Winning the War

A DEMAND for more active warfare by the Allies has spread widely. In France, dissatisfaction with the slow tempo of hostilities has given an opportunity for party manœuvring to bring down one Prime Minister and threaten the brief tenure of another; and M. Reynaud has seized his moment to set up a War Cabinet system. In Britain, the old outcry for more energetic action in diplomacy and economic policy has gathered strength; in the course of what is for the most part a singularly unimpressive interchange of Cabinet offices, Mr Churchill is set to supervise defence strategy, the only move that promises fresh vigour, and Sir Samuel Hoare has been oddly chosen to revitalise the Air Ministry; and, in both countries, inexperience has given an unfortunate backing to ill-timed calls for military adventures supported by no sound consideration of strategy.

Once again, it was left to the First Lord of the Admiralty to echo public feeling and speak the Government's mind. "It seems to me (said Mr Churchill in his broadcast last week-end) that an intensification of the struggle is to be expected"; but he gave no salute to admirers. "We do not seek a truce with Russia," he declared briefly, with M. Molotov's somewhat petulant self-defence and neutrality speech no doubt fresh in mind; and he made it plain that the essential next steps must be against neutral trade with Germany. Mr Churchill commiserated with small neutral countries open constantly to the menace of Nazi attack, and laid eloquent stress upon the outrages suffered by neutral seamen at German hands. But he left no doubt about the consequences of neutral policy: "their weakness feeds the aggressor's strength." There is *prima facie* evidence now, in the import figures of the European countries adjacent to Germany and in movements of trade and shipping as far afield as the Pacific, that the Allies' main weapon of blockade

is being appreciably weakened by neutral complaisance. On Tuesday this week, in the Commons, Mr Chamberlain took up Mr Churchill's theme. "We must deprive Germany of the materials most essential for the prosecution of her aggressive policy," he said; "the Allies are determined to prosecute the economic war to the utmost of their power"; and

our respect for neutral rights and our sympathy for the practical difficulties of neutrals must not blind us to the fact that any aid they may give to Germany might, if carried far enough, render them in the end liable to the hideous fate that has overtaken the previous victims of German policy.

The rest of the Prime Minister's speech, outlining the agenda for putting this fresh determination into practice, was wholly about economic measures. It aptly dispelled hasty expectations of military offensives in this, that of the other part of the world. War trade agreements with Norway, Sweden, Denmark, Iceland, Belgium and Holland already regulate these countries' sales to Germany, both of their own produce and of essential materials such as fats. Other agreements are being discussed; and all countries concerned

must realise that we cannot agree to make available to them products drawn from Empire sources, unless they in return are prepared to give us guarantees about the limitation of their future trade with Germany.

Minerals, fats and oils are being bought up by the Allies in the markets where German traders can still come. The steps taken by the Navy to interfere with German ships carrying cargoes from Scandinavia "have not reached the limit of effective operations"; and suitable measures, already illustrated by the stopping of two Soviet ships in the Pacific, are to be taken to see that Germany does not increase her supplies from neutral countries by new routes.

5L
X M 56, N 40
N 40.138

Neutral opinion has been deeply disturbed by these statements. Scandinavia, the Netherlands and the Balkan countries are caught between Scylla and Charybdis; bludgeoned by Germany, they are afraid of new pressure from the Allies; in protest they claim from the Allies the freedom in trade that the Nazis will not admit is their due. Italy, a strong Power and Germany's own sleeping partner, can take a more independent line; but the Allies' intentions have aroused great indignation there as well. Russia's root and branch opposition to the Allied blockade was made known in the first few weeks of war; and it has not been abated, though the Soviets' apparent disinclination to fall in more closely with Germany for the moment prevents it from taking practical shape. The Germans themselves are loud in warnings to the neutrals of the violence that the Allies are to use against them.

Actually, both neutral alarm and enemy fury may be premature. In no event will Nazi methods of robbery with menaces or by assault be emulated by the Allies; it is significant that the Prime Minister referred specifically to naval interference with German cargo ships in Scandinavian waters. Moreover, it would be a mistake for opinion either here or in other countries over-hastily to assume that any momentous departure in Allied policy has been signalled. Mr Chamberlain's statement of the practical steps involved in the decision to make war more actively added up to very little more than an account of the policy ostensibly in operation ever since war broke out. It has still to be demonstrated that the war trade arrangements he described will effectively prevent the seeping of essential war material through the Allied cordon; the neutrals have claimed, only this week, that the war agreements in force allow them "normal" trade relations with the Reich; and it is notable that, in the case of Germany's most powerful neighbours, no war trade agreements exist. For seven months now, it has been the professed object of trade diplomacy to employ Allied buying power to snatch goods from Nazi purchasers; the purchase of Norwegian whale oil and Balkan minerals and oil is an old commitment of the Government's; and the re-statement of this policy of pre-emption will not dispel fears that the process is still impeded by undue Treasury caution. Nor does the decision to break in upon the iron ore traffic via Norwegian waters from Narvik, a decision taken just when the spring will very soon be freeing the Baltic ore ports of Sweden from ice, remove the suspicion that this step, planned and prepared before war began, might have been taken sooner.

In principle, Government policy, as stated in the past week, has made an appreciable advance. The realisation that undue tenderness for neutral interests, by giving hostages to enemy ruthlessness and weakening Allied strategy, benefits neither the Allies nor the neutrals themselves is the more welcome because it is belated. It is simple common sense that the only effective blockade is a whole-hearted one. But what, in practice, does the new attitude imply? Does it mean that neutral traffic with Germany in war materials is to be arrested by what the experience of the last war indicates as the only effective method, namely, rationing or the restriction of neutral imports through the Allied contraband control to the quantities normally purchased in peacetime? The stated theory of the war trade agreements, that in return for trade facilities the neutrals will themselves ration the Reich, is unexceptionable—though the ration to the Reich is, in the context of a life-and-death blockade, generous, to say the least; but, in operation, it may lack the assured effectiveness that strict rationing by the Allies, which would guarantee the neutrals adequate supplies for themselves, but show no tenderness to Germany, would have. Again, does it mean that the power to withhold vital Empire supplies will be applied as an effective sanction, not only against the "forlorn" States that live in daily dread of German invasion, but also against the neutrals that can still stand on their own feet? And, in the same context, will only products of Empire origin be withheld from recalcitrant neutrals, or will the power of contraband control be used to the utmost? Finally, does it mean that the full strength of the Allies' capacity to buy and sell, backed by generous aid from the Treasury and the Allied exchange control, is to be deployed against Nazi trade in neutral markets?

The answers to these questions have still to be given.

Next week's secret session of the Commons may hear them. But, whatever the practical worth of this week's decisions may prove to be—and with vision and bold execution it may be very great indeed—the Allies' strategy is at last being clarified. At the beginning of the war it was believed that the war could be won by waiting; that Germany must crack in the pincers of economic warfare; that time was unshakably on the Allies' side. Now British Ministers have learned a lesson from M. Reynaud. He it was who first said that "time is on our side only if we annex it"; and it was he whom Mr Churchill was quoting, almost verbally, last Saturday, when he warned his hearers that "time is a changeable ally." The possibility of Germany defeating the blockade by organising supplies in the East and coercing countries in the West to provision the Reich is admitted and ways and means to frustrate this escape are in hand. If Mr Chamberlain had not spoken at Central Hall on Thursday as if the war were already won, it might have been hoped that the Government was at last to set about winning it.

What the consequences will be depends upon the extent to which this intention is fulfilled in vigorous detail. There may in practice be little change in policy; but, if the axe is firmly put to the root of the tree, then certainly, in the short run, neutral countries and neutral traders will be losers. Their overseas trade will in fact become dependent upon the fiat of the Allies as in theory—and in the balance of sea power—it has done ever since September. The yardstick for their trade with Germany will be the need of the Allies to win the war. The choice is a hard one, between becoming the commercial clients of the Allied Empires and the obedient servants of the predatory Reich. In the long run, there is a third and infinitely worse alternative—extinction by the German armies; and only the victory of the Allies, a victory so far impeded by the services rendered to the aggressor by fearful neutrals, can save the free countries of Europe from that fate. At bottom there are no neutrals in Western Europe—only Germany, on the one hand, and independent nations, on the other.

Where the Germans threaten invasion, and back their threats by sinkings, bombings and shootings, the Allies threaten rationing—and the least they offer to the neutrals is enough of the supplies which they control in their Empires or by their sea power to meet all normal needs. It is a fair bargain in equity as well as a just one in law.

It may be that this moment has been chosen to talk of more active measures, not simply because of the outcry of public and expert opinion in both Britain and France for greater energy, but also because of the apparent weakening of the aggressor front. "Germany has not any real friend in the world to-day," was one significant phrase in the Prime Minister's astoundingly optimistic harangue on Thursday. The Easter meeting on the Brenner has brought forth the Three-Power Pact. Russia has re-avowed her neutrality in what seem to be clear terms. Italy has defined strict non-belligerency as still her chosen path. Even on the narrowest front envisaged for three-power collaboration—the "stabilisation" of the Balkans (perhaps "petrification" would be the better word)—Ribbentrop's plans seem to have gone wrong. If the blockade is intensified, there may be changes in the alignment of Europe. The Nazis' plan to wait behind the West Wall and scheme in collaboration with their "neutral" and "non-belligerent" friends may require revision. If the net is really to be drawn close, the German fighting forces may be used in an effort to break loose.

For the moment it is only the war at sea and in the air over the water that is gathering momentum. The battle for trade is being extended on both sides with the aid of submarines, aircraft and warships. It is the Navy that has been given fresh orders by the new Allied decisions in so far as they have been defined; and in the campaign of retaliation that will inevitably follow the Germans will almost certainly be shown that, in the one field of sea power at least, the superiority of the Allies is indisputable. It may even become apparent to the unhappy neutrals who lie in the field of combat that the only real security for the lives of their seamen, the safety of their ships and the continuance of their commerce is the might of the British and French Navies.

The Budget Problem

THE broadcast news bulletin on Saturday evening of last week and the bulk of the daily Press, following suit, have greeted the final figures of the financial year just ended as favourable news. This is because the actual deficit of £767.7 millions is £170.5 millions less than was expected by the Chancellor of the Exchequer at the time of the War Budget last September. In point of fact, however, it is only by an abuse of language that such a result can be called favourable, for only £54 millions of the £170½ millions "improvement" is due to an excess of revenue over the estimates, while the remaining £116 millions is due to the inadequate scale of spending. The Chancellor expected to spend £1,413 millions between September 3, 1939, and March 31, 1940, and he has actually spent £1,297 millions. If we can assume that purely civil expenditure has been running at approximately the same level as last year, we can say that the Chancellor expected to spend on the war (in the widest sense) about £1,030 millions in its first thirty weeks, and that he has succeeded in spending about £910 millions. In spite of the obvious need for all due economy, this 12 per cent. lag in war expenditure behind the expectations is in no sense good news, especially when it is compared with the very heavy expenditure of the enemy. A letter from Mr Horabin which appears on another page draws attention to the way in which the Parliamentary Secretary to the Ministry of Supply, in a recent debate, attempted to suggest that Germany's rate of expenditure was not so great after all. It is a pity that members of the Government should thus exhibit their ignorance in public. Figures of German expenditure are estimates in the sense that they cannot be precisely accurate and that there is an unavoidable difficulty in converting from marks to sterling. But the figures are not wild guesses; the German official returns provide the basis for a close estimate, and it can be stated without any inaccuracy that Germany's present rate of expenditure on purely war purposes is at least half as large again, and possibly twice as large, as our own. This is not good news; it is the measure of the inadequacy of our war effort.

The figures of revenue and expenditure for the full financial year are given in the two tables at the foot of the page. The excess of revenue over the estimates, it will be noticed, is very largely due to four items—motor vehicle duties, customs, excise, and miscellaneous receipts—which

have together provided £46.4 millions out of the total of £54 millions. Income tax and surtax together provided almost exactly the estimate, and the excess of just over £2 millions in death duties is to be explained by the uneven incidence of death among rich men. In the circumstances, it is difficult to ascribe the increase in the revenue to what is usually understood by "buoyancy." The largest item was due to an under-estimate of the extent to which the Englishman now regards his car as a conventional necessity, which he will relitense in spite of stiffly increased rates of duty and severe fuel restrictions. The increase in customs is presumably due to the rise in the price of imports since last September, while the increase in the yield of excise duties is a reflection of the failure of any efforts yet made to reduce the consumption of the people.

More than usually, however, the interest is concentrated on the new financial year rather than on the old. What is the total expenditure in 1940-41 likely to be? The answer is necessarily a guess, but some light can be thrown on it by showing how the rate of expenditure has been increasing since the outbreak of war. The following table has been calculated on the assumption that the cost of interest on the debt is spread evenly over the year:—

Rate of total expenditure (£ millions)		
Four weeks ended—	Per diem	Per annum
September 30, 1939 ...	4.66	1,701
October 28, 1939 ...	4.61	1,682
November 25, 1939 ...	5.75	2,100
December 23, 1939 ...	6.72	2,452
January 20, 1940 ...	6.15	2,244
February 17, 1940 ...	6.64	2,423
March 16, 1940 ...	7.10	2,592
Two weeks ended—		
March 31, 1940 ...	10.04	3,668
Thirty weeks ...	6.22	2,270

The figures for the final fortnight are of little use as a guide to the future, since there is always a scramble to make payments before the end of the year, but the earlier figures give some idea of the pace of the increase. It is difficult, however, to predict how far the present pace will be maintained or increased. The rate of expenditure on all purposes in the eight weeks ended March 16th (chosen to minimise the end-year rush) was £6.87 millions a day; if we assume that purely civil expenditure is running at

last year's rate of about £660 millions a year, we can say that expenditure on the war alone in these eight weeks was £5.06 millions a day. A similar calculation for the eight-week period three months earlier gives a figure of £4.48 millions a day. War expenditure thus seems to be increasing at the rate of about one per cent. a week; if this rate of increase continues we shall be spending in twelve months' time 52 per cent. more than at present, and the average rate of expenditure on war purposes over the whole financial year will be 26 per cent. more than at present. This can surely be taken as a minimum; indeed, what a miserably low minimum it is to assume that expenditure on the war will be only a quarter larger than at present—when the present German rate is larger by at least half, and may increase! But this minimum would involve a total expenditure of almost exactly £3,000 millions in the year. If the average rate of war expenditure were 50 per cent. higher than at present, the total would be £3,420 millions. It is in this range that the correct figure lies, unless there is a very rapid speed-up in our preparations.

How is an expenditure of £3,000-£3,400 millions to be financed? The taxes already announced are estimated to bring in £120 millions more in 1940-41 than in 1939-40 plus whatever is produced by the Excess Profits Tax—say, £1,300 millions in all. The gap of at least £1,700 millions, and possibly £2,100 millions, is clearly far more than can be bridged by non-inflationary borrowing. If there is anything at all in the protestations of determination to avoid inflation, there must be heavy increases in taxation, with or without some form of compulsory lending—not in a year or two's time, but within the course of the present financial year. There is, perhaps, a case for postponing the actual collection of additional taxes for a very few months. There is no case for postponing the announcement of them.

Some stir has been caused this week by the appearance in almost all the newspapers on Tuesday morning of state-

ments to the effect that the Government's advisers had recommended the imposition of additional burdens on the class of persons with incomes between £5 and £12 a week. The Chancellor, questioned in the House of Commons, denied that any authority had been given for such statements to be made; he did not deny that any such measures were in contemplation. To single out any one class in this way is inevitably unfair either in fact or in appearance, and a Budget of heavy burdens must have "something for everybody" in it if it is to be accepted as equitable. But if the Government's advisers have reported that there is more room for increase of taxation in this particular range of incomes than either above or below them, they have been doing no more than their duty. The mainstays of our present system of taxation are income tax and indirect duties on articles of consumption; the one falls mainly on the man with more than £12 a week (unless he is a bachelor), the others inevitably impose a heavier burden on the poorest. Hitherto, in the process of increasing the burden of taxes, we have proceeded almost entirely by raising the rates of existing taxes. The £5-£12 a week incomes have been heavily hit neither by the increase in income tax (which they pay on only a fraction of their incomes) nor by the increases in the tea, sugar, beer and tobacco duties (which form only a very small part of their expenditure). The time has now come to strike out on fresh paths, to shape the curve of tax burdens as closely as possible to the ability to bear them, to evolve a whole new set of fiscal expedients.

Whatever he does, Sir John Simon's forthcoming Budget will begin a new era in British public finance. We must wait to know whether it will be the beginning of an era of timidity and collapse, or of an era of experiments as novel and effective as the invention of the income tax itself, which was William Pitt's answer to the financial problems of the French wars.

The Near East

II.—The Balance of Power

THE war of 1914-18 revolutionised the political geography of the Near East. The triumphant Allies occupied the dominion which had formerly been divided between the decadent Ottoman and Persian Empires, and for a few brief months in 1919 and 1920 Britain and France occupied a predominant position from the frontiers of Afghanistan to the shores of the Bosphorus. Their hegemony was extremely shortlived. With varying degrees of success, country after country threw off or slipped out of the foreign yoke until to-day, only twenty years later, the Mandates of Syria and Palestine and certain Arab Protectorates are all that remain.

The movement which freed the Near East of Western control was of the same character in all the Near Eastern States. It was part of a world-wide movement in which the introduction into non-European countries of European ideals of national liberty and self-determination led to a bitter revolt against the control of European capitalists and administrators. In three of the Near-Eastern countries—Turkey, Iran and Saudi Arabia—this dual movement of a revolt against Western power, coupled with the acceptance of many aspects of Western civilisation, was crystallised in the careers and personalities of three great national leaders, Kemal Atatürk in Turkey, Reza Khan Pahlavi in Iran and Ibn Saud in Saudi Arabia. But even though no great leader arose in Iraq, Egypt and the lesser States, the drive for independence was great enough to compel the British to relinquish their Mandatory power in Iraq in 1932 and in 1936 to bring to a close the long-drawn-out negotiations over full independence for Egypt, while both France and Britain had to accept the granting of independence as immediate points in their programmes for Syria and Palestine.

The common resistance to Western hegemony is, however, almost the only common factor discoverable in Near Eastern politics. Islam is divided between the Shiites of

Iran, the Sunnites of Iraq and Egypt, the Wahabites of Saudi Arabia and a host of lesser sects. Turkey has abandoned its official practice altogether. Pan-Arabia is only efficacious as an ideal of independence in face of European encroachment, and it covers a split between revisionist and *status quo* Powers fully as serious as the contemporary division of Europe. Turkey and Iran once ruled over Empires more extensive than their present territory. Syria has been obliged to cede Alexandretta. The Syrians—probably without reason—ask if it will be the turn of Aleppo next. Iraq secured the rich oilfields of Mosul only by British backing and after a long dispute with Turkey, and Turkey has no oil. Iran refused until 1929 to recognise the Iraqi Government and a number of frontier questions are still outstanding, sorest among them the Shatt-el-Arab. Finally, there is the problem of Saudi Arabia; Ibn Saud built up his kingdom by incorporating conquered principalities and sheikdoms. Are his ambitions satisfied? He has never recognised the loss of Akaba. Kuwait may well lead to difficulties with Britain. It is true that in recent years, relations have improved and treaties of friendship have been signed, a process which culminated in the Saadabad Pact between Turkey, Iraq, Iran and Afghanistan in 1937; yet little more than plaster has been smeared over the cracks. It might only need the upheaval of a war to split the fabric of the Near East along the old lines of weakness.

With their divergencies, jealousies and turbulent disputes, the Near Eastern States offer a happy hunting-ground to the roving ambition of predatory Great Powers. Once again, it is a question of revisionism *versus* the *status quo*. France and Britain, whose influence in the Near East is fairly secure, are anxious to keep out competitors. They are, on the whole, ready to accept the transference of sovereignty to the native peoples but certainly not to any other Great Power. Other States, there-

fore, in so far as they wish to achieve a position in the Near East, have first to expel the Allies, and the intrigues, seditions and propaganda set on foot by the totalitarian Powers in the last decade are all designed to weaken French and British sovereignty and to encourage the Arabs to "stand alone" (whereafter, it is argued, the setting up of new "Protectorates" should be a comparatively straightforward task). The days of the anti-British broadcasts from Bari are officially over, but Italy continues to conduct open propaganda against "Allied hegemony," particularly in Egypt. Russia has her scattered Arab Communist organisations which, according to Comintern instructions, are "to create an anti-imperialist popular front that extends over all the Arab countries," while Germany has coupled intensive commercial penetration with local propaganda, financial backing for Arab dissidents and discreet encouragement of any frontier or minority disputes which might embarrass the Metropolitan Power.

