing at a cost substantially lower than it is possible to attain in old-type plant, and the product produced is vastly superior. (Applause.)

The profits of the previous year would have carried the cost of training the men and starting up, but the profits of the year under review would have benefited through the lower Ebbw Vale production cost and the greater volume of business resulting from our ability to supply superior qualities, which would have increased the demand for our products, and I have no hesitation in claiming that our gross profits would then have exceeded the prospectus estimate.

## THE BALANCE SHEET

Referring to the balance sheet—if you will turn to page 6, under the heading of "Current Liabilities," and page 7, under the heading of "Contingent Liabilities," you will see that with the exception of £491,502 included in the former item, and £525,833 included in the latter item, a total of £1,017,335—the whole of the development expenditure at Irthlingborough, Ebbw Vale and Redbourn—had been taken care of as at April 1st last; and if you will refer to page 10, under the heading "Debentures," you will find that we still had undrawn £1,910,590 of the £5,500,000 prior lien stock made available to us.

If from this you deduct the £1,017,335 already referred to, due to be paid to complete the capital expenditure programme, you will see as at April 1st last we still had available £893,255, plus accruing profits, to take care of A.R.P. defence, normal recurring capital expenditure, additional working capital and other requirements.

## PRIOR LIEN DEBENTURES

Since April 1st we have taken up £781,000 further prior lien debentures, and as at yesterday the total issued was £4,370,410, of which we have redeemed £222,475, so that to-day we have outstanding £4,147,935, which, added to the £500,000 subscribed in ordinary shares at par by the Bank of England, means we have in the business £4,647,935 of the £6,000,000 made available to us by the banks.

As at September 1st last we had standing to the credit of our special capital expenditure banking account £108,000, after having liquidated since April 1st £397,000 of the £1,017,335 that then remained to be paid, leaving still to pay, say, £620,000 to complete the programme.

Since April 1st we have substantially increased our stocks, and at date still have undrawn £1,129,000 prior lien debentures.

You will observe that this year we have debited to general reserve £200,000 of the interest charges on the new capital expenditure.

The whole of the balance has been taken care of out of the profits of the three years, although a large portion of these interest charges could, with some justification, have been capitalised, inasmuch as interest on capital expenditure on so large a scale definitely forms part of the total cost.

From the point of view of the company's balance sheet, our position is sounder than at the time the new capital was issued, because the new works are now operating at a profit, and since April, 1936, we have retained in the business £1,200,000 via depreciation reserves and the £1,250,000 premium, less redemption and issue expenses, and we have charged to profit and loss account a substantial amount represented by interest on the new and (up to March 31st) unremunerative capital, while our old-type plant is to-day every bit as efficient as it was at prospectus date.

## PLANT POSITION

This comparison of our old-type plant is made *qua* that of similar plant in the industry. The efficiency of the new plant does, however, indicate that in the not very distant future much of this old-type plant will have to be replaced by modern plant. This being so, it will be of interest to you to know that we own 265 old-type sheet and tinplate mills, which stand in our books at a net figure of approximately £1,600,000, which is, of course, considerably less than their original erection cost. Inasmuch as it is unlikely that similar type plant will ever again be built, we must face the fact that over the next few years much of this plant will have to be written off.

Prior to the outbreak of war the tinplate industry was considering the best means of taking care of this problem of old-type plant

and was engaged framing a trade redundancy scheme. In recent months 75 per cent. of this old-type plant has been operating and earning modest profits.

## GENERAL RESERVE ACCOUNT

Referring again to the balance sheet, it could perhaps be said the gross profits of the year under review should have been debited with the £384,870 charged to general reserve account (see page 11), and that no amount should have been transferred from the contingencies reserve to take care of the £107,492 losses on stocks and forward contracts, etc. (see page 8). If this had been done, instead of showing a net profit for the year of £42,061, a loss of £450,301 would have been recorded.

Your directors thought in view of all the circumstances and the very large percentage of total capital represented by new plant that it would be unfair to shareholders to create a record that so misrepresented the true earning power of the company, although had profits been available the items to which I have referred would doubtless have been charged against them.

When the prior lien debentures were issued a condition was imposed that if any portion of the general reserve was applied in writing off losses or otherwise a sum equal to the amount so applied should be transferred to general reserve out of the balance of profits of future financial years.

This means that out of the current year's net profit the £267,429 (see page 11) that has been debited to general reserve will have to be restored, so that including the agreed £100,000 that has to be placed to reserve out of each year's profits a total of £367,429 will have to be transferred from the current year's or future earnings before any profits will be available for distribution.

## THE CURRENT YEAR

It would be unwise in this period of uncertainty to attempt to forecast what the current year's net profits will be. Our existing profit margins on tinplates produced in our old-type mills are greatly reduced, owing to the substantial advance in the price of tin from £170 per ton in April, 1938, to £230 to-day—the whole of which we have taken care of in our cost; but on the assumption that our total profits are maintained at the rate of recent months I am entitled to say that there is no ground for supposing the net profits of the current year will not substantially exceed the £367,429 earmarked for transfer to general reserve account, and this, after providing an additional £210,000 for depreciation, bringing depreciation allocation up to £650,000 for the year.

Before leaving this item I think it right to inform you that we have instructed our auditors to examine the whole assets of the company and report what, in their judgment, would be a reasonable allocation for depreciation. It may be that they will report that £650,000 per annum is insufficient, but it will be comforting to shareholders to know that some of our assets are undervalued, and I do not anticipate a too serious increase.

## GOODWILL ITEM

The item of £448,050 described in the balance sheet as goodwill, etc., is represented in the main by—as I think I have explained on previous occasions—the excess of the price paid for the Grovesend shares, over their par value, inasmuch as the net profits of the Grovesend group last year after providing for the dividend on the preference shares approximates 46 per cent. on the par value of the ordinary capital. I do not think for the present we need exercise our minds about this goodwill item.

There is another item on the balance sheet under "intangible assets"—see page 7—representing balance of excess war-time expenditure on our Redbourn plant. I think it will be found that this, viewed in the light of to-day's conditions, is conservative. The auditors will, of course, take this item into account when reporting on depreciation allocations as a whole. The item, as you know, was reduced by the allocation of £803,965 ex the premium on the ordinary shares issued.

As you are aware, when we raised the new money we held the sole rights to roll wide continuous strip in this country, but during the erection of our plant another manufacturer embarked upon the erection of a somewhat similar plant, without previously obtaining from us a sub-licence. We have now granted to this competitor a sub-licence on terms favourable to them, but under conditions that nevertheless substantially reduce the royalty and service charges to

us. Our annual payments under this heading will be debited to production cost and represent an annual charge of comparative unimportance.

The £84,000 prepaid royalties and service charges which appeared in previous years' balance sheets have this year been charged against the general reserve account.

#### RELATIONSHIP WITH CONTROL COMMITTEE

You would perhaps wish me to comment on our relationship with the control committee. It is wrong to suppose that the committee attempt to interfere with the day-to-day management of our business or have the slightest desire to suppress our progress. Personally, in the widest sense, I welcome the influence they in conjunction with the federation have over the destiny of our company, because under normal conditions I look to that influence to prevent the building of modern plant by others in excess of the requirements of the country's normal demand.

To build surplus modern plant would be worse—from a shareholder's point of view—than having no modern plant, because modern plant to justify its huge capital cost must be operated approximately to capacity, which would be impossible if capacity materially exceeded demand.

It is therefore in the interests of our shareholders and the public that in this country we avoid the mistake that has been made in America, where excess modern plant built competitively without any sort of control has resulted in efficient but very expensive plant becoming unremunerative.

I should this year like to pay a special tribute to the officers and staff of this company and colleagues who have shared with me the anxiety inseparable from the building of our huge new plant, the extra work it has entailed, and the temporary disappointments it has brought.

#### OUTPUT CAPACITY

Your company now possesses one of the finest plants in the world, and our steel capacity is equal to 10 per cent. of the total ingot capacity of the country, and, what is more interesting, some 50 per cent. of this ingot capacity has a book value approximating 25s. 3d. per ingot-ton, which is a very low figure.

Further, in normal times, i.e. in times of cheap scrap, this low-capital-cost plant is capable of producing ingots on an f.o.b. basis that compares favourably with any integrated modern plant in this country. The elasticity of this 50 per cent. low-capital-cost steel plant is not generally recognised. It consists of six completely independent units, each with an average output of 120,000 tons of ingots per annum. In times of fluctuating demand we are in a position to light up or close down at comparatively small cost these separate units, and thus make possible in times of poor demand to work our Ebbw Vale and Redbourn integrated plants fully.

Let any of my remarks made in an attempt to give you a true picture of your property should be interpreted by you as optimistic I would remind you that in times of poor demand our profits must shrink and that we have no control over world conditions or world demand.

#### EMPLOYMENT TO OVER 31,000 MEN

In conclusion, it will be gratifying to you to know that your company is giving direct employment to over 31,000 men, as against 13,650 men seven years ago. (Applause.)

Before I put the resolution to the meeting I feel I ought to refer to the conditions under which we meet. We meet to-day in a state of war, and I think you will agree it is fitting that we should place at the disposal of the Government the whole of the resources of your great company. (Hear, hear.)

I now move:—"That the directors' report and accounts for the year ended March 31, 1939, as submitted, be approved and adopted."

Mr John E. James (deputy chairman and managing director) seconded the resolution, which, after the Chairman had replied to questions, was carried unanimously.

The auditors, Messrs Peat, Marwick, Mitchell and Company, were re-appointed.

On the proposition of Mr Barnabas Russell a vote of thanks to, and confidence in, the chairman and board of directors was passed by acclamation, and the proceedings terminated.

## SECOND ALLIANCE TRUST COMPANY, LIMITED

### SUCCESSFUL RESULTS

#### MR JAMES PRAIN'S SPEECH

The annual general meeting of the Second Alliance Trust Company, Limited, was held, on the 8th instant, in the company's office, Meadow House, 64 Reform Street, Dundee.

The chair was taken by Mr James Prain, and after formal evidence of the proper calling of the meeting had been submitted, the Secretary read the auditors' report to the shareholders.

The Chairman, in moving the adoption of the annual report, said: I have now to submit for your approval the directors' report and accounts for the year to July 31st last.

We meet in the immediate shadow of the outbreak of war, and it will accord with your wishes, no doubt, if I deal very briefly on this occasion with the business of the meeting.

#### SATISFACTORY REVENUE FIGURES

The revenue figures are satisfactory and call for little comment. For the purposes of record, however, I should mention that the annual report of a year ago covered a period of expansion, issues of preference and ordinary capital, debentures and debenture stock having taken place in that year. The investments purchased with the proceeds of these issues have now contributed nearly a full year's revenue, and as a result gross income, amounting to £230,000, shows an increase of some £14,000.

On the debit side of the account, income tax, interest on borrowed money, interim dividends on the preference and ordinary stocks and the proposed final dividends, all call for payments which in the aggregate show an approximately similar increase. After giving effect to the board's recommendations there is a surplus out of the year's revenue of £28,475, as compared with £27,670 a year ago.

#### SAME PAYMENT ON BIGGER CAPITAL

The result, therefore, is that revenue has been maintained at a level which permits us to repeat last year's distribution of 21 per cent. on the increased ordinary capital, and provides us with a substantial surplus to carry to contingent fund.

In the balance sheet there is one small matter to which I should refer. A sum of £10,000 was set aside in 1937 as a special reserve for taxation to provide for additional liabilities arising in connection with past years. These matters have now been settled, and the account has been closed by transferring the small balance remaining to contingent fund.

#### REVENUE OUTLOOK

At the moment there is little I can usefully say regarding the prospects of the current year. Markets and prices in this country are for the present mainly nominal, while in America there are at present restrictions on our usual activities. I have no doubt matters will gradually adjust themselves and a certain volume of business will become possible. We can only await events and be prepared to adapt ourselves to changing conditions. The outlook for revenue is naturally somewhat uncertain, and I think we must expect some falling off in receipts, if only for the reason that in times of crisis and difficulty there is a tendency to postpone dividends in order to conserve cash resources. In this company we have, of course, no commitments comparable with those of commercial or manufacturing undertakings, and we have a freer hand to deal with the immediate interests of our stockholders when it comes to declaring dividends. Our main object will be to avoid, so far as is in our power, any sharp fluctuations, and with our large margin of earnings I have every reason to hope that we shall succeed.

I have to acknowledge the valuable services of our staff during the year, and I now beg to move that the directors' report and accounts for the year ended July 31, 1939, be adopted and approved, and that the final dividends be declared at the rates therein recommended—on £800,000 preference stock at the preferential rate of 4½ per cent. per annum and on £400,000 ordinary stock at the rate of 12 per cent. actual, making 21 per cent. for the year, both subject to income tax.

The report and accounts were unanimously adopted.

## BAJOE KIDOEL RUBBER & PRODUCE COMPANY, LIMITED

### BOARD'S DIVIDEND POLICY

The twenty-eighth ordinary general meeting of this company was held, on the 12th instant, in London.

Mr H. Eric Miller (the Chairman), in the course of his speech, said:—When the board met to decide upon their recommendations they came to the conclusion that, in view of the financial strength of the company, it would be in the national interest, as well as in the interest of shareholders, to distribute rather more by way of dividend than the amount of the credit balance for the year of £5,907 14s. 2d. Having been most conservative in our financial policy in years of prosperity, shareholders reap the benefit of this in the solid front presented by our balance sheet.

We accounted for much smaller crops of both rubber and coffee; consequently the unit cost of production was increased, but on the other hand the average net selling price for our rubber was somewhat higher.

Coffee results were particularly disappointing, but this would come as no surprise to those of you who have read my speeches in recent years. The lower price, coupled with a certain amount of active propaganda on the part of Brazilian producers, raised the consumption of coffee in the U.S.A. by nearly 1½ million bags, and as there was no aggregate falling off elsewhere, world offtake was correspondingly increased. The production capacity is, however, still far in excess of any likely consumption.

It is early days yet to attempt to foreshadow the effect of the war on the consumption of rubber, but the International Rubber Regulation Committee should be able to keep this industry on a fairly even keel.

Our estates are in good order, under capable management, and will be kept going efficiently at a minimum of expenditure. We have done a considerable amount of rejuvenation and replanting in recent years, the reports on which are encouraging, and we feel that the Bajoe Kidoel Company will weather comfortably such difficulties as may have to be faced as a result of the state of war now existing.

The report and accounts were unanimously adopted.

## DIVIDEND ANNOUNCEMENTS

Rates are actual, unless stated per annum or shown in cash per share. Rate for previous year refers to total dividend, unless marked by asterisk to indicate interim dividend.

## SHORTER COMMENTS

**Company Results of the Week.**—As a result of the war, some companies are adopting a more cautious dividend policy than is required by actual earnings. Thus, MAYNARDS, LTD., are again recommending an 8 per cent. dividend, but to conserve cash resources, half is payable "as and when the directors may decide." The full reports of CALICO PRINTERS' ASSOCIATION and of EASTWOODS, LTD., offer no comments to modify the disappointing impression left by the preliminary announcements. LONDON EXPRESS NEWSPAPER report a satisfactory increase in net profits, as sales increased and advertising revenue was maintained. A small setback in profits is recorded by NORTH CENTRAL WAGON COMPANY, but the 15 per cent. dividend is repeated. The engineering trades continue to show good progress. VAUGHAN BROTHERS (DROPPING FORGINGS) trading profits after depreciation are £50,406, against £42,622, and the dividend is increased from 20 to 22½ per cent.

## MISCELLANEOUS

**Imperial Bank of India.**—Report for half-year ended June 30, 1939, shows deposits Rs. 83,92,76,215 against Rs. 81,18,01,467 a year earlier. Advances Rs. 36,17,63,918 (Rs. 34,65,27,049). Investments Rs. 42,80,59,096 (Rs. 39,75,31,194). Cash, Rs. 14,59,53,973 (Rs. 16,28,00,518). Net profit, Rs. 39,78,410 (Rs. 39,52,341). Ordinary dividend, 6 per cent., tax free.

**Blakey's Boot Protectors.**—Trading profit year to June 30, 1939, £37,627, against £40,726. Net profit, £20,751 (£24,007). To: Income tax, £11,300 (£11,000); N.D.C., £1,675 (£1,715); depreciation, £3,635 (£3,763). Ordinary dividend maintained at 15 per cent. Carry-forward, £23,212 (£15,989).

**London Express Newspaper.**—Profit for year to June 30, 1939, £187,381 (£166,549). Ordinary dividend, 20 against 15 per cent. Carry-forward, £96,245 (£95,464).

**Lloyds.**—It is announced that Lloyds, the marine insurance companies, and also the Government War Risks office, will be closed on Saturdays until further notice.

**British Oxygen.**—All the share capitals of Coxeter and Son and of the Condensed Gas Company have been acquired by this company in exchange for shares in British Oxygen. The companies acquired manufacture medical gases and anaesthesia equipment.

**Cannock Associated Collieries, Ltd.**—Net profit year to June 30, 1939, £207,008, against £169,018. Ordinary dividend, 9 against 10 per cent. was paid.

## CURRENT STATISTICS

## Finance

## GOVERNMENT RETURNS

For the week ended September 9, 1939, total ordinary revenue was £12,567,000, against ordinary expenditure of £24,587,000, and issues to Sinking Funds of £245,000. Thus, including sinking fund allocations but excluding issues from defence loans, the deficit accrued since April 1st last is £191,450,000, against £149,292,000 a year ago.

## LONDON ACTIVE SECURITY PRICES AND YIELDS

NOTE: Yields on British Funds, Dominion and Colonial Government, Home Corporation, and Public Board Stocks are based on minimum prices shown without allowance for accrued interest. Approximate dealing prices on September 7th and 13th are given in left-hand columns. In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

## THE ECONOMIST

aggressor's heel. Russia is apparently to annex not only that part of the former Czarist Empire that lies east of a line drawn through Brest-Litovsk, but also Lemberg and the eastern half of the former Austrian province of Galicia. This will cut Germany off from direct contact with Roumania and bring Russia to the border of Hungary. Thus, for the first time, the Soviets advance beyond the 1914 frontiers of the Czar. Russia is advancing again, and Hitler may well find it necessary to keep many more troops on his Eastern front to watch the four million Russians than would ever be needed to keep the defeated and disarmed Poles down.

The events of the past week suggest two main conclusions for our own use. The first of these relates to the nature of the world we hope to create after the war has been won. More than ever, the Russian treachery to Poland shows that democracy must be the key-note of the new world. We should fight, not so much to make the world safe for democracy as to make it safe for decent living by democracy. And if men ask for a definition of democracy, it might serve to say that it is the opposite of all that has been exemplified by the actions in the past month of the brown Bolsheviks of Berlin and the red Nazis of Moscow. All the carefully elaborated distinctions that have been drawn between Hitler's system and Stalin's have now been blown to the winds. There is no difference between them, save in the precise content of the doctrinal nonsense with which they bemuse their followers. Their objective is the same—to keep in their seats of absolutism a set of power-drunk "leaders." And if their methods differ, it is only in the greater frankness with which the Nazis pursue their aims of aggressive plunder. The world will not be safe for decent men to devote their efforts to cleanly ends so long as any form of totalitarian dictatorship, armed against criticism and opposition, exists in any one of the Great Powers.

The second conclusion relates to the future course of the war. The strange mixture of boastful threats and cajolery with which Hitler addressed the world from Danzig on Tuesday has, of course, evoked no response in London or Paris; the real war is only beginning, and the overrunning of Poland is merely its opening incident, just as the over-running of Belgium was in 1914. But it is now apparent to everyone that the war will be won or lost on the Western Front. If the disappearance of an Eastern front serves to remove the last traces of illusion on that point, some good may come out of it. And it is reassuring, after a disappointing week, to reflect that no very signifi-

cant successes have yet been won in the West by the German aggressors.

The struggle in the air has hardly begun, but first blood went to Britain in the raid on the German coast, and the Allied air forces appear to have established an ascendancy on the Saar front. At sea, the sinkings of British merchant ships have been serious. But the submarine, waiting fully provisioned at its station at the outbreak of war, is obviously at a greater advantage, and the unconvoyed merchant ship at a greater disadvantage, in the first weeks of war than will be the case very soon. And, while the rate of sinkings of merchant shipping has not been as great as in the worst period of the last war, the rate of extermination of the submarines themselves, even if only proved cases are taken into account, has been double that of the last war's periods of greatest success.

On land, the cautious advance of the French shows with what respect they regard the Siegfried line. Their slow progress should be an encouragement to the far-sighted. For, during a great part of the war, it is the Germans who will be in greater strength on the Western front, and too easy a breach in the Siegfried line might merely augur a similarly easy breach, when the time comes, in the Maginot line which, for Britain as for France, is the vital bulwark. We can afford to take no chances on land. If we are to make sure that our defences hold, while the slow weapon of the blockade produces its effect, we must be ready to recruit a British Army of the same size as the French. The first task must obviously be to provide full equipment for the million men we already have in uniform. But beyond that is the barely less urgent task of raising and equipping a second, and even a third million. The public would like to have more convincing indications that these tasks are being pressed forward with all possible speed and energy. In the last war, two years elapsed before the new British Army went into action on the Somme. Those two years were the contribution to the Allied cause of Imperial Russia. The very different rôle played this week by Red Russia should stand as a military warning. We cannot take refuge in any belief that our economic and industrial contribution absolves us from the maximum military effort. Britain showed twenty-five years ago that she could be predominant at sea and in the air, and still raise a gigantic army. We can legitimately hope that a million lives will not be thrown away this time in fruitless offensives. But we can hardly hope that we shall achieve victory without an equal mobilisation of man-power to stand in the path of aggressive militarism.

## After Evacuation

WAR is a swift solvent of fallacies. In less than a month of hostilities we have come to know the complete falsity of the maxim *inter arma silent leges*. There is no question now of the activities of Government in the civil sphere being suspended, or even abated, while the war is on. On the contrary, Parliament and the Departments of State will need to work steadily at full pressure to make and maintain the complete transformation of civilian life which modern war requires.

Week by week since the war began, a summary record has been set down in these pages of a flood-tide of new laws and regulations; and the spate of statutes and orders is still far from ended. It is too early yet to weigh their consequences, for much of the new civil structure is still only on paper. But some part at least of the change-over is already represented by actual physical facts. Outstanding among these has been the movement of millions of people to new homes. Children, mothers, disabled persons and some officials have been moved by the Government from crowded and vulnerable places; very many families and firms have moved themselves. Not all the 3 million school-children, mothers and infants, expectant mothers, adult blind and cripples in the 11 million inhabitants of the evacuation areas have actually moved. It is doubtful whether the total number of evacuees, public and private

and including the staffs of transferred firms, exceeds 2 millions by any large margin; and some of those who have moved without official aid have gone into neutral and not reception areas. Even so, for the population of the reception areas, totalling some 16 millions, to be raised by, say, 2 millions in a few days is an event of tremendous magnitude. Between 1921 and the end of 1937, the total population of the London Transport area was raised by just under 17 per cent.; and, of the increase of 1½ millions, less than half were immigrants. In less than a week at the outbreak of war migration increased the population of the reception areas by 12 per cent.; migration increased the population of the London Transport area by only 8 per cent. in sixteen years.

The population has been redistributed with abrupt speed; and, for the moment, it is the difficulties of the process that are most noticeable. The impact of the official evacuees upon their new homes has not always been fortunate, and too many of them are coming back to danger. In reception areas, the problem of providing supplies, schooling, services, occupations, amusements and even accommodation for the visitors is sometimes acute. In evacuated districts, traders have been thrown into idleness because their customers have gone away; hotels and boarding houses have suffered severely. There is some dislocation and loss on all sides.

This is not surprising. Large-scale movements of population have always given rise to serious problems of adjustment; and this particular movement is less amenable than most to quick adjustment, because its causes were strategic rather than economic. The need now is to work out the special features and requirements of evacuation. In a sense it is simply the latest of an age-long and unceasing series of population movements whereby the stages of the country's shifting economy have been successively blocked out. But the resemblance of evacuation to its forerunners is only partial. The so-called drift to the South, for instance, which has inflated Greater London since the last war and created serious problems of urban congestion, was directly due to changes in the pattern of British industry; men and women moved to secure work in the new light trades and service occupations, which arose around the great town markets. Now, it is safety rather than work which the new migrants are seeking, and the bulk of them are children and mothers. Finally, and in the long run most significantly, it is *from* the large cities, and not *to* them, that they are moving. The trend of migration has been reversed.

The argument that this exodus lacks the economic origins of earlier movements can be carried too far. The business concerns that have moved (chiefly to the so-called neutral areas)—banks and insurance companies, timber and shipping firms, dealers and miscellaneous offices—will carry on. Their transfer is part of the necessary task of conducting the nation's business under conditions of war. The evacuated women and children, too, have wants and needs and purchasing power. Sooner or later, in some small degree at least, they will also represent labour bidding for hire.

It is important to remember that evacuation, though strategic in origin, is necessarily economic at bottom, because, so far, the movement has all the appearance of being costly and uneconomic. There is not only the out-of-pocket expense, to the Exchequer and to private individuals, of the actual process of transfer and settlement. There is also the cost in human terms represented by the unhappiness of evacuees and the resentment of some of their hosts. In addition, there is the immediate sharp loss to trade and commerce in London and the other large towns that have been depleted. This is, so to speak, the initial charge of a new colonisation. Much, probably the greater part, of this economic *malaise* need only be short-lived. The migrants are all consumers. Many of them are potential producers, too. They not only need lodging to replace the dwellings they have left behind. They need shops and supplies as well, to take the place of those that served them at home.

Even so, adjustment is not easy. The purchasing power of the refugees is scarcely so big as it was when they lived at home *en famille*. The allowances made to billeting for their guests are small; and the miracle of working-class domestic economy, which is to make the collective family income go unbelievably far, cannot be worked when the family is split up and scattered. Moreover, even though it is likely that much of what is now being lost on the swings in the cities will be regained on the roundabouts in the country, the gainers (except perhaps in the case of chain stores and multiple shops) will not be the same persons as the losers. And it is easier to empty houses, flats, lodging houses and shops in cities than it is to build new ones to replace them in the country.

One thing is certain. Adjustment will not come, except partially and slow-footedly, of its own accord. Evacuation was a sudden and forced movement; it meant that artificial break-up of family and trade ties. It is still regarded as essentially temporary and irksome. It is looked upon as a necessary evil.

It would be a pity if this view, very natural though it is, were to prevail unmodified. There are two reasons for saying this. In the first place, there is no room for waste in war. The less the out-of-pocket cost of this redistribution of the population, and the greater the productive and distributive efficiency of the swollen reception areas, the less will be the weakening of vital war effort. There is no place for passengers; that is why the new communities, visitors and hosts alike, must be placed on an economic footing at once. This may mean increased allowances for

billeted refugees. It may mean officially furnished canteens, markets and stores. It may mean the requisitioning of public buildings to ease the strain on overcrowded private houses and congested schools. It emphatically means that the fifty National Camps to replace the billets should be pressed on with and multiplied manifold. The ordinary household and town cannot easily bear the strain. The setting up of centres for part- and whole-time war work in the reception areas must be considered. The swift and comprehensive overhaul of water supplies, drainage systems and medical services, too, is imperative. Billeting is already compulsory; and it should be made an offence for evacuated children to be taken home into danger. But neither step is entirely fair until the process of adjustment and adaptation is set more firmly on foot than it is yet.

In the second place, is it so certain that evacuation, admittedly necessary, is altogether an evil? It has long been argued that the process of urbanisation has been allowed to go much too far; that towns like London and Birmingham are unduly costly to maintain and unhealthy and nerve-racking to live in; that contact between town and country has been largely lost; and that the city-dweller merely works at one end of a tunnel and lives at the other. The planners who have drawn up this indictment have based their own suggestions for amendment upon two principles; first, the dispersal of the population into smaller communities; secondly, the organisation of those communities in such a way that industry and agriculture can be carried on efficiently and pleasantly. These principles coincide very aptly with the policy of dispersal forced upon us now by the danger of air raids. It is needful to move and scatter the population of the most vulnerable places; but it is all the time vital that the nation's work should be carried on without interruption.

In brief, it would not be hard to draft a case in favour of the view that ARP has made some at least of the planners' dreams, our present peremptory needs. Nor is it simply evacuation which comes into this account. The towns that the refugees have left are dangerous and inefficient for war precisely because they were ill-planned in peace. The houses are too close upon one another. The roads are crooked and crowded. Homes and workplaces are too far apart. All this has been the planners' burden for a long while now.

We cannot escape the long-term view of evacuation. It has got to be made to work now forthwith, because the immediate needs of war command it. But, in so far as the movement has been away from choked cities, and (in part at least) towards the more rational spreading of the people over the countryside, longer-sighted and more enduring considerations must necessarily count in any assessment of it. The majority of the evacuees will come home, it is true. Children will rejoin their parents and women their husbands; they will go where their breadwinners' work is in peace-time. But not all the families and firms and individuals will go back to the cities. Some will have found the greater attraction of a new kind of community. Others, if the process of settlement and assimilation, which is essential for the duration of the war, is promptly and properly ordered, will have found a new and happier niche. And the children who do go back to, say, the East End of London will know the countryside and the sea that they are missing. The springboards of a healthy and natural decentralisation may even now be being placed in position.

Let there be no mistake. The one over-riding aim at present is to win the war. The refashioning of England can at the best be only very incidental. But there is good ground for the belief that, to a point, refashioning is vital for the war-effort itself. Unless evacuation is to create a dangerous drag upon the nation at war the new communities of the reception areas must be made active and, to some extent, self-supporting. The task of civil defence is to enable the nation's business to be carried on, undeterred and undiminished; and evacuation must be fitted firmly into this plan. If this is successfully done, then there may be the beginnings here of a new model England when peace comes again; and here at least there may well be some sweet fruits to be plucked from the brutal business of war.

## Local Autarky in America

THE American Constitution provides that none of the separate States that make up the Union "shall, without the consent of the Congress, lay any impost or duties on imports or exports, except what may be absolutely necessary for executing its inspection laws." Not only is this the law, it was an essential part of the economic and political structure that was built by the Founding Fathers. Nothing had more clearly demonstrated the need for a strong Federal Union among the colonies who had won the Revolutionary War against Great Britain than the epidemic of trade wars between the States that filled the years between the end of the war and the drawing up of the Constitution. Moreover, it has become an article of faith that the high living standards of the United States can largely be ascribed to the fact that it is one of the largest free-trade areas in the world.

This argument, however, has never been accepted by the legislatures of the States as being true without exception. Ever since the inception of the Union, America has been highly protectionist so far as foreign goods are concerned, and it has always been difficult for, say, the Massachusetts manufacturer to accept that, while it is a good thing for him to be protected against the products of cheap labour abroad, it is a bad thing for him to be protected against the products of cheap labour in the Southern States. The existence of very wide differences in climate and labour conditions between different parts of the country has acted as a spur to State legislatures.

As a result, a number of ingenious legal devices have been discovered from time to time which permit the States to circumvent the clear intention of the Constitution. A general preference for local products has frequently grown into definite discrimination against goods coming from other States, and there have been a number of overt commercial wars between specific States.

One remarkable characteristic of these quarrels has been that the warring States have not usually been immediate neighbours—an indication that the real lines of cleavage in America are those of regions rather than of States. The most famous quarrel of all was—and is—between States at opposite ends of the country—namely, California and Florida. This quarrel arises in part from the fiercest of all antipathies, that between rival health resorts. But the incident that raised jealousy to the level of a commercial war was California's decision to inspect all fruit coming into the State from Florida on account of the risk of infection with the Mediterranean fruit fly. This protection has been maintained, even though the original reason for it has largely disappeared, and California still imposes on her State lines an inspection service fully as rigorous as many national Customs barriers. The mutual dislike of California and Florida has also extended to the avoidance by Californian newspapers of photographs of Florida's far-famed bathing beauties and to sporadic attempts in Florida to boycott Hollywood films.

"Inspection" is one of the powers specifically left to the States by the Constitution and California's fear of the fruit fly is not the only emotion that leads States to impose inspection laws which in fact penalise producers in other States. It is only reasonable that States, or individual cities, should be allowed to inspect the conditions under which their milk is produced and to prohibit the sale of any un-inspected milk. This has led in some cases, notably that of New York City, to the exclusion of some supplies of milk on the ground that they come from outside the "milk-shed"—that is, the area within which New York will inspect.

Inspection, however, has proved a less potent weapon in the hands of State particularism than the taxing power. It would, of course, be illegal to place a tax on imports from other States, but there are less crude ways of achieving the same object. A State can, for example, insist that every motor lorry crossing its borders shall pay the full annual tax (with the result that any long-distance lorry bears a

collection of different licence plates as numerous as the hotel labels of the assiduous European traveller). The States can—and do—levy fiercely discriminatory taxes on chain stores with the object of protecting the local shop-keeper. A prime example of the extent to which taxes can be used for commercial protection can be taken from the story of margarine. Margarine is, of course, anathema to the dairy industry because of its fatal defect of being cheap. Because of the equally fatal defect that, until recently, it was manufactured from materials imported into the United States from abroad, it has been fiscally harried, not only by different State Governments, but by the Federal Congress itself. It is, for example, illegal to refer to the substance except as "oleomargarine," and this pejorative name, together with special licence fees imposed on dealers who are bold enough to sell the stuff, have contrived to create a general public impression that margarine's inferiority to butter as a foodstuff is far greater than is really the case. The attacks on margarine have naturally reached their maximum in Wisconsin, the great dairy State, which imposes licence fees ranging from \$1,000 a year on manufacturers of margarine down to \$1 on every consumer, as well as an excise duty of 15 cents a pound. The efficacy of these duties may be measured from the fact that their total yield in a recent year was exactly \$14.42.

Margarine, however, has recently acquired a champion. It has been discovered that margarine can be made from cottonseed oil, with the result that several of the cotton States have taken issue with the dairy States. Wisconsin is not only a great producer of butter; its biggest city, Milwaukee, is also one of the beer capitals of America. A natural repercussion of Wisconsin's anti-margarine taxes is a movement in the cotton States to boycott Milwaukee beer. Indeed, this intensification of the war may prove to be an advantage, since there are signs that the dairy States are being persuaded to see reason.

Duties on alcohol, in fact, are a favourite form of retaliation, since they, like inspection laws, are specifically exempted in the Constitution. The Twenty-first Amendment, which repealed Prohibition, specified that there should be no importation into any State "of intoxicating liquors in violation of the laws thereof." Originally intended to protect States that wished to remain dry, this clause has in fact been taken as licence to impose all sorts of restrictions on the entry of other States' brews. As a result, a number of liquor wars have broken out, especially in the industrial States of the Middle West, which have only been composed with some difficulty.

One further manifestation of this strange growth of local autarky deserves mention. During the depression, many States raised money for unemployment relief by means of a sales tax—that is, a general excise tax on all sales, usually with the exception of foodstuffs. But when such a tax is imposed, it is obviously necessary to protect local traders against the competition of neighbouring States where there is no sales tax. For this purpose the "use tax" has been invented. This is not a tax on imports from other States, for that would be unconstitutional; it is a tax on the privilege of using within the State goods that have been imported from other States. Lest that reasoning be thought too casuistical, it should be recorded that it has received the approval of the Supreme Court.

It would be a wild exaggeration to say that these local barriers to trade are a serious handicap to American business. But they have passed beyond the stage of mere curiosa and become real nuisances. In the last year or two an increasing amount of attention has been directed to them and the Council of State Governments recently convened a conference on the subject at Chicago, whose recommendations may have the effect of stemming the movement. But if not, it may not be very long before the Balkanisation of America—a phrase coined by the Governor of Missouri—ceases to be a picturesque metaphor and becomes a hard fact.

## Defence Measures

THE first stage in the construction of a legal and administrative framework for the life of Great Britain in war time is nearing completion. Since the commencement of the crisis which culminated in the outbreak of war, forty-seven Acts of Parliament have been passed, numerous Orders-in-Council have been issued and the machinery of civil defence has been prepared for action through the medium of departmental instructions. The diminution in the number of new defence measures now appearing indicates that the phase of bringing into effect specific types of organisation, fully planned in anticipation of the necessities of war time, is ending.

It now remains for the machinery which has been prepared to be put to the test of action. As that phase is reached—and there are signs that it is already beginning—there arises a need for new measures to facilitate working and remedy such deficiencies of the existing organisation as are revealed by the actual stresses of war. Those problems of an evacuated population which emerge after the initial task of transportation has been completed, are taking shape and calling for remedy; there have been modifications in the A.R.P. organisation and there are more to come; and the existing measures of price control and rationing have already required the commencement of the process of patching and modification which is continuously necessary to keep the machinery in working order.

The record of defence measures which has appeared in the last four issues of *The Economist*, and is continued below, has so far reflected the construction of a new administrative framework from carefully prepared material. It now includes an increasing number of measures introduced to meet the new day-to-day difficulties which are the product of the shifts and changes of developing war.

### DEFENCE LEGISLATION

On Thursday, September 14th, three Acts were passed. *Patents, Designs, Copyright and Trade Marks (Emergency) Act*

The first object of this Act is to make provision for patented inventions, registered designs, copyright work and registered trade marks belonging to an enemy to be used or produced by non-enemies in this country under licence. Secondly it extends the limits of time within which renewal fees may be paid and other acts done where the doing of an act is prevented by the state of war, or would injure the person concerned or the public interest.

#### *Administration of Justice (Emergency Provisions) (Northern Ireland) Act*

The administration of justice in Northern Ireland on lines similar to those laid down in previous Acts for England and Wales and Scotland (*The Economist*, September 16th, page 517) is provided for by this Act.

#### *Universities and Colleges (Emergency Provisions) Act*

This Act, which applies to the Universities of Oxford, Cambridge and Durham and to the colleges of Winchester and Eton, amends the Universities and Colleges Estates Act, 1925, and the Oxford and Cambridge Act, 1923, to enable these institutions to provide for the financial and administrative difficulties of war time.

The only Act passed on Friday, September 15th, was:

#### *Control of Employment Act*

The Minister of Labour and National Service is empowered by this Act to make an Order forbidding employers to advertise for certain classes of workers, specified in the Order, or to engage or re-engage such workers without the consent of the Minister.

On Wednesday, September 20th, was passed the

#### *Possession of Mortgaged Land (Emergency Provisions) Act*

The object of this Act is to close a loophole in the Courts (Emergency Powers) Act by assimilating the relief which that Act affords against the retaking of possession of property for non-payment of rent without the leave of the court, to con-

tracts between mortgagor and mortgagee. The latter type of contract is usual in the case of houses acquired through building societies.

### ORDERS IN COUNCIL

By a Ministry of Food Order which was announced on Friday, September 15th, eggs were added to the list of products whose prices are officially limited. Five categories of eggs are prescribed, and these must be indicated by sellers when invoicing or offering for sale.

A further Order by the Minister of Food requisitioned for storage and Service requirements all imports of bacon and hams arriving in Great Britain after midnight on Saturday, September 16th, except shipments from Northern Ireland and Eire.

On Sunday an important Order fixed Friday, September 29th, as National Registration Day.

The prices for potatoes which had originally been fixed by an Order of September 9th were modified by the Potatoes (Provisional Prices) (No. 2) Order, which was announced on Monday, September 18th. On the same day two Board of Trade Orders under the Trading with the Enemy Act specified 278 persons carrying on business in foreign countries who are deemed to be enemies, and required money normally payable to or for the benefit of an enemy to be paid within 14 days to one of the district Custodians of enemy property.

Condensed milk was added to the list of commodities whose maximum wholesale and retail prices are fixed, by a Ministry of Food Order announced on Tuesday. The Treasury, in an Order under the Defence (Finance) Regulations published on the same day, announced that travellers to foreign countries may take either bank notes or foreign currency up to £10 in total value, except in the case of Eire, where the allowance is £25. Travellers who wish to take out larger amounts must obtain a certificate. The Northern Ireland Ministry of Agriculture, under powers delegated by the Home Secretary, issued an Order requiring Northern Ireland farmers to increase their arable acreage.

The Minister of Agriculture reinforced his appeal for an increase in the number of allotments with an Order announced on Wednesday which gave urban authorities wide powers to take possession of the necessary land.

The Royal Warrant for the retired pay and pensions of members of the Military Forces disabled, and of the widows, children and dependants of such members deceased, in consequence of the war, was published on Tuesday, September 19th.

### DEPARTMENTAL INSTRUCTIONS

Sectional orders and announcements made on Friday, September 15th, included a number which reduced still further the economic inconveniences and social amenities of peace time but at the same time restored a few of the latter. On the one hand it was made known that the September wool sales had been cancelled, that the batch telegram service had been suspended and that certain London bus services would be curtailed on the following day. But it was also announced that cinemas, theatres and other places of public entertainment would be allowed to reopen until 10 p.m., or 6 p.m. in the Central London area. The Ministry of Food notified dealers in butter and cheese that they were required to register to facilitate the working of the control scheme.

The petrol rationing scheme which was to have come into force on Saturday, September 16th, was postponed for a week. Wheat prices were the subject of announcement by the Minister of Agriculture in which growers were informed that wheat marketed in the current cereal year will be eligible for deficiency payments. Maximum prices to be paid by authorised buyers for home-grown wheat were stated by the Food Minister. Egg importers were notified that they should register a once. A number of announcements dealt with various types of payments and allowances arising in war circumstances. The Minister of Pensions' scheme for the provision of grants in respect of physical injury to civilians as the direct result of warlike operations was explained in an official statement; the same Minister took over the responsibility for the award of allowances and pensions for the disablement or death of members of the services; the National Joint Council for the Building Industry issued a statement explaining the appropriate payments to be made to members of rescue

squads and other civil defence workers. The compensation which it had originally been proposed to pay for the 1,000 provincial hotels commandeered by the Government was considered inadequate and will probably become the subject of a protest by the hotel-keepers affected. An appeal by the Commissioner of Police of the Metropolis urged police officers to postpone joining any of the fighting services for the present. Reports received by the Board of Education from its inspectors indicated that it would shortly be possible to commence work on a war basis in most reception areas.

Schools were also the subject of announcement on Monday to the effect that enrolment for the technical and evening institutes in the London County Council area had been postponed; but it was indicated in a letter from the Board of Education to local authorities that such schools might be reopened in evacuation areas, subject to certain restrictions. The question of allowances was covered, in the case of families of men already in the services, by an announcement from the Admiralty, the War Office and the Air Ministry stating the rates to be paid; and the allowances to be made to married officers in a forthcoming Army Order were notified in advance. The appointment of the members of a Board for the cotton trade was announced by the President of the Board of Trade and the Minister of Supply. The Mines Department drew attention to the fact that the supply of motor fuel into other containers than the tanks of vehicles, except in special cases, is illegal. The adjustment of civilian amenities was the subject of two announcements of divergent effect—one that the relaxation of the black-out in country districts could not be permitted, and the other that a number of the normal passenger services of the Southern Railway would be restored.

On Tuesday the L.M.S. and L.N.E.R. also announced forthcoming improvements in passenger services, and the Ministry of Transport indicated that some of the London tube stations which had been closed would shortly be reopened. Adjustments to war-time regulations were the subject of an announcement that some doctors at present employed in whole-time emergency hospital service would be allowed to transfer to part-time, and of a notice by the Ministry of Transport outlining the procedure whereby operators of goods vehicles may obtain supplementary petrol rations. The Postmaster-General supplemented the announcement made on Sunday by the War Office and Air Ministry of the arrangements for correspondence with men serving abroad with an official description of the procedure for sending letters and parcels to members of the Army and the R.A.F.

## NOTES OF THE WEEK

**The Fourth Partition.**—On Sunday the Russian Army invaded Poland. European politics have gone back to Bismarck, for, whether we like it or not, Russia has returned to Central Europe; and although her return means the partition of our ally, Poland, and the risk of unwelcome pressure on Roumania and Turkey, there is already evidence enough to show that the Germans are going to like her return even less than we do. The technique of invasion was simple and, because the Poles were occupied elsewhere, a good deal more successful than on the previous occasion, twenty years ago. For days beforehand it was known that mobilisation had been effected in the whole of European Russia, that a total of nearly four million men were under arms (a direct witness to the distrust which must direct the friendship of Stalin and Hitler), and that invasion of Poland was imminent. In Britain and France there was no surprise, though there was a natural movement of protest, which was only weakly reflected in the British Government's carefully worded statement to the effect that "the invasion could not be justified by the arguments put forward"—those arguments having been a hotchpotch of the propaganda which the Soviets have conducted against the Polish "tyranny" ever since they failed to replace it by their own in 1920. The implications of the invasion are far less simple. With the discounting of Poland as a balancing factor in Northern Europe, the whole play of forces will change, and is already changing. Some measure of how the Baltic States are feeling is given by the silence of the Lithuanian Government, which has raised not so much as a finger for the recapture of coveted Vilna; and this, too, would seem to show that the Germans, fearful

The War Office also announced particulars of the arrangements for the transmission of goods and commodities to foreign countries by post. At an emergency meeting of the Drapers' Chamber of Trade it was decided to recommend members not to increase prices for existing stocks by more than 5 per cent. on the average. The use of the Blue Ensign and of the defaced Red Ensign by merchant and other private vessels was discontinued. An important announcement was made by the Ministry of Information to the effect that a national organisation to deal with civil air transport had been formed with the title of National Air Communication. An increase in home wheat production was strongly urged, and it was announced that there would be no interference with petrol supplies to farmers for at least five weeks.

It was announced on Wednesday that the Home Secretary had appointed an Advisory Committee to examine the cases of interned enemy aliens applying for release. The Civil Service Commissioners notified the suspension until further notice of open competitions for appointments. Wednesday also saw the first major casualty in the civil defence sector, when the Minister of Food announced in the House that the scheme for the distribution of fish had failed and that Billingsgate would reopen on Saturday. The extension of summer time until the night of November 18th-19th was a typical example of the unobtrusive adoption of the kind of measure which in normal times would evoke extensive discussion.

The preparation of plans for the control of supplies of meat to manufacturers of meat products and for increasing the production of seed potatoes was announced on Thursday. Adjustments to rationing schemes were notified by the Ministry of Transport, which clarified the position in the matter of additional petrol rations to goods vehicle operators; and by the Mines Department, which announced that the scheme for rationing gas will not apply to the users of slot meters. Details affecting labour were the extension of the period in which soldiers may be available to assist farmers until September 30th; the issue of a memorandum by the National Joint Industrial Council for Local Authorities Non-trading Services (Manual Workers) concerning rates of wages and overtime conditions of employees of local authorities on civil defence work; the extension of the period after the sounding of an "all-clear" signal during which workmen's railway tickets may be issued from 20 to 30 minutes; and an announcement by the Joint Agency of Women Teachers that a number of women teachers are unemployed as a result of the evacuation of secondary and private schools.

of Russia's enmity, have not encouraged the Lithuanians into an annexation from which the Germans themselves could later profit at Russia's expense. As must have been

implicitly recognised in the German-Soviet non-aggression pact, which undoubtedly paved the way for this partition

of Poland, Lithuania now falls to Germany and Estonia and Latvia to Russia in a way which leaves the Governments of those three small States with no option but to comply exactly with the orders they receive from their respective "protectors." It may be that we shall now witness what M. Karl Selters, the Estonian Foreign Minister, has called "preventive aggression"—invasion by one "protector" in order to discourage the offices of the other.

The line of Russian penetration is shown approximately on our map, for the exact frontier is not yet defined. It will be seen that the Russians have obtained the whole of the Polish-Roumanian frontier, the great city of Lwow, and most of the Ukrainian minority area. Germany is thus severed from direct contact with Roumania, and loses thereby what was presumably one of her major objectives. Roumania is by the same move very much in Russia's grip, and reports from Bucharest show that there is a lively appreciation of the dangers, not least among them the threat to Bessarabia, which that may mean. Here, again, there are countervailing advantages, for the German threat to Roumania becomes a much less immediate affair and must operate, if at all, through Hungary, which should give the Roumanians and the Allies by whom they are guaranteed plenty of warning. At this moment it may be no bad thing to compare the Russian line (so far as it is known) with the frontier proposed by Lord Curzon in 1919, and marked on the accompanying map. In support of the Curzon Line it was urged that the ethnographic limit of Poland ran much farther to the west than the Poles claimed; and it was also clear that, if the Curzon Line were adopted, Czechoslovakia would have a common frontier with the U.S.S.R. and would be correspondingly stronger. Both the Poles and the Roumanians argued that the line must run far enough east to give a common Polish-Roumanian frontier, and in the end they got their way. It is interesting, and may be profitable, to speculate on what would have happened if they had not.

**The Fighting in Poland.**—By a combination of skill, lucky weather, and great superiority in the air and in mechanised land equipment, the German Army has completed the virtual conquest of Western and Central Poland in three weeks. The success of their decisive thrusts in the north and south seems in any case to have been assured, for they never gave the Polish armies a moment's respite to reform and make a stand, throwing out swift mechanised columns far ahead of their main advance which harassed Polish communications and attacked the Poles in rear; but the final defeat of the Poles, who showed great gallantry, was naturally hastened by the sudden Russian advance along the whole Polish-Russian frontier. From that moment the structure began to crumble; Polish Government officials, including President Moscicki, and, it is reported, Marshal Smygly-Rydz, fled south-eastwards into Roumania, soon to be followed by streams of refugees; scarcely a day later the German and Russian armies had made contact, and their representatives had entered into conference at Brest-Litovsk on the precise line which the new frontier should follow. It seemed that all was over, and that the war in the west must now be waged with nothing but a memory of what had been Poland. Then it was understood that the Germans were still held up round Warsaw. Was this the Polish epic, not unexpected, that would lift their defeat above the bitter level to which it had fallen? During Wednesday and Thursday it was clear that another Battle of the Vistula was being fought; the German High Command issued a *communiqué* which said that "that was one of the greatest battles of extermination of all time"; and although there was practically no news from the Polish side, a piecing-together of the little that did come through showed that a large body of Polish troops, supported by the able-bodied population of Warsaw, and commanded by General Sosnkowski, were still holding out to the west of the Vistula. In a short time, by

sheer weight of numbers, they will be destroyed or, as the Germans would say, exterminated: but before that they will have stamped on the fourth partition a moral protest that the Germans will have cause to remember.

**The Czechs Revolt.**—In Bohemia and Moravia the German authorities are busy with another battle of extermination, though this time on a very different scale from that in Poland. A message issued from the Ministry of Information on Wednesday stated that a revolutionary movement started in the Czech provinces on Sunday, and that in the following three days riots occurred at Pardubice, Plzen, Tabor, Brno, and other places. On Tuesday the movement spread to Western Slovakia, where Slovak garrisons at Ruzomberok, Zhilina, and Trencin have revolted, and about 15,000 troops have been disarmed. The message emphasises the wide area over which the revolt took place, the courage with which it was prosecuted, and the organisation by which it must have been preceded. A great deal of damage to essential services, including the destruction of bridges, rolling stock, machinery, telephone equipment has been done by armed wreckers. The Czechs, like the Poles, are serving notice that they will not lie quiet under German oppression.

**Russia and Turkey.**—A joint statement by Russia and Turkey may be expected this week-end, or on Monday, dealing with their common attitude to the European situation. It will arise from a visit to Moscow of M. Sarajoglu, the Turkish Foreign Minister, to examine "questions of common interest." Before he left, M. Sarajoglu was in conference with the Turkish Ambassador in Roumania, and as this tied in with the report that some sort of a Black Sea pact was to be signed, speculation became general. Russia's primary aim, of course, is to remain the only Great Power neighbouring the Black Sea, and to do this she would doubtless make considerable sacrifices. But a formal Black Sea pact, provocative as it would be to Germany, is probably a good deal in advance of the Soviet Government's intentions. In effect, one already exists; Russia, Turkey and Roumania are each linked together, Russia to Turkey, and Turkey, less closely, to Roumania, while the terms of the Balkan Entente are aimed at possible Bulgarian aggression. As if to clinch the amity of Black Sea relations, the Bulgarian Government has lately shown itself less unyielding in its revisionist claims than for many years past. It is more likely that the Soviet Government wants to discuss the present implications of the Anglo-French-Turkish alliance, and it is for this reason that a certain amount of uneasiness has been caused by the visit. If the Soviets are willing to buy peace at the price of Germany's appearance on the Black Sea,

this uneasiness is fully justified; fortunately there seems little likelihood that they are. For the Turks, the problem is essentially one of reconciliation; and, in view of the fact that their alliance with ourselves and the French was declared with Russian approval (though, of course, before the announcement of the German-Soviet pact), they are apparently confident of success in this. The Moscow *communiqué* will say at little as usual on such occasions, but it should be possible to read between the lines. Stalin may even use it as a means of showing how far he is willing to go with Hitler.

\* \* \*

**Parliament and the War.**—The heavy war-time work of Parliament now pivots round the Prime Minister's weekly statement about the progress of the war. On Wednesday, Mr Chamberlain was again anxious to lay all the cards possible on the table. The Russian invasion of Poland, he said, had come as no surprise, but it was impossible yet to be sure of its real implications. In the West the keynote of the Allies' strategy was active and intensive preparation. At sea, despite the serious loss of the "Courageous," the war against submarines was gathering gratifying momentum. In general, the Government did not intend to be "rushed into courses of which their military advisers did not approve," though no threats would deter them from any course which seemed likely to succeed. The House, informed in this way that Members must "wait and see" and, by implication, that aerial bombardment of military objectives in support of the foundering Poles would have been impracticable, was very patient. Opposition speakers were naturally unhappy about the Allies' inability to aid Poland before her downfall; and, also with some justification, they were by no means convinced that the mobilisation of man power and the output of munitions were being pressed forward with the vigour and planned foresight which a war to a finish will require. There was wide support for the proposal to hold a secret session of Parliament at which tongues on both sides of the House might be loosened. There is no sign at all of any split in the solidarity of the Commons. Their resolve to resist aggression to a victorious end is united and unshaken. But most Members reflect the wish of the man in the street to get a move on; and, while they remain confident of the Cabinet's ability and determination, they are desperately anxious to contribute to success by free and continuous constructive criticism. It will be needful for the Government, at every stage, to give concrete earnest that substantial progress is being made in all departments of the war effort.

\* \* \*

**National Registration.**—Misgivings akin to those of the primitive Israelites in the matter of the sin of numbering have been expressed at each of the stages preliminary to the passage of the National Registration Act. But the Act itself took its place among the many sweeping measures placed unobtrusively upon the Statute Book in the first days of the war, and was in fact passed almost without opposition. Its direct application to the life of the civil population will, however, be speedily brought home. The work of distributing the necessary forms will be begun on Sunday, September 24th, by the 65,000 enumerators; the registration day has been fixed for Friday, September 29th; collection of the forms and the distribution of identity cards will begin on the following day; and it should be possible to complete the preparation of the summarised transcripts of the returns within a few hours of the completion of their collection. The object of the registration is to supplement and bring up to date part of the material of the 1931 census for the particular war-time purposes of food rationing, identification, the maintenance of contacts between members of dispersed families and recruitment for national service. There can be no reasonable objection to the principle of this enumeration. The methods of its performance have yet to be tested in practice, but they appear on paper

to be a model of expedition. The only misgiving at the moment is on the all-important question of the actual terms of the questionnaire. The schedule of required particulars which accompanied the Bill was scanty in the extreme and gave no indication that the information collected would in fact be sufficient for all the purposes which it is supposed to serve—and in particular for the maintenance of contact between members of dispersed families. This matter will no doubt be given attention before enumeration takes place, but it is hardly a question which is amenable to hasty treatment.

\* \* \*

**Congress on Neutrality.**—The United States Congress assembled in special session on Thursday for the express purpose of reconsidering the present Neutrality Act, which is, in effect, an embargo on exports of munitions to the democracies, who control the seas. The President's position is quite clear: he favours an immediate repeal of the embargo. He has strengthened his case and at the same time disentangled the issue from the bitter faction-fight that dominates American politics by inviting Mr Landon and Mr Knox, the Presidential and Vice-Presidential candidates of the Republican Party at the last election, to attend his eve-of-the-session conference with Congressional leaders and by securing their endorsement of his policy. But the opposition to a repeal of the embargo is vocal and numerous. On the outbreak of war quick repeal seemed certain. Then a reaction of opinion appeared to set in as the isolationists raised their voices. But the Russian attack on Poland has turned the tide again, both because it increases the danger to Britain and France and because it makes still more clear-cut the distinction between those who are fighting for the democratic way of life, in which Americans themselves so fervently believe, and those whose victory would leave America alone in the world. The prospect is still that the embargo will eventually be repealed, but only after a long and wordy struggle.

\* \* \*

**Controlling Prices.**—There has been no generally undue rise in the prices of consumers' goods since the war began. For most raw materials and many foodstuffs maxima have already been fixed; and at the end of this month official rationing will be introduced for several essential articles of consumption. Nevertheless, complaints are already rampant about quite arbitrary advances in a number of retail prices; and some notorious instances are quite scandalous. In general, these increases run quite counter to the Government's policy, which is to meet cases of temporary or local shortages by voluntary or official rationing rather than by rises in price. Every effort should be made, by the Government and by trade associations, to put a stop to this process, limited though it is, except where it can be proved that the increase in price is due to a commensurate increase in costs. Under the Defence Regulations there are drastic powers of fine and imprisonment which could be used against profiteers; and already the National Union of Manufacturers and the National Chamber of Trade have threatened offenders with severe sanctions. It would be foolish to ignore the fact that in some cases costs have appreciably risen; the scheme for insuring commercial stocks, for instance, at the rate of 6 per cent. per annum (30s. per cent. for three months) imposes a drastically heavy burden on undertakings with slow-moving stocks—though even here the Drapers' Chamber of Trade have stated that, on the average in their trade, there is no ground for an increase of price greater than 5 per cent. The justification of advances in price to meet costs swollen in this or other ways is obvious. But the object of price policy at a time like this should be to keep the prices of articles in general demand as steady as possible. If stocks are running out in any shop or district, and it is becoming difficult to maintain supplies to regular customers, then the proper course is for the retailer to ration the goods affected accordingly.

This is the view of the Board of Trade itself (content for the moment to advise rather than to coerce), and this procedure will serve well enough in a period of transition when there are no serious national shortages. But, if and when such shortages do appear, it will still be most inexpedient and inequitable for prices to soar. Rationing will still be the just principle of distribution. But it will then be by an extension of official rationing, rather than by voluntary steps by individual shopkeepers, that the end of serving each citizen according to his needs, and not according to his means, will be best achieved.

\* \* \*

**The Contraband Control.**—The embargo on war materials for Germany is being swiftly and efficiently applied. Already the whole apparatus of contraband control is in operation, and the following figures, giving the quantities of goods destined for Germany unloaded from neutral ships by the British Contraband Control show something of its success. The figures are for the two weeks ending September 16th:—

|                                |                               |
|--------------------------------|-------------------------------|
| 29,600 tons manganese ore      | 3,500 tons soya beans         |
| 41,850 tons iron ore           | 1,500 tons chlorate of potash |
| 48,500 tons petroleum products | 400 tons molybdenite          |
| 15,500 tons aluminium ore      | concentrates                  |
| 16,000 tons phosphates         | 200 tons rubber               |
| 7,900 tons haematite ore       | 160 tons wolfram ore          |
| and a number of mixed cargoes. |                               |

The Germans have replied by calling this control an act of warfare against women and children, though it is difficult to see how women and children are going to suffer from a shortage of manganese ore and petrol. They have also issued a number of magisterial pronouncements to neutrals, stigmatising it as unneutral conduct "if the neutral countries should really submit to formal control or limitations on the part of other States directed against the maintenance of a normal exchange of goods with or the transit of goods to Germany." If the neutral countries are troubled unduly by the British Navy, the Germans say, then they can always refuse to trade with Britain. According to an interview given by Admiral Raeder to the *Amsterdam Handelsblad*, the Germans are not waging unrestricted submarine warfare, but "incidents are likely to occur if British merchantmen are armed so as to enable them to attack submarines. This would provoke German counter-measures." We are invited to assist at the spectacle of British merchant ships leaving their lawful business (upon the conduct of which over a score of them have already been sunk) and going off in search of enemy submarines. It is a pretty compliment. What is more to the point is the fact that a considerable fraction of Germany's total submarine fleet has already been sunk, and that, if ocean-going submarines are taken separately, the proportion is much higher.

\* \* \*

**More and Improved Information?**—It is twenty five years, almost precisely to a day, since the Swedish Government, in answer to the allegation that the Press of Sweden was pro-German, contended that the reason for the apparent bias was the quite insufficient facilities and information given to Swedish journalists in London. The same sort of situation has arisen again. The reluctance of the Ministry of Information to speak, and the frequent maladroitness of its words when it does, have repercussions as unfortunate abroad as at home. Here it is rumour that is given free rein; in other countries it is the news and propaganda of the enemy that is aided. It is accordingly doubly welcome that public pressure, represented by strong and repeated criticisms in both Houses of Parliament, should now seem likely to bring about a change for the better. Hard upon the heels of last week's discussion of the topic in the Commons (recorded in the last issue of *The Economist*) came a debate in the Lords, when Lord Camrose made his indictment constructive and helpful. He expressed the view that, for the most part, the Ministry was blundering in ignorance, largely because it lacked the

services of men skilled and experienced in the very technical business of gathering and putting out news. The result of Lord Camrose's intervention was gratifying. In future it will not be possible to use the plea "they know not what they do" in extenuation of the Ministry's activities, for Lord Camrose himself has been drafted in to give the bureaucrats, academes and amateurs of the Ministry his own expert assistance. It is now evident that the Government is anxious to give the public as much news about the war as is consistent with military exigencies, and there is good ground for hoping that improved organisation and procedure may soon render this aspiration something like an accomplished fact.

\* \* \*

**Control of Employment.**—The ten days which elapsed between the introduction of the Control of Employment Bill and its passing into law on September 15th constituted what may now be regarded as an unusually long interval. It gave an opportunity for discussions between the Minister of Labour and representatives of the employers' associations and the General Council of the Trades Union Congress, which resulted in the introduction of a number of important amendments. The original Bill was intended to confer on the Minister of Labour and National Service the power to make Orders forbidding employers to advertise for certain classes of workmen or to engage or re-engage such men without the consent of the Minister. The importance of these powers is obviously great, and the Minister's announcement on introducing the Bill that they had been accepted in principle by the trade unions was therefore both necessary and acceptable. But it is equally obvious that the details, even more than the principle, of such a measure are proper subject for discussion by the parties affected. An interval for this purpose was therefore allowed. The exchanges which took place in fact led to the introduction of amendments providing that a committee representative of employers and workers must be consulted before Orders are made, and making further provision for appeals against such Orders and for the payment of compensation where appeals are allowed. A new clause was also added with the object of safeguarding the customary right of trade unions and employers to regulate entries into particular occupations. This clause in effect underlined the obvious inference from the original terms of the Bill that it is not a measure introducing dilution of labour. That has yet to come; and it will require considerably greater opportunities for preliminary discussion than were finally afforded in the case of the present measure. There is no doubt that the vast majority of British workers will loyally accept the principle of the regulation of employment. But the translation of the principle into practice involves the setting up of a complicated and delicate organisation, and if the number of

points of possible friction is to be reduced to a minimum both employers and trade unions must be given the fullest opportunity to co-operate in the preliminary work.

