The total number of men constituting "local" labour reserves in the five regions is 423,000, a large number. But 42 per cent. of them have been out of work for a year or more and only 29 per cent. have been out of work for less than three months, while in the South-Western region only 9 per cent. of the men unemployed have been out of work for over a year and 67 per cent. have been out of work for less than three months. In general, men who have been without work for long periods cannot be readily and rapidly re-absorbed into industry. Of the 423,000 apparent "local" labour reserves, probably not more than 245,000, those who have been out of work for less than a year, and not fewer than 121,000, those who have been out of work for less than three months, are available for immediate re-employment. The situations of the five regions are not homogeneous. The North-Western region contains the largest reserves. The least prosperous, Wales and the Northern region, contain comparatively small reserves due to the efflux of young men to other parts of the country. The total of these "local" reserves, though not as large as appears from a comparison of regional unemployment percentages, is equal to about six months' labour supply from school-leavers and other entrants into unemployment insurance. The soundness of a policy of distributing work regionally so as to absorb local reserves of labour is confirmed by this analysis, but their rate of absorption is likely to be more rapid than might at first sight appear.

## THE WORLD OVERSEAS

## South American Economy

IN South America economic regions bear little relation to the political map. The largest of the ten Republics, the United States of Brazil, is simply the successor to the Portuguese Empire. Spanish America came to be divided during the Wars of Independence, not for racial, national or economic reasons, but as a result of the difficulties of uniting settlements scattered at great distances without effective means of inter-communication. The six new Republics of 1826 were little more than old administrative areas with new names. Of the three Republics that had yet to come, two, Venezuela and Ecuador, themselves old Spanish administrative divisions, were breakaways from the greater Colombian Republic, and Uruguay came into being as a compromise after a war between Argentina and Brazil.

From the standpoint of demography and economic development, therefore, the political map is deceptive. The map on this page shows those parts of the continent where the density of population exceeds 10 per square mile. Vast areas are about as thinly peopled as the Sahara Desert. The only parts of South America that matter at all in population are within 500 miles of the sea; and within two hundred, a hundred or even fewer miles from the sea lies a very large proportion of the continent's ninety million odd inhabitants.

The only well-developed regions are the rich-soiled pampas of Argentina and Uruguay, with at least ten million inhabitants, and the south of Brazil. Most of the 43 million inhabitants of Brazil live along or near the Atlantic coast, and many between Rio and the borders of Uruguay. Two-thirds of the population of the continent live East of the Andes. The remaining third live either on the plateaux, as in Bolivia, along central valleys between the watershed and the Pacific Ocean, as in Chile or Colombia, or along the coast itself. Contrary to general belief Colombia in the North-West with 8½ million inhabitants, and Peru with 7 millions have larger populations than Chile, with only 4½ millions (largely clustered in the Mediterranean region around Valparaiso and Santiago).

The prime and common feature of all South America's economic regions is that—despite the existence of great modern cities like Rio, Buenos Aires and Valparaiso (ten

million South Americans live in towns of more than 200,000 inhabitants)—none have yet passed the "colonial" stage of development. Only a small part of domestic consumption and no machinery are home produced, while exports, almost without exception, consist of either raw foodstuffs or raw industrial materials.

It is even more important that these products are few in number. It is not merely that the prosperity of each Republic depends on the export of one or two or occasionally three commodities. On the basis of the three years 1935, 1936 and 1937, Argentina—with the widest range of exports—depends on wheat and maize to the extent of 40 per cent. and meat to the extent of 15 per cent. On the same basis, Uruguay depends on wool and meat to the extent of two-thirds of her exports; Brazil on coffee and cotton (nearly two-thirds); Chile on copper and nitrates (70 per cent.); Bolivia on tin (over 70 per cent.); Peru on petroleum, cotton and to a lesser extent copper (three-quarters in all); Colombia on coffee, petroleum and gold (90 per cent.); and Venezuela to the extent of 90 per cent. on petroleum alone. But in addition the exports of the Republics vary greatly in value. Last year more than a third of South America's total exports, or about £100 millions, came from Argentina and Uruguay, and mainly from the region of the pampas; a fifth, or about £60 millions, from Brazil; and not much under a fifth consisted of petroleum from Venezuela. All the other Republics together accounted for only a quarter of the exports of the continent. One-half of the continent's exports is made up of cereals, petroleum and coffee. Another quarter, or a little over, is constituted of meat, linseed, cotton, wool and copper.

This list is not the same as it was before the war, or even in 1929. In Brazil rubber has been replaced by cotton. In Chile nitrates have yielded first place to copper. Sugar has ceased to be important and petroleum, once very small, now vies with cereals to be the most important export of the continent.

But these changes have not expanded the number of export commodities; and since 1929 this paucity has proved a dangerous weakness. The Great Depression was followed by a failure of international trade to revive to the same

\* Ten Republics and the Guianas.

† In the case of agricultural products the figures are as nearly as possible averages of the five years ended 1913, 1929 and 1937, respectively. Meat production of Argentina, Brazil, Chile and Uruguay rose from about 2,880 thousand tons in 1929 to 3,420 thousand in 1937. (E) Exports.

## French Taxation and Borrowing

[FROM OUR PARIS CORRESPONDENT]

TAXATION receipts in June were 4,393 million francs or 1,085 million francs more than in June, 1938. The turnover tax produced 1,118 million francs, or 336 million francs more than a year ago and 109 million francs more than the estimates. For the first six months of 1939, receipts thus amount to 24,927 million francs, that is 5,150 million francs (or 25 per cent.) more than for the same period of 1938. These results, which take into account the produce of new taxes, including the armament tax, explain the recent declaration of M. Reynaud that the ordinary Budget was at last balanced.

The Minister of Finance has also published particulars of the situation at the end of March of the Equalisation Fund, which show that the stock of gold rose from 34,776 kilograms or 2,067 million francs in October, 1938, to 495,942 kilograms or 18,835 million francs now, after a cession to the Public Funds Equalisation Fund of 50,000 kilograms or 2,000 million francs gold.

Repatriation of capital, good fiscal returns and the progress of industrial production seem to have left the Stock Exchange quite indifferent during the past six months as the following index shows:—

|                                        | July 16, 1938 | Dec. 31, 1938 | July 15, 1939 |
|----------------------------------------|---------------|---------------|---------------|
| French stocks .....                    | 207           | 244           | 231           |
| Public funds and debentures .....      | 76.1          | 88.3          | 84.4          |
| Stock market activity (turnover) ..... | 38            | 46            | 12            |

The markets are, in fact, overshadowed by the fear of new international troubles, a sentiment which appears still more marked in Paris than in London and New York.

This double conjuncture—stability of the franc and equilibrium of the ordinary Budget on the one hand, and stagnation on the Stock Exchange on the other, has resulted in the accumulation of fresh capital in the money market, which should facilitate the financing of re-armament by short term borrowing. Borrowing will reach this year nearly 50,000 million francs, the effort towards budgetary amelioration having been balanced by an increase of war expenditure. It has nevertheless been possible to obtain the amount required without any increase of the rate of interest. There has even been a successful lengthening of the average term of Treasury borrowing.

After the creation of the 3-year National Defence Bond a two-year Armament Bond has been launched by M. Reynaud. The first, which carries 4 per cent. interest, seems to have a special appeal to private investors, who prefer middle-term to long-term investment. The appeal is strengthened by the fact that it is exempt from income tax and offers a good refuge against Government demands at a time when the control of incomes has been reinforced by the last decrees. The Armament Bond, on the contrary, will be subscribed from the funds of private companies. Its characteristics are very reminiscent of those of the former 2-year Defence Bond. It is actually a Treasury bond, and its produce goes direct to the Treasury. There is no maximum issue as in the case of the Defence Bonds.

So long as there is no new attraction towards foreign markets and no accelerated rise in French prices, the financing of re-armament is thus secured. The first eventuality is excluded as long as the fear of international complications persists. If hopes of peace should revive, on the other hand, the French market would no doubt benefit at once from the huge sums which still remain inactive and an entirely

extent as production. Expressed in pounds sterling, South America's exports last year were 37 per cent. lower than in 1929; and the trend of the terms of trade in the last decade has been decidedly unfavourable. The output of most of South America's agricultural products, and also of copper and petroleum, has continued to expand, as is shown by the table, but the prices of all the important commodities were lower in 1937 than in 1929. In the case of coffee, the demand is so inelastic that the increase of 40 per cent. in the volume of Brazil's exports in 1938, compared with the previous year, caused such a fall in price that the total value of Brazil's exported coffee was actually reduced by 10 per cent.

The exceeding vulnerability of the South American economy, based as it is on a limited range of exported commodities, has been a powerful stimulus to the development of new lines of production—particularly those with markets at home or in the United States. The means to do this are largely lacking. The unfavourable trend of the terms of trade has already made it difficult for South America to pay interest on foreign capital and a fortiori the prospects of floating new loans abroad are poor. The shortage of capital is rendered acute by the poorness of communications. South American railways are for the greater part at a very early stage of development. The pampas and South-Eastern Brazil are well served, but over the rest of the continent railways—largely isolated from each other—are not independent means of communication, but rather perform the function of "feeding" ports on sea and river. By far the greater part of goods transport proceeds by water.

## Industrial Development

The resources of the interior of the continent are therefore difficult of access, and the growth of industry catering for domestic requirements is retarded by the need to import coal from abroad. Yet considerable industrial progress is now being made in the ABC States, Argentina, Brazil and Chile. Brazil is now self-supporting in cotton goods; Chile, aided by a coal output which reached two million tons last year, produces at least a half of her requirements of cotton goods, possesses one of the most modern cotton mills in the world and, from her own wool supplies, manufactures her entire needs of the finished product. Argentina, with a much larger population than Chile, has not reached this stage, but now possesses a quarter of a million cotton looms, compared with sixty thousand in 1930, and supplies a quarter of her own requirements of cotton goods. In Brazil, an iron and steel industry has been started on the basis of the vast supplies of iron ore in the State of Minas Geraes. But here, as everywhere in South America, development is retarded by inadequate railways.

The expansion of industries catering for domestic requirements is sound policy at the moment. But, in the long run, the progress of the continent depends on the revival of international trade and the availability of new capital. Germany's barter agreements may prove attractive to the smaller Republics for short periods. But the commodities are few of which German purchases constitute a large proportion of the total supply. The importance of the German market for raw cotton, equal to the British market and taking a third of the continent's exports, partly accounts for German trade influence in Brazil and Peru. But no trading methods can drag the Republics into the German economic *Lebensraum*, for Germany has no capital to spare. Nor, in less degree, has the United Kingdom or any other European State. That is why economic relations with the United States are now of first importance to South Americans.

The United States has for long enjoyed close relations with the non-competitive tropical regions of South America. Before the war the trade was largely triangular and typified by that with Brazil. The U.S.A. took coffee from Brazil and sent wheat and cotton to Great Britain, and the triangle was completed when Great Britain sent manufactures to Brazil. After the war, Great Britain, no longer a large-scale lender of new capital, was gradually eliminated, and United States manufactures replaced British. Even more recently, the United States has started to develop relations with the temperate parts of the continent. The import of Argentine chilled meat is still prohibited on hygienic grounds, but recently President Roosevelt directed the Navy to buy Argentine corned beef. A good deal of American capital has found its way to Chile, and the U.S.A. is becoming an increasingly important market for the subsidiary products of the temperate regions. Moreover, the United States is in a position to supply capital. The recent credit to Brazil is a sign of the times. So long as Europeans are fully employed in preparing for war, the effective development of South America must depend on close economic co-operation with the great North American democracy.

The Bank undertakes banking business in all parts of the world,

and with its numerous branches offers special facilities in Canada,

Newfoundland and the United States

new situation would be created. Industrial progress as shown, for example, by the increase of exports of metallurgical products in the first six months of 1939 (pig iron: 3,745,000 tons against 3,178,000 in 1938; steel: 3,964,000 tons against 3,230,000 tons, that is the highest since 1931) would certainly provoke a new interest in this group.

As to the second danger—the rise of prices—new decrees will be passed this week and will include notably a reform of the Wheat Office. If this move has any marked effect it may be followed by a very important reorganisation of the Administration and economy. But every one knows that periods of easy money are not in this country favourable to audacious reforms.

July 27th.

## America's Lack of Capital

[FROM OUR NEW YORK CORRESPONDENT]

THE multiplicity of statistical series available in the United States, instead of facilitating the description of our economy, complicates it, and it is increasingly doubtful whether the index of production, which is generally cited as a pointer to the state of business, is an adequate representation of the general economy.

\* Data not yet available.

The influence of the coal strike is still visible in the May figures. It does not appear that the cessation of coal production was sufficiently protracted to cause any actual shortage, but the quick rebound in production in June suggests that the preceding rather wide-spread slowing-down of industry was induced by a threatened coal scarcity. Our economy has since last October hovered above and below an axis approximating to the level of October, 1938, when the production index was at 96—that is, for about half a year, there has been no distinct trend, but production has stayed on a level mid-way between prosperity and semi-depression, which is not inaptly called stagnation.

Moreover, wide local or regional variations in business activity make any simple picture of the American economy almost impossible to draw. There are parts—and considerable parts—of the country that are undoubtedly more prosperous to-day than they were in 1929, which was a period of perhaps exceptionally diffused prosperity. Other parts—and New York is one—have had little recovery from the depths of the depression; and New York opinion on the general state of the economy, however objective, can hardly help but be coloured by this state of affairs.

But one fact seems to be applicable to the whole economy. If economic saving is defined as the accumulation of a surplus of capital over and above immediate consumption—a surplus utilised or utilisable for increasing future consumption—then our economy has had almost no net saving for ten years. Indeed, it is not impossible that it has actually consumed a part of its pre-existing capital plant. It is computed that when the national income was about \$80 billions the United States maintained a fairly high level of individual and family consumption and “saved” about 20 per cent. to provide for future consumption. With the national income in the vicinity of only \$65 billions, individual consumption has been maintained at a fairly high level, but apparently at the expense of savings. This absence of savings is statistically visible in the figures of new capital issues, which, even including the issues of the Federal Treasury, are far below

the averages of the '20's. To some extent this lack of capital has been made up by the substitution of bank credit—as especially in the financing of the Federal deficit.

It was quite natural that, in the early days of the depression, the emphasis in economic comment should have been laid upon the maintenance of “consumer purchasing power.” With the national income below \$50 billions, as it was in 1932, this problem took precedence in popular thinking over any more general considerations. But, in recent months, it has been more clearly recognised that our economy cannot be maintained exclusively by concentration on consumer purchasing power—if for no other reason than that the annual increment of the population cannot be provided with the tools of productive employment if almost all the national income is devoted to individual consumption.

The next phase is beginning—the phase of emphasis on the need to put “idle” money to work in investment. This rests on the hypothesis that there is an untapped supply of idle money or inactive savings. That there is an unused potential of bank credit is obvious; that there is an uncertain amount of idle capital is suggested by the ratio of bank debits to demand deposits—which is only about half what it was in the feverish days of 1929. But that there is any substantial formation of capital in the economy at present, or that there has been, on an annual average, during the past ten years, is not positively demonstrable by statistics. Further, such data as are available—and they are by no means so adequate as could be desired—suggest that the outstanding fact of our economy is, and has been, an actual scarcity of capital, or absence of savings; and that this absence of savings is intimately related to the problem of so-called “permanent” or “irreducible” unemployment as contrasted with “cyclical” unemployment.

July 18th.

## Argentina and the Fall in Wheat

[FROM OUR CORRESPONDENT IN BUENOS AIRES]

THE Argentine Government's message to Congress announcing the Budget for 1940 was prepared before the recent heavy fall in the price of wheat, but the weakness of cereal prices is cited as one of the most serious preoccupations of the Government. What was said then is even more true now. The Budget deficit for next year is estimated at 167,200,000 pesos, or 27,200,000 pesos more than that expected in the present year. As the Government buys wheat from the producers at the basic price of 7 pesos per 100 kilos and sells it at the market price, the loss on the enormous amount of Argentine wheat still to be shipped is likely to be greater than was expected a short time ago.

The Message says—

“At present it is very difficult to foresee an economic improvement next year in the position of this country. At the best the 1939/40 harvest will find a more regular market, but without any appreciable improvement in value; and it would be rash to attempt to estimate the influence of the future maize crop. The volume of exports has increased compared with last year, but the general fall in prices, especially wheat, has largely neutralised the advantage which would otherwise have been obtained. While the tonnage of agricultural and pastoral products exported has risen by 58 per cent. and 11.2 per cent., respectively, compared with last year, the corresponding values have been higher by only 5.4 per cent. and 5.2 per cent. Furthermore, the position of the international wheat market does not promise an improvement in the rest of this year.”

In 1940 the Government expects general revenue to be 922,700,000 pesos, or 44.2 million pesos more than is expected in the current year—excluding profits from exchange control. The Message quotes from the report of the Minister of Finance for the year 1938:—

“The prosperity of 1937, thanks to the extraordinary volume of exports and to the good prices obtained in the international market, produced a very big surplus in our balance of payments, thus partly offsetting the effects of the poor harvest of 1938 and maintaining unchanged the consuming capacity of the population. Hence, excepting customs and port dues, proceeds of taxation maintained in general a high level.”

Expenditure in 1940 estimated at 1,089,900,000 pesos is considered to be the maximum amount possible and every effort will be made to keep it below this figure. But it would

be vain to hope for any considerable reduction, because excessive economy would only create new problems, such as unemployment and a lower standard of living for the poorer classes, and the remedy might be worse than the disease.

Shortly before the publication of next year's Budget, the Minister of Finance stated that the deficit on the current year, estimated at 140 million pesos, could be covered almost entirely by funds derived from differences in the Free Exchange Market. Although these were reserves accumulated over a period of years, he said, it was quite justifiable to use them for this purpose, as they were intended for times of emergency. This was not including the profits obtained in the Official Exchange Market which were intended to provide for the needs of the Grain Regulation Board.

Since wheat is quoted locally at the basic price of 7 pesos per 100 kilos, and the Grain Regulation Board is secretive about the prices which it actually realises, the recent fall in value is not apparent in figures published here, and can only be diagnosed from the prices in foreign centres. But the influence of the weakness of wheat on the price of maize is very striking.

The price of maize has fallen in one month from 6.30 pesos to 5.50 pesos per 100 kilos, while the price of linseed has declined from 15 pesos to 13.85 pesos, and of oats from 4.20 pesos to 3.90 pesos.

The free market value of the peso has not declined appreciably—doubtless owing to the intervention of the Central Bank.

The volume of Argentine exports in the first half of 1939 amounted to 6,705,852 tons against 4,228,230 tons in the same period of 1938—an increase of 58.6 per cent. Owing to smaller prices the value rose only from 712,522,731 pesos to 802,598,949 pesos—an improvement of no more than 12.6 per cent.

July 22nd.

## German Steel

[FROM OUR BERLIN CORRESPONDENT]

UNDER the influence of armaments, steel production in Germany continued to increase greatly in 1938. The production of crude steel reached about 23 million tons (including 673,000 tons from Austria), and was thus 18 per cent. above the 1937 figure and 25 per cent. above 1929. The Four Year Plan quota for 1940 was already attained in 1938. This progress in Germany was the more noteworthy because world crude steel production last year was 20 per cent. below the 1937 level.

The export picture is less bright. German exports of rolling-mill products fell by 25 per cent. in 1938 compared with 1937. This was partly due to a sagging market, as a result of general economic recession, and partly to intensified competition. New rolling mills have been constructed or enlarged in the Northern States of Europe, in Holland and in Australia, and these are now competing with the concerns associated in the International Crude Steel Export Association; and the agreement between the latter and the American producers was not entirely effective. The Cartel had to agree to price reductions in almost all markets.

Domestic sales of semi-finished products have also increased as a result of armaments and the Four Year Plan; but here again export business was injured by the falling-off of English demand and export prices were appreciably lower than in 1937. Total sales of semi-finished goods amounted to 1.43 million tons, against 1.19 million tons in 1937, and 84,800 tons were exported, against 116,700 tons in the preceding year. The output of railway overhead construction material rose by about 30 per cent. to 1.14 million tons, but only 171,600 tons, against 195,800 tons in 1937, were exported. The prices for heavy railway ties remained unchanged; for light rails they fell. Although new iron-saving methods have been introduced in construction generally, domestic deliveries of wrought iron remained last year at the 1937 level, because a large quantity was needed for fortification works. Export prices for wrought iron fell, and total output was about 1,000,000 tons, of which 106,800 tons, against 140,700 tons in 1937, were exported.

The decline in exports of bar iron was more than equalled by greater domestic demand. Total sales rose from 4.23 million tons to 4.64 millions, but only 490,000 tons were exported, against 660,000 tons in 1937.

The export contracts of the crude sheet metal group declined as a result of the Far Eastern conflict, because of the erection in Sweden, Finland, India and South Africa of similar works, and because of the generally uncertain political situation. Domestic demand, however, particularly for

machinery, boilers, containers and ships, remained as high as ever, and total deliveries rose from 1.39 million tons to 1.72 millions: of this total only 148,800 tons, against 192,800 in 1937, were exported, and prices fell. Exports of fine sheet metals declined by a third, from 125,500 tons in 1937 to 80,300 last year, but domestic demand was so great that a stop had to be put to acceptance of new contracts, and total deliveries rose from 1,240,000 tons to 1,280,000 tons.

### Raw Material Stringency

In the first half of this year German pig iron production (including Austria) has risen to 9,830,000 tons, compared with 8,960,000 tons in the same period of 1938. The raw material situation of the iron industry, however, is still very precarious. According to figures issued by the Reich Bureau for Business Expansion, between 65-70 per cent. of the iron is made from foreign ores, and only about 15 per cent. from domestic ores. The rest is derived from scrap.

Iron ore imports require a yearly sum of Rm. 250-300 millions in foreign exchange, of which Sweden gets the main share. British competition is becoming increasingly strong in the Swedish market, especially since Great Britain has been using the Thomas process, for which it buys yearly about 4,000,000 tons of Swedish ore. Research into domestic ores in the Salzgitter section, where the Goering works are being built, has shown that the mines there contain about 250 million tons. They would last for about 42 years if they were to be used to cover 30 per cent. of the pig iron used in Germany, but the percentage is to amount to only 15 at present. The prime costs of the Goering works for the production of iron from domestic ores should not be higher than the costs of other domestic foundries as long as coal can be delivered cheaply. It should be remembered, however, that the Goering works are burdened with capital costs four to five times higher per production unit than other similar undertakings.

July 24th.

## Crops and Contracts in Canada

[FROM OUR OTTAWA CORRESPONDENT]

ALL reports agree that, owing to the continuance of an adequate rainfall throughout June, Western Canada is now assured of a good wheat crop. Optimists expect that results may even equal the record of 1928, when the total yield was 544 million bushels. In practically every section of the prairie wheat belt moisture conditions are far better than in any summer of this decade. Saskatchewan has received since seeding began 50 per cent. more moisture than in the average year. Moreover, the abnormal wetness has effectively held in check the annual plague of grasshoppers and other pests.

On June 28th the Searle Grain Co. of Winnipeg placed the condition of the wheat crop of the three prairie provinces at 123 (base=100 for the average year) compared with 86 at the same date in 1938. The harvest promises to be late. A large proportion of the Western wheat acreage is planted this year with Thatcher and other rust-resistant types, and the danger of damage by rust on the scale on which it has occurred in previous wet years is therefore small. The expectation of a large crop has led to the re-opening of several hundred country elevators which had been closed down during the lean years. All that is necessary now to assure a bumper crop is warm weather accompanied by good showers at intervals. The favourable crop news had a depressing effect

### The British and Polish Trade Bank A.G., Danzig

Paid-up Capital: D. Gulden 5,000,000. --  
Reserves: D. Gulden 3,591,961.10

Chairman: Roman Górecki, D.C.C.L., Warsaw.

Vice-Chairman: Sir William Max-Muller, G.B.E., K.C.M.G., C.B., M.V.O., London.

Joint Managers: Stanislaw Pawlowicz and Philip Frederick Rann.

The Bank was formed to facilitate Exports and Imports from and to Poland, including Danzig.

INQUIRIES SOLICITED

upon wheat prices in Winnipeg, and a week ago new seasonal lows were reached when the July "future" dropped to 58½ cents per bushel, but disturbing news from Europe in the past week has brought prices up again.

### Arms Contracts

There is considerable dissatisfaction in manufacturing circles that Canadian firms have not secured a larger number of contracts for armaments from the British Government. Apart from the contracts placed for aeroplanes, with which progress so far has been disappointingly slow, only a few orders for shells and some forms of equipment have been received. The Canadian Manufacturers' Association has attributed a large proportion of the blame to the failure of the King Ministry to give any assistance towards the securing of armaments orders from Britain. Recently this body addressed a letter to the Premier suggesting that a delegation of Canadian manufacturers should proceed to London with the backing of the Canadian Government to explore the situation.

Following a conference at Ottawa between a deputation from the C.M.A. and a sub-committee of the Cabinet, Mr King issued a statement to the effect that his Government was both willing and anxious that Canadian industries should obtain armament orders from Britain, but that they must deal direct with the British Government. He declared that, if the manufacturers nevertheless decided to send a mission to London, it would have the blessing of his Government. A mission will probably be sent. In view of recent signs of greater interest by the British Government in the possibilities of Canada, such a visit would have considerable importance. It is understood that orders from the British Government for processed aluminium products are behind the recently announced programme of plant extension by the Aluminium Company of Canada, and will contribute appreciably to the capital cost of the extensions. The programme, which will cost \$7 millions, includes a completely new plant at Kingston, Ontario.

June 20th.

## Denmark's Balance Sheet

[FROM OUR DANISH CORRESPONDENT]

A RECENT official survey discloses the balance on capital account between Denmark and foreign countries at the end of 1938. In the course of that year two important loans were raised abroad: one in Sweden by the Government for 30 million Swedish kroner; and one in Holland by the municipality of Copenhagen for 8 million Dutch guilders. Below is given the last three years' estimate of the capital balance. When comparisons are made it has to be remembered that fluctuations are constantly taking place in the various rates of exchanges, and in 1938 the fall in the gold value of the pound resulted in a corresponding drop of about 6 per cent. in the gold value of the Danish krone, and this drop has to a certain extent influenced the position. The figures are as follows:—

#### Capital balance between Denmark and foreign countries

| Liabilities                                                    | At the end of |              |              |
|----------------------------------------------------------------|---------------|--------------|--------------|
|                                                                | 1936          | 1937         | 1938         |
| (In million kroner)                                            |               |              |              |
| Danish bonds abroad .....                                      | 756           | 768          | 785          |
| Mortgage Bank of Denmark and other State institutions .....    | 145           | 170          | 176          |
| Municipalities' consolidated debts .....                       | 395           | 390          | 422          |
| Credit Association bonds and other mortgage bonds abroad ..... | 130           | 125          | 120          |
| Other Danish securities abroad .....                           | 210           | 195          | 190          |
| Other consolidated debt .....                                  | 30            | 30           | 35           |
| Current debts .....                                            | 399           | 394          | 404          |
| <b>Total debt .....</b>                                        | <b>2,065</b>  | <b>2,072</b> | <b>2,132</b> |
| <b>Assets</b>                                                  |               |              |              |
| Foreign securities in Danish possession .....                  | 310           | 315          | 315          |
| Other long-term credits outstanding .....                      | 35            | 35           | 35           |
| Current credits .....                                          | 366           | 467          | 584          |
| <b>Total credits .....</b>                                     | <b>711</b>    | <b>817</b>   | <b>934</b>   |
| <b>Net indebtedness .....</b>                                  | <b>1,354</b>  | <b>1,255</b> | <b>1,198</b> |

The net indebtedness has thus dropped from 1,255 million kroner to 1,198 million kroner.

July 5th.

## Unrest and Activity in Palestine

[FROM OUR CORRESPONDENT IN JERUSALEM]

It is just over three years since the Arab riots in Palestine began. This seems an appropriate occasion to attempt to assess the influence of the disturbances on the economic life of the Holy Land, or at least on its Jewish section.

There is no need, nor indeed is it possible, to belittle the damage that has been done. But the following figures—mostly unpublished hitherto—go far to show the astonishing resilience of Jewish economy in Palestine. To take agriculture first. In 1936 there existed 197 agricultural settlements with about 94,000 inhabitants. In the last three years (that is, from April, 1936–December, 1938) 36 new settlements have been founded, and the 233 settlements now in existence muster a population of 125,000 souls, with an increase in cultivated acreage of about a quarter. Nor have the Jews alone benefited. The Arab population has been able to turn this development to account. Citrus exports have risen from 5.9 million cases in 1935–36 to 15 million in 1938–39, and (according to reliable estimates) the Jewish share of total exports has remained unchanged. At most it has risen by only 6–8 per cent., which means that the Arabs have undoubtedly gained from this increase in trade.

Building, too, shows that Jewish efforts have not been abandoned during the disturbances. In the four biggest cities the following area of new buildings was authorised:—

|                  | (In square metres) |        |           |        |
|------------------|--------------------|--------|-----------|--------|
| Monthly average: | Tel-Aviv           | Jaffa  | Jerusalem | Haifa  |
| 1935 .....       | 37,392             | 16,152 | 15,200    | 32,473 |
| 1936 .....       | 21,769             | 5,330  | 11,716    | 23,572 |
| 1937 .....       | 15,062             | 2,983  | 12,288    | 17,782 |
| 1938 .....       | 12,583             | 1,405  | 6,694     | 7,843  |

Tel-Aviv is an entirely Jewish city, Jaffa one with an overwhelming Arab majority; and Haifa has lagged behind in the last year in spite of its international business importance and the special incentive arising out of its character as a naval port.

It is possible to review the Jewish community more directly. The Jewish authorities have taken several censuses. According to these, the following changes took place between 1930 and 1937:—

|                                | 1930             | 1937              |
|--------------------------------|------------------|-------------------|
| No. of Jewish undertakings ... | 6,100            | 13,800            |
| No. of persons employed .....  | 19,000           | 53,400            |
| <b>Capital</b>                 |                  |                   |
| .....                          | £P 4.3 millions  | £P 21.14 millions |
| <b>Turnover</b>                |                  |                   |
| .....                          | £P 11.8 millions | £P 32.55 millions |

And the large new investments of 1935–37 have so far influenced turnover only partially. During the three years of unrest (1936, 1937, 1938) estimated new investments in the Jewish sector amounted to about £P17½ millions, of which about 50 per cent. went into buildings, etc., and about 25 per cent. into agriculture and land. During the same period the revenues of the Jewish National Funds (Jewish National Fund, Palestine Foundation Fund, etc.) totalled about £P5½ millions, of which nearly a million was raised during the last six months of 1938.

The influx of Jewish capital is coupled with immigration. But the growth of the Arab population has been no less important than the influx of Jewish immigrants. Figures compiled by the Government Office of Statistics of the settled population at the beginning and the end of the period under review give the following picture:—

|                   | Moslems | Jews    | Grand Total |
|-------------------|---------|---------|-------------|
| End of 1935 ..... | 770,000 | 355,000 | 1,242,000   |
| End of 1938 ..... | 834,000 | 411,000 | 1,354,000   |

The growth of Arab population in these years was about equal to Jewish immigration.

The net capital influx itself can only be roughly estimated. The most reliable calculation at hand places it at about £P6 millions for each of the last three years, and this estimate is corroborated to some extent by the trade and banking statistics. And there has been a rising demand for goods from the armed forces. According to official statistics, in 1938 about 19 per cent. of total imports were military stores, and many local industries have been occupied extensively for military purposes. Last year the share of the building co-operatives alone in military work was valued at about £P400,000, and other trades—such as canning, breweries and foundries—have been working for the armed forces.

July 7th.

## Letter to the Editor

### England and Eastern Europe

TO THE EDITOR OF THE ECONOMIST

SIR,—Your article of July 8th on "England and Eastern Europe" represents a clear and, I must say, convincing account of an opinion which seems to have gained wide currency in England to-day. My purpose in writing in reply to it is to draw attention to what in my opinion is the tragedy of present-day British policy which you have epitomised by reference to Mr Churchill's comment that "an Anglo-Russian agreement presents the best chance of avoiding a war and the virtual certainty of winning it if it cannot be avoided." Indeed, I would like to replace Mr Churchill's contention with the assertion that a Russian alliance would go a long way towards making a conflict inevitable, while its existence would render victory at best problematical.

It is almost forgotten that the pattern of European alliances to-day bears to an increasing extent the character of that formidable alignment of the Powers at the time when the world drifted into chaos in 1914. The Anglo-Russian Convention of 1907, originally designed to normalise relations on the Indian frontier and in Persia, developed into an instrument for resisting German aims in south-eastern Europe, soured by the embitterment of the relations of both Powers with Austria-Hungary after 1908. France hoped for security against Germany through the Entente Cordiale. German talk of encirclement was at that time spoken of in London and St. Petersburg as a "myth," while the meeting of King Edward and the Russian Czar at Reval in 1908 led the Kaiser to comment on the former's policy with the words: "He wants war, only another is to wage it, and I am to begin it, so that he doesn't get the odium." To-day many Germans are feeling the same about our Government in spite of reiterated assurances that none of the present treaties will enter into force in the absence of aggression.

Wars are waged because Governments and peoples are prepared to appeal in the last resort to the arbitrament of war. There is no doubt that all Governments and peoples, including the German, are far more reluctant to-day than in 1914 to resort to this desperate expedient. Yet the present is the more dangerous because we have for twenty years failed to realise the implications of the severance of the nations into the "haves" and "have-nots." It is strange that we have learned so little from history that is still memory to many as to repeat within the same century the mistake of seeking security against Germany in an alliance between the nations to her east and her west.

The present dangerous inflammation of British public opinion dates from the brutal annihilation of the Republic of Czechoslovakia. Yet we forget that there was a French military mission in Prague which directed the building of the line of forts on the Northern Czechoslovak frontier. We have forgotten the phrase which was so often heard in England only a year ago, that "the real defence of Britain is in Bohemia." We ignore the abortive French attempt to encircle Germany through the Franco-Czechoslovak, the Czechoslovak-Russian, the Franco-Soviet and the Franco-Polish alliances. In other words, we ignore the Franco-British share in the responsibility for the tragedy of the Czechs.

Ignorance of Germany and of the problems of eastern Europe has led to ignorance of the extreme dangers of the policy of the Peace Front. Ugly though we feel the idea of German ascendancy in eastern Europe to be, we prefer to forget the lessons of the past and to place our faith in policies whose consequences may well be far more desperate, not only for the peoples we hope to protect but for Germany and ourselves. And because our face is set in the direction of "security" through hostile alliances, we have given up the task of exploring patiently the real thoughts and aspirations of the German people or of attempting diagnosis of the fell disease which holds Europe in its grip.

## Shorter Notices

"British Far Eastern Policy." Information Department Paper No. 24 of the Royal Institute of International Affairs. Oxford University Press. 53 pages, 2 maps. Price, 1s.

Mr G. F. Hubbard, writing under the auspices of the Royal Institute of International Affairs, has produced a study of British policy in the Far East that is as valuable as it is brief and to the point. He summarises the main trends since the establishment of official contact between Great Britain and China in 1834, and brings the story right up to date with a reference to the Singapore military conference of the British and French Far Eastern commands last month. It is of some comfort to Western readers to see set down in such manageable compass the essential difference between the old regime of commercial, but not exclusive, intervention by the Western Powers in the affairs of China, and the new regime of exclusive control which it is the aim of the Japanese to establish. Mr Hubbard bears witness to the continuity of British foreign policy, and sketches the way in which that policy has been modified to changing circumstances but never fundamentally altered. He has wisely included as appendices extracts from several important documents; among these is included the correspondence in *The Times* newspaper which cleared the British Foreign Office of the implication of having refused to co-operate with Mr Stimson early in 1932.

"The Plough-up Policy and Ley Farming." By Sir George Stapledon. London. Faber and Faber. 169 pages. 2s. 6d. net.

This book provides a farmers' guide to ploughing up grass land. When to plough, how to cultivate, what seeds to sow, these and other matters are explained by Sir George Stapledon, the pioneer in the cause for better cultivation of grasslands.

"The Agricultural Register 1938-39." Agricultural Economics Research Institute, Oxford. 359 pages. 5s.

The newest issue of this most valuable reference book follows the lines of previous volumes. It summarises the year's events in agriculture, legislation and marketing, import regulation and supplies and prices of farm products and requirements. It is sad to learn that the continuation of this annual is doubtful, but it is to be hoped that larger sales of this year's Register will ensure the appearance of future issues.

## THE BUSINESS WORLD

## The Glut of Wheat

WHEAT is now changing hands in Liverpool at the lowest price ever recorded since futures trading was established there in 1883; its price in a free market (as little as 3s. 4½d. per 100 lbs. was accepted last Tuesday for July futures) is now barely one-third of what it was two years ago. This unprecedented slump is causing no little anxiety in the great wheat exporting countries. What are its causes, and how can the problem be solved?

The two diagrams accompanying this article provide a clue to the answers to both questions. The first diagram shows changes in the world's area sown to wheat (excluding the U.S.S.R., China, Iran and Iraq), together with production and the yield per acre during the past ten years; the second shows variations in the world's carry-over at the end of the season and in the United Kingdom import price averaged over each wheat year ended in July. With the exception of the index of prices, which has been calculated from the monthly trade returns, the figures are based on the estimates of the International Institute of Agriculture.

As the first diagram clearly shows, the prime cause of the instability of wheat prices is to be found in the annual fluctuations in the yield per acre. Man can control the area sown to wheat, but he cannot yet influence the weather, which largely determines the yield per acre and, hence, the size of the world's crop. The abnormally low yields per acre in 1934-36, by lifting prices, encouraged the extension of the total area sown to wheat. A year or two of normal yields, which has to be expected sooner or later, was therefore bound to upset the market and lead to another wheat crisis. Indeed, between 1936 and 1938 the yield per acre sown rose by 21.9 per cent., from 12.8 bushels to 15.6 bushels. Small changes in the supply of wheat have large reactions on prices, since the volume of demand is very insensitive, at least in the short run, to changes in price. Even if there had been no increase in the total area under cultivation after 1936, the resulting increase in production would have been big enough to under-

mine prices on the free market. The second diagram shows that the world's carry-over at the end of the 1938-39 season is expected to be as high as five years ago. And when reports pointed to another heavy crop in 1939-40 the bottom seemed to drop out of the market. The ultimate size of the new crop is of course still unknown, but it is unlikely to yield as much as last year's. Production in the United States, for example, is expected to be 275 million bushels smaller than last year, while Canada's harvest is estimated to yield 100 million bushels more. Reliable estimates from the other major producing countries especially from Argentina and Australia, are not yet available, but, in the view of *The Corn Trade News*, yield in Europe are expected to be lower than last year.

There is a second factor on the supply side which has aggravated the wheat problem in recent years. The Governments of the chief importing countries have encouraged the extension of the area under wheat by means of subsidies while those in the great exporting countries have, under political pressure, made deficiency payments to their farmers in years of low prices to prevent their impoverishment. This action has tended to hinder reduction in the world's area sown to wheat in times of falling prices. Thus, between 1927 and 1935, when the area sown to wheat in the exporting countries fluctuated between 199 and 206 million acres, it was increased from 60.5 to 67.1 million acres in the importing countries. Between 1935 and 1938, under the influence of higher prices, the area under wheat in the exporting countries rose from 200.9 to 223.7 million acres, but declined from 67.1 to 65.0 million acres in the importing countries.

This is, in a true sense, the fundamental cause of the wheat crisis. The world has extended its wheat fields until, in a year of normal yield, it is growing more than it will buy at a price sufficient to cover the cost of production. But though the rise in the wheat acreage is the more fundamental and long-term cause of the present situation, the immediate circumstances of any one year

CHART I

The World's Wheat Area, Production and Yield per Acre.

CHART II

The World's Carry-over and Average U.K. Import Prices.

are more likely to be influenced by the yield per acre than by the acreage. Thus, in 1936-37 and in 1937-38 the average import price of wheat in this country was almost as high as before the Great Depression. If the area under cultivation had not then been appreciably larger than ten years earlier, there might have been a scarcity of wheat.

If any attempt were made to put the wheat industry on a satisfactory basis, it would consequently have to move along two lines. In the first place, the world acreage sown to wheat would have to be limited to the figure which, given a normal yield, would just supply the demand at a price no higher than would remunerate the producer. For political and strategic reasons, it is highly unlikely that the wheat importing countries could be persuaded to reverse their present policies of encouraging wheat production. But if they would not reduce their present acreage, they might be persuaded not to permit any further increases. To ask, for example, for the abandonment of the British guaranteed-price system would be politically unrealistic; but it is wholly reasonable to suggest that the new agitation for a further increase in the guaranteed price, which would further stimulate production, should be rejected.

Secondly, if the total acreage could be fixed at the appropriate figure, arrangements would have to be made to secure that the amount of wheat marketed in any year should be approximately equal to the average (say the ten-year average) yield on the standard acreage. In bumper crop years the surplus would go into stock; in low-yield years the deficit would be drawn out of stock. And since the maintenance of these stocks would be for the benefit of consumers and producers alike, the costs involved should be shared between importing and exporting countries. In particular, there is every reason of self-interest for Great Britain to hold considerably higher stocks of wheat in this country than has hitherto been usual.

This is the barest outline of the possible shape that an international wheat control scheme could take if any prospect were to appear of securing the agreement of the large number of countries involved. Obviously there would be

very difficult technical problems to be solved. Yield per acre, to quote only one example, varies not only from year to year but from country to country. To limit the sales of a country where cultivation is intensive and yields high by calculating its quota on the basis of the world-wide average yield, would be most unjust. Countries must be allowed to apply their own yield figures. Moreover, provision must be made for developments in the technique of production. But these technical difficulties do not at first sight appear to be greater than those that have been surmounted in the case of other control schemes.

Mention of other control schemes, however, raises the largest hazard in the way of a wheat control scheme. Would it be in the general interest? Many—perhaps most—of the earlier commodity control schemes were merely devices to raise prices at the expense of the consumer. The latter-day schemes have followed a more moderate course, though whether that is due to a fuller realisation of the factors involved or merely to lack of opportunity it is difficult to say. The whole notion of commodity control is hardly yet out of probation, and to apply it to wheat might savour of a gamble with the traditional staff of life. On the other side, it can be urged that the case of wheat seems to be designed by Nature for control. Inflexible demand on the one hand and a production which cannot by any means be prevented from the widest fluctuations, on the other, are a challenge to human powers of organisation. The political difficulties of restricting the production of grain in any country are sufficient guarantee that the consumer would not be fleeced. On a balance of considerations, it would appear that an attempt to construct the framework of international control would do more good than harm. And there is no reason why the attempt should be confined to the producing countries alone.

Some of the leading exporting countries are known to be in favour of a co-ordinated effort to restore order to the wheat industry, and the possibility of convening a world wheat conference is now being canvassed. It is to be hoped that the low level to which prices have fallen will act as an inducement to co-operation.

## New Zealand's Refunding

WITH the opening on Thursday this week of the lists for £16 millions of 3½ per cent. New Zealand stock, 1939-44, Mr Nash's mission to this country has reached a successful conclusion. After several weeks of discussion, the New Zealand Finance Minister has obtained a £5 million credit for defence purposes; an export credit for £4 millions; and the conversion of the £17,172,191 of 3½ per cent. stock which is due for repayment on January 1st next year. New Zealand may have asked for more; indeed, trade credits of £10 millions, with additional sums for the development of secondary industries, appear to have been contemplated by the mission. But her Government can hardly be dissatisfied with what has been obtained to assist her over a time of pressing need.

There is little to add to the summary of the two credits, which was given on page 173 of last week's issue of *The Economist*. The defence credits will not, presumably, be called upon extensively in the near future, while the export credits, in Mr Nash's view, should tide the Dominion over the current year. For the future, it appears that the British Government has agreed to renew the credit facilities, if necessary, for a further period, but the full total is apparently needed to cover import licences granted to New Zealand importers for the second half of this year. It is plain, indeed, that without assistance on this scale—which itself is just adequate rather than lavish—New Zealand's sterling funds would have been in danger of exhaustion by the end of this year. It is estimated that the current total of her London funds is £12 millions; in view of the customary heavy import demands in the second half of the calendar year, and of the necessity to provide approximately £10 millions annually for debt service, New Zea-

land's sterling resources now stand at a critically low level. The arrangement of credits was an essential, but not the most difficult, part of Mr Nash's negotiations. For months past investors have shown growing concern regarding the prospects of a successful refunding of next year's large maturity. Since the 5 per cent. loan of 1946 stood as low as 94 at one time this year, while long-term rates or New Zealand issues were running well over the 5 per cent level, it was clear that refunding could only be achieved by one of two methods—a British Treasury guarantee or an "ultra short" bond issue. The first alternative was ruled out at an early stage; hence the second alternative has been adopted, but in distinctly unusual form.

The new loan, which has not been underwritten, is for £16 millions, since £1,172,191 of the existing loan is to be repaid from accumulated sinking funds. The absence of underwriting is in itself a commentary on the state of New Zealand's credit in the London market. In fact, the conversion loan could only be issued under the tutelage of the Bank of England itself. Mr Nash may regard the refunding of the existing 3½ per cent. loan at the same nominal rate of interest as a useful achievement; doubtless it will make the stiff—though by no means harsh—conditions attaching to sinking fund provisions the more palatable to his colleagues in the New Zealand Government. The latter have undertaken to provide for the redemption of the stock sufficient sterling to repay £2 millions of the issue in 1940 and £3½ millions in the four succeeding years, the whole loan thus being repayable by January 1, 1945. On this basis the average life of the stock, making allowance for the half-yearly application of the sinking funds, is just over three years. It would be difficult to find a precedent for

redemption by sinking fund of so large an issue in so short a period as five years.

Such sinking fund provisions may seem draconian, but it would have been impossible, for two reasons, to grant New Zealand a loan running for a longer term—say, up to a decade. In the first place, the rate of interest would necessarily have been higher, and possibly prohibitive. Secondly, the repayment time-table of New Zealand's existing obligations is already full for the only relevant period, between 1944 and 1949. Without including optionally redeemable stocks (which at present prices could not be converted at the earliest date) there are no fewer than six issues, repayable at fixed dates in this period, for a nominal amount of as much as £56,185,763. At present, these issues, on which interest ranges between 3 per cent. and 5 per cent., stand well below par. It is not too early for New Zealand to begin to consider these future obligations.

Cash applications at £99 per cent. and conversion applications (which will receive £1 per cent. cash payment) will be open until August 5th—immediately before the Bank Holiday. Although calls are payable £5 per cent. on application, £44 per cent. on August 15th and £50 on September 15th (the latter date, incidentally, may have some bearing on the timing of defence borrowing), the new stock will carry a full half-year's interest on January 1, 1940. Making allowance for this factor, and for the short average life, the stock offers a redemption yield of £3 19s. 11d. per cent. gross. Direct comparison with existing stocks is difficult, but (British) Conversion 4½ per cent. offers a redemption yield of £2 5s. 8d. per cent., assuming redemption next year, while five- and seven-year stocks like Conversion 2½ per cent. and National Defence 2½ per cent. offer redemption yields of £3 2s. and £2 19s. 3d. per cent. respectively. Possibly the nearest comparison in the Dominion list is Australia 2½ per cent. stock, redeemable 1941-43. This stock now stands at 94, and its redemption yield taken to the latest date, is exactly £5 per cent. gross.

None of these comparisons can be pressed. The new loan is not a British Treasury obligation; nor are the circumstances of New Zealand and Australia parallel. But they do at least suggest that New Zealand should not be dissatisfied with her bargain, for the new rate on the conversion stock is appreciably lower than had been generally estimated. It may be assumed that the authorities in London will ensure that full subscription, either by conversion or cash applications, will be obtained for the loan, and that large holders of the existing 3½ per cent. stock have been approached with a view to conversion.

In effect, the new loan will give New Zealand an opportunity to spread the repayment of the existing loan by deferred instalments over the next five years, instead of a single date next year, which would have proved beyond her present capacity. That concession imposes upon the Dominion the corresponding responsibility of tightening her belt to provide the large sinking fund instalments as they fall due. But it is a concession which imperial interests clearly demanded; the possibility of default would have been anathema both to New Zealand's creditors and to her citizens.

The way has, in fact, been cleared for a material strengthening of New Zealand's financial position. The necessity for the maintenance of import control has been recognised in this country; and the New Zealand mission has undertaken to relax the restrictions whenever possible. At the moment, however, the need is to make import restrictions really effective—indeed, it can hardly be said that they will become effective until 1940, in view of the extensive forestalling which has already occurred, and of the Government's liberal granting of import licences for the remainder of this year to encourage secondary industries. These are luxuries which New Zealand cannot, at the moment, afford, quite apart from their questionable economic justification in the long run. Including provision for the new loan, the Dominion must find sterling exchange of between £12 and £13½ millions, approximately, to cover her debt service. The export surplus for 1938, however, was £NZ9,477,000, and for the first half of this year £NZ8,595,000, compared with £NZ10,198,000 for the first half of 1938. Provided that a substantial reduction in

imports is effected next year, as was originally intended this year, a satisfactory surplus should be obtained. Obviously, a corresponding expansion of exports would be preferable, but world prices and British agricultural policy make it a slender hope at the moment.

Subscribers to the new loan will have options to convert the stock during the periods June 5th to 20th and December 5th to 20th in each year from 1940 into equal parts of 3½ per cent. stock, 1949-54, and 3½ per cent. stock, 1955-60. The value of these options cannot be established at this stage; rates of conversion will be published from time to time, and in any event their attractiveness will depend upon New Zealand's success in rectifying her present financial weakness. With the successful conversion of next year's maturity now virtually assured, this opportunity has been presented to New Zealand. In proportion as it is seized, the burden of the new loan will be reduced by voluntary conversions into the longer-dated options by investors.

The opportunity, however, has been associated with a tacit warning. The days have passed when a self-governing Dominion could be dragooned, and the close Imperial ties between this country and New Zealand would themselves rule out any suggestions of that type. But the mission must be aware of the definite views which prevail in London regarding the dangers of New Zealand's financial policy. They stop well short of the point of interference in the Dominion's internal affairs, but they are closely concerned with the position of her external finances. It is now for Mr Savage's Government to associate internal policy with the economic facts of a larger world. New Zealand, least of all countries, can afford a policy of economic self-sufficiency and a level of internal costs divorced from her trading position. But if these points have received scant emphasis by the New Zealand Government during the past year or two, it is not for any want of fundamental honesty on the part of the New Zealand people. The way is now open to the Dominion to restore her credit to its traditional high level.

The 6% Annuity Scheme solves the difficulty for those of advanced years of the loss of capital experienced with an ordinary Annuity: on capital invested there is allowed 6% interest for the life-time of the Annuitant and at death a generous return is made. Ask for particulars.

## ABRIDGED PROSPECTUS—FOR INFORMATION ONLY

## NEW ZEALAND GOVERNMENT

## £3½% CONVERSION STOCK, 1939-1945

Interest payable Half-yearly at the Bank of England on the 1st January and the 1st July

## ISSUE OF £16,000,000 STOCK

Authorised to be raised under the New Zealand Loans Act, 1932

A first payment of £1 : 15s. per £100 Stock, being a full six-months' interest, will be made on the 1st January, 1940

The Government of New Zealand have observed the conditions prescribed under the Colonial Stock Act, 1900, as notified in the "London Gazette" of the 14th December, 1900, and Trustees may invest in this Stock under the powers of the Trustee Act, 1925, subject to the provisions of Section 7 of that Act and unless expressly forbidden in the instrument creating the Trust.

THE GOVERNOR AND COMPANY OF THE BANK OF ENGLAND give notice that, on behalf of the Agents appointed for raising and managing Loans under the New Zealand Loans Act, 1932, they are authorised to receive applications for the above Stock.

Holders of New Zealand Government £3½ per Cent. Stock, 1940, which is due to be repaid on the 1st January, 1940, may surrender their holdings in sums of £100 and receive in exchange for each £100 Stock surrendered, £100 New Zealand Government £3½ per Cent. Conversion Stock, 1939-1945, together with a Cash Payment at the rate of £1 per Cent.

Cash applications will be accepted in accordance with the terms set out herein to an amount sufficient to make up with the Stock issued in conversion the above total of £16,000,000 New Zealand Government £3½ per Cent. Conversion Stock, 1939-1945.

The proceeds of Cash applications will be applied towards the redemption at par on the 1st January, 1940, of New Zealand Government £3½ per Cent. Stock, 1940, which has not been converted.

Transfers will be free of Stamp Duty and will be made on the ordinary common form of transfer.

The Stock will be convertible in due course into Stock Certificates to Bearer of the denominations of £100, £500, and £1,000, with Coupons attached, without payment of any fee.

The Stock will be redeemed by purchases at or under par exclusive of accrued interest or by half-yearly drawings at par, in sums of £100, commencing 1st July, 1940.

The New Zealand Government pursuant to an order of the Governor General in Council dated the 21st July, 1939, have undertaken to provide for the redemption of the Stock by making available in London out of funds accruing from exports from the Dominion or otherwise sufficient sterling to repay by instalments as set out below the whole of this issue by 1st January, 1945:—

| In the Year ending 31st December, 1940 | ... | £         |
|----------------------------------------|-----|-----------|
| " " " 1941                             | ... | 2,000,000 |
| " " " 1942                             | ... | 3,500,000 |
| " " " 1943                             | ... | 3,500,000 |
| " " " 1944                             | ... | 3,500,000 |

These instalments will be made available by two equal payments in each year on or before the 30th June and the 31st December, respectively, commencing 30th June, 1940. Half-yearly payments will be reduced by the nominal amount of drawn Stock converted under the option set out below in the half-year to which such payments respectively relate. Half-yearly payments will also be proportionately reduced as conversions of undrawn Stock or partial redemptions of Stock are made under the options set out below but so that such proportionate reductions will not affect the proportion of outstanding Stock to be redeemed in any half-year, nor the repayment of the whole of the Stock by the 1st January, 1945.

During the periods 5th-20th June and 5th-20th December in each year, commencing in 1940, holders of Stock, including holders of Stock drawn in accordance with the above provisions, will have the option of converting such Stock in sums of £100 as to one half into New Zealand Government £3½ per Cent. Stock, 1949-1954, and as to one half into New Zealand Government £3½ per Cent. Stock, 1955-1960, at rates to be published from time to time.

The New Zealand Government reserve the right on, or at any time after, the 1st July, 1941, on giving not less than three months' notice to redeem at par, together with accrued interest, the whole of the Stock or any part thereof not being less than the nominal amount of £1,000,000 sterling at any one time.

By Act 40 and 41 Vict. Ch. 59, the revenues of the Dominion of New Zealand alone are liable in respect of the Stock and the interest thereon and the Consolidated Fund of the United Kingdom and the Commissioners of His Majesty's Treasury are neither directly nor indirectly liable or responsible for the payment of the Stock or of the interest thereon, or for any matter relating thereto.

CASH APPLICATIONS  
PRICE OF ISSUE £99 PER CENT.

| PAYABLE AS FOLLOWS:             |     |          |           |
|---------------------------------|-----|----------|-----------|
| On Application ...              | ... | £ 5 : -  | per Cent. |
| On Tuesday, 15th August, 1939   | ... | £ 44 : - | "         |
| On Friday, 15th September, 1939 | ... | £ 50 : - | "         |
|                                 |     | £ 99 : - | per Cent. |

Copies of the Full Prospectus, on the terms of which alone Applications will be received, and Application Forms may be obtained at the Bank of England, London, E.C.2, or at any of the Branches of the Bank of England; of Messrs. Mullens & Co., 13 George Street, London, E.C.4; at the Bank of New Zealand (the Bankers to the Government of New Zealand in London), 1 Queen Victoria Street, E.C.4; of Messrs. J. & A. Scrimgeour, 3 Lothbury, London, E.C.2; at any Stock Exchange in the United Kingdom; or at the

Office of the High Commissioner for New Zealand, 415, Strand, London, W.C.2.

The Lists of Conversion and Cash Applications will be opened forthwith, and will be closed on Saturday, 5th August, 1939.

BANK OF ENGLAND, LONDON,  
26th JULY, 1939.

## Stocks for War

THE table appended to the article with the above title in *The Economist* last week contained a typographical error which made the figures of stocks incorrect. The corrected table is printed in full below:—

CONSUMPTION AND STOCKS IN U.K.  
(In thousands of tons.)

|                                  |   | Consumption     |            |         |        | Stocks                              |           |                       |      |      |

## Finance and Banking

**More Bills, Lower Rates.**—The discount market persists in its paradoxical behaviour of lowering the bill rate in the face both of an actual and of a prospective increase in Treasury bills much above the normal seasonal rhythm. Last Friday it was announced that the bills to be offered this week would be £10,000,000 in excess of the corresponding maturities. At this time last year Treasury bill issues were running at £5,000,000 below maturities. Quite apart from this unescapable reality in the situation the market has this week been provided by Mr J. M. Keynes with visions of such an abundance of Treasury bills as to gorge the banking system with liquidity and so, *faute de mieux*, ensure the due absorption of the re-armament loans when these appear—long, of course, after the money has been spent. And yet the Treasury bills issued last Friday went about 1s. per cent. lower at 14s. 8d. per cent. and the trend of open market rates this week has been correspondingly weaker. One of the reasons for the pressure on bill rates has been the exceptional activity of the official buyer. On every day of the week the broker who normally acts for the authorities has been a buyer of mixed parcels of September and October bills at a rate of 21/32 per cent. Some of these purchases have been on account of the Bank of England and are reflected in the further increase of £1.4 millions in Government securities shown by the latest Bank return. It is customary for the Bank to increase its holdings of securities at this time of the year in order to offset the effect of the expanding note circulation on the volume of bank cash. This year the need for such neutralisation has been somewhat enhanced by the maintenance of public deposits at the Bank at an unusually high level.

**Public Departments' Policy.**—These operations do not anything like account for the activities of the "special buyer," and it is clear that most of his purchases have been for account of public departments. The current surplus of such "departments" as the Unemployment Fund is now running at sizeable figures. In the normal course it would be making its way to the gilt-edged market for investment in the appropriate type of security. The experience of the markets concerned, however, does not suggest that this practice is being followed. The departments in question are, it would seem, investing their current surpluses in bills. The arguments for such a course are self-evident. By keeping liquid these departments place themselves in the best tactical position to offer their help to the medium or long-term defence loan which will appear "at the appropriate time." Further, by taking tender rather than tap bills and thus directly influencing open market discount rates, the authorities are exerting a helpful influence on the gilt-edged market. The weight of these open market operations has stimulated the banks' appetite for bills, which has thus become exceptionally keen for this time of the year when taxation payments normally encroach on bank cash and when the increasing demand for currency also tends to restrict the funds available for bill purchases. With the special buyer and the clearing banks in full cry for bills it is therefore not altogether surprising that the market rate should be sagging despite the substantial expansion in the supply of Treasury bills.

**The Demand for Gold.**—The turnover in the London gold market has recently been increasing. This may not be the impression conveyed by the published amounts of dealings at the daily fixing, but the feature of recent activity in the market has been the growing importance of

dealings after the fixing or for some other reason excluded from the published figures. The Continent has been the principal buyer and has kept the price sufficiently above the American shipping parity to deter all arbitrage operators—except the few (and they are getting fewer) who are still prepared to ship gold to New York without covering the war risk. The bulk of the buying this week has come from Holland, and can be linked with the increasing forward business in gold which is being transacted by Dutch banks. The fears of unfavourable political developments in Europe during the autumn together with recent budgetary developments in Great Britain and Holland have combined to stimulate the demand for gold as a hedge against war risks and currency depreciation. Now that the London market is closed to forward gold operations, whether of speculative or of hedge character, a good deal of this business is being transacted in Amsterdam. The Dutch banks cover themselves against their forward sales of gold by spot purchases in the London market and such operations have provided much of the demand for gold during the past week. Another indication of the increased demand for gold is to be found in the rise of the premium quoted on gold coins. This now stands at 1 per cent. after remaining for several weeks at around par. In every country in Europe there is an increasingly active market for coins to be found at subterranean levels varying in depth with the degrees of control to which the exchange and capital markets of the country concerned are subjected. London has recently played an active part in satisfying this increased demand for coins.

**Silver Below Parity Again.**—The lack of substance beneath last week's recovery in the sterling price of silver has quickly been revealed. The market was weak from Monday to Wednesday and the spot quotation in London fell to 16½d., recovering 1½d. on Thursday. The immediate cause of the fall was the reversal of the attitude of Indian operators towards the metal. Last week, spurred by the abnormally large up-country offtake of silver from Bombay, they provided most of the support in the market. This week they have sold just as aggressively, prompted apparently by rumours that the United States Senate was about to give serious consideration to the Thomas Amendment resurrecting the bogey of a complete cessation of American purchases of imported silver. The interesting feature of this renewed drop in the sterling silver price is the fact that on Wednesday it brought this quotation below the "dead parity" of 35 cents per fine ounce. On Wednesday the London price of 16½d. gave a dead dollar parity of 34.63 cents, and on Wednesday evening it was with some anxiety that operators awaited the posting of the American price for imported metal, fearing that the U.S. Treasury might, in accordance with Mr Morgenthau's recent pronouncement, bring the dollar price down to the sterling parity. No change was made, and it is evident that for the time being the United States are prepared to allow their price for imported silver to remain at a ratio of 1 : 100 to the price they pay for gold. It should be added that the simplicity of this ratio of 35 cents to \$35 does not invest the silver quotation with enough permanence in the eyes of arbitrageurs to tempt them to ship silver to New York on an uncovered basis. The U.S. Treasury is therefore not likely to be called upon to buy arbitrage silver for some time to come. Meanwhile, a reassuring sign in the silver market was to be seen this week in American trade buying of forward silver—attracted no doubt by the substantial discount to which the forward price has fallen, but also indicating some confidence in the maintenance of the American Treasury's import price for at least another two months.

**Dutch Banking Merger.**—The most important merger in the annals of Dutch banking was announced this week. It involves the two largest Dutch banks, the Amsterdamsche Bank and the Rotterdamsche Bank, vereeniging. The provisional agreement (it has yet to receive the sanction of the banks' shareholders) follows rather unusual lines. It provides for the pooling of profits as from the beginning of next year, for a complete interlocking of management and direction and for a substantial deflation of both banks' capital structures. In each case the issued capital is to be reduced—by repayment to shareholders—to Fl. 35,000,000 from the present figures of Fl. 55,000,000 in the case of the Amsterdamsche and Fl. 45,000,000 in that of the Rotterdamsche. At the same time the published reserve of each bank is being adjusted to the figure of Fl. 20,000,000 by transfers to or from hidden reserves, and, in the case of the Amsterdamsche, by a small distribution of cash to shareholders. These steps are generally held to be the preliminary stages of a complete fusion of identity and capital. The reasons for the merger are to be found in the excessive liquidity of the Dutch credit system and in the inordinately low level of interest rates which has greatly diminished the profitability of Dutch banking. Under these conditions, from which there appeared to be little hope of early release, the two largest deposit banks in the Netherlands were naturally drawn to one another by the prospect of the considerable economies in overhead costs held out by their merger. Each bank was over-branched and over-capitalised in relation to current and prospective income, and the community of interests which is being arranged will allow both excesses to be remedied. The merger will create a new unit whose dominant position among Dutch deposit and trading banks may have very interesting repercussions both on the policy of the remaining independent banks and in the sphere of control over credit exerted by the central bank. It may in fact create those problems against whose possible emergence we in Great Britain have guarded by the rule established in 1918 which requires official sanction for any merger among British banks.

**Standard Bank of South Africa.**—A reduction of 1 per cent. in the bonus, making the total distribution 14 per cent. against 15 per cent., had indicated that the

Standard Bank's profits for the year ended March 31 last would show a drop. The results recently published show net profits of £573,147, compared with £621,633, and the reason for this fall may be deduced from the balance sheet. Advances, the chief earning asset, are down by £903,034 to £37,349,247, in spite of a rise in deposits of £825,270 to £65,974,635. Bills of exchange are also lower by £858,095, and although there is an increase in investments of £537,034, this does not even counter-balance the rise in deposits. The result is a big jump in cash (including cash at call and short notice) from £10,674,961 to £12,720,571. As Mr R. E. Dickinson pointed out in his speech at the annual general meeting, gold mining may mitigate the effects of an external depression, but the Union cannot hope to escape them altogether. The income of the farming community was lower last year owing to the weakness of overseas markets, and commercial and industrial activity generally showed a substantial decline. No real improvement can be expected until confidence abroad is restored; but the bank, which is in a very liquid position, will obviously be well able to take advantage of such improvement as does occur.

**National Bank of Australasia.**—In spite of the general depression in Australia, as in other primary producing countries last year compared with 1937, the National Bank of Australasia has been able to record a small increase in net profits from £347,401 to £351,245 in the year ended March 31st last. Deposits show a rise of just over £1 million to £44,057,573, and advances are about £1.5 millions higher at £36,403,779. The bank has also made small additions to its holdings, both of Commonwealth Treasury Bills and investments, which together amount to £7,843,699, compared with £6,787,998. These increases have been made at the expense of cash (including money at call in London), which is down by £728,072 to £5,251,307, and bills receivable in London, which have fallen from £4,130,723 to £3,152,272. The bank is therefore in a rather less liquid position than it was last year, and the ratio of advances to deposits has risen from 80.8 per cent. to 82.5 per cent. These increases in its earning assets explain the better profits, and the dividend is maintained at the 6 per cent. level to which it was raised last year.

## MONEY MARKET NOTES

### The Bullion Market

THE latest Customs returns show a big shipment of £1½ millions of gold from the Union of South Africa and the export of another large amount, over £7 millions, to the United States. The latter must again be almost entirely an official shipment as arbitrage business has been negligible. The

absence of a further reduction in the American price for imported silver, in spite of the fall in the London price, encouraged buyers on Thursday. Both spot and forward were raised by ½d., and after the fixing there was a little more inquiry from India at a slightly higher price.

conditions have been very easy this week. Bond money has been available at ½ per cent. from outside quarters, and the clearing banks have been ready lenders against bills at the ½ per cent. minimum.

### The Money Market

IN spite of the fall in bankers' deposits revealed in the Bank Return, credit con-

\* Above or below American shipping parity. This week's calculations are based on a temporary parity, in which the war risk rate is taken as 18. 3d. per cent.  
† At fixing.  
The New York price for silver remained at 35 cents per ounce .999 fine during the week.

\* Viz. ½ per cent. for loans against Treasury bills and other approved bills and British Government securities within six months of maturity. ¾ per cent. for loans against 1 per cent. Treasury bonds and other gilt-edged stocks within six months of maturity. 1 per cent. for loans against other collateral.

### The Bank Return

A RISE in the note circulation this week was expected in view of the approach of the end of the month; and it has brought the total to a record high level. Last year and the year before the corresponding increase was £6.2 millions and £5.2 millions respectively; presumably, the smaller increase this year is due to the lateness of August Bank Holiday. The special purchases of bills which have been a feature of the money market this week must have been mainly for the account of public departments, as Government securities are only £1.4 millions higher. Other securities and discounts and advances

(Continued on page 225)

## Investment

**Equities v. Gilt-edged.**—Further study of the Government's defence finance problem has brought no consolation to the gilt-edged market, which lacks the power even to respond to Mr Keynes' persuasiveness. Indeed, the past week has seen a clearer division of forces between gilt-edged securities and equities. The formal arguments in favour of equities, now that the early stages of inflation are approaching, promise to be translated into policy by investors, whose preoccupation in recent months has been not economic but political. It is generally conceded that the political crisis, if it comes, may occur during August or September, but having abstracted from this possibility, the superior claims of equities as against gilt-edged securities are acknowledged. The consequences have been seen this week in a rise in the *Financial News* index of ordinary shares from 79.2 on Friday last week to 80.9 on Thursday this week, while the fixed-interest securities index shows only a modest movement from 117.7 to 118.0. The market shows no disposition to expect an early defence issue, even of a special short-dated character for the money houses. Possibly the fact that the final call on the New Zealand loan (which is discussed on page 220) falls on September 15th may have some relation to the timing of defence borrowing. Nor is the movement in equities a consequence of general expansion in business, although turnover has tended somewhat to improve. And it has been encouraged by special features, such as the impressive rise in rayon shares, led by Courtaulds and British Celanese. Yet it must be admitted that the Stock Exchange is now acting in as logical a fashion as the underlying economic facts and the overriding political uncertainties of a near-war situation permit.

**London and Provincial Dealings.**—A circular letter and questionnaire sent out to all London brokers by the Committee for General Purposes uncovers the root problem which, for reasons elaborated in *The Economist* of April 22nd, has to be solved before any far reaching accommodation between the London and the Provincial Stock Exchanges can be reached. It is now frankly admitted that the loss of business to London caused by the growth of country jobbing is a major subject of the discussions now proceeding between representatives of the Associated Stock Exchanges and the Committee of the London Stock Exchange. The provincial spokesmen have suggested that more business would come to London if London brokers were allowed discretionary powers to vary their commission charges. Accordingly, the London Com-

mittee undertook to investigate the possibility of this step, as part of a joint and reciprocal arrangement with the Associated Exchanges for controlling and limiting the extent of country jobbing. The questionnaire poses one question of policy and two which are designed to provide the Committee with information regarding the composition and machinery of the business at present passing between London and the Provinces. On the question of policy, brokers have been asked to state whether they are in favour of a discretionary commission on business for members of Associated Stock Exchanges as part of a wider arrangement covering the scope of country jobbing. The two information questions, with their sub-divisions, are clearly designed to show the proportionate interest of London in two distinct types of country trade, namely, private clients' orders and professional inter-market business. Although both types are commonly lumped under the generic label of "the Country," there is, in fact, a sharp demarcation. The inter-market business is handled by a comparatively small number of firms, which carry a highly specialised organisation comprising staff, private lines and teleprinters designed for the purpose. It is a matter of substantial business done on very fine dealing margins on a highly professional basis.

**The "House" Reaction.**—The date for return of the questionnaires was Thursday last, July 27th, and it is understood that a large proportion of brokers have sent in replies. The nature of the answers will, of course, be kept entirely confidential, but the tenor of opinion in the "House" is clearly crystallising along certain lines. Among brokers handling a large proportion of professional business—the so-called "shunters"—there is general recognition of the need for some such treatment as suggested by the Committee's circular. But while their proportion of the total provincial business handled in London must be very high, their numbers are few by comparison with the very large majority of brokers whose relations with provincial firms consist exclusively of an ordinary agency investment business. The latter, it is clear, have little to gain and much to lose by any general scheme of discretionary commissions on country business. And the considerable number of brokers whose provincial trade is entirely negligible have a natural bias on principle against any proposal which has the appearance of reversing the minimum commission policy, the success of which for most business is undeniable. It may, therefore, be surmised that, merely on a poll, the majority answer to the Committee's policy question would

(Continued from page 224)

show falls of £3.2 millions and £1.1 millions respectively, so that bankers' deposits have declined by more than the rise in the note circulation. There

is a small fall in public deposits, but the level is still very much higher than a year ago.

### Foreign Exchanges

GUILDERS and the Shanghai dollar have again provided the only features of interest in an otherwise lifeless foreign exchange market. After being as low as 8.73½fl. on Monday, when the formation of a Dutch Cabinet was announced, the rate rose sharply on bear speculation to 8.75½fl. the following day and at one time on Wednesday was quoted as high as 8.77fl. It is feared that the new Government will not be able to withstand strong opposition in the Chamber. Nevertheless, the forward guilder for three months is still quoted at a small premium. At the beginning of the week the Chinese dollar appeared firmer. The rate continued to be quoted at 4½d., but there was a certain amount of closing of speculative positions which were opened early in

June when the dollar first left its peg of 8½d. On Wednesday, however, there was another relapse prompted no doubt by Sir John Simon's statement of the day before, from which it was inferred that the resources of the Stabilisation Fund are virtually exhausted and that there was no prospect of further assistance from the British Treasury. On Thursday, quotations were very wide, and business was done at about 4d. Sterling opened the week with a firm undertone, but some selling on Continental account developed later and the sterling-dollar rate on Thursday was back to 4.68½-½. The Canadian dollar continues to appreciate against the pound and at 4.68½ is at a discount of only ¼c. over New York. The free rate for the Argentine peso is depreciating slightly, presumably in order to make up for the fall in the price of wheat.

be in the negative. Such a result, however, would not by any means settle the matter. The answers to the information questions will bring out the extent and nature of the interest of each broker in provincial business, and the Committee will obviously be guided by a quantitative and selective assessment of the opinions given. Indeed, there is every possibility that if the necessary dealing basis between London and the provinces can be established, a scheme might well be evolved which would meet the divergent requirements of all types of country business.

\* \* \*

**L.M.S. Economics.**—The hazards of estimating railway earnings could hardly find better illustration than the half-year's statement of the L.M.S. The company's results from all businesses show an increase in receipts of £25,000 for the half-year (compared with a traffic gain for the first 26 weeks of £110,000), but the company has actually achieved a reduction in total expenditure of £612,000. Net revenue thus shows an improvement of £637,000. A logical basis for estimating changes in expenditure, which was adopted in *The Economist* on July 8th, has proved wide of the mark—possibly because the effect of increased traffic upon expenditure has not become immediately operative. The board has adopted a cautious line, as was expected, in its dividend policy. Payments are confined to interim dividends on the 4 per cent. guaranteed and 4 per cent. preference stocks, and no declaration (as was the case a year ago) is to be made on the 4 per cent. 1923 preference stock. The board's statement makes the point that the reduction in expenditure cannot be regarded as indicative of the trend of the second half-year. In 1938, the last six months of the year provided a reduction in expenditure of £1½ millions, but the recent improvement in traffic will clearly involve an appreciable increase in the current half-year. The dramatic change in the railway trend during the past quarter has clearly upset precise calculation of the outcome of the full year. If traffic continues to advance at their recent rate, however, the marginal stockholder should obtain some benefit; this argument was the basis of the modest improvement in L.M.S. 1923 preference stock to 45 on Thursday.

\* \* \*

**Southern Railway Half-year.**—The market found the Southern Railway statement rather disappointing, for the directors maintained the preferred ordinary interim at 1 per cent., against hopes of 1½ per cent. Passenger traffic increased by £52,000 and goods takings by £40,000. Together with a rise in ancillary receipts of £62,000, gross revenues were £154,000 higher for the half-year, compared with a 26 weeks' traffic increase of £57,000. Working expenditure, however, increased by as much as £137,000, owing principally to increased prices, and consequently net revenue for the half-year is only £17,000 higher than for the first half of 1938. The additional interest charge on the new debenture stock itself absorbs £116,600 for the first half of 1939, so that available earnings for the preferred ordinary stock are nearly £100,000 lower than a year ago—a sum which is equivalent to one-third of one per cent. on the stock. Full interest on the new debentures in the second half of this year will require £150,000, but this period also carries the major portion of the company's important holiday traffic. The relatively sharp rise in expenses, however, is a factor for consideration by the preferred ordinary stockholder; as a result of electrification and the power of the coal industry to extract higher prices from electricity undertakers, the company appears to feel the effect of rising power costs more acutely than formerly.

\* \* \*

**Co-operative Chain Stores.**—Investors in the two leading fixed-price stores—Marks and Spencer and Woolworth—have seen imitators rise and fall. Despite the substantial profit-earning capacity of an established chain store

group, the need for comparably substantial capital resources has, more than any other factor, prevented any real challenge to the leadership of these two companies. The recent intimation that the co-operative societies are considering the possibility of entering the fixed-price store field, however, presents a rather different problem. The co-operative movement has experienced competition from the chain stores, particularly in the textile and grocery departments. The Co-operative Wholesale Society has reviewed this threat to the society's trade, and if their recommendations are confirmed by a referendum of the societies, the C.W.S. will be empowered to establish a subsidiary organisation with twenty chain stores in the near future. Estimates of "bazaar trading" given at recent co-operative meetings in Manchester have suggested that turnover amounts to £100 millions annually, compared with £38 millions for the dry goods departments of the co-operative retail societies. But apparently the comparatively recent growth of competition in foodstuffs causes the co-operative movement greater concern.

\* \* \*

The C.W.S. directors have computed that the capitalisation per store is £32,000 for Woolworth and £48,000 for Marks and Spencer. The size of the capital which would be involved in establishing even a moderate number of bazaar stores, coupled with the need for centralised direction, suggests that the C.W.S. would be the most appropriate body for managing the scheme, though it might be unable to keep average outlay per store as low as Marks and Spencer. Ten distributive societies have, in fact, experimented with bazaar stores in the past, but two have been abandoned, and average takings at other stores have ranged between £18 and £594. The average turnover in chain stores outside the co-operative movement, however, is substantially in excess of the maximum figure. Another point which may be noted by the chain-store shareholder is that the new co-operative stores do not propose to pay dividends on members' purchases—although this must be regarded as a startling development within five years of the centenary celebration of the Rochdale pioneers who founded the co-operative movement on the principle of equitable division of profits according to members' purchases. Moreover, the society may be involved in trade union negotiations to secure a new agreement covering wages and conditions in "bazaars," for the probability is that conditions in the existing co-operative stores are in advance of those in chain stores. Hence, the new co-operative proposals—even if carried into effect—will themselves raise many problems of a special nature. Shareholders in Marks and Spencer (which has 228 stores) and Woolworth (which has 737 stores) will probably not regard them as an immediate challenge to their companies' progress.

## Company Notes

**Distillers' Dividend Outlook.**—Lord Fortevior's eagerly awaited pronouncement, at last week's meeting, on the effect of the recent Distillers' capital bonus on dividend policy was guarded. Stockholders may well have been gratified by the chairman's optimistic review of the company's prospects, but the only clue to dividend policy is contained in the statement that the directors "cannot expect to maintain the present rate of dividend on the increased capital." Stockholders may define the limits of dividend policy, on the present level of profits and the increased amount of capital, as 16 per cent. on the new capital if the reserve allocation is maintained at £400,000, and 20 per cent. if no allocation is made. It is, in fact, plausible to assume that the rate will be reduced from the recent level of 22½ per cent. to somewhere between these two extremes. At the present price of 97s. 6d. for the ordinary stock (*cum* rights) a 5 per cent. yield basis would be secured with a dividend of 17½ per cent. The recent

satisfactory results in the home distilling market promise to continue, for aged whiskies still command high prices. Sales to the Empire and the United States throughout last year showed satisfactory results, and further benefit has been reaped from the Anglo-American Trade Agreement. Political difficulties have so far had little effect upon export turnover, for which prospects remain encouraging. Sales of industrial alcohol and yeast showed little change last year despite keen competition, and in Australia sales from the industrial alcohol factory continued to forge ahead. The acquisition of a majority holding in Commercial Solvents (Great Britain), Ltd., research work on various chemicals, and operation at full capacity at the two Gyproc plaster-board factories illustrate the progressive state of the group's secondary interests outside the potable spirit trade.

\* \* \*

### Furness Withy and Shipping Share Prospects.

Though the general difficulties of international trade are a fundamental cause of reduced shipping profits, Lord Essendon's survey at this week's annual meeting of Furness Withy illustrates the diversity of shipping experience on different trading routes. In the difficult circumstances of last year the New York-Bermuda service and the Shaw, Savill and Albion line did reasonably well, despite the need for exceptional chartering expenditure in the one case, and rising costs in New Zealand in the other. Again, the group's Mediterranean trade justified the new tonnage which had been introduced, while the Royal Mail Lines investment had "fulfilled expectations." On the other hand, the North Pacific service was affected by labour difficulties as well as the common problem of rising costs, while the Prince Line was affected by severe competition from subsidised lines in its trade between New York and Brazil and the Argentine, and also by import restrictions due to Argentine currency regulations. Lord Essendon anticipates some benefit from the Anglo-Romanian trade discussions although the Johnston Warren Line, trading to the Danube ports, had scarcely one profitable voyage last year. An important section of Lord Essendon's speech, however, was evidently addressed to a wider audience, for it consisted of a full explanation of the Government's various proposals for assistance to certain branches of shipping. Not unnaturally, Lord Essendon's comments were mainly favourable to the new schemes, though he explained that defensive measures for British shipping did not in themselves increase the total volume of trade available. He also reminded members that in the past he had been a friendly critic of T.F.A. loans on the ground that new ships were built unnecessarily and created additional competition. Shareholders will doubtless appreciate the chairman's disinclination to indulge in forecast regarding the future. Government assistance may help the industry, but it will not provide substantial dividends.

\* \* \*

**Victoria Falls Results.**—Except for companies on the fringe of the armaments industries, instances of increased dividends have been rare in recent months. But the increase in the Victoria Falls and Transvaal Power distribution from 13½ per cent. to 15 per cent., coupled with the recent satisfactory accounts, is fully in accordance with the company's progressive record. There have been phases of fluctuation in profits, for the company's success is closely bound up with mining enterprise, but the main trend has been upwards. Further expansion is in train. Ten out of twelve plants at the new Klip station (owned by the Electricity Supply Commission, but operated by the company) are actually working, and work has begun on the new Vaal station, which is to be run on a similar basis. Sales in the first six months of 1939 show an increase over the corresponding period of 1938. The profits record of the past three years is analysed in the next column.

|                                                       | Years ended December 31,<br>1936 | 1937      | 1938      |

At last Tuesday's meeting, Mr Arthur Hadley considerably amplified the relatively limited information supplied by the accounts. As the business has developed, taxation and rebates have required larger provisions. Mr Hadley explained, for example, that the basis on which the company charges for power provide for a reduction in unit prices as sales increase, and a rebate is given on a basic price which varies with the amount of sales. In 1938, in fact, this rebate required £171,000 more than in 1937. Another factor is the renewals fund, which again received £230,000 from revenue. The company's existing licence expires in 1950, when there are powers to expropriate the undertaking, and provision for renewals is thus all the more necessary as the raising of new capital would become more difficult as 1950 approaches. In all respects Mr Hadley's survey of the position confirms the satisfactory impression left by the accounts. The £1 ordinary stock units provide a return of £4 6s. per cent. at the present level of 70s.

\* \* \*

**Richardsons, Westgarth Recovery.**—The first full year's operations to March 31st of Richardsons, Westgarth since the reorganisation scheme was carried through are as encouraging as the 7½ per cent. dividend announcement earlier this month suggested. At the beginning of 1938 an amalgamation was effected with the North-Eastern Marine Engineering Company and George Clark (1936), Ltd. Profits for the year to March 31, 1939, amount to £175,760 compared with £25,469 for the previous fifteen months. No information is provided in the directors' report, however, regarding the extent to which the North-Eastern Marine Engineering Co. and George Clark (1936), Ltd. have contributed to these results. Doubtless, however, rearmament orders have distributed their benefits over all sections of the business. Although the subsidiaries reported an aggregate profit, no dividends have been taken into the parent company's accounts. Thanks to accumulated allowances for losses and wear and tear, no provision for taxation

(Chief Office): 1 Cornhill, E.C.

is required this year, but £32,844 has been provided for depreciation. Under the agreement of 1938, the company issued £500,000 5½ per cent. first mortgage convertible debenture stock, on which interest and sinking fund requirements absorb £35,504. Bank interest, directors' fees and other charges require £2,980 compared with £10,822, so that net profit for the year amounts to £104,432, equivalent to ordinary earnings of 23.5 per cent., out of which the directors recommend a dividend of 7½ per cent., the first for many years. A welcome sign of financial consolidation is a first allocation to general reserve of £50,000. Amalgamation and issue expenses of £14,660 are to be written off, leaving a carry-forward of £11,862, against £5,412 brought in. The balance sheet reflects the improved trading position of the company. Creditors and accrued charges have fallen from £226,093 to £97,335 over the year. Though work in progress and stocks are somewhat lower at £227,021, the directors report a fuller order book than a year ago, and investments have increased from £21,862 to £41,117, and cash from £99,801 to £117,837. It is, perhaps, too early to judge how far this spectacular recovery is due to re-armament business and how far it results from economies of rationalisation. But it is encouraging to note that "uniformity of control" has made considerable progress during the year. The company's brighter prospects are reflected in the price of the 5s. shares, now quoted at 4s. 3d., to give a yield of £8 16s. 9d. per cent.

**South African Distilleries and Wines.**—Since the public issue of ordinary shares in June, 1934, this company's profits record has been satisfactory. Although certain legal claims against the E. K. Green and Company subsidiary caused concern for a time, the questions involved were substantially settled more than a year ago, when the claims were recovered from the original vendors. South African Distilleries' total income for the latest year, to June 30, 1939, however, shows a reduction from £256,526 to £230,421, and since South Africa has been no more exempt than other countries from the general fall in profits, this moderate setback cannot be regarded as a disappointment. It is, moreover, an accurate reflection of the results of the two subsidiaries, whose consolidated net profits fell from £289,458 to £265,712, though the description of these profits does not make it clear if the earnings of sub-subsidiary companies are fully included. In the parent company's accounts taxation absorbs £1,000 less at £24,500, and after providing £41,250 for preference dividend, earnings for the equity are £25,963 lower at £158,836, equivalent to 15 per cent. against 18½ per cent. The year's dividend rate is reduced from 18½ to 15 per cent., but the final dividend of 9 per cent. is payable on a capital increased by the issue last January of 100,000 £1 ordinary shares at 100 per cent. premium. In fulfilment of a promise made at last January's meeting, a statement of assets and liabilities of the two subsidiaries and their subsidiaries is given—a welcome step since the bulk of the assets of the parent company consists of shares in and net amounts due from the two subsidiaries. This statement shows assets of £32,071,900 less liabilities of £3,650,061, the largest single item being stocks of £3,840,565. The directors hold the view that a consolidated balance sheet incorporating book values of the operating company's assets and liabilities would be misleading, since on the parent company's formation valuations were made of certain assets (and formed the basis of the purchase price), although the assets were naturally not written up in the books. The statement thus shows fixed assets based on 1934 valuations with subsequent additions and

sales. The directors' implicit suggestion that a consolidated balance sheet would be a somewhat unrealistic document in these circumstances has some justification, but the consolidated figures given in the report would have been even more useful had they been divided to permit a direct comparison with the prospectus figures. At a current price of 42s. the £1 ordinary shares yield £7 9s. per cent.

**Rubber Profits and the Quota.**—Reports recently published by rubber companies for accounting years to March 31st last show no relief from the depression in profits and reduced dividends of many months past. Nor, except in occasional instances, are these reductions due to a more conservative dividend policy. For most companies, average realised prices per lb. in 1938-39 were slightly lower, but compared with earlier years, fluctuations in prices were relatively small, and reduced quotas are mainly responsible for the current depression in profits. The average export allowance in the year to March, 1939, was only 50 per cent., against 82½ per cent. a year earlier, and while some compensation was obtained from higher standard assessments, such slight benefits were more than offset by the increase in unit costs due to the heavy cut in output. In the following table, the results of six important rubber or mixed producers, whose reports have been issued recently, are summarised:—

| Company (years to Mar. 31) | Rubber sales* |            | Gross inc. | Earned for Ord. |      | Div. | Present |       |
|----------------------------|---------------|------------|------------|-----------------|------|------|---------|-------|
|                            | Amt.          | Price      |            | Amt.            | %    |      | Price   | Yield |
|                            | lbs. 000's    | d. per lb. | £000's     | £000's          | %    |      |         | %     |
| <b>Anglo-Java—</b>         |               |            |            |                 |      |      |         |       |

\* Or crop, where sales not separately shown.

These companies show a rate of decline in gross proceeds over the past year varying between 30 and 35 per cent. throughout, but expenses have in most instances fallen in smaller proportion than output, and the effect on equity earnings is severe. Meanwhile, prospects for 1939-40 are somewhat better, for the commodity price has remained fairly steady, in the neighbourhood of 8d., while the raising of the quota from the beginning of the current quarter from 55 per cent. to 60 per cent. is welcome. But for the six companies shown above, even if the quota remains at 60 per cent. until the end of March next year, the 1939-40 average will be 57½ per cent., against 50 per cent. in 1938-39. This is a useful increase, though it cannot be regarded as decisive evidence of a substantial rise in profits. Meanwhile, current share values already look forward to an appreciable improvement in dividends.

**Rhokana Corporation Profits.**—The Rhokana Corporation profits estimate for the year to June 30th is the first of the Rhodesian copper announcements, and it will be found satisfactory. After providing for debenture interest, depreciation and development reserves and mine provident fund, net profits amount to £1,890,000, subject

to taxation, compared with £1,950,000 for the preceding year. Profits during the first six months of the year amounted to £896,000, so that the corporation did distinctly well in the second half of the year. The progressive reduction of quotas from 105 per cent. on December 15th to 95 per cent. from March 1st, however, was mitigated by an increase in the corporation's basic quota, and blister production rose from 44,247 long tons to 50,810 long tons, electrolytic output being slightly lower at 31,691 long tons against 32,028 long tons. The profits estimate does not include any dividend from Mufulira Copper Mines, Ltd., in which Rhokana has a 32.303 per cent. interest. Mufulira Copper net profits for the first three quarters of the latest year to June 30th amounted to £807,500, against £770,500 for the corresponding period of 1937-38. Hence, the prospect appears to be for a maintenance of the previous year's dividends, both for Mufulira and for Rhokana.

**The Week's Company Profits.**—The usual seasonal contraction in the number of reports issued has begun, and our table of profit and loss accounts, appearing on page 250, includes only 28 companies (other than banks) for which comparable figures are available. Net profits of these companies total £1,238,000 against £1,283,000, a decline of only 3½ per cent. Aggregate net profits of 1,638 companies whose reports have appeared this year to date are £209,469,000, or 8 per cent. below the total of £227,514,000 earned by the same companies a year earlier. The week's results are discussed in preceding Notes and on page 231 under the heading "Shorter Comments."

## THE STOCK EXCHANGES

### London SETTLING DAYS

TICKET ACCOUNT  
AUGUST 1 AUGUST 3

In the past week there has been no major change in the characteristic trend of the market—a small volume of business, a certain amount of irregularity as between different days and between individual issues. But the keynotes are the heaviness of gilt-edged stocks and the firmer prices for equities. Even the sag of gilt-edged issues, however, has been checked owing to the absence of further disturbing international news, and changes on balance have been small.

After a dull start through lack of support, gilt-edged stocks became steadier, and towards mid-week tended to rise slightly with a modest improvement in turnover at the same time. Dated stocks were rather more volatile than in recent weeks, and in mid-week tended if anything to gain more than the undated issues. Apart from New Zealand issues, Dominion stocks attracted little attention to start with, but immediately before the conversion loan there was a further advance in New Zealand stocks, which stimulated other issues in the Dominion list. Response to details of the loan was favourable. Among foreign bonds, Japanese stocks provided an important feature with a sharp rise in the earlier part of the week on the Tokyo agreement. The gains were reversed by the termination of the United States trade pact. Chinese issues were subdued. Though inactive, European stocks remained firm. Following Mr Cordell Hull's statement, Brazilian bonds advanced on hopes of negotiations for a debt settlement.

In home rails there was a bright start in anticipation of the half-yearly statements, but as Thursday approached, with the L.M.S. and Southern statements (discussed on page 226) there was a greater tendency to await developments. A moderate reaction occurred in mid-week on the disappointing traffics. After the L.M.S. dividend decision, the 1923 preference and ordinary stocks reacted temporarily, but the 4 per cent. preference rose to 62½. Among foreign rails, Argentine issues were steady at first, and then tended to drift.

The satisfactory trend among industrial continued, and the tendency towards firmer prices was particularly evident in mid-week. With few exceptions, however, turnover remained limited. Without showing great activity, iron and steel shares were firm, and, as the week proceeded, tended to improve. Stewarts and Lloyds and Neepsend were supported. The firm trend in coal shares, which had been in abeyance for some weeks, was resumed. More attention than of late was turned to electrical equipment issues, though less active conditions returned in mid-week. The trend in motor shares was uncertain. Conditions were quiet or irregular at first, but the tone was brighter on Wednesday. Business in aircraft shares remains restricted, but prices are steady. Textiles improved after an unexciting start, while rayon shares formed one of the most active sections of the whole market. Better trading reports and the agreement between staple fibre producers were mainly responsible, an additional fillip being given to British Celanese on expectations of the much-debated reconstruction scheme. Leading brewery and tobacco shares were in de-

mand. There was some improvement in the stores group, especially in Woolworth, which led to a little profit-taking in mid-week. Provision and catering issues were also firmer. Miscellaneous issues reflected the general trend, and the leaders improved, Dunlop Rubber being in demand. Shipping shares remained quiet.

Interest in oil shares was small on Monday, though "Shell," Royal Dutch and leading Trinidad issues were firm. The firm opening of Wall Street and some Continental support aroused interest on Tuesday, prices advancing under the lead of Anglo-Iranians and Lobitos. Later the advance continued with interest broadening into the speculative issues.

Rubber share movements have been governed by reactions to the quota decision. Prices were firm on Monday, and the negligible effect of the quota on the commodity price occasioned increased public interest with higher quotations on Wednesday. Tea shares were firmer in mid-week on public support.

Mining shares opened firm after the weekend. In a market short of stock, Government Areas were particularly prominent. In mid-week, local buying further assisted prices, with East Rand still prominent. Developing issues were active early in the week, Venterspost advancing in anticipation of the June quarterly report. After a lull on Tuesday, shares were again marked up in mid-week. West Africans were firm though rather featureless all week. Among Rhodesian coppers, Rhokana spurred on Tuesday, other shares hardening in sympathy.

## ACTUARIES' INVESTMENT INDEX

In July there has been a tendency for gilt-edged prices to sag slightly, whereas changes in industrial share prices are slightly firmer at the close. Thus, as compared with a month ago, the Actuaries' index of the price of 2½ per cent. Consols has fallen by 2 points, but that for equity prices by less than ½ point. On Tuesday, July 25, the index of 160 industrial share prices stood at 61.4, against 61.8 a month ago, and 66.7 a year ago. The corresponding average yields are 5.64, 5.63 and 5.88 per cent. We give below a selection of the separate indices, and also the usual monthly particulars of fixed interest securities:—

## New York

DESPITE continued good domestic news and a more optimistic reading of the international situation, prices reacted fractionally at the opening of Wall Street on Monday, owing to profit-taking and technical adjustments. Utility issues were strong in early trading, but steel shares failed to respond to the reports of higher steel mill activity. Motor shares were under the shadow of labour unrest. By Wednesday, however, further satisfactory dividend announcements and encouraging industrial reports stimulated renewed interest. United States Steel, Du Pont and Chrysler encountered sup-

port, and were accompanied by chemical issues and utilities, the industrial average finishing within striking distance of Monday's close. The bond market was also firm, though rails received little attention. *Iron Age* reports steel mill activity at 60 per cent. of capacity, compared with 56.5 per cent. last week.

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values calculated on closing prices (1926 = 100).

## Capital Issues

THE New Zealand conversion issue is discussed in a leading article on page 220. The offer of 449,446 Initial Services 5s. ordinary shares at 23s. does not provide new money for the company, since the shares have been acquired by Charterhouse Finance Corporation at an average cost of 22s. 7d. per share. The company has a record of steady expansion. *Simms Motor Units* 5 per cent. first debenture stock carries a conversion option up to July 31, 1944, to convert at par into ordinary shares, which may compensate for the somewhat low cover provided by profits in recent years. The purchase price for the net assets of *Engineering and Lighting Equipment* appears reasonable in relation to recent profits, although the latter have been increased by important Admiralty and naval shipbuilding business.

## CONVERSION OFFER

**New Zealand Government.**—Issue of £16,000,000 3½ per cent. conversion stock, 1939–45, at 99. A trustee stock. Redeemable at par by half-yearly drawings from January, 1940, to July, 1945 (stock drawn 5–20 June and December each year may be converted as to one-half into 3½ per cent. stock, 1949–54, and one-half into 3½ per cent. stock, 1955–60, at rates to be published); or from 1941 on notice. Holders of £100 3½ per cent. stock due January, 1940, may convert into £100 new stock plus 1 per cent. cash. Total exports, 1938, £NZ58,376,000, of which £NZ48,899,000 to U.K.

## PUBLIC OFFER

**Simms Motor Units.**—Issue of £100,000 5 per cent. first mortgage convertible debenture stock at par. Redeemable at 102½ by 1954 by drawings from 1945, or on notice. Convertible by July, 1944, into ordinary shares at par. Makers of electrical equipment for motor vehicles. Excess of assets £192,194 (of which patents, etc., £13,334). Profits, after depreciation, before interest: 1936, £13,536; 1937, £14,330; 1938, £18,017.

## BY OFFER FOR SALE

**Initial Services, Ltd.**—Offer for sale of 449,446 5s. ordinary shares at (Continued on page 231)

## Industry and Trade

**Building Plans and Activity.**—The returns of the value of building plans passed by 146 local authorities have shown an almost uninterrupted decline during the past eighteen months. In June, for example, the value of building permits was 12 per cent. lower than in the corresponding month last year. As the unemployment figures show, however, constructional activity has not only failed to shrink but is now actually higher than a year ago. Thus, the percentage of insured persons unemployed in building fell from 12.6 in June, 1938, to 12.4 in May and 11.3 in June, 1939; during the same period the unemployment percentage in public works contracting declined from 36.1 to 31.7 and 29.3. Recent experience has thus shown that the returns of the value of building plans passed no longer provide a reliable guide to future building activity. This is probably due largely to the fact that they do not include direct Government contracts, which must have shown an appreciable increase in value since last year. If this conclusion is correct it suggests that private building has shown a downward trend, but that the decline in residential construction has been more than offset by an increase in other forms of building.

**Recovery in Car Registrations.**—The downward trend in the sales of new private cars was reversed last November, when for the first time registrations exceeded the level of the same month in the previous year. Since then, the improvement has been maintained, as is shown in the table given below:—

|                      | Private Cars |         |          | Commercial Vehicles |         |          |

23s. Total assets, June, 1938: £1,615,006 (of which investments in subsidiaries, £574,200; goodwill, £160,000). Profits, years to June 30: 1936, £245,476; 1937, £276,693; 1938, £304,157. Charterhouse Finance Corporation take issue at 22s. 7d. including expenses.

**Engineering and Lighting Equipment Company.**—Offer for sale at par of 100,000 7 per cent. cumulative redeemable £1 preference and 325,000 2s. ordinary shares. Preference redeemable at 25s. by 1954, by drawings from 1942, or after 1941 on notice. Net assets, £200,000 (of which goodwill £82,452) bought for 100,000 preference and 1,000,000 ordinary shares. Profits before depreciation and directors' remuneration, years to March 31: 1937, £21,275; 1938, £39,228; 1939, £59,254.

## SHORTER COMMENTS

**Company Results of the Week.**—The £10,400 increase in THRELFALL'S BREWERY net profits to £358,924 is moderate, but satisfactory in view of the recent trend of brewers' profits. One of the outstanding results of the week is the sharp rise in AIRCRAFT COMPONENTS net profits from £23,124 to £70,134, coupled with an increase in the dividend from 7½ to 25 per cent. The first report of JAMES HOWDEN AND COMPANY since the company became public shows trading profits of £99,663 for 10 months. Increased profits are due to a high rate of production, and orders on hand assure full employment in the current year. Appreciable recovery has been experienced by MONTAGUE L. MEYER, whose dividend is doubled at 33½ per cent. Progress has been made by the NATIONAL CANNING COMPANY, whose latest net profits are £43,423, against £40,695. If any shares are issued to finance the growth of the frosted foods and

in the horse-power tax has not apparently checked the demand for new private cars, though it has stimulated the sales of the smaller cars at the expense of the larger models. But it is noteworthy that throughout the whole of the current season the sales of commercial vehicles have remained below the level of the previous year, though this discrepancy was much reduced in May. On the other hand, sales of miscellaneous vehicles are larger than last year.

**American Cotton Export Subsidy.**—After a considerable delay and many rumours, Mr Henry Wallace, the United States Secretary of Agriculture, announced at the end of last week the terms of the subsidy on the export of raw cotton

holidays fell in 1939. Comparing the total of the two months with the same period of last year, the daily value of retail trade was 2.3 per cent. higher in 1939, a slightly higher rate of increase than in the earlier months of this year. As in previous months, retail trade in Scotland and

Southern England was better maintained than in Central and West London.

**Oil from Coal.**—While the authoritarian countries continue to expand their production of oil from coal, the development of the British industry appears to have been halted. The coal hydrogenation plant of the I.C.I. at Billingham is now working at approximately its full capacity of 45 million gallons per annum; so far the financial results have not been sufficiently attractive to stimulate the erection of other plants. The plant for testing on a commercial scale the Fischer-Tropsch process is still non-existent in spite of the recommendations of the Falmouth report. Further, Low Temperature Carbonisation, Ltd., the pioneer and the most important company operating this process, has had to suspend the payment of dividends. Its difficulties have been largely due to excessive extensions of capacity, with the result that more than half of its plant was idle last year. But as the British Government does not look to this new industry either to provide a market for the excess capacity of the coal industry or to supplant imported fuel, a period of consolidation may be preferable to a rapid and uneconomic expansion.

**Increase in Rubber Exports.**—It was generally expected in London that the International Rubber Regulation Committee, at its meeting on Tuesday, would fix the exportable percentage for the last quarter

of the year at 60 or possibly at 65 per cent. of the basic quotas. As a result of the excess of consumption over production during the current year, stocks of rubber have fallen very considerably, as is shown in the table which is taken from the Statistical Bulletin of the I.R.R.C. The Committee has decided to fix the exportable percentage at 60 per cent. of the basic quotas for the last quarter of the year, but it also decided to revise the quota for the current quarter from 55 to 60 per cent. It is probable that the main reason for this latter step was the undesirability of allowing stocks to fall further in the current quarter, since stocks at the end of May represented barely 4½ months' consumption at its present level. Even at the higher quota, however, production from the regulated area will only slightly exceed 250,000 tons per quarter, while consumption in the first half of the year totalled about 260,000 tons per quarter, and the seasonal fall in consumption in the latter half of the year is not likely entirely to make good this deficiency in supplies.

**Further Fall in Prices.**—The general trend of the prices of primary products was downwards during the past fortnight, both in this country and in the United States. The decline is reflected in *The Economist's* indices for primary products. In consequence, the more comprehensive *Economist* and Irving-Fisher indices are also slightly down. The latest indices for France and Germany show little change, but the figure for Italy is slightly lower.

| 1913 = 100 .....    | 83.1                         | 99.3          | 96.1          | 95.4          |
| 1924 = 100 .....    | 52.2                         | 62.4          | 60.4          | 60.0          |

While the group indices for cereals and meat, other foods, and textiles are all lower than a fortnight ago, those relating to minerals and miscellaneous commodities show a slight rise. The sharp decline in the index for cereals and meat is due to falls in the prices of wheat, maize and beef.

## TEAM VALLEY OFFERS: These Important Services

**12** market investigations have been undertaken for industrialists by the Estate's specialists.

**13** highly qualified business men of 13 different professions are associated with the Estate Company and place themselves at your disposal.

**21** experts on architecture, engineering, lighting, heating, water and effluent, make no charge for their advice.

**45** tenant firms aid each other in business through the medium of the Team Valley Club.

**71** introductions to State departments, commercial buyers, and foreign connections have been given to tenants by the Estate Company.

**120** firms representing 54 industries have rented premises on the Estate in the last 2½ years: 10 have since expanded their factories.

*These services ensure success on Team Valley*

**TEAM VALLEY**

**TRADING ESTATE**

Team Valley is a 700 acre estate on the outskirts of Newcastle. The Estate Company is financed by Government grant, operating under commercial control without profit. Standard or special factories are rented, complete in every respect. The Estate is bounded by the L.N.E.R. main line, directly connected with the Great North road, within one mile of the wharves of Newcastle. Backed as it is by the

Government schemes for the Special Areas, Team Valley can offer its tenants services otherwise unobtainable — from help in applying for capital onwards. For further information, or for arrangements to view the Estate, please write to: O. W. Brennan, North Eastern Trading Estates Limited, Kingsway, Team Valley Estate, Gateshead-on-Tyne, 11. Telephone: Low Fell 76071.

## INDUSTRIAL REPORTS

HERE is much less evidence this year than usual of the seasonal decline in industrial activity during the summer. The output of coal is practically as high as in June and appreciably higher than a year ago. Similarly, the iron and steel industry continues to operate at high pressure, and the volume of orders is abundant and sufficient to ensure the maintenance of output for many months to come. The constructional industries also remain very busy. The volume of new business in textiles has declined, but order books are still well filled. An element of importance to the rayon industry has been the conclusion of an agreement between producers of staple fibre in Belgium, Germany, Italy and the United Kingdom; the agreement is signed to ensure the "orderly development of world markets" for this product.

## Coal

**Sheffield.**—The market is rather more active than usual at this time of the year, due to industrial pressure and the accumulation of emergency stocks. Householders are also taking advantage of summer prices to lay in supplies.

Steam coal is in firm demand, and the railways are taking good deliveries of the best locomotive hards. Electricity and gas undertakings are responsible for the briskness in smalls. Coke demand continues to expand, both for domestic and furnace use.

Export business is moderate, but the undertone is firm. Yorkshire and Derbyshire hards are not fully taken up, but a steady demand exists for cabbles. Bunkering sorts are quiet. General heating coke is coming into better request.

★

**Newcastle-on-Tyne.**—The coal market in this area is quiet but firm, and supplies of the better known brands are scarce. Business in Northumberland and screened steam coals is quiet at present, but the outlook is good and considerable contract business has been arranged. Durham coking coal moves off as briskly as ever and only odd lots are available. Trade in prime bunkers is steady but ordinary brands are plentiful. Patent oven coke continues to be a firm market under a strong domestic and export demand.

★

**Glasgow.**—The market has remained inactive this week. Both Fife and Lanarkshire made a slow start after the holidays and one unfortunate effect of this was that household merchants were unable to secure their full requirements for "binging" purposes prior to the withdrawal of the summer-time price concession this week-end. The Lothian collieries are on holiday this week and stocks in that district have been well cleared. So far business generally has not yet got fully into normal stride, but the indications are that the recent improvement will be well maintained, with prices probably showing a rising trend. The London trade in nuts remains satisfactory.

★

**Cardiff.**—Orders recently placed by the French National Railways

amount to 416,000 tons of South Wales steam large and through coals. A small contract for 8,000 tons has also been placed by the Beira Alta Railways. There has been little other new business passing, and last week shipments in the foreign and coastwise trades dropped to 393,300 tons, compared with 400,529 tons in the corresponding period last year. During the next few weeks production will be substantially reduced by the August holidays, but colliery owners are becoming a little apprehensive of the market position in the autumn.

★

**Workington.**—The coal trade is brisk, except in the local landsale department, and collieries working full time are disposing readily of their outputs. Ulster and Eire are taking more than 10,000 tons weekly, and there are also shipments to the Scandinavian countries. Industrial fuel is in strong request, chiefly on account of the activity at the coking plants serving the hematite pig-iron smelters. Prices are firm.

## Iron and Steel

**Sheffield.**—The output of steel in the first half of 1939 reached the record of 868,300 tons. The June figures were 148,900 tons, exceeding those of the corresponding month of last year by 47,000 tons. Production is still insufficient to meet requirements, and additional melting plant is shortly to be brought into operation.

The iron and steel market continues very active, and it is impossible to place in full all the business offering in basic billets. Fair supplies of imported billets are becoming available, but they are insufficient to make up the shortage. Acid billets and small steel bars are strong features, and there is an insistent demand for strip and wire rods.

While there is only a weak demand for forge pig iron, business in foundry shows improvement. Most of the buying, however, is for near delivery. Basic pig iron remains in strong request, and good contract buying of hematites is reported. Finished iron business is unsatisfactory.

No great change has occurred in the iron and steel scrap market. For most descriptions there is a steady demand. Heavy basic steel melting scrap supplies are below requirements. Iron scrap supplies appear to be fairly adequate.

★

**Glasgow.**—Work has been resumed at the steelmaking plants in the West of Scotland and there is every prospect that work will be continuous and output at capacity till the end of the year at any rate. For every class of material there is a big demand, and that for shipbuilding material is particularly heavy. The bookings already made will be further increased as work progresses on the new orders on hand at the shipyards. Further Admiralty orders and also mercantile orders have been announced within the week giving more work to four of the Clyde shipbuilding

concerns. Marine engineers in this district are also exceedingly busy as the bulk of the Clyde built vessels are being engaged by local builders who have also been entrusted with the work for many vessels being built in other districts. Sheet makers and sheet galvanisers have also made a good restart and are looking forward to a very busy period for at least six months to come.

★

**Cardiff.**—All branches of the iron and steel industry in South Wales continue very busy, with the pig iron and melting furnaces and the sheet and tinplate factories operating well up to their current capacity. New orders for tinplates are not perhaps as numerous as they were in the June quarter, but there is a steady flow of business and unexecuted orders are about 4½ million boxes. Shipments are much heavier than they were a year ago, but the home trade, including Government orders, is absorbing the larger part of the output. Prices show no change.

★

**Workington.**—A great change has come over the North-West Coast hematite pig-iron trade. The reduction in the price by 5s. per ton induced a large volume of forward business and makers, booked ahead until October, have either eliminated or are fast getting rid of the formidable stocks accumulated in the early months of 1938. Local absorption is normal and there are heavy deliveries to the Midlands, Scotland and South Wales. Needs are still in excess of demand, but no immediate expansion of production is practicable, and it may be late in the year before a single additional furnace is put into blast. Prices are steady. Refined iron is in fairly good request, but malleable iron is still on the quiet side.

Steelmakers are booked up for months to come, but the rail-making season is all but completed and billets, hoops and strips are the chief products of the mills. Orders are numerous, and those already on the books justify working to capacity until the end of October. Native ore, at 24s. per ton f.o.t., is largely in local request. There are few independent producers, and as owners are conserving supplies for local smelters very few parcels are being sold to the East Coast or to Scotland.

★

**News from Abroad.**—In spite of the approaching holiday season the turnover on international steel markets has remained fairly satisfactory, although new purchases are substantially below those of a few months ago. Business with Scandinavia has recently been comparatively active, whereas the Far Eastern and the South American markets are quiet and the South African market is subject to American competition. Demand for semis has remained very keen; Great Britain and Japan are the chief buyers. It is expected that Great Britain will soon order more supplementary quantities of semis on the Continent. Requirements for thin sheets and wire products have perceptibly decreased and those for thick plates and sections to a smaller extent.

Prices have further tended to weaken; quotations on unorganised markets have

recently been reduced by about 2s. per ton by way of higher rebates on official prices. Official price alterations for particular markets and products have become very rare, and the consideration of a general revision of Cartel prices, which was to have taken place at the beginning of this month, has now been postponed until the autumn. This is in conformity with the desire of steel producers to maintain their present activity over the holiday period. Price cutting by outsiders is scarcely influencing the price policy of the Cartel, since the increased steel consumption in all parts of the world has greatly mitigated the disturbing effects of this competition.

The thin sheet Cartel will hold a meeting in the first half of September to discuss the situation arising from the unused export quotas of the British members.

## Textiles

**Cotton (Manchester).**—There has been little change in the volume of business. Export trade remains disappointing and a substantial part of productive capacity in Lancashire is engaged on Government contracts and on the manufacture of goods for home consumption. The outstanding event on the raw cotton market has been the announcement of the American export subsidy.

In the American section of the yarn market, the most active demand has again been on coarse counts. The recent advances for ring beams have checked business somewhat and a rather better turnover has been reported in mule descriptions. It has been decided to renew the Egyptian yarn price convention, but the de-control of prices for carded yarns will continue.