In this tug of war, the Allies have not so far suffered any very serious setback, even though they labour under a number of unfortunate disadvantages. The greatest is the fact that they are the paramount Powers in the Near East; when the Egyptian or the Iraqi dreams of complete freedom from foreign tutelage, British regiments at Ismailia or a squadron of the R.A.F. lying beside Lake Habbaniyah disturb the vision. Even where well established independence has been achieved—in Iran or Turkey or Saudi Arabia—memories do not have to be very long to recall the post-war years when France and Britain were busy dividing Turkey, Britain had established a Protectorate in Persia and was backing an unpopular monarch at Mecca. Finally, when a Syrian or Palestinian Arab fights for the independence which is still withheld, he fights France and Britain. The Mediterranean Mandates are the gravest entry on the Allies' debit account. Neither German nor Italian propaganda could have made much headway had they not had the latent revolt of Damascus and the open revolt of Jerusalem to work on. And the Allies have complicated their task by adding—perhaps inevitably—to the minority problem, Britain with the Palestinian Jews, France with the Lebanese Christians.

Yet on the whole the balance is in the Allies' favour. In Iraq and Egypt the difficult step of withdrawal from paramountcy has been achieved without great friction, and although the presence of British military power is a reminder of past dependence, it is at the same time the only guarantee of present independence. Even where post-war relations were most strained, time and diplomacy have worked a change. France has made her peace with Turkey and sealed the new alliance with the cession of Alexandretta. Britain's relations with Turkey began to improve after Sanctions, and in five years have changed to a cordial alliance from which Turkey has been able to draw considerable financial benefit. Ibn Saud, whose rival we supported and whose State is fringed with our client sheiks, has invariably behaved with the utmost correctness; he has not permitted the Palestinian question to be debated upon his territory, and there is reason to suppose that the exchange of royal visits in 1938 was the prelude of even happier relations. Dissident Arabs accuse Ibn Saud of being pro-British. He certainly has not shown us hostility. Only in Iran, where the oil concessions, frontier questions with Iraq and our preponderant influence in the Persian Gulf offer as many opportunities for friction, is our position somewhat uneasy. However, from the Hindu Kush to the Golden Horn, in Mandates, in Protectorates, in allied and fully independent states, the Allies enjoy one inestimable advantage. The Arabs have a proverb, "A satisfied tick is better than a hungry one." Our hungry days are over.

Italy, Germany and Russia, however intense, astute and concentrated their propaganda may be, however lavish their bribes or alluring their promises, are all tarred with the same brush; they are expanding Powers. The Arabs, therefore, look on and calculate and profoundly mistrust. Italy may have a foothold in the Yemen. It only means that Saudi Arabia is closed to her as a field of influence. Nor is Libya a very satisfactory experiment from the Arab standpoint. Germany's penetration has been mainly economic and concentrated upon Turkey and Iran. In the latter country she has built up a certain prestige, but in Turkey,

in spite of intensive propaganda, a 50 per cent. share of Turkish and foreign trade and the granting of large credits, she has been out-manoeuvred by the Allies. Her greatest asset in the Near East is the spectacular success of her aggressions. Allah, too, is sometimes presumed to be on the side of the big battalions.

Russia enjoyed a brief reputation for satiety in her revolutionary period when her abandonment of Czarist expansion and her support for national independence gave Turkey and Persia the breathing space and support they needed to evict the Allies. In Iran, however, the lull was very short, and the Iranian Government has for the last fifteen years fought a diplomatic rearguard action against Russian encroachments. The situation became so strained after 1937 that all trading relations were broken off, and it is only towards the end of March this year that a new treaty was concluded. In Turkey, Russia pursued the policy of the good neighbour for much longer. Either as a solitary friend or, after 1932, as part of a system of collective security, Russia was Turkey's most persistent ally and did her signal service at the Montreux Conference in 1936, and nowhere did the Russo-German Pact come as a greater bombshell than in Turkey. Even so, M. Sarajoglu tried during October, 1939, to dovetail Turkey's Russian and Allied friendships. It was only when Russia demanded the closing of the Straits to all belligerent (therefore Allied) warships that Turkey withdrew in disgust and signed the Treaty of Ankara with the Allies, still stipulating, however, that an Allied war with Russia would not automatically bring Turkey in. Since then, Russo-Turkish relations have been "correct but not cordial."

This then was the balance of forces at the outbreak of war. In the first six months the Allies have on the whole maintained their position. The Arab press spoke unanimously in favour of the Allied cause. From the democracies the Arabs can still hope to achieve full freedom coupled with friendship and co-operation. The Poles and the Czechs remind them of what they can expect from a German victory. Even where the greatest hostility might have been expected, the tone of public opinion became more moderate. In Syria and Palestine, civil discord all but ceased, the Wafd in Egypt pledged their support, of all the Iraqi press only *Al Istiqlal* kept up the old peevish anti-Allied tone. Yet the support is obviously conditional. The Arabs expect a *quid pro quo*. The last war ended in some measure of Arab independence. The Allies must see to it that this war consummates the process. Otherwise, the support will be withheld. On this account, the regulation of land sales in Palestine was warmly welcomed as a step in the right direction.

Nevertheless, support does not imply any great willingness to be plunged into war. If Russia and Germany launched an attack, then undoubtedly all the reserves of manpower and armaments in the Near East would be at the Allies' disposal. During January and February, the press of Turkey, Iraq and the Mandated States did appear to be preparing public opinion for the possibility of a Russo-German outbreak in the Balkans or the Caucasus. Since the close of the Finnish campaign, however, the talk has died down and Turkey, at least, has made it clear that although attacks upon her would find her armies ready to a man, she does not propose to begin the fight. The Near Eastern States would probably like to regard the purpose of the Allies' great troop concentration as purely defensive. They would prefer the issue to be decided upon another front.

Of the future, all that can be said is that for us the paramount importance of defeating Germany is as pressing in the Near East as on the Western Front. We owe the advantages of our Near Eastern position to the fact that we are powerful and satisfied. If we cease to be powerful, the question whether or no we are satisfied will become entirely academic. The Near Eastern States will be reckoning how best they can come to terms with our conquerors. So long as we are militarily in command of the situation, we can count on reserves of goodwill and political support. If we prove we are in a position to inflict a crushing defeat, we may even secure military aid. One thing, however, is certain. We cannot fall back on a favourable Near Eastern situation. We can only create it.

Free and Controlled Pounds

THE recent sharp fall in the quotation for "free" sterling in New York has aroused some public attention and caused some private perturbation on both sides of the Atlantic. In Great Britain, fears have been expressed that the cost of imports will start rising again, that our exports will earn less than their due share of foreign currencies and that the confidence of the outside world in the value of sterling is being undermined; in America the fear is that British exports will be made artificially cheap and unfairly competitive. The fall in the "free" market rate—indeed, the existence of two quotations for sterling—is, of course, one of the results of the institution of exchange control at the outbreak of war. The ramifications of exchange control and its effects on exchange rates, foreign trade and prices are not a subject which even the hardest economist would choose for light reading. Nevertheless, it is a subject which it is particularly vital for those who are concerned with public policy in general to understand, since a mishandling of it might commit the double crime of squandering our foreign assets and of diminishing our foreign earning capacity. An attempt will, therefore, be made in this article to pick out the main principles of the matter, so that the lay reader may have, if not a detailed chart, at least a sketch-map of a country hitherto unknown to Englishmen.

The objects of exchange control and of foreign exchange policy in general in wartime are sufficiently obvious. The first canon of policy is to husband our reserves of gold, foreign exchange and marketable foreign securities and ensure that they are not drawn upon for any purpose that is not deemed necessary in the national interest. The second canon is to see that our exports earn as much foreign currency, while our imports cost as little foreign currency, as possible—in the technical phrase, to make the terms of trade as favourable to us as possible. For this reason it is in our interest in wartime to keep the value of our currency as high as possible, so that we can buy cheap and sell dear; there has been some criticism of the authorities for having devalued the pound to \$4.03 at the outbreak of war, and whether or not this criticism is justified, it is certainly true that any further devaluation would be harmful. The purpose of exchange control—that is, of the regulations that govern the purchase and sale of foreign currencies—is to discourage or prevent the export of capital from this country. The British exchange regulations prohibit the export of capital belonging to residents of the United Kingdom; they are prohibited by law from buying foreign currencies in exchange for pounds except from the Bank of England, and the Bank refuses to sell except for approved purposes.

The foreign owner of capital balances in the United Kingdom is not under this prohibition. The only disability laid upon him is that he is refused access to the official market, where \$4.02 can be obtained for every pound. But there is nothing in the regulations to prevent him from transferring his sterling balances to somebody else. He can transfer them to a British resident in payment for goods; or he can sell them in New York to another foreigner for dollars—for as many dollars as the second foreigner will pay him for them. This is the origin of the "free" or "black" market. It must be urged with all emphasis that the market is not "black" in the sense that it is in any way in contravention or evasion of the law. It is not a black market like that which existed before the war in Reichsmark notes, nor are foreign deposits in London blocked as they are in Berlin. Indeed, they are not blocked in any way; the foreigner can do what he likes with them.

The transactions in the "free" market are therefore between foreigners only. The rate of exchange that prevails in it is fixed by demand and supply, and, in spite of rumours to the contrary, the British authorities have not intervened in it in any way. The supply of pounds on offer in the "free" market comes from those foreigners who have sterling balances in London, but are refused permission to sell them at the official rate. The largest part of

these are capital balances dating from before the outbreak of war. The other source of sterling coming into the "free" market is pounds received by foreigners in payment for imports into Great Britain. If payment is made in foreign currencies, the British importer is allowed to buy them at the official rate—i.e. he gets them cheap, with advantage either to him or to the foreign exporter. It might, therefore, be thought that all imports would be invoiced in foreign currency in order to secure this advantage, and that would doubtless tend—possibly after some delay—to be the case, were it not that import permits seem to be easier to obtain where payment is to be made in sterling. It is difficult to see what advantage there is in this practice, as it merely feeds the "free" market, and there is no benefit to us in imposing a loss on the foreign exporter in getting his pounds out of the country, as he will recoup himself in a higher price.

The demand for pounds in the "free" market comes from all those non-residents in Great Britain who, for any reason, have payments to make in pounds; they will, of course, try to buy them in the "free" market since they can get them cheaper there. The recent fall was brought about by an arbitrary reduction in this demand. An amendment to the exchange regulations which came into force on March 25th made it compulsory for any British resident selling any of six commodities (whisky, furs, tin, rubber, jute and jute manufactures) to any of a number of countries (North and South America—other than Canada, Argentina and Uruguay—Belgium, Holland and Switzerland) to insist on being paid either in foreign currency or else in pounds which had been bought from the Bank of England at the official rate. This meant, of course, that it was no longer open to foreigners in these countries (which are, broadly speaking, the countries without exchange control of their own) to pay for their imports of the specified British commodities with sterling bought in the free market. The demand for free sterling declined, and the value of free sterling slumped.

Now it is apparent that the existence of a free market costs Great Britain a certain amount of foreign exchange that would otherwise accrue to the British authorities. When an American purchaser of Scotch whisky paid for it, a month ago, with pounds bought in the free market, the recipient of his dollars was the seller of pounds in that market—i.e. some foreigner anxious to remove his capital from London. When a sale of whisky to the United States is paid for to-day the dollars go to the British authorities, who can use them to pay for American aircraft or for any other national purpose. The existence of the free market is thus a direct or indirect drain on our exchange reserves. It is, however, stated by those in a position to know that its turnover is very small indeed—an attempt either to buy or to sell £100,000 on any one day will disorganise the market. The tacit argument is that it is worth suffering this small drain to avoid blocking—that is, interfering with the transferability of foreign-owned balances in London.

Does the Free Rate Matter?

If the existence of a free rate for sterling is a gap in our financial armour, does it follow that the lower the value of free sterling, the greater the disadvantage to us? At first sight that seems reasonable. When the free rate falls to \$3.50, foreigners can pay for their British purchases with less expenditure of their own money; it might seem to follow that we get less foreign exchange for our exports and are therefore disadvantaged. But this is not necessarily so; for we do not in any case get any foreign exchange as a result of exports financed through the free market. When the free rate falls from \$4.00 to \$3.50 it does not diminish the amount of foreign exchange we receive; it is the foreign seller of pounds—e.g. the foreign exporter of capital from Great Britain—who suffers the loss.

But though the fall in the free rate by itself does us no

harm, it has certain corollaries that are much less welcome. For one thing, the psychological effect of a fall in the free rate must not be ignored. In the greater part of the world the value of sterling is judged by the free rate in New York, even though only some 10 per cent. of our trade with the United States, and an even smaller proportion of our total trade, is financed at that rate. This has some propaganda value to the Nazis, but it is difficult to see what real harm it does to us. In any case, its impact effects are likely to be more severe than the lasting reaction. Secondly, the foreign owner of capital in England is not the only seller of sterling in the free market. Foreigners who come into possession of pounds by accepting payment in sterling for their sales to England also dispose of their pounds in the free market, and whereas the foreign owner of "capital" sterling cannot recoup himself for the loss, the foreign exporter can, by putting up the sterling price of his goods. This does not result in any direct loss of sterling, but it does mean, in effect, that more British goods have to be given in exchange for imports so financed; it offends against the second canon, if not against the first. It could be corrected by giving import permits as freely for goods invoiced in foreign currencies as for those invoiced in sterling—in which case all importers would choose the former course.

Effect on the "Soft" Currencies

Thirdly, a fall in the free rate for sterling has effects on trade with which it is not directly concerned. The phenomenon of a "free" rate diverging from the "official" rate occurs only in respect of those so-called "hard" currencies for which official rates are fixed by the Bank of England (notably American dollars) and the reason why a widening of the gap between the two rates does us no harm is that it does not affect the rate at which British residents do their buying and selling. But there are some currencies—the "soft" currencies, notably the lira and the yen—for which no official rates are fixed. There is only one rate of exchange between the pound and the lira or the pound and the yen, but this one rate fluctuates in rough accordance with the value of free sterling in New York. Clearly this is a different matter, for while a fall in free sterling in New York does not diminish the number of dollars received by the British authorities as a result of British exports to the United States, a fall of the pound in Milan or Kobe does lower the amount of lire or yen earned by British exports and increases the cost in lire or yen of our purchases from Italy and Japan. In short, it turns the terms of trade against us and thereby again offends against the second canon of a wartime exchange policy; and though the proportion of our trade affected in this way is not very large, it is by no means negligible. But it would be possible to get rid of this defect if the rates of exchange between Great Britain and these "soft currency" countries could be fixed by means of payments agreements or exchange clearings. This is the policy of the authorities, and when it has been fully carried out, and the payment for imports in sterling brought to an end, falls in the free rate of sterling will be powerless to turn the terms of trade against us, and we shall be able to disregard its fluctuations.

It is possible, then, to foresee a time in the near future—though we have not got there yet—when we shall be able to be indifferent to a fall in the value of sterling in the free market. But that does not get rid of the fact that the existence of the free market—even if the value of sterling quoted in it were exactly the same as the official rate—represents a loss of foreign exchange to us. Manifestly, it is to our advantage to reduce the volume of business done in the free market to a minimum, if we cannot abolish it altogether. Two courses of action seem to be open. The first is to cut off the demand for free sterling. That demand originates from foreigners who have payments to make in England, mainly for British exports. If payment for those exports were required in dollars or in pounds bought for dollars in the official market—if, that is, the regulations of March 25th were extended from the commodities specified to all British exports—there would be little or no demand for free pounds. The free

rate would fall very sharply, but very little business would be done. This course has some disadvantages. To encourage the invoicing of British exports in foreign currencies is not the best way to advertise the merits of sterling as an international currency—though this might be got over by requiring payment to be made in sterling through the official market. The great argument for this method is that it avoids incurring the odium of blocking foreign-owned sterling—though the foreign owner is likely to complain that the difference between blocking and a freedom which can only be enjoyed at the penalty of a ruinous discount is more formal than real. It might be possible to create some demand for free sterling by allowing British exporters to sell some part of their foreign exchange earnings in that market. But great care would have to be taken to see that this was only done for exports which would not be undertaken without the cheapening of their price that this would represent (as otherwise it would merely result in a loss of foreign exchange to our coffers) and the adoption of such a Schachtian device would hardly enhance our popularity in America.

Pros and Cons of Blocking

The other possible course of action is to block foreign balances in the United Kingdom—that is, either to prohibit entirely the transfer of funds out of a foreign-owned account or to permit it only for specified purposes. This would, of course, cut away the greater part of the supply of pounds in the free market; to the extent that it succeeds, it reduces the volume of transactions in the free market (and, therefore, the loss of foreign exchange) without driving down the rate. But there are serious objections to blocking. There is, first of all, the argument, based equally on commercial morality and self-interest, that it would ruin Britain's reputation as the world's banker. Who would ever again entrust funds to the keeping of London once they had been blocked? Secondly, the blocking of American assets in London might lead to the blocking of the infinitely greater British assets in New York—which would be a disaster of the first magnitude for the Allied cause. And, thirdly, for a country in Great Britain's position, blocking is a very difficult operation. Apart from the fact that a democratic country, even in wartime, cannot call on a Gestapo or enforce the death sentence in currency matters, we should be faced with the difficult choice between drawing the ring round the United Kingdom, thus cutting off the Empire, or else facing the impossible task of stopping leaks at every imperial frontier-post and at every port on the Empire's lines of communication.

These arguments are not unanswerable. As has already been suggested, there is little difference in morality, or in likely effect on a banker's reputation, between complete blocking and release at a very heavy discount, but one or the other must be faced, if the drain of the free market is to be substantially reduced. Complete blocking with equally complete release immediately after the war might well be accounted more honest than paying off our creditors now at ruinous rates. As for America, some special treatment would have to be accorded to American assets—either gradual release or permission to use them in payment for exports of luxury goods or other articles whose manufacture did not interfere with the war effort—but if such concessions as these are made, it should not be impossible to reach agreement. The technical difficulties are insuperable if every leak is to be stopped, but possibly not if attention is confined to the serious leaks. But clearly, blocking is not a policy to be entered on light-heartedly.

These two alternative policies—one which would reduce the demand for free sterling, the other which would remove the supply—differ less in their effect than in their form. The present policy of the authorities inclines to the first rather than to the second—official circles are very much impressed with the difficulties of blocking. It is not the purpose of this article to make a choice between the two policies. But this much can be said—that whatever policy is pursued, it is less likely to be successful if it is done hesitantly and half-heartedly. And whatever the policy, it is obvious that rules and regulations and the paraphernalia of control are bound to increase.

NOTES OF THE WEEK

Cabinet Changes.—Another reshuffle of Government offices was announced on Wednesday evening. Two of its features are very welcome. The first is the appointment of Mr Winston Churchill, First Lord of the Admiralty, as Chairman of the Defence Committee, and the suppression of that ineffective office, the Minister for the Co-ordination of Defence. There is no doubt that the public has confidence in Mr Churchill's conduct of the active war. The second is the appointment of Lord Woolton (better known until recently as Mr F. J. Marquis, managing director of Lewis's, Ltd.) as Minister of Food. Lord Woolton is, in the idiom of the last war, a "man of push and go," and to have a retailer at the Ministry of Food is perhaps the next best thing to having a consumer in that hotbed of producers. For the rest, the changes are, as *The Times* has aptly put it, "an elaborate game of puss-in-the-corner." Sir Kingsley Wood and Sir Samuel Hoare change places. That a more vigorous hand was needed at the Air Ministry has been apparent for some time, but the need seemed to be for someone with either industrial or technical qualifications; whatever Sir Samuel Hoare's reputation may be in the innermost circles, his name inspires no sort of confidence in the general public. The reasons for an exchange of offices between Lord De La Warr, hitherto President of the Board of Education, and Mr Ramsbotham, First Commissioner of Works, are even more mysterious. Mr Robert Hudson goes to the Ministry of Shipping, where his qualities will find full scope—though it is a pity that Sir Arthur Salter's claims have been overlooked, presumably on political grounds. Mr Geoffrey Shakespeare succeeds Mr Hudson at the Department of Overseas Trade, and Mr W. S. Morrison, hitherto Minister of Food, becomes Postmaster-General. There are also a few consequential changes in minor offices. But the details are unimportant; the essential fact is that it is only the scenery that has been shifted, the company and the performance remain as before. With the exception of Lord Woolton, no new blood is brought in. Several of the manifest weaknesses remain—notably the Ministry of Supply and the concentration of incompatible functions in the hands of the Chancellor of the Exchequer. The size of the War Cabinet is reduced by one only, and—except in so far as Mr Churchill's new task may possibly foreshadow the creation of a real Defence Minister—nothing is done to counter the criticism that it is too cluttered with departmental duties and cumbered with the representatives of purely departmental interests to leave any room for the formulation of policy.