\* \* \*

**The Value of Education.**—Schools in neutral and reception areas are open again. Technical colleges and technical classes are starting work all over the country. The universities, scattered in new homes with depleted staffs, are planning to resume their labours. Now that the initial shock of the redistribution of pupils and teaching establishments to remove them from air-raid dangers has been met, it is wholly good news that the vital industry of education is to be restarted. The idea that education can or should be skimmed or set aside in war-time, an idea too frequently expressed or acted upon in recent weeks, is quite mistaken. It is more than ever necessary when the nation's strength is being tested to the last item that education should be carried on. It is not man power in the raw that the forces and defence industries need nowadays, but skilled, educated and adaptable personnel; and not the least lack which the strain of war will reveal in Germany is the shortage of trained persons due to six years of persecution and the *Gleichschaltung* of the educational system. Already the need to train more doctors for war uses has been realised in this country. It is of paramount importance that this realisation should be extended to cover the whole of education. Undoubtedly there are difficulties in the way. There is a shortage of school buildings and equipment in reception areas. Young men ripe for university or technical training are now liable to be called up for active service. It is not easy to operate evening classes under black-out conditions or in vulnerable districts. Almost inevitably there will be a growing demand for juvenile labour which will compete with the schools and colleges; and already it is rumoured that the raising of the school-leaving age, due to come into force this month, is to be suspended. Yet the aim should be to make the maximum use of the limited resources available. School accommodation in reception areas should be extended by all possible improvisations.

The calling-up of young men between 18 and 22 should be conducted with all practicable deference to their studies or apprenticeships. Above all, technical training of every kind should be encouraged and maintained. It is skill and capacity rather than countable heads that will win this war—as the cry of the Services for technicians already shows.

\* \* \*

**Russian-Japanese Truce.**—Now that the Anti-Comintern Pact is well and truly broken, the Japanese have been brought to an "armistice" in hostilities on the Soviet-Mongol-Manchukuo frontier. From the Japanese Army's point of view, this means little more than insurance against Soviet "diversionist" activities aimed at weakening the Japanese advance in China. From the point of view of the Government at Tokyo, it may mean a good deal more than this. The armistice was negotiated in Moscow, and the Japanese were probably very glad to have it, for it does provide some sort of exchange for the German threat to Russia's rear, just as the Russians, for the same sort of reason, were glad to give it. There was also talk of a Soviet-Japanese non-aggression pact, and although this should not be set entirely aside, for the moment the Japanese have denied that they mean to sign one. The Germans are known to have pressed this suggestion on the Soviet Government, hoping perhaps to mend thus their broken relations with the Japanese, and the Russians would almost certainly be glad to have this too. After all, they have several times offered Tokyo a non-aggression pact, and there is no reason to suppose that they have changed their mind, even if they have changed their price, now that they are arm-in-arm with the Germans. On their side, the Japanese are probably more ready now than they have ever been before to make at least a temporary settlement with the Russians. Their operations in China are nothing like "tied down" yet; they are in the position which has always made them uneasy of having no precise diplomatic support in Europe; and they are faced with a Russia which is no longer "encircled" by a German-Japanese understanding. Their chief care must be to finish the war and relieve the pressure on their own people.

## THE WORLD OVERSEAS

### Japanese Bid for China Shipping

(From our Shanghai Correspondent)

THE first half of this year saw the Rising Sun definitely ahead of the Union Jack in the foreign shipping of the China ports. The total tonnage of vessels entered and cleared in these ports in January-June, 1939, amounted to 15,855,000 tons, of which Japanese shipping accounted for 5,700,000 tons, or 35 per cent. British shipping followed with a total of 4,800,000 tons, a share of 30 per cent. The Japanese flag completely dominated the shipping of the North China ports, and increased its share in Shanghai's maritime traffic to almost 30 per cent.

The Shanghai traffic is more than ever before the backbone of what remains of British shipping in the China ports. The port of Shanghai this year accounts for over 70 per cent. of all the China shipping under the Union Jack, and in Shanghai's shipping with foreign countries the British share still is about 40 per cent. This share is on the decrease, while the Japanese share continues to rise. The extension, early this summer, of the Japanese naval blockade of the Central and South China coasts resulted in a sharp curtailment also of all the Western nations' China coastal shipping from Shanghai and Hongkong. In the month of July, 1939, Shanghai outport shipping fell by 27 per cent., and Shanghai inland shipping by 35 per cent. British shipping accounted for the bulk of this decrease, while Japanese outport and inland shipping maintained its former volume.

The Japanese expect their shipping interests in the China waters to be much further promoted by the new East Asia Shipping Company, inaugurated in Tokyo in August to start operations about the middle of September. This company is a new mammoth concern incorporating the China services of

all the major Japanese shipping companies, including the Nippon Yusen Kaisha, the Osaka Shosen Kaisha, the Nisshin Steamship Company, the Kinkai Yusen Company, the Yamashita Steamship Company, and others. It is capitalised at Yen 73 millions (£4,500,000), enjoys the special protection and encouragement of the Tokyo Government, and will monopolise all Japanese private shipping along the following routes: Japan-Tientsin, Japan-Tsingtao, Japan-Shanghai, Japan-South China, Formosa-Shanghai, Formosa-Tientsin, Formosa-South China, Dairen-North China, Tientsin-Shanghai, Tientsin-South China, and Dairen-South China.

#### Organising Shipping Resources

This huge combine had been planned by the Japanese for a long time, but its establishment was repeatedly delayed by reason of the shortage of Japanese bottom space available for commercial shipping in the China seas. Up to the beginning of this year, no less than 1,600,000 tons of Japanese ships, about 30 per cent. of Japan's total mercantile marine, was engaged in auxiliary military service between Japan and China, as well as on the Yangtse River. During the first half of this year, however, over 600,000 tons of Japanese vessels were released from this service, so that Japanese shipping became able to take full advantage of the new conquests in China and of the many obstacles put into the way of the other nations' shipping there. About 500,000 tons of the ships released were placed into what the Japanese call their "near-sea" services, that is, into the Japan-China and the China coastal shipping, while only 100,000 tons were used to

strengthen the Japanese "deep-sea" services between Japan and other countries.

Nevertheless, the "near-sea" services failed to develop to the full satisfaction of the Tokyo Government. Private shipping preferred the transportation of well-paying high-grade cargo, so that other freight was neglected. There is to-day, in a series of Japan and North China ports, a substantial congestion of bulky goods, such as iron ore, coal, lumber, etc., greatly needed by various Japanese industries, but finding it extremely difficult to secure maritime carriage. To relieve this congestion, the Tokyo Government intend to enforce for the whole Japanese sphere of power, as from September, 1939, a new control of shipping space allotments, giving definite preference to goods the transportation of which is required primarily for the War Plan and the expansion of Japan's war industries. The enforcement of this control is expected to be greatly facilitated by the establishment of the new East Asia Shipping Company.

Shipbuilding in Japan is also to be made subject shortly to a new control system, which is to give preference to the construction of ships desirable as auxiliary craft for the Japanese Navy. Shipbuilding yards in Japan have at present under contract some 1,000,000 tons of new mercantile bottoms, of which less than 400,000 tons is under actual construction. Recent private orders for new ships in Japan differed substantially from last year. The type of new vessel at present preferred by Japanese shipping firms is a small, fast freighter of 4,000 tons with a speed of 20 knots on the average. These small freighters to-day enjoy the best prospects of making money abundantly and quickly, in the opinion of shipowners; while the larger vessels desired by the Tokyo Government, and in particular passenger liners, are considered as losing propositions, unless the subsidy is large. In the light of these Japanese efforts, the counter-action taken by other shipping nations as yet fails to be very impressive.

August 25th.

## War Excitements in the United States

[FROM OUR NEW YORK CORRESPONDENT]

THE second week of the war, in its economic impact upon the United States, was a logical extension of the first. The first week was marked by a strong rise in primary commodity prices, which lifted Moody's index from about 140 to almost 170. In the second week this level was held, but not advanced. But public interest in commodities had been excited. This was conspicuously true of sugar. Remembering the sugar scarcity of the last war, retail customers (at least in the New York region) suddenly centred their buying upon sugar. The rush caught the retailers off guard and local shortage developed, in some cases necessitating the limitation of individual purchases to, say, 2 lbs. per customer. The price, which had been 25 cents for 5 lbs., ran up as high as 38 cents in your Correspondent's suburb.

While housewives were scrambling for sugar, the same sort of emotion was shown by the male public in a Scotch whisky panic. Apprehensions of a shortage caused a run on the purveyors of that staple. Excitement about sugar was promptly allayed by the Presidential lifting of the sugar quotas; and the sterner sex was calmed by the reassurance from importers and distributors that no immediate drought was imminent. These were mere tempests in teapots, but they show the nervousness and instability of a public mind that, less than a year ago, was thrown into physical panic by a radio programme transposing Mr Wells's "War of the Worlds" to a New Jersey locale.

These episodes are illustrative for two reasons. In the past two weeks the public mind has jumped back two decades, and exists, so to speak, in a world of analogies. To the business man "war" connotes "war orders" and bull markets; to the housewife it means scarce and costly sugar. Secondly, a buyers' market for primary commodities had persisted since the spring of 1937. The price of these commodities had fallen very low, and in August was still sagging; stocks had been conditioned by the long duration of this buyers' market. The sudden appearance of demand, partly speculative, converted the buyers' market into a sellers' market overnight, with sharp, if limited, impact on prices.

#### Rising Commodity Prices

The following table, from the *New York Times*, gives the price movement of the commoner raw materials over the past two weeks:—

CASH COMMODITY PRICES (Wholesale)

|                          | Aug. 31 | Sept. 14 |                     | Aug. 31 | Sept. 14 |
|--------------------------|---------|----------|---------------------|---------|----------|
| Wheat .....              | 8638    | 1 0514   | Lead .....          | 0505    | 0512     |
| Maize .....              | 5938    | 76       | Zinc (St. Louis) .. | 0454    | 0614     |
| Coffee (Santos) .....    | 0714    | 0712     | Tin .....           | 495     | 70       |
| Cocoa .....              | 0445    | 0614     | Cotton .....        | 0891    | 0955     |
| Sugar (granulated) ..    | 0435    | 0534     | Wool tops .....     | 8612    | 1 23     |
| Butter .....             | 24      | 28       | Rubber .....        | 1662    | 2234     |
| Eggs .....               | 1634    | 1912     | Hides .....         | 11      | 15       |
| Lard .....               | 062     | 0814     | Gasoline .....      | 08      | 084      |
| Copper (electrolytic) .. | 1012    | 12       |                     |         |          |

Of these common commodities there is not one that has not risen in price. Most have risen by substantial percentages. While some are, more or less distinctly, to be classified as "war" materials, most are not. Some of the sharpest advances (for example, in tin and rubber) are in "sterling" commodities, and it might have been supposed that their dollar prices would give some reflection of the decline in sterling.

Another interesting price group is that of the non-ferrous metals. The British price of copper, lead and zinc is controlled, and the British controlled price is far below that in our market. Economically, these price movements have been among the most interesting phenomena of the past two weeks, especially when related to the movement (or absence of movement) of British primary prices and of the sterling-dollar exchange. But it is probably too early to make, or even attempt, generalisations and inferences.

This week there developed a disconcerting and presumably temporary dual market in sterling—an official market rate of \$4.02-.06, and an unofficial market rate of less than \$3.80. This both puzzled and disturbed Wall Street, which was already having its troubles with uncertainties and ambiguities in the British regulations relating to the purchase and sale of British-owned American securities.

September 15th.

## Canada Goes to War

[FROM OUR OTTAWA CORRESPONDENT]

CANADA formally declared war on Germany on Sunday, September 9th. The delay of a week in making the declaration was due to Premier King's determination to keep his pledge not to commit Canada to participation in another overseas war without the authority of Parliament. It also had the practical advantage of making it possible for certain war equipments and munitions ordered in the United States to be delivered in Canada before the Roosevelt Administration felt it necessary to make the terms of its Neutrality Act operative against the Dominion. When the Federal Parliament met on September 8th, the Government intimated that it would regard the adoption of the Address, which pledged it to "effective co-operation," as a mandate to join in the war. Ministers had the support of the main bulk of their own party, all the Conservatives and Social Crediters and all the C.C.F. Party except its leader, Mr J. S. Woodsworth, who stuck to his pacifist views. The only other dissentients were a group of French-Canadian Liberals, whose spokesman advanced the stock arguments for isolationism, and argued that Canada had no business to be mixed up in a European

The Bank undertakes banking business in all parts of the world, and with its numerous branches offers special facilities in Canada, Newfoundland and the United States

war arising from power politics and involving no direct Canadian interest. The dissentients, who probably numbered less than a dozen in a House of 245, did not press their opposition to a division.

The speeches of Premier King and Mr Lapointe indicated that, while the Government would despatch overseas at once as many trained aviators and planes as it could spare, and would undertake full responsibility for the defence of not only Canada but Newfoundland and Labrador, it proposed to make its initial contribution to the common cause take the form of substantial supplies of manufactured munitions, raw materials and foodstuffs, and did not contemplate the immediate despatch of an expeditionary force, such as was sent in the autumn of 1914. Undoubtedly it will be subjected to strong pressure from the English-speaking provinces to organise an expeditionary force, and Mr Lapointe admitted that its despatch was almost inevitable. Already there has arisen an agitation for national conscription of man-power and wealth, but Mr Lapointe was emphatic that neither he nor any of his three other colleagues from Quebec would remain in or support a Ministry which tried to enforce conscription. The pact between Nazi Germany and Russia, both regarded by French-Canadian Catholics as enemies of religion, has had a great effect upon public sentiment in Quebec; and the King Ministry anticipates no serious trouble with the French-Canadian element.

The war is bound to produce a serious dislocation of Canada's economic life. A certain amount of her export trade will be cut, and some of what survives will be hampered by exchange difficulties; export business in cheese has already been shut down for the time being. The discount on the Canadian dollar in the United States, which is already 9 per cent., will aggravate the debt problem. But, on the other hand, there will be an increased demand from the Allied countries for foodstuffs and raw materials like nickel and copper, lumber, etc. Large armament orders, which will keep many industrial plants busy, are expected to be placed by a British Mission which has reached Canada. Most agricultural products are also likely to rise in price, and there should be a substantial increase of rural purchasing power, which will help general business.

The Government has obtained a Parliamentary vote of 100 million dollars for special war expenditures. It has been given authority to set up a Ministry of Munitions and Supply. The War Measures Act of 1914, never repealed, has been made operative by proclamation; and, under it, the Ministry has created a War-time Prices and Trade Board armed with wide powers of control and regulation.

### Meeting the Cost of War

On September 12th Mr Ilsley, Minister of National Revenue, introduced a supplementary war-time Budget. Canada's economic and financial position he pronounced to be infinitely stronger than in 1914. He predicted an expansion of industrial activity as the result of war orders, and an increase in the national income. Accordingly, he felt justified in forecasting that the Federal revenues, which are now running well behind the estimate of the last Budget, would recover all the lost ground in the last five months of the year and slightly exceed the estimate of \$490 millions. Moreover, he hoped that the probable decrease in unemployment and farm relief costs would keep expenditure below the estimate of \$551 millions. When the special war vote of \$100 millions was taken into account, he expected a deficit of \$156 millions. While some of this would be met by borrowing, the Government had decided to meet part of the war costs by special taxation. He announced a number of increases in taxation to yield \$21 millions during the balance of the fiscal year and \$62 millions in a whole normal year. The income tax on individuals is increased by a War Surtax of 20 per cent. on the total income tax otherwise payable, and the rate of the corporation income tax is raised from 15 per cent. to 18 per cent., and in the case of consolidated returns from 17 per cent. to 20 per cent. The former change is applicable to the income of 1939, but the latter will only affect income earned in 1940. There is also a new Excess Profits Act on the earnings of all businesses, whether incorporated or not, but two alternatives are offered to the taxpayers. The first is a levy on all profits in excess of 5 per cent. on capital on a graduated scale. The second is that the taxpayer should pay at the rate of 50 per cent. on all profits in excess of average profits for the last four years. There are also sharp increases in the duties on practically all kinds of liquor, tea, coffee, tobacco, cigarettes, and a new duty is imposed on materials used in the manufacture of aerated waters.

### Heavy Wheat Harvest

The Bureau of Statistics published on September 8th its first estimate of the yields of the principal grain and fodder crops of Canada for 1939 and the grain estimates (in bushels) were as follows, the comparative figures for 1938 being given in brackets:—wheat, 449,058,000 (350,010,000); oats, 373,132,000 (371,382,000); barley, 99,209,000 (102,242,000); rye 16,549,000 (10,988,000); flax seed, 2,294,000 (1,389,000). The yield of wheat in the three prairie provinces is placed at 422,000,000 bushels, compared with 326,000,000 bushels in 1938, and it is the highest since 1928 and the fourth highest on record. The new crop is moving rapidly to the market, and on September 1st the visible stocks of Canadian wheat in store were placed at 142,999,827 bushels, compared with 66,090,748 bushels for the parallel date in 1938. The outbreak of war in Europe at once generated a sharp rise in grain prices. On successive days the price of wheat in Winnipeg rose the full limit of 5 cents permitted for any single day's trading, climbing to over 80 cents per bushel for No. 1 Northern, which is 10 cents above the basic guaranteed price of 70 cents per bushel.

September 13th.

## French Determination

[FROM OUR PARIS CORRESPONDENT]

THE inevitable comparison between the first days of the present war and August, 1914, has many comforting features for French observers. France must shoulder the burden of this war, but its very inevitability as implied in the policy of the Reich has enabled full preparation to be made. One immediate consequence has been that France at the outset has carried the war into German territory, instead of having to submit to the ruin and demoralisation consequent upon invasion.

This time there is none of the 1914 excitement, no cries of "à Berlin," no spectacular embracings of Communists by Conservatives, no "Marseillaise"—even at the final sitting of the Chamber—but simply the expression of solemn determination in a unanimous vote.

The errors of 1914 are being carefully avoided, but the lesson has been retained. The War Cabinet has been set up and the technical Ministries of Armaments and Blockade have been created at once—not after months of delay. There will be no waste, either of men or materials. In the matter of men, the central point is that the days of full-dress attacks are over. So far as materials are concerned, the probability that the war will be a long one provides a check to any tendency to undue expenditure, even though France now possesses a stock of gold double that of 1914, an industry which is intact and not, as it was twenty-five years ago, partly behind the enemy lines, and an Empire whose economic potential has been vastly increased in a quarter of a century by the wine, corn and iron of North Africa and the coal, rubber and rice of Indo-China.

The transition from a free economy to a war economy is facilitated by the fact that the nation had been prepared for it in the long period during which special measures had to be taken for the finance of re-armament and by the careful avoidance of such unnecessary dislocations as the declaration of a bank moratorium and the closing of the Bourse. Further, the Finance Minister (who has assumed the functions reserved in principle in the past to a Ministry of National Economy) has introduced certain measures, inspired by the practice of totalitarian States, to forestall from the outset all attempts at speculation and the raising of prices. They include the stringent control of wages and profits in war time and an additional tax of 15 per cent. on the incomes of civilians between the ages of eighteen and forty-nine.

Stability of money and prices have the effect of facilitating the working of the closed monetary system and securing a regular supply to the Exchequer of substantial subscriptions to the various National Defence and Treasury Bonds.

The test is only beginning, but it is a heartening thought that the cause of liberty has for its foremost defenders Britain and France—the possessors of the most powerful fleet and the best army in the world, the second and third largest of the national stocks of gold, and the two greatest Empires, with their inexhaustible resources of men and materials.

September 18th.

## Shrinking Vienna Stock Exchange

[FROM AN AUSTRIAN CORRESPONDENT]

WHEN the Vienna Stock Exchange was closed for many months after the annexation of Austria in March, 1938, it was only a shadow of its former self. Prior to the last war it ranked beside London and Paris as a European centre of finance; its significance as a stock and share market probably surpassed that of Berlin. The fall of the Austro-Hungarian Monarchy; the repatriation to the newly created Succession States of many enterprises previously centred in Vienna; and, more recently and mainly, the foreign-exchange and trading restrictions in Central Europe since the beginning of this decade: all these seriously affected Vienna. Yet, until March, 1938, Vienna was still not only Austria's stock market, but also a sort of arbitrage centre and outlet for stock exchange business in the whole of the Danubian basin.

There was still close contact with international markets, too. The most important of these were due to the fact that most Austrian State loans had portions made out in foreign currencies, and these were quoted in the appropriate foreign markets and in Vienna alike; and, in addition to reflecting the state of the country's money and capital markets and the ruling opinion of the Austrian State's credit, the price of these Austrian bonds also reflected the current valuation of the Austrian schilling. In the current evaluation of the sterling or franc batch of the International Federal Loan of 1930 (IBA) or of the Federal Loan Scrip, the effective exchange rate of the schilling found expression—even though traffic in foreign-currency values was really forbidden and the official rate of the schilling had to remain unchanged. Persons wishing to base their capital investments on foreign currencies rather than on the Austrian schilling were at liberty to buy a number of other Austrian stocks in foreign currencies apart from the Austrian State Loans. Some of these securities were not dealt in officially but on the kerbstone; and considerable traffic also took place in Vienna in Jugoslavain Blair Loans, Budapest Municipal Loans, Rumanian Monopoly Loans, etc. For many years a remarkable speciality was constituted by the so-called "agio" values, which were chiefly those of Swiss bank shares and the A-K obligations of the Swiss Federal Railways. In an entirely legal manner these Swiss currency securities were simultaneously bought and sold abroad, and the difference between the real schilling rate and the official schilling rate could thereby be ascertained—and, at the same time, the acquisition of franc credits abroad was rendered possible.

In addition, until March, 1938, the Vienna Stock Exchange dealt in several Western-European shares—largely of enterprises whose business was carried on largely in Austria or in the Danube countries. And it is a remarkable fact that on the Vienna Stock Exchange only one German share made out in German marks (that of the Scheidemandel chemical works) was quoted and that there was not a single German loan in the Vienna list of quotations, though a fair number of Austrian securities were constantly dealt in in Berlin. It is no exaggeration to say that, until March, 1938, Vienna was the most international Stock Exchange east of the Rhine—in spite of its sometimes rather small turnovers.

### Cut Down and Gleichgeschaltet

When, after being closed for seven and a half months, the exchange was opened again on October 27, 1938, it was changed, reduced and autarkised. Since then the Vienna Stock Exchange has sunk to a completely insignificant market, whose quotations bear the same purely local character as those of Leipzig or Düsseldorf. The drastic "cleaning up" which has taken place is seen from the fact that, in spite of the admission of various firms from the Altreich, there are now scarcely 30 exchange firms, against much more than one hundred before the annexation. Banking houses which retained an international reputation to the last are now particularly conspicuous by their absence—such as S. M. von Rothschild, Gutmann Brothers, Reitter, Ephrussi, etc. The quotation list has also been "cleaned up": nearly all the above-mentioned foreign-currency values have either been formally struck off the list, or else any possibility of dealings in them has been removed. Never before in all the 168 years of its existence has the Vienna Stock Exchange displayed so little activity.

Nor has the radical totalisation (Gleichschaltung) been confined to changes of personnel. The whole system of the

Vienna Stock Exchange has been altered. It is now limited to the task of subordinating itself to the aims of German loan policy—that is, to make capital in Austria available for German public loan requirements. The boom which the Anschluss has undoubtedly brought to a great part of Austrian industry would have meant a strong rise in quotations under ordinary circumstances. The fact that this has been only slightly apparent is due to the systematic skimming off of all available money for German loans, as well as to the concentration of the most important enterprises (whose shares were most widely distributed among the public) by gathering them into a few hands, and, more particularly, into State possession. It should not be forgotten that the largest industries now belong directly or indirectly to the German State or the Hermann Goering Works. A striking sign of the decline of independent shareholders is the report that, at the recent annual meeting of the Steyr Works, the second largest industrial concern in Austria, 73,500 out of a total of 88,000 shares were represented by three shareholders. Now Steyr shares were amongst the most popular ones before the Anschluss.

It is true that the quotation list of the Stock Exchange has been enriched by the introduction of a number of German loans. But this is only nominal; the prices of these securities are controlled even more strictly than those of other values. German bank shares, such as those of the Deutsche Bank, Dresdner Bank, and Reichsbank preference shares, have also been introduced at the Vienna Stock Exchange; and the admission of the Commerz and Privatbank, which has just opened a large branch in Vienna, may be expected. But this expansion, which has come about quite inorganically, cannot be regarded as really enriching the list. The new securities do not come as a blessing to the Austrian public. They are scarcely known, and the conservative owners of capital hung on to their holdings of Austrian State bonds as far as possible until the compulsory surrender of foreign values was enacted last year. Really marketable, fluctuating shares are rare, one of the chief reasons being that Old Germany buys them up. Not the least sign of the departed glories of Old Vienna is the restriction and strangulation of the Viennese Stock Exchange.

### A Stage in Economics

IN this "Inquiry into Some Fundamental Principles of Economic Theory" Professor J. R. Hicks has essayed two tasks of major importance: to reduce modern economic analysis to a manageable whole; and to construct a system of Economic Dynamics. He has not attempted to impose a schematic unification on economics, but to work out "a unity of method," as he says, by elaborating and refining certain aspects of the theory of value, and then applying the results to the main problems of both a static and a dynamic economy. In discussing the latter, Professor Hicks ranges over practically all the field contested during the past decade by Professor Hayek, Professor Robertson, Mr J. M. Keynes, and their disciples; the reader will find Interest—Income—the Demand for Money—the Trade Cycle—all treated with a remarkable combination of advanced technique and elegance of exposition.

The first part of the book consists of a working-out of a Theory of Subjective Value that carries a good deal further than they did the methods of Walras and Pareto. The concept of a quantitative measurement of utility is rejected, and the theory is built up on the basis of consumers' indifference curves. Particular attention is paid to the income and substitution effects of price-changes, and to the differences between the cases of complementary and competitive goods. Next, Professor Hicks addresses himself to the conditions of stability for a static economy, using the tools which he has forged or sharpened with great effect. These two parts comprise about a third of the book.

It is in Parts III and IV that we come to the problems of a changing economy, and make a more pronounced break with the past. This is not to say that Professor Hicks (with Mr Keynes and some other contemporary writers) is dealing with matters that never presented themselves to nineteenth-century economists—on the contrary, as he shows, Marshall and Böhm-Bawerk, to mention only two names, were aware of the dynamic problem and went some way towards solving it. But they made a "much less drastic readjustment" of their static analysis than Professor Hicks has done, and so there was produced that collection of studies of specific aspects of economic change which we know as "trade cycle theory," "monetary theory" and so on, only more or less related to a central mass of "pure theory." One of Professor Hicks's outstanding achievements is to take all these things in his stride.

When we try to estimate the extent of the development of economic science made in this book, we must ask how far Professor Hicks has succeeded in what he set out to do. Here it is important to be sure what we mean by "dynamics." For Professor Hicks the essential thing is that we must conceive of the economic system "not merely as a network of interdependent markets, but as a process in time." Everything must be dated, and since what people do at a particular date (in a certain week, in our author's terminology) is affected, not only by the past and present, but also by their ideas of the future, expectations are very important. He has introduced a concept of "elasticity of expectations," which may prove to be one of the most useful of his methodological inventions.

While this statement of the problem may be formally sufficient, it may nevertheless be asked whether it meets the challenge presented to economists to-day as much by workers in other fields of science as by the public—namely, how are the results of changes in economic factors worked out for a world in which "other things" never "remain the same"? Professor Hicks assumes throughout that markets are perfectly competitive. His justification for this assumption is

implicit in his remark in the introduction that "This is a work on Theoretical Economics, considered as the logical analysis of an economic system of private enterprise." But it is at least arguable that one of the leading features of a progressive capitalism is a tendency to monopoly, and one of the tasks of economic dynamics is to explain how such a trend arises.

It is beyond the scope of a short review to comment in detail on the excellencies and difficulties of this essay. But one thing seems certain—this is one of the few books which mark a stage in the advance of a science.

### Trade Boards at Work

It often happens that national achievements go unchronicled and unsung by the members of the nation concerned. This applies in no small degree to the relations between organised employers and trade unions in Great Britain. Not since the Webbs wrote their monumental, but insufficiently read "Industrial Democracy" has there been a single first-class book on industrial relations in this country. There are books on trade unionism, welfare schemes and industrial law, but the extremely important network of relationships coming under the headings of collective bargaining, conciliation and "Whitleyism" are quite inadequately studied by the people who practise them best. This American book\* fills a yawning gap.

The author writes with an extremely intimate knowledge of the social relations involved in *statutory* wage administration in Great Britain, with a view to guiding American administrators who will have to operate the Fair Labour Standards Act of October, 1938, in the United States. The Brookings Institution, the International Labour Organisation and the Bureau of Labour Statistics of the United States Department of Labour have all co-operated in assisting her.

The book describes the administration of the Trade Boards Acts of 1909 and 1918 and the Agricultural Wages Act of 1924. The first part is taken up with an account of the historical and legislative setting of the Acts themselves. The middle and longest part describes in great detail the actual working of the Trade Boards Branch of the Ministry of Labour, its relations with the Boards, with the Ministry and Parliament, and finally the working of the Boards themselves. We are given a very careful account of the technique of erecting a Board, the consultations which take place beforehand in order to secure the maximum of opinion in favour of setting one up, and the kinds of personalities who participate in the work involved. Miss Sells has evidently interviewed a great many of the people engaged in Trade Board work, and knows almost every detail of her subject. The last part examines the effectiveness of the Boards in terms of general real wage levels, industrial efficiency and democratic values, and there is a very useful appendix of illustrative material.

The original Act of 1909 was the result of agitation against sweating. By 1918, however, the Whitley Committee had made its report and a new body of ideals was in the ascendant. Stress was now laid, not only on the need to provide minimum wages, but also on the need to foster the elements of industrial democracy in industries in which organisation was weak. Miss Sells is convinced that the democratic spirit, involving the consultation of representative opinion before applying legal sanctions, and entailing the minimum of bureaucratic control, strongly characterises the whole British minimum wage administration. The joint participation of

employers, workers and independent persons on the Boards, she finds, has provided an example of really valuable co-operative effort in industrial life.

The only serious weakness in the system, as Miss Sells sees it, is the absence of sufficient power of discovery in the powers of the Boards. Not enough is known and not enough may be discovered by the Boards about the ability of employers to pay minimum rates. This criticism, though repeated several times in the book, is made only tentatively, however, and with the reservation that perhaps it could not be otherwise.

Another point made is that in British industrial relations there is a tendency for all parties to pay more attention to the precise manner in which things are done than to the effectiveness of the action taken. This judgment might have been taken further. There are many trades and occupations in Great Britain, particularly the work of snack bar attendants, restaurant workers, cinema attendants, car park attendants, hairdressers and tobacconists working on their own account, and errand boys, which very seriously need "cleaning up." Little action is taken, not because undesirable things go unrecognised, but because nobody can think of a polite enough method of doing the job. There are other trades in which a mere façade of Whitleyism exists for no better reason than that Trade Board methods would be regarded by certain people as "bureaucratic." Miss Sells renders a great service by dispelling the bogey of "bureaucracy" as far as Trade Boards are concerned, and one hopes that her book will help in the solution of new industrial problems on both sides of the Atlantic.

### Shorter Notices

"Tory M.P." By Simon Haxey. Gollancz. 263 pages. 7s. 6d.

This book is a detailed factual study of social origins, family connections, wealth, commercial interests and political ideas of the Conservative Members of the House of Commons in December, 1938. It includes eleven maps, charts and family trees, some of which are in great detail and bear witness to a considerable amount of ingenuity. The body of fact which is here collected is impressive. It shows the whereabouts of the goods of Tory M.P.s and it gives some very emphatic pointers to the material origin of their political policy. The facts might have been allowed to speak for themselves. But Mr Haxey accompanies them with a volume of commentary which seldom limits itself to the economical statement most appropriate to a statistical study, but overflows into the repetition of inferences which are not always valid, a number of familiar and a few grossly inaccurate historical statements, and a mass of personal detail which is sometimes relevant. Such faults are merely regrettable to those readers who do not share the author's obvious party sympathies. They will not reduce the value of this remarkable volume as a political tract. And they will amuse but not detain the historians of the future for whom the facts here presented will constitute a body of inestimably valuable material. For books like this are the stuff of political history.

"The World Wheat Situation." (Rome) International Institute of Agriculture. 96 pages. L. 20.

A very useful collection of the main statistics relating to the area, yields, production, exports and imports of wheat in the year 1938-39 and earlier seasons. The text elaborates the fact, illustrated by the statistics, that the fall in wheat prices in the last twelve months was due mainly to the steady increase in past years in the acreage sown to wheat, both in the exporting and importing countries. A series of droughts in the major exporting countries had kept yields exceptionally low between 1934 and 1937, but the appearance of a normal yield in 1938 brought the inevitable surplus and consequent fall in values, which has proceeded further in the weeks since the Review went to press.

"The Oil and Petroleum Year Book." Compiled by Walter E. Skinner. 15 Dowgate Hill, London, E.C. 4. 565 pages. 10s.

This is the thirtieth year of the standard work of reference on the oil industry. Its details of 850 British, American and foreign countries are as full as ever; and the account it gives of the world's oil production, by companies and by countries, is especially interesting at this present time.

## Blocked Sterling

IN one respect the control of sterling has already run true to the form set up by all the precedents of foreign exchange control schemes. It has led to a "black" or unofficial market in sterling and to a divergence, which at times has been considerable, between the rates quoted in the official and unofficial markets. This development was perhaps unavoidable in the circumstances, but it would be idle to pretend that it has not an unpleasant ring about it. The basic peg of sterling exchange is that with the dollar, where the official rates remain at 4.02-4.04. But during the past week it has become evident that a number of proposed foreign exchange transactions are not passing through the meshes of the control net. Official permission for the conversion into foreign currencies of sterling balances maintained here by foreign nationals and firms has only been granted where the strongest commercial justification for such conversion has been pleaded and proved. Similarly there has been the greatest reluctance in allowing the conversion into foreign currencies of the sales proceeds of sterling investments until now maintained in this country by foreign nationals.

The diffidence of the authorities in giving their permission to such conversions may be wholly justifiable. Judgment on this point can only be passed by those in possession of information on our gold reserves, the volume of foreign balances and investments in this country and other data upon which the veil of secrecy has now fallen and is likely to remain drawn for a long time to come. But whether justified or not, that diffidence has already created the phenomenon of blocked sterling. Certain foreigners are now the possessors of sterling assets which for the time being they are not allowed to convert into their own currency at the official rate through the machinery of the official market. The result of this state of affairs is that some of these holders of sterling offer it in neutral markets for what it will fetch. Since there is as yet no compulsion on the foreign buyer of sterling to obtain his supplies in the official market at the official rate, there is always a good demand for such cut-rate sterling.

The demand for sterling on the black market has been fed during the past few days by abnormal factors. In the first place the appreciable bear position against sterling built up during the last weeks of free market conditions is being covered and one may trust the astute speculators in question to effect the covering operations in the cheapest possible market. Secondly, the order to all British banks to cut the external credit facilities granted by them—irrespective of whether they are financial or commercial credits—has led to an appreciable demand for sterling to repay these overdrafts and acceptance credits. Again, these purchases are, wherever possible, being effected in the cheapest available market. The effect of these purchases has already made itself felt. Though sterling against dollars fell in the unofficial market to 3.79 on Monday of this week the rate has since recovered to 3.99.

The divergence at present is not serious, but the sensitivity of the unofficial market is such that this index—which is naturally regarded abroad with the greatest interest—may move again with unexpected suddenness. Whether it does so or not depends largely on the policy of the authorities in withholding foreign exchange permits, and therefore in creating the blocked sterling which is available to feed the unofficial market. The exchange control

policy is still in its formative and empirical stage. Despite the severe degree of control to which sterling exchange has been submitted we are still at a half-way house between a free and a wholly controlled market. If we are to go the whole hog to exchange control, all sterling balances must be blocked and blocked effectively. What is not allowed to pass through the official control must then be completely immobilised and not merely diverted to a black market. Furthermore, sterling needed for remittances to this country must, in such circumstances of complete control, be obtained through the official market and not at cheaper rates elsewhere. This is not a suggestion that these extremes of control ought to be applied, but an indication of the logical conclusion to which the authorities must be driven if they continue to show their present reluctance in giving exchange permits to non-enemy holders of sterling assets.

The present half-way attitude has the disadvantages of both extremes of freedom and control. The sterling which escapes through the unofficial market, after being forbidden to leave through official channels, costs the authorities almost as much gold and exchange as if official sanction had been given to its conversion. Those who buy the sterling in the unofficial market would have had to come to the authorities in the official market had the cheaper brand not been available. The discount which has been allowed to emerge in the unofficial quotations for sterling is a very small saving for the national war chest to be set against the psychological damage that its emergence has done.

The alternative is not to return to complete freedom of the foreign exchange market—that is a course which no one could expect at the present moment—but the dual course of liberalising the conditions on which permission for official transfer will be given and at the same time more strictly immobilising those funds for which permission is refused. Under this alternative there would be every justification for tightening still further the grip which has been placed on sterling belonging to British nationals and on all movements of domestic capital out of this country. But at the same time as little as possible would be done to tamper with the legitimate movements of foreign funds into and out of this country. The volume of such funds at present in this country cannot be substantial. The greater part of it represents the sterling balances normally kept here to finance trade between the countries in question and the United Kingdom. By giving more freedom to such balances it would probably be found that at present rates of exchange (even official ones) more funds of this character would come into than go out of this country, whereas by limiting that freedom the whole of those funds is rendered restive and eager to depart at the earliest possible opportunity.

With this liberalisation in the interpretation, though not in the letter, of the exchange regulations there might well be introduced some modification of the arbitrary command to cut all credit facilities to foreign customers. In many cases such facilities placed no strain whatever on sterling. It has always been a feature of foreign acceptance business granted by London houses that it involved the maintenance in London of sterling balances in excess of the credits actually utilised. There are many cases where the withdrawal of these facilities will cause the ultimate withdrawal of the balances held here by the debtors. The direct effect on sterling exchange will be nil. The indirect

effect will be unfavourable, since it will reduce the earnings and commissions of bankers, a not unimportant item in our invisible exports and in our balance of payments.

There would, therefore, seem to be a case both for stricter control and for greater freedom. There seems to be much less case for a state of affairs in which refusal of permission to deal in fact imposes very little handicap on the owner of the "blocked" funds. But whether the trend in our exchange policy be towards stricter control or towards greater freedom, there is an exceedingly strong case to be made for greater elasticity in the application of the regulations to the special cases which an intensely complicated mechanism such as that of the foreign exchange market is bound to produce. In this war the motto

"business as usual" is at a discount—and rightly so, since the economic effort called for by the war will have to ride rough-shod over the length and breadth of private enterprise. But let us beware of the danger of allowing this regrettable but necessary subservience of private enterprise to become a process of extermination. In this context of foreign exchange regulations let us beware of unintelligent, unimaginative, bureaucratic, "safety first" interpretations of the control slowly undermining and then destroying the really sensitive part of our foreign exchange market—that which resides with the merchant banks and the various specialist institutions. This is a jewel in the crown of the City of London which should not be lightly sacrificed—at least at this comparatively early stage of the war.

## Oil from Coal

THE importance of oil fuels in wartime is obvious. That the bulk of such fuels consumed in Great Britain has to be imported is also obvious. But war lends special point, both here and in other countries, to possible methods of avoiding the necessity to import. The manufacture of synthetic fuels to replace imported oil is a project which has caught the imagination of Governments all over the world. Assistance to the industry has been advocated on many grounds, and its champions have met with comparatively little opposition. Nowadays defence considerations are given the leading rôle, but we have also been told, *inter alia*, that scientific research would soon render the industry self-supporting; that we could not rely on the continuance of low prices for natural oil; that the industry would cause a "saving" of foreign exchange; and that it would provide a market for coal-miners in the special areas or peasants faced with bankruptcy (as the case might be). In short, all the protectionist arguments have been invoked, and it is therefore all the more appropriate to see what has actually happened, particularly in this country.

The position is far more complicated than the catchword "oil from coal" might suggest. There are a number of different processes, often starting from different raw materials and ending with different final products. We may best begin with a review of the more important, noting especially their present output and the facilities for expansion. To preserve a sense of proportion the reader should remember that the annual consumption of motor spirit in the United Kingdom is now about 1,400 million gallons, and that of heavy oil about 750 millions.

The most important process is that of hydrogenation, which is carried out by Imperial Chemical Industries. Their plant started operations in February, 1935, using creosote and low-temperature tar as raw materials, and treatment of coal began in October of the same year. It is designed to produce a total annual output of 45 million gallons (150,000 tons) of motor spirit—30 millions from coal and 15 millions from creosote and tar—and is now working at capacity. Only about 100,000 tons of coal are actually hydrogenated, which would provide work for about 300 miners, but a large quantity is also required for such purposes as the production of hydrogen and power. In 1937 this amounted to 330,000 tons, and in addition coal is the raw material from which creosote and tar are derived. We must not forget, of course, that this process yields other products as well, but altogether about 600,000 tons of coal are required to produce the 150,000 tons of petrol.

So far as raw materials are concerned there is clearly no obstacle to prevent a great expansion of the industry, or at least of its "coal" section. Such a procedure would, however, involve both a vast outlay of capital and a great loss of revenue to the Exchequer. The estimated cost of the original plant was £2½ millions for the treatment of coal and £½ million for that of creosote and tar, to which must be added about £2½ millions for the hydrogen and other pre-existing plant which was diverted from other uses. The existing plant thus cost over £5 millions and supplies about 3 per cent. of our (peace-time) petrol requirements.

The cost of production has not been disclosed, but it is certainly far higher than the c.i.f. price of imported petrol, which averaged about 4d. for the four years 1935-38. The chairman of I.C.I. has frequently stated that even the advantage of exemption from duty does not suffice to render the venture a good commercial proposition and in 1938 he announced that the company would certainly not extend its commitments for two years. Independent estimates, however, have put the cost of production at about 11d. per gallon, allowing for amortisation and interest on capital, so that assistance equivalent to nearly 200 per cent. of the present import price is clearly essential. If the whole of our petrol imports were replaced by duty-free synthetic products, the loss of revenue would be about £50 millions per annum.

After hydrogenation, high-temperature carbonisation of coal is our largest source of motor spirit, which in this case takes the form of benzole. The important point to note here is that the benzole is a comparatively insignificant by-product from the manufacture of coke or gas, only about 3 gallons being obtained per ton of coal carbonised; its output is therefore virtually determined by the demand for the main products. In 1938 the coke ovens produced 33 million gallons and the gas works 10 millions, whilst a further 12 millions was obtained by distilling the tar and tar oil also produced by carbonisation. Theoretically the output from gas works might be more than doubled, as the benzole is only recovered from about 40 per cent. of the gas produced. The process is, however, hopelessly uneconomic at small works, and virtually all the coke ovens recover their benzole; it may, therefore, be concluded that the supply of motor spirit derived from high-temperature carbonisation is only likely to show an important increase if the iron and steel industry requires more coke.

Coal may also be carbonised at low temperatures, and this method also produces motor spirit as a by-product. As yet the output is negligible, being only 1.3 million

Funds exceed £25,000,000

gallons in 1938, and the whole process is still in the development stage. The main products are semi-coke, which has many advantages over raw coal as a domestic fuel, and tar, part of which is now hydrogenated. The sales of both might well be expanded, but even if the whole domestic consumption of coal (about 30 million tons per annum) were replaced by semi-coke, the direct output of benzole would only be about 65 million gallons, whilst a further 20 millions might be obtained from the tar. It is most unlikely, therefore, that this source will ever supply an important proportion of our requirements.

The only other method by which significant quantities of motor spirit are now produced in this country is the distillation of shale; despite the tariff, the output from this source has declined owing to the exhaustion of the richer deposits, and it is unlikely to be of much significance.

The present position may be summarised thus:—

| U.K. PRODUCTION OF OIL FUELS<br>(Million gallons) |      |      |      |       |       |
|---------------------------------------------------|------|------|------|-------|-------|
|                                                   | 1934 | 1935 | 1936 | 1937  | 1938  |
| (1) Refined motor spirit:—                        |      |      |      |       |       |
| Hydrogenation .....                               | ...  | 20.8 | 33.3 | 35.0  | 42.0  |
| High-temperature carboni-<br>sation:—             |      |      |      |       |       |
| At coke ovens .....                               | 24.4 | 26.2 | 30.1 | 34.5  | 33.2  |
| At gas works .....                                | 7.4  | 8.6  | 10.0 | 10.0  | 10.0  |
| Tar and tar oil distillation...                   | 7.4  | 9.7  | 11.1 | 11.8  | 12.6  |
| Distillation of shale .....                       | 14.3 | 10.2 | 6.7  | 7.7   | 7.0   |
| Low-temperature carboni-<br>sation .....          | 0.5  | 0.7  | 0.8  | 1.0   | 1.3   |
| Total .....                                       | 54.0 | 76.2 | 92.0 | 100.0 | 109.1 |
| (2) Heavy oils .....                              | 90   | 93   | 100  | 114   | (a)   |
| (a) Not yet available                             |      |      |      |       |       |

The table also gives the figures for the output of heavy oils, which are obtained by distilling coal tar. There is a certain amount of double-counting, as these figures include some creosote which is subsequently hydrogenated, but this probably amounts to less than 15 million gallons. It is clear that the domestic output only covers a small part of our requirements, even though the percentage is larger in the case of motor spirit. The main obstacle to expansion is again the fact that coal tar is only a by-product.

Clearly, any move in the direction of greater self-sufficiency can only be justified on strategic grounds. The costs involved are so large that a careful control should be kept lest seekers after protection omit the word "only" from this statement, and use "defence" not merely as a trump card, but as a sort of joker, which can be played at any time and wins under any circumstances. Hydrogenation seems at present the only one of the above processes which can make a real contribution to the problem; this is presumably the method to be employed in the plant for producing aviation spirit which the Government is to build at an estimated cost of £6 millions.

The strategic arguments are, however, sufficiently strong to demand the consideration of all possible expedients, so

that we may usefully conclude with a survey of the devices adopted in other countries and of various other proposals.

The Continental practice of compelling distributors of petrol to use a certain percentage of power alcohol would be of little value in this country, even if it were produced from home-grown foodstuffs instead of imported molasses. The Government were thus fully justified in raising the duty on it last year from 1d. to 9d.; the Exchequer was suffering a progressive loss of revenue, since consumption had risen rapidly from 1.5 million gallons in 1935 to 12.1 millions in 1938, but it now seems to be declining.

In Germany considerable amounts of oils are manufactured from brown coal by the Fischer-Tropsch "synthetic" process. This could be applied to English coals—a variant of it is operated on a very small scale in one British plant—but the cost of production seems to be at least as high as in the case of hydrogenation. The chief advantage of introducing the alternative method would be the ability to experiment on a much smaller scale, as the plant need not be nearly so large.

More promising are the proposals to make use of producer gas or coal gas as fuel for commercial vehicles. Both these systems are claimed by their champions to give lower running costs than either petrol or diesel oil, though this would not be true if the duty were removed. The failure of road operators to adopt them is ascribed partly to ignorance and inertia, partly to the difficulties with which any individual must be faced until the system becomes general enough to ensure "service."

The first step here should clearly be a thorough and unprejudiced investigation. Producer gas is used to a small extent on the Continent, France having 4,436 such vehicles in December, 1938, and Italy 1,500, but the smallness of these numbers shows the lack of adequate data. The system involves installing a generator which takes up about as much space as two passengers in a bus, but it can burn a great variety of fuels, and the engine can be started within one and a half minutes of lighting the fire. The Mining Association, in conjunction with other interests, is understood recently to have provided funds for further research.

Coal gas was used in the war, but it is now proposed to compress it into cylinders instead of carrying it in a large balloon. The system requires the installation of compressing plants at a sufficient number of key points, where the motorist could have his cylinder refilled from the storage tank; such plants have actually been installed at a number of places in England. At one of these the total costs of compression are under 3d. per therm, and it is claimed that with gas at 6d. per therm the equivalent of a gallon of petrol could be sold for about 11d.

This scheme also deserves serious consideration, since it appears to require both a smaller capital outlay and a smaller annual cost to the Exchequer than an equivalent output by hydrogenation. But whatever devices may be adopted, Britain must continue to rely mainly on imports of petrol and oil from abroad.

## Finance and Banking

**More Treasury Bills for the Market.**—The expected expansion in the Treasury bill issue has now begun in earnest. For two weeks running the issue has amounted to £55 millions, or £5 millions in excess of the corresponding maturities. In recent weeks, however, it is in the tap and not in the tender issue that the expansion in Treasury bills has been taking place. Between August 4th and September 15th the tender issue fell by £4 millions, while the tap issue expanded by £84 millions—movements largely determined by the operations of the Exchange Equalisation Account. The time has now arrived when the continued expansion in Treasury bills will have to be provided by the tender issue. An interesting indication of the likely size of this task is provided by the increase in the discount market syndicate's total tender for Treasury bills. Until last week the syndicate's quota amounted to about £30 millions, divided among the various members in accordance with their capital. As the

total capital of the market may be put at £9,500,000, almost equally divided between the three companies on the one hand and the private houses on the other, the quota was approximately divided as to £15 millions to each group. For last Friday's tender it was decided, no doubt on official prompting, that the total quota should be increased to about £47 millions. This was done by allowing the companies to increase their respective quotas by 100 per cent. and the private firms to increase theirs by 13 per cent. This week the private firms are being allowed another 20 per cent., which should bring the aggregate syndicate quota to about £50 millions. With the help of the usual outside and semi-official tenders this should make it possible to cover a weekly tender issue of Treasury bills ranging up to £70 millions. The discount market, basking in the double sunshine of larger quotas of Treasury bills and of liberal margins between the rates at which bills are tendered for and those at which the banks are prepared

to buy, is rapidly recouping the losses incurred when Bank rate was increased to 4 per cent.

**Silver Booms.**—The sterling price of silver this week has risen to 23½d., the highest figure touched for nearly four years. The market is extremely narrow and the fluctuations out of all proportion to the turnover of business. There are still remnants of the bear position built up in June and July, when the United States appeared to be backing out of the silver purchase programme. The covering of such positions provides the main factor in the demand side of the London market. The commercial demand for silver, however, is also beginning to show signs of expansion, and it is expected that the prosecution of the war will continue to cause a somewhat abnormal demand for silver nitrate. The main feature in the London silver situation at present is the dearth of supplies. The sterling price for silver has now risen well above the world parity, and at the levels which have prevailed this week, all the available stocks of silver in the world should be making their way to London. That they are not doing so is due to the control of sterling exchange. Producers or arbitrageurs shipping silver to London under present conditions cannot be certain of converting the sterling proceeds of their sales here into their own currency. This uncertainty, together with the absence of a forward exchange market, have brought almost all imports of silver into this country to a stop.

**Indian Government Sales.**—The dearth of supplies would have been even greater and the jump in silver prices more striking had it not been for the renewed activity of the Indian Government in the market. For some days past the Indian Government has been selling silver in Bombay at a price slightly lower than the import parity from London. This means that Indian operators, who had the

usual forward contracts for the purchase of silver running in London, have on the maturity of such contracts resold the silver here and bought in Bombay from the Indian Government. These official operations have been thrice blessed. They have eased the position here; they have suited the Indian buyer who has been getting his silver in Bombay at a price cheaper than if he had shipped from London; finally these sales no doubt suit the Indian Government, which still wishes to reduce its redundant stocks of demonetised silver. The outlook for the metal, conditioned as it is by the uncertainties and abnormalities of the present situation, cannot be clearly visualised. The Indian demand is likely to increase with the prolongation of the war, but selling from official stocks is likely to neutralise this factor for some time to come.

**Discount Market Fusion.**—The most important fusion in the London discount market for many years past was announced this week. It is the merger of Cater and Company, Ltd., and Brightwen and Company, which is to take effect from October 2nd next, from which date the joint undertaking will be known as Cater, Brightwen and Company, Ltd. The operation involves an increase in the capital of Cater and Company, Ltd., the additional shares being issued as consideration for the capital of Brightwen and Company. The capital and reserves of the joint concern will amount to over £1,000,000. The two firms are among the oldest established in the London discount market, and each has built up a valuable goodwill and has specialised in commercial discounting business. Neither was on the list of firms approached a few months ago by the Bank of England with the strong suggestion that they should merge and form larger and stronger entities. Nevertheless, this joining of forces may be taken to meet with the approval of the authorities. It will create an entity which will rank fourth in order of importance in the market.

## MONEY MARKET NOTES

No change has been made in the Bank of England's official quotation for United States dollars, but in New York sterling has shown big fluctuations. After the rate had been as low as 3.79 on Monday, a firmer tendency set in on Tuesday on Mr Morgenthau's statement that means of combating speculation in sterling were being sought by the Administration, and the rate rose to within 10c. of the London official quotation. The undertone on Wednesday was easier at the opening but strengthened later, and the rate closed at 3.92. Canadian dollars throughout the week have been quoted officially in London at 4.43-47; but on Wednesday there were appreciations in the official rates for Swiss francs and guilders, the former dropping from 17.65-85 to 17.55-75 (the margin was narrowed on Thursday to 17.65-75) and the latter from 7.55-62 to 7.47-57. The Argentine peso declined by 20 points to 16.80-

17.40. Among the "free" currencies the Shanghai dollar has improved to 3½-4½d.

The clearing banks have been ready buyers of bills this week at 3 per cent. for Octobers, 3½ per cent. for Novembers and 3¾ per cent. for Decembers. These quotations have been maintained in the face of a rather weak undertone; and the banks' demands have not been fully satisfied, for the market was a reluctant seller in the early part of the week, believing that a reduction in Bank rate would be made which would be followed by a cut in other rates. When no change in Bank rate was made on Thursday, it was more disposed to part with its bills, especially as it has another large quota of Treasury Bills to take up this week; but the abundance of credit provides an alternative, and cheaper method, of financing them, and so long as this monetary ease persists,

the market is likely to hold on to its bills in the hope of an early reduction in Bank rate. Loans against bonds from outside institutions have been readily obtainable at 2½ per cent. in some cases. A rate of 3½ per cent. has been quoted by the market for the three months' bank draft, but in competition it has fallen to 3¼ per cent.

This week's Bank Return reflects the ease in the money market. The note circulation shows a fall for the first time since August 23rd, and the Reserve shows a corresponding rise. The return of notes, moreover, has not been offset, for the Bank's total holding of securities is virtually unchanged. Bankers' deposits, however, are down slightly as a result of a big rise of £9.5 millions in public deposits, but they are still at a large enough total to explain the banks' eagerness to buy bills.

### MONEY MARKET RATES

# Investment

**A Congealed Market.**—Fluidity is the essence of a properly functioning stock market, and fluidity is the one quality which the Stock Exchange at present so conspicuously lacks. This week, dealing in gilt-edged stocks has passed from the stage of difficulty to almost complete impossibility. And with the virtual cessation of dealing in this most vital part of the entire investment field, the remaining sections have covered under selling on the part of those investors who might normally have realised a certain volume of gilt-edged stocks in order to improve their liquid position, but have instead been forced to sell any shares which happened to be marketable. In consequence some important industrials have experienced sharp falls, which lacked any relation to their investment prospects in war, but which merely reflected the impossibility of dealing even in leading equity issues on a scale normally absorbed with comfort by the gilt-edged market. This technical condition, admittedly, was exacerbated by the news of the Russian invasion of Poland, and by the sinking of H.M.S. "Courageous." And it might be argued, though only by the employment of casuistry, that if any market must be depressed it is preferable that equities rather than gilt-edged should suffer. But the maintenance of gilt-edged prices which bear no relation to war conditions—the minima date not merely from peace time but from before the raising of Bank rate—is only the preservation of a figment which neither would-be buyers nor sellers really regard as a system of practicable dealing prices. Entrenchment is a virtue, so long as it is not carried out on the wrong line. And all the evidence which has accumulated during the last two weeks suggests that the dogged determination of the authorities to maintain a series of notional prices for gilt-edged stocks has merely stultified dealings. This is scarcely adequate preparation for a market which will know fairly soon the measure of its war-time burden and which already has a large legacy to finance from the near-war period.

**The Industrial Yield Basis.**—The measure of the consequent difficulty for the industrial market is vividly illustrated in the following table, which shows substantial losses in shares which would not, on general considerations, be regarded as markedly vulnerable to war conditions:—

| Security                 | Aug. 31, 1939 | Sept. 7, 1939 | Sept. 14, 1939 | Sept. 21, 1939 | Sept. 28, 1939 | Sept. 28, 1939 | Sept. 28, 1939 | Sept. 28, 1939 |
|--------------------------|---------------|---------------|----------------|----------------|----------------|----------------|----------------|----------------|
| B.A. Tobac. (£1)         | 415/2         | 412/2         | 315/2          | 315/2          | 325/2          | 325/2          | 325/2          | 325/2          |
| Brit. Oxygen (£1)        | 325/2         | 334           | 327/2          | 378            | 325/2          | 325/2          | 325/2          | 325/2          |

The industrial market, admittedly, is still groping towards a war-time valuation basis. At the lower levels established this week a two-way business has been possible. But the

small buying orders have necessarily been placed as an act of faith, for there is no general basis which can be applied as a yardstick for measuring comparative industrial share yields. The first impact of war on dividend policy—as on trading policy, to a large extent—has been deflationary. Dividends are being reduced over a wide field, and prospective dividends are uncertain. That uncertainty must continue well beyond the first war budget. In the long run a net increase in equity earnings may be expected for some industrial groups; precedent in this respect may well prove reliable. But the market, quite rightly, refuses to venture very far in discounting it.

**Wall Street's War Boom.**—Wall Street has entered upon its war boom with reservations. The major premiss for the boom is a speedy repeal of the Neutrality Act; the minor premiss (to American eyes) is the maintenance of hostilities in Europe. Apparently it only took Hitler's Danzig speech to convince the market that war would be continued; on this point, at least, the market might have been satisfied with the declared policy of the Allied Powers. As for the repeal of neutrality legislation, the market, at long last, finds itself at one with the President, though the omens suggest that he will not obtain a favourable decision without a struggle of the type which Wall Street, in the past, has been the first to relish. The following table shows the movement of pivotal stocks from the low levels recorded in April and significant pre-war points to the past week:—

| Stock                    | Apr. 8, 1939 Low | July 22, * | Aug. 24 | Sept. 2 | Sept. 12 | Sept. 18 | Sept. 19 |
|--------------------------|------------------|------------|---------|---------|----------|----------|----------|

| Dow Jones ind. av. ....  | 121.4            | 144.7      | 131.3   | 138.1   | 155.9    | 147.8    | 152.1    |

\* Date of Dow-Jones high April-August.

The market, as Monday's movements clearly showed, is still vulnerable to profit-taking. Seven dollar losses in United States Steel and Bethlehem Steel coincided oddly with a jump of over 9 per cent. in steel operations to 79.3 per cent. of capacity. And on Wednesday, after prices had been restored to last week's levels, the rise in war stocks was offset by a later reaction. The dominant note in the market is one of war opportunity; but it is checked by the possibility of war-time control.

**Bank Share Yields.**—Until the outbreak of war bank shares followed the course of gilt-edged securities, but they have been disproportionately affected by the difficulty of dealing in gilt-edged at minimum prices. The highest prices for leading fully-paid bank shares this year offered a yield only a few shillings above the minimum yield on 2 1/2 per cent. Consols—about 3 1/2 per cent. The present position is shown in the following table, which sets out prices and yields of principal bank shares, showing both fully- and partly-paid shares in those instances where they rank *pari passu*. As a standard for judging price levels, yields calculated on the assumption of a general 2 per cent. reduction in dividends

are also shown. No allowance has been made for the 1/2 per cent. increase in Martins Bank interim:—

| Share                          | Price     |                | 1938 div. % | Yields               |               |                    |

Among the fully-paid shares greater diversity of yields is now shown, but, broadly speaking, the margin between present gilt-edged yields and bank share yields calculated on the latest year's dividends is not excessive. On the other hand, yields based on a 2 per cent. reduction in distributions seem unduly low relative, say, to the current yield on Consols of £4 0s. 8d. per cent. Present prices of fully-paid bank shares do not, it seems, discount a general reduction in dividends. With partly-paid bank shares the situation has changed in recent weeks. A small yield differential between fully-paid and partly-paid shares was always taken as a matter of course. At current prices this differential has become very wide, though it varies considerably between individual banks. It is surely an anomaly that present prices should imply at one and the same time that dividends may be maintained and yet discount some increase in the remote risk of a calling-up of capital.

**Industrial Profits in August.**—The number of profit-and-loss accounts published in August is invariably small, but since the weighting of tea, rubber and oil company results is at a minimum, the total figure provides a fair indication of the trend of profits of home industrial companies. Last month total net profits of seventy-four companies were £7,812,400, compared with £8,368,741 for the same companies in August, 1938, a decline of 6.7 per cent. Comparative figures are set out below:—

| INDUSTRIAL PROFITS 1937-39 |             |              |                    |                |             |              |
|----------------------------|-------------|--------------|--------------------|----------------|-------------|--------------|
| Year and Month             | No. of Cos. | Net Profits* | Inc. on prev. year | Year and Month | No. of Cos. | Net Profits* |
| 1937                       |             | £            | %                  | 1938           |             | £            |

|                            |             |              |                    | Aug. ....      | 74          | 7,812,400    |

\* After debenture interest.

The July figures suggested that the trend of profits was on the turn towards improvement. If the net profits of Richard Thomas and Company are excluded from the August total, this conclusion is reinforced. For the remaining seventy-three companies total profits amounted to £7,513,915, compared with £7,293,795 for August, 1938, an increase of 3 per cent. This improvement was particularly marked among textile, food and miscellaneous companies.