Manufacturers of cloth suitable for export have not been able to make very much headway. In certain fabrics the recent advance in finishing charges has had the effect of restricting sales. Some India shippers have put out more inquiry, and irregular scattered buying has taken place. Only isolated transactions have been reported for Egypt and the Near East. Some useful lines have been secured in poplins for South America. Certain fine cloths have been in request for Switzerland. Deliveries for the home trade have continued encouraging, but fresh buying has not been important. Further Government contracts have been placed.

## THE COMMODITY MARKETS

THE commodity markets have not yet responded to the revival of business activity in the United States and to the improvement on the Stock Exchanges in New York and London. During the week ended last Wednesday, Moody's index of the prices of sensitive commodities in the United States actually declined slightly from 142.2 to 141.5.

Wheat prices showed a further decline in the past week and reached a new low record. The causes of the slump are given on page 219. The market in raw sugar, on the other hand, was steadier. The introduction of an export subsidy on United States cotton, details of which will be found on page 231, had little effect on prices, as it had

been largely discounted. Rubber prices remained steady despite the increase in the current quarter's export quota, discussed on page 232. Non-ferrous metals are scarcely changed in price on the week.

## Metals

**Copper.**—Demand on the copper market was comparatively small, but sellers remained reserved and the price of standard cash copper closed on Wednesday at £43 per ton, a net gain of 2s. 6d. on the week. In the United States the market has quietened down, but the undertone remained firm and the domestic price was raised by another ½ cent to 10½ cents per lb. American producers have now to deliver over 250,000 tons of copper to domestic consumers within the next three months, a fact which may help to reduce United States stocks and thus improve the outlook in London. Stocks of copper in official warehouses of the L.M.E. fell by 1,115 tons to 28,894 tons last week and thus reached a new low level for the current year.

★

**Tin.**—The cash price remained unchanged at £29 17s. 6d. per ton, but the backwardation has again widened from £4 15s. to £5 2s. 6d., a sign that consumers' buying has declined. The pool has the market under complete control, but this week it has not been called upon to any great extent. The International Tin Research and Development Council's Statistical Bulletin gives world production in the first five months of this year at 54,100 (a year ago 70,400) tons, while absorption in the same period is given at 63,400 (69,700) tons. There was thus a considerable excess of absorption which has, no doubt, made headway in June and July.

★

**Lead and Spelter.**—The London price of lead lost 2s. 6d. to close on Wednesday at £14 13s. 9d. per ton, while spelter gained 3s. 9d. to close at £14 6s. 3d. per ton. The margin between the two metals has thus narrowed to 7s. 6d., the smallest for several years. In normal times spelter used to be the dearer of the two metals, but in recent years lead has always commanded a substantial premium over spelter, owing to the unfavourable statistical position of the latter. The market in lead was adversely affected by the unfavourable June building returns, while spelter derived some benefit from the expanding consumption, which appears to be catching up with production.

## Grains

WHEAT prices have declined further in the past week, demand remaining quiet. The American Government is pressing forward with its subsidy for wheat exports while the approach of the new crop in the Northern hemisphere has limited the off-take of Argentine wheat. Weather reports from Canada continue favourable and those from Europe, while mentioning the lack of sun, indicate average or only slightly below average yields. Mr Morrison stated in Parliament last week that the British Government had taken the opportunity of the low price level to augment its reserves of wheat and it is reported that the Government are seeking to store

## Other Foods

**Provisions.**—Unusually large supplies of home eggs have brought a fall in London prices but prices of other types have been little affected. Flour prices were reduced during the week by a further 6d. per sack. Colonial butter prices were also lower than a week ago.

★

**Colonial Produce.**—There has been little change in the futures market for raw sugar, but the sharp reduction in quotations the previous week was followed by a fall of 4½d. per cwt. in the prices for most types of refined sugar.

★

**Fruit and Vegetables.**—The cold weather has affected the demand for salads, although tomatoes continue to sell freely. English cherries are now arriving in bulk on the London market and are in good demand. The strawberry season is over, but large arrivals of other soft fruits continue.

## Miscellaneous Commodities

**Oils and Oilseeds.**—The poor outlook for grain prices continues to influence the market in these products, whose sales are also restricted by the usual seasonal decline of business. Plate linseed has fallen further in price and is now 20s. to 25s. per ton below the highest reached in June. Prices for Indian linseed are also lower, but buyers remain uninterested. Favourable reports continue of the new American crop of linseed, which may, it is thought, be nearly twice the size of last year's harvest. Shipments from the Plate remain small. Trade in cotton seed is very desultory at about £4 10s. per ton afloat to Hull, an almost record low price; later positions are at a good premium at £5 2s. 6d. per ton September to January. The spot price of linseed oil is steady, after a fall of some 5s. per ton, while cotton seed oil is cheaper by 20s. per ton.

★

**Rubber.**—The decision of the I.R.R.C. is discussed in a Note on page 232. The London market was idle until the decision was known, when there was a slight fall of ½d. per lb. in spot prices, but the market has since been steady.

★

**Furs.**—As was to be expected, prices showed considerable strength at this week's summer fur sales in London. Beaver and musquash gained on the average 7.5 per cent. compared with the prices paid at the spring sales in April. South-West African Persian lambs advanced by 5 per cent., but mink and Afghan lamb remained unchanged. The demand showed a satisfactory level and the bulk of the supply was sold. The attendance at the sale was good and France, the United States and Germany were well represented.

## COMPANY MEETINGS

## THE DISTILLERS COMPANY LIMITED

The sixty-second annual general meeting of the Distillers Company, Limited, was held in the North British Station Hotel, Edinburgh on the 21st instant, when the Right Hon. Lord Forteviot, O.B.E., M.C., chairman of the company, presided.

The Chairman said:—

I shall first deal with the accounts, which I presume I may take as read. On the assets side you will observe that the first two items, land and buildings, plant and utensils, amount to £650,077. These assets have been fully maintained out of revenue, and, in addition, ample depreciation has been provided in accordance with our established practice.

Sundry investments, at £6,133,111, show little variation from last year's figures, and, despite the fall in the market quotation of our holding of British Government securities which has taken place, the total value of the investments is considerably in excess of the figure at which they stand in the balance sheet.

Our investments in subsidiary companies receive individual scrutiny at each balancing period, and any fall in values is provided for to the extent considered necessary by your board. That policy has again been followed in preparing the accounts which are in your hands, and the figure of £16,825,923, at which investments in subsidiary companies appear, has been arrived at on the usual conservative basis.

The last item, cash in bank and on hand, at £3,239,713, shows an increase of over £1,400,000 on the corresponding figure last year, but it has to be borne in mind that your company acts as banker to the group, and has to be in a position to meet any calls for finance required to maintain and develop the widespread and comprehensive activities of the organisation at home and overseas. The cash balance will, of course, be reduced by £1,210,492, the amount required to meet the proposed final dividends and cash bonus.

On the liabilities side of the account, the reserve fund, the super-annuation and provident fund, and the fire insurance fund, are increased by the amounts shown in the directors' report. The increase in the first two items is on the same scale as in previous years. The addition to the fire insurance fund, however, is £150,000 as compared with £50,000 in each of the three previous years. At the present figure of £500,000 the fire insurance fund may appear disproportionately large compared with the figure at which the land, buildings, plant and utensils stand in the accounts, but the position falls into proper perspective when it is realised that the cost of replacement of our fixed assets is very much in excess of their book value, and when it is further borne in mind that the reserve is designed to cover not only actual damage to those assets, but the consequential loss that would result from any disturbance to the production of our large operating units. The factor of war risks, which cannot be excluded in the present disturbed international situation, has also to be reckoned with, and your board had this risk particularly in view when they increased the appropriation to the fire insurance fund from £50,000 to £150,000.

Reference is made in the directors' report to the proposal that £4,276,385 of the amount at the credit of the reserve fund should be capitalised and applied in paying up in full a corresponding number of ordinary shares for distribution to the ordinary stockholders in the proportion of two new shares for every £5 of stock held. We propose to call an extraordinary general meeting for Thursday, October 19th, for the purpose of passing the necessary formal resolutions for the increase of capital and capitalisation of reserves, and immediately thereafter to issue allotment letters to the holders of ordinary stock on the register at September 30th. The usual rights of renunciation and splitting will be conferred, and, after the final allotment has been made, the shares will be converted into stock, which will rank *pari passu* with the existing ordinary stock as from May 16, 1939, the beginning of the company's current financial year, and certificates for which will be issued as soon as possible. I have to explain that this issue is being made solely in order to bring the issued capital into closer relationship with the working capital actually employed in the business. It is intended at the same time to increase the authorised capital of the company by £5,000,000 to £20,000,000. If this proposal is approved, the company will still have £2,832,653 of capital for issue if and when circumstances require. I am not, of course, in a position to forecast the rate of dividend which the company will be able to pay in future, as the distribution will naturally depend on the position and prospects of the

business at the time, but your directors cannot expect to maintain the present rate of dividend on the increased capital.

The directors are giving serious consideration to establishing a central superannuation and provident scheme, to be vested in the names of trustees, and transferring to them the various funds which have been established in this company and the subsidiary and associated companies.

Another full year's production of both grain and malt whisky has been undertaken at our distilleries, filling orders being well maintained.

Market prices of whisky with age, especially eight years and older, have hardened considerably, indicating the continued scarcity of well matured stocks which are in great demand, and for the United States market in particular.

The policy of maintaining the company's plant and equipment in a thorough state of efficiency is ever in front of us. The blending and bottling establishments of several of our principal subsidiaries have recently undergone reconstruction, which brings them completely up to date, whilst other modernisations are in process or in contemplation.

During the past year in the home trade the brands of Scotch whisky sold by our group companies have again shown up well. Whiskies with age still command high prices, but your directors are satisfied they have nothing to fear on this point, having ample cover to meet all demands and to give continuity of quality and age, which is so essential.

Our export trade, for the period under review, has shown a steady increase in most of the foreign markets where Scotch whisky is consumed, and the existing trading conditions permit us to report that the perturbed European situation, up to the present date, has not adversely affected our sales to any appreciable degree.

Our Empire export trade has been regular throughout the year, and the closing figures reveal a very satisfactory result.

The American trade continues to expand, and the Anglo-American trade agreement—in which Scotch whisky figured as the largest item of British exportation—gratified both the importers and the exporters by permanently stabilising the rate of duty on this commodity in the United States of America for the term of the treaty, and we congratulate the representatives of the Board of Trade upon the satisfactory and fair manner in which these negotiations were carried through.

Taking a general survey we believe that, barring eventualities which may emanate from fluctuating world-economic conditions, prospects in the export market are encouraging.

Our gin companies continue to hold a leading position in both home and export markets, and a steady demand prevails for the well-known brands.

In these days of public proclamation of the indispensability of beverages, may I remind the stockholders of the wholesomeness and the palatability of our own products. The Scotch whisky and soda, and the various combinations of which gin is a component, retain as of old—in spite of the increase of price due to enhanced duty—their value as healthy and attractive beverages. May I ask the stockholders to recommend the commodities, on the sale of which their dividends so largely depend.

No doubt the stockholders will have noticed the recent decision of the Justiciary Appeal Court of Scotland on the question of what constitutes Scotch whisky. Your directors received with gratification the decision laid down, namely, that only whisky which is entirely distilled in Scotland has the right to bear the name of Scotch. This, of course, has always been the view of your board, and, in our opinion, of the consuming public. Our satisfaction in this respect is no doubt shared by the stockholders, and, in view of the world-wide distribution of our products, this is a decision of supreme importance to the Scotch whisky trade.

During the year The Distillers Company Limited continued the policy they have adopted over a considerable period in giving what they felt was a reasonable price for Scotch barley purchased for the use of their malt distilling interests. This was done in order to ensure a fair price to the home growers of barley, and with a view to encouraging them to grow a crop on which the prosperity of Scotland so largely depends.

The price which we paid last year was above what we would have been called upon to pay for imported barley, and was, in fact, in excess of what we would have paid had we obtained our

requirements from England. This action has cost the company this year over £100,000, but we were of opinion that the good relations, which have always existed between this company and the farmers, were worth maintaining, even at considerable cost to ourselves. We are confident that the policy we adopted obviated a debacle in Scotch barley prices, and we understand that the farming community generally appreciated our attitude. As the largest buyers of barley in Scotland, we were able to carry through this policy, but unfortunately our lead was not followed by all others, and therefore such other users were able to cover their requirements from cheaper sources. This situation is inequitable, and it is possible that we may have to review our attitude, unless every concern purchasing barley for malt whisky distilling is placed on the same basis. Several schemes have been put forward, and there is a parliamentary Bill on hand, from which something may develop on the lines indicated.

The industrial alcohol market during the last year has not varied very much, and the quantity sold is approximately the same as the year before. There has been keen competition, but we have retained our share of the business.

Owing to the imposition of a tax on industrial alcohol for motor fuel, the quantity sold decreased, but not to a very large extent, and it was made up for by other uses.

In Australia, the industrial alcohol factory had a good year, and it looks as if it were going to improve still further as the sales are steadily increasing. We hope some day, with the support of the Queensland Government, to be able to use up all the waste molasses produced in Queensland.

Our yeast business had a fairly good year, and the sales kept up well. We have kept our process of manufacture up to date, and have made many improvements. The quality has been very satisfactory.

Both in the industrial spirit and in the yeast business we have had to meet severe competition, but the results have been fairly steady for the last few years.

On the chemical side of our business we have been actively extending our interest in the manufacture of new products, the result, mainly, of work done by our own research department. We are neglecting no opportunity of investigating all possible methods for the manufacture of industrial alcohols and chemicals from such indigenous materials as coal or coke or waste industrial gases, should, at any future time, such methods become cheaper than those in use to-day. At present, our basic raw material, as is well known, is molasses, which has to be imported in very large quantities. In any case, it is essential to take a long view in development work of this kind.

We are actively developing synthetic resins with special physical properties which we anticipate will have extended uses in the future.

During the year in question we have acquired a majority holding in Commercial Solvents (Great Britain), Ltd., whose factory at Bromborough in Cheshire is making industrial alcohol and solvents by fermentation.

Our building supply department has continued to expand, and both our factories are working to capacity in manufacturing our gyproc plaster board and special plasters, which continue to find favour with the building trade.

Since our last annual meeting the directors have had in hand the serious problem of Air Raid Precautions. Every possible measure has been or is being taken to ensure the protection of our various works and the safety of our workers. Our employees have been classified into groups, so as to release as many as possible immediately for National Service, and to enable our various companies to retain those essential to the operation of the plants. This has involved considerable expense, but your directors felt that the best way to prevent hostilities is to be prepared, and it is considered that money spent in this way is in the interests of the stockholders, the staffs, and the country.

You will see from the annual report that Mr William Harrison does not seek re-election as a director, and our best wishes go to him in his retirement. His long connection with the company and the valuable services he has rendered during that time have earned him the gratitude of his colleagues and the stockholders. This created a vacancy on the management committee, and, in view of the continually expanding duties and responsibilities, it was decided to appoint an additional member thereto. Mr T. H. Board and Mr H. J. Ross, who are well-known directors of the company, have been elected.

Mr Hogarth during the year resigned from the board on his retirement from business, and I wish to confirm our appreciation of his long record of useful work.

In the course of the year Mr Alfred Adams, managing director of John Walker & Sons, Ltd., was appointed to the board, and his wide experience will be of great benefit to the company. This appointment falls to be confirmed at this meeting.

As at the last annual meeting, but with even greater emphasis, I refer to the invaluable services of the staff. They have worked efficiently and well, and are again largely responsible for our prosperity and progress. During the year great numbers of the employees throughout our whole organisation answered the national call, and their efforts have been encouraged by very generous treatment by your board, and of this no doubt you will heartily approve.

I have now much pleasure in moving the adoption of the report, which recommends payment of a final dividend on the Preference Stock of 3 per cent. less tax, making, with the interim dividend of 3 per cent. already paid, a dividend of 6 per cent. less tax, for the year; also a final dividend on the Ordinary Stock of 12½ per cent. less tax, making, with the interim dividend of 7½ per cent. already paid, a dividend for the year of 20 per cent. less tax; also the payment of a cash bonus of 2½ per cent. less tax, on the Ordinary Stock, and carrying forward to next year a sum of £436,898 7s. 8d.

Sir Alexander Walker, K.B.E., seconded the adoption of the report, and this was agreed to unanimously.

## VICTORIA FALLS AND TRANSVAAL POWER COMPANY, LIMITED

## A SATISFACTORY YEAR

## INCREASED DIVIDEND

At the ordinary general meeting of shareholders of the Victoria Falls and Transvaal Power Company, Limited, held on the 26th instant in London, the chairman and managing director, Mr Arthur E. Hadley, C.B.E., presented a satisfactory account of the company's business for the year 1938.

The net profit for the year, after providing for taxation and all other requirements, amounted to £652,035, against £612,628. The full dividend of 10 per cent. had again been paid on the Preference shares, and the dividend on the Ordinary shares had been increased from 13½ per cent. to 15 per cent. The reserve fund had been brought up to £650,000 by the addition of £150,000.

Notwithstanding the continued and increased political unrest in the world, with its disastrous effect on international trade, the position of gold had not been adversely affected and, in point of fact, it stood at a higher price in 1938 than in 1937, and the gold mining industry was continuing its active policy of expansion.

The maximum sustained load at power stations for electricity amounted to 508,000 k.w., an increase of 14 per cent. during the year, while that for compressed air increased to 74,000 k.w. Units of electricity and compressed air sold during the year exceeded 3,000 millions, and the load notified by the consumers exceeded the notifications outstanding at the beginning of 1938. An increase in sales resulted in a reduction in the price of a unit of power, and this was effected by a rebate on the basic price. In the year 1938 the rebate was £171,000 higher than for the previous year.

## KLIP AND VAAL STATIONS

The 400,000 k.w. Klip station, belonging to the Electricity Supply Commission, which the company was constructing and operating on their behalf, had now 10 out of 12 generating plants at work, while the eleventh set had been shipped, and the last was expected to leave the makers' works during this year. This station, when complete, would burn 2½ million tons of coal annually. The work on the first section of the new 100,000 k.w. Vaal station was proceeding satisfactorily. This station would be the property of the Electricity Supply Commission, and would be operated and the power taken by this company. The hydro installation at the Victoria Falls continued to operate quite satisfactorily.

Mr Hadley asked the shareholders to authorise him to convey their appreciation to the executive officers, staff and employees of their whole-hearted services in the interests of the company during the past year.

The report and accounts were adopted and the retiring directors, Sir Douglas Malcolm, K.C.M.G., and Mr J. B. Braithwaite, were re-elected, and Messrs Cooper Brothers and Company were re-appointed auditors.

# FURNESS, WITHY AND COMPANY, LIMITED

## SHIPPING INDUSTRY'S PROBLEMS

### LORD ESSENDON'S REVIEW

The forty-eighth annual general meeting of Furness, Withy and Company, Limited, was held, on the 26th instant, at Furness House, London.

Lord Essendon (the chairman), in the course of his speech, said:—When we met a year ago I expressed a hopeful view of the future on the ground that most of the elements needed to bring about a revival in international trade were merely waiting upon return of confidence in the political sphere. It is a matter of common knowledge and common regret that the political situation throughout the whole of the past year has continued in a state of vacillation between hope and uncertainty. In consequence, international trade has lacked the confidence which is essential for settled conditions, and the shipping industry has not enjoyed any improvement. The result is reflected in the accounts before us to-day, and in the circumstances I believe you will not find them unsatisfactory.

The profit and loss account, frankly, is somewhat of a disappointment to your directors, showing, as it does, a net credit balance of £505,121, which is £115,000 less than in the previous year. There was an amount of £211,681 brought in, and after paying the two half-yearly dividends on the preference capital, and transferring £300,000 to depreciation, it is recommended that a dividend of 4 per cent. be distributed on the ordinary capital, which will leave £188,428 to be carried forward to the current year's accounts.

#### CAUSE OF FALL IN PROFITS

The fall in our profits is a direct reflection of the difficult conditions which have applied to the shipowning industry, which has suffered in almost every sphere. The New York-Bermuda service has done reasonably well in the circumstances, but we incurred an unfortunate loss in complying with the request of the Bermuda authorities to provide eight additional sailings last Easter. This request necessitated chartering additional tonnage, for which arrangements had to be made a considerable time in advance, and in the result it proved to be impossible to secure sufficient additional traffic to justify this expenditure.

I have made reference to the effect of political uncertainty upon the shipping industry, and there is no doubt that that is the chief cause of the lack of confidence in international trade, but there is a host of other problems which we have to face in present circumstances. I have, on many occasions, mentioned the subsidised competition of foreign ships, but even more insidious forms of competition have gradually made themselves evident, as, for instance, Germany frequently provides that her purchases abroad must be shipped in German tonnage, no doubt in order to avoid having to find foreign currency for the payment of freight. Also certain descriptions of marks may only be used for the payment of freights to German ships.

Another country is known to have warned manufacturers who enjoy the benefits of Government contracts that unless they ship their exports as far as possible in ships of the national flag they will prejudice their prospects of securing further Government contracts. I can multiply such instances more or less indefinitely, and it is obvious that British shipping companies, operating as commercial undertakings and responsible for their results to a large body of shareholders, cannot cope with such methods unaided, nor can they be expected—as both the Government and the public expect—to maintain and expand their fleets in such circumstances.

#### GOVERNMENT'S SUPPORT

The Government are fully alive to the difficulties, and the President of the Board of Trade has expressed the Government's intentions in no uncertain language to give their support to British shipping in the most direct and effective manner. It will be recalled that the President of the Board of Trade invited the Chamber of Shipping and the Liverpool Steamship Owners' Association to report to him upon the situation of each section of the industry—tramps, liners, tankers, coasters, and so on—together with their recommendations.

A comprehensive report of this nature was submitted in January last, and in consequence of that report a sum of £2,750,000 is to be made available annually for a period of five years from January, 1940, by way of a subsidy for tramp ships in the deep sea and near trades, but not the coasting trade. Unlike most of the foreign sub-

sidies, this sum is only to be made available for British ships when the level of freight rates falls below a specified index. It should ensure a living standard, but no more.

The problem of the cargo liners is of a different character, and needs different treatment. Accordingly, the Government have determined to appoint a small committee to advise them as to the nature and extent of any assistance that may be found to be necessary, out of a fund of £10 millions to be set aside for that purpose.

#### IMPORTANCE OF BRITISH TONNAGE

This practical evidence of the Government's intention to support British shipping has possibly been accelerated by the knowledge that the British share of world tonnage has been gradually falling during the past few years; but strong as these defensive measures are, they cannot of themselves ensure the building of more ships, firstly, because such measures cannot increase the volume of trade available, and, secondly, because they are not designed to do more than give existing ships the possibility of competing with ships of other flags on something like level terms.

Consequently, the Government have gone further, and have devised means whereby, in spite of high building costs in consequence of the re-armament programme—which in itself was seriously retarding the placing of new orders—encouragement will be given to build new tonnage of the tramp and cargo liner type. For this purpose a grant not exceeding £500,000 per annum for five years will be made in respect of any ships of the appropriate type. This building grant is also to be linked up with freight markets and will only be paid provided the average freight index remains below a specified level.

The shipping industry felt that there were two very strong grounds in justification of the Government's proposals, viz., the necessity of providing sorely needed work for the shipyards and engine works, and the maintenance of their personnel, and, secondly, the urgent need of additional ships under the British flag for purposes of protection in national emergencies.

The only criticism that I venture to offer is an expression of regret that certain very important sections of the industry have been practically excluded from the advantages of the arrangements which I have outlined. I have no doubt, however, that the industry will give its full support and co-operation in order that the greatest possible benefits may be secured in the national interests.

#### THE OUTLOOK

It seems to be expected of chairmen of public companies to tell their shareholders something of the prospects for the coming year. It is exceptionally difficult to say anything in that respect on this occasion. In some of our trades, conditions have definitely improved within the past few months; in others the movement of both cargo and passengers is very restricted and subject to severe competition. It is a noticeable fact that even seasonal business, which in past years could more or less be relied upon—as, for instance, the various grain seasons—is thrown out of order by the modern practice of storage at the point of origin pending improvement in prices, or storage at destination in exceptional quantities for gradual release. I am not for one moment criticising these arrangements, I am merely stating what is a fact.

In present circumstances it is clearly a matter of policy that arrangements should be made for the storage of essential commodities to the greatest possible extent, particularly at a time when shipping space is plentiful and cheap, and the price of commodities generally is at a low level. There has been some correspondence in *The Times* on this subject wherein it was suggested that not only should foodstuffs be stored in preparation for a possible emergency, but also that other commodities which are almost equally essential, and which are not so liable to deterioration and also cost less to store, should be imported and laid in reserve, such as ore, timber, etc. It is not my province to comment on these suggestions, except to make the obvious remark that any such arrangements would be of benefit to shipping, which is in need of additional employment at the present time.

The report and accounts were unanimously adopted, and, the formal business having been transacted, a vote of thanks to the chairman, directors and staffs ashore and afloat terminated the proceedings.

# STANDARD BANK OF SOUTH AFRICA, LIMITED

## SOUND POSITION

The one hundred and twenty-sixth ordinary meeting of the Standard Bank of South Africa, Limited, was held, on the 26th instant, in London.

Mr Robert E. Dickinson, who presided, said that after making an appropriation to contingencies account there was a balance of profit of £573,147 as against £621,633 in the previous year. It was recommended that £150,000 be allocated to the officers' pension fund and that a final dividend of 7s. per share be paid, together with a bonus of 2s. per share, making a total of 14 per cent. for the year. Having regard to the quieter business conditions which had prevailed during the year, the figures would, he was sure, be regarded as satisfactory.

While the year under review had been characterised by political disturbances in Europe and universal decline of trade, business conditions in the Union, although quiet, had remained fairly steady. The prosperity of the country was dependent to a great extent upon external economic conditions, and it could not be expected that South Africa would escape repercussions of the depressed conditions caused by the unsettled state of international politics, but, by virtue of her geographical position and the continued expansion and prosperity of her most important industry, gold mining, the Union had suffered less in that respect than most other countries.

Some indication of the maintenance of a healthy position, notwithstanding adverse external influences, might be found in the figures given by the Minister of Finance when introducing the last Budget. In place of the deficit of £100,000 contemplated by the Budget for 1938-39, it was estimated that the actual receipts and expenditure for the year would result in a surplus of £1,650,000.

The value of the total mineral output of the Union for 1938, including the currency premium on gold, was approximately £98,000,000, an increase of £4,000,000 over the figures for 1937. The base mineral deposits had attracted increasing attention during recent years. Although the trend of prices in many instances had been less favourable, the expansion of armament programmes in Europe and the widening use of metals for general industrial purposes should ensure the maintenance of interest in the various deposits in the Union.

#### GOLD MINING EXPANSION

The establishment of fresh records in respect of the quantity of ore milled and the number and value of fine ounces produced afforded convincing evidence of continued expansion in the gold mining industry. The measure of progress during 1938 was especially noteworthy in that the high production figures had been achieved notwithstanding the fact that the average yield of 4.346 dwt. per ton of ore milled was the lowest on record. During recent months the steadiness of the price of gold at an average figure in the neighbourhood of the highest levels on record indicated that confidence in the position of gold and its future was being well maintained.

With regard to the farming industry, notwithstanding unfavourable weather conditions and an appreciable decline in export price levels for certain farm products, notably wool and fruit, progress had been made in the establishment of the industry on a firmer basis. That was due partly to the wider demand for South African raw materials on both local and overseas markets and partly to official measures, such as the prevention of soil erosion, the extension of irrigation facilities and agricultural research, designed with a view to the improvement of conditions.

He might summarise the position in the Union by saying that the decline in trade activity had been offset to some extent by the continued expansion and undiminished prosperity of the gold mining industry. It might reasonably be predicted, however, that an improvement in the external political and economic situation would react sharply in favour of South Africa.

As to Southern Rhodesia, in the absence of any further deterioration in world markets the general business progress made by the territory in recent years should be maintained. The decline in the total value of exports from Northern Rhodesia was attributable to the lower prices prevailing for copper. During recent months prices had shown increasing steadiness.

In conclusion, he thought shareholders would have been impressed by the sound and liquid position of the bank as evidenced by the accounts. They could not look for the return of normal business conditions until an improvement in world affairs brought about the restoration of confidence, but they might congratulate themselves that their business lay mainly in a country which had such great natural resources.

The report was adopted.

# CENTRAL COMMERCIAL PROPERTIES LIMITED

## STEADY EXPANSION CONTINUED

The eleventh annual general meeting of Central Commercial Properties, Limited, was held, on the 27th instant, at 80 Grosvenor Street, London.

Mr W. Stanley Edgson, F.S.I., F.A.I. (the chairman), said that the accounts showed a further string of records, for both the gross and net rental income and, if only by a few pounds, their net revenue from rents alone, all showed advances, and, finally, they were recommending a record distribution to the ordinary shareholders. Perhaps the most pleasing result was that their rental revenue, ignoring profits from resales, again showed an increase in cover to both the preference and ordinary shareholders. He was continually being asked by shareholders whether the company's steady policy of expansion was proving profitable. It would be seen that in addition to the present year's preference dividend being more than twice covered by the net rental revenue, the amount earned on the ordinary capital, ignoring scrip bonus issues, had risen from 17.9 per cent. in 1936 to 23.3 per cent. in the present year.

In addition to a substantially increased allocation for leasehold redemption they had transferred another £2,000 to the recently formed contingency reserve. That fund was being built up primarily to provide for any depreciation of their freehold properties and to meet any obsolescence of the structure, and they were hoping they would not have to draw upon it for some years to come. He would point out that again they were putting back into the company in one form or another over 10 per cent. of the net rental revenue in addition to the £14,010 placed to capital reserve. During the last five years they had placed to reserve, including premium on share issues, no less than £133,800, and also had increased the carry-forward by £3,400.

The report showed that in spite of difficult market conditions they had actually, or were in process of acquiring, some forty-three individual shop units, mostly freehold, at a cost of £178,000. The properties were extremely well spread, all let, mostly on full repairing leases, and producing an income of £11,000 per annum.

#### WAR RISKS

With regard to his views on the property market, his most definite reaction was the very slight fall that had been experienced in the value of their particular type of security. The best class of gilt-edged security had perhaps shown the greatest depreciation, but this he had anticipated and they had wisely changed a number of that type of security in 1937. The more normal well-let security, which had been their mainstay, had maintained its value remarkably well, perhaps because it was so widely held in strong hands by those who realised that over a term of years yield and capital value were more constant than those of practically any other type of security.

Speaking with intimate knowledge, he thought that the fear of damage by enemy aircraft to property, although perfectly justified, was grossly exaggerated by many. In his view workable schemes on a contributory basis, whether compulsory or voluntary, should be capable of creation within a very short period, and he would like covered everything that arose from the land and what it produced.

As far as their company was concerned, they were particularly well placed in respect of war risk—their properties were remarkably well spread, many in areas zoned as neutral or reception areas, and they were mostly in small units where the actual bricks and mortar were only the lesser part of the security, which was mainly comprised in the land. Similarly, the provisions of the Civil Defence Act to provide Air Raid Protection only applied to two or three of their properties and would not involve the company in great expense.

#### THE FUTURE

As to the future, the outlook was most obscure, and he refused to express any decided views. They had guarded, as far as they were able, against possible inflation by acquiring additional properties with early reversions. It might be that they would see some slight setbacks in their rental income and that for the time being development and expansion would become restricted, but he felt that they were holding a security less liable to violent reactions than any other, that they were well organised, and that they had built up a solid foundation which should enable them to continue to present shareholders with a creditable account of their directorship.

The report and accounts were unanimously adopted.

## CHUNGLOON RUBBER ESTATE (1932), LIMITED

PROPERTY IN GOOD CONDITION

DIVIDEND OF 2½ PER CENT.

### MR R. DE LA BÈRE ON THE OUTLOOK

The seventh ordinary general meeting of the members of Chungloon Rubber Estate (1932), Limited, was held on the 25th instant, at the registered offices of the company, 411/419 Salisbury House, London Wall, London, E.C., Mr R. de la Bère, M.P., presiding.

The representative of the secretaries and commercial agents (Messrs E. B. Ridsdel and Company, Limited) having read the notice convening the meeting and the report of the auditors,

The Chairman said,—Gentlemen, before proceeding with the business of the meeting, I should like to refer to the death, on April 2nd last, of our friend and colleague, Mr E. B. Ridsdel, and to say how sorry we all are that he is not with us to-day; we grieve his loss.

The report and accounts have been in your hands for the past week, and with your permission I will take them as read.

### CROP FIGURES

From the report it will be observed that during the year we harvested a crop of 283,138 lbs. of rubber. Of this quantity 191,747 lbs. were sold in London at an average price of approximately 7½d. per lb., the equivalent of a little over 8d. per lb. landed London. Sales in the East amounted to 26,084 lbs., and the balance, viz., 65,307 lbs., in stock on the estate as at March 31st last has been taken into the accounts at cost.

Compared with last year our sales in London represent a reduction of no less than 127,000 lbs., which, on the basis of the selling price, realised, viz., 7.47d. per lb., represents a loss of revenue equivalent to approximately £4,000.

Our f.o.b. cost of 2.978d. per lb. must be considered very satisfactory, especially in view of the smaller crop we were allowed to harvest. Our selling price, too, at the equivalent of a little over 8d. per lb. landed London, must also be considered satisfactory, as the average spot price in London for the twelve months ended March 31st last amounted to only 7.4d. per lb.

### RESULT OF YEAR'S OPERATIONS

From the accounts it will be observed that the profit for the year amounted to £1,295 15s. 6d., which, added to the balance brought forward from last year—after allowing for the payment of the final dividend for 1937/38—gives us a balance of £5,644 3s. to deal with. Out of this sum it is proposed to pay a dividend for the year of 2½ per cent., less tax, which will absorb £726 18s. 8d., leaving £4,917 4s. 4d. to be carried forward. It will be realised by shareholders that in view of the reduced crop harvested, and the fact that the selling price has not improved to any appreciable extent, it has been impossible to pay the same dividend as last year.

Turning to the balance sheet, it will be observed that our liquid position is reasonably sound, as cash in hand, rubber stocks and sundry debtors, less creditors, total £7,913 4s. 10d., which shows a slight improvement on the corresponding position last year.

### THE ESTATES

In view of the reduced export allowance, the system of tapping adopted on the estate during the year was to place 594 acres on A.B.C. rotational tapping and 234 acres on indefinite rest. The yield per acre obtained from the actual area tapped was 672 lbs. per acre per annum, and in the last report received from our visiting agent a few months ago he reported the property to be in very good condition throughout and economically managed.

Dealing now with our immature rubber, the young budded trees planted during 1936/37 are 1½ years old and show a good even growth throughout. As regards our 1938 planting, which was planted up in October last, 15 acres have been planted with clonal seed and 39 acres with seed at stake, which should be ready for budding by October this year.

Under the Rubber Regulation Enactment, the company, in common with others, received during the year new planting rights equivalent to 5 per cent. of its planted area, and in consequence of this it was decided by your board to take advantage of the opportunity to fell and plant up 37.2 acres of jungle reserve. This work is now in hand and the area should be planted up by September

next. No further replanting, however, is contemplated for the current year.

### CURRENT YEAR'S PROSPECTS

As regards the future it is, of course, impossible, in view of the present international situation, to prophesy what the result may be for the current year. Having regard, however, to the fact that world stocks have fallen to a little under 400,000 tons of rubber—which represents only about five months' supply and compares with approximately 550,000 tons a year ago—and the fact that the Governments of this country and the United States have entered into a barter agreement involving the supply of about 80,000 tons of rubber, I think it is probable that the Restriction Committee, who meet to-day, will increase the export quota by 5 per cent. at least, or possibly 10 per cent., which should prove helpful.

Before concluding, I should like to thank our Eastern agents, our visiting agent, and our management on the estate for the care and attention given to estate affairs during the past year, and I am sure all our shareholders will wish to be associated with us in this tribute to the Eastern officials.

I now move: "That the directors' report and accounts for year ended March 31, 1939, together with the auditors' report thereon, be and they are hereby approved and adopted." I will ask Mr Martin to second this resolution, but before putting it to the meeting, I shall be pleased to answer to the best of my ability any questions you may care to ask.

Mr W. E. Martin, J.P., seconded the resolution and, after the chairman had replied to questions, it was carried unanimously.

The dividend as recommended was approved; the retiring director, Mr W. W. Halliday, was re-elected; the auditors, Messrs Fitzpatrick, Graham and Company, were reappointed; and the proceedings terminated with a vote of thanks to the staff in the East.

## MERLIMAU PEGOH, LIMITED

### THE BARTER AGREEMENT

The twenty-ninth annual general meeting of members of Merlimau Pegoh, Limited, was held, on the 26th instant, in London.

Mr G. Kingsley (the chairman) said that, taking everything into consideration, it was not unsatisfactory that they were able to add £5,000 to their reserves, and to recommend payment of a dividend of 7½ per cent.

The profit and loss account clearly reflected the effect on their earnings of the drastic curtailment in crops during the year. In round figures, the rubber proceeds item fell by £33,000 against a reduction in expenditure of £14,000. Profit from their own estates was in consequence £19,000 lower, and dividends and interest, which consisted mainly of distributions from their subsidiary companies, declined by £18,000.

After dealing with the results of some of the estate companies in which they were interested, the chairman said with regard to the proposals to barter rubber for American cotton, whilst they appeared to present certain undesirable features from the point of view of rubber producers, he saw no object in cavilling at them. The agreement between the two countries had been signed for better or worse, and if its conclusion strengthened the bonds of friendship between this country and the United States of America and provided some added measure of security for them all, he felt they should accept with resignation any slight hardship which it might bring in its train. If the barter agreement resulted in Estates receiving a larger exportable allowance without any disturbance to the price structure, it would prove advantageous to producers at any rate for the short view. So far as the longer view was concerned, he saw little cause for anxiety regarding the possible effects of the agreement provided the present transaction was an isolated one, and provided that the stock was held solely for the purpose for which it was to be acquired. If, on the other hand, as seemed to be feared in some quarters, what was intended to be an emergency war stock should in practice be used as a buffer stock to manipulate prices to the advantage of the consumers, then any extension or repetition of the agreement would deservedly be opposed by the producing industry with all the influence and power at its command.

Referring to the current year, their results should be no worse, and might be better, than those which they were considering to-day.

The report was unanimously adopted.

*Orders for the publication in these columns of the reports of Company Meetings should be addressed to the Reporting Manager of THE ECONOMIST, 8 Bowverie Street, Fleet Street, London, E.C.4.*

## CITY OF SAN PAULO IMPROVEMENTS AND FREEHOLD LAND COMPANY, LIMITED

### FAVOURABLE CONDITIONS

The twenty-seventh ordinary general meeting of this company was held, on the 27th instant, in London.

Mr Herbert Guedalla, F.C.A. (the chairman), dealing with the accounts, emphasised that the milreis had been converted into sterling at the rate of 6d. per milreis. In view of current fluctuations in the rate, and the possibility of improvement should there be trouble in Europe, the board had decided to submit accounts in the usual form, but they hoped in the course of the current year to adjust the Brazilian assets and liabilities to sterling figures which would show the true position; such adjustment would show a large deficiency on capital, which would have to be considered at the same time.

The profit for the year (taking milreis at 6d.) amounted to £117,175, after charging unpaid debenture interest amounting to £30,411. The profit of the subsidiary company, totalling £7,364, had been carried forward and no dividend had been declared.

The freehold land showed a continued increase in value in milreis. A new valuation made on November 30th disclosed a considerable increase, making a selling value (at 3d. per milreis) of £1,245,000, compared with the balance sheet figure of £1,750,000; 32 acres were sold during the year, leaving 353 acres of developed and 953 acres of undeveloped land to be disposed of. The building of the Stadium by the Municipality was progressing; negotiations for the sale of a further area for the Stadium approach were in hand, and a nearby estate had been purchased to replace the land sold.

The debtors, amounting to £951,937, represented amounts repayable over a term of years, and only a small proportion were in arrear with their payments. The cash in San Paulo (at present exchange about £60,000) and State and Municipal securities (worth about £20,000) were ample to meet the debenture interest liability as soon as remittances could be obtained. Conditions in San Paulo continued to be favourable to their business and they maintained their happy relations with the officials of the Municipality, which was actively improving the city in various directions and it was to be hoped that in time the sterling value of land and debtors would improve.

The report and accounts were adopted.

## TEA CORPORATION, LIMITED

### DIVIDEND OF 5 PER CENT.

The ordinary general meeting of Tea Corporation, Limited, was held, on the 25th instant, at 19 Fenchurch Street, London, Mr E. F. Slade, J.P. (chairman), presiding.

The Chairman, in moving the adoption of the report and accounts, said that, in common with most tea-producing companies, their profit for the year showed a falling off in comparison with the previous period.

The year's working resulted in a gross profit of £11,922, compared with £15,106 in the previous year, and, after making appropriations, there was a net balance of £6,211. The directors recommended that £1,000 be transferred to reserve account, increasing that account to £25,000, and that a dividend of 5 per cent. be paid, leaving £5,154 to be carried forward.

The Ceylon income tax actually amounted to over £2,000, being 15 per cent. of the company's profits, and was charged in the accounts as an expense. When the dividend was received share-

## SHORTER COMMENTS

(Continued from page 231)

**United States Steel Corporation.**—Net earnings for quarter to June 30, 1939, \$1,309,761 or 36c. per preferred share. For June quarter, 1938, loss was \$5,010,426, and for March quarter, 1939, profit of \$660,550. The regular quarterly dividend of \$1.75 on the preferred stock has been declared.

**Aircraft Components, Ltd.**—Total profit for year to March 31, 1939, £131,749 (£35,407). To tax reserve £55,000 (£10,650). Ordinary dividend raised from 7½ to 25 per cent. Carry forward £39,936 (£6,051). Stock, etc., £220,884 (£116,564). Debtors £173,334 (£65,192).

Amount due to bankers has increased from £50,824 to £108,210.

**Partington Steel and Iron Company.**—Net profit for year to June 30, 1939, £87,740 (£89,874). The 6 per cent. payment on the income debentures absorbs £40,994; £40,000 set aside for securing the income debentures. Balance of £6,747 reduces the debit-forward to £48,999.

**Shell Union Oil Corporation.**—Net profit for quarter to June 30, 1939, \$1,684,158, against \$2,922,990 for quarter to June 30, 1938, and \$478,266 for March quarter, 1939.

**Neepsend Steel and Tool Corporation.**—Net revenue for year to March 31,

holders would find that income tax had been deducted at the rate of 2s. 9½d., instead of 5s. 6d. in the £.

The company was the owner of six estates. Kuda Oya produced tea only, having 489 acres planted, and the visiting agent reported that all details on this estate were in really good order. Penylar comprised 408 acres planted in tea, and the tea there was reported to be in excellent condition. Springwood consisted of 771 acres of tea, 245 acres of rubber and 30 acres of cardamoms. The property was reported as improving, and that all that could be done for the welfare of the estate was being done. Kenilworth consisted of 808 acres planted in tea, and Arslena of 310 acres planted in rubber. Kaduwella, consisting of 96 acres in rubber and 93 acres in cocoa, was reported to be in good order and receiving every attention.

The output of tea to the end of June this year amounted to 415,642 lb., in comparison with 458,075 lb. in the previous year. Of this 287,525 lb. had been sold at an average gross price of 14.67d. per lb., as against 338,169 lb. at an average price of 14.58d. at the same time last year.

The output of rubber was 41,701 lb., compared with 43,425 lb. last year and the price realised to date was 8.25d. per lb.

The report was unanimously adopted.

## SOUTHERN KINTA CONSOLIDATED, LIMITED

### SUCCESS OF BUFFER STOCK SCHEME

The fifth ordinary general meeting of Southern Kinta Consolidated, Limited, was held, on the 27th instant, in London.

Captain Oliver Lyttelton, D.S.O., M.C. (the chairman), said that the two recent increases in quota had already had a marked effect in earnings and there was little doubt that the next interim dividend would be increased. Recent events had made it necessary for him to discuss the general tin situation again, and a little more fully. First he would point out that consumption had shown the expected improvement, the fall in visible supplies appeared likely to continue, and they might therefore look forward to higher quotas.

The buffer stock scheme appeared to be working satisfactorily and was confounding its critics. Nevertheless, a recent speaker wishing to restart the controversy had said: "Those sponsoring the buffer stock scheme placed a memorandum before Malay States producers in which, *inter alia*, the following claims were made: (1) Experience has shown that creation of a buffer stock would restore prices to their normal level; (2) The creation of a buffer stock would obviate the necessity for further reduction in quota and in the mining labour force employed; (3) Regulation by operation of the quota machinery had proved unsatisfactory." The fact was that the sense of the wording of the memorandum issued by the F.M.S. Chamber of Mines to any impartial judge was perfectly clear. No promise was held out that quotas would not be reduced. What was said most definitely was that the effects of drastic quota reductions would be mitigated by a special quota which would enable producers, if they so wished, to contribute to a buffer stock.

Other opponents of restriction, finding the buffer stock scheme a difficult subject upon which to exercise their critical abilities, had turned to the well-worn subject of outside production, and had put out figures and statements which could only be described as tendentious and misleading.

They were being asked in fact to follow the Gilbertian thesis that, in order to prevent an increase in the outside production of 9,000 tons, or less than 4½ per cent. of the total standard assessment, it would be worth while for the producers of upwards of 200,000 tons to accept from £80 to £90 a ton less for their output.

The report was unanimously adopted.

1939, £150,943 (£127,459). To investment depreciation £10,013 (£10,000); general reserve £29,247. Carry forward £11,984 (£7,885). Distribution on ordinary shares raised from 40 to 47½ per cent.

**Sir J. L. Hulett and Sons.**—Net profit for year to April 30, 1939, £174,406, against £81,270. Ordinary dividend and cash bonus raised from 7 to 7½ per cent.; also 25 per cent. capital bonus. To dividend equalisation £25,000; to reserve £50,000.

**The South Metropolitan Gas Company** is maintaining its interim dividend at 2½ per cent.

## Finance

## GOVERNMENT RETURNS

For the week ended July 22, 1939, total ordinary revenue was £20,395,000, against ordinary expenditure of £9,799,000, issues of £7,750,000 under the Defence Loans Acts, and a temporary advance of £2,500,000 to the Essential Commodities Reserves Fund. Thus, including sinking fund allocations but excluding issues from defence loans, the deficit accrued since April 1 last is £140,363,000, against £114,781,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 91 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On July 21st applications at £99 16s. 3d. per cent. for bills to be paid for on Monday, Tuesday, Wednesday, Thursday and Friday of following week were accepted at about 39 per cent. of the amount applied for and applications at higher prices in full. Applications at £99 16s. 4d. for bills to be paid for on Saturday were accepted in full. £40.0 millions of Treasury bills are being offered on July 28th.

\* Advances made by the National Bank of Roumania under the previous and current Agreements amount to £653,543. These advances are repayable in accordance with the provisions of Article 13 (4).

† This sterling is held by the Clearing Office in Sub-Accounts in the names of Roumanian authorised banks. To settle their debts due to United Kingdom creditors, Roumanian debtors must purchase this sterling from these authorised banks, at whose request the Clearing Office makes payment. The Clearing Office is not aware of the extent to which the unpaid balances may have been sold forward.

## SHORTER COMMENTS

(Continued from page 231)

**Hollychrome Bricks.**—Trading profit for year to May 31, 1939, £15,665 (£29,683). Net profit, £9,927 (£25,058). (It is stated that the lower profits are largely due to a strike.) Ordinary dividend reduced from 15 to 7½ per cent., is payable on the capital as increased by last year's 20 per cent. capital bonus. Carry-forward, £1,244 (£1,217).

**Gas Companies' Interim Dividends.**—The Gas, Light and Coke Company is maintaining its interim ordinary dividend at 2½ per cent., and South Suburban Gas interim is 3 per cent., as before. Commercial Gas Company interim dividend is 2, against 2½ per cent., and Wandsworth and District Gas Company is paying an interim of 3½ against 3½ per cent.

**Threlfall's Brewery Company.**—Trading profit, year to June 30, 1939, £430,800 (£419,766). To depreciation, £45,558 (£37,187). Net profit, £313,367 (£311,325). To Properties' Improvement £50,000 (same). Ordinary dividend maintained at 18 per cent. Carry-forward, £311,306 (£311,325).

**Bolton (Thomas) and Sons.**—Profits, year to March 31, 1939, £204,144 (£288,721). Net profit, £68,108 (£116,846). Ordinary dividend reduced from 10 to 7½ per cent. To: General reserve, £10,000 (£20,000); staff bonus, £4,000 (£7,000). Carry-forward, £55,120 (£53,512).

**Pearson and Knowles Coal and Iron.**—Net profit for year to June 30, 1939, £35,000 (£28,480). The 5 per cent. income debenture stock receives 4½ per cent. (against 4 per cent.), absorbing

£33,319. Carry-forward, £4,124 (£2,443). Deficiency account remains at £472,932.

**Clifford Motor Components.**—No profit for year to May 31, 1939, £90,800 (£47,616). To general reserve £45,000 (£15,000). Ordinary dividend and bonus raised from 20 to 30 per cent. Carry-forward £13,220 (£22,051).

**African and Eastern Offer.**—The Board state that up to date acceptances of recent offer by Lever Brothers and Uni lever have been received respecting over 85 per cent. of Corporation's capital. The Board say remaining stockholders may have been influenced by belief that value of holdings may rise, but give their reasons for not sharing that belief, and urge acceptance of the offer. Acceptance should be returned before Monday July 31st.

## LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

## The Parliamentary Watchdog

A QUARTER of a century ago this week-end, the armies began to march and the lamps of liberalism went out all over the world. To-day, twenty-five years later, the armies are again massed in readiness for the word of command and the lamps of decency and moderation—those few of them that were ever re-lighted—are again flickering low. It is idle now to speculate on the parts played by fate and by mismanagement in bringing us back to the same sorry pass in less than a generation. The war of 1914-18 was manifestly not a war to end wars. It can hardly, in its end-results, be called a war to make the world safe for democracy. Indeed, it was not, seen in retrospect, a war for anything; it was a rearguard action such as civilisation has always had to fight, and may have to fight again, to ward off the doctrines of tyranny and militarism that threaten the caravan of human progress towards betterment.

One of the treasures of our civilisation which is most directly affected by to-day's menace and most sincerely cherished by the peoples of Western Europe is the habit of settling public affairs by open discussion and debate. Indeed, it is at times like these that we realise how completely Parliament, with all its faults, lies at the centre of our national life. And it is deeply significant that just as we are girding ourselves to fight once more, if need be, for the sake of democracy, the House of Commons has been M. Boring its own rôle and duty. The Government's fulness, on, calling for an adjournment of the House from

August 5th to October 3rd, led on Wednesday evening to one of the most lively and impassioned debates that this Parliament has witnessed. The motion was, of course, carried, but only after protests, of which the most forceful came from the Conservative benches.

It is only natural that the Government should desire to get on with its job without the expenditure of time and trouble that daily attendance at Westminster involves. The whole Governmental machine is working under tremendous pressure and every departmental head has more than enough to keep him busy on the problems that arise within his own office. There has been no serious suggestion from any quarter that Parliament should continue to sit daily during August and September. Indeed, if it were merely a question of pushing ahead with the administrative programme, there would be everything to be said for a long Parliamentary holiday, especially since all the most urgent legislation has been passed.

The reason that inspires the widespread demand for occasional sittings of Parliament right through the holiday months is, however, nothing to do with either legislation or administration. It arises from the virtual certainty that, in the next two months, decisions of policy will have to be taken that will affect the life and happiness of every one of us and the survival of democratic institutions. The House of Commons, in the last year or two, has played a vital part as a policy-making body. It has not done this by its legislative powers, though there has been a steady

process of constructive amendment of the Bills brought forward by the Government. Nor has the House been at its best in formal debate, since good debaters are scanty and the great division of opinion is on the detailed application of principles rather than on the principles themselves. Much of the most valuable part of the Parliamentary time-table has been the question hour. It is there that Ministerial deficiencies have been shown up, that the Government has been prodded day by day until now it has adopted, or half-adopted, almost every one of the suggestions at which it originally jeered. Public opinion has been very definitely and constantly at work. In view of the somersaults that have been turned on a long array of issues, it can truthfully be said that the policy of the country is made at question time. No wonder Ministers want to escape from the discipline. No wonder there is a widespread demand that it should not be relaxed.

There is a tendency to-day, even among convinced democrats, to speak as if democratic institutions were necessarily slow, unimaginative and ineffective. This belief, in its current form, dates back to the speech in which Lord Baldwin tried to shuffle off the blame for his own procrastinations on to the electorate by saying that there was a necessary time-lag of two years before a democracy could be made to realise the necessity for painful action. It is doubtful whether, at the time, it was the electorate's imagination or Lord Baldwin's courage that was most conspicuously lacking. And in any case there is no evidence at all in the last two or three years to support the belief that democracy is less efficient than a less representative system. On the contrary; for if it was democracy that was holding us back, we should have the spectacle of an anxious and perceptive Ministry pushing ahead only so fast as the House of Commons would let them. The actual course of events has been the exact reverse. In fact, a regular procedure appears to have grown up. A policy is suggested by some private member of the House of Commons and ridiculed by the Government. The policy is pressed, and a reasoned rejection given to it. It is pressed again, and the Government promises to adopt it—but not yet. And finally it is put into force, anything from six months to two years too late. Parliaments in other countries are, perhaps, less effective, and in France (for example) it has been found necessary to proceed by decree as the best means of making rapid progress. But in Great Britain, as the record of the last two years proves beyond question, if the machine of Government were less democratic it would be less effective. As Mr Churchill put it on Wednesday, the House of Commons "is a

recognised addition to the defences of Great Britain."

In these circumstances, it is very regrettable that the Prime Minister has forced Parliament to go on vacation for two months at this critical juncture. The word "forced" is appropriate; for several of the Conservatives who spoke on Wednesday (and many more who did not speak) voted with the Government only because the question of confidence had been put and not because they thought the procedure was right. A Parliament which met to hear statements and ask questions every fortnight or so could perform two vitally important functions. In the first place, the machinery of preparation will work all the more rapidly and effectively if its decisions have to be submitted to immediate public cross-examination. And in the second place the House of Commons in session would provide the best of all safeguards against untimely appeasement.

The Prime Minister repudiated, with indignation, the suggestion that he was only waiting to get the House of Commons out of the way before attempting to make another arrangement of the Berchtesgaden-Godesberg-Munich character. His protests may be believed; for the Government is now so fully and clearly committed that any deliberate retreat from the present position would be most difficult to encompass. But, as Mr Churchill said, the Prime Minister's judgment has not always been impeccable. In any case, the Government must look strong as well as be strong, and what better proof of steadfastness could there be than to submit their policy at short intervals to the scrutiny of a suspicious opposition?

The sentiment of appeasement, it must be said in the Government's defence, is not confined to the Tory ranks. The opinion is frequently heard, even on the Left, that the conclusion of the Russian alliance will be the moment to make a fair offer to Germany. But this is most dangerous doctrine. If we are to make an attempt to conciliate the Nazis as soon as the pact with Russia is sewed up, the stitches will come out overnight. There is no chance of such an offer succeeding until the Nazis have recognised in their own minds that violence will pay, and after the long and painful haggling, it is doubtful whether the signature of a document in Moscow will carry this conviction in Berlin.

All these ideas need testing against the rising determination of the British people as represented in Parliament. This is a time when watchdogs should be at their most alert. It is a very bad mistake to choose precisely this moment for muzzling the most practised and effective watchdog in the democratic world.

## France under Decree

"WE still have unstable government. We still have profound divisions between Frenchmen. We still have shaken finances and a threatened currency. More than ever before we have a standstill economy, unworthy of a country which is so rich in resources and the holder of a great empire. We have little discipline, and small efficiency." So said M. Jules Romains, who is used to looking at his fellow-countrymen with the eye of affection, some ten months ago to the *Anciens Combattants* of Toulouse. And he was only saying what millions of Frenchmen were thinking.

Since last October the French have achieved much. If he spoke again to-day M. Romains would find good reason to strike a more cheerful note. It did not need M. Reynaud's broadcast speech of last week-end, setting out the main features of French recovery since the financial reform of November, 1938, to prove that the French have

made a remarkable effort towards curing the ills from which, in varying degree, they have suffered since the war. Last October it was possible to say of French Government, and among others M. Romains said it with much force, that in the four and a half years since February 6, 1934, "none of the defects, none of the weaknesses" which made possible the happenings of that black day, had been eliminated, or even been attacked. It is no longer possible to say that, for the measure of difference is very great.

It is a commonplace that this progress was made possible only by the threat from without. The Government has, in fact, continued to recognise that the promulgation of decrees is possible only because it is done under near-war conditions. But the latest batch of decrees, unlike the successive batches which have been coming out since the end of last year, do more than merely continue the work of reconstruction set in movement by the Reynaud

They strike out on new lines with an imaginative appeal significant of expanding confidence. Until last week the Government had shown itself wholly concerned with immediate problems: the increase of arms production; support of the franc and the release of the Treasury from its constant search for short-term funds; the generation of a belief in their success which would supplant the widespread discouragement caused by the decay—so demoralising in its inevitable gradualness—of the Popular Front, and later by the surrender at Munich. For many months after November no one could say with any certainty that the Reynaud Plan would be successful enough to keep in office a Government reported on all sides to be divided against itself on foreign policy. Pessimism was the prevailing mood. The test came in March. The moment it became clear that the German march into Prague was not going to blow the Government from office, it was held proven, and with good reason, that the Reynaud Plan had succeeded in its most subtle intention. The psychological conditions for a complete recovery had been created.

The latest decrees carry that psychological recovery several steps further. They deal with less immediate problems, showing that the Government feels itself more easily in its seat, with the question of how to raise the birth-rate (referred to in this week's issue on page 261), the importance of checking the flight from the land, the reorganisation of the Wheat Office, the establishment of a central information office under the direction of a well-known playwright. In regard to the last it would seem that six months ago such a sensible but apparently light-hearted appointment would never have received approval: the pessimism of those days would certainly have required the services of a superannuated diplomat. Very clearly, France is finding herself again. The most striking evidence of the Government's confidence in itself and in the support of public opinion, is the decision to defer until 1942 the general election which, under the existing law, would have to be held next year. A year ago few Frenchmen would have believed it possible that the Government would have the temerity to prolong its life for two full years, much less that the greater part of public opinion would acquiesce in this.

At the same time, it would be airy nonsense to suggest that France (any more than Britain) is entering upon a golden age of prosperity and frantic goodwill amongst men. Goodwill there is, more goodwill than has ever existed at any one time since the war—but it is the goodwill of men who are thrown together in a crisis, who remain suspicious of each other even while they are driven to common work. In the circumstances, it could hardly be otherwise. Because the general strike failed so ignominiously there is small reason to suppose that criticism from the trade unions has disappeared. On the contrary, it has merely been driven underground. M. Reynaud's appeal for a French "renaissance" may find a warm reception among the middle classes; the *petit commerçant* may well see that he would have had a softer deal from no one else, and easily a much harder one; the arguments provided by international politics are undoubtedly cogent—yet nothing that has been done or appealed for could have prevailed to silence Left unrest, had it not been for the fact that the Left parties were busy in mutual recriminations of their own. The Communists, to begin with, have developed their change of policy until they are now anti-Fascist (i.e. anti-German and anti-Italian) even before they are anti-capitalist. The Socialists, being electorally more important and doctrinally less subtle (not to say more honest), are in a much less favourable position for making the best of both worlds. As things go, they are not doing well with either. On the one hand, they have to admit that the Daladier-Reynaud combination is highly successful in preparing for a possible war, and that the importance of M. Bonnet, and therefore the need to oppose his pushfulness, has noticeably diminished during the year; on the

other hand, they perceive the inherently conservative nature of the Government's policy. Yet they are in no condition to put up an effective opposition. They lack unity and they are coming to lack leadership. Even if he had kept a national reputation strong enough to put him back into power, which he has not, M. Blum could not now marshal behind him the unanimous strength of his party. A large fraction of it, amounting to not much less than half, is now with M. Paul Faure in opposing his policy of national unity in preparation for defence against aggressors.

The Right groups meanwhile are playing a waiting game. The year's hammering on French foreign policy has helped them no more than it has helped the Left, for the German Government has become dangerously belligerent and the Italian Government surprisingly, unfairly, monstrosity, anti-French. The Spanish crusade, too, has turned out, against all their expectations, a tainted, even a dirty, affair; and there will be many *bien-pensants* who have ceased to commend themselves on their conduct during the civil war.

On the whole, though, the general impression is undoubtedly one of confidence. One good sign of this is the determined drive now being made against foreign propaganda agents. It is improbable that their sins, or those of others like them, were suddenly discovered; but the public washing of dirty linen can be done only in times of determination. The arrest of MM. Aubin and Poirier had all the makings of a scandal à la Stavisky; that it has not so developed is an indication very much to the good.

France is being governed by decree, and, to an extent surprising to the foreigner, is liking it. Does this mean that a fundamental change is taking place in the structure of French political life? The answer is both yes and no. Politically there is no change; the great majority of Frenchmen remain emotionally faithful to the Republic and its principles. The change is rather one of social environment, and it is not so much a change as a development. This development is the product of two converging trends: the movement set going by the social reforms of the Popular Front, and, after that, the growing danger from without with the corresponding pressure of rearmament on the French industrial system. It is having the inevitable effect (it was always inevitable) of reorganising methods of production, of speeding them up and concentrating them, of replacing craftsmanship by mass production, of improving and enlarging productive equipment.

Against this political and economic background the decision to defer the general election is almost certainly a wise one. Remembrance of the strikes which accompanied the fall of the Popular Front and the early months of his own Government should constrain M. Daladier to keep a careful eye on the justice of his decrees towards the working class. In its present state of disunity the Left, on its side, may even welcome the postponement of an election campaign which would only have accentuated its differences. The final argument, unwelcome though it may be, is provided by the virtual irreplacability of MM. Daladier and Reynaud. There is a wide understanding that the work of reconstruction will be carried forward only so long as the political truce holds firm; the overwhelming body of opinion is for the continuance of that work, and the natural conclusion, clearer than ever as the months pass, is that no governing combination can be hoped for which would better honour the conditions of that truce and serve its real ends than the present one. Even so, it is to be hoped that M. Daladier will not be too prodigal of decrees. For government by decree is a far cry from the democratic ideal, and it is neither carping nor over-cautious to ask that the "holiday" which the French Chamber is enduring (perhaps even, in part, enjoying) should be as brief as possible. Decree-making can easily become a bad habit; and bad habits are hard to drop.

## Refugees in Britain

THE effect of the present movement of refugees upon the economic life of Great Britain is best assessed through an examination of the magnitudes involved in the problem as a whole. At least 140,000 Jews have left Germany since the commencement of the Nazi regime in 1933 and there are perhaps a quarter of a million more in the same group who may be regarded as potential refugees. Nor is Germany the sole source of the exodus. The whole situation of the Jews in Central and Eastern Europe is full of uncertainty. They number about five and a half millions, and to them must be added at least a million other persons who may yet be driven out by political as distinct from racial persecution. These figures, however, give the maximum extent of the problem. At the very worst seven million people may have to be absorbed into the economic life of countries outside those which are now evicting certain classes of their population.

It is probably unnecessary to consider the movements of the next few years in anything like these magnitudes. The best informed authorities do not consider it necessary to provide organisation for the transference and reception of more than 250,000 persons in the next two years. A pessimist might envisage the whole problem as one of providing for 1,500,000 refugees between now and 1950.

On the assumption that measures to prevent emigration from taking place are out of the question, two main types of provision remain. They are (1) the settlement in suitable territories of groups of emigrants of as homogeneous a character as possible, and (2) the infiltration of individual refugees into already established communities. The contribution which Great Britain can make to the solution of the refugee problem is therefore two-fold. In the first place group settlement can be assisted by the provision of a proportion of the necessary capital, and the temporary accommodation of those refugees who are capable of performing the necessarily difficult and hazardous task of building up the new colonies. Secondly, every possible facility can be provided for the absorption of the maximum number of suitable immigrants into our own national economy. It is necessary to emphasise that neither of these activities need be regarded purely as acts of charity for which no material return may be expected. So far as infiltration into this country is concerned, the probability is that, far from requiring capital assistance, those refugees who have already come in have been more than able to provide for their own needs.

The mere statement of the fact that refugees may be in many cases able to supply their own capital requirements and very rapidly to become prosperous citizens, large consumers both of necessities and luxuries, and considerable employers of British labour, is apt to be greeted with some surprise in this country. The commonest reaction to the entry of numbers of immigrants into our economic life has been one of suspicion and fear lest the bread be taken out of British mouths. It is in fact required by the Aliens Order of 1920 that any foreigner wishing to enter the service of an employer in this country must produce before landing a permit issued by the Ministry of Labour to his prospective employer. If he has no such employer then, however great his acquired skill and intellectual ability, he will find it very difficult to get in.

The most powerful counter-argument to the current prejudice against refugees is an appeal to facts concerning numbers and their contribution to British economic life. The number of German and Austrian refugees at present in this country can hardly be smaller than 25,000, of whom perhaps two-thirds are Jews. Concerning the economic significance of this addition of about 0.05 per cent. to the

population of the United Kingdom four principal questions may be asked. They are (1) What amount of capital have they brought in? (2) What industrial undertakings have they established? (3) What sections of international trade have they transferred to this country? and (4) What new types and methods of production have they introduced?

First as to amounts of capital. Two estimates independently arrived at by competent investigators put the total at not less than £12,000,000. These estimates were made at a time when the number of refugees in the country was about 12,000. On the assumption that this number represents 4,000 families the average capital per family was at least £3,000, or more than the probable average figure for all British families. An inquiry into the financial position of 100-150 families including none with large fortunes (and large fortunes are not unknown among refugees) gave an average of between £2,000 and £3,000 per family.

This capital may have been brought into Great Britain by refugees in any one of a variety of forms. Some items have been transferred in cash in accordance with German currency regulations. Others already existed as balances or investments held abroad legally or illegally according to the German laws. Considerable new foreign balances have been created by prospective refugees who have allowed collected business debts to remain in this country. At the beginning of the present movement, when it was possible to arrange transfers at a loss of only about 25 per cent., significant amounts were brought here by legal methods. More recently illegal transfers have become more important. As far as Austria is concerned the most important recent items have been old balances held abroad. The number of instances of the importation into this country of industrial investments previously held outside both Germany and Great Britain has not been great, but some items under this head have represented large amounts. For example, the controlling interest in the Swedish Ferro-legeringe Stockholm, an important smelting undertaking, has been transferred to this country by a refugee concern.

The number of industrial undertakings established in this country by refugees is large. It is impossible for a number of reasons to compile a complete list. But it has been ascertained that at the end of 1938 at least 40 businesses manufacturing ladies' ready-made clothing had been established, with a total capital of not less than £250,000. Auxiliary undertakings connected with this particular trade included four firms making belts and employing 120 British workers, five for buttons with 150 to 200 workers, two for fancy goods, four producing knitted goods, blouses and underclothing and employing from 250 to 300 workers, and others manufacturing mackintoshes, zipp fasteners, umbrellas and handbags. Textile undertakings established by refugees gave employment to at least 2,200 British workers and leather and rubber firms accounted for about 1,600 more. Sir John Hope Simpson has estimated the total number of British workers employed by German refugees at 25,000. All these figures refer to the autumn of 1938, and there has probably been a considerable net increase since then. It is particularly important that about thirty firms have been set up by refugees in the Special Areas, particularly in the Treforest and Team Valley Trading Estates, where an increased diversity of industry is a necessity to long-term stability.

In addition to founding industrial enterprises here and providing employment for a body of British workers considerably in excess of their own numbers, refugees have transferred to this country a great deal of trade of an international character which was previously conducted

from foreign centres. The outstanding example is that of the fur trade. The decline of Leipzig has been accompanied by the establishment by German immigrants in Great Britain of 80 firms with a capital of about £750,000 and an annual turnover of more than £4,000,000.

New products, new techniques, new marketing methods and new markets are all welcome in a country whose vulnerability in time of crisis has in the past been increased by disproportionate dependence on a few large industries, and by sectional failures to secure the advantage of the latest discoveries in technique and organisation. The women's ready-made clothing industry already mentioned supplies a market for garments in the Continental style which has always existed in this country but has previously relied upon imports from Germany, Vienna and the United States. Arrangements are already being made for the supply by British firms of demands from Scandinavia and Holland. British firms have already benefited to a remarkable extent from the knowledge and skill of refugee technicians, particularly in the chemical industry, printing and engineering. It is in fact highly probable that a number of bottlenecks in British armaments manufacture may yet be widened through the agency of German workers.

It would be foolish as well as unrealistic to jump from the recital of such facts as these to the conclusion that refugees will be the saviours of British industry and trade. Their numbers and the amounts of capital at their command are too small to admit of any such possibility. But the benefits which they have already conferred upon our economy, and are likely to confer in the future, are sufficiently important to provide a strong argument for the re-

vision of the existing regulations governing their entry, and to reassure the many Englishmen whose present reaction to refugee immigration is one of fear rather than pleasure. Obviously not all refugees are capable of making an equal contribution to British prosperity. There may be some who are undesirable on other than economic grounds. But on the average they are more helpful to the community than the average Englishman whether the standard is monetary capital, industrial skill or intellectual attainments. National pride must not be allowed to obscure this fact.

If freer entry is granted to refugees good will come of it. But the admission of a few thousands into Great Britain will not solve the problem. It is always necessary to go back to the initial statement of the problem and to realise that the question of infiltration into Great Britain is only a small part of it. Its magnitude can only be reduced at the source by a removal or modification of those pernicious doctrines which dominate the policy of the countries from which the exodus is taking place. And if we must prepare to cope with hundreds of thousands of refugees in the next few years, then it will be as well to realise that our best contribution, both to their welfare and our own, will be by the reduction of all barriers limiting the amount and fixing the direction of international trade. These things and the provision of an organisation which will see the problem in terms of the numbers of refugees moving and about to move, rather than in terms of irrational fears as to their effect on particular sections of world economy, will ensure that the evils of the movement are reduced to a minimum and its potential benefits raised to a maximum.

## The Yes-Man

IT is commonly said and believed that Herr Hitler, through the agency of skilled astrologers, frames his policy on the movements of the stars; and if that be true then the issue of peace and war will depend on the opposition of Jupiter and Saturn, the conjunction of Venus and Neptune, the culmination of Uranus, and the lunation on the meridian. As flies to wanton boys are we to the stars. They kill us for their sport.

It is a disturbing thought, but it has one consolation. If Herr Hitler has his astrologers, so have we; and as nothing in the Universe is so certain, so exactly calculable as the future working of the stars, it must follow that the experienced astrologer in Berchtesgaden will come to the same conclusion about the events of the next twelve months as his trained colleague in London. If therefore we want to know what Herr Hitler's advisers are telling him, and so get a line on his future policy, all we need do is to consult our own experts and we have his movements, so to speak, taped for the next twelve months. On this reasoning, which may be thought to be flawless, the Prime Minister was talking sense when, rather than express an opinion of his own, he recently referred his Welsh audience to Old Moore. Let us take his advice and see what Old Moore has to say for 1940. Is Herr Hitler being told that he can risk a war in 1940 or warned that the stars are against him? We begin with the January forecast which is not of much interest except that it indicates the continuance of the present peace into next year. But in February things begin to move:—

At Tokyo Herschel is in the tenth squaring the setting luminaries—a plain indication that Japanese Imperialistic aims will now be sharply checked, probably by U.S.A. A political and economic crisis of the very first magnitude threatens both Germany and Italy.

So February is not going to be too good for the dictators and they are not likely to start their aggression

early in the year. March is rather better for them, although "sensational news concerning a Nazi leader is probable." Perhaps that means that one of the Nazi leaders is going to keep a promise—but we shall see. April, too, is a colourless month, but May warms up considerably.

At Rome and Berlin Saturn and Uranus respectively are rising—indicative of much economic distress and unrest among the people, who may now take active steps to change the form of their Government.

These active steps should keep Herr Hitler and Signor Mussolini busy at home, and they will scarcely choose that month for a foreign adventure. Mussolini, too, has trouble waiting for him in June, for in that month:—

The lunation is adverse for Italy and her King—also for Mussolini.

In July the stars have little to say about world politics, but recommend backers at Goodwood to put their shirts on Frank Butters's horses, so presumably we shall still be at peace, or Goodwood would surely have been cancelled. August is definitely bad for Herr Hitler:—

The lunation is likely to stir other astrological factors into operation producing earthquakes in various parts of the world—among others Japan and Mexico. Its worst effects will fall on Central Europe where it will cause increased revolutionary activity in both Germany and Italy. . . . At Washington the Sun and Mars in the seventh threaten a rupture of diplomatic relations—perhaps with a totalitarian State.

It looks like a good August for Great Britain and a plentiful of trouble for the dictators, while in September:—

In the first half of the month there are signs of much tension in Berlin to be followed by calm in the latter half.

Nothing of special interest to Herr Hitler comes from the stars in October or November, although the November Handicap at Manchester is to be won by a "candidate

carrying 8.2." But in December his troubles come to a climax, for:—

The full moon suggests the inauguration of new political parties greatly modifying (but not entirely suppressing) Nazism, Fascism and Communism; indeed, the world at large will now be giving birth to new political conceptions founded on a higher moral outlook.

That surely portends the end of Herr Hitler and his associates, and taking the year as a whole the Fuehrer is not likely to get any encouragement from these starry messages of 1940.

But, somehow, if one's interest is in human nature rather than in the movements, conjunctions and oppositions of the planets one is inclined to doubt whether the stars teach quite the same lessons in Bavaria that they preach in Middlesex. It is very difficult for a student of human nature to believe that any of Herr Hitler's astrologers will tell him to his face that, in December, 1940, a new political party will be inaugurated in Germany modifying Nazism and putting politics on to a higher moral basis. It is more likely that they are predicting a new party in England modifying democracy and putting English politics in subjection to Germany. Unless the German astrologers are men of heroic courage they will rather make the stars conform to Herr Hitler's wishes than persuade Herr Hitler to shape his policy by the stars. Their first duty, as we conceive it, is to find out what the Fuehrer wants and then proceed to make the planets dance to his desires. They are, in fact, Yes-Men.

The Yes-man is the product of a neuropathic age, whose function is to help his employer to self-confidence. Worried and nervy with the weight of his responsibilities, the great man comes to his decision, announces it, and then turning to his advisers asks, "Isn't that right?" and the advisers answer in chorus "Yes." The great man may know that they say "Yes" because they are paid to say "Yes," and that anyone who said "No" would be fired on the spot, but the sound of the word, even from mercenary lips, soothes and encourages, and he goes forward heartened and emboldened to achieve his destiny.

Crudely described, the Yes-man is an absurd, preposterous

figure, but if he has studied his job and reached the higher ranks of his profession he will be able to maintain a decent camouflage and keep on saying "Yes" for years without making it too apparent to his employer that his support is entirely mechanical. Has the employer written an important book or article? Then the chief Yes-man will see that a crowd of minor Yes-men write enthusiastic letters of gratitude and applause. Has he taken a decision of which in his heart he feels doubtful? Then a sympathetic Press will be unable to print all the letters spontaneously penned to prove the admiration of the best elements in the country for his statesmanlike policy.

At the moment, apart from the Cabinet itself, the most eminent of British Yes-men, counterpart of the very best astrologers of Germany, is the editor of *The Times*, whose dignified task is to prove to the Prime Minister how right he is at every point of his policy. He is right when he refuses conscription on Monday, and right when he adopts it on Tuesday. Right when he declines a Ministry of Supply on Wednesday and right when he establishes it on Thursday. To a certain extent that has always been the duty of a party newspaper like *The Times*, but the Yes-man of earlier generations of editors used to set a limit to his operations and confine them to his leading articles. The modern Yes-man flows over into the correspondence columns, and by a subtler flattery and a more careful selection, conveys to the great man that not only the paper itself but all its readers are shouting "Yes, Yes, Yes," at the tops of their voices and from the bottoms of their hearts. The great man must never be allowed to suspect that a large number of people from the bottom of their hearts are saying "No, No, No."

To make a really good Yes-man certain qualities are necessary. They are not confined to editors and journalists, for many of our most eminent politicians and Ministers are as richly endowed with them as the astrologers of Germany. Others, it must be admitted with sorrow, are deplorably short of them. Mr Winston Churchill, for instance, is no good at all as a Yes-man, and he and the country must pay the penalty for that deficiency.

## NOTES OF THE WEEK

**Britain and Japan.**—The Tokyo "formula," by which the British Government recognised "the actual situation in China" and the special requirements of the Japanese forces "to maintain public order in the regions under their control," was clearly enough a time-gaining instrument whose efficacy would depend on the temper of the Japanese and the pressure on the British Government of events in Europe. The fate of the formula has hung in the balance this week. On their side, the British Government have repeated their decision not to desert their neutral policy by deserting the Chinese and direct intimidation of this has been made to the Chinese Government; the Japanese, in their turn, are continuing to press for the handing over of the Chinese silver held in the Tientsin Concessions and for the banning of the Chinese dollar. To encourage the British negotiators they have further arranged for noisy anti-British demonstrations both in Tokyo and on the Chinese continent. British firms are being penalised, business held up, individuals molested, and missionaries expelled. To all protests the Japanese reply, what is manifestly not true, that the demonstrations are spontaneous and on that account must not be suppressed. The fact of the matter is that the Japanese in Tokyo have lost no time in going beyond the "local issues" for which the conference was ostensibly convened to those "general questions of policy" which, it was understood in London, could not be discussed bilaterally. If general questions were brought up, then other Powers with Far Eastern interests must obviously be included in the discussions. That was the British view, and subsequent

American action in retaliating against Japanese interference with American trade has confirmed its wisdom. Looked at from the most narrowly selfish angle, it would be an act of futility for the British Government to surrender the substance of their powerful position in the Far East for the shadow of Japanese tolerance; if bargaining of that kind were going to take place, then it must obviously be real bargaining and not one-sided surrender. Equally, that kind of bargaining can never be good policy. For, looked at from the standpoint of tradition as much as from that of international justice, to acquiesce in the exploitation of China and the Chinese by a body of rapacious soldiers and politicians would be to emulate the very people we are anxious to discredit.

**America and Japan.**—The denunciation of the American-Japanese commercial treaty of 1911 had an immediate depressing influence on the Stock Exchange at Tokyo, but of course its direct economic consequences cannot come into play before the expiry of the six months' period of grace which, according to the terms of the treaty, has to elapse before notice of denunciation can take effect. Meanwhile, the psychological consequences have been rapid and striking. In Japanese minds the news has dealt another blow to the now almost desperately wishful thinking that the end of Japan's military adventure on the Continent is in sight. The main purpose of the present Japanese pressure upon Great Britain has been to make

the Japanese public believe that the last remaining obstacle to the conquest of China is the British refusal to play Japan's game, and that this last obstacle is on the point of being overcome. Nothing could be more opportunistically depressing to the Japanese *moral* than the shock of the unexpected news that America is at last lifting her ban—in contradiction to the Japanese Government's assiduous assurances to its people that the Nine-Power Treaty could be torn to shreds, and American rights and interests in China trampled under foot, without any risk of retaliation. These carefully cherished illusions will be exploded by President Roosevelt's action last week—coming, as it does, at the same moment as the Russian Government's public declaration that the armed forces of the Soviet Union are directly engaged in the fighting on the border between Outer Mongolia and "Manchukuo." The utmost efforts of the Japanese Government's propaganda on the home front can now hardly prevent the Japanese people's hopes of a speedy peace with victory from once more receding into an indefinitely distant future. Yet, momentous though the effects on Japanese minds may be, it is even more interesting to note the reception of the President's act by his own fellow-citizens. In the United States there has been widespread approval, qualified by hardly a word of dissent, for the denunciation of the commercial treaty with Japan on the President's initiative. And this reaction of American public opinion to a dramatic presidential act is probably more enlightening than the obstructiveness of the Senate, whose acts are influenced partly by the traditional rivalry between Legislature and Executive, and partly by a personal animus against the present occupant of the White House. On these accounts we may venture to believe that the attitude and feeling of the American people is less accurately reflected in the tactics of their elected representatives than in the mirror of the Press. We hope this conclusion will be drawn at Berlin, as well as at Tokyo.

**Checking the Estimates.**—The enormous rise in public expenditure entailed by the armaments and civil defence programmes has undoubtedly aroused in some industrial circles a hope of inflated profits. The hope has not always been disappointed. But the sensitiveness of public opinion, largely engendered by former profiteering scandals, to any form of waste in this direction still provides a stimulus to the scrutiny of Government contracts and departmental expenditures, whether or not they are connected with the particular exigencies of near-war. The Select Committee on Estimates, which is especially charged with the making of that scrutiny, has now produced its report on those disbursements, which it views variously with doubt, surprise, disturbance, regret and dismay. The principal items are prices paid in connection with aircraft contracts; Home Office procedure in the placing of civil

defence contracts; the rise in the gross estimate for the Ministry of Agriculture and Fisheries since 1934 from £2,786,454 to £4,374,717—an increase of 56 per cent. in five years; and the continued expansion of Post Office expenditure at a greater rate than income. Aircraft firms are undoubtedly among those who have secured particularly high prices under recent contracts; but in the absence of full particulars as to those proportions of their profits which are attributable to Government orders and to the incidence of overheads upon a rapidly growing volume of work, an adequate check is not possible. It is already apparent, however, that detailed investigation into costs and prices paid to sub-contractors is producing useful results. The Committee make no reference to the possibility of setting up a comprehensive costing system and of machinery for compulsory disclosure of actual expenditure, such as existed in the last war. But it is arguable that the volume of armaments contracting required in the present near-war situation may be a sufficient justification for the revival of some such system in the near future. The fact that facilities for checking prices are sometimes refused (the machine tool trade is a persistent offender in this respect) provides an indication that wider Governmental powers might have an immediate usefulness. Such powers are in fact ready to hand in clause nine of the Ministry of Supply Bill. The Committee's recommendations for the reduction of departmental expenditure include a few items which are not likely to command a large body of public support—for example, its observation that the Department of Scientific and Industrial Research should aim at becoming self-supporting and its continued discouragement of expenditure on agricultural education. But the criticisms of the level of administrative costs under the National Fitness Scheme, the observation that expenditure on the building up of goodwill for the Post Office has now gone far enough, and the recommendation of a further decentralisation of the administrative machinery of the Board of Education are both just and timely.

**Cabinet Directorships.**—The announcement that Lord Runciman had resigned from the boards of the L.M.S. and six shipping companies was the practical result of the Prime Minister's re-statement of the Campbell-Bannerman rule that Cabinet Ministers should not hold directorships save in family or non-trading companies. This move does not represent any fundamental change in the position, as Lord Runciman had taken no part in the companies' management since entering the Cabinet. But in these matters the form is almost as important as the substance, if groundless insinuations are to be avoided. The fact that a Minister has been granted leave of absence by a company of which he is a director, even if it is known, can never be as convincing as a formal resignation. He must not only do the right thing; he must make plain to the world that he has done it.

**After Diplomacy, the Soldiers.**—The negotiations in Moscow, spasmodically continued this week, represent what might be called a negative discouragement to aggressors, since they have not detracted from the tempered optimism of last week. More positive is the news that British and French military missions are leaving for Moscow this week-end. Their task will be to measure up the military effort which the U.S.S.R. is prepared to make, and to compare it and fit it in with their own. Regarded as a means of preparation, these Moscow staff talks are obviously of first-class importance; failing the collusion of Polish officers (who, after all, might be the most directly concerned in what the Russians planned) it must be hoped that the talks will thoroughly traverse the essential ground of help for Poland, whether it came directly from Moscow or indirectly from Britain and France through Russian territory. In any case, the decision to dispatch the missions represents a more solid ground for hope of a Triple Alliance than almost anything which has followed the original opening of negotiations, more than three months ago. The close-range discussion of detail should do much to dispel the diplomatic lack of confidence which has been such a lamentable feature of the negotiations. It should also serve as a warning to possible aggressors.

\* \* \*

**Sidelights on Russian Policy.**—During the long-drawn-out negotiations at Moscow there have been two Western interpretations of Russian policy. One view has been that the Russians have merely been "leading us on," without any serious intention of compromising their neutrality in a coming war between the West European Powers and the Axis. According to the rival view, the Russians are just as genuinely eager as we are to build up a really solid peace front, and are only held back by an equally genuine fear that Mr Chamberlain may not sincerely mean business. The latter of these two incompatible views is supported by Mr Stalin's readiness to receive British and French naval, military and air missions; and this evidence is corroborated by articles just published in the Soviet Press in commemoration of the outbreak of war in 1914. The article in *Izvestia* takes an unequivocal stand in favour of a peace front "founded on full reciprocity, full equality of rights, an honest sincerity, and a resolute repudiation of the disastrous policy of 'non-intervention.'" It declares that the second imperialist war has already begun, along a front extending from Gibraltar to China, and that, while the guilt for the war of 1914 was divided between all the principal belligerents, the Triangle Powers alone are responsible for the renewal of the slaughter. Germany and her two confederates are castigated in the strongest terms, and they are warned that the whole strength of the Soviet Union will be thrown into the scales in order to frustrate their designs. The article in *Pravda* takes up the theme that the new imperialist world war has already begun. It goes on to declare that the Soviet people are defending the frontiers of the Mongolian People's Republic as if they were their own, in full accordance with the treaty of mutual assistance between that state and the U.S.S.R. It has, of course, been evident that, in the present apparently major operations on the border between Outer Mongolia and "Manchukuo," Russian and Japanese forces are fighting each other under the flags of their respective local satellites. The public proclamation at Moscow of this military fact in Eastern Asia is, however, in itself, a new fact of first-class political importance. The Kremlin is now going out of its way to make it plain where Russia stands. And every Russian word that is spoken in this sense is an additional discouragement to the aggressors.

\* \* \*

**Civil Defence Progress.**—The number of aspects of civil defence of which official cognisance is taken grows steadily. The present list of activities at various stages

of development is in fact so long that the allocation of sufficient Parliamentary time for their full discussion is out of the question. Tuesday's debate was a demonstration of this fact. There was, nevertheless, ample evidence of a constructive spirit in Parliament and Sir John Anderson was able to report a reasonably satisfactory advance towards the still distant goal of maximum shelter and completely organised exodus. The information that 1,900,000 persons had volunteered for civil defence service was particularly gratifying; though considerably more than 100,000 new volunteers are required before the immediately necessary total of two millions is reached. Numbers of those who have already enrolled represent a surplus in some regions, while in others there is still a deficiency. It is also good news that steel shelters for six million persons are already delivered, and that an output of 55,000 per week may be expected in future. Other evidences of progress are the publication of Ministry of Health Circular 1841 giving instructions for the setting up of appeal tribunals and billeting authorities in reception areas, and the Minister of Mines' statement that substantially complete plans are ready for the rationing of petrol in war time. The stream of new measures, instructions and amending orders is an expression of the fact that civil defence provision is essentially a developing process. It may be expected to go on developing even after the outbreak of hostilities and continual modification must be regarded as normal, if only because the circumstances of the individuals affected are continually changing. But elasticity is not the only requirement. An enormous stretch of ground has hardly yet been touched. If applications for equipment are any indication of progress, then the fact that out of 700,000 steel helmets ready for distribution for industrial A.R.P. personnel only 30,000 have been applied for is an excellent reason for the immediate commencement of the statutory period of three months during which employers must report progress or become liable to fines. Again, immediate measures must be taken to ensure an increased registration for evacuation in the areas where progress has been slowest. And the criticisms made in the latest bulletin of the Air Raid Defence League of the system of training the public for air attack and the administration of the warden service cannot be ignored.

\* \* \*

**Growing Provocation in Danzig.**—In all the close attention paid to conditions in the Free City of Danzig little heed has been given to the condition of the ordinary citizen. The number of ordinary citizens, true, has never been very large since the advent of the Nazi regime and its multifarious uniforms; and the number is doubtless very much smaller now than it was a few weeks ago. But the ordinary citizen must still exist, even if he wears wolf's clothing. His plight is not a happy one. His hands are full, one with a rifle and the other with an olive branch—and he waves them in turn one after the other. Newly armed though he may be, he can rest assured (according to his leaders) that in returning to the Reich he will not be required to use his arms. Depending entirely for his livelihood on trade with Poland (ordinary citizens are not paid by the Party), he can rest assured (again on the word of his leaders) that in returning to the Reich he returns to a land of milk and honey, where everyone is at work and, if not making money, at least earning it. In spite of these assurances, more of which were made this week by Herr Foerster, the secretary of the Danzig Nazi Party, who said that "they would return to the Reich, but they did not know when," there must be many doubts in the ordinary citizen's mind. For this week the Polish Government has struck from the free Customs list the products of the Amada margarine factory, one of Danzig's main economic supports. This Polish action, which is a reprisal for interference with Polish Customs inspectors, has caused the Danzig Senate to threaten to raise the Customs barrier between the Free City and East Prussia, a step which the Poles, knowing that it might prelude political annexation,

would have to regard with the gravest concern. The time would seem to be coming, moreover, when the continued militarisation of Danzig, manned as it is now understood to be by a force of some 12,000 men, must compel some precautionary action on Poland's part. If it neglects to take that action the Polish Government may find that it cannot readily prevent, by swift military measures, that political annexation which the Germans claim will take place, and take place peacefully. The possibilities are indeed obvious.

\* \* \*

**Encirclement or Information?**—In the present war of words Dr Goebbels has found the expression "encirclement" a handy weapon both in attack and defence. His practice of accusing Great Britain of wishing to encircle Germany, and then welcoming British denials as hypocrisy and humbug made manifest by the facts, is an excellent example of the adroit manipulation of words. It led Mr Herbert Morrison, in the recent debate on the Home Office vote for the preparation of plans for a Ministry of Information, to advocate desperate retaliation. He argued that we should in fact cease to deny encirclement and turn Dr Goebbels' weapon against his own breast by declaring our intention of surrounding Germany with "a ring of steel." This forthright statement at least drew attention to the fact that the denial of encirclement is the wrong policy. But it went much too far in suggesting that the affirmation of encirclement is the right policy. Nor does the attempt to distinguish between aggressive and defensive encirclement clarify the factual situation. The cause of the trouble is the word itself. Encirclement means in each situation what Dr Goebbels wishes it to mean. This is an excellent reason for excluding it from any British pronouncements for German consumption. Such pronouncements are most effective when they take the form of plain, positive and reiterated statements of the motive and objects of British foreign policy *vis-à-vis* Germany. If the blessed word encirclement is mentioned at all, that mention should simply state the fact that it is a term with no precise meaning and therefore out of place in British statements. Whatever other name is given to our collection of three virtual alliances, with France, Poland and Turkey, two unilateral guarantees, to Roumania and Greece, and one half-made pact with Russia, they certainly cannot be called an iron ring or any other sort of ring. Sir Samuel Hoare's statement of the aims of a Ministry of Information may be taken as an assurance that it will in fact present British policy in precise and positive terms. It also contained the welcome affirmation that such a Ministry will not operate in peace time and will not be turned to the improper end of the suppression of information at home.

\* \* \*

**Politics Before All.**—Both in Europe and in the United States there is one question that is on everybody's lips this summer: Will he risk it? The reference, however, is quite different on the two sides of the Atlantic. In Europe, it is Herr Hitler whose intentions are canvassed round every dinner-table and at every bar. In the United States the absorbing question is whether Mr Roosevelt will decide to incur the immense personal odium and run the grave political risks of becoming a candidate for the Presidency for the third time. Public affairs in America, in short, are already degenerating into the creeping paralysis that affects them every eight, and sometimes every four, years. In every action that is taken or proposed, the domestic political element is uppermost. It was this, rather than a considered view of foreign policy, that led the Foreign Relations Committee of the Senate to put off for six months all revision of the neutrality law. Conversely, the President had at least one eye on the domestic situation when he gave notice of abrogation of the commercial treaty with Japan. Mr Roosevelt can be under no illusion about the strength of the opposition he would have to face if he became a candidate for a third term. Congress, in

both its houses, is now definitely hostile to him and a coalition of Republicans and so-called conservative (i.e. anti-Roosevelt) Democrats seems to be in full control. Hardly a single one of the Administration's legislative projects has reached the statute book, at least in the form intended, and many blows have been struck at the bases of the President's power. The full executive control of relief, for example, has been modified and an Act has been passed prohibiting all forms of political activity by Federal office-holders—that is, by the President's nominees. Finally, the so-called Spending and Lending Bill, which was to have authorised expenditure of \$3,600 millions by various Governmental agencies, was first cut down to \$1,950 millions and then entirely buried by a vote of the House of Representatives on Tuesday. These actions by Congress are more likely to increase than to diminish the chances of a third-term candidature next year, since it may seem to the President that the only chance of salvaging the New Deal is to draw upon the immense popular prestige that he still unquestionably enjoys. But Mr Roosevelt is too canny to proclaim his intentions until the last minute. The appointment to the important post of Social Security Administrator of Mr Paul McNutt, one of the most prominent contenders for the Democratic nomination, may be interpreted either as the grooming of a chosen successor or as the capture of a rival. As in Europe, so in America, speculation on which way the cat is going to jump will continue until the moment of the take-off.

\* \* \*

**The French Family Code.**—The decrees issued by the French Government on July 29th included a new and lengthy Family Code, designed primarily to raise the birth rate. France had previously adopted various methods of reducing the financial burden of parenthood, and the main provisions simply extend these on the old lines. An important new principle has been introduced, however, whereby the same amount is paid whatever the occupation or income of the parents, though the scales still vary as between different Departments. The allowances which continue until the child reaches 14 (or in some cases 17) are expressed as a percentage of the average wage in the Department, and they may make a quite substantial addition to the family income. Thus 10 per cent. is paid in respect of the second child, and 20 per cent. in respect of each subsequent one, whilst a mother of more than one child who remains at home receives a further 10 per cent. The code also seeks to encourage young couples to settle on the land, where families are usually larger, by such devices as the grant of a marriage loan, parts of which are remitted as each child is born. Minor provisions increase the penalties for abortion and improve maternity services in regions where these are deficient. A final thrust is the imposition of a special tax on people without children to meet a part of the extra 1,000 million francs which the exchequer will now have to contribute.

\* \* \*

It is notoriously difficult to say how effective measures such as these are likely to be in inducing people to have larger families. It is somewhat easier to state to what extent the French population is failing to reproduce itself—a matter on which there are widespread misconceptions.

## The NATIONAL BANK of NEW ZEALAND, Limited

Established 1872

Head Office :—8 MOORGATE, E.C.2

|                    |            |
|--------------------|------------|
| Subscribed Capital | £6,000,000 |
| Paid-up Capital    | £2,000,000 |
| Reserve Fund       | £1,000,000 |
| Currency Reserve   | £500,000   |

The Bank has branches throughout New Zealand  
and conducts every description of Banking business  
with that Dominion.

Statisticians distinguish between *gross* and *net* reproduction rates; the gross reproduction rate, in broad terms, measures to what extent the present generation would be reproducing itself if every female child lived until the end of the child-bearing years. The net rate takes account of the fact that some women die before their reproductive years are over. For France the *gross* rate is approximately unity, so that in the absence of such deaths there would be more or less exact replacement; the existence of such deaths, however, brings the *net* figure down to 0.9. Allowing for a small fall in mortality rates, therefore, we may say that a rise of about 10 per cent. in the average size of families would suffice. It is interesting to note that the rise would have to be about twice as large in this country since the *gross* and *net* rates for England and Wales are rather under 0.9 and 0.8 respectively. The reason why our population is nevertheless still increasing, whereas that of France is falling, is—again in broad terms—that the fall of our net reproduction rate below unity, though it has gone further than in France, is of more recent date. France has reached the starting post first, but Britain will fairly soon be outpacing her along the road to smaller numbers.

\* \* \*

**Dr Colijn Falls Again.**—Dr Colijn's fifth ministry resigned on Friday of last week, after having been only three days in office, as the result of a defeat on a vote of confidence. This negative result was produced by the concurrence of two parties, the Catholics and the Socialists, who, only a few days before, had rejected an invitation to co-operate for the constructive purpose of forming an alternative government. Had they taken that opportunity, they would have met with no obstruction from Dr Colijn, who re-assumed office without eagerness and now lays it down again without regret—at least as far as personal considerations go, for on public grounds Dr Colijn no doubt shares the concern at the present interregnum in Dutch parliamentary politics that is felt by the Queen and the public and by the friends of Holland and of Democracy beyond the Dutch frontiers. It is difficult not to feel impatience with the responsible parties. When Dr Colijn formed his ministry without the support of the Catholics, he must have known (or should have found out) that they were ready to defeat it at the first opportunity. Alternatively, the Catholics should have made their position clearer: they would have lost nothing and might even have gained in bargaining power. As it is the Dutch are providing an unedifying exhibition of political obstinacy which can lead nowhere but to the bathos of a compromise. The question at issue is one of domestic principle, whether or not more money shall be spent on social services (the amount is not in question, only the principle): it is Dr Colijn's view that more expenditure at this stage would have a dangerous, and unproductive, inflationary effect. It is the view of the Catholic ministers who forced the Government's resignation that the facts of Holland's financial position do not warrant Dr Colijn's conclusion, and that even if the increased expenditure would be inflationary, no harm would come of it. On foreign policy there are no differences. Neutrality is so obviously the right policy that controversy has merely been limited to the way in which neutrality shall be assured. It is significant that five of the ministers in Dr Colijn's three-day cabinet made their names in the East Indies. Yet the confusion of domestic counsels can bring nothing but an aggravation of the danger from abroad. The stalling of the machine of parliamentary government in any democratic country offers one of the greatest encouragements to the dictators to embark on fresh adventures. No doubt, if they do take the plunge, the aggressors will be rudely undeceived. But when the bird does not want the cat to spring, it is foolish for it to simulate a broken wing; and this is what the Dutch parliament seems now to be almost perversely bent on doing.

\* \* \*

**New Zealand's Budget.**—New Zealand is beginning to face the bill for social security. The budget for 1939-40, presented this week by the Prime Minister in

Mr Nash's absence, shows an increase of expenditure from £35,773,000 to £38,243,000, the greater part of the increase being caused by social services, which take £600,000 more, and defence, which takes an extra £1,114,000. Revenue, on the other hand, is expected to fall on the existing basis, and in order to balance the budget the income tax, death duties, the beer duty and the petrol tax have all been raised, to yield an extra £2,500,000. This readiness to increase taxes when necessary may be taken as a tribute to financial orthodoxy, and as such will be welcome to New Zealand's creditors and a support to her new conversion loan. But the position in regard to the public debt is disquieting. Last year the total debt increased by £13,768,000, and this year, of £23,917,000 appropriated for public works, including £2,200,000 for defence, no less than £19,000,000 will be found from loans. The use of Reserve Bank credit, remarked Mr Savage in a gentle under-statement, has had obvious limitations lately. The Government are therefore drawing up a national savings scheme for small investors. Costless credit, it seems, is being thrown overboard. So, too, is the policy of unlimited public works. Mr Savage, admitting that it is not economically sound to keep the present number of men on public works, claims that the Government are transferring men to industry as quickly as possible. To this end, they aim at fostering efficient and economic home industries. Among other projects, they have decided to establish a state iron and steel industry, involving a capital outlay of £5,000,000 spread over 3½ years. It is reassuring to note that the New Zealand Premier stressed the need for increased production in order to consolidate the standard of life that is now demanded in the Dominion.

\* \* \*

**The West Indian Shipping Shuffle.**—The decision to withdraw after October the only two British passenger vessels serving the Leeward and Windward Islands and British Guiana marks the latest stage in the rearrangement of the shipping services between Europe and the West Indies. The complicated process which is at present going on had its origin in the intensification of competition between British and Scandinavian vessels in the Pacific coast trades. This has resulted in the decision of the Blue Star Line, which operates a cargo service between the United Kingdom and the Pacific coast ports of North America, to recoup itself for losses, which it claims are due to unfair foreign competition, by instituting calls at the Windward and Leeward Islands on the outward voyage. The Harrison Line, which has been operating cargo and passenger services to these islands and Georgetown in British Guiana for over sixty years, is likely to be hard hit by the loss of outward freight which this move will probably entail. It has therefore decided to withdraw the two passenger vessels, the "Inanda" and the "Inkosi," which are specially adapted to this service, on the ground that it is not economically possible to allow them to make the outward journey in ballast. The present position is that unless some radical development takes place between now and October, the inward cargo traffic and the whole of the passenger traffic of the islands will perforce be carried by French, German and Dutch liners. The freight trade of the islands, in which the principal export items are cocoa, sugar and molasses, and which has hitherto been amicably shared, the British line carrying United Kingdom cargoes and the foreign line Continental cargoes, is hardly likely to escape some disturbance. A particularly unfortunate feature of the present situation is that, although there is in fact subsidised foreign competition in the passenger trade to the Windward and Leeward Islands, the principal cause of the withdrawal of the two Harrison liners is competition from other British vessels. This may mean that the Harrison Line will be unable to apply for assistance under the Liner Defence Scheme. It is possible that the present difficulty may yet be resolved, but if it is not, a considerable loss will be entailed both to British shipping and to the inhabitants of the West Indies, who will have to make shift with a reduced service.

## THE WORLD OVERSEAS

### Turkey's Trade Dilemma

[From a Correspondent in Ankara]

THE statistics of Turkey's foreign trade with her principal trading partners are sufficient to make clear the nature of her economic problem. Total exports from Turkey amounted to 137,984,000 Turkish pounds in 1937 and 144,947,000 in 1938. Total imports were valued at 114,379,000 and 149,837,000 Turkish pounds respectively in the same two years (£1=5.85 Turkish pounds). The percentage distribution of Turkish trade between the principal foreign countries shows the speed and completeness with which Germany has come to dominate the whole Turkish market. Taking the last three years, the year of the Nazi revolution, and 1929 as a pre-crisis year, we get the following result:—

| (Per Cent.)            |       |       |       |       |       |
|------------------------|-------|-------|-------|-------|-------|
| Exports to:            | 1929  | 1933  | 1936  | 1937  | 1938  |
| Germany.....           | 13.26 | 18.95 | 50.99 | 36.53 | 42.92 |
| (Czecho-Slovakia)..... | 2.34  | 3.82  | 3.40  | 4.42  | 3.45  |
| United States.....     | 9.91  | 10.46 | 11.13 | 13.92 | 12.26 |
| Italy.....             | 21.80 | 13.48 | 3.68  | 5.27  | 10.05 |
| Great Britain.....     | 9.63  | 8.93  | 5.39  | 7.08  | 3.41  |
| France.....            | 12.63 | 6.42  | 3.25  | 3.82  | 3.28  |
| Imports from:          | 1929  | 1933  | 1936  | 1937  | 1938  |
| Germany.....           | 15.28 | 25.40 | 45.10 | 42.08 | 46.99 |
| (Czecho-Slovakia)..... | 6.03  | 4.64  | 3.91  | 2.63  | 3.85  |
| Great Britain.....     | 12.23 | 13.48 | 6.88  | 6.23  | 11.21 |
| United States.....     | 6.69  | 3.14  | 9.71  | 15.12 | 10.46 |
| Italy.....             | 12.49 | 11.44 | 2.18  | 5.32  | 4.75  |
| France.....            | 10.41 | 6.57  | 2.51  | 1.08  | 1.32  |

In other words, since the absorption of Czecho-Slovakia Germany dominates the Turkish market to the extent of supplying 50 per cent. of her imports and taking practically 50 per cent. of her exports, whereas the share of Great Britain and France, countries with which Turkey is now linked politically, is steadily diminishing. The figures so far available for 1939 suggest that the process is going on quite as rapidly this year.

An acquaintance with Nazi trading methods is conducive to an understanding of how this state of affairs has been brought about. On the one hand, there is the superior salesmanship and drive of German firms and the advantage to an unindustrialised country like Turkey of exchanging her raw materials with the manufactured goods of the German Reich. On the other hand are the state subsidies which have allowed German exporters to quote prices anything from 30 to 60 per cent. lower than any of their competitors, the state price manipulation which enables Germany to offer prices for Turkish goods much above the world level, with the result that after a year or so Turkey finds herself isolated with an uncompetitively high price level, while the proceeds of her sales to Germany are frozen in unconvertible German marks, good only for buying German wares. In June this year Germany's debt to Turkey amounted to 5,382,000 Turkish pounds.

The Turks find this position highly disquieting. Whereas Germany's share in Turkey's total foreign trade is practically 50 per cent., Turkey's share of Germany's counts for between 1.67 and 2.81 per cent. Obviously such a position is not that of mutual and profitable interdependence. It is total dependence upon the side of Turkey. Were the Nazi conception of economic relations separable from politics, Turkey might accept her apparent incorporation into Germany's *Lebensraum* with indifference, content to draw from it a solid advantage of economic stability. As it is not, she is extremely anxious to reduce her dependence by finding other outlets for her goods. It is in this context that the possibility of increasing Anglo-Turkish trade is being eagerly discussed.

The nature of Turkey's imports and exports is such that there is no real reason why Great Britain should not come

to occupy a more important place in Turkey's foreign trade. In 1937 and 1938 the principal exports were tobacco, grapes, nuts, cotton, wheat, figs, chrome and barley (in descending order of importance). Of these, tobacco occupies a place out of all proportion to the rest. In 1937 it accounted for one-third of Turkey's total exports, in 1938 one-quarter. The principal imports (again in descending order of importance) are iron of all kinds, steel, machinery, cotton thread and cotton goods, spun wool and woollen goods, fuel and mineral oils. Great Britain would be an excellent source of supply in practically all these categories, but in 1938 Germany provided over 50 per cent. of the iron and steel and machinery and nearly a third of the cotton and wool. The reason is not difficult to grasp. Great Britain does not buy Turkish goods, and that is the root of the matter.

Anglo-Turkish trade is carried on at present through the clearing agreement signed in September, 1936, and modified in May, 1938. The later annex imposed a quota system on imports from Great Britain. At present there is an almost total blockage, for Turkey has (June, 1939) 11,593,500 Turkish pounds outstanding against her in the clearing account, while her exports to Great Britain fell by 50 per cent. in 1938. During the same period Great Britain more than doubled her sales to Turkey (proof of Turkey's desire to buy)—hence the present deadlock.

British credits to Turkey (which work out as a form of disguised subsidy to British exporters) cannot offer a permanent solution so long as the British market is closed to Turkish products. The £16 millions credit of last year has done nothing to ease the general commercial position. The £10 millions trade credit has been earmarked for paying Brasseries for their big contract, the Karabük steelworks and for wiping out some old debts on British concessions (railways, telephone systems) taken over by the Turkish Government. Another large credit is confidently expected in the near future, and will be used on large scale industrial installations, improvement of communications, etc., but the problem of interest and repayment remains, provided Turkish sales to Great Britain are not increased.

One very interesting use to which a sufficiently large credit might be put has been discussed recently—that of underpinning the whole financial structure of Turkey while she accomplishes the difficult and uncomfortable operation of scrapping her clearings, pegging her pound to sterling (say at 10 pounds to the £) and adjusting her price level to that of the world market. Such a step would lead to a dangerous dislocation of her entire economic system. A country dependent up to 50 per cent. of its foreign trade upon the German market cannot return overnight to a commerce of free exchange without being very sure of finding alternative markets. And Turkey is not very sure.

The only real solution lies in increased Turkish sales to this country. Tobacco is the obvious commodity with which a start might be made. A reduction of only 5 per cent. in our

purchases from the United States and the substitution of Turkish tobacco would practically solve the problem. It is necessary to envisage the consequences for Great Britain of a failure to overcome the obstacles to the completion of this particular commercial transaction. They are that in the event of war she may find herself fighting beside an economically crippled ally. It would surely be wiser to take steps to lessen her dependence in time of peace when the necessary measures could be carried through with a proper amount of forethought and preparation.

July 20th.

## Revolt of the Relief Workers

[FROM OUR NEW YORK CORRESPONDENT]

THE so-called W.P.A. "strike" or "revolt" has subsided, although it cannot yet be said that the incident is closed. The general outline of the issues can be stated simply. The principle of the W.P.A. was public work-relief. W.P.A. workers were divided into four categories—skilled, semi-skilled, intermediate and unskilled. For each category a minimum monthly payment was established, varying geographically on a scale adjusted to the local cost of living. The W.P.A. work-month was 130 hours. The scale of payments was complicated by the "prevailing wage" clause—i.e. that skilled workers should be paid at the hourly union rate in that locality. This resulted in a work-month for the skilled W.P.A. workers of about 50 hours, more or less.

At this point the story is not simple. It is understood that the nature of the projects necessitated employing an uncertain number of skilled workers not on relief; while some skilled relief workers, having worked their stipulated maximum on W.P.A., sought spare-time extra-curricular labour in private employment. The revised Act which went into effect on July 1st stipulated that 130 be a month's work, regardless of the category of the employment, although the monthly pay maxima were not altered except by computation of the cost of living differentials.

In effect, then, the revised Act cancelled the "prevailing wage" provision and so aroused the antagonism of organised labour, particularly the building trades. Only a small minority of the W.P.A. personnel fell into this category. The Act also provided that all persons who have been on W.P.A. for eighteen consecutive months must be discharged, and be ineligible for reinstatement (a) until after a period of thirty days and (b) unless then they are formally certified as in need. The object of this provision is obvious—the W.P.A. was not inaptly called "the aristocracy of relief," and the rolls had long been virtually closed—or at least so it was charged by persons in serious need. It appears that over 600,000 persons were affected by the 18-month provision; their discharge before September 1st is mandatory, and actually they are being discharged by weekly quotas. This provision affected a distinctly different group than those with the "prevailing wage" grievance; it was inserted by Congress for two reasons—to spread the relief appropriation and to discourage the concept of the W.P.A. as a "career." Presumably, for every person laid off by the 18-month provision another would be taken on from the "home relief" rolls, as it was not contemplated that the total number on W.P.A. would be diminished by this provision. While in the aggregate a large number of persons were affected by the 18-month and the 130-hour provisions, the great majority of persons on W.P.A. were affected by neither. Hence, the quick adoption of picketing to make the cessation of work effective. The authorities, however, did not recognise the right of employees of the Federal Government to "strike," and the picketing appears to have been ineffective except in the case of the skilled workers, who were union members, and were striking for the "prevailing wage." The entire episode encountered a generally unsympathetic public opinion.

The revised Act contained another clause which has introduced another type of protest. It provided that 25 per cent. of every W.P.A. project must be contributed by the locality or municipality of its location after the end of the calendar year. To this provision, municipal Governments have taken exception, but the Act stands on the books, and it is questionable if there is time for Congress to revise it, or if Congress would revise it if it had time.

**Market Trends.**—On July 12th the share market which had been quiet for three months burst into activity at rising prices. This activity has since continued; and the rise has by now lifted the averages to the level from which they fell precipitately in March at the time of the international crisis. To-day it was announced that the Federal Reserve index for June, at 97, had recovered to the level of the first quarter of the year, from which it had fallen steeply in April and May, when the great coal strike was in progress. This upturn in business was by no means unexpected, for the weekly data had shown a marked improvement from late May, when the coal mines reopened.