M. Reynaud and his Critics.—M. Reynaud has lost no time in bringing into effect that tighter organisation at the centre which is to ensure a more vigorous prosecution of the war by the French people. The War Cabinet of nine has held several meetings; an Economic Council under the chairmanship of M. Chautemps, the Deputy Premier, has been set up; and a Cabinet Secretariat equivalent to that created in England by Mr Lloyd George in 1916 has been appointed. But M. Reynaud is not yet firmly in office. The sequence of events that led to M. Daladier's resignation and M. Reynaud's accession has left bitterness behind. It was the Right and the Socialists who, by abstaining from supporting M. Daladier, induced him to resign—though it is now abundantly apparent that there was no intention to remove him from the Presidency of the Council but merely to stimulate him to greater efforts. The Radicals—M. Daladier's own party—are indignant that this manoeuvre should have so completely succeeded, and they are tending to wreak their spite on M. Reynaud, in spite of the fact that M. Daladier remains as the second most important member of the Government with nine Radical colleagues. It is unpleasant to have to add that this understandable disappointment of the Radical Party is being played upon by two Ministers who were left out in the reconstruction of the Cabinet. Neither M. Bonnet nor

M. La Chambre has covered himself, or France, with glory during his term of office, and it would be an indictment of democracy if their personal hostility were to bring the Government down. So far as the Chamber is concerned, the situation turns on M. Daladier. He can bring the Radicals to heel if he will, and he is surely too big a man to encourage an intrigue against the Cabinet in which he serves, merely in order to return at once to the first place. In the Senate, rather different considerations apply, for though half the members belong to the *Gauche Démocratique*, which corresponds to the Radicals in the Chamber, their dominant sentiment is one of uncompromising anti-Socialism, and it is the inclusion of six Socialists in his Government that is M. Reynaud's worst sin in their eyes. There is to be a secret session of the Senate next week, and anything may happen. But there is a healthy growth in the public demand that a team of good men should be allowed to get on with their jobs. Changes of Governments mean less in France than in other countries; but they are hardly advertisements of national unity, and energy devoted to playing politics is inevitably diverted from winning the war.

The Allies and Russia.—Mr Churchill's "we do not seek war with Russia" was more than a statement of Government policy. It echoed the predominant opinion of British people. They hated the attack on Finland, and they distrust the disingenuous rôle that Russia is playing as Germany's "neutral" accomplice. But the main and only object is to defeat Germany and the harm that could be done to Germany by an attack on Russia is, at least for the present, less than the strain that such an extension of the Allies' task would impose on their resources. A minority, indeed, on the Labour side, looks upon this point as the acid test of the Allied Governments' sincerity in their fight against Hitlerism. Any move to "switch" the main objectives of the war farther East would greatly swell the number of those few who parrot-wise contend that this is an "imperialist war." The position in France is very different. There, a considerable section on the Right Wing of politics, the section that is most likely to seek the fall of M. Reynaud because of his six Socialist Ministers, wants open war with Russia. Their starting point is ideological. There can be no security, they say, until Communism has been crippled in Europe as it has been, quite ruthlessly, in France itself; to defeat Hitler is only to go half way. And, despite the fact that their views (expressed with startling frankness over the British radio this week in a short talk by an eminent French journalist) seem logically to seek war with half the world as well as Germany, they claim to be realists, too. Only through Russia can Germany's lifelines be cut, they claim; and Russia, they add, is hand in glove with Germany, in spite of all protestations of neutrality. These are not the views that France has accepted. Nor are they likely to be, unless Russia strikes aggressively again in Europe or gives an unneutral degree of assistance to Germany. But they are vocal enough to give an unfortunate backing to the contention of Russian statesmen and Western Communists that the Allies' ultimate aim is anti-Russian.

Russia and the War.—This Allied hostility to the Soviets was M. Molotov's main theme in his speech on foreign policy to the Supreme Council of the Soviets last week. Finland, he declared, had been sought by Britain and France as a base against Russia; in the Near East an Allied Army was tempting Turkey to "play with fire" in a drive against the Soviets; and in the manoeuvring for a springboard to launch the long-awaited capitalist war against Communism, both Italy and the United States, by their help to Finland, had played a part. It is at any rate a welcome proof of the force still inherent in the mere

phrases of morality and justice that so much ingenuity should be spent on repudiating the charge of aggression and claiming the mantle of self-defence. Here M. Molotov and Herr Hitler are at one. How far else are their policies linked together? "We must maintain our position of neutrality and refrain from participation in the war between the Great Powers"; M. Molotov's words seem clear enough, though they lose some conviction by the fact that he has never said anything else—not even when the Nazi-Soviet Pact was prepared and concluded. There is little doubt that Russia's inclination is to put as little positive energy as possible into the joint aggressor effort, or that her economy and war machine are ill-contrived for distant adventures.

But it is plausible to suppose that inaction, except in the economic sphere, is just what Germany wants from Russia—as from Italy. Non-belligerency is their contribution to the Nazi cause, with the rider always that they should be prepared, in self-defence, of course, to oppose force to the Allies, if we should seek to strike at Germany by side or back doors in Northern or South-Eastern Europe; M. Molotov's warning to Norway, Sweden and Finland to drop their proposed defensive pact was in the spirit of this part. The problem here for Hitler—and Ribbentrop—is to make sure that the non-belligerents do not clash between themselves in determining the places they are to protect. The debatable land is the Balkans, just as it was in the case of Germany's Austrian and Russian allies sixty years ago. At Easter a Three Power Pact resolving this question and locking the Balkans against Allied influence was promised. It has not yet come, and M. Molotov's speech may have thrown light on the reason. Russia had pacts of non-aggression with Turkey and Iran, but none with Roumania. This was because the question of Bessarabia was not settled. Although M. Molotov once more said Russia did not propose to go to war for Bessarabia, this was a scarcely veiled threat to Roumania not to act out of step with Soviet wishes. Even this may have been part of the rôle assigned by Hitler to Stalin, but at any rate, it gave a clear reason why Russia was not prepared to enter into a Three Power guarantee of the Balkan *status quo* and so allay Italian suspicions. If the aggressors are still in partnership, and there is no reason to suppose they are not, their mutual liability is still sharply limited.

Co-ordinating Information.—M. Frossard, the Minister of the newly constituted Ministry of Information and Propaganda in France, has been in London this week for discussions with Sir John Reith, and a new landmark in Allied co-operation has been reached. It has been announced that an officer is being appointed to co-ordinate the activities of the Ministry of Information in Paris and to act as a close and constant channel of communication between the two Ministers, while similar duties will be performed by a representative of the French Ministry in London. In a war of words and nerves co-operation in information and propaganda is obviously essential in presenting the Allied case; but it should also serve to increase the two countries' knowledge and understanding of what is happening in the other—a step in this direction has already been taken by the production of two films by our own Ministry of Information, which present the French Navy and munition manufacture in France. In this way the new co-operation will strengthen the basis of a permanent peacetime alliance which is the declared aim of both countries, and towards which the wisest move of all has been made with the plans for extending the alliance to education and promoting closer contact—by personal visits where possible, as well as by lessons in language, literature and culture—between French and British school-children. There is room here for co-operation not only between the two Ministries of Education, but also between the Ministry of Information and the Ministry of Education in each country. But before this is done the re-organisation of our own Ministry of Information must be

completed so that it can have a chance to settle down and do some useful work. The French Minister will, it is noted, have the censorship of the Press under his direct control; and it has long been felt that the hasty severance of the Press and Censorship Bureau from our own Ministry and the splitting up of its functions among the Service Departments was a mistake. Now there are reports that it will again be centralised, and the appointment of Sir Walter Monckton, Controller of Censorship, to the additional post of an Assistant Secretary of State at the Foreign Office implies that other propaganda activities, such as those of the British Council, are to be brought into proper relationship with the central organ.

Food Prices.—The belief abroad that large parts of Britain's population are going without sufficient food is fantastic. Last week's statement of Mr Lennox Boyd, Parliamentary Secretary to the Ministry of Food, to the effect that we could now be quite sure, not only of having sufficient food in all circumstances, throughout the war, to maintain life in all its vigour, but also of being able to convince everybody that justice was being done to the very poorest, tended to the other extreme. Few people would agree that an adequate plan for the development of home agriculture, for new arable acreage and the supply of feeding stuffs, has yet been definitively worked out; and no shrewd observer could deny that high food prices are causing not only widespread (and, admittedly, disproportionate) complaint, but also in some instances actual distress.

At the time of this week's Commons debate on the subject Mr W. S. Morrison was still Minister of Food, and his reply to Labour criticisms was very able. He pointed out that, whereas the cost of freight and insurance on 15 main imported foodstuffs had gone up 232 per cent., and the indexes of agricultural and wholesale prices both 40 per cent., food prices had only gone up 17 per cent.—compared with 22 per cent. in the first six months of the last war and 84 per cent. by 1918, when rationing was introduced. He pointed out, too, that, so far from exceptional war increases having taken place, the prices of butter, margarine, flour and bread were all below the level of December, 1929—a date somewhat arbitrarily chosen. The fact is, however, that, in spite of this impressive picture, and in spite of the work done by the Government to root out profiteering and cut down profit margins, rationing is not working equally between different sections of the population. The better-off people are rationed by the Government; the poorer people are rationed by price. This is merely a reflection of peacetime inequalities, but in wartime it becomes a special irritant. There is a widespread view that the introduction of rationing should presuppose that all citizens should be in a position to obtain the

ration—so far as an iron ration of the basic foods needed for ordinary health is concerned. This may not be practicable as a universal principle. Certainly prices could not be brought down by anything like enough to make it possible. But the very fact of the rich and bountiful supplies Mr Lennox Boyd pictured should give an opportunity for experiments to supply specially poor people with essential foods at cheapened prices.

* * *

An Employment Census.—The decision has been taken to compile a census of the skilled, semi-skilled and unskilled labour in the three essential industries of engineering, motor vehicle and aircraft manufacture, and shipbuilding. The returns have to be in by April 10th, and this promptness is a small compensation for the unforgivable delay of seven months in deciding to collect this most important and essential set of facts. The census is only a beginning; it is only a fraction of what was done in the last war, and a still smaller fraction of what is needed if economic policy is to be founded on knowledge rather than guesswork. It is apparently proposed to take the census quarterly—it was monthly in the last war. The three industries now included employed, last July, only just over one-tenth of the insured population (1,529,130 out of 14,322,000); the census should be extended to cover them all. Moreover, the number of persons employed is not the only fact, though it is possibly the most important, that the Government should know about industry from month to month. Information is to be collected in this first instalment on the nature of the products manufactured and on the proportion of plant being used for defence work, for exports and for civil requirements. Clearly, there are other matters which should be included. The most vital of these is the actual amount of money being earned by employees—an essential factor in the making of financial policy on which there is virtually no information at all. It is not impossible that an earnings census is in contemplation, though it is hard to tell how long a delay there will be before it is taken. The Ministry of Labour seems to be unaccountably shy of doing its statistical duty, and it has apparently required pressure from the very highest source to induce it to go even as far as this week's embryonic census. The results will not, of course, be published during the war; but it is to be hoped that the machinery of collecting these all-important facts will not be demobilised when the war is over.

Home Defence.—Seven months of no bombing have inclined many people to regard A.R.P. as a luxury to be pruned and disregarded. For the A.R.P. services themselves the burden of inactive waiting has been heavy. Yet

here, more than elsewhere in preparedness, the respite has been valuable. The problem of A.R.P. has not been quantity but quality, not numbers of men and women but their efficiency and the effectiveness of the organisation binding them together and bringing them into operation in case of need. There has been time since September to work out the status and operational requirements of A.R.P. as a service not inferior to the armed forces. This week, from the Ministry of Home Security, comes the announcement that General Sir Hugh Elles is to be Chief of the Operational Staff of the Civil Defence Services; with him, in the process of training, will be associated Wing Commander J. E. Hodsoll, whose contribution to the efficiency of the A.R.P. personnel and organisation is already high. Together, in collaboration with the twelve Regional Defence Commissioners, these two men will be responsible for training and organisation—precisely the two departments of civil defence work where, for lack of regular discipline, traditional standing, public sympathy and individual understanding, A.R.P. work is weakest and least uniform. The present system of regional training will stand. So, too, will arrangements for the direction of operations in actual air raids. But the new authority will join the services at their weakest link by concentrating on the joint action of separate local bodies, on inter-district mobility and on uniform standards of training and efficiency between the localities and regions. Something like a wave of frustration and apathy has swept over too many A.R.P. bodies. The non-technical services have suffered most, and the warden and first-aid services particularly. If the new direction is to be valuable, not only on paper but in local operation, it will strive to end this by securing the setting before all enrolled personnel, voluntary or paid, of the same sort of standards of achievement and discipline as prevail in the fighting services. The goodwill, industry and self-sacrifice of A.R.P. workers are very much greater than their daily critics give credit for; but, for their own sake as well as the nation's, it is all-important that they should not waste the time Goering has allowed them.

* * *

America and the War.—There can be little doubt that the collection of "documents" found by the Nazis (according to their own story) in the Polish Foreign Office at Warsaw and purporting to show that the American Ambassadors in Poland, France and Great Britain were egging on the Allied "war-mongers" last August, have been fabricated and released in an attempt to harm Mr Roosevelt and assist in the election of an isolationist President. The attempt has misfired. For one thing, Dr Goebbels must have known that immediate denials would come from the State Department and the Ambassadors concerned, and he must be deluding himself as well as the German people if he imagines that his word will be preferred in America to theirs. And for another thing, it is an almost invariable rule of propaganda that open attempts by one country to interfere in the domestic politics of another have the opposite effect from that intended. It has certainly been so in this case. The effect has been to give a slight flavour of foreign policy to the primary election in Wisconsin on Tuesday. The Democratic voters of Wisconsin had a three-to-one preference for Mr Roosevelt over Vice-President Garner, and their Republican colleagues had a two-to-one preference for Mr Dewey over Senator Vandenberg. The British observer must beware of reading meanings relevant to the American public's attitude to the war into electoral votes in Middle Western states, but at least the results are not such as to show that the President has been harmed or that the appeal of isolationists like Mr Garner and Mr Vandenberg has been enhanced. The current mood of America is for keeping out—but how far removed that is from isolationism is shown by such recent events as the decision to permit sales to the Allies of the latest models of American aircraft and the renewal of Secretary Hull's Trade Agreements Act. In the circumstances, the President's remark, after hearing Mr Sumner Welles's report, that there was scant hope of peace in Europe at present can also be taken as a sign that the Allies' standpoint is both understood and approved.

Balkan Expectancy.—Ribbentrop's plan to seal up the Balkans with a triple seal of Nazi-Soviet-Fascist design has apparently miscarried; and the initiative in South-Eastern Europe's diplomatic war has momentarily passed to the Allies and their Turkish associate. Britain's envoys in South-Eastern Europe have been summoned to London to report. On their return to duty France's envoys will follow suit in Paris; and, meanwhile, the Balkan countries are standing by to learn what is the rôle proposed for them in the strategic plans of the Western belligerents. From the aggressor side only one shot has been fired since Hitler met Signor Mussolini and Count Ciano persuaded the Hungarian Count Teleki to renounce revisionist claims on Roumania—on the assurance, it is said, that in spite of Nazi leanings towards an eastward move, Italy's guardianship over Hungary had not yet been surrendered. That shot was M. Molotov's, when he cynically dragged the unresolved Bessarabian dispute into the light of day in the course of his protestations of Russia's uniformly pacific intentions.

What the Allies will do with their moment is unknown. What they will not do is fairly clear. They will not plan assaults upon Baku, campaigns in the Vardar-Morava valleys or sorties up the Danube. These are figments of Nazi and Soviet imagination and wishful thoughts of impatient "activists" in Britain and France. The Allies' interest in the Balkans is precisely the same as Germany's and Italy's—Russia's is less certain—namely, to keep the peace there. But the gulf between peace and a Nazi peace is wide, and the Allies' aim is two-fold: first, to secure that neither the trade nor the policy of the Balkan countries, and of Roumania and Jugoslavia in particular, shall fall entirely into enemy hands; and, secondly, to convince the Balkan Governments after apparent Allied failures elsewhere, that Britain and France are strong enough, and resolute enough, to make good their promises. Turkey has the same aim: to see the Balkans free from German—or Italian—domination, and Turkey has a powerful army, now side by side with the Allied Eastern force. If the newly intensive blockade policy of the Allies is to succeed, the Balkans must not be lost either to influence or assault by the enemy, and for the moment Germany, near at hand and with the past successes of aggression to tell, has nearly the upper hand. But the winning cards are held by the Allies, if they are used rightly. In the military force that they could deploy, on land, at sea and in the air, they are at no disadvantage. In the economic strength that they could lend to aid the Balkans, their superiority is immeasurably greater. Only half-measures in their approach to the real interests of Balkan countries can lose them the diplomatic struggle outright.

The Neutrals in the North.—Caught between the Nazi devil and the deep blue sea controlled by the Allied navies, the nations of Scandinavia and the Netherlands are still dogged in their adherence to their own interpretation of neutral rights and duties. Britain, they claim, through the speeches of Mr Churchill and Mr Chamberlain, has put a false choice before them. They admit the excesses and outrages of Nazi sea warfare; Norway, Sweden and Holland have all protested in the last few days against the torpedoing and bombing of their vessels. They admit the illegality of Germany's attempts to press them into ceasing to trade across the North Sea; and they maintain that they have stoutly resisted this pressure, at great cost in loss and danger. But the unjustifiable demands made by Germany—and not conceded—do not, they contend, constitute a cause for the Allies to exert unjustifiable pressure on the other side. In Sweden and Norway, they were relieved to learn from Mr Chamberlain's statement that apparently, contrary to several forecasts, the Allied Supreme Council had not decided to "police" Norwegian territorial waters with their navies. But in all these countries the claim is made that, just as Germany

has no right to ask them not to trade with the Allies, so the Allies have no right to ask them to cut down their trade with Germany below normal levels; iron ore flows from Narvik to Britain as well as to Germany. In Holland especially, the point is made that for Germany's neighbours to join the blockade would be suicidal. Indeed, these are the two points on which the neutrals' definition of their position, not only with regard to the blockade but also with regard to Finland, are being based: first, that international law requires them to remain quite independent of either side in the war; secondly, that self-preservation suggests that, if they did not, they would be overrun and destroyed—by Germany. Self-preservation, in fact, is the real point of the controversy. The Allies claim, quite logically, that only by an Allied victory can the independent nations of Europe be saved from extinction. The neutrals reply that, though this may be true, their immediate problem is to ward off attack *now*; and, if the way to an Allied victory is by their own temporary extinction because of aid given to the Allies, then they prefer short-run safety to long-run salvation. Their stand is wholly intelligible. But the trouble is that Mr Churchill is right. The "crocodile" will eat them up in the end if he can; and, since the crocodile also has designs on Britain and France, the Allies must take every step to put a term to his marauding, even if such steps involve some restrictions on neutral freedom—as they must do, if only because Germany's main defence against the blockade is the existence of neutral corridors for her vital commerce.