## Company Notes

**Imperial Chemical Confidence.**—At a time when so many dividends are being passed or reduced as a precautionary measure, the maintenance of the Imperial Chemical interim dividend at 3 per cent. cannot fail to have a tonic effect. In the past the interim rate has been varied more than once, though without bearing any definite relation to earnings as ultimately published. But it is a sign of confidence in the continued profitability of an undertaking to repeat peace-time dividends in the present mood of caution. It must, however, be remembered that Imperial Chemical declare their interim when results for almost three-fourths of the financial year are already known, and that theirs is one of the essential industries in a war economy.

**London Store Interims.**—In the absence of profits figures it is impossible to say whether directorial caution or adverse trading results are responsible for the reduced interim dividends announced by several London store companies. But it was widely surmised that store companies did not benefit appreciably from the industrial recovery which set in last spring and trading conditions have recently been most difficult. Selfridge and Company are not to pay the dividends due September 30th on the 6 per cent. tax-free cumulative preference stock and on the 10 per cent. cumulative preferred ordinary stock. These two dividends together require £178,000 in a full year, and although eight months' dividend on the latter stock was charged in the 1938-39 accounts, it was not fully earned. Similarly, William Whiteley, Ltd., are passing the preference and preferred ordinary dividends due on the same date, whereas for 1938-39 the company earned the preference dividend with £5,145 to spare. The

## YOUR PENSION THEIR SAFEGUARD

- Income for those who are dependent upon you in the event of your death before retirement.
- Income for you for the rest of your life from age 60 or 65.

Obtain particulars of the "Pension Safeguard" policy—moderate in cost but comprehensive in protection. Ask for prospectus.

## LEGAL & GENERAL ASSURANCE SOCIETY LTD

Head Office: 10 Fleet Street, London, E.C.4  
General Manager: Vernon E. Boys  
Established 1836 Assets £47,000,000  
Branches & Agencies throughout the World

exact standing of the Selfridge guarantee of a 25 per cent. dividend on William Whiteley's ordinary stock is not clear in circumstances in which dividends on the preference stock have been passed. Selfridge and Company, however, are paying their debenture interest due on the same date. The directors of Jay's, Ltd., have passed the preference dividend for the half-year to July 31st. For 1938-39 (an exceptionally bad year) the full preference dividend was paid, though it was short-earned. The Army and Navy Stores have reduced the interim payment on their 10s. shares from 4½ per cent. (a rate maintained since 1931) to 2½ per cent. And Peter Robinson's directors have cancelled a resolution to pay an interim dividend of 1 per cent. on the ordinary capital. London stores in the Great War had on the whole a favourable profits record, but this proves merely that war does not of itself destroy retail trading earnings. On the present occasion, however, the dispersal of population from London in war has succeeded a prolonged period of adverse trading conditions.

**Heavy Industrial Results.**—The full Staveley and Sheepbridge reports are analysed in the following table, which shows the former company's operating results are better than the preliminary figures first indicated:—

| Years ended June 30            | Staveley<br>Coal and Iron |         | Sheepbridge<br>Coal and Iron |         |

\* Of which £15,000 to A.R.P. equipment reserve. † For Sheepbridge, figures refer to preference and ordinary capital, which rank rateably after 5 per cent. on ordinary. ‡ Including £93,000 profit from Markham sale.

The Staveley profits figures differentiate net trading profit from dividends received. Net trading profits rose from £506,119 to £587,928—conditions in most departments are stated to have been good, particularly in the latter half of the year—but dividends fell from £217,295 to £117,580. It is not specified into which category the special profit of £93,000 from the Markham sale in 1937-38 was brought, but in any event last year's trading results appear most satisfactory. Moreover, the £37,277 reduction in the preliminary net profits figure was due as much to a higher depreciation charge as to reduced total profits. Sheepbridge, on the other hand, have reduced the renewals provision from £50,000 to £30,000, so that, despite a 7 per cent. drop in total profits, a modest increase in earnings is shown, before charging £15,000 for A.R.P. A relative newcomer to the Stock Exchange, Cannock Associated Collieries, has published satisfactory preliminary results. Net profits are £207,008, against £169,018, though this considerable improvement is accompanied by a dividend reduction from 10 per cent. to 9 per cent., which might be due either to some special allocation or to a conservative policy. Bolsover Colliery, whose financial year ends on December 31st, has maintained the 3½ per cent. interim dividend. In recent years interim payments have varied to some extent with profits, so that the maintained payment may be provisionally regarded as of good omen. United Steel Companies have announced a final dividend of 5½ per cent., making 8 per cent. for the year to June 30th, against 10 per cent. Owing to financial changes during the year, however, it may not follow that the results will be disappointing. To finance the John Summers development (which has not yielded a full return in 1938-39) £1,500,000 of 4½ per cent. 10-year notes were placed, and 882,180 £1 shares issued to members at par. Interest on the notes and the dividend payable on the additional shares would go far to account for the reduced rate of dividend.

**Harrisons and Crosfield Results.**—This company's revenue is derived from many sources in addition to dividends on produce shares, and its profit record shows a general connection rather than a close correspondence with variations in rubber and tea company earnings. Hence the rise of 3½ per cent. in Harrisons and Crosfield's total profits for 1938-39 is satisfactory. Like many other companies, however, Harrisons and Crosfield have now adopted a distribution policy of decided caution. Although earnings would have permitted an increased distribution, the payment is reduced from 25 per cent. to 20 per cent., and £50,000 is placed to dividend equalisation reserve. The allocation and profits in the past three years is shown in the following table:—

|                                 | Years ended June 30th |         |         |

Carry forward .....

† Before charging £25,000 for staff pensions. \* After £50,000 to dividend equalisation reserve.

The report stresses that, in normal times, the directors would have recommended a final dividend at the former rate, but the transfer to reserve is a precautionary measure necessitated by the war and the company's widespread interests. The deferred ordinary capital in issue has now reached its authorised maximum of £500,000, and the new reserve represents a substantial safeguard for the immediate future. The balance sheet continues to show a high degree of financial strength. Until the last cash issue in November, 1938, the exercise of subscription rights regularly brought new money into the business, and total assets have shown steady expansion. Surplus liquid assets are not much changed, at about £558,000, but shares in and advances to subsidiaries have risen from £742,678 to £879,386, while holdings in produce companies are valued at a higher figure than balance-sheet cost. The £1 deferred ordinary stock units now stand at 77s. 6d. Subject to the operation of the time lag between higher produce company earnings and their appearance in the group company's profits, prospects for the deferred stock appear reasonably favourable in war-time conditions.

**British Sugar Results.**—Since its inception, the British Sugar Corporation has not specified the amount of earnings derived from trading profits and the total of Government subsidy. The main present fact for shareholders is that the corporation is paying its minimum ordinary dividend of 4 per cent. for 1938-39, but actual receipts are insufficient to provide any earnings for the shares. Bad crops were recorded in 1937-38 and those of 1938-39 were still worse. The effect on the corporation's accounts is summarised below:—

|                        | YEARS ENDED MARCH 31ST |         |             |
|------------------------|------------------------|---------|-------------|
|                        | 1937                   | 1938    | 1939        |

| Carry forward .....    | 81,570                 | 89,997  | 61,196      |

Some light, however, is thrown by the report on the financial relationship between the corporation and the Government. The rate of assistance is based on a forecast, and as all calculations were upset by the drought, the assistance actually received resulted in a debit balance on profit and loss. Discussions with the Government, apparently directed to obtaining additional assistance, accounted for the delay in issuing the accounts, and it is stated that the withdrawal of £130,000 from the Dividend Equalisation Reserve represents the estimated net yield of the additional assistance which the Government has agreed to make for 1939-40. It is hoped to replace this sum to reserve in due course. The outbreak of war makes the past background to the corporation's activities scarcely relevant. A war economy may provide the occasion for a review of the corporation's financial structure, but for the moment shareholders will regard the dividend decision as a confirmation of an expected minimum return of 4 per cent.

**New Modderfontein.**—With only a few years' life in prospect, New Modder has for some time shown a progressive decline in yield of gold per ton. Since 1935-36, however, milling operations have remained on the same scale, and the rising price of gold has retarded—though it has not been enough to prevent—a steady decline in profits. The results of working in the past three years are set out in the following table:—

|                              | Years ended June 30th |           |           |
|------------------------------|-----------------------|-----------|-----------|
|                              | 1937                  | 1938      | 1939      |
| Ore milled (tons).....       | 2,342,000             | 2,336,000 | 2,338,000 |
| Yield per ton (dwt.) .....   | 4.075                 | 3.776     | 3.489     |
| Working costs per ton .....  | 14/10                 | 15/-      | 14/9      |
| Working profit per ton ..... | 13/11                 | 11/5      | 10/11     |
| Total profits.....           | 1,653,181             | 1,361,124 | 1,296,141 |
| Expenses.....                | 743,934               | 591,525   | 571,009   |
| 10/- shares:—                |                       |           |           |
| Earned.....                  | 909,247               | 769,599   | 725,131   |
| Paid .....                   | 910,000               | 770,000   | 700,000   |
| Earned % .....               | 64.9                  | 55.0      | 51.8      |
| Paid % .....                 | 65                    | 55        | 50        |
| Carry forward .....          | 206,188               | 205,787   | 230,918   |

The fall in working revenue is no more than 3 per cent., and owing to a reduction in costs of 3d. per ton and to some saving in taxation, the amount available for the shareholders is only £44,468 lower at £725,131. The dividend is reduced by a rather greater sum. There is a useful addition to the carry forward of £25,131. Total ore reserves at the end of June amounted to 7,325,000 tons, with a value of 3.6 dwt., compared with 7,997,000 tons of 3.8 dwt. a year earlier. At last year's rate of milling the apparent life of the mine is thus barely three years, and though the recent rise in the gold price will make some

difference, a limit of 150s. will not alter the situation decisively. New Modder 10s. shares now stand at 22s. 6d.

**Consolidated Main Reef.**—The results of Consolidated Main Reef are even better than the 2½ per cent. increase in dividend had suggested. In previous years the company had followed the common practice of mining companies by distributing available earnings in full. On this occasion, however, there is a more generous margin between profits and the dividend. The following table shows the course of profits in the past three years:—

|                              | Years ended June 30th |           |           |
|------------------------------|-----------------------|-----------|-----------|
|                              | 1937                  | 1938      | 1939      |
| Ore milled .....             | 1,916,500             | 1,935,000 | 2,106,000 |
| Yield per ton .....          | 3.786                 | 3.692     | 3.424     |
| Working costs per ton .....  | 20/2                  | 19/9      | 18/10     |
| Working profit per ton ..... | 6/5                   | 6/-       | 6/4       |
| Total profit .....           | 643,289               | 616,217   | 694,407   |
| Expenses .....               | 301,689               | 313,579   | 290,645   |
| £1 shares:—                  |                       |           |           |
| Earned.....                  | 341,600               | 302,638   | 403,762   |
| Paid .....                   | 343,091               | 311,901   | 343,091   |
| Earned % .....               | 27.4                  | 24.3      | 32.4      |
| Paid % .....                 | 27½                   | 25        | 27½       |

Carry forward .....

The 9 per cent. increase in tonnage milled and the higher gold price more than compensated for the 0.268 dwt. fall in average yield, and working revenue rose from £2,496,976 to £2,645,131. The fairly substantial increase in tonnage, moreover, resulted in a reduction in working costs of as much as 11d. per ton. Hence, contrary to the showing of recent mining results, increased profits per ton contributed to higher net revenue no less than increased tonnage. A further influence was the sharp reduction in capital expenditure from £89,148 to £38,993, the latter sum being somewhat below the estimate put forward at the 1938 general meeting. The ore reserves continue to increase, and at the end of June were estimated at 11,246,200 tons, against 11,184,400 tons, averaging 3.9, against 4.1 dwt. The £1 shares now stand at 67s. 6d.

**The Week's Company Profits.**—This week's analysis of profit and loss accounts, appearing on page 585, comprises 19 companies, and includes a number of important results. Net profits of these companies amount to £2,714,000 against £2,866,000, a reduction of 5½ per cent. Aggregate profits of 1,759 companies reporting in 1939 to date total £222,161,000, showing a fall of 8 per cent., compared with £241,405,000 earned by the same companies a year ago. The week's results are discussed in preceding Notes and on page 577 under the heading "Shorter Comments."

## THE STOCK EXCHANGES

### London

*Note: All dealings are for Cash*  
THOUGH the Stock Exchange is used to shocks, the Russian invasion of Poland was a serious blow, and early in the week prices were considerably shaken. And while there has been perhaps too much readiness to ascribe the weakness of industrials to the stagnation in the gilt-edged market, whereby investors in need of cash have been compelled to sell industrial stocks, there is no doubt that this technical difficulty has been an added drawback. The declining tendency continued for a time, but the undertone became noticeably steadier in mid-week. And if there has been no appreciable recovery, the industrial market was better in places on Thursday.

Business in gilt-edged stocks is vir-

tually at a standstill. The optimists are hoping for a reduction in Bank Rate, and the realists are discussing the likelihood of a reduction in the minimum prices, which are an almost impenetrable barrier to actual business. The trend, in fact, can be measured only by the number of would-be sellers, and it was a better sign that they became less numerous in mid-week. *Foreign bonds* were weaker all round, even South American issues, which had been relatively in favour a week ago, losing ground. Both Chinese and Japanese bonds moved lower, though not simultaneously. Among *home rails*, unofficial minimum prices for the prior charges remained operative, and only a little business was passing. The ordinary stocks hardened somewhat after early dullness, but clearly no pronounced new trend can emerge until the position of

stockholders during the period of Government control is clarified. On Monday, Argentine rails reacted in sympathy with the general tendency and then became steadier.

The *industrial* market began the week in a mood of discouragement. Quotations were widened and business continued to be largely a matter of negotiation. There was, however, no real selling pressure, and by mid-week the market had recovered much of its balance, helped by the improvement on Wall Street and the announcement of unchanged interims by a few important companies. Among iron and steel shares, falls of 1s. or more were general on Monday. Subsequent movements were small, and there was a belated recovery on Thursday. Changes in electrical equipment issues were too few and diverse to test the real trend in this

group of shares. Motor shares were weak, though they showed some recovery on Wednesday, while aircraft issues became a little firmer as time went on. Compared with other sections, textile and rayon issues did not show up so prominently as in the previous week. They were dull to start with, and support in mid-week was selective. Breweries continued their recent downward drift, but moderate support was met at the lower levels. Tobacco shares improved on Wednesday under the lead of Imperial Tobacco. Little interest was apparent in the Stores group, prices ruling steady apart from a relapse in Woolworth on Tuesday, while provision and catering issues had an easier appearance. Shipping shares eased throughout the week led by Furness Withy. Prices sagged in the miscellaneous group after the week-end, but Imperial Chemical offered resistance on Tuesday. An irregular trend later developed, Turner and Newall and London Brick losing ground. Associated Cement with other isolated issues, however, advanced fractionally.

Oil shares were adversely affected after the week-end by liquidation on the part of holders requiring ready cash, and market leaders reacted sharply. A quiet but firmer tone developed in mid-week under the lead of "Shell" and Eagle issues. Trinidad issues offered strong resistance throughout the week. Rubber shares have eased slightly, in line with market sentiment and owing to lack of any lead from the commodity. The tea share market is still hampered by difficulty in placing buying or selling orders.

Political developments over the week-end and adverse conditions on the Johannesburg market were responsible for the dull tone in mining issues on Monday. Dealers were unwilling to take stock, and prices drifted downwards, but some support developing in mid-week at the lower levels. Developing issues weakened on fears of difficulty in raising funds for future operations, with Western Holdings and West Wits particularly affected. The improved levels following Tuesday's short rally were, however, maintained in mid-week. Finance issues followed the general trend, while West Africans, despite the latest news of Ashanti developments, have been out of favour during the week. Rhodesian copper shares were offered on Monday, lack of interest preventing any substantial improvement later in the week. Tin shares failed to live up to the previous week's promise, the revised third quarter quota decision having no material effect on prices.

## New York

ANTICIPATED peace overtures from Berlin following the partition of Poland and the impending fight over the Neutrality Act confused sentiment on Wall Street this week. Considerable profit-taking developed, especially among steel, copper, aircraft and chemical issues. Absence of peace proposals in the Danzig speech, however, was quickly interpreted as a bull point for war stocks, and steel and aircraft shares soared accordingly. On Tuesday the Dow Jones industrial average rose overnight from 147.78 to 152.14. In mid-week the advance was continued, but a more cautious attitude gradually developed pending the results of the political negotiations over the Neutrality Act. The bond market, apart from a somewhat firmer tendency among second-grade rails, has been inactive and dull. Iron Age estimates steel ingot production at 79 per cent. of capacity compared with 71 per cent. last week.

# Industry and Trade

**Commodity Prices.**—As was to be expected, the introduction of control of supplies and prices of a large number of commodities, necessary though it was, has given rise to a good deal of confusion. With a few exceptions, including cotton, rubber and tin, there have been no free market dealings since the outbreak of war, and in the case of certain raw materials subject to maximum prices, transactions have been of small dimensions. Some time must be expected to lapse before the machinery of control is operating smoothly. In view of the suspension of dealings and because the standard grades for which maximum prices were fixed differ from those which have been given regularly in our weekly list of wholesale prices on page 588, it has been necessary to omit certain prices altogether, and, where necessary, to substitute new grades for those hitherto shown. For the same reasons the publication of *The Economist's* fortnightly price indices has had to be temporarily suspended. Meanwhile, the force of the initial upward movement of prices in the United States, whose markets remain free of control, has spent itself. After rising from 140.3 (December 31, 1931 = 100) on August 31st to 168.8 on September 6th—an advance of 20 per cent.—Moody's index of the prices of sensitive commodities in the United States has varied within narrow limits, and on September 20th it stood at 171.1.

**Jump in Shipping Freight Rates.**—If the institution of control over the supplies and prices of important raw materials and foodstuffs has led to some confusion and

has rendered it difficult for consumers to obtain supplies, the virtual absence of control on the shipping freight markets has led to an indiscriminate, and in many cases probably unjustified, advance in rates. There have been many examples of increases in freight rates of 100 per cent. and more. In justification of these enormous increases shipowners point to the rise in insurance rates, and in the cost of fuel as well as to the risk of delay through the institution of the convoy system. Some advances in freight rates were undoubtedly justified, but, judging by the magnitude of the increases, there is a strong presumption that shipowners have made an altogether disproportionate allowance for the probable increase in costs and that in fact they are trying to secure as much as the traffic will bear. This is an unsatisfactory state of affairs, for in the present emergency there is no justification for waste or for increased profits. The behaviour of the freight markets since the outbreak of war indeed reinforces the conclusion reached in a survey of the shipping position in *The Economist* of September 16th (page 527), when it was pointed out that the merchant marine should be requisitioned and that official freight rates should be fixed without delay.

**Cotton Control Board.**—In view of the consultations which have taken place during the past fortnight between Sir Percy Ashley of the Board of Trade and representatives of the Lancashire cotton industry, there was no surprise when it was announced at the beginning of this

week that the Government had decided to appoint a Cotton Control Board. The Board is fully representative of the employers' and operatives' organisations, and Sir Percy Ashley will be chairman. The first meeting of the Board took place on Tuesday last, and it was announced that sub-committees had been appointed to deal with (a) raw cotton supplies; (b) production and Government contracts; (c) export trade; and (d) essential commodities. The chairmen of these committees will be members of the Board. Sir Percy Ashley, in a statement, said that the first and most obvious object of the Board was the provision of all Government requirements, not only for the fighting services, but also for home defence and hospitals, etc. Not less important was the encouragement of the export trade in cotton goods. Although compulsory powers of various kinds would have to be sought, a great deal could be done by voluntary effort. The fixing of prices was envisaged and some consideration would be given to compensation, though the problem was different from what it was during the last war, when compensation was provided for both millowners and employers. Sir Percy announced that some of the powers granted under the Cotton Industry (Re-organisation) Act would probably be assimilated by the Board, and they might have to apply for others. With regard to labour matters, it was desirable that existing organisations in the industry should be utilised as fully as possible.

\* \* \*

**Coal Exports in War.**—In the last war the decline in the production of coal, the increased requirements of many branches of our manufacturing industries, the claims of the allied fleets, and the contraction in the volume of international trade reduced considerably the amount of coal available for shipment to foreign countries. Our exports of coal, coke and patent fuel, in terms of coal, totalled only 43.4 million tons in 1918 compared with 98.3 million tons in 1913. But even at this level British coal proved of decisive importance in securing raw materials and foodstuffs and the assistance of neutral tonnage. In the present war the apparent immediate need for British coal for export is nothing like as great as it was in 1914-18. For of the world mercantile fleet approximately 53 per cent. (equal to 35½ million tons gross) is now fitted with oil-burning appliances compared with only just over 3 per cent. (1½ million tons gross) in 1913; the French and Belgian coalfields are not only intact and in the possession of their native owners, but are producing more coal than in 1913; Holland, instead of depending on external sources for the greater part of her consumption, is to-day exporting as coal, coke and patent fuel approximately half of her current production of about 13 million tons. Moreover, improved furnace practice has led to a great decrease in the consumption of coal per unit of power for marine navigation as well as for other purposes. How far these post-war changes have affected the volume of the international trade in coal may be roughly measured by the fact that the combined coal cargo and bunker exports of the United Kingdom, Germany, the United States, Poland, Holland and Belgium last year were 109,345,000 metric tons and 126,708,000 tons in the more prosperous trading year of 1937, compared with 164,021,000 tons in 1913. These greatly changed conditions necessarily affect fuel policy in the present war, but they have not deprived the United Kingdom of its predominance in the export trade, which has been increased by the interruption in German and Polish supplies. France has been given a prior claim on our export trade, and this may mean the supply to our ally of approximately 20 million tons per annum. The fuel needs of neutral countries are likely to be great; even during 1915-18 we supplied Norway, Sweden and Denmark with 73 per cent. of their total coal imports, while there are still some 31 million gross tons of shipping which use coal exclusively. There is, therefore, still scope for an active and expanding export trade in coal, by which our necessary imports of raw materials and foods can be partly covered.

**Larger Imports.**—The fall in the value of British imports between June and July was followed by an increase between July and August, when imports were valued at £81.1 millions; the increase was due chiefly to larger imports of food, drink and tobacco. There was a sharp fall in the value of British exports between July and August, concentrated on exports of British manufactures.

U.K. IMPORTS AND EXPORTS (£'000)

Compared with August, 1938, total imports last month were up by 9.4 per cent., while the value of domestic exports showed a rise of only 2 per cent. *The Economist* index of the volume of the intake of raw materials fell from 130.5 (1935 = 100) in July to 125.5 in August, while the index of the volume of British manufactured exports fell from 101 to 96.

\* \* \*

**Irish Exports.**—The Anglo-Irish trade war, coupled with the protection given by Britain in recent years to her own agriculture, resulted in a marked fall in Irish exports of food to Britain, which has not been entirely made good in the last two years. The table below shows for 1930 and the last two years British imports from Eire of food and live animals for food:—

|                       |                   | Imports from Eire |      |      | Total British Imports |

Britain is still Eire's most important market for her agricultural exports, and with the suspension of import quotas and probably a rising trend in prices Irish exports will no doubt also expand. Further, the return of large numbers of Irish labourers will ease the labour problem of the Irish farmer as it has intensified that in British agriculture. Eire's most valuable export is store cattle, which are bought in large numbers by English farmers for the beef trade.

\* \* \*

**War and Wheat.**—The Agriculture Act passed last summer provided for a periodic review of the standard price of wheat which farmers obtain under the present Wheat Act. The Committee appointed for this purpose has now reported to the Minister of Agriculture that they see no reason for an increase beyond the present level of 45s. per quarter, which is nearly double the market price. The Committee did not, of course, take into consideration the contingency of war, but the Ministry of Agriculture has announced that, after consultation with the Ministry of Food, it has been decided to continue both the standard price at its present level and the mechanism of the Wheat Act for the cereal year 1939-40. No announcements have yet been made concerning the barley and oats subsidy, which provided only a minimum price; it seems likely that, if a further 1½ million acres are to be ploughed up, some of which at least will be sown to cereals, the Government will institute fixed prices for these products as well as wheat.

**Rise in Oil Prices.**—In view of recent estimates of the probable magnitude of war-time mineral oil requirements, it is scarcely surprising that the outbreak of war in Europe has been followed by a pronounced advance in the prices of petroleum products. After almost three weeks of war, prices on the Gulf export market are still rather nominal; but, where available, petrol prices show advances up to 2 cents a gallon (say 40 per cent.) compared with those ruling at the end of August, while other products have also been advanced substantially. Though increases of this magnitude may, perhaps, seem reasonable on a long-term view, they would appear to have little present justification; and this for several reasons. In the first place, there is no doubt that many of the estimates that have lately been bandied about have greatly exaggerated the expansion in demand which is likely to occur in time of war. A sharp increase in military consumption of petrol, Diesel oil and certain other products is, of course, inevitable; but against these increases must be set the saving of civil consumption which is certain to follow the introduction of petrol rationing in practically every European country. That the British rationing scheme will drastically reduce consumption in these islands will by now be apparent to every private motorist. Outside the belligerent countries rationing schemes of various kinds have been announced in Italy, Eire, Scandinavia, Finland, Hungary, Switzerland and other countries. A lot of slack, therefore, remains to be taken up before total world demand can show any increase. Moreover, those countries—particularly Germany—which have accumulated substantial reserves against war, can now draw on their stocks.

\* \* \*

Nor does an examination of the supply position necessarily justify the expectation of a boom in world oil prices. With Texas producers working a five-day week and with output in other important American states drastically restricted by "proration" regulations, it is apparent that no foreseeable increase in demand at the Gulf could be sufficient to raise costs above their present level; indeed, costs would decline if some of the existing restrictions on production were removed. Hence, although the c.i.f. cost of petroleum products in this country may be sharply increased as a result of higher freight and insurance charges, and of the depreciation in sterling, there is no rational basis for a price boom on the world market. Realisation of this fact, and the operation of seasonal influences, may indeed produce a setback in Gulf prices in the near future, notwithstanding the modest improvement in the American statistical position which has followed last month's closure of many of the producing wells.

\* \* \*

**Tin Prices and Output.**—Much anxiety has been felt in the international tin markets at the exceptional disparity in tin prices between New York and London. The British Ministry of Supply has now fixed £230 per ton (the upper limit of the buffer pool) as the maximum legal price at which tin may be sold and a similar step has been taken by the Governor of the Straits Settlements. But in New York the uncertainties of shipment, the fact that the pool's holdings were located in Britain and the wave of speculation in war commodities combined to push up the price of tin from 48.85 cents per lb. on August 31st to over 70 cents. per lb. in the course of last week. This development has been countered by drastic action on the part of the International Tin Committee, which on Monday last announced an increase (the third this month) in the export quotas for the third quarter. At the new level of 100 per cent. of the basic quotas, exports from the seven restricting countries in the present quarter should amount to 51,994 tons (compared with 24,108 tons at the original export allowance of 45 per cent.), to which must be added another 14,000 tons from countries outside the scheme. Consumption in this period is unlikely to exceed 38,000 to 40,000 tons, and as the mines have been asked by their Governments to ship from their large stocks without delay, it is to be hoped that the New York traders will realise that ample supplies are available. These

measures have already succeeded in lowering the price of tin on the New York Commodity Exchange to 63 cents per lb., and the fall may be expected to continue until this abnormal disparity between the American and London prices has disappeared.

\* \* \*

**Timber from the Baltic.**—Shortly before the declaration of war the Admiralty advised British ships to leave the Baltic, and since the beginning of hostilities British trade through the Baltic has necessarily been suspended, while that in the North Sea may, for a time, be dislocated by submarine attacks. The closure of the Baltic will seriously affect the British timber trade; as the table below shows, one-third by value of the timber and wood pulp imported into this country in 1938 came from countries whose sole outlet is the Baltic.

BRITISH IMPORTS FROM BALTIC AND NORTH SEA COUNTRIES IN 1938

|                                         | Bacon and Hams | Butter    | Eggs in Shell | Fish, fresh and frozen | Iron Ore and Scrap | Wood and Timber | Wood Pulp for Paper |

\* With Russia, total Baltic £19.46 millions.

A very high proportion of the Swedish and Russian timber is also shipped by the Baltic, though some transference could probably be made, if the price justified the extra cost of land transport to the North Sea ports. It is this certainty of interrupted supplies, combined with the importance of timber and wood pulp as a raw material for other industries, that has led the Government to take complete control of the supplies of timber and paper. The timber situation is, however, considerably less serious than in 1914-18 owing to the development in the last twenty years of the North American timber and wood exports, supplies of which are not so liable to interruption.

\* \* \*

**Food from Scandinavia.**—The table given above also shows the very high proportion of British imports of bacon, butter and eggs which comes from Denmark. The production of these commodities is largely based on supplies of imported feeding stuffs and of fertilisers, and consequently may be again considerably curtailed in the event of a prolonged war. As in 1917 and 1918, therefore, American supplies of bacon, butter and lard may be of vital importance to the Ministry of Food. Owing to the very low prices of feeding stuffs, there has recently been an increase in the number of pigs in the United States; the census on January 1, 1939, gave a total of 49.0 million pigs, compared with 42.9 million on the same date of 1938 and the minimum number of 39.0 million in 1935. Compared, however, with the 65.3 million pigs recorded at the beginning of 1919, the figure is still low, and unless pig and lard prices rise considerably further than those of grain, and thus encourage a rapid increase in pig herds, exports of the scale of those in 1918 and 1919 are not immediately practicable. In Canada a slow fall in the number of pigs in recent years has been accompanied by a very rapid expansion in the exports of bacon to the United Kingdom; in 1938 Canada supplied one-fifth of the British imports, and her export trade could probably be increased if the price ratio between grain and hogs remains favourable.

## INDUSTRIAL REPORTS

## Coal

**Sheffield.**—A more active demand has followed the control of fuel supplies, and collieries are winding heavy tonnages. All qualities of industrial coal are in good demand, the heavy industries calling for increased deliveries. The operation of winter prices has slowed down the call for house coal, although business is quite active. Utility undertakings are being well supplied. Blast-furnace coke is in sharp request for prompt delivery, and business in other grades is on a good scale. Export business is limited, and will remain so until the new conditions of trading are clearer than at present.

\*

**Newcastle-on-Tyne.**—Curtailement of German fuel exports and the cessation of Polish supplies is affecting the demand for North-East coals. Licences are being granted more freely to neutral countries, which, combined with the fact that tonnage is chartering more readily, has placed collieries in a much better position. Northumberland steam classes are in good demand from home consumers while Durham manufacturing grades are wanted by France and Belgium. Prices show no change, being strictly controlled by the various sales committees.

\*

**Glasgow.**—This market has already largely adjusted itself to the new conditions. Export business is of course getting under way more slowly in view of the restrictions, but progress is being made and new price lists have been issued in Fife and the Lothians. These show at most only moderate increases, while in one or two instances there is actually a decline against the pre-war figure. The granting of licences is proceeding steadily. Apart from export trade market conditions remain active. Priority arrangements are now in operation, and the plan promises to work satisfactorily as outputs are running on a full scale.

\*

**Cardiff.**—Shipments at the South Wales ports are substantially lower than they were in August. Normally between 35 per cent. and 40 per cent. of the coal exports are carried in foreign bottoms, but in spite of the great increase in freight rates (they average about 100 per cent. higher than last month) the chartering of neutral vessels is hindered partly by the submarine war and partly by the delay in the adoption of war risk terms by neutral Governments. The control of tonnage for the shipment of coal to France is under the joint direction of British and French representatives in London acting through appointed agents at the exporting ports. The collieries are working normally and the railway authorities state that the new wagon pooling arrangements are operating smoothly. In the inland trade deliveries to factories are prompt, but in the house coal market delays are caused by transport difficulties and the

pressure of an abnormal accumulation of prompt orders. The market has not been informed of any change in the recent level of permitted prices, but it is understood that consultations are taking place on the subject with the Mines Department. The new licensing regulations are now generally in force and there is close co-operation between the coal supply and export supply officers and the Executive Board of the South Wales coal scheme through a Standing Joint Consultative Committee.

## Iron and Steel

**Sheffield.**—In existing circumstances attendance at the iron and steel market has small advantage, and consumers and producers are doing little more than discuss the position and prospects. Good supplies of forge and foundry iron are obtainable, and although consumption of hematites shows a heavy increase, users are securing full deliveries under contract. Basic pig is a less easy market, supplies being barely adequate to meet requirements. Finished iron shows some improvement.

For all steel materials there is heavy pressure, and delay in delivery is unavoidable. Billets, bright drawn steel, small bars and strip are all in sharp demand, and some producers have had to close their books in order to cope with the orders in hand.

Every branch of local industry is fully employed, and while the bulk of orders is on Government account, some firms are stated to be able to deal with a certain amount of ordinary commercial business.

\*

**Middlesbrough.**—Deliveries of iron and steel are now being made in accordance with priorities issued by the authorities. Slightly more business is being done by merchants, and in one or two cases the necessary licences have been received. Although the output of steel in this area has been slowly increasing for some time past, every effort is being made to obtain a larger production.

There is a strong demand for all classes of steel, billets and sheet bars being rationed and priority being given to suppliers of Government requirements. Foundry iron is in steady request, while hematite pig iron is being called for in increasing quantities and stocks are being reduced. Supplies of steelworks scrap are meagre, and any quantities coming on to the market are immediately taken up at the Control prices.

\*

**Glasgow.** The busy conditions reported last week are maintained in every branch of the trade in the West of Scotland and everything possible is being done to increase production. Fortunately stocks of raw material are proving sufficient for the exceptional demands. Saturday and Monday, September 23rd and 25th, are recognised holidays in Glasgow and neighbourhood, but many establishments are curtailing the holiday owing to the urgency of the work on hand. At other plants,

works engineers will be on duty practically all the week-end to take advantage of the cessation of operations to carry out a thorough examination of the machinery and to make necessary repairs.

\*

**Cardiff.**—Pig-iron furnaces are in full operation; 94 per cent. of the steel-works are at work, while the latest returns of the tinplate industry give an output of 65.53 per cent. of capacity. There is a scarcity of scrap, of which the South Wales steel furnaces consume a larger percentage than the other districts of the country; but delayed imports are expected shortly. The trade has been informed of a probable increase in the controlled prices of scrap, but that it may not exceed 2½ per cent. There is a heavy demand for tinplates for inland consumption, while Government steel sheet makers are still exceptionally busy in the manufacture of heavy sheets for A.R.P. and other defence requirements. Users are endeavouring to cover their requirements over extended periods of delivery.

\*

**News from Abroad.**—The European steel markets have remained disorganised, and the turnover has been very low. The principal neutral steel-exporting countries, Belgium and Luxembourg, who suffer from a shortage of raw materials (coke and iron ores) and whose traffic routes are largely interrupted and congested, are scarcely in a position to negotiate new sales. There is, moreover, great uneasiness about the price question. Up to now, the official Cartel prices have not been altered, but it is evident that a general advance in prices is only natural in the circumstances. No definite offers are, therefore, obtainable, and in a few cases, where consumers' requirements were urgent, crisis prices have been demanded and paid. Negotiations are imminent with a view to relieving the difficulties of producers who cater for export markets, and to examine price problems, although it is recognised that they may not yet be capable of solution.

Consumers, who are often reluctant to conclude new contracts with European suppliers, have submitted substantial inquiries to American exporters, and in several cases inflated prices have been paid. But even this trade is difficult in view of the transport and insurance problems, although an improvement is anticipated in the near future.

## Textiles

**Cotton (Manchester).**—There has been more activity in raw cotton, yarn and cloth partly due to the cotton futures market in Liverpool functioning more freely. Wider fluctuations have occurred in raw cotton rates and prices have been easier. The crop in the United States continues to make good progress; no figures are being published, but there are indications of larger supplies coming to this country.

Although some spinners have refused to quote, considerable weights of

American yarns have been sold. Customers on Government work have obtained priority with regard to deliveries. Sales of cloth have been larger than for some time back. Standard makes for the home trade have been bought freely and many manufacturers have extended their engagements. There is every appearance of an active demand for Lancashire's products throughout the war. Export business has been irregular, but encouraging orders have been secured, chiefly for South America, West Africa, Scandinavian countries and Switzerland. India offers remain disappointing.

## RAW COTTON delivered to Spinners ('000 bales)

## THE COMMODITY MARKETS

THE system of control over the most important markets is now in working order and trading has been resumed in some cases. The official maximum prices are, however, a hindrance in some markets, notably non-ferrous metals and wool, since sellers regard them as unnecessarily low in view of the recent increase in costs. In the United States, the rapid rise in many commodity prices at the outbreak of war has not been resumed, but the exceptional rise in the New York price for tin (discussed in a Note on page 579) was partly responsible for the rise in Moody's daily index of wholesale prices from 167.9 to 171.1 (December 31, 1931=100) in the week ended last Wednesday.

## Metals

TRADING in copper, lead and spelter on the London Metal Exchange remained suspended this week. Dealings between consumers and dealers are subject to licences by the Ministry of Supplies and are based on the official maximum prices published a week ago, which are regarded in market circles as rather low.

\*

**Tin.**—The market reopened on Monday of this week after it had been announced that the tin quotas for the September quarter had been again raised from 80 per cent. to 100 per cent. of the standard tonnages; the quota for the last quarter of this year still stands at 60 per cent., but as the I.T.C. now makes decisions without holding a meeting, changes may be made at very short notice. The Ministry of Supply has now confirmed the maximum price of £230 per ton ex producers' works in the United Kingdom; delivery charges are to be borne by the buyers. The confirmation of the £230 per ton basis by the Ministry of Supply and the new increase in the quota led to considerable

liquidations during the week. As a result the cash price for tin has lost 17s. 6d. since the reopening on Monday, to close on Wednesday at £229 per ton, while the three months forward price has lost as much as £1 15s., to close at £227 15s. per ton. The disparity between the London and New York tin price is discussed on page 579.

## Grains

TRADING in futures remains suspended at all markets. A fair trade has been done in spot wheat for milling purposes, and the new season's English wheat is now coming to market, for which millers have been authorised to pay up to 24s. per 504 lb. In a few districts the lack of suitable supplies of wheat has impeded the production of biscuits. There has been a steady sale of feeding stuffs, but with the good growth of autumn grass demand from farmers has not yet developed. The North American grain markets have fluctuated with rumours of drought in the seeding areas and proposed anti-profiteering legislation, but grain prices are little changed on balance from those of a week ago.

## WORLD SHIPMENTS OF WHEAT AND FLOUR ('000 quarters)

## Other Foods

**Provisions.**—Maximum wholesale butter prices were fixed on September 14th by the Ministry of Food at 148s. per cwt. for first and 129s. per cwt. for second grade butters. Prices of hams, lard and cheese remain unchanged; the wholesale price of Canadian bacon was raised by 3s. to 92s. per cwt. on September 18th, but other qualities remain unaltered. Supplies of fish are still extremely small, but the reopening of Billingsgate market should quickly restore more normal conditions in the London trade.

\*

**Colonial Produce.**—Trade in sugar occurs at fixed prices, and supplies at present are ample. Dealings in cocoa and coffee were small and prices unchanged from last week.

**Fruit and Vegetables.**—Growers' and retail prices have now been fixed for potatoes by the Ministry of Food, but trade is proceeding in the usual channels. Retail demand has improved with the colder weather, but supplies are sufficient. Home-grown fruit remains plentiful and in fruit growing districts extra supplies of sugar have been allowed for jam-making. The arrivals of imported fruit and vegetables are up to normal.

\*

**Milk.**—The following table is compiled from statistics issued by the Milk Marketing Board:—

|                                      | Aug., 1938 | June, 1939 | July, 1939 | Aug., 1939 |
|--------------------------------------|------------|------------|------------|------------|

| Total contract .....                 | 83.2       | 97.1       | 94.2       | 92.2       |
| Used by farmhouse cheesemakers ..... | 3.3        | 3.1        | 3.0        | 2.8        |

## Miscellaneous Commodities

**Oils and Oilseeds.**—Trade in these products is still suspended, except for deliveries, at prices to be fixed later, for urgent requirements. Production at the crushing mills continues, but sales are limited in order to conserve stocks. Shipments from Argentina and India continue, though at a lower level; the Argentine Ministry of Agriculture estimates the area sown to linseed at 7.41 million acres, compared with 6.61 million acres last season. Harvesting in the United States continues in excellent conditions and an out-turn of 431,000 tons is now indicated, against 204,000 tons produced last year.

\*

**Rubber.**—The market was very steady at the end of last week, but plantation grades were weaker on Tuesday and closed on Wednesday ½d. lower than a week ago. Para grades have remained unaltered at 10d. per lb., which compares with 7½d. per lb. at the end of August.

\*

**Timber.**—At the outbreak of war, the Ministry of Supply issued an order prohibiting (a) the felling of trees in excess of 1,000 cu. ft. without licence, (b) sales of timber (except to Government Departments and contractors engaged on A.R.P. work) which exceeded 10 per cent. of the stock held by the seller. This order has now been supplemented by a schedule of maximum prices which covers nearly all the specifications in common use. Trade is still restricted by the uncertainties of the normal European supplies; as war was declared at the height of the shipping season, a large amount of timber was on the seas or being loaded and news of cargoes is not yet definite. The war risks insurance has been a further handicap.

# Finance

## 585

(a) Management shares. (b) Deferred ordinary stock. (c) Absorbed £54,999. (e) Includes profit on redemption of  
 chief rents £12,966 against £26,309 a year ago and £66 on sale of investments (same). † Free of income tax.

## LONDON ACTIVE SECURITY PRICES AND YIELDS

NOTE: Yields on British Funds, Dominion and Colonial Government, Home Corporation, and Public Board Stocks are based on minimum prices shown without allowance for accrued interest. Approximate dealing prices on September 14th and 20th are given in left-hand columns. In calculating yields of interest-bearing securities allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption: where stocks are redeemable at or before a certain date the final calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. The return on ordinary stocks and shares is calculated by reference to the "cum div." shares.

This is the outline of the picture for 1939-40. That of 1940-41 is necessarily even hazier. But one or two limits can be sketched in. Expenditure in the remaining seven months of the current year is apparently estimated at £1,413 millions, or £202 millions a month. This figure is, of course, a minimum, and it is the average of a series of months during which expenditure will be accelerating. If, therefore, we say that the total expenditure in 1940-41 cannot be less than £2,400 millions, we are certainly not exaggerating the figures. But the revenue that will be brought in next year by the newly increased taxes will only be about £1,114 millions *plus* the problematical yield of the Excess Profits Tax. Thus the prospect seems to be that revenue will be about half of expenditure this year, and (in default of no further tax increases) less than that proportion next year.

Is this a satisfactory state of affairs? Before the question can be answered, it is as well to re-state the two cardinal principles of war finance, which were enunciated on Wednesday, the one by Mr Attlee, the other by Sir John Simon. The first is that the economic sacrifices demanded of the people by war cannot be reduced or shuffled off on to future generations by any financial policy. The choice of methods, in particular between taxation and borrowing, is, therefore, a choice between different methods of distributing the burden of sacrifice among those now living; it is not a choice between a heavier and a lighter burden. The second fundamental principle is that of all possible methods of financing a war the inflationary method is the least equitable, the least efficient and in the long run the most disturbing. It must at all costs be avoided; but the only way of avoiding it is by raising the entire cost of the war either by taxes or by loans subscribed out of the genuine savings of the people. The adequacy of the present Budget therefore comes down to this: Can the gap of £938 millions between revenue and expenditure in the current year, or the gap of at least £1,200 millions next year, be bridged by borrowing without giving rise to inflation? Can the genuine savings of the people be increased, by voluntary, induced or enforced abstention from consumption, to these figures? When the questions are phrased in this way, it can be seen that the proposed level of taxation, so far from being excessive or ascetic, is, at best, barely adequate. There are, of course, reasons, both of technique and of policy, for not increasing taxation too rapidly at a time when the first—and certainly temporary—impact of war has been to increase unemployment and impair taxable capacity. But these reasons will have vanished by April next year, and the taxpayer will then be called upon for another effort if the attempt to avoid inflation is to be serious.

The whole of this reasoning, however, is based upon the assumption that the total expenditure next year—and, by implication, in a "normal" war year—will be of the order of £2,400 millions. Is this a fair assumption? Is the cost of this war, when it is in full cry, likely to be about £200 millions a month, or £7 millions a day? That was, in very rough terms, the cost of the last war in its last year. It can hardly be less this time (since we are already, it appears, spending at that rate). But can it be relied upon not to be much more?

To predict the "ceiling" of war expenditure is obviously an impossible task. But, clearly, if we are to win the war, we have to measure our effort not by any absolute standard but by comparison with the enemy. We shall defeat Germany only by making greater efforts than she does, and since Germany will do her utmost, we must do our utmost also. The only safe assumption to make about the proportion of the national resources that will have to be devoted to the war is that it will be the maximum possible proportion, including every man and every machine that can possibly be spared from the business of feeding, housing and clothing the people. The fundamental problem is economic, not financial: What is the lowest fraction of our annually available supply of effort and materials that will suffice to meet the minimum demands for consumption? That fraction—a half, a third, a quarter—is the fraction of the National Income that can be left to the individual citizens of the nation. All the rest must by some means, by taxation, by borrowing or by inflation, be

gathered in to the Exchequer to meet the cost of the war. Analysed in this way, the problem can be given some numerical shape, and in view of its crucial importance, the reader may fairly be asked for indulgence while the elements of the calculation are set out. The gross National Income in the year 1918, the last previous year of totalitarian war, can be put, very tentatively, at £5,500 millions. In that calendar year the expenditure of the Exchequer (excluding loans granted to the Allies and similar capital transactions) was £2,700 millions, of which about £2,500 millions can be regarded as the cost of the war. Twenty-one years ago, that is to say, it proved possible to devote almost half the total resources of the community to fighting.

The gross National Income was running in the first quarter of 1939 at the rate of nearly £6,000 millions per annum, and the total for the whole year is certainly no less, and probably more, than that figure. When all the extra employment and extra effort of wartime have been added, the gross National Income, without any change in the value of money, will be as much as £7,000 millions. If the 1918 proportion is applied to this figure, the resulting possible total expenditure is about £3,500 millions.

This, however, is not a final figure. As Sir John Simon told the House of Commons, war is a more costly business to-day than in 1918, ship for ship, airplane for airplane, division for division. Moreover, we can afford a costlier war to-day. The minimum standard of consumption is the same to-day as in 1918. But our productive capacity has benefited from two decades of very rapid progress. The proportion of the National Income required by war and that which can be afforded for war are both higher now than they were. If 50 per cent. of the National Income could be devoted to Government expenditure in 1918, and if in the meantime the whole National Income has increased (in real terms) by 20 per cent., the maximum war proportion can safely be put at, say, 60 per cent. without pushing the standard of consumption below that of 1918. This, on a National Income of £7,000 millions, gives a figure of £4,200 millions a year, or £350 millions a month.

To carry the calculation to figures any less round than this would be to overstrain it. But it is enough to show that until the total national expenditure has reached some such figure as this, we shall not be able to say that we are making our maximum war effort. And if expenditure is to rise to something like £4,000 millions a year, shall we be able to borrow some £2,800 millions a year without inflation? The question answers itself. Severe though the burdens placed upon the taxpayer this week are, further sacrifices will almost certainly be demanded of him before the war is finished.

Those sacrifices will be resolutely borne if two conditions are met. The first is that the fundamental economics of the war are clearly and repeatedly explained. If once the taxpayer can be brought to realise that borrowing or inflating will cause him just as much current sacrifice as taxing, he will appreciate the necessity for still more drastic levies. The second condition is that the public must be convinced that the war is not being fought half-heartedly. Sir John Simon's words on departmental economy were rightly cheered in the House. But the counterpart of economy in the normal peace-time administration of the country must be the absence of any purely financial obstacles to the prosecution of the war.

Finance is, after all, nothing but a shroud for economic truth. The British public has no love for taxation or for borrowing, still less for inflation. But it is still the fundamental fact that the public will be dissatisfied with any cost of the war short of the maximum. For the maximum cost will merely be a reflection of the fact that the maximum effort is being made, and the public has clearly grasped the fact—more clearly, apparently, than the Government—that the quicker the maximum effort is made the quicker the war will be over. If British industry can build a gigantic air fleet, if British man-power can fill the ranks of a gigantic army, if British shipyards can keep the Navy and the Merchant Navy supreme—and they can—then money can be found to pay for them. In war, finance is a follower, not a maker, of policy, and "impossible" is excluded from its vocabulary.

## Stalin Over Europe

FEW could have foreseen how far-reaching would be the effects of the non-aggression pact between Germany and the Soviet Union. But the whole world was not long in finding it out. Less than two weeks after the pact was signed the great nations of Western Europe were at war, only Italy holding to neutrality. Less than four weeks after the outbreak of war, the Soviet Union had partitioned Poland far more advantageously to itself than even the acutest observers had thought possible. Scarcely had the return of Russia to Central European power when the governments of Turkey, Roumania and Bulgaria show unmistakable signs of dancing to a Russian tune of which the notes were not yet clearly heard.

It is an exaggeration to attribute all that has happened to the influence of Soviet diplomacy. The British Government's Blue Book published this week shows that already on August 16th the German State Secretary, Baron von Weizsäcker, felt confident of Soviet connivance, if not of actual help, but it is still true that there would have been no war unless Germany had willed it. It is also true that the course of the war has been, and will be, profoundly modified by Soviet intervention.

For the moment no one can be blind to the historic importance of the Red Army's march across the whole length of the Polish-Roumanian frontier, and westwards as far as the Vistula. Whether or not the Nazis intended this to happen (and it is difficult to believe that they did) will be known only when the result of Herr von Ribbentrop's second flight to the Kremlin shows a return, either in diplomatic phraseology or in definite compensation. The facts of the last few months, and the overriding anxiety to avoid actual warfare which the Soviet Government is generally thought to harbour, lead to the conclusion that we have not seen the last of German-Soviet collaboration. The decision rests with Stalin; and the gains of the first attempt are probably solid enough to encourage him to a second. His agreement to further co-operation, perhaps to an alliance of some kind, would provide him with one more chance to strengthen his position in Eastern Europe under cover of "collaboration" with Germany. In other words, he may see a way of resolving to his own advantage the German-Russian conflict of interests in Eastern Europe, by giving the Germans what appear to them to be his substantial support and goodwill.

But whatever he decides to do, that conflict will remain there to-day as surely as it remained there during all the years of Imperial Germany's efforts to remove it. For with Russia's westward advance the balance of power in Eastern Europe has been fundamentally modified. In the past months and years we have thought of the conflict of interests in the Balkans as being between Germany and the Western Powers, with Italy playing a secondary rôle on Germany's side. Our diplomatic and commercial policies have been shaped to meet a German drive for

Balkan domination. Now we can lay them all aside. They have become useless, or nearly so. For Russia has taken our place as Germany's Balkan opponent. There is a new Eastern question, only this time it may be resolved not by a long struggle between the European Powers, but by private treaty over luncheon in the Kremlin.

There is a great deal of evidence, much of it confusing, some of it strikingly conclusive. It is worth considering, because within a very brief time the immediate fate of the Balkans will have been decided, and we and they will know what liberties are left to them and what part they are to play in Stalin's peace and in Hitler's war.

The starting point, against the background of the German-Soviet pact and the over-running of Poland, is the visit to Moscow of M. Sarajoglu, the Turkish Foreign Minister. Here is something concrete. He is invited to Moscow to discuss "questions of common interest to the Soviet and Turkish Governments"; questions, evidently

enough, which include Turkey's relations with Britain and France, with the Balkans, and with Germany: in short, the whole of Turkey's foreign policy except for the Middle Eastern pact, which, at the moment, is of no significance. His task is widely recognised to be the reconciliation of Turkey's various obligations with her basic policy of good relations with the Soviet Union. Once more Stalin is in a position to call the tune. The Anglo-Turkish and Franco-Turkish pacts, which are not yet formal alliances but are nevertheless binding, make provision for mutual assistance against aggression in the Mediterranean region, are applicable

to any "act of aggression which might lead to war" in that region, and further provide for collaboration in "the establishment of security in the Balkans." The first part may be taken as aimed at Italy, the second at Germany. In either case the integrity of the Straits, fortified in conformity with the Treaty of Montreux, is safeguarded. The Soviet Union, interested always in maintaining the *status quo* in the Black Sea at the expense of all other great Powers, including Germany, could feel well satisfied. At the time there was every reason to think her satisfied, for it was known that Turkey had consulted with the Soviet Government before concluding the pacts with Britain and France, and had received its approval. The Turks, with the British and French behind them, would fight the Soviet Union's battles.

But, since then, two major events have shown a change in Soviet policy. The negotiations for an Anglo-Russian alliance were made a mockery by the signing of a German-Soviet non-aggression pact, and, in the course of the war on Poland that followed, Soviet troops have put Russia's name back on the European balance sheet. The Turks must now be got to refrain from compromising this new entry.

For this Stalin needs to bear in mind at least two considerations. First, that the advance of Germany must be fended off if a favourable Balkan *status* is to be assured;

and, secondly, that the position of the Turks in the Mediterranean must not be weakened. That means to say that the Soviet Union must take over in the Balkans the guaranteeing rôle hitherto played by Britain and France, at the same time fobbing off the Nazis as best it can, while leaving the Mediterranean part of the Turkish pacts with Britain and France intact. There are signs that he has already gone far in this direction. Before he left Turkey, M. Sarajoglu had conversations with the Turkish Ambassadors in Roumania and Yugoslavia, and there is a general suspicion that Turkey, from having been the "policeman of the Balkans," has now become their spokesman. Early this week alarming reports were to hand from Bucharest, referring to the massing of Russian troops on the Bes-sarabian frontier, and although both sides officially maintain that the Soviet's guarantee of neutrality towards Roumania is being observed, no one would be surprised by a second "preventive invasion." Indeed, last week's assassination of M. Calinescu, the Roumanian Prime Minister, by the Nazi-financed Iron Guard, might well have given rise to fear of a second partition. On a Soviet request, Hungary is about to resume diplomatic relations and, more significant, a similar request has also been made to Belgrade, where there has never been a Soviet Minister. Between Sofia and Moscow there is much activity; and Bulgarians must be asking themselves whether the Soviet Government does not now mean to take Bulgaria right under its "protective" wing, adding possibly the long-coveted Southern Dobruja. Effectively, the whole Black Sea area would then be under Soviet influence; and it would not be long before the Pan-Slav yeast began to work in Yugoslavia.

Supposing that this is the way Stalin's mind is working, there is still a host of problems for him to answer. He must compensate the Nazis for losing a sphere of influence upon which they would appear to have set their hearts. He can do this either by diplomatic or by economic concessions, or by a combination of both. Equally Stalin must consider the effect on the Western Powers. We cannot assume that he actually wants to destroy our Near Eastern position, at

least until he has replaced it by one of his own; and although he may demand of the Turkish Government that they will not give passage through the Straits to British and French warships (as they would be expected to do under the Treaty of Montreux, given application of the League Covenant), that does not mean that he will also try to wreck our Mediterranean alliance with Turkey.

Upon this point Signor Mussolini's final decision on Italy's part will doubtless largely turn. According to a semi-official report of a private meeting of Fascist leaders last Saturday, Signor Mussolini said then that a decision on policy was "not called for now." The decision to stay neutral, taken on September 1st, agreed with Italy's and other nations' desire to localise the conflict. "It is certainly with the wise intention of not enlarging the conflict," he added, "that the Governments in London and Paris hitherto have not reacted in face of the Russian *fait accompli*." Italy can wish for an extension of Russian influence in the Balkans even less than Germany, for she gets no compensation and may expect none. Her policy of "field of expansion" is then limited to North Africa, and the Albanian annexation is robbed of much of its value. It is no wonder that the Italian Government has lately been engaged in improving its relations with Balkan neighbours, and notably, by a mutual agreement to withdraw troops from the Albanian-Greek frontier, with Greece. A Russian attempt to weaken the Anglo-French-Italian alliance in the Mediterranean would necessarily have its influence on Signor Mussolini; so far, however, there are no signs that the attempt, if made, would be successful.

In all this the part of Britain and France is clear. Our position is not so strong that we can gratuitously make enemies. The probability is that Hitler and Stalin are pursuing not merely different, but irreconcilable ends, and it would be foolishness on our part to throw them into each other's arms. On the other hand, the Balkans are still the wings, rather than the centre of the stage on which the battle for the future of Europe is being fought out. Nothing that happens there, however unpleasant, should deflect us from our purpose.

## The Budget Proposals

THE speech with which the Chancellor of the Exchequer introduced his War Budget naturally differed in many respects from the traditional Budget speech. The elaborate survey of the results of the past year was entirely missing, and the no less elaborate calculation of the yield to be expected from existing taxes was placed by the simpler statement that the first impact of a war on the revenue was likely to reduce it by £54 millions. No attempt could be made to set down an accurate estimate of expenditure, and Sir John Simon could only say that he could not guarantee that the Vote

Credit of £500 millions, on top of a previously proved expenditure of £1,453 millions, would be enough. Precise budgeting was therefore out of the question, and the speech resolved itself, apart from an interesting though incomplete discussion of the economics of war, to a recital of tax increases. Only one new tax was announced, and that one, the Excess Profits Tax, is a development of the existing National Defence Contribution and Armament Profits Duty rather than a brand-new impost. But of the existing taxes, income tax, surtax, estate duty and the duties on alcoholic liquors, tobacco and sugar, are all heavily increased.

The major change in the *income tax* is an increase in the standard rate to 7s. in the £ for the current year and 6d. in the £ next year. The reduced rate charged on the first £135 of taxable income is also raised, for

the current year, from 1s. 8d. to 2s. 4d. in the £. To cushion this blow to those whose incomes have fallen, there is to be a special provision by which those taxpayers whose incomes in the current year can be shown to have fallen, as a result of the war, by 20 per cent. or more, are to have the option of being assessed on their income in the current year instead of the usual practice of being assessed on the income of the previous year. (This carries with it the technical corollary that if the taxpayer elects to be assessed on his current income this year, the Inland Revenue must have the right to revise his assessment for last year to bring it into accordance with last year's income.) The income tax allowances are not to be altered this year (with the exception of the increased rate on the first £135 mentioned above), but they are to be changed next year as is indicated below—

|                                | Present Provisions.                                                 | Proposed Provisions                                                |
|--------------------------------|---------------------------------------------------------------------|--------------------------------------------------------------------|
| Reduced Rate                   | One-third of standard rate charged on first £135 of taxable income. | One-half of standard rate charged on first £165 of taxable income. |
| Earned income allowance.       | One-fifth of earned income with maximum of £300.                    | One-sixth of earned income with maximum of £250.                   |
| Personal allowance.            | £125                                                                | £120                                                               |
| Allowance for married couples. | £180                                                                | £170                                                               |
| Allowance for children.        | £60                                                                 | £50                                                                |

The rates of *surtax*, which were increased in April, are to be raised again, the old and new scales being shown in the table at the head of the next column.

The effect of these changes in income tax and surtax on certain specimen incomes is shown in a Note on page 598. The rates of *estate duty* are also being increased. On estates between £10,000 and £50,000 the rates are to

| above 50,000                        |        | 9 0            | 9 6            |

be increased by 10 per cent. and on estates over £50,000 the increase of 10 per cent. already included in this year's Finance Act is to become an increase of 20 per cent.

The indirect taxes selected for increase were those on alcoholic liquors, tobacco and sugar. The details of the changes are necessarily complicated, but their effect can be chiefly stated as being 1d. a pint on beer, 10s. a proof gallon on spirits (or 1s. 3d. a bottle on whisky), 1½d. an ounce on tobacco and 1d. a pound on sugar.

The Chancellor also announced a new Excess Profits Tax, to be levied on the same lines as the existing Armaments Profits Duty, but applying to all firms and businesses. It will be levied at the rate of 60 per cent. on excess profits—that is, in general, on profits in excess of the pre-war average. National Defence Contribution will be retained at a rate of 5 per cent. on total net profits, but firms will pay only whichever of the two taxes, N.D.C. and E.P.T., is the higher.

The yield of these increases of taxation is estimated in the accompanying table, with the exception of the E.P.T., whose yield will be negligible this year and incalculable next.

The Chancellor also devoted some attention to the Government's plans for exacting a levy on fortunes in-

### EFFECT OF CHANGES IN THE WAR BUDGET

|                               | Effect in 1939-40 (£ millions) | Effect in 1940-41 (£ millions) |

| Total Customs and Excise ..   | +30.65                         | +66.6                          |
| Total change .....            | +107.15                        | +226.6                         |

creased by the war. This levy, he said, could be neither assessed nor levied until after the war, and he proposed no action for the present. That assessment of such a levy is impossible for the moment is, of course, obvious. But there would be a great deal to be said for setting in being the machinery that will some day be necessary for assessing the value of fortunes as they stood at the outbreak of war. A small tax on property—say at the rate of ½ per cent. per annum—might have been imposed even now as a means of obviating any tendency on the taxpayer's part to claim an excessive pre-war valuation of his property.

The net effect of these changes on the figures of the current year is to increase the estimated revenue to £995 millions. With total expenditure at £1,933 millions, the total of borrowing will be £938 millions. The Chancellor revealed none of his plans for borrowing, except to say that different varieties of loans will be issued to suit different requirements. To borrow a sum of these proportions is, however, in itself a task of major complexity.

\* April Budget estimate, with minor pre-war revisions. † Yield from Excess Profits Tax negligible in 1939-40. § April estimates, plus additional taxation, less a reduction of about £54 millions in yield on original estimates. ‡ Not separately specified.

### RUSSIAN-GERMAN TRADE

It has unfortunately proved impossible, in present conditions, to publish the Supplement giving details of the possible expansion of Russian exports to Germany which was announced as forthcoming in *The Economist* of September 2nd.

## Bagehot: Man of Affairs

EVEN in these crowded war-time days it would be unbecoming of *The Economist* to overlook a new book about the greatest of its editors, Walter Bagehot. It is true that Professor Irvine of Stanford University, California, is not very interested, in this biography,\* in Bagehot's twenty years or so of editorship. It is Bagehot the critic and man of letters that the book is about. Bagehot the banker and financial journalist, the economist who had "frequent and free communication on all matters of finance and currency" with Gladstone at the Exchequer, serves Professor Irvine mainly as a backcloth.