As has been often pointed out, for some eight months (November, 1938-June, 1939) the unadjusted index of production has fluctuated about the 96 level—rising briefly above it at the year end and dipping briefly below it in the second quarter of 1939 during the weeks of the coal strike. Such stability, without marked trend, is not characteristic of our economy, especially at that level, and there has been a widespread belief all through the period that it would not long persist. The action of the market is, therefore, accepted as evidence that the interrupted trend of the last half of 1938 is about to be resumed.

The extent to which our economy is currently affected by European developments is not distinctly traceable. A few industries are doing an unusual export business, but this does not seem to fluctuate with the headlines. But that our economy as a whole has felt any general stimulation from arms programmes abroad seems doubtful. The simple fact is that the rise in the stock market, even though it has merely raised prices to the level of last February, is endowed with prophetic economic significance; and everyone is attempting to give it an economic projection and rationalisation.

July 27th.

## German Trade with Japan and Russia

[FROM OUR BERLIN CORRESPONDENT]

NEGOTIATIONS for a new commercial treaty between Germany and Japan had been in progress for a long time, and the sudden announcement that an agreement had been concluded was presumably designed as a reply to abrogation by the United States of her treaty with Japan. The new agreement is due to come into force on October 1st, but it seems to provide little more than a framework, and the details will have to be settled by further discussions.

The existing treaty came into operation in 1928, and has been regularly prolonged for periods of three years. The two countries were very slow in concluding a treaty after the war. Discussions did not begin until 1922, and it was not until 1926 that even a preliminary agreement was reached. The greatest difficulties arose over the German export of chemicals and optical goods, for Japan had imposed a number of prohibitions. In the end Germany reduced the duty on soya bean oil, and a treaty was concluded on the basis of the most-favoured-nation clause.

German-Japanese trade has been both complicated and facilitated by the inclusion of Manchukuo, for Germany has a surplus of exports to Japan, but a surplus of imports from Manchukuo. A sort of triangular clearing arrangement has been instituted through the Yokohama Specie Bank. In 1938 the exports of Greater Germany to Japan and Manchukuo were valued at 93 million marks and 27 millions respectively, whilst the figures for imports were 25 millions and 77 millions.

The new agreement is designed to increase trade in both directions. Germany is to grant the Japanese a substantial export credit, but the amount is not known. It is quite likely that there will be few actual developments for some time, since the negotiations are really not yet complete.

Negotiations are still taking place for a new commercial treaty between Germany and the U.S.S.R. Trade between the two countries has declined progressively under the Nazi regime. In 1931 German exports amounted to 763 million marks, whilst she imported 303 millions of goods and 247 millions of gold and silver. In 1938 the figures for the Old Reich were down to 32 millions for exports and 53 millions for imports.

This shrinkage of trade has not been exclusively due to political and ideological differences; it can largely be accounted for by the economic changes which have taken place in the two countries under their respective plans. The U.S.S.R. has developed her industries to such an extent that she no longer wants to import large quantities of mass-produced goods; her demand is rather for such things as highly specialised machines, optical goods and chemicals.

Germany, however, with her re-armament economy and consequent shortage of labour and raw materials, can only supply such goods by curtailing production which she considers more valuable. Moreover, her prices are higher than those quoted by American and English industrialists, and there is always a delay of at least nine to twelve months in delivery. Furthermore, the U.S.S.R. is now in a position to pay cash if necessary, and so can no longer be tempted by German offers of extended credit. On the other side, the things which Germany would like to import are mainly raw materials, many of which the Russians can now more advantageously sell for free exchange.

The growing political tension between Germany and other primary producing countries has increased her desire to revive the trade with the U.S.S.R. In the case of the United States there has also been a deterioration in Germany's economic position, since the exports of the Old Reich fell from 209 million marks in 1937 to 149 millions in 1938. Germany's passive balance was also increased by a large rise in imports, from 282 millions to 405 millions, and restriction of imports appears essential; hence the urge to secure raw materials from the U.S.S.R.

It is noteworthy that the discussions are being conducted simultaneously in Berlin and Moscow, and that the main rôle is being played on the German side by industrialists. The Foreign Office is, of course, taking part, but is confining itself to questions which concern politics or credits.

The negotiators are encountering great difficulties, and for a time all talks were suspended. Rumours are now current that Germany is to grant a loan for several hundred million marks, but these are almost certainly exaggerated. It is possible that the export credit of 200 million marks which was granted in 1935 may be prolonged, or even converted into a sort of revolving fund. One must not forget, however, that the period within which goods were to be bought under this credit had to be extended several times, finally to June, 1937.

Apart from political developments, the chance of concluding a broadly based agreement seems to depend mainly on whether German industry can supply the desired goods at competitive prices and without delays in delivery.

July 31st.

## Eire's Balance of Payments

[FROM OUR DUBLIN CORRESPONDENT]

IN an article in *The Irish Trade Journal* for June particulars were given for the years 1934-38 of all those items in the Balance of Payments statement for which firm figures are available, or for which it is possible to make estimates. The following is a short summary of the position disclosed for 1937 and 1938:—

|                                             | Inward or Credit<br>Movements (Exports)<br>£'000 |        | Outward or Debit<br>Movements (Imports)<br>£'000 |        |
|---------------------------------------------|--------------------------------------------------|--------|--------------------------------------------------|--------|
|                                             | 1937                                             | 1938   | 1937                                             | 1938   |
| Capital items .....                         | 12,078                                           | 15,270 | 10,004                                           | 17,778 |
| Current items:—                             |                                                  |        |                                                  |        |
| Merchandise .....                           | 22,234                                           | 23,879 | 43,493                                           | 41,042 |
| "Invisible" items .....                     | 22,978                                           | 22,711 | 9,067                                            | 8,365  |
| Total known current items ..                | 45,212                                           | 46,590 | 52,560                                           | 49,407 |
| Total known capital and current items ..... | 57,290                                           | 61,860 | 62,564                                           | 57,185 |
| Balance unaccounted for .....               | 5,274                                            | 5,325  | ...                                              | ...    |

The recorded items have consistently shown an excess on the debit side, and the aggregate deficiency thus shown has amounted to about £23 millions in the last five years. The conclusion is inescapable that the country has been repatriating part of its external investments during this period. This transfer of capital was caused partly by the sale of external investments to finance the new industries resulting from the protective programme, partly by the flotation of various public loans in Eire during the period, and partly

to pay for the net debit balance on current account. The effect of the sale of foreign assets differs in the different cases, but in every case the position in regard to the balance of payments is weakened and the movement is one that cannot be continued indefinitely without causing anxiety to the monetary authorities.

The improvement in the balance of actual trade follows upon the Agreement with Great Britain whereby the economic "war" was terminated. The improvement was, however, mainly caused by the favourable trend of agricultural prices which moved the terms of trade in favour of Ireland. Export prices rose by 15.4 per cent., while the volume of exports fell by 7 per cent. The decrease in the import surplus is also to be attributed in part to a decline of 2.4 per cent. in import prices and of 3.8 per cent. in the volume of retained imports. It is obvious that the change that has taken place in the balance of trade gives no ground for complacency about the future, since a reversal of the relative price movements would quickly widen the gap. It must be the foremost concern of the Irish Government to increase exports of agricultural products. This important problem is receiving the attention of the Commission on Agriculture which is studying the agricultural industry in all its aspects.

The movements in the net external assets of the Irish banks are closely correlated with changes in the balance of trade. When the passive balance exceeds about £17 millions the excess is shown in a reduction of sterling assets of roughly the same amount. This suggests that the invisible credit balance is relatively stable, and indeed this is borne out by an examination of the published estimates. There is considerable uncertainty about both the debit and credit items in regard to tourist expenditure, but recent investigations "indicate that there is probably a balance in favour of Eire in respect of expenditure by tourists and other temporary visitors." Legislation is at present being passed providing for the development of the tourist industry which may become an increasing source of income in the future. The estimate for emigrants' remittances for 1938 is £600,000 from the United Kingdom and £2,430,000 from other countries. While the former sum will probably increase, the latter sum may be expected to decline with the passage of time owing to the stoppage of overseas emigration. Another asset which in its nature must prove wasting is the payment of pensions by the British Government. The pensions paid to Irish residents by the Ministry of Pensions have declined from £1,545,000 in 1934 to £1,310,000 in 1938. The tendency of the invisible exports to decline emphasises the need for building up additional exports of agricultural products.

July 16th.

## Future for Roumanian Oil

[FROM OUR BUCHAREST CORRESPONDENT]

THERE is a story current in Bucharest that when the Roumanian Prime Minister, M. Tache Ionescu, received a few years before the war the first offer of foreign capital for the exploitation of petroleum, he instructed his engineers to draw up a report showing how many years the petroleum deposits then known to exist were likely to prove productive if they were exploited. When the engineers reported that the deposits would yield for 20 years, Tache Ionescu exclaimed: "Very well, then let us go ahead for 20 years." In this way was first overcome the long opposition of the Bratianus to the entrance of foreign capital into Roumania, and the Standard Oil and Royal Dutch groups triumphantly installed themselves on the Roumanian oilfields.

Nearly twenty-eight years have gone by since then, and the oilfields continue to yield. Economically they are as important as ever, though it was not for economic reasons alone that the German, British and French Governments recently concluded new oil agreements with the Roumanian Government. The military significance of Roumanian oil is nowadays part of the currency of popular conversation: its value

**BRITANNIC**

will be increased by a consideration of the oilfields as they stand after a quarter of a century's exploitation.

The central point to note is that production has been steadily falling since its peak in 1936. Figures published in *The Economist* for April 1, 1939, show that from a total production of 8,704,000 tons of petroleum in 1936 the yield of the oil wells fell to 7,153,000 tons in 1937, and to 6,620,000 tons in 1938; exports of petroleum fell correspondingly from 6,885,000 tons in 1936 to 5,668,000 in 1937 and to 4,495,000 in 1938. There are three reasons to anticipate that this fall will continue: namely, that the deposits are being exhausted, that Roumanian legislation has discouraged private enterprise from drilling and prospecting, and that profits are being reduced to a minimum by heavy taxation, freight and shipping charges. The existing wells, therefore, are being used up; and private enterprise is neither disposed nor encouraged to make good a falling production.

Various estimates are available of the size of deposits which still remain. In the *Moniteur du Pétrole Roumain* of June, 1937, Professor Patriciu pointed out that in 1931 existing reserves were estimated at 111,100,000 metric tons. He calculated that in 1935 this figure had fallen to about 64 million metric tons. Professor Macovei, another expert, estimates the figure for 1935 at 61 million tons. If the 1936 production of 8.7 million tons be deducted from Professor Macovei's estimate, existing deposits in 1937 would amount to about 52.3 million tons. Many competent men in the industry are therefore seriously concerned with the possibility that Roumanian oil deposits may be entirely exhausted in seven or eight years' time, basing their calculation on the hypothesis that the whole of the deposits in the rock reservoir can be extracted. Yet it is scientifically improbable that the deposits can be fully drained. Minute calculations made in North America lead to the conclusion that the retentive action of natural forces, such as capillary attraction, exudations, adhesion to the walls of the wells and of the rock reservoir, will make it impossible to extract more than an average of 20 per cent. of total deposits.

New methods of extraction developed in North America are unfortunately not generally understood in Roumania. And where other European countries have had recourse to fresh drilling to keep up their production, Roumania is hampered by an exceptional legislative position.

Up to the present no generally accepted system has been introduced in the matter of new drilling concessions. Under the parliamentary system, in force before the new constitution was promulgated in the early months of this year, interested companies or individuals addressed applications for drilling concessions to the Ministry of Industry and obtained "exploration" concessions. On these the maximum tax was 150,000 lei per perimeter of 1,000 hectares. The applicant then sought the help of an influential member of Parliament, so as to have his new concession granted to him next door to the oil-bearing land on which his wells were already installed. In this way the "exploration" permit became in practice a permit for exploitation on a larger scale of lands already proved to be rich in oil, and the aim of the law, which was to give permits for the discovery of fresh oil lands, was defeated. But the Government retained the right to withdraw an "exploration" permit at any moment, and without allowing any compensation for expenses incurred in connection with it. The effect of this was to diminish the number of drillings. In March, 1937, drillings covered a maximum area of 38,000 metres; by April, 1938, this area had shrunk to 31,000 metres, and by December, 1938, to 13,500 metres.

With other discouragements, producers have to contend with heavy taxation and high transport rates. It is calculated that gross profits (i.e. before overheads have been paid) amount only to 12 per cent. or 15 per cent. of the selling price. At this rate the industry is practically working at a loss. It would appear to be urgently necessary that measures should be taken to encourage drilling, and to reduce the burden of taxation and transport charges that weigh upon the industry and prevent its normal development. As matters stand exorbitant taxation is killing the goose that lays Roumania's golden egg.

## A Plea for Freer Trade

[FROM OUR AMSTERDAM CORRESPONDENT]

THE majority of companies in the Netherlands have now published their annual reports. On the whole, it may be said that the financial results which are revealed have gone

beyond what was expected. Many companies show themselves in their reports to be optimistic of the future, the chance of political disturbances apart; and undoubtedly this trend would have been reflected on the Amsterdam Bourse if only war scares had not intervened.

The contents of the economic review compiled by the Central Bureau of Statistics correspond fairly well with the hopes voiced in these reports. This review has no hesitation in expressly stating that industrial development in the Netherlands does show a slight improvement, and that this is gradually affecting more and more branches of activity. Many businesses, of course, continue to profit by government orders for defence purposes as well as by more extensive programmes of public works. Among the heavy industries, a decline in shipbuilding orders for merchant vessels was compensated by an upturn in Government work, so that a high level of activity could be maintained. Branches in the clothing and textile trades, as well as of foodstuffs, have benefited by new defence measures. The fear of war has also stimulated the formation of stocks.

In contrast with this hopefulness, quite a different note was struck in the report of Dr Trip, President of the Netherlands Bank. He pointed out that the policy of reserving the home market as far as possible for domestic industries had resulted in increasing governmental interference in economic life. In his view a process of cartelisation of the economic life of the nation, at the instigation and under leadership of the Government, was unmistakably in progress. Through the consequent lack of freedom he foresaw a necessary rise in the level of prices and of costs of production. The burden thereby imposed on the consumer, coupled with new monetary and fiscal measures, would clearly result in poverty, reduced consumption, and rising unemployment. The power of the State was far-reaching, but it did not reach far enough to enforce on consumers buying-power and confidence.

Only by producing more cheaply and more freely, by promoting a gradual growth of international trade, by liberating commerce and industry from the innumerable obstacles impeding elasticity in prices and cost of production, and by releasing economic life from the intolerable burdens restricting private enterprise and investment, might goods be brought within the reach of the consumer on a larger scale and at lower prices. Then, and only then, would sound and enduring purchasing power, and a lasting improvement in employment, be created.

July 9th.

## Iron Ore from Sweden

[FROM A CORRESPONDENT]

SWEDEN is the largest iron ore exporting country of the world, ranking after France in terms of quantities but before France if the actual iron content is taken as the basis. Her iron ore reserves amount to about 11.1 per cent. of the total European reserves. There are two large mining districts, the Norrbotten district in the far north of the country, producing mainly for export, and the central and southern Swedish districts, producing mainly for the home market. The former are by far the richest mines, holding reserves of over 1,000 million tons with an iron equivalent of 738 million tons. The ore in this district is mainly of the magnetite type, with a high phosphorus content and an iron content of between 58 and 70 per cent.

The largest mines of Kiirunavaara and Gällivare are owned by the Luossavaara Kiirunavaara A.B., which in turn is controlled by the Swedish State and by the Trafic A.B. Graengesberg-Oxelösund equally. The Kiirunavaara-Luossavaara mines, containing about 738 million tons of ore, are situated about 100 miles from Narvik (Norway) and nearly 200 miles from Lulea on the Baltic. As the latter port is frozen from December to March, the ore is mainly shipped via Narvik, where it is transported by rail; this, incidentally, was the first Swedish railway to be electrified. The Gällivare mines, with 265 million tons reserves, situated 130 miles north of Lulea, were formerly worked by several foreign companies.

At the eastern end of the field a large deposit, the Koskullskulle mines, is owned by the Freja Mining Company, which is controlled by the Czecho-Slovak Witkowitz Steelworks, now under German domination. The iron ore deposits of central Sweden contain about 116 million tons reserves, with an iron content of about 66 million tons. Several hundred small mines are operated in this district, producing low-phosphoric ores, with the exception of the Graengesberg mines, whose product averages a phosphorus content of 1 per cent. and is mainly shipped via the port of Oxelösund, 164 miles distant.

\* Estimate.

† Excluding 38,000 tons exported from stocks in Norway.

The chief importers of Swedish iron ore are Germany and Great Britain; last year these two countries took 41 and 25 per cent. respectively of their import requirements from

Sweden. The British steel makers mix high-grade phosphoric Swedish ores with low-grade phosphoric domestic ores, whereas their requirements of low-phosphoric ores are supplied mainly by the North African mines. Germany has in recent years made efforts to secure a larger ore supply from Sweden and to prepare strategic measures to ensure the maintenance of supplies in case of war.

As the Swedish State controls practically the whole domestic iron ore mining industry and has enforced an output restriction, an increase can only be obtained through the Swedish Parliament. The production quota for the North was increased last year from an average of 9 million tons spread over three years to one of 11 millions, and it is anticipated that in the event of a European war the allowances would be increased, for the equal benefit of all purchasers. It would be possible for Great Britain to secure the transport of Swedish ore in time of war both from the northern mines and from those in central Sweden, if the port of Gothenburg were used for the latter. The transport of Germany's supplies, at least during the months when Lulea is frozen, would be more doubtful.

July 26th.

## Bulgaria and the Axis

[FROM OUR SOFIA CORRESPONDENT]

M. KIOSSEIVANOFF'S visit to Berlin at the beginning of last month caused a good deal of speculation in Sofia. It was agreed that the Prime Minister's visit was closely connected with recent happenings in the Balkans. Italy's occupation of Albania had made her a Balkan State; and, further, the guarantee given by Great Britain to Roumania and Greece, as well as the Anglo-Turkish agreement, now placed before the Bulgarian Government new problems in foreign policy. On her side, Bulgaria had declared for a neutral attitude,

but, so as not to recognise the *status quo* in the Balkans, had decided to remain outside the Balkan Entente. And, with the changed situation, her chances of obtaining frontier revision from Roumania and Greece had diminished. Roumania's refusal to discuss a return to Bulgaria of the Dobruja was followed by the incidents at Belitz in which twenty-two Bulgarians were murdered.

The Prime Minister's visit to Berlin was on a pattern with that made a short time before by the Prince Regent of Yugoslavia. In the course of his visits to Rome and Berlin the Prince Regent confirmed his Government's decision to remain neutral and maintain friendly relations with the Axis Powers. The Bulgarian Government wished to notify a similar attitude. This explains why, on his way to Berlin, M. Kiosseivanoff had a talk with the Yugoslav Minister for Foreign Affairs, and why, upon his return, he had further talks at Bled with members of the Yugoslav Government. The official statement then issued expressed the desire of the two Governments to co-ordinate their policies of neutrality and to continue friendly relations with their neighbours.

It had become necessary to clarify the Bulgarian attitude. The Roumanian Foreign Minister's visit to Ankara and Athens was interpreted in Bulgaria as an effort to consolidate the Balkan Entente, not only in regard to Bulgaria but also in regard to "external" Balkan frontiers. In spite of its friendly relations with Sofia, it may be noted that the Turkish Government has begun the construction of defensive lines along the frontiers marching with Bulgaria and Greece. In these circumstances the Bulgaro-Yugoslav pact of lasting friendship is considered in Sofia as a guarantee against the policy of encirclement now being pursued by the other Balkan States.

Bulgaria's close economic ties with Germany, and to a lesser extent with Italy, leave her with no alternative but to make clear her standing in regard to the Axis Powers. Germany to-day is the only important buyer of Bulgarian fresh fruit, vegetables, eggs, animal products, etc. By her commercial policy, paying high prices for block purchases, Germany has created for herself a position of first importance in the Bulgarian market. The clearing agreement with Germany is advantageous to her for the simple reason that it is Germany who has fixed the mark-leva rate. If it is true that Bulgarian farmers get better prices from Germany, it is equally true that Bulgarian importers from Germany pay on a correspondingly high level. There is the important fact, too, that Reichsmark balances in the National Bank are now of a considerable magnitude.

In order to offset Germany's strong position and obtain supplies of free exchange necessary for debt service and the purchase of raw materials, the Bulgarian Government has introduced a premium system for exports, the legal maximum of which is set at 35 per cent. This means to say that Bulgarian exporters to free exchange countries can augment the prices they receive (which are "world prices") by premiums paid to them by the Bulgarian Government. In practice, this system is of no great attraction to exporters for the reason that the prices paid by Germany are high enough to offset the premiums. The exchange position in 1938 was in fact a good deal worse than in the previous year. The poor crops of 1938 meant a serious curtailment of exports, and accordingly of supplies of free exchange. These supplies amounted in 1938 only to 776 million leva against 1,273 million leva in 1937 (£=385 leva). The outlook is now improved, however, and exports of this year's crop should be back at the normal level.

At the end of June the Bulgarian Minister of Finance, M. Boziloff, went to Berlin to discuss commercial questions. The important part played by Germany in Bulgarian trade provides obvious difficulties in the way of Bulgaria's purchasing raw materials elsewhere. It was arranged that a more even balance should in future be maintained in the Bulgaro-German clearing. The Reich is also to supply agricultural machinery, the payment for which is to be spread over five years.

## Books and Publications

### Lenin Re-edited

THE latest contribution to Marxian exegesis\* takes the form of an expansion of a tract by one of the Early Fathers, supplemented by a commentary. Lenin's original pamphlet on Imperialism is reprinted in full on the left-hand pages and on the facing pages are new statistical and other data collected by Messrs Varga and Mendelsohn. This arrangement somewhat reduces the effect of Lenin's clear and vigorous style, but facilitates the comparison of his statistics with more recent information. It also brings out plainly the main point which the present editors desire to establish, namely, the fulfilment of Lenin's prophecies.

The final effect of the extension of the statistical tables of the original pamphlet down to recent times is indeed striking. Writing in 1916, Lenin set out to illustrate with somewhat exiguous material the increasing concentration of production in modern industry, the growth of monopolies, the strengthening of the connection between the banks and industry, and the division of the world's markets between industrial and financial combines on the one hand and the principal imperialist Powers on the other. Messrs Varga and Mendelsohn faithfully demonstrate, with statistics which are, with a few exceptions, taken from the most reliable "bourgeois" sources, that

the facts and figures of capitalist economy during the subsequent twenty years not only corroborate the tendencies that were indicated in the data indicated by Lenin; they also reveal that these tendencies have become more marked and developed.

The arrangement of the new data follows strictly the plan of Lenin's original work. There is no direct statement that his figures have been verified by the editors, but there is some

\* New Data for V. I. Lenin's "Imperialism: the Highest Stage of Capitalism." Edited by E. Varga and L. Mendelsohn. Lawrence and Wishart. 322 pages + vii. 6s.

indirect evidence to that effect and, in any case, Lenin himself indicated his sources in almost every instance.

In fact, the principal criticism of this work lies, not in the facts which it presents, but in the interpretation which is placed upon them by Lenin himself and accepted without question by the editors. Few investigators would disagree with the purely statistical aspect of the thesis set out in Lenin's first six chapters. The occupation of an increasing proportion of the industrial and financial field by large scale enterprise is an incontrovertible fact, and the extension of imperialist domination in the past seventy years is also unquestionable. But arguments to the effect that the whole process follows the set lines of Hegelian dialectic, and involves the decay of capitalism and the growth of "parasitism" within it, are less acceptable. They outrun the solidly based inference that the tendencies examined involve a whole series of new problems of control, and go straight on to condemn the process outright. The intermediate steps in the reasoning are not to be found in Lenin's work. And, if it be argued that logical detail of this kind is inappropriate in a pamphlet, the natural reply can only be that the re-publication of that pamphlet, with all the trappings of statistical research, would also be inappropriate by the same token.

The fact is that Lenin's book is something more than a pamphlet. Despite its perverse terminology (for example, the use of "combined production" instead of the clearer and generally accepted "vertical combination"), and its occasional false parallels, such as that which is drawn between the relation of the banks to industry in Germany and in Great Britain, it is a stimulating work of energetic scholarship. Moreover, the figures compiled by the present editors have an interest of their own, and will inevitably provoke a re-examination of the tendencies which they illustrate. The editors are at their best when they are simply collating figures on the lines laid down by Lenin. They are less happy when they attempt to supplement his invective—directed equally at capitalism and the "bourgeois" economists who apologise for it—with the familiar phrases of present-day Communist propaganda.

Apart from the expansion of Lenin's figures, there are two new sections—a collection of supplementary data (pages 225-264) and an essay by Mr Mendelsohn at the end of the volume in which he emphasises the lesson of Lenin's teaching. The former is the weakest part of the book. Forsaking the salutary guidance of Lenin's thesis, the editors embark on an excursus of their own in which they include some curious items such as "Victims of the White Terror, 1925-35—12,978,000" as an example of "Direct and Indirect Destruction of Labour Power." The final essay is well written, but adds little to the argument. The data it contains could have been more conveniently included in the body of the work.

### Shorter Notice

"Currency Depreciation." By Milton Gilbert. Oxford University Press. 9s. net. 167 pages.

The mediaeval thinker craved for something craggy to break his mind upon. Nowadays, in these times of economic complexity, there is no dearth of problems to supply that want. Currency depreciation is one, and, in view of the widespread aspiration to create prosperity by juggling with counters, it is also a question which is profoundly important in practice. Mr Gilbert has no suit to plead. He simply seeks truth amid obscurity; and, by his skilful marshalling of facts and his lucid exposition, he enables the reader to reach something like confident conclusions. "Currency depreciation" as discussed here is the diminution, designed or not, in the purchasing power of a national currency unit over other currency units: a depreciated pound buys fewer dollars. Can such a process augment export trade? That is the author's question. His answer, based upon precisely formulated evidence from four countries of varied trade relations—Australia, Sweden, Britain, and the United States—is that the results in this direction are negligible. The attempt to stimulate foreign trade by currency manipulation is bound in the main to fail. A depreciating currency has some effect while the process of depreciation lasts; of itself, a depreciated currency is nugatory.

## THE BUSINESS WORLD

### The Scottish Banking Invasion

THE well-worn gibes at the invasion of the City and of its high executive positions from North of the Border must now cease to concern themselves solely with personalities. The agreement by which the Royal Bank of Scotland is acquiring the whole of the capital of Glyn, Mills and Company represents an encroaching movement of altogether more massive and formidable character. We have been well enough accustomed to the sight of English joint-stock banking giants devouring lesser Scottish institutions. The Midland Bank has done it twice, Barclays and Lloyds once each. But for one of the Scottish banks to come South and snatch one of the prizes of English banking, a house steeped in the traditions of the London goldsmiths, is a startling reversal of rôle. It gains in importance from the fact that the invader is the Royal Bank of Scotland, which nine years ago acquired the control of Williams Deacon's Bank and in 1924 inserted what is now seen to have been the thin end of the wedge in the London market by acquiring Drummonds Bank and later the private business of the Bank of England's West End branch. The purchase of Glyn, Mills and Company by the Royal Bank of Scotland is an operation important enough to mark a substantial shift in the balance of power among British banks. By combining its own funds with those of the two banks which it will soon own, the Royal Bank of Scotland will control resources to the tune of about £154 millions. This will place it immediately after the Big Five in order of ranking among the British banks, and will give it a comfortable lead over its nearest competitors, Martins and the District Bank.

The deal which has been arranged can be viewed from two equally interesting and significant angles. First, it can be seen as an aspect of the exceptionally dynamic progress of the Royal Bank of Scotland in recent years, especially since Mr William Whyte became its Cashier and General Manager—by no means an irrelevant point of departure. Secondly, it can be viewed as part of the regretted but perhaps inevitable passing of the private bank from the stage where formerly it found its most magnificent setting.

The published details of the proposed operation can first be recorded. The whole of the £1,060,000 capital of Glyn, Mills and Company, which consists of stock with unlimited liability, is to be acquired by the Royal Bank of Scotland. The consideration is to be partly in stock of the Royal Bank, whose capital will have to be increased for this purpose, and partly in cash. The amounts and proportions of each are not to be disclosed. There is to be an interchange of directors between the two banks; but Glyn, Mills and Company, although becoming a subsidiary, will retain its separate entity and will continue its business under the same name and management, with Sir Herbert Lawrence as Chairman and Mr Eric Gore-Browne as Deputy Chairman of the enlarged board of directors. The proposals for this merger have been submitted to the Treasury in accordance with the recommendations of the 1918 Committee on Bank Amalgamations, and have received the customary passive consent which, of course, implies no official responsibility for the scheme.

This "marriage" brings the Royal Bank of Scotland more than ever to the forefront of Scottish banks. The progress of that institution in recent years would have been striking even without taking account of the control

which it has acquired or is acquiring over two English banks. Over the past decade its own deposits have risen by 56.4 per cent., while the aggregate deposits of the eight Scottish banks have over the same period risen by 30.9 per cent. only. But it is through external rather than internal expansion that the most interesting and significant aspect of the Royal Bank's development has occurred. The acquisition of Drummonds Bank in 1924 gave the first hint of a new era in the long history of the Royal Bank, which on only one previous occasion since its foundation in 1727 had grown by absorbing another bank; that was in 1864, when it acquired the Dundee Banking Company. In 1930 came the first big "coup," the acquisition of a controlling interest in Williams Deacon's Bank, and with it a substantial stake in the fortunes of Lancashire and of the industrial Midlands. That stake is probably worth appreciably more to-day than it was in the difficult days of 1930. The Royal Bank was not the sole potential purchaser of the Williams Deacon's shares at the time, and since Treasury permission had to be given to the deal it may be assumed that the choice fell on it by special design as well as on the

score of the consideration offered for the shares. Now comes the deal with Glyn Mills, which will further broaden and diversify the basis of interests on which the Royal Bank rests. It is only at isolated and comparatively unimportant points that the present interests of the two institutions touch. By its control of Glyn Mills the Royal Bank will thus be tapping an almost new clientele, which includes most of the home railway companies, the principal accounts of the fighting services and such important companies as the Vickers group and the Hudson's Bay Company. The deal should certainly give greater stability still to the earning powers of an institution which on its record is already a symbol of solidity.

The reasons which have drawn Glyn Mills within the orbit of the Royal Bank of Scotland are clearly not to be found in a desire or need for support. The house of Glyn Mills may be the last of the private banks in the clearing house, but it has never been stronger than it is to-day. As the last of the big private banks it has, in fact, drawn some benefit from the amalgamation movement which has created the somewhat impersonal mammoths of the joint-stock banking world. That personal element in the relations between Glyn Mills and their customers is happily a feature which will remain wholly undisturbed by the link-up with the Royal Bank of Scotland. Indeed, it is so essential a part of the goodwill of the business that the purchaser would be very ill-advised to tamper with it in any way. The reason for this deal, viewed from the Glyn Mills' side of the table, is rather to be found in the nature of the bank's capital. The liability on the stock is unlimited, and for that reason difficulties must occur when attempts are made to convert it into cash—a process which is all too often called for by the claims of death duties. In the hands of a corporate body such as the Royal Bank of Scotland this disadvantage of unlimited liability will never become apparent—and it is in this particular case

the only disadvantage, since it would need an unimaginable succession of disasters to convert the potential into a real liability. In this mutuality of interests the two parties found the basis of a deal favourable to each. And since they both are imbued with the same tradition of personal, conservative banking, it was not found too difficult to translate that mutuality of interests into the actual operation which has now been arranged.

On its completion the deal will not fundamentally alter the picture presented by the structure of banking in Scotland. It will merely emphasise some of its light and shade. The leadership of the Royal Bank of Scotland must be increased by it, though not to the point of dominance. For the rest there are the three other independent institutions, which retain a sturdy individuality of their own. Two of these, the Bank of Scotland and the Commercial Bank of Scotland, have their headquarters in Edinburgh, while the Union Bank of Scotland operates from Glasgow. Then there are the two subsidiaries of the Midland Bank, the Clydesdale Bank, affiliated in 1920, and the North of Scotland Bank in 1924. Despite the common ownership of their capital, there are features in the management and the business of each of them that have militated against a complete merger. The National Bank of Scotland has since 1918 been affiliated with Lloyds Bank. Finally there is the British Linen Bank, which since 1919 has been controlled by Barclays Bank. Of Scotland's eight banks, half are thus independent and half are subsidiaries of English institutions. But the independents include the three largest banks, which are (in order of size, according to balance-sheet totals) the Royal, the Commercial and the Bank of Scotland, and the independent group consequently disposes of nearly 60 per cent. of the total resources of the whole system. These eight institutions provide Scotland with as vigorously competitive and yet as soundly conservative a banking system as could be desired.

## Disclosure for Nominees

NO student of the Companies Act of 1929 could doubt that British company law relies largely upon the virtues of publicity. Until the Act was passed, even the publication of adequate accounts was not axiomatic; and though to-day views on the adequacy of different forms of accounts vary widely—as, for instance, between the boards of the Dunlop Rubber Company and Gaumont-British Picture Corporation—the Companies Act, for all its deficiencies, has improved accounting standards. Scarcely less important is the procedure for establishing the identity of shareholders, and making that information available to interested members of the public. For example, Section 98 of the Act requires that a company's register of members must be kept at its registered office, and must be open, for at least two hours a day, for free inspection by any member and by any other person on payment of one shilling. In addition, every company must file a list of members and their shareholdings, and a list of persons who have ceased to be members, within fourteen days after the annual meeting each year.

The legislature evidently intended that public interest would be served if the fullest knowledge of a company's shareholders could thus be made public. Any person sufficiently curious or financially interested could obtain the facts at a cost of a shilling. Yet it is notorious that this intention is increasingly defeated by the device of the nominee holding. Section 101 of the Act perpetuates a point which has long been of the essence of British company law. It provides that no notice of any trust shall be entered on the register of British companies. The shareholder is the person (or persons) or legal corporation whose name appears on the register. Not only is it a matter of indifference to the company whether he is the beneficial owner of the shares or merely a nominee; the company is explicitly forbidden to recognise the equitable interest of any third person in the shares. Legal and not equitable interests are the only interests which company registration

law recognises, although the might of equity sometimes intervenes in cases where equitable rights might be jeopardised by legal owners.

Hence, the seeker for information, having paid his shilling, obtains particulars only of legal owners; although the real shareholder may elect to hold in his own name, or cover himself in the cloak of a nominee. The nominee is not a popular person among company investigators, for obvious reasons. But he is also a much misunderstood person. Before considering suggestions by which some of the disadvantages for which he is responsible might be avoided, it may be well to divide his various functions into those which are desirable on grounds of convenience, and those which are less obviously commendable.

The term "nominee" covers a large number of cases. Nominee companies may be subsidiary organisations of banks (formed to replace the older practice of joint accounts in the names of two bank managers, and to avoid the majestic formalities of applying the bank's seal to transfer deeds), or companies formed by stock jobbers and brokers, or private holding companies. The nominee company has advantages over the personal nominee; it has a continuous existence, and it cannot flee the country. But confidential clerks and bank managers are still identifiable by the trained eye in any return of shareholdings in a large public company. The distinction between the two types, however, is not so much one of legal constitution as of function. Taking bank nominee companies as an example, it is evident that they provide a useful function for many investors who cannot give regular attention to their holdings. The cumbersome technical routine of acquisition and transfer of shares may be avoided by using the bank's nominee company. Secondly, the latter may have shares registered in its name which have been hypothecated against a loan, either of a private client or of a professional security dealer. Such companies are plainly named nominee companies—for example, West Nominees Limited is

readily identifiable as one of the nominee companies of the Westminster Bank. And in so far as their functions are limited to those described above, they serve a sound utilitarian purpose.

Similarly, jobbers' or brokers' nominee companies may hold the securities of the firm in the ordinary course of business, or "contangoed" securities (in the case of jobbers' companies) or clients' securities (in the case of brokers' companies). Clearly, therefore, nominee companies provide many conveniences in the machinery of security dealings. If their functions were limited to these matters, they would be held in greater respect. But they provide further services, which may be comprehended in the general description of "camouflage." A bank nominee company, for instance, might hold unencumbered securities on behalf of clients, to mask the identity of the real owner, and to avoid the disclosure of operations which it would be tactless to conduct in the name of the actual principal. But it is certain that such concealment may be even more effective if it is carried out by a private holding company, of whose existence and controlling interests only a handful of people may have any knowledge. Cryptic names, constructed from the initials or names of the principal shareholders, or possibly from the country residence of the principal shareholder, are the characteristic feature of such companies, which ordinarily fall outside the common definition of nominee companies. But it is clear that they have a marked affinity to nominees, and provide opportunities at least as great for concealment.

Camouflage, however, takes many forms, not all of which can be regarded as inherently undesirable. Operations by insiders may be designed to sell out on the broad back of the public before adverse news becomes known to a wider circle, or of buying in advance of public knowledge of good news. But cases are conceivable in which directors might need to sell shares for cash, at a time when the market price of the shares in question is "correct." In such cases, the disclosure of a director's name to the market might produce an unwarranted reaction in the price. But the realisation of vendor's shares, and "shop" transactions scarcely warrant the same protection.

Employment of nominee holders evidently defeats the intention of the Companies Act, even if it does not promote positive abuse. How are these shortcomings to be remedied? An obvious method, though it would cut across existing concepts, is the registration of all beneficial owners, as well as legal owners, on the company's share register, and the entry of particulars of the former in the annual return of shareholders. Cases exist where successive layers of nominees mask the ultimate identity of the beneficial owner. To cover these instances, a statutory

declaration by the legal owner that he appears on the register as nominee for A, followed by an inquiry from the company, requiring an answer under penalty, whether A in turn was acting as nominee for a further party, would ultimately establish the true beneficial owner. This suggestion must not be taken to challenge the established principle that companies can only recognise the registered legal holder of the securities concerned. Yet even this system could hardly be applied to intricate cases of nomineehip. It would exclude the many instances of private companies which are in law principals but in fact nominees for one shareholder. And it would hardly be reasonable to call for the recording of beneficial owners of shares, purchased on borrowed money, or pledged against loans, which happen to be registered in the name of banks' or brokers' nominee companies. In legal fact, the speculator or borrower in the background is not a beneficial owner in such cases, but is merely entitled to an equity of redemption.

It has been seen, however, that one of the least welcome employments to which the nominee system is put is to mask the private operations of company directors. There are a few directors who regard their companies' chief function as a medium for their speculative pursuits. Others may regard occasional operation in their companies' shares as a legitimate perquisite of office, sanctioned by usage, and consolidated by immunity. The disclosure of such operations would depend upon regular inspection of the company's register, and upon publicity to the findings. A more effective method, however, could be patterned upon Section 16 of the American Securities Exchange Act of 1934, which requires the filing of a statement by each director, officer or person holding directly and indirectly more than 10 per cent. of any class of equity security, to show any change which has occurred in his ownership during the previous calendar month. If similar information were made available in this country, under statutory declaration, and filed by the company and also the Share and Loan Department of the Stock Exchange, it would constitute a desirable reform.

Thus, the nominee problem is not a matter of black and white. Up to a fairly advanced point, the system performs a useful market function; beyond that point, it may provide facilities for market practices which range from the mildly reprehensible to the specifically objectionable. It would be neither feasible, nor desirable, completely to abolish the nominee company. And if nominees were abolished, one simple way of avoiding the consequences would be to substitute bearer securities for registered securities. But the improvements suggested in this article would be capable of mitigating the more serious abuses of the system.

## Finance and Banking

**Circulation Record.**—The Bank of England note circulation appears to be set for the unprecedented feat of breaking its high record on three successive weeks. On Wednesday of last week the circulation broke by about £1,500,000 the previous record of £509,315,000 set up in December, 1937. The Bank return published this week leaves these previous peaks ranking among the minor ranges with a leap in the note circulation to £520,570,000. Next week, if the precedent of all previous August Bank holidays is to be followed, should see this record beaten once again. The reserve position can fortunately stand it, since the latest Bank return still shows unissued notes at £26,490,000. But it is evident that on this occasion the seasonal strengthening of the reserve effected by transferring £20,000,000 of gold from the Exchange Account to the Bank will most probably have been needed by the time the peak in the circulation has been passed. Had it not been for this strengthening the reserve would already be down to £6,490,000 and would probably have disappeared altogether over the holiday week-end. On past occasions when seasonal increases in the circulation have

been allowed for—by increasing the fiduciary circulation—it has been found that the seasonal peak was met without calling on the additional notes temporarily created. The authorities have largely neutralised the effect on Bank cash of the expanding circulation by buying bills in the market; hence the rise of £6,120,000 in Government securities and in addition an undisclosed increase in the holding of bills by public departments. These open-market operations largely explain the further decline in discount rates, despite the intimation given to the market during the past week that they must expect much heavier offerings of Treasury bills when the present seasonal increase in the flow of tax revenue dies down.

\* \* \*

**Fapi and Yuan.**—The first test of the highly elastic Tokyo formula is being provided by the discussions which are now taking place between the British and Japanese representatives on the currency position in Northern China. The Chancellor of the Exchequer, in answer to a question

In Parliament this week, declared quite unequivocally that the Anglo-Japanese agreement foreshadowed in no way a change in the Government's views as to the desirability of maintaining the Chinese currency in the interests of this country and of the countries which have important financial and trade interests in China. Inspired comment in the Japanese Press, on the other hand, makes it equally clear that in Japanese eyes the recognition accorded by the formula to the existing position in Northern China must imply a recognition of the currency sponsored by the Peiping Government and therefore the prohibition of the National dollar, or "fapi," in the Concession. Any other interpretation of the formula appears to the Japanese to be double-faced perfidy. The Japanese claims are twofold. In the first place, they demand the official recognition of the yuan and the prohibition of the fapi in the British Concession. Secondly, they demand the handing over to the puppet administration of the silver held for the National Government in the British and French Concessions. The Japanese are convinced—and quite rightly—that British submission to these demands would have a moral effect on the currency war in China, whose impact would be felt far beyond the confines of the Northern provinces to which the special issues now being discussed apply. The British Government has as yet refused to admit that the official discussions in Tokyo have concerned themselves with currency matters, but it is well known that a fact-finding committee has been inquiring into the history of Chinese currency and of the silver reserves in the Northern provinces. The committee has been presented with a Japanese contention that the silver now in Tientsin has never belonged to the Nanking Government, and that in 1935, when the National Government was carrying out the financial reforms under the guidance of Sir Frederick Leith-Ross, the silver in question was held in Tientsin in the name of the Political Affairs Commission of the Peking Government. Hence, according to this brief, it should now pass automatically to the new Provisional Government, which is another way of saying that it should be handed over to the Japanese.

It has apparently been rather more difficult to build up a historical case for the suppression of the National dollar and the official recognition of the yuan currency in Northern China, and on this issue it is reasonable to assume that the British representative will have received the necessary instructions from London to reject Japanese demands out of hand. There are those, however, who believe that firmness on this point may be softened by a readiness to comply with the Japanese demand for handing over the silver reserve. Meanwhile the Chinese dollar rate has again found a temporary resistance point at around 4½d., and is being held at this level without apparent support from the Stabilisation Fund. The problem of replenishing the depleted foreign currency reserves of the Fund has been discussed between this country, the United States and France, but no constructive step in this direction is to be expected while the talks are proceeding in Tokyo. It must be assumed from the statements made in Parliament this week that there is a genuine desire on the part of this country to help in the stabilisation of the Chinese dollar—both by reason of the trade we still conduct with China and because to abandon the Stabilisation Fund at this juncture must involve the loss of our earlier contribution to it. But before good money is again subscribed to this Fund means will have had to be devised to ensure that these resources do not indirectly find their way into Japanese hands. Meanwhile there is some reassurance to be gained from the knowledge that the Chinese National currency remains well managed and uninflated and retains the confidence of the Chinese population. Whatever may be the difficulties inherent in the balance of payments position this should at least save the exchange value of the currency from complete collapse. Even at the present level of 4½d. the Chinese dollar is so grossly undervalued that the pull against further depreciation must be acquiring considerable force.

**Silver Buffer Pool.**—The alternating fears and reassurances of the market on the fate of the Chinese silver reserves has played some part in causing the day-to-day fluctuations of silver during the past week. Broadly speaking, those fluctuations are taking place about the dead parity dictated by the American buying price of 35 cents per ounce. The most interesting feature of the market is the maintenance of an exceptionally large backwardation, the forward rate remaining at a discount of between ¾d. and 1½d. on the spot. The present balance of forces in the silver market is exceptionally interesting. On the one hand, American trade buying makes its appearance whenever the forward rate falls below the shipping parity, thus indicating some confidence in the maintenance of the present American price for imported metal. As against this, there is a persistent stream of forward selling, mostly of a hedge character, from producers. This selling has during the past few weeks been stimulated by continuing uncertainty in such countries as Mexico and Canada regarding the future course of the American import price for the metal. This selling would have had much greater effect on the forward price had it not been for the activities of what may be regarded as the silver buffer pool in London. This is a stock which is maintained here on behalf of the Indian Government and which is reputed to amount to between 10 and 14 million ounces of silver. Under conditions such as those which at present prevail this stock can be very profitably employed in swap operations—spot sales against forward purchases—which must have been yielding in the neighbourhood of 15 per cent. per annum. This important and often unsuspected factor in the market has during the past few weeks of unsettlement in silver been operated in such a way as to provide a very stabilising influence. Towards the end part of last week expectations of the defeat of the Townsend Bill, which provided for complete cessation of American purchases of imported silver, had a reassuring effect on the price of the metal, and on Monday when it was learned that the Bill had been defeated on the Saturday the spot price was raised ½d. and the forward ¾d. These gains, however, have since been lost, and uncertainty is increasing once again.

**"Outsiders" in the Gold Market.**—The main features of the gold market during the past week have been the reluctance of the Exchange Equalisation Account to satisfy the whole of the apparent demand for the metal and the persistent demand for coins which has now sent the premium to 1½ per cent. over the bullion value. The main demand for gold continues to come from the Continent, while on most days resales from these quarters have provided the bulk of the offerings. The authorities have been extremely diffident sellers of gold and in so far as sterling has needed support have preferred to give the necessary help by direct intervention in the foreign exchange market. These official purchases of sterling against dollars have been particularly apparent in the forward market—though it should be added that they have at no time had to acquire great importance. The severe rationing must not be taken to mean that a substantial demand for the metal remains unsatisfied day after day. When the market realises that the authorities are reluctant sellers it is apt to apply for rather more gold than it wishes to buy, assuming that a proportional allotment will approximately satisfy its real requirements. After one or two instances of genuine rationing therefore the apparent demand for gold tends to become inflated well beyond the real demand. The demand for coins continues to emanate from the Continent and supplies in London are now becoming rather scarce. Firms in the bullion market have recently been very surprised to discover competition in the coin business from a very unexpected quarter. A Stock Exchange firm, driven no doubt by the paucity of business in its own sphere, has taken a considerable interest in the traffic in gold coins. What is more, it has been providing facilities for option dealing in coins, a form of business from which the bullion market is barred by the

embargo on speculative forward dealings in gold. The amounts involved in these "outside" activities may not be substantial, but the development has none the less attracted considerable interest in the market.

**Borrowing for Defence in Australia.**—The problem of the best method of raising funds for defence programmes has now reached Australia where £78 millions are to be spent on defence in the next three years. At its June meeting the Loan Council allocated £14 millions to the Commonwealth Government as its borrowing programme for 1939-40; and as £10 millions of this is for defence, the opportunity was taken by the Commonwealth Bank, which acts as adviser to the Council, to present a memorandum on its views. A study of it shows that the same considerations that are causing anxiety here have been fully appreciated by the Bank. In brief, it is the question of whether the Government should obtain the money for defence by taxation or by borrowing, either from the public or from the Central Bank. Unfortunately, the Bank does not in its memorandum give any opinion as to the amount of unemployed resources, if any, at present existing in the Commonwealth, but it states without hesitation that if there is

general employment the worst method of all is that of loans by the Central Bank. Such loans would compete with existing money for the resources already being used; and the only effect would be rising prices. For Australia, more even than for Great Britain, a rise in prices would quickly bring disastrous results, because the price received for exports would not go up to correspond with the increase in the cost of production, while locally manufactured goods would no longer be able to compete with imports. The export surplus would, therefore, diminish rapidly with a consequent depletion of London funds. It is possible, of course, that the effects of defence programmes in other countries would mitigate these dangers, since, in Great Britain for instance, it is to be expected that industrial expansion will lead to a greater demand for imports of food and raw materials, and there is every likelihood of the cost of British exports increasing to an extent that would still allow Australian manufactures to compete with them. But though this may be of temporary consolation to Australia, it only means that the final results for all countries concerned would be as disastrous as the crisis of 1931. They can only be avoided by each country taking stern measures to prevent inflation, and the Commonwealth Bank has done Australia a great service in emphasising the dangers of unrestricted borrowing.

## MONEY MARKET NOTES

### The Bullion Market

AN interesting feature of the Customs returns of gold imports and exports for the week ended August 3rd is another shipment to Siam, amounting to £1.9 millions, which brings the total exports

Return is the maintenance of public deposits at a high level. For the last four weeks they have been over £20 millions; and although there is a drop of £2.7 millions this week, they are £13.8 millions higher than at the corresponding date of last year.

### The Money Market

THERE was a further fall, of about 4½d., in the average rate of allotment at last week's Treasury Bill tender, and the market's quota dropped to 27 per cent., compared with 39 per cent. in the previous week. This disappointing result was due to an increase in total applications from £68.6 millions to £73.8 millions, while the amount allotted, £36 millions, was only £1 million higher. The reason why the full £40 millions on offer was not allotted is presumably to be found in the present high level of public deposits at the Bank of England. Other discount rates have turned easier since the tender, the downward tendency being helped by special purchases. The clearing banks on Monday reduced their buying rates

Treasury bonds and other gilt-edged stocks within six months of maturity. 1 per cent. for loans against other collateral.

for September and October bills to 1½ and ¾ per cent., respectively; but in spite of the weak undertone they have not made any further reduction, and as the market has only a small amount of bills to pay for this week, it is holding back bills from the banks in the hope of a further cut in the rates, with the result that business is rather restricted.

The Government of Northern Ireland has placed £600,000 of 77-day bills at an average rate of just under ½ per cent.

The big rise in the note circulation, though largely offset by the special buyer, has made money rather more usable; but bond money is still obtainable at ½ per cent., although occasionally ¾ per cent. is paid.

### Foreign Exchanges

INTEREST in the foreign exchange market continues to be centred in the guilder and the Shanghai dollar. Movements in the guilder have been very erratic, but on the whole the trend has been against Holland. The news of the resignation of the new Government caused a rise in the rate to 8.81½f.; and although there was a recovery on Saturday, sales from Amsterdam produced further weakness on Monday, when at one time the rate reached the official limit of 8.82f. At this point official intervention was responsible for a brief rally; and the fact that the authorities showed themselves immediately willing to check any further depreciation when their limit was reached was probably responsible for the bear covering, which gave a firmer appearance to the guilder on Tuesday and Wednesday morning. On Wednesday afternoon, however, the absence of any solution to the present political difficulties caused a fresh wave of selling from Amsterdam; but there was a slight recovery the following day, and on Thursday afternoon the rate was quoted at either side of 8.80f. The sterling-dollar rate has been steady at around 4.68½ with some intervention from the Control, but forward dollars have been in demand and the premium has risen to 1½c. for one month and 1¼c. for three months. The Canadian dollar continues to be firm, and on Thursday was quoted at a slight premium on the U.S. dollar. Little change has occurred in the quotations for Swiss francs and belgas.

# Investment

**Equities Take the Lead.**—After recording further moderate gains on Monday this week, the industrial share markets have receded slightly. This is not a matter for great surprise, for the combination of a three-week account, the Danzig question, the demands of the locomotive engineers and a few disappointing industrial results, like those of Arthur Guinness, Son and Company, is truly formidable. But over the past month, which has included the revised outline of the defence-borrowing programme, the emphasis on equities, as opposed to gilt-edged securities, has become clear. Casting the eye back on the accompanying chart of British and American industrial share prices, two facts stand out. Firstly, despite the succession of political crises since September last year, the equity markets have remained astonishingly stable. The maximum deviation of the *Financial News* index has been 10 per cent. above, and  $7\frac{1}{2}$  per cent. below, the level of 80. The recovery of the past three weeks has put the index once

## BRITISH AND AMERICAN INDUSTRIAL SHARE VALUES DURING THE PAST TWO YEARS

(July 1, 1935 = 100)

American: *Standard Statistics* Index of 50 Common Stocks.

more on the right side of this psychological barrier, and, whatever may befall the markets as a whole, equities are likely to take the lead over gilt-edged. Secondly, in this period—up to the beginning of July, at least—the trend of Wall Street was unmistakably downwards. The past month's recovery may have some chartist significance, as a break from the parallels. But many investors will prefer to look at the forces which inspired the rise. In part, these were economic; there are signs, such as the recent improvement in steel operations, which suggest that a mild recovery is in progress in the United States. But the major factor in the month's rise is probably to be found in the market's cheerful reaction to President Roosevelt's difficulties in keeping Congress in rein. If this interpretation is correct, it deserves to be heeded; for when Wall Street plays politics, its economic judgment sometimes comes to grief. And President Roosevelt is a master in the art of turning the political tables on his opponents.

**New Zealand Conversion Reactions.**—Lists for conversion and cash applications for the £16 millions  $3\frac{1}{2}$  per cent. New Zealand conversion stock, 1939-45, close on Saturday this week. New Zealand stocks have not fully accepted the rate of 4 per cent. on the new stock, for a

OVER ONE HUNDRED AND TEN YEARS OF SERVICE

"short" like the 3 per cent. issue of 1945 still stands at  $89\frac{1}{2}$ , to offer a redemption yield of the order of  $5\frac{1}{4}$  per cent. The existing  $3\frac{1}{2}$  per cent. redeemable on January 1st next year has been established as a prime "short" for money market purposes, in view of the informal but official assurances regarding the subscription of the new loan. On Monday this week the price rose to  $101\frac{3}{8}$ , a level which attracted a considerable supply of stock, since it offered a favourable opportunity to sell the old and subscribe in cash for the new, rather than convert for a payment of £1 per cent. Since one interest payment remains to be made, the net worth of the stock can be put at £101 5s. 4d., after income tax, to the public, but at £101 15s. to a money house. Hence the fall in the bonds to 101 on Thursday (after having been slightly lower) still leaves them attractive as a five months' holding to the money market. It would not be surprising, however, if the houses have tempered their demand for the old bonds, if only for the reason that the larger the volume of old stock taken into money market portfolios, the larger must be the cash subscriptions, either from the public or from the authorities, for the new loan.

**League Loans Review.**—The seventh report of the League Loans Committee underlines the difficult task of those who are charged with the responsibility of protecting the bondholder's interests in a world confused by economic impediments. It is not a negative record, however. Estonia, the model debtor, continues to transfer the service of her League loans in full; Hungary fulfils her undertakings under the 1937 settlement; and Bulgaria last year agreed to a temporary arrangement for 1939, which has provided slightly improved coupon payments. The intransigent debtor, to whom the Committee addresses some plain words, is Greece. The Committee records its "grave disappointment" that all endeavours to reach agreement with the Greek Government have so far proved in vain. It has, in fact, indicated precisely its willingness to consider far-reaching concessions, but the Greek Government obdurately insists on its offer of 50 per cent. of contractual interest, and refuses to consider a temporary arrangement. Clearly, as the Committee points out, there is no case for the limitation of current interest payments to 40 per cent., when the Greek Government is already prepared to transfer 50 per cent. under a permanent settlement. It is well that Greece and Danzig should be reminded of the contribution which the League loans made to their economic development. The recent blunt announcement by the Bank of Danzig that transfer of the service of the League and other loans has been suspended has been the subject of representations by the Committee to the Danzig authorities. Such unilateral action, particularly following the modification of service in 1937, lacks all justification.

**"Outside" Dealers' Licences.**—At the end of May, the Board of Trade issued draft rules of conduct for "outside" licensed dealers under sections 7 and 20 of the Prevention of Fraud (Investments) Act, 1939. The Board has now issued an order giving the names of recognised exchanges whose members are exempt from acquiring a dealer's licence, with details of application and the fee for such a licence. The Board of Trade will recognise as stock exchanges and associations under the Act, the London Stock Exchange, the Mincing Lane Exchange, the Provincial Brokers' Stock Exchange, and some twenty provincial Exchanges, together with the Association of Stock and Share Dealers. Application for

dealers' licences must be made not later than September 15th, and after the appointed day it will be unlawful to carry on the business of dealing in securities without possession of a Board of Trade licence. A principal's licence, which will be required by corporations, partnerships and persons carrying on a business on their own account, will cost £25 in the case of a corporation and £10 for an individual or partner. The fee for a representative's licence, required by persons acting as servants or agents of persons requiring a principal's licence, is £2; while the same fee is charged for a substituted licence, that is, one granted for the remainder of a period of an original licence, where, for example, there has been a change of partnership, or the firm has changed its name. Under section 4 of the Act, the Board of Trade may not grant a principal's licence without the deposit of £500. A guarantee by an approved person may be accepted, however, in lieu of deposit, or a deposit may be dispensed with altogether in cases where hardship might be caused, or in which the Board is satisfied that the applicant has dealt in securities since the beginning of 1939. The final rules have removed the restriction, which appeared in the draft rules, on circularisation, for in their original form they defined any inquiry in response to a circular as "solicited." Restrictions imposed on transactions involving payment by instalments limit the payments to intervals not exceeding one month, in amounts not less than 10 per cent. of the total consideration, at interest not exceeding 10 per cent. per annum of the balance outstanding. Such transactions must be supported by a corresponding transaction with a member of a recognised stock exchange.

**Inactive Capital Market.**—Judged by new issue business in July, whether computed on our "old" or "new" basis, the London capital market still qualifies as a distressed area. The old basis total of £718,000 compares with £22,631,000 in June. Indigestion resulting from a spate of trustee issues which culminated in the unsuccessful L.C.C. loan at the end of June, is plainly marked in these figures. The holiday season cannot be accepted as an explanation of the decrease, for the corresponding old basis figures for July, 1938, was £14,681,000, which itself could not be described as a phenomenal amount. New basis figures last month totalled £4,887,000 compared with £29,056,000 a month earlier and £27,281,000 a year earlier. The trend of new issue business is shown in the following table:—

|                   | (£'000's omitted) excluding conversions |            |            |         |           |            |            |            |         |         |
|-------------------|-----------------------------------------|------------|------------|---------|-----------|------------|------------|------------|---------|---------|

| July, 1939        | Dr. 300                                 | 796        | 222        | Nil     | 718       | Dr. 300    | 4,505      | 682        | Nil     | 4,887   |

The Sudan and New Zealand conversion offers for £2,000,000 and £15,840,000 respectively are both excluded from these figures. The month's new issue business is hardly relevant to the question of defence borrowing tactics which the capital market awaits with expectancy rather than eagerness.

**Foreign Bonds in July.**—July was a quiet month in the foreign bond market. Prices showed little change, and the complete index compiled by the Municipal and General Securities Company shows a minor fall from 54.6 to 54.2 (January-June, 1934 = 100). Czecho-Slovakia

8 per cent. bonds were an exception to the general weakening in prices, on renewed hope of early repayment. Further defaults by China have been followed by a marking down of most Chinese issues, but Japanese bonds maintain their prices on the Tokyo agreement. Brazilian bonds also improved on the forthcoming departure of bondholder representatives to Rio de Janeiro. The index and its component series since the beginning of 1938 are reproduced in the following table:—

| End of Month | Europe   | Near & Far East | Egypt | South and Central America |           |       | Complete Index | Unaffected Bonds | Defaulted Bonds |
|--------------|----------|-----------------|-------|---------------------------|-----------|-------|----------------|------------------|-----------------|

| February     | 77.8(25) | 59.1            | 82.0  | 55.8                      | 42.9      | 52.4  | 61.0(106)      | 65.0(41)         | 55.4            |
| March        | 68.9     | 60.3            | 78.8  | 57.5                      | 45.7      | 54.4  | 60.4           | 62.5             | 56.6            |
| April        | 65.7     | 59.1            | 74.0  | 54.2                      | 41.4      | 50.8  | 57.6           | 59.9(40)         | 53.1(6)         |
| May          | 73.9     | 59.9            | 78.6  | 52.2                      | 40.3      | 49.1  | 58.6           | 62.1             | 53.7            |
| June         | 71.1     | 49.2            | 75.7  | 51.2                      | 40.9      | 48.5  | 54.6           | 54.6             | 51.6            |
| July         | 70.8     | 46.3            | 75.6  | 52.7                      | 42.2      | 50.0  | 54.2           | 53.8(34)         | 51.6(7)         |

N.B.—Figures in brackets denote number of bonds included.

The growing extent of default has compelled a revision of the index. Changes have been made in the composition of the defaulted and defaulted groups to give effect to the Brazil and China defaults, on the basis that a loan enters into default one clear month following the date of the first coupon not paid in full. The series have also been linked by the chain method, to avoid discontinuity.

## Company Notes

**L.N.E.R. Savings.**—The savings achieved by the L.M.S. during the first half of the year have been outstripped by those recorded by the L.N.E.R. The statement issued last Friday showed that an increase of £125,000 had been recorded in gross receipts of the railway and ancillary businesses (including net miscellaneous receipts) while the estimated reduction in expenditure was put as high as £734,000. Hence the increase in net receipts was £859,000 for the half-year. These results represent a distinct achievement, which is further reflected in the reduction of 2.6 per cent. in goods engine mileage, compared with the reduction of 0.8 per cent. in tonnage of merchandise originating on the system. The L.N.E.R.

brought forward into 1939 unexpired economies totalling £1,035,000, of which it has retained £734,000, despite a rapid rise in traffics during the second quarter of the year. Moreover, since the 26 weeks' traffics showed a gain of only £7,000, it would appear that ancillary businesses have made a satisfactory contribution to the half-year's gross gain. After a certain stage, ancillary services tend to provide a high proportion of net revenue from a given increase in gross takings, a point of importance for the L.N.E.R. stockholder. Both the northern lines, however, have shown that railway operation on the largest scale is compatible with close supervision of costs, even in the face of a dramatic improvement in traffics. The L.N.E.R. interim dividends are maintained at last year's levels, namely 2 per cent. on the first and second guaranteed stocks, but it will be recalled that twelve months ago the statement indicated that the payments had not been fully earned.

\* \* \*

**A Great Western Contrast.**—Great Western, whose traffics recovery has been proportionately more rapid than that of other lines, showed a rise in gross receipts from railway and ancillary businesses of £456,000 for the half-year. But expenditure shows an increase of £60,000—a somewhat surprising result, at first sight, since the "unexpired economies" brought forward from the end of 1938 appear to have been of the order of £500,000. Hence, the effective increase in costs over the past half-year may be put at £560,000. Net revenue from all sources increased by £383,000, compared with the first half of 1938. Total railway receipts for the half-year increased by £404,000, towards which goods receipts contributed £396,000; hence, the increase in ancillary takings was £52,000 gross. The directors have decided to defer consideration of a dividend on the ordinary stock until the full year's results are available, following the cautious lead adopted by the other lines. The diverse movement

of costs shown by the Great Western limits the opportunity for attempting any earnings forecast for the full year. The gain in net revenue for the first half of the year was equivalent to somewhat less than one per cent., and it would be premature to count upon a sufficient recovery in traffics and stability of costs in the remaining months of the year to establish the stock on a 3 per cent. earnings basis. Indeed, the entire railway market is now taking stock of the possibility of strike action by the Associated Society of Locomotive Engineers and Firemen, which is based on the rejection of the union's claims, as set out on page 282. Whether such action would be supported by the National Union of Railwaymen—or, indeed, whether the Society's tactics is part of a war of nerves, rather than a serious threat of hostilities—it is impossible to estimate. At any rate, the market, although inclining to the view that a strike would be avoided, recognised the possibility that peace might exact its price, and marked prices down to the extent of 3½ in L.N.E.R. second guaranteed, and as much as two points for debentures on Wednesday, before taking a more hopeful week-end view.

\* \* \*

**Arthur Guinness Setback.**—The announcement of a total dividend and bonus of 26 per cent. by Arthur Guinness, Son and Company, was followed by a check to the recovery in brewery shares, and by a fall of 4s. 6d. in Guinness ordinary stock to 101s. 6d. The preliminary statement, like the Distillers' statement a month ago, provides no specific information regarding the level of profits—an omission which runs counter to the expressed wishes of the Stock Exchange Committee, and seems the less necessary since the information provided is sufficient to enable the stockholder, with a little ingenuity, to work out an estimated profits figure for himself. The reserve allocation is £100,000—for 1937–38 no provision was made—and the balance carried forward is reduced to £876,311, against £905,285 brought in. These figures suggest that ordinary earnings amounted to approximately £1,485,000 after tax for the year to June 30th, compared with £1,602,112 for 1937–38, £1,834,804 for 1936–37, and £1,933,623 for 1935–36. It was in the latter year that the Park Royal brewery first came into production, and the sequence of profits since that date raises some question regarding the new plant's success. This point, however, is pure conjecture, for the course of development at Park Royal has not been explained in detail to stockholders. Is the company's rightly-famed publicity proving less effective? Or is it now having to combat a change in taste in favour of lighter beverages? These questions are of importance, since the earnings for the 26 per cent. distribution (which, incidentally, is at a lower rate even than for 1933 and 1934, when 27 per cent. was paid) leave a margin of only 1.3 per cent. over the latest payment. After this week's decline, the ordinary stock offers a yield of £5 5s. 5d. per cent. Hence, despite its recent profits trend, the stock retains a place in the front rank among brewery stocks.

\* \* \*

**Associated British Picture Progress.**—Mr John Maxwell's forecast at last year's meeting of Associated British Picture Corporation that the accounts for the year to March 31, 1939, would show a record profit has proved correct. Trading profits, including dividends received, have increased from £1,302,778 to £1,347,001, while earnings for the ordinary shares have advanced from £466,489 to £543,751. This improvement, even greater than the rise in trading profit, is due to a somewhat surprising reduction in the taxation provision from £315,738 to £216,103, which more than offsets a sharp increase in mortgage interest from £58,434 to £134,718. Hence the 20 per cent. ordinary dividend is covered with a margin of 17½ per cent., after providing £200,000, as before, for taxation, and thus permits the raising of the general reserve allocation from £200,000 to £250,000. The progressive results for the past three years are set out as follows:

|                                           | Years to March 31 |           |           |
|-------------------------------------------|-------------------|-----------|-----------|
|                                           | 1937              | 1938      | 1939      |
| Trading profit, including dividends ..... | 1,265,830         | 1,302,778 | 1,347,001 |
| Taxation and fees .....                   | 166,406           | 318,738   | 216,103   |
| Depreciation .....                        | 175,000           | 200,000   | 200,000   |

| Carried forward .....                     | 93,346            | 81,336*   | 85,087    |

\* After writing off £11,623 new issue expenses.

Such figures suggest that satisfactory profits can be consistently made by an efficient film exhibiting chain. But even the Associated British report leaves some questions unanswered. Further analysis of the single profits item, for example, might be welcomed, and consolidated figures would be even more advantageous. There is no reference to the Union Cinemas holding, nor to the holding of non-voting shares in Metropolis and Bradford Trust, which are at present earning no income. The consolidated balance sheet for the group indicates a position of considerable strength, with free reserves approaching £4 millions. Yet, on a generous computation, the group's net current assets as at March 31 last leave no margin to cover the parent company's final dividend. The group, however, makes satisfactory provision for depreciation, backed by liberal reserve allocations. And it also maintains a steady production of films which find ready display in its cinemas. The current yield of the 5s. ordinary shares, at 12s. 6d., is £8 6s. 8d. per cent. This is not unduly high for a cinema share, but Associated British is the only issue in its class which is likely to interest the speculative investor.

\* \* \*

**Gaumont-British Report.**—It has long been impossible to regard the annual reports of Gaumont-British Picture Corporation as satisfactory, and the latest report, for the year to March 31st, is one in a series which have provided shareholders with the minimum of information. In view of the substantial losses which the group incurred in 1937, and of the absence of ordinary dividend payments since 1936, this fact is the more to be regretted. The profit and loss account, admittedly, shows a token improvement in "Profit, including income from investments, profit on redemption of debenture stock, etc.," from £684,033 to £713,498, while ordinary shareholders may draw some limited consolation from an increase in earnings from £41,846 to £118,639. But the essential facts of the group's earning position are certainly not contained in the following figures from the last three reports:—

|                                      | Years to March 31st |          |          |
|--------------------------------------|---------------------|----------|----------|
|                                      | 1937                | 1938     | 1939     |
| Profit .....                         | 561,702             | 684,033* | 713,498* |
| Provision against subsidiaries ..... | ...                 | 50,332   | 30,399   |
| Taxation .....                       | 57,680              | 76,790   | 65,499   |
| Depreciation .....                   | 13,951              | 42,498   | 28,882   |
| Debt service .....                   | 294,858             | 293,817  | 291,329  |
| Preference dividend .....            | 178,750             | 178,750  | 178,750  |
| Ordinary and "A" ord. shares:        |                     |          |          |
| Earned .....                         | 16,463              | 41,846   | 118,639  |
| Paid .....                           | Nil                 | Nil      | Nil      |
| Earned (%) .....                     | 0.7                 | 1.9      | 5.5      |
| Reserve .....                        | Dr. 435,278         | 15,000   | 100,000  |
| Carried forward .....                | 31,953†             | 58,799   | 77,438   |

\* Includes profit on redemption of debenture stock.

† After crediting £200,000 from special reserve, and providing for £766,809 film production and distribution losses.

Nor, judged by the accounts themselves, is the rise in profits a matter for undiluted satisfaction. The directors

have reduced the depreciation and amortisation provision from £42,498 to £28,882, on assets, including properties and studios and equipment, booked at £2,006,333. There has also been a "moderate decrease" in profits from film exhibiting, possibly a significant point, since reference was made in the previous report to a fall in the combined profits of the theatres within the group.

\* \* \*

Hence, a fuller explanation of the rise in profits seems desirable, for it has not resulted from Bush Radio, nor from exhibiting. The balance sheet provides no fuller information than in past years. Out of total assets of £12,975,720, gross interests in subsidiary companies account for £9,688,822. The parent company has reduced its bank overdraft from £373,991 to £240,789, but the reduction in the amounts due from subsidiaries on loan and current accounts might conceivably have some connection with reduced bank indebtedness. The balance sheet shows a sharp expansion in debtors, including payments in advance, from £578,367 to £827,849, which is unexplained in the directors' report. Nor does the latter refer to several points of importance to Gaumont-British shareholders. No mention is made of the state of the merger negotiations between the Gaumont and Odeon groups. Nor, perhaps understandably, is there any reference to the appointment last February of a Board of Trade inspector to inquire into the Corporation's affairs. Shareholders will recall, however, that Mr Oliver Stanley recently described the directors' attitude as unhelpful. Further, shareholders would appreciate the fullest information regarding the progress of consolidating the group, with its 100 subsidiary and associated companies, to which the chairman referred two years ago. A radical improvement in the Corporation's earnings position is necessary before the ordinary shares can command even speculative support. Meanwhile, shareholders can only continue to press for much fuller information than the board is at present disposed to make available.

\* \* \*

**Watney Combe Reid Profits.**—The full report of Watney Combe Reid and Company hardly bears out the market's favourable interpretation of the preliminary figures, which showed an improvement in net profits, after providing for debenture interest and preference dividends, from £1,014,635 to £1,020,948. In fact, trading profits have been reduced from £1,978,985 to £1,961,155, while

rent and dividend income is slightly lower at £530,258. Hence the company's total income has been reduced from £2,514,948 to £2,491,413. Trade and other expenses are higher, but appreciably less has been needed for repairs and depreciation of brewery and other properties, the allocation being reduced from £291,756 to £238,095. This reduction contains the key to the company's improved net profits, and provides an increase in the balance of earnings available for the deferred stock from £887,219 to £893,532. This is equivalent, as the following table shows, to 31.9 per cent.:

|                                                 | Years to June 30 |           |           |
|-------------------------------------------------|------------------|-----------|-----------|
|                                                 | 1937             | 1938      | 1939      |
| Trading profit .....                            | 2,028,808        | 1,978,985 | 1,961,155 |
| Rents, dividends, etc. ....                     | 544,128          | 535,962   | 530,258   |

| Prof. and pref. ord. dividends                  | 211,663          | 211,663   | 211,663   |
| Deferred Ordinary Stock:—                       |                  |           |           |
| Earned .....                                    | 962,480          | 887,219   | 893,532   |
| Paid .....                                      | 605,228          | 573,374   | 573,373   |
| Earned % .....                                  | 34.0             | 31.6      | 31.9      |
| Paid % .....                                    | 19               | 18        | 18        |
| To property improvement reserve .....           | 350,000          | 325,000   | 325,000   |
| Carried forward .....                           | 325,586          | 314,430   | 309,588   |

Although the deferred stock units responded briskly to the preliminary profits announcement, the full report will accordingly lead to a revision of first thoughts. The company may be said to have fared well in a difficult year, and if further taxation imposts are avoided it may recover some of the ground lost during the past two years, in view of the present rising trend of purchasing power and expanding beer output. The balance sheet reveals the customary strong position, the chief movement being the reduction in gilt-edged and other securities from £1,828,283 to £1,611,417. Possibly as a result of last year's unexpected reduction in the bonus, Watney deferred stock has recently been standing on a significantly higher yield basis than brewery shares in general. This week's improvement, which has raised the price to 65s. 6d., may be regarded as a welcome corrective to a relative undervaluation of the deferred stock. But the revised yield basis of £5 14s. 1d. per cent. is probably now in line with its prospects.

**Tootal Broadhurst Lee Recovery.**—The excellent impression created by this company's preliminary figures has been confirmed by the year's full accounts. Profits for year to June 30th (after deducting general charges, directors' fees and depreciation) amount to £290,256, compared with £257,301 for the previous year. The directors' report offers no explanation for this improvement of 12.8 per cent., but doubtless the continued public demand for the company's branded products in the home market, on which it largely depends, assisted by its highly efficient distributive organisation and a certain expansion in the United States market following the Anglo-American trade agreement, are sufficient to explain the increase. Taxation and N.D.C. reserve receives £95,000 this year against £85,000, while interest and preference dividends absorb approximately the same amount as last year at £16,598. There is thus a balance of £178,658, compared with £155,573, available for the ordinary and employees' shares, from which the directors again recommend a dividend of 10 per cent., plus a 2½ per cent. bonus which in turn necessitates the provision of £40,000, as last year, under the employees' bonus scheme. The allocation to reserve is raised from £25,000 to £60,000 leaving £123,065 to be carried forward against £123,994 brought in. The profit and loss accounts for the past three years are analysed below.

August 5, 1939

|                                  | Years to June 30 |         |         |
|----------------------------------|------------------|---------|---------|
|                                  | 1937             | 1938    | 1939    |

\* Including bonus of 2½ per cent.

† After deducting general charges, fees, depreciation, etc.

‡ After allowing for employees' rights under bonus scheme.

The balance sheet shows fixed assets at £695,882 compared with £744,188, the decrease being largely due to the smaller value of additions made during the year, while £66,111 has been written off compared with £59,937 for 1937-38. The already strong liquid position of the company is now reinforced with an increase in the cash item from £414,144 to £455,595 though this may indicate only a lull in a long-term policy of maintaining technical efficiency by large annual expenditure on capital equipment. The increased holdings of stocks and stores from £877,591 to £981,125 suggests the anticipation of good business in the next few months. The company's trade-marked products certainly stand to gain from the rising purchasing power of the wage-earner generated by the re-armament programme. The ordinary shares are quoted at 46s. 6d. to yield £5 7s. 6d.

**Gold Fields Rhodesian Development.**—The report of Gold Fields Rhodesian Development for the year to May 31, 1939, shows simply that the company has been subject to the influences which have affected all mining finance concerns. Net profit is shown at £127,277, as against £139,963 for the preceding year, though both figures are shown before providing for depreciation of securities. The extent of this depreciation during the period under review is not clear, but a sum of £50,000 is provided from the year's revenue balance, and after allowing for this provision the market value of the quoted investments appears in the aggregate to show an appreciation over book values at May 31st last. The profit and loss account to that date shows, for the first time, revenue derived from profit on sales of investments as distinct from dividend on investments and sundry revenue, and during 1938-39 the former provided just under 50 per cent. of the total. A figure given for comparative purposes in the current report indicates that ordinary income was £2,272 higher at £73,253. The review of the Rand interests of the company (which form only part of the portfolio) provided by Mr D. Christopherson at this week's meeting, may be regarded as entirely satisfactory. In particular, Vogelstruisbult, in which the company is substantially interested, continues to show improved profits and encouraging development results, and declared an initial dividend in June. With a well-chosen portfolio, active management, and an established market following, the 10s. shares at the present level of 7s. 3d. are a good representative among shares of the smaller type of mining finance concern.

**The Week's Company Profits.**—The table of profit and loss accounts on page 298 analyses the results of 28 companies, which show net profits of £3,365,253, compared with £3,216,958 a year ago. This improvement of 4.3 per cent.—the first for a considerable time—is largely due to the Associated British Picture and Gaumont-British results. Aggregate net profits of 1,666 companies whose reports have been published this year to date amount to

August 5, 1939

£212,834,363 compared with £230,731,333, a decline of 7.7 per cent. This week's results are discussed in preceding Notes and on page 298 under the heading "Shorter Comments."

**Company Meetings of the Week.**—Reports of company meetings will be found from page 287 of this issue. Mr D. Christopherson's speech at the *Gold Fields Rhodesian Development* meeting is reviewed on page 287. Major C. M. Threlfall informed shareholders of *Threlfall's Brewery* that the company was now deriving benefit from the new and improved properties. Permission had

been obtained to erect four new fully licensed hotels. At the meeting of *Palestine Electric Corporation*, Viscount Samuel discussed the capital expenditure of almost £1,000,000 in 1937 and 1938 on new power stations at Haifa and near Tel-Aviv. The first five months of this year showed a 6½ per cent. increase in revenue. At the meeting of *Brush Electrical Engineering*, Sir Ronald W. Matthews dealt with the company's transformer department, and the latest arrangements for manufacturing Diesel engines. He declared that the directors looked forward to the future with confidence. Viscount Horne advised shareholders of *New Broken Hill Consolidated* that although the geological survey of the company's leases held out prospects of highly profitable working, evidence was not yet conclusive, and the report should be treated with caution.

#### SETTLING DAYS

TICKET ACCOUNT  
AUGUST 22 AUGUST 24

ALTHOUGH the industrial market maintained a show of firmness at the opening of the three-week holiday account, business and prices have declined as the week has progressed. The reasons are not far to seek. A slight increase in nervousness regarding Danzig, apparent differences of view regarding the Tokyo agreement, the railway engineers' demands, and the psychological effect of the Guinness dividend on a firm brewery market—all these factors have played their part in producing duller markets. Some recovery, however, was reported on Thursday.

*Gilt-edged securities* have not been featured in the headlines, but the trend has become distinctly adverse this week. Undated stocks, led by War Loan, were depressed from the outset, and by mid-week War Loan had touched 91½ compared with 92½ at the close last week. Redeemable stocks were at first content to remain dull, but they too suffered a sharp reaction in mid-week. The improvement in New Zealand stocks continued, although the balance of trading prevented any dashing rise in prices. Apart from certain Australian issues and the South African scrip, the Dominion list did not react immediately to the setback in gilt-edged prices, although interest fell to a low level. The L.C.C., Herts. and Sudan scrips were all marked lower.

German issues were the feature in the *foreign bond market*, for a small volume of selling due to political nervousness produced significant reaction throughout the list. Czech 8 per cents. experienced a sharp fall, after an equally sharp initial rise. Further reactions occurred in Japan bonds, and dealings earlier in the week could only be conducted by negotiation.

*Home rail stocks* were depressed by strike fears and a sharp fall was recorded throughout the marginal, preference and senior stocks. The relatively favourable traffics were without effect and on Wednesday the entire market showed significant signs of weakness, L.N.E.R. second guaranteed falling no less than 3½ to 60, while some of the debentures lost two points. Except for an early rise in Pacific Consolidated debentures the foreign railway market was entirely lacking in features, although prices were unchanged in mid-week.

Though conditions in the *industrial share market* were quiet after the week-end, the undertone was firm. Good class equities were in demand and leading steel issues showed improvement. Whitehead were outstanding, but they offered little resistance in the general decline on Wednesday. Engineering shares were favoured on Monday, and held their gains well into the week. In the electrical list, prices of equipment issues were mainly easier on Wednesday, but supply issues showed little reaction from Tuesday's higher levels. Motor shares were rather subdued this week, though Albion has provided an exception. The continued uncertainty of the effects of Government contract price-fixing and taxation on the aircraft industry had an unsettling effect on leading issues, prices slipping fractionally on Wednesday and Thursday.

Brewery shares were at first assisted by the good beer output figures for June, and Watney deferred were outstanding on the preliminary profits figures. The reduced Guinness distribution, however, was an unsettling factor later in the week. Tobacco shares, after an irregular opening, receded as the week progressed. Leaders in the textile group, and also several low-priced issues had a firm appearance but were unable to resist the easier tendency later. Courtaulds and British Celanese were subject to selling for the greater part of the week, though Courtaulds improved on Thursday. In the stores group, Great Universal found support on Monday. Later, Harrods and Marks and Spencer provided a short-lived diversion. Provision and catering issues opened strongly, with J. Lyons in the lead, but scattered sales of the leaders later caused a depressed tone. Shipping shares lost ground on Tuesday, but prices were held at the lower levels in

mid-week. Turnover in the miscellaneous section has been small, and fractional losses among the leaders on Monday set the trend for the rest of the week, though Associated Cement and Crittall offered resistance.

In the *oil share market*, prices opened firm on Monday with some investment demand for Anglo-Iranian. On Tuesday, the disappointing overnight performance of Wall Street and doubts regarding the international situation caused a marking down of prices which was later accentuated by sales of "Shell" and Royal Dutch from the Continent. The improved rubber price after the weekend caused a harder tone in the share market, and both professional and public support was in evidence. Later, the turnover of shares increased, though interest was concentrated on the outside issues. Among tea shares, Ceylon issues were a feature.

Among *mining* shares, the new account opened on a subdued note, though Geduld continued their rise. Fractional improvements in Kaffirs were due, however, to short supplies of stock, rather than sustained buying, and prices eased later, despite the favourable July profits statements. Among developing issues, Blyvoor responded favourably to the latest news on the flooded shaft, but other counters, after ruling steady in the early part of the week, reacted sharply on Wednesday. Central Mining were in demand among finance shares on Monday, but prices eased in mid-week. Ashanti created a diversion early in the week, but later lost ground on profit-taking. In the base metal market, copper shares failed to respond to the higher commodity price.

## FIFTEEN MOORGATE UNIT TRUSTS

enable comparatively small sums to be spread over a considerable number of market leaders, arranged in carefully planned groups.

**Odham's Properties.**—Offer by Odham's Press to shareholders of Odham's Press.

AFTER the sharp recession at the end of June, following the pessimistic reports on the Danzig situation, a sharp recovery set in, and lost ground was quickly regained. But the market remains nervous and incapable of any sustained improvement until the international skies clear. The only stocks to enjoy any considerable support have been companies interested in the fortunes of the prairies on optimistic reports about the western grain crop. The "Investors" index of the Bureau of Statistics, which stood on June 30th and 92.8, had regained 94.7 by July 7th and 96.7 by July 13th. In the mining market silver stocks slumped badly on the United States Government's announcement that foreign silver purchases would cease. In the general market, despite a fractional setback in the fourth week, prices have advanced several points on the month, particularly among industrials, newspaper, gold and base metal shares. The bond market has remained strong, with a good demand for high-class issues, the Bureau's Index for the price of long-term Dominion bonds for the week July 7-13 being 118.0, as compared with 181.1 for the corresponding week of June and 118.0 for the corresponding week of 1938.

## Berlin

THE Bourse last month showed no decided trend. On balance, a more optimistic tone developed, but shares showed little inclination to follow any general trend, and remained insulated from the political reactions in other bourses. After a firm opening, led by electrical

THE Bourse last month showed no decided trend. On balance, a more optimistic tone developed, but shares showed little inclination to follow any general trend, and remained insulated from the political reactions in other bourses. After a firm opening, led by electrical and shipping issues, prices became somewhat hesitant, and by the middle of the month shipping, steel, munition and bank shares had all slipped back. An improvement set in later, however, but gains were irregular, and shares in the same industry frequently showed widely divergent trends.

JULY opened under the bane of international tension and domestic political problems. Prices were marked up fractionally in the first half of the month, due to periodic spurts in market leaders and commodity shares, but restraint remained the keynote. Even the sudden mid-month spurt in Wall Street affected local markets for only twenty-four hours. By the third week, however, a more optimistic reading of political news resulted in a firmer tendency, activity in rubber shares spreading to other sections. Shipping issues were firm and even Dutch Government bonds had a stronger appearance. This improvement coincided with the sudden appreciation of Amsterdamsche Bank and Rotterdamsche Bankvereeniging shares on news of their amalgamation. A fresh Cabinet crisis towards the end of the month depressed the bond market, but equities were able to consolidate their recent gains. The *Telegraaf*

## MISCELLANEOUS

**MISCELLANEOUS**

**Steel and Company, Ltd.**—Second report for year to March 31, 1939, shows trading profits £34,714 against £36,243 for the initial 12½ months' period. To depreciation, £3,755 (£3,455). To tax and N.D.C., £4,416 (£5,047). To general reserve, £1,500 (nil). To reserve for doubtful debts, £2,000 (nil). Ordinary dividend, 10 per cent. as before. Carry-forward, £1,127 (£845).

**Magnet Joinery, Ltd.**—Trading profits year to February 28, 1939, £17,234 (£27,325). To depreciation, £2,614 (£3,625). Profits before tax, £13,829 (£22,989). To tax and N.D.C., £4,022 (£7,593). Ordinary dividend maintained at 10 per cent. Carry-forward raised from £2,493 to £9,272.

**Clifford Motor Components, Ltd.—**  
Net profit year to May 31, 1939, £90,806  
(£47,616). Total income, £137,508

**Saker Bartle (South Africa).**—Total income year to March 31, 1939, £18,910 (£24,289). To tax, £1,500 (£1,505). Net profit, £9,413 (£13,729). Carry-forward reduced from £1,232 to £270. Cash, £149 (£2,606). To bank loan, £104,110 (£88,001).

## SHORTER COMMENTS

**Company Results of the Week.**—The increase in the net profits of **SHOWELLS BREWERY** from £28,826 to £32,816 is encouraging, and against the trend of recent brewery companies' results. Investment trusts continue to feel the pinch of falling profits, though shareholders of **EDINBURGH & DUNDEE SECOND CLYDESDALE** and **THIRD-SCOTTISH AMERICAN** (whose reports are to hand this week) avoid the brunt of the decline. **CONTINENTAL AND INDUSTRIAL**, however, has lowered the distribution on the year to 4½ per cent. compared with 5½ per cent. Though the company's markets have been affected by political difficulties, **BENN BROTHERS** have well maintained their revenues, net profits having increased from £38,718 to £40,007. **W. AND H. M. GOULDING** continue their steady record over the last decade with net profits, but little changed, of £34,884 and pay the customary 6 per cent. ordinary dividend. Net profits of **BRITANNIA ELECTRIC LAMP WORKS** at £21,521 are down on the year, due partly to the large allocations to depreciation and amortisation, but despite satisfactory progress at the Acton and Wembley factories, a further £12,500 has been required to write off losses in subsidiaries. Another of the newer concerns, **KAY AND CO. (ENGINEERS)**, has reduced its ordinary dividend from 20 per cent. to 15 per cent. The profits of **SAKER BARTLE (SOUTH AFRICA)** show a serious fall, for the second year in succession, from £24,289 to £18,910, which is stated to be due to severe competition in the motor-car distribution business. The accounts of **STEEL AND CO.** reveal a satisfactory profits position compared with past years, the dividend for the 15 months to March 31, 1938, being repeated at 10 per cent.

**Celanese Corporation of America.**  
—Net profit second quarter 1939, \$1,691,060, making \$3,027,774 for first half of 1939. Net profit second quarter 1938, \$426,050, making total first half of 1938, \$540,325. Construction on the company's new plant in Virginia is proceeding rapidly, and it is anticipated that the plant will be in operation at the end of 1939.

**London and Thames Haven Oil Wharves.**—The company intimates that it is not anticipated that the committee's report to the shareholders can be completed until late in the autumn owing to the volume of accounts and documents to be examined and the complexity of the transactions entered into by those companies.

**Royal Bank of Canada.**—The Royal Bank of Canada announce the appointment of Mr W. F. Angus as a Vice-President of the Bank, to fill the vacancy recently caused by the death of Mr Julian C. Smith, and the appointment of Mr S. G. Dobson as a Director of the Bank and Member of the Executive Committee.

**Brightside Foundry and Engineering Company.**—Profits year to June 30, 1939, £137,000 (£90,850). Ordinary dividend 15 per cent., together with a cash bonus of 20 per cent. For preceding year the ordinary dividend was 15 per cent., together with a cash bonus of 10 per cent.

**Cossor Share Deal.**—Provisional terms have been settled for the disposal of a block of 1,000,000 ordinary shares of A. C. Cossor, Ltd., subject to approval of shareholders. These shares represent 50 per cent. of the issued capital and are owned by A. C. Cossor (Holdings), a subsidiary of Sterling Industries, formerly Ismay Industries. It is stated that the company's turnover for the first three months of the current financial year has reached record figures.

**Burma Corporation.**—Final dividend of 5 annas on ordinary shares of 9 rupees, making 9 annas tax free for year to June 30, 1939. The dividend is equal to 6½ per cent., tax free. For previous year dividend was 10 annas tax free, or 6⅔ per cent.

**Broken Hill Proprietary Mines, Ltd.**  
—Net profit year to May 31, 1939, of £1,431,513 shows a rise of £131,052. This figure is arrived at after providing £850,670 for depreciation, against £709,054 for previous year. Ordinary dividend maintained at 12½ per cent. on a capital of £6,950,776 against £5,220,371.

**Witwatersrand Working Profit.**—Total estimated working profit of Witwatersrand gold mines for June, 1939, amounted to £2,912,124, against £2,961,769 for May, 1939.

# Industry and Trade

**Record Employment.**—The continued expansion in business activity is reflected in the employment and unemployment returns for July. Between June 12th and July 10th, the number of insured persons aged 16 to 64 (exclusive of agriculture) estimated to be in employment in Great Britain rose by 95,000 to 12,064,000. This is the highest number ever recorded; it exceeds the record reached in August, 1937, by some 350,000, and the figure for July last year by about 650,000. That the improvement is not due to seasonal influences is revealed by the movement of *The Economist's* indices of employment and unemployment, given in the accompanying table. Moreover, the fall in unemployment last month was again fairly widespread; it was almost as marked in the

\* Estimated.

consumption goods trades as in the industries on which defence expenditure is mainly concentrated. The expansion in the demand for consumption goods is a direct consequence of the increase in Government expenditure. But how long will it be possible to increase the production of armaments as well as that of consumption goods? As the number of registered unemployed on July 10th was still 1,256,000, there appears to be considerable scope for a further expansion in production. Actually, however, the limit is much closer than this total suggests. It is quite possible, in fact, that a number of industries may soon reach the stage when their total output cannot be increased much further. When that stage will actually be reached, however, depends largely on the rate of increase in defence expenditure. The Government will then be faced with the task of curtailing production for non-military purposes; this can be done through taxation and rationing or by allowing prices to rise. So far, however, the Government has given no indication of the policy it is likely to adopt.

**Engineering Faces Labour Shortage.**—One industry in which a shortage of labour may soon be seriously felt is engineering, for unemployment in this branch of activity has already been virtually eliminated. The table

below shows how small the industry's labour reserves now are:—

| Administrative Division | PERCENTAGE OF INSURED PERSONS UNEMPLOYED IN JULY |                        |                    |  |
|-------------------------|--------------------------------------------------|------------------------|--------------------|--|
|                         | General Engineering                              | Electrical Engineering | Motor and Aircraft |  |
| London.....             | 2.5                                              | 2.9                    | 3.0                |  |
| South East.....         | 2.2                                              | 4.9                    | 2.0                |  |
| South West.....         |                                                  | 2.0                    |                    |  |
| Midlands.....           | 2.6                                              | 2.1                    | 4.8                |  |
| North.....              | 8.2                                              | 4.6                    | ...                |  |

The proportion of insured persons unemployed in general and electrical engineering and in the motor and aircraft industries is now only about 2 per cent. in the principal centres of these industries. The scope for further expansion in these industries thus appears to be limited in the absence of the dilution of skilled labour; but the unions, aware of their responsibilities, have virtually agreed to permit dilution when all skilled workers have found employment.

**Volume and Value of Overseas Trade.**—The volume of Britain's imports in the second quarter of this year was higher than in the corresponding quarters of 1929 and 1937. In view of the unprecedented expansion in industrial production this is scarcely surprising. Domestic exports, though appreciably higher in volume than in April-June last year, were still well below the level of the corresponding quarter in 1937. Nevertheless, the figures show that the revival in the export trades has played a part in recovery. Despite the increase in the volume of imports, however, their average price in the second quarter was scarcely higher than in the first quarter and remained well below that reached in 1937. The absence of a rise in import prices is probably due, in a large measure, to the

INDICES OF THE AVERAGE PRICE AND VOLUME OF IMPORTS AND EXPORTS (1935=100)

|                     | AVERAGE PRICE    |       |       | VOLUME           |       |       |

| Second quarter..... | 110.5            | 104.4 | 113.8 | 112.0            | 94.3  | 101.4 |
| Third quarter.....  | 110.6            | 106.7 | ...   | 111.6            | 95.5  | ...   |
| Fourth quarter..... | 127.7            | 112.4 | ...   | 112.8            | 105.0 | ...   |

recession in the United States early this year, which has only recently given way to an improvement. If recovery in the United States is sustained during the next few months, import prices will probably show a more marked upward trend. The decline in import prices since 1937 largely explains why the rapid expansion in domestic business activity has not been accompanied by a more marked rise in costs. Industry has been able to obtain cheap raw materials, while the fall in the prices of imported food, reflected in the decline in the cost of living, largely explains why there has been no marked intensification so far in the pressure for higher wage rates.

**Railwaymen's Wages.**—The announcement at the end of last week that the minimum wage of railway employees in the conciliation grades would be raised at the end of

July from 43s. to 45s. was welcomed as an expression of a spirit of conciliation within the industry. The initial gratification at this move, which was made by the general managers of the four main line companies and not through the normal machinery of the Railway Staff National Tribunal, was somewhat damped by a fuller consideration of the general railway wage position. At the end of February of this year the Railway Staff National Tribunal turned down an application by the unions for increases of pay and improved conditions of work. The granting of this claim would have added at least £6,869,000 to the railways' annual working costs. The unions have since modified their demands, and present claims would involve an addition to annual wages of not much less than £2,000,000. The decision actually made affects directly about 15,000 men in station, train movement and clerical staffs, and will cost the companies about £100,000 a year. The Locomotive Engineers, in particular, seem to have accepted the award as an insult, and their executive has issued a warning that unless its original claims are met in full resort may be had to a strike. Every sympathy must be felt for those members of the lower-paid grades of railway employees who have asked for bread and have been given an amorphous object which is neither bread nor a stone. But, on the other hand, it must be recognised that the reasons why the companies expressed themselves unable to meet the full demand of last February still hold good to a very great extent. At that time they said that traffic receipts and net earnings would not permit so great an addition to annual outgoings. The argument was a strong one; and the rise in net revenue during the past six months by £1,896,000 as compared with last year does not weaken it very appreciably, since the net revenue is still £2,772,000 less for the half-year than in the first six months of 1937. The National Tribunal last February said that an increase in the wages of the lowest grades should be a first claim when revenues rose sufficiently to make concessions possible. Revenues have risen; and concessions have become possible. It would be difficult to argue that these concessions should be limited to so small an amount as £100,000.

**Petrol in War-time.**—During the first six months of the current year Britain imported 1,691 million gallons of crude oil and petroleum products (something like six million tons) at a cost of over £24 millions; of this quantity 804 million gallons, or almost one-half, consisted of petrol. In view of the certainty of a large increase in mineral oil consumption in time of war and the fact that Britain is able to cover only about 7 per cent. of her peace-time requirements from domestic raw materials, it has long been evident that the most rigid economy would have to be practised in case of an emergency. From a statement made by Mr Geoffrey Lloyd, Secretary of the Mines Department, in the House of Commons on Tuesday, it would appear that the Government's emergency plans for oil are now virtually complete. Arrangements have been made, so Mr Lloyd revealed, for the maintenance of supplies, the accumulation of reserves, marketing and price control. As an inevitable corollary to the control of prices, a scheme of rationing has been prepared for the various categories of consumer. Fears had been expressed that private motoring would be prohibited altogether in war time, but while this is not the Government's present intention, it does not follow that it will in fact be possible to provision a fleet of two million private cars. Rationing will be on a horse-power basis, and owners will have the right to appeal against their allocation to a local petroleum officer. The necessary ration books and petrol coupons have already been printed and distributed throughout the country. Rationing of fuel will also be applied to public service and goods vehicles, though, in view of differences in operating conditions, separate arrangements have been made for each of these branches of road transport. As long ago as last January it was announced that the half-million goods vehicles would be arranged in voluntary "shadow" groups of 25 to 100

vehicles for the purpose of economising transport facilities in time of war; and a month ago the Minister of Transport stated that 316,000 vehicles had already been enrolled. Rationing would be on a group basis and "outside" firms would probably have great difficulty in obtaining supplies. For the 50,000 buses and coaches there will be no grouping system, but services will in all probability be drastically curtailed. Quotas for rationing will be fixed mainly on the basis of actual consumption in 1938, details of which have already been supplied to the Ministry of Transport. Meanwhile, supplies of other petroleum products to industrial users will be regulated by a system of priorities. Although, as Mr Lloyd revealed on Tuesday, the possibility of an extended use of substitute fuels in war time is being investigated, there is no evidence that the Government is contemplating any radical departure from the policy of reliance on imported supplies with adequate storage, recommended last year by the Falmouth Committee.

**American-Japanese Trade.**—On July 26th the Government of the United States notified Japan of its decision to denounce the trade agreement with that country. The decision takes effect after six months. An analysis of the most important products exchanged between the two countries, as given in the American trade returns, is given below:—

U.S. TRADE WITH JAPAN (Million \$)

|                                           | 1929  | 1936  | 1937  |                          |

| Chemical products.....                    | 12.2  | 9.9   | 7.3   | 5                        |

The value of American imports from Japan has fallen considerably since 1929, due very largely to the severe fall in prices of raw silk; although the value of the American imports of Japanese raw silk fell from \$356 millions in 1929 to \$100 millions in 1937, the quantity declined only from 70 to 54 million lbs. In 1938 the value of American-Japanese trade again declined; American imports from Japan were valued at \$131.7 millions and her exports to Japan at \$288.6 millions. Japan supplied in 1937 practically the whole of the raw silk used in the United States and an appreciable proportion of her imports of cotton and silk manufactures. In recent years Japan has bought a smaller proportion of her raw cotton requirements from America, but she is still her best market for wood pulp. As in the case of Anglo-Japanese trade, Japan's

**OTARD'S** EST. 1795  
V.S.O.P.  
**LIQUEUR BRANDY**

MATURED AND BOTTLED AT CHATEAU DE COGNAC

exports are largely luxury goods, while her imports consist mainly of raw materials, necessary both for her export trade and her armament industries. If, therefore, the denunciation of the American-Japanese trade agreement were followed by measures restricting the imports of Japanese goods into the United States, it would be extremely difficult for Japan to maintain her existing level of industrial activity.

**French Wheat Policy.**—The fall in cereal prices in 1930 led in France as well as in Britain to measures designed to maintain to the home producer of wheat the customary level of prices. In January, 1933, the French Government, by offering a price considerably above the then world price for wheat, obtained possession of large stocks which it could not resell without heavy loss. In July, therefore, the Government instituted a fixed minimum price for all wheat sold within France and in August, 1936, this measure was reinforced by the setting up of a National Wheat Board to control the prices, production and marketing of wheat. The Board is administered by a Central Council on which are representatives of wheat growers and users, and various Government Departments; it obtains funds by the imposition of a levy on all wheat growers, in proportion to the amount of wheat sold and also obtains the proceeds of the import duty on wheat. In the first two years of its existence, the short harvests enabled the Wheat Board to concentrate its energies on the disposal on world markets of the stores accumulated in 1933-4, but last autumn, when world prices were again declining, the Board was faced with a domestic crop of almost record size. Details of production and trade are given below:—

| FRENCH WHEAT PRODUCTION AND TRADE       |      |      |      |      |
|-----------------------------------------|------|------|------|------|
|                                         | 1935 | 1936 | 1937 | 1938 |
| Area under wheat (mill. acres) .....    | 13.3 | 12.7 | 12.7 | 12.5 |
| Production (mill. quintals)...          | 77.6 | 69.3 | 70.2 | 94.1 |
| Imports (mill. quintals).....           | 7.0  | 5.3  | 4.6  | 4.7  |
| Exports of wheat (mill. quintals) ..... | 8.2  | 3.2  | 0.3  | 0.7  |
| Exports of flour (mill. quintals) ..... | 1.5  | 1.3  | 0.8  | 1.2  |

Arrangements were made with the milling trade to lower the extraction rate of flour, while the State Alcohol monopoly arranged to take over nearly two million quintals of wheat for distilling, and further large quantities have been stored by the State against an emergency. The Board increased by 50 per cent. the levy on growers in order to obtain funds to meet the cost of disposing of the surplus, but this measure was inadequate and subsidies had to be granted from the French Treasury. The latest series of decrees issued in Paris on Monday deals, among other matters, with the problems of the Wheat Board. In future, in years when a special administrative committee considers that the wheat crop, taken in conjunction with any surplus remaining unsold from the previous year, will exceed domestic consumption, growers will surrender to the Wheat Board that proportion of their crop which is considered to be surplus to French requirements and they will be paid for this surplus only on the basis of its realisation value. In effect, the growers will obtain the fixed minimum price (at present 204 francs per hectolitre, less the levy) for that part of their crop which is bought by the trade and a different and presumably lower price for any excess.

**Depressed Oil Markets.**—British oil prices, and those of the world market in general, are dependent in large measure on the course of quotations at the Gulf of Mexico,

for the United States is the world's most important exporter of petroleum products. For most products Gulf export prices in recent months have continued to run below the level of a year ago, despite the fact that total demand has compared very favourably with last year's figures. This fact is revealed by the following table of price indices taken from a recent issue of the *Petroleum Press Service*:—

| EXPORT PRICES F.O.B. GULF<br>(Average of 1929 = 100) |            |          |            |         |                    |                 |
|------------------------------------------------------|------------|----------|------------|---------|--------------------|-----------------|
|                                                      | Petrol     |          | Kerosene   |         | Gas and Diesel Oil | Bunker Fuel Oil |
|                                                      | U.S. Motor | 64/66 B. | 41/43 p.w. | 77 w.w. |                    |                 |
| Annual average:—                                     |            |          |            |         |                    |                 |

A seasonal advance in motor fuel prices is normal in the second quarter of the year. Last year, however, seasonal influences were outweighed by the effects of the recession in business activity in general, with the result that American petrol prices showed a progressive decline. Owing to the excessive optimism of the American refiners and their consequent failure adequately to reduce their stocks, the incipient recovery movement has been arrested during 1939, and petrol prices have risen very little from their low level. Kerosene, gas and diesel oil have actually continued to decline in price during the past six months, though in the case of the last two products the fall now appears to have been arrested. Bunker fuel oil has undoubtedly made the best showing; with Gulf coast stocks reduced below the level of a year ago, and with demand on the up-grade, this product has risen to its highest level for over twelve months. This, however, is no compensation for the low level of petrol prices, from which the industry's profits are largely derived. With the summer consuming season now well under way, a drastic restriction of refinery activity will be necessary if the industry is not to be burdened with excessive stocks of motor fuel next autumn.

**Messrs Bunting and Company.**—The difficulties of Messrs Bunting and Company, produce brokers, to which reference was made on page 131 of *The Economist* of July 15th, have reached a decisive stage. A statement was issued by the company's solicitors, according to which the committee appointed by the meeting of interested parties has recommended the liquidation of the firm. The company has decided to accept the recommendation. The approximate statement of the company's position, submitted to a statutory meeting of creditors, showed that against liabilities of £583,583 expected to rank, there appears to be a deficiency of £522,264 on the estimated realisable value of the assets. A trading associate of Messrs Bunting and Company, Messrs J. and I. Batten and Company, has also decided to wind up. A declaration of solvency has been filed and the liquidation will be a voluntary one. Fortunately, the tea market will not be endangered by the difficulties of Messrs Bunting and Company. It has been officially stated by the firm's solicitors late last week that the tea stocks involved—they are valued at £1,250,000—are "strongly held." This statement has had a reassuring effect on the tea market. Prices were firm this week, and they have virtually recovered to the level prevailing before rumours of Messrs Bunting's difficulties gained currency early in July.

**Further Fall in Freight Rates.**—Tramp shipping freight rates continued their downward movement last month, and *The Economist* index for July is lower than for any other month this year:—

| The Economist INDEX OF FREIGHT RATES<br>(1898 = 1913 = 100) |              |            |            |             |           |            |            |
|-------------------------------------------------------------|--------------|------------|------------|-------------|-----------|------------|------------|
|                                                             | Average 1913 | June, 1938 | July, 1938 | April, 1939 | May, 1939 | June, 1939 | July, 1939 |

| Homewards .....     | 124.4     | — 6.2               | Australia .....                | 108.5     | + 1.0               |
| North America ..... | 112.9     | — 1.1               |                                |           |                     |

The fall in freight rates is not unconnected with the growth in the world's merchant shipping tonnage; according to *Lloyd's Register of Shipping* it rose from 67.8 million gross tons in June, 1938, to 69.4 million gross tons in June this year.

**Sugar Supplies in 1939-40.**—The poor beet crops in Europe last autumn and the buying of sugar by Governments for emergency stocks, which has led to a temporary shortage of supplies in the current season, has scarcely affected the problem of excess supplies in the new season beginning on September 1st. During the past month the International Sugar Council has been considering this

problem, and in a *communiqué* issued on Monday it published its solution. The basic export quotas, amounting to 3,647,500 tons, have been reduced, firstly by the 80,000 tons which have been shipped in the current season to meet the shortage, secondly by 71,000 tons to allow for quotas which will probably not be used, and thirdly by voluntary surrenders of quotas amounting to 385,500 tons by parts of the British Empire. The supplies available for the free market are thus reduced to 3,111,000 tons, which just balances the expected consumption, after an allowance of 38,000 tons has been made for the renewal of stocks depleted during this summer. The table below shows the estimates of free market requirements and supplies in 1939-40, given by the Council:—

| SUGAR SUPPLIES AND FREE MARKET REQUIREMENTS IN 1939-40<br>(Metric tons)                                                                                            |           |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|
| FREE MARKET SUPPLIES                                                                                                                                               |           |
| Basic quotas .....                                                                                                                                                 | 3,647,500 |
| Less—                                                                                                                                                              |           |

| Plus—                                                                                                                                                              |           |
| Carry-over from second quota year .....                                                                                                                            | 38,000    |
| Less—                                                                                                                                                              |           |
| Share of British Dominions and Colonies in estimated increase in United Kingdom and Empire requirements (after deducting 30,000 tons not at present claimed) ..... | 145,000*  |
| Available to suppliers of the free market .....                                                                                                                    | 3,111,000 |

Provided, therefore, supplies of sugar from beet are of normal size and consumption is not unduly disturbed, a balance has been struck for the coming season. But, in view of the speed with which such a balance can be upset by vagaries of the weather or of international politics, it is to be hoped that the Council will find some procedure by which supplies can in the future be more quickly adjusted to changes in demand.

## INDUSTRIAL REPORTS

**THE** holiday month has opened with activity in many industries at a higher level than ever before. The coal trade remains active, though output has naturally been reduced by holidays. The iron and steel industry, too, continues to operate at a high level and production has not been curtailed as much as usual. The tinplate industry will cease operations next week, but orders on hand remain substantial. New business in cotton goods has been less active, but the industry remains busy. The production of wool textiles is now at a higher level than at any time since the beginning of 1937. Owing to the heavy pressure for delivery, operations in many industries will be curtailed as little as possible this summer.

### Coal

**Sheffield.**—The market remains very firm, although demand this week has been slower on the eve of the holiday, particularly for industrial steams. The forward export market is gathering strength, but prompt business is limited. The Swedish State Power

Board has placed a contract for 25,000 tons of best South Yorkshire washed smalls for shipment during August, September and December, which will help to reduce the heavy stocks at pits. Swedish buyers have bought 100,000 tons of patent oven coke for stock, and to deal with this the Midland district has received a special allocation of 50,000 tons from the International Coke Cartel.

**Newcastle-on-Tyne.**—Market conditions in this area remain steady and the prospects for some months to come are regarded as satisfactory. Northumberland steam collieries are comfortably placed and, with the exception of smalls, a fair amount of business has been placed ahead. Durham collieries producing manufacturing coals are heavily sold ahead; substantial contracts have been placed with Germany and Italy. Patent oven coke is a firm market under a persistent demand from both home and foreign consumers.

**Glasgow.**—Except in Lanarkshire, production is now in full swing after

the holidays, and in all areas demand is brisk. In Fife and the Lothians export supplies are fully booked until the end of the month, and in the West Country inland and shipping business combined absorbs the bulk of the output. With prices due to rise by 2s. 6d. per ton on Monday next house coal meets a ready off-take, especially the better qualities, while public utility, general industrial and London requirements account for the supply of washed smalls. Irish business is an important factor in the Ayrshire field. Owing to the slow return of labour, shipments last week, at 150,000 tons, were 30,000 tons down on the year. The excess over last year's shipments to date, at 609,000 tons, is encouraging; aggregate loadings to date total 6,430,000 tons.

**Cardiff.**—The Egyptian State Railways have invited tenders for between 360,000 and 480,000 tons and the Lithuanian Railways for 65,000 tons of locomotive coals, and the Piraeus Electricity Works for 30,000 tons of duff coals. These orders have been the only feature of a very quiet prompt market

and shipments under contract are now averaging about 400,000 tons per week. There are fairly considerable stocks of large and ordinary small steam coals, but these will probably be depleted next week when work will be suspended practically throughout the coalfield for the annual "holidays with pay." Prices are a shade easier for spot positions.

## Iron and Steel

**Sheffield.**—The iron and steel market has been quiet this week on the eve of the holiday. Consumers, however, are taking heavy deliveries of material under contract, their stocks in many cases having run rather low. Forge pig iron continues very limited in demand, but for foundry there is a steady inquiry. Hematite business remains active for mixed numbers, and there is heavy booking of special qualities. Finished iron transactions are few and of little weight.

American imports are helping to meet the shortage of heavy basic steel billets, but the fact that they are more expensive than British billets causes buyers to prefer the latter. Small steel bars are in heavy demand, as are wire rods and acid steel billets. Structural steel business shows a week-to-week improvement.