Establishing Mr. Wang.—Official Japanese declarations on the occasion of the establishment of the Wang Ching-wei regime bespeak a more conciliatory attitude towards the Western Powers. Japan's priority in the development and utilisation of Chinese resources is claimed; but Mr Wang's undertakings in this respect will not, it is said, exclude foreign economic activities which "conform to the new situation." The "peaceful" nature of the Chinese War is emphasised, and though Japanese actions may have belied the present protestations, hints are given that after the incident is closed the Army will be put in its place by the civil Government. Such soft words can only mean that Japan, left high and dry by the German-Soviet Pact and fearing lest the end of the Finnish War will enable Russia to direct her attentions once again to the Far East, is anxious to make capital out of the bad odour in which Russia now stands with the democracies. She evidently has hopes that the Allies and the United States will in future eye askance a Government that counts on Russian support; and her haste in coming to terms with Mr Wang, after so many months of negotiation, suggests that she believes the present to be a propitious time for establishing his regime. From one quarter, however, she met with an immediate and uncompromising rebuff. The United States is in no two minds as to her attitude towards the war in the Far East; and Mr Cordell Hull lost no time in denouncing Mr Wang and in declaring that she would continue to recognise the Government of Chiang Kai-shek as the Government of China. It can be no coincidence that this flat assertion of policy followed hard upon an appeasement speech by the British Ambassador at Tokyo, who on the eve of Mr Wang's inauguration expressed confidence in the future of Anglo-Japanese relations, saying that though methods might differ, both countries were ultimately striving for the same objective—"a lasting peace and the preservation of our institutions from extraneous and subversive influences." The speech was interpreted in America as foreshadowing a Far Eastern Munich, and Mr Hull's prompt statement implied that America's attitude would not be shaken by any change in British policy. Lord Halifax has since given the assurance that no such change is contemplated and that there was no question of the Government recognising Mr Wang. Sir Robert Craigie's speech may, therefore, be taken as no more than a gesture to make a bid for Japanese sympathy in our own struggle. But we can hardly forget that, whatever her attitude towards the war in Europe, in the Far East Japan is an aggressor in her own right.

Shorter Notes

The March unemployment figures show the first real improvement since the war began. The reduction in the total number of unemployed is 382,887 on the month and 605,716 on the year; and there is even a reduction amounting to 111,000 on the August total, which ended the long series of declines beginning in January, 1939. The number of wholly unemployed, 966,000, is also below the August figure of 968,000.

There is still no sign that in Great Britain women are to any appreciable extent being employed in industry in the place of men, and the number of women unemployed is still 57,000 higher than in August. In France, on the other hand, in February alone 170,000 women were taken on in war industries; in establishments under the direct control of the Minister of Armaments 29 per cent. of the workers are women; and by a new decree the employment of a certain proportion of women—in some cases 100 per cent.—will be made compulsory in a number of industries.

It is understood that the Minister of Transport is considering a statement from the railway companies which puts in a plea for increases in rates and fares to meet the higher costs caused by the war. Coming so soon after their very generous treatment in the agreement with the Government, this request justifies the fears then expressed lest the companies' appetite should grow by what it feeds on.

The twelve regional committees to consider the cases of German and Austrian aliens, subject to restrictions or deemed worthy of review, have now been appointed and consist of a chairman with legal qualifications and two lay

representatives drawn from a panel of local residents. In addition, they will examine the cases of all aliens resident in the areas round naval ports which are declared protected, to decide whether they should be allowed to remain there.

The shipment of Swedish iron ore from Narvik to Great Britain and Germany in the first two months of this year, according to official Norwegian statistics, was as follows:—

	Germany		Great Britain	
	1939	1940	1939	1940
January ...	487,890	281,740	67,730	148,291
February ...	475,482	99,391	70,234	131,855

Finland's losses in men killed during the whole of the war are authoritatively estimated at between 15,000 and 20,000, which is considerably less than the 60,000 claimed by Molotov. The total damage to house property—excluding damage in the ceded territory—is estimated at one milliard Finnish marks (about £5,000,000), and the area of the territory ceded to Russia is roughly 41,900 square kilometres.

Mr J. A. Hobson, who died on Monday of this week, occupied a unique and remarkable place in British economics. Neither a business man nor the holder of an academic chair, he nevertheless had more influence over economic thought than all but a very few of his contemporaries. He saw the accepted doctrines of the academic schools approach quite close to his own views, though he never had the ultimate satisfaction of the heretic—of hearing the world say that he is right for the right reasons. A humanist, a rationalist and an idealist all in one, Mr Hobson has been aptly described as a latter-day John Stuart Mill.

Letters to the Editor

Winning the War

TO THE EDITOR OF THE ECONOMIST

SIR,—The problem raised in your article "Anvil, Fire and Hammer" (March 30th, page 555) is the war problem *par excellence*. I agree entirely with your insistence that it is necessary to have a plan to win this war. But I very much question whether victory presupposes, as you put it, "the defeat in the field of the German military machine." (Italics are mine.)

Military machines are only a part of the war-making equipment in total war, and it is at least possible that we have reached a stage in the evolution of war in which they will play a subsidiary part.

It is quite impossible for me in any space you could allow me to develop my argument on this point, but you may care to allow me to inform your readers that a memorandum entitled "On Winning the War" which I have prepared is now in print and will be sent to any of your readers who cares to ask for it on a postcard. In order to avoid misunderstandings I should perhaps explain that any member of the K.H. News-Letter service will automatically receive this document.

Yours truly,
STEPHEN KING-HALL.

Headley, Hants.

The War Effort

TO THE EDITOR OF THE ECONOMIST

SIR,—In your leading article, "Anvil, Fire and Hammer," on March 30th you make a comparison between Nazi expenditure on their war effort and what we are spending on ours. You then go on to say "That the House of Commons should debate the attitude of the Ministry of Supply towards commission agents would be admirable—if only it would also turn its attention to the inadequate scale of the Ministry's positive achievements."

May I point out that, in the early stages of the debate on the Ministry of Supply on March 15th, to which you refer, I spoke of the inadequacy of our effort as compared with

Germany's and stated facts which were fully confirmed by the article on "The Nazi War Economy" in your issue of the next day, March 16th. Replying to the debate, Col. Llewellyn, Parliamentary Secretary to the Ministry of Supply, said:—

I pass to the speech of the Hon. Member for North Cornwall (Mr Horabin). I must say the impression which his speech gave me . . . was that it was—*unfortunately*, I think—the greatest tribute paid in this House since this war started to the Nazi system. I was rather depressed to hear the Hon. Member make that speech, but I do not think the Nazis would be overjoyed, because I think the speech of the Hon. Member was not founded upon fact.

My reason for writing this letter is the reason why I despair of the capacity of the present Government to conduct our war effort effectively. Here we have a member of the Government, intimately concerned with supply, and completely ignorant of the facts about the German war effort. It is reasonable to assume that the rest of the Government is equally ignorant of the facts, otherwise the Parliamentary Secretary to the Ministry of Supply would have recognised the truth of my statement—after six months of war.

Yours faithfully,
T. L. HORABIN.

House of Commons.

THE WORLD OVERSEAS

Sweden and the Belligerents

(By a Correspondent)

IN the struggle between Germany and the Allies for the ear of the Scandinavian public, the former started with many advantages. Proximity counts for much, and the Germans have far older and stronger cultural and trade connections. The German colony in Sweden is much larger, and there have been many intermarriages between the aristocratic and business families in the two countries. Most important amongst the latter was Goering's first marriage. This gave him connections in certain important Swedish circles. He has been at great pains to cultivate these, and a large section of Swedish society was openly sympathetic with the Nazi regime until the Russo-German pact. The pact killed their interest in German political theory, but it did not make them pro-Ally. Business men could not see why, having accepted the absorption of Czecho-Slovakia, Britain should worry about Poland. They retained memories of 1914, when they were prosperously neutral and on the whole pro-German. The unpolitical Swedes saw no reason why history should not repeat itself.

The classes normally friendly to the Allies are politically to the Left. They have, however, disapproved of English policy since the Abyssinian affair. Sweden felt the Ethiopian tragedy very strongly. She had many connections with the country, not only through General Virgin and his staff but through the strong medical mission which had worked for years in the country. The subsequent developments of the appeasement policy were equally unpopular amongst the Swedish Liberals. Munich and the *Einmarsch* appeared as a deliberate rather than an unwilling betrayal of a small democracy.

Propaganda Failings

At the outbreak of war there was some reaction against Germany, but it was not balanced by any great confidence in the Allies. The Polish war created a quite lamentable impression. Whatever may have been the technical reasons against giving more assistance to the Poles, these reasons were most emphatically not explained to the Northern neutrals. The German agents took advantage of this, and their propaganda has been both realistic and effective. They have made no further attempts to popularise Nazism as a political creed. Instead they have concentrated upon advertising Germany's military strength, and the efficiency of her diplomatic methods. At the same time they have carried on a vigorous campaign, openly and also through their many personal connections, in order to show the Allies as cunning and decadent plutocracies, always buying others to fight for them, and anxious to lure neutrals into wars by giving them guarantees which they will never fulfil. All this fitted in with the view of England which has long been preached by Herr Sven Hedin and others.

The British reply to this campaign has been inept. The local representatives have done their best under very adverse

circumstances, but their case has been hindered in London. They could not appeal to the political Left, because it was considered necessary to justify British policy since 1935, a subject already discussed *ad nauseam* in Sweden, and one on which the Social Democrats have long made up their minds. The British cause also suffered much from certain propagandist books which depict Mr Chamberlain as a kind of Fabius Cunctator, saving the British Empire by making vicarious sacrifices abroad. These, of course, played directly into the hands of the German agents; it was exactly the case which they were putting forward.

Before the Finnish war, no party in Sweden had any doubt about their ability to remain neutral. Conservatives and Liberals felt that Swedish and Danish pacifism had been justified. Not until Russia invaded Finland did they see any possibility of being drawn into a war for which they were totally unprepared. Even then it was only the politically alert who understood what was happening. The active interventionists were men of the political Left, and mostly in the industrial areas. Herr Sandler and his friends found themselves against a solid block of sceptical indifference when they went into the country districts.

The Swedes would subscribe generously or send volunteers to the Finns, because they hate Russia and dislike aggression against small countries, but they were solidly opposed to being drawn into any kind of war. The predominant idea was that their country should not be made into another Poland, nor become a battlefield in a struggle on which Sweden has not really made up its mind.

The later stages of the Finnish war strengthened this feeling. The Swedish volunteers, to the number of about six thousand, were equipped and went to Tornio. They found not a sign of any British or French volunteers. They also saw no evidence of preparations for any large scale intervention by the Allies. These facts, reported back in Sweden, confirmed the growing suspicion that England was engaged in some complicated manoeuvre, which would end in the sacrifice of Scandinavia. There is no doubt that peace will bring an immense relief to everyone in Sweden and Norway, and that they will thank Germany for bringing that relief.

The recent tendency to blame Scandinavia for the Finnish peace terms will have the worst possible effect. The four Northern democracies do not want advice as to how they should conduct their affairs. They have no illusions about the weakness of their position, and are inclined to blame France and England for bringing Europe to its present unhappy condition. I happened to be in Sweden shortly after Mr Churchill's speech on the proper policy for the Western neutrals. The immediate hardening of sentiment against England was most remarkable. Nobody in Europe is prepared to accept the British Cabinet as arbiter and no one looks to England as the leader of the democracies. Even worse than scolding is the appeal for sympathy, and the British tendency to regard themselves as the weary Titan bearing the burdens of civilised Europe. It may be just possible to retrieve the position in Scandinavia, but it will require not only a new vigour, but also a totally different attitude.

Italy's "Imperial" Budget

[BY A CORRESPONDENT]

THE Italian Cabinet, under the presidency of Signor Mussolini, published in January, as in every past year, the Budget for the coming fiscal year 1940-41, which starts on July 1st. This time the announcement was restricted to figures, and no indication was given of the state of revenue

and expenditure in the current year. This renders it exceptionally difficult to pronounce any judgment on the state of Italy's finances. Some explanation is, however, likely to be given when Signor Thaon di Revel, the Minister of Finance, presents his preliminary estimate for acceptance to one of the two Houses of Parliament; and this year, as has just been announced, it will once more be placed before the Senate and not, as last year, before the less critical Chamber of Fasci and Corporations.

Record Expenditure

The new Budget is the largest ever presented by any Italian Government. The ordinary expenditure amounts to nearly 35,000 million lire. The announcement of this sum induced Professor de Stefani, a former Minister of Finance and now an economic journalist, admiringly to state that Italy was relinquishing her former and customary "metropolitan" Budget and entering on her first "imperial" Budget. The present Minister of Finance expressed himself less poetically, but more clearly, when he prophesied last May that in future Budget estimates ordinary expenditure would be nearly as high as the combined total of ordinary and extraordinary expenditure in recent years. He also stated that the increase of extraordinary expenses, due to the dangerous world situation, would make it impossible to normalise the Budget, as had originally been intended. In consequence, Mussolini's celebrated command "Live dangerously!" is again being obeyed in Italy's financial policy.

The ordinary expenditure for the three defence forces, as shown in Table II, now amounts to more than 10,000 million lire. The ordinary expenditure on the defence ministries and on the Ministry for Italian Africa, which still includes large military expenses, amounts to more than a third of the total. This is not remarkable, when compared with the Budgets of the belligerents. All the same, it is without precedent in Italy. Moreover, in recent years, ordinary military expenditure, on paper, has been little guide to actual expenditure. In 1937-38, the last year for which final results are available, ordinary expenditure on defence and Africa amounted to 7.2 thousand million lire; extraordinary expenses were 11.9 thousand million lire. It was additional military requirements which forced up the net deficit between 1937-38 and 1938-39, and forced the Minister of Finance last May to revise upwards his original estimates of ordinary expenditure for 1938-39 and 1939-40. This upward revision amounted to 7,500 thousand million lire in each of the two years and accounted for the low figure for 1938-39 of 6,500 million lire of extraordinary expenditure actually so-called. Thus part or all of the cost of the military occupation of Albania and other special expenses may have been booked to the ordinary Budget.

As already mentioned, no information has been given about the ordinary Budget for the current year since last May. The estimated "ordinary" deficit of 7,400 million lire will doubtless be reached, provided that the assumed receipts of 24,600 million lire are actually obtained. Doubts in this respect are justified, as the new taxes, which are expected to provide more receipts, either do not come into force until 1940-41 or have only been collected since the middle of February. Regardless of this difficulty, ordinary expenditure in the new Budget for 1940-41 is up by 2,900 million lire over the estimate for the current year, whilst revenue is up by 4,400 million lire as a result, no doubt, of the new taxes. As in Germany, the expected receipts have been spent in advance.

These hopes of bigger future receipts are based on two different factors. First, on the reform of taxation, commenced three years ago by Signor Thaon di Revel. The aim is to attain greater concentration and better organisation. This complicated task, which demands much time, is probably the reason why Signor Thaon di Revel is the only one of the economic ministers who was not touched by the "Change of Guards" in October, 1939. However, this reform, even if it does increase the efficiency of Italy's tax collecting system, is not likely to increase the revenue next year by as much as 4,400 million lire.

The other sources of additional revenue are the two new taxes decided on last autumn. The first is a 2 per cent. turnover tax levied on all sales. It came into force in the middle of February and is to replace the "tassa scambio" and the "bollo ordinario su note" previously levied. These latter were very complicated and their rates varied according to the object or transaction from 2 to 12 per cent. It is hoped that the new tax will simplify matters. Whether this will be the case remains to be seen. At present the introduction of this new tax has given rise to considerable disturbance. Its extension to every business transaction with the exception of wages and salaries and a few others already subject

to special taxes, is expected to be followed, despite the low rate, by a general rise in prices.

The second new tax, which comes into force at the beginning of the next fiscal year on July 1, 1940, is a novelty for Italy. It is a $\frac{1}{2}$ per cent. general property tax, levied on every kind of property of more than 10,000 lire. The novelty of this tax as well as the very complicated methods of valuation, are causing the authorities some difficulties. It will therefore be wise, at least at first, not to attach too much hope to the smooth functioning of this new source of revenue.

Italy is counting on an eventual annual net increment of 7,500 million lire from these two taxes. Together with an additional 1,000 to 2,000 million lire resulting from the general reform of taxation, the Italian revenue would suffice, at least on paper, for a future ordinary expenditure of 35,000 million lire annually.

New Loans

But apparently the authorities themselves do not share the optimism shown by a semi-official agency. For they announced the issue of new 5 per cent. "Buoni del Tesoro" of nine years' duration at the same time as the new Budget. These bonds are intended "to cover the extraordinary demands of the Budget." How far they will be used to meet extraordinary expenses is not stated nor is the total amount of the bonds known. Their issue ceased on February 29th. They are to replace the corresponding nine years' bonds which have to be repaid on May 15th next.

Other securities repayable in the first half of the current year, as for instance the bonds of the Prestito Nazionale (5 per cent. from December, 1915) as well as the coupons of the public loans, may be converted on similar terms into the new bonds. But even if all holders, as is expected, agree to the conversion, the result will not be an additional income, but will only spare the State disbursements in this and next years. But it is to be presumed that the Government will take advantage of the extraordinary liquidity of the banks and savings banks and induce them to take over large sums. But even if the ordinary deficit of 7,400 million lire is covered, there is still the extraordinary Budget. According to a private estimate extraordinary expenses in the current year may be 10,000 million lire, bringing the total deficit to over 17,000 million lire.

Whether any official information will become available remains to be seen. It is inconceivable that the deficit should be further met by bonds bearing a high rate of interest, as these will only raise the annual burden on the ordinary Budget. Such a policy would also end in a credit inflation which could not be disguised. It must therefore be assumed that the "non-recurrent" special taxes or taxes on capital started during the Abyssinian war will be continued. By this measure in any case the anti-inflationary effect of "skimmed" purchasing power would be achieved as in Germany. Yet in spite of all these endeavours rising prices present a very serious problem.

TABLE I
ITALY'S BUDGET FROM 1934-35 TO 1940-41

The Bank undertakes general banking business and with its numerous branches offers special facilities in Canada, Newfoundland and the United States

Uncertainty in France

[FROM A CORRESPONDENT IN PARIS]

THE political situation is still unsettled. M. Reynaud is in office but not yet in power, and the attitude of the parties who hold the balance in the Chamber and the Senate is not yet known. The position is that the fall of M. Daladier was, in a sense, accidental. Considerable manoeuvring went to bring about the state of affairs which led to his departure. But many Members were surprised when he resigned. It is a common view that the votes cast against him, and the large number of abstentions, were not intended to represent a vote of no confidence in him personally. They meant rather, it is said, a demand for a refashioning of the Cabinet and a revitalising of policy, under his control.

It is agreed that, in M. Reynaud, France has a man of exceptional qualities, a man of remarkable intelligence, notable independence and courage. But, in the Parliamentary sense, M. Reynaud is an "outsider." He has never submitted to the strait discipline of a party. Often he has stood up for his opinions even against his friends. There is not behind him the solid block of political supporters that both M. Blum and M. Daladier can command. He has great worth and authority, but no sworn followers. Parliamentarians are uneasy about a leader who has no party.

M. Reynaud has, indeed, formed a Ministry. But, to many, it gives no impression of cohesion. Most parties are represented, it is true, several by their heads, but in too many cases representatives of the second rank have been chosen, because the leaders themselves are unwilling to commit themselves. The Right has not put in M. Marin or M. Flandin. The Left has not sent M. Blum or M. Paul Faure. Only the Radicals have let their chief take office, in addition to several other prominent members. But MM. Bonnet and Delbos have retired to the back benches. The impression is not of the National Government that M. Reynaud himself undoubtedly wanted, but of a patchwork Ministry in which the different pieces have far from the same value.

The trouble is the Socialists. Six of them have taken office, and M. Reynaud has chosen here men who were leaders of the Popular Front—M. Monnet and so on. The great majority of the Senate, the parties of the Right in the Chamber and almost all the Radicals dislike and distrust this. Old feuds die hard in France. The bitterness between Radicals and Socialists is the greater because once they were allies.

Already, to show this fear and suspicion, the Radicals in the Chamber have abstained from a vote of confidence. In the Senate MM. Caillaux and Laval are hostile. The question is: can M. Reynaud overcome this opposition? He would have been markedly assisted if Mr Chamberlain could have brought the Labour leaders into the British Government. M. Reynaud will struggle hard. And, if he fails, it will be a loss to the Allied cause, as well as to France, because he is outstanding among Allied Ministers—but he has no party.

April 1st.

Whither American Business?

[FROM OUR NEW YORK CORRESPONDENT]

ONE could not write the economic history of Europe for the winter of 1939-40 without reference to the unusual severity of the weather. In the United States, it has not been extraordinary, except for an extremely heavy blizzard in February in the lower Mississippi Valley, and persistent sub-average temperatures in the extreme South-East, which caused local losses to the citrus and vegetable crops.