"Bagehot (he says) was a man of several professions and one avocation." That avocation was literary criticism, and the burden of this book is that the kind of criticism which Bagehot contributed to Victorian letters drew its peculiar strength from the fact that Bagehot was not, in the narrowest sense, a literary man. He was trained as a lawyer. He directed a bank. He was a working editor. He walked in the world of London society and high politics in the footsteps of James Wilson, his father-in-law and *The Economist's* founder. It was only in his spare time that he settled down to write about literature, religion and science; and he brought to bear upon his "avocation" an unusually practical training and an uncommonly many-sided experience.

There is much to be said for this estimate of Bagehot's achievements. Lord Bryce once declared that he was the most interesting man in London to talk to; and his essays on the Victorian literary giants—the best of their kind before the studies of the late G. K. Chesterton—on the Romantic poets and on Shakespeare, Milton and Gibbon shared the shrewd, forceful and attractive common sense of his conversation. In place of scholastic research and academic punditry it was a wide general knowledge and a broad mind which Bagehot brought to bear upon the books and their authors. He liked good prose and poetry, said so and tried to explain why.

But the matter cannot rest there. It was precisely this breadth of training, outlook and work, the breadth which Professor Irvine hails as his chief equipment for his literary labours, that made Bagehot pre-eminently suited to edit a journal of economic and public affairs. To say that "the literary essays represent that part of his mind which found no adequate expression in a column of figures or the ephemeral pages of *The Economist*" or, in effect, to regret that "living in the world of business and politics, writing at least two articles each week for *The Economist*, he fell into a rapid, more or less journalistic style," is to miss the point. Bagehot's education in mathematics and German, as well as the usual classics, at Bristol College (1839-42); his courses in philosophy, chemistry and political economy, as well as Latin, Greek and logic, at University College, London (1842-48); his post-graduate mathematics scholarship and the philosophy medal that came with his mastership in 1848; his prowess in debating and the law studies that ended with his call to the Bar in 1852; his return then to the family Somersetshire bank which had grown from its small eighteenth-century beginnings in Langport to become the largest private bank of issue in England—these were not the preliminaries to a literary career. They were the apt and ample preparations—unconsciously made, it is true—not only for becoming the author of what Professor Irvine calls "the grave and sedate tomes" of *Lombard Street* and *The English Constitution*, but still more for becoming the editor of *The Economist*.

Bagehot began to write for *The Economist* in 1856, at the invitation of an old friend, Richard Holt Hutton, who was Wilson's collaborator. It was Hutton who introduced Bagehot to Wilson and, indirectly, to Eliza Wilson, who became his wife. The partnership of Wilson and Bagehot was successful, and in 1860, after having been editor in fact for some time, he became editor in title, as well as

director, on the death of the paper's founder and proprietor. He remained editor until he died in 1877, and it is at the editorial desk that the definitive biographer of Bagehot will find the core of his material.

There is little need to labour this point. "It was his mission (wrote Woodrow Wilson of Bagehot) to clarify the thought of his generation and to vivify it; to give it speed when slow, vision when blind." He did this in *The English Constitution* (1865-67), "the flesh and bone of factual analysis," which told Englishmen of the time what their stratified system of government really was and how it worked. He did it, too, in *Physics and Politics* (1865), which was the first book to set out "the full significance of natural selection for the doctrine of human progress"—before even Spencer or Darwin himself took up this aspect of their theme. He did it again in *Lombard Street* (1873) which was aimed, in the words of Mr Keynes, "to knock two or three fundamental truths into the heads of the City magnates."

But he was doing it every week in *The Economist*, for over twenty years—less roundly than in his *opera*, it is true, but at least no less effectively. It was his practice, we are told by Robert Giffen, his assistant editor, to write always with some typical City man in mind—"a man not skilled in literature or the turnings of phrases, but keen as to fact, and reading for the sake of information and guidance respecting what vitally concerned him"—and to hammer home his meaning with every trick of simple phrasing and the effective use of words. "We believe (he himself said) that the knack in style is to write like a human being . . . to write their own thoughts in their own words, in the simplest words, in the words wherein they are thought." "The art of narration (he averred) is the art of writing in hooks-and-eyes. The principle consists in making the appropriate thought follow the appropriate thought, the proper fact the proper fact." No one has put better the essentials of effective exposition and few have applied them more successfully than he did in *The Economist's* leader columns.

Nor had Bagehot one view of style for the "ephemeral" uses of his paper and another for "literature." One critic has complained, for instance, that his essay on Shakespeare contains "a little too much mere common sense." There is "too much high art," he would have replied; "it is not addressed enough to the common feelings and minds of ordinary people." He objected to Sterne because "he never begins at the beginning and goes straight through to the end." He declared that Gibbon's style was too grand—"he cannot mention *Asia Minor*." He said of Edward Gibbon, the historian's grandfather, that "his genius, like that of Mr Hudson, had a natural tendency towards a commerce in the metaphysical and the non-existent." This is the voice in equal measure of the incisive critic and the economical editor.

But Bagehot brought more than clarity and a sense of style to his writing. He brought the experience and ideas which made his paper, no less than his books, authoritative and closely read. He was passionately interested in people—just as he always wrote rather about authors than about their books—and he mixed with the makers of Victorian politics and economics. He was "a man made to flourish in a great city." He was "respected and admired and sought after in council (Professor Irvine tells us) by the most celebrated statesmen of his day." He was an adviser behind the scenes of Ministers and heads of departments. He was called "a sort of supplementary Chancellor of the Exchequer." He was elected to the Athenæum Club, a much greater distinction then than now. He surveyed the drama of the day from the wings.

In politics Bagehot was a conservative because he believed that, in face of the stupidity of people in the mass and the hardness of what he called the "cake of custom," progress must necessarily be slow. In economics he was a liberal, a free trader and a relentless critic of privilege. In both fields he abhorred abstract generalisations. It was

"a statesmanlike consideration of problems" that he always called for, "a wise and patient weighing of facts, a real mastery of the reasons—to say nothing of the consequences—of the existing state of things"; of the Constitution of the United States, a country in which he was deeply interested, he said, "the limited clauses of an old State paper cannot for ever regulate the future." Above all, he was practically minded.

A man of his time, Bagehot believed in the accumulation of wealth and failed to see most of the social misery that industrialism was causing; but the extremer view that "a great fortune was a glorious monument to the Lord" passed him by. It was because the production of wealth could make leisure possible, elegant and artistic, that he approved the mechanisms of commerce and industry which he spent his life writing about. Mere busy-ness appalled him:—

One of the devices to avoid the exertion of the reason (he wrote) is activity. People rush to and fro. They are never still. They spend so much toil and trouble, they make everyone so uncomfortable, in order to boil a pea, that those who know no better suppose that the pea is actually boiled.

## Defence Measures

THE process of putting into effect a body of defence measures, prepared in anticipation of the war, is ending. The absence of any new emergency legislation in the past week, and the reduction in the number of Orders-in-Council issued, both bear witness to this. At the same time, the fact that such Orders as have appeared have dealt almost exclusively with the revision of price regulations indicates that a second phase—that of adjusting the existing machinery—has begun. Departmental instructions are the only class of defence measures in which no reduction can be expected. The maintenance of the civil defence organisation and the official regulation of a large section of the national economy necessarily require a continuous flow of such instructions. For the time being they form the main part of this record, which is continued from the last five issues of *The Economist*.

### ORDERS IN COUNCIL

On Friday, September 22nd, the Board of Trade issued the War Risks Insurance (General Exceptions) Order. This excluded certain classes of goods from the scope of the Board's insurance scheme on the ground of indestructibility or unsaleability. The list included growing crops, goods forming the subject of hire-purchase agreements, coal, certain classes of iron and steel, and some objects of art or craftsmanship.

An Order by the Ministry of Food requisitioning all butter in registered cold stores in Great Britain, all imports of butter arriving, and all butter for manufacture, came into force on Saturday, September 23rd. On the same day the Ministry issued orders revising the maximum prices of butter and prescribing wholesale prices for glucose.

Further Orders by the Ministry of Food coming into force on Monday, September 25th, requisitioned stocks of imported pork in all cold stores and revised the schedules of prices for eggs and fat cattle.

The prices of granulated and soft brown sugar were increased by a Ministry of Food Order which came into operation on Tuesday, and had the effect of increasing the margin between wholesale and retail prices.

### DEPARTMENTAL INSTRUCTIONS

Food supplies were the subject of a number of announcements which appeared on Friday, September 22nd. The Ministry of Food requested consumers to restrict their meat purchases, which had been above normal during the week; the price of bread in London was raised by one halfpenny to 8d. a quarter, the change to operate on Monday, September 25th; and it was made known that the introduction of a standard blend of tea at a definite price was under consideration. Two announcements particularly affecting the newspaper industry were made; by the Ministry of Information, which issued instructions as to the procedure for the censor-

In similar vein, he held that modern statesmen and modern peoples were "far too willing to burden themselves with responsibilities." He would even have been "glad to have found a fair excuse for giving up India, for throwing the colonies on their own resources and for persuading the English people to accept the place of a fourth- or fifth-rate Power"—if the calibre of the national mind, taste and conscience could be thereby raised. He was a religious man as well as a practical one; and in his worldly wisdom he never lost sight of the ends which political and economic means ought properly to serve.

There is all this and more in Professor Irvine's literary study and biography. If the balance of his notable and welcome portrait can be questioned, it is because in his *Hamlet* he seems at times to have left out Denmark itself. It is the sagacious, lively, shrewd, widely read and influential editor of *The Economist* that is too often missing—the Bagehot who handed down to all his successors on this paper the broad principles of how to write and edit with integrity and success, the Bagehot who completed the transformation of an Anti-Corn Law newspaper into a journal of affairs.

ship and dispatch of matter intended for publication in the press outside the United Kingdom; and by the Periodical, Trade Press and Weekly Newspaper Proprietors' Association, which suspended the practice of accepting from distributors unsold copies of papers. Payments to local authorities for casualties treated in emergency hospitals and to owners of goods vehicles requisitioned for Civil Defence work were announced on the same day. Carpet manufacturers decided to meet part of the new demand for blankets by converting carpet looms, and the Cotton Board urged that the prices of cotton goods should not be unduly advanced. The prevention of all forms of profiteering was foreshadowed by the announcement in the House of Commons of forthcoming legislation, and the Chancellor of the Exchequer also stated that a thorough review of public expenditure was being carried out. The Minister of Supply announced the formation of a Council of Supply. The Schedule of Reserved Occupations was further revised. The temporary advance in unemployment was noted in a preliminary announcement by the Ministry of Labour on the September figures. A local instance of the general question occurred with the paying-off of two hundred Paddington paid A.R.P. workers.

It was announced on Saturday that the Federation of British Industries had drawn the attention of its members to the necessity to keep prices stable. On the same day it was confirmed that the prices of nearly all kinds of confectionery had been advanced. The partial removal of the prohibition on the export of absorbent cotton was annulled at the request of the Ministry of Health. This was the first day of operation of the petrol rationing scheme.

Monday's announcements were of a very miscellaneous nature. They included notices of increases in payments to seafarers in view of war risks; advances in the price of whisky; an invitation by the Wool Control for offers and samples of certain grades; an arrangement whereby building workers may make up by overtime any time lost through air-raid warnings; the cancellation of the 1940 British Industries Fair; forthcoming modifications in the lighting restrictions to permit in particular the use of street lamps to be controlled by a master switch and the better lighting of London buses; and the commencement of the censorship of newspapers for dispatch abroad. The Ministry of Agriculture announced particulars of approved crops to be sown on ploughed up grassland and notified the County War Agricultural Committees of recommended changes in horticultural crops. The normal system of distribution of fish was restored with the re-opening of Billingsgate market. It was announced that persons who have been trained to some other occupation than that which they now follow will be enabled to record the fact in the National Register.

On Tuesday it was made known that the whole position as to paid A.R.P. and A.F.S. workers was under review, and that efforts would be made to reduce the present cost of these services. The Ministry of Economic Warfare announced the establishment of a commercial inquiries section for firms, shipowners and agents. A number of important appointments

\* Walter Bagehot. By William Irvine. Longmans, Green. 303 pages. 12s. 6d.

were notified on this day. They included the persons who will sit as tribunals to consider the cases of enemy aliens, business advisers to the Food Ministry and the Colonial Office and a panel to advise the Minister of Agriculture on technical questions. The Supply Council appointed to direct and co-ordinate munitions production met for the first time. Modifications of existing regulations also announced on Tuesday were an increase of 50 per cent. in the petrol ration to London taxi cabs, provision for the notification of changes in addresses given in the National Register and a warning by the Chancellor of the Exchequer that the Regulations requiring the sale of foreign currencies to the Bank of England must be complied with at once.

The appearance of the Budget on Wednesday was immediately followed by a notice from the Ministry of Food that in view of the increase of duty the maximum prices of sugar would be raised at once. On the same day it was announced that the number of Governors of the B.B.C. had been reduced to two.

On Thursday it was announced that in discussions between the Home Office and the Air Ministry it had been decided that any relaxation of the lighting restrictions to permit of the control of street lights by a master switch was unlikely to be allowed. The addresses of the offices of the Ministry of Food to deal with two controlled commodities, potatoes and canned salmon, were announced. The decision of the Isle of Ely Education Committee that children of twelve years and over would be released from

school to assist with the harvest was an instance of the type of measures made necessary by the rural labour shortage.

The following table gives maximum retail prices fixed under the Food Defence Regulations and by certain other controls. It is hoped to reproduce it with particulars of current changes week by week. Prices of other controlled commodities will be added as particulars become available.

| MAXIMUM RETAIL PRICES                                     |                     |                |                  |
|-----------------------------------------------------------|---------------------|----------------|------------------|

\* Voluntary maximum.

## NOTES OF THE WEEK

**The Home Front.**—It is the task of waiting which weighs most heavily upon the civilian population—not waiting for air raids, for that risk had been anticipated and discounted, but waiting to know what the future may be for households, livelihoods and businesses that have been gravely hit in the transition to war. It was the virtue of the Lord Privy Seal's broadcast to the nation last week that he put his finger on precisely these anxieties; and it was perhaps the weakness of his talk that there have been only few signs so far of the Government's determination, which Sir Samuel Hoare emphasised so strongly, to end this state of affairs as soon as possible. The unemployment figures (discussed in a Note on page 598) serve sufficiently to confute the comforting announcement by the Ministry of Information that the whole manhood and womanhood of the nation is now fully organised for war. The machinery for mobilising man-power more fully and efficiently than ever before has been set up; but it is not yet in operation; and hundreds of thousands of people who must work to live are waiting, sometimes in despondency. There have been too many reckless dismissals by employers in panic, and Sir Samuel Hoare's appeal to them to keep their heads was well justified. Even so, it was inevitable that civil business should be gravely upset by the outbreak of war, by evacuation, by air-raid precautions, by distasteful but essential controls, by insurance charges and by transport difficulties. The Government's duty in these conditions is threefold: to minimise, by advice and if need be by orders, all needless dislocation; to alleviate genuine distress; and, as quickly as possible, to effect the transfer of discarded workers into essential war employment.

Meanwhile the chorus of complaint from special interests is growing. It is being said that at least one-third of the two million private cars in use will be driven off the road by petrol rationing and the high horse-power tax, and that garages and the motor trade may be very nearly bankrupted. The Hotels and Restaurants Association has filled the news-hungry Press with protests against the wholesale commandeering of hotels in the provinces—throwing some 20,000 workpeople out of employment, driving away guests and destroying goodwill. Landlords, tenants and mortgagees have found the contractual obligations and payments upon which they depend thrown into confusion. A great part of this outcry can be discounted.

The hardship to motorists, garage proprietors, hotel-keepers and the owners and users of property is undoubted, and it will involve substantial sections of the community in serious material loss. But it is also inevitable in the making of war. The real question which arises is whether the hardship is not greater than it need have been because there has been too much improvisation and too little foresight and drive in the first stages of war-time economic planning. The great need now is for the situation on the home front, which is in many ways so uncertain and obscure, to be swiftly clarified. The transition from peace to war must be made as little onerous as possible, not only to abate civil loss and suffering, but also to win the war.

**Successes at Sea.**—Two statements were made in the Commons on Tuesday, one by the Prime Minister and the other by Mr Churchill, war-time's recruit to the Admiralty. It was the First Lord's measured words of encouragement which won the ears of Parliament and the public. Mr Chamberlain's review was deliberately factual and informative. Much of what he said about the war in the West and in the East was already well-known; and his reminders of the necessarily long-drawn-out process of blockade and economic warfare and the vital need for no sense of false security about bombardment from the air, unquestionably true and timely though they were, were not calculated to arouse the enthusiasm of a House which still shares the puzzlement of most citizens about the curiously lethargic course of hostilities. Mr Churchill, on the other hand, had the ball at his feet. He was able to report a steady fall in shipping losses from 65,000 tons in the first week to 46,000 in the second, 21,000 in the third and 9,000 only in the last six days. He was able to make known that we had arrested and converted to our own use 65,000 tons of merchandise more than had been sunk in our own ships. He was able to reveal that the convoy system was now in operation, inwards and outwards, and that British ships were now leaving port armed and manned against submarines, raiders and aircraft. His speech was the performance of the Government's ablest politician, who knows very well that what is wanted by the whole country is information and more information, set out to reinforce the fact which no one really doubts, namely, that we will win the war. It will serve as the model for future statements from the Front Bench. But it would be unfair if Mr

Churchill's brilliant innings on a plumb wicket were to black-out entirely the more sober performance of the Prime Minister. Over-confidence is the gravest psychological trap which awaits a public which has so far been bewilderingly spared the horrors of war. It is wholly to the good that Mr Churchill should robustly underline Britain's command of the seas—and his faith has been since reinforced by the successful resistance of a full naval squadron, which was unscathed, to German attack from the air. But enemy aircraft has attacked neither towns, ports nor merchant ships yet, and the Prime Minister's warnings against over-sanguine emotions (endorsed *en passant*, it is true, by the First Lord) have their place in the making of a realistic public opinion as well as Mr Churchill's very welcome oratory.

**On Land and in the Air.**—This week the R.A.F. has made more reconnaissance flights over German territory, returning each time without loss and scarcely molested. They have now dropped over Germany 18 million copies of various messages to the German people, and by this time there can be few people in Germany without a cousin or an aunt who has not read one of them and absorbed the significant implication of each pamphlet: "This might have been a bomb." This is an excellent work, and should continue. It is precisely the imaginative sort of thing for which, if it had not been carried out, there would have been a public outcry. The war on land continues to be one largely of preparation. On the Western Front, the French have further strengthened their advanced positions in German territory and held them against German counter-attack and artillery bombardment. The leading detachments of the British Expeditionary Force are now efficiently ensconced in their stations behind the lines, and from France there are enthusiastic reports of the warm way in which they have been received, and of the excellence of their equipment. In the East the epic story of the resistance of Warsaw has earned a place in modern history comparable with the defence of Madrid, for although Madrid held out for over two years and Warsaw for less than four weeks, the quality of courage was of the same high order. There are appalling stories of the ruthless and indiscriminate bombing of Warsaw, and of the ruin and misery which has been caused. We may wonder if that bombing was necessary because the German Army is no longer that of 1914.

**American Neutrality.**—It is the desire and intention of all the countries of the American continents south of Canada to stay neutral in the war. In Washington and at Panama ways and means to make this determination effective are under discussion. The Foreign Relations Committee of the United States Senate has before

it a draft bill, sponsored by the President and his Administration, designed to remove the present complete embargo on the export of arms and munitions to belligerents; and the bill is so carefully contrived to remove the slightest risk of trade with the warring nations leading to American implication in the conflict that it now seems likely, despite the vigorous opposition of the extreme isolationists, to become law in some form or other. Early next week the Senate will begin to debate it, and a majority of about 20 for the removal of the embargo is being forecast in Washington. Already the National Republican Club, made up of prominent Republicans from all over the United States, has registered an eight-to-one vote in favour of "cash and carry," which the President's bill would substitute for the embargo. It is very strictly, almost puritanically, a neutrality bill. Belligerents must take title for the arms or munitions they buy before the goods are shipped, and only non-renewable 90-day credits will be accorded. Belligerents must not sell securities in the United States. American vessels, by the bill, must carry no goods or passengers to belligerent countries, and no American vessels or citizens must enter "combat areas."

This out-and-out neutrality will not aid American shipping, and it is at Panama, where 21 American countries are in conference, that correlative compensations are being considered. Measures to organise and develop inter-American trade and communications are under discussion, together with plans to stabilise inter-American exchange rates and to furnish loans for South American countries. Indeed, it is already the cry of Nazi propagandists, busy in the Republics, that the United States is seeking to create an American economic empire under the cloak of joint American neutrality, and to create it in the very countries where German trade had its highest successes in pre-war penetration. None of the American countries will be turned from their path by belligerent protests. Their aim is to protect themselves, strategically and economically, against the repercussions of the war in Europe. They wish to clear their waters of belligerent vessels of war—German submarines have been seen close to land—and the United States proposal that the Americas should be ringed round with a "safety belt" of "international territorial waters" hundreds of miles wide will receive favourable attention. Both in Washington and at Panama it is honest neutrality that is the first aim, even though inter-American co-operation to secure it may well bring material economic advantages as well.

**The Commonwealth's Part.**—The war plans of the Dominion Governments are maturing with surprising speed. The Canadian Government has decided to raise an expeditionary force of two divisions, and from the number

FIFTIETH ANNIVERSARY 1889-1939

## THE NEW YORK TRUST COMPANY

Capital Funds \$37,500,000

COMPLETE INTERNATIONAL  
BANKING FACILITIES

100 BROADWAY, NEW YORK CITY

CABLE ADDRESS: NYTRUSTCO

EUROPEAN REPRESENTATIVE: 8 KING WILLIAM STREET, LONDON, E. C. 4

Member of the Federal Deposit Insurance Corporation

of applications that seem to have been received—in this direction Australia and New Zealand have the same story to tell—the only problem should be one of selection. According to an official statement by the reformed Cabinet (the most important change in which is Mr Norman Rogers's transfer from the Ministry of Labour to that of National Defence), plans are laid for the "maximum effective co-operation" with the British Government. At Canberra the House of Representatives has voted a bill to provide for a war loan of £20 millions. Part of this will go towards the equipment of an air expeditionary force to consist of four bomber squadrons and two fighter squadrons with some complement of ground staff, making a total of 550 men. Mr Menzies has stated that this force should be ready to go overseas before Christmas. It will be recruited from the 3,000 or 4,000 applicants in the Civil Air Reserve. Commercial measures which have been taken include a system of export licensing. In New Zealand the Government has set up a Primary Production Council to organise war-time production, and an Industrial Emergency Council to supervise labour matters. A special military force of 6,600 men is to be formed, and for this more than 13,000 recruits have applied. In India another step towards the definition of the Congress Party's policy towards the war in Europe has now been taken by a further meeting between the Viceroy and Mr Gandhi; the nice balance of the Congress Working Committee's compromise between its opposition to the British in India and its sympathies with their cause elsewhere will doubtless take time to evolve.

\* \* \*

**Russia in the Baltic.**—M. Selter's story shows the arbitrary way in which the balance of power is changing in Eastern Europe. On September 24th the Estonian Foreign Minister arrived in Moscow and had immediate discussions with M. Molotov, the Soviet Prime Minister. He was back in Tallinn the next day, evidently with disturbing news. On September 27th he was in Moscow once more, this time in company with M. Sarajoglu, the Turkish Foreign Minister, and with Herr von Ribbentrop and his thirty-eight legal and political luminaries. By that time the cat was far enough out of the bag to measure its distress. The Soviet Government, it appeared, was pressing on M. Selter the acceptance of some kind of "transit trade treaty"—Russian-Estonian transit trade is already subject to special concessions and amounts to little in weight or in value—and behind this screen further appeared the strong suspicion that the Russians wanted certain islands off the Estonian coast, presumably as a set-off to the still unfortified Aaland Islands, which are in Germany's sphere of influence, and to the islands which the Finns are known to have fortified off their coast. This was a pretty appendix to the long contested dispute over the Aaland fortifications, and it may be followed by others in the same sense. And in case M. Selter felt emboldened to hold out against these terms by the declaration of the Estonian Commander-in-Chief, General Laidoner, that Estonia would fight for her independence, the Soviet Government had meanwhile issued a number of minatory statements on the escape from Tallinn harbour of an interned Polish submarine, the Orzel, and what were supposed to have been that vessel's subsequent exploits in Baltic waters.

\* \* \*

**Mobilising Production.**—In the last war, a shortage of shells brought down a Government and threatened the issue of the war itself. This has not been forgotten. Last week, Mr Burgin, Minister of Supply, gave details of the new drive to make munitions, and to a point his account was impressive. His job, he said, was to ensure a smooth and ample flow of supplies, and to aid him he had called in ten leaders of industry, commerce and finance. On paper, the personnel of this Munitions Supply Council could scarcely be bettered; and the statistics which the Minister gave of the contractors, firms and factories now at work under his supervision were encouraging. Yet

Mr Burgin's *apologia* still left the House unconvinced that the errors and the delays of the last war were being surely obviated. The avowed reluctance of the Ministry to interfere with the normal course of industry until shortages or delivery difficulties have already arisen has aroused some misgiving ever since war broke out; and the Ministry's refusal to take advantage of its full statutory powers to take the whole sphere of war supplies under its central control leaves open the likelihood that a time will come once more when the sheer necessity of the forces' demand for material will compel a sudden and drastic overhaul of the machinery of supply. It is not present needs but future needs which should dictate Mr Burgin's use of his powers. It is to win the war and not simply to carry it on that is the prime objective. The dichotomy between Army supplies (including anti-aircraft), which the Minister controls, and Air Force and Admiralty supplies, which he does not, is fortuitous and, in the long run, wasteful of time and material. The Supply Council itself is made up of part-time experts who have normally other jobs to do. The thirteen officers, who are to assist Mr Burgin and the Council initiate an expansion of munitions output, are ex-Service officers not drawn from the active ranks of the engineering trades that are chiefly concerned. The Ministry has at present neither the authority nor the personnel to marshal the plant and labour of the entire engineering industry, even though it is precisely this marshalling which the needs of the war will require. This criticism can be couched too strongly. The Government is in an infinitely better position to furnish the forces with material than it was in 1914; and the early-war slump in civil businesses has automatically released resources for war needs. It is perfectly true that rigid regimentation of industry is neither needed nor desirable. But clear-sighted planning is; and it is precisely this which is put in danger by the ultra-cautious procedure of Mr Burgin's Ministry.

\* \* \*

**Unemployment.**—Early in 1914 an eminent politician announced that he intended to devote himself for the duration of the war to alleviating the lot of the unemployed. Those persons who have felt misgivings at the current increase in unemployment are likely to be reassured by the fact that six weeks of war were sufficient to show that this gentleman's devotion would not be required. They will also have welcomed Sir Samuel Hoare's broadcast statement and the official pronouncement of the Ministry of Labour that the present phase will quickly pass. But there is no solid assurance of immediate betterment. The reduction of 76,000 in the number of male unemployed in the month ending September 11th was outweighed by an increase of 175,000 in the number of unemployed women. Moreover, it is clear that the bulk of the increase occurred in the eight days which followed the declaration of war. And it is reasonably certain that the number of unemployed has continued to grow since that time. In fact, whatever the prospects of ultimate recovery, and they are undoubtedly good, the present position is unpleasant. London and the south-eastern counties have had an all-round increase in unemployment, and the prospects of a great improvement here are small. The main demands for workers will come from the regions concerned with heavy industry and ship-building, and they will not be met without migration and a certain amount of consequent hardship. A close watch will have to be kept on the size of these movements. It was widely recognised before the war began that a permanent population increase in those areas where employment is certain to fall off steeply as soon as war demands cease would be a disaster. Now is the time to decide how much new plant is wanted to meet war demands and to choose with an eye to the long term where the new works shall be built.

\* \* \*

**The Incidence of Income Tax.**—The effect of the proposed increases in the rates of income tax and surtax is illustrated in the following table. It is not possible to select more than a few examples from the many

that could be quoted. The cases of a single man with income all from investments and a married man with three children and an income wholly earned have been chosen as illustrating the two extremes. The tax is expressed as the effective rate charged in the £ of the taxpayer's total income.

| Income  | Single Man, all Investment Income |              | Married Man, three children all Earned Income |              |
|---------|-----------------------------------|--------------|-----------------------------------------------|--------------|
|         | Old Rate                          | 1940-41 Rate | Old Rate                                      | 1940-41 Rate |
| £       | s. d.                             | s. d.        | s. d.                                         | s. d.        |
| 125     | 0 10                              | 0 10½        | 0 10                                          | 0 10½        |
| 200     | 0 10                              | 1 10½        | 0 10                                          | 1 10½        |
| 350     | 2 5½                              | 3 7          | 0 11½                                         | 0 8½         |
| 500     | 3 4½                              | 4 9          | 1 3½                                          | 2 5½         |
| 800     | 4 5                               | 5 9½         | 1 11                                          | 3 3          |
| 1,000   | 4 9½                              | 6 7          | 2 9                                           | 4 3          |
| 1,500   | 4 11½                             | 6 10         | 3 5                                           | 5 0½         |
| 2,000   | 5 7                               | 7 6          | 4 6½                                          | 6 4          |
| 3,000   | 6 1½                              | 8 1½         | 5 4½                                          | 7 3          |
| 4,000   | 6 8½                              | 8 8½         | 6 1                                           | 8 0          |
| 5,000   | 8 7½                              | 10 9½        | 8 3½                                          | 10 5         |
| 10,000  | 12 5                              | 15 4½        | 12 4½                                         | 15 3½        |
| 50,000  | 13 9½                             | 16 5½        | 13 9½                                         | 16 5         |
| 100,000 |                                   |              |                                               |              |

This table illustrates the fallacy of discussing income tax in terms of the standard rate. It is necessary to have an income of £3,000 in the first case, and of over £4,000 in the other, before the effective rate of tax reaches the standard rate. This point has very great psychological importance. If the family man with an income of £800 had been told on Wednesday, not that the standard rate was to be 7s. 6d. in the £, but that he was to pay income tax at the rate of 2s. 5½d. in the £ of his income, he might even have imagined that his liability had been reduced. A standard rate, converted into a graduated scale by a complicated series of allowances at one end and by surtax at the other, has never been a very logical method of fitting assessment to the capacity to pay. With the rise to 7s. 6d., it has become a positive psychological handicap. There were phrases in the Chancellor's speech which suggested that he was contemplating an entirely new method of assessment which, so far as individuals are concerned, would substitute graded steps for the standard rate. This clearly cannot be done in the middle of a year; but he will be well advised to make the change in April.

\* \* \*

**Profiteering.**—The practice of charging excessive retail prices has spread. As was argued in these columns last week, the only just cause for increasing prices is a rise in costs. Ever since the war began the Government has recognised this, but it has been found that, in the case of goods whose prices are not actually controlled, official persuasion and public opinion are not enough to prevent profiteering. There are even instances of fixed prices being infringed. A week ago the President of the Board of Trade expressed his determination to put a stop to this. He admitted that there were good grounds for higher prices—the fall in sterling, the rise in world prices, transport difficulties, the cost of insurance and the expense of A.R.P. But the profiteers were taking a toll far heavier than these charges could justify. It is the Government's intention to take two steps: to bring the prices of many more goods under control and to introduce new and more severe sanctions against offenders. It was disappointing to learn that these sanctions are still only "under consideration." The difficulty has been foreseen for a long time, and it is precisely now that the ruthless stamping-out of petty profiteering is most urgently needed.

\* \* \*

**Civil Defenders.**—It has long been the contention of critics that an error was made in the organisation of A.R.P. when it was decided to give all parts of the country, both urban and rural, vulnerable and safe alike, passive protection on the same scale. This has now been recognised in official quarters. The feeling that too much money is being spent and too many men used in the watch and ward against air raids has grown; and it is likely that the corps

of civil defenders in small towns and country districts will soon be thinned out. In particular, many of the paid full-time firemen and wardens will be replaced by voluntary part-time workers. This economy is obvious common sense—provided it is not carried too far. The whole country is entitled to adequate protection, and such devices as the black-out must necessarily be nation-wide. Above all, as the Prime Minister urged on Tuesday, the absence of air raids so far must cause no relaxation at all in civil defence. A false sense of security might bring fatal consequences.

\* \* \*

**Japan on Her Own.**—In spite of the sparse news coming through, the battle for Changsha, begun by the Japanese in the middle of last week, seems to have taken the disguise of a major campaign. Neither side can yet claim a victory, though if the Japanese are as much in earnest as they seem the Chinese may be expected to be driven southwards further into Hunan. It is more likely that the news, chiefly from Japanese sources, is being coloured by a desire to herald with good military news the formation of Mr Wang Ching-wei's puppet government in South China. This is on the programme for early October, and is expected to take place at Nanking. The Japanese Government would then accord the South China Government its formal recognition and make it the occasion for at least a temporary suspension of hostilities. General Chiang Kai-shek, whose position with his own people seems to be as strong as ever, would presumably welcome this opportunity for further preparation and reconstruction. In Tokyo disillusion with the Germans is growing deeper, and is probably a factor in the Government's decision to prop Mr Wang Ching-wei on the top of some sort of peace structure in South China. Another effect seems to have been the decision to appoint as Foreign Minister (in place of Mr Arita) an admiral who was for some time Naval Attaché in Washington and is understood to be *persona grata* in the United States. Admiral Nomura's job, as far as can be seen, will be to do precisely nothing apart from keeping his good reputation. Towards Europe his bearing will in that case be one of polite interest qualified by heavy private suspicion. It might be worse.

\* \* \*

**Swedish Safeguards.**—There are no British ships in the Baltic, and so the Germans, retaliating in any way they can against the British Contraband Control, have taken to sinking Scandinavian ships bound for the United Kingdom, even if they are carrying goods not on the contraband list. Swedish and Finnish ships have been sunk this week, to the indignation of their owners and the respective Governments. This sort of thing may be expected to continue until the British and Swedish Governments have fixed up at least a temporary agreement for the regulation of their war-time commerce—and that will take some time—and have come to an arrangement about warship convoys. Shipment of goods via Norway and the North Sea need not be seriously considered, for the cost, especially at a time when the British Government has fixed maximum

prices, would be prohibitive. In the present interval the Germans may be expected to do everything they can to ruin British-Swedish trade and to hamper the conclusion of the trade agreement made necessary by the Contraband Control. They will be hampered in these wrecking tactics, however, by the lively pro-British sentiment which exists in Sweden (to-day far more than in the last war) and by the general realisation that Swedish business, far from making war profits, will be lucky to escape incurring war losses.

**Serbo-Croat Federation.**—After a long examination of the completed federal agreement, both sides in Yugoslavia seem to be well satisfied of its fairness and workability. The extremist (Frankovci) wing of the Croat People's Party has made its anticipated complaints that the agreement was not drastic enough; but their opinion does not count for much, and Dr Matchek, who has the ruling say in Zagreb, has told the Press that he himself is content. Both the Skupstina and the Senate are now dissolved, the Government has received full powers to alter the electoral and other affected laws, and the next step must be new elections for a Parliament that will be more in accordance with public opinion. In the present troubled circumstances, the date of those elections is likely to be put off for longer than would have otherwise been possible or desirable; but in the meantime the Croatian *Ban* has been appointed in the person of M. Shubashitch, who was for long Dr Matchek's assistant, and the administration of Croatia has been provided for by the appointment of eight Croats and two Serbs, roughly proportionate to the population of the new self-governing province, to serve as departmental heads. Now that he has got his foundation, Dr

Matchek can go ahead with the superstructure while waiting for Parliamentary reorganisation; it is to be hoped that he will show patience and moderation. This easing of old frictions has left the bulk of Yugoslavs free to turn their minds to problems of foreign policy, and, with the Balkan balance of power altering daily, those problems are likely to demand more and more attention. There are signs that, in common with her neighbours, Yugoslavia is giving a good deal of that attention to Russia.

**Stagnant Capital Market.**—Capital issues statistics for the third quarter of any normal year are usually dull, but the figures for the past quarter can only be described, as abject. The period, of course, covers one month of war, a month of acute tension and a month affected by holidays. Thus, the capital issue statistics published for the first half-year in *The Economist* of July 1, 1939, might merely be repeated without causing any grave distortion of the facts. Issues by direct public offer for the first five months of 1939 amount to £50.7 millions, compared with £47.4 millions for the first half of the year and with £155.6 millions for the first nine months of 1938. Including securities for which permission to deal has been accorded, the nine months "new basis" total is £85.7 millions, compared with £74.7 millions for the first half of the year and with £217.8 millions for the first nine months of 1938. Expressed as a proportion of direct public offer business transacted in the first nine months of 1928, the total for the corresponding period this year represents no more than 17 per cent. The four tables set out at the foot of this page tell their own vivid story of a capital market which has ceased to function on a normal basis, and has now been brought under close control.

**Capital Market Control.**—The exiguous totals recorded this year—and particularly during the past quarter—are not, however, without some compensating advantages. Sir John Simon's Budget speech on Wednesday has clearly set before the gilt-edged market the size of its problems—to raise £938 millions for defence purposes this year. Already, however, a sum of £502.4 millions had been earmarked for borrowing before the outbreak of war. Hence, while the market needed no convincing that in principle it is right and proper to tax to the uttermost for defence purposes, it wisely keeps in its mind the probability that defence borrowing on this scale represents only the first instalment. Nor was any light shed in the Budget speech on the terms of prospective borrowing, except that the appeal would be nation-wide. In these circumstances no one would deny the importance of proper control over the capital market, the general basis of which was indicated in a Note on page 498 of *The Economist* of September 9th. But these general indications have not subsequently received any official clarification. For example, while the broad distinction between issues made for cash and other issues is clear, the bonus share apparently still remains on an undemarcated border-line. Clearly, bonus issues are not, proximately at any rate, issues for cash, although it would be possible to devise the conditions of their issue in such a way that they are tantamount to issues for cash—for example, if a substantial cash dividend were withheld and substituted by a scrip bonus. The technique of control over bonus issues—which must, of course, be submitted for approval—would thus appear to merit closer examination than it has yet received, though *bona fide* issues representing the capitalisation of tangible reserves should receive approval. At the same time, it may be asked, in view of the disclosures relating to local mortgages in a Note on page 612 of this week's issue, whether the apparent exemption of such issues from the purview of the Capital Issues Committee might not be reconsidered.

**German-Polish Self-Sufficiency.**—At a moment when Germany is threatened with losing the production of the Saar coalfield, which in a good year amounts to about 13,000,000 metric tons, it is of interest to calculate what raw materials she may hope to draw from the Polish territories in her hands. In coal the gains are considerable. The former Czechoslovak coalfield of Ostrava-Karvina, annexed by Poland in 1938, produces over eight million metric tons per year, and the three other Polish coalfields, all in German hands, together produce over 35 million tons per year. Of mineral raw materials, Germany will gain little. Polish iron ore production in 1938 amounted to 280,000 tons compared with Germany's production of over 3,000,000 tons and imports of 21,000,000 tons. Production of zinc was 107,000 tons compared with Germany's imports of 425,000 tons. Poland produces no copper, or bauxite (for aluminium), or manganese, and little lead. Agricultural products make a much better showing:—

AVERAGE OF 1936-7-8  
(000 metric tons)

|                                | Production | Exports | German Imports |
|--------------------------------|------------|---------|----------------|
| Wheat .....                    | 2,023      | 31      | 854            |

| Oats .....                     | 2,547      | 45      | 88             |
| Rye .....                      | 6,418      | 153     | 97             |
| Wheat and rye flour .....      | ...        | 118     | ...            |
| Maize .....                    | 111        | ...     | 1,409          |
| Meat .....                     | 769        | 62      | 1,289          |
| Butter.....                    | ...        | 11      | 84             |
| Eggs .....                     | ...        | 26      | 94             |
| Flax .....                     | 38         | 17      | 12             |
| Wood & timber (unplaned) ..... | ...        | 1,368   | 3,827          |

Poland was a large net exporter of grains and wood, and was slowly building up an export trade in meat and dairy produce. But she was on balance a net importer of oils and fats.

## THE WORLD OVERSEAS

### Neutral Switzerland

(From our Geneva Correspondent)

**THOUGH** neutral by tradition and by her own will, Switzerland is nevertheless deeply affected by the European conflict. She has, in the first place, to defend her neutrality, and the whole of her Army is under arms. The new military organisation has proved excellent: on August 29th, within six hours, all the frontiers were occupied by the Frontier Defence Force, about 80,000 strong; general mobilisation began on September 2nd at 8 a.m., and on September 3rd—exactly ten minutes before the telegraph announced that England was at war with Germany—all the Army units, 500,000 men in all—were at their appointed places. This is no negligible burden for a small country, as mobilisation costs exceed 5 million francs a day (£1 = just over 17½ Swiss francs); and the funds for meeting these expenses will probably be obtained by the issue of short-term Government bonds.

The Federal Government has also been granted full powers by Parliament to take the measures necessary for the maintenance of neutrality and the economic defence of the country. The export of arms, war material, ammunition and explosives is strictly prohibited; and all other exports are controlled by the State and subject to licence.

The delicate task is to take steps for the revictualling of Switzerland. The country can live for about 36 weeks on its own production. It has no seaport or outlet to the sea. It is shut in between France, Germany and Italy, and wholly depends on other countries for maritime transport. On the outbreak of war, the Government at once imposed a series of restrictions with a view to avoiding the grave errors made in 1914-18. Then life continued as usual; the consumption

of food and fuel was not reduced; and hoarding and the raising of prices were not prevented. Nothing was done until, towards the middle of 1916, the situation grew so serious that drastic restrictions had to be imposed; rations were then insufficient; and the population suffered to some extent from under-feeding.

These mistakes have not been repeated this time. As soon as mobilisation became unavoidable the Government prohibited the sale of cereals and their by-products, rice, dried vegetables, sugar, fats and oils, methylated spirit and alcohol. Only small quantities of coffee, soap and other products can be purchased. Coal, oil and petrol were at once rationed, motorists being allowed about nine gallons a month, and

### THE COMMERCIAL BANK OF SCOTLAND LIMITED

RESERVE FUND . . . £3,150,000

ESTABLISHED 1810

motor traffic being suspended on Sundays, except for public transport, military and medical services. Ration cards will be issued within two months, and meanwhile the population must live on the foodstuffs it was ordered to store a few months ago. That does not mean that there is any shortage of foodstuffs and fuel. Actually, stocks of foodstuffs are sufficient for 18 months, and those of coal for over two years. But the Government intend to prevent speculation, hoarding and the raising of prices, and to enable present stocks to last as long as possible.

### Switzerland and her Neighbours

The position of Switzerland is not an easy one, as she depends on her neighbours for revictualing. Italy has put her ports at the disposal of Switzerland for the unshipping of liquid fuel and foodstuffs. France has allowed the forwarding of oil and petrol now stranded in French ports and railway stations. England is ready to supply her with foodstuffs and raw materials on condition that they will not be re-exported to Germany.

Germany, much disturbed by the beginning of the blockade, is now endeavouring to persuade neutral countries to trade with her as if there were no war. If any neutral abides by the rules of the British blockade and adopts an attitude "contrary to neutrality," Germany will be compelled "though with regret, to reconsider the loyal and objective attitude she has adopted in regard to neutrals." This disguised menace leaves the Swiss unmoved. They are neutral, both from the political and military point of view, but they do not accept the German theory of economic neutrality.

No foreign Government, it is said here, has the right to interpret according to its own views the character of Swiss neutrality. Switzerland mobilised all her forces to show her will to defend herself against any aggressor. She stopped the export of arms, and submitted all other exports to Government control, thus showing her resolve to remain wholly impartial and not to be a party in any blockade scheme. Switzerland is free to export her home products, but she will not re-export the goods and products she will get from the Allies for her own consumption. The revictualing of the country rests on Swiss probity, and the Federal Government as well as the people are decided to maintain that attitude strictly despite the veiled menaces of Nazi Germany.

## The Foundations of the French War Economy

[FROM OUR PARIS CORRESPONDENT]

WHEN a state of war was declared between France and Germany it was the hour of the Army. The Army had first claim upon everything and everybody. But as soon as the Army was drawn up on the frontiers, it was the task of the Government to organise the home front in the rear to support and maintain the strength of the front line. What were the principles of the war economy thus begun? M. Reynaud has put it neatly: "In peace it is liberty, but in war it is control." Fifteen days after the outbreak of war a batch of decrees appeared in the *Journal Officiel* which laid down the foundations of France's war economy.

These decrees fall into two main classes. There were, first of all, a series of defensive measures designed to ensure the stability of money and prices. French holders of foreign assets were called upon to declare them before December 1st on pain of penalties running from six months to five years' imprisonment. The purchase of foreign securities was for the most part forbidden. The raising of prices above the level of September 1st was forbidden, except for agricultural prices, which were put under the control of the Ministry of Agriculture.

Two other decrees consolidated these enactments in principle. One instituted the control of foreign trade with the evident intention of reducing to a minimum the gap between imports and exports. The other placed limits upon increases in profits and wages. In sum all these measures will tend to preserve the equilibrium of the period of liberal economic policy and arrest the inflationary tendencies that would endanger the execution of war orders. They laid a foundation of stability.

The next step was to provide for the most rapid possible increase in industrial output. It is to this end that the second

batch of decrees is directed. There are measures to restore the smooth working of industries upset by the mobilisation orders; heaped-up stocks are freed; payment for goods requisitioned and for war orders is to be speeded up. Another enactment fixed the powers of the new Ministry of Armaments; it is charged with the task of ensuring supplies of material to the armed forces (excluding work for the Navy and Air Force), and with the supervision of all the many and varied industries supplying raw materials and semi-finished and finished goods for war purposes. Other measures gave the Minister of Commerce power to organise, within the framework of the country's economic regions, the whole of French production, and to plan ahead for the restocking of raw materials and for expanding manufacture.

Only the foundations have been laid. The substitution of control for economic freedom will raise complex problems. But the process of intensive re-armament in peace-time had already opened the door to war economy. Moreover, the Daladier-Reynaud Cabinet had already increased confidence in peace-time and expanded production by securing collaboration between all classes in the country; and a chief aid in this work was the German menace.

It is this confidence which has brought back to the country 26,000 million francs' worth of gold. It is this confidence which has appreciably raised the indices of industrial production and foreign trade. In August imports were valued at 3,845 million francs, against 3,712 millions in August, 1938; and exports were 2,908 millions, against 2,457 millions. The August import surplus was thus only 938 million francs, against 1,255 millions twelve months before; and of this 938 millions only 638 millions were on account of trade with foreign countries, the rest of the surplus being incurred in trade with the French colonies. In the first eight months of this year the import surplus was 8,707 million francs, compared with 11,786 millions in the first eight months of 1938; and in trade with foreign countries only the eight-months surplus fell from 8,800 millions to 6,260 millions.

This steady improvement was an encouraging prelude to the strain of war. Moreover, it occurred in a period of relatively stable prices. At the end of last month (just before the war-time price controls were put on) the general index of wholesale prices was 672 against 677 at the end of July and 644 at the end of August, 1938. The index of the cost of living was 129 (1930 = 100) against 128.7 in May and 118.6 in August, 1938.

The situation when war began was good. Money was stable; prices were steady; production was on the upgrade; fiscal receipts had been rising for some time; savings bank deposits were expanding; and it is an index of financial stability that this month, after rising to 146,000 million francs on September 7th, the fiduciary note circulation of the Bank of France fell back in the following week to 145,000 millions. After three weeks of war the war economy is going ahead under its own steam.

September 23rd.

## United States Business and the War

[FROM OUR NEW YORK CORRESPONDENT]

ON September 21st, the Congress assembled in special session to consider amendments for repeal of the Neutrality Act of 1935, prohibiting the export of arms and munitions to belligerents. Specifically, the principal item immediately concerned is airplanes. With this exception, it is not clear that its continuance or repeal is a major factor in the volume of our exports to Europe.

Its replacement by the so-called cash-and-carry plan is more incalculable, as it would probably involve a considerable re-routing of shipping. While opinion generally expects a material increase in certain types of exports to Europe, it imagines that other types will be curtailed, and is inclined to question the idea that our aggregate exports to Europe are about to increase greatly. On the other hand, it appears that a certain windfall of South American orders is already coming into our market.

The third week of the war found United States markets seeking some sort of equilibrium. Primary commodity prices climbed a little higher, gilt-edged bonds fell lower, and share prices advanced, then reacted, and finally rallied, arriving to-day at a level about equal to that of a week ago. In spite of the weakness in long-term Government securities, the Reserve Banks afforded little support—although several

reduced their discount rates, which are now purely nominal. In the past three weeks, this chronicle of the impact of war on America has concerned itself with markets because their movements are conspicuous, indicative, and reported daily. The movements of business activity, on the other hand, are less volatile, and statistical data are slower to appear. It is now clear that most, if not all, branches of business moved sharply upwards in the first three weeks of September. Steel operations are now running at nearly 80 per cent. of capacity, against an average of 50 per cent. in the first half of the year; and such significant indices as those of car-loadings and electric power production have risen steeply. Indeed, one hears conjectures that a freight-car shortage of sorts may appear at the time of the seasonal peak of activity, which ordinarily comes in early October. It is because of these signs that "forward buying" is again in evidence. This is only to be expected; but it is a little surprising that even the real estate market (at least in New York City) has been quickened after a decade of uninterrupted lethargy.

All these signs and portents quite definitely date from the outbreak of war. Nevertheless, they are only partially war phenomena. In part, they are seasonal, for in the American economy the advance in activity in the autumn, although less marked than in the spring, is still conspicuous. In part, too, these signs of improvement are cyclical; inventories had been reduced during the long period of the "buyers' market," and from the end of the coal strike in May down to the end of August, there had been a distinct upward trend in business, most evident in steel, most significant, perhaps, in car loadings and power production. This trend had found no reflection in either share or commodity markets. It was the war that gave the stimulus, and caused prices to rise.

It is the appearance of this "sellers' market" rather than the actual upturn in business activity that has revived inflation-mindedness. Inflation-mindedness is not new. Its symptom is an epidemic of conversations or discussions forecasting or foreboding a decline in the internal value of the dollar, as distinct from a rise in prices. It is not unlikely that the inflation-mindedness has had a part in the sound liquidation of gilt-edged bonds; another example is what is called "investment" buying of diamonds by individuals as a "store of value."

Simultaneously, one hears fears expressed about the deflationary consequences of the fall in sterling. The pound is now worth almost a dollar less in the exchange than the average of the five-year period 1934-38. Six months ago, a decline of this magnitude would have aroused fears of a flood of European imports; under the circumstances, it is recognised that European industry has its hands full. Hence, these fears are centred on primary commodity prices.

The final phase of the American price collapse of 1931-32 has always been attributed to the initial devaluation of sterling. It is recognised that general conditions are radically different now; and, confounding all theory, the fall in sterling has actually synchronised with a vigorous rise in commodity prices. None the less, a considerable body of opinion has always held that the dollar-sterling rate is a world economic factor of first importance, and that a sudden and material alteration in the exchange rates of the two is likely to be followed by important consequences. To the great relief of Wall Street, the disparity between the "official" and the "black" rates for sterling (mentioned last week) has narrowed. The spread has at times been as big as 20 or 30 cents—not wide, as such markets go, but disconcerting to persons who were shocked at the very idea.

September 22nd.

## Portugal's Economic Defences

[FROM OUR LISBON CORRESPONDENT]

PORTUGAL is strictly neutral and not at war, but it has been none the less necessary to take swift measures there to ensure that the war in Europe will not fray the life-lines of her economy. Immediate, and what look like being effective, steps have at once been taken by the Portuguese Government to maintain and guarantee supplies of food and other necessities. In August, 1914, there was chaos in these matters in Portugal. This time, an all-embracing decree, published on September 7th, gave ample and immediate powers to the authorities to prevent profiteering by retailers now or by speculators in the future. Some abuses, such as the doubling

in price of medical supplies coming from countries at war, although current stocks in the hands of Portuguese wholesalers are ample, have been stopped by the arrest and temporary detention of the offenders. Extension of these malpractices will mean the application of the extremest rigours of the law. Private hoarding is frowned upon; and, so far as possible, the economic life of the country has been kept upon a normally even keel.

Portugal lives by farming and fishing. This year the country has been blessed with good crops of the grains and pulses (beans, peas, etc.) which, with dried codfish, form the people's staple food. The year's fishing, off the Newfoundland banks and the Greenland coast, has also been exceptionally favourable. The fear that the oil market would slump because of the abundant supply and the end of the Spanish Civil War has now gone. There is a surplus of wine and wine products. In all, Portugal is well placed by the bounty of nature to face the near future; and the outlook for food supplies is very satisfactory for at least six months.

### The Importance of Overseas Trade

What is not perhaps so clear is the outlook for Portugal's export trade and industries. The maintenance of domestic manufactures is imperative for the country's well-being; and this is why the Government has set up a licensing system for several categories of exported merchandise. The list includes all metals (including tinplate, old iron and scrap), all forms of rubber, paper and rags, fish oil (including whale oil), machinery and coal. These are the things that Portuguese industry must have; supplies from overseas may be interrupted or cut down; and only after the needs of industry have been met will the export of any of these commodities be permitted.

This does not mean that Portugal's export trade is to be suspended. To carry it on is still a vital need, and the disposal of the country's chief export products—wine, cork, canned fish and (especially important now) resinous products—is a first concern. Given the open freedom of the seas, Portugal should be able to dispose of the bulk of these on favourable terms to France, Great Britain and the United States, her usual customers.

The case of resin and turpentine is not so simple. In peace-time 75 per cent. of Portugal's exports of these went to Germany. Nor is it likely that the demand for cork from Scandinavian countries will take up the large surplus now available.

It will be some months before these matters are made clearer. All one can say now, in the first throes of a terrible international upheaval, is that the outlook for Portugal is much better now than it was 25 years ago. That this is so is largely the achievement of Dr Salazar, President of the Council and executive head of the Government. And a not unimportant factor in the future will be the degree of assistance Britain and France will be able to give to Portugal in the task of carrying on her normal overseas trade.

September 19th.

## The Economic Outlook in Greece

[FROM OUR ATHENS CORRESPONDENT]

It is perhaps appropriate, while the war in Europe is still in its very early stages, to examine the immediate prospects for business in Greece. While unfavourable weather conditions adversely affected a number of crops, there is every sign that agricultural production, upon which Greece still mainly depends, will prove satisfactory. Tobacco production, for instance, is provisionally estimated at 57,000 tons, which is about 8,500 tons more than the output last year.

Industrial activity is brisk; and the foreign trade returns for July showed a fall in the value of imports compared with July, 1938, and an increase in exports. For the first seven

months of the year the import surplus in merchandise trade was Drs. 3,567 millions (the market rate for sellers is £1 = 535 drachmas). This was Drs. 900 millions less than in the first seven months of 1938.

Internal trade, on the other hand, has been slack for some time. This is not unusual at this season of the year, but this year it has been made progressively worse by the gathering momentum of the European crisis.

The immediate task is to counter the less welcome economic consequences of actual European war. Already a Ministerial committee has been set up to co-ordinate the efforts of the authorities to ensure the supplies of the food-stuffs and commodities the country needs. But, though the text for the renewal of the commercial agreement with Germany has been initialled in Berlin, the facility of discounting clearing credits in Reichsmarks has been suspended since September 1st. Payment in drachmas will hereafter only be made so long as there exist German drachma balances in the clearing, representing the proceeds of imports from Germany. Meanwhile it is indicative of the impact of the war threat upon the ordinary Greek that the note circulation of the Bank of Greece jumped from Drs. 8,109 millions on August 23rd to Drs. 9,981 millions on August 31st. Bank deposits were withdrawn and notes were hoarded.

September 18th.

## Japanese Trade and America

[FROM OUR TOKYO CORRESPONDENT]

THE United States' Government's recent notice of the abrogation of the commercial treaty with Japan was rather sudden and unexpected, although it did not come out of the blue. If and when an embargo is imposed on American imports and exports, Japan will suffer considerably in view of America's predominant share in Japan's foreign trade.

In 1938 Japan purchased from America 34.3 per cent. of her total imports, and sold 15.8 per cent. of her total exports. The figures of trade by commodities reveal some even more important relations:—

|                                     | (000 yen) | Percentage of total % |
|-------------------------------------|-----------|-----------------------|
| Imports from U.S.A. :—              |           |                       |
| Ore and metals .....                | 262,866   | 36.2                  |
| Oils .....                          | 240,143   | 80.4                  |
| Raw cotton .....                    | 166,413   | 38.1                  |
| Machinery, etc. ....                | 158,110   | 50.4                  |
| Exports to U.S.A. :—                |           |                       |
| Raw silk .....                      | 297,883   | 81.8                  |
| Tinned and bottled provisions ..... | 12,021    | 13.1                  |
| Silk goods .....                    | 18,282    | 23.3                  |
| Pottery and porcelain .....         | 6,574     | 21.3                  |
| Toys .....                          | 6,093     | 24.3                  |

If, for example, the American Government imposes an embargo on oil, it will immediately present a serious problem to Japan, although she is able to buy it elsewhere. A ban on scrap iron, if imposed, will prove a blow to Japanese steelmakers, even though the steel industry is fast getting rid of its dependence on imported scrap. American machine tools, especially high-grade ones, are essential to certain branches of the Japanese engineering industry; but if America refuses to sell them, Japan can now manage to do without many of them, and the sufferer in this case would rather be the American manufacturers as a result of the loss of one of their principal markets.

Of Japan's staple exports to America, raw silk will not be so adversely affected by the termination of the treaty, since it is a raw material essential to the American silk industry, though silk goods may be liable to prohibitive restrictions. Tinned and bottled provisions also are not likely to be shut out; and toys will easily surmount any tariff barriers that may be raised. Unless America wants war she is hardly likely to apply economic sanctions wholesale, and on the other hand if an American embargo is imposed piecemeal the pressure it will bring to bear upon Japan will probably not be strong enough to hold her in check.

August 19th.

## Books and Publications

### The Actual Record

THE Blue Book\* concerning German-Polish relations and the outbreak of hostilities, published last week, makes an enthralling narrative, as its wide sales to the public have shown; read as a diplomatic and political record, it is an eye-opener on the history of the past twelve months. Here, in a regular gallery of crime, are all the failings and hot-tempered impetuosity which report has fastened on the Nazis; here, too, the almost diffident (and almost always prim) record of the British Government's part in the events which led up to the outbreak of war. Theirs comes out as an honourable record, and with these documents before them it will be difficult for the historians to find the chink in their diplomatic armour. Even the cold light of post-war disillusion will find there little on which to pour its intolerance and scorn.

Headed by a brief summary, the documents number 144, from the text of the German-Polish non-aggression agreement of January 26, 1934, running through a series of relevant quotations from Herr Hitler's Reichstag and other speeches (quotations which are completely damning of his integrity), then including a whole series of diplomatic reports and telegrams, and ending with the Prime Minister's broadcast talk to the German people on September 4th. There is thus presented what amounts to a consecutive narrative, and the documents have been compiled so effectively that the minimum of knowledge is required to fill in the gaps. It is therefore right that they should reach, as they are doing, a wide public. On the British side this is good democratic diplomacy.

The methods of German diplomacy are often new, but the theme is an old one. Once the stage was set, and the Germans

were hesitating to invade Poland only so long as they thought it worth while to work at the British Government to stay neutral, then the Anglo-German conflict of wills came plainly to the surface. On August 23rd, we read in a telegram from Sir Neville Henderson to Lord Halifax recording an interview with Herr Hitler that the latter "began by asserting that the Polish question would have been settled on the most generous terms if it had not been for England's unwarranted support." Sir Neville Henderson, who comes out of the whole thing with much credit, then "drew attention to the inaccuracies of this statement, our guarantee having been given on March 31st and the Polish reply on March 26th," Herr Hitler "retorted by saying that the latter had been inspired by a British press campaign, which had invented a German threat to Poland the week before." On August 29th Sir Neville Henderson was again telling Herr Hitler "that he must choose between England and Poland." Time after time the British Government's determination to honour their obligations to Poland was stated and restated. Their position was crystal clear.

One of the most interesting features of this collection of documents is the light it casts on Hitler's mentality. It is strange, but very understandable, that the British Ambassador should think it necessary to preface his reports, on more than one occasion, with comments on the Fuehrer's bearing. "During the whole of this conversation Herr Hitler was excitable and uncompromising . . ."; while a day later he was "quite calm and never raised his voice once." On August 26th he was "absolutely calm and normal and spoke with great earnestness and apparent sincerity"; on August 29th "the interview was of a stormy character, and Herr Hitler was far less reasonable than yesterday." And so it goes on, with Herr von Ribbentrop screaming away at second fiddle.

It is all there, in cold undeniable print. The manner of diplomacy should be precise; the Nazis have made theirs

extravagant. It should be restrained; theirs is a curious blend of the pompous and the puerile. It should have at least some traffic with the truth; theirs has none. It should show respect for the other side; theirs has made a virtue of vituperation. The spectacle of this humiliation is instructive, but it is not pleasant, and even while we rejoice in the incompetence of our enemies we may regret that so great a people as the Germans could find such unworthy rulers.

### Stalin's Past

WHY did Stalin make a pact with Hitler and partition Poland? Everyone is asking this question, and time alone will tell the true reply. Meanwhile, here is an answer from a renegade Communist source,\* built into nearly 700 pages of rather dreary biography recounting Stalin's part in the last forty years of the long-winded and unintelligible doctrinal vicissitudes of Russian Communists. How authoritative the answer is seems doubtful. M. Souvarine's clear aim is to denigrate Stalin. Lenin he wholly approves. Trotsky he admires, but writes off as a supreme individualist, oddly out of place in that *galère* of Communists.

Even so, quite a liberal allowance for M. Souvarine's bias still leaves Stalin's part scarcely noble.

Stalin is too rude (wrote Lenin himself soon before his death), and this fault . . . becomes insupportable in a General Secretary. Therefore I propose to appoint another man who in all respects differs from Stalin only in superiority—namely, *more patient, more loyal, more polite and more attentive to comrades, less capricious.*

A quarter of a century ago Stalin was strongly suspected in the Party (on no tangible evidence, it must be straightway admitted) of denouncing his comrades to the police. Always, in the wilderness days, he revealed the capacity "of secretly urging others to action while remaining himself aloof." Never did he express a single original opinion on the political situation or the future of the revolution. He was content to bide his time.