The pressure of national defence work continues to increase, and to meet this the holiday is being reduced at some of the big works.

★

**Middlesbrough.**—Shipments of pig iron from the Tees during July amounted to 6,435 tons; 4,940 tons went to coastwise destinations. The largest purchaser was South Wales; the clearances of pig iron to that district were the heaviest for six years. The total of manufactured iron and steel shipped during the month from the Tees was approximately 42,000 tons, of which 27,000 tons went to foreign destinations. Imports of iron ore in July were 169,000 tons, compared with 179,800 tons in June.

There is little change in the position. Production of basic iron is well maintained and is all absorbed in the local steelworks. Very little foundry iron is being produced, but the statistical position with regard to East Coast hematite pig iron is better owing to the shipments to South Wales. The steel output is still below requirements but the position has been eased by the arrival of foreign semi-manufactured steel. It is expected that further quantities of heavy steel scrap will be arriving from America but in the meantime steelworks are taking any quantities available from local merchants. Another blast-furnace has been lighted in this district during the past week and is producing ferro-manganese.

★

**Glasgow.**—Plants in Glasgow have now an exceptionally heavy programme of work before them and have made an excellent start after the holidays. Extensive repairs and alterations have been carried out and as a result outputs have been increased at many establishments. The amount of work now on the books of the steelmakers is exceedingly heavy

and new business very plentiful. Sheet makers are in a like position, and orders are being placed quite freely for delivery in October and November. Tube makers continue to be fairly well employed and in some branches are very busy. Supplies of Continental semis have been more plentiful of late and re-rollers are obtaining regular deliveries.

★

**Cardiff.**—Production in the tinplate industry continues at over 70 per cent. of capacity, but there has been a little quieter trend in current business and at the beginning of the present week unexecuted orders stood at 4,227,405 boxes, compared with 4,252,000 boxes a week ago. The new mills at Ebbw Vale are reported to be operating at capacity. The trade in sheets is exceptionally active in the home market, where A.R.P. orders are still the dominating factor. Other re-rolling sections as well as the heavy branches of the industry are fully employed. The tinplate works will be idle next week for the usual summer holidays, but in view of the abnormal pressure for steel the melting furnaces will continue working. The quotation for good cast-iron scrap is now 80s. per ton and upwards, but other scrap iron prices are fixed.

★

**News from Abroad.**—The demand on international steel markets has slowed down further in view of the holidays, and many consumers have postponed their purchases. But during the last few days a number of medium orders for particularly speedy delivery have been offered to American makers, especially by Scandinavian shipyards, suggesting that there is some difficulty in obtaining prompt delivery from European works. In some cases, consumers seem to be anxious to increase their stocks in order to be prepared for an emergency. It is generally expected that the seasonal slackness will soon be overcome and that the spring business will be satisfactory this year.

Current steel consumption for armament orders is everywhere substantial, and requirements are likely to increase considerably as soon as the political outlook is clearer. Inquiries from several South American countries, Holland and Scandinavia have recently been on a tolerably satisfactory scale, but the Far Eastern business is very quiet. Semi-products, merchant bars and thick plates are in fairly good request, but the demand for thin sheets, strips and wire products has perceptibly decreased.

Rebates on official prices have experienced a further increase on unorganised markets. For merchant bars and sections concessions of about 6s. to 8s. (gold) per ton are granted by certain Continental re-rollers. Thin sheets are offered by French mills below official prices and a similar situation is prevailing in regard to strip. On the other hand, prices on the Scandinavian markets have been slightly increased for certain products owing to the diminished Swedish competition.

## Textiles

**Cotton (Manchester).**—The demand for yarn and piece goods has been fair and some useful orders have been secured; firms engaged in the coarser

end of the trade are much busier than producers of fine goods. The Government has decided to buy a new style of cloth and specifications and samples will be available next week. It will be similar to a denim and mule yarns may be used. Contracts are expected for about 5,000,000 yards.

There has been very little change in raw cotton prices. Trading appears to be settling down after the adjustments to the export subsidy in the United States. Diverse weather reports have been received from the American belt, but on the whole the plants appear to be doing fairly well. The first Government estimate of the yield will be published next Tuesday, and the forecast is expected to be between 11,500,000 bales and 12,000,000 bales.

★

**Wool (Bradford).**—At the fourth series of London sales the home trade purchased more wool than at any series so far this year; it took 59,000 bales and the Continent 24,000 bales. Nothing is credited to the United States, although a few lots were taken for that country. The carry-over of 39,000 bales is small. Although cross-breeds failed to maintain the full opening rise, the improvement in greasy crossbred fleece was considerable. The limitation of prices for khaki fabrics which the Government has decided upon clearly indicated to spinners and manufacturers that they could not afford to pay a great deal more than at the May series. The trade is now entering the longest vacation of the year; the next London sales will begin on September 19th.

The past month has seen a marked improvement in the civilian demand, a reflection of the increase in purchasing power. But the chief concern of spinners and manufacturers is to execute their contracts with the War Office as quickly as possible, and there is virtually no idle machinery in any part of Great Britain where khaki contracts are being carried out. The past week has produced some speculation regarding a further important Government order for some Continental ally, but nothing has yet materialised. It would probably be difficult to find more machinery which could tackle additional Army orders. Mills are now busier than they have been since the early months of 1937, and prices all round are steady and firm.

★

**Jute (Dundee).**—While the Dundee markets were closed last week, prices for raw jute showed a decided fall in London and Calcutta. This was not unexpected in view of the favourable reports of the new crop, combined with the fact that there will be a much smaller consumption this season through curtailment of production in India. The mills there have now commenced working with 20 per cent. of their hessian and 7½ per cent. of their stacking looms sealed up.

The raw material has now fallen to fairly reasonable levels for new crop, and old crop has also gone down in sympathy, at least where it is quoted. There is now extremely little old crop on offer, perhaps a little Daisee and Tossa to Dundee, but white jute is not mentioned. The price of old crop Daisee-2/3 is still about £27 per ton,

(Continued on page 289)

## COMPANY MEETINGS

### GOLD FIELDS RHODESIAN DEVELOPMENT COMPANY, LIMITED

#### REVIEW OF MINING INTERESTS

#### MR D. CHRISTOPHERSON'S SPEECH

The twenty-seventh ordinary general meeting of the Gold Fields Rhodesian Development Company, Limited, was held, on the 28th ultimo, at the Chartered Insurance Institute, 20 Aldermanbury, London, Mr D. Christopherson, C.B.E., the chairman of the company, presiding.

The chairman, in the course of his speech, said that the balance carried down to appropriation account showed a decrease of £12,686 as compared with the previous year. That decrease, a comparatively small one having regard to the unsettled world conditions which had existed, was accounted for by an increase of some £3,000 on account of Kenilworth maintenance and depreciation, due to loss of cattle, and a decrease in the net profit on sales of investments of £12,178, against which, however, there was an increase of £2,272 in the revenue received from dividends on investments and sundry revenue.

It was hardly necessary to say that the reduced profit on sales of investments was entirely due to unfavourable market conditions which had existed practically throughout the year, making profitable realisation of investments extremely difficult. Receipts from dividends and sundry revenue were made up by £65,452 from dividends, a slight decrease of about £650 as compared with the previous year, and by revenue from such sources as interest, underwriting commission and from farms and royalties, etc. They had hoped that the receipts from dividends would have exceeded the amount shown in the previous year from this source, but owing to the fact that certain companies, who had declared dividends last year just previous to the end of their financial year, did not do so this year until after the year had closed, they would not receive the benefit of those dividends until the current year.

Out of the available balance, £50,000 had been placed to reserve for depreciation and £15,000 transferred to reserve account, and the directors recommended a dividend of 5 per cent. for the year. Investments stood in the balance sheet at £1,088,372, and their market value showed in the aggregate an appreciable excess over this figure.

They still retained their large shareholding in the Wanderer Consolidated Gold Mines, from which they continued to receive a yearly dividend of 12½ per cent., a very satisfactory return on the value of their holding. In Northern Rhodesia they still retained a moderate interest in Rhodesian Selection Trust, Rhodesian Anglo-American, and Rhodesia Katanga Company.

#### INTERESTS ON WITWATERSRAND

Turning to their main interests on the Witwatersrand, their investment in the Luipaards Vlei Estate and Gold Mining Company had been somewhat increased. The development on this mine continued excellent, both as regarded value and percentage of payability. They had little doubt but that this investment would eventually show material appreciation on the capital invested therein.

Their holding in the Simmer and Jack Mines remained substantial, with which they were well satisfied.

The Vogelstruisbult Gold Mining Areas, in which they were substantially interested, had continued to show improved profits, while development also continued to show encouraging results both as regarded tonnage and values. An initial dividend of 6d. per share had been declared last month.

They still retained their interest in Spaarwater Gold Mining Company, which company continued to open up a fair percentage of payable development.

With regard to Venterspost Gold Mining Company, in which they still retained their holding, it was hoped eventually to see this mine milling at the rate of 200,000 tons or more per month with resultant very satisfactory profits. Meanwhile development continued to show good results both as regarded values and percentage of payability.

#### WEST AFRICAN INVESTMENTS

Turning to their West African interests, they still held a substantial interest in Ashanti Goldfields, which company continued to open up exceptionally fine values. This was an investment they had just cause to be well satisfied with.

They retained a holding in Gold Coast Selection Trust, which company was a large shareholder in Marlu Gold Mining Areas,

Ariston Gold Mines, Amalgamated Banket Areas, Bremang G Dredging Company, and Gold Coast Main Reef, all of which were either good dividend payers or were likely to become so in not distant future.

Other West Coast companies in which they held interests were Taquah and Abosso Mines, Konongo Gold Mines, Ariston G. Mines, all of which were dividend-paying companies with prospects of paying increased dividends in the near future, while without exception the development results were most encouraging.

In Australia they retained their holding in Gold Fields Australi Development Company. Their interest in Lake View and Star had been somewhat increased in view of the continued satisfactory development results and the good return to be obtained on investment at present market prices.

The prospects of Oroville Dredging Company continued to be the highest order, and they expected to see that company pay increased dividends in the near future.

In conclusion, the chairman said that he regretted to say that again it was impossible at that early stage of the financial year to give any forecast as to the prospects for the year. To attempt to do so with so much uncertainty as to the course of events. Europe and elsewhere would make any such attempt of little value. He thought, or at any rate hoped, they would agree that the company's capital was well invested and under normal conditions should show profitable returns, while at the same time their liquid resources were very sound, and placed the company in a position to take up new promising business when such presented itself.

The report and accounts were unanimously adopted.

### THRELFALL'S BREWERY COMPANY, LIMITED

#### IMPROVED RESULTS

The fifty-second annual general meeting of Threlfall's Brewery Company, Limited, was held, on the 2nd instant, at Southern House, Cannon Street, London, E.C., Major C. M. Threlfall, J.P. (the chairman) presiding.

The Chairman, in the course of his speech, said that he felt sure stockholders would have perused the report, balance sheet and profit and loss account with much satisfaction, and the directors were equally pleased that the trading results under review exceeded those of the previous year. General industrial activity throughout the country had been stimulated during recent months by the intensified re-armament programme, and in the Liverpool and Merseyside district business had been more active and a general improvement had been noticeable.

A certain proportion of the increased sales of the company's products was naturally due to such improved conditions, but he felt, however, that he would like to express the view of their directors that it was not caused by that alone, as a decided benefit was now being derived from their new and improved properties, which were furnishing them with an increased proportion of their income. In that connection permission was granted at the last Brewster Sessions to erect four new fully licensed hotels. With regard to the properties generally, in structure, appearance and comfort they compared very favourably with those of any other licensed premises throughout the areas in which they operated.

Whilst the profits showed an increase over those of the previous year, the accounts had had to bear a considerably higher charge in consequence of the rating assessments under the recent "Robinson" judgment. In addition they had borne the full amount payable by the company in respect of National Defence Contribution.

The gross profit for the year was £430,800, and the net profit £313,367.

The report was adopted and a dividend at the rate of 20 per cent. per annum on the ordinary stock for the half-year, making 18 per cent. for the year, approved.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to:—

# PALESTINE ELECTRIC CORPORATION, NEW BROKEN HILL CONSOLIDATED, LIMITED

## STRONG POSITION

### VISCOUNT SAMUEL'S SURVEY

The sixteenth ordinary general meeting of the Palestine Electric Corporation, Limited, was held, on the 28th ultimo, at 2 Grosvenor Gardens, London.

The Rt. Hon. Viscount Samuel, P.C., G.C.B., G.B.E. (chairman of the company), in the course of his speech, said: Throughout the year under review Palestine continued in a disturbed state. This has been the third year of unrest and violence; and to these conditions political uncertainty had now been added. The economic life of the country has of necessity been greatly affected. In these circumstances, it is gratifying to find that the business of the corporation suffered no shrinkage, and that the gross revenue for 1938 was at no lower level than that of the previous year. There was, indeed, in the number of consumers an increase of over 4,500, or 6 per cent., but there was not a corresponding increase in the energy that was consumed.

In consequence of the larger capital now invested in our power stations and transmission system, the provision for depreciation is increased in these accounts by £21,550 to the total for the year of £116,700. Fuel prices have also been increased, and the cost of meter-reading and collection of accounts has been higher on account of the disturbed conditions. We have also charged to profit and loss account a sum of £10,279, being part of the special expenditure that has been involved. These are the chief reasons why, although our receipts have remained the same, our net profit is less by £52,374.

### CAPITAL EXPENDITURE

The capital expenditure for the year was £330,710, principally on equipment for the new Reading power house, near Tel-Aviv, which was put into commission last August, and on extensions of the distribution and transmission lines. In these matters again the conditions of the country have had their influence. It has been largely in order to secure the South of Palestine—where the greater part of our consumption lies—from the danger of interruption in the supply (the economic results of which to the whole population might be very serious) that your directors thought it necessary to press on with the construction of the power house near Tel-Aviv.

Our two new power houses at Haifa and near Tel-Aviv, together with some other developments, have involved a capital expenditure of almost exactly £1,000,000 in the years 1937 and 1938. We have, however, raised additional capital only to the extent of £500,000—that being the amount of 4½ per cent. second redeemable cumulative preference shares issued in 1937; the remainder having been provided by the utilisation of reserves. Our balance sheet now shows that on December 31, 1938, the assets of the undertaking at cost stand, in round figures, at £4,000,000, while our issued capital amounts to under £3,000,000. Our general reserve, our depreciation reserve, and share premium account amount to well over a million pounds. Further, we are now providing annually for capital amortisation, as well as for the preference shares sinking fund. So it will be seen that our general position is a strong one.

### ALLOCATION OF PROFIT

The net profit for the year was £183,192. To this we have to add the carry-forward from last year of £25,851, making a total of £209,043. Deducting the dividends already paid on Preference and Second Preference shares and the interim dividend of 2½ per cent., free of United Kingdom income-tax, on the Ordinary and "A" Ordinary shares, which together absorb £92,034, we have a balance of £117,009. We now recommend the allocation of a further sum of £20,000 to general reserve, of £30,000 to reserve for income-tax and contingencies, and a final dividend on the Ordinary and "A" Ordinary shares of 2½ per cent., free of United Kingdom income-tax, requiring £43,441, making 5 per cent., free of tax, for the year 1938, leaving a carry-forward of £23,568.

### THE CURRENT YEAR

I am somewhat chary of making any observations with regard to the present year's receipts, since last year I mentioned that the first six months had shown a satisfactory increase of revenue, a promise which the remaining months did not maintain. But I may nevertheless mention, without, I hope, arousing any undue expectations, that the first five months of 1939 have shown an increase in revenue of 6.5 per cent. on last year.

The report and accounts were unanimously adopted.

## DEVELOPMENT PROGRESS

The third ordinary general meeting of this company was held, on the 3rd instant, in London.

The Rt. Hon. Viscount Horne, in the course of his speech, said: You will, I am sure, have read with interest the statement in our report regarding the geological and geophysical surveys made of your leases by or under the direction of Dr J. K. Gustafson, of the Central Geological Survey of Broken Hill. Dr Gustafson has reported that the:

"... correlation of the geophysical and geological data ... has resulted in a geological interpretation which, if correct," (I desire to emphasise this qualification) "will profoundly affect the future of the New Broken Hill Consolidated Company."

His report dealing with the major conclusions affecting the future of New Broken Hill Consolidated states:—

"There are no major faults or transverse structures such as occur elsewhere in the district which are likely to interrupt seriously the extension southwards of The Zinc Corporation ore-bodies."

Still quoting Dr Gustafson's report we find this statement:—

"Although the evidence is not conclusive there appears to be a very reasonable chance that the favourable beds which contain the Broken Hill orebodies will continue within the known ore-bearing structure at mineable depths above 4,000 feet for nearly three miles south of The Zinc Corporation boundary."

### THE PROSPECTS

If what Dr Gustafson refers to as a "very reasonable chance" is shown by exploration and development to be a fact and the favourable beds continue within the known ore-bearing structure "at mineable depths for a distance of nearly three miles," the prospects of your leases, already proved by the work near The Zinc Corporation boundary to be attractive, will be greatly enhanced. I use the word "prospects" advisedly, because it has yet to be proved whether these favourable beds will be found to be mineralised as heretofore in these same structures. Dr Gustafson adds that if similar mineralisation is established, then

"... the entire past production of Broken Hill will be duplicated within the limits of New Broken Hill Consolidated property." The geologist's report is based on expectations which include that "the ore occurrence in the New Broken Hill Consolidated is one of extension rather than repetition," and that "the ore bodies in the southern area will be elevated closer to the surface than elsewhere as a result of 'pitch crests,' one of which is indicated in the vicinity of the new air shaft, and another halfway between the White Leads and Rising Sun" (two of New Broken Hill Consolidated leases).

In all these estimates and anticipations of the geologists much depends on what I may describe as the "flattening out" of the ore occurrence and the presence and influence of the "pitch crests."

### TESTS BY DIAMOND DRILLING

We have set out to test the views set forth in the report in the first place by diamond drilling. We will keep you fully and promptly informed of all developments, but, if you accept my advice, you will, in the meantime, treat the report with reserve and exercise caution in making estimates until the results of actual exploration show to what extent the views of the experts are justified. It goes without saying that I earnestly hope they will be found to have a solid basis in fact.

The date at which we are likely to enter production obviously is governed by the speed with which we can, by using the deeper levels of The Zinc Corporation, reach the ore body within our leases, and that in turn depends on bringing their new main shaft into operation. Unfortunately, that company ran into very bad ground in the final stages of sinking its shaft, and there has, in consequence, been a corresponding delay in our developments, but, in my opinion, this has not adversely affected our prospects. From now on our progress should be more rapid. You must not, however, overlook the fact that, until we have the results from the special exploration I have referred to, our present main objective is to exploit the extension into our leases, at a vertical depth of about 2,000 feet, of the great ore body of The Zinc Corporation, and we may perhaps hazard the opinion that present indications favour a satisfactory result.

The report was unanimously adopted, and a resolution was passed authorising the conversion of the shares into stock.

# BRUSH ELECTRICAL ENGINEERING COMPANY, LIMITED

## EXCELLENT ORDER BOOK

The annual general meeting of the Brush Electrical Engineering Company, Limited, was held, on the 1st instant, at Winchester House, Old Broad Street, London.

Sir Ronald W. Matthews (the chairman) said that the efforts of Mr Keep, the new managing director, during the last six months of 1938 had been mainly concentrated upon reorganisation following the capital reduction scheme. The trading profit was admittedly, but not unexpectedly, unsatisfactory, but the directors did not consider that any great importance should be attached to the trading results of the year under review, as the directors looked forward with confidence to the future.

They had successfully established themselves as manufacturers of the Brush Ljungstrom Turbine, a machine second to none as regards reliability and efficiency. They had supplied recently a new large installation for the Brighton Corporation and had obtained a

number of orders, including five large turbines. The transformer department continued to develop.

The manufacture of Diesel and oil engines was now one of their largest departments. Since the end of their last financial year they had entered into an arrangement with Blackstone and Company, Limited, of Stamford, who took over entirely the sales of their Brush Horizontally-opposed Diesel engine, marketing it under the name of Blackstone-Brush. The Brush Engine was maintaining its pre-eminent position and the Petter engines had proved themselves outstanding in their class. Since December 31, 1938, they had acquired the business of the manufacture of the "Bates" Diesel engine and the "Fielding" Diesel engines. Those two ranges were complementary to their existing programme. He felt it necessary to add his voice to the many protests which had been made against the policy of the Government of allowing Diesel marine engines of foreign manufacture to enter the country free of duty provided they were consigned to a registered shipyard.

Brush Coachwork Limited continued to maintain a fairly constant order book. Viewing the position as a whole, the order book was eminently satisfactory, their total orders on hand to-day being almost four times what they were a year ago.

The report was adopted.

## INDUSTRIAL REPORTS—continued from page 286

but new crop can be obtained at £19 5s. per ton for October-November, with Tossa-2/3 for same shipment ruling at £20 15s. and fours at £19 7s. 6d.

Dundee spinners and manufacturers are still very busy and they are unwilling to make any change in their quoted prices, at least for anything wanted early. Should anyone wish to buy forward from October onwards, however, considerable discounts would probably be obtained, but there is reluctance on the part of buyers to purchase any distance ahead. The price of common 8-lb. cops and 8-lb. spools, now both quoted at the same level, is 2s. 8½d., while for 10-oz. 40-in. hessians 3½d. is still named, with 8-oz. at 2½d. Calcutta goods are all distinctly easier.

smelters have now raised their price to 10½ cents per lb. to equal the official producers' quotation. Sales in the United States reached over 182,500 tons in July, about three times as large as sales in the previous month and the highest monthly level of this decade.

★

Tin.—Standard cash remained stable at £229 17s. 6d. per ton throughout the week, but the backwardation has narrowed by 5s. to £4 17s. 6d. The market gave a strong appearance and sales were heavier. The Pool, however, was a willing seller at the official price. According to Messrs A. Strauss and Company, Limited, the visible supply of tin fell in July, compared with the end of June, by 420 tons to 28,431 tons. New supplies, at 8,408 tons, showed an advance of 783 tons on the month, while deliveries, at 8,508 tons, were 171 lower than in June.

★

Lead and Spelter.—The price of cash lead gained 15s. to close on Wednesday at £15 8s. 9d. per ton, while spelter gained 3s. 9d. by closing at £14 10s. per ton. Demand for lead was very active. Home warehouse stocks in this country totalled only 11,691 tons at the end of July against 12,209 tons a month before and 13,976 tons at the end of February. Trade in spelter benefited from the general strength of the markets, but it was less active than in the other three metals. Home warehouse stocks of spelter fell from 21,560 tons at the end of June to 20,060 tons at the end of July after having been at 25,771 tons on February 28th last.

## Grains

THE international wheat markets developed a firmer tone this week, owing to the extreme heat and drought which has persisted in Western Canada and the United States. Some damage to the standing crops is reported but it is not probable that it will seriously affect the prospects of a bumper crop in Canada, where the area sown to spring wheat is now officially estimated at 25,813,000 acres, compared with 24,946,000 acres in 1938. Crops in South-Eastern Europe are also reported to have suffered from a heat wave, while prospects in Northern Europe have been adversely affected by the continuation of wet cold weather. After a period of weakness, the maize market rallied

later in the week; shipping continues steadily from the Plate and South Africa, but little interest is shown in American maize. Prices of feeding barley also improved with the firmer tone in other cereal markets.

## Other Foods

Provisions.—Egg prices remain at a level considerably below the normal, English eggs being most depressed in price. The offtake of meat at the Central London markets remains poor, in spite of the unusually cold weather.

★

Colonial Produce.—Prices of refined sugar were reduced by 1½d. per cwt. on three occasions during last week, following the easier tendency in the market for raws. Prices at the London tea auctions have improved slightly in the past fortnight, particularly for Indian varieties.

★

Fruit and Vegetables.—The continuing cold weather has reduced the demand for salads and tomato prices, in particular, have been unsatisfactory to many growers. English apples are arriving on the London markets, but soft fruit is still plentiful and in good demand.

## Miscellaneous Commodities

Oils and Oilseeds.—With a stronger tendency in grain prices, there has also been some recovery in the volume of business in these markets. The American linseed crop is reported to be suffering from excessive heat. Shipments of Indian linseed continue to this country, while Continental crushers have bought fair quantities of Plate. Trade in Egyptian cottonseed is poor, but prices have slightly improved and linseed oil has risen by 10s. per ton in price, in sympathy with the firmer market in linseed. Trade in oilcakes is extremely slow and there have been some reduction in mill prices.

★

Rubber.—After the stagnation of last week, there was some improvement in the volume of trade in spot and nearby positions, but forward business remains on a small scale. Prices have been firm throughout the week and closed slightly higher.

## THE COMMODITY MARKETS

UNFAVOURABLE weather reports from both America and Europe helped to strengthen the grain markets in the past week, and this improvement has been reflected by a similar trend in prices for vegetable oilseeds. In London the metal markets have shown a firm tendency and prices for the main non-ferrous metals improved. A similar trend was noticeable in the United States, where Moody's index of commodity prices rose from 141.5 (December 31, 1931 = 100) to 142 in the week ended last Wednesday. In contrast, sugar prices continue to decline and quotations for raw cotton remain at a low level.

## Metals

Copper.—Demand showed an improvement while sellers were extremely reserved and the price of standard cash gained exactly £1 to close on Wednesday at £44 per ton, the highest level since January 9th last. Extra-U.S.A. stocks are now less than seven weeks' consumption, while stocks in United Kingdom warehouses fell at the end of last month to 28,273 tons (a year ago 36,537 tons), the lowest level of this year. At the present rate these stocks are insufficient to meet any buying movement on the L.M.E. In the United States, too, the position has strengthened this week and customs

## Panama and Suez

## GOVERNMENT RETURNS

For the week ended July 29, 1939, total ordinary revenue was £13,285,000, against ordinary expenditure of £16,510,000, issues of £10,250,000 under the Defence Loans Acts, and £245,000 issued to Sinking Funds. Thus, including sinking fund allocations but excluding issues from defence loans, the deficit accrued since April 1st last is £143,834,000, against £125,739,000 a year ago.

## ORDINARY AND SELF-BALANCING REVENUE AND EXPENDITURE

| Revenue                    | Receipts into the Exchequer (£ thousands) |                                |                          |                          |
|----------------------------|-------------------------------------------|--------------------------------|--------------------------|--------------------------|

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills except those paid for each Tuesday, which are 88-day bills. On July 28th applications at £99 16s. 4d. per cent. for bills to be paid for on Monday, Tuesday, Wednesday, Thursday and Friday of following week were accepted at about 27 per cent. of the amount applied for and applications at higher prices in full. Applications at £99 16s. 5d. for bills to be paid for on Saturday were accepted in full. £35.0 millions of Treasury bills are being offered on August 4th.

## CENTRAL AND SOUTH AMERICA

THE BANK OF LONDON AND SOUTH AMERICA, LTD., issues the following details relative to quotations for certain of the South and Central American exchanges. All these exchanges, with the exception of Bolivia and Paraguay, are related to the United States dollar, and the approximate sterling rates may be obtained by applying the dollar-sterling exchange rate.

|              |                                                                                                                                                                                                  |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bolivia.*    | Sight selling rate on London was 141.40 bolivianos per £ (nominal) on June 30, 1939.                                                                                                             |
| Colombia.*   | Sight selling rate on New York was 175.15 pesos per 100 U.S. dollars on July 4, 1939. This rate applies to holders of permits buying in the "open" market.                                       |
| Ecuador.     | Sight selling rate on New York was 15.30 sucres per U.S. dollar on June 24, 1939.                                                                                                                |
| Guatemala.   | Sight selling rate on New York is maintained at one quetzal per U.S. dollar, but a commission of 1 per cent. is charged by the Central Bank for the sale of drafts.                              |
| Nicaragua.*  | Sight selling rate on New York for payment of imports was fixed by the National Bank at 5.52½ cordobas per U.S. dollar (including 10 per cent. tax and ½ per cent. commission) on June 23, 1939. |
| Paraguay.    | Exchange is quoted on Buenos Aires; the sight selling rate was 72 Paraguayan pesos per Argentine "free" paper peso on June 17, 1939.                                                             |
| El Salvador. | Sight selling rate on New York was 2.50½ colones per U.S. dollar on June 24, 1939.                                                                                                               |
| Venezuela.   | Sight selling rate on New York has been maintained at 3.19 bolivares per U.S. dollar since April 27, 1937.                                                                                       |

\* Exchange controls are operative in these countries.

## SHORTER COMMENTS

(Continued from page 281)

Allied Industrial Services.—Final dividend 36 per cent., making 50 per cent. for year to June 30, 1939, on capital for year to June 30, 1939, on capital increased by the capital bonus last December of 87½ per cent. For previous year dividend was 70 per cent. Profits have risen from £159,901 to £204,695.

Bunting and Company.—This company is to go into liquidation. The approximate statement of affairs shows that against liabilities expected to rank of £583,583 there appears to be a deficiency

of £522,264 on the estimated realisable value of the assets. A committee of inspection of five principal creditors has been formed.

## LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

## THE ECONOMIST

Vol. CXXXVI

AUGUST 12, 1939

world in particular is to be drawn upon. From the nature of the case, no such policy has been publicly announced. But sufficient credence has been put in the reports for action to be taken by the Civil Service Clerical Association, the trade union whose greatest strength lies in the grades of the Service below the highest, or administrative. The argument of the Association is that if the administrative grade is to be reinforced from outside its own ranks, the other grades should be the first to be called upon. And it may be surmised that similar disapproval of the new step is felt in the administrative grade itself—civil servants would be less than human if they did not feel some resentment at a policy which necessarily impairs their own prospects of promotion.

Yet few would deny that some drastic steps need to be taken to reinforce the Civil Service. This is not to imply that the Service has lost its high standards—the contrary is the truth. But the decimation of the war generation has produced a shortage of men in their forties and fifties, who should now be moving into the higher posts—a shortage that has not been met in the Civil Service, as it has in many other walks of life (notably in Parliamentary politics), by a postponement of retirement ages. Even with no increase in the burden of work resting on the Service, this factor would have created difficulties at this time. But there has been a most manifest increase in the burden of work—a threefold wave of increase, one as a result of the war, one as a result of the depression and the inauguration of a much more interventionist economic policy, one as a result of re-armament. This last, which is the chief cause of chronic overworking in Whitehall at the moment, may perhaps be regarded (though only with some optimism) as temporary, and met by temporary expedients. But the other two are permanent.

This argument, so far as it has gone, would seem to call for the reinforcement of the Service by more men of the same stamp as the established civil servant. To increase the normal recruitment at the bottom is too slow a remedy; new blood must be brought in at the top. And the natural places to seek this new blood are the local government service and the universities, both of which make a closer approach, though from different sides, to reproducing the characteristics of the civil servant than any other walk of life. This is the justification for Sir Horace Wilson's policy (if, indeed, it is a policy and he is its parent).

But the argument can be carried further. The work of the Civil Service has not merely grown quantitatively; it has changed qualitatively. The Home Civil Service, as it was founded in its modern form by Gladstone, was confined to administration in a rather narrow sense of the word, to the execution of principles laid down elsewhere, to a watch over the observance of the law. The recruitment and training of the service were adjusted to this

aim. Young men were (and are) recruited direct from the University by an examination in which excellence in any field of academic study is sufficient; a classical scholar may be posted to the Customs and Excise. Save for exceptional cases, there is no other avenue of recruitment to the administrative grade, and it has frequently been said that, for a civil servant, previous experience is a positive handicap.

The system is the glorification of the amateur, and there can be no question that it has served the country well. It has given us a Civil Service that combines incorruptibility with efficiency; no other country, except possibly Imperial Germany, has ever built an administrative machine to equal it. But its tasks are changing. More and more the senior civil servant is having to undertake the work of a business executive. The Ministry of Transport builds and maintains our trunk roads. A Civil Servant sits as Chairman of the International Tin and Rubber Committees. The defence departments are more and more the masters—and the servants—of gigantic industrial machines. The Treasury is the dominant influence in the capital and foreign exchange markets. The Ministry of Agriculture takes an increasing hand in the finance of farming. The Board of Trade designs plans of control for a lengthening list of industries. And behind all these activities there looms the prospect of a wider problem—the actual management or control of industries by the community. Hitherto the Civil Service has pushed this problem from it in horror, and when industries have been given a central organisation they have been left to the industrialists themselves to run. But the dangers of encouraging private monopolies are so obvious that there must inevitably be a reaction towards the proposition that if industries must be managed centrally, they should be managed in the public interest. That will inevitably create a demand for an entirely new variety of public servant.

This new and vast field of activity into which the Civil Service is reluctantly advancing suggests the need for something more than a reinforcement of the existing cadres with outsiders of similar attainments and outlook. The strength of the university don as a recruit for the higher ranks of the existing Civil Service is his weakness for this new kind of post. On the other hand, the recruitment of personnel equipped for these new tasks must clearly be regulated if all the evils of *ad hoc* appointments are to be avoided. The solution would seem to be the formation within the Civil Service of a special branch which, like the Diplomatic Service, would have its own methods of recruitment and its own ladder of promotion, but which, unlike the Diplomatic Service, would not spurn that previous outside experience without which it will be difficult for any bureaucracy efficiently to administer a positive economic policy.

## Our Undeveloped Roads

IF more vigorous action is not taken in the future than in the past there will be a complete strangulation of traffic, for saturation point has almost been reached. "Nothing should be allowed to stand in the way of a vastly accelerated programme of road construction." There is no need to pick further phrases out of the recent Allness Report, or other available documents, to prove that our roads have never been suitably developed for the exigencies of motor traffic. A dilemma has been reached; either roads must be improved or traffic reduced. Since about 500 new cars are hatched on to the roads every day; since motor traffic has doubled since 1925 and may well double itself again by 1955; the former policy becomes imperative, unless the whole trend of motor

development is to be diverted, which is unthinkable. Considerations of industry and defence, as well as the rights of heavily taxed private motorists and of the public—now slaughtered at the rate of 6,000 per annum and injured at the rate of 230,000 per annum—back the demand for new and better roads. Since 1910 motor vehicles have increased their number by 2,000 per cent. road mileage has increased by 2 per cent. Nine miles of our trunk roads are of the 120-foot width recommended as desirable by the Ministry of Transport; 3,761 miles, or more than three-quarters of the total trunk road mileage are under 60 feet in width.

Owing to population density, costs of land, and the enormous financial strength of the railways, road develop-

ment for motor traffic was, from the start, destined to be difficult in this country. No comprehensive policy to this end has yet been envisaged; measures which have been taken have been patchwork dictated by short-term considerations; and the Ministry of Transport has seldom been anything more than a nursery for rising politicians. Such amateur methods are no longer adequate. The measure of their inadequacy emerges plainly from a simple recital of what has actually been done so far to develop our roads, especially since 1910.

The internal-combustion engine appeared on the roads with the twentieth century; by 1910 there were 143,877 such vehicles in use. In 1909 Mr Lloyd George attempted to solve the problems created by the "new form of traction" by a sensible piece of legislation. A central fund was to be provided from the produce of a duty on motor vehicles and a petrol tax of 3d. per gallon, with a 50 per cent. rebate for commercial vehicles. This fund was to be dispensed by the Road Board among local authorities and used entirely for road improvements in the interest of the motoring community which paid it. From 1911 to 1915 sums rising annually from £1,000,000 to £1,800,000 were so spent, while total road expenditure increased from £14.6 millions to £18.1 millions. This promising plan was killed in its infancy by the war. From 1916, when the petrol tax was doubled, till 1920, the fund was commandeered by the Government. In 1921 about two-thirds of the moneys thus diverted were repaid to the roads. In 1921 the second plan, that of the Roads Act, came into force, and carried on a harassed existence until 1936.

These were the years of the Road Fund proper. Its history was likewise tragic, for it was repeatedly raided by Messrs Churchill and Chamberlain, and its existence as a separate fund was finally ended by the latter. The new fund was to be raised by means of motor vehicle and driving licence receipts, and the petrol tax was repealed. Nevertheless, money receipts at £10.2 millions in 1921 were seven times what they had been in 1914. They rose to £18 millions in 1926. These amounts were spent on roads, through the medium of the local authorities, and were something less than a third of total road expenditure (as compared with about a thirteenth before the war). By 1926 the total expenditure, at £59 millions, was (in money terms) more than four times as large as in 1910; so that out of an increase of £44.4 millions, ratepayers were paying an extra £27 millions and the Road Fund an extra £17 millions. Had the scheme been allowed to develop, motor traffic would increasingly have paid road costs, more improvements would have been made, and the present dilemma would have been largely averted. The moneys not earmarked for special purposes were largely spent in resurfacing and widening existing roads and, according to the slightly complacent Royal Commission of 1930, were spent quite well.

In 1926 the Exchequer decided to appropriate for special Budget purposes one-third of the total revenue from private cars and motor-cycles, thus imposing on these a new form of indirect taxation. In addition to this recurring burden on the fund, Mr Churchill also carried out two raids, in 1926 and 1927, on its capital to the tune of £19 millions. Thereby the principle of the Road Fund was repudiated; and no other principle was substituted. The anomalies that followed provide an example of the fate of economic concerns in the hands of politicians. From 1927 to 1937 the volume of traffic rose by 55 per cent. and the yield of motor taxation by 253 per cent., while expenditure on the roads remained on balance almost exactly the same. In the present year the yield of motor taxation will be about £104 millions, of which less than a quarter will be spent on the roads. In 1925, before the first raid, the taxation on motor vehicles represented an average of £11, while expenditure on the roads was £39

for each of the vehicles on the road. In 1938 the tax had risen to £28 and the expenditure fallen to £22. In the last days the Road Fund was raided of a further £9 millions, and in 1937 it was abolished altogether.

Since that time grants of £20-£25 millions per annum approximately the same as the expenditure of the Road Fund in its last years, have been voted in the Civil Estimates to the roads. If at the year's end any of these dribble sums are unspent they are allowed to be retained in what is still called "the Road Fund"—that is, a money-bag for savings from an annual Treasury allowance. On top of all this, road taxation was raised again this year.

The motoring community has thus seen its tax diverted from the ends for which it was originally agreed that they should be paid; to be conscripted, indeed, for two reasons. First, the obvious need for re-armament; secondly, the Five-Year Programme. Mr Hore-Belisha announced early in 1935 that the Government had decided on a Five-Year Plan for the roads. Just before the General Election of that autumn Mr Chamberlain told radio-listeners that an extra £100 millions were to be spent on the plan. Next spring Mr Hore-Belisha called it the "greatest ever contemplated," and mentioned an expenditure of £130 millions, in addition to the million normally spent on maintenance. So far the scheme has been little more than a device for lulling the motoring community into quiescence while it contributed about £5 millions to £80 millions per annum to the Exchequer. By 1940, according to Mr Hore-Belisha's original statement, dual carriageways were to have been constructed wherever necessary; by March, 1938, there were only 16 miles built, and 91 miles under construction.

Three items have been accomplished. First, a circular was actually posted in February, 1935, asking local authorities to submit schemes to be completed over the next five years. Grants were to be made for works "on an adequate and modern scale." How many of these uncentralised, locally devised schemes have been accomplished. In January, 1939, Mr Burgin stated that £31 million had now been spent on the plan. But the average contribution to road expenditure from national funds in the three years 1936-39 was only £214,000 more than the level of 1935-6, so works masquerading under this title one cannot but conclude, are merely the normal annual schemes under a new name. Secondly, from April 1937 (May 16th in Scotland), 4,452 miles of trunk road were taken over for centralised control by the Ministry. To judge by the figures of expenditure, the standard of maintenance and the speed of reconstruction have not been improved by the change. Indeed, the Select Committee of the House of Lords stated that less work has been done on these trunk roads under the Ministry than in the five years preceding. At the present rate of removing level crossings, they will disappear in 200 years. Captain Wallace has recently announced a total of expenditure on major improvement and new construction of £15 millions; at the present rate of expenditure this will be a new, but miniature, Five-Year Plan. Thirdly, Sir Charles Bressey was asked by Mr Hore-Belisha to develop a scheme for the solution of the London road problem. The scheme was published more than a year ago, but the Ministry and the local authorities have not yet agreed upon respective shares in the cost of the work. Required land is in some cases being built over. Captain Wallace has said that he "sincerely hoped" that the Bressey scheme was not dead. Such pious hopes will not bring it to life.

Plainly, then, the Five-Year Plan, 1935-40, will have achieved next to nothing. For this re-armament will probably be blamed. Mr Burgin began to retreat from the position of his optimistic predecessor when he said last year (in plain contradiction of the original statements), "it was

never supposed that so vast an expenditure could be completed within five years. The intention was that it should be initiated over that period."

So three consecutive plans for road development have failed. What present assurances have we of the Ministry's will to solve the problem? It told Lord Allness that by the end of 1938 a twenty-years' plan would have been worked out. To judge by the fate of the Five-Years' Plan, that means that twenty years will be taken to initiate it. The probable meaning of the statement is that a large number of costly localised schemes have been prepared, especially on the trunk roads, that is, a policy of piecemeal improvements along existing alignments. As for trunk roads "885 miles will be by way of new construction, comprising diversions varying from  $\frac{1}{4}$  mile to 15 miles in length," "a long-term programme to be carried out as quickly as financial circumstances permit."

Apparently, the Ministry envisages employment of men and money on these unco-ordinated patchworks after re-armament. Till then, little road-building is likely to be done. However, plans have to be prepared in advance, with due consideration for the fact that land-acquisition takes a long time in Britain; so the present is the moment for debate on the road problem. The Ministry should reveal what road-system it envisages under this twenty-years' plan; then the public and industry will be able to judge

upon the expediency of adopting it, as against other plans, such as the County Surveyors' scheme for 1,000 miles of dual carriageway high-speed motorways. Such roads are obviously demanded by modern traffic; the proposed 1,000 miles would cost, according to the surveyors' estimates, about £64 millions and cover only 10,300 acres of land, which may be expected to be less expensive than the land beside existing routes which the Ministry will have to buy up at great cost in connection with its scheme for widenings. Yet the Ministry has ignored the proposition up to date, while not fully revealing its own purposes. If these are inadequate, it would be best to say so. There has so far been no report on the Select Committee's suggestion to build such a trial motorway, now, from London to Birmingham.

The solution of the road problem will come, if it comes at all, from the same source that has been the cause of its present intensity—the pressure of politics. When the time comes for the reduction of expenditure on re-armament, the country will be faced with the problem of finding work for the labour now flowing into the defence industries. When that time comes (and brings with it a relaxation of the strain on the Exchequer), the demand for a very large programme of public works will be irresistible. The cry will go up for roads fit for heroes to ride on. It would be well to have the largest plans ready.

## Strategy in the Mediterranean

AS the place where imperial trade routes converge and the only convenient link between the Western and Eastern members of the Peace Front, the Mediterranean is one of the most crucial parts of the world for England and France. Moreover, it is so narrow that for strategic purposes it must be considered in terms of military and aerial, as well as naval, power. In the ultimate analysis all other factors are dominated by the question of who holds the key-points, where the coasts are so close that their possessors can completely control the passage of shipping.

If a balance-sheet of the present position is drawn up, it can be seen that modern armaments have rendered the British preparations of yesterday more or less obsolete. It is true that with her prospective allies Britain holds the Eastern gateway through Suez, and the Northern through the Dardanelles, which is essential if she is to rely

on the help of the U.S.S.R., Roumania and Poland. In the West, however, the fortress at Gibraltar could not hope to ensure a passage for its friends unless Spain were at least neutral, though it might deny one to its enemies. Similarly, in the centre Italy has a powerful grip on the gateway between the Eastern and Western sections of the Mediterranean, which the British and French bases of Malta and Bizerta may not be able to keep open. Finally, Italy can menace each one of the outlets, even where she does not control them—Suez from Libya, the Dardanelles from Rhodes, and Gibraltar through her policy of co-operation with the new Spain.

Mussolini has said that Italy will not allow herself to be shut up in the Mediterranean, thus showing his desire to be sure of at least one outlet. What then are likely to be his tactics? Italy has the great advantage of a central position, which enables her to concentrate almost the

whole of her forces on either front. This means that her adversaries must either abandon one half of the Mediterranean or else keep in each a force almost equal to the whole of what Mussolini can command. On the other hand it also means that Italy is threatened with rapid strangulation should she fail to secure an outlet.

From her central position Italy can choose between two alternatives: a thrust to the East and a thrust to the West. *A priori* the thrust to the West seems the more decisive. It opens up the route to Latin America and the United States (where the totalitarian powers still hope that the last word has not been said); it cuts the direct line of communication between France and her colonies in Northern Africa; it threatens the alternative route to both the French and British Empires; and finally it establishes an iron ring round France by linking the Alps and the Pyrenees.

Such a stroke would indeed be effective if it were successful. But there are many difficulties in the way of its execution. It requires the wholehearted support of Spain, more especially in keeping the Straits of Gibraltar closed until a decisive victory can be gained at sea and in Northern Africa. But Spain is weary of war, and would not willingly face the powerful attacks with which France and Britain would try to force a passage. Moreover, the forces opposing Italy in the Western Mediterranean and in Northern Africa are in any case too strong to permit of a rapid victory, despite the fact that Sardinia and the Balearic Islands form a chain between Italy and Spain with which to hem in the French. Finally, such a plan runs counter to the whole of German strategy, which seems to comprise a vigorous thrust to the East, coupled with a defensive attitude—preferably diplomatic, but if need be military—towards the West. As Germany is undoubtedly the dominant partner of the Axis, this point would be decisive, whatever considerations of local tactics might suggest; Rome must keep her beautiful dreams in cold storage until the German army is ready to return from the East for the culminating onslaught on the Western democracies.

The thrust to the East, on the other hand, makes an admirable complement to the German plans. Strategically, it resembles them, in that it involves, in the first place, only attacks on small and weak powers, or on Franco-British forces that are both limited and separated from the main reservoirs of strength in the West. Diplomatically, it resembles the German plan in that it can be carried a certain distance without a direct attack on French or British possessions.

The project seems to call for an advance along two different lines: via the Balkans to Istanbul, and via Libya to the Suez Canal. The first would be covered by Albania and Rhodes, and would itself cover the German flank by

closing the Black Sea to allied reinforcements or supplies; if the support of Yugoslavia and Bulgaria were secured it would involve little fighting and a new objective might thus be attained without an open breach with Britain. The second thrust would strike a powerful blow at the British Empire, establish contact with the garrison in Abyssinia, and provide the counterpart to a Japanese attack on Singapore. Both these operations would be covered against attacks from the West by a defensive barrier of mines, submarines and aircraft between Sicily and the African coast. In effect these would extend the Siegfried line to the Sahara.

A thrust to the East would thus be less dangerous, less costly and better adapted to the general strategy of the Axis. Of the two it is the more likely to be adopted, but its success would be by no means certain, especially in view of the Peace Front's preparations, and Italy may well hesitate before pressing for its adoption.

In discussing counter-measures it is important to avoid one serious pitfall. The Mediterranean is so narrow and so easily controlled from the neighbouring coasts that it is useless to talk of clearing it of Italian ships by naval means alone. The reply to the Italian campaign must obviously be amphibious. Contact between the Eastern and Western basins of the Mediterranean can only be maintained by combined operations aimed at securing the vital bases both in Sicily and Libya. If that is done, then the position of Italy will be untenable. We shall then be in the centre, and her fleet will be either bottled up in the Adriatic or divided into two sections. Abyssinia, Libya and Rhodes will soon fall through lack of supplies, and Italy herself may share their fate. Finally, and most important of all, contact with the Eastern front will be restored via the Dardanelles, and Germany's strategic advantage will be destroyed.

From this rapid survey it may be concluded that the present position constitutes a sort of unstable equilibrium, and that a military or diplomatic success for either side would have far-reaching consequences. It is no exaggeration to say that the war, whether white or red, may well be won and lost in the Mediterranean.

With so much at stake, Italy's policy is exposed to the play of conflicting forces. Fascist pride is stirred by visions of mighty triumphs, but Italian good sense insists on measuring the immediate risks involved. The present tactics of applying pressure here to-day, there to-morrow, and always withdrawing if the opposition is too strong, are well adapted to the divided nature of the Mediterranean. By their power of distraction these feints and sallies provide valuable support for Germany's policy towards Western Europe. We may hazard the conclusion that such tactics will only be abandoned if Italy is dragged by her Führer into a general conflict.

### Agenda for Preparedness—VIII

## Mobilising Overseas Investments

IN the three months which have elapsed since the first article in this series appeared, several problems of military, civil and economic defence which were then hardly in the blue-print stage have been brought to the point of action. We have conceded, perhaps rather stiffly, the principle of economic assistance to our allies. But it is no less necessary to buttress our own financial position to meet the enormous demands which would be made upon it in the event of war. Under near-war conditions, as yet, no formal financial restriction has been introduced, though it is possible that control of capital issues and capital movements may eventually be required. But it is certain that, in war, it would be necessary to recruit all assets which

could be employed for paying for war-time supplies. For practical purposes, that policy involves the use of the United States as a bank of hypothecation, which would provide accommodation against the collateral security of mobilised British assets, or as a market in which British holdings of eligible securities could be sold outright in order to furnish dollar exchange.

The inquiries which are now being made of investment trusts and insurance offices by their respective organisations will thus have Treasury approval, even though they may not have been officially instigated. Questionnaires have been issued, asking for detailed information regarding holdings of foreign securities, their domicile, currency and

their market. This is a sensible act of preparation, which might well be extended to cover large holdings in other hands, regarding which information might be sought by a simple request from the Treasury, backed with the co-operation of the banks and the Stock Exchange. Important though the foreign securities holdings of investment trusts and insurance offices are, they do not entirely cover the field.

In the Great War the purchase and deposit schemes by which the American Dollar Securities Committee pegged the New York exchange were not contemplated until the end of 1915. The first scheme provided two alternatives—the outright purchase of dollar securities in exchange for 5 per cent. Exchequer bonds at market price, plus 2½ per cent. premium; or the loan of such securities to the Government, in return for a rate of interest ½ per cent. higher than that obtainable on the securities concerned. The loan conditions were necessarily accompanied by transfer of power of sale to the Treasury in order to make them eligible for collateral security. In August, 1916, the Treasury extended the scheme for five years, and included in the lists certain non-American securities, including Argentine, Brazilian, Canadian, Scandinavian and other issues. The total amount of securities handled by the Treasury under the scheme was £216,644,396 purchased and £405,951,189 deposited as loan. Out of the grand total of £622,595,585, dollar bonds and shares accounted for £284,556,592, but of the remainder a large proportion consisted of sterling obligations issued by United States undertakings.

The success and scope of this historical precedent deserve to be recalled. Organisation on similar lines, if needed, would create no difficulties, for the experience of the American Dollar Securities Committee would provide a ready-made outline of a new scheme. And there would be no justification for a delay of two years before its introduction. The important difference, in a future war, would be the measure of our marketable security holdings against the enormously increased cost of modern hostilities. It is impossible to isolate all the holdings of American and other eligible securities, but an attempt can be made from independent research and published sources to survey the broad orders of magnitude involved.

Roughly, there are 200 investment trusts in Great Britain, with a total capital of approximately £300 millions and investments (measured by book values) of about £340-350 millions. Not all trusts publish information regarding their holdings, and those trusts which provide analyses of investments may base them either on book values or on current market values. We have examined the investment analyses of 144 investment trusts, of which 83 are based on market values and 61 on book values. For the former group of 83 trusts the investigation shows that, out of total investments of £141,154,000 (at market values) holdings in the United States account for £27,703,000, Dominion securities (including Canada) for £14,271,000 and other foreign securities for £19,364,000. The investigation for 61 trusts whose investment distribution is based on book values shows that out of total investments booked at £119,848,000 (whose market value totals £98,414,000), United States securities account for £16,346,000; Dominion securities (including Canada) for £12,791,000, and other foreign securities for £23,693,000.

By comparing the market value and book value of investments of the latter trusts, a rough impression can be obtained of the total market value of investments of 114 trusts, whose investments, at book value, amount to £286,716,000, and thus comprise the bulk of the investment trust movement's entire resources. The market value can be put at £239,568,000, of which approximately £41 millions is represented by United States securities, £25 millions by Dominions (including Canada) and £39 millions by other foreign securities. For the investment

trust movement as a whole, these figures are probably of the order of £50 millions, £30 millions and £47½ millions, respectively.

Insurance company holdings of foreign securities are less easy to establish. But a line may be obtained through the accounts of 38 of the principal offices, whose investments were analysed on page 14 of the Insurance Supplement published with *The Economist* of July 15, 1939. Holdings of Dominions securities of these offices at the end of last year totalled £86,862,000, while holdings of foreign securities accounted for £51,692,000. These offices themselves held 74.4 per cent. of the Dominion securities in the portfolios of all British offices at the end of 1937 and 58.0 per cent. of the foreign security holdings. Hence, it is reasonable to assume that the Dominion assets of the insurance offices as a whole represent a total of £116½ millions and their foreign security holdings a total of £89 millions. Part of these assets, however, is retained in the Dominions and foreign countries to meet local legal requirements, while offices conducting a large foreign business may hold a proportionately larger portfolio of currency loans. On the other hand, since the totals given above are restricted to government, provincial and municipal issues, they exclude holdings in foreign railways and industrial undertakings which could be mobilised in case of necessity.

Additional light on British holdings of United States securities is shed by the report of the U.S. Department of Commerce on "Foreign Investment in the United States" at the end of 1934 and by subsequent compilations of the net movement of investment funds to the United States published by the Treasury Department. At the end of 1934 British long-term investments in the United States totalled \$1,297 millions. Of this total \$678 millions consisted of "direct" investments (taken at book values), of which investments in industrial undertakings (mainly textiles) accounted for \$305 millions and "direct" investments in insurance for \$231 millions. The marketable stocks, as at the end of 1934, totalled \$619 millions, of which common stocks (at market values) accounted for \$233 millions, preferred stocks (at par values) for \$135 millions, bonds for \$87 millions and other investments for \$164 millions. Railroad securities totalled slightly more than \$100 millions—a striking contrast to the situation in 1914, for this country mobilised more than \$1,000 millions of railroad stocks and bonds during the course of the Great War.

Between the end of 1934 and March this year the net movement of capital from the United Kingdom which has found investment in American domestic securities is put at \$448 millions. Hence the total of marketable (as opposed to "direct") investments in the United States, held on British account, may be put approximately at \$1,067 millions, or £228 millions at current exchange. Clearly this figure must largely include the holdings of British investment trusts and, to a smaller extent, those of insurance offices. After deducting the value of United States securities, so far as they can be estimated, for the two latter groups, the remaining total should give the private holdings of United States securities. These can hardly be less than £125 millions.

In the event of war, we should lack the formidable financial protection of our pre-war holdings of American railway securities. But there are three additional items which might combine as substitutes. "Direct" British investments in the United States, though originally made for reasons of industrial strategy, could presumably be mobilised in case of extreme need. Secondly, there are holdings in certain neutral countries which might be of interest to American finance houses or investors, as they were in the last war. Finally, holdings in mining and transport undertakings in the Dominions might appeal to the United States public or Treasury. Some of these,

such as Rhodesian copper shares, already enjoy a market in New York, and others, like Rand mining shares, could be listed. Clearly, questions of the retention of British control of these undertakings would need careful consideration. But at least some part of the £410 millions nominal of mining capital quoted on the Stock Exchange—which, incidentally, had a market value of £714 millions on March 24th last—could be realised or pledged.

The approximate results of this examination of British investments abroad are shown in the accompanying table. Holdings in foreign railway undertakings have been excluded from the count, on the ground that their current position would hardly commend itself to intending United States purchasers. Factors like double counting, the need for retention of British control and the unsaleability of some of our foreign holdings suggest that the total of £1,172½ millions should be discounted fairly liberally.

\* Mainly Dominion or Colonial.

But, on a conservative reckoning, it should be possible to mobilise total investments at least equivalent in value to those raised during the last war—and this in the absence of substantial holdings of American railroad securities. Despite the enormous increase in the cost of waging war to-day, this reserve of financial strength would obviously be a major factor—and might well be a deciding factor—in the result.

## NOTES OF THE WEEK

August, 1914, and August, 1939.—After twenty-five years, the world stands again, in August, 1939, on the brink of the precipice over which it hurled itself in August, 1914. To-day we know once more—and indeed this time much more clearly than we realised our tragic position on the eve of war in 1914—that a world-war may break out at any moment. It is still, happily, possible that the repetition, this year, of a supreme catastrophe may be averted. Yet, even if we do scrape through to the autumn and winter without sheer disaster, we can see no issue at present from a break-neck competition in armaments; and, in modern history, it is something unprecedented and portentous that the world should find itself in these straits twice over in one lifetime. Hitherto, the world has not indulged in bouts of war on this scale more frequently than at intervals of about a hundred years' length each; and, though there have been minor wars in between, these have not been comparable, either in intensity or in range, to the major orgies in which mankind has reduced itself to exhaustion. Our plight is the more serious because, at the moment when war on the grand scale is threatening us with this appalling increase in frequency, it is at the same time showing an equally striking extension both in area and in incidence. The moral of all this is unescapable. Now that war has come to be what it is to-day, it has become an institution that is incompatible with the existence of civilisation as we know it. One of the two is bound shortly to be eliminated from the world in which we live. But which is to be? That is the question which, though still inscrutable to-day, may have received its answer "before the leaves fall" this autumn.

If we compare the strategic map of the world as it will be in August, 1939, if war breaks out, and as it was in August, 1914, we shall find both resemblances and differences. The most striking point of likeness is that a couple of Central European Powers, with Germany as the leading partner, will once again be engaging in a war on two fronts in which they will be pitting themselves against the world. Once again, the war will have the character of a siege, in which a grand alliance will be trying to break the Central Powers' resistance by cutting them off from access to overseas resources. Perhaps the most striking difference is that, this time, the Central European Powers' home fortress will be much more narrowly bounded than last time, while this handicap will perhaps be offset by their possession, this time, of a first-class ally situated on the further side of the grand alliance's lines of circumvolution. It should be possible, this time, to keep open the maritime communication between Russia and the Western Powers; and this, in turn, taken with the industrial development of Russia, means that Russia and Poland would be able to exert

much greater pressure on a German frontier which in 1939 is only half as far from Berlin as was the frontier of 1914. Thus in Europe the position is distinctly less favourable for Germany now than it was then. On the other hand, in the Far East, Japan, who was Britain's ally then, may be Germany's ally to-morrow, and in that case it will be our turn this time to see our Far Eastern outposts fall. On the other hand, Japan and Italy are likely in the long run to pay as dearly as Austria, Hungary, Bulgaria and Turkey paid in 1918 for the privilege of having been Germany's allies. Finally, all European Powers will suffer much more severely this time than last, because every one of them can be raked from end to end by air attacks. By contrast, Russia will have a huge citadel in the Urals which no air attack can reach, and the United States (if she again becomes a belligerent) will still be completely immune from attack, even by air, on her home territory. Obviously, whoever may be the victors, all European belligerents will suffer the full pains and penalties of defeat.

\* \* \*

The Mock War.—The war rehearsal has been proceeding during the past week at an increased tempo. The manning of a reserve fleet of 133 ships, the further expansion of the number of Territorial Army units in training and the commencement of R.A.F. exercises on a larger scale than any previously undertaken, have produced, at least for the men taking part, something of the atmosphere of real warfare. The air of verisimilitude has been heightened by weather conditions which have subjected many of the troops in camp to genuine hardship, by the fact that the Reserve Fleet has not been mobilised on anything like the present scale for fifteen years and by the occurrence of actual casualties in the course of the air exercises. There is no doubt that the forces have learnt some valuable lessons. But the machinery for the organisation of the civil population in air raids remains without a major test. First the black-out of the South-Eastern half of England was postponed for twenty-four hours from the early part of Thursday morning on the ground that weather conditions made satisfactory observation impossible. It is difficult to see how any rehearsal of this kind can ever be of real value if it is not permitted to take place in precisely those conditions in which, as the air exercises demonstrated, a considerable proportion of the attacking force of bombers can reach its objectives. It is even less clear that the co-operation of the general public in a black-out can really be tested in the after-midnight hours, when the vast majority of citizens are in any case in bed and not burning lights. The announcement that a test commencing at 8 p.m. will be held in Birmingham in October does not excuse the fact that a black-out could commence at

10 p.m. in London in August. The civil defence organisation is new, and it must be allowed to make mistakes if it is to learn its job thoroughly. It is no doubt the case that a number of factors, including official dilatoriness and lack of leadership, have so far prevented it from becoming a reliable instrument. It must be toughened by experience. A policy of tempering the wind to the shorn lamb may spell disaster for the whole flock.

\* \* \*

**Japanese Army Tactics.**—The Japanese army is making another effort to manoeuvre its Government into joining the German-Italian military alliance, through the offices of the Japanese Ambassadors to Berlin and Rome, who announced after a conference last week-end that Japan's adherence was only a matter of time. This development must be considered in its Far Eastern context. It represents one more step in a campaign—which the Government in Tokyo has hitherto resisted—to coerce the British Government into a more compliant attitude towards the war in China. This week there have been several other moves in this campaign, including the bombing and sinking of two British ships at Ichang, a demand by the Japanese-sponsored Provisional Government of Honan for the transfer of the Peking Syndicate's anthracite mines in that province, and many minor incidents designed to damage British prestige and property. There is every reason to protest most strongly against these calculated attacks by an army in the field whose Government, according to the recently approved Tokyo "formula," has bound itself to see that order is kept in the Chinese provinces under its control. The fault of the army commanders, of course, is to have read into an intelligent diplomatic compromise an unintelligent political surrender. If they are not prepared to carry out their Government's policy, the whole basis for negotiation automatically disappears and the British Government is left with no alternative but to defend its interests piecemeal and as best it can. But once again, the Japanese Government is out of sympathy with its soldiers. Its ministers are each understood to prefer a policy of independence unattached either to Germany or Italy; and their reasons are doubtless economic as much as strategic. Nor would Japan's adherence to the Axis alliance substantially alter the Far Eastern position. If war breaks out, Japan will scarcely be on our side. If war does not break out, then neither Germany nor Italy can do much to help the Japanese, unless it is by forbearing to help the Chinese. And it may be noted with interest that while months ago it was the Axis that was suing for Japan's favour, the tables are turned, and it is Japan that is now the suitor.

\* \* \*

**The Prime Minister on Japan.**—The Japanese Army's tactics are having little effect on the negotiations in Tokyo. Whitehall "will not be hustled" in replying to the Japanese memorandum, and new instructions to Sir Robert Craigie have now been under consideration for more than a week. Mr Chamberlain's remarks on Anglo-Japanese relations, made in the House of Commons on the day of the adjournment last week, were symptomatic of this attitude. At the present moment, he said, we have not in the Far East a fleet superior to that of the Japanese. We have such a fleet at home, and in certain circumstances we may find it necessary to send a fleet to Far Eastern waters. But we would much rather settle our differences with Japan by discussion and negotiation, provided that we can do this without sacrificing fundamental principles. The drift of Mr Chamberlain's further statement was that the British Government did not wish to undertake special commitments to China of the kind undertaken towards Belgium and other European States, and that, in considering our Far Eastern policy at this moment, we should remember that grave events may be pending nearer home which would require all our energies. Meanwhile the negotiations in Tokyo are proceeding slowly, but, on the whole,

not unfavourably. The Japanese have produced fresh evidence against the four Chinese held in the British Concession at Tientsin, and the main obstacle to an agreement will probably prove to be the Chinese silver reserve deposited in the French and British Concessions there. As Mr Chamberlain reiterated in his speech, the Japanese demand that the silver be handed over to their puppet authorities is one of those "questions of a general nature" which can be settled only after consultation with other interested Powers. This means the Governments of France and the United States. It appears that both Governments have told the Japanese that they are interested in the questions under discussion, and that the French have stated that they have common interests with Britain on the silver and currency issues. There is, up to the present, no evidence that the British Government will consent to give the Japanese the help they want in conquering the obstinate Chinese.

\* \* \*

**Military Talks in Moscow.**—With the arrival in Moscow this week-end of British and French military missions an element of stern reality enters the long-range discussions which have now been going on for over four months. The present arrangements are that the military and diplomatic talks shall continue side by side; but it seems more likely that the Soviet Government will prefer to postpone the resumption of diplomatic talks with Sir William Seeds (Mr Strang has now come back to London) until it sees what may be the material outcome of the military talks. Both sides will now be able to assess in the plainest of all terms, in those of military values, the benefit which each may expect to take from the conclusion of an alliance: the bargaining tactics of each, presumably, will be modified accordingly. The diplomatic agreement still sticks on the definition of "indirect aggression": it may be that the best solution of this, if it could command agreement, would be to leave the definition open pending an understanding between the three army commands on what steps would be feasible to cover a German advance in the direction of the Baltic States. In the end, however, there must be a diplomatic decision if the military talks are to be of real value. For the soldiers can only discuss "how"; they cannot (and they should not) discuss "when."

\* \* \*

**Imperial Airways in Difficulties.**—Imperial Airways has announced this week that it is suspending for the present its Empire passenger services. The explanation is that the growth of the air mails and the decision to carry a greater surplus margin of petrol have crowded passengers out of the limited and inadequate number of aircraft available. The explanation is logical and correct; but it is already clear that it will not avert the indignation of the public. It has long been apparent that British overseas civil aviation, especially that part of it in the control of Imperial Airways, was in a bad state. The company has received a series of severe and merited rebukes from Parliament and from official investigators and is shortly to be legislated out of existence. This latest development, however, though it is only the logical outcome of factors that have long been known, has something of the character of a last straw, and the House of Commons will be doing its duty if it insists on placing the responsibility where it belongs. Some of the blame lies on the former management of Imperial Airways; some lies on the unpardonable dilatoriness of the Air Ministry; most probably rests on the official refusal, based on little more than silly sentiment, to permit the purchase of American machines. Other lines—for example, the Dutch—seem to gain rather than suffer in prestige through their use of American machines; they certainly do not suffer a tithe of the loss of prestige that this week's confession of failure brings with it. The record is hardly relieved by the inauguration last week-end of the British transatlantic air mail service, since that event has been surrounded by every

evidence of a desperate scramble to begin at least in the same year as the Americans, and the service seems destined to be withdrawn after a few weeks. Another disturbing reflection suggests itself. The suspension of passenger bookings will obviously affect the profits of the company, since the payment for mail is of the nature of a flat-rate payment. Was this contingency taken into account when the purchase price of 32s. 9d. was fixed for Imperial Airways' shares—a price fixed in view of the goodwill represented by the expectation of profits? And can that price any longer be justified?

\* \* \*

**The Technique of Industrial Control.**—Changes in the board of directors of Richard Thomas and Company (which are discussed in detail on page 326) provide certain object lessons in the latter-day technique of industrial control. Richard Thomas provides a particularly good example, since, as a result of financial stringency, the company was compelled to submit a year ago to the supreme direction of a Control Committee, in order to obtain the necessary finance to complete its new strip mill at Ebbw Vale. The recruitment of the Control Committee could scarcely have been bettered, for it consists of the Governor of the Bank of England, the chairman of Richard Thomas and Company, a representative of the steel industry and a nominee of the 4 per cent. debenture stock trustees. National interests, expert knowledge of the new plant and the steel industry generally, and financial responsibility are all represented here. Yet the Control Committee's first appointments to the board of Richard Thomas have, with one exception, now resigned. Two of these nominees are important figures on the boards of companies in direct competition with Richard Thomas, but lacking its modern equipment. The three new nominees, whose appointment has been made "after consultation with the British Iron and Steel Federation," are representative of the steel industry generally rather than of the sheet trade in particular. In this respect, their appointment is clearly to be welcomed. Yet there will be regret that the new appointments do not cover the same wider range of interests as the Control Committee itself. The latter is an instrument of general supervision, which already has the advantage of expert knowledge. But its new nominees, with their narrower interests, might be regarded as mere symbols of industrial concentration. Would it have been impossible to secure at least one general industrial representative to serve on the board? Clearly, the significance of the new Richard Thomas plant for a number of important branches of the engineering and metal trades which consume its products cannot be overrated. If it is to be controlled by anybody other than its shareholders, it should be by representatives of the public interest, not by delegates of the steel trade.

**The Road and Rail Rapprochement.**—The railway and road industries, having fought each other for a number of years with considerable bitterness, are now treating the public to demonstrations of their goodwill towards each other. A Road and Rail Central Conference was set up on April 12, 1939, with the object of defining the principles of future rates agreements, in anticipation of legislation to implement the proposals of the "Square Deal" report. This Conference has in turn formed four sub-committees to deal respectively with classification, conditions of carriage, licensing and general purposes. The function of the general purposes committee to date has been to make arrangements for the setting up of the regional committees which have now been established in each of the twelve traffic commissioners' areas with the principal task of surveying the main traffic streams preliminary to recommending specific rates agreement to the Central Conference. The work of producing order out of the existing condition of confusion and cross-purposes is in fact proceeding in a businesslike manner. To organise the existing multiplicity of road goods transport undertakings into a compact body is indeed a task of enormous technical difficulty which is further complicated by the fact that traders, who have hitherto drawn considerable advantage from playing off rail against road interests, must be consulted in the course of the negotiations for new rates agreements. Moreover, the ingrained habits of competition are not easily removed, and the measure of the trust existing between the rail and road interests is perhaps to be gauged by the fact that the railways are for the present reducing the number of their objections to applications for road traffic licences by fifty per cent. and no more. Finally there remains the possibility that the promised Bill, when it arrives, may have an unequal appeal to the two sides, or even please neither, in which case all the new machinery may be quickly swept away. But it is unlikely that any Government with an appreciation of the strategic as well as the economic advantages of transport co-ordination will do anything to sabotage the progress which these two important branches of the industry have already made.

\* \* \*

**Ribbon Development.**—As soon as Parliamentary time permits, the Minister of Transport is to introduce a Bill to amend the Restriction of Ribbon Development Act, 1935. Its main object, apparently, is to extend and simplify the system of Exchequer grants towards the cost of compensation. Broadly speaking, grants may now be made only where building is restricted in order to provide for a possible widening of the road; if the highway authority, without wishing to widen a road, wants to preserve its usefulness and amenities by controlling a wider strip (which is what is usually meant by the restriction of ribbon

## BANKERS TRUST COMPANY

development), then the entire charge falls on local funds. This provision was widely criticised at the time (see, for example, *The Economist* for May 18, 1935) on the ground that the poorer local authorities would be quite unable to raise the necessary funds. Unfortunately experience has fully borne out this view. Progress has been slow even with the first type of scheme—standard widths (i.e. of freedom from new building, not of the actual road surface) have been prescribed for less than 1,200 miles of highways. Lack of interest and complications of procedure may be partly responsible, but the main deterrent has undoubtedly been the fact that the Exchequer grant only covered part of the cost. The wider powers have been practically a dead letter except in the Home Counties and a few other wealthy areas. Meanwhile, of course, the situation has not been standing still; as the Red Queen pointed out, it is sometimes necessary to run very hard in order to stay where you are. The main result of the Act of 1935 has not been to restrict ribbon development but merely to provide one more instance of the inefficiency of the present dyarchy between central and local governments. There is a long list of essential tasks which the central government will not, and the local authorities cannot, undertake.

\* \* \*

**Refugees in Britain.**—Some indignation appears to have been engendered among those who have misunderstood a sentence in the article with the above title that appeared in *The Economist* last week. The passage in question was as follows:—

Obviously not all refugees are capable of making an equal contribution to British prosperity. There may be some who are undesirable on other than economic grounds. But on the average they are more helpful to the community than the average Englishman, whether the standard is monetary capital, industrial skill or intellectual attainments.

Some have read into this a denigration of British national qualities. But nothing of the sort was expressed or implied, as must be obvious from a reading of the whole article. There was no suggestion that the average refugee is a better man than the average Englishman of comparable background. But figures quoted in the article indicate that the average refugee family has more capital than the average English family. Most of them are either skilled workers or professional people or intelligentsia, and their average skill and intellectual attainments may therefore be presumed to be higher than that, not of English skilled workers and intelligentsia, but of Englishmen in general. To deny this is to assert that the unskilled Englishman is more useful to the community than the skilled worker of any other country, which would be an excess of national pride. To the extent, however, that the wording of the sentence, when removed from its context, lent itself to misunderstanding, *The Economist* must express its regret.

**The Liberals and Family Allowances.**—At the final session of the Liberal Summer School, Lord Samuel announced that the Liberal Party would place family allowances in the forefront of its social programme for the next election. The preceding discussion suggested that their main object was to raise the birth-rate, so as to prevent a rapid decline in our population. Experience in other countries has shown that, from this point of view, family allowances are of very limited value unless they are very generous indeed. On social grounds, however, the case for them is overwhelming. Every social survey has shown that poverty, over-crowding and under-nourishment are strongly correlated with the size of the family; large families actually have to live in smaller houses than those with the same income and fewer children; £10-£20 millions spent on family allowances would do much to overcome these evils and improve the quality of the next generation, even though a far larger sum would be needed to make much difference to its quantity. We already give the unemployed man a larger income if he has a family, with the result that he is sometimes worse off if he finds a job. This position is clearly unsatisfactory, but we cannot take away the family allowance from the unemployed; we must complete the system by giving it to those in work also.

\* \* \*

**Deciding Danzig's Future.**—Until Thursday, when Herr Forster, secretary of the Danzig Nazi Party, made a speech which embodied Herr Hitler's instructions (he had just come back from a conference at Berchtesgaden), the policy of the Danzig Nazis was very like a ship without a rudder. It swung to and fro, now driving with the winds of Goebbelian propaganda, now veering hastily against them to avert shipwreck on the rocks of Polish reprisals. Its destination, evidently enough, was always that of the Third Reich; but in the absence of precise instructions from Herr Hitler the steering has sometimes been erratic. Herr Forster, who spoke at an indignation meeting on Thursday, has set no very precise course. He issued the usual irrelevant warnings, and talked much of threats which the Polish Press is said to have made. The background of this speech is furnished by increasing military preparations in the Free City, and by an acrimonious exchange of notes between the Polish Government and the Danzig Senate. The immediate issue is whether or not the Polish Customs inspectors in the Free City (the main task of Customs inspection is carried out, or should be carried out, by Danzigers who are under this Polish supervision) are to be allowed to do their work. For the moment, the Polish Government has vindicated its rights over Customs inspection, and the Danzig Senate, unexpectedly meek, has once more accorded recognition of those rights.

\* \* \*

But everything is temporary. The decisive date cannot be far ahead, though the choice is comparatively wide. The German autumn mobilisation for manoeuvres on the Eastern frontier should be complete by August 15th, Herr Hitler is due to speak at Tannenberg on the 27th, and a few days after that there is the opening of the Nuremberg Congress "of Peace" on September 2nd. If the Nazis follow last year's programme, their Press should soon begin a violent campaign against the Poles (there was a preliminary skirmish this week), gradually working up to a peak coinciding with the Fuehrer's big speech at Nuremberg. At the same time, incidents might be expected on the boundaries of Danzig which would culminate in a proclamation by the Senate that Danzig had formally returned to the Reich. The Nazi gamble would then be that the Poles, faced with extreme international tension, an army of over a million Germans manoeuvring on their western frontier, and the prospect of several days' severe fighting before the Free City could be taken, would consent to negotiate. It remains for the Peace Front Powers to persuade Herr Hitler that this programme will not work, and that there cannot be a second Munich.

**German Views on the Situation.**—Our Berlin correspondent writes:—The German mobilisation is being continued with great intensity, and will reach its peak about the middle of August. Military manoeuvres are beginning, in which the air force is playing the leading rôle. Long rows of requisitioned cars and omnibuses are to be seen at the rallying points, and private transport is also being severely hampered by lack of petrol; even where they have supplies, filling stations may only sell one to two gallons per day to each motorist. The mobilisation is officially only for "routine manoeuvres," but its scale is far in excess of what can be regarded as normal, and altogether it bears an uncomfortably close resemblance to the movements carried out at the time of the Sudeten crisis last year. Coupled with the remilitarisation of Danzig, it suggests the conclusion that Germany is trying to force Poland to give way over Danzig and the Corridor by military pressure. German official quarters profess to have become much more optimistic in the last few weeks, and one frequently meets the view that these questions will at the worst only lead to a short struggle with Poland, and not to a general war. In the light of the repeated declarations of British Ministers, this position is remarkable, but diplomatic circles are discussing the possibility that Mr Chamberlain will—despite his experience at Munich—offer to co-operate in finding a peaceful solution of the Danzig question. Such a thesis is all the more astounding because on the German side it is being said, albeit not officially, that a "solution" must include the restoration of the pre-war German boundaries; this would mean the incorporation not only of Danzig and the so-called Corridor, but also of what is now Polish Upper Silesia, with its coal and iron, and of the large district around Poznan. The Polish-Danzig customs dispute is not considered to have much importance in itself, but some people think that it may lead to Danzig's terminating her customs union with Poland and forming one with Germany as a first step towards political absorption. Meanwhile the colonial question has been raised again by Herr von Epp in a recent speech on the occasion of the colonial exhibition at Dresden. He insisted that Germany could not wait for the satisfaction of this claim until all other questions had been settled, and seemed to contemplate the use of military force to recover her former possessions; for he stated that the Reichskolonialbund was not seeking economic objectives, but rather aimed at providing the Fuehrer with a powerful striking force. This statement is all the more remarkable as Herr Hitler declared after the Munich conference that the colonial question would be solved without resort to war.

\* \* \*

**Germany's Coal Difficulties.**—The appointment of a Special Commissioner for the coal industry by General Goering last week is another stage in the growing crisis that faces Germany's coal industry. A plentiful supply of coal lies at the very centre of all Germany's industrial plans, especially those that are designed to make her self-sufficient in essential war materials. The Hermann Goering works, planned for a capacity of 4 million tons of steel, will increase coal consumption (since they are based on low-grade ores) by a very considerable amount. The plants manufacturing synthetic petrol, rubber and fats consume, either directly or indirectly, very large quantities of coal. A number of new power plants are either planned or building. Transport and shipping are increasing their requirements. The only use of coal that can be reduced without damage to the whole plan is that of household coal, and the proportion of Ruhr coal (itself two-thirds of the total) going to household uses has already fallen to 17½ per cent. German estimates of the necessary increase of coal output vary from 20 to 50 million tons, or 10 to 25 per cent. of the present output (excluding brown coal). But in spite of this enormous demand for coal, it has proved impossible to increase the output. It was less than 2 million tons higher in 1938 than in 1937 and almost all the increase in the first half of 1939 was due to the inclusion of Austria in the statistics. The all-important Ruhr field produced only 346,000 tons more.

This state of affairs is due to the falling-off in the output per manshift, which reached its maximum of 1,711 kilograms in 1936 and had fallen to 1,554 kilograms in the first quarter of 1939. In an attempt to correct this, the hours of work were lengthened to 8½ hours on April 1, which has resulted in some increase in output, though not to the 1936 level. But another difficulty has now arisen. Men have been drawn away from the mines by work on the western fortifications and by the demands and attractions of the armed forces. The number employed in the Ruhr fell from 314,298 in May last year to 309,945 in November. The increase of hours threatened to intensify this exodus, so that a decree had to be issued on June 11th forbidding miners to leave their jobs without permission. This in turn led to serious unrest, threatening a further fall in output, and the Commissioner has now been appointed to improve the social conditions of miners, to increase the labour supply and to speed up rationalisation. It is doubtful, however, whether an increased labour supply, if it could be found, would be very effective. The truth is that the Ruhr coalfield has reached the limit of its present capacity. Virtually all the coal is already produced mechanically and some of the biggest companies have recently reported a decrease in output even after the number of workers had been increased. The only apparent possibility of increasing output is to sink new shafts. But this in the Ruhr takes time, measured in years, and the companies are not eager to embark on heavy new expenditure when the supply of capital is erratic and their profits are falling.

\* \* \*

**Political Tightrope in Spain.**—The long-awaited reconstruction of General Franco's Government is at last in progress. The new constitution, promulgated on August 4th, carries Spain a long way towards totalitarian Fascism, for it provides that the Falange, the Spanish equivalent of a Fascist party, shall subordinate to itself every other party in Spain and, what is more important, the whole personnel of the fighting forces. In line with his German and Italian models, General Franco has established a political council from leading members of the Falange, and this political council bears the same relationship to the Spanish National Council as, in Italy, the Fascist Grand Council bears to the Chamber of Deputies or, as it is now called, the Chamber of Fascios and Corporations. The whole arrangement bears a close resemblance to the early days of Fascism, when the authority of Mussolini was qualified by the Quadrumvirs (Balbo, de Vecchi, Bianchi and de Bono), whose collaboration had made possible the March on Rome. Gradually the authority of Mussolini prevailed, just as in Spain the authority of General Franco (unless he is overthrown) may be

## WILLS & TRUSTS

In acting as an executor or trustee, the Westminster Bank aims at putting itself in the position of a private trustee. It is therefore its practice to employ the family solicitor, if there is one, or any other solicitor the client may name; by such means the Bank succeeds in combining domestic tradition with business efficiency. A book showing the advantages of corporate executorship and the terms of appointment may be had at any branch

WESTMINSTER BANK LIMITED  
Trustee Dept., 53 Threadneedle Street, E.C.2.  
Also in Piccadilly, Bournemouth, Bristol, Liverpool  
and Manchester

expected to prevail over that of Señor Suñer, who is appointed president of the Political Junta, and over that of representatives of sectional opinion such as General Munoz Grande, who is appointed to the most influential post of secretary-general of the Falange.

General Franco becomes head of the State, with full dictatorial powers. He has reorganised the Government into twelve Ministries, those of foreign affairs, interior, war, marine, air, justice, finance, industry and commerce, agriculture, national education, public works and labour. And, of course, he has a controlling finger on the organisation of the Falange. At present, this follows closely the Italian model (although the Pope and his advisers, when considering whether it can be reconciled with Catholic principles, will doubtless not forget that a Concordat will soon be necessary); appointment and election is in every case from above, and the hierarchy tapers upwards through the ranks of local parties, regional federations, provincial authorities, until finally it reaches the Political Junta. Alongside the party organisation there is the customary paraphernalia of mock syndicalism. This neat blue-print for Spanish Fascism promises to meet with far more serious difficulties than its foreign predecessors. The latter erected their organisations in times of comparative peace, after years of preparation and ruthless treatment of allies as well as of enemies. General Franco is in no comparable position to impose his will on men who have just helped him to win a war. Behind the façade of unity there are bitter quarrels and divisions, not least on foreign policy. His must be the way of conciliation and compromise.

**Strains on Balkan Friendship.**—The extent to which the Serb and Croat negotiators in Yugoslavia find it expedient to sink their differences is no bad measure of their outlook on the international situation. The agreement signed on April 27th last (and later denounced) was the direct result of the German march on Prague. It provided a settlement whereby Yugoslavia would continue to be governed from Belgrade (by the Serbs), but leaving the Croats a substantial measure of autonomy. As time passed and no more terrible event happened than the German-Italian military alliance—though this, because it promised to define Axis spheres of influence in the Balkans, was bad enough—Belgrade and Zagreb resumed their customary haggling tactics. Now, with the dangerous month of August drawing onwards, there is news that agreement is once more in sight. It will be very welcome. For Balkan relations are already showing the severe strain to which their new-found amity is being subjected. With the tentative formation of a second, shadow, Balkan Entente (having a good deal more substance than the first, nominally still in force) between Roumania, Turkey, and Greece, designed to protect "external" as well as inter-Balkan frontiers, the tentative links with Bulgaria are showing signs of parting. The Turkish-Bulgarian frontier is once more, after a lapse of several years, the scene of anxious watching by troops on either side; it may not be long before the Greek Government finds it necessary to reinforce its frontier defences. And alongside this unhappy reversion to the old distrust of Bulgaria, there is a parallel movement between Bulgaria and Yugoslavia, for long enemies but now thrown together in their mutual state of unguaranteed neutrality. Both in Belgrade and Sofia there is a growing understanding that their position is, and is likely to remain, one of isolation; both Governments are doing what they can to alleviate the rigours of their solitude; in view of Germany's trade hold and the facts of geography, it may be doubtful how long they could continue to resist strong pressure on them to join the Axis.

It would seem that pressure is not now being exerted. M. Koisseyanoff, the Bulgarian Prime Minister, returned from Berlin without having had to make more than the

friendly pronouncements usual on such occasions though doubtless uttered, in his case, with more than usual sincerity. Meanwhile, a Bulgarian parliamentary delegation is on a visit to the U.S.S.R., and the President of the Bulgarian Sobranie, M. Moshanov, was recently in London, and was received by the King and by Lord Halifax. Prince Paul of Yugoslavia has just concluded a stay at Buckingham Palace. None of these movements can conceal the anxiety with which the two Governments gaze upon the world. The same sort of anxiety, the direct result of a fear that the Axis Powers are planning aggression towards the south-east, is observable in Hungary. It is one thing for the Hungarian Foreign Minister, Count Csaky, to warn his fellow-countrymen against thinking that Germany harbours designs against them; it is quite another thing for them to believe it. The facts are with them. Rumours are persistent that the German Government plans to annex at least the northern part of the Slovak "republic," from which German troop movements are reported; if this were to happen, Hungary would be more than ever at the mercy of the Third Reich. The tension between Roumania and Hungary, which came to a head a short time ago with an exchange of shots on the River Tisza, is a direct indication of the rôle which Germany may demand of Hungary in order to coerce Roumania's goodwill. Wherever one looks in the Balkans it is possible to see the effect of Axis pressure, in a closer friendship here, in a more precise hostility there: the spirit of Balkan friendship threatens to be one of the first casualties in this undeclared war.

**The Spirit of the Czechs.**—"The victory of democracy and freedom in Europe means the liberty of my beloved country, Czecho-Slovakia." These words are the concluding sentence of Dr Benes's first public utterance in England, made last week at the Liberal Summer School, an address which in its wisdom and unembittered judgment did the utmost credit to a man who has suffered an experience of perhaps unexampled bitterness. And yet Dr Benes may take the consolation that his policy has been proved right, that what he said last year has been borne out by the twelve months which have followed. We know now beyond any doubt that last September it was "not only the fate of the Czecho-Slovak State which is at stake," as the Czecho-Slovak Government said in its reply of September 20th, "but also the fate of other countries"—and we are left with nothing more to do than to try to make good the losses we then suffered. But the Czechs are left with the burden of living under German military rule. The last few weeks have brought a fresh instalment of oppression. Having commanded the Jews of Bohemia to sell their property (at ruinous prices, of course) not to the Czechs but to the Germans, they are now in the process of taking over by similar means those Czech businesses which are of particular commercial value to them. Arrests are a common part of everyday life. Many thousands of workers, most of them unwillingly, have been transported to Germany. Markets are under close control; even the harvest cannot be threshed until the Reichsprotector has given his permission. The promise of cultural autonomy is being violated every day and the Czech language subordinated to German. Even now the Czechs do not despair. And in everything they do the Germans are meeting that profound hostility which comes from a certain knowledge of having suffered injustice, and which, in the long run, will give the Germans a barren victory indeed.

**Turkey's Trade Dilemma—A Correction.**—It was stated on page 263 of last week's issue of *The Economist* that "the £10 millions trade credit (to Turkey) has been earmarked for paying Brasserts for their big contract, the Karabük steelworks and for wiping out some old debts on British concessions (railways, telephone systems) taken over by the Turkish Government." We are informed that the credit has not been earmarked for these purposes.

## THE WORLD OVERSEAS

### Expanding the French Air Force

(From a French Correspondent)

[The following article, which is written by an expert observer of French aircraft production, continues the story of modern French air force expansion begun in an article in *The Economist* for December 10, 1938.]

It was recently remarked that the money spent by the French Government for aeroplane production in 1939 would equal all that had been spent on it during the last nineteen years. A good deal of progress has now been made since the crucial days of 1938, when the Czecho-Slovak crisis caught France with an aircraft production of scarcely more than 50 per month. Much remains to be done; how much can be realised only when it is appreciated to how small an extent French aircraft producers are using methods of mass production. That is the main difficulty; until industrial reorganisation is complete and production has been rationalised it will be impossible to make the best use of the abundant credits which are now available.

Reorganisation is already well advanced: the next few months should show the beginning of mass production of aeroplanes. The whole aircraft industry is in the process of being fitted into the general structure of the metallurgical industry, so that small and average-sized firms will now be able to play their part. Another symptom of the Government's determination to press on with their programme is the decision that aircraft factories shall continue working all through the summer, the workers receiving in lieu of ordinary summer holidays extra days which they will be allowed to take after September.

As well as out-moded methods of production, there are other reasons for the slow advance in first-line strength. Raw materials have not always been available, and there have been times when producers have competed against each other for those which were to hand. The manufacture of certain essential parts, such as airscrews and undercarriages, has at times been so poorly co-ordinated as to have delayed the output of finished aircraft. Efforts have been made to eliminate this deficiency; several factories (Chaudière, Hispano, Gnome, Ratier) have increased their production by the use of sub-contractors.

The main deficiency in production remains, however, that of engines. The number of engines being turned out is insufficient to satisfy the demand, and it is obviously useless to push the manufacture of air-frames until the deficiency has been made good. The industry is finding special difficulty in fulfilling orders for engines of more than 1,000 h.p. These problems are not yet solved; it would seem that provisional measures will be taken while long-term solutions are being worked out. It may be noted that several orders have been placed abroad, in particular for the production of Rolls-Royce engines. Construction licences have been obtained from Messrs Pratt and Whitney by the Talbot factories, for Bristol Hercules by the S.I.G.M.A. concern, and for Rolls-Royce engines by Ford's.

When it comes to discussing actual production, there are two healthy tendencies to be noted. The first is the general acceleration in the production of all types, and the second is the design of new types which may be turned out by mass production. The first tendency stands out clearly from the figures. Of these there are few available, a decree of some months ago having placed a ban on the publication in the Press of armament statistics. The latest official estimate was made on May 5th when the Air Ministry declared that aircraft production had attained and even passed the figures established during the two previous months. Compare this with the gloom of 1938. Then, the aircraft industry was able to deliver an average of only 53 planes a month; with the aftermath of Munich production began slowly to rise, until in December it was at an average of 73 planes a month. In January the figure had risen to 94.

These figures refer only to the production of the new types

with a speed of at least 310 miles per hour for fighters and of 265 miles per hour for bombers. In April and May the figures stood at 113 and 160 respectively, the numbers being in each case rather less than the official forecasts, which were 120 and 170. The rise continued in June with a total construction of 175, of which 110 planes were chasers. This figure should be maintained in July: but August and September, with the introduction of mass production methods, should attain the level of 200 planes a month for which official forecasts have allowed. After September production is expected to be at the rate of 300 a month, and there is no reason why that figure should not be attained.

#### Mass Production Types

The general plan upon which the industry is working is for the construction of 4,800 aeroplanes and 12,000 engines during the period from March, 1938, to March, 1940. This would permit of a first-line strength of 2,617 planes. Payment for the 1939 programme will need 18.5 milliard francs. Of this sum 11 milliards will come out of the Budget, the remaining 7½ milliards being provided by supplementaries.

After the promulgation of the decrees loosening the application of the 40-hour week and permitting a week of forty-five hours, with overtime at 5 per cent. up to 60 hours, labour problems have receded into the background. While there are no official statistics, the number of workers and engineers in the aircraft industry may be taken to be fairly closely as follows:—

In nationalised factories: about 40,000 workers.

In private factories: about 12,000 workers.

of which:

|                 |       |
|-----------------|-------|
| Gourdou .....   | 800   |
| Breguet .....   | 3,200 |
| Levasseur ..... | 300   |
| Morane .....    | 1,400 |
| Caudron .....   | 2,700 |
| Amiot .....     | 2,400 |
| Kelner .....    | 600   |

In about 30 small sub-contracting factories: 30-35,000 workers.

Total of all factories: about 80,000 workers.

The average working week is now around fifty hours, but several factories are working up to sixty hours a week. Several new factories are being built.

A notable example of a mass-produced chaser which is about to go into production is the Dewoitine 520, which needs only about 6,000 man-hours of work. Compared with this, the work which went into earlier types seems prodigious. The Morane 406, for instance, a two-seater, single-engined chaser which has met with particular difficulties in

### THE BRITISH LINEN BANK

City Office: 38 Threadneedle Street, E.C.2

West End Branch: 198 Piccadilly, W.1

production, required some 30,000 man-hours and was assembled from 6,000 parts. Methods have now been improved, and the Morane now requires only 14,000 man-hours; nevertheless, up to May 15th only 150 of these planes had been delivered. Another machine which has met with production difficulties is the twin-engined Amiot bomber announced for regular construction some months ago. It appears that this plane will be in mass-production by September. Like the Dewoitine, the Amiot has shown very satisfactory results; it was developed from the machine in which, last year, Commander Rossi set up two world records. A third type, the Breguet 691, which is a light, twin-engined monoplane bomber and chaser, originally ordered in June, 1938, will be in production at the rate of one plane a day after September. So far, only about twenty of these machines have appeared. As far as engines are concerned, the Société National de Construction des Moteurs, at Argenteuil, has developed a new water-cooled engine of 1,600 horse-power.

With this determined attack on the dual problems of mass production and engine production, the French Army of the Air is nearing the end of a long period of adaptation. The period of high-speed development is at last at hand.

August 8th.

## German Shipping

[FROM OUR BERLIN CORRESPONDENT]

GERMAN shipping has been able to increase its traffic and better its finances since world conditions became more favourable a few years ago, and since the shipping concerns bring in a large part of Germany's foreign exchange, the upward trend has been of direct help to the Reich's foreign exchange holdings. Many of the smaller concerns have been able to declare dividends again, and in some cases have even increased their payments. The position of the large shipping concerns which had been particularly affected by the crisis is less satisfactory. Neither the Hamburg-America Line nor the North German Lloyd have been able to resume dividends, since they have been compelled to retain large sums for their financial consolidation, and also forced to begin important construction programmes in order to be able to compete with other firms.

The upward trend of German shipping suffered a check in 1938, which affected the various individual shipping firms differently. While South American traffic increased with the more or less successful German South American barter deal, the African traffic suffered considerably from the deterioration in the international situation. The Levant lines were fairly successful. The Hamburg-South American Steamship Company, with a capital of Rm. 10 millions, was able to increase its dividend from 6 to 8 per cent., and the Hamburg-Levant Line from 5 to 6 per cent., while the Bremer Hansa and Neptun Line paid 6 per cent., as in the previous year. Decreased traffic was accompanied by increased prime costs, particularly personnel and material costs; but it should be noted that large write-offs were made parallel with the building programmes.

The sums written off are considerable. They rose from Rm. 22.7 millions in 1937 to Rm. 23.5 millions in the case of the Hamburg America Line, from Rm. 17.8 millions to Rm. 21.4 millions for the North German Lloyd, and from Rm. 8.9 millions to Rm. 9.8 millions for the Hamburg South America

Line. Liquid assets and securities, however, have diminished in amount. The extent of self-financing is shown in the fact that the debts of the Hamburg America Line remained unchanged, while those of the other two shipping concerns fell greatly. But the present financial strength is largely due to the delay in the completion of the new construction. This, in turn, is occasioned by the fact that German shipyards must first complete contracts for the navy and for export.

The statistics of the German Lloyd show that the output of German shipyards rose from 182,652 tons gross in 1937 to 226,164 in 1938; the navy and export orders provided the bulk of the demand. The German merchant fleet has increased by only 189,199 gross tons as compared with the increase of 276,274 in 1937. Fewer ships were purchased abroad and more were exported. Contracts for 520,676, as against 423,818 gross tons, were distributed. The German merchant marine now consists of 4.35 million gross tons, as against 4.16 millions in the preceding year, and about 0.6 million gross tons in 1919.

Taking the armament contracts into account, the German shipyards will be fully employed for several years. Present contracts are for 258 units as against 284 in the preceding year or for 851,004 gross tons against 929,854. The demand from abroad has declined; only 48 units, against 82, or 330,328 gross tons, against 506,036, are now on order on foreign account. In 1938, 55 against 41 units, of a total gross tonnage of 263,441 against 217,257 in 1937, were delivered abroad. Total output from German yards increased from 399,909 to 490,065 gross tons, or 197 units against 169 in the same period.

The deterioration in the position of German shipping concerns has produced some strong criticism of the subsidy policy of foreign countries, particularly of England, and also of the demand of the shipping conferences for improved loading standards in German ships. At the annual meeting of stockholders of the North German Lloyd, mention was made of the discrimination against the German flag in the coverage of insurance risks. At the same time a warning was issued that if the foreign members of the conferences are unable to put an end to this discrimination, the German shipping firms will have to revise their relationship with the conferences. The Hamburg America Line and the North German Lloyd have already terminated the North Atlantic Conference agreement over cabin-class prices, owing to the fact that the cabin class on German ships is little patronised.

Germany is doing all in her power to expand her navy. The termination of the Anglo-German naval agreement, signed in 1935 and regarded as the main hindrance to a naval armament race, has released the Third Reich from maintaining the 35:100 ratio. The German declaration of the desire to continue the qualitative clauses of the pact was mainly due to the fact that German re-armament possibilities are restricted by the scarcity of raw materials. According to statistics of the Institute of Business Research, the following tonnage of warships has been built by the leading naval powers in 1937 and 1938:—

|                     | 1937   | 1938    |
|---------------------|--------|---------|
| U.S.A. ....         | 45,000 | 116,000 |
| Great Britain ..... | 67,000 | 79,000  |
| Germany .....       | 14,000 | 73,000  |
| Italy .....         | 32,000 | 33,000  |
| Japan .....         | 50,000 | 16,000  |
| France .....        | 35,000 | 8,000   |

Figures of naval expenditure are not published in Germany. Great Britain spent Rm. 1,878 millions on her navy in 1938, and is planning to spend Rm. 2,277 millions this year. Since Germany has so much leeway to make up her naval expenditures can hardly be less than this.

August 7th.

## Cars and Residential Building in the U.S.A.

THE point in the business cycle at which this country now finds itself is a matter of some uncertainty. The indices of manufactures speak with two voices. If the adjusted index is taken as the guide, it implies that last autumn's upturn might have been of the "flash-in-the-pan" variety—what is called in Wall Street semantics a "soda-water rally"; while the unadjusted index suggests that the six

months from December 1938 to June 1939 have been a period of consolidation, preparatory to an extension of the upward movement. On the whole, both financial and industrial opinion inclines to the latter view and looks forward to the autumn in a state of mind which may be described as stronger than hope, and not so strong as confidence. The adjusted indices are as follows:—

BUSINESS INDICES  
Adjusted for seasonal, 1923-25 = 100

|                                     | June, 1938 | May, 1939 | June, 1939* |
|-------------------------------------|------------|-----------|-------------|
| Industrial production, total .....  | 77         | 92        | 97          |
| Manufactures, total .....           | 74         | 91        | 96          |
| Durable .....                       | 50         | 71        | 81          |

\* Preliminary.

### The Building Index

The part played by residential building in the current cycle is interesting, partly because so much emphasis was placed on it in the discussion of some years ago. Residential building is a laggard in the recovery. The annual average for 1932 was 13; for 1933, 11; for 1934, 12. Upturn began in 1935, continued into 1937, dropped rapidly, but picked up early in 1938, and has been more sustained since.

The upward movement from 12 early 1935 to 45 early 1937 and the subsequent downturn to 26 were quite marked, but this fall at its lowest left the index at more than double the years 1932-34. The improvement of 1938 promptly carried the index above the best figures of 1937, and this index has now for nearly a year held at level almost a third higher than the best months of 1937. There are four general comments readily made on the residential building activity.

1. To some extent it reflects the accumulation of need built up during the long period when new residence building hardly equalled the destruction by fire of existing homes.

2. The extremely favourable financing terms of the F.H.A. of 1938 (90 per cent. mortgages at 5 per cent., now reduced to 4½ per cent.) have made it rather easier to finance a new house than an old house.

3. This in turn has discouraged recovery in price or marketability of existing houses; and the total national investment in houses is, in value, comparable to that, say, in listed corporate securities. While corporate securities have materially lifted their values since the depth of the depression, the urban real estate market has had little recovery.

4. The new building is clearly illustrative of the demographic population shift created by the popularisation of the motor car. That is, the new homes are being constructed on the edge of centres of population, in areas in which the occupants are dependent on the family car for transportation either for work or shopping.

### Expanding Suburbs

This fourth phenomenon in a measure is related to the third. The effect of the motor car on the distribution of population was foreseen years ago, and the first evidences are more than a decade old. But the real movement has become visible only in the last two or three years, and is now clearly conspicuous in the present type of residential building. When, for example, ten years ago, the residence of a suburban season ticket holder was described as so many "minutes" from the railway station the term implied so many minutes' walk. Now it connotes so many minutes by car. The increased distance which the householder is enabled to travel in this time by using his private car represents an increase in the radius from the station within which urban residential construction may take place.

The actual number of families in the United States, and the number of family cars, is not mathematically very different from the figures of the late 20's. The economic impact of the car on the family was more or less delayed by the long depression, but it is taking a remarkable part

in shaping current developments. The present residential building is therefore something quite different from meeting an alleged accumulated shortage; and though certainly facilitated by the terms of financing it is probably not caused by them. Its basis is a dispersion of population caused by the habituation of the family to the motor car.

## Egypt and the Balance of Power

[FROM OUR EGYPTIAN CORRESPONDENT]

ALTHOUGH the seeds of the present world unsettlement were already discernible three years ago and actually hastened the signing of the Anglo-Egyptian Treaty, Egypt at the time heralded the event as the beginning of an era of fulfilment and complacency. A young King had just ascended the throne, the Wafd to all appearances was at long last firmly entrenched in office and the way seemed to be paved for economic and social development. From the very first steps, however, in its independent life the country has been beset with internal and external difficulties.

Of the four principal factors in home politics, the palace, the opposition, the Wafd and the British, the treaty eliminated only the latter. A combination of the first two drove the Wafd out of office and the elections that followed the dissolution of the Chamber of Deputies resulted in an overwhelming defeat for Nahas Pasha, already weakened by a serious split in his party. Clearly, administrative pressure could not solely account for the change, which was due also to a swing from the Wafd of a section of the educated classes. Since then and apart from occasional reshufflings the ministry of Muhammad Mahmud Pasha, comprising the liberals and dissident Wafdists (Saadists), has been able to govern the country without encountering much effective opposition outside the Senate. And the latter would have been insufficient to jeopardise the stability of the cabinet if the failing health of the Prime Minister had not prevented him from giving the full measure of his talents and thus recently laid open the question of his successor.

### New Problems for Old

In the course of the past three years Egypt has reaped one after the other the fruits of her independence. The capitulations regime has gone, a fully-fledged fiscal reform has been initiated and the Egyptianisation of more than one key institution has been tackled successfully. But together with the removal of old grievances new problems have arisen. Where the previous moderate taxes sufficed to keep the State machine going, the present increasing receipts are proving inadequate to cover the cost of expanding defence needs and of land reclamation as well as of sanitation urgently demanded by the rapid growth of an already extremely dense population. The country has been treated to a prolonged flight of capital and on the top now comes the subsidising of American cotton exports, which strikes at the root of Egypt's prosperity.

While party politics still retain much of their appeal, national issues are steadily gaining importance. With a potential enemy at the gates constitutional slogans no longer arouse past enthusiasm, especially among the younger element; rather is the demand for efficiency. Drive may be lacking in many departments, public initiative may often be marked by amateurishness, yet national defence is changing the face of many things and as a compensation for the material loss involved there is good hope that a greater spirit of self-sacrifice and a stricter sense of discipline will develop.

For the first time after many decades Egypt is being called upon to play an active part without her borders. In normal times she naturally would have concentrated on the long-cherished leadership of the Arabic and Moslem worlds. As a matter of fact the Egyptian and Iranian dynasties have recently been united by marriage and Egypt has ever been willing to supply the more backward sister states with technicians and sometimes capital. During the Palestine Conference the Egyptian delegates displayed much statesmanship. But the Mediterranean situation being what it is, geography must make first claim and thus the first official tour of the Minister of Foreign Affairs did not carry him from Ankara to the capitals of the signatories of the Saabad Pact but to Bucarest, Sofia, Belgrade and Athens.

### Trade with the Balkans

Egypt can play her part in alleviating German economic pressure on the Balkans. The latter, Greece excepted, have an active trade balance with Egypt and they can divert to this country a portion of their foreign purchases which, in turn, would allow a further increase of sales to Egypt without aggravating the present position. Although an agricultural country, Egypt imports large quantities of tobacco, timber and livestock, typical Balkan produce. On the other hand Alexandria possesses an excellent organisation for the marketing of high grade raw cotton. The young Balkan textile industry would be only too glad to avail itself of the facility if permitted to. In the course of the past four seasons, Roumania increased her takings of Egyptian cotton from a negligible quantity to 43,748 bales, while her oil exports to Egypt amounted last year to £E.807,446. Egyptian rice could also be placed in large quantities in these countries. Following the dumping policy adopted by the United States in relation to cotton Egypt is now much more favourably inclined to consider barter propositions.

Egypt is more or less self-sufficient in foodstuffs and could be made more so if, as in 1914-18, the acreage sown to cotton were curtailed. Such a course would become imperative in a war that closed a number of Continental outlets and held up commercial navigation in the Mediterranean. In the industrial field, apart from textiles, the country is dependent to a very great extent on imports, but the rapidly expanding output of the oil wells bids fair to cover in a not distant future all peace-time requirements. A survey of Egypt's economic contribution to a possible struggle would not be complete without mention of her hardy labourers, about a million of whom rendered great services during the last war. On the other hand, one of the greater weaknesses resides in the fact that the country's whole life is so closely bound up with an intricate and vulnerable system of dams, canals, railways and bridges over the Nile.

### Better Feeling

It is a truism that the presence of British forces in Egypt has never been so welcome as at present. No less appreciated is the link of the currency with sterling, the value of which was illustrated last September when even at the height of the emergency the heavy seasonal movement of London funds into Egypt for the financing of the cotton crop proceeded without a hitch. And the increase in the demand for English educational facilities testifies to the improved feeling since the treaty. The Wafd is no exception for, as in the past, its outwardly critical attitude of the British when in opposition, for which there is far less ground nowadays, would not be maintained if it were again returned to office. Foreign perils have convinced the people that the peace front now building offers the best protection against aggression and the adhesion of Turkey has not only dispelled remaining doubts but taken the wind out of the sails of the Axis propaganda.

August 3rd.

## Preventing the Price Rise

[FROM OUR PARIS CORRESPONDENT]

FOREIGN trade figures were lower in July than in June—a consequence of the holidays. The advance over the corresponding month of 1938 remains nevertheless considerable as the following table shows:—

|                                          | July,<br>1938 | June,<br>1939 | July,<br>1939 |
|------------------------------------------|---------------|---------------|---------------|
| (In million francs)                      |               |               |               |
| Imports—                                 |               |               |               |
| Foodstuffs .....                         | 980           | 1,126         | 1,028         |
| Raw materials .....                      | 2,023         | 2,278         | 2,139         |
| Manufactured goods .....                 | 511           | 668           | 760           |
| Totals .....                             | 3,514         | 4,072         | 3,927         |
| Exports—                                 |               |               |               |
| Foodstuffs .....                         | 302           | 471           | 374           |
| Raw materials .....                      | 699           | 911           | 931           |
| Manufactured goods .....                 | 1,284         | 1,825         | 1,579         |
| Totals .....                             | 2,285         | 3,207         | 2,884         |
| Import Balance .....                     | 1,229         | 865           | 1,043         |
| Import Balance (Colonies excluded) ..... | 909           | 627           | 679           |

For the first seven months of 1939, imports were 25,931,000 tons valued at 28,693 million francs (against, respectively, 28,285,000 tons and 26,779 million francs in 1938) while exports were 16,706,000 tons and 20,924 million francs (against 15,597,000 tons and 16,249 million). The excess of imports over exports decreased from 10,530 to 7,769 millions.

There is, moreover, a remarkable invasion of foreign—notably British—tourists. Official circles also reveal that the inflow of gold and subscriptions to treasury bonds are now greater than ever. The franc is firmly established on a positive balance of payments and the foreign exchange trend favours the repatriation of capital. This new situation will be officially registered in the next weekly return of the Bank of France which will show the second transfer of 5,000 million francs in gold by the Equalisation Fund.

The last decree-laws, notably those concerning the Wheat Office and the quotas, show that the Government is very attentive to subsequent movements in the price level which are all important for the future of internal and foreign trade. By fixing the price of wheat too high (140 francs per quintal in 1936, 180 in 1937, 204 in 1938), this Office provoked an expansion of production which reached 100 million quintals last year, as against a home demand of about 75 million, and produced a deficit at the Office of 3,000 million francs which will have to be covered by loans. The social importance of the Office is such that it cannot cease working when wheat is worth 50 francs at Chicago and 200 francs at Paris. But the next crop will be better estimated and the price more scientifically fixed. Production will be henceforth divided into two parts. For the first, corresponding to the internal requirement, the owner will be paid at a profitable rate; and the second, corresponding to the surplus, will be sold as advantageously as possible. The price of the 1939 crop will shortly be fixed. Rumours announce a lowering of the former price. But since another excellent crop is expected the peasants will no doubt be content with a smaller unit basis.

If, however, a rise of prices is forbidden to agricultural products, the same rule must be applied to consumption goods. Import quotas on about sixty industrial products (out of a total of 300) have therefore been abolished, the principal items benefiting being consumption goods, notably textiles. This is the first step which has been made towards a return to liberalism since the creation of quotas in 1931. The objective is evidently the progressive substitution of protective duties for quotas and the reorganisation of the customs on more flexible lines so that better commercial treaties can be arranged in the near future. The defect of this first decision, however, is that it concerns products which play a very small rôle in the cost of living; its danger is that certain countries would seize the occasion to introduce their goods at abnormal prices on the French market. This contingency has been foreseen by the decree and the Government gives notice that abolished quotas would be in such case re-established at once.

The effort to keep down prices is thus firmly fixed in the general policy of M. Reynaud, which is tending towards a return to liberal practices. The Wheat Office is retained, but ordered to work in such a way as practically to stabilise the market situation which would be produced by normal demand and supply. Industry continues to be favoured by

war orders, customs assistance and financial support from the State. But now that the franc and the balance of payments have recovered their stability, the market is opened a little wider to foreign competition, which will prevent employers from falling asleep on guaranteed profits.

This invitation of the Government to industry to undertake new risks, to improve their plants and to seek new markets will probably be accompanied in the near future by other measures. In his last broadcast speech, M. Reynaud declared that "if fetters still hinder production, they will be put away" and "if taxation is now too heavy, it has an excuse, which is to give to the Government the time in which to realise durable economies in public expenditure." The next step of the Minister of Finance towards a French regeneration will certainly include a new attempt to increase economic activity through freer production and lower taxation.

August 10th.

## Scandinavian Preparedness

[FROM OUR STOCKHOLM CORRESPONDENT]

NEUTRALITY is and remains the keynote of Sweden's foreign policy. Everything the Government does abroad, and everything that foreign Governments do, is first considered by public opinion in the light of its possible influence on Sweden's prospect of staying neutral. It is the prevailing opinion that war can no longer be avoided. The neutrality attitude has become in this country almost a religion—a circumstance not always realised abroad. Yet this attitude has by no means impaired Swedish willingness and capacity to fight, if necessary, against any aggressor approaching Sweden's borders, whether he comes to lay hand on the precious stores of iron ore or merely to bestow on Sweden a guarantee for which she never asked. The Government's efforts to strengthen the national defences are accepted without criticism in spite of the material sacrifices which they usually entail.