There has been another meteorological phenomenon not yet

The OCEAN

Head Office: 36-44 Moorgate, London, E.C.

FOR ALL CLASSES OF INSURANCE

capable of appraisal. Last autumn was dry over much of the United States. Winter snows and rains have provided some moisture, so that talk about drought in the South-West has subsided. Nevertheless, the fact appears to be that a considerable part of the country is now entering the spring with some deficiency of water, both in the soil and in reservoirs.

The February business indices released by the Federal Reserve Board looked very much as expected.

BUSINESS INDICES

1923-25 = 100 (unadjusted for seasonal movements)

	Feb. 1939	Aug. 1939	Nov. 1939	Jan. 1940	Feb. 1940
Industrial production (total)	99	99	124	117	110
Manufactures (total)	98	99	123	116	109
Durable	84	85	125	117	104
Non-durable	111	111	122	116	113
Minerals	105	96	127	120	116
Construction contracts (total)	63	76	74	61	54
Residential	51	66	59	44	49
All other	72	84	87	75	58
Factory employment (total)	93.6	96	104	101.5	...
Durable goods	83.3	84	98	97.4	...
Non-durable goods	103.5	108	109	105.3	...
Factory payrolls (total)	86.0	90	102	98.3	...
Durable goods	77.7	82	101	98.2	...
Non-durable goods	95.3	99	102	98.5	...
Freight-car loadings (total)*	62	70	82	78	73
Miscellaneous*	75	74	89	86	83
Department store sales*	87	89	95	92	90
Department store stocks	65	65	82	61	...

* Adjusted for seasonal.

From these tables there is little evidence of change between February, 1939, and August, 1939, except in building, in which there was a vigorous rise, partly of a seasonal nature and partly attributable to the release of Government contracts. Between August and November, there was a very strong spurt in production, most marked in the durable goods industries—especially steel; less marked in non-durable goods; still less marked in department store sales.

From the record of March, it appears that the recession in the durable goods industries has continued, but at a slower pace. At the moment, the prospect of an early upturn rests entirely on hope. It now seems clear that the autumn spurt was a war-consequence, once removed. That is, war orders (direct or indirect) played a negligible rôle; but the hasty expectation of war orders caused a stampede to place domestic orders in the areas in which a hypothetical war demand might be expected.

The Outlook?

This situation has led to three opinions. First, there is the view that the cycle initiated in the middle of 1938 is definitely played out, and that we are now only in the initial phase of a major downturn which will pass presently from recession into depression. While this is often stated in the mechanistic terms familiar to students of business cycle statistics, it rests fundamentally on the theory that our entire structure has changed so radically that it cannot longer support a standard of living (or volume of production) anything like so high as in the past—in short, that cyclical fluctuations are to be expected to move about a lower norm. Secondly, there is the view that, after the terrible collapse of 1929-32, the process of reconstruction would be slow, fitful and arduous. On this theory, just as the depression of 1938 was less severe than that of 1932, so this one would not plunge so low as 1938.

The third view is almost (but not quite) entirely mechanistic. It belongs in the pulmotor school of economics; and expects that when or if the recession descends to a level which rouses popular pressure, some potent stimulant (in Wall Street parlance, "a shot in the arm"—an economic expedient derived from a study of the life of Mr Sherlock Holmes) will be injected into the jaded economy to galvanise the moribund creature into a semblance of vigour.

It will be noted that each of these three opinions is derived from purely domestic considerations. There are a number of others which, held by minorities, are related to the international. One of these is the belief that the war will eventually cause an enormous increase in our export trade, both to the belligerents and to the markets vacated or hypothetically to be vacated by the belligerents.

Still another group clings to what might formerly have been regarded as orthodox American economics—viz. a devout belief in the quantity theory of money. These would hold that, regardless of other factors, a projection of the trend of the circulating media (currency and deposits), whether as a consequence of gold imports or deficit financing, will eventually produce inflationary phenomena which will take the shape of a recovery or of a sustained boom.

Germany at War

(An objective account of economic trends in the Reich compiled weekly by the editorial staff of The Economist from German and neutral sources.)

THE full report of the *Vereinigte Stahlwerke A.G.* (the leading German coal, iron and steel producer) for the business year 1938-39, which ended on September 30, 1939, lays special emphasis on the further increase of output during the year. The output figures available are as follows:

	(In '000 tons)			
	1937-38 Oct.-Sept., 12 months	1937-38 Oct.-June, 9 months	1938-39 Oct.-June, 9 months	Percentage increase for the 9 months' period
Coal	27,050	20,270	20,440	0.08
Coke	8,850	6,520	7,320	12.3
Pig iron	6,800	5,000	5,450	9.1
Steel	7,460	5,480	5,990	9.3

In the whole of Germany's coal-mining industry no further increase in coal output was possible, because of lack of skilled labour and the full working of capacity on the other hand. The extraordinary increase in coke output was necessary because of the greater demand for working domestic low-grade iron ore.

The total value of the plant and machinery of the *Vereinigte Stahlwerke A.G.* has increased from Rm. 988 millions in 1935 to Rm. 1,364 millions in 1938-39. The subsidiary *Gelsenberg-Benzin A.G.*, established for the production of synthetic petrol, began operation during the year. Total wages increased by roughly 12 per cent., indicating a considerable rise in the number of workers. Gross profits rose from Rm. 202.7 millions to Rm. 222.2 millions, and net profits and dividends remained unchanged at Rm. 27.6 millions, and 6 per cent., respectively. Total taxes paid increased from Rm. 44.7 millions in 1937-38 to Rm. 66.1 millions in 1938-39, or by 47.8 per cent.

The development of the *Vereinigte Stahlwerke*, controlling roughly one-seventh of Germany's total coal output and more than one-third of the total steel output (Czechoslovakia and Poland not included), indicates to a certain extent the trend of Germany's coal and iron and steel industry during 1939. It may thus be of interest to compare Germany's steel output in 1939 with the output of other countries. The American journal *Steel* published the following table, quoted on March 14th in the *Frankfurter Zeitung* with the Greater German figures left out, showing steel output in 1938 and 1939:—

	(In '000 tons)		
	1938	1939	(+) increase (-) decrease per cent.
World output	109,200	137,100	+ 25.6
U.S.A.	28,804	46,501	+ 61.5
Germany, Czechoslovakia and Poland	26,100	26,000	- 0.4
Great Britain	10,564	13,716	+ 29.9
France	6,186	8,534	+ 28.0
Soviet Union	18,068	18,796	+ 4.0

These figures are naturally based on estimates and are probably too optimistic for Germany. They show clearly that Germany will experience great difficulties in achieving a further expansion in her steel output. During January and February this year, output must in fact have considerably decreased. A recent survey, published by *National Zeitung-Essen*, admits the difficulties caused by the prolonged cold, which include the difficulty of shipping Swedish iron ore to Germany. Orders have piled up and delivery has often to be postponed. The whole industry is now working primarily for armament orders.

Electricity.—The business year of the two leading electrical companies, the *Allgemeine Elektrizitätsgesellschaft*, in short "AEG," and the *Siemens-Schuckert* and *Siemens und Halske Konzern*, also ends on September 30th. Both the companies reported a record turnover. Increased demand for heavy and light electrical machinery and apparatus compelled the companies to expand their plant considerably. Substitute industries, requiring enormous quantities of electric energy, have caused the expansion of

power stations, which had to be equipped by these companies.

Cellulose.—The leading company producing cellulose, the *Zellstoffabrik Waldhof*, reports an increase in turnover in the calendar year of 15 per cent. In recent years the manufacture of cellulose has constantly shifted to new raw materials. First, fir trees were the chief raw material; then, when fir trees became scarce in Germany and no exchange was made available to buy imports, the industry changed to beech and pine. The company now finds 50 per cent. of its total raw material from other than fir trees. In 1939 raw material supplies became more difficult because imports from Canada were no longer possible. The report expresses hopes of new imports from Russia and believes Poland will yield some quantity.

The company is now producing cellulose suitable for manufacture into artificial leather, and from a high-quality cellulose hopes to produce a substitute for cotton-linters. The *Zellstoffabrik Waldhof* owns the Finnish cellulose plants at Kexholm, which are situated in the territory annexed by Russia.

The second leading cellulose company, the *Feldmühle Papier und Zellstoffwerke A.G.*, reports record output in 1939. Plant was extended and domestic raw materials were substituted for imports from the British Empire. War conditions have increased the demand for cellulose manufactured from straw. The capacity of the *Vereinigte Strohstoffabriken* is being rapidly expanded, and new plant is under construction to use potato leaves and a reed specially grown for this purpose which is to be cultivated in Germany.

Articles in the German press praise the new artificial textile fibre, called *PeCe*, manufactured from coal and limestone. Plant for the manufacture of this fibre on a large scale is being built. The new fibre is reported to be acid proof. The American fibre called *Nylon*, produced in the same way, is different from the German product. The high water resistance quality of the German fibre makes it specially suitable for fishing nets. Being acid proof it will probably be used chiefly for workers' overalls in chemical and other industries. It is also reported to be of great strength and samples of machine belting made of *PeCe* fibre are already on the market. The fibre is produced by the *I.G. Farben Industrie*, the German Dyestuff Trust.

The output of cellwool has increased from 162,000 tons in 1938 to roughly 200,000 tons in 1939. The total output of artificial fibre, amounting to 229,000 tons in 1938, may have increased to 300,000 tons in 1939, or roughly 30 per cent. of the total supplies of 1938. Total home supplies, natural and artificial fibre, rags and waste, were estimated officially at 356,000 tons in 1938, or 32.4 per cent. of the total demand. Total home supplies in 1939 will probably reach 400,000 to 425,000 tons, or roughly 36 per cent. to 39 per cent. of the total supplies of 1938. In 1933 only 5.5 per cent. of the textile fibres used were home-produced, regenerated rags and waste not included.

New Standstill Agreement.—At the beginning of the war Great Britain and France held roughly Rm. 360 millions out of the total amount of Rm. 800 millions of Germany's Standstill debts; Rm. 120 millions out of the remaining Rm. 340 millions is held by the United States of America. The other parts are held by Holland, Belgium and Switzerland. A new agreement with the United States was concluded in September, 1939. Its most important point was the reduction in interest of one half per cent. Subsequent agreements concluded with Holland, Belgium and Switzerland also reduced the interest by one half per cent.

An advisory committee under the presidency of a Swiss banker has now been formed, and for the three neutral countries an arbitration committee has been set up at the Bank for International Settlements. Monthly payments of Register-Marks have been increased from Rm. 350 to Rm. 500. Register-Marks may also be used for allowances paid to persons living in Poland. The so-called Traveller's Mark has now been fixed in value and consists as to 75 per cent. of Register-Mark and 25 per cent. of Degomark, i.e. a mark issued by the "Golddiskontbank."

THE PRUDENTIAL ASSURANCE CO. LTD.

Points from the Directors' Report and the Speech of
SIR EDGAR HORNE, Bart.

Chairman of the Company, at the 91st ANNUAL GENERAL MEETING
held at Holborn Bars, London, E.C.1, 4th April, 1940

ASSETS AND INCOME. The assets of the Company are now **£354,455,855**, of which over 93 per cent. are invested in the United Kingdom and the Empire. The income during 1939 was **£56,254,060**.

ORDINARY BRANCH. The net new sums assured were **£27,130,000**. The reversionary bonuses declared on participating policies in force at 31st December, 1939, are **£1.14.0** per cent. for Whole Life Assurances, and **£1.10.0** per cent. for Endowment Assurances.

INDUSTRIAL BRANCH. The premiums received were **£23,810,034**, being an increase of **£694,548**. The reversionary bonus is **£1.4.0** per cent.

Since the initiation of the profit sharing scheme in the Industrial Branch, **£59,000,000** has been allotted for bonuses to policyholders.

A further reduction in the Industrial Branch expense ratio. For 1939 the ratio was **22.46** per cent. of the premiums received.

GENERAL BRANCH. The premiums received were **£2,620,959** arising from Fire, Sickness and Accident, Employers' Liability, Motor Insurance, etc.

APPROVED SOCIETIES. The total amount expended on benefits was over **£4,500,000** including **£546,000** on dental benefit.

SERVICE and SECURITY

THE BUSINESS WORLD

The Future of Private Banks—I

AS a form of banking organisation, the private partnership has been fighting a defensive battle for close on a century. In the realm of domestic banking that battle was joined in the '40's and irretrievably lost in the '70's and '80's of last century. But when one speaks of private banks in Great Britain to-day and considers what the future may hold in store for them, one refers to institutions whose other familiar synonyms are merchant banks and acceptance houses and whose sphere of activities has been the overseas rather than the domestic market. Most of them are partnerships or private limited liability companies, the distinction between the two forms of organisation being one of fiscal convenience rather than of organic structure. A number of public companies such as the Anglo-International Bank, the British Overseas Bank and the former London Merchant Bank, must however be included among them.

Many of these banking houses were founded by families of foreign origin or extraction though there are outstanding examples of domestic produce in the group, such as Barings and Guinness Mahon, to mention two only. The merchant banks rose to the height of their power, prestige and prosperity with that nineteenth century development of international trade and finance which elevated London to its unquestioned pre-eminence as the international merchanting and financial centre. Their own contribution to that development and that pre-eminence was considerable. Their overseas connections—often family ties with foreign banking houses—made them the channel through which London canalised most of the short-term and long-term credit which was being poured into every other country in the world during those constructive and magnificent decades—a period when the gold standard was in fact a sterling standard. The private banks developed the international acceptance credit into the fine and sensitive instrument which, with the help of the London discount market, did more than any other single factor to ensure exchange stability and the smooth and efficient functioning of international trade and finance. In addition, they undertook new issues for overseas borrowers, granted short-term accommodation which often preceded a long-term loan, commanded the underwriting lists which guaranteed the success of any issue they undertook to sponsor, and, after the operation, looked after the service of the

loans issued by them. As an ancillary part of their relations with an overseas clientèle, some of the merchant banks began to specialise in foreign exchange business. But for them, this highly important and profitable branch of financial activity would, until the war of 1914-1918, have remained the monopoly of the London agencies of foreign banks. The merchant banks were the British pioneers in foreign exchange business and their activities in that sphere facilitated international arbitrage in bullion and securities, highly profitable sources of income for London.

Then came the war of 1914-18. The world in which the merchant banks had lived and thrived had been shaken to its very foundations by the economic convulsions and aftermath of those years. The hegemony of the gold standard was gone. The unquestioned supremacy of London as an international financial centre was fading. International trade was increasingly trammelled by the growth of economic nationalism. Something had disappeared of that sense and tradition of international financial morality on which the whole business of foreign loans ultimately rested. But the symptoms of this changing and disintegrating world did not make themselves immediately apparent. Foreign defaults on Government and private debts occurred with greater frequency; but for some years the losses were outweighed by a tremendous increase of activity in spheres which the merchant banks had made their own. The huge borrowing programmes of the years of economic reconstruction in Europe brought much grist to their mill. There was an immense increase in foreign exchange business and though the clearing banks began to encroach on this profitable preserve the specialists probably received most of the additional business. There was, moreover, a recovery in international acceptance business which carried the aggregate amounts involved well beyond the heights reached before 1914. But much of this feverish activity was hollow and unhealthy. The money poured into reconstruction loans was preparing new defaults and underpinning an edifice which was not to last more than a decade. Most of the increase in foreign exchange business was of spurious, speculative character, a resultant of the gradual collapse of international currency stability. For these banks it was, therefore, a deadly malignant growth. But they did well out of it while it lasted. The same was true to a large extent of the new expansion in acceptance business. Much of it was not so much a reflection of the recovery of international trade as an indication of the abuse and perversion of the acceptance credit. The large line of open credit facilities granted to some foreign bank had taken the place of the genuine commercial documentary credit granted directly to the firm utilising its facilities. Thus, short-term credit which should have been repaid and recreated every three or six months was, in fact, going into permanent capital. That abuse was fully revealed with the sequence of defaults, moratoria and standstill agreements that ran through Europe and South America in the early 1930's.

The veil had fallen and, willy nilly, the defensive battle had to begin in earnest. Fortunately, the transition was not too abrupt. The great mass of short-term credit affected by the moratoria of 1931 was not defaulted upon but made subject to standstill agreements which provided for the payment of a reasonable rate of interest and for various devices by which the capital tied up could be gradually recovered. For the London acceptors and other creditors, the blow was not crippling. The foreign exchange market continued for some years to offer the profits of exceptional activity—much of it still the disquieting fruits of specula-

tion and of panic movements of funds from suspect currencies. But many of the merchant banks had read the signs of the times correctly. They cut their losses on frozen foreign credits and endeavoured to seek in the domestic field some compensation for the business they had lost in their traditional overseas markets. There began a campaign to popularise domestic acceptance credits, while a number of important merchant banks began to forge valuable financial links with industrial concerns and groups at home. But domestic trade had largely lost the bill of exchange habit and though valiant work was done to restore to favour this method of domestic finance, the results achieved could only provide compensation for a small fraction of the business lost in the foreign sphere. The rapprochement between the merchant banks and domestic industry was a development of possibly greater import for the future. It led to the sponsoring of new industrial issues of capital and to the establishment of relations between the banking houses and industrial groups concerned going well beyond those of banker and customer. If these relations were to endure they must obviously be based on some permanent participation of the bank in the equity of the industrial enterprises and this raised many questions as to whether a certain section at least of the merchant banking community might not be evolving towards a type of organisation akin to the Continental "banque d'affaires."

Then came September, 1939, and all these doubts had to yield to problems of far more pressing character. In the first place the default on the German standstill debts became complete and those acceptance houses whose German paper was still circulating in the discount market and with the banks had to stand the test of liquidity involved in the task of taking up the paper for their own account. It may be estimated that the commitments of the merchant banks in Germany totalled some £23,000,000 on the outbreak of the war. Much of this had taken the form of cash advances. Most of the acceptances involved had already been taken off the market as the result of earlier requests by the Bank of England. But the completion of default nevertheless must have been fairly painful in those quarters whose standstill policy had emulated too closely the "hope for the best" attitude of our political

leaders in their relations with Germany. The resultant test of liquidity was successfully passed, but not without cost to available resources and earning power. In some cases, but fortunately for only small amounts, there was a call on the special help from the Bank of England for which provision was made immediately following the outbreak of the war. That was the first shock. The second was the complete suspension of new issue business, both foreign and domestic. The departments concerned may not have been profitably employed for some time before the outbreak of the war, but they became wholly redundant with the sudden imposition of a rigid control on the new issue market. The third blow came in the shape of the control of the foreign exchange market. It was a particularly cruel blow because, quite unwittingly perhaps, it discriminated against the merchant banks. Unlike the clearing banks to whom they had taught the business of foreign exchange dealing, the merchant banks found themselves outside the list of "authorised dealers." Under the system of exchange control, clearings and Government operations in many commodity markets, the total amount of foreign exchange business to be transacted was in any case bound to become much smaller. But the merchant banks have suffered not only absolutely but also in their share of the reduced volume of business passing.

For the duration of the war there can be little hope of escape from the difficulties which suddenly descended upon the merchant banks on its outbreak. There is unfortunately little scope for their functions and activities in the inevitably controlled economy of the belligerent state engaged in totalitarian war. But, for the duration of the war, at least, they will endure in, broadly speaking, their present form. The few that may need help will be "looked after," though their power of ultimate resistance and survival must be somewhat weakened by the cost of the special accommodation which the Bank of England is ready to furnish—namely, the decidedly penal rate of 6 per cent. And after the war? What rôle will they play, under what guise will they function, in the world which we hope will emerge from our present turmoil? Even without attempting a definition of that brave new world, it should be possible to formulate tentative answers to these questions. The task will be attempted in a second article.

Building Material Shares

SHAREHOLDERS in companies producing building materials have no excuse for living, in wartime, in a fool's paradise. As the directing head of some of the largest cement and brick undertakings of this or any country, through the period of their greatest prosperity, Sir P. Malcolm Stewart speaks with the voice of authority. At the meeting, on March 18th, of British Portland Cement Manufacturers he declared that, so long as the war lasted, the demand for cement products must be almost entirely dependent on Government, A.R.P. and export orders. This week, Sir Malcolm has made this point with even greater emphasis to stockholders of Associated Portland Cement. "The volume of Government A.R.P. and export orders is uncertain, and I am bound to warn you that we cannot expect under war conditions a repetition of the results achieved last year." And recently, at the meeting of the shareholders of the London Brick Company (which succeeded in paying a total dividend for 1939 of 10 per cent., against double that rate for the preceding year, only by reducing the amount provided for depreciation), he was even more forthrightly pessimistic. "The general house-building industry, on which we mainly depend, is virtually dead for the time being. There is not in sight to-day any other source of demand of such magnitude as will take its place."