In the Revolution he was never in the van. His reputation was won as an "organiser" behind the scenes, and whenever he came to the fore his judgments appear to have been wrong ones. He came to power, according to this version of his career, because he intrigued for it, consistently and continuously; and he was saved from failure by Lenin's death, just when a break had become inevitable, and by the maladroitness in which Trotsky dealt with the Opposition that cast him out.

Once in power he stayed there by the same means, and he now had the repressive powers of the State to aid him. He tripped and threw down his rivals one by one. The consistency of his career so described is not the consistency of Communism or, indeed, of any set of ideas. It is the consistency of sheer opportunism.

So it is, in this view, with his foreign policy. It has always been devised with an eye to the main chance. After 1933, in spite of the ideological antipathy of the U.S.S.R. to Fascism, Stalin hoped to come to terms with Hitler, as he had done with Mussolini. But Hitler, hot in his tirades against Bolshevism, would not have it. Instead, Stalin made his own regime more and more Nazi, with concentration camps, purges and the national instead of international slogans. Afraid of attack by Germany, he supported the League of Nations and even toyed with the Peace Front. Intervention in Spain and China showed the principle of limited liability upon which the "war against Fascism" was based.

In the end it was first thoughts which won. His new nationalism wanted security and Russian Poland: in the Peace Front he would have had to be prepared to fight for them, and even then he might not have got any of Poland; as an uneasy and provisional friend of the Reich he has gone to Warsaw with scarcely a skirmish.

The pieces of M. Souvarine's argument fit nicely. But it may be quite wrong. It is the speech of counsel for the prosecution. The course of history may be counsel for the defence, and there may be sound and acceptable reasons for Russia's latest moves. At present it is hard for the democracies to see them.

\* Stalin. By Boris Souvarine. Secker and Warburg. 690 pages. 15s.

### Shorter Notices

"An Outline of International Price Theories." By Chi-Yuen Wu (Ph.D.Econ.). With an introduction by Professor Lionel Robbins. Routledge. 373 pages. 15s.

Dr Wu received the scholarship in economics granted for the years 1934-37 by the Board of Trustees of the Administration of the Sino-British Foundation in Nanking. He spent the period at the London School of Economics under the guidance of Professor Robbins, and finally produced the doctoral thesis published in the present volume. It is an exhaustive study of the theories of international trade in Western Europe from the earliest mercantilists down to Professor Bertil Ohlin at the present day. Taking the background of economic history over the long period covered by the book as given, Dr Wu studies each thinker and the school to which he belongs in a severely academic way. The result is a very formidable volume, but one whose careful and disciplined style will appeal to the serious student of pure theory. It is a summary of almost everything that has been written about a very contentious subject. At present the author is boxed up, along with his fellow students, thousands of miles in the interior of China. One hopes that his work will go on.

"Switzerland and Her Industries." Edited and published by the Swiss Office for the Development of Trade. Lausanne. 128 pages. No price stated.

This short and pleasantly written guide provides a succinct description of Swiss economic activities and includes some excellent photographs. Among other interesting facts is the surprisingly small proportion of the population engaged in agriculture and the growth of the traffic of the port of Basle.

# THE BUSINESS WORLD

## Investment and War — Prospect

IN *The Economist* of September 16th we examined the behaviour, during the war of 1914-18 and after, of a number of leading groups of British securities. The conclusions suggested by our examination, broadly, were (1) that the decline in gilt-edged prices, in relation to war-time financial needs, was not catastrophic; (2) that industrial equities as a class afforded only a partial "hedge" against war investment risks, and (3) that in the groups whose war-time trend was upwards, the armament industries, as such, were much less conspicuous than the commodity-producing, shipping and "essential consumptive" trades. The course of prices under present abnormal Stock Exchange conditions—in which the temporary freezing up of the gilt-edged market is enforcing selling of other securities on grounds of mere immediate saleability rather than future merits—clearly affords no guidance whatever to prospects when markets, and the British economy generally, have settled down into a war rhythm. At first sight it might seem that any attempt, however tentative, to estimate the probable trend of security prices during the course of this war, would be subject to so many imponderable but vital factors as to be almost valueless. Closer study, however, reveals a number of basic assumptions whose validity can hardly be contested. In the following article we propose to state some of them, and to ask our readers whether, once they have admitted their validity, they can logically disregard the conclusions, for investment policy, which flow directly from them.

The greatest of all imponderables, of course, is the duration of the war itself. In view, however, of the past fortnight's events, investors can hardly regard the Cabinet's adoption of a minimum period of three years' hostilities as the basis for its war-time plans as over-pessimistic. If the war ends sooner, so much the better for everyone, but in investment calculations it is best to err on the conservative side. Secondly, it now appears reasonably certain that this country will be committed to a maximum effort by sea, air and land—all three, and not in any one element alone. Developments during the last twelve months—or for that matter the last four weeks—have removed all possibility of Britain participating on a basis of limited liability. Consequently, the task of so organising the entire national resources as to produce the maximum striking power at every point of contact with the enemy will involve, first, a definite increase in national production and, secondly, a deliberate transfer of productive resources, human and material, from less to more essential goods and services—"essential" in this context meaning indispensable for the successful waging of war. Finally, to achieve this result it will be right and necessary for the Government to use its power to tax or to borrow from its citizens, like all other weapons in its armoury, solely with reference to the contribution its policy will make to the securing of the main objective. Peace-time limits, conventional or theoretical, to the portion of the national income which the State ought to take into its coffers and redistribute, by way of taxation and Government expenditure, will have to go by the board. There will be an increasing tendency to use taxation as an instrument, on the one hand, for reducing national consumption of "inessential" products to the lowest limit compatible with the maintenance of national morale, and, on the other, for leaving producers of essential materials and services with sufficient additional re-

ward to stimulate the additional effort which the national interest requires, and no more.

How can these basic conditions, which, thus enunciated objectively, are likely to command general assent—be applied in a Stock Exchange context? At the outset investors may abandon all thought of "benefiting" from the war. The ultimate benefits to markets—and to humanity—of a victory ensuring the maintenance of free institutions, will be incalculable, but they will be intangible and deferred until the struggle is over. The investor's immediate purpose is so to arrange his financial affairs as to "spread" the inevitable cost of achieving victory in the most economic way, from the community's viewpoint as well as his own. Obviously he will be called upon to take considerable quantities of new gilt-edged stocks into his portfolio. But he realises that the Emergency Budget which Sir John Simon opened on Wednesday this week has applied at once the experience which the Government took three years to acquire in the last war. The imposition of heavy additional taxation has roughly equated this year's burden between taxation and borrowing—a superior initial achievement, at least, compared with that, say, of the later years of the last war, despite the greater probable intensity and cost of the national effort under present conditions. In the last war and after, much the greater part of the Government's actual borrowing was effected between 1916 and 1920, but during that period the average price of 2½ per cent. Consols dropped only 11 points, from 58 to 47. The biggest drop occurred between 1914 and 1916, when the average fell from just under 75 to 58. In other words, the effect of the Government's borrowing was, to a very considerable extent, discounted in advance of the actual borrowing operations. In 1914 the Government's re-armament programme had to be extemporised in the period of the war itself. This time we are not starting from scratch, and there is particular investment significance in the fact that between 1937 and to-day—a period which economically has a close resemblance with 1914-16—the price of 2½ per cent. Consols has already declined by approximately 23 points. In the last war, 5 per cent. became an effective market rate for long-term gilt-edged securities, only in the period after hostilities, when the heavy expenditure of the last few months of the war was being funded. If the analogy between 1939 and, say, 1916 (not 1914) holds good, we are effectively starting to-day on a slightly lower level of interest rates than before—the price of 2½ per cent. Consols on the last day of free market dealings before the German invasion of Poland was 65½, against an average of 58 for the year 1916. The various Government "controls" designed to reduce the export of capital and competitive claims at home, are more effective, and have been more speedily applied to-day, than in the last war, and the technique of catering for all possible tastes and requirements, in the way of short, medium and long-term stocks, is better understood. On the whole, investors may not be over-optimistic in concluding that the rise in interest rates, in a war of moderate duration, will be no more catastrophic in the present war than in the last; that it will, in any case, represent a temporary disturbance rather than a permanent upward adjustment of the rate of interest, so that holders of Government stocks may fare relatively as well in the lifetime of the present generation as they did in that of the last; and, consequently, that investors who take British Government war stocks into their

portfolio in coming months will be usefully serving their country's long-term interest without prejudging their own.

The course of industrial share values, in war as in peace-time, will be the resultant of three distinct factors. The first will be the level of interest rates, which is a determinant in the capital price investors will pay for a given prospective rate of income. The second is the amount of gross profit which a company is considered as being likely to earn, and the third, the proportion of that amount which it is likely to distribute in dividends—after meeting taxation claims and the cost of that insurance against future contingencies which is represented by allocations to reserve. The effect of the first of these forces has been discussed above. Under the second heading there will undoubtedly, taking companies as a whole, be a net rise—for, *ex hypothesi*, the total volume of national production will rise in war-time, apart altogether from any increase in the monetary value of a given volume of production owing to inflation. But the increase will be anything but uniform between different trades, and in some cases there may be an actual decline. It is not difficult to draw up a list of industries—including some of the newer industries like private motor-cars, radio, the entertainment trades, etc.—which are vulnerable to any tendency towards a lower popular standard of living, and are therefore particularly vulnerable in war-time. On the other hand, those trades which have no special war-time equity, but cater for mass needs which must be satisfied even in war-time—the food industries and retail trade generally, for example—may suffer some initial disturbance but are likely to recover before the war ends. These are, so to speak, the "neutrals" of the ordinary share market in war-time. The shares with a positive war equity are, first, those of companies in the

armament and quasi-armament trades at home (i.e. the textile producers, etc.), and secondly, the companies whose services will be in special demand overseas, like shipping concerns and the producers of essential primary commodities like oil, rubber, tin, copper, etc. Of these, the former are the more in the public eye, and the more accessible to special taxation measures than the latter, the price of whose services, even in war-time, is determined to some extent by international influences—and to that extent is less susceptible to control measures by a single country, however powerful. These conditions, broadly, will determine the grading of industrial shares, according to the extent of their direct war equity, on this occasion as on the last. The third influence—the gap between gross profits and divided profits—is the hardest to assess, but on the whole it may not be unreasonable for investors to conclude that the State-intercepted portion of profits, in the case of all companies, will not be less, and may well be more, in this war—which within a month has seen the introduction of a 60 per cent. tax on excess war profits.

In brief, the conclusions suggested by this article would appear to be: first, that a "balanced" portfolio—balanced both as regards its spread between fixed interest and variable dividend securities, and between short- and long-dated maturities—is no less desirable in war than in peace-time; and secondly, that, in the purchase of equity shares, the need for selectivity will be paramount. The war-time advantages of ordinary shares, as such, are largely illusory; for ordinary shares are a hedge, not against war, but against inflation, which may or may not be one of war's concomitants. But the conditions outlined in this article furnish a basis on which different investment groups will be analysed in future issues.

## Wood Pulp

ONE of the visible effects of the war has been the reduction in the size of the daily papers. This restriction is partly due to the fact that Britain's supplies of wood pulp, the raw material for paper, are largely drawn from Scandinavia, and are therefore liable to interruption by Germany. The commercial importance of wood pulp is of comparatively recent origin, yet the growth of its uses during the past decade is an outstanding example of the great influence which the achievements of chemistry have had on industrial progress. Until a century ago paper was made chiefly from rags, which were introduced in Europe as a paper raw material by the Arabs instead of certain silk fibres used by the ancient Chinese paper makers. A new era in the paper industry began with the introduction of wood pulp by the Frenchman Réaumur at the beginning of last century, and with the subsequent development and improvement of the pulping process by British, Swedish, German and Dutch pioneers. Since then the forests of the world have to an ever increasing extent been tapped to satisfy the rising demand for paper and other products made from wood pulp, including a great variety of recently introduced manufactures, such as rayon, transparent wrapping paper, cellulose wadding, plastics, containers and vulcanised fibres.

Wood pulp occupies an important place among the products obtained from timber. In 1937 the value of world wood pulp exports accounted for 14.5 per cent. of total timber exports. The proportion of the timber production made into wood pulp varies considerably in different countries; it amounts to about 5 per cent. in the United States and to no less than 38 per cent. in Scandinavia.

The raw material for pulp—pulp wood—is chiefly derived from coniferous soft woods, such as spruce, pine and fir, not suitable for the saw mills because of their small size. Pulp wood is converted into cellulose as used by the paper, rayon and various other industries by either a mechanical or a chemical process. About 40 per cent. of the total output of pulp is produced by the mechanical, and the remainder by the chemical, process. The

mechanical process consists in reducing the wood to pulp by pressing it against a revolving grindstone. The pulp mass is then beaten and refined and passed to the paper machine. In the chemical process the wood is cleaned and chipped into small pieces, and then heated under pressure with certain chemicals, in order to remove the lignin which binds the fibres. The two main varieties of chemical cellulose are sulphite and sulphate. Whereas by the mechanical process the wood with all its contents is converted into a paper sheet, the chemical treatment involves the extraction of all non-cellular material. Thus, mechanical pulp is used for inferior products (chiefly for newsprint in mixture with chemical pulp), whereas chemical pulp is required for the manufacture of high grade paper, rayon, plastics, and a host of other commodities.

The rapid increase in the consumption of wood pulp is due chiefly to the improvement in the chemical treatment

of cellulose and the introduction of a great number of new paper products. Since 1925 the world's consumption of wood pulp has doubled, and the increase is likely to continue. The paper industry is by far the largest consumer of wood pulp (something like a third of the total output is made into newsprint alone), and although comparatively small quantities are required by the rayon, plastics and various other industries, wood pulp is the basic material for these manufactures.

The growth of production and consumption of wood pulp in the principal countries, as well as in the world as a whole, is shown in the table below:—

WORLD OUTPUT AND CONSUMPTION OF WOOD PULP (ALL GRADES)  
(In thousands of tons)

† Including other countries.

The principal producers of wood pulp are the United States, Canada and Scandinavia; these countries supply almost three-quarters of the world's output. But while the North American pulp mills use the bulk of their output at home, as do, incidentally, the German producers, the Scandinavian industry, although converting large quantities of pulp into paper products, caters largely for the export market and contributes almost 75 per cent. to the world's pulp shipments.

In Sweden, the leading exporting country, the cellulose industry occupies a prominent position, for it uses more timber than the saw mills and exports almost twice as much as the latter. Sweden produces chiefly chemical pulp, while Norway is the largest producer of mechanical pulp in Europe. Finland's wood pulp exports have risen more rapidly than those of any other country during recent years, her main product being sulphite pulp. She is the only Scandinavian country whose cellulose output could be further increased without a material reduction in her timber resources, while Sweden is just maintaining a balance between cutting and growth in her forests, and Norway at times even imports pulp wood from Russia and Finland.

Canada possesses huge untapped sources of pulp wood, and is, with her comparatively small domestic consumption, an important potential world supplier of pulp and paper products. She exports her surplus output of chemical pulp mainly to the United States, whereas her output of mechanical pulp, amounting to 65 per cent. of her total wood pulp output, is largely converted into newsprint, a prominent item in Canada's export trade. Adjoining Canada, Alaska may in future become an important supplier of raw material for the paper factories of the United States, and Newfoundland is the only British country contributing materially to the pulp requirements of Britain. Her pulp and paper industry is largely controlled by British capital, and the recent acquisition of the International Power and Paper Company at Cornerbrook by the Bowater Paper Mills indicates that increasing supplies will be drawn from Newfoundland.

In spite of her big domestic output, the United States imports about 30 per cent. of her requirements; mechanical pulp and bleached sulphite pulp are drawn from Canada, whose pulp mills are largely controlled by United States paper makers, whereas unbleached sulphite and sulphate cellulose are mainly imported from Sweden. A factor of considerable importance for the future development of the cellulose markets is the rapid expansion of the pulp and paper industry in the southern states of the United States. They are already adding about 1.2 million tons of kraft cellulose annually to the domestic output, and are capable of further expansion. The United States has for some time been aiming at self-sufficiency in paper material, and the imposition of an import duty on cellulose has been widely discussed. In recent years the United States has considerably increased her exports of certain grades of wood pulp of which she has a surplus.

Great Britain imports the bulk of her wood pulp requirements from countries bordering on the Baltic Sea. While only 4 per cent. of Britain's total imports come from Empire countries, mainly Canada, Finland supplies 34 per cent., Sweden 31 per cent. and Norway 14 per cent. Until the outbreak of war a regular supply of wood pulp was assured by close collaboration between British consumers and Scandinavian suppliers. But as Germany is in a position to cut off supplies from the Baltic it will be necessary to look to North America for alternative sources of supply, for the establishment of a large pulp industry in Britain is impracticable. While the North American pulp mills cannot be expected to be capable of replacing at short notice the Scandinavian shipments, they should be able substantially to increase their exports and to relieve any likely shortage in Britain. There can be no doubt, however, that in a prolonged war the world's wood pulp industry will be seriously dislocated.

unprecedented. On two occasions in 1932, when Bank rate was descending from the 6 per cent. level reached on the departure from gold in 1931, the reductions to 5 and then 4 per cent. were made in bounds of 1 per cent. The customary adjustments to the lower Bank rate have been duly made. The clearing bankers' deposit rate has been reduced from 2 to 1 per cent., while the minimum rate for short loans secured by bills has come down from 3 to 2 per cent., and for similar loans secured by bonds from 3½ to 2½ per cent. Open market rates are rapidly adjusting themselves to the lower official minimum. The full three-months' bill, which is a popular end-December maturity, is already being quoted about 2½ per cent. On the last batch of Treasury bills, which were discounted at about 3½ per cent., the market will therefore make a quick and substantial profit. But that automatic profit will but neutralise the equally automatic loss which was incurred when Bank rate was doubled on August 24 last. The market has already begun talking about the next reduction, which it is expected will be reserved for the eve of the first of the New Defence Loan operations.

## Finance and Banking

**Bank Rate Down.**—Bank rate was reduced on Thursday from 4 to 3 per cent. The move was not unexpected. The previous increase from 2 to 4 per cent. occurred ten days before the outbreak of the war, when his country was still operating a comparatively free economy, and when it was urgently necessary to stem the rush to liquidity which was then gathering such massive impetus. To-day the exchange and capital markets are rigidly controlled; the tendency to convert credit into cash has been arrested and for two consecutive weeks there has been a net reflux of currency to the Bank of England. The need for a higher Bank rate has suffered other attacks in its reality. One is the substantial influx of gold and foreign currency into the Exchange Equalisation Account following the issue of the Defence Regulations. Another is the centralised control over commodity prices, which has become effective with astonishing speed and efficiency. The reduction in Bank rate may be regarded as a moderate counterpoise to the Budget both in the sphere of psychology and in that of more practical economics. The reduction by a full 1 per cent. is against precedent, though not

**The Break in Bill Rates.**—Confident anticipations of an imminent reduction in Bank rate have been very clearly reflected in the trend of discount rates over the past week. The Treasury bills issued last Friday went at £3 6s. 1d. per cent., or about 5s. per cent. lower than the previous Friday's average. This fall was due not only to expectations of a lower Bank rate but to the fact that the £55,000,000 of bills tendered for included the end-of-year maturities. The market naturally focused its applications on these bills, and as a consequence virtually the whole of the payments for new bills this week have been postponed until Saturday. At the same time, it is on this day that the bulk of the week's maturities are concentrated. Dealings in bills have thus been kept down to a minimum this week, most of the business done being on a forward basis. The demand for bills has been exceptionally keen, originating both from clearing banks and outside quarters. Such business as has been transacted has therefore been done on the basis of a steadily falling level of rates. The "hot" bill was bid for during the first part of the week down to 2½ per cent., the demand coming mostly from outside quarters. In this outside demand, funds which would normally have been canalised to the Stock Exchange have played a prominent part. The list of gilt-edged minimum prices being what it is, there has been a natural inducement to invest money in the form of three months' bills when the return on such investment seemed not unduly less favourable than that indicated by the minimum prices on longer term securities. Running brokers, who have been keen bidders of December bills at 3 per cent., and must therefore have sold those bills at a fraction under this figure, have in fact added important Stock Exchange names to their list of clients in recent weeks.

**Clearing Banks and the Treasury Bill Tender.**—Clearing banks themselves have also been keen buyers of bills, but at the rate of 3½ per cent. for December maturities, which they maintained during the first part of the week, they have found the supply of bills exceptionally meagre—certainly far smaller than the amounts dictated by their current maturities and by the state of their cash reserves. The difficulty experienced by the banks in getting adequate supplies of bills, taken in conjunction with the knowledge of substantial allotments of Treasury bills having been made to the market, has led to a good deal of complaining by the banks. They appreciate the desire of the market to make as good a profit as possible on their turnover of bills, and they understand the reluctance of the market to sell bills when there is a universal expectation of an imminent reduction in Bank rate. But this is not a case where *tout comprendre c'est tout pardonner*. The banks must have the bills, and there have been veiled threats that if those bills are not forthcoming from the discount market they will have to be obtained by the revival of direct tendering for Treasury bills by the banks. Such a development would be highly distasteful to the market.

**Bank Loans and Capital Issue Restrictions.**—The Treasury have this week exempted two types of domestic issues of securities from the compulsory reference to the Capital Issues Committee required by the Defence (Finance) Regulations. They are: (1) issues of securities such as mortgages to banks in respect of advances or overdrafts obtained in the ordinary course of business, and (2) the receipt by local authorities of loans from a bank for the repayment of capital expenditure incurred before September 13th last. In the case of the first type of now authorised transaction it is laid down that it shall not be a condition of the secured advance from the bank that it will be wholly or partly repaid out of the proceeds of a subsequent issue of securities. In other words, short-term bank borrowing by an industrial undertaking in anticipation of a future long-term issue, as yet unauthorised by the Committee, is not to be permitted. In the case of the now authorised local authorities' loans, however, such short-

term borrowing in anticipation of a subsequent appeal to the longer term capital market will be permissible provided the funds are needed to cover capital expenditure incurred before September 13th. It is interesting to note that the complete stoppage of new issue business allied to the abnormal A.R.P. and other expenditure incurred by local authorities has led to a big expansion in the raising of rates loans and other short-term accommodation by various local bodies.

**War Risks Insurance.**—The trading community's criticisms of the Government scheme for the war insurance of stocks have grown in urgency and vigour. In many cases the first quarter's premium, amounting to 1½ per cent. of the value of stocks, is in excess of available or liquid resources. The onerousness of the premium does not appear to be much alleviated, in the view of those who have to pay it, by the reflection that loss of stocks through enemy action would be a far greater calamity than payment of an insurance premium in advance. Moreover, not only the height of the premium rate but also some other features of the scheme have been under attack. One obvious deficiency was the failure to allow for any elasticity in the sum insured. The introduction of weekly declarations of stock values on quarterly policies and the granting of monthly policies with a fixed sum insured have now, however, removed this particular grievance. But there remains dissatisfaction at the compulsion to insure all stocks valued at more than £1,000. The issue last week of a list of goods now excluded from the scheme on the grounds of their indestructibility or unsaleability (e.g. coal, iron and steel of certain descriptions, certain objects of art) has not allayed this feeling. It seems plain, nevertheless, that a complete reversion from the principle of compulsion to that of voluntary insurance would, in the absence of such a complete system of differential rating as is impossible in this sphere, involve selection of risks against the State. On the whole, it now appears that any desirable concessions concern the height of the premium. In the first place, the projected revision of the rate at the end of the first quarter—completely overlooked in many circles where complaint is most bitter—might be anticipated by, say, one month; in the second place, some allowance might be made for variations in the turnover of stocks in different trades. The trader whose stocks move slowly certainly has a larger value at risk at any given time, but since this cannot be an actuarially accurate insurance scheme there is little point in purist objections to some mitigation of his premium payment.

**Forward Exchanges Again.**—After a suspension of three weeks, the forward exchange market has again begun to function this week. The Bank of England on Tuesday published a list of buying and selling rates for the more important foreign currencies. Transactions in the forward market must, as in the case of spot dealings, be made through an authorised dealer. They will only be allowed if the commercial character of the operation underlying the forward deal can be proved. The rates quoted hitherto are for one month. In the case of neutral currencies such as dollars, guilders and belgas the Bank of England is prepared to buy at par with the spot rate and to sell at premiums amounting to about 3 per cent. per annum. In the case of the French franc it is the selling rate which is at par while the buying rate is at 25 centimes discount,

**OTARD'S** EST. 1795  
V.S.O.P.  
**LIQUEUR BRANDY**

MATURED AND BOTTLED AT CHATEAU DE COGNAC

equivalent to about 1½ per cent. per annum. Most of these rates are likely to apply to a one-way market, and the readiness of the authorities to sell foreign exchange forward, on terms which cannot be regarded as abnormally expensive or considerably out of alignment with interest rate parities, must be deemed an assurance of the likely stability of spot rates at their present pegged level.

\* \* \*

**Surrender of Foreign Currency.**—In a statement this week in the House of Commons the Chancellor of the Exchequer announced that the compulsory offer to the Government of foreign exchange held by residents in this country must be made forthwith. The Regulation in question specified no date or time limit for such sales, because the order it contained was in the present imperative. The result of the Chancellor's statement has already become apparent in a considerable acceleration of the flow of foreign currency and gold coins to the authorities. Sir John Simon in his statement said that the regulation applied "to every person resident in the United Kingdom," and when pressed on this point in later supplementary questions he pointed out that foreigners resident here "ought to comply with this most important regulation." It is understood, however, that the Treasury has already granted complete dispensation from this regulation to all United States residents whose domicile in the United Kingdom has been less than seven years. This concession was the result of very strong protests made by official United States quarters here. As yet it has not been extended to nationals of other

countries, though at first sight this appears to be a matter where the "most-favoured-nation-clause" principle should apply. If this principle is not made to apply, the result will be the creation of ill-feeling for which the paltry amounts of foreign currencies collected by the Government from the foreign nationals concerned will be very inadequate recompense.

\* \* \*

**Australia's Exchange Control.**—The provisional scheme of exchange control hurriedly introduced in Australia on the morrow of the similar step taken here has during the past week been appreciably tightened up. This has been done by subjecting the whole of Australian export trade to an official licensing system. Under the Customs Act the export of all goods except under licence has been prohibited. As a corollary step exporters have been instructed to place the whole of the foreign exchange proceeds of their external sales at the disposal of the Commonwealth Bank. The conditions require the licensee to deliver shipping documents together with bills of exchange and other documents to the Commonwealth Bank or its agents. For this purpose and that of effecting the conversion of the exchange proceeds into Australian currency, the Australian trading banks have been appointed as agents. With the finishing touches thus being put to the Australian exchange control every Dominion, with the exception of South Africa, has now come into line with the scheme of control introduced in the United Kingdom on the outbreak of the war.

## MONEY MARKET NOTES

THE recovery of sterling in New York, noted towards the end of last week, has continued. Closing of the substantial bear position opened before the outbreak of war has been chiefly responsible for this improvement; and the pound has been quoted at around \$4.00 during most of the week, rising to \$4.01½ on Wednesday. No change has been made in the official London quotations for either U.S. or Canadian dollars. Among other currencies, belgas, Swiss francs and guilders weakened on Monday owing to uneasiness over German military plans in the West. The official quotation for belgas rose from 23.40-70 to 23.50-80; for Swiss francs from 17.55-75 to 17.60-80; and for guilders from 7.45-55 to 7.50-60. Belgas and guilders rallied slightly on Tuesday. Argentine pesos appreciated on the announcement that the Argentine Government's new official import rate has been fixed at \$15 to the pound sterling

for necessary foodstuffs and raw materials, the old rate of \$17 continuing for other imports.

\*

The Bank return shows few changes of importance compared with last week. The note circulation is down again, but the return of notes has been more than offset by a reduction of £1.6 millions in Government securities and of £5 millions in other securities. On the other hand, public deposits have fallen by £1.7 millions, so that bankers' deposits show very little change on the week. They are £7.2 millions higher than the figure given in the corresponding return of last year, which was issued at the height of the Czecho-Slovakian crisis.

\*

The price of silver remained unchanged until Thursday, when a big

drop of ½d. for spot and ¾d. for forward was shown. The covering demand has abated somewhat, but it was sufficient to maintain the price at 23½d. per ounce throughout the greater part of the week, in spite of sales from the Indian Government and from unofficial sources attracted by the present high level.

\*

Northern Ireland Treasury Bills, to an amount of £600,000, were placed recently at a rate of about 3¼ per cent. The extent of the present demand for bills may be measured by the fact that applications totalled over £5 million. The bills were a popular end-December maturity. Paisley Corporation has also placed some three-month bills, amounting to £100,000, for which the discount rate was 3½ per cent.

## MONEY MARKET RATES

# Investment

**The First War Budget.**—If the Stock Exchange sheltered any illusions regarding the first war Budget they have been rudely dispelled. The Chancellor—in marked contrast to his line of policy in April—has established the principle that war can only be won by a painful reduction in general consumption, and has taxed to hurt. The mixture of a stiff increase in income taxation, sweeping aside all preconceived ideas that 6s. in the £ represented the absolute maximum, coupled with substantial increases in sumptuary taxation (of which only the increase in the sugar duty hits an essential foodstuff) will be acceptable to most investors. Yet these increases cover a relatively minor part of the total burden of the cost of war, even in early stages. And there was already a peace-time legacy of £502.4 millions to finance by loan, apart from the further sum of £43½ millions which is to be met by borrowing. The figures are stupendous, and they can only be secured, firstly, by the diversion of expenditure on current consumption to the subscription of new defence loans, and, secondly, by the elimination of competition for new capital which might prejudice the paramount claims of the State. Sir John Simon emphasised that all sections of the community would be enjoined to respond to the appeal for subscriptions to new loans. By the apportionment of the quota between the small saver, the larger investor, and the institutional investor, the sums can be raised. In an ultimate sense, it is irrelevant whether they are borrowed or raised by taxation; the important point is that normal consumption of essential products can be diverted to assist the war. It is on this basis of calculation that the investor will approve, even if he does not relish, the Budget.

\* \* \*

**New Borrowing and Gilt-Edged.**—Sir John Simon contented himself with the statement that the present time was not opportune for the launching of a defence loan programme, and indicated that, when the time came, the appeal would be directed to the widest possible public. It is impossible to criticise either of these points. Clearly, the gilt-edged market at the moment is in no condition to absorb large loans. Pre-Budget dealings this week were slightly freer, partly on the stimulus of Mr Churchill's speech and partly on the lively expectation (confirmed on Thursday) that Bank rate would be reduced. But technical expedients by which purchases of certain "shorts" at several points above minimum levels were linked with sales of the "longs" at minimum prices have illustrated the unreality of the present minima. It is wholly undesirable that facilities should thus be accorded, in effect, for dealing in gilt-edged below minimum prices by methods well known in Great Portland Street, but not hitherto practised on the Stock Exchange. The hard truths of the Budget, however, dispelled any feeling of optimism. And the market was inclined to complain that although the Chancellor had given a full statement of his borrowing requirements, he failed to give the slightest clue regarding his prospective financial policy. The reduction of Bank rate will have afforded some general indication that the authorities intend to finance the war effort without impeding their objectives by slavish adherence to high interest rates. But that general indication deserves official confirmation at the earliest opportunity.

\* \* \*

**The Market's Reaction.**—The decisive phase in this week's markets was not the loosening of dealing conditions earlier in the week, but the tussle for predominance on Thursday between a stringent Budget and the reduction in Bank rate. It can hardly be said that the gilt-edged market has reached any new dealing basis as a result of the contest;

but it can be recorded that, whereas the impact effect of the Budget was again to freeze the market completely, lower Bank rate was followed by some tentative efforts to deal, and certain stocks—particularly Conversion 4½ per cent., whose relative strength has been in contrast to the remainder of the market—staged a moderate improvement. But during the greater part of Thursday no appreciable consequences for long-dated securities were to be observed. Again, although the indirect taxation imposed by the Budget had been largely discounted in the industrial market, the latter naturally remained cheerless after the disclosure of its new burdens. Imperial Tobacco, for example, declined from 5½ to 5¼, though a later recovery took the price to 5½ after the reduction of the Bank rate. This must be regarded as a meritorious performance for a share which has been exposed to two taxation increases in five months, and—as a tax-free dividend payer—is vulnerable to the increased rate of tax. The course of leading gilt-edged and industrial prices this week is shown in the following table:—

| Description                        | Minimum Price | Sept. 21, 1939 | Sept. 22, 1939 | Sept. 23, 1939 | Sept. 26, 1939 | Sept. 27, 1939 | Sept. 28, 1939 | Yield % |

† Free of income tax.

Broadly speaking, the direct Budget victims have behaved manfully in face of their new burdens. The E.P.T. will take a large slice of any increased profits in those industries which are fortunate enough to secure them. There may be some "spill-over" of profits to the equity investor after taxation and controls have done their part. But, on the evidence of the Budget alone, there is very little ground for the too frequent distinction drawn—to the prejudice of the latter—between equities and gilt-edged in wartime.

\* \* \*

**Budget Victims.**—The slimming process, however, will be a painful one, not merely for the private investor, but also for many of the consumption trades which have provided such satisfactory investments in the past. Retail trade, in the widest sense, must suffer. Perhaps the fate of this week's Budget victims is an omen of burdens in store for other trades. It is popularly supposed that beer taxation was already at an effective maximum—though the argument owes more to the vagaries of the trade cycle than to ultimate fiscal truth. But the penny on the pint must affect consumption—that is its point. It is impossible to guess the effect upon consumption, though experience in the 1931 emergency Budget—for what the parallel is worth—is enlightening. As a result of the penny increase in September, 1931, plus the emergence of trade depression, consumption of beer fell from 25,047,000 bulk barrels in 1930-31 to 22,217,000 barrels in 1931-32. Moreover, the brewing industry will face increased costs due to higher taxation on sugar,

higher prices for hops, and increased transport costs. In particular areas—steelmaking centres and heavy industrial districts—increased purchasing power may offer an antidote to these depressing factors. For the tobacco industry, the second increase of 2s. per lb. in the tobacco duty within five months must upset all calculations. The growth of the industry into a supplier of a conventional necessity has been assisted by improved quality and low prices. Demand must inevitably be seriously checked by the rises in duty alone. And for the manufacturers the fall in sterling must imply a considerable increase in the cost of leaf tobacco, which must be equalised over a period of years. Finally, the sugar industry is perhaps most fortunately situated, for it is sufficiently homogeneous to pass the duty to the consumer, and its product is an essential commodity whose consumption, in normal times, shows comparatively small response to variations in prices or the national income.

\* \* \*

**Gross and Net Yields.**—The composite income-tax rate of 7s. in the £ which the Chancellor of the Exchequer proposes for the current fiscal year involves a recalculation of the conversion factor for translating net into gross yields, and *vice versa*. For expressing free of tax yields on a gross basis, it is necessary to multiply the net return by 1.538. Conversely, to reduce a gross yield to a tax-free basis, it is necessary to multiply by 0.65. It may be questioned, perhaps, whether the declaration of dividends free of tax will be so widely practised in future. Obviously, many companies will be tempted to follow the lead given by Courtaulds in 1936, and make the transition from tax free to gross dividends. To maintain any given rate of tax-free dividend, when the standard rate of tax has been basically increased from 5s. 6d. to 7s. 6d. in the £—with no necessary guarantee of permanence—would prove a costly matter. Certain preference shareholders will also be affected by the new rate, in cases where their dividends are payable free of income tax up to 6s. in the £—the previous maximum. A selection of typical examples with a comparison of gross yields on the two bases is given below. The yield at the higher rate of tax gives effect to the full relief of 6s.:—

| £1 shares or units           | Price,<br>Sept. 27,<br>1939 | Gross Yield %                         |                                       |

| Vickers 5% .....             | 23/9                        | 5 16 2                                | 6 0 7                                 |

Further investment complications will arise by the adjustment of tax deductions at source from dividend payments, in order to establish a joint rate of deduction of 7s. in the £ for the fiscal year, on both interim and final dividends.

\* \* \*

**Excess Profits Tax.**—The replacement of the Armaments Profits Duty (itself a sop to the public conscience, rather than a determined fiscal instrument) by a general Excess Profits Tax, based on the same principles of computation, completes the systematic curtailment of consumption and should assist the prevention of any inflationary dangers arising from the defence borrowing programme. The yield of the new tax will be negligible during the current year, but in succeeding years its importance may rival that of the income tax itself. Until fuller details are available in the Finance Bill, E.P.T. must be described by analogy with A.P.D. The £200,000 arms turnover criterion, characteristic of A.P.D., of course disappears. The criterion for E.P.T. is an excess of profits over those of one of the following alternative periods: the

year 1935; the year 1936; an average of 1935 and 1937; or an average of 1936 and 1937. These optional base periods are fair, in a sense in which the first version of N.D.C. was not fair, for they represent a level of earnings close to the cyclical peak. This point is clearly shown in the following table of index numbers of profits for leading industrial groups:—

| PROFITS INDICES, CALENDAR YEARS (APPROX.) | 1935 1936 1937 1938 |      |      |      |
|-------------------------------------------|---------------------|------|------|------|
|                                           | 1935                | 1936 | 1937 | 1938 |
| Breweries .....                           | 100                 | 109  | 116  | 111  |
| Iron and steel .....                      | 100                 | 134  | 178  | 187  |
| Motors and aviation .....                 | 100                 | 128  | 143  | 137  |
| Oil .....                                 | 100                 | 136  | 165  | 152  |
| Rubber .....                              | 100                 | 165  | 298  | 181  |
| Building materials .....                  | 100                 | 112  | 117  | 110  |
| Food, provisions, etc. ....               | 100                 | 102  | 103  | 102  |
| Electrical equipment .....                | 100                 | 121  | 144  | 142  |
| Miscellaneous industrial .....            | 100                 | 113  | 123  | 112  |
| All companies .....                       | 100                 | 114  | 129  | 120  |

Any excess over the best option available to the traders concerned is accordingly clearly established as due to benefits of war, and 60 per cent. of that excess will be absorbed by the State. Details of the manifold adjustments in respect of new businesses and increased capital will doubtless be forthcoming later, although in view of the generalised character of the tax it is to be presumed that exceptional depreciation on capital extensions effected since January, 1937 (which was fixed at 10 per cent. under A.P.D.), will not be conceded. The incidence of the tax on individual companies cannot be calculated at this stage; moreover, it may be noted that, if E.P.T. calculated on this basis falls below the amount due for National Defence Contribution, the latter will remain payable—a point of importance to those companies which show no growth in profits during war.

\* \* \*

**Local Mortgage Offers.**—While gilt-edged prices are maintained at the prescribed minima, there is no index of the true level of current interest rates. That fact would not necessarily be disadvantageous in a market which is now subject to close, if not totalitarian, control. There is no flow of new issues to test the market's real conception of the current rate of interest. To that extent the control exercised by the Capital Issues Committee is effective, and not unwelcome, for the primary task, as all investors recognise, is to finance the war-time borrowing programme. But for some reason best known to the authorities, the new issue control does not extend to local mortgages. Such borrowers are free to issue mortgage obligations, usually of a strictly short-term character, at highly attractive rates of interest. There are two reasons why this form of finance is undesirable in present circumstances. First, it permits a local authority to scale the barrier to the capital market; secondly, the local mortgage, particularly if it carries a high rate of interest, is a debilitating instrument of local finance, and an encouragement to the creation, through the "tap," of a large volume of short-dated and costly debt, which may prove difficult to renew. Such is the pressure for funds, however, that outside houses are actively offering loans of local authorities, usually for fixed amounts, and at highly attractive rates. A list published this week includes the following items:—

| Amount       | Borrower              | Rate        | Term |
|--------------|-----------------------|-------------|------|
| 50,000 ..... | Gateshead .....       | 4½          | 3    |
| 50,000 ..... | W. Hartlepool .....   | £4 16s. 3d. | 5*   |
| 45,000 ..... | Welwyn Garden City .. | 5           | 6    |

\* Subject to mutual break at end of third year.

The first two loans are available to trustees, and all are offered in multiples of £1,000. All are doubtless sound

securities in their class. It is the method by which they are issued, and the threat to any stability of market rates of interest if that method should be extended, which is open to reservation. Returns such as those shown above for ultra-short-dated securities must, if unchecked, prejudice the entire structure of interest-rates. Meanwhile, those authorities who can demonstrate the most pressing urgency of their financial needs can presumably meet those needs with the assistance of the Local Loans Fund.

## Company Notes

**Thomas W. Ward Results.**—The reduction in Thomas W. Ward's interim dividend in the spring of this year from 3½ to 3 per cent. had already prepared shareholders for a decline in profits from the "abnormal level" of 1937-38—to quote the chairman's description at the meeting last October. The accounts published this week show trading profits of £193,225 for the year to June 30th after working expenses and taxation, against £241,698 in the previous year. This 20.2 per cent. setback, on which the directors' report offers no comment, no doubt indicates a fairly general decline in the company's extractive, productive and merchanting activities towards the end of 1938, which subsequent industrial recovery to June apparently failed to make good. After allocating £45,576, against £56,601, to depreciation and making provision for preference dividends and the 5 per cent. (tax free) dividend on employees' shares, a surplus of £101,637 results, compared with £139,897 the year before. The directors, possibly deriving encouragement from the present outlook, have recommended a liberal dividend of 10 per cent. on the ordinary shares (covered with an earnings margin of 2.7), against 12½ per cent. in the previous year, when the margin was 4.8 per cent. A transfer of £15,000 is again made to reserve, and £105,940 is carried forward, against £99,053 brought in. Profits for the past three years are analysed below:—

|                        | Years to June 30 |           |           |
|------------------------|------------------|-----------|-----------|

† After charging working expenses and taxation. ‡ Including 2½ per cent. special bonus.

According to the balance sheet, sundry creditors (which includes provision for charges, etc.) shows a considerable decline from £644,458 to £559,435, while general reserve now stands at £135,000. The company is apparently continuing its policy of employing liquid resources to the full. Land and buildings are now valued at £595,225, against £562,919, while shares in subsidiary companies have increased from £339,943 to £542,409. The latter figure excludes the Triumph acquisition, which was announced earlier this month. Stocks show a considerable fall from £1,056,144 to £706,295. Both the company's fixed assets and its stocks are well distributed geographically in the present emergency, and the latter probably avoid liability, to some extent, under the War Risks Insurance (General Exceptions) Order, 1939, from the commodity insurance scheme. The wide scope of the group's activities, which now extend over the whole field of essential war industry from cement and, potentially, through the Triumph acquisition to aircraft manufacture, should ensure satisfactory profits. The £1 shares are quoted at 18s. 9d.

**Rover Company Profits.**—Shareholders have every reason for satisfaction with Rover Company's operations for the difficult year which ended August 5, 1939. Net profits, as disclosed in the preliminary statement, amounted to £205,957, after depreciation, compared with £168,938 for the previous year, and thus increased by almost 22 per cent. The directors point out that, except for a small fee received for operating a shadow factory, the whole of the year's profit has been earned in the motor-car business. Clearly, the company has adequately maintained its position in the medium-priced car market in this period. Taxation again requires £70,000, leaving earnings of £135,957 available for the ordinary shares against £86,938. The directors are therefore able to repeat last year's 15 per cent. dividend and to supplement it by an additional 2½ per cent. cash bonus. Since the latest year's earnings have increased from 19.2 to 30.1 per cent. this distribution is still cautious, as the circumstances dictate. War contingencies reserve receives £50,000 and £55,233 is carried forward, against £48,446 brought in. The company's prospects now depend upon the adaptation of the company's plant to armaments work, and upon the supplemental assistance to profits provided by the shadow factory. But they will undoubtedly be assisted by the £50,000 allocation to war reserve and by the company's liquid position. The directors' comments on the difficulties of the present period of transition and on the long-term prospects of the company will be awaited with interest.

\* \* \*

**Harrisons and Crosfield's Outlook.**—Mr Eric Miller's survey of the past year's results of Harrisons and Crosfield strengthened the general satisfaction with the accounts, for all sections of the business made their due contribution to profits. The special interest of Mr Miller's speech, however, lay in the light which it might shed on prospects of the rubber and tea industries in war-time. Mr Miller's survey of the outlook, however, was necessarily limited in scope, for it is too soon fully to assess the effects of war on the plantation industries. There is no likelihood of any shortage of tea, but it is important that other consumers of tea, such as the U.S.A., Canada and Australia, should be able to obtain their normal supplies from the East. As for the rubber industry, Mr Miller expressed surprise that U.S.A. manufacturers had allowed their rubber stocks to decline to an abnormally low level, and considered that this policy had been partially responsible for fluctuations in the quota. The Regulation Committee, however, should have no difficulty in fulfilling its function, in Mr Miller's view; war activities were likely to call for more rubber. In 1937 and 1938, Germany, Austria and Czechoslovakia imported an annual average of 110,000 tons (for comparative purposes it may be noted that world exports in 1939 are estimated at 970,000 tons), but further supplies are unlikely to reach the Reich. Poland took nearly 8,000 tons in 1938, and supplies to continental neutral countries would presumably be rationed according to need. But although the data at present is slender, the war-time outlook for rubber and tea producers may be provisionally regarded as relatively hopeful.

\* \* \*

**Qualcast Dividend Policy.**—The Qualcast general meeting was to have been held last Tuesday, but owing to the war the directors have postponed the meeting until a later date—at present unspecified—when the directors' recommendations will be made. Meanwhile, the next best course has been adopted: the accounts have been issued, and though no actual recommendations for final dividend and transfers to reserves are made, the report shows, for information only, the proposals that would have been made in normal times. The following table sets out the profits figures, but it must be emphasised that, so far as distribution is concerned, the final ordinary dividend, general

reserve allocation and carry forward are shown for purposes of record only and are not definitive:—

|                                  | Years ended June 30 | 1937   | 1938   | 1939    |
|----------------------------------|---------------------|--------|--------|---------|
| Profit, after depreciation, etc. | £                   | 74,900 | 80,070 | 97,553  |
| Taxation                         | £                   | 10,747 | 13,245 | 26,359  |
| Expenses                         | £                   | 10,804 | 12,345 | 15,212† |
| Prof. dividend                   | £                   | 3,970  | 3,872  | 3,915   |

|                  |   |        |        |         |
|------------------|---|--------|--------|---------|
| Ordinary shares: |   |        |        |         |
| Earned           | £ | 49,379 | 50,608 | 52,067  |
| Paid             | £ | 32,461 | 33,676 | 10,875* |
| Earned %         |   | 45.6   | 45.1   | 47.6    |
| Paid %           |   | 30.4   | 30     | 10*     |

|                 |   |        |        |           |
|-----------------|---|--------|--------|-----------|
| General reserve | £ | 25,950 | 25,000 | (22,750)‡ |
| Carry forward   | £ | 47,882 | 39,814 | (36,288)§ |

\* 10 per cent. interim only; final dividend in abeyance, 20 per cent., costing £21,967. † Including £1,494 A.R.P. and £462 patents bought. ‡ Of which 7½ per cent. on old capital. § In abeyance.

During the year to June 30th last, Qualcast acquired nearly the whole capital of Follows and Bate, who were competitors in the lawn-mower business, and also took over the lawn-mower department of another business. The Follows and Bate accounts cover eighteen months, so as to synchronise them with those of the parent company. As a result of these changes, it is accordingly difficult to pass judgment upon the £17,483 increase in total profits. But shares in subsidiaries at cost have risen from £15,158 to £95,845, and in relation to the apparent outlay on the Follows and Bate shares, the results suggest that the expansion of interests has enhanced the results of a satisfactory year. Until the revised recommendations of the directors are made known, however, the main interest of the accounts must necessarily be concentrated in the balance sheets. The parent company's balance sheet discloses a number of important changes. Interests in subsidiaries are £103,864 higher, debtors total £64,389 against £40,298, and there is an increased holding in Government securities. As the Follows and Bate purchase involved the issue of only 3,000 Qualcast 5s. shares, the cash position has entirely changed, in spite of a fall in stocks from the exceptional level of £108,408 to £70,913. Compared with cash holdings of £60,102 a year ago, there is now an overdraft of £47,891, on which interest has been charged before striking the total profits figure. For the first time, a consolidated balance sheet is presented, which shows total assets of £516,220—a figure which differs only slightly from the parent com-

pany's total assets. It is satisfactory that no value is attributed to goodwill and trade marks. On the whole, the results are satisfactory, though the cash position, as well as the war, may have played some part in the final dividend decision. Qualcast 5s. shares stand at 18s. 9d.

\* \* \*

**Horlicks Setback.**—It is hardly surprising that this patent food and beverage manufacturing company records rather disappointing results for the year to March 31, 1939. Profits, after debenture interest, depreciation and other expenses, have declined from £243,099 to £191,717. This fall of 21 per cent. is apparently due to political uncertainties and increased costs. Taxation requires £61,938 compared with £77,327 in 1937-38, and the earnings percentage on the ordinary stock thus shows a fall from 43.7 per cent. to 34.3 per cent. The directors, however, again recommend a final dividend of 16½ per cent., which maintains the full year's distribution at 30 per cent. In consequence, only £15,000 is put to reserve in the latest year, compared with £50,000 for the previous year, and £20,449 is carried forward against £19,554 brought in. The balance sheet shows an expansion in plant and machinery from £202,215 to £253,236, while stocks have increased from £106,099 to £144,773. Investments, however, have fallen from £621,473 to £568,486. Though the prospects for the company must necessarily be somewhat obscure in wartime, there should be a satisfactory demand for a well-advertised food product both from the forces and from the public. But whether these possible supports to the company's turnover will prove sufficient to offset rising costs is another question. The 5s. ordinary stock units are quoted at 20s.

\* \* \*

**The Week's Company Profits.**—Our usual analysis of profit and loss accounts appearing on page 626 covers 27 companies, whose latest net profits show a 6 per cent. fall to £1,199,000 against £1,274,000. Aggregate net profits of 1,786 companies reporting in 1939 to date are £223,359,000, and are 8 per cent. lower than the total of £242,679,000 earned by the same companies a year ago. The week's results are discussed in preceding Notes and on page 615 under the heading "Shorter Comments."

## THE STOCK EXCHANGES

### London

Note: All dealings are for Cash

THE main factor this week has been the Budget, and in the absence of fresh war developments, business became subdued in the earlier part of the week. Turnover was small, and prices tended to drift downwards from sheer neglect. Paradoxically, the tone was distinctly better immediately before the Budget speech, and the general impression is that the effects of fresh taxation had been adequately discounted. The lowering of Bank rate softened the blow for markets. It became possible to deal again in four or five leading gilt-edged stocks, and ordinary shares recovered their initial losses.

Earlier this week, the gilt-edged market remained in a state of inaction, interest being confined to the Conversion 4½ per cent., which was dealt in just comfortably above the minimum. But on Wednesday there was considerably more freedom of dealing on hopes of a Bank Rate reduction and on bear covering before the War Budget. On the lowering of Bank Rate to 3 per cent., gilt-edged

confidence recovered sufficiently to permit of freer dealings. Conversion 4½ per cent., which closed at 101½ on Wednesday, and opened at 101 on Thursday morning, had recovered to 101½ by the close.

Foreign bonds lacked uniformity, though they had on the whole a steadier appearance in mid-week after a poor beginning. The trend of European issues was mostly lower, while there was occasional support for Japanese and Argentine bonds. Home rails were quietly firm at first on hopes of an announcement of Government compensation terms. Demand for the ordinaries and marginal stocks became relatively brisk towards mid-week, and the prior charges attracted business at or above their unofficial minima. One of the main features of the railway market, however, was demand for Canadian Pacific on expectations of increased freight activity.

There was little activity in industrials up to the time of the Budget, and though there was some recovery in prices towards mid-week—after a previous tendency to drift—the increase in business was very tentative. Adequate

allowance, however, had been made for possible taxation proposals, and the market withstood the shock of a merciless Budget very well.

Iron and steel shares again showed the uncertain trend that has been in evidence since war started. Small losses were widespread on Tuesday, but there was a firmer tone in mid-week. Coal shares lost ground, though Wm. Cory rallied on Wednesday. Electrical equipment issues ruled lower on the whole, and the number of transactions was small. Motor issues made a mixed showing, as there was no clear trend, and demand was selective. Rover responded to the good results. Aircraft shares were again quiet and only slightly changed. Textile and rayon shares proved steady if uninteresting. Breweries, apparently discounting increased taxation, had a firm appearance this week, while tobacco shares after some nervousness on Monday became imbued with a similar optimism and advanced accordingly on Tuesday and Wednesday. The stores group slipped back early in the week, led by Woolworths, but later wiped out some of the losses, while Cerebos was a firm feature among pro-

vision and catering issues on Wednesday. Shipping shares, apart from general fractional improvements on Tuesday, have moved irregularly. Further weakness was displayed after the week-end by the miscellaneous group, but the trend was reversed on Wednesday, with Imperial Chemicals, British Oxygen and Dunlop firm features. The response of industrial shares to the combination of the Budget and lower Bank rate was not wholly unfavourable. Many initial losses on Thursday were more than regained by the close.

\*

Oil shares made a good showing after the week-end led by "Shell." An easier tendency developed on Tuesday, despite only limited trading of a professional character in mid-week. Some of the earlier losses were recovered. Trinidad issues were a firm feature all week. Rubber shares have been quiet this week, the setback in the commodity price on Tuesday occasioning only limited liquidation. Tea shares have been dull pending the Budget announcement and the Government scheme of tea marketing in war time.

In the mining market business has been difficult to negotiate this week, light selling pressure being sufficient to cause somewhat severe marking down in prices. On Monday, producing affairs moved irregularly but Sub Nigel and Geduld were weak features. The downward movement developed towards mid-week, assisted by rumours of French liquidation. Developing issues followed the general trend. Finance issues have been particularly weak, led by General Mining and Gold Fields. Leading West African issues, though never really tested, have held their ground all week. Among base metals, Rhodesian copper shares were first adversely affected by a moderate volume of selling, and though a half-hearted rally developed on Tuesday, prices slid back later in quiet trading. In shares have moved irregularly, and a particular trend developed.

### ACTUARIES' INVESTMENT INDEX

THE Actuaries' Index of fixed-interest securities for September brings out interesting comparisons with the crisis month of September, 1938. Industrial debentures and preference shares, which are not subject to minimum prices, show a greater relative fall both since August and since September, 1938, than Old Consols. It is hoped at publication of the Actuaries' index, now temporarily suspended, will shortly be resumed. The customary monthly particulars of fixed-interest securities are given as follows.

| Group (and No. of Securities) | Prices (Dec. 31, 1928 = 100) |               |                |
|-------------------------------|------------------------------|---------------|----------------|

## SHORTER COMMENTS

**Company Results of the Week.**—Satisfactory progress is shown by HORSELEY BRIDGE and THOMAS PIGGOTT and by STOTHERT AND PITT, who both pay higher dividends. Total profits of the former company are £106,824 against £87,365, though there is a reduction in net profits owing to higher taxation. RANSOME AND MARLES BEARING COMPANY report a substantial increase in sales, and there is some improvement in earnings. The setback in J. HEPWORTH AND SON net profits from £86,156 to £66,143 is somewhat sharp, but the 5 per cent. dividend is repeated. Though there is no alteration to the 20 per cent. dividend, net profits of ASPRO, LTD., amount to £181,341, against £168,260.

# Industry and Trade

**Employment and the War.**—The outbreak of war has naturally caused some dislocation in industry. There has been an abrupt decline in the activity of a number of trades ministering to the consumer, especially luxuries, and an acceleration of output in the defence sector of industry. The effect on insured employment was a fall of 76,000 in the number of unemployed males between August 14th and September 11th and an increase of 175,000 in the number of females on the registers of unemployment exchanges. The increase in unemployment among women has been accentuated by evacuation. So far as individual industries are concerned, unemployment has shown an increase in the hotel and boarding-house and distributive trades, and in the entertainments, sports and fishing industries. Increases are also reported from the furniture, tailoring, dressmaking and millinery trades, from some of the textile trades, and from the motor industry. On the other hand, there has been a further improvement in the coal-mining, iron and steel, engineering and ship-building industries. Since September 11th, unemployment in the consumption goods industries is understood to have shown a further increase, while a number of trades engaged on war work have been hampered by the difficulty in obtaining banking accommodation.

**Unemployment in Key Industries.**—As a result of the rapid expansion of the industries supplying the means of warfare since the beginning of this year unemployment has been substantially reduced and, in many cases, virtually eliminated. The following table shows the number of persons engaged in selected important industries in July, 1938, together with the percentages unemployed in August, 1938, and August, 1939:—

|                                        | UNEMPLOYMENT IN IMPORTANT INDUSTRIES |                         |                         |
|----------------------------------------|--------------------------------------|-------------------------|-------------------------|
|                                        | No. insured July, 1938 ('000)        | Percentage August, 1938 | Percentage August, 1939 |
| Coal-mining .....                      | 858                                  | 18.0                    | 11.1                    |

| Hand tools, etc. ....                  | 32                                   | 17.8                    | 9.1                     |
| Explosives .....                       | 30                                   | 3.4                     | 2.9                     |

In a number of industries, including pig iron, steel melting and rolling, and tinplates, unemployment has been more than halved in the past twelve months, while in the chemical and explosives trades, as well as in general and electrical engineering, in the motors, cycles and aircraft section, and in electric cable and apparatus manufacture the percentage of insured persons unemployed was already below 5 in August. This does not mean, however, that output cannot be further increased; thus the Amalgamated Engineering Union has agreed to dilution, which should enable output to be speeded up. Moreover, a substantial proportion of the capacity of some of these trades is still employed on civil work and could in case of need be diverted to military ends.

**Coal Production in War.**—Consultations are taking place between representatives of colliery owners and miners and between the industry and the Government, with a view to increasing the production of coal. In the last war over 250,000 miners enlisted, or nearly one-fourth the personnel in August, 1914, and although nearly 75,000

persons were in this period drafted into the industry, largely from other employments, the production of coal in the United Kingdom in 1915 was only 253.2 million tons, compared with 287.4 million tons in 1913. Meanwhile, inland consumption had increased from 189 million tons to about 200 million tons, and as a consequence of the fall in production at a time when inland consumption as well as the bunker requirements of the Allied Fleets (then coal-burning) were increasing, neutral countries had to be severely rationed. Far-reaching changes have taken place during the past twenty years in the structure, output capacity and in the nature of the coal trade. There are now only about 2,000 mines at work, compared with over 3,000 in 1913; while the number of persons employed has been reduced from over 1.1 millions to less than 770,000; moreover, during the first half of the current year production was at the rate of about 236 million tons per annum, compared with 287½ million tons in 1913; and the quantity exported as coal, coke and patent fuel (in terms of coal) was at the rate of 51 million tons, compared with 98.3 million tons. By the Schedule of Reserved Occupations, and by the provisions of the Armed Forces (Conditions of Service) Act and the National Service (Armed Forces) Act, the Government has taken steps to ensure that the man-power essential to the industry shall not be unnecessarily diminished, and arrangements between the Minister of Labour and the War Office have led to the temporary demobilisation of key men from the Territorial Army and to the return of others who had enlisted for full-time A.R.P. work or taken up Government contract employment. It is difficult to say how far it may be possible to reopen pits at which operations have been suspended, to reopen collieries which have closed down, to employ miners who have been for years out of work, and to reduce the normal rate of absenteeism. These questions are now being investigated, but the need for an increase in coal production is imperative, and it is particularly gratifying to know that the industry itself has never before been so united in its desire to serve the national interest.

**Cotton Trade Wages.**—Although no definite action has yet been taken, several meetings of the cotton trade unions have been held in Manchester this week, and it is fairly certain that within the next few days the operatives in all sections of the industry will make an application to the employers for higher wages. Individual employers have already been approached by their workpeople for concessions and in some cases an advance has been granted. For a long time before the outbreak of war the scarcity of labour, especially of young persons, has been a serious problem in the cotton industry, and the shortage has been accentuated during the last few weeks, as many of the operatives have attempted to leave the mills in order to secure the higher wages paid in the National Services or in other trades. It is understood that some managers of mills have offered inducements to employees at other factories to transfer their labour. In the circumstances it is expected that the employers will have to grant a general increase in wages. Negotiations are also continuing on the subject of working hours during the winter months. It has been proposed that operations should be restricted to daylight hours, but manufacturers engaged on Government contracts who have made the necessary arrangements to black-out their mills are not prepared to agree. Arrangements are being made to appoint joint committees of representatives of the employers and the trade unions to discuss the necessary changes in working hours and conditions.

**Sheffield's Steel Production.**—Compared with 1918, Sheffield's capacity for steel production has increased by at least one-half. Measured by value, the city's steel output

has more than doubled, for a much higher proportion of the total production is now worked up into high-priced articles such as precision tools. Trade in Sheffield's own specialities—alloy and stainless steels—is increasing rapidly. Manganese steel, for instance, invented in Sheffield nearly forty years ago, is in great demand for dredging machinery, coal screens and conveyors, tramway points, and other uses in which resistance to wear cannot be countered by lubrication. Stainless steel is being used to an increasing degree in household and canteen fittings, and the first stainless steel lifeboat was exhibited last year in Glasgow. Greatly increased quantities are now required for all types of tools and for various kinds of armaments. In spite of enlarged production the demand for acid and basic billets cannot be satisfied. Railway engines and wagons and commercial road vehicles are in very strong request and orders are rapidly coming in to hand for quarry and cement machinery, for heavy shipbuilding steel, and for steel sheets for civil defence. The restriction of imports of timber is likely to increase the pressure on the steel-making capacity of this country, and Sheffield will probably produce this year some 1,800,000 tons of steel, mostly of the very valuable types, compared with an output in 1913 of only 800,000 tons.

**August Imports by Commodities.**—The preliminary overseas trade returns for August, which were noted on page 578 of last week's *Economist*, revealed that compared with a year ago, there was a considerable rise in the value of imports and a smaller rise in the value of British exports. The increase in imports was due partly to a larger

intake of meat, wood and timber, wool, iron and steel manufactures and machinery. There was a noticeable fall in the exports of iron and steel scrap, railway materials and locomotives, but exports of pig iron and ferro-alloys, of textile piece goods, of wool tops and of paper showed considerable increases.

**Fish Again at Billingsgate.**—At the outbreak of war it was decided to bring immediately into effect the plans for the decentralisation of the distributive side of

the fish industry. These plans, which were based on the expectation of heavy air raids on London and other ports immediately war was declared, provided for the setting up of a number of inland fish distributive centres and for the allocation of fish merchants and buyers to the appropriate centres. The natural difficulties which beset any such scheme of decentralisation were aggravated by the small supplies of fish available and by the difficulties of transport due to interrupted train schedules, to the commandeering of vehicles and to the black-out. Further, the allocation of fish to the different centres gave rise to many complaints, since the types of fish demanded by fish friers are quite different to those required by the high-class fishmonger. During the fortnight that this experiment was in force its effect was shown chiefly by the dearth of fish, and the announcement that the Ministry of Food had decided to abandon the scheme was greeted with general approval. Regulation of fishing boats remains, together with powers to control prices in the event of a shortage. Meanwhile, the fish market has been reinstalled at Billingsgate and the customary auctions have been resumed at the fishing ports.