The strengthening of the armed forces is the Government's most urgent care. Attention has also been given, however, to the organisation of economic preparedness for an emergency. This enormous charge has been handed over to a body specially created for that purpose, the Swedish Rikskommission for Economic Defence Preparedness. It is composed of a chairman and ten members, who represent the army, the navy, the Board of Trade, the Social Board and the most important sections of economic activity. The Committee has elaborated a "General Plan" for obtaining its object; this plan embraces the organisation of supplies, organisation of the labour market, of insurance, foreign trade and shipping, control of prices and many other economic questions arising from the adaptation of the country to emergency conditions. The plan provides for two stages of emergency, firstly for carrying on as a neutral under general war conditions, and secondly for carrying on an actual war.

Particular attention has been given to the war preparedness of five important industrial groups, those concerned with the iron, engineering, chemical, textile, and leather industries. These enterprises have been registered for the production of war material. Special instruction to this end, as well as a plan for Government supervision, has been prepared. Questions of supply, as of raw materials, liquid fuel and so forth, are receiving extensive investigation. Since early 1937 negotiations have been conducted with similar organisations in three other Northern countries with the object of intensifying trade between the Scandinavian States in case the normal supply of goods should be shut off.

Though the nation is ready to sacrifice at need some of its economic rights and privileges, this State interference is equally odious to all classes of the population. There is a general understanding that emergency measures tending to suppress economic freedom will be abolished as soon as the emergency has passed. One of Sweden's prominent economists and politicians, Hr Anders Oerne, who is also the Postmaster-General, has emphatically pointed out the dangers and the consequences of all these restrictive measures. He urges that, together with the elaboration of such measures, attention should also be given to plans for their removal and for the winding up of emergency organisations. The experiences of 1918 proved that the lack of such a plan can entail very heavy losses.

**Business Activity.**—This first showed improvement during the second half of 1938. It has now assumed the shape of a pronounced boom and the Swedish general index of business activity, compiled on the average of 1935 taken as 100, has risen gradually from 123.3 at the beginning of 1939 to 127.6 in April. This compares with the peak record of 124.2 in August, 1937. The boom is doubtless largely supported by the foreign armament industry, which is requiring increased supplies of Swedish goods. Construction of barracks in Great Britain, for instance, has immediately caused an improved demand for Swedish timber. Substantial timber sales have also taken place to Germany and to Spain.

Out of the total Swedish annual timber quota of 656,000 stds. over 530,000 stds. have already been placed. Pulp exports have also much increased, and foreign buyers' stocks are reported as greatly reduced. For ironworks the position is particularly satisfactory, partly because of foreign demand for high quality steel, and partly because of Sweden's unprecedented building boom. As far as rolling-mill products are concerned, Swedish ironworks are now working at full capacity.

Figures for foreign trade and for trade with Great Britain are shown in the following table:—

| FOREIGN TRADE<br>(In million kronor)                 |               |       |  |
|------------------------------------------------------|---------------|-------|--|
|                                                      | 1938          | 1939  |  |
|                                                      | January-May   |       |  |
| Imports .....                                        | 813.6         | 937.0 |  |
| Exports .....                                        | 728.1         | 730.5 |  |
| Import surplus .....                                 | 85.5          | 206.5 |  |
| TRADE WITH THE UNITED KINGDOM<br>(In million kronor) |               |       |  |
|                                                      | 1938          | 1939  |  |
|                                                      | January-April |       |  |
| Exports to U.K. ....                                 | 141.1         | 128.2 |  |
| Imports from U.K. ....                               | 117.0         | 121.6 |  |
| Export surplus .....                                 | 24.1          | 6.6   |  |

An outstanding feature of Swedish-British trade is the marked decline of Swedish exports to Great Britain and the rise of British imports to Sweden. On the export side timber has declined in value from Kr. 44.4 millions to Kr. 41.2 millions. On the import side, textiles have advanced from Kr. 21.6 millions to Kr. 25.1 millions.

Employment has on the whole kept up well. The number of unemployed at the end of May totalled 15,000 compared with 22,000 in April, and 12,000 in May, 1938. Wholesale prices show a rising tendency. The index of wholesale prices compiled by Professor Silverstolpe stood in May at 124, against 122 in April, and 130 in May, 1938. The money market remains easy, though money has somewhat tightened lately after several large loan redemptions and conversions.

July 30th.

## The Canadian Wheat Crop and Industry

[FROM OUR OTTAWA CORRESPONDENT]

A NUMBER of factors have combined to complicate the Cabinet discussions about whether a general election should be held this autumn or deferred until the summer of 1940. The advocates of an early election argue that conditions are

EXECUTORSHIPS AND TRUSTEESHIPS ACCEPTED

never again likely to be so propitious for a successful appeal for a new mandate. They point out that the Conservative Party is divided by a serious internal quarrel over the railway issue, and that as long as Dr Manion stands firm against any plan of unification he will get no support from the financial and business magnates of Montreal and Toronto, and will thus enter the campaign with a very bare Treasury.

The good crop which is ripening in the West is expected to put the prairie grain-growers in a more cheerful mood and help to wean them from the allurements of the Social Credit and C.C.F. programmes. Undoubtedly during the past fortnight the grain crops of the prairie provinces have suffered a certain deterioration as the result of a spell of very high temperatures unrelieved by any rainfall of serious dimensions and Mr Gardiner, the Minister of Agriculture, on returning from a tour of the West last week, declared that the extent of the damage done had not been realised in Eastern Canada. The crop seems likely to be poor in a substantial area in the southern parts of Manitoba and Saskatchewan, which have been drought-stricken for a number of years, but the suspicion prevails that the authorities who have been watching with alarm the steady descent of wheat prices, welcome any excuse for reducing estimates of the probable aggregate yield of the western wheat crop and that, while some damage has been incurred, the crop will still be far better than any of its recent predecessors. Harvesting has already begun in some of the earlier districts and the yields are reported to be very satisfactory. The Liberals are further heartened by a serious quarrel which has developed between the two Leftist parties—the "New Democracy" party of Mr Herridge and the Confederation of Canadian Farmers.

On the other hand, some Ministers do not wish to hold an election so long as there is a danger of its coinciding with the commencement of a European war. Canadian participation in such a war could hardly fail to become an election issue, and they fear that trouble would develop for themselves in Quebec. They are also pledged not to commit Canada to participation in another overseas war without the authority of Parliament, and if Parliament were dissolved the position might well be a very embarrassing one. So a decision is likely to be postponed.

### Improved Business

According to the Bureau of Statistics the index for the physical volume of Canadian business in June was 121.7, as compared with 108.4 in June, 1938, and 121.4 in May; the index of industrial production was 124, as compared with 109.3 and 123.3. In July business has been more than holding its own and the general economic index of the Bureau, which stood at 107.3 for the week ending July 1st, has risen a point to 108.3 for the week ending July 22nd. The downward trend of prices is a disturbing feature for which the fall in grain prices is largely responsible. The latest employment bulletin of the Bureau, however, showed that the reporting firms increased the number of workers on their payrolls in June from 1,100,098 to 1,126,216, an increase of 2.4 per cent., which is larger than the average gain for June.

Undoubtedly, if the threat of a general war could be removed, there would be a reasonable prospect of a substantial improvement in Canada's prosperity during the second half of the year. The prospect of an expansion of business in the Prairie Provinces is already having beneficial effects upon Eastern industries; cotton mills and farm implement firms are expanding their output while large orders are coming from the West for groceries, furniture, clothing and household equipment. The handling of the heavy crop will ease the unemployment situation in the western towns and substantially increase railway earnings.

Another encouraging factor is the revival of Canada's export trade; in June, exports of Canadian domestic produce had a value of \$93,269,144, compared with \$66,661,943 in June, 1938, representing a gain of roughly \$26½ millions, achieved in face of a fall in prices. For the first six months of 1939 domestic exports were valued at \$461,987,491, compared with \$391,076,834 in the parallel period of 1938. In these figures the drop in wheat prices was reflected, the 5½ million bushels of wheat exported in the first half of 1939 being valued at only about a million dollars more than the 25½ millions exported in the first half of 1938.

The industrial life of Canada has the prospect of securing a useful reinforcement of capital and skilled labour as the result of the decision of a number of individuals and firms, which had formerly conducted their operations in Czecho-Slovakia, Austria and Germany, to transfer their activities to Canada. Of these migrants the most important is the Batt'a boot and shoe firm, which in face of the strenu-

ous opposition of Canadian manufacturers has secured the permission of the Federal Government to bring in up to 250 experts and technicians. These will form the nucleus of the staff for a large new modern plant which, along with a model village, will be built by the Batt'a interests at Frankford in Central Ontario and may eventually employ in addition 1,000 Canadian workers. Other refugee industrialists are proposing to manufacture gloves, hats, wood products and beet sugar. Naturally there is some apprehension among vested interests about the consequences of this influx, but in some cases goods not previously made in Canada will be produced and, generally speaking, the Press has strongly supported the immigration of refugees with capital to establish industries.

July 31st.

## Nationalisation in Chile

[FROM OUR SANTIAGO CORRESPONDENT]

A BILL has been tabled in Congress to change the present regulations applying to foreign banks in Chile. At present, domestic and foreign banks enjoy the same privileges; and for both it is the rule that their capital and reserves must amount to not less than one-quarter of their deposits and total liabilities. The new Bill preserves this ruling for domestic banks, but alters it in respect of foreign ones. In the case of the latter, their capital and reserves must amount to not less than one-half of their deposits and liabilities. If the Bill passes its results will be very far-reaching. It may even bring about the winding-up of foreign banks originally established in the belief that they would be bound only by the usual laws of the country.

The six foreign banks affected have made considerable capital investments in Chile; and, moreover, they have already lost large sums through the successive depreciations of the peso. If the present capital and reserves of these banks is valued at the rate of 6d. per peso—and most of the capital was brought into the country at rates higher than this—the total value would be £4,575,000. The ruling "free" rate is 160 pesos per £, at which figure the value of the foreign banks' capital and reserves amounts only to £1,143,750, or a loss of nearly £3½ millions in the short space of seven years.

On the one hand, the usefulness of the foreign banks to Chile cannot be questioned. They grant credit facilities to Chilean trade and industry, and contribute considerably to the development of a country, which, though endowed by nature with riches, lacks capital to develop them. On the other hand, the proposed law will antagonise foreign capital precisely at the moment when there has been passed a Bill to provide for reconstruction and development for which Chile is endeavouring to raise large loans abroad.

The immediate consequences of the new Bill can be readily foreseen. In order to adjust themselves to the new regulations, the foreign banks will be obliged to curtail their credit facilities, and it is unlikely that the domestic banks will be willing or able to fill the gap. Moreover, it is likely that the net effect will be to bring about an increase in interest rates. The average rate of interest on advances made by domestic banks for the period 1936 to 1938 works out at 8.09 per cent.; the equivalent figure for foreign banks is only 6.82 per cent. From these figures alone it can be seen how unfavourably the proposed change may react on the economic life of Chile.

This Bill is but one more sign of a marked tendency towards nationalisation. Another is the proposed Government monopoly of petrol and oil imports and their distribution. This monopoly was first instituted in 1932, but it has since been held in abeyance. Now, the object of the present regime is to expropriate the oil companies' interests using as a basis the 1932 valuation of 60 million pesos (it must be remembered that the peso was worth 6d. then and it is worth only 1½d. now). It is not likely, however, that this step will be taken at once. More probably the monopoly will once more be held in abeyance, if only because the Government has no experience of shipping, storing and distributing. And, more important, there is the difficulty of financing the operation: the only reasonable way would be in dollars or sterling; and both of these currencies are scarce in Chile. Another nationalisation scheme is to reserve all the retail trade of the country for native Chileans. This is more reasonable. Foreign capital would not be appreciably antagonised by such a step and it would create no great difficulties of an economic kind.

July 14th.

## Letters to the Editor

### Savings and Investment in the U.S.A.

TO THE EDITOR OF THE ECONOMIST

SIR,—I observe in your latest issue that your New York correspondent seems to be arguing that there is a lack of capital in America due to insufficient saving. This reminds me of a letter to *The Times* by Mr Malcolm MacDonald in 1930 putting forward the same contention in similar economic conditions; and I must say that I thought that that fallacy had been sufficiently refuted since then not to re-appear again, and certainly not in your columns. However, perhaps you will allow me to restate that there can be no question of lack of capital at a time when large quantities of unclaimed wealth exist in the form of abundant supplies of unemployed labour, unemployed capital equipment and unemployed surplus stocks of goods. It is an undisputed fact that large quantities of such unclaimed wealth exist to-day in the United States, and thus the trouble is not lack of capital, but rather the lack of incentive for the investment of capital in new capital equipment.

Actually, savings can only be conserved as real capital by investment in capital goods, for otherwise they are dissipated by reduced production that necessarily follows the withholding of purchasing power. In other words, savings are dissipated by unemployment of the "saved" labour, capital equipment and surplus stocks of goods. Thus, whilst it is certainly true that a lack of capital may be due to insufficient saving, it is equally true that the supply of capital may shrink as the result of insufficient final-buying of goods.

However, the symptoms of a shortage of capital due to insufficient voluntary saving are full employment, rising prices and currency depreciation, none of which is present to-day in America.

Yours faithfully,  
A. H. ABBATI.

Eastbourne.

TO THE EDITOR OF THE ECONOMIST

SIR,—It seems to me that your New York correspondent has been unduly impressed by Mr Keynes' latest terminology. It is true that on his definitions savings and investment are necessarily equal. The fact that there has been little or no net investment in the United States during the last ten years may also be expressed by saying that there has been little or no net savings. But to conclude from this that net investment would be encouraged by a reduction of individual consumption, as your correspondent appears to recommend, is to make a completely fallacious use of the above definitional identity.

Such a suggestion follows indeed the orthodox tradition of classical economic teaching. But then classical economic teaching was based on the assumption of a constant national income and full employment. Under those conditions, an increase in investment could only be achieved by cutting down consumption.

In the United States where, as your correspondent points out, the national income fell within three years from \$80 milliards to \$50 milliards, and unemployment increased by more than 11 millions, the classical assumptions seem rather out of place. National income is still only about \$65 milliards, and unemployment is estimated at some 10 millions. It therefore hardly seems necessary to reduce, or even to discourage, an increase in consumers' purchasing power in order "to provide the population with the tools of productive employment."

Your correspondent is perfectly justified in regarding the stagnation in investment as "the outstanding fact" in the United States economic situation. Any policies—monetary, fiscal or other—which would stimulate investment would therefore be highly desirable; but there seems little evidence that a curtailment of consumption could be included in this category. On the contrary, most business men would surely regard it rather as a factor discouraging investment (and hence savings, according to the above definition).

M. F. W. JOSEPH.

London.

### Disclosure for Nominees

TO THE EDITOR OF THE ECONOMIST

SIR,—Will you allow a Scottish reader of your paper of August 5th to point out an error, which has occurred in the article on page 270 entitled "Disclosure for Nominees." The article states: "Section 101 of the Act [the Companies Act of 1929] perpetuates a point which has long been of the essence of British company law. It provides that no notice of any trust shall be entered on the register of British companies."

If reference is made to the Section referred to it will be found that it is in these terms:—

*CI. Trusts not to be entered on register in England.* No notice of any trust, expressed, implied or constructive, shall be entered on the register, or be receivable by the registrar, in the case of companies registered in England.

The writer of the article has overlooked the terms of the Section, which refers to England alone, and that there may be companies registered in Scotland to which the Act otherwise generally applies.

It has been long the custom for Scottish companies to disclose on their registers trust holdings, where this is desired by the shareholders, and it is most convenient for identification that "A" and "B" should be entered as "Trustees of John MacDonald," or "Trustees of Peter Parley" if they hold as such. The Bank of England and certain railway companies allow trustees in Scottish trusts to be entered as such on their registers.

The law of Scotland is not the law of England, nor is the law of England the law of Britain, and in some respects a Scotsman thinks the law of his native land is preferable to that of England.

Your obedient servant,  
W. S.

Edinburgh.

# THE BUSINESS WORLD

## Synthetics and Substitutes

**F**EARS of war have greatly intensified in many countries the search for increased independence of imported raw materials. In some countries, such as Germany, Italy and Japan, ideological opposition to the "shackles of foreign trade" has driven the search for substitutes to a degree which is economically unjustifiable. The replacement of imported lemons by the domestic rhubarb and the production of textile materials from milk, at a cost far greater than that of cotton and wool, are alike symbols of an intense nationalism and of a disregard for the usual canons of economic cost. But while the benefits of these more extreme manifestations of autarky are generally regarded with scepticism, the world can undoubtedly take advantage to some degree from the knowledge and experience thus gained of the industrial potentialities of the chemist's inventions.

There are to-day at least three synthetic materials in common use whose production on a commercial scale was due partly to war preparations—synthetic nitrogen, rayon and the diverse group known as plastics. The capacity of the world's synthetic nitrogen factories totals some four million tons, while the consumption of all nitrogen products barely reaches three million tons. The Chilean nitrate industry has been seriously affected by these substitutes, whose invention has been followed by that of a number of artificial fertilisers. The world's potential output of rayon is now in excess of 600,000 tons, about ten times greater than the annual supply of natural silk in good years; it is no longer only a substitute for silk, but has become the basis of a new textile industry.

The newest development in the rayon industry has been the growth in the output of staple fibre. This material resembles more closely the natural textile fibres than does continuous filament rayon, and it can therefore be used both as a substitute for and as a mixture with textiles to a far greater degree; the qualities of the product—softness, isolation of warmth, tensile strength—have steadily improved. The world's output of staple fibre (according to the German Institut für Konjunkturforschung), which amounted to 10,000 metric tons in 1932, increased to 283,000 tons in 1937 and to 425,000 tons in 1938, when it was only 17,000 tons smaller than the output of continuous filament rayon. The increase in the production of this fibre has been most marked in Germany, Italy and Japan, who supply about 90 per cent. of the total output, but its use is also growing in this country and in the United States.

Synthetic plastics were first used in the years just before the war as a substitute for natural resins in paints and varnishes. The growing importance and variety of these materials was discussed in *The Economist* of September 24, 1938; every industry of importance to-day uses one or another of the innumerable plastics, either as a substitute for some more expensive material or as the basis of a new process. Last year the world output of synthetic plastics totalled some 250,000 tons, of which the United States accounted for more than half, Germany one-quarter and Great Britain one-fifth. Japan, Italy, France and Switzerland have also a considerable output.

Production of these three groups of synthetic materials is now on a commercial basis, and their use is no longer a matter for surprise. To-day interest is concentrated on a number of newer inventions of the industrial chemist,

inventions whose commercial possibilities are still uncertain. Of these, three products may be singled out as examples of a far wider range—oil from coal, the group of textile fibres made from milk, and synthetic rubber.

The technique of the production of oil from coal has been known for some time past, and the oil and petrol so obtained is of high quality. But economic problems still restrict the development of this product, except in countries where complete autarky is in fashion. Of the two main processes, low-temperature carbonisation of bituminous coal is the cheaper, since the oil is produced jointly with certain types of coke as well as useful chemicals; but the output of oil is very small. The process of hydrogenation, by which practically all the coal is converted into oil, is very expensive. In Britain, the exemption of coal oil from the excise duty of 9d. per gallon is just sufficient to enable this process to be continued. Unless, therefore, there is both a considerable and a permanent rise in mineral oil prices, the production of oil from coal is not likely to show much increase in countries which have access to supplies of mineral oil, and even then it can only be produced in countries which have a supply of cheap coal.

Similarly, the production of "lanital" and other textile substitutes from casein is restricted to countries which have a surplus of cheap milk and which, for some reason, do not wish to use the far cheaper wool or cotton. The defects of these materials, developed originally in Italy during the sanctions period, are being gradually overcome; and "lanital" is even being used experimentally in this country in mixtures with other fibres. The amount of "lanital" produced is not known, but it is still insignificant in relation to the world's wool clip or cotton crop.

A far more hopeful development is the production of synthetic rubber, concentrated in Germany and Russia. The efforts of industrial chemists have succeeded in producing a substance—called "buna"—which is able to resist acid, atmospheric changes and wear to a higher degree than the natural product, although it is still inferior to rubber in elasticity. Improvements in technique have enabled the production costs of "buna" to be reduced from about 3s. to about 1s. 9d. per lb. in recent years, and Germany now produces about 10,000 tons per annum. Russia is believed to produce about double that quantity, and various rubber-like materials are being produced in Great Britain by I.C.I. and in America by Dupont de Nemours; the latter firm have christened their products Neoprene and Duprene. Compared with a price of 8d.-9d. per lb. for natural rubber, the cost of these artificial rubbers is still high, but they have found a market for certain uses in which resistance to wear is more important than elasticity and cost. It seems likely that the development of these products will follow, though more slowly, that of rayon, and from being expensive substitutes for rubber they will find new markets of their own.

Of these three groups of commodities the commercial possibilities of synthetic rubber thus seem the most promising, for coal oil and "lanital" do not possess special properties which might compensate for their relatively high cost of production. And it is probable that neither of these substitutes would be produced to-day if it were not for fears of war. They are still far more costly than mineral oil and natural textiles. Moreover, cost cannot be ignored as a mere matter of finance, least of all in war-time, since the

high cost of substitute materials is merely a measure of their heavy requirements of fuel and labour power. The German Institut für Konjunkturforschung, in a recent review of the German coal industry, gave the increasing fuel requirements of the newly-established "buna," coal oil and synthetic textile industries as one reason for the shortage of coal at the end of last year. In an economy which is approaching full employment, or in times of war, the attempt to extend the production of these costly substitutes would provide an additional strain on domestic resources.

It is also worth noting that so far there are two groups

of commodities for which no satisfactory substitutes have been found—metals and food. Plastics have supplanted some metals in a few minor uses, but steel, the metals necessary for the various steel alloys, and the other non-ferrous metals remain unchallenged as the primary materials for modern industry. Nor have substitutes been found for human food. It is possible to shift the human diet so as to increase the consumption of home-grown foods, and modern methods of cold storage and canning enable the area of supply to be spread over both space and time. But human food still has to be obtained from crops and animals and cannot yet be evolved in the laboratory.

## The Aski-Mark

**S**INCE 1932 the share of Germany's exports in the total imports of all South American States has risen from 8.5 to 14 per cent. The increase has been achieved largely at the expense of British exports, whose relative proportion has concurrently declined from 17 to 12.5 per cent.

The first thing to note about these significant changes is their uneven spreading over the various South American countries. While in Argentina, for example, the proportion of German exports has remained practically unchanged, in Chile and Peru it has nearly doubled and in Brazil it has increased from 9 to 24 per cent. (Fuller figures will be found in *The Economist*, November 5, 1938.) This is, of course, no simple coincidence. The need for bilateral trading, with the twofold objective of assuring sales of produce in bulk and diverting purchases to those countries which accept payment in merchandise, is bound to be greater the weaker the economic structure of the country. In view of the relative exchange positions of the above-mentioned countries, which were reviewed in a previous article in *The Economist* of July 15th, it seems safe to conclude that Germany's spectacular gains in some of them are due, first and foremost, to their own economic weakness. The chief achievement, so far as Germany is concerned, consists in the quick grasp of the situation and in finding appropriate technical devices to turn it to her own advantage.

Any reference to German export technique in South America leads inevitably to the Aski-mark. Before entering into a detailed examination of this often-mentioned (but seldom explained) method, two misconceptions must be removed.

The one looks upon the Aski system as a panacea for a *devisenlos* economy, replacing a free-exchange regime by an exchange-free one. In truth, the Aski system can exist only so long as free exchanges are kept with third countries. Moreover, even within a bilateral regime, as in trade with South America, it is only one of the methods employed in conjunction with other forms of export subsidising and, what is more important, with a closely co-ordinated import policy. It is equally wrong to regard—and dismiss—the Aski system as simple barter, in the sense of a direct exchange of goods. Unquestionably, it does originate from barter; however, in its present form it has undergone such substantial changes that the original elements of barter are hardly recognisable by now.

The position can be best illustrated by sketching the gradual evolution which has taken place. In ordinary barter, where commodity is exchanged against commodity, no money operation is involved between the parties. There is only one party on each side, uniting the functions of buyer and seller. By introducing the Aski-mark, as a special barter currency, the time factor in barter is eliminated, since the two merchandise operations need no longer be effected concurrently. Likewise it is no longer necessary to determine beforehand the reciprocal objects of barter. By a further extension, applied specially in trade with South America, the Aski-mark was made transferable from exporter to importer, at a free rate. The main significance of this change is that there are henceforward

two parties involved in each country, the export and import operation becoming entirely independent of each other. At the same time, the free play of an "exchange rate" gives added flexibility to the system and more scope for individual initiative.

At this stage the Aski system comprises the essential functions of an exchange clearing, plus a private compensation, plus (since the external exchange value of the Aski-mark is kept at a discount) a special depreciated export currency for the benefit of the German exporter. The extent of the discount on Aski-marks, compared with the rate for free Reichsmarks, varies considerably from country to country, providing another instance of flexibility: the present extremes are 10 and 30 per cent.

Technically, the system operates in the following way. In Germany, the importer of South American produce pays the purchase price into a special "Aski" account with one of the commercial banks. This account is conducted in the name of one of the South American "Aski" banks, along the lines of an ordinary banking account between two bankers, with the important reservation that any payment out of it can be effected only against German exports to the country of origin. In South America, the produce exporter, as ultimate owner of the Aski-mark sum held through his banker, will sell his holding to an importer of German goods in his own country. The rate at which this exchange operation is effected is a free one, although there exists a tendency on the part of banks and monetary authorities on both sides to keep fluctuations under control.

How does the Aski system affect the South American country? Its effects are widely different from the standpoint of the primary producer and from that of the central bank. The first, doing his trading in terms of his own national currency, has of course no other concern than the price, expressed in his own currency, that he can get for his products. If sales to Germany yield a higher price

INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

in that sense, he will continue to sell to Germany, irrespective of currency considerations. Indeed, he will go further: the attraction of better prices will make him a salesman of German exports in his own market and a spokesman of German interests with his own government—an aspect not overlooked by Germany.

The South American central bank's position is vastly different. Obviously, the change in the direction of the country's exports has marked effects upon its exchange position, making for a shortage of free foreign exchange. But there is an important further consideration: the disturbance of internal monetary conditions. In most South American exchange markets there is a permanent abundance of Aski-marks, and this is bound to exercise a pressure on the monetary situation, as the unused balances have to be financed by the central bank. Either the latter is called upon to buy up the surplus sums, as is the case in certain countries, or it has to refinance the commercial banks' advances to exporters, made against unsold Aski-mark holdings. These factors explain the various measures taken from time to time with a view to reducing the supply of Aski-marks (and by implication the volume of exports to Germany), such as the rationing of offerings to the exchange markets by imposing delay in the sales of some holdings, the stopping of advances against unsold sums, and, as a last resort, a temporary embargo on exports to Germany, like that decreed by Brazil last year. This is the exceptional case in which exchange control, instead of rationing the demand for foreign exchange and restricting the importation of goods, has the opposite effect.

Despite such temporary hitches, however, the system survives, since the pressure of the producers, and of the volume of unsold products, especially in the weak countries, is bound to carry greater weight than the principles of a sound monetary policy. Few South American countries are in a position both to realise and to avoid its obvious long-term dangers. It should be recorded, as a matter not without significance, that Argentina has never admitted the Aski system in her trading with Germany, though isolated barter deals have been effected of late.

In Germany the system likewise sets up political pressure, but in the opposite direction, i.e. from the authorities to the consumer. Clearly, the Aski system can be kept going only by paying high import prices. In the first place, the prevailing external discount on Aski-marks necessary to sell the German exports has to be neutralised internally; in other words, the hidden depreciation of the mark is charged to the German consumer as a higher price. In addition, a price inducement must be offered to the South American seller, as a monetary compensation for

the delay with which the liquidation of Aski-marks is usually bound up, and also to counteract the opposition of the South American central bank; this bill must be footed equally by the German consumer.

The effect of higher import prices should not, however, be overrated under a totalitarian regime. Indeed, it may be safe to say that, considered as a whole, the method, as employed, is the best possible solution of Germany's exchange difficulties under the present peculiarly artificial circumstances. If recent figures suggest a slowing-down, and in some cases even a setback, in German exports to South American countries, the reasons are to be sought in other directions. For one thing, at least in some South American markets, the upper limit for the absorption of German exports seems to have been reached and any forcing beyond saturation point would entail serious commercial risks for Germany. It should be borne in mind, in addition, that for the time being certain sections of German industry have had to abandon export activities altogether, while other German goods are being reserved for countries paying in free exchange.

The second explanation is the active trade policy recently embarked upon by the United States, with a view to meeting Germany's challenge in South America, with all its wider implications. The visible signs of this attitude consist of the creation of powerful *ad hoc* export groups and of the granting of medium-term loans in connection with American exports, such as the recent credits to Argentina, Brazil, Chile, Paraguay and Nicaragua.

It must remain necessarily outside the scope of this survey to consider in any detail the pertinent question of how Britain, in face of the struggle going on for the South American market, will be able to maintain her already deteriorated trading position there, but one or two immediate inferences might usefully be drawn from the foregoing examination. The fact has to be faced that exchange control, though conceived originally as a temporary measure, has come to be, and to all appearance will remain for some considerable time to come, a permanent state of affairs. This implies, among other things, that the question of the instrument of settlement for trade between countries has developed, at least in primary producing countries, from a purely technical side-aspect into the central problem on which foreign trade moves.

So far as the South American countries are concerned, Germany has chosen one particular way of organising and adapting herself to the changed conditions. The United States has chosen another way, though a widely different one. Both provide valuable object lessons for the third great trader in the South American continent.

## Finance and Banking

**Discount Rate Movements.**—The position in the money and discount markets continues to reveal rather intriguing contrasts. During the first part of the week the combination of last week's under-allotment of Treasury bills and of aggressive buying of bills by clearing banks and the special buyer caused rates to weaken considerably, October bills being actually dealt in at  $\frac{1}{16}$  per cent. The intensification of keen competition for bills from the clearing banks, however, appears to have been arrested on Wednesday by the action of one of the clearing banks which called the bulk of its money from the market—a move which gained in effectiveness from the fact that Wednesday was not that particular bank's making-up day. The result was a considerable tightening up in the short loan position and a sympathetic hardening of discount rates to a level at which the previous day's purchases were seen to have been made at unnecessarily low rates. The October quotation has now returned to  $\frac{1}{8}$  per cent. and the

rate for full-dated three months bank bills which appeared to be in danger of falling away towards the  $\frac{1}{2}$  per cent. minimum is again clinging more confidently to the  $\frac{5}{16}$ – $\frac{1}{16}$  per cent. level. The persistence of the special demand for bills has now reached a point at which earlier explanations concerned with the investment of current income of public departments, such as the Unemployment Insurance Fund, appear somewhat inadequate to account for the phenomenon. One is in fact driven more and more to the conclusion that part of the buying of bills in the open market is being made on behalf of the Exchange Equalisation Account, whose gold losses in recent weeks must on this theory have been rather larger than generally appreciated. Although the special buyer never operates at an unduly competitive rate but at prevailing market quotations it cannot be denied that his operations have recently played a considerable part in lowering the open market discount rate.

**The Pull of Dollar Swaps.**—The market is therefore being made particularly aware of the paradox by which the phenomenon of an efflux of gold is being accompanied by that of a weakening of short-term money rates. The paradox is made all the more glaring in this instance by the fact that a substantial part of the recent pressure on sterling has made itself felt in the forward exchange market and has now widened the discount on sterling as against dollars to a point at which swap operations are again particularly attractive to banks in this country. The swap yield on three months dollars has again returned to the neighbourhood of 2 per cent. per annum, and the contrast between this level and the rate at which three months bills are now being discounted in the London market is too marked to have about it much promise of permanence. The pull of the dollar swap yield has made itself particularly felt on the supplies of non-clearing-bank money in the market. The volume of such funds is now but a small fraction of what it was even a year ago. It is still being depleted by the withdrawal of foreign funds, which is again acquiring greater momentum with the approach of the autumn, while it is to these "outside" institutions that the attraction of the dollar swap yield makes itself most rapidly apparent. In the circumstances, it may seem surprising that the rate for loans from these outside lenders against the security of bonds should not have risen beyond the  $\frac{3}{4}$  per cent. figure where it now stands. One of the reasons is that the demand for accommodation from the Stock Exchange—which normally accounts for a fair proportion of these outside loans—is at present at a very low ebb. The other is that the discount market itself has during the past few months made a further considerable reduction in its holding of bonds and is therefore a much smaller user of outside money. The June 30 balance sheets of the private houses which have recently been circulating in the market reveal on the whole a remarkable liquidation of the gilt-edged position. The warnings from the Bank of England earlier this year, the clouding of the gilt-edged outlook caused by the prospect of defence borrowing, and the promise of an adequate supply of Treasury bills, have all served to help in this deflation.

**Sterling Takes the Strain.**—The seasonal pressure on sterling which recently began to manifest itself in the market for forward dollars has during the past week also spread to other currencies. The forward belga has again risen to a premium in the London market, while the discount on French francs has virtually disappeared. There appears to be enough doubt on the Continent regarding the likely behaviour of sterling during the coming months to cause an anticipation of the seasonal pressure on this currency. The disinclination to be "long" of sterling is thus responsible for a substantial accumulation of selling orders in the forward market. A case in point is provided by recent substantial forward sales of sterling against belgas representing the payment for future large exports of Belgian steel to this country. These operations have been mainly responsible for establishing a premium on forward belgas. They illustrate two aspects of the present foreign exchange position: in the first place the tendency of foreign recipients of sterling to liquidate their position at the earliest possible moment; the second, the additional pressure placed on our balance of international payments by abnormal imports directly connected with the re-armament programme. The speculative position against sterling is probably of exceptionally small dimensions, but the genuine commercial pressure is forcing the Exchange Equalisation Account to provide support both in the spot and the forward markets. The French control finds it necessary day by day to sell francs against sterling. French funds continue to return to France while British tourist expenditure in France is running this year at an abnormally high level. The transfer of Frs. 5,000 million of gold from the French Stabilisation Fund to the Bank of France which appears in this week's Bank of France

return represents for the most part gold gained from the British Exchange Account. The operations of the latter no doubt help to explain the maintenance of Government deposits at the Bank of England at an unusually high level—this week they have risen by £8,566,000 to the comparatively high level of £31,845,000, despite the Exchequer returns' evidence of a steady acceleration in Government expenditure.

**Clearing Bank Averages.**—The clearing bank statements for July are chiefly noteworthy for their revelation of the progress made in restoring the normal ratio of liquid assets to deposits. The ratio of these quick assets (cash, cheques in course of collection, short loans and bills) to deposits, which had fallen below the conventional minimum level of 30 per cent. in the earlier months of this year, had last month recovered to the wholly normal figure of 32.7 per cent. Last month's jump in this figure was the product of a two-fold movement. In the first place the expansion in the Treasury bill issue was responsible for rises of £29,300,000 in discounts and of £5,600,000 in short loans. On the other hand the less liquid assets fell quite appreciably between June and July—advances by £5,400,000 and investments by £3,200,000. The fall in advances must in part be regarded as the reflection of reduced activity in the stock markets and of the repayment of loans for which the stock exchange collateral had depreciated to a point at which additional margin had to be put up or repayment made. There is no need to assume from the July averages that the industrial demand for credit accommodation has been falling off except perhaps in the

Note.—In the past it has been the practice of *The Economist* to exclude from its monthly summary table of the returns of the London Clearing Banks the figures of the National Bank, Ltd., on the ground that the bulk of this bank's business is done in Ireland. This practice, though it has logic to commend it, is neither convenient nor customary. It will, accordingly, be suspended. The above table includes, and future tables will include, the figures of all members of the London Clearing House.

building trade. At the same time, with the Government's re-armament programme providing an ever-increasing part of the industrial stimulus in this country, it is reasonable to assume that part of the demand for credit facilities which would normally reach the banking system through requests for loan facilities by industrial and commercial undertakings are to-day doing so in the shape of increased issues of Treasury bills. The defence programme must involve some transfer of banking assets from advances into Treasury bills—which is very good from the point of view of liquidity, but not so good from that of the profit and loss account. Last month's fall in investments is rather more difficult to interpret. It was certainly not a defensive measure dictated by a dearth of liquid assets. Some banks are known to make the appropriate adjustments in the book value of their investments for the June 30th as well as for the end-year balance sheets, and since gilt-edged values fell over the first half of the year by 4.5 per cent. it may be assumed that such adjustments bear part of the responsibility for last month's decline in this item.

**The Liquidity Ratio.**—In commenting on the clearing bank monthly averages and on that aspect of them—the ratio of liquid assets to deposits—which has recently become so fashionable, some confusion has recently been created by an important difference in practice. There are those commentators who, in calculating the total of liquid assets, include the item of cheques in course of collection and those who consciously ignore it. For the July figures these two methods gave as their results ratios of 32.7 per cent. and 29.8 per cent. respectively. As one was well above and the other still below the traditional 30 per cent. minimum, the choice of method perforce coloured the comments based on these figures. It is evident that in looking at the position of the clearing banks as a whole, and in judging the liquidity of these institutions, the item "cheques in course of collection" should be ignored, since the amount it represents is still included in the total of the banks' cash, and its inclusion must therefore involve the duplication of the figure in question. But in discussing

the liquidity ratio as a basis of clearing-bank policy it is equally evident that the item should be included and the duplication perpetrated. Each clearing bank, in judging its own liquidity figures, regards these items in course of collection as "near cash" and includes them in its aggregate of quick assets. In so far as the individual banks guide their policy by reference to a normal ratio—whether it be 30 per cent. or some other figure—that item figures in their calculations. When, therefore, the commentator is, by analysing the monthly aggregate averages, attempting to obtain a collective view of the individual banks' liquidity positions and of their reactions to that position, he must include the item of cheques in course of collection, though knowing full well that in doing so he is in fact inflating the total by this amount. If he regards himself as too much of a purist to be guilty of this duplication he should remember that the item of "cash" is already inflated by considerable duplication as a result of "making up" by different banks on different days of the week.

## MONEY MARKET NOTES

### Foreign Exchanges

THE resistance shown by the Shanghai dollar most of last week has given way to renewed weakness. General selling set in at the end of the week, which is attributed to the Foreign Secretary's statement that the question of granting fresh help to the Chinese currency would have to be considered in the light of Great Britain's other heavy financial obligations. The unfavourable interpretation put on this statement has outweighed the news that the United States Treasury has agreed to purchase 6,000,000 ounces of silver from the Chinese Government. The amount is regarded as too small to help the exchange, and the rate has now fallen to about 3½d. The guilder, on the other hand, has recovered from last week's relapse; and after a temporary setback on Tuesday, when the rate rose to 8.79½fl., was quoted at around 8.78fl. on Wednesday, improving to 8.77½fl. on Thursday afternoon. The announcement that a Dutch Government has at last been formed was responsible for the firmer tone on Wednesday and Thursday. There has also been a recovery in the forward guilder, the premium for three months widening to 1-¾c. Swiss francs have also been firm, except for a reaction due to profit-taking on Tuesday. The spot rate on Thursday afternoon was quoted at 20.72½, compared with 20.73½ on Wednesday and 20.73 at the end of last week.

coins are still in demand; the premium is more than 1½ per cent. over the bullion value. Silver has, on the whole, been a firmer market, most of the buying coming from India. The discount

The New York price for silver remained at 35 cents per ounce .999 fine during the week.

on the forward price narrowed slightly to ½d. on Tuesday; but on Wednesday India and other quarters sold forward, and the forward price fell ½d., the spot price remaining at 16½d. Bear covering was responsible for Thursday's recovery in both spot and forward prices.

### The Money Market

THE very low level to which bankers' deposits have fallen, illustrated in this week's Bank Return, explains why money has been more usable than for some time. The tightness would have been more marked if the demand for accommodation from the market had not been restricted by the fact that at the last Treasury Bill tender it only secured an allotment quota of 21 per cent. Moreover, the amount of new Treasury Bills being paid for this week is exactly equal to the corresponding maturities, whereas previously payments had exceeded maturities for many weeks. This has also tended to reduce

the demand for loans and has thereby

| Three months' bank bills | 1½            | 1½           | 5½            |

\* Viz. ½ per cent. for loans against Treasury bills and other approved bills and British Government securities within six months of maturity. ¾ per cent. for loans against 1 per cent. Treasury bonds and other gilt-edged stocks within six months of maturity. 1 per cent. for loans against other collateral.

mitigated to a certain extent the undoubted tightness in the short-loan market.

### The Bank Return

As was expected the note circulation this week shows a further increase to a new high record. The rise is smaller than normally takes place in the week including the Bank Holiday, but, on the other hand, the pre-holiday week's rise was much larger than usual. The increase in Government securities has more than offset the withdrawal of notes; but bankers' deposits show a fall

of £7.9 millions, as public deposits have leaped up again and at £31.8 millions are at their highest level since May 31st, when they were temporarily swollen in preparation for the War Loan distribution on June 1st. A large part of this week's rise may be put down to the support of sterling by the Exchange Account.

## Investment

**New Zealand Loan Dealings.**—No official announcement has been made regarding the relative proportion of cash and conversion applications for the New Zealand loan, nor of the support, if any, which special quarters had to give to the issue. Dealings opened on Wednesday this week—for there was no compelling reason for the Bank of England to adopt its usual expedition in posting allotments in this instance—on the basis of ½ discount to ⅓ premium, but this price suggested that the "peg" had been firmly inserted. The market's inference, in fact, is that the larger part of the issue is being taken care of, and in such circumstances there is neither any provocation to sell, nor, so far as jobbers are concerned, any incentive to run an appreciable book in the stock. Since the authorities, who are acting as the "shop," have the strongest hands in which to retain the stock, the prospect is for a stable price but rather uninteresting dealing conditions for the issue. Wednesday's Stock Exchange Supplementary List recorded one marking at 99 in the conversion stock, one marking at 99½ in the fully paid cash stock, and two markings at 4½ in the cash stock, £5 paid.

**An Improving Profits Trend?**—No single month's statement of industrial profits provides conclusive evidence regarding the trend of earnings, but there are some features in the July total which suggest that the industrial prosperity of recent months may soon find its way into the recorded figures. Profits reported by 189 companies last month showed a reduction of 6.30 per cent., from £15,350,338 to £14,383,201, compared with falls of 8.33 per cent. and 6.29 per cent. for June and May respectively. Recent results are set out below:—

| INDUSTRIAL PROFITS 1937-39 |             |              |                    |                |             |              |
|----------------------------|-------------|--------------|--------------------|----------------|-------------|--------------|

\* After debenture interest.

**Holiday Rail Traffics.**—An apparent seven-figure increase of £1,193,000 in the pre-Bank Holiday rail traffics actually flatters the takings of the railway companies last week. The true comparison, of course, is with the corresponding pre-holiday week of 1938, for the chance of the calendar has thrown the figures one week out of step. If the 1938 figures which were published ten days ago (for comparative purposes with the 1939 traffics for the week ending July 30th) are used, the true increase in pre-Bank Holiday traffics will be found to be no more than £104,000. And the truly disappointing feature of the returns is a fall in passenger takings of as much as £163,000 between the two pre-holiday weeks. The movement in traffics on the basis described above is shown in the following table:—

HOME RAIL TRAFFICS, WEEK ENDED AUGUST 6, 1939  
COMPARED WITH CORRESPONDING WEEK 1938

|          | Passengers | Merchandise | Coal and Coke | Total Receipts |
|----------|------------|-------------|---------------|----------------|
| L.M.S.   | - 95       | + 88        | + 43          | + 36           |
| L.N.E.   | - 17       | + 42        | + 24          | + 49           |
| G.W.     | - 14       | + 54        | + 11          | + 51           |
| Southern | - 37       | + 8         | - 3           | - 32           |
| Total    | -163       | +192        | + 75          | +104           |

Merchandise and coal receipts are still running at very satisfactory levels, although next Wednesday's traffics will show an apparent (though not necessarily a true) fall, owing to the interruption of business this week. Indeed, the latest figures do not provide more than provisional conclusions regarding railway takings over the whole holiday period. The important Bank Holiday week passenger movement has yet to be recorded—though the weather may well have affected these receipts this year—and it will be necessary to wait a further week before the figures reveal the resumption of normal goods movements. For the first two weeks of the holiday season the average gain amounts to £348,000, and this figure gave some slight encouragement to the market on Wednesday. But the main factor in the stockholder's mind was Thursday's talks between the Associated Society of Locomotive Engineers and Firemen and the general managers of the four main lines. These have been adjourned until next week. The Society's claims are estimated to cost £1,269,000 in a full year—a sum only £627,000 less than the improvement in the companies' net receipts during the first six months of 1939.

Of the fall of £967,137 in the latest month's total, however, rubber companies alone are responsible for £606,571. If this group is eliminated, together with tea and oil companies, the residual profits of 130 companies mainly engaged in British industry show a reduction of no more than 2.7 per cent., from £13,538,290 to £13,166,166. Confirmatory evidence of the suggestion that a change in the profits trend is now in progress must wait, however, until the close of this year, when company reports to September 30th become available.

**Brazil and Chile Bond Developments.**—It has become known this week that the Council of Foreign Bondholders will be represented in the debt discussions with the Brazilian Government in Rio de Janeiro by Sir Bertram Hornsby and Mr John Phillimore. Mr Phillimore is, in fact, due to arrive in the Brazilian capital this week-end, simultaneously with the American representative, Mr Dana Munroe, vice-chairman of the Bondholders' Protection Association. Consequently, bondholders may expect an early commencement of the discussions, though they may not be concluded by August 25th, when Sir Bertram Hornsby is due to arrive. Both of the British representatives are well fitted, as past chairman of the Anglo-South American Bank and partner in Roberts, Meynell and Company of Buenos Aires respectively, to undertake these duties. Meanwhile, an interesting position has resulted in Portugal, where the despatch of a

### The Bullion Market

CONTINENTAL buying has again been the chief feature of the gold market this week; and as the Exchange Account has again been a reluctant seller buyers have been fairly severely rationed, although as was pointed out last week, genuine rationing is confined to a few cases only. The reduction in the premium on Wednesday from 1d., at which it had been maintained for a fortnight, to ½d. gave a slight encouragement to arbitrageurs, and some arbitrage business was reported. Gold

representative to Rio de Janeiro is under consideration. The unique interests of Portuguese investors in Brazil are well known, but since Brazil's external obligations are in sterling, dollars, francs and Dutch florins, the position of a Portuguese representative in Rio de Janeiro would evidently differ from that of the British, American and French spokesmen. Bondholders will hope that, on this occasion, a satisfactory debt settlement can be achieved; despite her current economic difficulties, Brazil has expressed her good intentions so firmly that a positive result should emerge from the talks. The report that trade discussions are to open between Great Britain and Chile is of great interest to Chilean bondholders, who have the less reason for favouring Law 5580, which now determines the level of the debt payments, because the current year's copper tax proceeds are likely to be lower. The Finance Minister has re-affirmed Chile's intentions to maintain debt payments, and fears that the service moneys deposited with the Caja de Amortizacion might be raided for internal needs have to a large extent subsided. Indeed, it is understood that the necessary funds for reconstruction following the earthquake have been provided from domestic sources.

**New Company Registrations.**—The extreme stagnation in the new issue market over the half-year January to June hardly finds a counterpart in the number of new company registrations. Messrs Jordan and Sons' detailed semi-annual analysis shows that registrations totalled 6,617, compared with 6,666 for the corresponding period of 1938, involving a capital of £30,101,902, compared with £32,342,222 last year. Compared with the new capital issue figures for the same period, these are slight declines. Public company registrations were reduced from 48 to 44, though the capital involved increased from £2,102,316 to £5,471,250, of which engineering, shipping and investment alone provided over £3½ millions. In the latter group, the registration of Unicos Property Corporation with a capital of £1,500,000, and several similar companies, follows the inclusion of a clause in the Prevention of Fraud (Investments) Act giving certain property societies the option of re-registering as limited companies. The compilers of the analysis find little trace, as yet, of broking firms registering under the new Stock Exchange rules as companies with unlimited liability.

**Richard Thomas Board Changes.**—Recent market reports regarding possible changes in the composition of the board of Richard Thomas and Company have been confirmed by the company's official announcement. The control committee, which supervises the company's direction and consists of the Governor of the Bank of England, Lord Greenwood, Mr E. H. Lever, and Sir William Firth, have acceded to the request of Sir Charles Wright and Mr S. R. Beale (chairmen of Baldwins, Ltd., and Guest Keen and Nettlefolds respectively) to be allowed to resign from the board. Coincident with these changes, Sir William Firth, at present chairman and managing director, will in future be chairman of the company; Mr John E. James, who is chairman of Lancashire Steel Corporation and was appointed to the board by the Control Committee twelve months ago, will become managing director; thirdly, the Earl of Dudley, Sir James Lithgow and Mr A. C.

### NORANDA MINES, LIMITED DIVIDEND NOTICE

Notice is hereby given that an Interim dividend of \$1.00 per share, payable in Canadian funds, has been declared by the Directors of NORANDA MINES, LIMITED, payable September 15th, 1939, to shareholders of record at the close of business August 21st, 1939.

By order of the Board. J. R. BRADFIELD,  
Toronto, July 26th, 1939. Secretary.

Macdiarmid (who are, respectively, chairmen of Round Oak Steel Works, Steel Company of Scotland, and Stewarts and Lloyds) have been appointed directors, after consultation with the British Iron and Steel Federation. Mr J. Adamson, who was appointed as financial director by the Control Committee in August last year, has also resigned, and in due course a whole-time finance director will be appointed to fill the vacancy.

No official reasons have been given for these changes in the Richard Thomas board, but study of the personalities concerned provides internal evidence of their causation. The presence of directors from companies in the same section of the steel business as Richard Thomas on the latter company's board must have accounted for more than one awkward occasion in recent months, and both sides of the board table may well have felt that a case should go to the Control Committee for reconsideration of its appointments of last year. The three new directors, it is true, are engaged in the steel industry, but not directly in the sheet and tinplate trade. General supervision of the new plant, on behalf of the Control Committee, should, however, be preserved by the appointment of directors from branches not directly affected by the progress of the Richard Thomas plant. No shareholder, again, is likely to raise objection to the decision to appoint a full-time finance director to the board. It is to be inferred, however, that these changes have involved some corresponding cost, for although Sir William Firth remains titular head of the undertaking, he will no longer act as managing director.

**Canadian Pacific Earnings.**—The latest gross traffic return of the Canadian Pacific Railway discloses a rise in receipts from January to the end of July amounting to \$1,087,000. But it is not solely—or even mainly—the improvement in gross receipts which has attracted the attention of stockholders in the past months. For the half-year to June (the latest date for which net figures are available) the company showed the distinctly favourable improvement in net receipts of \$2,670,000, compared with an improvement in gross receipts, to the same date, of \$520,000. The movement in gross traffics, expenses, and net receipts during the half-year is shown below:—

|                     | 1939           |              | 1939 compared with 1938 |                  |              |
|---------------------|----------------|--------------|-------------------------|------------------|--------------|
|                     | Gross receipts | Net receipts | Gross receipts          | Working expenses | Net receipts |
| Three months:—      |                |              |                         |                  |              |
| January-March ..... | 29,346         | 1,468        | - 820                   | - 1,040          | + 220        |
| April-June .....    | 32,461         | 3,883        | + 1,340                 | - 1,110          | + 2,450      |
| Total, six months   | 61,807         | 5,351        | + 520                   | - 2,150          | + 2,670      |
| July .....          | 11,658         | ...          | + 568                   | ...              | ...          |
| Total, seven months | 73,465         | ...          | + 1,087                 | ...              | ...          |

Exceptionally heavy receipts in May (which were possibly connected with the Royal visit to Canada) turned a deficit on gross receipts of \$1,120,000 at the beginning of the month into a plus of \$310,000 at the end, and takings in June and July continued to show a satisfactory improvement. But the saving of \$2,150,000 in working expenses during the first six months represents a considerable achievement, even when allowance is made for the elimination of the wage restoration made in April last year from the second-quarter comparison. In fact, the undertaking achieved a saving of \$1,040,000 during the first quarter, despite an increase in wage costs, compared with the corresponding period of 1938, of \$431,000. Reports of a recent deterioration of crop prospects owing to insufficient rainfall may be followed by a reduction in grain haulings below the expected level, but the volume of grain traffic will undoubtedly be large. Moreover, the recent improvement in Canadian business conditions should assist the company's general traffic.

Since economies alone are running at an annual rate equivalent to 3.1 per cent. on the preference stock, while prospective available earnings (without any allowance for a further improvement in traffics) are already of the order of 4.4 per cent., the results for the current year should evidently be much improved. Certain safeguarding clauses, however, are necessary for proper interpretation of these figures. Firstly, the current guaranteed wheat price of 70 cents per bushel will save the Canadian farmer from distress, but it may not give him a volume of purchasing power sufficient to provide bumper return traffic of manufactured goods to the prairie provinces. Secondly, litigation regarding the company's guarantee of "Soo" bond interest, on which payments terminated in July last year, is now in train. Thirdly, ancillary income and special charges play an important part in deciding the eventual outcome of Canadian Pacific profits. Fourthly, further charges to profit and loss account will result from the retirement of properties from service. Such charges do not represent disbursements and the management has always made the point that they need not be taken into account in reaching decisions regarding dividend policy. But, in conjunction with other factors mentioned above, they form a natural counter to the manifest improvement in earnings which is now in progress. To that extent, they limit the prospects for the Canadian Pacific preference stock, which now stands at 25½, compared with a "high" of 30½ and a "low" of 18½ this year.

**Arthur Guinness Full Report.**—The full report and accounts of Arthur Guinness, Son and Company confirm the estimates of profits given on page 276 of last week's issue of *The Economist*. Trading profits showed a significant fall from £1,741,543 to £1,614,987 for the year to June last, and after including net investment income, the company's total revenue was reduced from £1,926,169 to £1,800,934. No major changes are shown in the expense items, and after charging net preference dividends, available earnings for the ordinary stock are reduced from £1,602,112 to £1,484,776. The last figure compares with our approximate estimate last week of £1,485,000, and its derivation is shown in the following three-year profits analysis:—

|                                 | Years to June 30 |           |           |
|---------------------------------|------------------|-----------|-----------|
|                                 | 1937             | 1938      | 1939      |
| Trading profit.....             | 1,901,594        | 1,741,543 | 1,614,987 |
| Dividends and other receipts... | 187,016          | 184,626   | 185,947   |
| Total profit .....              | 2,088,610        | 1,926,169 | 1,800,934 |

| Preference dividend .....       | 90,750           | 88,500    | 87,000    |
| Ordinary stock:—                |                  |           |           |
| Earned.....                     | 1,834,804        | 1,602,112 | 1,484,776 |
| Paid .....                      | 1,642,500        | 1,599,375 | 1,413,750 |
| Earned (%).....                 | 32.4             | 29.0      | 27.3      |
| Paid (%) .....                  | 29               | 29        | 26        |
| To reserve .....                | 200,000          | ...       | 100,000   |
| Carried forward .....           | 902,548          | 905,285   | 876,311   |

The profits trend over the past eleven years is shown in the chart below:—

The persistent decline in net profits since 1936 has necessitated a reduction in ordinary dividend payments to the lowest level since 1933-34.

The directors' report throws no light on this disappointing profits trend in recent years, for it is confined to a recital of the profits figures and to formal notices regarding retiring directors and auditors. This lack of information makes it rather difficult for the Guinness ordinary stockholder to assess the prospects of the company's trade in general and of the Park Royal brewery in particular. Whatever the results at the new brewery may have been, they have not sufficed to offset an appreciable decline in earnings. No significant changes are shown by the latest balance sheet, which as usual provides an exhibition of great financial strength. The further decline in the ordinary stock units to 99s. this week testifies to the investors' disappointment with the latest results, although the market was naturally disposed to await Lord Iveagh's statement at the meeting, which was held on Friday after we had gone to press, before reaching hard and fast conclusions regarding the current year's outlook.

**Cinema Commentary.**—There are few points of similarity between the Associated British and Gaumont-British Picture Corporations, yet the structure of the speeches of the respective chairmen, Mr John Maxwell and Mr Isidore Ostrer, at this week's meetings, was distinctly parallel. Each provided a *vade mecum* to the balance-sheet figures, and a certain amount of incidental light was thrown upon policy. Mr Maxwell declared that "short of the complete upheaval which none of us desires and, perhaps, not many of us expect, the Associated British results for the current year should be no less satisfactory than for the past year." For his part, Mr Ostrer declared that "having regard to the extent of the reserves now appearing in our balance sheet, and the substantial improvement in our financial position during recent years, shareholders may feel that a resumption of ordinary dividend payments on the ordinary shares next year may not be imprudent. . . ." Since Mr Ostrer referred to the Gaumont-British balance sheet, it may be pertinent to observe that reserves, part of which are free, and part of a specific character, account for £1,006,000, out of a balance-sheet total of £12,976,000. The subsidiary and associated companies have reserves of their own, and, as Mr Ostrer claimed, they provide for depreciation out of their own profits. But the relevant criterion of adequacy is the group's reserve position as a whole, and shareholders are afforded no knowledge, in the absence of consolidated accounts, of its extent. Mr Ostrer did not indicate the measure by which last year's profits benefited from profits derived from debenture redemption, though since the actual amount of stock purchased totalled £212,452, the

possible credit would appear to be considerable. Nor did he indicate the movement of profits of the directly-owned and subsidiary cinema interests, though he suggested that a "first definite step" might possibly be taken during the current year towards a consolidation of the theatre interests. No information was given regarding the state of the Odeon merger negotiations. Finally, he claimed that the directors, although anxious to facilitate the work of the Board of Trade inspector, had other interests to consider, and were acting on the opinion of eminent counsel. Shareholders may well feel that the speech had certain notable omissions, despite its optimistic reference to dividend prospects.

**The Week's Company Profits.**—Our usual table of profit and loss accounts, on page 342, analyses the results of ten companies. These show net profits of £2,056,142 for the latest year, compared with £2,191,989 for their preceding financial years. The fall of 6.2 per cent. is due largely to the reduced profits of Arthur Guinness, Son and Company (discussed on page 327). Aggregate net profits of 1,676 companies whose reports have been published this year amount to £214,890,505, and show a reduction of 7.7 per cent. compared with the previous year's total of £232,923,322. This week's results are discussed in preceding Notes and on page 329 under the heading "Shorter Comments."

## THE STOCK EXCHANGES

#### SETTLING DAYS

TICKET ACCOUNT  
AUGUST 22 AUGUST 24

TRADITIONAL lack of investment interest in the middle of the three-weeks' August account, coupled with the absence of many members and investors on holiday and training, have produced slack and featureless markets this week, save for moderate buying of rubber shares. The slight swing of the weather-cock suggested that markets became rather duller on Tuesday afternoon after a firm opening, while the reverse process applied on Wednesday. But in fact business has been insufficient to establish any real trend. Thursday's narrow movements and ultra-quiet dealings were typical of a week lacking in investment significance.

After a small accumulation of orders had been disposed of on Tuesday, the *gilt-edged market* receded slightly, with irredeemable stocks leading the drift. A further recession on Wednesday morning was followed by a recovery which restored the long-dated issues to their overnight levels. The short-dated issues remained firm, and some improvement was recorded in the new scrips, the Hertfordshire issue being prominent on Wednesday. Dealings in the New Zealand loan were very limited, and after being called *re* premium, the scrip closed slightly below par.

In the *foreign bond market*, Japanese issues were marked lower on the delay in the resumption of the Tokyo talks, and on the growing uncertainties in the Far Eastern situation. After falling a point on Tuesday, however, the bonds showed no net change in mid-week. Chilean issues responded to the Finance Minister's assurances regarding the debt service, but the imminence of negotiations in Rio de Janeiro failed to assist Brazilian bonds.

Small business was transacted in *home rail stocks*, owing to the wage talks between the locomotive engineers and the managers on Thursday. The speculative issues were generally marked down at first, and although slightly better prices were quoted for the ordinary stocks, following the pre-holiday traffics, small selling of the preference issues caused further fractional losses. Business in Argentine rail issues remained extremely poor.

Conditions in the *industrial share market* remained very quiet, and there was frequently no quotable change in prices. Business in steel shares was small, and while Neepsend and Whitehead improved, most of the group

showed smaller gains or losses. Electrical equipment shares opened firm, but lost a few pence in mid-week. Associated Equipment responded to the London Transport contract, but other motor shares were neglected. Aircraft shares showed small changes, but were mainly lower. Ind Coope were easier on the mixed results shown by certain subsidiaries, and Guinness fell further in anticipation of Friday's meeting. Tobacco, store and provision shares remained dull, and the rayon group failed to maintain its recent activity, although a further mid-week fall in Courtaulds was later recovered. No perceptible trend was evident in the miscellaneous group, though many of the leaders shed a few pence. Olympia preference were a firm feature.

Interest in *oil shares* was at a minimum, and a small volume of business, mainly from Paris, was sufficient to move prices in each direction by a moderate amount, mainly in "Shell" Transport and Royal Dutch. Movements in the Eagle issues scarcely responded to the latest developments in the negotiations.

It was left to *rubber shares* to provide the week's features. The improvement in the commodity to 8½d. on Wednesday, though it was not maintained, released the signal for further buying, which was usually of a discriminating character. Leading shares, such as Anglo-Dutch, Malayalam, United Sua Betong, and Allied Sumatra showed satisfactory improvement.

Turnover in the *Kaffir market* remained small, and prices became easier. Western Holdings advanced on the cable, but Western Reefs were depressed. The producing mines showed small movements, mainly to lower levels. Rhodesian copper issues made little response to the improving prospects of the metal—signalled in the raising of the quota from 95 to 105 per cent. of basic tonnages as from August 16th—and business in jungle shares was very limited.

#### ACTUARIES' INVESTMENT INDEX

A fall of 0.4 of a point during the week to August 8, 1939, is shown by the Actuaries' Index of 160 industrial equities. At that date the index stood at 61.7, compared with 62.1 a week earlier and 60.7 a month earlier. The corresponding average yield figures are 5.60 per cent., 5.56 per cent. and 5.74 per cent. respectively. A selection of the individual series is given below:—

| Group (and No. of Securities) | Prices (Dec. 31, 1928 = 100) |              |              | Prices 1939 High |

### New York

AFTER its sharp reaction on Thursday of last week, Wall Street's course has become chastened and irregular. The market's one achievement has been to disregard the expected "chartist" signal to sell below the resistance point of 140, which the Dow Jones industrial average broke through at the end of the second hour's trading on Wednesday. The market, as usual, has given full heed to Europe's political uncertainties, but it has devoted rather quixotic consideration to the United States' political and economic background. After discounting the President's troubles fairly generously last week, it appears to have heeded the deflationary consequences which may follow the defeat of the spend-and-lead programme. Trading has shrunk below the half-million mark and rails and utility stocks are virtually neglected. The market, however, finds satisfaction in the trend of automobile business, and in the expected further improvement in steel operations, which are calculated to reach a peak of 65 per cent. of capacity within

the next few weeks. *Iron Age* estimates current activity at 61 per cent., against 60 per cent. last week.

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values calculated on closing prices (1926 = 100).

### BY STOCK EXCHANGE INTRODUCTION

**Cornbrook Brewery Company, Ltd.**—Particulars of £250,000 4½ per cent. (Phoenix) debenture stocks; secured by first mortgage on properties valued at £436,981 acquired from subsidiary, Phoenix Brewery Company, and by floating charge on remaining assets. Redeemable at par August 15, 1964, or by earlier purchase at or below 101 per cent. £160,000 subscribed by Cohen, Laming, Hoare at £98½ per cent. net. Balance of £90,000 held by Lloyds Bank as collateral security.

## SHORTER COMMENTS

**Company Results of the Week.**—Brewery company results account for the bulk of this week's profits. FRIARY, HOLROYD AND HEALY'S trading profits show a small increase from £231,612 to £235,643, and net profits are virtually maintained at £138,140, compared with £136,205. The 13 per cent. ordinary dividend is repeated. Three subsidiaries of Ind Coope and Allsopp have issued their reports. ALTON AND COMPANY show an improvement in net profits from £39,463 to £42,500, while COLCHESTER BREWING net profits are unchanged at £15,907. Dividends are maintained in both cases. On the other hand, STRETTONS DERBY BREWERY reports a significant reduction in net profits from £106,153 to £95,044, while the ordinary dividend has been lowered from 3½ per cent. to 3 per cent. EMPRESS BREWERY and CLARKSON'S OLD BREWERY also report somewhat lower earnings, though the latter's dividend is maintained. STEEL BARREL SCAMMELL'S results are somewhat disappointing. Profits of the three subsidiary companies in fact show a reduction from £42,210 to £29,668, while the parent company's net profits are reduced more moderately from £32,594 to £27,470. The report states that the new Uxbridge factory dislocated manufacturing operations, while a shortage of labour was experienced. The ordinary dividend is reduced from 14 per cent. to 12 per cent. Net profits of Isaac Holden

(Continued in next column)

## DIVIDEND ANNOUNCEMENTS

Rates are actual, unless stated per annum or shown in cash per share. Rate for previous year refers to total dividend, unless marked by asterisk to indicate interim dividend.

# Industry and Trade

**Recovery in Coal.**—During the first four months of the current year both production and exports of coal were still smaller than in the corresponding months of 1938. Since May, however, the coal-mining industry has made rapid headway and both production and exports in the first half of 1939 were slightly higher than in January-June, 1938. In June, the quantity of coal raised was 12.7 per cent. higher than in the corresponding month last year, and total exports showed an increase of no less than 22.6 per cent. While the recovery in domestic demand is due to the expansion in general business activity, the remarkable increase in shipments is largely a reflection of the sharp decline in Germany's exports, from 16.8 million metric tons in the first half of 1938 to 12.7 million tons in the corresponding period this year. The improvement in

\* Including Cumberland, Gloucester, Somerset and Kent.

British exports has been widespread. France and Spain are the only two countries which took appreciably less British coal in the first half of this year than in January-June, 1938. Germany herself has bought considerably more this year; British shipments to Germany rose from 1,785,000 tons in January-June, 1938, to 2,130,000 tons in the first half of this year. Exports to Italy also showed a substantial increase during this period, from 1,104,000 tons to 1,511,000 tons. As the accompanying table shows, the incidence of the improvement in Britain's coal-mining industry has been uneven; in Durham and in South Wales production in the first half of 1939 was still below the figures for 1938. In June, on the other hand, production was higher than a year ago in all districts. Although total output in the first quarter of this year was 2.3 per cent. smaller than in January-March, 1938, the ascertained profits per ton of the coal-mining industry rose from 21.45 pence to 24.48 pence, the highest figure for this quarter since 1924. Since output in the second quarter exceeded that of the corresponding period last year, and as prices have been well maintained, the profits per ton in April-June were probably also higher than a year ago.

**Wool Textile Activity.**—The wool textile industry has experienced a remarkable expansion in demand and some of the principal sections of the trade are now

working at capacity. The percentage of insured persons (aged 16 to 64) unemployed in the woollen and worsted sections fell from 22.9 in June, 1938, to 9.1 in June and 6.7 in July this year, while the index of total wages paid, given in *Wool Intelligence Notes*, rose between June, 1938, and June, 1939, by 27.8 per cent. in the woollen section and by 13.8 per cent. in worsted manufacture. The improvement is also reflected in the *Weekly Wool Chart's* estimates of the consumption of imported wool during January-June, 1938 and 1939, given below:—

CONSUMPTION OF IMPORTED WOOL  
(In millions of lbs.)

|                    | 1938       | 1939       |
|--------------------|------------|------------|
| January .....      | 38         | 51         |
| February .....     | 36         | 50         |
| March .....        | 42         | 59         |
| April .....        | 37         | 51         |
| May .....          | 43         | 59         |
| June .....         | 40         | 64         |
| <b>Total .....</b> | <b>236</b> | <b>334</b> |

The estimated consumption of imported wool during the first half of 1939 showed an increase of no less than 41½ per cent. over the figure for the corresponding period last year. Despite the increase in consumption, however, stocks of wool are heavier than a year ago; according to *Wool Intelligence Notes* stocks in public warehouses at the principal ports and in railway and canal depôts in Yorkshire were 184 million lbs. at the end of June, against 131 million lbs. a year earlier. The improvement in the wool textile industry, which is expected to be maintained, is due mainly to the increase in defence expenditure; apart from direct Government contracts, the industry has experienced an expansion in civil demand as a result of the growth of purchasing power. Export demand, however, has also shown an appreciable improvement. Exports of wool tops rose from 14.7 million lbs. in January-June, 1938, to 21.4 million lbs. in the first half of 1939; during the same period shipments of woollen and worsted yarns increased from 12.6 million lbs. to 15.4 million lbs. and those of woollen and worsted tissues from 45.2 million square yards to 46.7 million square yards. The industry's fortunes have naturally benefited from the revival, though profits on Government contracts are stated to be small.

**U.S. Cotton Policy.**—Last Tuesday the Crop Reporting Board of the United States Department of Agriculture estimated the probable yield of the cotton crop at 11,412,000 bales, compared with 11,943,000 bales produced in 1938 and 18,946,000 bales in 1937. The estimate, which confirmed expectations, hardly caused a stir on the markets; for while the new crop is roughly equal to the world's consumption in the 1938-39 season, the carry-over of American cotton at the end of the past season was no less than 14,400,000 bales, of which the Government of the United States held 11,000,000 bales. The markets are therefore much more interested in the future policy of the United States Government concerning the disposal of its enormous holdings than in the new crop. The uncertainty concerning America's methods of disposal has made it almost impossible for traders to take a view on the probable trend of prices. A meeting of the International Cotton Federation in Zürich at the end of last week therefore decided to press the Government of the United States to adopt a definite long-term policy concerning the disposal of its holdings of raw cotton. The American Government, in turn, is anxious to conclude an agreement with other cotton-growing countries in an attempt to reduce fluctuations in market supplies and prices. It remains to be seen whether the American export subsidy, by stimulating exports, will act as a lever in inducing other countries to co-operate with the United States.

**Changes in Agriculture.**—The preliminary figures of the June agricultural census, published by the Ministry of Agriculture this week, are summarised in the table below:—

|                                        | England & Wales |          | Scotland |         |
|----------------------------------------|-----------------|----------|----------|---------|
|                                        | 1938            | 1939     | 1938     | 1939    |
| <b>Area under crops ('000 acres):—</b> |                 |          |          |         |

| Other cattle .....                     | 3,636.9         | 3,657.6  | 813.9    | 845.6   |
| Total cattle .....                     | 6,708.4         | 6,756.3  | 1,315.7  | 1,360.0 |
| Sheep .....                            | 17,900.7        | 17,955.3 | 7,969.0  | 8,042.0 |
| Pigs .....                             | 3,561.1         | 3,506.9  | 257.4    | 252.9   |
| Fowls .....                            | 52,439.0        | 52,638.0 | 7,324.0  | 7,236.8 |
| <b>Labour ('000):—</b>                 |                 |          |          |         |
| Regular workers .....                  | 412.7           | 409.8    | 91.5     | 89.0    |
| Casual workers .....                   | 79.6            | 95.7     | 104.3    | 103.2   |

For the first time since 1935 there was an increase in the arable area in England and Wales, due to an expansion in the acreage of rotation grasses, beans and peas and of barley and oats; the area under wheat fell by 8.1 per cent., due probably to the extension of the price insurance system to the other cereals. The increase in the arable area has been accompanied in England and Wales by a fall of 121,000 acres in the area under permanent grass. In Scotland, however, the slow decline in the arable area was continued in 1939 and there was an increase in the area of permanent grass. Among livestock, the dairy herds continued to expand, though there was a fall of 6.1 per cent. in the number of cattle under one year in England and Wales. The sheep population is still increasing and has reached a record in Scotland; the expansion of 140,000 in the number of ewes in Great Britain indicates that, given normal weather, there will be no shortage of lambs next spring. In both parts of the Kingdom there was a fall in the number of pigs, but this was concentrated on the older pigs; the sow population increased by 15,400 during the year. The number of regular agricultural workers continued to fall, but in England and Wales the deficiency was more than offset by an increase in the number of casual labourers employed.

**Rearrangement of Sugar Exports.**—The Russian Government informed the International Sugar Council last week that it did not propose to use the additional quota of 65,956 metric tons allotted to it at the end of May. These additional quotas, it will be remembered, were arranged by the Council to meet the shortage of supplies on the British market and the Russian quota has now been re-allotted as follows:—

|                          | Metric Tons   |
|--------------------------|---------------|
| Cuba .....               | 25,941        |
| Dominican Republic ..... | 11,039        |
| Netherlands .....        | 28,976        |
| <b>Total .....</b>       | <b>65,956</b> |

At the same time, the Dutch Government has decided not to export the 20,000 tons which were allotted to it in July, when it was decided to release a further 100,000

tons for shipment to the United Kingdom, and the Council announced on Tuesday that this amount would not be redistributed.

**Price Trend Still Downwards.**—Despite the sustained expansion of business activity in this country and the recent revival in the United States, *The Economist's* indices of wholesale prices showed a further decline during the past fortnight. The indices for primary products relating to the United Kingdom and the United States both registered a fall. The more comprehensive British and French indices are also slightly lower; the Irving Fisher index for the United States remained unchanged and the official German index showed a further, though small, rise.

\* These figures refer to August 5th. † Monthly average.

Of the five constituent series of the British complete index, four showed a decline, while one (that relating to minerals) registered a slight rise, due to the improvement in the prices of non-ferrous metals.

There are no signs of significant changes in prices in the near future.

**Strong Copper and Lead Markets.**—The improvement noticed in the last few weeks on the London markets for copper and lead is due in both cases to a revival in demand. The price of standard cash copper has

HOTEL WESTMINSTER  
NEW MANAGEMENT  
FULL BOARD From 27/6  
**Le Touquet**

risen from less than £42 per ton in the latter half of June to £45 per ton; it is believed that recently Japan has been an extensive buyer on world markets, as the Government is anxious to acquire a reserve supply of copper in case the United States should eventually place an embargo on exports. On Thursday it was announced that the co-operating producers had decided to raise from next Wednesday the output quota from 95 to 105 per cent. of their basic quotas; this move was not unexpected, as the object

of the production regulating scheme was to lift the price of copper to about £45 per ton. The increase in the demand for lead is also due mainly to re-armament, since consumption by the building trade, the chief user of lead in peaceful times, has been disappointing. The total demand for lead is therefore likely to continue at its present high level for some time to come, and this may induce the Lead Cartel also to relax or remove the existing restrictions on the production of this metal.

## INDUSTRIAL REPORTS

THE flow of new orders to industry has shown a seasonal decline, while production has been temporarily suspended or curtailed in a number of industries which have granted holidays with pay. But in view of the heavy volume of orders on the books of most industries, current activity, unless temporarily reduced by holidays, is maintained at a high level. During the last week of July the output of coal was 4,333,000 tons, against 4,077,100 tons during the corresponding week last year. The iron and steel industry is curtailing output only in so far as is necessitated by holidays and the need for repairs. Building activity continues at a high level, and the textile trades also remain very active, and there is considerable pressure for the early delivery of the orders placed by the Government.

### Coal

**Sheffield.**—With most of the works and pits on holiday, little interest is shown in the market. The inland position is regarded as quite satisfactory, and with the resumption of operations industrial demand will quickly revive. There are ample stocks of smalls at the pits. Household demand has fallen off as is customary at this period. Blast-furnace coke is a good feature, but central heating coke is poorly taken up at present.

Export inquiry continues at about the level of the last few weeks. Some qualities are in short supply, particularly nuts, which are offered very sparingly. Bunkers are a quiet market. Coke demand is fairly substantial. Prices are unchanged.

**Newcastle-on-Tyne.**—With most of the Durham collieries closed this week, miners having their week's holiday, there is a scarcity of prompt supplies of all classes of industrial coal. The market generally is steady; collieries are well booked on contract and, in addition, there is a fair inquiry from the Scandinavian countries. Prices show little change. Patent oven coke is a firm market; inquiry is good from the Scandinavian countries, and home trade remains active.

**Glasgow.**—Stringency of supplies is the feature of the market. Partly this is the outcome of the holidays and the slow resumption of work thereafter, but in the main it results from pressure of demand on both home and foreign account. Export inquiry has not appeared specially brisk of late, but it has, nevertheless, proved sufficiently active to absorb shipping tonnages for some weeks ahead. The collieries in Fife

and the Lothians have therefore little to offer, and ex-Grangemouth supplies are also scarce. Irish and inland business absorbs Ayrshire production. In Lanarkshire, which is busy on industrial and utility account, the main development has been an expansion in household buying despite the rise in prices by 2s. 6d. per ton.

**Cardiff.**—By the new agreement providing for a week's holiday with pay, production has been suspended practically throughout the South Wales coalfield since last Saturday. Shipments, however, were resumed on Tuesday, and in view of the recent heavy accumulation of stocks loading operations are likely to be normal for the rest of the week. The respite will also greatly relieve the congestion which has been restricting the service of wagons both for the export and import trades for some time past. In the week ended August 6th coal exports in the foreign and coastwise trades totalled 419,900 tons, compared with 366,796 tons in the pre-holiday week last year. Current business is temporarily at a standstill, but prices are nominally unchanged.

### Iron and Steel

**Sheffield.**—Owing to the holidays there has been little doing in the iron and steel market this week, and not until the end of the month is a return to full activity expected. Consumers of pig iron appear to have fair supplies on hand, and are showing little disposition to do more than cover their immediate requirements of forge and foundry. Hematite demand continues satisfactory, and there are substantial bookings to the end of the year. Finished iron inquiries are disappointing.

So far as steel is concerned the quieter market conditions are welcomed but the lull will speedily end, for users are on the look-out to place substantial business at the first opportunity. Basic billet supplies are still short of requirements despite the fact that considerable quantities of imported billets are making their appearance. Acid billets, wire rods and bright drawn steel are in good demand, and the inquiry for stainless steel sheets is fully maintained.

Although Sheffield is turning out a large amount of Government work the bulk of orders in hand at most establishments relate to commercial requirements, and a substantial portion comes from overseas. At some works there is enough business on the books to ensure full employment to the end of the year or well into the next year.

**Middlesbrough.**—It is expected that holidays will be restricted to the minimum. Sheet makers are very busy; the demand for semi-finished steel is well maintained and imports of this class of material from the Continent continue. Constructional steel is being delivered as rapidly as produced, and shipbuilding materials are being specified in greater quantities.

There is little change in the pig iron trade. Heavy steel melting scrap is taken from merchants as it becomes available at the controlled prices. Good Durham blast-furnace coke is available at 24s. 2d. per ton at the ovens. Ore imports have been well maintained.

**Glasgow.**—Steel plants are now working to capacity and makers are finding it increasingly difficult to meet all the calls made on them. At several plants the possibility of further extensions is under consideration. Demand from all users is heavy. The tonnage of shipbuilding material booked is already considerable, and it is expected that this will be largely increased within the next few months as work progresses on the many vessels now on the books of shipbuilders. Local sheet makers are overwhelmed with work, and the new business includes a fair tonnage for overseas markets. Sheet rollers and sheet galvanisers have sufficient work on hand to ensure regular employment for many months provided raw material is available. In regard to semis generally, the position has improved of late as supplies of Continental material are more plentiful. Tube makers are fairly busy, chiefly with work for the home market.

**Cardiff.**—The tinplate works have been idle this week; the great majority of the mills have been undergoing extensive repairs and renewals. New orders, however, have been placed and unexecuted commitments are estimated at over 2.4 million boxes. Both the steel and the pig-iron furnaces are in active production. Shipments of tinplates last week were slightly lower at 4,603 tons, compared with 5,151 tons in the corresponding period last year, and stocks in warehouse and in vans have been increased to 5,294 tons. Prices are nominally unchanged.

**News from Abroad.**—Demand on international steel markets has been very quiet recently, in some respects even quieter than had been expected in view of the holiday season. Since recent reports about the activity of the peace industries have been quite satisfactory and requirements of the armament industries have remained on a

high level, exporters have thought that the holidays would not interfere to a large degree with the flow of orders.

A favourable feature of the situation is that prices have not undergone a further decline recently, concessions on official prices having remained at their previous level. This fact is likely to contribute to an improvement of consumers' purchases, just as the previous increase in rebates has discouraged buyers. It is noteworthy that the object of producers who granted the higher rebates, viz., the maintenance of export business, has not been attained, although iron and steel output has not experienced a major decline. Fairly sizable orders have recently been booked from Scandinavia, the Baltic, Argentina and Brazil, and contracts for supplies of semis to Great Britain have also contributed to keep Continental (particularly the Belgian) producers busy over the slack period. American competition has been less keen of late, and additional steel works have adapted their prices to the European level. Nevertheless, cut prices have recently been offered, especially for ship steel.

Unofficial discussions are taking place to settle the differences which have arisen over the quota accounts and the payments of fines or compensations for an excess or deficiency of exports in relation to the allowances. It is possible that important alterations of the internal organisation of the Cartel will be suggested in this connection. Discussions are taking place with the South African steel producers on a revision of the import quotas granted to the European exporters for the South African market. The South African producers demand a reduction of these quotas in view of their increased output capacity.

### Textiles

**Cotton (Manchester).**—Business has been adversely affected by holiday influences. Buyers have not been disposed to place orders of any weight. The first estimate of the American crop, discussed on page 330, has had little effect on prices. During the past week more favourable weather reports have been received from the belt. There have been signs of rather more demand, but speculative interest in futures has been dormant.

Inquiry in American yarns has continued more encouraging. In addition to the persistent demand in coarse counts, rather more business has been done in medium numbers. Home users of Egyptian yarns have taken deliveries more freely, but fresh contracts have been scarce.

There has been little change in cloth market conditions. A fair amount of testing of prices has occurred from day to day, but buyers have limited their commitments. Not more than a retail business has been done for India. Some makers have secured fair lines for South America. Varied buying has occurred in standard makes for the home trade, and a little more activity has shown itself in some quarters for the Dominions, especially South Africa. As many looms as possible are being turned on to Government contracts, and there is considerable pressure for deliveries.

## THE COMMODITY MARKETS

THE improvement in the level of demand, mainly for armaments, in the metal market brought a further increase in copper and lead prices during the week. Elsewhere there were few developments, the holidays having interrupted the flow of purchases. Sugar and cotton prices were both lower on the week, but the fall in wheat prices has apparently been checked. Similar trends have occurred in the United States; a weakening in sugar, cotton and lard prices caused a fall in Moody's index of wholesale prices from 142 (December 31, 1931 = 100) to 140.1 in the week ended last Wednesday.

### Metals

**Copper.**—The demand for copper continued good and standard cash gained another 12s. 6d. to close on Wednesday at £44 12s. 6d. per ton. The feature of the week was the revival of speculation, but so far the speculative account is still comparatively small. This week Japan placed a major order on the United States market in anticipation of a possible embargo, and further orders from Japan are expected. American consumers have also maintained their purchases, although they have bought heavily for over six weeks. Under the influence of the recent orders, United States stocks are likely to fall in the autumn and will thus help to strengthen the international copper position. It was announced on Thursday that the output quotas of the restricting producers have been raised from 95 to 105 per cent. of the basic tonnages with effect from August 16th. This news caused a slight fall in prices.

**Tin.**—The cash price remained stable at £229 17s. 6d. per ton, but the forward price advanced by 10s. to £225 10s. per ton. The backwardation has thus narrowed to £4 7s. 6d., a sign of the growing strength of the market. The Pool has again been able to sell a considerable tonnage; its holdings of actual tin are now estimated at less than 9,500 tons, but it will receive a certain tonnage later this month and in September, which it had lent to the market three months before. Nevertheless the basic position of the tin market has now so much improved that an advance in the quotas for the last quarter of 1939 is more than likely. The tinplate industry remains very active on both sides of the Atlantic and the position of the motor industry is also quite satisfactory.

**Lead and Spelter.**—Lead gained another 12s. 6d. to close on Wednesday at £16 1s. 3d. per ton after having touched £16 3s. 9d., the highest level of the year, on Tuesday. Spelter, on the other hand, lost 1s. 3d. and thus closed at £14 8s. 9d. per ton. The strength of lead was due to a very strong demand from British and Continental sources on armament account. According to the British Metal Corporation, the British consumption of lead advanced from 83,000 tons in the first quarter to 87,000 tons in the second quarter of this year, while the consumption of slab spelter increased from 52,000 tons to 57,000

tons. The Metallgesellschaft reports that extra-United States production of lead in the first five months of 1939 totalled 548,627 (a year ago 527,894) metric tons. The corresponding figure for spelter was 490,588 (494,564) metric tons.

### Grains

THERE has been little change in wheat prices in the last week. Attention is focused on weather reports from America, which indicate that some further deterioration in the condition of the crop may be expected from the continued heat and drought. The North European harvest is being delayed by wet and stormy weather. Demand for Argentine maize has remained firm; the United States crop is now expected to yield about 2,520 million bushels. The continent continues to take fair quantities of feeding barley from North Africa; offers of new crop barley from Russia or Roumania are small, and it is probable that supplies from these countries will not be large, as the barley harvest was disappointing.

### Other Foods

**Provisions.**—After a period of unusually low levels, egg prices rose sharply during the week, especially for home eggs. Trade in meat has been slow, but pork prices have risen with a scarcity of small pigs.

**Colonial Produce.**—The holidays have affected most of these markets and little business was transacted. There was a further small decline in the futures market for near sugar, but with a fair demand, prices for refined have remained unchanged. Prices for Accra cocoa were also lower.

**Fruit and Vegetables.**—Wet weather has depressed both the quality and the demand for English fruit. Heavy supplies of plums and English apples are now arriving in London and prices are low. Supplies of main crop potatoes were also large early in the week but were diminished later by the wet weather.

### Miscellaneous Commodities

**Oilseeds and Oils.**—Harvesting of the linseed crop is proceeding in the United States and yields and quality are reported to be equal to the average of recent years. Shipments of old crop from the Plate to the Continent continue at a fair level, but British demand is concentrated on the Indian variety, the prices of which are firmly held. The carry-over of the old cottonseed crop in Egypt is large, and although business in new crop has not yet begun, prices for the old crop have eased. In sympathy with seed, linseed oil is dearer and the discount of later positions has been reduced.

**Rubber.**—The London market was closed over the holidays. On Tuesday and Wednesday, the tone was firm but prices show little change.

## COMPANY MEETINGS

## GAUMONT-BRITISH PICTURE CORPORATION, LIMITED

## DIVIDEND PROSPECTS

The twelfth annual general meeting of the Gaumont-British Picture Corporation, Limited, was held, on the 10th instant, in London.

Mr Isidore Ostrer (the chairman) said that the available surplus for the year had enabled the directors to transfer to reserve a much larger sum than last year and at the same time to carry forward a balance of £77,437 against £58,798 brought in. In recommending that the available surplus be dealt with in that manner, the directors had not overlooked the possibility of a resumption of dividend payments on the ordinary shares.

A new agreement had been entered into with General Film Distributors, Limited, for the production of further films; one of the advantages of the new arrangement would be the reopening of their studios at Shepherd's Bush for film production.

They considered their holding in Baird Television, Limited, of great importance to the future of the Corporation, being satisfied that the period of development in the home receiver side of the business was now past and that the popularity of the new art could be assured. From the theatre angle they were concerned in what was termed Large Screen Television and they had taken the necessary steps to secure the installation of those sets in their theatres as fast as they could be produced.

Shareholders were aware that the Board of Trade had seen fit on the application of holders of a bare ten per cent. of the shares to appoint an Inspector to investigate the affairs of the Corporation. While the directors were anxious to facilitate the work of the Inspector as far as they could, they had other interests to consider, and in that respect they were acting on the opinion of eminent counsel as to their duties.

As to the prospects for the current year, having regard to the extent of the reserves now appearing in the balance sheet and the substantial improvement in their financial position during recent years, shareholders might feel that a resumption of dividend payments on the ordinary shares next year might not be imprudent if in the meantime the ordinary course of business was not adversely affected to any material extent by abnormal conditions.

The report and accounts were adopted.

## ASSOCIATED BRITISH PICTURE CORPORATION, LIMITED

## ANOTHER SUCCESSFUL YEAR

The twelfth ordinary general meeting of the Associated British Picture Corporation, Limited, was held, on the 9th instant, at Winchester House, London, Mr John Maxwell (chairman and managing director) presiding.

The Chairman, in the course of his speech, said that the directors recommended this year a further transfer to general reserve of £250,000, bringing the total up to £2,875,000, and this represented nearly one and a half times the ordinary share capital. Shareholders would agree that this showed a position of quite considerable strength. All departments of the business had functioned successfully during the year. The available total of profit, after providing for every kind of charge and expense and bringing in the £81,000 brought forward from the previous year, was £912,086. An interim dividend of 10 per cent. actual, less tax, on the ordinary shares was paid in January, and it was proposed that a final dividend of 10 per cent. actual, less tax, be paid on the ordinary shares. In the view of the board, the Corporation had had a further really successful year, and it was to be noted that the trading profit had shown a substantial increase in each of the past six years.

As to the current year, he was glad to state that the results of this year, so far as it had gone, again showed improvement. While they were living in extremely troublous times and any forecast of the result of a business to be shown next March was more than usually difficult, he could, he thought, say that, short of the complete upheaval which none of them desired and, perhaps, not many of them expected, there was every likelihood of the trading results being again as satisfactory as those now before them.

In the consolidated statement the combined assets now represented a total of nearly £18,000,000, with reserves and undistributed profit balances amounting to approximately £4,000,000, as against the share capital of £4,000,000.

He welcomed some evidence of revival in the British film production business. In the case of their own Corporation, production had proceeded steadily through the past 12 years, and he was glad to feel that they had that record of consistency.

The report and accounts were unanimously adopted.

## SHORTER COMMENTS

(Continued from page 329)

**Rawang Concessions.**—Profits for year ended March 31, 1939, £13,354 (£58,734); depreciation, £5,000 (£10,761); ordinary dividend, 5 per cent. (20 per cent.), absorbing £10,000. Carried forward, £30,146 (£31,792).

**Rawang Tin Fields.**—Profits for year to March 31, 1939, £41,157 (£106,487); depreciation, £20,000 (£19,891); ordinary dividend, 2½ per cent., against 7½ per cent. Carried forward, £76,139 (£76,882).

**George Shaw and Company.**—Net profits for year to June 30th (after debenture charges and N.D.C.), £36,918 (against £36,877); ordinary dividend, 12.38 per cent. (12.295 per cent.). Carried forward, nil.

**Batchelor's Peas.**—Trading profit, year to June 30, 1939, £101,367, against £66,454; net profit, before tax, £87,166 (£55,410); ordinary dividend 15 per cent., against 10 per cent., in two previous years.

**Whitworth and Mitchell, Ltd.**—Ordinary dividend, 1½ per cent. actual (3s. 6d. per share), less tax; net profit for year to June 30, 1939, £42,209 (£29,326).

**Allied Investors Fixed Trusts, Ltd.**—Mr S. C. Parker has resigned his position as manager of this company.

**Crompton Parkinson.**—Mr F. Le Neve-Foster has been appointed to board of Crompton Parkinson, Ltd. Mr Le Neve-Foster is a member of Warren, Murton, Foster and Swan, solicitors; has been associated with the company for many years and is also a director of Stanton Ironworks.

**Port of London Authority.**—Net income for the year to March 31, 1939, £1,838,661 (£1,772,330); taxation,

£102,909 (£101,997); stock interest and redemption funds, £1,446,140 (£1,436,970); A.R.P., £29,730 (nil); maintenance and renewals, £130,000 (£200,000). Carried forward, £370,637 (£340,969). Further £42,409 for A.R.P. charged to capital account.

**Norvic Shoe Company.**—Profits for year to June 30, 1939, £53,828 (£35,049). Taxation, £5,017 (£1,363). Preferred ordinary dividend 6 per cent. against 5 per cent.; deferred dividend 4 per cent. (nil). Carried forward, £14,748 (£8,311).

**International Nickel Company of Canada.**—Net profit, after preferred dividend, for quarter ended June 30, 1939, \$8,226,137.52, equivalent to 53 cents per share on the common stock, against \$9,547,300.37 or 62 cents per share, for first quarter. Net profit six months to June, \$17,773,438 (\$16,732,251). Six months' tax provision, \$4,437,245 (\$3,903,293); depreciation, \$3,681,254 (\$3,458,411); retirement system, etc., \$890,912 (\$859,405); net profit carried to surplus, \$17,773,438 (\$16,732,251). Current assets, \$80,563,936, of which \$39,215,228 cash (\$79,384,984, of which \$40,422,819 cash).

**Friary, Holroyd and Healy's Breweries.**—Trading profit, after depreciation, year to June 30th, £235,643, against £213,612. Net profit, after £40,000 to repairs and £16,000 debenture interest (same) and taxation, is £138,140 (£136,206). Reserve, £40,000, as before; £26,266 forward against £26,080 brought in. Dividend maintained at 13 per cent.

**A. C. Cossor, Ltd.**—A conditional agreement for placing half the issued capital "in extremely strong hands" was approved on August 10th. The shares involved are 1,000,000 5s. ordinary shares

retained by vendors to the company, A. C. Cossor (Holdings), a subsidiary of Sterling Industries (formerly Ismay Industries). Completion of transfer involved, *inter alia*, modification of agreement restricting dealings in shares for period of three years.

**General Motors Corporation.**—Net profit second quarter to June 30, 1939, \$47,815,000, or \$1.06 per share, compared with \$24,786,000, or 52 cents per share, for second quarter 1938. Net earnings half-year to June 30, 1939, \$100,993,000, or \$2.24 per share, against \$33,020,000, or 66 cents per share, in first half of 1938. Net sales June quarter, 1939, \$371,633,000, against \$272,265,000 in same period 1938, while unit sales totalled 461,714 cars and trucks against 315,682.

**Hunters The Teamen.**—Net profit year to June 30, 1939, £38,895 (£29,517). Ordinary dividend raised from 6½ per cent. tax free to 8½ per cent. tax free. Carry-forward increased from £9,098 to £13,936.

**Imperial Chemical Industries, Ltd.**—Sir Andrew Rae Duncan is joining the board of Imperial Chemical Industries, Ltd. Sir Andrew is chairman of the executive committee of the British Iron and Steel Federation, and a director of the Bank of England. He is also a member of the Central Electricity Board.

**Empress Brewery.**—Profits for year June 30, 1939, £42,544 (£45,111). Loan service, £9,900 (same); N.D.C., £2,000 (£2,500). Ordinary dividend £24,644 (£26,711).

**Wolverhampton Corporation, 3 per cent. Stock, 1924-1954.**—Books close from August 18 to 31, 1939, to prepare interest warrants due September 1, 1939.

## Children of To-morrow

These diagrams illustrate the sizes of the two next generations as percentages of the present one in the countries named. It is assumed that the respective mortality and fertility rates, in the latest years for which particulars are available, will persist.

## Finance

## GOVERNMENT RETURNS

For the week ended August 5, 1939, total ordinary revenue was £20,771,000 against ordinary expenditure of £21,663,000, and issues of £9,000,000 under the Defence Loans Acts. Thus, including sinking fund allocations but excluding issues from defence loans, the deficit accrued since April 1st last is £144,726,000, against £129,775,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On August 4th applications at £99 16s. 6d. per cent. for bills to be paid for on Tuesday, Wednesday, Thursday and Friday of following week were accepted as to about 21 per cent. of the amount applied for and applications at higher prices in full. Applications at £99 16s. 7d. for bills to be paid for on Saturday were accepted in full. £30.0 millions of Treasury bills are being offered on August 11th.

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

## INVESTMENT—cont.

apart from the bad weather which made last week's exercises scarcely the fairest of tests, the greater part of the failures in interception and marksmanship were due to lack of skill. This was most noticeable among the searchlight units. Some of these were reported to be excellent—which is evidence that the faults of the others lie not in material but in training, and that, in turn, means that they can be corrected. Guns and fighters are of little use at night unless the searchlights can pick out the raiders. It is clear that there should be a period of the most intensive concentration on the training of searchlight crews.

The other great gap discovered last week was of a different order. The black-out was deliberately timed to cause the least possible disturbance and inconvenience to private citizens and business concerns. Indeed, held as it was between 12 and 4 o'clock on Friday morning, when most people would normally be in bed and asleep, it was hardly a test of preparedness at all. Yet, even so, the great city of London and its environs were given away to the raiding bombers by a host of instances of sheer carelessness. It is true that the railway companies whose lights blazed throughout the black-out had so far contracted out of the exercise as to ensure the maintenance of their essential services—though even here much more care might have been taken. But there was no excuse at all for the wilful indifference to the importance of the black-out demonstrated in shops and factories, in advertisement signs and street-lighting and by motorists and householders.

If the progress of civil defence among the population at large—that is, apart from the two millions who have enrolled for active work—can be taken as a test of democratic ways, the conclusions to be drawn so far are disturbing. It is true that the Government has contributed very largely (many would say decisively) to civilian apathy and uncertainty during the past two years or so by its own procrastination and indecisiveness in A.R.P. But this excuse holds little water when applied to the specific case of last week's black-out. The occasion had been well publicised by pamphlet and radio, and the steps to be taken were simple and inexpensive. The fact is that, while the individual citizen must himself be a vital factor in any effective system of civil defence, too many citizens look to the activities of other people to protect them.

The seriousness of this state of affairs cannot be glossed over merely by reference to the Government's own undoubted shortcomings. *The Economist* has never hidden its view that the chief gap in civil defence has been the Government's failure to give a clear lead. But public apathy is none the less a fact, and the black-out was only one case in point. The rush of some two million men and women to enrol in the various civil defence services cannot conceal the fact that many millions more are just not interested. There is a disturbingly large number who have shown no activity at all in anti-fire and anti-gas precautions, in the preparation of shelters and in food storage. True, guidance has often been lacking, but there has not been enough inclination to seek or follow what guidance there was. When actual hostilities begin, the great bulk of the population will, no doubt, willingly rally round. That is what the average man is waiting for. But, in the conditions of modern warfare, last-minute patriotism of this kind might come too late; and, in any case, the whole point of our present defence efforts is to make ourselves so ready that war will not come.

The time has clearly come when every householder must be told, in precise terms, what is the minimum duty he owes to the common safety. He must be given a date by which his preparations must be ready and when they will be inspected. For the vast majority of people such a schedule would be all that would be needed to stir them into doing what they fully intend to do—sometime. And for the small recalcitrant minority there should be compulsion, since it can no longer be pretended that the

negligent few endanger only themselves. For the use of compulsion there is now excellent precedent, since the recent Civil Defence Act places upon the owners and occupiers of industrial and commercial buildings the most stringent requirements for protecting their property and their workers. When these further steps have been taken—or even before—there must be renewed black-outs, at hours when people are awake, and extended to cover every sort of activity, including the railways. Inconvenience will, of course, be caused. But only so will the reality of war be reproduced and the weak spots of the organisation detected.

As it is, education in defence is especially the job of the A.R.P. wardens, and nowhere are the dragging effects of private apathy—as well as of public maladroitness—more apparent than in the wardens' attempts to rally their neighbours. The principle of the service is for one warden to be on hand to advise, assist and instruct about a hundred neighbours, as well as to report local damage in actual raids and so bring into action the anti-fire, anti-gas, first-aid and rescue services. There are many faults inside the service, as the August bulletin of the Air Raid Defence League shows. There are serious local shortages of wardens in some dangerous areas like the East London boroughs. Equipment, good instructors and clerical staff are widely lacking. Full-time local chiefs of the service are too often done without. The necessarily local basis of recruitment and organisation for A.R.P. too frequently blots out the urgent need for regional co-ordination, mobility of personnel and common standards of instruction. These needs are becoming known and are being slowly met. But the wardens are *par excellence* the link between A.R.P. and the public, and it is here that they are least successful.

This failure is in general no fault of theirs. Some wardens are admittedly negligent, for none is under any compulsion either to receive instruction or to give it. But for the most part the wardens can do no more by way of education and advice than the public will permit them to do. They have no status or authority, and they can put no pressure upon their neighbours. The wardens will gain fresh strength when their own service is more efficiently ordered than it is now; their words will have more weight when a much greater proportion of the shelters now planned have been actually erected and when the enduring dilemma of evacuation from London has been finally resolved. But they will need more than this if they are to convince the general public that civil defence is indeed their business. They need, in short, to be vested with the authority to do their job. It is true that, except for a small part of their number, they are amateurs and not professionals. They cannot easily be given the powers that, say, policemen have. But the case for reinforcing their advice and persuasion by the imposition of minimum legal duties upon all citizens is clearly very strong indeed.

This is no new doctrine. As long ago as a year or more, many voices, among them that of *The Economist*, were raised to demand the drafting of a code of essential defence duties to be pressed upon all institutions and individuals. We have now the Civil Defence Act; it is hard to escape the view that we need a new Defence of the Realm Act as well. It is always an uneven picture which voluntary methods in an individualist and competitive community produce. In civil defence, millions have flocked eagerly to defend their country at home or abroad. Millions more have done nothing. A few have been obstructive. Ever since preparedness began in earnest the voluntary system has done magnificently wherever it has been called upon. But, in all branches of national service, the voluntary method needs some degree of aid by compulsion in order to level out the minimum standard of performance between one citizen and another; and it is in the sphere of civil defence that further rules and sanctions are most urgently required. Here more than anywhere else the strength of the chain is that of its weakest link.

## The Danger in the South-East

DURING the last seven days the apprehension in which we live has been screwed tighter by several degrees. Over the week-end Europe awaited the outcome of the meeting at Salzburg between the German and Italian Foreign Ministers; and the dull fact that the dictators were once more announced to be in complete agreement was then quickened by the news that Herr Burckhardt, the League High Commissioner in Danzig, had been to Berchtesgaden at Herr Hitler's invitation the day before Count Ciano. Here were two meetings of obviously first-class importance. While nothing is known for certain of what transpired at Salzburg, it would seem that weighty decisions were taken, modified perhaps by Italian caution, at least sufficient to cover German action during the next few weeks of diplomatic and military mobilisation. The most important of those decisions must clearly be with regard to Poland: whether or not a supreme effort is to be made to destroy her independence of action; if so, how that effort is to be concerted; and if not, what alternative course is to be followed.

There is no final evidence yet to show what the decision was. But there is some evidence that the dictators are not finding the "war of nerves" wholly to their taste. Indeed, Herren Hitler and von Ribbentrop appear to be getting alarmed at the total absence of any sign of "mediation" from London. The signs of that are manifold. An American Congressman, arriving at Oslo in Herr von Ribbentrop's aeroplane and fresh from entertainment by that gentleman, sends up a balloon for a new Four-Power (i.e. Munich) Conference. A whole crop of rumours may be harvested in any European capital, not only of four-Power conferences, but of partition plans and "realistic" solutions; these rumours do not originate in London or Paris but in Berlin and Rome. Dr Goebbels's propaganda in England and France has been doubled and re-doubled in recent weeks. Professor Burckhardt's visit is open to a similar interpretation. The Fuehrer gave him no peace plan; but he is regarded in Berlin as the natural successor to Lord Runciman, and his invitation to Berchtesgaden was an effort to "prime the pump" of appeasement. The fact that all these plain invitations have been accompanied by a Press chorus of "No Compromise" and by blood-curdling private threats of war before the week-end is probably only part of the game. A desperate effort is being made to frighten us. So far there is not the smallest sign of fright in London, Paris or Warsaw. The fact that the French and British Governments are still composed of the men of Munich naturally leads to their every action being most suspiciously scrutinised. So far, however, the white rat of appeasement has not stuck even so much as a whisker out of his hole. If there is a deadlock, it is of Berlin's making and Berlin must resolve it.

The situation in Danzig remains meanwhile one of nervous uncertainty. Local talks taking place between the Senate President and the Polish High Commissioner can have no real significance, for the matter has gone far beyond local issues. But while defence of the *status quo* of

Danzig, and thus of Poland, must continue to be the focal point of all our efforts, this week has brought other reports which further emphasise that if Germany decides to defer for the time being a military stroke against Poland, there is still a wide field of "peaceful" activity for her army and its auxiliaries. It is of the utmost importance to consider what that activity might be, since in the next few weeks we are going to have either war starting at Danzig or an outbreak of German activity elsewhere.

On September 2nd the Nazi Party opens its rally at Nuremberg, to be called the "congress of peace." Perhaps in preparation for this, perhaps as part of a strategy made ready months ago, the pressure is now being applied to points of leverage in the south-east. In effect the "republic" of Slovakia is already in German hands, for the Reichswehr has occupied a wide belt of territory running up the valley of the river Vah and eastwards along the northern frontier. When it was learnt that Count Csaky, the Hungarian Foreign Minister, had also been in consultation with Herr von Ribbentrop at Salzburg last week (a meeting since repeated) there was immediate fear that the long-awaited drive for control in Budapest had begun. There were rumours of an ultimatum and some outward signs to lend plausibility to the rumours. It was clear that Germany would gain much from a control of Hungary, and that there was nobody outside Hungary (and dangerously few inside the country) who could and

would fight to prevent its assumption. With free passage assured for his armies Herr Hitler would then have strengthened his strategic grip on Poland by command of the Ruthenian hills (from the northern spurs of which the Austrian armies held off the Russian south-westward push for many months in the early part of the last war); he would have advanced to the borders of Roumania; and he would have encircled the fertile lands of northern Yugoslavia, with their German and Hungarian minorities.

After Czecho-Slovakia the process of gaining control in Budapest would seem to be a fairly simple matter. In this year's elections the Hungarian Nazis, fed as always by German money and profiting by the exclusion of Jews from the poll, increased their representation in the Hungarian Chamber from six seats to forty-eight. Divided among themselves though they may be, and perhaps because of that, they provide an effective vehicle for the spreading of German influence; if they took over the government it would not be the first time that a Nazi majority had climbed to power on the back of hypothetical public support. And at one remove the Hungarian position will stand as representative of the domestic play of forces in the Balkans when set in movement by Nazi activity. By extending their control of Hungary's foreign trade (until in 1938 they took 50 per cent. of Hungary's exports and supplied 48 per cent. of her imports), and appealing to the peasant and the landowner with apparently high prices, the Germans have won for themselves much public sympathy as well as a commanding political

position. In Hungary, too, the Nazis have played the revisionist tune skilfully, and in the countryside they have worked on the peasants' hopes of land reform. The nation is well divided against itself. Only one factor prevents it from falling. The Government remains in the hands of the aristocracy, ruling through the Upper House, delegating power to men like Counts Teleki and Csaky, who can be relied upon to place the dignity of Hungary before purely personal aims. The struggle for control in Hungary, as elsewhere in south-eastern Europe, is no longer only national: it is also dynastic.

If Hungary cannot hold out, what may be expected of the Balkan peoples, more at peace between themselves today than ever before? In answering this question, the essential problem (assuming always that the Peace Front suffers no defection) lies in Belgrade. For in a very true sense, Yugoslavia is the keystone of the Balkan defensive arch. Remove it and you destroy all hope of Balkan neutrality. If the Germans removed it there would be no material reason why their armies should not reach the Black Sea without firing a shot.

But it is fruitless to talk of "Jugoslavs." There are few of them and they do not make up one nation. The actors in this drama are called Serb, Croat and Slovene; and it is the Serb, as it was in 1914, who will decide whether or not the next war shall begin in the Balkans. If Prince Paul declares for the continuance of a policy of honest neutrality and a refusal to join the Axis, he must consider whether the Germans and Italians (having agreed to parcel out the country) will not then work to detach Slovenia, Croatia and the wheat plains between the Save and the Danube. With Hungary under German control, with the support of German and Hungarian minorities in the Banat and in Slovenia, helped, too, by Croat separatism translated into extremist terms by the Zagreb Frankovci group, they might well not work in vain. The Yugoslav idea is a fine one, but it is not yet profound. Even if peaceful detachment of northern Yugoslavia proved impossible, or too slow a process, the Axis Powers might be tempted to threaten invasion. The Yugoslav army, commanded as it is almost completely by Serbian generals, would then have to reckon whether it were better to fight in order to keep recalcitrant Croats within the frontiers of a mutilated Yugoslavia or to retire from the strategically weak northern frontier to the spurs of the Dinaric Alps, even as far south as the Vrbas River, and then to stand for a Greater Serbia within the quadrilateral of the Bosnian Highlands, the Save, the mountains of the south and the Adriatic coast.

Commanding Slovakia, Hungary and Yugoslavia north

of the Save, the Axis Powers would in that case be confronted by a reincarnated, but still neutral or hostile, Serbia. They would have done much. They would have shattered Balkan peace, begun the encirclement of Roumania, stretched out a warning finger to Bulgaria. But to obtain their ends they would not have done enough. It is not Croatia or Slovenia but Serbia itself that is required to link up a friendly Bulgaria with the Axis and to turn the flanks of the immensely strong Roumanian defensive position in the Carpathians. If the Axis invaded Serbia proper, 1914 would repeat itself, with the Serbians meeting the first shock and waiting desperately for Anglo-French help through Salonica. But, unlike 1914, they would have behind their backs a friendly Balkan alignment formed by Turkey, Roumania and Greece, which would neutralise Bulgaria and open the way for assistance. Without the neutralisation of Poland such a war would be hazardous indeed to those who undertook it. If they wish to be sure of the Balkans it is cardinal that the Axis Powers should first force the compliance of Prince Paul, at least to the passage of their troops down the Danube and over the Belgrade-Nish-Sofia main line. Everything is then in their favour. With the Reichswehr on their frontiers, the Bulgarians would have little option but to take their orders from Berchtesgaden, for the revisionist argument, proved good in Hungary, could scarcely be resisted in the much more inflammable atmosphere of Bulgaria. There would remain the Roumanian dynasty to overturn, menaced then from the west and south, and Germany would have completed her "peaceful" occupation of south-eastern Europe.

This is not a fanciful picture. Nor is it conceived with the intention of painting the Germans in colours of black destruction. On the contrary, it is a picture of extreme realism. Those who direct our policy, and play so decisive a part in deciding the endurance powers of the Peace Front, should realise that they have only to make one or two small slips and the whole edifice of south-eastern defence will be laid bare. Yugoslavia is not an essential member of the Peace Front. But it is essential to the Peace Front that she remain neutral. We may have every sympathy for Prince Paul, doing his best to remain neutral in the most difficult of circumstances. We may commend him, as he should be commended, in that effort. But we must understand that we shall help him best by leaving him uncompromised, and by standing rock-firm on our decision to resist all attempts to weaken the defensive encirclement which our declarations have brought into being, meeting if necessary force by force.

## The Paradox of Prices

**S**TIMULATED by the rapid increase in defence expenditure, British industrial production has not only recovered from the recession of 1937-38 within little more than six months, but it has already surpassed all previous records. But while the recession of 1937-38 brought with it a downward movement in wholesale prices and in the cost of living, the vigorous expansion in industrial activity this year has found little correspondence in the movement of prices. This is illustrated by the first of the diagrams at the foot of the next page, which shows the course of the Board of Trade's price indices of food and tobacco, of basic raw materials and of manufactured goods. The absence of a major rise in prices is unquestionably one of the most remarkable features of the present boom in industry, and, in view of its far-reaching consequences, deserves explanation.