Any sermon on these texts must necessarily be an essay in survival—in measuring the forces of adversity and, with normal markets ruled out, in seeing how far alternative wartime demands are likely to fill a gap which is bound to be uncomfortably wide and deep.

Certainly the last war brought a painful contraction in

earning power, as is clearly brought out by the table of the results of the two largest, interrelated companies in the cement industry which appears at the head of page 624.

During the war years the net profits of British Portland Cement fell to one-half and those of Associated Portland to one-fifth of the 1913 figures. Recovery began about halfway through the war, and military demand evidently played some part in it. Its influence, however, was far

from decisive, and it was not until civilian demand somewhat violently reasserted itself, with the post-Armistice boom, that earning power regained and surpassed the standard of 1913—only to fall again sharply in the succeeding depression of the early 1920's. And that, it should

be noted, was the experience of representative companies in the cement industry, which, by general consent, has much more of a wartime equity than the brick-making trade.

In one respect the background for earning power in these industries may be less favourable in this war than the last; for it is the Government's policy this time to avoid, if it can, the big rise of prices of commodities (especially of constructional materials) which markedly affected the earning power of all companies in the years between 1917 and 1920. In all other respects, however, the building material producing companies can at least face the difficulties of the present war with more merited confidence in their ability to withstand them than they could a quarter of a century ago. In 1914 the large horizontal combine of British Portland Cement had been formed for only three years, and although Associated Portland had experienced fourteen years' working as a still larger trust, it was far from having attained stability, either financially or in its relationship with competitors. In 1940, by contrast, both cement- and brick-making concerns have the strength, internal and external, which comes only from a prolonged period of prosperous working, backed by conservative finance, rationalised production,

* June, 1923.

NOTE.—The above figures are based on the following data—Employment: Numbers of insured persons in employment in June of each year, in (a) Brick, pipe, tile, etc., making; (b) Cement, limekilns and whitening; (c) Building trades. Production: Census of Production returns (millions of bricks and thousand tons of cement), for 1924, 1930 and 1935; supplemented by Import Duties Act Inquiry figures and estimates for other years. Houses Built: Official returns for England, Wales and Scotland, for twelve months ended in following year, throughout. Building Plans Passed: Figures for certain towns and cities (excluding London, and all Government work), for calendar years, as given in Ministry of Labour Gazette. Profits: Net, before preference dividend.

and a measure of price agreement. The outstanding feature of the last ten or fifteen years has been an unprecedented increase in building construction, residential and otherwise, but particularly residential. For the cement manufacturers there has been superimposed on it the development of new and important uses for their material (road-building being among them). Relevant figures bearing on the growth of demand for building materials between 1924 and 1939, so far as they are available, are grouped in Table I at the foot of page 624, and their movement between 1924 and 1939 is contrasted with that of the profits of the largest brick-making company and of British Portland Cement, respectively, in a supplementary table of index numbers based on the statistics for 1924.

The returns relating to building activity are seriously deficient. For buildings other than houses, the regular returns include only the value of plans passed, and even these exclude building in the County of London and Government building generally. Taking the figures as they stand, however, the lessons of the last fifteen years, from the investor's viewpoint, are readily perceptible. At the peak of the building boom of the later 'thirties the profits of representative companies in the brick and cement trades were approximately two and a half times as great as in 1924. This rate of increase was appreciably greater than that of production either of bricks or cement. And it was much greater than the rise in the effective labour force of the two industries. The tendency—gratifying for shareholders—for profits to outstrip production factors was, of course, partly attributable to decreased overheads. But most people who are familiar with the recent history of these industries would award the lion's share of the credit to the successful quest of those at the head of the largest companies for the economies of increased efficiency—coupled in the cement industry (more prominently than in the brick trade) with an increasing awareness of the potential benefits of a co-ordinated rather than a competitive price policy.

The peak of prosperity came approximately in 1936/37. Between then and the outbreak of war, building activity was declining and, as the more detailed Table II of company results given on page 624 suggests, the trend of profits also turned downwards. Three of the five companies in the table—Associated Portland, Alpha Cement, and Eastwoods—reduced their dividends in 1938, and all those whose reports for 1939 have been issued have made further reductions. The drop in earnings was steepest in the case of London Brick, where the effect of the falling demand for residential building was less cushioned by that of re-armament building than in the case of the cement manufacturers. Under war conditions the difference in the strategic position of the two industries is bound to be greatly accentuated. The closing down of speculative building operations, officially sponsored slum clearance, and office and flat building in Greater London and the larger provincial urban areas, will unfavourably affect both trades. But cement has a closer interest in wartime construction—military and industrial—and in civilian protection. Cement, much more than brick, is a possible wartime substitute for timber. And cement will travel, while bricks, like some of the finer wines, can hardly stand a long journey. Finally, cement, whose materials are entirely indigenous, is an admirable product for inclusion in any wartime export drive. That point has not been lost on the Associated Portland Cement management, for stockholders were informed this week of the great effort which the company is making to penetrate into new markets, in collaboration with the Export Council.

For these reasons, it is anomalous that London Brick ordinary should, at current Stock Exchange prices, yield appreciably less than British Portland Cement. The chairman of London Brick has himself declared that although the company hopes to obtain a share of "important orders required to execute work for the Government," the volume of visible demand is not reassuring in relation to the magnitude of the company's productive capacity. Already it has been decided to discontinue the quarterly dividends which have been paid regularly for eleven years, and the form of words used by the chairman in announcing this fact is capable of bearing the construction that the directors

must have the full results of the current year's trading before them before they can decide whether any ordinary dividend at all is justifiable.

Belt-tightening for brick company shareholders in wartime may be inevitable, but for holders of cement shares the omens may be rather more promising. Of the two factors which determine their profits and dividends, one—the level of prices achieved after infinite diplomacy before the war—seems at present unlikely to be threatened by war contingencies as such. The other—the volume of output—may quite conceivably be determined by considerations of high Government policy. Cement, up to a point, is a munition of war. It is bound to be in urgent demand in the period of reconstruction after hostilities. In other ways it affords an excellent example of the species of industry which would make a bigger contribution to the national war effort by maintaining its existing organisation and sharing in a Government-assisted export campaign than by materially reducing its output and allowing a significant part of its labour force to be drawn off and retrained for direct war industries. Stockholders, in any case, could not expect dividends at the pre-war rate, since entry into export markets on the scale desired would probably involve Government assistance in one form or another, but their prospects would be materially strengthened. The whole question, however, now lies in the lap of Whitehall, and in the light of known present factors it may be asked whether yields of 6½ to 7½ per cent., based on the distribution up to or near the hilt of the earnings of a mainly pre-war year, are not unduly low, even for the best cement equities. Admittedly, the companies will have a favourable E.P.T. standard, but earnings are unlikely to reach any level at which E.P.T. considerations will be more than academic. In other ways current prices seem slightly out of alignment; for it is anomalous that the ordinary stock of British Portland Cement, with its record of greater stability than Associated Portland over nearly three decades, should give the higher yield when a declining trend of profits is in prospect.

THE LEGAL & GENERAL ASSURANCE SOCIETY

announces that the

WAR RISKS EXCLUSION CLAUSE

now common to all new Whole Life and Endowment Assurances

CAN BE WAIVED

by the payment of a moderate extra annual premium in respect of the following categories:

MEMBERS OF H.M. FORCES AND ALL CIVILIANS BOTH MALE AND FEMALE IRRESPECTIVE OF AGE: An extra of £1 per annum per £100 sum assured for a maximum period of five years to cover War Risks in the United Kingdom but excluding aviation other than as a fare-paying passenger on a recognised air route within the United Kingdom. MALE CIVILIAN LIVES OVER 40 YEARS OF AGE AND ALL FEMALES: An extra of £1 10s per annum per £100 sum assured for a maximum period of five years to cover War Risks both at home and abroad provided that at the time the proposal is made there is no prospect of leaving the United Kingdom.

The Society is also prepared to consider covering War Risks both at home and abroad in respect of male civilian lives under 40 years of age, each proposal being considered on its merits. Life Assurance is more necessary to-day than ever before. Do not delay in providing your dependants with the fullest protection.

Finance and Banking

Free Sterling.—From the low point of 3.45½ touched last week, the sterling rate in the New York free market this week recovered to 3.59 and then sagged again to the neighbourhood of 3.55. The free currencies quoted in London have tended to follow these gyrations. One feature of the free market during its recent period of agitation has been a noticeable widening of its turnover. This may seem paradoxical in view of the fact that the demand for sterling in this market has been considerably reduced by the latest exchange regulations. It also runs counter to the expectations held in high quarters here, that a greater measure of fluctuations in the free sterling rates would be a desirable thing, since it would indicate a narrowing of that market. The fact is that, with the severity of the recent decline in the free sterling rate, many foreigners who had until then been content to leave their funds here suddenly changed their minds, and by their sales seriously upset the equilibrium of the market, which had just been deprived of a considerable part of its support. The turnover in the free market was also swollen by the sudden development of bear operations. It is a somewhat disquieting fact that prominent neutral banks appear to be able to obtain overdraft facilities in London which, it is strongly suspected, are in certain cases being used for speculative operations. The education of some of our "authorised banks" in the mysteries of the international exchange market and in the shadier activities of certain of its Continental members is still far from complete.

Amsterdam remains the principal dealing centre for free sterling, and it is there that speculative activity in our currency is mainly concentrated. It has been evident, however, that during the past three weeks heavy outright selling of sterling has come from the Far East, a fact which confirms earlier suspicions in the market that centres such as Shanghai have provided fairly substantial loopholes for the escape of funds from the sterling area. The free market in sterling and French francs (the two may be regarded as synonymous) has also been fed by the "black" market (the adjective is used advisedly) in smuggled notes. The extent of France's land frontiers makes it extremely difficult to enforce the restrictions against the export of capital in this form. Though the traffic may not have become disquietingly large, it cannot be denied that appreciable markets in French notes have sprung up in countries such as Belgium. The authorities in France and Britain are aware of this problem and are putting such obstacles as the present regulations allow in the way of the free and unconstitutional repatriation of such notes. There is another loophole for capital from the sterling area through foreign domiciled trust companies, which in fact hold

assets for British beneficiaries. It is to be hoped that the coming Budget will deal very firmly with this particular form of evasion.

Monthly or Weekly Making-up?—The disturbances in the money market occasioned last week by the clearing banks' monthly making-up should draw attention to the faults of this war innovation. It will be remembered that on the outbreak of the war it was decided to discontinue the publication of monthly clearing bank aggregate figures for the duration. There was an immediate and justifiable outcry against the inclusion of these vital figures in the statistical "black out" which then descended upon the country. The Committee of Clearing Bankers relented and decided to continue the monthly figures but to change their basis by relating them to the final making-up of the month for each of the clearing banks concerned instead of to the average of the weekly making-up days in the month. The justification advanced for the change was that it would simplify the whole procedure of compiling the figures and that in the special circumstances created by the war the saving of clerical work was imperative. It is doubtful, however, whether the saving resulting from this change in the compilation of the monthly figures is more than negligible. Each bank continues to take out weekly figures for its own purposes. As a matter of domestic accounting and checking routine, the weekly making-up continues, though it may not be achieved with the detail and preparation that go to the compiling of the figures which are actually published. The case for the monthly making-up is not therefore particularly impressive.

The case against it, on the other hand, is strong. It has compelled a return to "window-dressing" and to its attendant disturbance of the money market on a scale which had not been seen since the days of the gold standard. It stands to reason that when the clearing banks had four or five lots of figures to average in compiling their monthly statements they did not find themselves compelled by the emergence of an exceptional depletion of cash on one of the days in question to correct the position by severe calling from the market. They could in part rely on the position being evened up over the other making-up days in the month. That cushioning effect of the weekly averages no longer obtains to-day. If on the effective monthly making-up day the position promises to reveal a shortage of cash, it must immediately be corrected by the appropriate recall of money lent on the market. The impact of this monthly making-up is all the more felt as the selected days are the last making-up day of the month for each clearing bank. Their incidence therefore falls during a period when abnormal disturbances of the credit position from changes in the note circulation, preparations for dividend payments, etc., are usually at their maximum. This leads to yet another item in the case against the monthly making-up, namely that it photographs the banking situation in a decidedly unnatural pose, when the figures tend to be distorted by purely temporary movements of funds. This appreciably affects the continuity of the new series with the pre-war figures and even invalidates the comparability of the new figures. This is therefore a case where the claims of statistical accuracy tally with those affecting the convenience and smooth functioning of the market. They do not appear to be effectively offset by the arguments hitherto propounded for the monthly making-up and a return to the weekly averages would on balance seem desirable.

Silver Export Point.—The recent fluctuations in the free sterling-dollar rate have emphasised an important

aspect in the position of the London silver market which has received curiously little attention. It concerns the calculation of the effective sterling parities for silver in terms of the official United States price for imported metal. Hitherto these calculations have been made on the basis of the official dollar rate, and have yielded results showing that London prices of silver remained well above the American parities. The inward parity—the silver import point—need not concern us. The embargo on the import of silver into this country has given that figure no more than academic and nominal significance. But since silver is free to leave this country, the export point is one of practical importance. That it has not yet entered into the day-to-day preoccupations of the market is partly due to the utilisation of the official sterling-dollar rate in its calculation. But there is nothing in the exchange regulations to debar an American purchaser of silver in the London market from paying for his metal in sterling obtained in the free market. The effective export point is therefore one which moves not merely with changes in the official American Treasury price and with alterations in the costs of shipping silver across the Atlantic, but with the fluctuations in the free sterling-dollar rate. When that rate recently slumped against us to the low level of 3.45½ the point was, in fact, reached at which it would have been theoretically feasible to buy silver in London and export it at a profit to the United States—provided the free market was used for the relevant exchange operation. It was a fleeting opportunity which does not appear to have been seized by any operators. But it is one which may recur, aided not necessarily by the movements in the exchange, but by those in the sterling price of silver. If, when it does, the Silver Purchase Act still stands, a basic line of defence for the sterling price of silver will be available at a level decidedly more reassuring—from the point of view of silver—than that indicated by the export point calculated on the official exchange rate.

Peseta Rates.—With the coming into force of the Anglo-Spanish Trade and Payments Agreement on April 1st the Bank of England began quoting two rates for pesetas. Both apply to the conversions under the clearing machinery set up by the agreement. The official rate has

remained at 38.60 pesetas to the £, and in addition there has been a so-called "voluntary" rate quoted at 45 pesetas to the £. The official rate is to apply to the payments of amounts due from this country to Spain for goods or freights where such debts are expressed in pesetas. The voluntary rate will apply to other items which have not yet been specified in detail between the British Clearing Office and its Spanish *vis-à-vis*, the Instituto Español de Moneda Extranjera. It may, however, be assumed that it will cover such items as personal remittances and payments made by British insurance companies in respect of claims arising from policies on Spanish property. The destruction caused by the civil war has left a relic of outstanding and, in many cases, as yet undecided claims of this kind. Their settlement will be effected through the clearing. The provisions for including the settlement of "invisible" items in the balance of payments of the two countries in the clearing is an interesting and significant advance in the scope which such agreements have hitherto covered. Moreover, the establishment of a "two-decker" tariff of exchange rates within the clearing is an interesting innovation in clearing technique.

Italy's Gold Reserve.—Ever since October, 1935, the Bank of Italy has not published weekly returns of its position. They disappeared at that time with a host of other statistics on the economic and financial position in Italy. This fact gives additional interest to the occasional glimpses into the reserve position revealed by the annual reports of the central bank. The cabled summaries of the latest balance sheet reveal the following changes:—

(In million Lire)			
	End of 1937	End of 1938	End of 1939
Gold	3,996	3,674	2,700
Foreign exchange	32	152	300

MONEY MARKET NOTES

THE officially quoted exchange rates have remained unchanged throughout the week. The unofficial rates have fluctuated in accordance with the fluctuations in sterling in New York. Lire, for instance, have moved up from 68.70 at the end of last week to 69.70½, but Finnish marks and escudos have moved against the pound.

The money market has experienced extremely easy conditions after the temporary stringency of last week. The clearing banks have been exceptionally good buyers of bills, and the market, which obtained a rather better allotment quota at last week's Treasury

tender—amounting to 49 per cent. against 38 per cent.—has sold as many as they could. Some idea of the present plethora of money may be obtained from the results of the tender for the £1,000,000 Port of London Authority Bills. These, which run for six months, were placed at an average rate of 1½ per cent. This is the same as the effective rate for the three months' bank draft. Bond money has been easily obtainable at ¾ per cent.

The Bank Return shows why the banks have been such eager buyers of bills. Owing partly to first of the month dividend disbursements, and partly to payments for Government contracts,

there has been a big switch-over from public to bankers' deposits. The former are down by £20.7 millions, while bankers' deposits are up by as much as £22.8 millions. They have also benefited slightly by the return of notes from circulation, although, since the Easter holiday was rapidly followed by the end of the month, this is being a much slower process than in normal years. The decline in the note circulation, in fact, only amounts to £0.7 million. Government securities, on the other hand, are up by £3.4 millions, which probably represents Government borrowing on Ways and Means from the Bank to meet its first of the month requirements.

growth in the circulation and other sight liabilities. In some ways, the meagreness of the reserve margin has been emphasised since the outbreak of the war by the exchange movements which followed it. The lira has not followed the belligerent currencies in their depreciation against gold, and consequently the evidence on the unimpressive reserve position has been reinforced by the increased over-valuation of the currency in the exchange markets.

* * *

Holland Revalues her Gold.—The recently enacted Gold Revaluation Act providing for the revaluation of the Netherlands Bank's gold reserve is given effect to for the first time in the weekly return published this week and showing the position on April 1st last. The gold reserve has risen from Fl.1,023,055,000 to Fl.1,244,672,000, the increase being "almost exactly accounted for by the recalculation of the reserve at 122 per cent. of the previous fixed gold price. The principal offsetting changes are an increase of Fl.121,187,000 in deposits and a reduction of Fl.55,451,000 in advances. The Act provided that part of the revaluation profit should be available for the general purposes of the Dutch Treasury, and in particular for covering special defence requirements. This allocation probably accounts for the increase in deposits. The balance was to be earmarked to the repayment of advances made by the Netherlands Bank to the Dutch Equalisation Fund.

* * *

Eastern Banking Results.—The four banks operating in India and other eastern countries whose accounts have appeared recently have certain balance-sheet changes in common, which may be directly attributed to the war. The figures of the Chartered Bank of India, Australia and China are not comparable with last year's as in the meantime the P. and O. Banking Corporation has been taken over, but even allowing for this factor the trend is the same as for the other three. For instance, all show rises in bills payable, amounting in three cases to about 100 per cent. At the annual meeting of the Chartered Bank, Mr d'Anyers Willis explained that whereas before the war remittances from the East were

chiefly sent home by air, they now come mainly by the much slower surface mail, with the result that outstandings are much heavier at any particular date. The general increase in deposits is also due both to more active business resulting from the war and the desire of the public in the countries concerned to keep their resources liquid. So far as assets are concerned, the banks have increased their liquidity correspondingly with the rise in deposits. Cash shows a general rise—in the case of the National Bank of India by as much as £2 millions—and securities are down. Advances are up in every case, so that the banks, while preserving a liquid position, have been able to meet the increased demands for credit. Taxation and war expenditure, however, have prevented this improved business from being reflected in profits. Those of the Chartered Bank and the Mercantile Bank of India show small rises, and those of the Eastern Bank and the National Bank of India equally small falls. With the exception of the Eastern Bank, whose dividend is reduced from 7s. to 6s. a share, the dividends are maintained.