**Supplies from the Dominions.**—To prevent an interruption in the normal flow of food supplies the Ministry of Food has taken over the task of providing the main foods for the civilian population. In order to compensate for the expected fall in imports from the Baltic and North Sea countries, farmers in this country have been called upon to grow more food, and the Dominions, who have seen in the last six years one limit after another placed on their exports to this country, have also taken up with enthusiasm the task of supplying the British population. The New Zealand Government, which already controls, through its Dairy Products Marketing Department, the export of the main New Zealand products, has reserved for the British market all the surplus food produced. The Australian Government has taken over the 1939 wheat harvest and is negotiating with the British Government over the selling price of the entire wool clip. The Canadian Government has announced that it will supply to the United Kingdom as much of the surplus wheat as is required, and has set up an Exchange Control Commission to regulate the import and export trade. Since all these Dominions in recent years have been concerned with the problem of excess productive capacity of the staple foods such as grains, meat and fruit, a rapid increase in production can be expected. Provided, therefore, that the loss of ships can be kept down, it seems likely that the Ministry of Food will not be called upon after the first few months to allocate rations for a diminished food supply, except possibly for special commodities such as bacon. The problems of internal transport and of distribution to a scattered population may indeed be eventually of more importance.

**Trade of Neutral Countries.**—During the last week in August and the first in September most of the European countries took steps to bring their import and export trade under the control of the State; an outline of such legislation has been given week by week in the *Board of Trade Journal*. In order to conserve home supplies of foods and other important commodities, all European neutrals prohibited temporarily their export; some States also set up an import monopoly of these types of commodities. Exports of armaments have been entirely prohibited by the States concerned in their manufacture. A second step has been the control of exports to belligerent countries, which has involved the setting up of licensing departments and trade councils of the important industries concerned. Countries with large mercantile fleets such as Norway and Holland have also instituted insurance against marine war risks. Measures have also been necessary to control more closely dealings in foreign exchange and foreign securities; the fall in the value of sterling in the last month has further intensified the financial difficulties of foreign trade for the Baltic and Scandinavian States.

## INDUSTRIAL REPORTS

**BROADLY**, there has been a recession in industries ministering to the consumer in recent weeks, while defence work has been speeded up further. The growth of the defence sector of British industry, however, has not been sufficient to offset the decline in civil work. The home demand for coal has shown a tendency to expand, partly because of the desire of householders to lay in stocks before rationing becomes effective. The iron and steel industry, too, is rapidly expanding its output in order to meet the increase in demand, mainly for defence purposes. Further details concerning the general trend of business and the position of individual industries will be found in the *Trade Supplement* published with this week's *Economist*.

## Coal

**Sheffield.**—The inland market is very strong, and prices firm. Steam-raising smalls are in sharp demand, but stocks are ample for all requirements. Household buying has been heavy in anticipation of rationing, and utility undertakings are calling for heavy deliveries under contract. Coking smalls are fully taken up as a result of the demand for blastfurnace coke, and patent oven and central heating qualities are moving freely. Export business is being arranged under licence, prices being about a shilling above those ruling at the outbreak of war.

★

**Newcastle-on-Tyne.**—The market is fairly steady; export licences are granted fairly freely, but at the present there is no scarcity of any class of coal. Patent oven coke is in good demand from neutral countries, but most makers are fully booked. From midnight last Friday Northumberland steam prices for export were increased 2s. per ton to 21s. per ton for prime large steam coal, with singles and doubles at 19s. 6d. per ton f.o.b. A similar increase has been made in Durhams for export, which brings prime coking coal up to 22s. 6d. per ton and gas coals up to 21s. per ton f.o.b.

★

**Glasgow.**—Full-time activity continues in the Scottish coal trade. Home business, in particular, is on an extensive scale, and several collieries are arranging to increase their outputs. The position will, no doubt, ease once the rationing arrangements for domestic consumers come into force, as the recent demand has been largely for stocking purposes. Public utility undertakings, both in the land-sale market and on coastal shipping account, have also taken in extra tonnages. The shipping market is steadily adjusting itself to the new conditions, but is on a restricted basis, partly as a result of the extreme pressure in the home market. New export price lists have been issued involving increases ranging from 1s. 6d. to 2s. 6d. per ton f.o.b. This increase is due partly to higher wages and increased costs of pitwood, but it is also

a co-ordinating movement to align the prices of the various districts.

★

**Cardiff.**—The market is rapidly settling down under the emergency regulations. Production suffered through enlistments and the migration of a number of craftsmen to other war-time employments, but the Government is co-operating with the industry with a view to improving the labour position. There has been a substantial increase during the past week in the quantity of coal shipped at the South Wales docks, and more neutral tonnage has been available for employment. In the inland trade industrial deliveries are regular and plentiful, but there are still delays in supplying domestic orders. In the rationing of supplies several administrative details have still to be adjusted, notably the determination of "basic" quantities and their relation to actual consumption rather than to the dates of purchases in each of the quarterly periods. In the consideration of such matters there is close and active co-operation between the Mines Department, the Chamber of Coal Traders, and the Central and District Wholesale and Retail organisations, and it is expected that these problems will be solved without much difficulty.

## Iron and Steel

**Sheffield.**—The restrictions imposed by Government control of iron and steel are reflected in the market. Attendance appears to be more for discussion than for transaction of business, but difficulties are being rapidly smoothed out. There is a better demand for all types of pig iron. Supplies of basic steel billets are still behind users' requirements, and pressure for other steel materials is fully maintained.

Production of steel in this district is at a very high level, but steps are being taken to increase it still further. High quality steels are in specially urgent demand. Good supplies of iron and steel scrap are available. Maximum prices have been arranged for most classes, but with certain exceptions sales and purchases are exempted for the time being from licence requirements.

★

**Glasgow.**—Intense activity is maintained in every branch of the iron and steel trade in the West of Scotland. Steelmakers are overwhelmed with work on orders already on the books and there is in addition a constant stream of new orders from shipbuilders and from the various engineering trades, not only in this district but from all parts of the country. Sheet makers and other re-rollers are working continuously and present stocks of raw material are sufficient for immediate requirements. At the same time stocks of semis and other material are quickly being absorbed, but it seems to be generally accepted that further supplies will be available in sufficient quantity to ensure continuity of operations. Improvement is maintained in the light castings trade and full time working is general.

**Cardiff.**—The heavy branches of the iron and steel industry in South Wales continue to be fully employed and the re-rolling branches are as busy as the supply of raw materials allows. In the tinplate trade production under the pooling scheme has recovered to 70.38 per cent. of capacity, and the licensing regulations governing exports are now operating smoothly. Under the revised schedule of scrap prices heavy cast iron has been raised from 60s. 3d. to 65s. 3d. for East Wales and 67s. 9d. for West Wales; light scrap iron from 55s. 3d. to 60s. 3d. and 62s. 9d., respectively, while good cast iron machinery has been raised from 75s. to 75s. 9d. per ton. There is no abatement in the heavy pressure of the demand for sheets.

★

**News from Abroad.**—Uneasiness is still prevailing on international steel markets. The main obstacles in the way of contracting and carrying out orders are the transport conditions and costs and the reluctance of shipowners to contract freights. Even transactions between neutral countries are often subject to these difficulties, and American exporters, who entered the market on the outbreak of war on a large scale, are not entirely satisfied with the actual execution of sales transactions. A certain improvement has recently taken place, but the insecurity of the seas continually raises new problems. Prices also contribute to the unsatisfactory conditions, both from the point of view of sellers and from that of buyers who, owing to the instability of freight and insurance costs, are not in a position to calculate their actual c.i.f. costs. Belgian sellers have abandoned sterling quotations, and are trying to find a new level which meets the circumstances.

The distribution of exports among the large steel exporting countries will undergo considerable changes during the war, certain features of which are already discernible. Thus, Germany will cater largely for the Eastern European countries and will endeavour to maintain her supplies to the Baltic countries in order to secure foreign currency. Germany's former overseas customers, however, will have to draw supplies, as far as possible, from the Western European countries, and, to a larger extent, from the United States.

## Textiles

**Cotton (Manchester).**—Although many difficulties have been experienced in arranging price and delivery, many producers have sold freely at figures which show a distinctly wider margin of profit than a month ago. In most sections of the industry a sellers' market has been established. American prices show little change, but there has been a rather sharp fall in rates for the Egyptian staple in Liverpool. There have been substantial sales of American yarn, especially coarse counts. The question of delivery has tended to become more acute, and some spinners have refused to sell without a guarantee from customers that the material is wanted for Government contracts. Egyptian yarns have been purchased in limited lots, but spinners complain that

it is difficult to secure sufficient orders from home users to equal the lost export trade. Demand for piece-goods has been persistent. Home trade buyers have wanted to ensure future supplies of standard makes and some considerable transactions have been arranged. The stronger position of spinners and manufacturers is apparent in practically all sections of the industry.

★

**Wool (Bradford).**—During the past fortnight there have been important developments in connection with wool control. Last Monday the trade was officially informed that the Department was in further need of a large supply of medium crossbred tops, etc., to cover important orders for war fabrics. Also, that if and when a higher scale of prices was announced the raw materials taken over would be subject to such increase.

During the past three weeks sellers have refused to deal as control prices for many qualities of wool and tops are regarded as totally insufficient for anyone to make even a small profit. In addition, the British Government has made overtures to the Commonwealth of Australia to purchase the current clip, and the impression prevails that higher prices will have to be paid than the control prices here, in which case an increase will be made in the latter. Although wool and tops are controlled, yarn and piece-goods can be sold at any price spinners and manufacturers care to quote. Mills are still exceedingly busy.

★

**Jute (Dundee).**—Subject to licence, members of the jute trade can now transact business in all sections of the industry. The control of prices has been temporarily suspended, after three weeks of idleness. Spinners' and manufacturers' prices are as yet undetermined as there is still much uncertainty in regard to raw material prices. Jute brokers are offering the fibre for sale at about £30 to £31 per ton for Daisee-2/3 for October/November shipment, but with all the surcharges for war risk insurance, expected increase of freight, etc., it may cost many pounds per ton more by the time the material arrives in spinners' warehouses. The authorities can order a steamer to discharge its cargo at any port, and the buyer must pay the additional cost of transit from that port to Dundee. Calcutta goods also come into this category and buyers are rather chary of buying for shipment at to-day's prices, which are 31s. 8d. for 10-oz. 40-in. and 26s. 8d. for 8-oz., October/November/December shipment. Spinners and manufacturers are all very busy on orders on hand. It will probably take some days before the market can settle down under the new conditions and definite prices can be established. Meantime, they are all nominal.

## THE COMMODITY MARKETS

The commodity markets have not yet settled down to the new conditions, and trading in many materials, especially those controlled by the Government, remains difficult. There have

been no major price changes this week, either in this country or in the United States. In the absence of sufficient data it is still not possible to resume the calculation of *The Economist's* price indices. Moody's index of the prices of sensitive commodities in the United States (December 31, 1931 = 100) fell slightly from 171.1 to 170.7 during the week ended Wednesday. Among commodities in which dealings are comparatively free in this country, raw cotton and tin are virtually unchanged on the week, while rubber was slightly cheaper.

## Metals

A new order of the Ministry of Supply has laid down that licences will be needed in future for the delivery of copper, lead and zinc required in Government contracts, as in other work. Scrap from these metals is not covered by the licensing system, and maximum prices apply only to zinc scrap. Deliveries of semis will not require licences.

Trading in copper, lead and spelter on the London Metal Exchange is still suspended, and the maximum prices have remained unchanged.

★

**Tin.**—The tin market has been less active. Last week's rise in the tin quota for the September quarter was followed by a wave of selling, which was accentuated by an announcement from the Ministry of Supply that the maximum price of £230 per ton must include the cost of war risk insurance. As a result, the standard cash price fell to £227 15s. per ton, the lowest price since mid-June, on Friday last. The three months' forward price fell at one time to £227 10s. Since Monday selling has ceased, and although demand remained small the cash price has recovered to £229 10s. per ton and the forward price to £227 10s. per ton, representing an improvement of 10s. in cash and a loss of 5s. in forward. An announcement is expected shortly regarding sales of tin in this country and the Straits Settlements. In the meantime British dealers have been permitted to trade with the United States market at a reasonable profit. In New York the September price advanced late last week to well above 70 cents per lb., but in the meantime a reaction has taken place, and on Wednesday the price was quoted at 65 cents per lb.

## Grains

DEALINGS have not yet been resumed. Deliveries of English wheat from farms are proceeding slowly; from August 1st to September 23rd deliveries totalled 574,000 cwt., compared with 1,786,000 cwt. in the corresponding weeks of the previous season. Sales of barley and oats are also small. At Antwerp, No. 2 Northern Manitoba on passage has been quoted at 44s. 2d. per quarter (excluding war risk insurance) and Rosafloat at 38s. 2d. per quarter, including insurance. It has been announced that the United States has resumed payment of the wheat export subsidy, but the amount of the subsidy has not been disclosed; the Minister of Agriculture has advised farmers, notwithstanding

the European war, to keep their wheat sowings within their allotted acreage, so that the authorities in the United States clearly do not envisage any shortage of supplies in the coming year.

WORLD SHIPMENTS OF WHEAT AND FLOUR ('000 quarters)

## Other Foods

**Provisions.**—During the week, the two price grades of butter have been abolished, and the retail price of all types has been stabilised at 1s. 7d. per lb. Maximum wholesale prices remain unchanged for other provisions. Fish supplies are still short, but the reopening of Billingsgate has eased the problem of distribution. Difficulties still occur with the distribution of meat, but the new scheme is now in working order.

★

**Colonial Produce.**—Higher prices were paid for good grades of Costa Rica and Kenya coffee, and cocoa prices also rose during the week. Sugar prices were unchanged during the week, but were marked up on Thursday with the increase in duty.

## Miscellaneous Commodities

**Oils and Oilseeds.**—It was hoped that official prices would become effective from last Monday, but their introduction has again been delayed, probably until the first week of October. Trade at current prices (the average of those ruling in the week ended September 2nd) is very limited. There is still some delay in the granting of delivery permits even for urgent transactions. Good accounts are received of the condition of the new Argentine linseed crop.

★

**Rubber.**—During the past week the market has been irregular, and business has been on a small scale. Prices in New York fell sharply during the week, with some reaction on the London market, but the American rubber prices are still considerably higher than those in London.

## LONDON ACTIVE SECURITY PRICES AND YIELDS

NOTE: Yields on British Funds, Dominion and Colonial Government, Home Corporation, and Public Board Stocks are based on minimum prices shown without allowance for accrued interest. Approximate dealing prices on September 21st and 27th are given in left-hand columns. In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption: where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

| Approximate Dealing Prices 1939 |          | Prices, Year 1939 Jan. 1 to Sept. 27, inclusive |         | Name of Security           | Price, Sept. 27, 1939 | Change since Sept. 20, 1939 | Yield, Sept. 27, 1939 |     | Name of Security | Price, Sept. 27, 1939 | Change since Sept. 20, 1939 | Yield, Sept. 27, 1939 |        |       |

## OIL OUTPUTS

Anglo-Iranian Oil Company, Ltd.—  
Production in Iran for the month of  
June, 1939, amounted to 828,000 tons.  
The total production for the period  
January 1 to June 30, 1939, was  
5,060,000 tons.

The Attock Oil Company, Ltd.—  
Controlled production for August, 1939,  
5,598 barrels.

The British Burmah Petroleum  
Company, Ltd.—Output for August,  
1939, 55,319 barrels.

British Controlled Oilfields, Ltd.—  
Total output week ended August 26, 1939,  
18,505 barrels; total output for August,  
1939, 86,079 barrels; total shipments for  
August, 1939, 59,571 barrels. Total out-  
put for week to September 2, 1939,  
19,397 barrels; total output for week to

September 9, 1939, 19,682 barrels. Total  
output week ended September 16, 1939,  
19,458 barrels. Total output week ended  
September 23, 1939: 19,773 barrels.

Dacia Romano Petroleum Syndicate,  
Ltd.—Gross output for August, 1939:  
Dacia, 1,137 tons; Perimeter X, 2,643  
tons; Starnapha, 323 tons.

Trinidad Consolidated Oilfields, Ltd.—  
Output for August, 1939, 41,561 barrels.

## THE ECONOMIST BUILDING SOCIETIES

SATURDAY, JULY 1, 1939

## INTERESTING . . .

to the discriminating investor is the news that restrictions on investment in the Abbey Road Building Society can now be relaxed. The Society's policy of financing only the best type of mortgage business has been so successful that the following wider opportunities are now available:—

● Sums up to £1,000 can be invested in share accounts where the yield is 3½% net and free of liability to Income Tax.

● Sums up to £5,000 can be invested upon Deposit (at three months' notice) to bear the yield of 2½% net.

● No investor in the Abbey Road Building Society has ever lost a penny of his capital—a £1 at the Abbey Road is always worth 20/- plus accrued interest.

 Abbey House, Baker Street, London, N.W.1

## Impregnable Financial Strength OF GREAT BRITISH BUILDING SOCIETY

Year by year, million by million, the assets of the Woolwich Equitable Building Society increase. These assets are secured on land and house property in all parts of Great Britain. In addition to such widespread security over £3,500,000 is held in ready cash and Trustee securities.

To-day, with assets amounting to the record figure of more than £40,000,000 and reserves and undivided profits exceeding £1,800,000, the stability and financial strength of the Woolwich Equitable Building Society are assured for years ahead.

TOTAL ASSETS OF THE SOCIETY:—

## Progress and Problems

DURING the past twelve months the building society movement has been confronted with more than its due quota of problems. Some of these have been of a general character, common to all financial institutions in a year of recurrent political crisis. But even these influences have struck the building societies with peculiar effect, firstly because they borrow short and lend long, and secondly because their mortgage investments are subject, like all property, to the incidence of war risks. There has been evidence of concern on these points in an accentuated, though only slightly accentuated, removal of funds on the part of some shareholders and depositors from the societies. And if the war risks factor did not exert a noticeable effect upon the volume of new advance business last year, there is no lack of indication that it is now having more marked consequences.

These problems would be sufficient fully to occupy the deliberations of building society leaders. But the year has also included a *cause célèbre* and the introduction of two Bills in Parliament affecting building societies. The case of Bradford Third Equitable Benefit Building Society *versus* Borders was discussed at length in *The Economist* of February 18, 1939. But one of the questions which it raised—the responsibility of building societies for building standards of property on which advances had been made—had already given rise to rumblings of discontent in certain areas. The “mortgage strike” is a new, and unwelcome, feature of a difficult year. Mr Justice Bennett’s decision in the case provided an indirect confirmation that the taking of collateral security in connection with mortgages based on adequate security of property was proper, but the matter was clearly so important that the issue had to be put beyond all doubt. That is one of the principal objects of the Government’s Bill, which is now in its concluding Committee stages. The Bill also attempts to make provision for safeguarding the mortgagor in respect of the quality of the property which he has purchased, and an important amendment moved only this week by Mr Walter Elliot will undoubtedly strengthen these safeguards. Building societies themselves, being concerned in law only as lenders, strongly resisted the object of Miss Ellen Wilkinson’s Bill, which sought to impose upon the societies the responsibility of warranty in respect to

the quality of houses on which they advanced funds.

These matters, and others scarcely less important, form the subject-matter of the present survey of the building society movement. It is the third in a series—earlier issues were published on April 11, 1936, and April 23, 1938—which has devoted special attention to current building society problems, and has attempted to throw new statisti-

cal light on the development of the movement’s finance and business. Some of the methods of calculation employed on later pages are unique, and there is much material in the summary table relating to the financial development of 108 leading societies since 1925 which is new, and which, unfortunately, cannot be adequately examined in a survey of the present length. For students of building society affairs its usefulness will be none the less apparent.

Amid these difficulties, however, the movement has once again proved its capacity for uninterrupted growth. T

have achieved an increase in mortgage advances in so difficult a year as 1938 is itself a testimony to its energies. The official figures relating to the growth of total assets, mortgage assets, shares and deposits, are charted above and set out in detail in the following table, together with the record of mortgage advances since 1929:—

(£ millions)

|            | No. of Societies | Total Assets | Mortgage Assets | Shares | Deposits | Mortgage Advance during Year |
|------------|------------------|--------------|-----------------|--------|----------|------------------------------|
| 1929 ..... | 1,026            | 312.7        | 268.1           | 250.2  | 38.9     | 74.7                         |
| 1930 ..... | 1,026            | 371.2        | 316.3           | 302.8  | 44.6     | 88.8                         |
| 1931 ..... | 1,013            | 419.2        | 360.2           | 341.8  | 50.4     | 90.3                         |
| 1932 ..... | 1,014            | 469.3        | 388.4           | 380.9  | 61.5     | 82.1                         |
| 1933 ..... | 1,013            | 501.1        | 423.5           | 395.5  | 75.5     | 103.2                        |
| 1934 ..... | 1,007            | 555.6        | 476.2           | 424.3  | 97.3     | 124.6                        |
| 1935 ..... | 999              | 602.0        | 529.7           | 447.2  | 114.8    | 130.9                        |
| 1936 ..... | 985              | 656.2        | 586.6           | 480.7  | 128.4    | 140.3                        |
| 1937 ..... | 977              | 710.4        | 636.4           | 517.5  | 143.3    | 136.9                        |
| 1938 ..... | 971              | 758.9        | 686.8           | 548.3  | 155.7    | 137.0                        |

These are striking figures, financially. But they are more than a document of social progress and economic impetus. After a period of extremely rapid development a breathing space may afford the movement an opportunity for self-examination. It would emerge honourably from the test, but perhaps strengthened in its purpose to serve the community—and particularly the small saver and property purchaser—with even greater zeal than in the past.

# The Building Societies Bill

Now that the Government's Building Societies (No. 2) Bill has nearly concluded its committee stages, it is possible to appraise its broad effect. Its title derives from the fact that it was preceded by Miss Ellen Wilkinson's Bill, which obtained a first reading but was automatically suspended by the introduction of the Government's measure. This Bill has its origin in certain issues raised in the case of Bradford Third Equitable Benefit Building Society v. Borders, in which the defendant questioned the right of the plaintiff society to take collateral security for a mortgage advance, and also challenged the legality of what are known as "pool" agreements between building societies and builders-vendors of mortgaged property.

Although Mr Justice Bennett (whose decision was discussed in *The Economist* of February 18, 1939) found it unnecessary to do more than express an opinion, without pronouncing judgment, that such transactions were not *ultra vires*, the issue was of such paramount importance to building societies, since it affected thousands of mortgage contracts in all parts of the country, that the Government decided to place the question beyond doubt by giving statutory sanction, retrospective and future, to collateral and pool business.

The main purpose of the Bill—to validate by statute the taking of collateral security, and pool arrangements—had the assent of all parties, who recognised that these practices had materially assisted the acquisition of homes by persons of moderate means. But this authorisation was subject to conditions giving rise to strong opposition. A sub-section restricting the basic loan under a pool arrangement to 75 per cent. and the additional (collateral) security to 20 per cent. of the purchase price for which an advance is made was contested, and an increase of the basic limit to 80 per cent. was urged. The lower figure has been adopted, however, on the ground that less responsible societies might endeavour to secure business by offering a basic advance exceeding that which more prudent societies would be prepared to allow.

Clause 4, however, has perhaps attracted the greatest controversy. It provides that:—

Where a society makes to any person an advance for the purpose of its being used in defraying the purchase price of freehold or leasehold estate, the society shall be deemed to warrant to such person that the purchase price is reasonable.

Then follows an apparently conflicting proviso:—

Unless, before any contract requiring such person to repay the advance is entered into, the society gives to such person a notice in writing stating that the making of the advance implies no such warranty.

On publication of the Bill, the Government had immediately been notified of the uncompromising opposition of building societies to this clause, which, in their view, placed upon them an unjustifiable responsibility, having regard to their position as mortgagees. They realised that the proviso afforded the means of evading the responsibility implied by the opening sentence, but they objected in principle that a lending institution should be held liable in any circumstances for matters regarding which builders and vendors must ultimately carry the responsibility. And because the right to contract out was given, Miss Wilkinson and other members were equally opposed to the clause, on the ground that the apparent protection given to the borrower with one hand was withdrawn with the other.

And yet, by reason of its contracting-out proviso, the clause may be regarded as a protection to the borrower, by those who have complained that the borrower has been misled by the belief that, if a building society is prepared to lend, say, up to 80 per cent. of the purchase price of his house, it must be worth the money. If societies avail themselves of the contracting-out clause—as they naturally will—the borrower will know that the build-

ing society valuation on which the mortgage advance is based is no necessary indication of the "reasonableness" of the price he is paying for the property. Moreover, it is further safeguarded in this respect by another clause which provides that the character and amount of any collateral security which is taken shall be disclosed to the borrower before the mortgage contract is executed.

Miss Wilkinson sought to substitute for this warranty clause an amendment requiring building societies to give to mortgage borrowers an unqualified guarantee that the premises were erected and completed in an efficient and workmanlike manner, of good and substantial materials, and in compliance with the byelaws of the local authorities; and that the premises were, at the date of the advance, in all respects reasonably fit for human habitation. Her contention was that building societies' arrangements with builders are such that they could not avoid some measure of responsibility for work and materials which are later found to be inferior. The impossibility of obtaining the required data when societies have had no opportunity of inspecting a house during its construction—and many applications for mortgages relate to houses completed actually in the occupation of borrowers—proved fatal to this proposal. Hence the warranty clause, with its contracting-out proviso, stands part of the Bill.

The clause leaves untouched those other institutions and corporate bodies—insurance companies, friendly societies and banks, and also private individuals—which engage in mortgage business, and an amendment to bring these, or some of them, within the provisions of the clause, was ruled out of order.

Clause 4 also makes it a penal offence for any person, or his agent, who, having a financial interest in the disposition of property, represents to an intending mortgagor (whether with fraudulent intent or not) that the making of an advance by a society implies assurance that the property is sufficient security for the loan. This drastic provision, while intended to safeguard mortgagors from unscrupulous advisers, was contested by an amendment designed to safeguard persons acting honourably and reasonably, and to penalise only the making of statements known to be false or deceptive, or the concealment of material facts. This amendment was negatived, but the Solicitor-General has promised consideration of the position of unauthorised persons who might make representations of this character. On this understanding the clause was added to the Bill, but only by the casting vote of the chairman.

Despite its implications, no society, careful of its reputation and its interests as mortgagee, can object to Clause 5, which imposes upon directors the duty of taking care to ensure that in selling property which has fallen into possession "the price at which it is sold is the best that can reasonably be obtained." It links with another clause, in which directors and officers are warned against dereliction of duty or trust, and is apparently intended to guard against the possibility of collusion between mortgagees (as vendors) and buyers, or the operation of a ring of speculators who depute only one of their number to buy property and then, when it is re-sold at an enhanced price, divide the profit. There are, however, certain objections to a suggestion that details of such foreclosures and sales, with, possibly, the names of defaulters, should be open to public inspection. It will probably rest with the Chief Registrar to prescribe what details of all such transactions shall be sent to him.

Because of its bearing on a very general business practice by building societies, Clause 6 required clearer definition from the outset. It prohibits the offer or payment by a society, or by its officers or agents, of commission for the introduction of mortgage business to "any person" having a financial interest in the disposition of property which is

the subject of a mortgage advance. Many societies—notably the larger ones—are largely dependent for mortgage business upon introductions by solicitors, surveyors, and estate and commission agents, to whom fees are paid for their services. Such societies would resent the prohibition of what they regard as legitimate business, and that resentment is shared by members of the professions concerned. On the other hand, certain societies—especially those that cannot afford to pay commissions—might have welcomed the removal of a form of competition which they are unable to meet. By a Government amendment, however, the ban upon the offer of commission will not apply in relation to payments made to an agent "engaged or retained by a society in the ordinary course of its business." The importance of the clause turns upon interpretation of the expression "any person having a financial interest" in property offered in mortgage.

Clause 7 places upon every director or member of a society's committee of management the duty of seeing that the security taken in respect of an advance shall be assessed by a competent, experienced and prudent person in order to ensure its adequacy. The clause raises the question of valuation in its general aspect. A society's first consideration, in surveying property offered in mortgage, is—or should be—to ensure a margin of security for the protection of investors whose money is being used for the loan. There is no arbitrary method by which this calculation is made. Some societies have staff surveyors; others depend on the advice of practical members of their directorates and may call in expert professional opinion for large advances. Others, again, engage valuers in particular districts, where knowledge of local housing conditions may seem essential. There is nothing in the clause to prohibit any of these methods of valuation, and it appears to be rather in the nature of a reminder to directors that their duties in this respect must be taken seriously. This is emphasised by a provision in clause 8, which imposes liability upon directors and officers of societies in respect of any negligence, default, breach of duty or breach of trust of which they may be guilty.

An amendment to Clause 7 was carried, however, against the Government's advice, which would require a society which proposed to make an advance to report in writing to the intending borrower, specifying whether the house was in a good and tenable state of repair, whether or not the quality is reasonable (in relation to the purchase price) and whether or not the house was constructed in compliance with local by-laws.

The question whether any report regarding the quality of a property should be given to a borrower, and at what stage, has, in fact, occupied much of the Committee's time. A Government amendment to Clause 7 may be regarded as the reply to the amendment just described, although at the moment it stands part of the Bill. Under the later amendment a borrower could obtain a copy of the building society's record showing the amount at which

the property was assessed, the person who made the assessment, and particulars of any additional security taken by the Society. In other words, the information would not, under this clause, be available to an intending borrower but only *ex post facto* to persons who had already borrowed.

On Tuesday this week the Minister of Health moved a new clause, intended to reconcile the general view of the Committee that something should be done to safeguard building standards with the building societies' contention that this responsibility rests primarily upon the building industry. A system of house certification is contemplated under the new clause, which empowers the Minister of Health to approve "certain bodies" whose objects include the improvement of building standards. Such bodies would regularly inspect houses during erection and would issue certificates stating that the standard of building was in accordance with their standard specifications, which themselves would have to be approved by the Minister. Proper arrangements would also be required to indemnify purchasers against any loss if the building did not conform to the certified standard.

The first object of the clause, therefore, is to encourage intending house-purchasers to require certification, although until a sufficient demand for such facilities is encouraged the setting up of approved bodies may prove a somewhat lengthy process. The second object is to put the building industry on its mettle. These objects are encouraged by special facilities which the building societies will be able to give, under the clause, for advance business under "continuing arrangements" concerned only with certified houses. The release limit for collateral security would be raised from 66½ per cent. to 70 per cent., and the maximum term of years from 20 to 23. Such concessions would probably make for a material, though not excessive, reduction in the borrower's weekly repayments.

The schedule of the Bill prescribes as authorised classes of security which may be taken as collateral (1) a charge upon a life insurance policy, not exceeding its surrender value; (2) a guarantee by an insurance company; (3) a guarantee by a public authority; (4) a deposit of money with a lending society, or lodgment under lien of trustee investment stocks; (5) a personal guarantee by a third party—say, a father for a son—supported by tangible security; and (6) any other form of guarantee backed by tangible security. These forms of additional security are, in fact, in accord with general practice.

As this survey goes to press, the Bill is still under consideration by the committee. Its examination, clause by clause, has been marked by a good deal of contentious, though not obstructive, criticism. Building societies will have a measure which, while still open to objection on certain points of principle, confirms their position in vital matters of practice, affords some protection to mortgage borrowers, and in no respect impairs the confidence of shareholders and depositors in the security of their investments.

## Building Societies and War Risks

(By a Correspondent)

MODERN warfare is no respecter of persons or property. The raiding aeroplane, if recent experience in Europe and Asia can be taken as a guide, makes little discrimination between military and non-military objectives, and under present day conditions of warfare ordinary dwelling-houses are exposed to danger from enemy attack. Since these constitute the physical security for almost the whole of the building societies' mortgage assets, the incidence of war risks is an important factor in contemporary building society policy. In a substantial sense, however, this is not a problem which is peculiar to building societies or one which can be divorced from wider considerations of national policy. At least, the effectiveness of the national defences, both as a deterrent against and as a protection in an emergency must be related to the question of possible damage.

To this extent, the notable improvement in the country's position is reassuring. Admittedly, this is mere generalisation. But it is far from easy to advance beyond generalisation in discussing any aspect of the problem, since the discussion, happily, concerns a hypothetical war—a limitation which should be borne in mind in reading what follows.

The building society embraces two broad and distinctive groups of individuals—namely, investors and borrowers. How, in the first place, would the investor be likely to fare? In an actual emergency the first Government move, in regard to financial institutions, would, no doubt, be to enact a moratorium covering the preliminary phase, following the precedent of the Great War. Apart from this, however, building societies mostly enjoy the protection of at least one month's notice before investors' funds need

be repaid and the rules usually prescribe that thereafter withdrawals shall be met according to priority of notice; though it may be assumed that most societies would aim at meeting without delay all moderate demands for cash. This in itself would provide a useful breathing space. There would be some acceleration in withdrawals, but it may be doubted whether they would in the main be such as to require resort to very exceptional procedure. The building society investor, whether judged by the September crisis of last year or any similar test, exhibits traditional steadiness; and assuming the investor did withdraw, he would be faced sooner or later with the unenviable task of seeking a satisfactory alternative investment medium. It is hardly possible to anticipate whether, and in what degree, the Government might limit the freedom of action of investors at large, but in any event the fact that building societies chiefly cater for the small investor would doubtless be given due weight.

Reason might well fortify convenience, however, in inducing the investor to leave the greater part of his funds undisturbed. The dwelling house, reinforced by the borrower's personal covenant, constitutes the chief security for the investor's funds. At the beginning of the year the Chancellor of the Exchequer made an important statement outlining the Government's policy with regard to damage to property in war time.

The Government, rightly recognising that any scheme on a pure insurance basis would be impracticable, has accepted the principle of national responsibility in this matter. In brief, it is proposed that compensation shall be provided from public funds at the conclusion of hostilities, within certain limits and according to the nation's remaining resources. The building societies welcomed this announcement so far as it went, since they had urged the substance of this policy upon the Government during the preceding two years. It was recognised, however, that the Chancellor's statement represented little more than a definition of principle, leaving much that was doubtful on questions of detail. These doubts have not yet been removed, though any well conceived attempt to do so would be widely appreciated. Perhaps the widely-supported motion table this week in Parliament that a Joint Committee of both Houses should be set up to report on a scheme of compensation may produce more precise results.

Despite the doubts on points of detail, however, the acceptance of the principle of national responsibility represents a safeguard which should not be under-rated. Its application to building society operations in particular will be obvious. But this is not to say that the security of the societies' funds under emergency conditions is exclusively based on the Government's scheme of compensation. The larger societies, which operate on a national basis, enjoy the advantages which accrue from the dispersal of their mortgage securities over the greater part of the country, while some other societies, although their securities are relatively concentrated, serve localities which are not regarded as vulnerable. Again, few societies have any appreciable proportion of their mortgages in the more vulnerable centres of areas with large population, since the new house building in which they are largely interested tends to be on the circumference. Indeed, it is clear that many societies have a distinct advantage over a large number of industrial undertakings, whose property is often highly concentrated in urban centres.

The societies' physical security, however, is reinforced by

the borrowers' personal covenant; and it is the borrowers' repayments which provide the income from which investors derive their dividends and interest. In other words, we have reached the second part of the inquiry. What reactions might an emergency have on borrowers and their capacity to maintain their repayments? Although modern warfare is totalitarian warfare, it is still true that only a proportion of the population would be enrolled on active service and receiving service rewards; and in the case of building society borrowers the percentage involved, when allowance was made for age distribution, would probably be less than proportionate. Admittedly, many would be engaged in connection with civil defence and the like, but it has already been announced that these would receive rather more than subsistence allowances. Thus large numbers of borrowers would be receiving an income which would bear some not wholly unreasonable relationship to their building society commitments. In fact, under emergency conditions, family income, rather than individual income, would be the more relevant criterion of capacity, whatever may be the position normally.

On the other hand, in suitable cases the societies could smooth any genuine difficulty by temporarily suspending capital repayments, the borrower paying interest only; in these circumstances, typical wage-earning households would often be required to pay a maximum of, say, 10s. per week. The Chancellor of the Exchequer has intimated that arrangements would be made to protect the interests of borrowers on active service, etc., but the precise form of the arrangements is not known. In some instances employers would doubtless supplement service pay and family allowances; and here, as elsewhere, family income, together with the habit of sharing accommodation which is especially prevalent in war time (and in which the advantages of newer property in outer areas would be marked) would assist in preventing insurmountable difficulties.

In short, there would be an extremely wide range of borrowers with an income which, in conjunction with any special temporary arrangements that might be made to lighten the repayment burden, could be considered to safeguard the societies against any substantial embarrassment in regard to revenue. Of the wider economic reactions of a war, the principal point which need be made is perhaps that the rise in the price level, which would be its inevitable corollary, would serve as a cushion so far as property values were concerned—a material advantage if the societies had in fact to exercise their mortgage powers extensively. In any event, most societies have considerable reserve funds which would stand them in good stead in an emergency. The borrower who sustained damage to or the destruction of his property would of course be eligible for compensation under the Government's scheme. His obligations as a mortgagor have been the subject of recommendations by the Lord Chancellor's Committee on the Responsibility for the Repair of Premises Damaged by Hostilities, but from the mortgagee's standpoint, the compensation scheme is the vital element.

Despite the unknown quantities which are inseparable from this discussion, both the building society investor and borrower should under war conditions be spared major difficulties and embarrassments. Both may therefore view their present position with a corresponding degree of confidence. Comparison with the Great War has its limitations, but it is significant that the building society movement emerged virtually unscathed from that searching test.

## More Houses for Fewer People

WE have reached something like a turning point in post-war building history. It is not simply that the possibility of war has involved policies affecting the whole structure of risk, contract and financial accommodation upon which building progress has lately been erected. Nor is it because the threat of aerial attack involves special defence constructions as well as the redistribution to some degree of

population and businesses. These are the immediate repercussions of a near-war situation. But there are longer term issues, quite apart from the precariousness of peace.

The impetus of the greatest building boom in recorded history has not yet died down. But the triumph marked by the completion this year of the four-millionth house built since the war has its warning as well as its welcome.

Branches and Agencies throughout the Country.

side. Eight years ago an official estimate was made of the number of houses that would be needed in the next ten years to provide for increased population, the replacement of obsolete houses, the clearing of slums and the relief of overcrowding. The estimated number needed was already built over two years ago, and there can be little hope that the need to make up an actual shortage of houses will provide a large-scale demand for new building in years to come. The slack has been taken up just at the moment when the chief topic of debate among forward-looking expert observers is the impending decline in British population. So far, house-building activity has been maintained remarkably well despite authoritative forecasts of a falling-off, but it would be foolish to ignore the fact that the statistical portents point to a downward trend in the quantitative demand for dwelling houses.

This is not to say that the building industry has to anticipate a sharp slump in the near future. There are many reasons for supposing that the rate of building does not simply depend upon the rate of increase of the population. Since 1934, for instance, the marriage rate has risen appreciably and there is, accordingly, still a growing number of young married couples looking for new homes. Moreover, the pace of building since the war has always been in excess of the rate of increase in the population. Between 1921 and 1937 the number of families in this country, that is the number of private households, increased by as much as one-fifth, while the population rose by only 8 per cent. The number of persons, it has been estimated, per private family was 4.17 in 1921 and 3.61 sixteen years later.\* It is this fanning out of the population into smaller family units that has largely accounted for the unprecedented building activity of the past decade or so. This means that the problem for the future is whether this thinner spreading of the population can persist when the increase of the population itself halts and then ceases.

Here the problem is precisely that of industries offering consumers' goods to the home market. How is it possible to find new types of purchaser, to tap new sources of demand? It is a characteristic of post-war building that it has fallen into two classes. There has been, on the one hand, the house building of private enterprise largely to cater for the needs of the middle and wealthy classes, and there has been, secondly, the subsidised building of local authorities to cater for working-class families. The task now is to bridge more securely the gap between these two realms of demand.

Since the depression of the early 'thirties there have indeed been evident signs that private enterprise building has increasingly narrowed this gulf. To-day, just under half of the outstanding assets of building societies are valued at under £500 apiece and something like two-fifths come into the class between £500 and £1,000. The average value of new mortgages has indeed changed but little in the last ten years, but their composition has altered. On the one hand, the proportion of large mortgages has increased; on the other, the value of the smaller properties covered by mortgage accommodation has declined. The proportion of mortgage assets valued below £500 has steadily risen since 1932, and there can be little doubt that an important part of the continued boom in building has been due to the rôle played by building societies in making it possible for the better-paid artisans and clerks to purchase their own homes. What is needed now is to carry this trend still further.

The future of building, and of the activities which are ancillary to building, therefore, rests to a large degree upon the possibility of bringing still lower the minimum income limit at which the heads of families can buy their own houses. If we look at the housing estates which consist of subsidised dwellings we can easily see what needs must be satisfied if these municipal estates are to be used as feeders for a renewed flow of private enterprise building. There are the families whose wage earners have "got on" in trade or industry and who want to change their subsidised dwellings for houses of their own. At present the gap

between what they pay now and what they would be called upon to pay for housing independence is too often too great. Secondly, there are the newly married couples who do not desire the three-bedroomed houses which predominate on the subsidised estates. Thirdly, there are the parents whose families have grown up and gone away; they again want small but pleasant accommodation, and too often their needs are not qualitatively met by the municipal estates†.

The lesson is clear. What is needed now to maintain building activity is not so much consideration of quantity on the part of builders as consideration of quality. It is not so much the number of houses that promises to count as the kind of houses. The building boom of the Great Recovery after 1932 was due to an increase in the number of families separately housed rather than to the increase in the population. It represented a remarkable rise in British housing standards. But it was a middle-class movement. It was the relatively well-off people with family incomes of over £5 a week who benefited. If house-building is to boom in the years to come it is the working class who must in turn be enabled to spread themselves more thinly over the dwellings available. The mere growth of population will not maintain building because the population is not going to grow for much longer. It is its redistribution in smaller, more comfortable, more human and more civilised households that can continue to keep the builder busy.

To do this will mean catering for households whose chief wage earners bring in not £5 to £10 a week but £3 to £4. A typical working-class estate of subsidised houses, for example, shows† that last year the average weekly wages of the chief earners were under £3 in the case of one-seventh of the families; between £3 and £4 in the case of two-thirds; and over £4 for the rest. It shows that the weekly *per capita* income of families with two to four members was between £1 and 25s. and that the weekly *per capita* income in families with five members or more ran between 10s. and £1. It is into the upper and middle reaches of these people that private enterprise building must penetrate if the remarkable vigour of the past few years is to be retained and renewed. At the least, it is necessary to provide houses to buy (and financial accommodation for buying) for heads of families earning something like £4 a week. In short, it is needful to carry still further the marked trend towards catering for poorer people which is already evident in the record of private building and building society finance. Cheap houses to buy, as well as cheap houses to let, are—with higher incomes—the order of to-morrow.

It is hardly time yet for pessimism about the future of building. There is no reason to suppose that what has been done so successfully for the upper and middle classes since the war will not prove possible of achievement for some part at least of the working classes in the next decade or so. The prospect is clouded by the menace of war, and it is not rendered easier by conscription, evacuation, civil defence liabilities and all the obligations attaching to national preparedness. It involves, too, further adjustment of the financial calculations of builders and building societies. But unless it is done building may eventually begin to languish. The problem is one which can scarcely be solved simply and solely by the higgling and haggling of the market. It needs a survey of the requirements still to be met and planning of the means to satisfy them. The trouble is that in both its economic and social aspects house-building remains no one's conscious responsibility. So far, autonomous private enterprise has met many of the nation's needs. If it is to continue to do so, to its own prosperity and to the nation's advantage, it is as well that its leaders should know that this can only be accomplished by taking due note of the fact that the only way to success is by the fanning out of the working classes themselves into smaller and more comfortably housed families.

# Building Societies since 1925

THERE is no way of describing the average building society, for the average building society does not exist. In the course of the past decade, the total number of societies has fallen from just over, to just under, one thousand. Among this number, the widest range is found. There is no norm of size, organisation or resources, such as exists among the banks, the railway companies, and even among industrial companies. The large societies are tremendously large. The total assets of Halifax Building Society exceed £128,242,000—a total of £32 millions higher than the consolidated assets of the Imperial Chemical Industries group, and equivalent to 25.2 per cent. of the total assets of the largest clearing bank. Abbey Road controls total assets of £51,948,000—a sum equivalent to the resources of the largest joint stock companies—and there are four other societies—Leeds Permanent, Woolwich Equitable, National, and Co-operative—with assets exceeding £30 millions, and six others—Leicester Permanent, Burnley, Bradford Third, Huddersfield, Westbourne Park, and Leeds Provincial—whose assets range between £10 millions and rather over £15 millions. These twelve societies, in fact, control £411.3 millions of the movement's total assets of £758.9 millions. They are the outstanding large-scale, or "capitalistic" units, in the movement.

A second class might be distinguished, whose growth, while substantial, has been achieved in what may be described as "home territory." These are not, typically, societies with a national multi-branch organisation. Some of the societies have, indeed, spread their activities to the London and South Coast areas in connection with large-scale estate development. Among this field of medium-sized societies it is invidious to select examples, but Coventry Permanent, Scottish Amicable, Brighton and Sussex, and Norwich are among those which show particularly impressive growth during the past few years.

Between this second category and the third the dividing line is vague. But it is safe to say that the largest hundred societies are sufficiently representative to enable the investigator to ignore the remaining nine hundred without risking the possibility of wrong conclusions. The smaller societies are, for the most part, strictly local organisations which retain much of the philanthropic character of the original friendly society spirit from which the movement sprang in the seventies. Their management is frequently honorary; they hardly compete with the larger societies for business; but they have a very conscious independence and strong sentiments of local public service.

Few of the societies of this type are to be found in our analysis of the financial growth of 110 of the largest building societies, which appears on pages 14 and 15. These 110 societies are those which, in 1934, had total assets exceeding £500,000. Subsequent years have changed the 1934 order of precedence, and have also brought new societies above the original minimum, but since the sampling has scarcely been affected, we have retained the same group of societies for convenience of computation. In addition to the information regarding total assets, shares, deposits, mortgages, new shares and deposits, and mortgage advances, given in detail for each society on these pages, we have also extracted the fullest particulars of their finances and progress since 1925 to the latest year under no less than fifty heads, and the results are shown in the summary table opposite. In our building society survey of April 11, 1936, comparable results were available for 98 of the 110 societies, while the survey of April 23, 1939, gave the record of 99 societies since 1925. On the present occasion, comparable figures are available for no less than 108 of the 110 societies.

There can be no doubt of the adequacy of this sample. The total assets of the 108 societies account for no less than 86.7 per cent. of the total assets of the entire movement. Their mortgage advances last year represented 84.6 per cent. of the whole, and their combined liabilities to shareholders and depositors 88.6 per cent. Conclusions

based on this sample are therefore likely to hold good the movement.

This point is important, since a considerable part of the information, and the subsequent calculations based upon it, is published in advance of the full official figures for 1938 while part is not available from any other source. It should be mentioned that reports published for financial years up to March are included in the figures for the preceding year. Opportunity has been taken to expand the detailed table from 40 to 50 items this year by the inclusion of fuller information regarding mortgages over £5,000, properties in possession and in arrears, investments and municipal loans, and finally by the extraction of bank loans. Since certain loans are now returned separately while up to 1936, were included in deposits, the latter figure for 1937 and 1938 have been adjusted, as far as possible, to preserve comparability with the earlier figures. From 1936 it has also been impossible to distinguish payments of interest from repayments of capital for shares and deposits withdrawn. Finally, the analysis of mortgages now covers non-members' mortgages; in some earlier years a small difference between the analysis and the total is due to their exclusion. This large-scale inquiry has been greatly facilitated by the willingness of building societies to furnish copies of their reports and by the helpful co-operation of the Chief Registrar of Friendly Societies and his staff. This assistance is again gratefully acknowledged.

The growth of building societies, once a phenomenon, has to-day become almost a commonplace. Yet the further records established last year are important, for two reasons. The societies had reason to fear that the sharp fall in private house building might affect their advance business considerably. Actually, the official total of mortgage advances for the whole movement was slightly higher at £137,019,678, compared with £136,855,953 for 1937 and

£140,310,068 in the record year 1936. Secondly, the political fears in the later months of the year led to a withdrawal of funds by shareholders and depositors which did, in fact, embarrass a certain number of societies whose mortgage business has absorbed an undue amount of their liquid funds. But the movement again substantially increased its share and deposit liabilities during the year—from £517,484,014 to £548,262,942 for shares and from £143,282,723 to £155,666,822 for deposits, according to the official returns. The reaction of these fears on new mortgage business and upon building society finance are examined in earlier articles. A third factor—the "Borders" case—did not come prominently before the public until early this year, and although there is some evidence that the case and the Government's Bill have put building society shareholders and depositors upon inquiry, it is probable that the war risks factor has been of greater immediate importance in their calculations. But the conclusion from the 1938 figures is that tightness of liquid funds on the part of a limited number of societies has not been associated with anything approaching a "run" on the societies as a whole.

These conclusions are confirmed by the records of the 108 societies whose finances have been specially examined in this survey. Since 1925 their total assets have increased

more than 4½ times, from £142,439,200 to £657,936,600. The pace of growth for mortgage assets has been more rapid, for the increase from £121,660,300 to £591,118,000 is little short of five-fold. In the table on page 10 total assets, mortgage assets, shares and deposits are shown by index numbers based on 1925. The second part of the table relates mortgages, shares and deposits to total assets.

On this showing 1938 was, statistically, a normal year. The growth of mortgages and shares has shown striking regularity during the past few years. It is only in the deposits index that the effect of the special efforts of the societies to reduce their effective interest charge, on the one hand, and to slacken the restrictions upon new invest-

ment, on the other hand, have been specially obvious in recent years. Deposits again increased at a striking rate last year—the index jumped from 565 to 621—but it was still in accordance with the previous trend. The tendency since 1929 has been for the proportion of deposits to total resources to increase—in that year shares represented 82.1 per cent. of total assets and deposits 11.6 per cent. Last year the respective proportions were 74.2 and 20.7 per cent. respectively. But, in fact, the proportion of total assets financed by shares showed an increase against the trend last year. Whatever the difficulties of 1938 may have been for the movement, they introduced no startling financial problems.

## Building Societies' Finance — 1925-1938

[Note.—THE TABLE COVERS THE OPERATIONS OF 108 LEADING SOCIETIES SINCE 1925]  
(Amounts in £'000)

## The Societies' Funds

IN the following section of this survey, reference is made to the increasingly important part which "return money" now plays in building society finance. This factor, however, is still less important than the level of the societies' shares and deposits, for even to-day "return money" covers less than two-thirds of new mortgage business, and the societies have consequently to ensure an increase in their net share and deposit liabilities year by year. Their increased appeal for new money—which at first was concentrated mainly on deposits, but has recently been extended to shares—provides clear proof that this is now a positive task. A few years ago, on the first rapid fall in interest rates, they received a considerable volume of "bad money," which might have been withdrawn on short notice, and could not be fully employed in new advance business. The result was that restrictions were quickly imposed on new investment, and interest rates were scaled down. To-day, that situation is in process of being reversed, for reasons which are evident in the following table:—

TRENDS IN INVESTMENT BUSINESS

|                  | Average Balance Outstanding | Subscribed during Year | Proportion of Average Outstanding | Repaid during Year | Proportion of Average Outstanding |
|------------------|-----------------------------|------------------------|-----------------------------------|--------------------|-----------------------------------|
|                  | (£'000)                     | (£'000)                | (%)                               | (£'000)            | (%)                               |
| <b>SHARES—</b>   |                             |                        |                                   |                    |                                   |
| 1925*            | 96,928.6                    | 29,383.8               | 30.3                              | 15,072.3           | 15.6                              |

\* Based on sample of 98 societies. 108 societies subsequently.

Taking the share department first, new share subscriptions for the 108 societies during 1938 amounted to £66,281,100, compared with £65,341,900 for 1937. The record of share subscriptions in recent years, however, needs careful interpretation. The table indicates the flood of "bad money" in 1932—when subscriptions totalled £61,958,200—and the close restriction on new subscriptions between 1933 and 1935. In 1937, however, the figures

showed a considerable increase compared with 1936, but that increase has not been repeated to anything like the same extent in 1938.

If we now turn to repayments of shares, the converse position is found. Between 1933 and 1935, repayments of shares fell considerably, but significant increases have since been recorded. Some part of these share repayments is associated with new mortgage business—a share account is frequently opened with a view to a later purchase of a house by the shareholder, who will then apply his savings towards the mortgage. But the significant fact is that, while new share subscriptions have been relatively stationary, at between 14 and 15 per cent. of the average volume of shares outstanding between 1936 and 1938, the proportion of repayments has been rising somewhat sharply over the same period from 9.7 per cent. to 12.1 per cent. The net difference between repayments and new subscriptions, expressed as a percentage of the average volume of shares outstanding, has declined from 4.8 per cent. to 2.0 per cent.

On the deposits side, somewhat different considerations apply. This branch of building society finance has been greatly developed during the phase of low interest rates. As a prior charge, deposits carry lower interest; and by statute their issue is limited to an amount not exceeding two-thirds of the societies' mortgage assets. That limit, despite the rapid increase in deposits in recent years, is still remote, for outstanding deposits for the 108 societies included in this survey, totalling £135,850,000, represent no more than 23 per cent. of the total amount of £591,118,000 due on mortgage. But although the societies have fostered the growth of deposits in preference to shares in recent years, the absolute amount of new deposits received has varied within the narrow range of £38 millions and £42.7 millions, between 1934 and 1938. And even after the recent encouragement of deposits net new sums received in this branch are still appreciably smaller than net new share investment. Deposit business has not replaced share business to any vital extent, although the movement clearly had the best reason to increase the proportion of deposit finance to its total liabilities. Deposits may carry the incidental disability of prompt repayment, in case of demand, but they are also considerably cheaper in interest cost. In the recent phase of low interest rates, that reduced charge has proved very useful in enabling the societies to scale down their mortgage rates, without absorbing an undue margin of profit.

### Estimated Interest Charges

It is possible to obtain a fairly accurate impression of average interest rates paid by building societies by using

the device of average balances for shares and deposits, and expressing the interest charged in the societies' accounts as a percentage of these averages. In the following table such calculations are shown since 1925, with the addition of the average rates charged to mortgagors:—

COMPUTED INTEREST RATES

|       | Average Balances (£'000's) |          |           | Interest Paid (£'000's) |          |           | Computed rates of interest (%) |          |           |
|-------|----------------------------|----------|-----------|-------------------------|----------|-----------|--------------------------------|----------|-----------|
|       | Shares                     | Deposits | Mortgages | Shares                  | Deposits | Mortgages | Shs.                           | Deposits | Mortgages |
| 1925* | 96,929                     | 18,794   | 100,179   | 4,242                   | 725      | 5,857     | 4.4                            | 3.9      | 5.9       |
| 1929* | 194,646                    | 28,344   | 199,145   | 8,786                   | 1,111    | 11,492    | 4.5                            | 3.8      | 5.8       |
| 1932* | 309,054                    | 44,607   | 309,060   | 13,884                  | 1,659    | 18,184    | 4.5                            | 3.7      | 5.8       |
| 1933  | 349,645                    | 58,159   | 349,777   | 13,416                  | 2,006    | 19,568    | 3.8                            | 3.4      | 5.6       |
| 1934  | 366,592                    | 74,721   | 388,113   | 13,548                  | 2,098    | 21,230    | 3.7                            | 3.0      | 5.2       |
| 1935  | 382,142                    | 93,122   | 433,146   | 13,594                  | 2,761    | 22,530    | 3.6                            | 3.0      | 5.2       |
| 1936  | 404,953                    | 107,608  | 481,059   | 13,786                  | 2,969    | 23,672    | 3.4                            | 2.8      | 4.9       |
| 1937  | 435,660                    | 118,838  | 526,429   | 14,474                  | 3,191    | 25,612    | 3.3                            | 2.7      | 4.9       |
| 1938  | 469,846                    | 129,808  | 569,007   | 15,399                  | 3,492    | 27,521    | 3.3                            | 2.7      | 4.8       |

\* Based on sample of 98 societies. 108 societies subsequently.

The average cost of share interest has fallen from approximately 4.5 per cent. in 1932 to 3.3 per cent. in 1938. Some societies, in fact, pay a lower rate on their shares than the standard of  $3\frac{1}{2}$  per cent. tax free. In the case of deposits, a comparable fall in interest from 3.7 per cent. to 2.7 per cent. has been recorded over the period. In this branch it is evident that the standard rate of  $2\frac{1}{2}$  per cent. tax is sometimes exceeded. For mortgages, the average rate of interest showed a much later fall. It was not until 1934, when the existence of cheap money had been fully confirmed, that the movement made significant reductions in mortgage interest, partly by a reduction in the rate on new business and partly by rebate of interest to existing borrowers. The effect of these concessions is seen in the fall in the average rate from 5.9 per cent. in 1932 to 5.2 per cent. in 1935 and to 4.8 per cent. in 1938.

The movement of interest rates is thus of particular concern to building societies. In the recent period of low interest rates the movement was able to adjust its borrowing rates more promptly than its lending rates, and thus had the advantage of the time lag. What would happen if, in the future, interest rates showed a rising tendency? That the symptoms of such a tendency are already apparent may be inferred from the removal of restrictions upon new share subscriptions by many societies. If, as the result of any general upward movement in interest rates, due, say, to the defence borrowing programme, the attractions of outside investments became more competitive with building societies' shares and deposits than in recent years, the movement would need to take prompt steps to adjust their borrowing rates, in order to maintain their total funds. By no means the whole of building society resources, of course, is sensitive to changes in general interest rates, and gilt-edged rates, in any case, must rise further before they become competitive with shares, although they are now somewhat in excess of the average gross deposit rate after allowance for the standard rate of income tax. But if these interest adjustments should be required in the future, mortgage rates will need similar prompt adjustment. In all cases the societies have power to effect such adjustment, but it may be even more difficult to maintain new mortgage business if borrowing rates were to show an appreciable rise. The problem of reconciling the claims of creditors and borrowers during any phase of changing interest rates is invariably difficult; and the societies at present may well hope that any serious upward movement in rates will be averted.

The conclusion of this examination of the building societies' funds is that the growing balances in the share and deposit branches are the resultant of a fairly significant inflow and efflux of capital each year, though for part of the growth the societies may rely on the automatic accumulation of interest in share and deposit accounts. But there is a significant margin of sensitive balances which react fairly promptly to changes in interest rates and to the fluctuations of political confidence.

## Mortgage Finance

THE table in the preceding section shows that the proportion of mortgage assets to total assets has now reached practically 90 per cent. From the figures given in the table on page 11, it is possible to draw up a consolidated balance sheet for the 108 societies included, which illustrates not merely their financial position but also certain financial problems. Reduced to percentages, it would show the following position:—

|                                           |       |                        |       |
|-------------------------------------------|-------|------------------------|-------|
| Due to shareholders ...                   | 74.2  | Due on mortgages ..... | 89.9  |
| Due to depositors .....                   | 20.7  | Investments .....      | 7.6   |
| Bank loans .....                          | 0.5   | Cash .....             | 1.9   |
| Undivided profits and reserves, etc. .... | 4.6   | Other assets .....     | 0.6   |
|                                           | 100.0 |                        | 100.0 |

That is the typical financial set-up of the building society movement. It is not, in some points, an ideal one. Certainly, the growth of mortgage assets, both absolutely, and as a proportion of total assets from 81.4 per cent. in 1932 to 89.9 per cent. last year, carries some disadvantages, particularly for those societies whose growth has been so spectacular that they have lacked the opportunity to augment their liquid funds at the same rate. But the problem is not only one of present liquidity; it is also concerned with the future rate of repayment due in respect of mortgage advances made in recent years. The first step in its examination is to relate new mortgage business to repayments, as in the following table:—

TRENDS IN MORTGAGE FINANCE

|      | Total<br>Mortgages<br>outstanding | New<br>Mortgage<br>advances | Repayment<br>of advances<br>inc. interest | Proportion<br>new<br>advances to<br>average<br>outstanding | Proportion<br>repayments<br>to average<br>outstanding | Proportion<br>gross<br>repayments<br>to new<br>advances |

| 1936 | 505,964.2                         | 119,051.5                   | 94,130.1                                  | 24.8                                                       | 18.7                                                  | 85.7                                                    |
| 1937 | 546,895.2                         | 115,235.5                   | 98,598.4                                  | 21.9                                                       | 17.5                                                  | 86.2                                                    |
| 1938 | 591,118.0                         | 115,923.3                   | 99,784.0                                  | 20.4                                                       | 17.5                                                  | 86.2                                                    |

Except in 1932, when several societies adopted a cautious advance policy, the total of new mortgage advances has comfortably outstripped mortgage repayments, including interest. Last year the margin was over £16 millions, and in the record advance year, 1936, it amounted to nearly £25 millions. The expansion has been comfortably financed, of course, by increased shares and deposits. But the significant factor for the future lies in the prospects of advance business, and the growth of repayments. Since 1932, the amount repaid, together with interest, on mortgage has increased from £64,273,000 to

£99,784,000. A substantial part of any year's advance business can thus be financed from "return money."

How large is this proportion? The gross figures, including interest, suggest that repayments have increased from 76.4 per cent. of new advances in 1934 to 86.2 per cent. in 1938. But the repayments figures are perhaps less revealing than they should be. Formerly, sums arising from the sale of properties in possession were sometimes treated as repayments. But even after the exclusion of these items, it is also necessary to eliminate interest from the total repayments, in order to isolate the amount of capital involved, which can be re-invested in new advances. The societies' accounts do not separate the figures—a disadvantage, incidentally, which also applies to the gross withdrawal figures for shares and deposits, which also include substantial amounts of interest. Hence, it is necessary to fall back on the method of calculation first devised in the survey of April 23rd last year.