Broadly, a country's price level is determined, on the one hand, by the prices of industrial raw materials and

crude foodstuffs, and, on the other, by the cost of converting these materials into finished products. Britain is in the rather exceptional position of importing virtually all her raw materials (with the notable exception of coal), something like one-half of her requirements of foodstuffs and a not inconsiderable quantity of manufactured articles. In 1935, the last year in which a census of production was taken, the value (including shipping charges, etc.) of Britain's net imports was £701 millions, while the value of the industrial output of firms employing more than ten persons on the average was £1,576 millions (net) and that of agriculture £206 millions (gross). The size of Britain's purchases abroad is such that a significant change in import prices causes marked shifts in the ratio between individual prices as well as in their absolute level. If wage rates remain unchanged, for example, in face of a major decline in the price of food, part of the income of British wage-earners is released for the purchase of other goods often

of a capital character, such as houses, or semi-luxuries such as motor cars. This new source of demand for goods which are predominantly made in Great Britain may even, as in 1932, give rise to a movement of industrial recovery.

Since the third quarter of 1937 average import prices have shown a marked downward trend, which has continued to the first quarter of this year. During this period they fell by no less than 12.8 per cent. A simple calculation shows what this means. In the first half of the current year retained imports amounted to £420 millions; but if import prices during this period had been the same as in the third quarter of 1937, the cost of these purchases would have been £481 millions, i.e. £61 millions more. This represents a saving at the rate of no less than £122 millions per annum. As the second diagram shows, the fall in the average import prices of raw materials since 1937 has been very substantial. The average price of exports (which, however, consist mainly of manufactured goods) has also declined, but as domestic conversion costs (i.e. mainly wages) are comparatively inelastic, the extent of the fall has been much smaller. As a result, the quantity of imports obtained in exchange for a given volume of exports has tended to increase.

It is more difficult to measure changes in conversion costs, but such evidence as is available suggests that, on the whole, they have shown little, if any, decline between 1937 and 1938, and that the tendency in recent months has been slightly upwards. Wages, which form a large proportion of conversion costs, have certainly shown no decline during last year's recession. The official index of weekly wage rates (1924 = 100) actually rose from 102½ in the third quarter of 1937 (the peak of the previous boom) to 106 in the second quarter of 1938, and has remained at that level until the first quarter of 1939.

If this diagnosis is correct, the fall in the prices of imported raw materials and foodstuffs largely explain why the domestic price level has as yet shown scarcely any rise and why it is still lower than in 1937. It has also been one of the factors (the increase in defence expenditure is the other) responsible for the growth of purchasing power, especially in the lower income categories, reflected in the expansion in the consumption goods trades this year.

But how is it that the prices of imported raw material and foodstuffs have shown practically no response to the increased volume of overseas purchases, which, in the second quarter of this year, was actually higher than in the corresponding periods in 1929 and 1937? And why have domestic conversion costs so far shown only an insignificant rise?

The third diagram, which puts *The Economist's* index of the prices of primary products alongside an index calculated by the League of Nations to show variations in the accumulated stocks throughout the world of 24 industrial raw materials and crude foodstuffs, provides a broad answer to the first question. Clearly, the supplies of primary products as a group have since 1937 again tended to exceed the demand for them, and prices have consequently shown a sharp fall. Early in 1939 the movement in stocks was reversed, but though the reversal has caused a slight improvement in prices, it has not yet gone very far. The diagram also reveals the enormous amplitude of fluctuations in commodity stocks and shows how close is the inverse correlation between changes in stocks and in prices. The indices, however, are averages, and consequently they conceal marked divergences in the behaviour of the stocks and prices of individual commodities.

In contrast to the cost of converting raw material into finished goods, which is comparatively inelastic and

BOARD OF TRADE INDICES OF WHOLESALE PRICES (1930 = 100)

AVERAGE IMPORT AND EXPORT PRICES (1929 = 100)

STOCKS AND PRICES OF PRIMARY PRODUCTS (1929 = 100)

BUSINESS ACTIVITY AND RAW MATERIAL PRICES (1930 = 100)

explains the stability of the prices of manufactures in face of violent changes in those of raw materials and foodstuffs shown in the first diagram, the prices of primary products have always been subject to wide fluctuations owing to the difficulty of adjusting market supplies rapidly to changes in demand. It may be worth while to examine briefly some of the peculiarities in the conditions of supply and demand for primary products.

So far as conditions of supply are concerned it is useful to distinguish between materials which are produced continuously, such as metals, and annual crops. While the output of the former can be adjusted at comparatively short notice, the output of crops depends not only on decisions made from six months to a year previous to the actual harvest but also on weather conditions. Some plants take several years to mature, and the potential output of tea, coffee and rubber in any one year, for example, depends on the area put under cultivation years before the crops are harvested. But as the rubber tree and the tea bush, once matured, yield an annual crop for a number of years, the actual output can be varied by more or less intensive "tapping" or "plucking." Consequently these crops may perhaps be grouped best under the first heading.

The yield of crops, such as cereals, on the other hand, cannot be as readily adjusted to changes in demand as the output of materials produced continuously. If then, the conditions of supply were all that mattered, annually cropped commodities would have much wider swings in stocks and prices than continuously produced commodities. Actually, this does not happen: differences in the conditions of demand to some extent restore the balance. It so happens that most continuously produced commodities are industrial raw materials, the demand for which fluctuates very widely, while most annual crops are foodstuffs, for which the demand is much more stable. Thus very broadly and subject to exceptions like cotton (which is an industrial crop), it can be said that foodstuffs have capricious supply but a steady demand, while for industrial raw materials the supply is more susceptible to control but the demand is unpredictable. The net effect is that both categories of prices fluctuate violently, but sometimes for quite different reasons.

The third diagram also shows that the movements of both stocks and prices are usually most marked at the beginning and towards the end of a cycle. The explanation is not far to seek. Towards the end of a boom, when primary producers are operating at or near capacity and when supplies cannot be increased further at short notice, consumers, afraid of a shortage, increase the ratio of their stocks to consumption and thus drive up prices. Conversely, at the beginning of recession, consumers are anxious to reduce their stocks, and by keeping new purchases below consumption, which is itself falling, they cause violent collapses in prices. These phenomena are not of course peculiar to primary products, for in industry, similarly, prices are frequently pushed up by competitive bidding when the reserves of labour and plant are nearing exhaustion.

The main reason why the stocks of industrial raw materials have tended to rise and prices to fall since 1937 is the fall in world demand. But since the United States and the United Kingdom are the two biggest consumers of primary products, movements of stocks and prices are conditioned, in a large measure, by the course of business activity in these two countries, as is demonstrated in the fourth diagram. Until the beginning of 1937 business activity tended to expand both in Britain and in the United States and prices consequently moved sharply upwards during this period. But as soon as recession set in across the Atlantic prices began to decline and the fall was accentuated after the summer when business activity in Britain also took a downward turn. When industrial production began to increase again in the United States in the spring of 1938

prices also moved upwards, but only slightly, because business activity in this country was then marking time. During the early part of this year the course of business in Britain and the United States showed divergent trends, and prices remained neutral. Early this summer, however, when American business showed signs of improvement and recovery in Britain was in full swing, prices took an upward turn. If, later this year, there is substantial recovery in America, so that business is moving upwards on both sides of the Atlantic, precedent would indicate a sharp rise of prices, caused in the first instance by a sudden movement by industrial consumers to replenish their private stocks. This is the more likely in view of the fact that the stocks of many primary products have been prevented from reaching excessive levels by the operation of restriction schemes, and the rise could, of course, be moderated by a relaxation of these restrictions. There may, of course, be exceptions to the general trend, due to peculiarities on the supply side. For example, a series of heavy yields has led to excessive supplies of wheat and, in the absence of a control over exports, some time may elapse before wheat prices rise above depression levels. The same is true of some other foodstuffs where demand is unlikely to overtake supply. Again the recent break in crude oil prices in the United States was caused by the lack of effective control of raw supplies.

While the trend of the prices of primary products (and especially that of industrial raw materials) during the next few months depends largely on the course of business activity in the United States, the movement of domestic conversion costs will depend mainly on the rate of increase in defence expenditure. There has so far been little increase in wages, partly because they were not reduced during last year's recession and consequently now possess a higher purchasing power, but chiefly because the present recovery only got under way early this year. Pressure for higher wages usually increases when profits begin to rise. Hitherto, published profits have been falling on the average. *The Economist* quarterly index of company profits, for example, has recorded four consecutive falls. But the results so far published in the third quarter (admittedly a very small sample) show a fall, compared with the previous year, of only 0.5 per cent. and the turning point is clearly not far distant. But although some of the recent demands have already been granted, by the engineering industry for example, there is usually a considerable time-lag between the application for, and the grant of, higher wages, especially if there is still a reserve of labour. But there can now be no doubt that many industries will reach the limit of their capacity in coming months. And unless the Government takes drastic steps to relieve shortages where possible by encouraging imports through reductions in duties (this has already been done in France) and, where necessary, to curtail civil consumption either by increased taxation or by the exercise of priority, or both, competitive bidding for plant and labour may well set in.

The results of this analysis can be briefly recapitulated. The three main elements in what is broadly meant by "the level of prices" are the prices of industrial raw materials, the prices of raw foodstuffs and the cost of converting materials into finished products (including, of course, distribution costs). A rise in the first of the three, industrial raw materials, seems, in view of the level of British demand, to be waiting only upon a resumption of recovery in the United States. The prices of certain foodstuffs are depressed by heavy crops, but they too are not entirely insusceptible to demand. Conversion costs depend mainly on wages, which will tend to go up when profits show a decisive rise, which will probably happen in a few months' time. If, this autumn and winter, a wage-raising movement in British industry coincides with American recovery, we are likely to witness quite a sudden spurt in prices, similar to that which happened just three years earlier.

## NOTES OF THE WEEK

**The Chinese Prisoners.**—It was made known in London on Friday of last week that, on advice from the Law Officers of the Crown, the Government had decided to hand over the four Chinese who are now in asylum in the British Concession at Tientsin to be tried, according to the Japanese demand, in a local Chinese court. It is stated in London that the present decision has been reached "on the judicial merits of the case," and that the surrender of the four Chinese suppliants at the altar of British justice will therefore be unconditional. Though the present Japanese military blockade of the British Concession at Tientsin was imposed expressly on the ground of our original refusal to hand these men over, we are not now asking that the blockade shall be raised or even eased as a condition of their extradition. Indeed, the first reaction has not been to appease the Japanese but rather to increase their suspicions that we are trying to spin out the negotiations at Tokyo without facing matters. We may concede that the legal situation did change in one respect when on July 30th the Japanese Government at Tokyo at last communicated to the British Ambassador the evidence in the additional case which the military authorities in Northern China had so far refused to communicate to the Consul-General at Tientsin. Since the British authorities at Tientsin, on instructions from London, had refused to hand the men over on the ground that the evidence so far furnished was insufficient to constitute a *prima facie* case against them, it was no doubt logical that the question of extradition should be reconsidered in London in the light of the additional evidence now supplied. In the light of this evidence, the Law Officers have found a true bill: that is presumably to say, they have found the additional evidence to be of the kind on which a grand jury in the United Kingdom would have been likely to commit prisoners for trial on a charge of murder.

In this case, however, it is common knowledge that the prisoners are being handed over, not for a *bona fide* trial, but for a virtually pre-determined condemnation to death by a court which will be only nominally Chinese and only nominally judicial, while in fact it will be a mere agency for furthering the military and political aims of the Japanese. This is a capital point which the British Government seem to have surrendered at the outset by making the question of extradition turn solely upon that of the adequacy or inadequacy of the *prima facie* evidence. The justification for the British Government's action is that we are simply acting on treaty obligations towards China which provide for the delivery, "on due requisition by Chinese authorities addressed to the British consul," of Chinese offenders who have sought asylum in Chinese territory under British administration. In a note of protest to the British Government, the Chinese Government contests the implication that the puppet governments of Japan in China are to be regarded as "Chinese authorities" within the meaning of the treaty. In this China is surely in the right. In fact, there is every indication that the Foreign Office's interpretation of expediency had as much to do with the decision as the Law Officers' interpretation of the law. And whether or not it is good law, the decision looks like very questionable politics, since it has angered the Chinese, and lowered our prestige in the Far East. The assets are not apparent, since if the aim was to buy time in Tokyo, it has not succeeded. The Japanese military delegates to the conference have departed with some ostentation for Tientsin, the negotiations are at a deadlock on the currency question and the anti-British campaign continues in full swing. Meanwhile, a summons for a writ of *Habeas corpus* on the prisoners, returnable next Tuesday, has been granted in London; this follows a refusal to grant a writ by the British Supreme Court in Shanghai. The affair is not yet closed.

**Japan and the Axis.**—While Japan is, of course anything but a democracy, her political life is not unified, like that of the totalitarian Powers in Europe, by the complete ascendancy of any single political force. In Japan the Army, the Navy and Big Business are each semi-independent powers; and, though the general public may have little or no influence on the play of these mighty forces, it at least has certain opportunities of showing, when there is a trial of strength between its rival masters, where its own hopes and sympathies lie. To-day the Japanese public is evidently in sympathy with the civilian authorities and the Navy against the Army in the momentous issue between the rival policies of looser and closer association with the Berlin-Rome Axis. The Japanese Army believes that, if it can bend British action in Eastern Asia entirely to serve Japanese military purposes, this will give Japan just the added force that she needs for breaking China's resistance. Great Britain, the Japanese soldiers think, can be forced into complete compliance in Eastern Asia if the Axis can be induced to add its pressure on Great Britain in Europe to Japan's own pressure on her at Tientsin and in the Yangtse Valley; and, to secure this timely aid, as they hope, decisive German and Italian aid, the Japanese soldiers are apparently ready to commit Japan very deeply to intervention on the Axis Powers' side in the event of a European war. On the other hand, Big Business and the Navy see very clearly that it would be financially and economically impossible for Japan to keep up her effort to conquer China if she were to lose her present trade with the British Empire and the United States.

In this conflict of rival Japanese policies the Army seems to have met with another check on August 8th when the inner Cabinet debated and rejected a demand from military quarters that the cautious policy of relative aloofness towards Europe, which the Cabinet adopted on June 6th, should be reconsidered. This reading of what happened last week appears to be confirmed by public statement made by the Prime Minister, Baron Hironuma, this last Sunday; and last week's balance of political forces in Japan must have been one of the factors with which Rome and Berlin reckoned in taking the decisions, whatever these may have been, at which the arrived during the week-end. As far as it goes, the policy that now holds the field at Tokyo is not in the Axis.

owers' favour; but we must recognise that the political balance in Japan is unstable and the present policy therefore precarious. A breakdown of the Anglo-Japanese negotiations or an outbreak of war in Europe might precipitate rapid and important changes of policy in Japan, as well as in Russia and the United States.

\* \* \*

**Problems of Conscription.**—The general principle of conscription is simple, but the universal application of any simple principle nearly always creates hard cases. These might, of course, have been ignored, save for the strong native tradition in favour of doing everything possible to safeguard the position of individuals. The Military Training Act consequently contained a large number of provisions designed to mitigate hardship, and the inevitable minor difficulties arising out of these have recently been coming to light on several sides. The local tribunals to whom conscientious objectors must take their case have not made very rapid progress, but seem to have been able to decide whether the applicants' convictions were honestly held or not. One unexpected problem arose at Bristol when a case had to be adjourned because the Ministry of Labour official said that the provisions about reinstatement did not apply to conscientious objectors; if this reading of the Act is really correct, then an amendment is needed to give effect to Parliament's clear intention of giving them equal protection. A more serious difficulty, and one which clearly had to be expected, has emerged through the summoning of a firm of shoe factors by a clerk who claimed that he had been dismissed on account of his liability to be conscripted. It is to be hoped that such cases will not often come before the courts, for it must frequently be quite impossible to prove whether or not the liability to conscription contributed to the reasons for an employee's dismissal. Only general goodwill can make this section of the Act workable; it would be absurd to deprive employers of all effective power to dismiss an unsatisfactory worker, who was approaching the dangerous age, and it would not be in the interests of the man himself if they were compelled to brand him publicly as incompetent. Another problem has arisen out of the Government's ban on payments by local authorities to members of their staff who are serving in the militia. An outright ban on a practice which has been adopted by many private employers is perhaps too great a violation of local independence, but there is much to be said for the view that the treatment of the militia has been not ungenerous, and that public money should only be used to improve their lot in exceptional cases. The first umpire's decision permitting an unemployed youth to register for training lightly before reaching the age of 20, because otherwise he would find it difficult to secure a job, shows a sensible determination to make minor adjustments in special cases.

\* \* \*

**Property War Risks Plan.**—The Government has lately been moved to appoint a conference of five, under the chairmanship of Lord Weir, to consider the practicality of a scheme for the insurance of war risks on property. That conference should feel some gratitude to the Association of British Chambers of Commerce, which has published an outline scheme as a basis of discussion. This scheme observes the basis of all insurance—mutuality—and imports the necessary principle of compulsory cover, with certain reservations, for all freehold and leasehold buildings, fixed machinery, and landlord's fixtures. It proposes that a pool should be opened at once, with an initial contribution of 2s. per cent., and an annual premium, on the outbreak of war, of one per cent., which is estimated to yield £100 millions annually. Payment for the replacement of property would be met by a levy on all property covered, and claims would be paid, in the first instance, by means of provisional indemnity certificates, carrying interest at ½ per cent. These would later be replaced (on the closing of the scheme) by Government guaranteed bonds. For an

amount equal to the claim, less the appropriate rate of levy on all the property covered, which would also carry interest and would be repaid by means of the levy. The latter would be a prior legal charge on the property covered, and payment would be extended over a short period of years. In outline, this scheme seems essentially reasonable. But it does not escape the difficulty that property owners would receive no final compensation until the end of hostilities. Nor is the risk itself actuarially coverable, in the absence of actual experience of war damage. If the latter proved to be light, the scheme might be self-financing, without Government support. And this fact, as Sir George Schuster has pointed out, might weaken the resolution of the Government to insist upon reparation by the whole of the community. Finally, personal property, including household goods, might not suffer monetary damage on the same scale as real property; but the risks to which it would be exposed in time of war invite protection under the suggested separate scheme.

\* \* \*

**The Presidential Campaign Opens.**—The adjournment of Congress has been the signal for the first shots in the campaign for the American Presidential election which is to take place in November next year. The first public avowal of candidacy has now come from Mr Robert Taft, Senator from Ohio, a son of that President Taft who succeeded the first President Roosevelt, and as convinced a conservative as his father. Mr Taft is not, of course, the only Republican aspirant. Senator Vandenberg, of Michigan, has been in the race from the start. His record in Federal politics is far longer than Mr Taft's and not undistinguished, but neither of the two Senators makes a very colourful personal appeal. Mr Dewey, the crusading District Attorney of New York City, on the other hand, combines a popular personality with a total absence, so far as is known, of opinions on any subjects other than the suppression of crime. These three, with the enigmatic figure of Mr Hoover in the background, are the leading contenders for the moment and though the emergence of some other figure is always possible, the Republican party looks like suffering, as it has done ever since 1932, from a lack of leaders of stature approaching Mr Roosevelt's.

\* \* \*

On the Democratic side the picture is both simpler and more confused. It is simpler in that the struggle in next summer's convention will clearly be between a Conservative and a New Dealer, and that the Conservative will almost certainly be Vice-President Garner. But the identity of the New Dealer is still unknown. Mr Roosevelt has replied to his repeated defeats at the hands of Congress by a series of statements in which he has nailed his colours to the mast of his declared policy and by a threat that he will not support the Democratic Party next year unless it nominates a candidate of liberal views. The odds are still that he will feel forced to seek the nomination for himself, for lack of any other winning candidate in the ranks of the New Deal. But if he should decide not to, there is a subsidiary competition among the New Dealers for the role of understudy, in which Mr McNutt of Indiana, the newly-appointed Social Security Administrator, and Mr Murphy of Michigan, the Attorney-General, seem to be the current favourites. And there is always the possibility of a compromise between the two wings of the party, resulting in the nomination of somebody such as Secretary Hull or Governor Stark of Missouri. In short, the American political outlook, as is usual a year before the election, is confused and uncertain, and during a crucial twelve months the actions of the most powerful country in the world will be governed by the manoeuvres of a group of prima donnas rather than by considerations of policy.

\* \* \*

**General Franco's Staff.**—As was to be expected from the constitutional decrees, the Spanish Cabinet that was sworn in last week is a coalition of the army and the

Falange. The twelve members, presided over by General Franco with wide autocratic powers, include one colonel, four generals, and seven civilian Falangists. Señor Suñer, who is generally regarded as being of wholly Fascist sympathies, remains at the Ministry of the Interior, though he is also, of course, president of the powerful political junta of the Falangist Party. An unexpected appointment is that of Colonel Beigbeder to the Ministry of Foreign Affairs. He replaces the moderate and widely trusted General Jordana, a close counsellor of General Franco; and in some degree he may be expected to adhere to a Spanish rather than to a Fascist point of view. Dictators are notoriously jealous of their Foreign Ministers, and General Franco may have been moved to appoint the High Commissioner of Spanish Morocco as his Foreign Minister for the same reason that he appointed General Muñoz Grande, another colleague of his African days, to the influential secretaryship of the Falangist Party. The three defence Ministries are in command of Generals Varela, Moreno, and Yaguë, respectively, for the Army, Marine, and Air, and in passing it may be noted that independent or moderate-minded soldiers like Generals de Llano and Aranda have received no political appointments. Civilians have command of the Ministries of justice, finance, industry, agriculture and labour, and education, and there is also a Minister to represent the Falangist Party. General Franco's task was to unite behind him the various and disunited groups of his followers, while retaining for himself supreme and unchallengeable power. In these matters perfection is not to be expected, and it is no criticism of General Franco's manoeuvring that there will remain almost as many sore hearts as hale ones. The maintenance of his Cabinet will depend on his success in keeping his own position as arbiter untouched, and on the tact with which he manages the undercurrents that are bound to flow.

\* \* \*

**The Mandates Commission on Palestine.**—The report of the Permanent Mandates Commission of the League of Nations on the British Government's latest proposals for the government of Palestine cannot be disguised as anything but a severe rebuke to Great Britain. The Commission unanimously finds that the new proposals cannot be reconciled with the interpretation that has hitherto been set upon the Mandate both by the League and by the British Government. Four of the members—the Dutch, Swiss, Norwegian and Belgian members—hold that the plan cannot be squared with any interpretation of the Mandate, while the remaining three members—the British, French and Portuguese representatives—are willing to believe that the Council might be justified in re-defining the meaning of the Mandate. The two points that have mainly influenced the majority are the proposals to make the Jewish immigration quota, after five years, dependent on Arab agreement and the wider project which clearly looks forward to an Arab-dominated Government of Palestine. The Commission remark that they have not felt entitled to take political considerations into account. The British Government, in a statement published with the report, take issue with the Commission on this point, and "political considerations" (i.e. the mess we have allowed Palestine to get into) will doubtless weigh heavily with the Council next month. But to have their plans condemned so roundly by the representatives of the unprejudiced neutral States is not a pleasant draught for the British Government to swallow—or a pleasant spectacle for the British citizen to contemplate.

\* \* \*

**Mexican Oil and the "Good Neighbour."**—The story of the Mexican expropriations was carried a chapter forward this week with the report that negotiations are now broken off between the oil companies and the Mexican Government. Resumption in the near future seems doubtful, although efforts to this end will certainly be made. To many observers a breakdown seemed inevitable from the moment that Mr Richberg, in his visit to Mexico City some months ago, failed to reach terms which

might promise a settlement. The chief stumbling block is not, as might be supposed, the question of ownership and compensation, but of management of the oil properties. The companies have continued (and will continue) to claim that the only terms which are commercially acceptable are that the Mexican Government should hand over full responsibility for domestic management of the oil wells, receiving in return an agreed scale of royalties. President Cardenas, in his turn, continues to sit fast upon his principle of Mexican management. He is willing—he would be very foolish if he were not—that the companies should become responsible for the technical management of the wells, but he will not concede them full business management. In view of the fact that oil production has fallen steeply since expropriation, this would be an ideal solution from the Mexican point of view: equally, the companies will not agree to suffer that degree of Mexican interference, and no one can blame them for this.

\* \* \*

Those are the two points of view. So far they have proved irreconcilable, and the State Department in Washington, increasingly anxious for its "good neighbour" policy, sits uncomfortably between them. The dilemma is an unusually difficult one. If the oil companies are officially castigated for the sake of good relations with Mexico, then the example to other Latin-American nations whose natural resources are under foreign exploitation will scarcely be to the United States' (or to Britain's) advantage. The oil companies, too, would not be content to sit tongue-tied while this doubtful manoeuvre was being carried through. If, taking the contrary view, the State Department came out booted-and-spurred for the companies against the Mexican Government, the result would be no more enviable. The "good neighbour" policy would be assailed by memories of American marines in Nicaragua, and there would be talk of *Yanqui Imperialismo* once again. Even worse, the extensive American mineral interests in Mexico might suffer the same fate as the oil interests, legality or no legality. The State Department, in the form of Mr Sumner Welles, is therefore steering a very careful course, though Mr Welles has said publicly that failure to settle the dispute (implying that the responsibility was the Mexican Government's) would erect a "material barrier" between the two countries. It may prefer to temporise until next year's elections show whether General Camacho, who is likely to be Mexico's next President, is more inclined towards a settlement than President Cardenas.

Eastern garrisons, without first seeking the approval of the Legislature. In the existing state of Indian public opinion, the episode does not seem to have been handled with great imagination by the Government of India. The wise course would surely have been to consult the Legislature on a matter so close to nationalist susceptibilities, and thus to have thrown on the elected representatives the responsibility for opposing, if they thought fit, a policy so obviously inimical to the totalitarian Powers. The decision might at least have been announced in India first, and with some show of respect for Indian parliamentary opinion. The result will only be to lower still further the value and prestige of a Legislature which is already somewhat discredited in these days of responsible self-government in the provinces and suspended transition at the centre. The Congress move is supposed by some observers to be a competitive bid against Mr Subhas Bose, who is the Sir Stafford Cripps of Indian politics. Mr Bose, the leader of a "Forward Bloc," organised opposition to resolutions of the Congress higher command, and for his insubordination has been barred by the Working Committee from membership of any Congress committee for three years. As Mr Bose is president of the Bengal committee of the Congress, this is indeed a pitched battle. We may be witnessing the birth of a new Left-wing party in India, which would upset the virtual monopoly of popular Hindu support at present enjoyed by the Congress.

\* \* \*

**Marketing for the Colonies.**—It will be agreed that the better way of helping the economically depressed areas of the colonial empire is not to give them doles but to help them to find paying markets for their produce and thus to bring their own finances into order; further, that the better road to paying markets is not preference and protection but improved methods of production and nationalised marketing at home and abroad. Therefore the institution of the Colonial Empire Marketing Board nearly two years ago was a sound and far-sighted piece of imperial policy. Yet a study of the first report of the Board, issued this week, leaves an impression of trivial accomplishment in comparison with an immense task. The Board investigated, during the period October, 1937, to March, 1939, marketing conditions for 31 listed commodities, from agar-agar (a preparation of dried seaweed) to wool: the impression of small achievement derives from the aridity of the notes on the action taken, from the absence from the list of such vital and controversial products of the colonies as sugar, vegetable oils and cocoa, and from the apparently exclusive attention paid to the United Kingdom market. The colonies need world markets, and it is part of the specified duties of the Board to assist in finding them. If necessary, the Board might usefully bring influence to bear on official trade policy in order to widen the international channels of trade for colonial products. The meagre performance of the Board in comparison with expectations is illustrated by the fact that in 18 months its total expenses were only £9,094, whereas it was expected to spend twice that sum in 18 weeks when it had entered into full operation.

\* \* \*

**Broken Bones.**—Though medicine to-day is becoming more and more specialised, hospital services are not being properly adapted to put the more specialised

knowledge into general use. Thus, the Committee on the Rehabilitation of Persons Injured by Accidents finds that the prevailing system of treating fractures in general surgical wards under the general surgical routine is gravely defective. It is deplorable that the big advance made in orthopaedic surgery should be confined in its application to a few hospitals only; even if fractures constituted only a small part of the nation's annual sick bill, such a state of affairs would call for immediate remedy. Actually the total number of injuries by accidents treated yearly in our hospitals is about one and a quarter millions, and the cost under the Workmen's Compensation Acts alone averages about £11 millions per annum. Of all injuries by accidents, fractures and allied injuries are much the most important group, so that the Committee felt justified in concentrating on these. Treatment of fractures now goes through three stages—reduction, immobilisation and functional re-education. It is this third stage, involving the early active movement of the injured joints and muscles, which is most stressed in modern treatment, for if it is neglected prolonged disability generally follows. But it is this stage also which under the prevailing hospital system has the least chance of success. The Committee therefore recommends the immediate establishment, in all hospitals of a certain size, of fracture clinics where the first stages would be undertaken by specialised surgeons and nurses but where, too, remedial treatment and after-care would be thoroughly supervised. It is now more than two years since the Committee presented its interim report outlining its scheme; yet, although the scheme has the approval of orthopaedic surgeons, virtually nothing has been done to put it into force. For this delay the question of expense is probably responsible. Where a voluntary hospital has not the means, it is proposed that the local authority should either subsidise it or set up a clinic in its own hospital. But experience has shown that to invite local authorities to contribute towards the expenditure of a scheme of this sort is the least likely method of ensuring its adoption.

\* \* \*

**Industrial Damage.**—A legal code to cover the whole subject of damage to land values and amenities in the neighbourhood of factories, mines and quarries is an immediate necessity. The recently published report of the Kennet Committee on the restoration of land affected by iron ore working provides, in addition to a careful examination of this particular question, one more argument for general regulation. The purpose of the Committee was to investigate possible measures for dealing with the hideous nuisance of ridge and furrow formations in the wake of surface working for iron ore in Northamptonshire and the neighbouring counties. Owing to the fact that complete restoration of the land surface is not an economic proposition when ores are worked at a greater depth than 15 feet, the agricultural and amenity value of some 200 acres a year is at present being destroyed, and altogether 80,000 acres are menaced with this type of avoidable ruin. The Committee had to reach its own conclusions on a whole multitude of important issues of public policy not exclusively connected with the particular question with which it was dealing. It finally recommended the setting up of an entirely new authority to take the necessary measures (afforestation was principally recommended) to recover the land in question, the finance for this activity being provided by contributions from landowners, mining companies and local authorities. The report, in fact, represents an attempt to provide a solution for a difficulty which should have been prevented from arising by general legal regulation. Such a *tour de force* will presumably have to be made over and over again until all the possible questions of smoke abatement, water pollution, damage from burning slag heaps, and destruction of amenities by derelict factories and workings have become a sufficient nuisance to call for Parliamentary attention and piecemeal solution. The case for general prevention as the alternative to a succession of difficult and expensive cures is plain.

## THE WORLD OVERSEAS

### New Trade Conditions in China

(From Our Shanghai Correspondent)

THE China trade of the second half of this year is bound to suffer a further substantial reduction. All over China, the conditions confronting foreign trade fundamentally changed in July, 1939. In the north, the centre and the south of the country imports and exports were made subject, during that month, to additional limitations, while former trade facilities were largely withdrawn.

China's National Government, as from July 1st, completely banned imports of foreign goods now classified as "luxuries." Imports of other goods are only theoretically free. In actual practice, these imports since July 1st depend completely on allotments of foreign exchange by the Chinese Government banks. No exchange and only minor amounts of Chinese currency may be exported from the areas in question without special permits. The purpose of this regime is to promote the import of goods which increase China's capacity for resistance, but to discourage other imports.

All exports from Free China are subject, since the beginning of July, to strict exchange control. Exporters are required to give up the foreign exchange proceeds of export transactions to the Chinese State Banks, which have to approve all export contracts prior to execution. Exchange must be sold at pre-war rates, but exporters are entitled to varying payments of compensation on account of differences between those rates and the open market quotations.

This new trade regime applies only to territories still under the Chungking Government's control. In North China, the Japanese-sponsored "Provisional Government" in Peiping introduced an outwardly similar regime on July 16th. As from that date, the partial export exchange control, enforced on March 11, 1939, for only 12 products, was extended to all exports from North China. All these exports have been made subject to a licensing system, and export licences are granted only to the extent that the foreign exchange obtained for exports is sold to the Japanese Yokohama Specie Bank, acting as foreign exchange agent of the Peiping "Federal Reserve Bank." The Yokohama Specie Bank is effecting payment for exchange only at its official rate of 1s. 2d. on London, and unlike the Chinese Government banks is not paying compensation in respect of the difference between the official parity of the Peiping dollar and its open market rate, which is as low as 4d.

The Yokohama Bank suggests that exporters secure such compensation by linking their transactions with the business of importers, who also secure exchange from the bank at the 1s. 2d. parity, and that exporters and importers split between themselves the exchange advantage derived from that latter rate if granted on imports. Importers, of course, will have to come to terms with exporters, since otherwise they would have little or no prospects of obtaining exchange. With the Yokohama Bank seizing all export exchange, and the Chinese Government having discontinued exchange sales in North China, North China importers are also completely at the mercy of the Yokohama Bank's exchange permits. Exchange is being allotted to importers primarily upon the basis of a newly promulgated list of the so-called "preferred imports," including chiefly all sorts of metals, machinery, oils, a series of chemicals, as well as rubber, raw jute and wood-pulp. Other imports are not explicitly banned, but will have to wait for exchange until after the "preferred" imports will have been satisfied.

On the surface, the new trade regime in North China appears to be not very different from that enforced in South China. There is, however, a fundamental difference in the application of the two regimes. In North China the new trade restrictions and controls are being exercised on behalf of a pseudo-Chinese puppet regime by the Japanese themselves, and with an avowedly discriminatory view to promoting trade between North China and Japan at the expense of other countries. In Free China, on the other hand, exchange and trade control are being exercised by the Chinese National Government without any discrimination for or against any other country or group of countries.

Moreover, Free China is making available for payment for imports large amounts of foreign exchange from sources other than exports, while in North China the Yokohama Bank announced its intention of devoting only part of the exchange collected from exports to the financing of imports.

No recent changes have occurred in the trade regime of Shanghai and the remainder of Central China, but the new arrangements in the North and South are greatly impairing Shanghai's position as an intermediary between the two. North China, in particular, is now dealing with the other parts of the country as with foreign territories, and insists upon British currency in payment for shipments to Shanghai. Free China, on the other hand, is treating the Japanese-occupied areas as enemy country, and bans Shanghai products in the manufacture of which the Japanese may have taken a hand.

The heaviest blow to Shanghai's trade, however, was delivered by the discontinuation of exchange allotments out of Chinese currency reserves, and by the consequent further drop of exchange rates for Chinese national currency since the third week of July. Shanghai imported during the first half of this year £21,000,000 worth of foreign goods, against exports valued at only £6,300,000, and had to rely for cover of the difference upon the Hongkong Anglo-Chinese Stabilisation Fund. No cover from that quarter can be expected in the future, and upon the present basis of a 4d. dollar most foreign goods are too expensive.

July 26th.

## German Price Control

[FROM OUR BERLIN CORRESPONDENT]

IN October, 1936, Germany introduced a "price-stop" law as a supplement to the Four Year Plan, and a gigantic organisation has been built up to enforce it. The object of the law was to prevent unwanted increases in prices and wages at a time of rising currency circulation, rising investment in unproductive goods and falling supplies of consumables. Despite rigorous inspection, however, the shortage of labour, materials and goods has led to considerable evasion. To check this, the Government's price-commissioner has issued a new decree, but this has been somewhat astonishingly suppressed immediately after publication.

The decree aims at establishing a system of "economically justified prices." Prices, wages and salaries must henceforward conform to the principles of a regimented or conscript economy. Price calculations may only be based on the official wage scales; if these do not exist, the Labour trustee will fix a rate. Only the compulsory social insurance contributions may be included in costs, any voluntary provision by the employer being disregarded. Similarly, for fuel, material and transport, only the standard charges may be included, with no allowance for additional costs due to over-employment or shortage of materials. Cartelised and monopoly prices are declared to be unjustified. Any business which is carried on uneconomically (as judged by the new principles) may be reorganised, subsidised, closed or liquidated.

ESTABLISHED 1835

48 Gracechurch Street, London, E.C.3

The new decree gives the price-commissioner dictatorial powers. It completes the supersession of the principle of allowing prices to be fixed by supply and demand.

The ban on the inclusion of more than the standard rate of wages is designed, not so much to secure price reductions, as to prevent the offering of such wages to entice workmen from one firm to another—a practice which has become widespread as a result of the labour shortage. The exclusion of voluntary contributions to welfare funds is contrary to the National Socialist social programme; industry ought at least to be left in a position where it can provide its long-suffering workers with adequate security for their old age. The importance of this point may be seen from the example that Siemens last year paid 24 million marks in compulsory social contributions and 23.2 millions voluntarily.

The decree may well have its origin in the financial difficulties of the Treasury. The Government has promised that there will be no more tax increases, and industry has declared that these would be intolerable. If revenue cannot be increased and the programme is nevertheless to be completed, then a forcible reduction of prices is the obvious expedient to try next.

The decree also provides a new method of controlling consumption by price manipulation, which seems all the more necessary as the long sustained shortage of foodstuffs and many other consumers' goods has led would-be purchasers to offer prices in excess of the official maxima, either directly or by also buying uncontrolled goods. The shortage of goods is reflected in the inflationary rise in the monetary circulation. Excluding the new tax certificates, which are really a form of currency, the July figure of 11,209 million marks is double that of 1936 and 2,504 millions higher than last year.

The provision which permits the forcible rationalisation or liquidation of "uneconomic" enterprises is especially noteworthy. The system of price control makes it possible to render any branch of industry unprofitable at will, and so to place it under State control or in State ownership. In this sense the decree represents a further step towards State Socialism; one must not forget that the Hermann Goering enterprise was undertaken by the State because the steel industry declared that the high level of costs in relation to prices made the use of domestic ore uneconomic.

\* \* \*

**German Shipping Difficulties.**—As an appendix to last week's letter on this subject, it is worth noting that the President of the Hamburg-America Line has made a speech emphasising the scarcity of modern vessels in the German mercantile fleet. Only 11 per cent. of the ships are under three years old, and only 27 per cent. under ten years old. Between 1931 and 1938 only 825,000 gross tons of new shipping was acquired, whereas normal replacement would have called for 1,800,000 tons. The explanation is largely to be found in the preoccupation of the shipyards with naval and foreign orders; in the last two years these have built 490,000 tons for export and only 396,000 for the German fleet.

## America's Agricultural Problem

[FROM OUR NEW YORK CORRESPONDENT]

THE two outstanding problems of our economy are the Farm Problem and the Unemployment Problem. The former is the older of the two; for a Farm Problem (with capital letters) was politically recognisable in the '20's, when the two-party Farm Bloc in Congress held the balance of power

for years. On the other hand, the Unemployment Problem (also with capital letters) was not politically recognisable until the depression.

In a consideration of the Farm Problem, four basic factors, often overlooked, should be kept in mind:—

(1) The history of agriculture for a hundred years has been one of rapidly changing technique. The first phase was largely mechanical, the second largely chemical, and the second phase is relatively recent.

(2) In the process of occupying the continent, all land not absolutely forbidding (from its mountainous, swampy or arid character) was put under some form of agricultural use, the initial holder acquiring it either as a gift or grant, or on payment of a nominal sum. In this rapid process, good and bad land alike was put under cultivation—and the variations between good and bad land range from the superlatively excellent to the distinctly sub-marginal.

(3) Except in the South, where a plantation system developed, and in those areas long under Spanish rule (where the hacienda or ranching system had taken root) the typical American farm has been remarkably uniform in size. The unit of homesteading was the quarter-section (160 acres); and even in those areas which were never homesteaded, this was roughly the conventional size. With the exceptions noted above, the word "farm" in the United States has always connoted a freehold of 100-200 acres, owned, occupied and worked by a family, with a minimum of hired labour. (In recent years, however, tenant farming has shown a tendency to increase.)

(4) The changes in agricultural technique, combined with the changes in social habit introduced by the motor car, increased the farmer's need of a cash income both for working capital and changes in living habit. Farming changed from an almost self-sufficient way of life to production for a cash market. This both widened the disparity between the marginal and the favoured farm and increased the number of marginal farms, when measured against the new standards.

### Lost Markets

All these factors worked within the limits of our own economy. Of themselves, they would have produced a farm problem. But they were complicated by external factors—that collection of factors loosely grouped as the loss or restriction of the foreign market. In part this was inherent in events. The super-demand of the war and immediate post-war period was by its very character temporary, although it persisted long enough to be written into our agriculture. But the ensuing cult of economic self-sufficiency abroad limited our potential foreign market, while our own relief measures both retarded domestic adjustment to the changing conditions of agriculture and also, by holding supplies off the market, encouraged competitive developments elsewhere. The policies could only be justified by the (false) hypothesis that the difficulty was temporary.

Students of the Farm Problem usually lay great stress on our tariff policy as a factor both in losing our export market and in raising the price of the industrial articles bought by farmers. The fact remains, however, that during most of the post-war period down to the present, our economy has had a large surplus of exports over imports—our exports of industrial goods expanding as our exports of agricultural products fell. This would seem to indicate, firstly, that in one way or another foreign buyers obtained access to dollar exchange above the proceeds of our merchandise imports; and, secondly, that they elected to use that exchange for the purchase of our industrial rather than our agricultural products, whether because the former were relatively cheaper or for other reasons which made non-price factors the determinant of choice. The effects of tariff policy are not clearly marked.

In short, the Farm Problem does not date, as our Employment Problem does, from the collapse of 1929-32. It is conveniently dated from the agricultural war boom; but this was only one of several contributing causes, which in one way or another have affected the marginal farmer. It is probably no more than a truism that the Farm Problem is essentially the problem of the marginal farm; but most of our political farm relief has been directed toward the relief and maintenance of the marginal farm. The Farm Problem is, therefore, a social as well as an economic problem. For almost twenty years it has been a leading political concern, and hardly a session of Congress has passed without some sort of farm legislation. That almost two decades of continuous farm relief have left us still with a farm problem and with a demand for large appropriations and more drastic measures of support is evidence of its complexity.

August 7th.

## Production and the Bourse

[FROM OUR PARIS CORRESPONDENT]

THE index of industrial production, which stood at 83 in October last, rose to 100 in June of this year (1928 = 100). This is its highest point since March, 1931. It is only 10 per cent. lower than the record of 112 in 1930.

This improvement affects all industries:—

|                            | June,<br>1938 | April,<br>1939 | May,<br>1939 | June,<br>1939 |
|----------------------------|---------------|----------------|--------------|---------------|

| Iron and steel .....       | 63            | 82             | 90           | 94            |
| Engineering .....          | 74            | 92             | 96           | 99            |
| Automobile .....           | 89            | 104            | 101          | 102           |
| Building .....             | 61            | 77             | 79           | 81            |
| Gas and electricity .....  | 132           | 141            | 143          | ...           |
| Miscellaneous .....        | 110           | 109            | 110          | 110           |

War industries are naturally the most favoured, but others, as, for instance, export and automobile industries, are also in a much better situation; though it is difficult to measure to what extent the "civil sector" is vivified by the "war sector." In the instance of the building industry, progress in which in the past year has been marked, the transfer from Paris to the country of many factories has had a considerable influence.

This revival of activity is supported by two sets of exceptional circumstances. The first is re-armament, the easy financing of which has three main explanations: (1) the political recovery of M. Daladier; (2) recourse to the money market (instead of the difficult launching of long-term funds); (3) the heaviness of the so-called "strong currencies"—pound, gulden and Swiss franc—due to the new international tension coupled with general war precautions. The second is the fact that, after the successive devaluations of the franc in recent years, French prices have still an advantage over world prices. This amounts to 12 per cent. in the case of wholesale prices, against 15 per cent. a year ago, and 17.5 per cent. for retail prices, against 29 per cent. a year ago. Activity in export industries has increased 30 per cent. since a year ago, and the profits of the tourist industry are considerable.

Production could be still more developed, if private capital would accept the encouragement of a large margin of profit and return to its former activities. No doubt this would provoke difficulties, for, so long as the real average working week does not exceed about 41 hours, there is likely to be a lack of skilled workers. But new capital investment would on that ground be all the more useful as a palliative. The inactivity of the Stock Exchange, however, shows that private initiative continues to be very hesitant. While the index of production increased sharply from 87.8 in December, 1938, to 100.4 in June, 1939, the general index of 300 French stocks advanced only from 227 at the beginning of December to 234 at the end of July.

The issue of debentures, however, is much more encouraging with 2,280 million francs' worth of private issues during the first seven months of 1939, against 250 millions in the corresponding period of 1938—a progress notably aided by the lowering of the rate of interest from 7 per cent. (average 1938) to 5.5 per cent. Experts are nevertheless disquieted by the paralysis of the Stock Exchange, on the ground that if the private capital should abstain any longer from taking the lead in a revival of private economic activity, the State would be led to take a new initiative at the expense of the liberalising efforts of M. Reynaud. This opinion, moreover, is held in precisely those circles which applauded the system of the decree-laws and the prorogation of the 1936 legislature. It is curious that these two liberal institutions, Parliament and the Stock Exchange, which were so often enemies in the past, seem now both sunk in the same lethargy; and it is interesting to speculate whether the next revival of the Stock Exchange, if it is accompanied by a return of economic stability, will in its turn announce a revival of political liberalism.

August 17th.

## Unemployment and Defence Expenditure in Australia

[FROM OUR SYDNEY CORRESPONDENT]

IN the light of past experience it might have been expected that the fall in commodity prices since 1937 would lead to an appreciable decline in the general level of business activity in Australia. This, however, has not been the case. The outstanding factor preventing this decline has been the continued rapid expansion in secondary industry. An indication of this development is the recent placing of large orders for Australian steel by the United Kingdom. The following table shows the position during the last few years:—

| Year          | MANUFACTURING INDUSTRIES        |                       |                                |                        |
|---------------|---------------------------------|-----------------------|--------------------------------|------------------------|
|               | Number of Establishments ('000) | Hands Employed ('000) | Salaries and Wages paid (£A.m) | Value of Output (£A.m) |
| 1931-32 ..... | 21.7                            | 337                   | 55.9                           | 292                    |
| 1932-33 ..... | 22.3                            | 371                   | 59.4                           | 305                    |
| 1933-34 ..... | 23.3                            | 406                   | 64.4                           | 330                    |
| 1934-35 ..... | 24.2                            | 450                   | 72.8                           | 365                    |
| 1935-36 ..... | 24.9                            | 493                   | 82.1                           | 415                    |
| 1936-37 ..... | 25.7                            | 524                   | 90.1                           | 452                    |
| 1937-38 ..... | 26.4                            | 559                   | 102.1                          | 499                    |

The defence drive has concentrated still further attention upon the significance of industrial development. Realisation that war would place Australia in a difficult position, and fear that the enemy might cut off supplies of essential war equipment, has accelerated the development of new industries, chief among which is the manufacture of aircraft. New factory building in the Sydney area showed a marked increase during the quarter ended June, 1939.

In spite of this activity, there has been some increase in the number of workers idle during the past year or eighteen months. There is no satisfactory single unemployment index for Australia. The percentage of trade unionists unemployed stood at 9.8 in February, 1939, compared with 8.0 in February, 1938. In Queensland, however, the figures of the State Insurance scheme show a decided improvement in employment during the same period, the percentage of employable population unemployed being 4.6 in April this year compared with 8.4 in April 1938. Other indices show a trend somewhat similar to the trade union figures.

X

### Government Loans

The State Governments are responsible for the welfare of the unemployed within their own boundaries, and they have been watching the gradual increase in the number of workers unemployed with considerable misgiving. Late in June the Loan Council of Commonwealth and State representatives met to decide the amount of borrowing for the 1939-40 financial year. State Premiers were anxious to increase their public works expenditure from loan moneys to stem the

increase in unemployment. The Commonwealth Government, on the other hand, wanted to approach the loan market to finance the greatly increased defence expenditure.

In the past the Loan Council has not considered defence borrowing or loans raised by local authorities. At this meeting, however, it was decided that, in view of the exceptional conditions prevailing, and the need to conserve investment resources as much as possible, complete co-ordination of all borrowing programmes was essential. It was finally approved that the total borrowing programme for Commonwealth and States, including local authority loans, should be £A41 millions, out of which £A10 millions is to be spent on defence and £A27 millions for public works and State deficits. This total is about £A10 millions more than for the last financial year.

Experience in the United Kingdom has shown that re-armament cannot be expected to have substantial effects upon industrial output and employment until some time after the programme has been begun, at least during a period of declining business activity. To the extent that there is this lag between the formulation of plans and their reaching fruition, a continuance of public works expenditure will be essential if a further fall in employment is to be prevented. However, Australia is not very far from a state of full employment at present, so that she will soon be faced with the difficult problem of transferring labour and resources from their present spheres to armament industries. It now appears almost inevitable that priorities will have to be determined and resources, particularly skilled labour, diverted to defence needs, if rising prices and dangerous maladjustments are to be avoided.

July 23rd.

## Capital Movements in Egypt

[FROM OUR CORRESPONDENT IN ALEXANDRIA]

THE present proceedings for the transformation of the British and foreign controlled National Bank of Egypt into a Central Bank with an Egyptian majority on the board represent but one aspect of the profound change which capital movements in this country have undergone in recent years. For many decades past Egypt benefited from an almost uninterrupted inflow of foreign funds which played an outstanding part in the rapid economic development of the country. The stability resulting from the close connection established after 1882 with Great Britain, together with the extra-territorial rights enjoyed by foreigners, offered special inducements to the European investor. The total capital of Egyptian joint-stock companies, which amounted to £E14 millions in 1897, had reached £E87 millions by 1917.

Foreign investment was interrupted by the Great War, but the effect was partly compensated by the heavy outlay of the large British forces concentrated in Egypt during the period. The country also profited considerably from the high prices commanded by cotton, and after the war about £E25 millions of Egyptian securities held abroad were purchased by local capitalists (not necessarily Egyptian).

The inflow of foreign capital was resumed after the war. Despite the unsettled political conditions due to the rising tide of nationalism, Egypt continued to be considered by European investors, chiefly French, as offering a safe refuge, especially against devaluation. After the onset of the world economic crisis, however, the stream dwindled considerably. At the end of 1936, it was estimated that about £E100-110 millions of foreign capital were invested in Egypt apart from the £E240 million of Suez Canal shares and debentures. And these figures do not tell the whole story, for they leave out of account the millions owned by foreigners residing permanently in Egypt, and invested in all branches of the Egyptian economy.

The turning point came in 1935. After a long period of sheltered life, Egypt awoke to the possibility of a foreign attack. Italian funds were the first to leave the country on the eve of the Ethiopian war. The first Mediterranean war-scare had no sooner subsided than the Anglo-Egyptian treaty, followed by the Montreux convention, invested the Egyptian State with full legislative and fiscal powers over foreign residents. A second, larger and more comprehensive exodus of capital ensued, which was swelled by the subsequent general repatriation of French funds and recurrent war scares.

While it is the natural ambition of Egyptians to play, in

future, the leading part in the financial life of their country, the reversal of an age-long trend in capital movements is not viewed with equanimity. Owing to the great preponderance of foreign finance capital, and the inadequacy of Egyptian capital, as well as the traditional disinclination of the average Egyptian to invest his funds outside agriculture and real estate, the transfer of the bulk of commercial and industrial undertakings from foreign to Egyptian hands is not considered feasible within a reasonable space of time; and, as a growing amount of public expenditure is being devoted to national defence, the State can no longer carry out large public works. Thoughtful Egyptians are coming to realise that a resort to borrowing abroad may become a necessity in the long run.

## Marketing and Trade in South Africa

[FROM OUR JOHANNESBURG CORRESPONDENT]

THE first annual report of the National Marketing Council, recently presented to the Union Parliament, outlined an ambitious, but unquestionably necessary, scheme for the more efficient control of the principal agricultural products of South Africa. The Marketing Act of 1937 which brought the Council into existence provides for the formulation of schemes for the control of such products. Once a scheme (after due investigation and acceptance) has been brought into operation it has the force of law, and is administered by a board set up for the purpose. Up to the present eight draft marketing schemes have been published and referred to the Council for investigation. They cover mealies and mealie products, wheat and wheaten products, dried fruit, tobacco, dairy products, chicory, deciduous fruit for export, livestock and meat. Schemes in respect to the first four products are at present in force.

The annual statement relating to trade and shipping of the Union has also been presented to Parliament. This shows that, exclusive of goods in transit, imports into the Union in 1938 totalled £95,881,850, and exports £83,344,702, as compared with £103,382,242 and £125,359,840 respectively, in 1937. The import balance of the Union was £12,537,148 in 1938 as compared with an export balance of £21,977,598 in the previous year. The value of imports of United Kingdom origin decreased from £40,866,219 in 1937 to £37,249,372 in 1938. Imports from foreign countries were valued at £40,095,048 in 1938 and £47,195,822 in 1937. The distribution of exports of South African produce (exclusive of gold) between the United Kingdom, other parts of the British Empire, and foreign countries, is indicated in the following table:—

|                         | 1938              | %            | 1937              | %            |
|-------------------------|-------------------|--------------|-------------------|--------------|
| United Kingdom .....    | 10,795,835        | 40.7         | 15,170,121        | 41.1         |
| Other British .....     | 2,547,733         | 9.6          | 3,451,022         | 9.3          |
| Foreign countries ..... | 13,213,981        | 49.7         | 18,290,656        | 49.6         |
| <b>Total .....</b>      | <b>26,557,549</b> | <b>100.0</b> | <b>36,911,799</b> | <b>100.0</b> |

The United Kingdom maintains her position as the principal market for the Union's exports of foodstuffs, having taken in value 74.4 per cent. and 68.4 per cent., respectively, of the foodstuffs exported during 1938 and 1937. Germany heads the list as the Union's chief foreign purchaser, having taken £4,992,336, as compared with £4,982,050 in 1937. The principal items in these exports to Germany in 1938 were: wool, £3,766,000; manganese, £355,237; maize, £206,256; chrome ore, £118,234; copper bars, £44,492; asbestos, £35,890.

## Insurance Share Prospects

PERHAPS the best epitome of the case for investment in insurance shares is the experience of one living investor who inherited a parcel of shares in the P— Assurance Company, and has never wished or dared to change his holding. For him, the phrase "the investment problem" has no meaning. His fortune has quadrupled during his own lifetime; his investing is done for him by proxy by a corps of highly trained and successful experts; and the fruits of every notable advance in the welfare of the nation reach him automatically. That this investor's experience is broadly representative is suggested by the latest available computation of *The Economist's* Insurance Share Index, which shows that every £1,000 invested in 1913 in the ordinary shares of 24 leading insurance companies was worth £3,982 at June 30th last. Clearly, holders of insurance shares have fared well by contrast, say, with holders of 2½ per cent. Consols, which stand to-day at 66½ compared with an average price of 75½ in 1913. And even the net rise in industrial ordinary share values, since the pre-war year (as measured by the London and Cambridge Index) has been only of the order of 1,000:2,000.

But recent experience has plainly shown that a progressive long-term trend offers no sure guarantee against considerable short-term fluctuation in prices. Buyers of the 24 shares in *The Economist's* index at the average prices prevailing at the end of each of the four quarters of 1936 (not at the top prices of the boom) have suffered a subsequent capital depreciation of 21 per cent. The Actuaries' Index (based on the prices of 10 insurance ordinary shares) showed an identical fall between the end of 1936 and July of this year. During the same period, the price of Consols has fallen by 24 per cent. (the fall from the peak of 1935 is as much as 28 per cent.) and prices of industrial ordinary shares (according to the Actuaries) by 32 per cent. There have been, obviously, three main factors in the recent decline in insurance share values—rising interest rates, a falling equity market, and a tendency to discount the possibility that the extension of the Government's re-armament programme may prove something of a mixed blessing for the insurance companies.

The implications of a "near-war" economy for the insurance shareholder can hardly be understood without some reference to the fact that a composite insurance company, of the type in which most investors are interested, is in one sense a large-scale investment trust which, on the average, meets about four-fifths of the cost of its ordinary share dividends out of interest earnings. The assets from which these interest earnings are derived are composed on the average (the portions vary widely between different offices) as to nearly one-fourth of mortgages—including loans on policies—and as to another fourth of British, dominion and foreign government securities. Debenture stocks account for rather less than one-fifth of the whole, on the average, and preference stocks for rather less than one-tenth. The table given on page 14 of *The Economist* Insurance Supplement of July 15th last, from which these figures are taken, shows that in the four years between 1934 and 1938 there was a definite movement away from home, colonial and foreign government securities, which fell from 30.5 per cent. to 24.1 per cent. of the average portfolio. But the movement was not so much from fixed-interest securities, as such, into equity stocks, as from Government securities into industrial securities—fixed-interest and ordinary. The proportion invested in debenture and preference stocks, together, rose from 25.3 per cent. to 28.3 per cent., while the proportion invested in ordinary stocks increased only from 6.4 per cent. to 9.2 per cent. The change, in short, has identified the offices, in their investment policy, rather more closely than before with the course of British industrial earning power, without adding decisively to their protection against the effect of changing interest rates on the capital value of all fixed-interest securities, Government or industrial. The issue during the next few months of large amounts of new British Government securities (in the successful placing of which the co-operation of the insurance offices will be essential) may tend to reverse the process of the last few years by increasing the percentage of Government securities in insurance company portfolios. Whether it will also involve further depreciation in the market value of existing fixed-interest holdings depends on the extent to which the Treasury succeeds in financing its admittedly heavy requirements without a comparable rise in the general rate of interest. On the whole, insurance offices prefer stable interest rates. A fall, like that of 1932 and after, increases the value of their security holdings but, if long maintained,

ture and preference stocks, together, rose from 25.3 per cent. to 28.3 per cent., while the proportion invested in ordinary stocks increased only from 6.4 per cent. to 9.2 per cent. increases the attraction of the terms which can be offered to intending policy-holders. A rising rate of interest reverses the rôle of swings and roundabouts, but still leaves the offices with unwanted adjustments to make. And as far as re-armament finance involves the probability of successive increases in direct taxation, it still threatens the offices with a reduction in *net* interest earnings.

The primary business of an insurance office, however, is to insure its clients against actuarially calculable risks to life and property. Its ideal background is a community steadily increasing in numbers, health, business activity and prosperity. Now, although re-armament may have increased business activity and employment, it owed its inception to international political unsettlement, and its progress has been punctuated by a series of European crises. The 3 per cent. fall in the amount of new sums assured in the life ranches of 38 offices last year (as shown in *The Economist* Supplement), which interrupted a long series of increases over many years, can be explained not merely by lower industrial prosperity in 1938 than in 1937, but also (chronologically) by the effect of increased political tension, during and after the Munich crisis.

In truth, war and insurance are contradictory terms. Yet, if the worst were to happen, the position of the British insurance offices would be indomitably strong. Their internal financial position is granite-like, after decades of austere reserve policy. King's enemy risks have never been an appropriate subject of insurance; but whatever the views of property owners—particularly holders of real property—on the adequacy of the Government's declared arrangements for wartime, the insurance offices themselves will have few fundamental complaints to raise—with one important exception. Life-policy holders called up for service to-day, whether as militiamen, territorials or reservists, are absolved from liability to pay premiums for stipulated period, which may run up to a year and a half or even longer. If such an arrangement were extended to those called up in war-time, and applied to the entire period of their service with the Colours, the offices would have good reason to complain that a vastly increased ability had been conjoined with a serious diminution even of normal premium receipts. For the rest, though a period of monetary inflation, in near-war or war-time, would be unwelcome to the offices, they could face it, within limits, without undue disquietude; for although working costs could rise, their largest single item, commission on new business, would almost certainly be offset by higher rates charged on new policies taken.

On the whole, the conclusion must be that, provided the companies are not required, without help from the State, to shoulder potential liabilities which are alien to the whole conception of insurance business, they can face future un-

certainties with reasonable confidence. The truth is that an insurance share at all times—and doubly so at this time—is essentially a long-term, not a short-term, investment medium. Unless investors postulate a future in which Western civilisation, insurance, and investment itself have no part to play, they must regard an insurance share as a security held against a more settled future order, when a population that may have ceased to grow in numbers will still have reason to look forward to a progressive advance in material prosperity. In proportion to its wealth to-day, Great Britain as a whole is still under-insured. Whenever the process of taking up arrears attains a momentum comparable, say, with that of national electrification in the last decade, the position of insurance shareholders will be enviable. At the moment, A.R.P. charges and war precautions generally may be adding to working costs, but under normal conditions there are still opportunities for reductions in expenses if the results already achieved by some offices since the War can be taken as a general guide. And the trend of future development may well be in the direction of those forms of insurance which involve reduced initial and running expenses.

That investors have not lost sight of the essentially long-term element in insurance shares as a class is suggested by the fact that, even at present prices, the yields on the representative shares shown in the accompanying table vary only between 3.60 per cent. and 4.70 per cent., with an average of 4.15 per cent. Those unit trusts which have

† Tax free.

done much to bring the merits of insurance shares home to a wider public may justly claim to have performed, *inter alia*, two valuable services. By making "spread" holdings of shares available virtually "on tap," they have relieved investors of the difficulties of limited marketability. And their emphasis on shareholding for one or more decades has helped to place insurance equities in their due perspective.

## Anglo-American Trade

THE quarterly returns of the geographical distribution of Britain's overseas trade provide the material for review of British trade with the United States during the first six months of the Anglo-American trade agreement. The agreement provided for the reduction or abolition of a considerable number of import duties on either side: the United States reduced her import duties on irons, certain textile products, and other miscellaneous commodities, while Britain abolished her import duties on foreign wheat, ham, and lard and reduced those on certain issues of fruit, canned foods, machinery, clothing and chemicals.

In the first six months of this year, exports of British manufactures (excluding re-exports) to the United States are valued in the British trade returns at £13.6 millions, rise of 55 per cent. compared with the figure for the corresponding months of 1938; British imports from the United States in 1939 were valued at £53.2 millions, a fall of 17.2 per cent. from 1938. But, as the table below shows, if the comparison is made with the first half, not

of 1938, but of 1937, the opposite result is obtained; compared with 1937, British exports to the United States were smaller in 1939 while the value of British imports from that country were larger:—

ANGLO-AMERICAN TRADE

\* U.K. Trade Returns. † U.S.A. Monthly Summary of Commerce.

These straightforward comparisons of quantities obscure the fact that between 1937 and 1939 the trends in the overseas trade of the two countries were entirely different.

Total British exports, for instance, fell in value between the first six months of 1937 and 1938 and rose in 1939, while the value of American exports followed an exactly opposite course. British imports have declined in value in each of the two later years, while American imports, after falling in 1938, again increased in value in 1939. The rise in American imports from Britain between 1938 and 1939 might therefore be due as much to the general rise in the value of total American imports as to the effect of lower duties; conversely, the fall in total British imports might be partly responsible for the fall in the value of British imports from America. In order to disentangle these two influences, it is necessary to compare for each country the relative proportions which the trade with the other bears to the total. This is shown below:—

|                                                                    | Average 1934-6 % | 1937 % | 1938 % | 1939 % |
|--------------------------------------------------------------------|------------------|--------|--------|--------|
| Six Months ending June :—                                          |                  |        |        |        |
| British exports to U.S.A. as percentage of total British exports   | 5.0              | 6.6    | 3.8    | 5.8    |
| British imports from U.S.A. as percentage of total British imports | 10.7             | 9.7    | 13.5   | 11.9   |
| Five Months ending May :—                                          |                  |        |        |        |
| American exports to U.K. as percentage of total American exports   | 16.6             | 13.7   | 16.5   | 16.4   |
| American imports from U.K. as percentage of total American imports | 7.4              | 6.7    | 5.4    | 6.7    |

On this basis, there was between 1938 and 1939 a relative, as well as an absolute, rise in the value of British exports to America, though the proportion was still lower than in 1937. There was also a relative fall in the proportion of our imports taken from America, although the latter half of the table shows that there was very little change in the last two years in the proportion of total American exports taken by this country. The conclusion therefore remains that, compared with 1938, the course of trade in the first six months of 1939 favoured British exports to America to a greater extent than American exports to Britain. Compared with 1937, the evidence suggests, though less decisively, that the balance of advantage lies with the United States.

But it is possible that these changes are due to shifts in the nature of the trade between the two countries rather than to the trade agreement. The generalisation needs to be amplified by an examination of the trade between the two countries in the most important commodities. Changes in Britain's imports from the United States are shown below:—

U.K. IMPORTS FROM U.S.A.

| January-June                               | Quantity |         |       | Value (£'000) |         |         |

(a) Duty of 2s. per quarter abolished. (b) Duty of 10 per cent. *ad valorem* abolished. (c) Various duties reduced. (d) Duty unchanged.

Owing to short harvests elsewhere, we imported from America in the first half of 1938 an abnormally large quantity of wheat, valued at £5.4 millions, compared with nil in 1937 and £2.7 millions in 1939, when wheat prices were very considerably lower. If wheat imports are excluded from the table given above, the proportion of total British imports drawn from the United States was 12.3 per

cent. in the first half of 1938, against 9.7 per cent. in 1937 and 11.3 per cent. in 1939. Secondly, America's policy with regard to the production and disposal of the American cotton crops, of which Britain is a large buyer, has adversely affected the competitive power of the American product as against "outside" growers and there has been a steady fall during the last three years in the amount of American cotton imported by Britain. Thirdly, owing to the large stocks of tobacco accumulated in 1938, British imports of this conventional necessity, drawn largely from America, have been considerably smaller in the current year than in the corresponding period of 1938. Nor must it be forgotten that, apart from these three crops, British imports from America consist largely of industrial raw materials and semi-manufactures, whose prices were abnormally high in the early months of 1937.

The individual circumstances of these three major crops are, therefore, responsible for most of the fall in Britain's imports from the United States this year, irrespective of the provisions of the trade agreement, which affected only one of the three. In the case of some of the less important commodities there has been an expansion in American exports to Britain, particularly in foods and in those commodities, such as machinery, chemicals and petrol, which are increasingly needed for re-armament.

The next table shows Britain's exports to the United States of important commodities:—

U.K. EXPORTS TO U.S.A.

| January-June                         | Quantity |         |         | Value (£'000) |         |         |
|--------------------------------------|----------|---------|---------|---------------|---------|---------|

(a) Duties on gin and bitters of all kinds reduced from \$5 to \$2.5 per proof gallon. (b) Free entry maintained. (c) Various reductions.

The marked increase in 1939 in British exports of textile piece-goods to the United States is undoubtedly a reflection of the trade agreement though the expansion has been magnified by the postponement of orders during the negotiation of the agreement. But it will be noted that only for woollen and worsted piece-goods did British exports recover in 1939 to the level of the first half of 1937.

In the first six months of the trade agreement, therefore, the movement in trade bears out the forecast made by *The Economist* of November 26th last year that the agreement would have a larger effect on British exports to the United States than on British imports from that country. But it is clear that six months is far too short a period in which to assess the full effect of the agreement. The volume of trade between the two countries has expanded in the last six months and that in itself may be reckoned a benefit to both.

The customary quarterly tables showing the geographical distribution of the overseas trade of the United Kingdom in the second quarter of the year will be found on page 379 of this week's issue.

# Finance and Banking

**The Mendelssohn Suspension.**—The suspension of payments by the Amsterdam banking house of Mendelssohn and Company which was announced on Friday of last week can already be ranked among the major failures which have punctuated the history of international banking. Its importance derives not only from the magnitude of the sums involved but from the Governmental and international character of most of the operations undertaken by the bank in recent years. The suspension therefore may have reactions on the finances of the Governments for which Mendelssohns acted as external bankers and also on the status of the Dutch capital market which in its recent advances into the realms of international financing had had the house of Mendelssohns as its spearhead. The suspension of payments is now seen to have been the inevitable climax of a prolonged indulgence in methods of fundamentally unsound banking—the familiar sin of borrowing short and lending long. This disregard of the canons of good banking had taken place on two planes. In the first place Mendelssohns had in their recent loans to the French, Belgian and Argentine Governments granted their accommodation firm for periods of one to twenty years, but had made the bonds, as sold in the international markets, subject to renewals at short intervals. Mendelssohns, in other words, took the risk of the renewals on their own shoulders, a risk which in the world of to-day was more than a rash speculation; it was an invitation to disaster. In the second place, the firm had for many months past been borrowers in the international markets against the securities which had been left on its hands in the course of its partially unsuccessful issuing activities. The terms on which it had been borrowing had recently provided increasing evidence of a decidedly difficult position. During the few weeks which preceded the suspension of payments, Mendelssohns had been bidding actively for dollar call loans in London at 2½ per cent., a rate which the additional yield of the dollar swap brought up to about 5 per cent. for the lender in London. This was hoisting an unmistakable danger signal and in London at least that signal was duly heeded.

**Dr Fritz Mannheimer.**—It only needed the death of Dr Fritz Mannheimer to bring down this precariously-poised position. Dr Mannheimer had become so completely identified with the astonishing progress of the house of Mendelssohns that his sudden death on Thursday of last week provided the signal for a considerable cancelling of the call facilities granted to the firm in almost every money market of international importance. Less than twenty-four hours revealed the inability of the bank to meet these calls, and on Friday the partners suspended payments. The list of assets and liabilities lodged with this application showed the latter at 217,854,000 guilders, exceeding assets by 5,680,000 guilders. These figures have since had to be swollen by some 70,000,000 guilders as a result of the liability arising out of the above-mentioned renewals of Government bonds—a contingent liability which is bound to become actual on the first of the renewal dates. The firm thus goes down with total commitments equivalent to at least £33 millions. The magnitude of the failure, however, cannot be gauged until more detailed information is available about the composition of the assets. Of these by far the greater part is made up of foreign bonds and securities which provide the collateral for the credits raised by the bank on the Continent and in the United States. Most of these securities are French and Belgian Government paper, and it is understood that in both cases arrangements have been made with the help of the respective Governments to prevent forced liquidation from endangering the credit of the two countries. This means that the secured creditors should find it possible to extract themselves from their commitments without exces-

sive loss. The provisional balance sheet of the bank, however, also shows debtors in guilders and foreign currencies totalling some 57 million guilders, and these items must give rise to some concern which will persist until further information is divulged as to the identity of the debtors in question. In accordance with Dutch legal practice, the principal list of creditors has already been published. In this list Amsterdam, Paris, Brussels, Switzerland and New York are well represented. On the other hand, it does not contain a single London name for more than £7,000.

**Forward Exchange Commitments.**—The principal direct interest in the suspension held by London banks is in the forward exchange market. Nearly all the bonds financed by Mendelssohns, though expressed in belgas, French francs or guilders, had dollar clauses and were financed by loans expressed in dollars; Mendelssohns accordingly had to cover their exchange risk by forward purchases of dollars. Many of these operations had been placed in the London market. The London banks concerned, who had sold forward dollars to Mendelssohns and, of course, squared their book by buying the same quantity of forward dollars for their own account, have the option of closing the operation immediately, i.e. selling dollars forward for the appropriate date, or of waiting for the maturity of the contract and then selling spot (instead of delivering to Mendelssohns) the dollars which they will have bought forward. In either case the London banks should be adequately covered. No one can reasonably object to being a bull of dollars at the present time. If the positions in question are closed immediately—and that appears to be the course which most banks here intend to pursue—the result should provide some welcome support for the forward sterling rate.

**Premium on Gold.**—The Exchange Equalisation Account is still losing gold on balance and its operations are reflected in the unusually high level at which Public deposits are still running at the Bank of England. During the past week these Government balances have fallen by £4,388,000, but this decline is largely due to the reduced issue of Treasury bills and at £27,456,000 this item is still some £7,000,000 higher than at this time last year. The pressure on sterling has been most evident in the gold market, where the premium of the sterling price over the dollar shipping parity has risen to 2d. at fixing and to 3d. in dealings after fixing. The main demand has come from Continental sources and must be connected with the intensification of political fears. The authorities in London have been extremely diffident sellers of gold, realising that the demand for the metal in London was for hoarding purposes and arguing therefore that support for sterling could more effectively be provided by direct intervention in the foreign exchange market. After fixing, the Exchange Account has refused to deal at all and this explains the exceptional level to which the premium on gold has on certain days risen during the course of the afternoon. The volatility of the premium included in the sterling price of gold is largely due to the disappearance of the substantial stocks of gold which were formerly maintained by dealers in London against their forward sales of the metal. When up to £50 millions of gold was held in this way it was always possible to satisfy any special demand for gold after fixing without going to the authorities and without unduly affecting the premium. The available stock of gold in dealers' hands has to-day virtually disappeared.

**Silver at Import Point.**—The position in the silver market has undergone interesting fluctuations this week. The London price for spot silver, which touched 16½d., its lowest point in the recent depression, on July 10th, had by Tuesday of this week recovered steadily to 17½d., a recovery which had confounded most of the prophets. The reasons for this rise were in the main bear covering and the unusually large offtake from India, where the population will persist in regarding silver as cheap and gold dear at their present respective prices. That the market operator has thought otherwise is evident in the discount on forward silver which this week has ranged at ½d. under spot, a backwardation equivalent to the abnormal rate of 11 per cent. per annum. Whether the Indian ryot's view or that of the silver dealer will prevail will ultimately depend on the policy of the United States administration. But the immediately interesting feature of this rise in the London price of spot silver is that it has proceeded to a point at which it has paid to ship silver to this market from New York—taking the dollar price as the 35 cents paid by the United States Treasury for imported silver. This rise in the sterling price of silver above the import point has not caused the United States Treasury to adjust its price upward. Mr Morgenthau's adjustments to the world price apparently occur only when they involve a reduction in the price which his department pays for the commodity. But the open market price of silver in New York has, of course, had to align itself to this movement in the London quotation. Despite Wednesday's fall in London, which was continued on Thursday and took the price down to 17d., the sterling price remains above the American parity. This means that the whole of the newly-mined silver which in the normal course would be going to New York for sale to the United States Treasury is being diverted to the London market. London can withstand this influx while the bear position remains uncovered. But when this technical feature of the situation has been removed it is only reasonable to

assume that the London price will again resume its dependence on the American Treasury price and will no longer presume to dictate to that arbiter of the silver world.

**Treasury Bills and A.R.P.**—As from this week it will be possible for discount firms to apply for Treasury bills in denominations of £50,000 and £100,000 as well as those of £5,000 and £10,000 which have hitherto been the sole series available to the market. The market has in the past seen bills of larger denominations than £10,000, but these reached it via the tap and not the tender. The increase in denomination is in part to be regarded as a token of the larger issues of bills that are to come. With the promised permanent increase in the volume of Treasury bills outstanding, the negotiation of such bills—already a cumbersome process when a large total amount is involved—should be facilitated by raising the denomination of the individual bills. It is understood that the change was decided upon in connection with the discussions which have taken place on the position of the discount market in case of war. The aim has been to simplify the functioning of the market machinery and to provide every possible precaution against the risk of loss arising from air attack. With this end in view there has been a move recently to inscribe as many bonds as possible and this procedure may even be applied to Treasury bills if the need arises. The market is not likely to use the £100,000 bills to any extent and would probably have welcomed a £25,000 series. Suggestions have also been made that to avoid mistakes in handling and counting bills the various series might be given distinguishing colours. The suggestion could be carried further: the re-armament bills might be given a red, white and blue border, and those issued for the Exchange Account a gilt edge.

## MONEY MARKET NOTES

THE tightness in the money market noted towards the end of last week was intensified on Monday and Tuesday, when, in spite of special bill purchases, even the clearing banks were reluctant lenders, and it was difficult to obtain loans against bonds except, in some cases, at slightly over ½ per cent. By Wednesday, however, as is revealed in the Bank Return, the return of notes from circulation and the special bill purchases had restored bankers' deposits to a more normal level, and more comfortable credit conditions were noted. Discount rates, however, are unchanged at the higher levels to which they rose with the shortage of money. The banks are only buying small amounts of bills, and no decline in rates is expected in the immediate future.

For the first time for many weeks the gold in the Issue Department of the Bank shows a small change, having

been valued at 148s. 7d., which was the market price on Wednesday. The difference arising from the higher valuation has been transferred to the Exchange Account in cash. The note circulation is down by £9.5 millions; and as there has been a reduction of only £2.2 millions in Government securities, which is nearly counterbalanced by a rise of £2 millions in other securities, bankers' deposits show a big recovery from the low level to which they had fallen in the previous week. In addition to the return of notes, there has been a decline of £4.3 millions in public deposits, so that the net increase in bankers' deposits is £13 millions.

The demand for dollars has continued this week, and on Thursday the pressure against sterling was particularly marked. The British control has maintained the spot rate at 4.68½, but more fluctuations have taken place in the for-

ward market. On Monday the premium on the one-month dollar was ½c. and on three-months 2½c., but on the following day the demand for forward dollars fell off and the premiums contracted to ¼c. and 1¼c. respectively. Since then they have again widened, and on Thursday, in spite of official intervention, the premium on one month was quoted at ¾-1½c. and on three months 2¼-3c. Guilders have been under the influence of the Mendelssohn affair. The possibility of having to meet demands for accommodation in Amsterdam has induced Dutch banks to repatriate a large part of their foreign balances; and at one time on Monday the spot guilder appreciated to 8.69fl., although heavy sales by the Dutch authorities brought it back to 8.71½fl. at the close. Since then they have been able to maintain the spot rate at 8.72fl., but the forward guilder continues to be in demand and the premium for three months has widened to 2½c. The Chinese dollar is still weak at about 3½d.

## MONEY MARKET RATES

|                                | Aug. 18, 1938 | Aug. 10, 1939 | Aug. 17, 1939 |

# Investment

**Danzig League Loan Service.**—The League Loans Committee has announced this week that sterling service moneys which had been received by the London paying agents up to July 4th—the date on which suspension of transfers of service of Danzig's external loans was first reported—will be applied to paying the September 1st coupon on the Danzig 5 per cent. (originally 7 per cent.) Mortgage Loan of 1925 and the October 1st coupon of the 4½ per cent. (originally 6½ per cent.) Tobacco Monopoly Loan of 1927. Sinking fund purchases have been suspended; hence the sterling sums in hand, less amounts already used for sinking fund purchases, will be applied in payment of the next coupons at the reduced rates agreed in 1937. Any remaining balances will be retained for the time being by the paying agents. The Committee remain "in contact" with the Danzig Government, but it is already clear that the generous accommodation which was accorded to Danzig only two years ago has been singularly ill repaid. Attention has been drawn in Danzig to the point that suspension of sterling transfers would restore full rights to Danzig's creditors under the original bonds. Thus, in the present extreme circumstances, the Committee has reserved the full rights of bondholders, and has also safeguarded the latter from the consequences of interest default on at least one coupon. It will be hoped that the ensuing six months will provide an opportunity for two-sided negotiation, to replace the indefensible consequences of unilateral default.

**Watney Combe Reid and Guinness.**—Difficulties which will affect most brewers, the incidence of which falls upon the current financial year rather than the past year, were reviewed by Colonel Serocold in his address to Watney Combe Reid shareholders last week. And reference was made to the same rising cost factors at the Arthur Guinness meeting. Under a House of Lords decision last year, the basis of assessment of licensed houses has been changed, and although the effect of the alteration is not yet fully known, it is presumed that higher assessments will be the rule. This factor, of course, will not affect Guinness directly. Again, for a period of seven years, beginning with this year's harvest, the price of hops has been raised from £9 to £9 10s. per cwt., while a scheme for stabilising the price of barley, which had hitherto been a free market, is also under discussion. Under a stop-gap plan to operate for the 1939 crop only, a cash levy on brewers is being made to subsidise barley growers. Such factors apply to all brewers, but their effect upon the results of the past financial year was uneven. The fall in the profits of Watney Combe Reid was small, and was due to the non-recurrence of profit from whisky sales from bonded stocks, for sales of beer increased. The rather sharper decline in the Arthur Guinness profits was ascribed by Lord Iveagh to increased taxation and to the higher cost of materials. The chairman, however, did not review in detail the causes of the persistent fall in profits since 1935-36, though he declared that increased taxation and rising costs amounted to nearly £400,000, compared with that year. Guinness stockholders will doubtless be glad to have the assurance that the Park Royal brewery has fulfilled expectations, both of the quality of its product and of economies of its working. Lord Iveagh denied categorically that the company intended to leave Eire, though he mentioned

that "adjustments" in Dublin were gradually proceeding which "in time" would save money. Brewery shareholders, at present, are faced with the calculation whether rising costs will outstrip rising consumption, and the ever-present risk of increased sumptuary taxation cannot be dismissed.

**Stewarts and Lloyds-Stanton Merger.**—The provisional proposals (discussed on page 175 of *The Economist* of July 22nd) for the acquisition by Stewarts and Lloyds of Stanton Ironworks have been followed by circulars from both companies, whose effect is broadly to confirm the satisfactory impression (particularly for Stanton stockholders) left by the original announcement. As first announced, the offer consisted of £1 Stewarts and Lloyds 6 per cent. cumulative first preference for £1 of the similar Stanton stock, and £1 Stewarts and Lloyds deferred, plus 12s. 6d., to be satisfied partly in cash and partly in 5 per cent. third preference stock taken at 22s., for each £1 Stanton ordinary stock unit. The exact division of this 12s. 6d. premium is to consist of 6s. 8d. nominal (or 7s. 4d. if taken at 22s.) of Stewarts and Lloyds 5 per cent. cumulative third preference stock, plus 5s. 2d. in cash. When the offer was first published, Stanton Ironworks ordinary stock responded promptly to the favourable terms, so that this week's circular from the company urging acceptance of the offer covers well-prepared ground. It is pointed out that Stanton preference stockholders will have the advantage of a better cover and also of certain participating rights on winding-up, while the ordinary stockholders have the prospect of a further 2½ per cent. dividend as well as the 12s. 6d. bonus. More general arguments are put before Stewarts and Lloyds stockholders, whose attention is called in the circular to the advantages of technical and other co-operation and to the improved position in the export market. The directors declare, moreover, that under normal conditions they confidently expect to be able to maintain the 12½ per cent. dividend on the increased deferred capital. Stanton stockholders have everything to gain by acceptance of so favourable an offer, but the general merits of the amalgamation will doubtless commend the scheme to Stewarts and Lloyds members as well.

**Eagle Oil and Shipping Finance.**—Large public issues are a distinct rarity during the holiday season. But the offer for sale this week of £3,000,000 Eagle Oil and Shipping 4½ per cent. guaranteed debenture stock at 97½ by Lazard Brothers and Company, together with the private placing of £1,500,000 5½ per cent. redeemable guaranteed preference shares, claims distinction for other reasons. The company, which markets petroleum products in this country through Shell-Mex and B.P., and is controlled by Canadian Eagle Oil, formerly relied largely on Mexican production, but since the Mexican Eagle properties were expropriated in March last year, it has been compelled to find alternative supplies. The proceeds of the two issues, after repayment of a bank loan, will be applied, through Canadian Eagle Oil, to finance a programme of developing and operating oil-fields, in conjunction with the Royal Dutch-Shell group, in Venezuela, Colombia, Ecuador, and Cuba. Arrangements are also being made to provide Canadian Eagle with "immediate and continuing" supplies of crude oil from Venezuela at an eventual minimum rate of 600,000 tons per annum, for a period of not less than 30 years. The fact that the Foreign Transactions Advisory Committee has raised no objection to the issue may be read as an official acknowledgment of the desirability of maintaining adequate oil supplies to this country in time of emergency, for more than half of the Eagle Oil and Shipping sales,

by value, in 1938 (which totalled 3,073,000 tons in volume) were made to this country. The parent company's guarantee of its subsidiary's obligations is welcome for two reasons. In the first place, Eagle Oil and Shipping is completely controlled by Canadian Eagle. Secondly, the direct benefits of the profits and assets arising from the new developments in South America will accrue to the parent company. Although the terms on which the latter will interest itself in these developments are not disclosed in the prospectus, there can be little doubt that the ensuring of adequate alternative supplies of oil will benefit the company, and will also contribute to the national advantage. The redemption yield on the new stock, to final date, is £4 14s. per cent., which may be regarded as a reasonably satisfactory return.

**Calico Printers' Further Setback.**—In the earlier part of the 1938-39 financial year there was nothing in the cotton textile outlook to encourage hopes of recovery for Calico Printers apart from the uncertain—and in any case delayed—benefits of the Enabling Bill. The subsequent moderate recovery in Lancashire (based partly on defence orders) has evidently by-passed the group, for the preliminary statement of profits for the year to June 30th last, while it contains no fresh shock, must be regarded as a depressing document. Working profit (apparently after directors' fees) may be calculated at £334,982, against £401,686 for 1937-38 and £616,602 for 1936-37. This profit is more than absorbed by a charge of £356,762 (against £367,228) for depreciation, repairs, etc., so that debenture interest, which absorbs £128,000, is wholly unearned. The Association's net loss of £149,780, against £93,542, is the worst recorded since 1930-31, and the balance carried forward is approximately maintained at £40,028 only by a draft of £150,000 on the general reserve. In the absence of any further transactions which may be disclosed only in the full report, general reserve would stand at £450,000 after this transfer. No preference dividend is being paid, and arrears now amount to £527,818 gross, dating from the end of 1935. A reasoned survey of the outlook must await the full report and the annual meeting, but there are no obvious grounds for expecting even a partial solution of the Association's difficulties in the near future. Certainly, by quoting 4s. 1½d. for the ordinary stock and 6s. 6d. for the preference stock, the market expects no such development.

**Triplex Safety Glass Profit.**—Although the Triplex Safety Glass Company is distributing 20 per cent. against 25 per cent., on its ordinary capital for the year to June 30th, the new rate is payable on an increased capital resulting from the acquisition of the capital of Lancegaye Safety Glass (1934) in June last. The preliminary profits statement shows that earnings, before taxation and employees' share of profits, amounted to £163,489, and thus showed a slight reduction on the 1937-38 total of £166,511. Such results are not unsatisfactory for a difficult year in the motor trade, which was heightened by the emergence of keen competition between the Lancegaye and Triplex companies. The circumstances of the acquisition of Lancegaye by the Triplex company were discussed in *The Economist* of June 10th. Assuming that all Lancegaye shareholders have accepted Triplex exchange offer, the 20 per cent. dividend would absorb approximately £94,870 net, compared with £90,625 net for the 25 per cent. dividend a year ago. The statement does not disclose to what extent, if any, the latest year's profits have benefited from the Lancegaye acquisition, but on the basis of previously reported profits, the amount could hardly be substantial in any event. The full fruits of the merger would clearly require time, but meanwhile the Triplex company has the advantage, in addition to its motor glass business (for which both prices and demand are presumably improving), of supplying scientific glass and also certain aircraft material.

**Are Rubber Share Yields Adequate?**—Until recently rubber shares formed the most stagnant section of the stock market, but the improvement in the commodity has resulted in a revival of interest during the present account, although buying has not been sustained this week. Low yields, at levels incapable of attracting buyers, have long been a feature of the rubber share market, and it is pertinent to ask whether the new levels appear justified, particularly in relation to the general upward adjustment of yields during the past few months in other sections of the market. To provide the data for an examination of the adequacy of current yields, we have estimated the probable earnings of a sample of six leading companies for 1939. Output has been calculated at 55 per cent. of standard assessments for 1939, and though it cannot be taken as certain that actual crops will be restricted to export allowances in individual cases, the production figures in the following table should be reliable in the absence of an alteration to current quotas, as the financial periods correspond in all instances to the calendar year. The average selling price of rubber for the year has been taken at 8½d. :—

## BY OFFER FOR SALE

**Eagle Oil and Shipping Company.**—Offer for sale by Lazard Bros. of £3,000,000 4½ per cent. guaranteed debenture stock, at 97½ per cent. Principal, sinking fund and interest unconditionally guaranteed by Canadian Eagle Oil Company. Redeemable at par by annual drawings or by purchases at or below par by sinking fund commencing year ending January 15, 1941; final redemption, January 15, 1960. Secured by floating charge; no prior or *pari passu* charges to be created. Proceeds to repay bank loan and to finance oil development in South America and Cuba. Net assets December 31, 1938, £9,656,698. Profits (after depreciation, before interest and taxation): 1936, £1,075,501; 1937, £1,147,895; 1938, £1,001,814. 1,500,000 5½ per cent. cumulative redeemable guaranteed £1 preference shares have been placed privately at par.

## BY STOCK EXCHANGE INTRODUCTION

**Elephant Trading (South Africa) Holdings.**—Particulars of issue of £200,000 5 per cent. registered redeemable notes. Unsecured, but no other charges (except to bankers) without holders' consent. Redeemable at par by September, 1960, from 1940, or on notice 1945-50 at 102 or at 101 thereafter. M. Samuel and Company take issue at 96, or £96 8s. 6d. including expenses.

## BONUS SHARES

**Reynolds Bros.**—Bonus share distribution of one in eight, absorbing £90,625 of general reserve, to be distributed in December, 1939. Directors intend to distribute further bonus shares at rate of one in nine (absorbing £90,625) in December, 1940, if trading conditions permit.

## CONVERSIONS AND REPAYMENTS

**Aktebolaget Separator.**—4½ per cent. debenture loan of 1934, of Kr. 5,000,000, will be repaid at 103 on November 1, 1939.

## DIVIDEND ANNOUNCEMENTS

Rates are actual, unless stated per annum or shown in cash per share. Rate for previous year refers to total dividend, unless marked by asterisk to indicate interim dividend.

(a) 2 per cent. on August 31, 1939; 2 per cent. on February 1, 1940.

(b) First liquidation dividend.

(c) Paid on larger capital.

(d) Annas per share, free of Burman tax.

\* Free of tax. (e) Less tax at 5s. 2½d. (f) Bringing payments up to June 30, 1934.

**ILLOVO SUGAR ESTATES.**—Dividend of 5 per cent. for year ended March 31, 1939. Same paid in previous two years.

**LIMMER AND TRINIDAD LAKE ASPHALT.**—Interim dividend, 4½ per cent., against 6 per cent., tax free, in 1938.

**CLAPTON STADIUM.**—Interim dividend of 10 per cent. for year ending December 31, 1939, against 12½ per cent. last year.

**HOUGHTON MAIN COLLIERY.**—Final dividend 4½ per cent., making 7 per cent., for the year on capital of £645,021, against 12 per cent., on capital of £430,014.

## SHORTER COMMENTS

**Company Results of the Week.**—Although HENRY BRIGGS, SON & COMPANY have experienced a moderate reduction in net profits, from £105,096 to £97,897, the 10 per cent. dividend is maintained on a larger capital. A substantial rise in total profits, from £66,524 to £101,404, is recorded by BATCHELOR'S PEAS. Timber companies have in general had a better year, and GABRIEL WADE AND ENGLISH net profits are £98,164, against £82,726. After producing a record sugar output, SIR J. L. HULETT AND SONS (whose accounts are presented in an altered form, giving less detail than formerly) have earned £173,304, against £136,170.

A 25 per cent. scrip bonus is proposed, and a 20 per cent. bonus fore-shadowed for 1940. Another company to record a satisfactory improvement is MECCANO, LTD., whose total profits are £250,324, against £216,728. The general experience of newspaper companies has been reversed by "NEWS OF THE WORLD," LTD., who are again paying 20 per cent., tax free, on the privately-held ordinary shares, after earning £370,272, against £333,376.

**News of the World.**—Gross profits for year to June 30th, £465,428 (£417,499). Tax and N.D.C. £95,156 (£84,122). Depreciation £40,000 (same). Ordinary dividend maintained at 20 per cent., tax free, for the year. To reserve £100,000 (same). Carried forward £24,824 (£9,112).

**Henry Briggs, Son and Company.**—Total income for the year to June 30, 1939, £99,703 (£106,701). Ordinary dividend 10 per cent. for year on increased capital, against 10 per cent. last year. To reserve £25,000 (£20,000). Carried forward £38,874 (£36,977).

**Chrysler Corporation.**—Net earnings for June quarter \$13,707,481, or \$3.15 per \$5 common share, against \$3,599,630, or 83c. per share for corresponding quarter in 1938. Dividend of \$1.50 per share declared, same as last quarter, but compares with 25c. this time last year.

**Marsman Investments.**—Net profits for the year to April 30, 1939, £93,434, against a loss of £5,905. Final ordinary dividend 7½ per cent., making 15 per cent. for the year (nil). Carried forward £20,734 (£2,300).

**Anaconda Copper Mining.**—Net earnings for quarter to June 30, 1939, \$3,483,425, or 40c. per share (against \$1,624,847, or 19c. per share). For the first six months of the year, net figure is \$7,170,336, or 83c. per share, against \$4,010,363, or 46c., for first six months of 1938.

**Trepca Mines.**—The company has given notice of its intention to close mine in 15 days from August 15, 1939, due to labour difficulties. Reports that mine has already been abandoned and that engineers have left the country are incorrect. Work ceased at the mines on July 18th.

**Dufay - Chromex, Ltd.**—Satisfactory arrangements have been concluded for the provision of additional finance for the future development of the company's business. The transaction does not entail a new share or debenture issue.

**Royal Bank of Scotland.**—At a special general court on Wednesday, stockholders unanimously approved increase of capital to £4,250,000 by allotment of £469,808. New stock with a cash payment is to be given in exchange for £1,060,000 capital stock of Glyn Mills and Company. No figures relating to the purchase consideration were disclosed.

**Steel Barrel Scammells and Associated Engineers.**—Addressing shareholders at the annual meeting last Wednesday, Mr H. R. Hood Barrs pointed out that in four years the output of the Uxbridge factory had practically doubled. Production, moreover, for the first six months of the current year constituted a record. It had not been thought necessary to pay an interim dividend for the six months of the current year from the subsidiaries, so that the profit which was in hand represented a substantial reserve not appearing in the accounts.

**Broken Hill Proprietary Company.**—Eighty-seventh report for year ended May 31, 1939, states that the demand for the company's steel products has been well sustained and output constitutes a record. Aggregate tonnage was: pig iron, 674,444 tons; steel, 869,904 tons. Tonnage of ore extracted at Broken Hill was 59,478 tons. Underground operations ceased in March. Net profit for year,

(Continued on page 369)

## Industry and Trade

**The Railway Wage Impasse.**—The refusal of the railway companies to concede anything beyond the 45s. per week minimum wage for conciliation grades which they offered at the beginning of the month was given to the representatives of the National Union of Railwaymen and the Railway Clerks' Association on Monday and repeated to the Associated Society of Locomotive Engineers and Firemen on Wednesday. There is therefore no reason to think that the companies' offer, which would entail a cost of little more than £100,000 a year, was merely a provisional move intended to open the bargaining. It is indeed unfortunate that the companies have decided to stop short at so small a concession, particularly in view of the fact that revenues have risen substantially since February, when the Railway Staff National Tribunal expressed the opinion that something should be done for the lower paid grades as soon as revenues made it possible. It is even more regrettable that the Locomotive Engineers are sticking to their original claims for wage increases, longer paid holidays, abolition of the permissive roster of nine hours a day and improvement of Sunday duty rates of pay, and that the N.U.R. has decided to stand out for a fifty shilling per week minimum. These claims involve a cost to the companies which would more than absorb the revenue increase achieved so far in the present year. Obviously both the facts of the case and the national and international circumstances in which it arises remove all excuse for an immediate resort to strike action. But unless both sides take up a less uncompromising attitude serious trouble can hardly fail to ensue. The suggestion of the companies that fresh resort should be had to the machinery of the Railway Staff National Tribunal seems to be the only reasonable way out of the present impasse. The unions cannot claim that this body has shown a lack of sympathy to them in the past. The technical argument that since the machinery was used as recently as February it need not be used now cannot carry much weight with the public, which is equally anxious to avoid a strike at the present time and to see justice done both to the railwaymen and the companies.

**U.S. Oil Difficulties.**—The low level of petrol prices in the United States, to which reference was made in *The Economist* of August 5th, led to a sharp reduction in the

Mid-Continent crude oil price from \$1.02 to \$0.82 per barrel late last week. This first major change in the price since October, 1938 was initiated by the Sinclair Prairie Oil Marketing Co., a subsidiary of the Consolidated Oil Corporation. The latter concern has worked at a considerable loss in the first half of this year and it published its profit and loss statement immediately before the cut in the crude oil buying price. The move of the Sinclair Prairie Oil Marketing Co. was followed immediately by a number of other concerns and by the beginning of this week the cut had become general. The reduction in the crude oil buying price, however, was not accepted without opposition. The Texas Railroad Commission, the oil control authority for Texas, which supplies some two-fifths of the United States' oil, ordered a 15 days' shut-down of all wells in Texas with only minor exceptions. This restriction order is likely to be extended for one month or ever more unless the oil companies revise their new policy. Oklahoma, Arkansas, Kansas, Louisiana and New Mexico have already followed the example of Texas. Together with Texas these States are responsible for nearly three-quarters of the total oil output of the United States. Whatever the ultimate effects of this week's moves may be, the shut-down of wells which has met some opposition in oil-producing circles should lead to a reduction in the level of oil stocks in the United States. The situation of that market is already much better than it was a year ago and a fall in supplies may help to restore more normal prices. But so long as the oil-producing States do not co-operate effectively in a long-term scheme to regulate supplies the industry can hardly expect the stability it desires.

**Industrial Expansion.**—The expansion in industrial activity this year is reflected in the official production index published in this week's *Board of Trade Journal*. In contrast with last year, when the index declined by 7.9 per cent. between the first and second quarters, it showed a rise of 1.8 per cent. in the corresponding period this year. Apart from those relating to mining, leather and boots and shoes, and gas and electricity, which registered a seasonal fall, all the group indices rose in April-June. Compared with the corresponding quarter in 1938, the

## SHORTER COMMENTS

(Continued from page 368)

**Wright's Biscuits.**—Trading profits for year to June 30, 1939, £35,431 (£32,705). Preference shares receive 2 per cent., participating dividend. Ordinary dividend, 25 against 17½ per cent. Carried forward, £6,900 (£3,208).

**Gabriel Wade and English.**—Trading profit for year ended May 31, 1939, £126,353 (£102,913). Taxation, £27,153 (£16,813). Ordinary dividend, 6 plus bonus of 4 per cent. (6 and 2 per cent. bonus). To reserve, £30,000 (same). £50,000 appropriated from general reserve to write off goodwill.

**Tinsley Park Colliery.**—Offer to acquire business of J. and G. Wells, Ltd., by exchange of one £1 Tinsley Park ordinary share for three £1 ordinary shares of J. and G. Wells, and five ordinary shares for four £1 preference shares. Tinsley Park paid 7½ per cent. on £630,000 of capital, and an interim this year of 2½ per cent. J. and G. Wells last paid dividend on £50,000 6 per cent. cumulative preference shares in 1927 and on £250,000 ordinary shares in 1926.

**James Lyne Hancock.**—British Tyre and Rubber (the parent company) offers J. L. Hancock preference shares for J. L. Hancock ordinary shares, at the rate of

two for five. Preference shares are entitled to a non-cumulative dividend of 7½ per cent. No ordinary dividend paid for last eight years. Debit balance on profit and loss account, £17,434.

**Frederick Gorrings.**—Company to pass interim ordinary dividend, for many years maintained at 3½ per cent. Half-yearly payment on 5 per cent., participating cumulative preference shares will be met as usual.

**Odham's Properties.**—Total income, year to March 31, 1939, £170,129 (£152,594). Tax and N.D.C., £11,575 (£10,832); general expenses, £16,091 (£12,325). Net profit, £92,573 (£85,611). Ordinary dividend, 12 per cent. (on £400,000) against 11½ per cent.; to reserve, £18,000 (£19,000); carried forward, £133 (£610). Leases, plant, etc., increased from £855,499 to £1,089,227. Recent issue of £100,000 5 per cent. 1st mortgage debenture stock was heavily oversubscribed.

**Meccano.**—Total income, £250,324 (£216,728); expenses, £148,467 (£135,407); tax and N.D.C., £25,252 (£17,841); depreciation, £10,842 (£11,212). Ordinary dividend maintained at 15 per cent., tax free. Carried forward, £23,577 (£16,735).

**Transvaal Gold Output, July.**—Witwatersrand, 1,052,066 fine ounces; other districts, 28,675 fine ounces; total, 1,080,741 fine ounces. Total, June, 1939, 1,064,284 fine ounces. Native labour at end July, 1939: gold mines, 317,412; coal mines, 17,434; total, 334,846.

**Batchelor's Peas.**—Total profits for the year to June 30, 1939, £101,404 (£66,524). Ordinary dividend, 15 against 10 per cent. To general reserve, £20,000 (nil). Carried forward, £23,373 (£22,607).

**Folland Aircraft.**—Profits for year to June 30, 1939, £19,737 (£22,106). Final dividend, 5 per cent., making 8 per cent.

complete index shows a rise of 9.6 per cent. During this period the index for building and building materials was the only one of the constituent series to show a decline. But the fall in this index probably exaggerates the extent of the decline in activity, for there has been no corresponding movement in the unemployment figures. Lastly, a

BOARD OF TRADE INDEX OF PRODUCTION. (1930=100).

\* Includes also various industries not specified above.

comparison of the complete index with that for the second quarter of 1937 shows that industrial activity in April-May was as high as two years earlier. The relative importance of the various industries, however, has undergone a change since then. Thus, activity in the mining, non-ferrous metals, building materials and building, and textile industries was lower in the second quarter of this year than in the corresponding period in 1937, but the remaining trades all recorded an expansion.

\*       \*       \*

**Iron and Steel Production in July.**—Holidays and the need for plant renewals and repairs has naturally caused a temporary reduction in the activity of the iron and steel industry in recent weeks, but owing to the pressure for the delivery of materials production is being maintained at as high a level as possible. The output of pig iron (a continuous process) rose further between June and July, from 715,700 tons to 743,600 tons, and the number of furnaces in blast was increased from 114 at the end of June to 115 at the end of the past month; despite the increase, however, production last month remained below the highest levels reached in 1937. The output of crude steel, on the other hand, showed a decline in the past month. But this was due entirely to the holidays in Scotland, and on a daily

PRODUCTION OF PIG IRON AND CRUDE STEEL

\*       \*       \*

basis production in England and Wales actually showed a further increase. The volume of exports of iron and steel materials rose from 135,100 tons in July, 1938, to 177,200 tons last month, against 232,200 tons in July, 1937. The expansion in imports, however, was much more marked; they were 202,300 tons in July, 1937, 65,000 tons in 1938 and 220,600 tons in the past month. There was also an appreciable increase in the intake of iron ore and scrap; thus, imports of ore rose from 329,800 tons in July, 1938 to 551,900 tons in the past month, while those of scrap and ships intended for breaking up advanced from 51,000 tons to 103,600 tons and from 6,000 gross tons to 8,200 gross tons respectively. While the output of crude steel in the current month must be expected to show a reduction, operations are likely to be speeded up rapidly in September.

**Fruit from Palestine.**—The latest of the Imperial Economic Committee's annual surveys of British fruit supplies contains, among many other points of interest, an account of the rapid development of fruit exports from Palestine in recent years. Exports of oranges have trebled since 1932-33 and exports of grapefruit have increased eight-fold:—

EXPORTS OF FRUIT FROM PALESTINE

(a) Provisional figures.

As the table shows, the bulk of the Palestine exports finds a market in Great Britain, which took 60 per cent. of the total exports in 1938-39; this proportion has fallen slowly in recent years, with the development of subsidiary markets in Europe and the Near East. The check to Spanish fruit exports caused by the civil war has undoubtedly been of great benefit to the Palestine trade, since Spanish and Palestine supplies both arrive in Britain in the first half of the year; and oranges and grapefruit from South Africa, Brazil and the United States are sent to the British market in the summer and autumn. Between 1928 and 1938 the proportion of the total British imports of oranges derived from Palestine rose from 14.2 to 36.7 per cent. and of grapefruit from nothing to 45.5 per cent.; in 1937 Palestine supplied no less than 57.8 per cent. of Britain's supplies of grapefruit. The season just ended was, however, a poor one for the Palestine trade; production was exceptionally large, and owing to the severe weather at Christmas sales in England were below normal, with the result that during succeeding months an accumulation of stocks weighed on the market. There was also increased competition on the British market from the United States. Proposals have now been made for setting up a Palestine Citrus Fruit Board, which, by enforcing a higher standard of quality for exports and by regulating supplies might be able to improve the financial returns to the Palestine growers.

\*       \*       \*

**Larger British Exports.**—Between June and July there was a fall of nearly £4 millions in the value of imports into this country, but the value of British exports showed a slight increase from £39.9 millions to £40.4 millions. The improvement over the figures for the corresponding month a year earlier was maintained in July, when the value of imports was 5.9 per cent. and that of British exports 7.6 per cent. higher than in July, 1938.

| Re-exports .....               | 47,346  | 37,353  | 31,819  | - 5,534                      | - 14.8   |
| Total Exports .....            | 346,270 | 307,981 | 308,437 | + 456                        | + 0.1    |
| Excess of Imports over Exports | 222,750 | 235,138 | 217,077 | - 18,061                     | - 7.7    |
| Transshipments under bond ..   | 21,585  | 18,175  | 18,630  | + 455                        | + 2.5    |

The fall in the value of re-exports has continued, while the excess of imports over exports, though smaller than in June, was 7.3 per cent. greater than a year ago. The fall between June and July in the total value of imports was due to smaller imports of food and drink, while the intake of industrial raw materials continued to increase; *The Economist* index of the volume of raw material imports rose from 127½ in June to a provisional figure of 130½ in July, which compares with 114 in July, 1938. The improvement in the value of British exports was due very largely to coal and textile piece goods, but the application of the seasonal correction caused *The Economist* index of the volume of British manufactures exported to fall from 107 in June to 101 in July.

## INDUSTRIAL REPORTS

INDUSTRIAL activity is still affected by holiday stoppages, but the prospects of most industries remain good. The demand for coal is well maintained and the reduction in German exports is benefiting the industry in this country. The iron and steel industry is maintaining its activity at as high a level as is possible at this time of the year and orders on hand point to a rapid acceleration in output next month. The building industry also remains busy, largely because of the urgency of Government work. The principal textile trades, too, still have substantial orders on their books. The cotton trade has to deliver 25 million yards of cloth ordered by the Government by the end of November and a further 5 million yards by the end of January.

## Coal

**Sheffield.**—With the ending of the holidays output is back to normal, and generally demand is good. Household requirements have become prominent, due to the expectation that with the beginning of September prices will be advanced by about 1s. 8d. per ton. Industrial fuels are being well taken up. Ample supplies of smalls are on offer. Coking smalls are in good request. There is a movement to raise quotations for blast-furnace coke, which is 21s. 8d. per ton at ovens for inland, to meet increasing production costs. In the export market washed trebles, doubles and singles are in good demand. Inquiry for forward delivery is quiet, but shippers are hopeful of a revival owing to the coal shortage in Germany. Prices all round are unaltered.

\*

**Newcastle-on-Tyne.**—There is little new trade in this coal area, but the considerable amount of contract business booked earlier in the year is maintaining a regular trade at all collieries. Coking coal remains very scarce, whilst gas and bunker grades have a steady outlet. Northumberland steam classes with the exception of smalls are steady, large coals being well booked ahead.

\*

**Glasgow.**—Stringency of supplies is becoming more acute and is also developing much earlier than usual. Primarily it results from the very

high industrial consumption in the "armament" trades and is also accentuated by a desire on the part of consumers to keep stocks at as high a level as possible. The influence of the "clear-out" of colliery stocks before the holidays and the slow resumption thereafter is also still being felt. New foreign inquiry remains quiet, but this is a relief rather than an embarrassment, for already shipping supplies are fully booked, in some cases until October. The public utilities are taking full supplies, and despite the rise in prices house coal is also moving readily, with Irish requirements an important factor in the Ayrshire field.

\*

**Cardiff.**—The most gratifying feature on the Welsh steam coal market during the past week has been the placing of business with local shippers by the Portuguese Railways for about 36,000 tons of through coals for delivery during October-December. Originally these buyers called for offers for the supply of about 220,000 tons of coal for delivery during twelve months, or alternatively for about half that quantity for delivery during six months. They have restricted their purchases, so it is stated, because of the heavy stocks of coal they have on hand. At one time the whole of the Railways' orders were placed in South Wales, but in recent years Germany has made big inroads into the trade and a year ago she secured the whole of the order. So far, at any rate, no part of this year's order has been placed with German shippers.

Apart from this, however, the market presents a very quiet appearance. Supplies of most classes are severely restricted following the stoppages at a number of mines throughout the whole of the Bank Holiday week. Although new demand fails to show any material expansion, business is therefore not so easily negotiated and in the case of some of the more favoured grades, notably duffs and sized descriptions, stems are almost completely filled for some considerable time ahead and prices are consequently high.

acid billets are readily taken up. The call for small steel bars and wire rods does not ease, and deliveries are subject to delay. Forge and foundry pig iron are in only moderate demand, but basic and hematites are being increasingly well booked. There is little change in bar iron.

The plan to build up big reserves of iron ore and pig iron meets with approval here, tending as it would to keep supplies more regular in time of emergency.

Pressure for supplies of steel shows constant increase, and production is approaching capacity. Arrangements are in hand, however, still further to increase output, thus avoiding delivery delays which are at present causing some inconvenience.

\*

**Middlesbrough.**—Although the present week is looked upon as the local holiday week and shipyards and foundries are closed down, the majority of the steelworks are continuing operations through the week owing to the heavy demand for steel. Some interest is being shown locally in the Iron and Steel Federation's proposal to establish a reserve of one million tons of iron ore.

\*

**Glasgow.**—Production at the steel plants is at its highest level and output is being rapidly absorbed by the various consuming industries, shipbuilders and engineers making particularly heavy demands. Sheet mills also are in full production. At present a large proportion of the sheet mills' output is required for the supply of sheets for the Home Office garden shelters, but demand from other quarters is also brisk and bookings include a substantial quantity of highly finished sheets. Local sheet metal workers have within the past week or two obtained some very good orders and they too are operating at capacity. The recently noted improvement in the tube trade is maintained.

\*

**Cardiff.**—The tinplate trade has settled down after the annual holiday week and a steady business is passing in both the home and foreign trades. Practically all the works are well booked with orders and are busy. The heavy demand (for A.R.P. purposes) for galvanised steel sheets is absorbing almost the whole of the output and only a very limited amount of ordinary business can be arranged.

## Iron and Steel

**Sheffield.**—The iron and steel market is getting back into its stride after the holiday, and business generally is on a good scale. Basic steel billets are still in short supply, and

Power, Heating and all Industrial Purposes  
**on the North - East Coast**  
**NORTH-EASTERN ELECTRIC SUPPLY Co. Ltd.**  
Carlisle House, NEWCASTLE-UPON-TYNE  
SITES FOR WORKS Apply to above address for particulars

**News from Abroad.**—Demand on international steel markets has recently improved in some cases, but the general tendency has remained quiet. Inquiries from Scandinavia, in particular, have been quite satisfactory, and the Near East, Portugal and the Baltic also have been in the market for certain quantities. The Far East has shown interest in small tonnages, but the currency difficulties in these countries are delaying the placing of actual orders. The Chinese buyers, for instance, have sustained losses on their engagements in view of the depreciation of the currency and are trying to obtain price concessions or even to cancel orders. In the case of Japan, precautions are necessary to ensure payment before orders are confirmed. The demand from South America, which was very satisfactory until recently, has perceptibly declined. Great Britain has continued to specify semis, but the delay in placing further additional orders has caused some uneasiness on the Continent.