* * *

Bank of Scotland.—The fall in profits of £31,086 to £274,548 shown by the Bank of Scotland for the year ending February 29th is easily explained by additional war expenditure and heavier taxation, for the balance sheet shows increases in all the profit-making items. Advances are up by £781,029 to £10,508,426, acceptances by £813,154 to £5,261,273 and bills discounted by £1,812,506 to £2,395,436 (of which £2,000,000 consists of Treasury bills). Investments, which, with the exception of £944,461, are all British Government securities or securities guaranteed by the British Government, show an increase of £1,164,727; and their total of £26,841,526, together with cash and other quick assets, which amount to £13,254,262, make a sum which is equivalent to 77 per cent. of the bank's liabilities to the public. The bank is, therefore, well able to meet the prospective increase in demands for credit. At the annual general meeting, Lord Elphinstone said that it was already giving assistance to the farmers in their efforts to increase their production of crops and was co-operating with the Scottish Office in plans for extending this assistance.

INSURANCE NOTES

Refuge Assurance.—A characteristic of the industrial-cum-ordinary offices last year was the relatively smaller decline in new business in the industrial branch compared with the ordinary branch. Thus the industrial new business of the Refuge, the third largest of these offices, amounted to £14,325,800, or only £1,535,200 less than in 1938. In the ordinary branch, the decline was comparable with that of the ordinary offices—the total for 1939 being £6,422,700, or £1,472,200 less than the previous year.

A slightly increased premium income was obtained in the industrial branch, despite the transfer of a relatively large volume of business to the State-owned company in Eire. Expenses in this branch fell from 32.83 per cent. of premiums in 1938 to 32.07 per cent. in 1939, although the war added to costs in several directions. The industrial surplus amounted to £1,028,600, an increase of £134,000 over the surplus in the previous year, and the allocations both to policyholders and shareholders were increased from £454,400 to £514,000 and from £51,400 to £112,500, respectively. As in the previous year £250,000 from the surplus was transferred to investments reserve fund. The carry-forward at £152,000 was rather more than in the previous year (£138,800). The company shared in the general experience regard-

ing interest rates, the net yield on the industrial funds showing a decline of 4s. 1d. per cent. to £4 5s. 4d. per cent.

In the ordinary branch, there was a decline in earned interest of 6s. 10d. per cent. net, the 1939 net yield being £3 12s. 7d. per cent. The surplus at the annual valuation was reduced from £1,775,800 in 1938 to £1,344,400 in 1939, largely owing to the smaller amount brought forward. The directors have adopted a different policy in the distribution of the ordinary surplus, compared with the industrial surplus. In 1938, £1,061,500 was allocated to policyholders and shareholders, but a bonus is not now declared—except for policies becoming claims during the year—and the allocation to policyholders is in consequence only £67,100, while shareholders are allotted £7,500. In consequence, the very large amount of £1,269,900 is carried forward against £464,300 a year ago. This will stand the company in good stead in the event of adverse repercussions caused by the war. The expense ratio in the ordinary branch, as in the industrial branch, was lower than in 1938—13.52 per cent. against 14.03 per cent.

At present, market values of the assets in both the industrial and ordinary branches exceed book values, without taking account of the investment reserves.

Scottish Amicable.—The general view among life offices regarding prospects is indicated by the many cases in which interest bonuses have been reduced, and in some cases omitted, on policies becoming claims in the near future. The Scottish Amicable has taken the very conservative course—against which no criticism can be advanced—of passing the interim bonuses for the present, though policies becoming claims during the remainder of the current quinquennial period will be entitled to participate in any bonuses that may be declared at the new valuation. This office suffered a fairly appreciable decline in the gross rate of interest (£4 17s. 11d. per cent. to £4 15s. 11d. per cent.) as well as in the net rate (£3 17s. 11d. per cent. to £3 13s. 1d. per cent.). Thus higher taxation was reinforced by the general difficulties of obtaining a remunerative return on the funds. Such difficulties were aggravated by the new investment of money, for the Scottish Amicable life fund grew from £12,830,900 to £13,124,400 during the year. The society transacted its business at an expense ratio of 15.25 per cent. of premiums. New sums assured totalled £1,685,800 for the year, against £2,131,100 for 1938, but consideration money for annuities granted was £22,300 against £14,700.

Investment

April Anticipations.—During the past week or two the market has made up in tone what it lacked in turnover. But it is finding little support in advance of the 90 per cent. call on the 3 per cent. War Loan, due on April 15th. And it is thinking hard about the stern facts which the Budget will disclose on April 23rd. In such circumstances, to have maintained a show of firmness is something of an achievement, particularly since the last week or two have witnessed the meeting of the Axis partners on the Brenner and an intensification of economic and aerial warfare. The promise that the Allies are stiffening their resolution, however, has provided something of a tonic to counter all the blusterings from Berlin and any sense of discouragement at home. As the accompanying chart suggests, however, the appearance of the War Loan—and possibly some of the attendant circumstances of the issue, which were handled in a negative rather than a heartening manner—marked the temporary peak of the market's progress since the end of September

FIXED-INTEREST AND EQUITY SECURITY MOVEMENTS (July 1, 1935 = 100)

Financial News indices of 20 fixed-interest securities (converted to new base) and 30 ordinary shares.

last year. Until the Budget hurdle is cleared, the market can at best expect to maintain its present firmness, adding, perhaps, small fractional gains from time to time. But whether the Budget, once out of the way, will afford much consolation to the market is another matter. Equity investors are hoping for some modification of E.P.T. which would limit some of the grosser anomalies which the tax now displays. But that relief, if it is granted, may well represent the utmost that the Chancellor can do by way of concession. Heavier taxation is expected, and will be received calmly. It may be significant that those annual pre-Budget victims of rumour—tobacco, brewing and distilling shares—have so far exhibited little sign of nervousness. But the significance lies, not in any reduction of odds against increases in sumptuary taxation, compared with previous years, but in the market's tacit admission that all branches of investment, from fixed-interest securities to the most vulnerable of equities, are now involved in the same task—of assisting to pay for the war.

* * *

British Overseas Airways.—Contrary to expectation, British Overseas Airways, which took over the undertakings of Imperial Airways and British Airways on Monday last, has not made a public issue of stock, to which shareholders of the two companies were promised preferential allotment. In a circular to shareholders of Imperial Airways it is explained that the Treasury have decided that

no public issue of stock can be made in present circumstances, and the cash required for the purchase price has been raised by a private placing of stock. The terms of this placing have not been disclosed, but the amount involved is of the order of £3½ millions, and the issue, of course, will carry Treasury guarantee. The loss of any preferential advantages will naturally not weigh heavily upon shareholders of the merged companies, since the Airways stock would in any case have been issued at gilt-edged rates and it carries no equity advantages. Yet it is difficult to see why shareholders of Imperial and British Airways, who are in any case to be paid out in cash, should not have been given an opportunity to subscribe for the new stock, for the method of private placing, coupled with cash payment to shareholders, appears to offer no advantages, so far as the protection of the capital market is concerned, over a public issue of stock to which shareholders in the two companies would have been accorded preferential treatment. Imperial Airways shareholders will receive a sum of 34s. 6.615d. per share, made up of the purchase price of 32s. 9d., together with interest at 4 per cent. for two years, less tax at the average rate of 6s. 3d. in the £. So the finance of overseas civil aviation is taken finally from the hands of the equity investor, who has perhaps learned the lesson in the 16 years' history of Imperial Airways that it is hazardous to put reliance upon relatively high dividends which are derived from subsidies from public funds. The Corporation's future policy will have the advantage of adequate supplies of necessary capital at the cheapest rates. Its operating policy will not be a matter of direct investment concern—though it may perhaps be urged that the development of civil aviation is no less essential in wartime than in peacetime. The supply of civil aircraft from the De Havilland works must necessarily be limited in present circumstances, but it is desirable for that company—and essential for the Corporation—that a certain number of such machines should be put into service even in wartime.

* * *

Brazilian Bond Payments.—This week, the Stock Exchange has witnessed the rare and pleasing spectacle of Brazilian bonds being marked ex interest. The schedule of payments is so devised that resumption of interest has been made on April 1st in respect of coupons due on that date two years ago, and a similar arrangement will apply for May 1st coupons. On June 1st, coupons due on December 1, 1937, are expected to be met, and on July 1st coupons due on January 1, 1938. The guiding principle is that payments begin on April 1st in respect of the last coupon due and unpaid after November 10, 1937, with suitable modifications for exceptional cases such as San Paulo Coffee 7's. Some importance has been attached to the publication of a translation of Decree-Law No. 2085, which embodies the offer recently made by the Brazilian Government and recommended for acceptance by the Council of Foreign Bondholders. In particular, the confirmation of the provision, embodied in the 1934 decree, that further foreign exchange supplies accruing to the Brazilian Government may be applied to the purchase of bonds below par, has been stressed. This point was, of course, made in the Council's recent communiqué regarding the offer and was described in *The Economist* of March 16th as "one of the most dubious principles which defaulting debtors have attempted to erect in recent years." The possibility that the Brazilian Government may have available, in each of the four years of the scheme, substantial sums amounting to "several hundred thousands of pounds," clearly has a bearing on the prospective prices of Brazilian bonds, though it does not indicate whether the Brazilian authorities will redeem the maximum amount of nominal debt—by buying low-grade

bonds—or whether they will concentrate on saving the largest amount in interest—by buying the senior issues. Whichever policy they adopt, they will be able to cancel debt at cut prices, by using funds which could otherwise have been applied to more generous interest payments than the agreement, in fact, affords.

* * *

Canadian Pacific Report.—Although the full report of Canadian Pacific Railway repeats the directors' reasons for deciding against the declaration of a preference dividend for 1939, it throws no further light on the "uncertainties of the present situation," and merely emphasises "the impossibility, owing to war conditions, of predicting the effect of developments in the near future." Preference stockholders must therefore continue to nurse their disappointment, and take consolation from the further rise in their stock to 45½ this week. Freight traffic last year reached the highest level since 1930, and earnings from grain and grain products increased by \$6,214,457, or 24.2 per cent. Such was the benefit of the second largest Prairie wheat crop in history. In fact, it presented some embarrassment to the railway, which last October had to impose a temporary stop on movements of grain from various points to the Lakehead elevators. By the end of the year, accordingly only 60 per cent. of the crop had been moved, compared with 70 per cent. in the previous year. The deferred benefit has presumably been seen in the substantial increase in gross receipts recorded in the first quarter of the current year. The report tells a story of improved operating efficiency and train loadings, a substantial reduction in shipping income, and the minimum of progress in the achievement of co-operative economies with the Canadian National Railways. Holdings in United States lines now undergoing reorganisation have been written off from reserves, at a cost of \$15,650,021, and several actions have been instituted by holders of "Soo" bonds who claim that Canadian Pacific's interest guarantee should continue to run until the principal is repaid. Payment was due—though it was not made—on July 1, 1938, on which date Canadian Pacific ceased to make interest payments under the guarantee. The company's legal advisers, however, insist that a good defence can be entered to these claims, and in one case this has succeeded. Meanwhile, there is a significant clue to the prospect of increased operations in the near future. A substantial increase was made in retirement of rolling stock last year, and during 1940 the company proposes to spend \$10,053,690 on new rolling stock—mainly freight cars—to provide for replacements and to enable the company to handle with greater economy "the increased business resulting from wartime activity." Preference shareholders may reasonably retain their holdings on the expectation that, unlike last year, they will presently be allowed to share in these benefits.

Company Notes

I.C.I. Progress.—The profits announced in the preliminary statement of Imperial Chemical Industries for 1939 set up a new record for the company. They are the more impressive since they are struck after income tax, N.D.C. and E.P.T., and it is evident that last year provided highly successful trading conditions for the group. Profits after taxation have increased from £8,561,291 to £9,313,485, from which £2,000,000—the highest allocation yet recorded—is provided for central

obsolescence and depreciation fund, against £1,500,000 in 1938. After providing for preference dividends, equity earnings amount to £5,647,381, against £5,395,210. Although the latest figure is apparently below that of 1937, earnings adjusted for taxation are higher at 12.9 per cent. against 11.6 per cent. in 1938 and 12.5 per cent. in 1937. These results are shown in the following table:—

	Years to December 31,		
	1937	1938	1939
	£	£	£
Profits after taxation ...	9,010,707	8,561,291	9,313,485
Central obsolescence and depreciation fund ...	1,500,000	1,500,000	2,000,000
Preference dividends ...	1,663,512	1,666,081	1,666,104
Ordinary stock:—			
Earned	5,847,195	5,395,210	5,647,381
Paid	4,284,158	4,032,149	4,032,149
Earned (%)	12.5	11.6	12.9
Paid (%)	8½	8	8
General reserve	1,500,000	1,125,000	1,375,000*
Workers' Pensions	172,000	172,995	180,049
Carried forward	556,179	621,245	681,428

* Of which £1,000,000 to War Contingency Reserve.

The directors have thus pursued a distinctly conservative dividend policy in maintaining the 8 per cent. payment. They have opened a new war contingency reserve with a transfer of £1,000,000, while £375,000 is transferred to general reserve. Stockholders will await the full report with whetted appetite, for, on the preliminary figures, it seems a fair inference that Imperial Chemical Industries should be well secured from the earnings aspect, even if dividends may be regarded as semi-fixed in wartime. The £1 ordinary stock units at 32s. 3d. yield £5 2s. 6d. per cent.

* * *

United Molasses Dividend.—On an annual basis the 28½ per cent. dividend declared this week by United Molasses Company for the fifteen-month period to December 31st last is equivalent to 22½ per cent. per annum, as paid for the year to September, 1938. In addition to this distribution, however, a 10 per cent. tax-free payment is to be made from capital reserves, whose nature is not specified. The preliminary statement discloses that capital profits amounting to £145,225 were obtained during the fifteen months. The special distribution, however, will require £195,450. Consolidated trading profits for the fifteen months amounted to £1,622,911, against £1,157,321 for the previous year. Taxation absorbs £495,818, against £279,607, and depreciation calls for a provision of £244,055, against £205,701. The net profit for the fifteen-month period is accordingly £883,038, compared with £672,013 for the previous twelve months. The molasses business came under Government control on January 1st, and the company now acts as agent for the Ministry of Supply. A subsidiary company has meanwhile been formed to take over the tanker fleet, which has been fully employed since the beginning of the war. Shareholders will look forward to receiving some indication in the forthcoming report regarding the financial terms on which control of the molasses business has been arranged.

* * *

Provision Store Trading.—Interesting light has been thrown on the course of trading in 1939 by Sir George Schuster at the Home and Colonial and Maypole Dairy meetings. In the 32 weeks to August 19th last year trading was normal, and the favourable and unfavourable factors in the last ten weeks of the year had cancelled out. It was the intervening period of ten weeks between mid-August and the end of October which provided last year's rise in profits. Abnormal public buying

was coupled with a small addition to profit resulting from the sale of stocks (though not at full replacement costs) bought at a lower price level. This ten-week period, in fact, produced profits sufficient to meet part of the heavy cost of E.P.T. While Sir George disclaimed any wish to complain of war burdens in general, he emphasised—what is readily apparent from the companies' profits records—that their E.P.T. position is unfortunate. And he pointed to the irony that the Home and Colonial would be unable to gain from the war owing to Government restrictions and yet was confronted with a heavy liability for a tax intended to absorb the bulk of such increased profits. The future outlook of the group is bound up with the effect of Government regulations, the volume of turnover, the interpretation of (and possibly changes in) E.P.T., and rates of wages. But in the long run the decisive factor is turnover, and the problem may increasingly be to maintain it as the war proceeds.

* * *

Alliance Trust Results.—This company's satisfactory record has been well maintained. Revenue for the year to January 31, 1940, at £668,301, is only 1 per cent. lower than £676,493 obtained in 1938-39. After charging taxation (£151,161, against £137,090), together with a reduced sum for loan and debenture interest and the usual preference dividends, earnings for the ordinary stock are £286,327, against £282,168, equivalent to 42.3 per cent., against 36.6 per cent. The maintained 25 per cent. dividend is thus covered with an enhanced margin, and after again placing £100,000 to general contingent fund, the carry-forward is increased by £17,186. The report explains that revenue collections continued at a satisfactory level up to the outbreak of war, and that although some dividends were subsequently reduced, they had been largely offset by higher sterling proceeds from the company's dollar income. It is stressed, however, that the outlook for

1940-41 is less promising, and some reduction in earning power may result from restrictions on the scope of operations imposed by wartime measures. There is some evidence in the balance sheet, in fact, of a small reduction in earning assets. The decline in investments from £11,657,904 to £11,455,860 is larger than the contingent fund allocation of 1939-40, and cash has risen from £17,625 to £128,978. On the other side of the balance sheet, debentures and short loans outstanding have fallen from £2,558,475 to £2,454,745. If funds cannot be speedily reinvested at satisfactory rates at home, ordinary stockholders clearly have nothing to lose if they are applied to the reduction of loan debt. The depreciation on the portfolio of only 2.81 per cent. below book values is sufficient evidence of the Trust's impressive financial strength, and there is considerable cover for the dividend. At 48s the ordinary stock yields £5 3s. per cent.

* * *

Higher Rubber Profits.—The transformation in the commodity markets since war began is well brought out by a number of recent rubber company results. Rubber Plantations Investment Trust results, of course, are subject to a time-lag, and for 1939 total profits of £194,260 compare with £274,725 in 1938. The only hint in these accounts of the much improved outlook for rubber profits lies in the decision to maintain the 10 per cent. dividend by adding £40,000 from dividend equalisation reserve to the 7.7 per cent. earned for the equity out of current revenue. But plantation companies whose accounts run to December 31st last provide a real indication of recovery. When comparison is made with the disappointing results of September 30th companies, it is clear that the inclusion of four months, against only one month of war, has definitely turned the scale. Prices rather than output have made the difference. Among this week's reports, *Gulakalumpang Rubber* show total profits of £55,969 against

Ore Reserve.—The fully developed reserve, as recalculated at the 31st December, 1939, amounted to 10,447,000 tons of an average value of 4·4 dwts. over 44 inches. (1938: 10,750,000 tons at 4·4 dwts. over 44 inches.)

Copies of the full Report and Accounts may be obtained from the London Secretary, Winchester House, Old Broad Street, London, E.C.2.

London: 5 Walbrook, E.C.4, and 45 Pall Mall, S.W. 1

surface dumps, which have now been depleted, but the mine is now in a position fully to supply the mill, provided the labour supply is adequate. The company should have a prosperous career for many years to come.

Rose Deep.—This is an old mine, but there is still a large area in depth to be opened up. The annual report reveals that in spite of the shortage of labour, resulting in restriction of underground development, the available ore reserves were more than maintained at 2,400,000 tons averaging 4 dwt., which was a decline of 0.1 dwt. in grade. The reserves represent somewhat under three years' supply to the mill. Development was again mainly confined to the southern section of the property, but very erratic values were disclosed. Capital expenditure will continue to be heavy during this year, after which the long programme of reorganisation of underground conditions and modifications of the reduction plant, which has been carried on for some years past, will be complete. The company should then be in a position to enter a steady dividend-paying career for some years to come. This is a mine which could clearly be included among those which should benefit from the new mining regulations regarding the price of gold.

De Beers Report.—Recovery in the diamond market during 1939, in spite of four months of war, has increased De Beers' profits on diamond account by 62 per cent., from £656,473 to £1,065,362, and after including other income total profits show an increase of £201,849 to £1,824,756. This improvement, however, appears large only in relation to 1938, and comparison with the three good preceding years is less favourable. The surplus, in fact, barely covers payment of a year's preference dividend. This is shown in the following table:—

	Years ended December 31		
	1937	1938	1939
From diamond account	2,536,603	656,473	1,065,362

† After special credit of £12,699.

The past year has seen certain changes in the company's investments, but these are of an internal character which do not affect the interests of the group as a whole. Operations at the New Jagersfontein mine are ceasing owing to the exhaustion of tailings, and the property is being leased to De Beers, who have acquired 250,000 Diamond Corporation shares in return for £250,000 4½ per cent. debentures of that Corporation. The latter will in future provide the principal source of revenue for New Jagersfontein. A larger transaction arises out of De Beers' acquisition of the Anglo-American and Barnato interests in Diamond Corporation. It was agreed in connection with this transaction that Consolidated Diamond Mines of South-West Africa should be allowed to participate in the purchase, and Consolidated Diamond are in fact taking over 687,500 Diamond Corporation shares from De Beers in return for £687,500 Consolidated Diamond 5 per cent. debentures to be issued. Thus there is a net reduction in De Beers' holding of Diamond Corporation shares of £437,500. Other transactions include acquisitions of £60,950 in diamond mining companies, and a reduction from £732,000 to £467,000 in Diamond Corporation 4½ per cent. debentures. Satisfactory sales have so far been reported in 1940, and a publicity campaign has been opened in the U.S.A. Speculative operators have taken due note

of these current prospects and De Beers' preference shares have now advanced to 10½.