Gross repayments are first expressed as a percentage of the average amount of mortgage assets at the beginning and end of the year. Next, the amount of interest charged on mortgages during the year (this is not the same sum, of course, as the amount paid by mortgagors) is expressed as a percentage of the average amount outstanding. The difference between the two rates gives the approximate net rate of repayment of capital, excluding interest, and this rate can then be expressed as a proportion of the new advances. In the following table, these calculations are set out for the 108 societies for each year since 1933:—

GROSS AND NET REPAYMENT RATES  
(As percentage of average mortgages outstanding)

|      | Gross Rate | Computed<br>rate of interest | Approximate<br>net rate of<br>repayment | Net repayments<br>as percentage<br>of new advances |
|------|------------|------------------------------|-----------------------------------------|----------------------------------------------------|
| 1933 | 22.0       | 5.6                          | 16.4                                    | 65.1                                               |
| 1934 | 21.3       | 5.5                          | 15.8                                    | 58.9                                               |
| 1935 | 20.3       | 5.2                          | 15.1                                    | 58.5                                               |
| 1936 | 19.6       | 4.9                          | 14.7                                    | 59.3                                               |
| 1937 | 18.7       | 4.9                          | 13.8                                    | 63.0                                               |
| 1938 | 17.5       | 4.8                          | 12.7                                    | 62.2                                               |

Since 1933 the approximate net rate of repayment of mortgage advances has been consistently falling. Undue accuracy cannot be imputed to the figures, for the new advance figures are not entirely composed of purchases of new property, nor are all mortgages maintained until full term. But some lengthening of the average term of mortgage advances seems to have occurred over the past six years. The latest net repayment rate of 12.7 per cent. suggests that approximately one-eighth of the mortgage balance is now being repaid each year. Assuming increasing repayments of capital the average actual life of mort-

gages would amount to approximately 16 years, compared with slightly over twelve years in 1933. Between the average effective life of mortgage advances and the term of years arranged for individual advances, however, there may be a significant difference.

Although the net rate of repayment, expressed as a percentage of the average mortgages outstanding, has been declining in recent years, however, the proportion of these net repayments to new advance business has been steadily increasing. In 1934, net repayments accounted for approximately 56.9 per cent. of the new advances of that year, which totalled £107,964,000; the proportion has since grown—even in the record advance year, 1936, when new mortgage business totalled £119,051,500 for the 108 societies, the trend was not interrupted—until the latest year. In 1938, however, repayments, including interest, showed a much smaller increase than in recent years. In 1936, the total increased by some £6 millions compared with 1935, and in 1937 by nearly £4½ millions compared with the preceding year. Last year, however, repayments increased by no more than £1,185,600 from £98,598,400 to £99,784,000. Clearly this was not due to any decline in the volume of mortgages outstanding. It may have been due, in part, to the gradual completion of mortgages arranged at higher rates of interest in earlier years, and the consequent increase in the proportion of mortgages at lower interest, on which initial interest payments would be lower. Again, any tendency to increase the average life of advances would also be reflected in the repayments figure.

## Trends in Lending Policy

BETWEEN the beginning of 1919 to September, 1938, some 2,767,443 houses have been built by private enterprise in this country. Over the same twenty-year period the movement's mortgage advances have reached a prodigious total of £1,440 millions, of which no less than £1,109 millions has been advanced since 1929. A rising standard of living has translated the desire for better housing accommodation into effective demand; the development of the outer London area—and outer urban areas generally—as centres of light manufacture has added to this demand; the former resident of the inner suburbs has moved outwards in a search for fresher air for his children, a garden for his leisure, and a garage for his car. These factors have been accompanied by two others—a period of low interest rates, and the development of new methods of mortgage finance involving the use of collateral security. Of these, the builders' pool has certainly been outstanding.

The volume of new mortgage business which has resulted from these trends since 1925 has already been examined. We have seen how the proportion of mortgage assets to total assets has tended to rise in recent years, and how the volume of repayments on outstanding mortgages now finances an increased proportion of new advances with each succeeding year. Unfortunately, it is impossible to subdivide new advances into more than two categories—those over £1,000 and those below £1,000. This year we have analysed the new mortgage advances (totaling £115,923,300 for the 108 societies) into these two classes. Advances up to £1,000 totalled £86,798,000, and thus accounted for almost 75 per cent. of the year's business. The average value of the new advances in this category was £478, while the average value for the 10,424 advances exceeding £1,000, which totalled £29,125,300, was £2,795. Thus mortgage advances are heavily weighted in favour of "owner-occupier" business in the smaller house categories, as the following table shows:—

AVERAGE VALUE OF NEW MORTGAGES

|      |      |      |      |
|------|------|------|------|
| 1929 | £546 | 1935 | £565 |
| 1932 | £522 | 1936 | £564 |
| 1933 | £438 | 1937 | £579 |
| 1934 | £580 | 1938 | £604 |

For a more detailed analysis of mortgage policy, it is possible only to use the figures relating to outstanding

There is no evidence from other published figures, at least, that borrowers have shown any increased inability or unwillingness to maintain their payments. The schedules which set out particulars of properties in possession, and properties in arrears, for more than twelve months, it is true, are not among the most helpful features in building society accounts. The rapid decline in the figures during recent years, despite the striking increase in mortgage business—some of which, inevitably, must prove bad—sets up a presumption that the usefulness of the schedules is limited. And when large societies are able to show no entries in either schedule, that presumption widens into the virtual certainty that the intention of the schedules—to show how carefully the societies' advance business is conducted—is being avoided. It is, of course, in the societies' interest to realise any property on which total default has occurred as quickly as possible, and they have no wish to hold property as mortgagees. The fact that, in most cases, properties in arrears or possession, are disposed of, either to eventual buyers or to interim receivers, within the space of twelve months means that, in effect, there is no clear evidence regarding the extent of default. The extended figures showing the original advances, and arrears for properties in possession or arrears which have been computed in our summary table for the latest year are of little value as ancillary evidence in themselves. But over the next few years it is hoped that they will throw increased light on this aspect of building society management. The latest figures certainly do not go far to explain the relatively small increase in mortgage repayments last year.

mortgage balances, which are divided into five categories in building society balance sheets. In the first table these

figures are expressed as a percentage of total mortgage assets for each class:—

PERCENTAGE DISTRIBUTION OF MORTGAGE ASSETS

|            | Under £500 | £500-£1,000 | £1,000-£3,000 | £3,000-£5,000 | Over £5,000 |
|------------|------------|-------------|---------------|---------------|-------------|
| 1925 ..... | 46.4       | 30.3        | 13.8          | 3.2           | 5.3         |
| 1929 ..... | 44.4       | 35.9        | 12.5          | 2.4           | 3.7         |
| 1932 ..... | 40.7       | 42.5        | 11.2          | 2.0           | 3.1         |
| 1933 ..... | 42.0       | 42.6        | 10.0          | 1.9           | 3.1         |
| 1934 ..... | 43.6       | 41.8        | 8.7           | 2.0           | 3.2         |
| 1935 ..... | 44.3       | 41.0        | 7.8           | 2.0           | 3.9         |
| 1936 ..... | 45.7       | 39.8        | 7.3           | 2.3           | 4.5         |
| 1937 ..... | 46.7       | 39.0        | 7.1           | 2.2           | 5.0         |
| 1938 ..... | 46.9       | 37.7        | 7.1           | 2.7           | 5.6         |

Changes in the constituent items below £5,000, of course, partly reflect the shift of individual mortgages into the lower classifications as the outstanding balance is reduced by repayment. But the concentration of the societies' business upon moderate-sized house property is plainly marked. The outstanding mortgage assets on which current balances are below £1,000 account for 84.6 per cent. of the total mortgage assets recorded last year. The movement can fairly claim that a substantial element of diversification of risk has been achieved for the protection of building society investors.

It will be noticed, however, that mortgages over £5,000 show a rise, as a proportion of total assets, for the fifth successive year. This increase raises some interesting questions of policy, on which some societies probably hold divergent views. Some of the larger societies have tended to develop a general mortgage business as an ancillary to owner-occupier mortgages, which are the commonly recognised building society terrain. Large mortgage business, if it is to be transacted at all, is best left to the larger societies, who can handle it without impairing the diversification of their mortgage assets, and have the expert staffs to assess the commercial risks involved. Since the protection of the personal covenant, which is so important in owner-occupier mortgages, is not present in the same form for the majority of larger mortgages on commercial buildings, flat property and the like, this valuation point is of great importance.

In order to throw additional light on lending policy in respect of large mortgages, we have this year extracted particulars of the original valuation and amounts advanced on mortgages whose outstanding balance still exceeds £5,000, which are set out in the summary table on page 11. For the 2,347 properties concerned, the original valuation was £52,984,200, equivalent to £22,600. The amount advanced was £37,266,100, an average of approximately £15,900, or 70.4 per cent. of the valuation. This percentage shows that the societies transacting large-scale business apply a more cautious discount to appraisal values before making their advances than would normally apply to house property, on which the basic advance is usually 75 per cent. of valuation. But this proportion of 70.4 per cent. is slightly in excess of the two-thirds limit which is laid down by the Trustee Acts for mortgages arranged on the sale of trust lands.

In the next table the average balance outstanding per mortgage in the five different categories is set out:—

AVERAGE VALUE OF MORTGAGES

|            | Under £500 | £500-£1,000 | £1,000-£3,000 | £3,000-£5,000 | Over £5,000 |
|------------|------------|-------------|---------------|---------------|-------------|
| 1925 ..... | £309       | £614        | £1,444        | £3,753        | £9,375      |
| 1929 ..... | 265        | 669         | 1,368         | 3,803         | 10,494      |
| 1932 ..... | 274        | 664         | 1,355         | 3,772         | 10,580      |
| 1933 ..... | 280        | 655         | 1,415         | 3,707         | 11,063      |
| 1934 ..... | 287        | 648         | 1,413         | 3,507         | 11,560      |
| 1935 ..... | 293        | 642         | 1,422         | 3,861         | 12,957      |
| 1936 ..... | 302        | 632         | 1,456         | 3,813         | 13,838      |
| 1937 ..... | 301        | 637         | 1,454         | 3,857         | 13,849      |
| 1938 ..... | 303        | 635         | 1,471         | 3,891         | 14,174      |

This table requires rather careful interpretation, owing to the changing constituents in each group. We know, however, that the total amount of new mortgage business in recent years shows only a modest reduction from the peak of 1936, and if the composition of recent new mortgages among the different groups has remained relatively constant, the distorting effects occasioned by the transfer of mortgages into successively lower categories should be relatively small over a short period. That presumption, at least, seems to be confirmed by the great steadiness in the average values of outstanding mortgages during the past three years in the three lower categories. It is noticeable, however, that as the categories become higher the average balance tends to increase, and in the largest category it has increased fairly rapidly. Thus, although the societies' bulk business remains unchanged, in the smaller owner-occupier classes, large mortgage business is being developed on a significant, though not relatively substantial, scale.

This development clearly has considerable significance in the circumstances of to-day, when it would be idle to look for the maintenance of owner-occupied mortgage business on the record scale of recent years. The societies are not, of course, dependent exclusively upon the level of the new house building. Changes in ownership from older to newer properties, and dealings in the substantial volume of pre-war houses, are important sources of new mortgage advance business. Moreover, there is some prospect of an increase in investment demand for new houses which are leased to tenants, at least in selected areas. Some general problems affecting the future character of the demand for housing are discussed in an earlier article, and in the long run it can hardly be doubted that further progress in housing standards will provide new business for the movement. At this juncture, however, it is only reasonable to anticipate some decline from the high levels of recent years. House-building plans approved in 1938 showed a reduction from £67,636,000 to £60,004,000—equivalent to 11.3 per cent.—and movements in plans approved have usually been fairly closely correlated with the advance business of the following year. That relation, it is true, did not hold good of 1938, and the explanation may possibly be that the societies obtained a rather larger proportion of a smaller volume of house mortgage business actually available. Whether these conditions will hold good during the current year has yet to be seen.

## Prudence

Investors who appreciate the advantages of a policy of Prudent Lending, consistently carried out for 89 years, and in a favoured area, are invited to ask for Investment particulars and Balance Sheet of the Principal West Country Society.

## SPREAD SECURITY means SAFE INVESTMENT

In these uncertain days the wise investor does not put all his eggs in one basket. He believes in minimising his risk by spreading his holdings. An exceptional opportunity for this is the General Investing Shares of the Leek & Moorlands Building Society. Their six million pounds of assets are represented by no less than fourteen thousand separate properties. These are not situated in a few congested areas, but are dotted about the whole of England, mainly in rural and semi-rural districts. Interest is 3½% free of Income Tax.

A comparison of the Leek & Moorlands Balance Sheet emphasizes the strong position of this eighty year old Society. It shows a Reserve Fund of £360,000—larger in proportion to the Society's liabilities than that of almost any Building Society in the Country. Management expenses are extremely low. Only sound properties are accepted, advances being mainly to owner occupiers of private residential properties not under Builders' Pool Schemes.

# HUDDERSFIELD BUILDING SOCIETY

Seventy-five Years of Service

1864 to 1939

FOUNDED in 1864 the Society marks this year three-quarters of a century in the service of thrift and home ownership.

From humble beginnings the Society has steadily progressed until it is now one of the leading societies in the country, with assets totalling over £14,000,000.

Controlled development and conservative methods of finance have given the Society a stability ensuring the thousands of its members and depositors a safe home with profitable return for their savings.

# THE ECONOMIST INSURANCE SUPPLEMENT

SATURDAY, JULY 15, 1939

PRELUDE TO

*Adventure*

In Elizabeth's yards rose ships to brave the anger of uncharted seas . . . ships to girdle the earth and sail proudly back to Plymouth Sound. Such enterprise has made us what we are. But to-day it is more easy to be bold. Risks there are and many . . . yet

few against which we cannot guard. Insurance is at hand to offset every private and commercial risk. It is the modern prelude to adventure. Used with sagacity, insurance can help to turn a phantom argosy of hope into a treasure ship in full sail.

**ALLIANCE ASSURANCE**  
**CO. LTD.**  
FIRE, LIFE, ACCIDENT, BURGLARY, MOTOR, MARINE, ETC.

HEAD OFFICE: BARTHOLOMEW LANE LONDON, E.C.2

## IN CASE OF EMERGENCY

POLICE, Fire Brigades, and Ambulances are instantly available in case of emergency, but there is one essential service which cannot be enjoyed unless it has been secured BEFORE the emergency arises.

The burglar may be arrested, the fire extinguished and the injured succoured, but the COST of replacing stolen or damaged property can be recovered ONLY by means of suitable insurances effected before the event. Similarly, insurance can be applied as a means of making good a depleted income occasioned through sickness or accident.

In the face of the gravest emergency—fatal illness—the public services are unavailing, and your dependents must rely upon your resources, which should include substantial life assurances.

Are you, your family and your business interests fully prepared for any emergency?

The C.I.S. transacts all classes of insurance at rates which will enable you to perfect your protection at little cost. Act to-day, to-morrow may be too late!

## INSURANCE IN A CHANGING WORLD

### War Risks on Sea and Land

WHEN war broke out in 1914 the British insurance market was in a reasonably comfortable position. On land, its war commitments were negligible and at sea the marine underwriter had for long been inserting in his policies the f.c. and s. clause, freeing him from liability for capture, seizure, detention and the consequences of hostilities. He had thus a clean book, and he was able to rate the war risks when war started, without thought or care for war liabilities accepted in time of peace.

One of the minor legacies left by the war was the habit of war insurance; and from 1918 onwards not only did merchants wish to insure their cargoes against war damage, but bankers would not take policies as security unless the risk was covered. Consequently, insurance against war damage became all but universal in cargo policies, and for a long time it was thrown in as a make-weight without additional premium. The more cautious underwriters shook their heads over the habit, but it stayed until 1935, when, disturbed by the Abyssinian crisis, underwriters asked for and obtained a small premium to pay for the risk.

Even this, however, left many underwriters uncomfortable, for, as they argued, the war when it came would come quickly, and long before the liabilities which had been assumed for a nominal premium ran off, the Mediterranean, the Bay and the Channel would be filled with the gravest dangers for ships and cargoes. "We are writing," they argued, "war risk at 6d. per cent., and if war comes we shall be insuring these cargoes for that trivial premium when an adequate rate would be £5 per cent." At least one Lloyd's underwriter was so much impressed with this argument that he gave up his cargo account altogether, rather than run the war risk without which he could not take the marine. And when the September crisis came he was justified, for his fellow underwriters had risks on their books at 6d. per cent. which would take weeks or months to run off and for which the rate was ridiculously inadequate.

The chaos which fell upon the marine insurance market during September is explained by these low rates for war cover charged during times of peace, and those critics of marine underwriters who complained of profiteering not only overestimated the profits made in that hectic fortnight, but underestimated the troubles by which the underwriters were beset. War rates, especially for Mediterranean voyages, rose very sharply, jumping to £2 per cent. and, at the height of the crisis, to £5 per cent.

When the crisis temporarily settled down the market returned to more normal rates, cover through the Mediterranean being obtainable at 7s. 6d. per cent. for the outward voyage and 10s. per cent. for the homeward. But the old dilemma remained unsolved. On the one hand, underwriters were chary of filling their books with liabilities that would run for weeks or months, and, on the other hand, merchants could not afford to pay in times of peace rates that would be appropriate should war break out. In particular, merchants were worried by one agreement which underwriters made among themselves—that they would not fix war rates more than seven days ahead. If a risk were written at 7s. 6d. per cent. and the vessel sailed ten days later, underwriters could, if they desired, fix a higher rate than the one originally agreed upon, so that a merchant after basing his price on a 7s. 6d. per cent. rate might find himself paying £2 or £5 per cent. when the boat actually sailed. The awkwardness of that arrangement for the merchants is obvious.

There is little doubt that, throughout this period, the Government, which was anxious to keep trade moving, was bombarded with complaints from merchants about the paralysing effect of this ambiguity on business. There were long negotiations which dragged on without much effect—mainly because the Government, while anxious to help trade, was scarcely less anxious not to become an underwriter till war broke out—and that state of mind continued until the rape of Prague and Albania at last forced the issue. War rates through the Mediterranean had shot up again to 35s. per cent. and were likely to go higher, and in a great hurry the Government Pool for covering war risks on cargoes, was born, after a leisurely gestation.

The Pool is an arrangement by which the Government acts, not as a direct insurer of war risks, but as a re-insurer of marine underwriters. The underwriters in the first place write the whole war risk at a premium agreed with the Government and then re-insure with the Government the King's Enemy risk, which may roughly be defined as capture or destruction by enemy vessels. Thus the bulk of the risk falls on the Government, and the bulk of the premium goes with it. But as the Government is prepared to face a loss which underwriters cannot face, the rate of premium is much below what the market, normally functioning, would charge. Immediately the Pool started the Mediterranean rate fell to 5s. per cent. and the limit of seven days, to which merchants had rightly objected, was removed.

The scheme is, in essence, a State subsidy to commerce—a Government insurance thinly camouflaged as a measure of re-insurance, and its value was at once demonstrated by the establishment of similar pools in other countries to subsidise their own foreign trade as the British Treasury was subsidising ours. It is likely to continue until—which Heaven forbid—it is replaced by a scheme of direct Government insurance on the outbreak of war.

So much for war insurance of cargoes. Progress in covering war risks on hulls and on stocks on land has been slow, but both are covered by the War Risks Insurance Bill, published this week, to which reference is made in the accompanying issue of *The Economist*. As merchants found that the sensitive movements of war rates at sea were paralysing their enterprise, so they were loth to hold stocks of commodities in warehouses which might be attacked from the air. They preferred to keep stocks low and buy from hand to mouth—a policy which carried the most obvious threat to our economic strength in time of war. A general scheme of insurance on land has been again and again refused by the Government, but under the threat of low stocks the Government did agree

to work out a limited scheme of insurance for essential commodities held for sale or manufacture. As long ago as January last the Chancellor of the Exchequer announced his plans to the House of Commons, and doubtless they have been under negotiation since he made his speech. But Treasury clerks share a well-known attribute with the mills of God, and the details of the essential commodities scheme have only been made public this week, so that cover is still not available. The growing strength of our air defences and the enormous increase in public confidence which has resulted from it may have stilled some of the demands for cover, but it is, nevertheless, highly desirable for the scheme to become operative without delay so that merchants may know where they will stand.

Lastly comes the problem of buildings, and here there is neither cover nor prospect of cover. Various enterprising concerns have stepped in where the British Treasury fears to tread, but the confidence they enjoy is not widespread, and nothing can solve the problem except a national compulsory levy chargeable on all buildings irrespective of their site and their prospective danger—an *ad hoc* *ad valorem* tax imposed to meet a common national risk.

## Insurance and Economic Nationalism

IN the post-war period, and especially in the last decade, British insurance offices have been forced to admit into their vocabulary words which previously found no place there—like “nationalism” and “self-sufficiency.” Before 1914 it was generally agreed that these concepts were alien to the very idea of insurance, for the basic principle that risks should be spread as widely as possible was commonly accepted. But as soon as nationalistic economic policies displaced trade that was relatively free, restrictions were imposed on the free international conduct of insurance, and in recent years these impediments have increased both in number and effectiveness. In many countries a drive towards self-sufficiency in economic life generally, and in insurance in particular, has been growing. At the same time, harassed Finance Ministers have come to regard foreign insurers as an easy source of revenue. Thus, in addition to the general restrictions upon international trade from which insurance companies have suffered with other traders, they have also been subjected to attack on two fronts. First, many governments have set out to tap the profits of their business to the greatest possible extent. Secondly, in the interests of nationalism, insurers have been deprived of many underwriting liberties.

Since the essence of international insurance business is the remittance of balances between one country and another according to underwriting experience, the growth of currency restrictions of various kinds naturally constitutes a serious difficulty, whose scope may be measured by the widespread nature of devices of currency control. British insurers, in particular, have been wont to operate, either directly or by way of reinsurance, in practically every one of the world's currencies. The companies find that even when they succeed in making an underwriting profit, it becomes increasingly difficult to transfer their earnings home. Moreover, they frequently find that remittances of underwriting profits, even when effected, are calculated at a rate of exchange completely unrelated to that used when currency has to be remitted to the country in question in settlement of large claims, so that losses on exchange accrue. There are, it is true, some mitigating points. In a number of countries reinsurance has not been saddled with the fullest currency restrictions—rather surprisingly, Germany may be cited as one of these countries. Nevertheless, the general obstructions on trade entailed by currency regulations severely handicap British companies.

The difficulties thus placed in the way of insurers are grievous enough, but if they were all, insurers at least would not consider themselves the victims of undue discrimination. But as it is, the demands of foreign governments for monetary dues, directed peculiarly against insurance companies, and the restriction of underwriting

powers in various directions, constitute heavy burdens, which are relieved only by the fact that in some very important parts of the foreign field the tendencies towards restricted underwriting have been extended less far than in countries which are not so important, from the viewpoint of the volume of business involved.

The amount which insurance is expected to contribute to national exchequers is, however, increasing in practically all countries. Types of taxes peculiar to insurance multiply and rates of tax tend upwards. To mention only a few of the special levies, in the United States there is a fire marshal tax; in Canada, a fire prevention tax; in the Argentine, an impost is levied on sums assured; while in Queensland there is a levy on reinsurances; commissions are taxed in Spain, capital in Portugal, and remittances in Brazil. The ingenuity of government officials is applied towards the abstraction of as large a portion as possible of insurance underwriting profits—not merely to the detriment of shareholders' dividends, but also to the possible risk of insufficient allocations to reserves. It was estimated by Mr N. M. Sharp last year that the total taxation on insurance companies, both at home and abroad, amounted to a minimum of 43 per cent. of underwriting profits during the period 1933-37. It is probable that, at the present time, at least one-half of the underwriting balance is absorbed by governments. In the United States, taxes peculiar to insurance, apart entirely from Federal and general taxes, amount to over \$100 millions, of which about three-fifths is paid by non-life insurers.

There are also other aspects of the taxation problem which need mention. In some countries insurance taxation has to contribute towards the upkeep of government supervisory offices. When, as in the United States and Canada, the degree of supervision thus subsidised by the insurance companies is extensive and is multiplied by the existence of State as well as Federal control, the companies are penalised in a manner difficult indeed to justify. In other countries insurers are forced to bear taxes for special purposes which cannot by any stretch of the imagination be deemed a proper charge upon them; thus in Germany they must contribute towards the reconstruction of the collapsed Phoenix Company of Vienna. Other countries, for example Spain, go so far as to compute foreign companies' taxation, not on the basis of profits earned within the national area, but on profits over the whole sphere of the companies' operation.

Underwriting liberty is restricted in many countries and in many different ways. Since fire insurance forms the largest and most widespread section of the business of the companies' foreign agencies and branches, it suffers most in this respect; but accident insurance is not immune,

though it is concentrated in the U.S.A., where discrimination against British companies is fortunately largely absent. The life business of British companies written abroad is very limited indeed, and marine insurance is mainly effected in London or Liverpool. In relatively few countries was the British principle of “freedom with publicity” teen followed, though fortunately the countries which have adopted control or interference of a kind which leaves a fair degree of freedom of operation—for example, the United States, France, Holland, Portugal, Scandinavia and the British Dominions—produce a very important part of the companies' foreign business. A favourite imposition is the requirement of excessive deposits and reserves, to be invested in national securities, and an outstanding instance of this form of control carried to extreme is provided by Mexico. In this case, the British companies, finding the conditions imposed upon them impossibly onerous, recently decided *en masse* to cease business in the country. Though the American companies still transact Mexican reinsurance business, foreign insurance interests as a whole in the country have been severely truncated.

In some countries, again, not only are insurers required to deposit large amounts in national securities, but, ironically enough, they must replenish the reserves in the not unlikely event of depreciation in the values of these investments: this situation has arisen in Greece. Other forms of interference which are quite common include the control, or fixing, of premium rates and the close regulation of policy conditions. In the United States there is a rather advanced form of interference with the companies' powers of determining premiums, which frequently works against the interests of the companies. So long as the United States retains its present degree of freedom in other directions, however, and preserves the present lack of discrimination against non-national companies, it would be invidious to stress this point too strongly, for on the whole the American market—by far the most important single market for British insurers—remains unrestricted.

Nationalism in insurance takes on other forms. National companies, either in the ownership or control of governments or under official patronage, are fostered. During the past year the extreme nationalism of Japan, for example, has led to the setting-up of a national reinsurance pool and to other attempts to restrict the volume of reinsurances coming to British companies. In all, the amount of Japanese reinsurance business lost to the British market is considerable, though the reinsurance pool is reported to be a failure, and there is some consolation in the fact that much of the Japanese business at the present time is not particularly attractive on underwriting grounds. In Peru and other countries national companies have been set up and encouraged, *vis-à-vis* foreign insurers. In Cuba only authorised insurers are allowed to transact insurance, and in Chile new entrants into the business are forbidden. Already in a number of instances the extreme step has been taken of establishing government reinsurance or insurance offices, sometimes existing side by side with commercial (including non-national) companies, sometimes possessing a complete monopoly. Thus State reinsurance offices have existed for some years in Chile and Turkey, while Iran and Brazil have now to be added to the list. In the U.S.S.R. a State office, the Gosstrach, has the complete monopoly of insurance, though it reinsures with foreign, including British, companies; in Uruguay, New Zealand and Queensland state fire insurance offices are in existence, but commercial companies also operate; in a number of States of the U.S.A., government workmen's compensation offices, either competitive or monopolistic, exist. It has been decided to establish a State fire office in Alberta, and in a number of other countries—for example, France and Belgium—nationalisation of insurance has been mooted in some quarters during the past year.

What, then, are the prospects for British insurers abroad? Due regard must be paid to the efforts of the companies to retain their portfolios in the various markets where unrestricted working is no longer possible. To an important degree they are turning to the development of reinsurance business in the place of direct business, the volume of which is on the decline; there is no doubt that the number of reinsurance treaties between British com-

panies and those in foreign countries has increased substantially in recent years. This development is, however, subject to two drawbacks—reinsurance is normally less remunerative than insurance, and it cannot usually be obtained without the reciprocal cession of direct business. Sometimes a number of British companies find it possible to minimise the effects of restrictions upon their operations by setting up a single organisation within a given country, which pools risks among the companies in stipulated proportions; in other instances one or a number of British insurers may interest themselves in a “national” company working in the country concerned. It has also happened on occasion that pressure by the British Government has fortunately prevented the imposition of further restrictions. In the case of Cuba, for example, the companies have received valuable assistance from the Government in this way. Perhaps, however, there is room for a rather readier appreciation by the authorities of the value of the invisible exports represented by British insurance abroad and for a more emphatic determination to give the companies every possible protection.

It remains a lamentable fact that over a large part of the foreign field *laissez-faire* must be regarded, for all practical purposes, as defunct, unless a widespread revulsion of feeling against the cult of nationalism and self-sufficiency occurs. The consolation remains that another large part of the world—which as it happens is far more important to British companies—retains what is relatively speaking a considerable degree of freedom, or at least imposes little differentiation against non-national companies. This section of the foreign field is constituted, broadly speaking, by the British Empire, the United States, the sterling bloc and the Continental democracies. It appears, therefore, that the British companies may increasingly be compelled to concentrate their main attentions on the countries which happen to lie closest to Great Britain politically, though they will do everything possible to avoid any retreat from the outstanding position they had acquired in the insurance business in other parts of the world.

# Regulating Insurance in the United States

[The following article, which has been contributed by Professor George W. Goble, professor of law in the University of Illinois, reviews the scope of the restrictions imposed by the forty-eight States of the Union and the District of Columbia, which are designed to combat fraudulent insurance business and to improve the policyholder's security.]

IN America, as in other countries, insurance began as a project of individual initiative and private enterprise. Originally, the only limitations imposed upon the business were those of the common law and those contained in the charters of companies. But with the increased recognition of the benefits of insurance and the consequent expansion of the business it became a fertile field for exploitation by the unscrupulous and dishonest adventurer. The technicality and complexity of the subject and the employment in policies of words and phrases incomprehensible to the layman supplied the insurance swindler with an effective shield for his fraud. The insurance crook sometimes enticed his unwary victim into a transaction by offering him a policy with practically unlimited protection at very low cost. He would collect and pocket the premiums until claims began to appear and then liquidate the company. Or, relying upon the normal person's disinclination to read his contract, or inability to understand it if he did, he sold a policy containing many deceptive and unfair provisions, and, when a loss occurred, materially reduced or completely avoided liability by resort to one of the trick clauses of the policy. When sued by the deceived and disappointed policyholder his defence was completely covered by that glittering Anglo-American legal maxim "freedom of contract." Even for an insurer organised on a sound basis and issuing fair and reasonable policies, the temptation to speculate with accumulated reserve funds was in some instances too great to resist, and policyholders were forced to take heavy losses because of impaired assets.

That such practices have been resorted to in America more frequently than in England is partly explained by the fact that during the last half of the nineteenth century—the period during which insurance was passing through its crucial formative years—America was still in its pioneer stage. Its morality was that of the frontier. Land speculations, railroad bubbles, gold rushes and other get-rich-quick schemes set the business temper of the time. The insurance man, armed with his policy full of tricks, worked the same territory as did his more romantic contemporary Jesse James armed with his forty-four. It was inevitable that the reckless business standards of the period should find their way into the insurance field. As recently as 1935, there was a type of document being sold in the State of Illinois which appeared upon its face to be a regular \$1,000 life insurance policy, but a close inspection would reveal that if the insured died of any of a list of diseases, including practically every ailment to which man is susceptible, the amount payable would be reduced to about \$15.

The only recourse of the people against this exploitation of the ignorant and unwary was to the legislatures, and these bodies responded in generous measure. As a consequence, insurance in the United States is more closely supervised by Government than any other business. Since there is no provision in the Federal Constitution which empowers Congress to legislate in this field, the supervision of insurance falls exclusively within the jurisdiction of the several States. All the 48 States and the District of Columbia have enacted laws setting out, most of them in great detail, the requirements that must be met by companies, brokers and agents to enable them to do business within the State.

Such statutes specify the procedure for incorporation; provide how a company's reserve liability shall be calculated; require that rates shall be reasonable; impose restrictions upon expenses and dividends; set forth what shall and shall not be contained in all policies issued in the State, even to the point, in the case of fire insurance policies, of dictating the actual provisions; require the filing with the State Insurance Commissioner of detailed annual financial statements; define what constitutes insolvency; and set out the procedure for liquidating and winding-up

insolvent companies. Statutes also govern a company's minimum capital and surplus; the types of securities in which its funds may be invested; the method by which such securities shall be valued, and the required amount of the securities which must be deposited with the State Insurance Commissioner. For examples of typical requirements, under the Illinois Insurance Code, the minimum capital for most types of companies is \$200,000, all of which must be deposited in the form of cash or securities with the State Commissioner of Insurance. The required minimum surplus is 50 per cent. of the capital. A company may invest its funds without limit in Government, State, county and municipal bonds, but it may not invest more than 25 per cent. of its assets in railroad, public utility or private corporation bonds, more than 10 per cent. in preferred stocks, nor more than an amount equal to its capital and surplus (and less if it is a life company) in common stocks. In order to assure wide diversity and distribution of investments the statute also limits the amounts that may be invested in the stocks and bonds of any one corporation and in any one issue.

Each State has a department of insurance, usually headed up by a single official known as the Commissioner of Insurance. But administering the insurance laws of even a small State is more than a one-man job. Consequently, many deputies and assistants are used, and in the more populous States, such as New York, Pennsylvania and Illinois, the number of officers and employees of the insurance department runs into several hundreds. The Commissioner has sweeping inquisitorial and supervisory powers over all insurance companies, brokers and agents doing business in his State. He may conduct hearings, summon insurance officials and agents to appear before him and compel them to testify under oath. He may visit the offices of companies and examine their books, inspect their properties and securities, and make such orders as seem to him necessary to keep the business on a sound basis. The most drastic sanction back of the order of the Commissioner is his power to refuse, revoke or suspend the licence of any company, broker or agent found to have violated the law, and such action is not infrequently taken. However, the orders of the Commissioner are subject to review by a court of law.

What has been said has primary reference to domestic insurance companies—that is, companies organised or domiciled within the State whose law is under discussion. Of special interest to British offices are the rules imposed upon an out-of-State, or alien, company desiring to do business in the United States. In general, an alien company must satisfy the law applicable to domestic companies in each of the States in which it desires to do business. It must, for example, satisfy the same requirements as to the amounts of its capital and surplus, must file an annual financial statement (only, however, of its United States business), its policy forms must comply with the domestic law, and there must be compliance with the local law affecting agents. Usually, however, such a company is not subject to the domestic law with respect to the limitation of expenses or declaration of dividends, and after it has made a deposit of securities in one State in compliance with the law of that State, further deposits in other States into which it might extend its business are not usually required. If such a deposit depreciates in value, however, contrary to the British practice, it must be repaired. As to investments of its funds, an alien company usually need only comply with the law of its domicile, provided (in some States) that such compliance affords a degree of financial security equal to that required for similar domestic companies.

Though, of course, an Insurance Commissioner of one State has no jurisdiction in another State or country, he

can request an alien company to submit to him its books and records for examination, or request its officers to appear before him to testify, and, in case of refusal, revoke or suspend the company's licence to do business in the State.

With legislation continuously spouting forth from 49 unrestrained legislative bodies in the United States, a great diversity in insurance law is inevitable. This diversity is accentuated by the rule that judgments in one State are not binding in the courts of another, and by a recent Supreme Court decision holding that a judgment of a State court, not involving a federal question, is binding in the federal court. The same words in a policy of insurance, therefore, may have different meanings in different States. For example, a clause in the standard fire insurance policy provides that the policy shall be void if the insured transfers his title, interest or possession. In some States a contract for the future conveyance of insured property is a transfer of "title"; in others it is not. In some States putting a vendee into the occupancy of the property is a change in "possession," while in others it is not. In some States "interest" means only legal interest, in others it means legal or equitable.

But there are strong influences counteracting this move-

ment toward diversity, found in the tendency of States to copy legislation from each other, and in the active promotion by various insurance societies and bar associations of uniformity in State legislation and administrative rulings. These forces have eliminated the most serious inconsistencies and have kept the system within practicable bounds.

In their desire to kill off the insurance "racketeer," it now seems probable that the American States have extended their regulations of the insurance business too far. This strictness, without doubt, has been good for bad insurance, but it has also been bad for good insurance. The inelasticity of the system has in some degree stifled enterprise and ingenuity, and in a few instances has actually crystallised undesirable insurance practice and saddled the public with unfair and unreasonable policy forms. On the other hand, the States in which most of the largest and soundest insurance companies in America have originated and developed, and in which there have been the fewest insurance failures, are States with the strictest regulations. But this is probably due to a combination of many factors. After all, the wise regulation of insurance is more dependent upon the honesty and competency of State officials than upon the law.

## Equity Investment in Assurance

THE investor's distinction between fixed interest securities and equities finds a parallel in life assurance policies. Non-profits, or non-participating, policies simply guarantee payment of stated sums on the death of the lives assured; interest on these policies is assumed at a certain level and no account is taken of variations in the actual interest experience. With-profits, or participating, policies, on the other hand, guarantee the holders minimum sums assured, but in addition they provide for variable additions to these minima. As the interest experience of the life office varies, holders of its with-profits policies share in its changing fortunes. They bear—or, rather, enjoy the benefit of—part of the equity.

The popularity of the with-profits policy was established long ago. The idea of the periodically declared surplus profits appealed to the public to such good effect that by 1886—the first year for which official statistics are available—sums assured under with-profits policies totalled £366.8 millions against only £75.9 millions on a without-profits basis. The public welcomed the opportunity of combining a stake in economic prosperity at large, as represented in assurance offices' "surplus" earnings, with an assurance proper. By 1913 there were in force with-profits policies for £691.1 millions, compared with a total of £163.9 millions without-profits assurances. In the decade following the Great War, the rate of expansion of participating policies was very marked, and by 1928 the respective totals had reached the huge figures of £1,055.7 millions and £383.6 millions. Unprecedented expansion has proceeded in both categories since that date, but the last few years have witnessed some alteration of emphasis. The public have by no means lost sight of the advantages which with-profits assurances bestow, for by 1937 a total of no less than £1,443.0 millions was assured under these policies. But the without-profits policy has come into greater relative favour, for sums assured in this category totalled £696.8 in 1937.

It is not necessary to search far for an explanation of this development. In part it is due to the fact that certain popular types of policy which were introduced comparatively recently are most appropriately without-profits in form—for example, the group life assurance and the family income contract. But without doubt it is partly due to a realisation that if with-profits policyholders stand to share in a mounting profit surplus during a period of rising interest earnings, they also stand to bear their part of the brunt when conditions are reversed. The falling trend of interest rates since 1931 has found its reflection in surpluses, and though offices have been reluctant to reduce their

bonus declarations on with-profits policies, such a step has become inevitable in many cases and is in prospect in others. Thus some cold-shouldering of the with-profits policy has become discernible.

From the viewpoint of the assurance office, however, experience in the investment market in recent years has thrown the advantages of the participating policy into sharp

focus. Anxiety regarding interest earnings is considerably relieved if the office can pass on to policyholders part of the burden of any decline. If the assured does not participate in profits, higher premiums on new policies are the only remedy for a continued fall in interest rates, and offices are loth to seek this way out of the difficulty. It is true that lowering of profit declarations is also to be avoided as far as possible—but at least this course does not prejudice irretrievably the ultimate return offered by the office, for profits may rise in future. But once premiums on without-profits policies are raised, new contracts are fixed irrevocably on a more expensive basis. By the same token, the absence of the profit-sharing element causes new policyholders to suffer relatively to the old, whereas participating policies do ensure something like equal treatment to new and old holders alike.

A number of life offices, having decided that the unwelcome rise in premium rates could not be postponed beyond the current year, have been persuaded by such arguments to increase rates in the without-profits branch in relatively greater degree. Thus, over the section of the life assurance market where higher premium rates were put into force during the early months of this year, it is probable that with-profits policies have regained part, at least, of their superior popularity. If a pronounced upward movement of interest rates were to set in, and were not to be offset by increased taxation, such a tendency would no doubt become emphasised. But failing such a development, the offices must consider the possibility of a continued movement away from with-profits policies. It was partly to ensure that the policyholder took some share in the equity that early this year the "Equitable"—incidentally the first office to introduce the with-profits policy—made all new policies participating contracts in greater or less degree. This office decided that all policies should fall into two classes—"major-profits" or "minor-profits"—ranking, as it were, as first and second participating preference shares respectively. The example has not been followed, though the principle has not failed to receive support.

Actuaries have, indeed, carried the principle very much further, at least in theory. Thus Mr E. H. Lever has argued that all premium rates should be computed on the assumption of a rate of interest of zero, account being taken of actual earnings in excess of this only by way of profit declarations on policies. If this idea of the extreme with-profits policy were adopted, the assurance office would be entirely protected for variations in interest earnings. It would perform the elementary and pure assurance function whereby the estates of those who die young are subsidised out of the incomes of those who die old—a service for which there would always be a demand—but it would not guarantee any given interest return. If the future prospects for the lender of capital are as barren as some economists forecast, an approach towards this revolutionary suggestion may ultimately prove necessary, but the extreme form of this proposed policy is, to say the least, unlikely. The two facts, that life assurance is a competitive institution and that the assurer who charges premiums on an assumed rate of interest of zero would need to pitch them very high, seem sufficient to ensure that offices will continue

to bear some of the equity, even if they attempt to place a larger part of it with policyholders.

The greater inclination of policyholders for the fixed-interest type of policy—at least to cover a substantial part of their risk—rather than the equity type, has probably been one major factor causing a number of the offices to invest a greater part of their incoming funds than formerly in equities and a smaller proportion in fixed-interest bearing securities. In recent years the assurer's burden arising from a fall in interest has increased. At the present time, moreover, the net interest rate earned, after income tax, on insurance funds, shows no tendency to move upwards—rather the reverse. Hence, many life offices have found it desirable to take advantage of the higher average return which can be obtained from equity investments.

Thus, the assured also shares in the equity in a different sense from that used earlier in this article, for he does so when the assurance office holds a proportion of the accumulated funds in ordinary securities on his behalf. On the general question of the desirability of ordinary securities as an assurance investment, controversy has extended over generations. The first of Arthur H. Bailey's famous "canons of investment"—which, laid down in 1862, have not yet passed out of current citation—was that the primary necessity was to secure safety of capital. Some argue that equities do not satisfy this principle. But the proponents of the "active investment policy," which means, in the main, the policy of placing part of insurance funds in equity securities, have undoubtedly gained ground in recent years.

It is true that the proportion of total insurance funds placed in ordinary shares remains limited, and there is therefore little danger of the active policy being carried to excess. But, as the table given on page 14 of this supplement shows, the proportion has increased appreciably in recent years, from 5.1 per cent. in 1932 to 9.2 per cent. in 1938. The average figures do not, moreover, reflect the full significance of the movement, for in the case of a number of offices the proportion is considerably higher and its expansion in recent years is much more pronounced. Thus, seventeen out of thirty-eight offices, as the table referred to demonstrates, now hold more than 10 per cent. of their funds in equities, though seven years ago only eight offices held more than this percentage. A few offices still retain only minimal amounts in equity form, but their number diminishes. The precepts of the "active investment" school grow in forcefulness, moreover, with the danger of war.

Even in normal times, the assumption that the capital of variable interest securities is more vulnerable than that in fixed interest investments is far from proved. The adherents of the active investment policy have produced statistical evidence to show that over periods of years not only has the interest return on ordinary securities been greater but also the movement in capital values has been more satisfactory. The researches of Mr H. E. Raynes may be mentioned in this connection—and there have been other workers who have reached substantially similar conclusions. Provided that reasonable limits are observed, it is a legitimate conclusion that the assurance office may safely give the policyholder a share in the equity.

## General Results in 1938

THE departmental results in 1938 were, on the whole, rather better than in 1937, but owing to heavier taxation there was some small reduction in the net profit shown in the following table. In the life branch the net rate of interest fell further, largely on account of the increase in the rate of income tax. New sums assured, after showing regular increases for many years, declined by about 3 per cent., a fall which is fully explained by the increased political tension in the second half of the year. Annuity con-

sideration moneys were also smaller. A sharp increase took place in marine premiums, but underwriting results were again unsatisfactory. Fire premiums and underwriting results were somewhat smaller, but while premium income in the accident department showed little change, profits were very satisfactory and much above the average. Under present-day conditions insurance companies with world wide interests encounter problems of currency and exchange restrictions, and are affected by a continuous flood

## ENDOWMENT POLICIES WITH HOUSE PURCHASE PRIVILEGES

### SOME ADVANTAGES OF ENDOWMENT POLICIES

Issued by the  
**WESLEYAN  
& GENERAL  
ASSURANCE  
SOCIETY**

- 1 If you take up a policy at once, you can obtain it at a cheaper rate than you will have to pay in the future. "DO IT NOW."
- 2 You may be insurable now, but not insurable in the future, when an advance for House Purchase would prove of great service to you.
- 3 The Life Assurance comes into force immediately the first premium is paid; the policy is a sound investment even if the privilege of obtaining an advance is never exercised.
- 4 You can take out your policy now and defer the selection of the house until a suitable property is available.
- 5 The premiums paid under these policies enable you to obtain statutory rebate of income tax.
- 6 The policy entitles the assured to all the benefits of an ordinary Endowment Assurance Policy with the additional advantage of being available for House Purchase.

## PEARL ASSURANCE COMPANY LTD.

President and Chairman:  
SIR GEORGE TILLEY, F.C.I.I.

Life. Fire. Loss of Profits through Fire. Motor. Personal Accident. Driving Accidents. Workmen's Compensation. Public Liability. Fidelity Guarantee. Engineering. Boiler. Burglary and Theft. Plate Glass. Comprehensive Household. House Purchase. Pension Assurance. Educational.

a uniform basis for all the offices. The reserve for unexpired risk, except in the marine branch, has been taken at 40 per cent. of the premium income of the year, which is the basis used by the majority of offices. It is not possible to use a uniform method of calculating marine underwriting profits, and the method of the company concerned has been followed. Special attention is drawn to the headings of each column; the calculations may differ from the published results of individual companies, as is only to be expected when various data are reduced to a comparable basis, and this fact should constantly be borne in mind. In arriving at the trading surplus shown in column 2 all allocations to investment and other special reserves have been deducted, as well as amounts actually written off investments, which last year were in some cases substantial. Undoubtedly this method will operate somewhat unfairly in certain cases, but it is impossible from the accounts to distinguish between what may be regarded as

an addition to free reserves and what is required by ordinary business prudence. Column 4 indicates the amount of the contribution to the net trading surplus derived from the operations of the life department. Such profits emerge from actuarial valuations, and in the majority of cases these valuations take place only at quinquennial intervals. It may be mentioned that some companies set aside the shareholders' proportion of surplus revealed at a quinquennial valuation, and, in each year of the new quinquennium, credit one-fifth of that surplus to profit and loss. This practice, however, is not universal. Hence the absence of any figure in this column for some companies which transact life business merely means that no valuation was due to be made. The Prudential is in a special position, since the life profits belong entirely to the "A" shareholders. The table is concerned only with the "B" shareholders, whose interest is confined to the remaining departments.

## Life Assurance Business

THE valuation returns made by the British Life Offices to the Board of Trade as at the end of 1937, or to the preceding valuation date, show that, excluding industrial insurance policies, there were 5,978,000 policies in force, representing sums assured, plus existing bonuses, of £2,140 millions. The total interest income in 1937 was £38,903,000, and the premium income £87,900,000, while the accumulated funds totalled £984,453,000. The adjoining table is compiled from the same official source.

### NEW BUSINESS

(a) *Life Assurance.*—The table on page 12 shows the new sums assured, excluding industrial assurances, effected in each of the past two years by a number of representative offices. Between 1932 and 1938 new sums assured showed steady expansion each year, due to some

| Year | Aggregate Net Sums Assured under New Policies Mill. £ | Increase or Decrease per cent. compared with preceding Year |

extent to the increasing popularity of low-rated plans, such as family income and group insurances. This expansion continued during the first half of last year, but the September crisis had a serious effect on business, and although the offices in general imposed no war restrictions on new assurances they exercised discrimination in offering the cheaper types of policy. Over the whole year, the aggregate fall in new business in respect of the offices included in the table was only 3 per cent., which in the circumstances, appears remarkably small. For the present year to date, new business is almost certainly on a lower level than a year ago. As the offices still issue unrestricted policies in most cases, life assurance at the present time is offered on very attractive terms in view of the possibilities of war, but the public has not taken advantage of the liberality of the present policy pursued by the assurance companies. The uncertain outlook is, no doubt, a very strong deterrent against even the most advantageous long-dated assurance contract.

(b) *Annuity Business.* The immense increase in annuity business a few years ago was mainly due to the fall in income suffered by many people from the time that interest on War Loan was reduced. Although the terms offered by the offices since 1932 for annuities are substantially less favourable to purchasers than was the case previously, the amount of business transacted, although tending to fall steadily, is still much in excess of a decade ago. It will be seen from the table on page 13 that there was a further reduction in consideration moneys last year. The peak year for the combined offices shown in the table was 1935, with a total of £14,426,000, but the largest individual item was in 1936, when the Equity and Law received purchase moneys amounting to £2,510,000. This office has pursued a bold policy in the extent to which it has sought this class of business. The directors have held the view—and it is gratifying to learn that they remain satisfied with the results of their policy—that owing to the broadening in the basis of annuity business the boggy of exceptional longevity traditionally enjoyed by annuitants has largely disappeared.

| Grand Total .....                    | 11,409,695 | 10,410,164 |

## MORTALITY

So far as can be gathered from the Annual Reports and Chairman's speeches, the mortality experience in 1938 did not differ very materially from that in the previous year. The obsolete O<sup>M</sup> table is being steadily replaced by the A<sup>1924-29</sup> table as and when actuarial valuations fall due.

## INTEREST

Following on a decrease in 1936 of 1s. 5d. per cent. in the average net rate of interest and a further 1s. per cent. in 1937—in both these years there was an increase of 3d. in the rate of income-tax—the net rate of interest again fell last year by 2s. 9d. per cent., when the standard rate of tax was increased by a further 6d. These results must be regarded as very satisfactory, and their effect on future bonus rates seems more encouraging than might have been anticipated a few years ago. There has been a distinct tendency to reduce the rate of interest adopted in valuing liabilities and the average rate is now definitely below 3 per cent. There is a further point that the published rates of interest are calculated on the assurance

funds; actuarially the proper basis of comparison with the valuation rate of interest is the rate earned on actuarial liabilities. The true margin, therefore, is substantially greater than is revealed. In considering the following table, it should be borne in mind that the net rates shown for any two offices are not necessarily strictly comparable owing to differences in book-keeping. Among other things, a good deal depends on the method of valuing the assets.

## Life Office Investments

THE adjoining table shows the distribution of the assets of the principal British countries, the average of the percentages held in each group of assets by all companies, and also the average percentage holdings in each of the four groups, viz. mutual, proprietary, industrial-cum-ordinary and composite offices.

In recent years there has been some steady increase in the proportion of assets invested in mortgages, and this tendency was repeated last year, but the increase in debentures, preference and ordinary stocks seems to have slowed

down. The percentage of assets in British Government securities has fallen further, and this is true also of foreign government and municipal securities. The amount of depreciation or appreciation in Stock Exchange security holdings is seldom mentioned in the reports, and its extent last year must have varied considerably according to the nature of the investment portfolio of individual companies. Judging from the remarks of several of the chairmen, depreciation on securities for an office having an average distribution of investments did not exceed 4 per cent. of the total funds. In spite of the fall in market values in the last two years, the majority of offices still show book values below market values on December 31st last. The following table gives the average distribution of all the companies in each of the past five years:—

## PERCENTAGE DISTRIBUTION OF INSURANCE ASSETS, 1934-1938

| Class of Assets                                     | 1934 | 1935 | 1936 | 1937 | 1938 |
|-----------------------------------------------------|------|------|------|------|------|
| Mortgages, including loans on policies              | 22.8 | 22.0 | 22.3 | 23.0 | 23.6 |
| British Government securities                       | 21.3 | 19.5 | 18.1 | 17.5 | 17.0 |
| Indian, Colonial and Foreign Government securities  | 9.2  | 8.8  | 8.2  | 7.5  | 7.1  |
| British municipal and county stocks                 | 2.9  | 2.9  | 2.9  | 2.8  | 2.9  |
| Indian, Colonial and Foreign municipal securities   | 2.9  | 2.7  | 2.5  | 2.3  | 2.1  |
| Debenture stocks                                    | 17.7 | 18.4 | 18.6 | 18.7 | 18.9 |
| Preference and guaranteed stocks                    | 7.6  | 8.7  | 9.2  | 9.5  | 9.4  |
| Ordinary stocks                                     | 6.4  | 7.5  | 8.6  | 9.2  | 9.2  |
| Reversionary interests, properties and other assets | 9.2  | 9.5  | 9.6  | 9.5  | 9.8  |

## PERCENTAGE DISTRIBUTION OF ASSETS OF 38 PRINCIPAL OFFICES

| Office                                 | Mortgages including Loans on Policies | British Government Securities | Indian, Colonial and Foreign Government Securities | British Municipal and County Stocks | Indian, Colonial and Foreign Municipal Securities | Debenture Stocks | Preference and Guaranteed Stocks | Ordinary Stocks | Reversionary Interests, Properties, and Other Assets |
|----------------------------------------|---------------------------------------|-------------------------------|----------------------------------------------------|-------------------------------------|---------------------------------------------------|------------------|----------------------------------|-----------------|------------------------------------------------------|

## Life Office Valuations

THE Assurance Companies Act, 1909, provides that every office "shall cause an investigation to be made into its financial position, including a valuation of its liabilities," at least once in every five years. The table on page 16 analyses the results of the valuations made at the end of last year, together with the corresponding data for the preceding valuation. Where no allocation to shareholders is shown, the office concerned is a mutual society and has no shareholders. All the offices which make annual valuations maintained their reversionary rates of bonus. The National Mutual, the only office which values biennially, has declared its normal rates of bonus, but has not repeated the special additional bonuses of the previous two occasions. The bonus rate declared by the Beacon is poor, and probably exceptional, while among those offices valuing quinquennially only the Scottish Provident shows a reduction of bonus rate. Thus, out of the sixteen offices no less than thirteen maintained their previous rates. In the industrial branches the results were also satisfactory. The bases of valuation are in general more stringent than a few years ago, and in spite of falling interest rates there is no indication so far of the drastic reduction in bonus rates which might have been expected. But, even in the absence of war, some moderate reduction in bonus rates in the future is almost certain.

## Annual Valuations

*Britannic.*—Ordinary branch bonus 38s. per cent. on the sum assured (same). It will be seen that the cost of this bonus is well within earning capacity. In the industrial branch the same sum as in 1937 has been set aside for policyholders.

*Co-operative.*—Ordinary branch bonus 36s. per cent. calculated on the sum assured (same) and the same bonuses as in 1937 have been declared in the industrial branch. In the ordinary branch the valuation of immediate profit assurances was altered from O<sup>M</sup> to A<sup>1924-29</sup>; no doubt as a result of this change the amount set aside for future expenses and profits has increased to 27.7 per cent. of the annual premium income from 21.7 per cent. in 1937.

*London Life.*—Bonus reserve method used on the same assumptions as in 1937. The reversionary rate of bonus declared by the London Life is again 35s. per cent., calculated on the sum assured and bonuses. In the reduction of premium class the increase in rate of reduction for the year beginning July 1, 1939, is 2 per cent. This follows three successive declarations of 3 per cent., but it was pointed out in these years that declarations of less than 3 per cent. must be expected in some years. The reversionary bonus declared for the Clergy Mutual is at the rate of 3 per cent., calculated on the sum assured, increasing in the case of whole life assurances by 3s. per cent. for each additional year of age over 65, compared with 4 per cent. and 4s. per cent. in recent years. The rate of abatement in the case of the Metropolitan is 6 per cent., against 5 per cent. in 1937.

*Pearl.*—The rate of bonus declared in the ordinary branch is 2 per cent. of the sum assured; in the industrial branch the rates are 16s. and 12s. for each weekly premium of 1s. in the whole life and endowment assurance classes respectively, and the policies participating are those effected prior to January 1, 1932 (same).

*Prudential.*—The rates of reversionary bonuses declared in the ordinary branch are 46s. per cent. for whole life

assurances and 40s. for endowment assurances, calculated in each case on the sum assured. The bonus in the industrial branch is at the very satisfactory rate of 32s. per cent. on the sum assured (same). In the ordinary branch, as in the previous year, the bases of valuation are  $O^M$  3 per cent. for assurances and  $a^{(t)}$  and  $a^{(m)}$  3 per cent. for annuities. In the industrial branch English life table (No. 10) with interest at  $2\frac{1}{2}$  per cent., which was first adopted in 1937, has again been used.

**Refuge.**—The bonus in the ordinary branch is again at the moderate rate of 36s. per cent. on the sum assured. The allocation to policyholders in the industrial branch has been largely increased. In the ordinary branch the valuation bases were unaltered, namely  $O^M$  3 per cent. for assurances and  $a^{(t)}$  and  $a^{(m)}$  for annuities. In the industrial branch the reserves were again strengthened at an unstated cost. English life table No. 10 replaces the No. 8 table, and on this occasion  $2\frac{1}{2}$  per cent. was used not only as in 1937 for premium paying policies, but also for free policies. For a number of years the reserves have been progressively strengthened, and last year we pointed out that the results of this process were emerging in the shape of increased surpluses and bonus distributions. Last year the surplus earned was more than double that in 1937 and three and a half times that in 1936. In the ordinary branch, surplus earned differed little from that of recent years, but it will be seen that a substantial allocation has been made to the investment reserve fund at the expense of the carry forward.

**Standard Life.**—The very high bonus rate of 42s. per cent. per annum, calculated on the sum assured and bonuses, is declared for the twelfth successive year. As will

be seen, the cost of the bonus is much more than covered by current earnings.

**Wesleyan and General.**—The rate of bonus in the ordinary branch is again 38s. per cent., calculated on the sum assured. The allocation to policyholders in the industrial branch is on the same basis as in 1937, and takes the form of an addition to the sum assured payable in claims arising either by death or maturity between April 2, 1940, and March 31, 1941, equal to  $2\frac{1}{2}$  per cent. of the sum assured for policies of ten years' duration, increasing by  $\frac{1}{4}$  per cent. for each additional year up to a maximum of 10 per cent. for policies of forty years' duration and over. The valuation bases used in the ordinary branch were the same as last year, namely  $O^M$  3 per cent. for assurances and  $a^{(t)}$  and  $a^{(m)}$  3 $\frac{1}{2}$  per cent. for annuities. In the industrial branch English life table No. 9 has replaced English life table No. 6, and the rate of interest has been reduced from  $3\frac{1}{2}$  per cent. to 3 per cent.

#### Biennial Valuation

**National Mutual.**—The same normal rates of bonus as have been distributed in each of the preceding six years have again been declared: 42s. 6d. per cent. per annum for whole life full profit policies, 37s. 6d. per cent. per annum for endowment assurance with full profits policies, and 15s. per cent. per annum for low premium participating policies. These rates are calculated on the sum assured and existing bonuses. In view of the present obscure financial outlook it has been decided not to repeat the additional "prosperity" bonuses given on the last two occasions. The basis used in valuing liabilities at the close of 1936 was

very stringent; on this occasion the rate of interest assumed for assurances has been increased from  $3\frac{1}{2}$  per cent. to  $3\frac{3}{4}$  per cent. and for annuities from 3 per cent. to  $3\frac{1}{2}$  per cent. The new basis is still strong and more stringent than that employed in the 1934 and earlier valuations.

#### Triennial Valuations

**Beacon.**—The rate of reversionary bonus calculated on the sum assured has been drastically reduced from 36s. per cent. per annum for whole life and 34s. per cent. per annum for endowment assurances to the very poor rates of 22s. per cent. for whole life and 20s. per cent. for endowment assurances. It will be noticed that the carry forward has been increased from £15,000 to £49,000, but even had it remained unchanged the bonus earned would have been increased by only about 4s. per cent. The basis used in valuing the life assurance contracts is the same as three years ago, namely  $O^M$  3 per cent., but some strengthening of reserves took place for annuities and capital redemption policies.

**United Kingdom.**—Bonuses are at the same high rates as on the last three triennial occasions, namely 45s. per cent. and 41s. per cent. for whole life policies in the temperance and general sections respectively, these bonuses being calculated on the sum assured and existing bonuses. For endowment assurances the rate is 43s. per cent. in the temperance section where the original term is not less than twenty-five years and 41s. per cent. under all other policies, including those in the general section. On this occasion, however, the cost of bonus is somewhat in excess of the surplus earned in the period. The bases of the valuation are the same as three years ago.

#### Quinquennial Valuations

**Alliance.**—The rate of bonus is 38s. per cent. per annum calculated on the sum assured and existing bonuses (same). The basis of valuation has been strengthened by the assumption of interest at  $2\frac{1}{2}$  per cent. in place of 3 per

cent. The cost of this change is stated to be in excess of £600,000, the amount set aside five years ago to effect this purpose.

**Liverpool and London and Globe.**—Reversionary bonuses are declared at the rate of 45s. per cent. in the whole life and 40s. per cent. in the endowment assurance classes, both calculated on the sum assured (same). In the valuation the opportunity was taken to move to the A<sup>1924-29</sup> ultimate table for assurances; the rate of interest used was  $2\frac{1}{2}$  per cent. compared with  $2\frac{3}{4}$  per cent., combined with  $O^M$  3 per cent. net premiums, five years ago. For annuity contracts the  $a^{(t)}$  and  $a^{(m)}$  tables were again used, but  $2\frac{1}{2}$  per cent. interest was substituted for 3 per cent. These changes result in a further strengthening of reserves. Unfortunately the report does not furnish the necessary information to enable us to give our customary analysis of the valuation results.

**Scottish Provident.**—This office has a distinctive system of bonus distributions in the whole life class, under which policies begin to participate in profits when premiums accumulated at 4 per cent. per annum compound amount to the sum assured. Policies effected on the old scale of premiums and now participating for the first time receive a bonus of 28s. per cent. in respect of each complete year of duration up to December 31, 1938, excluding the years 1914-1918, compared with 30s. per cent. on the last occasion. Policies which have already participated receive additions at rates varying from 30s. per cent. to 36s. per cent. per annum, compared with from 30s. per cent. to 40s. per cent. per annum five years ago. Whole life premium rates were reduced in 1928; for this class of policy reversionary additions at the rate of 15s. per cent. per annum are allotted, whether for the first or subsequent participation. In the endowment assurance class the rate of bonus is 35s. per cent. per annum compound, compared with 38s. per cent. in 1933.