Prices have shown a remarkable resistance considering the adverse influence of the holiday season. Rebates on official prices have been reduced by one-third to one-half in several cases. The reason for this firm tendency is that the potential steel requirements are known to be considerable, and that, consequently, a substantial improvement in demand can be expected next month.

The routine meetings of the Cartel Comptoirs are expected to recommence in the middle of September. In the meantime, a settlement of the Polish quota claims in connection with the territorial changes is being attempted, and new quota regulations, providing for the abandonment of the payment of fines for an excess of quotas, are under discussion.

## Textiles

**Cotton (Manchester).**—There has been an easier tendency in raw cotton prices. Buyers in all quarters have limited their commitments. The crop in the United States is now making good progress, and it is being suggested that the next official estimate will be near 12 million bales. The removal of the cotton export tax in Egypt has resulted in a rise in prices in Alexandria, and a fall in Liverpool.

Business in yarn has been irregular. Coarse American counts have continued in active request for Government cloth contracts. Users are pressing for larger deliveries. As expected the Egyptian type yarn price agreement has been renewed for a further period of twelve months, but prices for carded qualities remain decontrolled.

There have been no important foreign orders for piece-goods. The position with regard to Government contracts for the defence forces can now be summarised. For delivery up to November 30th 25 million yards have recently been purchased. Further contracts are now being arranged amounting to about 5 million yards, and delivery has been extended to the end of January.

**Wool (Bradford).**—The annual holidays have interfered with the wool trade. All mills are compelled by law to stand one full week during the year, and those in Bradford, Halifax and Huddersfield are closed this week.

Other important centres have had their vacation, but by the end of the month all mills will have resumed full time. Owing to the marked revival in the civil demand for woollen and worsted cloths, there is a prospect of mills running full and over-time for a considerable period. Prospects point to current raw wool prices being fully maintained when the new Australian selling season opens in Sydney on August 28th.

## THE COMMODITY MARKETS

THIS has been a comparatively quiet week on the commodity markets and the general trend of prices has been downwards, both in this country and in the United States. Moody's index of the prices of sensitive commodities in the United States (December 31, 1931 = 100) fell from 140.1 to 138.8 during the week ended last Wednesday.

A feature has been the break in American crude oil prices and the drastic steps subsequently taken to curtail output, discussed on page 396. Among non-ferrous metals copper was marked down slightly after the announcement of the increase in the production quotas of the co-operating producers. Lead was also cheaper, but the prices of spelter and tin are virtually unchanged on the week. Wheat, raw sugar and American raw cotton were all marked down in price, but the market in rubber remained firm.

## Metals

**Copper.**—After last week's decision to increase the quotas, the demand for copper contracted this week and the market wore a quieter appearance. Standard cash consequently lost 6s. 3d. to close on Wednesday at £44 6s. 3d. per ton. The undertone, however, remained confident and a rally appears more likely than a further fall. The July statistics were again encouraging; extra-United States stocks fell by nearly 5,000 tons to 173,876 short tons, while U.S.A. stocks declined by 18,500 tons to 316,543 tons. Production both in and outside the United States remained below consumption last month, a position which is likely to be maintained for the time being.

**Tin.**—The turnover in tin was small this week and the cash quotation remained stable at £229 17s. 6d. per ton; the backwardation showed great steadiness after widening from £4 7s. 6d. to £4 12s. 6d. The market is well in the hands of the buffer pool and no major changes are expected in the near future. The I.T.C. will not meet before the second half of September, when an increase in the quotas by 5 per cent. or even 10 per cent. is expected.

**Lead and Spelter.**—Spelter closed unchanged on Wednesday at £14 8s. 9d. per ton, but lead lost 6s. 3d. to close at £15 15s. per ton. The latter reaction was natural after the recent sharp advance. Despite the reaction, however, spot supplies remained fairly short and the contango (the premium of the nearby quotation over the three months' price) noticeable for the first time early

this month was maintained this week. There is a possibility that the Trepca lead-zinc mine in Yugoslavia will close down temporarily as a sequel to the recent strike movement. The zinc market remained very quiet throughout this week and there is still no news about the cartel negotiations.

## Grains

**HARVESTING** in Northern Europe and North America is now in full swing and merchants are disinclined to enter the international markets until the size of the domestic crops is more accurately known. The August estimate of the United States wheat crop, at 731 million bushels, was higher than had been expected, in view of the excessive heat of the past few days. The statement made by Mr Wallace last week indicates that the American Government will not itself enter into the export trade next season but will provide a sufficient subsidy to enable exporters to compete on the international market. Reports on the condition of the American maize crop indicate considerable deterioration and prices on American markets have advanced.

## Other Foods

**Milk.**—The following table is compiled from statistics issued by the Milk Marketing Board:—

|                                      | July, 1938 | May, 1939 | June, 1939 | July 1939 |
|--------------------------------------|------------|-----------|------------|-----------|
| Prices (per gall.)                   | d.         | d.        | d.         | d.        |
| Liquid .....                         | 17.0       | 13.5      | 13.5       | 16.0      |
| Av. manufacturing..                  | 6.655      | 6.366     | 6.13       | 6.333     |
| Av. pool .....                       | 12.61      | 10.34     | 10.19      | 11.86     |
| Contract sales (mill. galls.)        |            |           |            |           |
| Liquid .....                         | 53.1       | 54.9      | 53.4       | 53.6      |
| Manufacturing .....                  | 35.0       | 43.0      | 43.7       | 40.6      |
| Total contract .....                 | 88.1       | 97.9      | 97.1       | 94.2      |
| Used by farmhouse cheesemakers ..... | 3.4        | 2.9       | 3.1        | 3.0       |

**Provisions.**—Flour prices were reduced by 6d. a sack on Monday for all grades. Egg prices continued to rise sharply, the normal seasonal movement having been considerably delayed. Supplies of the new season's cheese are now arriving at London, on a rather slow market; new Canadian is quoted at 63s. per cwt. on the Provision Exchange.

**Colonial Produce.**—With larger supplies available, there has been a further fall in the quotations for spot and near raw sugars; refined prices were marked down by 1½d. per cwt. on Monday and again by 3d. per cwt. on Wednesday to meet a slow demand. Buying of good Indian teas was strong at the recent auctions and brought a firmer tendency in prices.

**Fruit and Vegetables.**—The heavy rains of the past few weeks restricted the lifting of potatoes and supplies to the central markets have been considerably reduced. Prices were very firm at the beginning of the week, but have eased with the arrival of larger quantities. English plums are in excess of demand and only good quality fruit can be sold; English apples are also rather a glut on the markets at present, as the quality has so far not been high.

## COMPANY MEETINGS

### WATNEY COMBE REID AND COMPANY, LIMITED

#### BEER SALES INCREASE

At the annual general meeting of the company, held on the 11th instant, at the Windsor Castle Restaurant, Victoria, S.W.1, the Chairman, in the course of his speech, said:—

At our annual general meeting a year ago I spoke of a case coming before the High Court which was of great importance to owners of licensed property who were improving their houses. In that case the Customs and Excise argued that magistrates had no power to sanction alterations to licensed premises where ground previously unlicensed was taken into an extension, but that in such cases it was necessary for the owners to apply for a new licence. The new licence would then become subject to monopoly, while the value of the old licence would be entirely lost.

The case was taken to the Court of Appeal, where I am glad to say the decision of the High Court was reversed, and the law on the subject, which dates back to 1902, was re-established. The Customs did not take the case further to the House of Lords.

A decision of far-reaching importance with regard to the assessment of licensed houses was come to by the House of Lords last year. They over-ruled the decision arrived at in a previous case which for forty years had provided the basis for such assessments. Formerly the gross annual value of a Public House was estimated by considering what a "free" tenant—a retailer—would give by way of rent for it; now the element of the wholesaler's or brewer's competition is to be regarded in arriving at that rent. I am afraid that this judgment of the House of Lords must result in an increase in assessments, and so of rates and probably of Licence Duties.

The Government's promise to bring in legislation with regard to clubs still stands. Meanwhile the evils attendant on bogus clubs continue, but the Government, while profuse in pledges, persists in failing to honour them.

#### HOPS AND BARLEY

The Agreement between the Brewers' Society and the Hops Marketing Board expired after last year's crop. A new Agreement for a period of 7 years has now been negotiated, and the price has gone up from £9.0.0 to £9.10.0 per cwt.

Having spoken of the controlled price of hops, I will mention another entirely new and important development which has taken place in regard to barley. Barley has hitherto been a free market, and therefore liable to fluctuations. Meetings between the N.F.U. and the brewers have taken place at intervals since 1936 with a view to finding some common ground on which barley prices might be stabilised.

The Board of Agriculture entered the field and asked both the N.F.U. and the brewers for their suggestions, the basic idea being that the brewers should in some form or another pay a subsidy on the barley bought for malting. The brewers at once signified their agreement to that policy, and have been in conference with the Ministry and the farmers for many months past to evolve a working arrangement. A stop-gap scheme, to apply to the 1939 crop only, has been evolved by the Ministry, with the concurrence of the brewers, under which a cash levy will be raised on brewers. This applies to malting barley only. A subsidy to the growers of feed barley will be paid out of Imperial taxation.

This levy for a barley subsidy will be reflected in a higher cost of malt, and neither in the case of dearer malt nor dearer hops can

any part be recovered in any form from the consumer of our finished product—beer.

The company is empowered to redeem outstanding 5½ per cent. Debentures in September, 1940, at £101. At that date they will amount to £1,544,800, and it is the present intention of the Board to redeem the whole amount.

The decrease in trading profit is largely due to the non-recurrence of profit from sales of bonded whisky stocks. Beer sales during the year show an increase over those for the previous year.

The balance of profit carried to the balance-sheet, after deduction of debenture interest and preference dividends, is £1,020,948, against £1,014,635, and with the balance brought from last year, less the interim dividends on the preferred and deferred stocks, leaves £1,080,545 with which to deal.

The Board recommend that £325,000 be carried to property improvement and contingency reserve, and that a final dividend of 9 per cent., making 15 per cent. for the year, and a bonus of 3 per cent. be paid on the deferred ordinary stock.

The report and accounts were adopted.

### STEEL BARREL SCAMMELLS AND ASSOCIATED ENGINEERS, LIMITED

#### PROMISING OUTLOOK

The third annual general meeting of the company was held on the 16th instant in London.

Mr H. R. Hood Barrs (chairman and managing director) said that the combined net income of the company amounted to £28,692, and the total available for distribution was £34,272. He thought it would be agreed that the accounts were highly satisfactory, and the companies, supported by a strong financial position, looked at the future with great confidence.

In four years the output at the Uxbridge factory had been practically doubled, and he saw no reason why it should not again be doubled. The production for the first six months of the current year showed a new record and an increase on the corresponding period of the year under review, which had constituted a record for that period. The record sales for the year under review were a very happy augury for the future. Their companies were equipped with a wealth of experience, expert staffs and ample finances, which, coupled as they were with three fine properties in the form of Carrimore Works on the Great North Road, Scammell Works in Spitalfields and Phoenix Works at Uxbridge, were capable of great expansion. He viewed the future with every confidence and thought that shareholders should be proud of their interest in such a fine and progressive undertaking.

The directors had not thought it necessary to pay an interim dividend in respect of the six months of the current year from the subsidiaries. That profit was in hand and represented a very substantial reserve, which did not appear in the accounts. They had the fullest confidence in the future. Given reasonable conditions, he saw nothing to prevent an even more generous dividend policy being adopted by the Board. The steady expansion of the business was proceeding along sound lines, and that, coupled with their large cash resources, should justify larger dividends when they had passed the present troubled period, during which the directors had adopted a conservative financial policy.

The report and accounts were unanimously adopted, and the proposed final dividend of 6 per cent., less tax, making 12 per cent. for the year, was approved.

## INDUSTRIAL REPORTS—continued from page 372

### Miscellaneous Commodities

**New Timber Quotas.**—At a meeting in Stockholm on August 3rd the European Timber Exporters' Convention decided to increase export quotas for 1939 by 290,000 standards to 3,194,000 standards. Publication of this decision, which is presumably the response to the rise in prices, had been withheld pending its ratification. The countries adhering to the Convention will share as follows in the new quota: Sweden, 721,000 standards; Finland,

884,400 standards; Russia, 836,000 standards; Poland, 275,400 standards; Roumania, 216,500 standards; Yugoslavia, 147,800 standards; and Latvia, 111,800 standards.

**Oils and Oilseeds.**—Shipments of linseed continue at a fair level from the Plate and the exportable surplus now remaining in Argentina is estimated at 269,000 tons, against 317,000 tons on July 29th and 466,000 tons a year ago. The American linseed crop is estimated at 394,000 tons, the highest production since 1930. Demand for linseed is quiet but values are only slightly lower than

a week ago. Linseed oil is firmly held for near delivery but new crop is at a big discount. Trade in Egyptian cotton seed has improved; new crop has been quoted at £5 2s. 6d. per ton for November shipment.

**Rubber.**—There is still a fair demand for spot and nearby rubber, but prices have been very steady in the past week for all positions. The July consumption in the United States is returned at 43,880 tons, a slight but expected fall from the June figure; stocks in hands of dealers and manufacturers showed a further fall to 174,240 tons.

## Britain's Food Imports

Each of the circles in the above diagram represents an average of values of imports for the three years 1936-7-8. Figures were taken from the Trade and Navigation Accounts for December, 1938, and The Agricultural Register, 1938-9, compiled by the Agricultural Economics Research Institute, Oxford.

## Finance

## GOVERNMENT RETURNS

For the week ended August 12, 1939, total ordinary revenue was £12,513,000, against ordinary expenditure of £14,793,000, while £2,500,000 was repaid from the Essential Commodities Reserve Fund, and £245,000 was issued to sinking funds. Thus including sinking fund allocations but excluding issues from defence loans, the deficit accrued since April 1st last is £147,251,000, against £135,516,000.

## LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

## Double Cross Roads

THE Russian Bolshevik has always been represented by the world's cartoonists as a bearded figure carrying a smoking bomb. But no revolutionary Bolshevik ever hurled a bomb that exploded with more shattering effect than that which was detonated in Berlin and Moscow on Monday night. In what must surely be the biggest single piece of perfidy in history, Soviet Russia has betrayed all its principles, encouraged the aggressors and double-crossed those who were trying to be her friends in Western Europe. No amount of ideological perfume will avail to remove the smell that will for ever hang about the name of Bolshevik.

Until Monday it was assumed that Soviet Russia had almost taken her place in the Peace Front against aggression. Even so, the diplomatic position was dangerous and precarious. There was every indication of Nazi Germany's resolve, come what might, to commit aggression against Poland, in spite of the clear determination of Britain and France to honour their pledges to support the victim. The reason for Hitler's refusal to be shaken by the apparent strength of the Peace Front became apparent shortly before midnight on Monday, when the German official wireless announced that Germany and Russia had agreed to sign a non-aggression pact. Nothing was then announced of the terms of the pact. But even on the most favourable possible interpretation of Russia's action, it was a very dangerous manoeuvre, since it so greatly inflated the spirits of the German extremists. Nevertheless, there were many in London and Paris on Tuesday and Wednesday

day who were disposed to take the view that the shock to the Peace Front was only moderate. There was much justification for this view. It seemed inconceivable that Stalin should be ready to stake the future of his regime on the Fuehrer's promise. Moreover, there were protestations from Moscow that the negotiations with Germany would take a considerable time and that there was no reason why the conversations with Britain and France should not continue. It was even possible for two days, to enjoy the matchlessly humorous spectacle of Herr von Ribbentrop, the only begueter of the Anti-Comintern pact, hastening to the Kremlin to grasp the hand of Stalin, Secretary of the Communist Party.

Any comfort thus derived was utterly dispelled when it became apparent on Thursday that the terms of the treaty were wholly favourable to the Germans. Russia has promised not to fight Germany or to join in attacking her or to support her enemies or to join any combination directly or indirectly aimed against her. In these circumstances there seems to be no remaining possibility of Russian adherence to the Peace Front, on any terms.

It cannot be disguised that this treaty is a very severe set-back to the diplomacy that Great Britain and France have been pursuing since last March. It encourages the Nazis to go further on their path of aggression and makes it less possible to restrain them if they do. Already, it is reported, Roumania has declared her intention of remaining neutral in a war between Germany and Poland. And the sinister von Papen is on his way to try to shake the

steadfastness of Turkey. Poland, in fact, is isolated, and the only way in which her allies can go to her assistance is by assaulting Germany's western defences.

Yet the announcement of the pact has completely failed in what appears to have been its main immediate aim, to disrupt the Anglo-Franco-Polish alliance and persuade the two Western Powers to back out of their obligations. That was made perfectly clear by the admirably firm *communiqué* issued by the British Cabinet on Tuesday. French opinion is shocked but unshaken, and reports from Warsaw reveal no flaw in Poland's determination.

Nor are the diplomatic effects of the treaty wholly on one side. One immediate effect has been to end, once and for all, the prospect of a military alliance between Germany and Japan. Japanese comment, in fact, is bitter. If the Peace Front is broken so is the Triangle. Japan is now free of commitments, and the utter discrediting of the Army's ideas on foreign policy may powerfully assist in arriving at an accommodation with Britain. In Spain, too, where the crusade against Communism has been taken seriously, the effect has certainly not been to encourage Franco to desert his neutrality. And all over the world, Hitler has lost his most powerful propagandist weapon, his pose as the champion of civilisation against Bolshevik chaos.

Stalin's motives must be left for History to unravel. Fear of being involved in a war that might bring his regime down played some part in them, as also did the desire to be the balancing factor in Europe. These are ambitions that can easily be forgiven. But to advance them by putting his country in pawn to Hitler is dangerous in the extreme. And to choose this method at this time is almost the same thing as provoking a world war with the deliberate object of bleeding European civilisation to death. It is an act of perfidy, infamy and criminal irresponsibility

#### *Agenda for Preparedness—IX*

## Industrial Man Power

THE war-time labour problem, in its broadest terms, is set by the necessity to do more work with fewer men. In Great Britain it is intensified and complicated by the fact that even after a sufficient number of men have been withdrawn from industry to provide for the personnel requirements of the armed forces; and when the necessary adjustments have been made in industry to provide for the vastly augmented war-time needs of those forces and the (perhaps slightly) reduced consumption requirements of the civil population; there still remains the necessity not merely to maintain but to expand production for the export market in order to provide some of the foreign exchange requirements of a country whose dependence on outside resources is enormously increased by the exigencies of war. Numerically the man-power problem is formidable. Military conscription being applied at the outset, it may be possible to absorb into the fighting forces in two years some 6,000,000 men, or half the present gainfully occupied male population. The experience of the last war, when 4,900,000 men entered the forces in 51 months, suggests the feasibility of such a transfer. Thus all the personnel requirements of industry will have to be met with half the number of men now available, reinforced by all women, older men and boys capable of working.

Thus two of the main categories of the problem emerge at once—the allocation of men between the fighting forces and the home front and the reinforcement of the latter from outside sources. The others are the distribution of workers according to the urgency of the work to be done and the maximisation of output by available workers. The

beyond calculation. It provides a tragically clear demonstration that there will be no safeguard for the ordinary decencies of international life so long as any dictatorship, of whatever superficial ideological hue, is allowed to remain.

Meanwhile we are left with the threat of imminent war. In every country preparations go forward, in England not least, and the public lives in hourly expectation of the final blow falling. King Leopold of the Belgians, the Pope, and President Roosevelt have all made last-minute appeals that reason may prevail. But it is not encouraging to reflect that their success depends entirely on the effect they have on a single mind, abnormal at any time and now flushed with success.

If war comes, it will not be fought for Danzig or for Poland. It will be fought for the right to live in peace, to pursue the ends of human welfare untroubled by the constant necessity to divert resources and attention to the sterile purposes of defence. If the conditions under which war is engaged are less satisfactory to Britain and France than they might have been, the change is nevertheless not decisive. The overwhelming naval superiority of the democracies is untouched; their position of potential superiority in the air is little affected; and on land the odds are not heavy enough to secure success for the attackers.

Yet that we should be faced with such a heavy struggle is a shameful burden placed by the bankruptcy of statesmanship on the shoulders of the people. Over and over again we have been given the chance of stopping the rot at infinitely smaller risk. But we have let the League of Nations die, and even its bastard offspring the Peace Front is barely alive. The bravery and endurance of the common people will now have to pay heavily for the utter lack of courage and foresight in those who have held the high offices of state during the past eight years.

work of rapidly expanding the Army, Navy and Air Force will commence with the outbreak of war. The list of reserved occupations already in existence will then become effective, and will presumably be revised at frequent intervals as the actual war needs take shape and are modified. Careful forecasting should at least ensure that skilled men whose value in industry is greater than their effectiveness with the forces will be made available to do certain types of work. But that will not be enough. It will be necessary to see that the particular tasks which they perform are essential. Persuasion will give the ideal and compulsion the least desirable method of effecting the transfer, with the indirect damping down of inessential activities through the control of material supplies as a convenient and effective intermediate device.

Reinforcement of available labour will be necessary at the same time. In the last war the gap left by the men who went into the defence forces was filled in a variety of ways. A total of about 1,300,000 persons came from the natural growth in the population, from immigration, the employment of boys and old men and the absorption of the unemployed. This time the natural growth would not be so great (though there still is a natural growth in men and women of the working ages); but more than offsetting that is the greater volume of unemployment. There is also a larger reserve of women. In the census of 1911 the total number of women in the age group 15-65 was 13.3 millions, of whom about 5.4 millions were occupied. Of the remaining 8 millions about half were married women, and if 3 millions of these are taken to be fully occupied by home duties, there remained a maximum potential reserve avail-

able for whole-time or part-time work of 5 millions. The number of women workers in industry actually increased between 1914 and 1918 by 1,660,000, and there was doubtless a further increase outside industry. The figures of the census of 1931 lead to the conclusion that this reserve is now a million larger. Thus in 1914-18 there were recruits to industry from these two sources of at least 3 millions, and in another war the figure might be well over 4 millions.

The fact that the number available to fill the gap left by those men who enter the forces is rather larger than it was in 1914 does not remove the need for fuller use of available personnel. The necessity for more continuous and more intensive work will remain; the highest degree of mobility of labour compatible with efficiency will have to be aimed at; and all artificial restrictions on output will have to be removed. The last-named point to some extent comprehends the other three. The chief agencies imposing artificial restrictions on output now are the trade unions. This is the service which they properly perform in the interests of organised labour in peace time. But they cannot be carried out as usual in the exceptional circumstances of war. Not only must the unions recognise new principles to fit the new situation, but detailed plans of the war-time machinery must be drawn up with their positive co-operation. In fact, dilution of labour, that bitter pill whose very name produces wry faces among trade unionists, will have to be compounded ready for swallowing.

As defined by Mr Humbert Wolfe in his historic volume on labour problems in the last war, dilution of labour means "to add to the numbers of skilled men large reinforcements of unskilled or lesser skilled persons whose work they would in a sense supervise." When dilution becomes a reality, trade union restrictions and privileges which artificially control the entry of new men into skilled occupations are suspended. The work to be done is so arranged, and processes so subdivided, that all tasks which are in any way capable of being performed by unskilled or semi-skilled men are handed over to them, and only the key points are left in the hands of the skilled. In essence, dilution is a precise scientific process. In practice it has centred around the "suspension of trade union practices." The means have been confused with the end.

The unions are bound to require guarantees that such exceptional arrangements as are made are for the duration of the war only; that the control of labour shall be accompanied by the control of profits and food prices; that permanent wages shall not be adversely affected by war-time changes—in short, that the whole system shall be operated in such a way as to assure to labour adequate safeguards and a due return for the surrender of its privileges. It is plain that complete restoration of pre-war conditions will not be possible. Experience at the end of the last war, when it was claimed that wage scales in certain branches of engineering were stabilised at an effective level below that of 1914, indicated the type of difficulty which is likely to arise. The most that can be safely guaranteed is that similar pay will be granted for similar work—not that the whole structure of industry will be restored to its pre-war outline. There is one pre-eminently desirable way of ensuring that such demands as are reasonable and possible are met. The workers through their trade unions must co-operate freely and at once in the planning of schemes and safeguards.

The detailed matters which must be settled fall within the specific province of trade union experts and negotiators. For example, the modification of the existing provision that only men with definite qualifications may perform certain classes of work requires a review of apprenticeship regulations, of the possibility of enlarging the definition of "approved experience," and of the rules governing admission to skilled unions. In addition there are a multitude of highly technical inter-union questions concerning the particular provinces of specific classes of

skilled men and the adjustment of the dividing lines to conform to the criterion of maximum output per head. The ratio of skilled to unskilled men must be revised, restrictions on hours of work adjusted and closed-shop regulations re-examined.

Naturally, not all the labour problems of the next war will be of a technical and detailed nature. The most highly skilled trade union official is not specifically concerned with forecasts as to how many additional women will be available for industrial work and in what regions they will be found. Nor is he the person best fitted to calculate what degree of transference will be necessitated by air bombing or at what phase of the trade cycle this country will find itself when the war begins. These are contingent facts to be provided for by intelligent anticipation and flexibility of policy rather than by detailed planning.

There would be no necessity to labour the point that the greatest positive contribution can be made by the trade unions if, in fact, there were any sign of present readiness on their part to do the job. But there is no such sign. In the spring of the present year the General Council of the Trades Unions Congress produced a scheme, which was submitted to the Ministry of Labour, for a series of National Industrial Committees which would deal in war time with questions of wages, hours, working conditions and mobility of labour. It was suggested that these committees, which would be representative of both employers and unions, should be consulted when Government contracts were placed or schemes for the enlargement of industrial output were under consideration. The plan dealt in considerable detail with questions of procedure and made it plain that the proposed organisation would be on an industrial basis and involve only a minimum of interference by the T.U.C. in the affairs of the individual unions. It provided for a National Committee on each industry in which joint negotiating machinery at present exists and for further regional committees where these were considered necessary. There were even suggestions for the application of the new provisions to industries and employers outside the present negotiation schemes, and for bringing unorganised trades under control. But of dilution there was no word.

It would be unfair to place on the unions all the blame for what can only be called the failure to prepare for the labour problem of the next war. It is understood that invitations were issued by the Government some months ago to both employers and unions to submit their suggestions. This fact does not absolve the Government and the Ministry of Labour in particular from their portion of the responsibility for the fact that no adequate preparation seems to have been made. Nor can a reply such as that made by the T.U.C. be taken as anything more than the first step towards detailed dilution plans. If these plans are not forthcoming soon the blame will have to be placed not only on the unions and the Government, but also upon the employers' association, who seem to have done less than either of the other two agencies concerned.

Dilution of labour is necessarily a difficult and complicated business requiring both a firm and positive general policy and meticulous attention to a mass of technical detail. The sort of details concerned have been enumerated above, but the application of the categories to each particular industry with due reference to its present structure, its war-time function and its potentialities of expansion has not been attempted. It is a vast task, but if a war comes there will be no way of avoiding it. Yet there is little evidence of preparation of a character calculated to arouse confidence in the avoidance of a repetition of the confusion and cross-purposes which occupied many months of the last war before dilution was accepted in principle. And even after such an acceptance the working out of detailed schemes requires months of intensive study. There is, in fact, a huge gap to be filled on the home front.

# The Panama Canal's Jubilee

ON August 15, 1914, the Panama Canal was formally opened to commerce, an event of sufficient importance to create a stir even in the prevailing atmosphere of war. To the schoolboy of to-day, who takes the canal's existence for granted, it must seem astonishing that so obviously desirable a project has only just celebrated its silver jubilee; this feeling is doubtless shared by the spirit of the Portuguese navigator Antonio Galvao, who published a book in 1550 describing four possible routes for a canal across the isthmus. Yet in point of fact it needed the vigorous determination of the United States Government to get the work finished even 45 years after the completion of its counterpart at Suez.

The difficulties were not primarily technical, though the engineers had some hard problems to solve; they were mainly financial, medical and political. In 1879 Ferdinand de Lesseps secured the formation of a company to construct a sea-level canal at Panama, and at the second attempt the shares were floated on the market in 1880. After two years of survey work plans were drawn up and construction began. Progress was slow, however, largely because of the heavy toll taken by yellow fever; it is said that every yard of the stretch completed by this company cost a human life. The extravagance and corruption of the management also became notorious, and although it was decided to reduce the work by building locks, operations were suspended in 1889 when the company became bankrupt. It had already spent nearly 1,300 million francs, against de Lesseps's original estimate of 658 millions.

Meanwhile the United States Government, not relishing the prospect of a canal controlled by Europeans, had been negotiating for an alternative route through Nicaragua. A treaty was actually concluded in 1884, but failed to secure the two-thirds majority of the Senate necessary for ratification. After the appointment of several commissions, however, and much political and diplomatic manoeuvring, a Bill was introduced into Congress in 1901 to authorise the construction of the Nicaraguan canal. This so alarmed the new company which had taken over the uncompleted works at Panama that they offered to sell all their assets for \$40 millions, and this proposal was accepted by the United States.

The United States were thus left without a rival, but the concession from the Colombian Government was on the point of expiry, and in 1903 the Colombian Senate refused to ratify the agreement which was negotiated for a new one. The scheme might have had to be abandoned had it not been for a very timely revolt by the inhabitants of Panama, whose independence was hastily recognised by the United States. The new Republic then granted its champion full sovereignty over the canal zone for a cash payment of \$10 millions and an annual rental of \$250,000.

President Theodore Roosevelt decided that the canal could best be built by direct labour, and entrusted the control to the Corps of Engineers. Thanks largely to the efforts of Dr Gorgas in fighting the yellow fever, work proceeded steadily and was completed in almost exactly the estimated time. The total cost incurred up to the opening date, including the payment to the French company, was \$366,650,000, and this also conformed closely to the estimates. Since then considerable sums have been spent on improvements, notably widening; after deducting the amounts provided for depreciation and adding \$129 millions for interest during the construction period the book cost to the United States Treasury on June 30, 1938, stood at \$508 millions.

The effectiveness of this outlay as a means of shortening voyages may be seen from the following table, which shows the number of nautical miles saved by using the canal

instead of an all-sea route:—

| To                    | Liverpool | New York | New Orleans |
|-----------------------|-----------|----------|-------------|
| San Francisco .....   | 5,666     | 7,873    | 8,868       |
| Valparaiso .....      | 1,540     | 3,747    | 4,742       |
| Wellington, N.Z. .... | 1,564     | 2,493    | 3,488       |

The saving is naturally greatest for voyages between the East and West coasts of North America, a fact of which the railroads have become painfully aware.

With such advantages to offer, the canal soon attracted a considerable share of the traffic, though at the outset its volume was inevitably curtailed by the war. In the year to June 30, 1924, the net tonnage of its shipping exceeded 26 millions, and, for the first time, was slightly higher than that recorded by the Suez Canal. Since then it has remained remarkably steady, with a peak of 30 millions in the fiscal year 1929-30, and has fallen below 25 millions in only two years. The figures for Suez, on the other hand, have shown a rising tendency and latterly have been mainly between 30 and 35 millions.

A glance at the map shows that rivalry between the two canals is not restricted to the statistical field. For many journeys—e.g. between England and the Far East—each can offer about the same saving in distance, so that they are economic competitors also. The choice between them does not, however, depend simply on which route is the shorter, for there are many other factors to be taken into account, such as the traffic with intermediate ports, the cost of refuelling and the charges made by the canals themselves. Suez generally offers better prospects for trading *en route*, but oil is cheaper at Panama and the dues there are lower.

This last point raises questions of considerable importance, especially in view of the different systems of administration. Comparison is made more difficult by the fact that net tonnages are calculated differently by the two administrations, but any allowance under this head would probably be in favour of Panama; it certainly could not offset the fact that, despite several reductions, the charges at Suez are 5s. 9d. per net ton for laden vessels and 2s. 10½d. for unladen, against 90 cents and 72 cents at Panama. The discrepancy becomes all the more striking in view of the fact that operating expenses at Panama are increased by the existence of locks, and that the capital cost was far greater—the figures for expenditure up to the date of opening were 433 million francs for Suez and 367 million dollars for Panama (about £17 millions and £75 millions).

The direct return to the United States Government from the Panama Canal may have been relatively small, but they have no cause to regret their venture. Their shipping stood to gain most from the canal, not merely because they would make most use of it, but also because the saving in distance would usually be greater. This has strengthened the competitive power of their manufacturers, particularly in the Far Eastern markets.

The United States have in fact consistently made more use of the canal than any other country. In 1937-38 their ships carried nearly 10 million tons of cargo, out of a total of 27.4 millions; the United Kingdom was second with rather over 6 millions. This preponderance has in no way been secured through discrimination in favour of American vessels. As long ago as 1901 the Hay-Pauncefote treaty between the United States and this country provided that the canal should be "free and open to vessels of commerce and of war of all nations observing these rules on terms of entire equality." In days when international agreements are all too often disregarded as soon as they become inconvenient, it is pleasant to record that this one has been strictly observed.

# Political Patchwork in Spain

(By a Correspondent)

AFTER five months of manoeuvring and wire-pulling, of which Press reports have given only the faintest reflection, the new regime in Spain has revealed its political complexion. General Franco, as President, retains autocratic powers. He is a law unto himself in the civilian and military spheres and can, if he chooses, rule by presidential decree. But his authority is to be exerted through no fewer than three delegations. There is in the first place the Cabinet. In despair of ever achieving among the political janissaries the kind of discipline to which he was accustomed by his long experience in Morocco, he has contrived a patchwork affair out of the various contending factions—which is notable only for its exclusion of the old discredited *políticos*. This structure is buttressed by the Political Junta, on the one hand (the link between Party and Government) and, on the other hand, by a Military Defence Directorate immediately subordinate to *El Caudillo* himself.

This is a *solution* only in the chemical sense. Just as, for the prosecution of the war, it was found necessary to fuse the Falangist and Traditionalist elements into a compound substance which was indefinable, so now Army and Falange are thrown into the new political mould and told to sink their differences and get on with it. There was no other way of smoothing over the personal and factional animosities which were fast discrediting the idea of a united Spain. As an attempt at the conciliation of incompatibles it is no small achievement. Of any reconciliation with the millions of Spaniards who maintained their allegiance to the legitimate Government of the Republic there is not the slightest sign. In that respect the new dispensation is scarcely in the true Spanish tradition. The *de facto* domination of the country by the Falange is now translated into legal terms, with Señor Serrano Suñer, *el Cuñadísimo*, Minister of the Interior and President of the Political Junta as the king-pin. At the same time all the evidence goes to show that the original patriotic and idealist core of the Falange, associated with the name of Jose Antonio Primo de Rivera, has been submerged in the maelstrom of camp-followers of the Movement who rallied to the Falange standard simply because it was evidently going to be the dominant force after the war. (There is a kind of Gresham's law in the matter of Party currency which operates in all countries that palter with Fascism). Señor Fernandez Cuesta, for example, one of the original national-syndicalist reformers—who, during the war and until recently, held the key-position of secretary-general of the Party—has now disappeared from view. No doubt he was regarded as not being sufficiently malleable: or else, like General Queipo de Llano, he had achieved a personal popularity which might have dangers for *El Caudillo* himself.

People talk glibly about the Falange as if it were what Stalin would call "monolithic." Actually, it has not—and has never had—the consistency and homogeneity of the Fascist or Nazi parties in Italy and Germany. There are at least four different strata: (1) the original national-syndicalist subsoil, (2) a *couche* of politically ambitious young men taking their cue from the "dynamism" of the new Germany and Italy and aping the Fascist methods and symbols, (3) a perfect alluvium of political waifs and strays and opportunists who streamed into the Party during the war; and (4) the anarcho-syndicalist groups which found refuge in the Party and which earned for Falangists in Conservative quarters the name of *rojos estampillados* (surcharged Reds).

Now it is quite clear that of these categories it is the

second and third which enjoy the sunshine of General Franco's smile—and for the very good reason that they are docile instruments of his Axis-controlled policy. No amount of wishful thinking can disguise the fact that the new Spain is closely associated with the expansionist ambitions of General Franco's war-time allies. It may be that Spain's adherence to the Anti-Comintern Pact has little significance since Wednesday's *volte-face*; and the recent talks between General Franco and Count Ciano have as yet resulted in no diplomatic instrument. But the evidence is written all over the country, specifically in the Press, which would appear to have lapped up subsidies from Germany. Even the *ABC*, controlled by the little Monarchist group associated with the Marquis Luca de Tena, finds it expedient to join in the chorus of scorn and ridicule of the democracies. And, for the moment, there is no evidence to suggest that the German-Soviet Pact will alter the position that Spain will take up in any future war. General Franco himself would opt for "neutrality"; he is terrified of the impending general war. But a "nominal" neutrality is the most that can be expected, and this would actually suit the book of Germany and Italy—at least in the initial stages of a war—better than a formal alliance.

The new Minister of Foreign Affairs, Colonel Beigbeder—an old comrade-in-arms of General Franco in Morocco—is entirely under German influence. One remembers some of the outrageous things he said to newspaper correspondents about the authorities of French Morocco in the early months of the war. He was for some years Spanish Military Attaché in Berlin.

Inside Spain German and Italian influence is, on the whole, unobtrusive. None of the members of the new Cabinet, except Señor Serrano Suñer himself, have any particularly close associations with the foreign allies. And General Yagüe has not been too polite about them.

The *militares* are, to a man, former colleagues of Franco in Africa—and, like himself, devout Catholics without, otherwise, any particular political predilections. The one interesting figure is General Muñoz Grande, the new Secretary-General of the Falange. Lieut.-Colonel Muñoz Grande was a good Republican who expressly rejected an invitation from General Mola in the summer of 1936 to take part in a military insurrection. When the rebellion broke out he was in Madrid. The police found in his house the copy of his letter replying to General Mola, and he was arrested, charged with complicity for not having denounced the plot, and sentenced to three years' imprisonment. It was a harsh judgment. After a year the authorities realised their mistake and released him. He, in the meantime, had heard news (which turned out to be untrue) that his wife and children had been murdered, and in utter disgust he took refuge in a certain foreign Embassy—and then later escaped into Franco territory. He has, really, no Falangist credentials; but it suits General Franco to have an old friend of his as Party watch-dog. His particular, rather thankless, task will be to try to suppress once and for all the activities of irresponsible elements—the bandits who have made life in certain districts intolerable, apart from the shortage of food and general misery.

Several of the civilian Ministers are men who first came out of their shells during the Primo de Rivera dictatorship—men who have no political history in the ordinary sense. Don Luis Alarcon, the Minister of Industry, is a typical prosperous merchant of Seville; and Señor Benjumea, the new Minister of Agriculture (replacing in this post Fernandez Cuesta), was assistant to his brother, Count

Guadalhorce, the Dictator's very able Minister of Public Works. Señor Benjumea is no fool, either. The one "Traditionalist," Señor Bilbao, was president of the Diputación (Provincial Council) of San Sebastian during the Directory period. He is essentially an opportunist, not at all representative of the Carlist elements proper.

The latter are few and disgruntled. They know that without the *requetes* General Franco would never have made much headway in the field; yet, by comparison with the Falange, their influence counts for very little. It is true that religion is in full honour in the new Spain: the order of the Traditionalist motto "Dios, Patria, Rey" is in fact faithfully observed. Indeed, the apotheosis of Catholicism is the one positive feature of the new dispensation. (For details the reader may be referred to the ultra-Fascist tract *Que es lo nuevo?* by Jose Pemartin, who holds a high post in the educational hierarchy.) Otherwise the Falange dominates the stage.

There is no Government programme—except reconstruction, and even in this matter the attitude is mainly

negative: we may remember Franco's remarks in the speech at the Victory Parade on May 19th about "economic encirclement" by the powerful interests which have long been hostile to our independence and our strength. . . .

Those who are in the ascendant to-day are just not interested in the question of the Monarchy. As in Nazi Germany, they regard such a thing as among the "residual fauna" of a discredited *ancien régime*. And yet . . . and yet, no one who knows Spain will exclude the possibility, when the present makeshift administration has exhausted itself, of a solution of despair being sought in the return of King Alfonso; not, be it said, with any idea of restoring the old pseudo-Parliamentary regime, but in order to make possible the old Spanish custom of an amnesty for the "outs." (After three months or so he would give place to Don Juan, the son.) Then at last we may see a *rassemblement* of all Spaniards of good will, and, one hopes, a rebuilding of the country on the foundations that are being laid at present.

## NOTES OF THE WEEK

**Defence of the Realm.**—It was a calm and united House of Commons which gathered on Thursday to hear the Prime Minister make plain why war was imminent and to deal swiftly with the Emergency Powers (Defence) Bill. Mr Chamberlain made no attempt to conceal the shocking surprise which the "bombshell" of the Nazi-Soviet Pact had been to him and his colleagues. But he left no doubt of the Government's view that the *volte-face* in Eastern Europe had not altered Britain's duties and intentions on the Continent. But it was deeds rather than words that the Prime Minister brought for Parliament's approval. The first need of the moment was to make fully ready the nation's defences against any emergency; and the Emergency Powers Bill which was passed through all its stages in both Houses in a single day gave authority to the Government to do so. The Act authorises the making by Order in Council of regulations to secure the safety of the public, the defence of the realm, the efficient prosecution of war and the maintenance of supplies. It gives the Government the right to take over property, to search premises and to levy charges in connection with schemes of control; and it sanctions the detention of persons where it is deemed expedient and the holding of judicial hearings *in camera*. It is a grim measure, bearing in its sweeping clauses and indifference to the accepted principles of legal and political procedure in peace-time all the marks of the distasteful exigencies of brutal war. But there were only four members prepared to oppose the Bill's introduction, and they did so on pacifist grounds; while, in debate, Labour and Liberal members, in full agreement, were only anxious to supplement the measure with certain safeguards. The Home Secretary, who steered the Bill through the Commons, was ready to meet them half way; unconditionally he gave a pledge that in no case would the emergency powers be used in industrial disputes; and it was made quite clear that no extension of conscription, for the fighting forces or into industry, was intended, and that no civilian would be placed under the edict of courts martial. The Act is ready for use, a stern reminder of the character of war-time organisation. If war comes, it is only the beginning. Much more conscription of man-power would then be inevitable, and even the sparse limits set to this wide measure would assuredly be overstepped. It is the thin end of the wedge of arbitrary rule and regimentation which the irony of events may decree to be our only means of preserving freedom and democratic ways.

**Attitude of the Dominions.**—Statements made this week by responsible Ministers in the Dominions echo those

which were made during the crisis of a year ago. In Australia Mr Menzies, the Federal Prime Minister, has stated that it would be a cardinal error for any country to assume disunity among the British peoples. Australia stood where she stood twenty-five years ago with Britain. From New Zealand comes a statement by Mr Fraser, the Acting Prime Minister, in which he said that if war came it would find the people of New Zealand standing shoulder to shoulder with the Mother Country. In Canada Mr Mackenzie King, the Prime Minister, has not yet made a precise statement of policy: it is known, however, that the Canadian Parliament will be called whenever a decision is imminent, and little doubt is felt of what Parliament's decision will be. South African opinion continues to fluctuate between the views of the Government and those of the Nationalist Party. Speaking as leader of the Nationalists, Dr Malan has called for a neutral policy towards a European war, holding that thereby South Africa will best assure the inclusion in the Union of South-West Africa. The Government's course will naturally be circumspect, a compromise between those who lean towards, even if they do not favour, the Nationalist view, and those who, like General Smuts, think that South Africa must play a loyal part as a member of the British Commonwealth. In face of the German-Russian pact the position of the Indian Congress, anxious to discredit the British Raj but to retain its idea of solidarity with the democracies, will be even more uncomfortable now than it was before. Congress must become either isolationist, in which case it loses its international flavour and its right to be regarded as a party of principle, or it must be ready to back the defence of the Commonwealth. Perhaps the most encouraging aspect of the various speeches and comments which have been made is the general approbation of what the British Government has done in past months and what, by standing firm, it means to do to-day.

**Rail Threat Withdrawn.**—On Tuesday, the Associated Society of Locomotive Engineers and Firemen decided to call a strike on Saturday night unless their demands for higher pay, longer holidays and improved working conditions were forthwith conceded. This was a threat to paralyse the nation's railway system at the peak of a national emergency; and the wiser second thoughts which led the enginemen to call off their strike on Thursday came in the nick of time to save them from nation-wide condemnation and, not impossibly, stern official measures. The A.S.L.E.F. will discuss their claims further with the railway managers, and in preferring discussion to force

they will emulate their colleagues, the National Union of Railwaymen. The N.U.R., too, have claims upon the railway companies' recently increased revenues, and better claims than those of the 50,000 relatively well-paid engine drivers, firemen and cleaners of the A.S.L.E.F. There is no weaker spot in the railway wage structure than the fact that over 100,000 railwaymen receive weekly wages of less than 50s., and nearly all of these are members of the N.U.R. The companies have offered a weekly minimum of 45s., and the N.U.R., still claiming 50s., have properly consented to return the matter to the Railway Staff Tribunal who rejected their claims in February with regret. Even so, apart from the argument *ad misericordiam*—the plea that a living wage should be a first charge on railway revenues—it is hard to regard the case for higher railway wages now as convincing. The cuts of 1931 were fully restored by 1937, although the volume of merchandise carried on railways had fallen 11 per cent. since 1929. Last year, when the main line companies' net revenue at £29 millions was only £240,000 more than in the worst year of the depression, the total sum paid in wages was virtually the same as in 1929, when net revenue amounted to £45 millions. This year net revenue at the best is unlikely to exceed £34 millions. The railwaymen are receiving at least as large a slice as in 1929 of an appreciably smaller cake; and it is a more valuable slice, because the cost of living is still lower than it was ten years ago. Nor is this all. In 1938 payments to equity stockholders amounted to just over £1,500,000, against £11 millions in 1929; and even in 1937 payments to equity stockholders were less than half their 1929 figure. Stockholders, too, have a cause to plead *ad misericordiam*. They have borne the brunt of the railways' post-war decline, while the trend of railway finance has continued, admittedly with justice, in favour of the wage-earners; and it is doubtful doctrine to assume again that the next increase in net revenue should be handed *in toto* to labour.

**Manning the Home Defences.**—The absence of public excitement and hectic improvisation which marks off the present crisis from that of last September is in no sphere more pronounced than in that of civil defence. What has in fact happened since Monday has been little more than an acceleration of the routine additions of detail to the effective structure based on the reasonably complete plans which, after months of agitation and steady administrative effort, now exist on paper. Preparations in factories were given an impetus on Monday by the announcement that the code making precise the obligations on owners provided in principle under Part III of the Civil Defence Act would shortly be put into effect. This may be done unobtrusively and quite effectively by the simple issue of instructions to factory inspectors. A Ministry of Health circular to housing authorities at the same time indicated that their present responsibility for the repair of working-class houses will be extended by emergency legislation to all buildings used for the accommodation of the general population in war. These authorities were thus apprised of their general duty to see that the people are housed, and informed that they will be assisted by Government loans for necessary repairs. The effect of Tuesday's Cabinet statement was to call up a small proportion of A.R.P. personnel and to instruct the whole force of two million odd to stand by. At the same time it was known that the Lord Privy Seal, in a letter to local authorities, had recommended the arrangement of temporary transfers of part of the existing force between adjacent areas with the object of meeting strains imposed by day to day conditions or filling for the time being the gaps in those areas which have not so far fulfilled their duty in Civil Defence. Most definite of all, and reflecting most strongly the anticipation of immediate war, were Wednesday's announcement that all possible preparation should be made by individuals and local authorities for compliance with an Emergency Lighting Order, the calling up of the London Anti-Aircraft military units and the instruction to school teachers and others responsible for the direction

of evacuation to be available for duty on Saturday morning.

There is thus a full assurance that what can be done at once will be done. The arrangements for the moving of four millions of the population of the evacuation areas are complete and in certain preliminary details the machinery is already in motion. For the seven millions that remain shelter is all ready for perhaps two and a half millions, and can be provided by the erection of steel shelters already delivered for four million more. There is plainly a gap here. It is not possible to assemble the parts of 700,000 steel shelters and sink them three feet in the ground in a very short time. Moreover, the absence of street refuges means that people caught between their homes and their work may be virtually unprotected. This part of the work will probably take even longer than the provision of complete shelter in dwellings and factories. But those arrangements which are independent of the time factor are not likely to be made ineffective by absence of administrative machinery or responsible personnel. For what it is worth, Britain can face a war with a civil population at least as well protected as that of any country in Europe and probably better.

**The Pope's Appeals for Peace.**—Last Saturday the Pope took the opportunity of an address that he was delivering to a party of pilgrims from Venetia in order to make an eleventh-hour appeal for peace. He implored the rulers of the peoples to "put an end to war where it now rages, and to preserve all from the scourge of new and still more tremendous sanguinary conflicts." He spoke very strikingly, in the name, not only of "Catholics throughout the world" but of "all those who, while living outside the Church, aspire equally to peace." On Thursday evening His Holiness made a second, more urgent, appeal. He spoke of the supremacy of reason over force, for it was by reason and not force that the justice could be assured without the practice of which no empire was blessed by God. He asked for mutual understanding. "The whole world wants peace—bread and work—not steel and war." These appeals are not overtures to any attempt at political mediation. The Vatican has no political power or status, and it would merely compromise its possibilities of fruitful action on the religious plane, which is its own, if it were to make concrete political proposals or even to express a moral judgment on the respective responsibilities of the parties to the impending conflict. In the past to which we have come, it is hardly conceivable that even the united efforts of all the Churches could prevent war if Herr Hitler is bent on it. On the eve of the deluge, the prophets can do no more than give their testimony. On the morrow of it, they can rally the remnant that are left.

**The "Oslo" States and Neutrality.**—Among those men who will be remembered for having tried to keep the peace this week is King Leopold of the Belgians. In his own name and in those of the heads of the seven small States whose representatives are now gathered in Brussels, he broadcast an appeal on Wednesday that was all the more moving for having come from the capital of 1914's first victim. "We want peace with respect for the rights of all nations," he said—and none better than he can know what that means. This thought and its implications will be very close to the minds of those who sit at this week's conference, representatives of Belgium, Denmark, Finland, Holland, Luxemburg, Norway and Sweden. Switzerland's refusal to attend will lend added point to their deliberations, which will centre upon ways and means of remaining neutral. The problem is not as straightforward as it was in 1914. It might still be possible to avoid entanglement in the war on sea and land, but it remains to be seen how far it would be possible to remain outside the war in the air. When, in April, 1937, the British and French Governments officially released Belgium from all obligations towards them resulting from Locarno and other arrangements, while maintaining the guarantees to Belgium given at Locarno, the danger of hostile aircraft passing over Belgium had not escaped notice. It was obviously of the greatest importance that, in default of air passage actually being impeded, warning of it should be given by the Belgian Government. And it was understood at the time of the British and French declarations that King Leopold had given an assurance that the passage of foreign military aircraft over his country would be regarded as a violation of Belgian territory and as an act of war, which would bring into operation the Locarno guarantees.

Belgium is not the only "Oslo" State to be faced with grave danger of entanglement. The Dutch have long been aware of their danger, and, as in the crisis of last September, they have this week taken military precautions against a German *coup* across their frontiers. Among the Scandinavian States Denmark must expect to be subjected to a special German regime—possibly military occupation—in time of war; and what is occupied by Germany then becomes open to Allied attack. The position in the Baltic is now a good deal changed by the Russian-German Pact, but neither Finland nor Sweden will forget that possession of the Åland Islands may yet become a matter of dispute between the joint rulers of the Baltic Sea. Only Norway, her coast protected by the British Navy, is likely to find an easy course between the rival furies of fighting Powers.

**Standstill in the Far East.**—The Anglo-Japanese negotiations have come to a halt which is meant to be temporary but may turn out to be permanent. The breaking-off of negotiations between Sir Robert Craigie, the British Ambassador, and Mr Kato, Japanese Minister-at-Large, was followed by the simultaneous issue of *communiqués* by the British and Japanese Foreign Offices. The gist of these was, on the British side, that the silver and currency issues could not be discussed without bringing to the conference table representatives of "certain other Governments"—those of France and the United States—while, on the Japanese side, it was replied that this argument was inconsistent and inadmissible. Impatient at this diplomatic dilly-dallying, the Japanese Army has resorted to further threats against British property, although its threatened blockade of Hongkong has not materialised, and did not, apparently, square with the wishes of the Japanese Navy leaders. The anti-British movement in China continues to be cried abroad as the spontaneous product of Chinese indignation, and there is even some Press evidence that the Japanese think that we are fooled by this childish obvious manoeuvre. On the whole, it would seem that the Toyko Government is genuinely puzzled as to what its

next move should be; and that for the moment, even without the bitter news from Moscow, nothing more frightful was to be feared than a continuance of anti-British propaganda in the Press. Meanwhile, a further step has been added in the unhappy progress of the four Chinese prisoners whose detention in the British Concession at Tientsin was the original pretext for the blockade. The summons for a writ of *Habeas Corpus* granted on behalf of two British applicants has been dismissed in the courts, the judge deciding that no *prima facie* case had been made out that the prisoners were being illegally detained. There would now appear to be no effective obstacle of any kind to prevent the men being turned over to the Japanese-controlled Chinese courts.

**The Axis and Hungary.**—Last week we recorded the Hungarian Foreign Minister Count Csaky's visit to Herr von Ribbentrop at Berchtesgaden. It now appears that he did not leave Germany without being put through the ordeal of a visit to Herr Hitler himself, beginning in his villa at Berchtesgaden and ending in his inmost lair, the fantastic "tea-house" on the summit of the Kahlstein. While nothing of what passed has been officially divulged, we can reconstruct the scene on the analogy of what we now know of Dr von Schuschnigg's visit to Herr Hitler in February last year. We can learn more from the strenuous, though unsuccessful, efforts that have been made in Germany to keep the interview secret; more still from the immediate and totally unexpected journey by air which Count Csaky made from Germany to Rome on Friday of last week. Over these discussions in Italy, likewise, there has been a complete official reticence; but, as he travelled to Rome in a German Government aeroplane, we may conjecture that the German Government were anxious that he should satisfy himself at first hand that Hungary has no more prospect now than Austria had last year of obtaining any effective support for resisting German pressure. In Budapest on Monday, immediately after his return, Count Csaky published an emphatically worded denial of having been subjected to pressure of any kind. Yet it is hardly possible to doubt that, in truth, he was confronted in Germany with a demand (perhaps coupled with the offer of a territorial bait) that Hungary should give free passage for German troops both through Carpatho-Ruthenia into the Polish Ukraine and across the Hungarian plain into Rumania. How far the Hungarian Government has been able to resist such demands, we do not know yet. The Prime Minister, Count Teleki, is still taking vigorous measures of repression against the Hungarian Nazis; and on Saturday a courageous speech was made by the leader of the small Farmers' Party, Mr Tibor Eckhardt: a particularly able and vigorous representative of a group of political parties in Hungary which are not sufficiently *personæ gratae* to Germany to be able, nowadays, to hold posts in the Government at Budapest, but which may nevertheless cherish much the same views and hopes as Count Teleki himself on the vital question of Hungarian independence. The theme of Mr Eckhardt's speech was a sharp repudiation of Germany's claim to include Hungary within the *Lebensraum* of the Reich. We fancy that Count Teleki, and perhaps Count Csaky too, would say as much if their official position did not impose discretion. But for Hungary the question of her relations with Germany has now been reduced to terms of naked power politics.

**Roumania's Independent Line.**—Over the week-end news came from Bucharest that the Roumanian Government had suspended oil deliveries to Germany. Under the German-Roumanian trade treaty of last March, Germany is entitled to import Roumanian oil to the value of 25 per cent. of her total purchases from Rou-

mania. The quota has now been filled, and the Government has decided not to extend it. This will be annoying to the Germans. In 1938 they imported from Roumania 13.3 per cent. of their total oil imports of 5,268,000 tons, in 1939 they had good hopes of increasing this proportion, and for the future they had bigger and bigger plans. An interesting aspect of the suspension is its evidence of Roumanian independence, for, while during the past year the quota has sometimes been exceeded—whenever Roumania was importing unusually large consignments of German armaments and special goods—this time the Government has not hesitated to stand by the quota as it suited their convenience. A letter from our Correspondent in Bucharest, which will be found on page 403, points out that oil is not Roumania's only disappointment to the Germans. In several main branches of agricultural production they have found by experience that their hopes of last spring are not being justified in the event. There is nothing surprising in this. Apart from the primitive condition of much of Roumania's agriculture, it is to the direct advantage of the Roumanians to go slow in admitting German collaboration in bringing their agriculture up to date. Only in this way can they draw the benefit of German energy and capital investment without at the same time selling their commercial—and then their political—independence.

**A Federal Yugoslavia?**—The Yugoslav Government and the leaders of the Croat People's Party are still groping for an agreement. Early this week it was once more announced that full agreement had been reached between M. Tsvetkovitch, the Prime Minister, and Dr Matchek, the Croat leader. It is reported without official confirmation that this new agreement will be presented immediately to the Regency Council, now assembled at Bled. In this case, it may be hoped that it will not suffer the same fate as that which overtook the previous attempt at settlement. That was reached at the end of April, only to fall through after objections from the Regency—though the main cause of failure, as usual, was lack of confidence between Serbs and Croats. The urgency of the near-Balkan situation since the German entry of Prague last March has pushed the two sides a long way towards reconciliation; it was even agreed, what had seemed most unlikely, that constitutional difficulties should not stand in the way of administrative reform. The Croats agreed to waive their theoretical objections, so long as they could be satisfied in practice that they would receive full self-government under the customary federal conditions of a unified monarchy, unified defence forces, and unified foreign policy. Having got so far, the negotiators disputed for some time over the delimitation of federal frontiers, Bosnia being the bone of contention; eventually this, too, was settled. Croatia was to comprehend, as well as its own area proper, the districts of northern Dalmatia, northern Bosnia (down to a line which was not made known), and most of Primorska, more commonly called the Dalmatian Coast. Inland it was to be bounded by the valley of the Save. That would mean a federal Yugoslavia consisting of Slovenia (already effectually self-governing), Croatia, the Voivodina and Slavonia (districts between the Save and the Danube), and finally Serbia proper. The agreement said to have been reached this week will be on these lines. Given continued loyalty to the Yugoslav idea by the four or five federal units, it should provide a basis for complete reconciliation. All men of peace in the Balkans and beyond will hope that it does.

**No Change in Egyptian Policy.**—Egypt faces the world this week with a six-days-old Government. The Wafd remains in the wilderness, the Government being a product of co-operation between the Opposition and the palace. As with other "crisis" governments which have

been formed lately in small European countries, the new Cabinet contains a large number of "technicians" (or experts); while the Saadists (the dissentient Wafdist group) gain by the refusal of the Liberals to join the Government, and they have now five Ministers. The purpose of Aly Maher Pasha, the new Prime Minister, in appointing "technicians," is presumably to ensure that the vital administrative posts, such as those of Finance, Agriculture, Defence and Public Works, will be filled by men not subject to party discipline, and therefore less likely to defect from the Cabinet at a time when stable government is absolutely essential to Egypt's security. The resignation of Mahmoud Pasha, the outgoing Prime Minister, was on personal rather than political grounds, for he had been in ill-health for some time; the new Prime Minister stands high in palace circles and may therefore be expected to continue without change the policies of his predecessor. Those voices still raised in Egypt against full co-operation with the British are of less and less significance; with the passing of peace they may be expected to fade out altogether.

**Planned Work.**—The outstanding item of public interest on the agenda for the 71st Trade Union Congress, which will meet at Bridlington on September 4th, is the comprehensive resolution which calls for pressure on the Government to provide for "a planned development to be inaugurated immediately the armament programme begins to ease off." Additional importance is given to this resolution by the statement in the report of the General Council that the Prime Minister, at a meeting with a deputation from the T.U.C. in July, indicated not only that local authorities had been asked to prepare public works schemes, but that he had considered the setting up of an organisation without executive functions for the comprehensive and continuous survey of the problems of unemployment. Such a body is an obvious necessity, and the fact that, according to the Prime Minister's statement, he has only been prevented from putting his scheme into effect by pressure of other business, may be taken as a definite indication that the principle of positive action to deal with unemployment has been accepted. Such action remains necessary in all circumstances. If anything the outbreak of war will strengthen the argument for it.

**Work in Factories.**—At first glance most people would regard the working of last year's new Factory Act as without significance in a week when war looms nearer than it has ever done since the Great Powers mobilised twenty-five years ago. They would be very wrong in this view. The Report of the Chief Inspector of Factories for

1938, which was published just a week ago, would be no less a handbook for war-time politicians, administrators and industrialists than it would be for public men in peace. The chief question about last year's working of the Factory Act is whether the speeding-up of work due to re-armament was responsible for an increased number of accidents. The answer is that it was not; the number of accidents was 7 per cent. less than in 1937, and the number of fatal accidents 6 per cent. less. In manufacturing industries alone, the improvement was over 10 per cent. for both accidents and fatalities. The presumption is that the new safety rules of the 1937 Act, which came into operation last year, have so far been noticeably effective—though it must be remembered, *per contra*, that 1938 was a year of marked depression in industrial activity. The moral of the moment is that the new Act, fortified by *ad hoc* provisions to meet the new strain, might be an invaluable aid in adding personal safety to the fevered and all-out industrial employment necessarily associated with modern warfare. It is not true that social amelioration ceases in war-time. The years 1914-18, with their record of social, educational and industrial welfare advance, are a standing disproof of this. The morale and minimum essential well-being of a nation 100 per cent. at war are dependent upon the extended and improved working of such measures as the Factory Act; and, at a time when it may well be necessary very soon to throw open vital industries to even younger workers than now, it is most important to note the fact that the general accident rate among young persons last year was still 7 per cent. in excess of the rate among adult workers. At home and abroad alike, in both peace and war, it is man power that is the sinews of material strength.

\* \* \*

**New Houses.**—There are signs that the upward trend of house building since 1919 is changing. Since the beginning of 1935 the number of houses built annually by private enterprise without State assistance has been falling and the number provided by local authorities with State assistance rising. The latest half-yearly return issued by the Minister of Health shows that the fall in the first-named category in the year ended March 31, 1939, was the largest recorded in a single year. Unassisted private enterprise provided 226,409 houses against 257,081 in the year ended March 31, 1938, and 286,374 in the peak year 1934-35. The magnitude of the fall was such that the rise in the number of houses provided by local authorities from 77,970 in 1937-38 to 101,764 in 1938-39 was more than offset, and the total fell from 337,602 to 332,360. It is apparent that a sharp downturn is only retarded and not now prevented by State-assisted building. Further evidence of a slackening trend is perhaps provided by an increase in the proportion of houses built by private enterprise for letting, which may possibly be interpreted as indicating a search for a new market. The proportion of houses having a rateable value of £13 or less (£20 in Greater London) built by private enterprise and occupied by persons other than their owners rose from 45.2 per cent. in the half year ended September 30, 1938, to 46.4 in the half-year ended March 31, 1939. The long term figures indicate that there is a great deal to be done in this field before building for letting reaches its pre-war level of 90 per cent. Of the four million houses built since 1919 (representing a rise of 50 per cent. in the total number of houses in England and Wales) two million are occupied by their owners.

\* \* \*

**The Plight of the Refugees.**—Any impression that, if left alone, the refugee problem will solve itself must be removed by Sir Herbert Emerson's first report as League of Nations High Commissioner for Refugees which is now submitted to the Assembly. It is easy to demonstrate that these persons are, in the main, representative of the highest classes in the economic and cultural life of the countries which have expelled them, but this does not absolve the peoples and governments of the countries of refuge from

an obligation to make positive provision for their immediate reception and ultimate settlement. The present report makes it quite plain that the strongest argument for their assistance is their present plight, which is growing worse rather than better. The statistical position is that between 120,000 and 140,000 persons left German territory during 1938, many of them in the disorderly rush which followed the pogrom of November, and of these only 60,000 have found new homes and occupations. The bare statement that over 60,000 people are adrift outside their home countries and without definite prospects of earning a livelihood, could be amplified into a long list of personal tragedies and intolerable hardships. About £20 millions has been provided since 1933 by governments, voluntary agencies and individuals for the assistance of refugees, but the Commissioner is unable to forecast any probable decrease in the amounts which will be required in the next few years. Present funds barely cover the requirements of urgent relief expenditure, and there is no margin for the financing of large-scale settlement schemes. The fact is that even if the actual rate of exodus is not accelerated, the plight of those who have already left must deteriorate unless internationally co-ordinated planning is undertaken at once and backed with adequate finance.

\* \* \*

**London Statistics.**—The forty-first volume of "London Statistics" fully upholds the high reputation of this series. We are once more presented with information on almost every subject connected with the metropolis, in a form which makes it easy to study both the wood and the individual trees. It provides the seeker after statistical curiosities with almost unlimited material, such as the ten fisher-women recorded as insured against unemployment in Greater London. This year special attention has been devoted to the statistics of Public Libraries and Museums, which show that they are used more than the cynics might imagine. On the larger issues the main impression created is that all the major trends of recent years have been continued. It is all too easy to assume that this simply represents "normal development," and does not therefore call for any hard thinking. Yet in many cases these cumulative movements, however familiar they may have become, resemble the cumulative addition of straws to the camel's back. Every year that the population of Greater London grows larger and more scattered makes the transport problem progressively harder to solve and the need for a Green Belt progressively more acute. The position with regard to transport is really more difficult than appears from the figures of total population, for the number of children is continuously declining, and this partly masks the increasing number of adults who travel at peak periods. Similarly, the need for some change in the administrative system to secure better co-operation becomes ever more pressing. The area controlled by the L.C.C. now only contains 4,094,500 people out of a total in Greater London of 8,655,000. These problems must not be shelved indefinitely merely because there is no single time at which the situation suddenly becomes intolerable.

# THE FREE CITY OF DANZIG

## 1. Danzig from 1308 to 1938

THE main town of Danzig was founded by the Order of Teutonic Knights in the early years of the fourteenth century. It has remained a city of Germans ever since. The Order found it in 1308 a ducal seat defended by a wooden fort and palisade and left it in 1454, when King Casimir of Poland incorporated Danzig within his realm, a leading member of the Hanseatic League. Danzig is a product of Polish as well as of German civilisation.

Throughout its history Danzig's position at the mouth of the Vistula has been one of political isolation. Its possession has been disputed for nearly seven hundred years; and this year 1939, six hundred and thirty-one years after the coming of the Teutonic Knights, may well mark one more step in that unending dispute.

The city has never prospered without Polish goodwill, and Danzigers have usually preferred to stand well with Poland. They have understood that their position exacted a special status, and they have usually been glad to undertake the responsibilities which that implied. It was after the final partitioning of Poland that the special status of the city was developed on modern lines. In 1793 Danzig came under Prussian rule; in 1807, after the Peace of Tilsit, free port privileges were restored to the city, watched over by a Polish garrison; in 1814, once again, Danzig returned to Prussia and lost those privileges. It was therefore historically justifiable that the Allies, in carrying out Wilson's Thirteenth Point, should make of Danzig and its immediately adjoining territory a Free City.

Weimar Germany's grievance against Poland was not so much the retrocession of Danzig and its new status (for that was by no means unfavourable), as the driving of the "Corridor" between West and East Prussia and, on a wider view, the fact of Polish resurrection. Beyond the confines of the Free City, and only to a limited extent within them, there existed no Danzig question until 1933. Even then Danzig figured only as a minor item in the long account which the Nazi Party presented to the world for settlement.

But for the Free City itself the Danzig question was born in the same moment as the Polish State. Perhaps the main reason for this was the unwillingness of most Germans to believe that Poland could go on living as a separate State and their disappointment when the Battle of Warsaw proved that she could. There were plenty of facts to support the view of those middle-class Danzigers who said that Poland would quickly disappear, and that it was therefore better, from Danzig's point of view, to hasten that disappearance and unite again with Germany. And the workers saw in Poland the adversary of Soviet Russia and a product of international capitalism. In 1920, with the Russians advancing on Warsaw, the dockers of Danzig refused to handle munitions ordered for the Polish army, and in so doing they strengthened beyond all words—those were to follow—the Polish case for Gdynia.

In the nineteen years since then there have been two groups of opinion in Danzig: one group, the smaller but the more vehement, who have never reconciled themselves to Poland's existence and who have regarded the overthrow to Poland's existence as merely a matter of time; and the second group, composing the bulk of Danzigers, who were ready after the first few years to settle down and co-operate with the Poles as best they could.

From 1920 until 1925 the Nationalists governed Danzig. After a brief interlude of coalition between the Catholic Centre, the Liberals and the Social-Democrats, the Nationalists returned to office in 1926 and continued until the end of the following year. By that time the power of the League of Nations was running at full strength, the Polish State was firmly launched on its career and Weimar Germany seemed to have forgotten some of its bitterness.

In elections held in November, 1927, the Social Democrats ousted the Nationalists from their leading position, and two months later they formed another coalition government with the Centrists and the Liberals. The Nazis captured one seat.

Unlike the previous coalition government, however, they were less successful in their dealings with Poland. To a large extent they may be excused by the fact that it was in the years immediately following 1927 that the Poles began to construct the alternative port of Gdynia, fifteen miles away on the western side of Danzig Bay. In 1930 there were fresh elections, and this time the Nazis, drawing strength from their campaigns in Germany, increased their representation in the Volkstag to twelve seats out of seventy-two. More important still, they became the minority party which held the balance of power, and through this were able to exert a powerful influence on the Centre-Nationalist coalition which took office in 1931.

Long before the elections of 1933 it was clear that the Nazis hoped to obtain the two-thirds majority which was necessary to them before they could legally alter the con-

THE MIDDLE BALTIC

stitution, and that with the alteration of the constitution much else customary in Danzig would alter as well. Great preparations were made. Herren Goebbels and Kerrl made speeches in the Free City. On the eve of the poll Herr Hitler, now Reichschancellor, broadcast an exhortation from Berlin. If the Left Parties had needed a warning, it was given to them on May 12th, two weeks before the election, when Nazi storm troopers co-operated with the Danzig police to seize the headquarters of the trade unions. In the event the Nazis obtained 38 seats, more than half but still less than the necessary two-thirds of the Volkstag.

Dr Hermann Rauschning, a former member of the Danzig Nationalist Party, became President of the Senate (the executive governing body), presiding over eight Nazis, two Centrists and one Independent. Between June, 1933, and August, 1934, his administration spent, on public works and propaganda, money given by the Reich which was confidently reckoned to have amounted to a total of 30 million Reichsmarks. Almost at once after the elections, following the policy of Herr Hitler in Germany, there was a marked *détente* in Polish-Danzig relations, and on June 20th Dr Rauschning and Herr Greiser, the

Vice-President, went to Warsaw for economic discussions with the Polish Government. The visit was a success, and several important agreements were signed.

The new Government took about six months to get into its stride. Thereafter it is no exaggeration to say that there was no peace, either for the Polish Government, for individual Poles, or for Jews and members of the Opposition parties. By the end of 1934 the subsidies from the Reich had stopped flowing, and this loss of revenue, added to the difficulties caused by excessive expenditure, urged the Senate to demand new terms from the Poles.

The elections of 1935 were a bitter disappointment. Only 60 per cent. of the electorate voted Nazi, compared with 50 per cent. two years before. After the polling was over, the Supreme Court ruled that three per cent. of the Nazi votes in the City and ten per cent. in the rural districts must be discounted; in the end the Nazis gained only one seat more in the Volkstag on what they had had before.

## 2. The Versailles Status

ACCORDING to a letter written in 1919 by M. Clemenceau to Count von Brockdorff-Rantzau, leader of the German Delegation at Versailles, Danzig was "severed from Germany because in no other way was it possible to provide for the 'free and secure access (of Poland) to the sea' which Germany has promised to concede." The City was put under the full protection of the League, and League representation was provided for (and still exists, in theory, in the person of Dr Karl Burckhardt); although subsequent events have rendered that protection invalid, it should be noted that at no time was the Polish Government in a position to influence directly the general Government of Danzig.

In accordance with Article 104 of the Versailles Treaty, a convention was made whereby Danzig was placed within the Polish Customs area, Poland was assured the free use of the port without any restriction, and also control and administration of the Vistula and railway system as well as of postal, telegraphic, and telephone communications between Poland and the port. Poland further has the right to develop and improve the waterways, docks, etc., to provide against discrimination, and to conduct the Free City's foreign relations. In its final form, signed at Paris in November, 1920, the convention provided for the setting-up of a Harbours and Waterways Board with equal representation of Poles and Danzigers. The Customs service was to be manned by Danzigers under Polish supervision. The number of Polish Customs inspectors has usually been about 35; some months ago this was increased, but the total is still less than one hundred.

In regard to the defence of the Danzig Free City, it is

It was only too clear that the people were not sufficiently with them.

The history of the last four years is one of open and ruthless coercion. As early as 1935 the League High Commissioner in Danzig remarked that his own "intermittent efforts" had not "prevented the application of an anti-constitutional policy in a steadily increasing degree." On October 20, 1937, the Centre Party was dissolved, and with it went the last remnant of the Opposition; and in the same month there were anti-Jewish riots. The League Commissioner's office had already become a farce.

As a slogan, "Back to the Reich" did not appear until after the elections of 1935. Even then, although reversion to the Reich must have been the Nazi aim since the beginning, the Senate soft-pedalled during the next two years; and it was not until the September success in Czecho-Slovakia that Berlin gave orders for a full-blast campaign of reversion.

important to note that Poland was provided by the League with full powers to act against all possible forms of aggression. On such questions the Council of the League came to very precise conclusions. A report by Viscount Ishii was adopted on June 22nd, 1921, whereby

it will be within the competence of the High Commissioner to anticipate the authorisation of the Council and to address a direct invitation to the Polish Government to ensure the defence of Danzig or "the maintenance of order" in the following cases:

(a) In the event of the territory of the Free City being the object of aggression, threat or danger of aggression from a neighbouring country other than Poland, after the High Commissioner has assured himself of the urgency of the danger;

(b) In the event of Poland being, for any reason whatever, suddenly and effectively prevented from exercising the right possessed by her under Article 28 (to import and export freely via Danzig) of the Treaty of November 9th, 1920.

It will be recognised that these two alternatives fully cover the present threat to the *status quo*.

In its original form (i.e. before the Nazis obtained power) the Danzig Statute provided for autonomous government through a Volkstag, or legislative chamber, and a Senate, or executive cabinet. The Volkstag was to have 72 members, and the Senate 12. The President of the Senate would be the head of the Government. The population of the Free State is about 400,000, of which rather less than ten per cent. are Polish, and the area of it is about the size of a large English county.

## 3. Danzig in 1939

THE fortunes of Danzig are to-day, as they have been for the past three and a-half years, in the hands of a small group of men whose one aim has been to transmit effectively the orders of Berlin. In general, they may be commended for their efficiency, for they have let nothing stand in their way, least of all the commercial well-being of the Free City. They have stamped out all overt opposition, confiscated much Jewish property, and instituted all the paraphernalia of the party-State. They have taken under their hand every organ of administration and opinion, and the apparatus of suppression and repression has been faithfully copied from the Reich.

Not all of this small group of men are Danzigers. The most important of them, Herr Forster, is a Bavarian who first went to Danzig in 1930. In his capacity as secretary of the Danzig Nazi Party, he has since then carried the mantle of the Fuehrer himself. In addition to being

Gauleiter of Danzig, Herr Forster is a member of the Reichstag, and at the time of his appointment was also a Prussian Counsellor of State. It is he who takes the stand at big parades, makes the important speeches, and has the final say on every question of policy. Playing Fairfax to Herr Forster's Cromwell, Herr Greiser became Vice-President of the Senate in 1933, and shortly afterwards, when Dr Rauschning proved impossibly scrupulous, full President of the Senate. His main task has been that of drawing the world's attention to Danzig; among his more successful public appearances was the occasion on which he thumbed his nose at the Press of the whole world during a meeting of the Council of the League of Nations. Both from his manner in negotiation and the matter of his public utterances it is obvious that Herr Greiser is a man of much smaller capacity than Herr Forster. He is, however, a Danziger.

Lesser lights who play important rôles in Danzig are

Dr Fuchs, the head of the Senate's Press department, and Herr Zarske, the editor of the *Danziger Vorposten*, the organ of the Danzig Nazi Party. Beyond that it is unprofitable to go, for the local Nazis are no longer in control. During the past three months or so there has been a steady infiltration of Reich Germans, police, propagandists, soldiers and civilians. It may be presumed that complete Reich control has now been established for several months. By a Senate decree issued on Thursday, Herr Forster took over complete power in the Free City, thus sweeping aside the Versailles Statute.

In the early days of Nazi government in Danzig its organisations comprised only an inconsiderable number of people, and on October 10, 1937, Herr Forster publicly admitted that only one-tenth of the population (of which the total is about 400,000) belonged to the party. But after the failure of the 1935 elections to yield a majority by constitutional means, voluntary enthusiasm was no longer left to work on its own. Coercion came to help it. While it is impossible to state the exact number of men organised by the Nazi Party, and therefore presumably liable to terms of military service, the number may be estimated within rough limits. According to the 1929 census figures there are in Danzig some 75,000 German-speaking males between the ages of 20 and 50. It is reasonable to assume that two-thirds of these are enrolled in party organisations and that one-fifth would be available for immediate military service. To these must be added from two to four thousand "tourists," members of the Reichswehr and of the German police. The total of effectives is therefore somewhere in the neighbourhood of 20,000, and probably rather less than this number.

That, then, is the picture of Danzig at the moment of its greatest crisis. A city inhabited by Germans and governed by a Nazi dictatorship which is sincerely supported by only a fraction of the population. The dictatorship is so complete, and Polish supervision so abruptly set aside, that reversion of the city to the Reich would mean very little alteration from its present regime.

It must, therefore, be asked why the whole Polish nation is prepared to fight odds which may be overwhelming in order to prevent that reversion. Setting aside the arguments of prestige and propaganda, the Poles have two reasons. It will be seen that they are quite conclusive.

The first reason is economic. Gdynia has grown mightily, but it is not yet, and cannot be in any near future, able to handle the whole of Poland's maritime trade. If Danzig is ceded to Germany, even on the condition that Poland is to retain her free-port rights, the Germans will have obtained a trump card for the purposes of diplomatic and commercial bargaining.

The second reason is even more important, though it is closely linked to the first. Danzig and its territory, wider

from east to west than the Polish Corridor, was established by the Treaty of Versailles as a demilitarised zone. Neither the Free City authorities nor the Polish Government are allowed to maintain troops there or to make military dispositions, the sole exception to this being the small Polish guard over the munitions dump on the narrow Westerplatte peninsula, marked on our map. So long as the territory remains demilitarised, the Poles may rest assured of their ability to repel, or at least to counter, a surprise attack on the Corridor. But a glance at the map will show that the defence of the Corridor is conceivable only so long as Danzig remains clear of German troops.

Danzig, then, must remain demilitarised; and if it cannot be Polish then it must not be German.

It may be answered that, in fact, Danzig is no longer demilitarised. Since the middle of June the Government of the Reich has collaborated intimately in an emergency militarisation of the Free City and territory. In addition to the dispatch of troops and special police, large quantities of arms and ammunition have been sent into the Schichau Wharf (see map), from which Polish customs inspectors have been forcibly excluded, smuggled across the frontier from East Prussia, and transported in barges over the waters of the Frisches Haff. The small island of Holm has become a regular arsenal. Anti-aircraft guns, field guns, and even heavy Skoda guns taken from the Czecho-Slovak fortifications have been mounted on the Bischofsberg and other strategic points. Schools have been turned into barracks, new barracks built, and trench lines dug to the south and west of the city. For weeks many thousands of armed men have been training and standing to arms.

The implication is clear. By the terms of the Statute the Poles are now entitled to march into Danzig to restore the status set up at Versailles. The German Government means to make it impossible for them to do this without provoking general war.

If the German Government's calculations prove wrong, and Poland orders her troops into Danzig, the fight that will follow may be expected to be brief and brisk. Danzig's *Heimwehr*, unless heavily reinforced from East Prussia, will be swept, more or less literally, into the sea. For although they have now established direct communication with Elbing by way of a pontoon bridge between Kaesemark and Rothebude and the road-bridge at Einlage (the other bridges are at Marienburg and Tczew), they will face Polish troops advancing from Tczew and from the south-west and west. While they are retreating to their trench lines they will be shelled from the heavy guns on the Hel Peninsula, which guards Danzig Bay, and from the batteries which the Poles are understood to have in position at various points on the border of the territory. With the appearance of the German Army, of course, the war would enter an abruptly different phase.

THE FREE CITY OF DANZIG

## 4. Danzig's Share of Poland's Trade

DANZIG is an economic dependent of Poland. This is as indisputable as that its population is German. The Germans argue as if Poland's trade policy must be arranged to suit Danzig's convenience and Poland's thirty-three millions must dance attendance on Danzig's four hundred thousand. The argument stems from German unwillingness to be reconciled to the existence of Poland: in the face of facts it makes the sheerest nonsense.

The Danzigers have only one substantial grievance against Poland, and that is that Poland is economically no longer entirely dependent on Danzig. The thirty-three millions have at last got the better of the four hundred thousand. Basically Danzig's case against Gdynia rests on a decision of the League High Commissioner in 1921 that: "the Polish Government will engage to make full use of the port of Danzig, whatever other ports she may open in the future on the Baltic coast..." This statement has been variously interpreted by jurists, but generally this engagement is assumed to have been implied by the terms of the Versailles Treaty.

Setting aside the fact that the refusal of Danzig's dockers to load munitions in 1920, and the conduct of the Nationalist Senate up to 1927, were between them largely responsible for inspiring the Poles to a most costly and difficult effort, there is sufficient substance in the case put forward by Danzigers to make it worthwhile examining the facts.

The tables below tell the whole story in a comparison of the trade handled by Danzig and Gdynia.

TRAFFIC HANDLED BY DANZIG AND GDYNIA  
(In millions of tons)

|              | 1936 | 1937 | 1938 |
|--------------|------|------|------|
| Danzig ..... | 5.30 | 7.20 | 7.13 |
| Gdynia ..... | 7.74 | 9.01 | 9.17 |

POLISH TRAFFIC THROUGH GDYNIA AND DANZIG, 1928-1938

|                     | 1928  | 1929  | 1933 | 1934 | 1935 | 1936 | 1937  | 1938  |
|---------------------|-------|-------|------|------|------|------|-------|-------|
| (In million tons)   |       |       |      |      |      |      |       |       |
| Exports:—           |       |       |      |      |      |      |       |       |
| Gdynia .....        | 1.6   | 2.5   | 5.0  | 5.9  | 6.3  | 6.3  | 7.2   | 7.4   |
| Danzig .....        | 6.7   | 6.9   | 4.6  | 5.3  | 4.2  | 4.4  | 5.1   | 5.2   |
| Imports:—           |       |       |      |      |      |      |       |       |
| Gdynia .....        | 0.1   | 0.2   | 0.7  | 0.8  | 0.9  | 1.2  | 1.5   | 1.3   |
| Danzig .....        | 1.6   | 1.6   | 0.4  | 0.4  | 0.4  | 0.5  | 0.8   | 0.8   |
| Total:—             |       |       |      |      |      |      |       |       |
| Gdynia .....        | 1.7   | 2.7   | 5.7  | 6.7  | 7.1  | 7.4  | 8.6   | 8.7   |
| Danzig .....        | 8.4   | 8.4   | 4.9  | 5.6  | 4.6  | 4.9  | 5.9   | 6.0   |
| (In million zlotys) |       |       |      |      |      |      |       |       |
| Exports:—           |       |       |      |      |      |      |       |       |
| Gdynia .....        | 45    | 71    | 239  | 270  | 311  | 370  | 477   | 485   |
| Danzig .....        | 588   | 699   | 284  | 328  | 278  | 306  | 316   | 278   |
| Imports:—           |       |       |      |      |      |      |       |       |
| Gdynia .....        | 34    | 64    | 297  | 385  | 451  | 578  | 721   | 698   |
| Danzig .....        | 888   | 793   | 124  | 84   | 77   | 71   | 100   | 98    |
| Total:—             |       |       |      |      |      |      |       |       |
| Gdynia .....        | 79    | 135   | 536  | 655  | 762  | 948  | 1,198 | 1,183 |
| Danzig .....        | 1,476 | 1,492 | 408  | 412  | 355  | 377  | 416   | 376   |

Judged on the *volume* of goods, Danzig has nothing to complain of; judged on the *value* of goods, she has weighty evidence to support her case. More and more the Poles have left Danzig to handle the heavy, and therefore less remunerative, exports such as coal and metal ores, and sent through Gdynia their grain and dairy produce. It will be seen from the tables that nearly all of Poland's maritime imports come through Gdynia, denuding Danzig not only of docking and handling fees but also of much of the customs revenue on which the City's finances largely depend.

Among the agreements which followed the visit to Warsaw of Dr Rauschnig and Herr Greiser in 1933 was one which contained an undertaking by the Polish Government to give Danzig an equal share with Gdynia in Poland's maritime trade, both as regards quantity and quality. In return the Danzig Senate was to cease its anti-Polish policy. In the event this agreement was never carried through, although a protocol to it was signed and repeatedly extended until December of this year. The above tables show that the terms of the agreement have not been fulfilled by the Poles; nor, of course, has the Senate carried out its undertaking.

There are many ways of illustrating the discrepancy between value and volume. In 1937 Danzig's exports other than coal fell by nearly 200,000 tons; while imports other than metal ores rose by only 88,000 tons. Over the same period Gdynia's exports other than coal rose by over 55,000 tons, and imports other than metal ores rose by nearly 1.27 million tons. Both grain and timber exports have been consistently diverted over Gdynia. There is scarcely any dairy produce exported through Danzig. In 1929 Danzig handled 212,000 tons of Polish sugar; today she handles none. In 1929 81,000 tons of cement were handled in Danzig, nine years later it was only 500 tons—while Gdynia's consignments had meanwhile risen from nil to 54,000 tons. Imports of copper and zinc are almost entirely through Gdynia. In 1938 Danzig's 0.8 million tons of purely Polish imports were worth 98 million zlotys, Gdynia's 1.3 million tons were worth 698 million zlotys.

The Polish reply is to point to the conduct of the Danzig Government as an irrefutable argument for pressing on with the equipment of Gdynia. They cannot afford to risk the probability that their maritime trade (which in 1938 amounted to 78 per cent. of all their foreign trade) will

otherwise be subjected to hindrance and delay by a Danzig Government under the direct orders of Berlin. They point, too, to the volume figures while omitting to compare them with the value figures; and without that comparison they are of course on very safe ground. In 1920 Danzig handled a total trade of 1.84 million tons. By 1928 this had risen to 8.62 millions, well over four times the pre-war level. In 1933, at the bottom of the slump, the figure still stood at 4.95 million tons; by 1938 it was six millions.

Nor do the Poles admit that the equipment of Danzig has been neglected. It is estimated by one Polish authority that up to 1930 more than 32 million gulden (about £1,250,000) were spent on improving Danzig's harbour equipment.

Exports of timber through Danzig have increased from less than 300,000 tons before the war to an annual average of about 1,000,000, and this increase has meant a big extension in handling and storing facilities. A large number of new cranes, warehouses, handling equipment, have been installed; the length of quays has been extended.

On an unprejudiced view, therefore, Danzig's complaints have only a relative significance. That the Poles have not given Danzig all they promised (and far from what the Danzigers demand) does not obscure the fact that after 20 years of Polish supervision Danzig is a greater city than ever before in its history.

## THE WORLD OVERSEAS

### Poland's Monetary Problems

THE economic life of Poland to-day is dependent on the momentary political horizon and on the needs of national defence to a degree not to be found in any other country—certainly not in either England or France. A century of partition and the depredations of rival armies during more than six years of war withheld from Poland the fruits of the industrial development of the nineteenth century; since then she has nevertheless been compelled to focus her major effort upon making good the deficiency on the military side, while leaving the development of consumption goods industries until some more auspicious moment.

Further difficulties have been encountered in the monetary field. Poland lacks the reserves available in richer countries for the financing of intensive military preparation and the maintenance of an abnormally large force under arms. The difficulties have been overcome so far by means of bank credits and the issue of an Air Defence Loan. The latter owed its success largely to compulsion, which was necessary despite the enthusiasm with which it was greeted, and to the fact that (rather on the model set by Germany) the loan could be used for the payment of taxes to the State. Pressure upon available resources meanwhile continues and may yet make necessary drastic changes in monetary policy. It was doubtless with this consideration in mind that the Polish Government, through the economic mission it recently sent to London under Colonel Koc, pressed for a gold transfer (the actual amount mentioned was £5,000,000) which might be used for easing the financial strain. The plainest sign of financial pressure is the continuous increase in the monetary circulation, revealed in the following figures:—

|                         | Note Issue | Coinage | Total Monetary Circulation |
|-------------------------|------------|---------|----------------------------|
| June 30, 1937.....      | 989.5      | 427.6   | 1,417.1                    |
| June 30, 1938.....      | 1,137.4    | 431.4   | 1,568.8                    |
| September 30, 1938 ..   | 1,547.5    | 461.2   | 2,008.7                    |
| February 28, 1939 ..... | 1,289.4    | 431.8   | 1,721.2                    |
| March 31, 1939 .....    | 1,669.4    | 455.4   | 2,124.8                    |
| June 30, 1939 .....     | 1,847.8    | 480.1   | 2,327.9                    |

\* £1 = about 25 zlotys.

These figures would suggest a very considerable inflationary movement in Poland; but it must be remembered that there has been, during the last two years, a widespread movement of note hoarding which has become more pronounced with each successive crisis. The best guess that can be made is that something of the order of half the 900 million zlotys by which the monetary issue has increased over the period has simply been withdrawn from circulation so that to this extent the increase has not so far given rise to an expansion of money in use.

During the last few weeks there has been a new and inconvenient, if not very serious, wave of hoarding in the form of the accumulation of silver coins—whose bullion value is the accumulation of silver coins—whose bullion value is only 14½ per cent. of their face value. The result has been the almost complete disappearance of any coin of value greater than 50 groszy (about 5d.)—so that the change for the smallest note usually consists of over forty coins.

But this reveals only the monetary side of the picture. There are also a number of factors which suggest that the production policy followed in Poland has not been as expansionist as it might have been. All the indices of prices and the index of the cost of living are lower now than they were at the end of 1937 despite the considerable increase of the monetary circulation in the meantime. The index of production of 126.8 in March, 1939 (base 100 = 1928), shows only a comparatively moderate increase over the pre-depression years when set beside the enormous possibilities of development available in Poland. Further, of the 54 manufacturing industries where such a comparison is possible, the physical output has fallen in 1938 compared with 1929 in the case of 17—and these are for the most part working for a home market which is far from being satiated. Then, again, the

published figure of 456,000 unemployed for the end of 1938 is very little below the maximum figure reached during the depression (470,000 for the end of 1937) and still greatly above the 1929 figure of 185,000. Since these figures do not include the total number of unemployed it is clear that the available reserves of labour in Poland, even without calling on the teeming population of the villages, is still far from being exhausted.

The fact is that the state of the banking system and the lack of a private capital market make it impossible to develop new private industry in Poland to-day except, on the one hand, from the internal savings of existing firms or from the resources of individuals personally known to the entrepreneur or, on the other hand, from funds provided by the Government for military reasons. Thus long-term financing is haphazard in the extreme. An enterprise may obtain almost unlimited sums without interest or at a moderate rate (say 5 per cent.) if it has the blessing of the military authorities, while if it lacks that support funds will usually not be available on any terms; if they are the rate will not be below 9 per cent. and will often be very much higher. The same differences are to be found in the provision of working capital where even first-class private firms have to discount at about 8 per cent. and other private firms at 12 per cent. and more. It should be noted, however, that the published rates of interest are exceedingly delusive in Poland, owing to the practice of charging costs and commissions amounting to anything from 1 to 3 per cent. in addition to interest. At the same time funds have been made available for house-building at 5½ per cent. or even less. At a time like the present it may well be impossible to avoid this unsatisfactory method of financing, but it does appear that more funds might well be put at the disposal of sound industrial borrowers and that the State might mitigate its policy of taking all the available capital, often for purposes which have very little military importance.

#### After Deflation

Until almost the end of the great depression Poland followed a policy of rigid deflation in an attempt to maintain the value of the zloty at the level fixed in 1927. But by 1936 the pressure had become too severe; industrial production was still only 72 per cent. of what it was in 1928, wholesale prices 54 per cent. and the value of exports only 30 per cent. But even when it was decided to abandon deflation there was no decision to devalue; exchange restrictions were introduced in the middle of May, 1936. From this date the recovery of Polish industry began. It became unnecessary to preserve the large favourable trade balance which had been built up at such cost during the depression period. But a more important factor than the partial moratorium on foreign debts and the prevention of the export of capital from Poland lay in the fact that exchange control could be and was used to carry through an effective devaluation of the zloty. There was at the time and there still is a powerful demand for the formal devaluation of the zloty by persons who do not relish the extensive control of industrial activity which comes with exchange control. But these have been overruled, chiefly on the ground that a further devaluation would give rise to extensive distrust in the zloty among the peasant population and lead to a flight into goods and a reversion to the former practice of using foreign money for internal transactions. The recent waves of hoarding show that these fears are not wholly unreasonable.

But the problem remained that Polish prices were well above the world level and a further dose of inflation would have been intolerable. The method actually employed was that of a revenue tariff. Imports were restricted by the use of the power given by exchange control, and various methods used to persuade the exporter to accept a considerably lower zloty price from a foreign purchaser than he would have done from a Pole. Thus there are products for which the

domestic price is 15 zloty and the price for export 9 zloty, which means that, at the official rate of about 25 zloty to the pound, the pound will buy goods for which the internal price is about 40 zloty, which compares with the rate paid on notes in London of 30-40 zloty to the pound. The effective rate which can be calculated in this way differs according to the product and the country to which it is sent, but, with very few exceptions, the rate is considerably lower than the official rate, so that, despite the endeavours made to keep up appearances, the zloty is in effect devalued.

This policy has its merits, but involves a complicated and rigid apparatus of control which could be greatly simplified if the zloty were adjusted.

In Warsaw rumour has even gone so far as to suggest that formal devaluation, coupled with the removal of exchange restriction, was a condition for the grant of credits from Britain. There seems to be no more in this than the fact that the British authorities no doubt recommended this course, and were answered by the plea that it was impossible in the present state of confidence. But there seems still to be a good possibility of devaluation in the autumn, if the dangers abroad do not bring war. If a reserve fund in sterling were then made available it might be possible to relax the restrictions progressively, as was done in Austria between 1935 and 1938. In the short run exchange restrictions may be very useful, but until they are removed in Poland there is no chance of developing the confidence without which foreign capital will not be available. And it is only when foreign capital becomes available that the fundamental economic problems of Poland can be solved. But here, as elsewhere, a future policy must give way to the military needs of the moment, for without adequate defence there will be no future to provide for.

## German-Russian Relations

[BY OUR BERLIN CORRESPONDENT]

THE conclusion of a commercial and credit agreement between Germany and Russia came as a surprise after the many months that the negotiations had lasted. The movement of goods between the two countries has fallen to only about one-tenth of the 1930 level, so that an increase should be relatively easy to bring about. The new agreement governs, in summary form, the commercial exchanges of the two countries for the next two years. Germany accords Russia a credit of Rm. 200 millions, as was expected. This is, in practice, only a renewal of the 1935 credit, of which, in spite of frequent prolongations, only Rm. 182 millions had been used up to June 30, 1937, partly because German industry was either unwilling or unable to deliver the goods Russia required, partly because objection was taken to the qualities, delivery dates or prices quoted. Russia now undertakes to deliver Rm. 180 millions of goods (especially raw materials, oil, grain and wood) to Germany in the next two years. The structure of German-Russian trade and the importance of Russian raw materials for Germany can be seen from the following figures of the imports of the old Reich from Soviet Russia in 1937 and 1938:—

|                            | 1937<br>(Rm. millions) | 1938 |
|----------------------------|------------------------|------|
| Sawn timber .....          | 13.7                   | 18.6 |
| Petroleum and products ... | 14.9                   | 4.8  |
| Tobacco .....              | 4.5                    | 4.5  |
| Raw phosphates .....       | 1.56                   | 3.15 |
| Manganese ore .....        | 2.9                    | 2.9  |
| Flax .....                 | 6.7                    | 2.3  |
| Foodstuffs .....           | 1.5                    | 1.9  |
| Vegetable fats .....       | ...                    | 1.3  |
| Pit preps .....            | 0.4                    | 1.1  |

In the last two years the chief German (old Reich) exports to Russia have been as follows:—

|                                    | 1937<br>(Rm. millions) | 1938 |
|------------------------------------|------------------------|------|
| Machinery .....                    | 72.3                   | 11.1 |
| Of these, machine tools ..         | 47.8                   | 7.4  |
| Scientific and optical instruments | 6.7                    | 4.9  |
| Wire .....                         | 2.2                    | 3.1  |
| Chemicals and dyes, etc. ....      | 6.2                    | 3.3  |
| Ferro-alloys .....                 | 3.5                    | 2.1  |
| Tubes .....                        | 2.7                    | 1.3  |

Germany's exports to Russia are mainly finished industrial goods. Russia used the credit of 1935 to order (figures in Rm. millions): machine tools 87, machinery for chemical, cement or foodstuff factories 21, optical and scientific instruments 15, mining equipment 14, electric machines 9, power

machinery 8, printing paper and textile machines 6, ship-building equipment 2.5 and railway material about 1.

As Russian industry is capable of producing most mass-produced articles, the Russian demand is concentrated on special machines and equipment of high value, and German industry will have to make very severe efforts to meet the Russian orders, since it is not now in a position to use its export quotas even for payment in free currencies.

A commercial treaty, however, especially one concluded at this precise moment, is of fundamental importance, the more so since it has provided a basis for the non-aggression pact between Germany and Russia. The interests of other countries trading with Russia and other East European States are clearly affected by it. Germany's relations with the primary-producing countries have been much worsened by the expansion policy of the Third Reich. Germany was faced with the necessity of seeking an understanding with Russia in order to ensure the supply of the raw materials and food-stuffs necessary for the continuation of the armament programme. Hitler's primary aim is to be sure of his supplies, since there are no illusions that the domestic stocks of raw materials would last long in conditions of intensive demand for them, or that the soil would stand up for long to intensive cropping.

Given conditions favourable to Germany, Russia might form a broad enough basis of supply. If the situation develops as is hoped in Berlin, Germany will be indifferent to pressure from the west. Moreover, the Western Powers will disappear from Eastern Europe as political or commercial competitors with Germany. This can be seen from the geographical distribution of Russia's exports and imports. The figures in the following table have been converted into millions of Reichsmarks at the official Berlin rates:—

|                          | Imports from<br>Russia |       | Exports to<br>Russia |       |
|--------------------------|------------------------|-------|----------------------|-------|
|                          | 1937                   | 1938  | 1937                 | 1938  |
| Germany (Old Reich)..... | 65.1                   | 47.4  | 117.4                | 31.8  |
| Greater Germany .....    | ...                    | 52.8  | ...                  | 33.6  |
| Great Britain .....      | 357.9                  | 238.4 | 240.0                | 212.5 |
| Of which, re-exports ... | ...                    | ...   | 202.1                | 134.0 |
| U.S.A. ....              | 76.9                   | 60.1  | 107.2                | 174.2 |
| Belgium and Luxembourg   | 62.9                   | 66.4  | 37.8                 | 37.2  |
| Holland .....            | 55.4                   | 43.5  | 30.3                 | 32.0  |
| France .....             | 72.6                   | 44.5  | 11.3                 | 12.4  |
| Switzerland .....        | 7.8                    | 16.5  | 4.2                  | 5.8   |

In recent years Russian orders have been diverted to the United States, Great Britain and Holland; under the new agreement they could be re-diverted to Germany. Such a development is all the more likely, since Russian industry was largely equipped with German machinery, which must now be renewed or replaced. The purchase of English or American machinery would be more costly and less convenient. Under the influence of the Rm. 300 million credit of 1926, the two so-called Piatakof Agreements of 1931 and 1932 and the Rm. 200 million credit of 1935, Germany's portion of the Russian market rose to 47 per cent. of the whole of Russia's imports and 24 per cent. of the total exports in 1932. What has been done before can be done again.

August 23rd.

## French Economic Strength

[FROM OUR PARIS CORRESPONDENT]

STATISTICS concerning two great departments of French industry, metallurgical production and the export of automobiles, have just been published. Both show spectacular progress. The production of pig iron was 732,000 tons in July, against 719,000 tons in June and 433,000 tons in July, 1938. This brings production in the first seven months of the year up to 4,477,000 tons, against 3,610,000 tons in the corresponding period of 1938. The production of steel was 745,000 tons in July, against 763,000 in June and 436,000 in July, 1938, the production of the first seven months being 4,707,000 tons, against 3,664,000 tons in January-July, 1938. Furnaces in blast number 106, against 86 in June, 1938. Exports of automobiles in the first seven months of the year amounted to 20,904, against 12,250 in the corresponding period in 1938, a proof that the activity of the "civil sector" can be compared to that of the "war sector."

These statistics—however interesting to experts—are not closely followed by the general public. Results so favourable to the welfare of the community do not explain the remarkable calm and confidence of the country, in spite of the inter-

national tension. The average Frenchman remains individualistic and apt as ever to estimate the state of home politics according to that of his domestic affairs. And his present confidence is certainly created by the comparison of his private affairs two years ago at the time of the "vicious spiral" of a falling currency and rising prices with his present improved possibilities of spending and saving.

The new method of the Government in financing rearmament through the short-term instead of the long-term market is the other explanation. The Stock Exchange is lifeless. But nobody is anxious any longer about the market for public funds, which remains very stable. Monthly statistics show that the national debt was 444 thousand million francs at the end of June, an increase of 4,500 millions on May 31st and 23,500 millions on January 1st. The State borrows at least 1,000 millions a week. Figures show that the short- and middle-term debt maturing in 1939 has decreased from 37 to 27 thousand millions during the last six months. The redeemable debt has increased from 173 to 186 thousand millions; the middle- and short-term maturing in 1940 increased from 29 to 33 thousand millions, and that maturing after January 1, 1941, from 26 to 43 thousand millions. Once again, such information principally concerns the experts, who are often anxious to underline the favourable evolution of Governmental policy. But the general public still is unacquainted with statistical documentation, and the man who saves is satisfied with the old National Defence Bonds, which answer to his need, being a short-term bond bringing an "honest" interest and exempt from tax charges.

In short, the workers are working overtime, the peasants are favoured by high agricultural prices, and those who can save have discovered new possibilities of building up their reserves. The confidence of the French people is not based on spectacular collective results and collective mysticism. It is made up of many millions of modest individual satisfactions. This is the key of the successful method of M. Reynaud.

It is particularly important that the Treasury can face a new international crisis with a confidence born of the fact that its ready money was 16 thousand million francs on July 1st, and the calmness of the country has encouraged the current of returning gold and subscriptions to bonds. A new mobilisation can, in fact, be foreseen with equanimity, while a return to peace would open the way to useful operations for funding the floating debt.

August 24th.

## Luxembourg, Peaceful and Free

[FROM A CORRESPONDENT]

THE Grand Duchy of Luxembourg is a peaceful land abounding in natural loveliness. Of all countries of war-jittery Europe it seems the one farthest removed from strife. It comprises an area just short of a thousand square miles, wedged like a shoe-shaped puzzle block into a hole in the map made by segments of French, German and Belgian borderland. Its 300,000 or so inhabitants are a happy people fond of good living. This year they are celebrating the centenary of their independence from the war lords, large and small, who for more than a thousand years ruled over it. But they are troubled, for they see the Siegfried line along their rivers and, remembering the German invasion during the Great War, they are now anxious lest this tragedy should happen again.

Luxembourg has always been important strategically. In the past it has been a kind of European crossroads for marching armies. Here the Moselle opens a way to and from Germany. Here, too, you are within striking distance of Holland, Belgium and France. For Germany Luxembourg would be particularly valuable in a war because it constitutes a gap in the Belgian line of defence; though, on the French side, the Maginot line sets up a formidable barrier to any German advance. In past days Luxembourg was so heavily fortified that it was called Europe's Inland Gibraltar. Those forts have long since been dismantled, and Luxembourg has no system of defence whatever.

It was the German war hero Siegfried who first raised his castles on Luxembourg's high cliffs as long ago as 963; and since Siegfried's day a varied history has woven itself around this land. In 1244 Luxembourg's citizens received a charter of self-government from the Countess Esmerinde. Then, for nearly five centuries it fell under foreign domina-

tion—Burgundian, Spanish, Austrian and French. The Congress of Vienna set up the present Grand Duchy, which for a time was under the tutelage of Holland.

The present Grand Duchess, Charlotte, was born in 1896, succeeding her sister, the Grand Duchess Marie-Adelaide, whose forced abdication, because of her partiality for the Germans during the war, was a tragic episode in Luxembourg's history. The people have a Parliamentary Government. The Parliament consists of a single house with 52 Members chosen from the country's twelve cantons. There is a Cabinet of Ministers, a Prime Minister, and a Council of Elder Statesmen. At present there is a coalition Government of three parties, of which the two strongest are the Clerical and Labour; the third party is the Radical Liberals, representing industry and finance.

It is the religious issue that is the principal subject of political dissension in Luxembourg. Although there is no union of Church and State the clergy are paid salaries from the public purse, while the Church also benefits by certain local tax levies. The Labour Party takes the lead in asserting that the Church Budget constitutes too heavy a burden, while it is also critical of the Church political activities.

### Industry and Agriculture

Luxembourg, in addition to its strategic position, has another attraction to Germany, namely, its iron mines and smelters. Iron is produced mainly in the Northern strip of the country lying next to the French border town of Longwy, itself one of the most important centres of the French iron and steel industry. In this area are virtually all the blast mills of Luxembourg together with those of Longwy. There are about a dozen mining and smelter towns in all, the largest, Esch, having a population of 30,000; and, aside from this narrow area, the little country seems as remote from modern industry as it was in its most medieval days.

The steel produced in this small region places Luxembourg seventh among the ranking steel-producing countries. Its output in 1937 was 2.5 million tons. Iron ore production in 1937 was 7.7 million tons.

Before the Great War Luxembourg formed part of the German customs union. After the war a customs union with France was approved by a popular vote. The fact that 60,000 voters out of 90,000 favoured this union may serve to indicate the pro-French sentiment; but France declined the invitation in favour of Belgium. Thus in 1932 Luxembourg became part of the Belgian customs union. One of the consequences of this was a growing Belgian influence: the shops are filled with Belgian wares.

In addition, Belgian money is currently used together with Luxembourg's own coin of the realm. The Luxembourg franc is pegged at about 25 per cent. above the value of Belgian money and 60 per cent. above the French franc; and it is well to carry three purses in Luxembourg, for you may use any of these three monies. Although the "Franc Lux" is pegged high, prices are low, and Luxembourg is about the cheapest country in Europe. Eight francs, or about thirteen French francs, buy a meal that would cost from 25 to 30 francs in France itself.

The capital city, also called Luxembourg, is a stately metropolis of broad avenues, spacious plazas, green rambling parks, of imposing public buildings, churches and monuments. It is a modern city travelling in harness with a city centuries old, of which old city gates, towers, palaces, castles and dismantled fortresses in great profusion tell the story. The "Greater City" has less than 60,000 inhabitants but, because of its wide-spreading spaciousness and fine buildings, one would at first glance make it a city of at least 200,000. It is a place where everyone has elbow room and to spare.

The Moselle, brushing by Luxembourg from France, is a

broad stream, placid and lovely as it moves slowly between gently sloping strips of meadow that separate the vineyards from the water's edge. Vineyards climb these hills as they slope away on both sides. Here the famous Moselle wines are produced; and Luxembourg vineyards produce an average of 80,000 hectolitres of various kinds of Moselles. Under the old customs union with Germany, Luxembourg wine was sent out readily to the world markets with the German Moselles. But the Belgians have established no such wine markets and they themselves are no great connoisseurs. This has created something of a slump.

The land is very rich indeed in agricultural production and maintains a large modern agricultural college. An Englishman, Sidney Thomas, has made his contribution to the wealth of its soil. A rather hilly part of the country, towards the North, lay in fens and barren ground, because the land lacked lime and phosphorus. Thomas, in 1890, taught the Luxembourgers that their lime and phosphorus lay right at hand in the basic slag. The land has grown fertile again, and the people refer with gratitude to their "Scories Thomas," as this fertilising product is called. It is on the knees of the gods whether the Luxembourgers will be left much longer to their farming and their peace.

August 22nd.

## Anxieties in the American Middle West

[FROM OUR KANSAS CITY CORRESPONDENT]

MID-SUMMER finds the central part of the United States seasonally preoccupied with agriculture. Nature has been only moderately bountiful this year. It is true that there has been no repetition of the disastrous droughts of 1934 and 1936; and that even the much-publicised "Dust Bowl," if not exactly blooming like the rose, at least no longer seems immediately destined to become desert. But the wheat crop was relatively small, and maize (which was in excellent condition during June) has been damaged by the recent heat. Finally, abnormally low grain prices have done nothing to lessen the farmers' disappointment.

On the other hand, pasturage is unusually good, and the livestock industry flourishes, despite threats of a strike among packing house workers. Present indications also point to an abundance of fruit. Indeed, the total farm income of the Middle West is somewhat larger than it was a year ago at this time (according to the latest estimates of the Department of Agriculture). But estimated farm income includes various Government payments, and no intelligent farmer is entirely comfortable about a situation in which subsidies continue to play so large a rôle.

It is generally recognised here that for any sound prosperity American agriculture requires the recovery and development of its foreign markets. Secretary Hull's trade agreements policy has received some of its strongest popular support from the farming Middle West. Unfortunately, political conditions in both Europe and Asia have interfered with this policy; its expected benefits have been curtailed; and even bitter critics of the Administration's farm programme have come to realise that some form of public assistance for agriculture is still needed. The chief current objection to Government aid, therefore, is directed against the way in which it is given and not against the principle of State help.

### A New Democratic Leader?

Politically, the Middle West has just experienced a major sensation in the overthrow of one of its most powerful bosses—Mr T. J. Pendergast, head of a local Democratic organisation in Kansas City. By virtue of his despotic control over municipal affairs, Mr Pendergast had become a national figure in the last few years. His leadership, apparently impregnable at home, was finally destroyed from without by the intervention of State and Federal authorities, and he is now serving a prison sentence for income tax evasion.

One important result of this episode has been to bring Mr Lloyd Stark, Governor of Missouri and one of the officials chiefly responsible for Mr Pendergast's downfall, into the spotlight as a possible candidate for the Democratic Presidential nomination next year. The Governor's associations have generally been with the older traditions of his party, rather than with the New Deal, and he would presumably draw most of his support from Democrats opposed

to the recent economic experiments. But his principal claim for consideration would probably rest upon his record as an aggressive and capable public servant of the reformer type.

### The Middle West Looks at Europe

These domestic concerns, however, have by no means overshadowed the Middle West's interest in the European situation. This part of the country is traditionally isolationist, and almost certainly a majority of its inhabitants are still in favour of refraining from any kind of intervention in European affairs. There is a widespread distrust of sentimental appeals on behalf of Great Britain and France, both of which countries, it is felt, have themselves always acted realistically in their own interests. On the other hand, there is a good deal of sympathy for the position in which the European democracies now find themselves; and there is an instinctive dislike of everything for which the dictatorships stand. The German-American Bund, for example, has made almost no headway in the Middle West.

A growing section of the population, moreover, is aware that it would be extremely difficult—probably impossible—for the United States to remain indefinitely out of a major European conflict. The average Middle Westerner is vastly better informed about world affairs to-day than he was in 1914. The old dictum of a Denver publisher that a "dog fight in Champa Street" was of more interest to his readers than any conceivable event in Europe has been invalidated long ago, and the Middle Western newspapers regularly carry much foreign news and many interpretative articles. Indeed, as a whole, the Middle Western Press is just as strongly in favour of modifying the Neutrality Statute, removing the arms embargo, and restoring the cash-and-carry provisions as the papers of the Eastern seaboard have been.

The European dictators would make a serious miscalculation if they counted upon public sentiment in the Middle West to keep the United States out of a foreign war in all circumstances. Meanwhile, the Middle Westerner, wrestling with his agricultural and business problems, scarcely realises how fortunate he is to live in the heart of a continent protected by several thousand miles of ocean on either side.

August 10th.

## Hongkong's Trade and the War

[FROM OUR HONGKONG CORRESPONDENT]

THE trade figures of Hongkong for the first half of the year show a decline from the record level reached in 1938 and it is extremely unlikely that a recovery can be expected until peace in China is restored. In view of the adverse circumstances in which the trade of the colony has been carried on during the past six months it is remarkable that imports have exceeded a total of \$300 millions, with exports not far short of that figure. The following table shows a comparison of the statistics for the first half of this and the past four years:—

| IMPORTS<br>(In \$ millions) |       |       |       |       |       |
|-----------------------------|-------|-------|-------|-------|-------|
|                             | 1935  | 1936  | 1937  | 1938  | 1939  |
| Merchandise .....           | 191.2 | 212.3 | 286.4 | 342.2 | 300.9 |
| Bullion .....               | 24.6  | 18.7  | 5.6   | 7.5   | 0.5   |
|                             | 215.8 | 231.0 | 292.0 | 349.7 | 301.4 |

There are one or two features in the trade returns which call for comment. Until last October part of the colony's trade entered and left by the railway to Canton. After the closing of the Yangtse this rail traffic grew to enormous proportions as goods which would normally have used the Yangtse were diverted to other routes, all eventually connecting up with the Canton-Hankow Railway. The consequence was that for over a year Hongkong supplanted Shanghai as the entrepôt for trade with Central China, and the colony benefited accordingly. The sudden fall of Canton and the seizure of rail communications with that city resulted in an accumulation of cargo which had reached Hongkong from overseas but could not be forwarded until

new routes from the coast to the interior had been discovered. It was not long, however, before these alternative routes were developed and for the past nine months British coastal steamers have been fully employed carrying cargo not only to the treaty ports of Swatow, Amoy and Foochow, but also to several non-treaty ports. Few, if any, modern facilities exist in these ports, but nevertheless a good deal of merchandise has been handled there. Other means of ingress and egress have been found via the Portuguese colony of Macao and the French territory of Kwong-chow-wan.

Another development of local trade is accounted for by the transfer of the tea market from Shanghai to Hongkong. The port of Wenchow (now in Japanese hands) has been one of the principal depots for the collection of tea for shipment to Hongkong, whence a considerable portion has been forwarded to Russia and North Africa. The total quantity of tea exported during the first half of the year amounted to over 30 million pounds, of which more than half went to Russia.

Until the past few weeks commercial circles in Hongkong showed little concern about the future. Trade with the interior had adapted itself to the conditions brought about by disrupted communications and with so many gaps in the blockade the flow of trade was well maintained. The capture of Swatow, the extension of the blockade, the catastrophic fall in China's currency, the restriction of imports by the Chungking Government, and pessimism as to the outcome of the Tokyo Conference are all factors of recent origin which have rapidly changed the outlook. The more optimistically inclined accept the Prime Minister's statement that there has been no change in Britain's policy, for however strong one's sympathy with China, it is realised that the attitude of neutrality which has prevailed among the authorities of the concessions in China as well as in this colony has been justified. There is, of course, impatience at the lack of retaliation to Japan's brutal behaviour and utter disregard of British rights, especially when the Japanese in Hongkong are not only free to trade as they like but are even allowed to publish a newspaper in the English language which has a decidedly anti-British tone. Moreover, there is the unpleasant prospect of a cordon being drawn round Hongkong to strangle its trade, and already supplies of foodstuffs from the country districts are being interfered with. But against all this there is the belief that Japan is reaching the stage of exhaustion and that the Chinese can never be defeated. Whether that belief is justified the next six months will probably decide.

## Second Thoughts on German-Roumanian Trade

[FROM OUR BUCHAREST CORRESPONDENT]

THE Roumanian-German Treaty of March 23, 1939, continues to draw public attention here. A supplementary agreement was signed on July 20th which consisted of:—

(1) A plan for the improvement of agriculture in all principal branches. The Roumanian Government has accepted the German Government's offer to help in the improvement and development of agricultural production in Roumania by the introduction of new varieties of rare plants, and the delivery of stud livestock. Germany will benefit by having the right to acquire what she wants from exports of these two branches of Roumanian produce.

(2) Germany will buy quantities of oleaginous seeds, particularly linseed and sunflower. Roumania has undertaken to carry out a series of experiments for the production of new oleaginous seeds, and a special organisation will be set up for this purpose.

(3) The export from Roumania of animals for slaughtering will be extended. To increase exports Roumania has agreed to the importation of stud stock.

The aim of this agreement is to increase the volume and variety of Roumanian exports to Germany. In fact, this increase is already proceeding with surprising rapidity.

Imports by Germany, Austria, Bohemia-Moravia and Italy, and exports to the same countries, are as follow:—

|               | 1938    |         | 1939    |         |
|---------------|---------|---------|---------|---------|
|               | Imports | Exports | Imports | Exports |
| January-March | 52.6    | 43.1    | 60.2    | 37.0    |
| April.....    | 51.6    | 46.5    | 63.4    | 55.4    |
| May.....      | 56.3    | 38.1    | 66.9    | 55.9    |

The percentages are in relation to the total foreign trade of Roumania. Italy's share is insignificant, not more than 10 per cent. to 15 per cent., so that the bulk goes to Greater Germany.

At the present time the principal articles exported to Germany are: petroleum and oil products, cereals, raw timber, and worked timber. It may be worth examining each of these in turn.

**Oil.**—The relevant paragraph in the Treaty of last March, referring to exploration concessions for Germany, is not yet in practice; no new mixed German-Roumanian company has been formed. Meanwhile, Germany has bought oil and oil products in Roumania to the total of 50 million Reichsmarks per year during the next two years. Until last week she had also the right to buy quantities to the value of 46 million Reichsmarks in 1939. This last amount will be paid for by armaments and munitions. (See Note on page 392.)

**Cereals.**—This year's wheat crop has been rather disappointing. It should provide 150,000 wagons for export, or 74,000 less than last year. Last year's price, as fixed by the Roumanian Government, was 40,000 lei per wagon. The difference will therefore be at least 960 million lei. Unfortunately, the quality of the wheat this year is less good than that of last year owing to bad weather while it was ripening. In view of the heavy world harvests, the Roumanian Government has fixed the price at 40,000 lei the wagon. But the Government, not the producer, must bear the loss.

It seems doubtful if Germany will be able to secure much more than the 40,000 wagons she has already bought. Needing foreign exchange, obtained largely from exporting wheat to free-exchange countries, the Government will be anxious to keep supplies to Germany as low as possible.

**Raw Timber and Worked Wood.**—Here, too, the Germans will be disappointed. There is reason to believe that German experts have been mistaken in their estimate of the quality and size of Roumania's forests. Up to the present no mixed company has been formed for the exploitation of forests. There is in view, it is true, a contract for renting 70,000 hectares of forest lands in the eastern Carpathians, but nothing has yet been signed. It is even thought that Germany will give up the idea of exploiting Roumanian forests.

Meanwhile, the only concrete results of the German-Roumanian Treaty are the deliveries of munitions and armaments and the construction of a series of silos in the Braila district. But the armaments are the results of old orders placed with former Czecho-Slovakia at the Skoda works, and the silos built were erected under contract with the German firm of MIAG (Muhlen-Industrie-Aktien-Gesellschaft), the order being placed in the summer of last year for the sum of 15 million Reichsmarks.

For the rest, little work of importance has been carried out. The mixed companies provided for under the Treaty have yet to be formed, and the free zones referred to marked out. German commercial control is far from being an established fact.

## Books and Publications

### The E.E.A.

DURING the last seven years Britain has taken the lead in the development of a new and fascinating technique for securing the maximum degree of compatibility between internal stability and the stability of the foreign exchanges. Mr Waight's study\* is a valuable addition to the limited literature on the Exchange Equalisation Account, and the author has fortunately interpreted his terms of reference broadly. His intention has been to explain to the student and the general reader the way in which the Account works and the repercussions of its operations on the internal credit and banking system; and to do this successfully he has of necessity written a highly illuminating account of the institutions and the inter-relations of the money market, the foreign exchange market, and the gold market.

Those who are familiar with Professor N. F. Hall's "Exchange Equalisation Account," Mr F. W. Paish's articles in *Economica*, and the discussions of the working of the Account which have appeared in this journal will find little that is new in Mr Waight's methods and conclusions. His work is merely more systematic and detailed than any which have preceded it, and brings the history of the Account up to date; the text traces its operations to the end of 1938, and the important changes of policy announced in January and February of this year have been dealt with in Addenda.

Mr Waight's discussion of the effect of the Account's operations on the internal credit structure follows lines which may now be called orthodox. In his explanations he makes effective use of the method of hypothetical balance sheets, showing precisely what has happened to the position of the Account, the Bank of England, and the Joint Stock Banks at each stage of the operations. An inflow of capital is shown to be normally deflationary, and an outflow inflationary, after the Account's primary offsetting operations (the sale or purchase of Treasury Bills); but the complications of timing are considered in great detail, and the ultimate effect is shown to depend upon what the foreigner decides to do with his money (as well, of course, as upon further offsetting operations by the Account and the Bank of England).

Mr Waight has by no means said the last word on these important matters, nor has he presented his conclusions in the happiest possible form. The ambiguities in the terms "inflationary" and "deflationary" are not adequately resolved. There is little reference to effects on interest rates in general, or to the possibility that a movement of capital may have diverse effects on long- and short-term rates of interest so long as the Account holds its sterling assets in the form of Treasury Bills. It is difficult to accept Mr Waight's conclusion (page 104) that it makes some real difference whether the foreigner uses his sterling deposit to purchase old or new Government securities.

Mr Waight is critical of those who contend that the Account has not confined itself to ironing out "temporary" and "erratic" influences on the foreign exchanges; but his own views on this question are unsupported by rigorous definitions or convincing argument. Mr Waight's judgments of the Account tend in general to be somewhat complacent. He exaggerates both its importance (the same results could be achieved by other methods) and the wizardry of its managers. Mr Waight is at his best when dealing with the technical aspects of his subject. A definitive study of the peripheral problems requires a knowledge of monetary and banking theory as thorough as is Mr Waight's of banking practice.

It is to be feared that the student and the general reader, for whom the book is intended, will not find it easy reading. The style is involved; the glossary of technical terms is too limited to be of much assistance; the parts and chapters are not labelled, and the sequence of the exposition is obscure.

\* "The History and Mechanism of the Exchange Equalisation Account." By Leonard Waight, with a Foreword by the Hon. Francis Rodd, Cambridge. The University Press, 1939. 8s. 6d.

But despite these faults, which are not vital, Mr Waight's book is an adequate treatment of an important subject. Its usefulness is enhanced by the inclusion of a number of tables, necessarily based in part on guesswork, showing the movements of such important relevant magnitude as the holdings of the Account, and by an Appendix which contains all the important legislative enactments affecting the subject.

### Central Banking

THE literature of Central Banking is recent. The need of a Central Bank in the sense of one to control the purchasing power of the money unit became evident and peremptory only when gold was deposed from its rôle of automatic controller. The literature though recent is yet voluminous, but this excellent survey\* stands out. In it theory is happily married to practice: its author, Doctor de Kock, the Deputy Governor of the Reserve Bank of South Africa, is a practical man who is able to expound lucidly and readably the principles underlying his practice; and in the course of his exposition he pricks, incidentally but most effectively, many an airy bubble among the arguments of the "more money" advocates. This is a salutary antidote to the doctrine that the economic problems of the world can be solved simply by money manipulation or "money management." "Create more money" has unfortunately become a widely-favoured specific for all our economic ills, and it is good to have a reminder here of the major principle of economics, namely, that, if we choose to use our resources in one way, we cannot use them in another—no matter how we manage or manipulate our money.

### Probing the Trade Cycle

PROFESSOR LESCURE's book\* provides a valuable supply of information and abounds in statistical data. There is little to dispute in his main contention that a crisis is "organic," an inherent characteristic of capitalist society, and that, though credit is important and money essential, it is production and consumption, supply and demand which play the predominant part in the life of the economic world. The view on which he bases his analysis—that the trouble begins when the entrepreneur ceases to create because the profit margin appears to him to shrink—has a wide measure of support. Nevertheless, one fact remains: Professor Lescure's book is pre-revolutionary—pre-Keynesian, if a name and date are really necessary. M. Kalecki's book,† on the other hand, belongs to the latest stage of theory; and it is able and stimulating, as well.

Economic fluctuations cannot be treated as an appendage, even an overgrown appendage, to the long-run trend; they must be treated as an integral part of it. Otherwise, neither the long-run trend nor—what is more important at the moment—the fluctuations can be properly mastered. The exciting problem for economists at the present time is how to effect this change in treatment. This is the new approach.

M. Kalecki is on the left-wing of this movement and consequently his is a difficult book. He seizes on certain points in the Keynesian theory and in the theory of imperfect competition and puts them to "macrodynamic" statistical tests at such speed and with such definiteness and determination that the more traditionally-nurtured reader may well find himself breathless and confused at the first reading—and a little sceptical.

## THE BUSINESS WORLD

### Germany's Finances

(From a Correspondent in Germany)

IT is in the fourth stage of the Nazis' financial experiments that the Third Reich has come to the brink of world war. The time is apposite to ask whether Nazi finance policy has given to Germany a strength commensurate with her parade of shot and shell and airplanes; and it is hard to escape the view that it is financial weakness and strain, rather than power or economic might, that has been won by the desperate devices of recent years. The first period of Nazi economics, when the method of financing State projects was by work-creation bills, lasted from 1933 to 1934. The second period, when the so-called special bills were put into use, lasted from 1935 to April last year. The third period, when financing by means of delivery certificates was introduced, went on until April this year; and since then, in the fourth phase, the New Finance Plan of issuing tax anticipation certificates has been in operation.

All these successive stages of policy designed to finance the Government's vast armament and construction programmes have been alike in their fundamental principles. They have differed only in the details of financial technique. Broadly, the situation has been as follows: the German economy has come to depend to an ever-increasing extent on State investment; step by step the resources of the Reich have been brought into full employment, until a serious state of strain and shortage has developed; and the task of the Nazi financiers, in default of any slackening of the tempo of re-armament, has been to eke out the nation's resources and to evolve means of payment without pushing the German economy into grave inflation. All the devices adopted, from the work-creation bills of 1933 to the delivery certificates of last year and the recent tax certificates (anticipating future tax receipts in the quest for additional means of payments) have been contrived to keep the wheels of re-armament and the Four Year Plan turning. The brutal facts are: first, that Government expenditure has steadily exceeded revenue by millions of marks; and, secondly, that the demands made upon the nation's resources of material, plant and labour have become excessive under the pressure of the Nazis' dynamic foreign policy. The expansion of credit has been the leading theme and the vast multiplication of debt has been a major consequence.

Dr Schacht's policy, on the other hand, which was repudiated early this year, was to control State investment and Government expenditure and prevent an undue increase of indebtedness. Credit expansion seemed to him justifiable and safe only so long as there were additional resources still to be brought into production: only so long as production could still be genuinely expanded was an expansionist financial policy, in his view, sound and free from the dangerous risk of inflation. The Nazi view that the consequences of their policy could be postponed indefinitely by financial jugglery and State control over wages and prices was misconceived. Dr Schacht's plan was to restrict financial expansion according to the strict limits set by the possibility of further real economic expansion; and he proposed to do it, after a six months' transition, by

financing expenditure from regular taxes and loans, meanwhile consolidating as much of the Reich's piecemeal debt as possible.

But principles of sound finance like these have been destroyed by events. Last year Reich debt increased more rapidly than ever before. By the New Year it was clear from the stringency imposed upon the money and capital markets by excessive State demands that the only way out was inflation; and the real task of this year has been to limit and control that inflation. The immediate result has been a considerable increase in the currency circulation.

The facts of the stringency are plain: since April last year about Rm. 3,000 millions of delivery certificates have been issued, and only a small portion of these could be negotiated in industry itself, two-thirds being actually absorbed by the banks. Of Rm. 17,500 millions of Reich loans and bills issued between 1935 and 1938, only Rm. 9,000 millions could be disposed of to the public. The rest had to be taken up, more or less compulsorily, by insurance companies, savings banks, credit institutions and, since last year, even by local authorities as well. The immobilisation of liquid funds and the clogging of the capital market are clear. The impact of these enforced demands upon banks and companies was felt the more severely because the tax receipts of the Reich had risen from Rm. 6,600 millions in 1932-33 to Rm. 17,700 millions in 1938-39.

The New Finance Plan, like Dr Schacht's plan last year, is just another temporary expedient which attempts to anticipate future tax receipts by the issue of tax certificates. It was hoped that because of the advantages attached to the certificates it might be possible to lay hands upon additional liquid funds. Actually existing liquid funds had been considerably over-estimated; the daily turnover of tax certificates on the Bourse amounts to several million Reichsmarks, and their price shows a declining trend. The Reichsbank has attempted to support the price of tax certificates Class 2 by a policy of buying in the open market. The result has been that the chief point of the New Finance Plan, which was to prevent a dangerous increase in the note circulation, has been nullified.

The whole structure of payments and credit is being altered by the New Finance Plan. Forty per cent. of all Reich works expenditure—by the public corporations, railways, post office, motor roads, supply undertakings and the Goering works—is paid in tax certificates. The yearly issue of tax certificates must amount to Rm. 7-8,000 millions. This represents total works expenditure of some Rm. 20,000 millions, which shows how much public spending exceeds receipts, especially when it is remembered that salaries and many other items of official expenditure cannot be paid in tax certificates.

The situation is not likely to ease. Industry is in dire needs of credit and the burden of its demands will fall on the banks. Often, tax certificates have to be used as security for industrial credits; and the result is that the banks, whose liquidity has already been seriously impaired

by their absorption of delivery certificates, find their liquidity still further endangered.

This is the general picture. It can readily be picked out in relief from current statistics. Take first of all the currency circulation. In the past, even in years of the greatest increase in production, the circulation increased by only some Rm. 500 millions a year. At the end of last month, at Rm. 11,209 millions, it was actually Rm. 2,504 millions higher than it was twelve months before. Similarly the use of cheques, postal orders, etc., has risen twenty-five per cent. in twelve months. Bills outstanding at the Reichsbank have risen from Rm. 5,832 millions to Rm. 7,545 millions and the Reichsbank's reserve of gold and exchange has fallen from Rm. 2,064 millions to Rm. 77 millions. The following table of bills held by all the banks shows how they have been drawn into the net of State financing:—

|                                          | (Rm. millions) |       |        |        |        |
|------------------------------------------|----------------|-------|--------|--------|--------|
|                                          | 1928           | 1933  | 1937   | 1938   | 1939   |
| Total bills .....                        | 6,390          | 5,636 | 12,271 | 13,756 | 15,659 |
| Treasury Bills bearing no interest ..... | 145            | 1,265 | 1,806  | 1,656  | 4,749  |

In 1928 outstanding bills were almost all commercial bills. To-day some Rm. 10-12,000 millions of armament bills are in circulation—and these do not appear in the return of Reich indebtedness.

In the past year the capital market, too, has been almost wholly claimed by the State. Of the total new issues of the last twelve months amounting to about Rm. 17,400 millions some Rm. 15,000 millions were allotted to public loans. Out of Rm. 822 millions of shares issued, Rm. 395 millions were for the Goering works. The object of the New Finance Plan, to open the capital market more to private needs, has only slightly been achieved. In the cur-

rent year provision was made to introduce about Rm. 1,000 millions of private issues. In the first half-year, however, only Rm. 300 millions was taken up for private purposes, and the market was so limited that the banks had to take up an appreciable part even of this.

The strain has not been eased despite the New Finance Plan. No devices have been found to get more out of the German economy than German resources will allow. Reich tax and customs revenue rose in the last fiscal year from Rm. 13,964 millions to Rm. 17,712 millions in the current one, with a national income of Rm. 77,000 millions. In 1929 when the national income was Rm. 75,500 millions tax revenue was only Rm. 9,023 millions. The revenue for the current fiscal year is put higher still, at Rm. 22,000 millions.

Public indebtedness leaps up too. In the last accounting year it rose by about Rm. 11,600 millions to Rm. 30,700 millions—about four times the 1929 figure, even though the special armament bills are not included. There is, in fact, a large additional burden of undisclosed debt, which makes the rise in indebtedness even more spectacular—and dangerous.

It is in no very promising position, therefore, that the Reich contemplates entering upon a war. Financially and economically the Germans have paid the price of war strain long before hostilities have begun. In that sense the German economy is much less strong than it was 25 years ago when the profits of peace were enjoyed right up to zero hour. The Third Reich is more ready in many ways than William II's Empire. Preparedness has been made a way of life, but it has been a desperately hard regime, and Germany is at bottom no stronger now, to say the least, for having placed herself in a state of economic siege for years before the first shots were fired.

## The Timber Trade

THE uses of wood are both various and varying. Anybody who looks around him at the numerous articles made directly or indirectly from wood will appreciate the truth of the first proposition, but the second may not seem so obvious. Yet the extent to which its uses have changed is in many ways more striking than their present variety.

Before the industrial revolution timber was our most important fuel, both for industrial and domestic purposes; indeed, the iron-smelting industry was consuming so much that British forests were in danger of exhaustion. Similarly it was predominant in building, including the construction of many machines. Thus early steam engines and locomotives all had wooden cranks, and the British Admiralty did not finally give up the use of timber for warships until about 1860. The great bridges which help to carry the Canadian Pacific railway across the Rockies were mostly made of timber.

Wood has been largely displaced from these uses, and its employment in others is threatened by such developments as steel furniture and steel windows. New outlets have been found for it, however, especially through the intermediate production of woodpulp. This is converted into all sorts of commodities ranging from paper and rayon to the latest form of plastics. The demand for most of these is growing, and should outweigh any decline in other directions.

The variety of timber's uses is increased by the fact that the term really covers a multitude of different products. The broad division into hard-woods and soft-woods is too familiar to need emphasis, but in itself accounts for a great deal. In addition there are many special uses which depend on the peculiar characteristics of a particular tree. Thus ash is admirably adapted to the manufacture of walking-sticks and racquet frames because it can be permanently bent without losing its shock-resisting powers; cedar's scent makes it excellent for cigar-boxes; teak's strength is put to good account in the backing of armour plates and the construction of railway coaches; and so on through an almost unending list. Technical developments

not infrequently cause one wood to be substituted for another in some employment fully as often as they lead to the complete displacement of wood by another material.

The existence of numerous different kinds of wood might in any case be expected to lead to some international exchange of specialities, but this is a comparatively minor feature of the world's timber trade. Far more important is the broad division of countries into importers and exporters, with the inevitable intermediate section, a classification adopted in the table below, based on the statistics for 1937 of the Comité International Du Bois. Since then, of course, Germany has absorbed both Austria and a part of Czecho-Slovakia, which has reduced her import requirements considerably. Britain is much the most important importer, while Canada heads the list of exporting countries, followed by Finland and the U.S.S.R.:—

| IMPORTS AND EXPORTS OF TIMBER (ALL CLASSES), 1937 |                 |           |
|---------------------------------------------------|-----------------|-----------|
| Mainly exporting:—                                |                 |           |
|                                                   | '000 cu. metres | Per cent. |
| Canada .....                                      | 10,683          | 19.5      |
| Finland .....                                     | 8,777           | 16.0      |
| U.S.S.R. ....                                     | 8,595           | 15.5      |
| Sweden .....                                      | 4,733           | 8.5       |
| Latvia .....                                      | 2,873           | 5.1       |
| Poland .....                                      | 2,775           | 5.0       |
| Austria .....                                     | 2,129           | 3.9       |

Besides minor omissions the table takes no account of the growing trade in plywood. In 1937 total exports

amounted to 698,000 cubic metres, of which 32.5 per cent. came from Finland, 21 per cent. from the U.S.S.R. and 17 per cent. from Poland; the United Kingdom took 64.5 per cent. of the total imports.

Timber production must be on extensive lines, so that densely-populated countries like England and Holland naturally fall into the importing group. It would be absurd for them to try to be self-sufficient, though they may well produce a part of their requirements on land fitted for little else or as a by-product of trees planted mainly for the sake of amenities.

On the supply side timber shows many features of interest. There is first the well-known time-lag between the planting of the trees and their maturity, which amounts to some 40 years for soft-woods and 80 years, and in some cases far more, for hard-woods. Since it is virtually impossible to foresee anything about the state of the market so far ahead this means that afforestation requires both great patience and a willingness to run great risks. Paradoxically enough, however, this same time-lag is also the factor which makes it so easy to expand the output of timber in the event of a sudden shortage. At any given time the number of trees which are sufficiently near maturity to be cut in case of need is always far in excess of the annual output, so that a temporary increase can be obtained without difficulty. The effect on subsequent output of consuming capital in this way may be catastrophic, as was seen after the Great War; but it does bring relief in an emergency.

If the world's timber resources are to be maintained, the trees cut must be replaced by new planting or natural regeneration. In a new country, however, there is usually such a large area of matured forest that consumption may continue for years at a level far in excess of the annual growth without any danger signals becoming obvious. In some countries timber-cutting is treated quite frankly as an extractive industry, like coal-mining, and about the same amount of heed is paid to the ultimate exhaustion of this raw material. The United States has for a long time been conducting its industry along these lines; the drain through cutting and fire losses in that country are now equivalent to about 1½ times the annual growth. Much of the virgin forests has now disappeared, however, and this excessive and indiscriminate cutting has led to serious soil-erosion; the Federal Government have consequently adopted a policy of re-afforestation.

For the world as a whole there is no need to fear a shortage of timber, though particular kinds of very slow-growing hard-woods may disappear (e.g. Australian jarrah). The total area of forest is some 7,500 million acres, of which conifers account for 35 per cent., temperate hard-woods for 16 per cent. and tropical hard-woods for 49 per cent. Since much of this is now, and will probably remain, unexploited, it is perhaps more significant to set out the figures for some of the leading producers:—

TIMBER AREA OF IMPORTANT COUNTRIES, 1937  
(million acres)

|               |    |                          |       |
|---------------|----|--------------------------|-------|
| Norway .....  | 17 | U.S.S.R. ....            | 1,582 |
| Sweden .....  | 56 | Canada .....             | 600   |
| Finland ..... | 49 | U.S.A. (incl. Alaska) .. | 645   |

One of the most significant points is the comparatively high ratio of output to the area under timber in the Scandinavian countries. If the same systematic methods were applied to all the areas in the other three countries, the total output would be gigantic.

Clearly the consumer of timber need lose no sleep over the fear of rising prices due to a shortage of trees; the U.S.S.R. in particular is cutting an amount far smaller than the annual growth. Importing countries are, however, exposed to two other possible dangers: interruption of supplies by war, and exploitation by the producers.

The United Kingdom produces only some 10 per cent. of its requirements, so that the former danger is a very real one. It is true that a temporary increase in output can be obtained by denuding the forests, but even this would only meet a small part of the demand. Britain is still suffering from the aftermath of clearing some 330,000 acres in the last war—the Forestry Commission has planted about an equal area, but few of the trees are even approaching

maturity. Further planting would of course bring no relief for a very long time, and the only practicable measure seems to be the accumulation of stocks. These are at present by no means large, thanks partly to the introduction of kiln drying in place of ordinary seasoning; for July 1st the figure given by the Timber Trades Federation, which covers the stocks of sawn and planed soft-woods excluding sleepers, hewn soft-wood, plywood and a few lesser categories held by all leading importers, were only 555,000 standards (2,590,000 cu. metres). This is equivalent to less than three months' consumption. There are naturally some invisible stocks but they are probably not very important. On the other hand there is one mitigating factor—the building industry is one of the main consumers of timber, and is not likely to be active in time of war.

The European trade in sawn soft-woods (by far the most important branch of the timber trade) has been regulated since 1932 by the European Timber Exporters' Convention. While the E.T.E.C. regulates exports by quota, and therefore does not directly control prices, its policy is a major factor in determining them, and consuming interests must insist on fair treatment. As with most primary commodities there is no way of measuring costs of production so as to test the Convention's reasonableness, more especially as the allowance for depletion of forests must be largely arbitrary. One is forced to rely on a study of actual price movements before and after the establishment of control, and the results are not altogether reassuring.

If the price for Swedish unsawn 2 by 4 is taken as a touchstone of the E.T.E.C.'s policy, it will be found to have risen from £15 per standard in 1932 to a peak of £21 in 1937. The boom in 1937 was probably due more to the madness which seized the commodity markets in that year than to the Convention's policy, for the export quota was raised from 3,850,000 standards (18,000,000 cu. metres) in 1936 to 4,000,000 standards (18,700,000 cu. metres) in 1937. But the reduction in the quota to 3,600,000 standards (15,800,000 cu. metres) in 1938 was a factor in preventing the price from returning to the 1936 level, and this summer it has again risen above £20 per standard, compared with the 1928-29 average of about £19. In view of the advance in prices this summer which was partly caused by lower Russian shipments, the E.T.E.C. decided on August 3rd to raise the quota for 1939 from the original figure of 2,803,000 standards (13,600,000 cu. metres) to 3,194,000 standards (14,980,000 cu. metres). The members of the Convention share as follows in this total:—

|                  | EXPORT QUOTAS |            |
|------------------|---------------|------------|
|                  | Standards     | Cu. metres |
| Sweden .....     | 721,600       | 3,390,000  |
| Finland .....    | 884,400       | 4,150,000  |
| U.S.S.R. ....    | 836,000       | 3,900,000  |
| Latvia .....     | 111,820       | 520,000    |
| Poland .....     | 275,400       | 1,280,000  |
| Roumania .....   | 216,500       | 1,050,000  |
| Yugoslavia ..... | 147,800       | 690,000    |
| Total .....      | 3,193,520     | 14,980,000 |

The effect on the course of prices of the decision to increase quotas, which was announced on Thursday last week will depend on whether the increased allocations will indeed be forthcoming.

While the E.T.E.C.'s policy has naturally been dictated chiefly by the interests of the timber trade, the available evidence does scarcely convict it of downright rapacity. The fact that a number of important timber exporting countries do not adhere to the Convention is, of course, a safeguard against exploitation. The main problem of the timber trade is to smooth out excessive fluctuations in price due mainly to sudden variations in demand, by a rapid adjustment of supplies. In this task, however, the E.T.E.C. has as yet scarcely succeeded.

Meanwhile, the long-term trend of the demand for timber remains upwards, especially as the many new industries based on this primary product, are rapidly expanding. And while it may be impossible to eliminate short-term fluctuations in prices, the existence of ample supplies should prevent prices from rising to levels which, in the long run, would put timber out of the reach of its principal consumers.

# Finance and Banking

**Bank Rate Doubled.**—The clearest evidence the City has yet given of the gravity of the international situation was provided on Thursday by the raising of the Bank of England rate of discount from 2 per cent., at which it has stood for seven years and two months, to 4 per cent. The movement is more than a precautionary gesture. If Bank rate retains any significance whatever and is to play any part in the machinery of credit control, it had to answer to the present emergency by a movement such as that made this week. Given the pressure on sterling and the general tendency to rush for liquidity, the authorities deemed it essential that Bank rate be increased as a normal defensive measure. This is not to say that the era of cheap money is past or that the technique of monetary and credit control slowly evolved since we left the gold standard goes by the board. But as long as this country is not a closed economic and monetary circuit, as long as some modicum of freedom characterises the capital and foreign exchange markets, recourse to the orthodox machinery of defence and control is imperative at times such as these. It is, however, obvious that the increase in Bank rate is in itself no complete answer to the present situation. A 4 per cent. Bank rate is no deterrent to the exodus of capital nor to the rush for liquidity. The mixture of *laissez faire* and official controls which is being applied in the first stages of this emergency cannot remain an adequate machinery of market control for a sustained period. More important developments must be expected in the near future. Meanwhile the market rate of discount has settled down at 3½ per cent., and the new Bank rate is as fully effective as it was intended to be. The banks on Thursday were exceptionally short of cash, and the market had to find relief in sales to the official buyer, operations which were put through at a rate to be decided upon later. The Bank return shows a fall of £12 millions in Government securities, which suggests the big scale on which the Exchange Account has been losing gold. These securities have evidently been redeemed out of Exchange Account sterling, and must be added to the similar purchases of bills made in the open market during the whole of the past week.

**Bill Rates Harden.**—Even before Thursday the money and discount markets had provided their inevitable reaction to the steadily gathering crisis. Quite apart from the precautionary marking-up of discount rates, the market was faced with a more specific factor pulling in this direction, namely, the virtual cessation of bill purchases by the clearing banks. The banks in their turn were more or less forced to suspend their buying of bills by the sluggishness of the return of notes from holiday circulation and by the inroads on bank cash made by the continued operations of the Exchange Account. The Bank Return shows a reduction of only £4.3 millions in the note circulation during the past week, indicating that the normal post-holiday return of notes has been largely offset by a crisis demand for currency. The technical reasons for a rise in discount rates were therefore apparent even before the rise in Bank rate altered the whole situation. These reasons were supplemented by a further contraction in the volume of "outside" money in the London market due partly to withdrawal of foreign funds and also to the persistent attraction of dollar swap operations. The rate for bank bills of three months' maturity had by Thursday morning risen to 1½ per cent. The rise would have been even sharper had it not been for official purchases of bills in the open market. The official broker in the first half of the week was a buyer of October bills at 1½ per cent., and of Novembers at 1½ per cent., and the market has taken

advantage of his operations to lighten its portfolio considerably. The resources for these official operations have come to hand via the Exchange Equalisation Account and in any case official purchases were demanded by the necessity to return to the credit circulation the funds immobilised by official intervention in the foreign exchange market. But by operating at virtually pegged rates the official buyer gave the market a much-needed steadying influence until more decisive guidance was provided by the increase in Bank rate to 4 per cent.

**Sterling and the Crisis.**—The turmoil of international events has also left its mark on the foreign exchange and bullion markets. Sterling has again been under considerable pressure during the past week and the authorities, in their endeavours to hold the spot rate at \$4.68½ and the forward premium on dollars at about 2½ cents, have been called upon to provide persistent support and to lose gold on a considerable scale. The selling of sterling has in large part represented the further liquidation of foreign holdings of securities and liquid assets in this country. Of a domestic export of capital there is only negligible evidence. In the forward market the effect of commercial operations is making itself more apparent. Every requirement of dollars is being covered at the first possible opportunity and the whole of the normal seasonal pressure on our currency—a pressure which in any case would be exceptionally large this year as a result of re-armament—is in fact being compressed into a few weeks. In addition there has been some offering of forward sterling by Continental quarters as a hedge against sterling assets which cannot conveniently be realised at present. Only a proportion of such offers have been able to pass through the meshes of the unofficial embargo on "speculative" forward operations. The Exchange Account has been the sole buyer of forward sterling on any appreciable scale, and the clearing banks, through whom most of these official operations have reached the market, have submitted each deal to close scrutiny—especially where foreign banks have been the counterparty. Consequently the forward market in sterling has been kept much smaller than it would have been under conditions of complete freedom. At the same time instances have occurred of forward operations being transacted at rates appreciably above those at which the control was prepared to put through duly authenticated transactions. There are elements in the present position which suggest the danger of a dual market in forward sterling. It is a danger which should if possible be avoided.

**The Question of Over-valuation.**—In the circumstances which have obtained this week the authorities in charge of the Exchange Equalisation Account have obviously pursued the only policy open to them. To have allowed wide movements in the sterling rate to occur as a direct result of the present critical spasm of international tension would have been an admission of defeat in the "war of nerves." For this reason the maintenance of sterling, even if it be at an economically unjustifiable rate, must be held wholly justifiable. In the circumstances which have prevailed this week, a discussion of the valuation of sterling in the exchange market loses much of its reality. The confusion of capital movements, hedging operations and commercial transactions, allied to the abnormal sensitiveness of the market, make it impossible to determine whether sterling is being called upon to bear an unfair and ultimately intolerable burden at the present rate of exchange. But the present confusion should have

been foreseen, the rational analysis of exchange policy should have been attempted before that confusion arose and the appropriate measures taken. A few weeks ago the exchange market was absolutely calm, the speculative position against sterling at a negligible figure. Those are the conditions in which a reasonable adjustment in exchange rates should be made—with no appearance of panic, without seeming to have to bow involuntarily to superior pressure, and incidentally without having to make an unnecessary gift to international speculation. To-day the Exchange Account is many million pounds' worth of gold the poorer and is being forced to continue its fight for sterling on much less favourable ground than if it had been prepared to adjust the exchange value to the realities of the situation. Those realities were reflected clearly enough in the trend of the trade balance and in the implications of our defence borrowing programme. They were not materially affected by consideration of the balance of payments of the sterling area as a whole, since that balance only helps when the member countries are prepared to leave their surpluses here. The only sizeable surplus being built up at present is that created by the credits to New Zealand—hardly a factor of strength. For the most part, the surplus balances of most members of the sterling *bloc* are being taken out in gold.

**Gold and Silver Contrasts.**—The gold and silver markets have provided marked contrasts during this difficult week. As usual when war has seemed imminent, gold has come out of hoards and the proceeds of its sales have been converted into dollars. The movement this time has not challenged comparison with the comparable operations of last September and March, because the open position in gold—whether spot or forward—has been enormously reduced during the past six months. But it has sufficed to convert the premium included in the price of the metal which has recently ranged between 1d. and 2d. into a discount of ½d. Moreover it has even made it possible for the Exchange Account to acquire small amounts of gold at the daily fixing. These official purchases have been of extremely modest proportions and have borne no relation to the much larger losses of gold incurred by the Exchange Account in its direct supporting operations for sterling in the exchange market. In the silver market, on the other hand, the risk of war has led to a veritable boom. India has followed her traditional line of buying silver at times of uncertainty, while, in addition, the remnants of those bear speculators who partook so profitably in the recent collapse in silver prices have been "squeezed" mercilessly. On Tuesday the price of silver in London rose to 18½d. which gave a dollar parity of 2½ cents higher than the Treasury's buying price of 35 cents for imported silver. The turnover which led to this jump in the sterling price of silver was comparatively small, but the feature of the market was the complete absence of sizeable selling orders. With the sterling price so substantially above the American parity the whole of the current output of silver should be finding its way to London. That this is not occurring is due to the fact that all the big producers sold their output forward during the uncertain days of June and July, a feature in the market which largely accounted for the abnormal discount on the forward quotation which has ruled for several weeks past. There is thus a dearth of spot supplies which also explains the inability of the New York market to seize the chance offered by the premium in the sterling price of silver to arbitrage to London. By Wednesday, however, the artificiality of the position was attracting a small volume of selling and this sufficed to put the price down to 18½d., to be followed, however, by a new rise to 19½d. on Thursday.

**The Empire's Balance of Payments.**—Through the courtesy of a leading finance house, we are again enabled to publish estimates of the balance of payments of the British Empire. For items on current account last year

showed the largest adverse balance since 1931, but no addition had to be made to the deficit in respect of capital items. Indeed, since 1930 repayments of loans by foreign countries have exceeded new issues. The estimates shown in the table below differ from those published in *The Economist* of August 6th last year.

THE EMPIRE'S BALANCE OF PAYMENTS  
(£ millions)

|                                   | 1923-29 | 1930-32 | 1933-37 | 1936   | 1937  | 1938  |

\* Including protectorates and mandates other than Palestine.  
I. Current account: Merchandise, silver, interest and other services, domestic production of gold (assumed to be fully exported) and private gold movements in India.  
II. Excludes Exchange Equalisation Account.  
IV. Residual includes: Gold acquired by Exchange Equalisation Account (-); inflow of refugee money (+); "genuine" lending by foreigners to the Empire (+); net purchase of existing foreign securities (-); errors and omissions.

The Canadian and colonial figures have been revised and more exact statistics of capital repayments have

Education is far too important a matter to be left to chance. It is a wise plan to create a fund in the child's early years so that when school days arrive the parent is relieved of heavy annual expenditure.

The booklet: "Education" describes how this can be accomplished and how the educational programme can still be completed even in the event of the parent's early death. Please ask for a copy.

**LEGAL & GENERAL ASSURANCE SOCIETY LTD**  
Head Office: 10 Fleet Street, London, E.C.4  
General Manager: Vernon E. Boys  
Established 1836 Assets £47,000,000  
Branches and Agencies throughout the World

become available. The net result of this revision is to reduce the aggregate adverse balance of the Empire during the period 1923-37 from £289 millions to £125 millions and in the case of current items (less private gold movements) from £359 millions to £254 millions including also certain capital and gold movements (items II and III in the table). These revisions are rather large and suggest, as the authors would be the first to admit, that in the absence of more informative sources the estimates can only be approximate.

\* \* \*

**War Risk Rates Increased.**—The new general schedule of rates for insuring cargoes against war risks, agreed this week by the joint committee of Lloyd's and company underwriters, has given sharp effect to the grave political situation. These increased rates (which are, of course, outside the "Pool" rates under the Government's re-insurance scheme) applied to sailings from August 24th and for the most part they have reverted to the high levels in operation under the schedule of April 13th. Additional rates, for example, are quoted at 20s. per cent. for Baltic and Mediterranean passages, compared with the reduced level of 2s. 6d. previously in operation. Atlantic passages are rated at 10s. per cent., compared with 5s. per cent. previously. In one important respect, however, the new schedule differs from that of April 13th. Cargo carried in German or Italian vessels, or bound to or from German or Italian ports or possessions, is excluded from the list, although it may be insured at underwriters' discretion, at not less than scheduled rates.

**More Control for Argentine Peso.**—The Argentine Government has this week announced a tightening up of the foreign exchange control in the Republic. Henceforth all exports will have to pass through the official market. Hitherto it was only the proceeds of "major exports" such as wheat and meat which had to be sold at the official export rate of 15 pesos to the £, and the balance fed the free market, where the rate recently has been stable at about 20.20 pesos to the £. The imports which hitherto have been financed in the free market will henceforth be paid for through a new controlled rate of 20 pesos. The old official import rate of 17 pesos will still apply to privileged imports, but greater discrimination is to be exercised by the Argentine authorities in granting the permits which will allow imports to rank in this category. Thus part of the import trade, which has up to now benefited by the 17 pesos rate, will in future be shifted to the 20 pesos rate. This step will inevitably tend to restrict such imports, since it will raise their prices in terms of pesos. This dual move of submitting almost the whole of the Argentine exchange market to official control and of lowering the average exchange rate at which Argentine imports are financed has been prompted by the deterioration of the balance of payments. The continued slump in cereal prices gives no promise of an early change in that tendency, and drastic remedial measures have thus had to be applied. In any case the deficit for the current year will have to be met by exports of gold from Argentina. The new regulations will deprive the free market of other than negligible importance. By increasing the profit margin between official buying and selling rates for exchange they should provide the Argentine authorities with larger resources for subsidising wheat-growers.

## MONEY MARKET NOTES

THE demand for accommodation has been progressively keener this week owing to the combined effect of Exchange Account operations and withdrawals of currency from the clearing banks. Had it not been for the substantial help given by special purchases of bills the discount market would have been forced to borrow at the Bank of England. Up to Thursday bond money from outside lenders had been quoted at  $\frac{1}{2}$  per cent. and the discount rate had risen to  $1\frac{1}{2}$  per cent. Following the rise in Bank rate there were prolonged meetings of the clearing banks and discount houses committees, and during their sitting most business in bills was transacted on the understanding that the rates to be applied would be decided later. It was later decided to fix the clearing banks' deposit rate at 2 per cent. The banks' short loan rate, whether against bills or bonds, is at 3 per cent. for the time being, and the discount rate is  $3\frac{1}{2}$  per cent. for three months' bills.

The Bank return shows a further reduction of 1d. in the price at which the gold reserve is valued. The difference has been transferred from the Exchange Account in cash. The note circulation is £4.3 millions down, and this fact, together with a transfer of £5.1 millions from public deposits, has safeguarded the level of bankers' deposits from the full shock of a £12 millions drop in Government securities. This last movement may be connected with the operations of the Exchange Account. The fall in bankers' deposits has thus been kept down to £2.6 millions, but even at £92.1 millions the level of these deposits is a low one bearing in mind the pressure that must have been put on them by withdrawals of cash in the latter part of the week.

\*

Apart from the pressure on sterling, which is dealt with in an earlier note, the foreign exchange market has this week been provided with several fea-

tures, most of them connected with the sudden turns of the international situation. The belga has been particularly volatile, fluctuating wildly between the extremes of 27.55 and 27.76. Capital has left Belgium on a fairly large scale during the week, but the control has always been able to steady the market. On Thursday previous influences in this market were reversed and the rate recovered from 27.65 to 27.61. French francs have come under pressure with the deterioration in the political situation but have been firmly held by the control. Swiss francs have weakened from 20.72 to 20.77 on capital movements prompted by political fears. The guilder, which might have been expected to react to similar emotions, has, on the other hand, strengthened from 8.73 to 8.70. The Shanghai dollar has recovered from  $3\frac{1}{2}$ d. to  $3\frac{3}{4}$ d., partly on the Tientsin silver decision, partly on the cheerful interpretation which Chinese circles have chosen to place on the German-Soviet pact.

# Investment

**Crisis and the Stock Exchange.**—Both on Tuesday and Wednesday, the London Stock Exchange found a sufficient glimmer of hope, after the shock of the announcement of Russo-German negotiations, to put prices better. The terms of the non-aggression pact, however, brought the market to a complete standstill on Thursday, and the decision—it had already seemed inevitable on earlier occasions this week—was taken to impose minimum dealing prices in British funds, Corporation and Dominion stocks. Short of that decision, the raising of Bank rate to 4 per cent. would probably have compelled an even more drastic revision of prices throughout the list. The minimum prices are, in fact, the lower (or "bid") quotations in the Stock Exchange Official List for Wednesday, August 23rd. Industrial shares, whose prices became nominal on Tuesday morning on the Russo-German announcement, were slightly steadier in mid-week, but were further depressed on Thursday. Some shares, exceptionally, improved on bear covering, for buying orders were scarcely less difficult to execute than sales. But the week's movements are fairly summarised in the *Financial News*' index (July 1, 1935 = 100) of ordinary shares, which shows a fall of nearly two points from 78.9 last Friday to 77.2 on Monday, further declines to 76.5 and 76.1 on Tuesday and Wednesday, respectively, and a precipitate drop to 74.1 on Thursday.

\* \* \*

Movements in leading British and foreign Government, railway, industrial and commodity securities are set out in the following table. This shows the lowest marking on September 28th last year, and prices on March 10th (when the *Financial News*' index reached the highest point of the year, immediately before the rape of Czecho-Slovakia) and for the current week:—

Only fears of the imminence of war itself could justify this record, yet even those fears have scarcely contributed a particle towards selling pressure. Indeed, investors generally have exhibited a degree of calm in the present crisis which surpasses that of September last year. And price movements have resulted from the hopes or fears of the moment, without any direct response in the volume of business, nor any change in the determination of jobbers to carry the lightest possible book.

**Minimum Prices Compared.**—In the September crisis last year, minimum prices in British Government, corporations and Dominion stocks market, lasted for the brief space of two days, but even this period was sufficient to disclose an appreciable leakage of business, at prices below those stipulated, through outside channels. On Thursday this week, the method of fixing minimum prices was made more watertight. Members are forbidden to deal with non-members or with members at prices below the minima, which were, in fact, the lower quotations recorded in the official list of August 23rd. At the same time, the Committee has imposed a ban on all dealings in this range of stocks except on a strict cash basis. The following table compares the minimum prices for leading British Government securities posted this week with those of eleven months ago:—

|                                                         | MINIMUM PRICES    |                   |
|---------------------------------------------------------|-------------------|-------------------|

The fact that the "longs" are generally lower, and the "shorts" generally higher than in September, 1938, suggests that the market on this occasion has been disposed to apply the traditional relative preference for dated as against undated stocks in a time of emergency. But that fact has not prevented a formidable adjustment of yield level on dated stocks. Moreover, it would probably be unwise to count upon the maintenance of all minimum prices, as fixed this week, under all conditions.

\* \* \*

**The New Yield Basis.**—Wednesday's gilt-edged prices showed an appreciable recovery compared with Tuesday, but (as our table of security prices and yields on page 428 shows) the yield basis on the long-dated or irredeemable stocks was close to, if not actually on, a 4 per cent. basis. War Loan, redeemable after 1952, offered a yield of £3 18s. 8d. per cent. on Wednesday's middle quotation of 89 $\frac{3}{4}$ , while 3 per cent. Local Loans, an irredeemable stock, offered 4 per cent. flat at a price of 75. The new minimum prices have established the 4 per cent. basis beyond a doubt. For an ultra-short, like 4 $\frac{1}{2}$  per cent. Conversion, 1940-44, the new yield basis, taking redemption even at latest date, is £4 8s. 8d., an anomaly doubtless due to the fact that the stock has been held as a first-line defence for liquid reserves. The market, already apprehensive of rising interest rates in recent months, has now been compelled to say farewell to cheap money, following Thursday's rise in Bank Rate, but it has had time to make its dispositions and thus avoided the sudden discomfiture of the discount market. The flat yield on War Loan at 88 $\frac{1}{2}$  is £3 19s. 7d. and on 3 $\frac{1}{2}$  per cent. Conversion £3 18s. 8d. per cent. Unless the raising of Bank Rate may be regarded as a final step in itself and not the first of a series of increases, the immediate outlook for holders of fixed-interest securities generally is not hopeful. In that event, the problem of raising the projected £500 millions for defence would be correspondingly increased. Whatever their outcome, this week's events have made it virtually certain that measures for capital market control must be included in the Emergency Powers.

**Wall Street's Reaction.**—The response of the New York Stock Exchange to the European crisis during the past week is only generally indicated in the index of closing prices and the total dealings given in the following table:—

|                | Trading Volume (Shares) | Dow Jones Industrial Average |
|----------------|-------------------------|------------------------------|
| August 18..... | 840,000                 | 135.54                       |
| August 19..... | 290,000                 | 135.11                       |
| August 21..... | 850,000                 | 132.81                       |
| August 22..... | 860,000                 | 135.07                       |
| August 23..... | 790,000                 | 131.82                       |
| August 24..... | 1,290,000               | 131.33                       |

In fact, Wall Street's behaviour from hour to hour has merely illustrated rapidly changing moods of optimism and pessimism, and the market has had no general sense of policy. It received the news of the Russo-German negotiations almost with elation, for operators took the line that a non-aggression pact would avert the risk of war. With a bound, the market restored last Saturday's closing prices, the Dow Jones industrial average rising from 132.81 to 135.07 on a turnover of 860,000 shares. Wednesday's setback, though largely concentrated in a hectic final hour's dealings, was marked by a fall of the index to 131.82. The market appeared to be dismayed by higher war risk rates, and higher prices for essential commodities, such as wheat and sugar. Yet even on Thursday it fluctuated between hope and fear, and recorded nothing more than irregular fractional losses at the close, although turnover increased to 1,290,000 shares. Possibly some buying support is being received from Continental quarters which are still free of rigid or informal restriction, but Wall Street's performance, as a more or less isolated spectator in this week's crisis, has suggested that for hedging purposes against the fear of war American stocks have no decisive advantages.

**The "House" in Wartime.**—No official indication has yet been given regarding the future of Stock Exchange business, and the place where it will be conducted, in the event of war. Powers have, of course, been available for some time to the Stock Exchange authorities to obtain alternative premises in case of need, and to act as quickly as necessary. Hence, it may be presumed that plans have been drawn up, and only await the zero hour to come into operation. In moving an institution, where dealings are traditionally based on the close proximity of members' offices to the Exchange and on personal negotiation between broker and jobber, problems of organisation are clearly difficult enough. And it would be adding to them if the projected site, for use in the event of emergency, were to be broadcast in advance, for a scramble for accommodation and higher rents would almost certainly result. If the worst happens, it is probable that the market would at least attempt to maintain open doors in Throgmorton Street. It is fortunate, in one respect, that there is no open position comparable with that of August, 1914. Hence the settlement of differences in the event of hostilities would hardly occasion the lengthy disturbance which was one of the operative factors in the delay in the re-opening of the "House" in 1914.

**Roumanian External Debt Payments.**—The prospective arrangements between the Roumanian Government and the Council of Foreign Bondholders regarding the allocation of part of the funds arising under the new clearing agreement to the service of all bondholders of Roumania's sterling issues were noted in *The Economist* of July 22nd. The Council has now issued a *communiqué* regarding the service on the debt for the year which commenced on April 1st. Holders of the 4 per cent. External

Loan 1922 will continue to enjoy priority. The government offers to pay, in full settlement, 63 per cent. of the contractual amount of interest due for the year, plus a supplementary payment of £19,455. These payments will be jointly equivalent to a rate of 3.92 per cent. per annum or 98 per cent., of the contractual rate, which is the average rate paid to United Kingdom bondholders only, for the year 1938-39. The 4½ per cent. Gold Loan 1913 and the 4 per cent. Consolidated Loan are to receive the same payment, in full satisfaction, as the average of 1938-39, namely, 47 per cent. In all cases, amortisation is to remain in suspense. Although Roumania has thus merely maintained last year's interest payments on the three loans, and ratification of the agreement was not completed until quite recently, there must be satisfaction that Roumania remains in the small circle of hard-pressed debtors who reach bilateral agreements regarding their debt service. Expectations that the increased allocation of funds for the debt service contemplated by the clearing agreement may lead to higher future coupon payments must be tempered, for the time being, by the reflection that the resulting funds will not be payable exclusively to British nationals, unlike the April 1st coupon payments announced this week on the 4½ per cent. Gold Loan of 1913 and the 4 per cent. Consolidation Loan of 1922, which are only due to British holders.

**Insurance Share Movements.**—Although the average level of *The Economist* insurance share index shows a further fall from 4,057 to 3,982 between March 31st and June 30th, and thus continues the declining trend over a full twelve months, the experience of individual shares was diverse during the past quarter. The index, which is based on an investment of £1,000 in 24 insurance shares in 1913, is given in full in the following table:—

| Company                            | Average 1937 | Average 1938 | June 30, 1938 | Sept. 30, 1938 | Dec. 30, 1938 | Mar. 31, 1939 | June 30, 1939 |
|------------------------------------|--------------|--------------|---------------|----------------|---------------|---------------|---------------|

| Average .....                      | 3,762        | 3,511        | 3,504         | 3,504          | 3,504         | 3,298         | 3,298         |
| Average .....                      | 4,795        | 4,226        | 4,312         | 4,307          | 4,198         | 4,057         | 3,982         |

During the quarter, nine shares showed a fall, which in most cases was small, although Equity and Law, and Scottish Union and National shares showed fairly considerable falls. Eight of the component shares were unchanged, while seven showed modest improvements.

**The Investor and Radiolympia.**—The annual "Radiolympia" has opened this week with all its customary publicity, but it is questionable whether it will mark the beginning of a new era for investors in the industry. The period of adjustment through which most radio companies are passing seems still to have some way to run. Some companies have already experienced two years of declining profits, and since the period of rapid expansion is over and replacement demand provides the bulk of the orders, virtually all the larger companies have attempted to broaden their scope by manufacturing appliances other than radio sets. The resulting experience of individual companies has varied, but it is not generally reassuring. Electric and

Musical Industries, who have been far in advance of the smaller companies in widening the range of their products, and could never be regarded as exclusively interested in the radio trade, published unexpectedly disappointing results for 1937-38, though with the approach of the end of the 1938-39 financial period on September 30th, these earlier profits have little relevance at the moment. Changes in the board in May, however, may have been connected with manufacturing policy. Pye, Ltd., maintained their 25 per cent. dividend (fully covered by earnings) in the year to March 31, 1939, despite a fall in total profits from £119,338 to £93,819. The reduction in E. K. Cole total profits from £40,468 to £34,756 was not large in absolute amount (though such results provided a disappointing contrast with the high levels of earlier years), but the ordinary dividend was passed, while in 1937-38 10 per cent. was paid but not earned. For 1938, Philco Radio incurred a loss of £114,790, slightly larger than for 1937, and was compelled to adopt a drastic policy for reducing stock values. Diversification has also been achieved by this company, for non-radio Government and other contracts have been obtained, to employ the full capacity of the factory. Technically, of course, the main interest of Radiolympia lies in the progress of television, and one of the most interesting developments of 1938-39 has been the use of large-screen apparatus. Gaumont-British are equipping certain theatres with the Baird system, while Scopphony are supplying the Odeon group and the Monseigneur news theatres. Each year the commercial exploitation of television is brought nearer, but the progress of the past two or three years is none the less of slender benefit to shareholders. The Baird report for the year to June 30 last is not yet available, and no Scopphony profit and loss account has yet been published, though a report was issued in May, and in June the need for new finance was referred to at the meeting. Producers of home television receivers have yet to develop the mass market, which would appear to entail further price reductions. Hence, the prospects of radio and television companies must still be regarded with reserve, for the declining tendency in earnings over the past two years would be further intensified if a rise in the cost of living should reduce the purchasing power for semi-luxury goods, or if political uncertainty should lead to a postponement of normal replacement demand.

**Instalment Dealings and Outside Brokers.**—The Board of Trade rules governing the operations of outside brokers have had their sequel in the liquidation of two firms, Messrs Cornforth, Limited, and Messrs Johnson and Sanderson. Under Rule 13 of the Rules made by the Board of Trade on July 26th, under the Prevention of Fraud (Investments) Act, a licensed dealer may not hold himself out as prepared to enter into any margin or optional transaction unless he acts as agent and supports the transaction with a corresponding transaction with a member of a recognised stock exchange. This rule has been responsible for the decision of Cornforth, Limited, to go into voluntary liquidation. In a letter to its clients the company states that in operating its deferred delivery system the company has acted as a principal. Since the directors see no means whereby their system can be altered to comply with the rule—a matter which they alone can decide—they have concluded that the company has no alternative but to discontinue its business. If it continued under the present method, the company would clearly be dependent upon business from existing clients, and would be debarred from advertising for new connections. The difference between acting as agent and acting as principal is important, for it marks an important distinction in law between an investment transaction and a gaming transaction, although the intention to deliver or accept stock is the final arbiter. It is presumably for such reasons that the Board of Trade has been unable to modify Rule 13. The effect upon firms whose systems have been conducted respectably is, however, unfortunate. Under its established system Cornforth, Limited, were able to offer speculative facilities without directly charging Stock Exchange commissions, but under

Rule 13 that advantage would clearly not be available. It is understood that Thomas Massey and Company, Limited, which also transacts deferred instalment business, is considering its position under Rule 13, but a definite decision has not yet been reached.

**C.W.S. and Chain Stores.**—When the suggestion was first made that the co-operative movement might enter what is called "bazaar trading" it was not widely believed to constitute a threat to established chain-store companies. This point of view, adopted when the proposals were discussed in *The Economist* of July 29th, is fully confirmed by the results of the referendum organised by the Co-operative Wholesale Society, which have largely re-affirmed the basic principles of co-operative trading and the autonomous character of the retail societies. The main proposal of the C.W.S. that they should take powers to form a subsidiary company to develop bazaar trading was rejected by 2,347 votes against 2,202, and by a more emphatic majority the societies turned down the recommendation that the dividend should be eliminated from any bazaar trading. An alternative suggestion that the C.W.S. could establish stores in towns where the consent of the local retail societies had first been obtained was, however, adopted. This diversity of attitude among the member-societies suggests that the scheme is unlikely to reach fruition—if at all—in the near future; in the meantime, the value of holdings in the leading chain-store companies remains unimpaired by the C.W.S. project.

**Trust of Bank Shares.**—The managers of Trust of Bank Shares (Trust of Insurance Shares, Ltd.) have announced this week that, as from August 21st, Martins Bank, Ltd., has taken over the trusteeship of the trust from Equity and Law Life Assurance Society. Certain modifications and improvements have also been made in the trust deed, a summary of which will be circulated with the next distribution warrant on September 15th. The change in trusteeship is not entirely unexpected. The late trustees have certain affiliations with the management company which, while they occasioned no disadvantage for the unit holder, might not have been completely reconcilable with the principle enunciated by the Anderson Committee that close connection between management companies and trustees was undesirable. The Anderson Report, however, contented itself with the simple recommendation, which has not been literally incorporated in the Prevention of Fraud (Investments) Bill nor in the Board of Trade rules relating to unit trusts. The announcement itself does not disclose any reason for the change, and it is possible that more than one factor determined the management company's decision. It will, however, be welcomed as a voluntary adherence to the Anderson Committee's suggestions.

**Timber Share Outlook.**—Within the past six months, the prospects of companies trading in timber have assumed a brightness which is in marked contrast with the depressed conditions which set in towards the end of 1937. The major factor has been the increased demand for timber due to the constructional work required, directly or indirectly, by the arms programme. Quite apart from this greater quantitative demand, prices have also been rising, for exceptional purchases for defence purposes

have been superimposed upon the shortages of supply due to diversion of orders from the Continent. A continuance of these price and demand trends, moreover, seems likely for some months, and it is probable that they will not be counteracted to any major extent by the 10 per cent. increase in export quotas agreed last week by the European Timber Exporters' Convention. What are the implications for holders of shares in timber companies? We set out below a summary of the results of four leading timber companies in each of the past three years:—

| Company (Years to March 31)          | Total Profits | Earned for Ordinary |       | Ord. Div. | Aug. 23     |       |
|--------------------------------------|---------------|---------------------|-------|-----------|-------------|-------|
|                                      |               | Amt.                | Rate  |           | Price       | Yield |
| <b>Austins of E. Ham—</b>            |               |                     |       |           |             |       |
| 1937                                 | 73,167        | 50,749              | 39.3  | 17½       | 7/6 (5/-)   | 11.7  |
| 1938                                 | 78,206        | 52,562              | 41.7  | 17½       |             |       |

\* For "amount earned for ordinary" read "balance available for preferred ordinary and for ordinary." † Years ended May 31. ‡ Also 200 per cent. capital bonus in preferred ordinary shares.

The most noticeable fact which emerges from this table is the considerable disparity between the results of different companies, for which, in part, the time factor is responsible. The upward trend of prices is of recent date and was not necessarily of much benefit to those companies whose financial years ended in the spring. Secondly, the type of business conducted by any individual company has an important bearing on the results. It is only non-domestic demand that has recovered so rapidly in recent months, and the decline in dwelling-house construction accounts for a considerable part of the set-back experienced by Austins of East Ham, who specialise in standard joinery. The 1938-39 increase in Montague L. Meyer's profits is substantial, but the previous year's level of earnings was exceptionally low. The satisfactory Gabriel, Wade and English results, however, have brought a prompt response from the market. But at Wednesday's meeting it was stressed that exceptional Government requirements had not arisen till the end of May, and that the satisfactory profits had been achieved in the face of difficult trading conditions. As the companies shown above did not experience in their 1938-39 financial years the full benefit of the rise in prices which has occurred since last spring, their financial prospects for 1939-40 should be correspondingly enhanced. At least, a continued high demand for timber is assured in the immediate future; long-term prospects, however, must remain obscure until prices find a more even keel.

**Wardle and Davenport Improvement.**—In the years 1936-37 and 1937-38, some progress was shown by the Wardle and Davenport accounts; and this has now

been succeeded by a substantial improvement in profits for the year to June 30th last. Total profits, after ordinary depreciation, amount to £30,490 against £22,461, and earnings for the equity total £20,018 against £14,018 (or 8.0 per cent. against 5.5 per cent.) after providing £6,000 against £4,000 for additional depreciation. The dividend, as already announced, is raised from 5½ to 7½ per cent. Such results for 1938-39 are most satisfactory for a company connected with the textile trades, though they still contrast adversely with the high profits of earlier years. No comment on the recent recovery is offered in the report, but the chairman pointed out a year ago that some new machinery had not come into production soon enough to affect the 1937-38 results; hence the latest year may have benefited correspondingly. And though it is not conclusive evidence, the reduction in stocks from £40,876 to £31,359 may be a reflection of higher turnover. A yield of £7 15s. per cent. is offered on the £1 shares at 19s. 4½d.

**Armstrong Shock Absorbers.**—In view of the satisfactory outlook for this company a year ago, the heavy drop in profits for the year to June 30th provides a sharp disappointment. Consolidated total income of the parent company and its operating subsidiary has fallen from £40,324 to £17,734, and after depreciation and tax the revenue of the parent concern is halved at £6,311, against £13,357. The cash distribution is reduced from £11,016 to £3,625, and the rate from 20 per cent. to 5 per cent., although the latter is payable on the capital as increased by the one-in-three share bonus. General reserve is reduced to £2,000, against £15,000 at June 30, 1938, for in addition to the cost of the share bonus, the sum of £7,000 has been used to write down the holding in Avril Products, which has continued to experience a loss. The survey of the year's difficulties, however, which is contained in a print of the chairman's speech incorporated in the report, suggests that the setback in 1938-39 may be due to temporary factors. Turnover fell considerably owing to the recession in the motor industry, and efforts to obtain Government work have so far been unsuccessful. But much of the difficulty arose from the need for producing simultaneously an old and a new type of shock absorber. This led to some internal dislocation, and at first the new type could not be produced in sufficient quantity to be remunerative. Possibly, the manufacturing adjustments which have been effected, coupled with the chairman's reference to a "very satisfactory" volume of trading, hold out hope of some recovery in profits for the current year. At the present price of 1s. 7½d. the 2s. shares yield £6 3s. per cent.

**The Week's Company Profits.**—This week our usual analysis of profit and loss accounts includes only 11 companies, whose net profits of £201,000 compare with £209,000, a drop of 4 per cent. Aggregate net profits of the 1,700 companies reporting in 1939 to date are £216,137,000, or 7½ per cent. lower than the £234,043,000 earned by the same companies in the previous year. The week's results are discussed in preceding Notes and on page 416 under the heading "Shorter Comments."

SETTLING DAYS  
TICKET ACCOUNT  
SEPTEMBER 5 SEPTEMBER 7

AFTER making a brave attempt at second thoughts, the market has in the end been thoroughly sobered by the gravity of the international outlook, and, without any display of panic, has had to return to "crisis" measures. The week started badly, with a continuance

of the falls that had begun towards the end of the previous week, but in late dealings on Tuesday there was a more cheerful tendency, which was followed up on Wednesday by a definite rally, which Wall Street's attack of nerves was too late to check. On Thursday, however, the rapid deterioration of the situation following knowledge of the full terms of the German-Soviet pact administered a shock. Minimum prices were eventually fixed for gilt-edged stocks, and there was a general lower-

ing and widening of quotations. But there was little selling in mid-week, and business was at an exceptionally low ebb. The adjustment of prices has been precautionary, and was not produced by a flood of selling. Indeed, the market's chief fear on Thursday was that it might be oversold.

Gilt-edged made a bad start to the week, the perpetual stocks in particular being subjected to persistent though not heavy selling. With a release from this pressure, prices ended on Tuesday

above the worst, and on bear-covering towards mid-week there was a markedly better tone. On Thursday there was a virtual cessation of business while the Committee were discussing minimum prices. It was announced later that minimum prices would be established immediately on the basis of the lower quotation in the official list of August 23rd (as set out on page 411). Home Corporations stocks were dominated by the general market sentiment, and Dominions issues followed gilt-edged. Among foreign bonds, European descriptions were naturally a weak market. German bonds, after a rally on Wednesday, reacted sharply on Thursday, Dawes Loan falling 6½ points to a nominal level. Japanese bonds received some support after early weakness.

**Home rails** showed probably the most diverse trends in the whole market. Owing to the strike threat as well as to general influences, prices (especially the preference stocks) fell back on Monday, and there was a little selling, until support from bargain-hunters brought some recovery on Tuesday. This rally became more marked in mid-week on hopes that a strike might be avoided, and on the good traffics. On Thursday jobbers did not at first open dealings in home rails, pending guidance from the Committee, though some transactions were put through on a nominal basis later. Argentine rails became steadier on Wednesday.

**Industrial shares** proved undecided on the whole, though, as in other sections, the trend was downwards. But there was very little selling pressure, and the lowering and widening of quotations was mainly precautionary. The general nervousness on Monday led to an all-round fall in prices, and though there was an attempt at a rally late on Tuesday, irregularity returned towards mid-week. Thursday's falls were severe but not actuated by sales pressure. The cheapness of some of the leading shares, in fact, brought out a few buyers, and some spasmodic bear-covering was seen.

In iron and steel shares losses remained quite moderate until Tuesday, but on Wednesday there were only trifling movements. Coal shares lost ground, and small losses were general in the engineering section. Certain electrical equipment issues made a stand on Wednesday against the declining tendency. Though affected by general market conditions, motor shares were relatively steady, while aircraft shares weakened. Textile and rayon shares were neglected and price movements unimportant. Brewery and tobacco issues followed the general tendency, while stores were somewhat steadier on Wednesday, and provision and catering shares lost ground. Among miscellaneous descriptions the leaders were the worst hit and were correspondingly responsive to occasional support. In the shipping group losses remained on a small scale.

In common with other sections, oil shares were marked down at the outset, and there was some selling on Continental account. The subsequent course of quotations was in accordance with the general trend. Rubber shares lost steadily under slight but relentless selling and the complete lack of buying support. Tea shares also were dull.

Mining shares likewise were entirely

dominated by political considerations. Kaffirs were marked down from the outset, and there was a small volume of selling. Towards mid-week, however, there was very little further selling, though quotations continued to be lowered as a precautionary measure. The non-producing mines were considerably more sensitive to the falling tendency than the dividend-payers. Rhodesian copper shares became steadier after early losses but reacted sharply on Thursday.

### ACTUARIES' INVESTMENT INDEX

The relatively sharp fall of 2.4 points in a week is shown by the Actuaries' index of 160 industrial equity prices, which stood on Tuesday, August 22, 1939, at 58.9, against 61.3 a week ago and 61.4 a month ago. The corresponding average yields are 5.86, 5.63 and 5.64 per cent. We give below a selection of the component indices:—

| Group (and No. of Securities) | Prices (Dec. 31, 1928 = 100) |               |               | Price 1939 High |

### New York

WALL STREET was completely dominated by the European situation after the week-end. Encouraging domestic news, particularly the reported higher steel-mill activity were ignored, the Dow Jones industrial average losing 2.62 points in the first two hours' trading. The bond market was also weak, led by long-dated Government issues. On Tuesday the markets interpreted the Russian-German agreement as a short-term stabilising influence and prices advanced, assisted by bear covering and a moderate volume of speculative buying. The nervous undertone was, however, revealed in mid-week. Unfavourable news from Europe caused a further burst of selling, which was

assisted by the firmer trend of essential commodity prices, including wheat and sugar. The Dow Jones average was a point lower on Wednesday's close than on Monday. Iron Age reports steel-mill activity at 63.0 per cent. of capacity, compared with 62.5 per cent. the week before.

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values calculated on closing prices (1926 = 100).

## PRIVATE PLACING

**Eagle Oil and Shipping Company.**—Messrs Lazard Bros. have placed privately 1,500,000 5½ per cent. £1 preference shares. Dealings opened at around par.

## SHORTER COMMENTS

**Company Results of the Week.**—Some recession of net profits is recorded by **TYNE-TEES SHIPPING**, but the setback is quite moderate, and the 5 per cent. dividend is maintained. **OXLEY ENGINEERING** have maintained total profits, which are £26,655 for 1938-39. Sales proceeds of coffee received by **CAMBUHY COFFEE AND COTTON ESTATES** were £71,411, against £47,552, and net profits are slightly higher, but there is no dividend owing to inability to remit funds from Brazil. A satisfactory improvement is also shown by **ILLOVO SUGAR ESTATES**, who are repeating their 5 per cent. dividend.

## MISCELLANEOUS

**Glyn, Mills and Company.**—Sir H. A. Lawrence is chairman and Col. E. Gore Browne vice-chairman of the reconstituted board of the company. Of the nine directors, three are nominees of the Royal Bank of Scotland. There are a further three extraordinary and four local directors.

**James Howden, Ltd.**—The first accounts for ten months to April 30, 1939, show a profit of £99,663. To general reserve, £20,000. To A.R.P. reserve, £7,500. To depreciation, £10,100. Ordinary dividend, 15 per cent., absorbing £35,700. Carry-forward, £18,659.

**Mitchells and Butlers, Ltd.**—The Board have completed arrangements for acquiring the undertakings of Highgate-Walsall Brewery Company, Walsall Breweries Proprietary, and all the properties of Messrs. John Lord, Brewers, Walsall.

**Illovo Sugar.**—Net profits for year to March 31, after depreciation and tax, £32,591 (£30,142). Debenture interest and sinking fund, £8,525 (£8,128). Ordinary dividend repeated at 5 per cent. To

reserve, £5,000 (nil). Carried forward, £12,611 (£9,864).

**Siamese Loan, 1907.**—Hongkong and Shanghai Banking Corporation announces that coupons of the Royal Siamese Government 4½ per cent., Sterling Loan, 1907, due September 1, 1939, will be paid in London on or after that date.

**Chilean Loans.**—Messrs N. M. Rothschild and Sons are authorised to receive bonds of the Chilean Consolidated Municipal Loan, and City of Santiago Loans of 1928 and 1930 for payment of interest for years 1936 to 1939 according to agreement by which bondholders of above loans receive same debt service treatment as holders of the Government's direct and indirect debt.

**Leigh Mills Company.**—Profits for the year to July 30, 1939, £18,776, compared with loss of £4,198 for previous year. Ordinary dividend 8 per cent. Last dividend was 7½ per cent. in 1936-37. Carried forward, £6,675 (£2,128).

**Mozambique Company.**—Net profits for the year to December 31, 1938, £85,480 (£95,694). Amortisation, £17,684 (£15,011). Special reserve fund, £61,385 (£73,506).

**Hurst, Nelson and Company.**—Net profits for year to July, 1939, £59,903 (£48,262). A.R.P., £3,000. Ordinary dividend for 1938-39, 10 per cent. (same). Interim dividend for year 1939-40, 2½ per cent. To reserve, £10,000 (same).

**Leopoldina and G.W. of Brazil Railways.**—Brazilian Government has advanced to Leopoldina 30,000 contos, to be spent on purchase of rails, transport and other materials; also, 40,000 contos to Great Western of Brazil for general improvement purposes. Part of G.W. of Brazil lines are to be taken over by the Government-owned E.F. Central de Rio Grande de Norte. Loans to be repaid from earnings exceeding 6 per cent. net on the capital.

**Maple and Company.**—Payment of interim ordinary dividend postponed owing to uncertainty of immediate trading conditions. In 1938, 2½ per cent. interim and 2½ per cent. final dividends were paid.

**Associated Gas and Water.**—Offer to acquire ordinary shares (£25,000) of Minehead Gas, Light and Coke. For every 100 £1 ordinary shares in Minehead, company offers 166 ordinary £1 shares; alternatively, 100 £1 ordinary shares in Minehead may be exchanged for £162 10s. cash.

**Brewers and Distillers of Vancouver.**—Consolidated statement shows net profits of group for first six months of 1939 at \$202,627 (after depreciation \$67,252 and tax \$90,062), against \$186,605.

**Bolivia Railway.**—Schroder Executor and Trustee Company informs shareholders that it is prepared to consider tenders for the railway's 5 per cent. income bonds (series "A"). Tenders must be received by September 13, 1939.

**William Baird and Co.**—Trading profit for 13 months ended June 30, 1939, including only seven months' trading results of plant, etc., transferred in December, 1938, to Bairds and Scottish Steel, £411,747 (£598,935 for 12 months). Debenture interest, £38,807 (£37,871). Taxation, £54,344 (£181,000). Ordinary dividend, 16 per cent. (same). Carried forward, £312,560 (£169,396). Company now in voluntary liquidation.

**Commonwealth and Southern Corporation.**—Company announces \$16,000,000 expansion programme in addition to previously announced \$33,000,000 scheme. Tennessee Valley Authority officially took over properties of the company for the sum of \$78,600,000 on Wednesday, August 16, 1939.

**Sunbeam Wolsey.**—Net profits for year ended June 30, 1939, £20,190 (£20,041). Final ordinary dividend again 7½ per cent., making 12½ per cent. for the year (same). Carried forward, £21,089 (£19,398).

**Stephen Smith.**—Total income for year ended April 30, 1939, £50,227 (£45,832); net profits, £33,404 (£29,276). Final ordinary dividend of 7½ per cent., making 12½ per cent. for the year (same); to investment reserve, £3,000. Carry-forward, £5,587 (£4,675).

(Continued on page 417)

## DIVIDEND ANNOUNCEMENTS

Rates are actual, unless stated per annum or shown in cash per share. Rate for previous year refers to total dividend, unless marked by asterisk to indicate interim dividend.

† Free of tax.  
(a) Free of U.K. tax at 4s. 6½d.  
(b) Arrears now \$32.37½ per share.  
(c) On smaller capital.

**D. H. EVANS.**—Interim dividend of 5 per cent. maintained.

**NATIONAL BANK OF EGYPT.**—Interim ordinary dividend maintained at 4 per cent. for 1939.

**R.F.D. COMPANY.**—Interim dividend 6 per cent. In 1938, three 3 per cent. interims and a final of 6 per cent. were paid.

**RYLANDS AND SONS.**—Consideration of interim ordinary dividend deferred until full year's trading results are known. The half-yearly dividend on the 6 per cent. participating preference shares will be paid.

**MANVERS MAIN COLLIERIES.**—Ordinary dividend of 6 per cent. (5 per cent.).

**COLEMAN AND COMPANY.**—Interim ordinary dividend again 4 per cent.

**HUGON AND COMPANY.**—Interim ordinary dividend repeated at 5 per cent.

**JOHN BARKER AND COMPANY.**—Interim dividend again 5 per cent.

**HARDING, TILTON AND HARTLEY.**—Interim ordinary dividend of 12½ per cent., as the year before.

**BAIRD AND SCOTTISH STEEL.**—Interim ordinary dividend of 3 per cent.

## Industry and Trade

**Growth of Purchasing Power.**—The recovery of the consumption goods trades is due to the combination of the increase in defence expenditure with a reduction in the cost of living, caused by the fall of import prices, especially of foodstuffs. The accompanying diagram, based on the official indices of weekly wage rates and of the cost of living, shows what has happened to the purchasing power of wages since 1927. Between 1929 and 1933 the cost of living fell sharply in relation to wage rates, thus inducing the increase in the real income of persons in employment which was partly responsible for the boom in dwelling-house construction. The

WAGES AND THE COST OF LIVING

improvement in the purchasing power of wages was virtually maintained until 1936; in 1937, however, the cost of living rose faster than wage rates, thus causing the decline in purchasing power reflected in the reduction in purchases of consumption goods. Despite the reduction in 1937, however, the purchasing power of wages remained well above the average for 1927-29. At the beginning of 1938 the cost of living again turned sharply downwards,

and the decline has persisted to the second quarter of this year. Weekly wage rates, on the other hand, continued to rise until the second quarter of 1938 and have since remained unchanged. As a result, the purchasing power of wages is at a higher level than that of a few years ago.

\* \* \*

**German Purchases and British Stocks.**—On Wednesday evening, the Board of Trade issued an order prohibiting the export, except under licence, of a number of essential commodities, including metals, rubber, oil and textiles. This step followed certain purchases by German traders on London commodity markets, which had received wide publicity and considerable criticism in commercial circles and the Press; as the purchases were for immediate delivery, supplies had to be taken from stocks in this country. In fact, these purchases were on a very small scale, compared either with British reserves or Germany's needs. As far as can be ascertained, German buyers have purchased since the beginning of this month about 10,000 tons of copper, a somewhat smaller amount of rubber and 2,000 tons of shellac. Stocks of copper in this country in official warehouses now stand at about 25,636 tons, after a slow decline in recent months due to the restriction of exports by producers; at this level they represent only slightly more than one month's consumption but can quickly be supplemented by stock in the hands of consumers, merchants and the British Government, whose holdings, though unknown, are believed to be considerable and to have increased in recent months. Stocks of rubber in official warehouses have also fallen since the beginning of the year, due again to restriction of supplies, but at 50,708 tons they will supply five months' consumption at peace-time level and can

## SHORTER COMMENTS

(Continued from page 416)

**Pearl Assurance Company.**—Mr A. J. Berry has been appointed deputy controller.

**Oxley Engineering.**—Trading profit year to June 30, 1939, £26,655 (£26,825). Taxation, £6,800 (£6,550). Bad debts, £1,400 (nil). Ordinary dividend repeated at 12½ per cent. Written off preliminary expenses, £2,000 (£1,895). To reserve, £6,000 (same). Carried forward, £5,474 (£4,180).

**E. I. Du Pont de Nemours and Company.**—Company to pay third quarter dividend of \$1.25 per share (same as last quarter) compared with 75c. a year ago. Company is preparing to retire its 6 per cent. debenture stock, \$109,294,800 outstanding, while increase of cumulative preferred stock from 500,000 to 3,000,000 shares is planned, redemption price to be raised from \$115 to \$120.

**Davy and United Engineering Company, Ltd.**—Mr J. B. Talbot-Crosbie and Mr W. Kilpatrick, directors of Duncan Stewart and Company, Ltd., have joined the board of Davy and United Engineering Company, Ltd.

**Industrial Finance and Investment Corporation.**—Ordinary dividend for year ended June 30, 1939. Company reduced capital in July, 1938. Last dividend was 2 per cent. for year 1936-37.

**British-American Tobacco.**—Fourth interim dividend 4½ per cent., tax free, similar to last year.

**Trojan (Holdings).**—Net profits for the year to August 14, 1939, £19,648 (£19,843). Final ordinary dividend 7, maintaining total distribution at 10 per cent.

**Distillers Company.**—Company has concluded an arrangement with the British Xylonite Company to take half-interest in B.X. Plastics, the wholly-owned subsidiary of the British Xylonite Company. Present capital of B.X. Plastics 450,000 ordinary £1 shares and a reserve of £200,000, £150,000 to be utilised out of reserve in payment for 6 per cent. preference £1 shares to be issued at par by B.X. Plastics to the British Xylonite Company. 50,000 of the 450,000 fully paid shares in B.X. Plastics, Ltd., now held by the British Xylonite Company will be converted into 6 per cent. cumulative preference shares to rank equally with the above 150,000 shares. 200,000 ordinary shares will be sold to the Distillers Company for £400,000. To maintain equal holdings of ordinary shares by the two companies, any time the Distillers Company should subscribe further ordinary shares of B.X. Plastics, British Xylonite shall have option to convert at par 6 per cent. cumulative preference shares into ordinary shares of equal amount.

**Brazil Railway Company.**—Variable interest for the year 1938 on the 5 per cent. 1st mortgage 60-year variable income gold bonds (international series) will be paid at ½ per cent. on English issue, and 0.503 per cent. on Belgian issue.

**Western Union Telegraph.**—Net loss for first half of 1939, \$223,388 (\$1,518,701). Aggregate loss for year ended June 30, 1939, \$342,567 (\$325,165).

**Henry Briggs, Son and Company.**—Net profits, year to June 30, 1939, £97,89 (£105,096). Final ordinary dividend, plus bonus of 2½ per cent., making 10 per cent. for the year (on larger capital) a before. To general reserve, £25,000 (£20,000). Carried forward, £38,87 (£36,977).

**Cowans Sheldon.**—Total income £63,952 (£47,042); taxation, £13,00 (£8,500); depreciation, £4,123 (£3,457). Net profit, £43,004 (£34,786). Ordinary dividend maintained at 10 per cent. To reserve, £25,000 (£10,000). Carried forward, £53,440 (£50,436).

**Mincing Lane Properties.**—Mr C. D. Dillon, of Messrs Boston Mayhew and Company, and Mr E. D. Davy, of Messrs Wood Drew and Company, appointed joint liquidators. It was not thought necessary to appoint a committee of inspection.

**Peter Robinson, Ltd.**—The interim ordinary dividend is being maintained at 1 per cent.

**Paterson Engineering Co.**—After depreciation, profits for year to April 30, 1939 are £34,332, an increase of £29. Net balance, £20,962 (£21,690) after £9,370, or £1,475 more, for taxation. Total distribution again 12½%. Carried forward £34,542, or £8,687 more.

again be supplemented by other holdings. The importance of the German purchases can thus be exaggerated, and as German buyers have for some months done little business on British markets, their sudden return was probably nothing but a well-considered move in the "war of nerves."

**Redundant Cotton Looms.**—A few weeks ago the Cotton Spinners' and Manufacturers' Association, which on the employers' side controls the weaving section of the Lancashire cotton industry, approved a scheme for dealing with redundant plant which provided for the scrapping of 60,000 looms at an estimated cost of £700,000. It was decided before taking definite action to consult the nineteen local associations which have recently held special meetings. Although no official announcement has been made, it is understood that the scheme is certain to receive adequate support which will justify the Association in proceeding with the proposals. It is believed that when the Cotton Industry (Reorganisation) Act comes into operation the Cotton Spinners' and Manufacturers' Association will be in a position to put the scheme into force. It is urged that the removal of redundant looms is necessary before any minimum cloth prices can be established.

**Milk and Pig Contracts.**—At the last general meeting of the Milk Marketing Board Mr Foster warned producers that they could not expect any further rise in the price of milk sold for liquid consumption. Consumers may be gratified to find that, in the new contract for the year 1939-40 negotiated between the Milk Marketing Board and the Central Distributive Council, this warning was given effect. Retail milk prices are to remain unchanged, which is at least preferable to a further rise from their already high level. The only change in the contract is that milk retailers are to be allowed to provide 25 pints for the price of 24 if paid for in advance, a form of discount which is designed to compete with the dividends of the co-operative societies, who have been capturing an increasing share of the retail milk sales in urban areas. The terms of the new bacon pig contract were also issued last week. The basic price to be paid for bacon pigs sold on contract was laid down in the recent Bacon Industry Act, and was fixed for 1939-40 at 12s. 5d. per score when the price of the standard ration of feeding-stuffs is 8s. 6d. per cwt. This price is 1d. less than that fixed for 1938-39, but in other respects the pig producer has been given more favourable terms. The weight limits of the various classes have been widened and reallocation of pigs from the curers to whom they have been nominated is to be limited to pigs in excess of 60 per cent. of the curers' total allotment, a provision which should considerably reduce the ill-feeling which has arisen in the current season over the large number of pigs transferred from one curer to another. If, however, the number of pigs on contract does not exceed 1.8 millions (as it almost certainly will not; only 1.4

millions were offered last year) the curers will be allowed to buy pigs in the open market at an unregulated price, and farmers can choose whether they will accept a guaranteed price under the contract system or run the risks of the open-market price. It is probable that, as in 1938-39, the larger and more specialised pig feeder will decide for a certain return to be obtained by contract, while the farmer who feeds a few pigs as a side-line and finds it difficult to arrange for a regular supply each month will ignore the contract.

**Profit-Sharing Schemes.**—Arrangements by which employees are given a share in the profits of their firm are not a new invention in industry. A number of schemes existed at the end of last century, but the decade after the War saw the greatest increase. In 1929 there were 526 schemes in operation known to the Ministry of Labour by which employees obtained a pre-arranged share of profits, excluding cases where occasional bonuses were given at the discretion of the shareholders or managers and excluding bonuses given on the basis of commission or sales. Since that year there has been a steady fall in the number of such schemes to 404 at the end of 1938; the number of employees entitled to participate has declined by a smaller proportion—from 267,000 persons in 1929 to 261,000 persons in 1938. Nearly a third of the total number of existing schemes are run by co-operative societies, and a large number of public utility undertakings have also adopted some form of profit-sharing. For obvious reasons such schemes outside the co-operative field are restricted mainly to trades in which profits are fairly stable and to firms employing a large number of persons; according to the *Ministry of Labour Gazette*, there were on the average 6,500 persons per scheme at the end of 1938. The importance of these factors can be seen from the fact that, of the schemes discontinued in recent years, over one-half came to an end owing to lack of profits or to the dissolution or transfer of the business. Although there was a steady expansion in the number of schemes in the years of comparatively good trade up to 1929, it is noteworthy that the recovery from the depression of 1930-32 led only to a slowing up in the fall in the number of individual schemes, though there was an actual increase, checked in 1938, in the three years 1935-6-7 in the number of persons who benefited from some form of profit-sharing.

**Cereal Production in Eire.**—By the schemes begun in 1933 and subsequent years the price of Irish wheat has been fixed at much the same level as that of the

AREA UNDER CULTIVATION IN EIRE

British Wheat Act—10s. per cwt.; there are also fixed selling prices for barley and oats. This system has been responsible for a very considerable increase in the production of these crops in Eire. During the great depression the area sown to wheat sank to barely 21,000

acres; by 1936 it had risen to 254,500 acres, from which level there was a slight decline in the two succeeding years. The preliminary returns for 1939, however, show a further increase to 258,100 acres. Up to 1936 the increase in wheat production was accompanied by an expansion in the total area under cultivation, as is shown by the chart. But last year there was a resumption of the fall in the total area under cultivation, due mainly to the decline in the area under roots. This change has been due partly to the growing use of home-grown cereals as feeding-stuffs and partly to the very sharp rise in the wages of agricultural labourers which has occurred with the introduction last year of legislation on the lines of the English Agricultural Wages Board.

**The Herring Season in Scotland.**—The Scottish herring season has received an unfortunate setback this summer owing to a general scarcity of herring experienced on the north, west and east fishing grounds. When operations began several weeks ago, it was hoped that the fishing would meet with some measure of prosperity as the existing stocks of cured herring had been cleared out and there was also an increased Continental demand for Scottish-caught herring, particularly in Germany. At the end of July, however, it was estimated that the summer catch had dropped 150,000 crans in comparison with the same period of last year. At Lerwick the results proved the worst for a considerable time. For the week ending July 15th, only 2,900 crans were landed, valued at £7,260, compared with 18,871 crans and £222,968 for the same week of the previous year. Aerial spotting of herring shoals off the coast of Shetland last year proved extremely helpful to the drifter-men operating there. When the dearth of fish became apparent at the beginning of the present fishing season, the drifter crews appealed for the assistance of aerial spotting, but none was then readily available. Since then steam drifters and flying boats have been engaged in an exhaustive, systematic search of the northern and north-eastern grounds, but unfortunately without success. No two theories agree as to the cause of the herring scarcity off the Scottish coast. Gulf Stream warmth influences, it is suggested in some quarters, may have lured the herring from their usual whereabouts. Not a few fishermen are convinced that the shoals are in deep water under the drift nets, which at the most are seldom immersed in more than from three to four fathoms of water. The demand for herring during the autumn in East Anglia will no doubt be extremely keen, and larger quantities than usual could probably be disposed of if they were available and of standard quality.

**Lower Tin Stocks.**—The International Tin Research and Development Council has revised its figures for tin stocks. In the past the Council has compiled its estimate of stocks by taking W. H. Garsten's figures of the visible supply, plus the smelter carry-overs in the Straits Settlements and at Arnhem. From the end of June onwards the carry-over figure at Arnhem has been extended to all smelters in Belgium, Holland and the United Kingdom, with the only exception of the British Tin Smelting Company, Ltd.; this company, a young subsidiary of the Straits Trading Company, has refused to release detailed figures of its holdings. In addition, the Council will now publish regular figures on stocks of tin in ore and intermediate products with the smelters in the Straits and in Europe, including the carry-over of the British Tin Smelting Company. On the basis of the new compilation, visible stocks plus the carry-overs aggregated 28,391 tons on July 31st, compared with 28,831 tons a month before and 34,221 tons on the monthly average of 1938. Stocks in ore concentrates, etc., at the smelters fell from 15,221 tons on the average of 1938 to 11,121 tons at the end of July, 1939. The combined total of tin stocks outside the control areas, therefore, has fallen even more sharply in recent months than indicated by the old statistics. The above visible

supply includes, of course, the buffer pool, and as holdings of tin consumers—for which figures have not been compiled—are at present exceedingly small it is not surprising that the pool has the tin market under complete control.

**Steady Wholesale Prices.**—During the last few days, the increasing fears of a European war have brought a rise in the prices of a few staple commodities, such as wheat, sugar, cotton and rubber. This movement has so far been small but it has been sufficient to counteract a fall which took place in some wholesale prices last week. Consequently, *The Economist* index, both of wholesale prices in general and of primary products, has shown little change in the past fortnight:—

SEPTEMBER 18, 1931 = 100

\* These figures refer to August 19th. † Monthly average.

On the other hand, *The Economist* index of American prices, which have reacted far more than English to fears of war, has risen considerably, while that of Irving-Fisher, which relates to an earlier date, shows a fall.

Details of *The Economist* complete index are given below:—

A rise in cotton prices has more than offset a fall in flax prices, while other prices are little changed.

**Tobacco-Growing in Nyasaland.**—The increasing interest in the production of tea in Nyasaland has now ousted tobacco from its position as the leading export of that Protectorate. Although the quantity of tobacco exported from Nyasaland to the United Kingdom, virtually its sole market, has not changed much in recent years, the proportion of the value of total exports provided by tobacco has fallen from 86 per cent. in 1932 to 41 per cent. in 1938. This shift has been accompanied by considerable changes in the internal structure of the Nyasaland tobacco trade, which are described in the latest number of *Tobacco Intelligence*, the quarterly published

by the Imperial Economic Committee. The fall in tobacco prices in 1928-29 had a disastrous effect on its cultivation by Europeans, as is shown in the table below:—

| DISTRIBUTION OF TOBACCO PRODUCTION<br>(Million lbs.) |          |        |       |
|------------------------------------------------------|----------|--------|-------|
|                                                      | European | Native | Total |
| Average, 1927-29 .....                               | 8.2      | 7.3    | 15.5  |
| Average, 1936-38 .....                               | 2.8      | 14.5   | 17.3  |

One result has been the geographical shift in the industry, away from the highlands in the southern province, where European cultivation predominated, to the newly cleared regions in the northern province, which still have the advantages of fertile soil. The marketing systems have also been recently overhauled. Following the example of Southern Rhodesia, official auctions under the supervision of a Tobacco Control Board were instituted in December, 1937, for European-produced tobacco; the Board also controls the export of tobacco, and licenses both growers and buyers, so that a check is available on excess production. A somewhat similar body has developed from the Native Tobacco Board, which was set up in 1926 to improve the methods of cultivation and marketing of native-grown tobacco. The Board now buys all tobacco grown by natives (except those who are tenants of Europeans, through whom the crop is sold) on the basis of the estimated market price less a deduction for expenses. After grading and repacking, the tobacco is then resold by the Board at the official auctions. As a result of the efforts of the Board over the last decade, there has been a considerable improvement in the quality and grading of the native-grown tobacco, but on the British market the Nyasaland product still meets with severe competition from other Empire tobaccos, particularly from Southern Rhodesia and India.

**Overseas Trade in July.**—The increasingly high level of industrial activity in Britain is reflected in the continued rise in the imports of most raw materials. Imports of raw textiles (with the exception of cotton), petrol, non-ferrous metals, and iron and steel manufactures were all larger last month than in July, 1938, or in June, 1939, with the exception in this case of flax, hemp and jute. There was a sharp

increase in the imports of wheat, but the fall in price during the last year was such that the value of wheat imports was less in July than a year ago. Exports of coal and of

textile piece goods continued to improve, while the slight fall in the volume of cotton yarn exports between July, 1938 and 1939 was offset by a rise in value. Exports of pig iron, iron and steel manufactures, and motor vehicles were higher than a year ago, while those of scrap iron and steel, of locomotives and parts and of boots and shoes were noticeably smaller.

## INDUSTRIAL REPORTS

THE sudden political crisis has been met calmly by business men, but there has naturally been a tendency to hold up new civil orders except for urgent requirements. The demand for coal has been well maintained and as output was severely curtailed owing to the widespread suspension of work in Bank Holiday week, supplies are not too plentiful in certain districts. The pressure on the iron and steel industry remains heavy, despite some decline in new civil business, while raw material supplies appear to be none too plentiful despite increased imports. Apart from Government business, the markets in cotton and other textiles have been quiet. Further details of the course of general business activity and of the position of individual industries will be found in the *Trade Supplement* accompanying this week's *Economist*.

### Coal

**Sheffield.**—The inland market is firm, with a good demand for industrial steams and locomotive hards. Household coal is moving quite freely in anticipation of higher prices next month. Small coal is in good supply, and coking coal is in demand at advancing prices. Coke is in steady request for use in furnaces.

Export business continues quiet; demand for prompt shipment is limited. Cobbles and washed trebles are well taken up. The coke trade shows a distinct improvement.

**Newcastle-on-Tyne.**—Apart from the usual periodical inquiries from Scandinavian countries there is not much foreign inquiry for coal, and business on this market is dull. Production, however, moves off very well. Collieries are fully occupied in fulfilling contracts made earlier in the year. Collieries producing Northumberland steam classes are comfortably placed, whilst in Durham manufacturing coal is firm with gas and bunker grades steady. Patent oven coke is in good demand both from consumers abroad and at home.

**Glasgow.**—Apart from the household coal section, the market remains strong with demand active. Both in the case of industrial consumers and the public utility undertakings a strong restocking movement has been in progress. Coastal trade to Ireland and the South has also been good, with the result that a position of stringency is now

developing in certain cases, chiefly in regard to export supplies. In most districts the collieries are now strongly placed for some weeks ahead.

**Cardiff.**—Holiday stoppages at the various mines continued to restrict the amount of coal available on the market, and demand, although still on the slow side, could not easily be satisfied. Practically the whole of production, especially of the more favoured kinds, was earmarked for deliveries which had to be made on account of contracts already on hand and as a result offers of supplies for early shipment remained limited. Prices, consequently, were well maintained at recent steady levels. In the case of more popular brands sellers were not anxious to accept much further business for delivery during the next month or so, while some descriptions, notably bituminous duffs, were almost unobtainable for the rest of the year. New contract business came in very quietly. The Lithuanian Railways, who recently called for quotations for the supply of 65,000 tons during August, 1939-April, 1940, have decided to place business for about 10,000 tons with local shippers. The bulk of this business, as a rule, is secured by North-East Coast producers.

**Workington.**—The coal trade is brisker than in any summer during the past ten years, and that despite the fact that landsale is very quiet. Industrial fuel needs are very substantial and all the smalls are absorbed by the coking plants making for the hematite pig-iron smelters. The Irish trade is good, and weekly shipments to Ulster and Eire are averaging between 12,000 tons and 14,000 tons. Prices are firm.

### Iron and Steel

**Sheffield.**—The iron and steel market remains very firm, although the volume of business in forge and foundry pig iron is of no great dimensions. Consumers are not booking forward to any extent, being content to cover requirements as they arise. Basic pig, on the other hand, is in strong request, with plenty of buying over the next few months. For both East and West Coast hematite there is a steady market, with supplies adequate to consumers' needs. Very little improvement is to be noticed in finished iron, although business in common and marked bars is slightly upward.

Basic steel billets are still difficult to book in full, notwithstanding that imported billets have eased the situation to some extent. Business in small bars is at a high level, and there is a wide demand for structural steel.

In the iron and steel scrap market better supplies of some classes of material are coming forward. Control prices are firmly maintained, and where quotations are not fixed they are fully held. The huge consumption of basic steel scrap is barely met, even with the considerable imports now available.

**Middlesbrough.**—Whilst ordinary business is restricted on account of the political crisis, there is a continued demand for steel from the Government and for constructional and shipbuilding purposes. Most of the blast furnaces locally are producing basic pig iron for which there is a heavy demand from the adjoining steelworks.

Semi-finished and finished steel makers are producing at capacity and whilst larger imports of semis are relieving the position there are still firms which cannot obtain sufficient finished steel for their requirements.

Foreign ore imports are well maintained and are slightly above the previous month's figures. Good Durham blast-furnace coke is plentiful and regular deliveries are being made, prices being based on the official figure of 24s. 2d. per ton at the ovens. Heavy steel scrap is taken from local merchants as it becomes available, at the official control prices, but an additional cargo of steel scrap from America is now being discharged here.

**Glasgow.**—Shipbuilding material is now bulking large in the order books of the steel makers and demand for this continues to increase. Makers are quite unable to meet all the demands made upon them, although plants are running at capacity. In the

sheet trade the position is similar. Despite the fact that output has been increased by every means possible, it is still not equal to the requirements of sheet users and the tonnage at present on books would absorb all the output for the present year. Re-rollers of steel bars are finding new business more plentiful and just recently there has been a marked improvement in the tonnage placed locally. Structural engineers, locomotive builders, and machinery makers in this district are all exceedingly busy and have work on hand to keep them employed for many months to come.

**Cardiff.**—Active conditions ruled in all sections of the iron and steel market of South Wales last week. A fair volume of business was passing on the tinplate market, while galvanised sheets were in demand for defence purposes; ordinary business was quiet and difficult to arrange. Scrap iron and steel continued in good request. The tinplate output has been well maintained at recent improved levels.

**Workington.**—There was some decline in the volume of business on the North-West Coast hematite pig-iron market during the holidays, but trading is increasing again; a considerable turnover in spot buying has been done, and there are prospects of a rush of orders in the autumn. The make of the six furnaces in blast between Workington and Barrow does not now suffice to satisfy needs, and as orders for deliveries against old contracts in the Midlands, Scotland and South Wales are numerous, stocks have practically been cleared out. Prices are firm.

The outlook for the steel trade is excellent. Orders already on the books promise an uninterrupted run of activity until the end of the year. Ordinarily during the summer and autumn there is a diminution of the rolling of rails, but a large production of billets, hoops, sleepers and strip is now required. Large importations of foreign ore, chiefly from Africa, continue to be made. At Workington alone more than a quarter of a million tons have been discharged for the Workington Iron and Steel Company.

**News from Abroad.**—The international steel trade has remained under the influence of the slack season, and the increased political tension has contributed to a dull tone. As far as orders have been placed, the tonnages involved were rather small, and even tentative inquiries were not particularly numerous. The large British requirements for semis have kept Continental steel makers busy, and in addition a quantity of 27,000 tons of joists has recently been placed with the Cartel for delivery to this country. Scandinavia and Holland have been in the market, although for reduced tonnages, plates being in good demand. Demand from Japan, especially for semis, has perceptibly improved, but the difficulties of obtaining payment are considerable. In view of the changed attitude of the United States towards exports to Japan,

Continental exporters hope to improve their position on the Japanese steel market which used to be largely supplied by the American producers. South America and South Africa have of late been less active buyers.

There have recently been discussions in trade circles on the possibility of price alterations in the near future, and although this problem has for a long time been under examination by the Cartel, it appears that no decisive steps are intended for the time being. Delivery times of steel producers working for the export markets have become shorter during recent weeks, and a general advance in prices is not expected to encourage buyers. Concessions on official prices have not undergone alterations during last week and are no longer a conspicuous factor in the trade as a whole. Whereas on products such as merchant bars, sections, thin sheets, galvanised sheets and especially cold rolled strips quite sizeable rebates are granted in some cases, this is not so in regard to thick and medium plates, which is remarkable if it is remembered that some months ago trade in the latter products was particularly depressed.

### Textiles

**Cotton (Manchester).**—All other matters in trading circles have been overshadowed by the political crisis, although traders have remained calm. But the opinion has gained ground that whatever happens lower prices for raw cotton and manufactured goods are improbable. Raw cotton prices in Liverpool have risen. After further favourable reports relating to the crop in the United States complaints have been received of the plants being damaged by heavy rains in certain parts. Stocks in Liverpool are very low.

The yarn market has been firmer, but buying has been patchy. Coarse American counts have again been much sought after, especially for early delivery. Only a limited turnover has taken place in Egyptian descriptions. The Lancashire Cotton Corporation, Limited, has secured a big yarn contract for Roumania amounting to about 2,000,000 lbs.

In the piece-goods section export trade has again been at a low ebb. At a time like the present very few people are prepared to take any risk. Operations for India have been confined to trifling lots to meet urgent requirements. Home trade purchases have not been important, but further Government contracts have been placed in heavy and fine cloths.

**Jute (Dundee).**—It is reported that the Bengal Government will introduce legislation to stabilise jute at a minimum price of 36 rupees for First Marks, or approximately two rupees under the current rate. The present crop is likely to be a large one, probably yielding about 11½ million bales, compared with the last season's crop of 8,912,000 bales, which was short of meeting the requirements of the world by about 500,000 bales. The consumption of raw jute during the current season may be only about 8,500,000 bales, the Indian jute mills requiring about 5,000,000 bales.

Dundee's consumption of the fibre will be reduced, now that intimation has been received from the Government that by about the middle of January the full quota of sandbags will have been delivered if the present delivery rate of four million bags per week is maintained. The Government has been asked, however, if deliveries could not be tapered off so that the trade can become accustomed to the altered order of things. The sudden stoppage of deliveries of sandbags would result in displacement of workers and machinery on a large scale, especially if the ordinary trade kept as quiet as it has done for some months past.

Raw jute prices have advanced on account of the Bengal Government's action, the full group of Daisee-2/3 rising to £20 10s. per ton after £19 had been paid for October-November shipment. The market was rather easier again yesterday, however, with sellers at £20 5s.

Jute yarns are quiet, sellers now quoting 2s. 6d. for common 8-lb. cops for quick delivery and 2s. 4d. for November-December. Cloth rules slow but unchanged at 3.68d. for 10½-oz. 40-in. and 2.86d. for 8-oz. Calcutta goods suffered a distinct fall, but a good recovery has been made.

## THE COMMODITY MARKETS

THE sudden political crisis has been the major factor on the commodity markets, and on Wednesday the Board of Trade issued a long list of raw materials, including textiles, metals, oils and rubber, whose export is to be subject to licence.

The trend of the prices of the principal primary products was upwards, both in this country and in the United States. The advance was led by wheat, as in previous crises, and other cereals as well as raw sugar were also marked up. The markets in vegetable oils and raw cotton were firmer; the advance in the latter was assisted by reports of crop deterioration in the United States. Among non-ferrous metals, copper and lead, after rising in price early in the week, were marked down on Wednesday and Thursday.

## Metals

**Copper.**—After rising on Monday to £45 per ton, the highest level for 1939, standard cash copper declined again to £44 12s. 6d. per ton on Wed-

nesday and to £44 per ton on Thursday. The earlier rise was partly due to certain German purchases for immediate delivery, which helped to raise the cash price for the first time this year above the three months' quotation; greater interest was also shown by British and certain Continental trade buyers. Although home warehouse stocks declined last week by nearly 2,300 tons to the new low level for this year of 25,636 tons, there was by no means a scarcity of supplies; larger arrivals are expected soon as a result of the higher quotas.

**Tin.**—The tin market was very quiet this week and the cash price continued unchanged at £229 17s. 6d. per ton. The reduced interest, however, made itself felt in an expansion of the backwardation from £4 12s. 6d. per ton at the end of last week to £6 7s. 6d. on Wednesday. As consumption is still at a high level, an increase is probable in the tin export quotas for the last quarter of this year. According to the International Tin Research and Development Council, the world's tin output totalled 62,800 (a year ago 82,500) tons in the first half of this year, while consumption reached 74,900 (80,900) tons.

**Lead and Spelter.**—Lead gained 7s. 6d. to close on Wednesday at £16 2s. 6d. per ton, while spelter lost 1s. 3d., thus closing at £14 7s. 6d. per ton. Demand for lead continued to be active, but contrary to certain reports there was no evidence of German purchases. Owing to favourable domestic deliveries, stocks of lead in the United States fell from 129,400 short tons at the end of June to 124,000 short tons at the end of July. The unfavourable British building returns for July did not affect the market. Spelter remained very idle throughout the week, but the easiness of the market was more due to lack of buying than to excess of supplies.

## Grains

UNTIL the week-end, the markets remained dull, under the influence of the large supplies weighing on the markets in Argentine and America. On Monday, however, the increasing gravity of the political tension in Europe brought a firmer tendency which was followed by a definite rise in Liverpool quotations; on Thursday the nearest future on the

standard contract was quoted at 4s. 0½d. per cential, against 3s. 8d. per cential last week. There have been large purchases of Manitoba wheat, to be shipped from North American ports early in September, by United Kingdom buyers, believed to be acting on Government account. The course of the maize market followed that of wheat, and closed on a very firm level. Dealings in feeding barley have been irregular.

## Other Foods

**Provisions.**—Egg prices continue their seasonal rise and there has also been a firmer tone in the butter market. The hot weather has not affected the trade in meat as much as might have been expected, and has led as usual to a rise in bacon prices on the London Provision Exchange.

**Colonial Produce.**—After a quiet market, there was a recovery in the demand for sugar on Tuesday, which led to a small rise in the prices of refined sorts. Raw futures were also firmer, and a better demand was noticed for cocoa and good liquoring Indian teas.

**Fruit and Vegetables.**—English plums and apples are very difficult to clear, and only good quality lots can obtain a satisfactory price. Trade in vegetables remains fair and the large arrivals of the new main crop of potatoes are cleared at unchanged prices.

## Miscellaneous Commodities

**Oils and Oilseeds.**—After a period of quiet conditions, prices of linseed advanced late in the week in sympathy with grain markets. Little new business has been transacted, however, as consumers have well covered their immediate needs and are not willing to buy forward in the present uncertain state of international politics. The United States' crop of linseed is estimated at 400,000 tons, nearly double last year's yield. The exportable surplus of old crop linseed in Argentine and Uruguay has now been reduced to less than 300,000 tons. Trade in other seeds and oils remains quiet, although linseed oil is somewhat dearer in sympathy with linseed.

**Rubber.**—During the week a considerable business was done in nearby rubber, some of it on Continental account. Consequently, spot rubber held a premium over other positions for the first time for several months; quotations for distant futures showed little change. Compared with last week, the price of standard ribbed sheet on the spot closed on Thursday ½d. higher at 8½d. per lb. The export of rubber was prohibited except under licence by the Board of Trade on Wednesday

## Our Information Service

The Intelligence Branch of *The Economist* has been enlarged to meet the growing demand for economic and statistical information. A special feature of the Department is the preparation of regular or occasional reports, on request, for business men and industrialists anxious to keep abreast of all developments which may affect their branch of activity. Fees are proportionate to the work involved.

Enquiries should be addressed to the Intelligence Branch,  
THE ECONOMIST, 8 Boulevard St., London, E.C.4

## Finance

## GOVERNMENT RETURNS

For the week ended August 19, 1939, total ordinary revenue was £19,583,000, against ordinary expenditure of £17,862,000, and issues from Defence loans of £3,000,000. Thus including sinking fund allocations but excluding issues from defence loans, the deficit accrued since April 1st last is £145,551,000, against £128,443,000 a year ago.