**Scottish Widows.**—The rate of bonus is 42s. per cent. per annum calculated on the sum assured and existing

#### Some Good Points

- \* Promptness in Settlement of Claims.
- \* Liberal Policy Conditions.
- \* Perfect Security. Established 1866.
- \* Assets £32,000,000.
- \* Premiums Moderate.
- \* Excellent Bonus Record.
- \* House Purchase Facilities combined with Life Assurance.

LIFE, FIRE, ACCIDENT, BURGLARY,

bonuses (same). Five years ago the  $O^M$  and  $O^M(5)$  tables were used in valuation for assurances, but on this occasion a change has been made to the  $A^{1924-29}$  table using "select" net premiums. For annuities the  $a^{(m)}$  and  $a^{(f)}$  tables have again been employed. Interest has been taken at  $2\frac{3}{4}$  per cent., except that for both existing bonuses and in arriving at the cost of the bonuses now declared  $2\frac{1}{2}$  per cent. has been used.

**Yorkshire.**—The rate of bonus declared is 48s. per cent. on the sum assured (same); it is of interest to note that the intention is to pay interim bonuses at the rate now

declared on claims arising before the next valuation. In 1933 the  $O^M(5)$  table was used for whole life policies and the  $O^M$  table for endowment assurance policies, with interest at  $2\frac{1}{2}$  per cent. and 3 per cent. for participating and non-participating classes respectively; on this occasion the  $A^{1924-29}$  ultimate table has been used with special net premiums, with the result that the reserves are "very materially greater" than those of a  $2\frac{1}{2}$  per cent.  $A^{1924-29}$  net premium valuation. The reduction in the amount carried forward is stated to be due to the strengthening of the valuation reserves.

## Fire Insurance

FIRE insurance premium income last year appears to have been somewhat smaller than in 1937. This reduction was probably due in the main to the lower United States receipts, which resulted from reductions in premium rates in 1937 and 1938 following the unusually favourable underwriting results of recent years. Conditions in China must also have accounted for some falling off in premiums, but now that hostilities in Spain have ceased some partial return, at least, to normal trading conditions in that country should ensue. The following tables relate to twenty-two large composite offices and include many subsidiary com-

panies. It will be seen that there is remarkably little annual fluctuation in the aggregate premium income, especially considering that the income is derived from all parts of the world. Underwriting profits also show a considerable degree of stability, in spite of the effect of increased foreign taxation on expenses in most cases. Among individual offices the General Accident (which, moreover, charges lower rates than the average) again shows the highest profit ratio. The Alliance, whose results are consistently excellent, takes second place on a much larger premium income than the General Accident.

## Marine Insurance

MOST companies recorded a sharp increase in the marine premium income in 1937 and last year showed some further increase. Underwriting results were unsatisfactory. The moderate upward adjustment of hull rates is being well supported, and the effect of these increases may be more apparent in later years. The cost of repairs is estimated, however, to be about 40 per cent. higher than 1937. Premium rates for cargo insurance are inadequate, and the real position is obscured by the inclusion of war risk premiums. The special arrangements which have now been made for the treatment of war risks will involve the separation of the war premiums, and by clearly showing the meagreness of the cargo rates may result in greater co-operation among underwriters for the purpose of improving the position. During the September crisis and again during recent months the market has been faced with abnormal commitments on gold shipments in one bottom across the Atlantic. The market has thus been exposed to the risk of a loss of much greater margin than it should properly undertake. It is the practice of those offices who confine their activities mainly to this class of business to leave the underwriting account open for two years. The account is then closed by taking the unexpended balance of the first year's premiums to profit and loss, after making suitable provision for further claims by a transfer to a suspense account. Hence the 1938 report shows the profit which, it is estimated, emerges from the 1937 premiums. The following table gives the results obtained during the past five years by representative marine companies:—

| Office              | Account | Premiums | Claims and Suspense | Expenses | Surplus or Deficit |
|---------------------|---------|----------|---------------------|----------|--------------------|
| British and Foreign | 1933    | 371,539  | 268,117             | 97,202   | 6,220              |
|                     | 1934    | 389,127  | 262,890             | 98,650   | 27,587             |
|                     | 1935    | 398,073  | 280,100             | 99,942   | 19,031             |

The general practice of composite offices is to present their marine accounts in the form used for their fire and accident business. The claims are thus to a large extent unrelated to the premiums appearing in the same account. The amount transferred to profit and loss does not represent the underwriting profit of any particular year or years; the results, however, may be gauged approximately by comparing the total premiums received over a period of years with the total claims and expenses in the same period. During the last few years, voyage business has on the whole been profitable to marine underwriters, but few underwriters, if any, have even attempted until quite recently to separate in their books premiums received for war risks from the corresponding premiums received for marine. Voyage accounts have thus been a mixture of marine and war, and since, apart from Spanish voyages, no war risk claims have arisen, it is impossible to say whether the marine voyage has been profitable by itself or not. The immediate problem facing the marine underwriter is whether he will be able, at the present level of voyage rates, to make a profit out of marine risks pure and simple now that the war risk has been separated and carried to the pool.

| Office                           | Premiums  | Claims    | Expenses |

# Accident and Miscellaneous Insurance

ALL branches of insurance, except life, fire and marine, are included under this category. Premium income has increased rapidly in recent years and is now much in excess of fire premium income. The latest returns published by the Board of Trade relate to 1937, when the total accident and miscellaneous premiums of all companies established in this country exceeded £75 millions, of which £37 millions are attributable to motor insurance, while the corresponding fire premium income was less than £50 millions.

The following table shows little change in the aggregate premium income last year, but underwriting profit was very satisfactory and formed a higher percentage of premium income than in any previous year. There was a decrease of over £500,000 in the premium income of the employers' liability, which was mainly due to the large fall in workmen's compensation premiums in the United States. Many insurance chairmen have referred to the inadequacy of motor insurance rates in the home market in view of the increased cost of settling third-party claims. A year ago we referred to the concern felt by the companies at the decision in the House of Lords in the case of *Rose v. Ford*, which laid down that, in addition to any

claim which the dependants might have, the legal representatives of a person who had been killed in an accident through the negligence of another are entitled to claim for the benefit of the deceased's estate for loss of expectation of life. We also referred to the much larger amounts now being awarded in court. In one case towards the end of last year, £2,500 damages was awarded to a woman who was shocked through seeing a collision between two motor vehicles, one of which she feared was going to hit her. An even more remarkable case, however, was that in which the Court of Appeal awarded damages to four mourners who sustained shock when a tramcar jolted the hearse, causing the coffin to slip from its bearings while still remaining on a damaged vehicle.

On various occasions in the past, the high percentage of premium income absorbed in commission, both in the fire and accident departments, has been criticised in *The Economist*, and it may fairly be suggested that commission on motor premiums in particular should be reduced to a more modest level. The combined efforts of the companies might be devoted towards this objective in the first place, before the question of increased premium rates falls to be considered.

## ACCIDENT AND MISCELLANEOUS—GENERAL RESULTS, 1935-38

TRADE SUPPLEMENT

New Series

SATURDAY, JULY 29, 1939

No. 31

## The Trend of Business

THE vigorous expansion in industrial activity, which began early this year, has continued in June and July. *The Economist* index of Business Activity rose from 101 (1935 = 100) in December to 110½ in May (revised) and 111½ in June; the current index is only two points below the highest level recorded in August and September, 1937.

The chief cause of the buoyancy of British industry is, of course, the rapid increase in defence expenditure. Originally estimated at £590 millions, defence expenditure for 1939-40 has been raised by supplementary estimates to £747 millions, an increase of £347 millions, or 87 per cent., over the outlay in 1938-39. But in spite of the persistent growth of the defence sector of British industry, there has as yet been no reduction in the activity of the consumption goods trades; on the contrary, the output of consumption goods has been expanding with the output of armaments, for while the wages bill has risen, prices have remained almost unchanged. The

advance in real wages has been assisted by the downward movement in import prices, due partly to the recession in the United States and to the overproduction of certain commodities, such as wheat.

So far, therefore, business activity in this country has advanced on a wide front, in contrast to the continued stagnation on the Stock Exchange. Of the thirteen constituent series of *The Economist* index of Business Activity, only four (those relating to building activity, raw cotton delivered to mills, the volume of domestic exports and Town clearings) showed a small decline between May and June, while two (those relating to the consumption of electric power and to the number of commercial vehicles in use) remained unchanged. The remaining seven indices all registered a further advance. The index of employment showed the biggest rise since recovery began. The advance in the figures for coal consumption and for the quantity of iron and steel becoming available for home consumption reflects the intensification of activity in the heavy industries, while the rise in the index of the volume of imports of raw materials points to a further expansion of business, though part of the increased intake may have been added to emergency stocks.

Only two indices, those relating to building activity and Town bank clearings, stood at a lower level in June than a year ago. The fall in Town clearings reflects the reduction in financial transactions in the City, due largely to the uncertain political outlook. So far as the fall in the index of building activity is concerned, this does not include direct Government contracts and consequently is no longer a reliable indicator of changes in the total volume of construction. But the index does suggest that the residential building industry is one of the few major branches of activity in which new private investment is on the downgrade.

Current reports from industrial centres show that there is little evidence this year of the usual decline in business

activity in the summer. The output of coal has shown some decline with the reduction in the demand for heating fuel, but production is running well above last year's level, a reflection of the increase in industrial consumption and in exports. Exports of coal last month, for example, were appreciably higher than in the corresponding months of 1937 and 1938. The iron and steel industry, too, remains very active, and the decline in output this month is expected to be smaller than usual. Activity in the shipbuilding industry is tending to expand as a result of the recent spurt in new orders; Lloyd's quarterly returns revealed a substantial increase in the tonnage of merchant ships under construction between the end of March and the end of June. Most branches of the engineering industry are still making headway, but the scarcity of labour is a limiting factor.

Among the consumption goods trades there has been a remarkable recovery in textiles. The expansion in the textile

trades, moreover, cannot be attributed directly to increased defence expenditure; not only has domestic civil demand shown an increase, but exports of all the principal materials are well up on the year, partly as a result of heavier takings by the United States.

Even sales of private cars have continued to increase, despite the gloomy forecasts after the announcement of the increase in the horsepower tax. New registrations of private cars in May were 15 per cent. higher than a year earlier, and there has been a switch from the heavier to the lighter cars.

Present indications point to a further expansion in industrial activity after the holidays. In view of the rapid increase in defence expenditure, the armament sector of British industry will continue to grow. Nor are there any signs of an imminent reduction in the activity of the consumption goods industries. So far the choice between guns and butter has scarcely become a problem in this country, but in view of the rapid absorption of our free labour resources the issue may well come to the fore next winter.

In the United States, hesitancy in industry has again given way to an upward movement. After declining from 104 (1923-25 = 100) last December to 92 in April and May, the Federal Reserve Board's index of production (adjusted for seasonal variations) rose to 97 in June. The flow of new orders to industry has shown a definite improvement and most observers now expect a further measure of recovery. In most Continental countries industrial activity is being stimulated by re-armament. In the Scandinavian countries, business activity remains at a high level and France is now going ahead fairly rapidly. In Germany further expansion is hampered by the shortage of labour and materials. The latest reports from the principal raw material producing countries do not reveal any significant changes, though the persistent fall in wheat prices is regarded with no little anxiety.

## British Industrial Developments

The following reports on British industry cover, in most cases, the period to the middle of July. In the remainder they relate to the month of June.

### COAL

As a result of the usual seasonal decline in the demand for heating fuel the output of coal has tended to decrease. But the reduction in output between May and June was much smaller than usual owing to the increased industrial intake and the improvement in exports. A year ago output declined from 19.1 million tons in May to 17.1 millions in June; during the corresponding period this year production declined only from 19.9 million tons to 19.3 millions, so that output last month exceeded the figure for June, 1938, by 2.2 million tons. That increased exports played no small part in the improvement is shown by the returns for June. Exports and shipments for the use of steamers last month were 4,565,000 tons, an increase of 843,000 tons over the figure for June, 1938. Compared with a year ago, output showed an improvement in June in all coal-fields. The latest weekly returns suggest that the improvement is being well maintained. During the week ended July 8th the quantity of coal raised was 4,611,000 tons, compared with 4,675,000 tons during the first week in June and 4,201,000 tons in the first week of July, 1938.

### IRON AND STEEL

The output of pig iron rose from 692,100 tons in May to 715,700 tons in June, but that of crude steel declined slightly from 1,218,100 tons in May to 1,175,600 tons in June. The slight decline in the output of crude steel between May and June was due to the smaller number of working days in the past month. Calculated on a daily basis, production rose from 45,115 tons per day in May to 45,215 tons in June; the number of steel furnaces in operation at the end of June was 356, against 335 at the end of May. In the case of pig iron, the increase in production was even more marked, though, in contrast to steel, output in June was still below the highest level reached in 1937. It is understood that the flow of raw materials to the steel furnaces is now fairly satisfactory and that the output of steel can be maintained at the present high level. Moreover, Mr R. S. Hudson announced in the House of Commons on July 10th that arrangements had been made to supplement domestic steel production by additional imports. Apart from the normal annual imports of just over 500,000 tons of steel under its agreement with the Continental Steel Cartel, the British Iron and Steel Federation has recently made arrangements with the Cartel to import an additional 300,000 tons of semi-manufactured steel during the next few months. Actually imports of iron and steel materials rose sharply in the last month, when they amounted to 199,900 tons compared with 60,900 tons in June last year. Imports last month thus exceeded exports, which totalled 162,300 tons against 150,900 tons a year ago.

### GENERAL ENGINEERING

The trend of production in engineering remained upwards in June and there has been little evidence of the usual seasonal lull in activity this month. Current reports indicate that the proportion of defence orders to total orders is steadily increasing. Nevertheless, civil business is still fairly well maintained. Those firms engaged mainly in defence work are, of course, the most active, and do not report any seasonal decline. On the other hand, the section engaged in the manufacture of printing, sugar crushing and refining, agricultural and mining and excavating machinery have experienced a slight lull in activity. The unemployment percentage in general engineering fell from 6 per cent. in May to 5.4 per cent. in June; a year ago the figure stood at 8 per cent. Consequently there is still a margin for further expansion in activity (in September, 1937, the unemployment percentage was actually down to 4.8). The margin, however, is now fairly small and if the demand continues to expand the industry may be faced with serious labour problems later in the year. Exports of machinery are sharply down in volume compared with last year; they amounted to 34,400 tons (valued at £4,442,400) in June against 40,400 tons (valued at £4,834,500) in June, 1938. Imports on the other hand, are up on the year. Last month shipments were 13,000 tons (valued at £2,481,500) compared with 10,400 tons (valued at £1,726,000) in the corresponding month last year.

### ELECTRICAL EQUIPMENT

Activity in the electrical equipment industry continued to expand in the past month. Thus, the proportion of insured persons unemployed declined between May and June from 4 per cent. to 3.6 per cent. in electrical engineering and from 6.3 per cent. to 5.4 per cent. in the case of electrical cable, apparatus and lamp manufacture. Exports of electrical goods and apparatus rose from £1,028,900 in June, 1938, to £1,076,400 in the past month. On the other hand, shipments of electric machinery declined sharply from £379,300 (1,977 tons) to £202,600 (1,049 tons) during this period.

### AUTOMOBILES

New registrations of private cars continue at a higher level than last year; the increase in May, when 28,268 private cars were registered, amounted to 15 per cent. over the figures for May, 1938. There has, however, been a considerable shift from the large to the smaller types of car, as a consequence of the increase in tax. Production is well maintained and exports of private cars in the first half of 1939 were slightly larger than a year ago, while imports were considerably reduced. Sales of commercial vehicles recovered in May from the low levels of previous months, but in the first eight months of the current season, only 69,218 commercial vehicles were produced, against 73,519 in the same months of the 1937-8 season.

### BUILDING

The value of building plans passed in June by 142 local authorities was 12.2 per cent. lower than a year ago. There has been a marked decline in the value of plans passed for dwelling houses but an appreciable increase in the figures for factories, workshops and other commercial premises. These returns, however, do not include direct Government contracts and the volume of constructional activity as revealed by the unemployment figures actually showed an increase last month and it is now higher than a year ago. The proportion of insured persons unemployed in building was 11.3 per cent. in June, 12.4 per cent. in May and 12.6 per cent. in June, 1938; the corresponding figures for public works contracting are 29.3 per cent. for June, 31.7 per cent. for May and 36.1 per cent. for June, 1938. The indications, moreover, point to the maintenance of a high level of constructional activity.

### CHEMICALS

Home trade in industrial chemicals has been quite active during the past month and values have remained practically unchanged. Among wood distillation products, there was a better demand for acetates of lime, and business in other products was also good. Further improvement was shown in trade in coal tar products, for some of which better prices were obtained; this market, however, is still far from satisfactory. Business in pharmaceutical and other fine chemicals was on a moderate scale throughout the month. There was a further improvement in June in the overseas trade in chemicals, drugs, dyes and colours; exports increased in value by £524,186 and imports by £586,192 as compared with June, 1938. Comparing the figures for the first six months of this year with those for the same period of 1938, exports show an increase in value of £966,856 and imports an increase of £2,131,916.

### POTTERY

There has been little change in the past month. Trade at Bristol and Derby remains good but in Staffordshire business is poor. In the trade as a whole there was a slight increase in unemployment between May and June, the proportion of insured persons unemployed rising from 16.8 to 17.1 per cent. The export trade is improving; in the first six months of 1939, the export of sanitary ware totalled 254,963 cwt. against 221,097 cwt. in the corresponding period of 1938 and exports of china have been well maintained. The United States continue to take good quantities of earthenware, but trade with the Empire has fallen off.

### FOOTWEAR

Work on service contracts keeps manufacturers busy in most centres. The volume of orders placed for Army boots has resulted in a shortage of suitable leather and some manufacturers may find it difficult to complete their contracts within the time specified. The civilian demand has been checked by the bad weather of the past few weeks, and autumn buying is not expected until after the holidays. It is expected that there will then be a rise in shoe prices, since manufacturers are having to pay higher prices for most types of leather.

### COTTON

During the past month, the industry has made further progress; unemployment has again fallen and more machinery is working than for some time past. Spinning production at the end of June rose to 67 per cent. of capacity, compared with 64 per cent. in the previous month and 50 per cent. a year earlier. This revival has been mainly due to Government orders for army clothing; orders have been placed for 24 million yards of cloth and it is understood that contracts for another 6 million yards are pending. Some difficulties have been experienced in arranging for the delivery of these goods before the end of November, and negotiations are taking place for the purpose of getting the Government to lower the standard of certain cloths so as to enable more machinery to be worked on the contracts. These orders have stimulated the demand for coarse counts, especially in ring descriptions and some mills working on

American yarns are fully sold for three or four months ahead. The Lancashire Cotton Corporation has made two advances of 4d. per lb. each in prices for ring yarns. In contrast, business in the Egyptian section remains unsatisfactory; it has been necessary to decontrol prices for carded counts and the whole price convention is in danger of collapse. Purchases by the home trade have been of fair extent but further improvement has been checked by the half-year stocktakings. The demand for piece goods for the export trade remains disappointing; the uncertain European situation is not good for trade and in addition, there is a certain resistance to the recent rise in prices. In spite of these unfavourable factors, exports of piece goods in June amounted to 112.5 million sq. yards, against 96.1 million sq. yards in June, 1938, and yarn shipments increased from 8.4 to 9.1 million lb.

### JUTE

The arrival of new crop jute into Calcutta has eased prices and civilian demand has slackened until a new price level has been established. Government orders continue to keep busy manufacturers in Dundee; unemployment in the jute trade declined in June to 17.5 per cent. of insured persons. Though production in Indian mills will be curtailed in August, prices for manufactured goods continue to decline in sympathy with those of the raw material.

### LINEN

Business remains quiet due partly to the holidays in Belfast and Dundee. While private trading is hampered by high production costs, spinners and weavers are well supplied with Government orders. Reports of the new flax crop on the continent are satisfactory and it is expected that supplies will be sufficient. Trade with America continues to give satisfaction but it is expected that the recent improvement in exports of piece goods to China will be checked by the Japanese invasion of Swatow and other ports. For the first six months of 1939, exports of linen piece goods totalled 36.6 million sq. yards, a considerable increase over the 26.8 million sq. yards exported in the same period of 1938, but still much below the 1937 half-year's total of 48.7 million sq. yards.

### RAYON

Rayon business has not been entirely satisfactory during the last

month, though buying for the autumn is expected shortly. There is still some delay in deliveries against old contracts of certain sorts. Hosiery business is moderately satisfactory. Exports of all-rayon piece goods continue to expand and for the first six months of the current year amounted to nearly 20 million sq. yards, compared with 15.0 million sq. yards in the first half of last year; most of this trade goes to the Empire. Business in mixed fibres is less satisfactory.

### WOOL

Raw wool prices continue firm with an increasing demand. The sales of English wools in London in the past fortnight have reflected the firm tone of previous auctions of imported wools. Manufacturing activity continues to increase and unemployment to fall. Government contracts are of course mainly responsible for this improvement but there is also a more confident feeling in the home trade. Buyers are more willing to meet manufacturer's ideas of prices and a higher level of prices for all types of piece goods is generally expected.

### AGRICULTURE

The hay harvest in the west has been much delayed by the wet weather of the last few weeks. Some fields were cut and carried during the fine spell early in June, but a considerable acreage is still standing. Corn crops are generally doing well although heavy thunderstorms have done some damage; not more than average yields are expected in most districts, and the long spring drought has reduced the length of straw. The lambing season is generally satisfactory.

### SHIPPING

The freight markets remain depressed. There is no demand for July tonnage at the River Plate and demand for August and September is very limited. A few vessels have been chartered by the grain trade from the St. Lawrence and more interest has been shown in tonnage available in the North Pacific. The sales of Australian flour to the Far East are temporarily stopped and both in that and the Mediterranean markets there is little inquiry.

## UNITED KINGDOM—THE ECONOMIST INDICES OF BUSINESS ACTIVITY\*

Corrected for normal seasonal variations. Daily Averages of 1935=100.

| Period                  | Employment | Consumption of Power |             | Transport               |                         | Postal Receipts | Building Activity | Iron and Steel available for Home Consumption | Raw Cotton delivered to Mills | Foreign Trade            |                                 |                    | Bank Clearings                    |      | Complete Index |                               |

\* For method of construction and earlier figures (1924-1936) see Supplement to *The Economist* of July 25, 1936. This Supplement is now out of print, but a record of the complete index was given in *The Economist* of November 5, 1938. † Revised. ‡ Annual indices represent averages of monthly figures.

(a) Old quarterly Board of Trade indices linked on to new indices; figures in italics based on old indices. (b) Annual figures relate to year end d September. (c) Figure for 1936 is average of August–December. (d) Indices shown in last month of quarter to which they relate. (e) Daily average. (f) Monthly figures as averages of quarterly returns. (g) Average of weekly figures. (h) Ordinary and Self-balancing revenue and expenditure. Annual figures are totals for financial year beginning in year shown. Monthly figures are cumulative. (i) Annual figures relate to end of year. (m) Average January to August: figures for September to December are not comparable owing to revised method of counting adopted in September, 1937. (n) Excluding Agriculture. (p) Four weekly figures; annual figures relate to year beginning March in year shown. Public Authorities only. (q) Annual indices, year beginning in July; quarterly indices year ended in quarter shown.

## UNITED STATES, FRANCE AND GERMANY

## British Industrial Developments

The following reports on British industry cover, in most cases, the period to the middle of August. In the remainder they relate to the month of July.

### COAL

The output of coal showed a seasonal decline between June and July, but the quantity raised last month was well above the level of the corresponding month last year. Actually, production fell from 19.3 million tons in June to 18.0 million in July; compared with a year ago, however, output last month showed an increase of 1,140,000 tons. The improvement in demand has not been confined to the domestic trade, for exports have shown a sharp increase. Cargo shipments rose from 3,056,000 tons in July, 1938, to 3,736,000 tons in the past month, while shipments for the use of steamers advanced from 835,000 tons to 872,000 during this period. In fact, the increase in exports compared with a year ago has been more marked than the expansion in domestic consumption. The explanation of this vigorous recovery is to be found in the heavy decline of exports by Germany; they fell from 16.8 million metric tons in the first half of 1938 to 12.7 million tons in the corresponding period this year.

### IRON AND STEEL

Holidays and the need for plant renewals and repairs has naturally caused a temporary reduction in the activity of the iron and steel industry in recent weeks, but owing to the pressure for the delivery of materials production is being maintained at as high a level as possible. The output of pig iron (a continuous process) rose further between June and July, from 715,700 tons to 743,600 tons, and the number of furnaces in blast was increased from 114 at the end of June to 115 at the end of the past month; despite the increase, however, production last month remained below the highest levels reached in 1937. The output of crude steel, on the other hand, showed a decline in the past month. But this was due entirely to the holidays in Scotland, and on a daily basis production in England and Wales actually showed a further increase. The volume of exports of iron and steel materials rose from 135,100 tons in July, 1938, to 177,200 tons last month, against 232,200 tons in July, 1937. The expansion in imports, however, was much more marked; they were 202,300 tons in July, 1937, 65,000 tons in 1938 and 220,600 tons in the past month. There was also an appreciable increase in the intake of iron ore and scrap; thus, imports of ore rose from 329,800 tons in July, 1938 to 551,900 tons in the past month, while those of scrap and ships intended for breaking up advanced from 51,000 tons to 103,600 tons and from 6,000 gross tons to 8,200 gross tons respectively. While the output of crude steel in the current month must be expected to show a reduction, operations are likely to be speeded up rapidly in September.

### GENERAL ENGINEERING

The expansion in the engineering industry continued in the past month and is reflected in a further decline in the proportion of insured persons unemployed in the industry as a whole, from 5.4 per cent. on June 12th to 4.8 per cent. on July 10th. The growth of activity is due largely to the further increase in armament work; civil demand has shown a (partly seasonal) decline. The increase in the demands made on the engineering industry by rearmament is reflected in the foreign trade returns. Thus, imports of machinery last month amounted to 10,349 tons compared with 10,730 tons in the corresponding month last year; but while the volume of imports showed little change their value rose from £1,822,000 to £2,290,000 during this period. The volume of exports, on the other hand, fell sharply, from 38,286 tons in July, 1938, to 34,191 tons last month, but the decline in their value, from £4,874,000 to £4,434,000, was less marked. An analysis of the unemployment position by sections and districts shows considerable divergences; in some sections and districts virtually all the available labour has now been absorbed.

### ELECTRICAL EQUIPMENT

The electrical equipment industry, in particular, is now operating at a very high level. For example the proportion of insured persons unemployed in electrical engineering was only 3.0 per cent. on July 10th compared with 3.6 per cent. a month earlier; the corresponding figures for electric cable, apparatus, and lamp manufacture are 4.6 per cent. and 5.4 per cent. The expansion in electrical engineering is due largely to increased domestic orders, for exports of machinery actually declined from 1,914 tons (valued at £398,000) in July, 1938, to 1,387 tons (valued at £270,000) in the past month. Shipments of electrical goods and apparatus also fell during this period from £1,082,000 to £1,035,000.

### AUTOMOBILES

Private car sales during the month of June were 17 per cent. higher than in June last year, and the production of private cars and taxis increased by 6,300 units. Production of commercial vehicles also increased by 700 compared with June, 1938; owing to the low level of output in the early part of the season, the total output of commercial vehicles in the nine months ending in June was considerably smaller than in the same period of the previous season, while the output of private cars was much greater. During the

seven months ended July, 2,500 more private cars were exported than in the same seven months last year, thereby reaching a record total of 49,234 units. Exports of commercial vehicles, however, show the slight decrease of 200 units.

### BUILDING

Constructional activity has been maintained at a very high level; the percentage of insured persons unemployed fell between July, 1938, and the past month from 13.6 to 11.3 in the case of building and from 35 to 31.4 in the case of public works contracting. Between June and July the figure for building remained unchanged but that for public works contracting showed a slight increase. But, while the unemployment figures suggest that activity is now actually higher than a year ago, the course of the returns relating to building plans passed by local authorities has been sharply downwards. Last month, for example, the value of building plans passed was 30.9 per cent. lower than a year ago. The apparent contradiction between the unemployment returns and the figures for building plans passed is due to the fact that the value of building permits excludes direct Government contracts, which must have shown a substantial increase in recent months. The decline in dwelling house construction has thus been practically offset by an increase in other forms of building.

### CHEMICALS

During the past month the home chemical market has been fairly active for the time of year, particularly so the industrial chemicals section. The demand for all-wood distillation products has increased, and there has been a fall in stocks, although prices have, as yet, shown no increase. The pharmaceutical and fine chemicals section of the market has been rather quiet during the month, and business in coal tar products has continued to be difficult. There was a further improvement in overseas trade in chemicals, drugs, dyes and colours during July, exports increasing in value by £306,053 and imports by £452,670 as compared with July, 1938.

### POTTERY

After a period of hesitation at the end of June, business again improved in July, particularly at Bristol and Derby. There was also a slight improvement in North Staffordshire, where a considerable amount of short time is still being worked. The percentage unemployed among insured workers fell from 17.1 on June 12th to 16.3 on July 10th, due to a fall in the number of both "temporarily" and "wholly" unemployed. Imports of pottery products remain at a considerably lower level than a year ago, while the volume of exports is slowly rising. In the seven months ending in July exports of sanitaryware totalled 298,488 cwt., valued at £406,427, compared with 255,629 cwt., valued at £370,133, in the corresponding period of 1938; exports of earthenware have improved from the low levels ruling in the early months of the year, but the total for the first seven months is still below that of a year ago.

### FOOTWEAR

Buying on civilian account has been restricted by the holidays, and in spite of good clearances in the first week of August a resumption of orders is not expected until the end of the month. Factories working on Government contracts reduced their holidays to the minimum and are again working at full pressure. Leather prices remain firm with an upward tendency, and manufacturers are finding it slightly easier to secure an advance in prices for forward buying of their products. Imports both of leather and of rubber footwear continue at a much higher level than in 1938 or 1937; the wet weather of the last few weeks has particularly stimulated the sale of rubber boots and overshoes, the bulk of which are imported.

### COTTON

An active demand has again been experienced in coarse American yarns, and spinners are very busy, with users pressing for deliveries. Spinning production rose in July to 75 per cent. of capacity, compared with 67 per cent. in June. Fine American numbers and Egyptian qualities have been rather slow. The price control scheme for Egyptian yarns has been renewed for twelve months, but the agreement will not apply to carded descriptions. The first Government estimate of the American cotton crop for the new season was 11,412,000 bales, but since then the prospects for the yield have improved, and there is a possibility that the forecast at the beginning of September will approach 12 million bales. There has been a tendency for more machinery to be worked, due largely to the increased number of contracts given out by the Government. According to an official announcement, 25 million yards of cloth have been purchased by the Government for delivery up to November 30th. Further contracts are pending, carrying delivery up to the end of January, and the total Government contracts will then amount to over 30 million yards. The export in cloth is disappointing. The bazaars in India are over-supplied, and very few fresh orders have been secured for that important market. A fair amount of buying has taken place in fancies for Rangoon, Java and Singapore. A steady demand has been experienced in printing and finishing styles for South America. Heavy goods have moved off fairly well for the Dominions, especially South Africa. Exports of cloth during July were 128,976,000 square yards, against 112,548,000 square yards in

June and 113,260,000 square yards in July, 1938. Yarn shipments during July were 9,267,000 lb., against 9,096,300 lb. in June and 9,321,400 lb. in July, 1938. New orders from the home trade are rather unsatisfactory, but good clearances are being made against existing contracts.

### JUTE

The certainty of a good crop of jute, combined with the probability of a restricted Indian demand, led to a sharp fall in prices for new crop early in August, though there has been a certain revival on rumours that the Bengal Government may intervene to maintain prices. Only a moderate business is done in Dundee in jute yarns, except those wanted by manufacturers of sandbags and tarpaulin, who are still extremely busy.

### LINEN

Forward reports of the new flax crop indicate that yields will probably be less than last year, while the quality is only moderate. The policy of the Soviet Flax monopoly is still unknown. Prices remain very firm, and civilian business in yarn and cloth, as is usual at this time of year, is restricted to immediate requirements. The export trade is well maintained on the whole, and Government contracts, particularly for linen thread, help to maintain employment.

### RAYON

There has been little change in the rayon position during the past month and in the continued state of international uneasiness any marked improvement is unlikely. Nevertheless, in the cloth section there has been a slightly more favourable tendency, and the belated summer weather should prove a welcome fillip. There is still a fair volume of trade in the yarn section against existing contracts. Exports of rayon piece-goods continue at a higher level than a year ago, owing to the sustained demand from the Dominions.

### WOOL

The holidays have restricted the flow of new orders on home account and most mills closed down for one week or more early in August. Those working on Government account reduced their

holidays to the minimum and a shortage of skilled workers is reported from several districts. Although little new business has been placed by the home trade, the firmness of wool prices has induced some buyers to contract forward for bulk lines at existing prices. Activity in all sections of the industry is expected to increase further in September; the percentage unemployed among insured workers declined from 9.1 on June 12th to 6.7 on July 10th, which compares with 22.1 per cent. in July, 1938.

### AGRICULTURE AND FISHERIES

The cold wet weather of recent weeks seriously delayed the hay harvest, which is poor both in quantity and quality. Much was not cut until the second week in August, when the weather improved. The yield of corn crops, according to estimates made by the Ministry of Agriculture, is expected to be considerably lower than last year, but about equal to the average of the last ten years; the eastern districts of England and Scotland although lacking in sun had less rain in July than western areas. Root crops have generally grown well, but weeding and lifting of potatoes have been hindered by wet weather; sunshine is generally needed, particularly for the sugar beet. Turnips in Scotland are reported to have suffered both from the drought in June and the rain in July. There are large crops of plums and apples, but prices have already fallen to very low levels, particularly for plums. The latest returns of sea fisheries show that in the seven months ending in July, the herring catch amounted to only 109,474 cwt., less than half of the weight landed in the corresponding period of 1938; the catch of other fish has been about normal.

### SHIPPING

The international tension is not favourable to an increase in world trade and tramp shipping freights remain at a low level. The *Economist* index of freights, for instance, reached in July the lowest level of the year. Some business has been done in scrap iron and steel from North America to the Continent and there is a steady movement on a small scale of wheat from the Plate. During last week, a number of contracts (believed to be on Government account) were secured for wheat from North America to be loaded early in September, but business elsewhere is likely to remain dull, until the political situation is clearer.

### UNITED KINGDOM—THE ECONOMIST INDICES OF BUSINESS ACTIVITY\*

Corrected for normal seasonal variations. Daily Averages of 1935=100.

\* For method of construction and earlier figures (1924-1936) see Supplement to *The Economist* of July 25, 1938. This Supplement is now out of print, but a record of the complete index was given in *The Economist* of November 5, 1938. † Revised. ‡ Provisional. § Annual indices represent averages of monthly figures.

## Business Developments Overseas

## BRITISH EMPIRE

**AUSTRALIA.**—Negotiations between the Commonwealth and State Governments over a larger subsidy to wheat farmers are held up owing to the refusal of the Victorian Government to co-operate. There has been a seasonal decline in retail and wholesale trade, according to a cable from the National Bank of Australasia, but defence contracts and the prospects of further expenditure on defence have helped to give confidence. The effect on the Australian exports of the low prices for wheat is partly offset by the firm market for wool and by larger exports of butter and gold.

**CANADA.**—The excessive heat of the past few weeks has brought some deterioration in the condition of the wheat crop, but estimates still indicate an out-turn of 400 million bushels. The prospects of this record crop, which is now being harvested, has encouraged business in Western Canada, where a number of elevators have reopened. Exports are also on a large scale; the United Kingdom continues to take good quantities of timber, minerals and pulp. Business as a whole continues to increase slowly; the value of contracts awarded to the construction industry and of building permits were both larger in June than in May or than in June, 1938.

**INDIA.**—The famine conditions in Central and Western India have been somewhat relieved by heavy rains in Berar and the Central Provinces, but scarcity both of human food and of cattle fodder persists in the western states. The fall in the prices for raw jute has impeded trade in jute manufactures, and, in spite of the restricted production by the Calcutta mills, the offtake from the mills is very slow. Imports of cotton yarn and piece goods continued to increase in May, and the local mills are finding it extremely difficult to meet Japanese competition in the cheaper classes; up-country sales are at a very low level in most districts owing to the prospects of a poor harvest of many of the principal crops. It is reported that the Millowners' Associations in Bombay and Ahmedabad are discussing a scheme for restricting production in the Province.

**SOUTH AFRICA.**—Heavy rains in most provinces in July have improved wheat prospects and the supply of fodder for cattle, but the threshing of maize and delivery to elevators has been hampered. The export of maize continues steadily, but prices on international markets are very low. Trade in hides and skins has improved, owing to strong buying from overseas, and there has been a noticeable rise in prices. Retail trade has been satisfactory on the whole.

## EUROPE

**FRANCE.**—The rate of expansion in industrial activity has been sharply accelerated since the spring. Thus, the official index of industrial production (1928=100) rose from 92 last February to 98 in May and 100 in June, against 83 in June, 1938. The figure for June, moreover, was the highest since March, 1931, and only 10 per cent. below the record of 112 reached in 1930. The expansion in activity, while due in a large measure to increased defence expenditure, has been fairly widespread. It has been very marked in the mining, iron and steel and engineering industries, but the textile trades have also experienced a vigorous recovery. Even building activity, though still at a comparatively low level, has shown some improvement. Such evidence as is available for July suggests that the improvement has continued. The number of unemployed in receipt of benefit, for example, fell from 337,000 on July 8th to 317,000 on August 5th. The trend of prices of both domestic and imported materials has tended to decline in recent weeks.

**GERMANY.**—According to the official statistics the volume of industrial activity has been maintained at a high level. The index of industrial production calculated by the German Institute for Economic Research (1928=100) stood at 136.9 in June against 139.9 in May and 130.2 in January. But while the index of the production of capital goods rose from 134.4 in January to 146.8 in June, the figure for consumption goods fell from 120 to 113.3. The Institute's weekly index suggests that there was little change in the general level of activity in July. As a result of the feverish war preparations the economic balance has been seriously distorted. This is reflected in the difficulty in maintaining the flow of raw materials from overseas and in the shortage of coal and other materials produced at home. While the official indices of the prices of commodities and industrial securities have shown little change in recent weeks, there was a further marked increase in the volume of money in circulation, from Rm. 10,742 millions in the first week of July to Rm. 11,229 millions in the first week of August.

**NORWAY.**—As in England, the herring catch has been exceptionally poor, both in quantity and quality; this is the more unfortunate as the export trade in cured and canned fish has improved considerably in recent months. Exports of canned fish in the first five months of 1939 increased by 30 per cent. in quantity and by 35 per cent. in value, compared with the same period of last year. The very wet weather in July has seriously affected the hay harvest in many districts. The low level of tramp shipping freights and the lack of prospects of any immediate improvement led to a sharp increase in the number of vessels laid up from 49

at the end of June to 83 at the end of July, of which 44 were oil tankers.

**SWEDEN.**—The international tension has helped to increase the foreign demand for many Swedish products, notably for steel and timber. Combined with the boom in domestic building, the revival of international demand has led to full working in many Swedish ironworks. The decision of the European Timber Exporters Convention to raise the export quotas of its members will mean for Sweden an increase from 656,000 to 721,000 standards in her permissible exports for 1939; at the present level of demand in European importing countries and with the low level of stocks, the extra allotments should be easily cleared. Wholesale prices have begun to rise owing to increased prices for textiles, building materials and British coal, and employment is maintained at a satisfactory level in most industries.

**HOLLAND.**—The recovery in business activity in Holland continues to make headway, aided by Government expenditure on defence. Unemployment, while still large, is less than a year ago; the value of contracts secured by the building industry in June totalled 15.1 million guilders, against 14.3 million guilders in May. Exports show a considerable increase in value compared with last year, owing partly to the improved trade in textiles and partly to larger exports of bacon and eggs to England and of horticultural products to Germany; the export of the latter is likely to be restricted again by the exchange difficulties with Germany. Increased employment and the continuing low level of the cost of living has led to an increase in the turnover of retail sales and in the yield of the turnover tax. The suspension of payments by Mendelssohn and Company at the end of last week led to an influx of funds from other centres by banks and other firms wishing to increase their liquidity, and as a result there was a temporary fall in both the dollar and pound exchange. The suspension has led to no panic either on the Bourse or in the exchange markets and a number of Dutch banks are assisting in the orderly liquidation of the affairs of the Mendelssohn Company.

## UNITED STATES OF AMERICA

The recovery movement which began in May has gathered momentum. Thus, the Federal Reserve Board's index of industrial production, adjusted for seasonal variations, rose from 92 in May (1923-25=100) to 98 in June and 102 in July; the figure for July, 1938, was 83. It appears that the advance in the index is due partly to the contra-seasonal expansion in steel production, but this in itself is a reflection of the improvement in general business conditions. Construction activity has tended to expand and the average daily value of building contracts awarded during the first three weeks of July was slightly higher than in the corresponding period of June. The latest reports from the lighter industries are also encouraging. There has been an improvement in the cotton industry and the wool textile and rayon industries have also made headway. Retail trade is appreciably better than a year ago. In the absence of a European war most observers in the United States expect a further expansion of general business during the next few months.

## LATIN AMERICA

**ARGENTINA.**—The Government has stated that the low price of grain will not induce it to raise exchange rates, and that it is in a position to finance the guaranteed wheat prices to farmers this season, by the use of the financial reserves accumulated in times of prosperity. The local Buenos Aires grain market has recovered slightly on reports of adverse weather in Canada. With continued restriction of imports in the first half of this year, combined with a large volume of exports, Argentina had in the first six months of 1939 a favourable merchandise trade balance of over £11 millions sterling against an import surplus of £2 millions sterling in the same period of 1938, in spite of the fall in wheat prices. Britain's share of Argentina's import trade in the first half of this year was 21.7 per cent. against 18.8 per cent. in 1938, while the United States supplied 15.2 per cent. of Argentina's imports, against 19.2 per cent. There is a marked return of competition with British textiles from both Italy and Japan.

**BRAZIL.**—The free exchange rate is steady, although export bills are scarce. With the beginning of the period of high cotton exports, the trade balance at the end of May was favourable to the extent of £588,000 (gold), against an adverse balance of £2,376,000 (gold) twelve months previously.

## THE FAR EAST

**JAPAN.**—Negotiations have been opened with the Indian Government for the renewal of the Indo-Japanese trade agreement, which expires in March next. The Japanese cotton trade is pressing for an increase in the ratio between the quantity of Indian cotton purchased by Japan and the quantity of cloth which Japan can export to India, and for an alteration in the Indian import quotas of cloth, to favour Japanese printed cloths rather than plain. Wholesale prices continue to rise, in spite of the efforts of the Government, and are reflected in an increase in the cost of living. The note circulation of the Bank of Japan on July 22nd amounted to 2,212 million yen, against 1,881 million yen a year ago.

UNITED KINGDOM  
(Population, mid 1938, 47,485,000; Area, 95,030 sq. miles; 244,000 sq. kms.)

| United Kingdom figures; otherwise Great Britain (G.B.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Unit of Measurement  | Monthly Average |        |        |        |        |        | 1938   |        |        |        | 1939   |        |        |        |        |        |        |

## British Industrial Developments

The following reports on British industry cover, in most cases, the period to the middle of September. In the remainder they relate to the month of August.

### COAL

The output of coal in August continued above last year's corresponding level. Thus, the quantity raised during the four weeks ended August 26th was 15.6 million tons, an increase of 2.7 per cent. over the figure for the corresponding period in 1938. Exports rose from 2,863,000 tons in August, 1938, to 3,005,000 tons in the past month, and bunker shipments increased from 855,000 tons to 894,000 tons. The publication of production statistics was discontinued at the outbreak of war. Reports from the various coal districts indicated that the outbreak of war caused some confusion, but by the end of this month the industry had done much to adapt itself to the new conditions. There has been a spurt in the demand for household coal as householders were anxious to lay in as much fuel as possible before rationing comes into operation; industry's coal requirements have remained substantial. There has, of course, been some dislocation of exports, but even this section of the market showed some improvement towards the end of the month. So far there has been little change in f.o.b. prices.

### IRON AND STEEL

Like the coal industry, the iron and steel industry came under Government control at the outbreak of war. Control is exercised through the British Iron and Steel Federation and Sir Andrew Duncan was appointed Controller. As the British Iron and Steel Federation has long been in close co-operation with the iron and steel companies, the transition from peace to war-time conditions was effected smoothly. Licences are now necessary for the purchase of iron and steel except in the case of Government Departments, civil defence work, railways, shipbuilding, and coalmining. As far as possible supplies are made available for the completion of old contracts. Prices, moreover, are to remain unchanged until the end of October. The latest reports suggest that the industry has been increasing its output as rapidly as possible. Moreover, as a result of the recent increase in imports, substantial stocks of raw materials and semi-manufactured products have been accumulated. Imports of iron ore rose from 344,000 tons in August, 1938, to 680,000 tons in the past month. During the same period the intake of scrap increased from 14,000 tons to 114,000 tons and that of iron and steel products from 51,000 tons to 237,000 tons. Exports of iron and steel products, on the other hand, remained virtually unchanged from August last year, at 136,000 tons. As in the case of coal, the publication of output statistics has been suspended.

### GENERAL ENGINEERING

Activity in the engineering industry continued to expand in the past month. Contrary to the normal seasonal increase, unemployment actually showed a decline of 0.2 per cent. in August. In engineering as a whole only 4.6 per cent. of the number of insured persons was unemployed last month. The percentage was 4.5 in general engineering, 2.9 in electrical engineering, 6.0 in marine engineering, and 8.4 in constructional engineering. In a number of sections of the industry unemployment has been eliminated altogether, and the Amalgamated Engineering Union has therefore given its consent to dilution in order not to hamper production. Imports were again heavy in August, when they amounted to 10,973 tons (valued at £2,279,000), against 8,976 tons (valued at £1,655,000) in August, 1938. The increase has been very marked in the case of machine tools and marine internal combustion engines. Imports of machine tools rose from 1,260 tons (valued at £285,000) in August, 1938, to 2,161 tons (valued at £528,000) last month. The increase was due mainly to heavy arrivals from the United States; imports from Germany also remained substantial, but smaller than a year ago. Exports of machinery, on the other hand, showed a decline from 33,869 tons (valued at £4,442,000) to 30,303 tons (valued at £3,963,000). The decline was fairly general, comprising chiefly boilers, lifting machinery, electrical machinery, oil engines and textile machinery. Exports of machine tools, exceptionally, showed an increase from 1,963 tons to 3,256 tons. The bulk of the increase was due to heavier shipments of presses, punching and shearing machines and lathes.

### ELECTRICAL EQUIPMENT

Electrical equipment is one of the busiest sections of engineering. Thus the proportion of insured persons unemployed fell during the twelve months ending August from 5.3 per cent. to 2.9 per cent. in electrical engineering and from 7.1 per cent. to 4.0 per cent. in the electric cable, apparatus and lamp section. Exports of electric equipment last month were somewhat smaller than a year ago. Shipments of electric machinery fell from 1,934 tons (valued at £339,000) in August, 1938, to 1,362 tons (valued at £266,000) in the past month. During the same period the value of shipments of electric goods and apparatus fell from £1,050,000 to £935,000.

### AUTOMOBILES

The introduction of petrol rationing on a draconian scale has seriously affected the motor trade. Thousands of cars will probably

be laid up either for good or for the winter months and the sale of new private cars has abruptly stopped. The latest registration figures, which refer to July, show that the increase since last year in private cars was maintained in that month, when registrations of new private cars totalled 23,962 against 20,810 in July, 1938. Reports indicate that there was also a fair volume of sales in the early part of August. A considerable proportion of the plant and labour resources of the motor industry will no doubt be absorbed fairly soon in the manufacture of aeroplanes and army vehicles, but the restrictions on the private motorist have hit hundreds of garages and service depots, whose trade has largely vanished and whose stocks of second-hand cars has been rendered almost valueless.

### BUILDING

The constructional industry remained active in the past month. Thus the proportion of insured persons unemployed fell between August, 1938, and August, 1939, from 12.8 per cent. to 10.4 per cent. in building and from 34.3 per cent. to 30.0 per cent. in public works contracting. But, as the monthly survey of the Building Industries National Council points out, this activity conceals a considerable change in the nature of the work. Dwelling-house building by private enterprise was declining, especially in the south of England, but the slack was taken up by the urgent short-term programme of military construction, by work in connection with civil defence, and to some extent by the indirect stimulus to non-residential, and especially factory, building by the high rate of Government expenditure. So far as building materials are concerned, there has been a brisk demand for the heavier structural materials and comparative slackness in the case of materials for the construction of dwelling houses. The publication of the value of building plans passed by 146 local authorities has been discontinued.

### CHEMICALS

During August trade in most sections of the chemical market was on quite a good scale. In the industrial chemicals section interest was fairly general, acetic acid, acetone and formaldehyde being particularly good items. There was an increasing demand for insecticides during the month, and business in wood distillation products was on quite a good scale. A very fair inquiry was received for pharmaceutical and other fine chemicals, and a slight improvement was shown in the coal tar products market. The outbreak of war brought a considerable activity in chemical markets and a large increase in the number of orders received. Prices were higher generally, but certain products are now unobtainable on the open market.

### POTTERY

Unemployment showed a sharp increase in August, due partly to extended holidays. The proportion of insured persons unemployed in the pottery and earthenware trades rose from 16.3 per cent. in July to 31.1 per cent. in August. Some improvement occurred later in the month, but new orders have been delayed. Exports in August maintained the level of those in July.

### FOOTWEAR

The outbreak of war found most firms working full time on Government and civilian orders. There has been a steady flow of new orders from the home trade, while the export of footwear has been temporarily suspended pending the setting up of the licensing system by the Leather Department of the Ministry of Supply. Supplies of leather suitable for Government contracts are in demand and the question of prices is complicated by the incidence of war risks insurance costs and the rising trend of hide prices.

### COTTON

At the outbreak of war there was a sharp advance in the price of American cotton in Liverpool of about 2d. per lb., but there has since been a reaction and prices are now about 1½d. per lb. higher than at the end of August. Spinners were handicapped by the relatively small stocks of cotton held in this country, but imports have now increased. A Cotton Control Board has now been appointed by the Government, which will arrange for priority to be given to supplies necessary for Government contracts; it is also hoped to expand the export trade in manufactured goods, in part compensation for the cessation of German purchases of yarns. The institution of the Control Board has not prevented an extensive rise in prices in the industry. Since the end of August prices for yarn and cloth have advanced by about 40 per cent.; there has been a 12½ per cent. rise in calico printing charges, dyeing lists are up by 20 per cent. and there has also been a rise in the prices of packing materials. In the first week of war orders were at a standstill, but recently an increased business has been done in piece goods for foreign outlets, particularly for South America, Java, West Africa, Scandinavia, Switzerland and the Dominions. Extensive purchases have also been made by the home trade, and the Government have given out further big contracts.

Sept. 30,  
1939

### JUTE

Stocks of cloth and bags have been cleared at Dundee, but so far there has been little new business. Dealings in raw jute are prohibited, except for deliveries for Government contracts, but at the prices fixed there are no sellers. Freight rates have risen sharply, and sailings from India are uncertain. The Indian Government has placed large orders in Calcutta which caused considerable fluctuations in raw jute prices; the Mills Association has agreed to an extension of working hours from 40 to 45 per week and to the unsealing of all stopped looms.

### LINEN

On the outbreak of hostilities the trade was taken over by the Flax Control Board, which placed an embargo on all transactions in raw material and yarns except for direct Government requirements. Later, deliveries against private contracts made prior to September 2nd were continued for the time being. Trading in cloth has so far remained unrestricted. Prices of flax and yarns have now been fixed by the Board, but supplies of the raw material are short as there is little to be expected from the Baltic. Prices at Courtrai have risen sharply, and the Belgian linen trade is alarmed at the export of flax and flax seed, which, may, they feel, leave inadequate supplies for their looms.

### RAYON

Trade in rayon yarns and in the raw materials for rayon is now under the control of the Silk and Rayon Department of the Ministry of Supply. The institution of control occasioned only temporary difficulties and orders for both home and export delivery have been placed in the last few days. Courtaulds have raised the price of standard qualities of fibro (except strong fibro) from 10d. to 10½d. per lb.; the price of 32's staple fibre is now 18½d. per lb., against 17½d. per lb. at the outbreak of war.

### WOOL

Until the Wool Control is more firmly established private trade for civilian and export account is at a standstill. The maximum prices fixed by the Wool Control represent those ruling before the

outbreak of war, and there are no sellers of tops at these prices, nor have the majority of top makers any need of further orders for the moment. It is possible to obtain permits for the delivery of merino and fine cross-bred wools and tops, but the trade in 50's and below is being closely controlled. When conditions are more settled a considerable volume of civilian business is expected, as the usual spring orders have been delayed for some weeks. Negotiations are proceeding with the Australian Government over the coming wool clip, which has been reserved for the British market. In anticipation of war orders and of improved domestic business United States merchants have bought largely in South American markets at considerably advanced prices.

### AGRICULTURE

The war organisation of agriculture is slowly taking shape. The county committees have begun their work and are now engaged in the ploughing-up campaign. Supplies of seed, fertilisers and tractors are required, and, in addition, it is probable that temporary loans will be needed to enable farmers, who are generally short of available capital, to meet the heavy cost of converting grass to arable land. The fixed maximum prices for fat stock have worked well as a temporary measure, though where fat stock were bid up to the maximum local rationing had to be introduced among the purchasers. The main task of agriculture is that of feeding as many as possible of the existing number of livestock off the products of the farm for as much of the year as possible, and hence the area under short leys and grain and the use of ensilage and dried grass must be expanded.

### SHIPPING

Freight markets have necessarily been subject to extreme fluctuations in the past month. A considerable part of the British mercantile fleet is now working under the control of various area committees representative of the British Government. The Tramp Shipping Administrative Committee has ceased to function, and freights already agreed upon are considerably higher than the minima in force at the outbreak of war. Neutral shipping has to consider the higher cost of fuel, the delays in sailing and in loading, war bonuses to crews as well as war risks insurance, but so far these varying conditions have not been reduced to a uniform basis for freights.

## UNITED KINGDOM—THE ECONOMIST INDICES OF BUSINESS ACTIVITY\*

Corrected for normal seasonal variations. Daily Averages of 1935=100.

## Business Developments Overseas

## BRITISH EMPIRE

**AUSTRALIA.**—Negotiations are taking place between the Australian and British Governments over the purchase price of the Australian wool clip, which has been reserved for overseas trade. The Federal Government has set up official controls for overseas trade and foreign exchange dealings. Industrial output is well maintained, and according to a cable from the National Bank of Australasia, and a rapid expansion is expected in the production of armaments and other defence requirements.

**INDIA.**—Since the outbreak of the war Indian Jute Mills Association has decided to allow sealed looms to be worked and has increased working hours from 40 to 45 per week. This step is the result of the sudden increase in demand for all jute manufactures, to which the Indian Government has contributed. There have been wide fluctuations in the price of raw jute. Compared with last year, the value of Indian imports and exports showed a considerable increase in August.

## EUROPE

**FRANCE.**—Under the stimulus of increased defence expenditure and a better export demand for a number of products, industrial activity in France was making headway in the early part of the summer. While there are no production figures for August, the unemployment returns showed a steady decline from 320,000 on July 29th to 302,000 on August 26th. The trend of wholesale prices was downwards during the past month; the official figure (July, 1914 = 100) declined from 677 on July 29th to 665 on August 26th. In view of the rapid deterioration in international relations, the value of Stock Exchange securities tended to decline; the official index of share values (1913 = 100) fell from 234 on July 29th to 217 on September 2nd.

**GERMANY.**—Official figures covering the whole of August are not available. The latest official figures relating to the first week of August show a slight decline in business activity. The index of business activity, calculated by the German Institute for Economic Research (1936=100) stood at 123.8 for the week ended August 5th, against 124.2 for the last week of July and 117.0 for the first week of August in 1938. The average daily output of coal in the Ruhr area increased from 421,600 tons in the last week of July to 430,400 tons during the first week of August, against a daily output amounting to 409,100 tons during July-August, 1938. The official index of wholesale prices (1913=100) increased from 107.2 at the end of July, 1939, to 107.4 on August 5, 1939. Total banknotes in circulation increased from Rm. 8,907 millions at the end of July, 1939, to Rm. 10,907 millions at the end of August. At the end of August, 1938, banknotes in circulation amounted to Rm. 6,689 millions. The rapid progress of mobilisation as well as the introduction of a totalitarian system of rationing, covering foodstuffs, civil industrial goods and labour, during August must have accentuated the usual seasonal decline of industrial activity. Figures available show, however, that the output of the key industries, especially of coal, iron and steel, has slightly increased.

**NORWAY.**—There was the usual seasonal recession in industry and trade in July and August, due to the annual holidays. Trade at the end of August was almost at a standstill until the State control had been firmly established. A general export embargo was declared on August 26th, and exemptions therefrom are administered by the Board of Trade. Various foodstuffs have been rationed, and petrol has also been rationed. State departments have been set up to deal with foods, fuel and industrial raw materials, shipping and foreign trade. The fall in the pound-dollar exchange rate after August 25th was followed by wide fluctuations in the Oslo exchange market, and the Norwegian Bank announced on August 29th that in future the kronor would not be based on sterling. At the outbreak of war there was a marked increase in the number of ships laid up, but the withdrawal of British ships from the Baltic has led to a considerable demand for neutral tonnage. There has also been a sharp rise in coal freights from the British North Sea ports, which is a further inducement to Norwegian shippers.

**SWEDEN.**—On August 26th the Government took steps to control the export and import of certain commodities. Exports of foods and feeding stuffs, metals, chemicals, rubber, glass, machinery and electrical apparatus, means of transport and instruments were prohibited except under licence, and imports of certain foods were also subjected to licence, in order to regulate the available supplies. The suspension of sea transport led to a complete stoppage of overseas trade for the time being, but business is now on a more normal scale. Freights have risen sharply since the outbreak of war, but prices of coal were little changed up to the middle of the month.

**HOLLAND.**—During the past year the Dutch Government laid the foundations of a war-time economy by a number of Acts entitling the State to control industry and trade in the event of war. Much of this legislation has now been invoked. The State has taken

over the sales and import trade in grain and certain other goods and measures have been introduced against unjustified price increases. Exports of textiles, metals, leather, rubber, oils and petrol, clothing and foods have been prohibited, except under licence.

**SWITZERLAND.**—At the present moment attention is fixed on the measures adopted by the Government for the safety and welfare of the country, which include the general mobilisation of troops and auxiliary civil services. The National Bank has again put into circulation a certain number of Fr. 5 notes, to meet increased demands of means of payment. Contrary to the general opinion, these notes had never been definitely called in, but were withdrawn from current circulation in 1923. The position of the National Bank is reassuring. Judging by the latest report the bank possesses about three thousand millions of Swiss francs, in gold and covered foreign bills, that is to say, an amount fifteen times greater than the gold reserve held in 1914. This reserve is sufficient to assure Swiss importation for two years, on the condition that prices do not rise too sharply. The Federal Council has introduced a form of war risk insurance for imports and exports. To prevent a rise in the cost of living, the Federal Department of Public Economy has forbidden increases in prices of goods, rents and farm rents, as well as in the tariffs of public enterprises, notably gas and electricity. In addition, the Government will take all necessary measures to prevent speculation and hoarding and to assure the necessary supply of food for the population. Switzerland has already concluded arrangements, in principle, with all her neighbours, who have declared themselves ready to maintain her supplies of food to the best of their ability. The cultivation of cereals, sugar-beet, and other products will be increased. To assure the necessary manual labour for agriculture, industry and the public services, all persons of both sexes, who are unemployed can be mobilised for industrial work.

## UNITED STATES OF AMERICA

Owing partly to the imminence of war, the industrial revival which began in May slowed down somewhat in August. The Federal Reserve Board's seasonally adjusted index of industrial production (1923-25 = 100) after rising from 92 in May to 101 in July rose to 102 in August. The outbreak of war, however, was the signal for a veritable flood of new orders, due partly to the somewhat premature expectation of heavy orders from Europe and countries hitherto supplied by Germany, France and England. Moreover, there was a jump in the prices of primary products early in September. For example, Moody's index of the prices of staple commodities (December 31, 1931 = 100) rose by no less than 20 per cent. between August 31st and September 6th. Since then, however, the advance has been more gradual. Practically every branch of activity has benefited from the sudden increase in new orders. The output of crude steel is now at the rate of about 80 per cent. of the industry's capacity, and is higher than at any time since mid-September, 1937. The output of electric power, at 2,444 million kw., reached a new record in the third week of September. The railways have placed large orders for renewals, and motor-car production showed a strong seasonal increase. Provisional unofficial estimates expect that the Federal Reserve Board's index of industrial production in September will be about 110, which is the highest level reached since September, 1937.

## LATIN AMERICA

**ARGENTINA.**—Large quantities of wheat and meat have been purchased by Britain, so that the guaranteed minimum prices to farmers for wheat and linseed have been abolished. The import exchange rates have been unified into one rate of 17 pesos per £, which step is likely to lead to increased competition for British goods from the United States, with which country Argentina is now about to sign a trade agreement. The Argentine Government has taken measures to preserve economic stability in view of the European crisis, including the virtual establishment of minimum Stock Exchange prices, so that markets are stable. The outbreak of war in Europe renders it impossible to give any indications of prospects for the import trade in Argentina, and there is naturally much uncertainty. Whilst hitherto there has been keen competition among the countries supplying the Argentine market, there is now a possibility that the demand for imported merchandise may exceed supply, and it is believed that the Argentine Government will shortly remove or drastically reduce the existing restrictions on imports.

**COLOMBIA.**—The market in coffee was very erratic at the outbreak of the European war, since German purchases have been suspended. The rising trend of prices on the New York market has helped to restore confidence. Dealings in Aski marks have been suspended.

**BRAZIL.**—The outbreak of war led to a suspension of business in the export and import trades. Export of coffee and cotton has been held up, except for goods already ordered. Quotations of foreign exchange have been largely nominal and no business is being done in German currency.

## UNITED KINGDOM

(Population, mid 1938, 47,485,000; Area, 95,030 sq. miles; 244,000 sq. kms.)