The Week's Company Profits.—This week, our usual table of profit and loss accounts, on page 667, shows a rise in both gross and net profits of 58 companies by 15½ and 14½ per cent. to £6,324,000 and £3,471,000 respectively. Although the list includes some very satisfactory results, the rate of improvement in net profits is weighted somewhat by the more normal 1939 profits of companies who experienced heavy losses in 1938. Aggregate total profits of 610 companies reporting in 1940 to date are £131,725,000, against £125,496,000, a rise of 5 per cent., while net profits are 3½ per cent. lower at £72,660,000. The week's results are discussed in preceding Notes and on page 638 under the heading "Shorter Comments."

Company Meetings of the Week.—Reports of important company meetings held this week commence on page 644 of this issue. The position of *Mercantile Bank of India, National Bank of India and the Chartered Bank of India, Australia and China* is described in the Note on page 628. Lord Elphinstone's address at the *Bank of Scotland* meeting is referred to on page 625, while Sir George Schuster's review of current business conditions at the *Maypole Dairy* meeting is outlined on page 630. Sir P. Malcolm Stewart's discussion of *Associated Portland Cement* prospects is referred to on page 623. At the *Refuge Assurance* meeting, Mr J. Wilcock Holgate outlined the reasons of wartime caution which had prompted the directors to carry forward the whole of the surplus in the ordinary branch. Mr Arthur L. Hunt, at the *Wesleyan and General Assurance* meeting, described the new type of guaranteed bonus policy which the Society has recently introduced. Sir Alexander Roger reported to *British Insulated Cables* shareholders that a record balance of orders was on the books, and that in certain departments at least capacity output would be required for many months to come. Record production and sales were reported to *British Aluminium* stockholders by Mr R. W. Cooper, and increased production is being energetically sought. Sir Felix J. C. Pole emphasised the importance for *Associated Electrical Industries* of securing as much export business as possible, and reported a record number of employees and unfilled orders for the group exceeding £19 millions. At the *British Ropes* meeting, Mr Herbert Smith reported that although the company was receiving its share of Government wire contracts, the improved results of last year were by no means wholly derived from war work. *Ericsson Telephones* shareholders were informed that the company's plant was being used to an ever-increasing extent on contracts for the Defence Ministries. At the *Telephone and General Trust* meeting, Sir Alexander Roger reported that the year had started well and that it was hoped at least to maintain the strong position of the company. Addressing shareholders of *Automatic Telephone and Electric*, Sir Alexander stressed the importance of telephone development even in wartime, and welcomed the formation of the Export Council. Mr Arthur I. Phillips informed shareholders of *Godfrey Phillips* that in his judgment the two increases of 2s. per pound in tobacco duty last year had not tended towards any change of tobacco consumption nor in the choice of brands. The chairman of *Maple and Company* discussed the effect of the war upon the high-class furnishing business. Satisfactory figures were reported to *Provincial Cinematograph Theatres* shareholders despite the increased expenses incurred in the early stages of the war. The president of the *Halifax Building Society* declared that the outbreak of war at no time led to panic withdrawals, and that after the initial shock withdrawals speedily returned to normal dimensions. A large increase in production was reported at the recent meeting of *Coal Mines of Salótarján*. Mr A. A. Jamieson's review to *Vickers* shareholders included a reminder of the problems which will arise for the group after the war. At the *Clerical, Medical and General Life Assurance* meeting, Sir Francis Smith gave a candid warning regarding next year's bonus possibilities.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

THE year's revenue return and the stimulating effect of Mr Churchill's week-end speech, with its promise of an intensified war effort, cheered the market on Monday, though it did not bring any noticeable increase in business. Turnover has indeed remained at an extremely low level, but during the earlier part of the week prices in general remained firm and were only slightly checked by the political reports from Paris.

Gilt-edged showed an advance of up to half a point on Monday, Old War Loan rising by ½. A further gain was recorded on Tuesday when the stock closed at 99½, but the mid-week check resulted in a slight fractional decline.

In the *foreign bond* market Brazilian issues provided a feature, for a number were marked ex interest on Tuesday for the first time in several years. Japanese issues reacted, but there was some transient demand for Chinese issues.

Expectations of increased charges still sustained the *home rail market*, and some fairly substantial rises were seen on Tuesday in the equity stocks. Emphasis later tended to be placed on the preference issues.

The *industrial* market has been thoroughly dull, with a fairly steady undertone to prices, but a shrinking turnover. Conditions have tended to become more subdued as the week progressed. Movement has not been uniform, however, through all sections, and demand remains selective. Iron and steel and engineering shares were very quiet. Prices were mostly firmer where changed at all in the earlier part of the week, and then reacted slightly. Electrical equipment issues were dull, while in the supply section many shares lost a few pence. The rather brighter tendency in the motor and motoring equipment group continued, and aircraft shares made a mixed showing. The upward trend in textiles was resumed, Lancashire Cotton being particularly firm. Rayon shares also advanced. Brewery shares wavered as taxation fears advanced and receded, while tobacco issues tended to harden. In the miscellaneous section, moderate strength was shown by some of the leaders. Imperial Chemical rose in advance of the dividend announcement, and United Molasses responded to news of the 10 per cent. cash bonus.

Oil shares began quite well, and then changed only fractionally, but on Thursday Continental selling of some of the leaders affected sentiment, and prices were marked down. Burmah Oil continued to be supported. Rubber shares were irregular and quiet, and then lost fractionally under the influence of the Continental bourses. Tea shares were irregular, though the market has become rather less stagnant. In the *mining* market, the early cheerfulness in Kaffirs was not sustained, but prices were firm except for small declines in mid-week following a number of fractional gains on Wed-

nesday. Cape support assisted market sentiment. Diamond shares did not hold the small gains made early in the week, while little interest was shown in Rhodesian copper shares. Tin shares did not respond to the better tendency in the metal price.

ACTUARIES' INVESTMENT INDEX

The tables of fixed interest and ordinary share indices and yields below suggest that price movements during March were mainly in the nature of readjustments after the upward movement during February. *Gilt-edged* stocks were adversely affected by the indifferent circumstances which prevailed when dealings began in the new War Loan, but debenture and preference issues experienced small gains, and are still in restricted supply. Equities were in the majority of cases marked slightly lower, the downward trend in the aircraft manufacturing and building material groups being continued to lower levels. By contrast, the index for coal shares reached 100.2 against 76.9 a year ago. The home rail index registered a further increase to 59.9 compared with 57.2 last month.

New York

WALL STREET'S principal fear this week was that the intensification of economic warfare might harm American trade. As a result, trading continued cautious until a burst of activity occurred on Wednesday. On that day, turnover reached 1,730,000 shares and all-round gains were recorded, the Dow Jones industrial average jumping from 147.92 to 149.65. *Iron Age* reports a slight improvement in steel activity to 61½ per cent. of capacity, against 61 per cent. last week, and refers to substantial export orders and to a mild improvement in domestic sales.

CANADIAN PACIFIC RAILWAY COMPANY

FIFTY-NINTH ANNUAL REPORT
OF THE DIRECTORS OF CANADIAN PACIFIC RAILWAY COMPANY

YEAR ENDED DECEMBER 31, 1939

To the Shareholders:—

The accounts of the company for the year ended December 31, 1939, show the following results:—

INCOME ACCOUNT

Gross Earnings	\$ 151,280,699.78
Working Expenses (including taxes)	122,756,880.31
Net Earnings	28,523,819.47
Other Income (after providing for depreciation of steamships and hotels)	6,764,851.22
	35,288,670.69
Fixed Charges	\$ 24,700,692.40
Interest on bonds of Minneapolis, St. Paul & Sault Ste. Marie Railway Company, guaranteed as to interest by your Company	805,830.00
	25,506,522.40
Balance transferred to Profit and Loss Account	9,782,148.29

PROFIT AND LOSS ACCOUNT

Profit and Loss Balance, December 31, 1938	\$ 136,969,650.26
Balance of Income Account for the year ended December 31, 1939	9,782,148.29
	146,751,798.55
Depreciation:	
Loss on lines abandoned and on property retired and not replaced	\$ 4,838,055.47
Miscellaneous—Net Debit	560,240.22
	5,398,295.69
Profit and Loss Balance, December 31, 1939, as per Balance Sheet	141,353,502.86

The balance of income account available for transfer to profit and loss account was \$8,519,766 greater in 1939 than in 1938.

RAILWAY EARNINGS AND EXPENSES

The comparative results of railway operations were as follows:—

	1939	1938	Increase or Decrease
Gross Earnings	\$ 151,280,699	\$ 142,258,981	\$ 9,021,718
Working Expenses (including taxes)	122,756,880	121,506,515	1,250,365
Net Earnings	28,523,819	20,752,466	7,771,353
Expense ratios:			
Including taxes	81.15%	85.41%	4.26
Excluding taxes	78.26%	82.29%	4.03

The increase in gross earnings of \$9,021,718 is equal to 6.3 per cent. Decreases were experienced in the first four months of the year, reflecting the lower level of business and industrial activity throughout Canada. Commencing in May, improvement became evident and increases were recorded each month with the exception of October in which the decline in earnings from grain more than offset the increases from other classes of traffic.

Passenger earnings decreased \$504,341, or 3.1 per cent., despite the stimulating effect of the Royal Tour in May and June and an increase in midsummer tourist traffic from the United States. In the early part of the year unfavourable business conditions resulted in a lower volume of travel in Eastern Canada. The inauguration last spring of long-distance travel in Canada. Although there was a substantial increase in all-expense tour traffic from overseas, it was offset by a heavy decrease in regular traffic to and from Europe and the Orient as a result of unsettled international conditions.

Freight earnings increased \$10,010,559, or 9.1 per cent., reaching the highest level since 1930. In the early part of the year, the general industrial recession was responsible for decreases in most classes of commodities. Improvement commenced in the second quarter and became more pronounced in the remaining months, owing to the grain movement and the impetus imparted by the war to certain classes of business.

Earnings from grain and grain products for the year increased by \$6,214,457, or 24.2 per cent., almost three-fifths of the increase having occurred in the period prior to the movement of the new crop. Handlings of all grains totalled 203 million bushels, an increase of 38 millions. This compares with the 1930-38 average of 150 million bushels and the 1925-29 average of 254 millions. The 1939 wheat crop in the Prairie Provinces amounted to 463 million bushels, the second largest in history.

The increase in working expenses of \$1,250,365 is equal to 1.0 per cent., which was more than accounted for by the fact that in the first three months of 1938 deductions from basic rates of pay were still in effect, and, towards the end of that year, there was a temporary lay-off of shop and clerical staffs which did not recur in 1939.

Maintenance expenses increased \$242,993, or 0.5 per cent., and represented 31.93 per cent. of gross earnings, as compared with 33.78 per cent. for 1938. Maintenance of way and structures expenses decreased \$430,214. During the year 181.2 single track miles were relaid with new rail, and 1,489,082 treated and 1,857,436 untreated ties were placed in track. Maintenance of equipment expenses increased \$673,207. While there was an increase of \$1,395,250 in charges for retirements of rolling stock, the total of which was \$7,411,151, there was a substantial reduction in the cost of other maintenance of equipment expenses, owing principally to the fact that only one passenger car was air-conditioned as com-

pared with 90 cars in 1938. At the end of the year, 85.6 per cent. of locomotives and 96.5 per cent. of freight cars were in serviceable condition, as compared with 85.8 per cent. and 94.9 per cent. respectively at the end of 1938.

Transportation expenses increased \$926,661. The ratio to gross earnings was 36.18 per cent., as compared with 37.82 per cent. in 1938. With the exception of the year 1936, when wage reductions were in effect, this was the best transportation ratio since 1929. The improvement resulted in part from the greater concentration of traffic in the period of the year when conditions of operation were most favourable, making possible heavier train loading and more economical use of motive power. The operating efficiency of your company continued to improve, as indicated by the following comparison with 1938; the average freight train load was 1,717 tons as against 1,604 tons, an increase of 113 tons; the average consumption of fuel was 99 lb. per 1,000 gross ton miles, as compared with 102 lb., reaching the lowest level yet recorded; the average speed of freight trains increased from 17.1 to 17.2 miles per hour, and the gross ton miles per freight train hour from 27,363 to 29,573.

OTHER INCOME

Other income amounted to \$6,764,851, a decrease of \$598,821. Dividend income was reduced by \$665,141. Dividend disbursements of the Consolidated Mining and Smelting Company of Canada, Limited, were at the rate of \$2.00 per share as compared with \$2.50 in 1938. The amount received by your company from that source was \$3,365,000, or \$841,250 less than in the previous year.

Net income from interest, exchange, separately operated properties, and miscellaneous sources amounted to \$2,621,100, an increase of \$1,128,570, due principally to the more favourable rates of exchange.

The operation of ocean and coastal steamships resulted in a net loss of \$71,274, after deducting \$3,782,277 for depreciation. This compares with net earnings of \$591,071 in 1938. Prior to the actual outbreak of war, unsettled international conditions brought about a decrease in gross earnings from ocean steamships in Atlantic and cruise services. The commencement of hostilities resulted in further disturbance to both freight and passenger business in all services. All ocean cruises were cancelled and many of your company's ships were engaged in war services. All told, gross earnings of ocean steamship services suffered a decline of \$2,307,389. Insurance charges increased \$846,318, largely for war risks. Net earnings of coastal steamships decreased by \$62,805, due mainly to increased insurance charges. In the circumstances, the result of the year's operations was as satisfactory as could be expected.

Net earnings from hotel, communication and miscellaneous properties amounted to \$12,960, a decrease of \$399,905. There was a decrease of \$352,386 in hotel earnings, after providing \$1,448,008 for depreciation. The provision for depreciation, which was \$201,321 more than in 1938, was computed at 2½ per cent. of the depreciable investment, the full rate set as the objective for hotel depreciation charges.

DIVIDENDS

While operations for the year resulted in a substantial improvement in earnings, your directors, after very careful consideration, reluctantly came to the conclusion that in view of the uncertainties of the present situation they would not be warranted in declaring any dividend on the preference stock in respect of the year 1939. Your directors feel that, in the interests of all of your company's security and stock holders, such course was the proper one to take, particularly in view of the impossibility, owing to war conditions, of predicting the effect on your company of developments in the near future.

LAND ACCOUNTS

During the year, 106,148 acres of agricultural lands were sold for \$762,315, an average price of \$7.19 per acre. This included 1,203 acres of irrigated land sold at an average of \$47.60 per acre and the remainder at an average of \$6.71 per acre.

Since the setback caused by the depression, the activities of the Department of Immigration and Colonisation, which involved an expenditure of \$264,411 for the year, have been showing steadily increasing results, particularly in connection with the bringing over from Europe of experienced agricultural families with sufficient capital to enable them to acquire and operate farms. The number of these brought over and settled on farms in Canada under the auspices of the Department from the first of the year until the outbreak of the war was 51 per cent. greater than in the corresponding period for 1938.

FINANCE

Payment of the final instalment of the amount payable for the railways purchased jointly by the Canadian National Railway Company and your company from the Government of Alberta was made on June 1st, your company's proportion being \$2,790,000. As this obligation had been assumed by the Northern Alberta Railways Company, 5 per cent. bonds of that company in the amount of \$2,790,000 were issued and delivered to your company in consideration of the payment referred to.

During the year, loans totalling \$15,000,000 were obtained from Canadian banks on short-term promissory notes. On December 28th these loans were reduced by a cash payment of \$3,000,000, and the balance of \$12,000,000 was converted into serial notes payable in

[Advertisement]

instalments of \$2,000,000 each on December 1st, in each of the years 1940 to 1945. The notes maturing in the years 1940 to 1943 bear interest at 3 per cent. per annum, and the notes maturing in the years 1944 and 1945 bear interest at the rate of 3½ per cent. per annum. The notes provide that they shall be collaterally secured by the deposit of shares of the capital stock of the Consolidated Mining and Smelting Company of Canada, Limited, having a market value at least equal to the principal amount of the indebtedness outstanding, and consolidated debenture stock of your company having a market value at least equal to 35 per cent. of the principal amount of the indebtedness. Your company has the right, on giving 30 days' notice, to pay off in whole or in part the notes maturing within two years from the date of such notice. At the end of the year, there were on deposit as security for these notes 280,000 shares of the capital stock of the Consolidated Mining and Smelting Company of Canada, Limited, and \$8,000,000 principal amount of consolidated debenture stock.

As a result of these and other financial transactions, there was a net reduction of \$3,988,938 in bonds, notes and other obligations and of \$2,790,000 in the contingent liability in respect of the Northern Alberta Railways Company.

PENSIONS

Pension disbursements for the year amounted to \$2,722,051 and were included in working expenses.

Since the inception of the contributory pension plan on January 1, 1937, the employee contributions, less refunds, have amounted to \$5,938,670.

During the year, 602 employees were pensioned, but owing to deaths and other causes, there was a net increase of only 358 on the pension payroll.

THE ROYAL TOUR

The visit to Canada during the year of His Majesty, King George VI, and His Gracious Consort, Queen Elizabeth, was an event of outstanding historical significance and proved to be without question the greatest single contribution to the unity of the Dominion since Confederation. Your company was privileged to play an important rôle in the transportation arrangements of the Royal Tour. Their Majesties were carried across the Atlantic to Canada in the "Empress of Australia," and back in the "Empress of Britain." While in this country, the royal train, which was provided jointly by the Canadian National Railways and your company, travelled 3,388 miles over your lines. The efficiency of your company's organisation was strikingly demonstrated in the successful accomplishment of this extensive journey.

OUTBREAK OF WAR

The outbreak of war found your company fully prepared to meet the increased demands upon its facilities and services. It has since been the constant endeavour of your directors and officers to co-operate with the Government authorities in every way possible, in order that in the various fields within which your company's activities are carried on nothing should be left undone that would assist in making most effective the contribution of Canada towards the fulfilment of the great task that has been undertaken by the Empire and its loyal Allies.

THE MINISTRY OF SHIPPING

The chairman and president of your company has been appointed as the representative in Canada of the British Ministry of Shipping.

E. A. LESLIE,
Comptroller.

AUDITORS' CERTIFICATE: We have examined the Books and Records of the Canadian Pacific Railway Company for the year ending December 31, 1939, and having compared the above Balance Sheet and related schedules therewith, we certify that in our opinion it is properly drawn up so as to show the true financial position of the Company at that date, and that the Income and Profit and Loss Accounts correctly set forth the result of the year's operations.

Montreal, March 8, 1940.

PRICE, WATERHOUSE & CO.,
Chartered Accountants.

[Advertisement]

His functions are to supervise in Canada all ships registered in the United Kingdom, neutral ships chartered by the Ministry and prizes of war engaged in its services, and to deal with such other matters as may be delegated to him by the Minister. Your directors have consented to his services being given to the Ministry of Shipping without cost to the latter.

TRANSPORT CONTROLLER AND CANADIAN SHIPPING BOARD

Owing to the necessity for the closest co-operation between all transportation interests to prevent port congestion as a result of war conditions, the Dominion Government, by Orders-in-Council under the War Measures Act, has provided for the appointment by the Minister of Transport of a Transport Controller, and for the establishment of the Canadian Shipping Board.

The duty of the Transport Controller is to determine questions of priority in regard to the movement within Canada of troops, naval forces, materials and supplies, and to co-operate with the Canadian representative of the British Ministry of Shipping.

The functions of the Canadian Shipping Board are to control the transportation by sea from Canada in ships of Canadian registry of materials and supplies other than those consigned to the British and other Governments, and to co-operate with the Transport Controller.

Subject to the limitations referred to, the railway companies continue to exercise their full powers as carriers.

CO-OPERATION WITH THE CANADIAN NATIONAL RAILWAYS

Further studies of co-operative projects under the provisions of the Canadian National-Canadian Pacific Act have continued to demonstrate the many obstacles to the attainment of worth-while economies under separate management. The only additional projects made effective during the year were (1) the abandonment of the Canadian Pacific Line between Linwood and Listowel, Ontario, 16.5 miles, and (2) the opening on May 25, 1939, under joint management, of the new Hotel Vancouver. The vice-presidents' joint committee established in 1938 for the purpose of widening and expediting co-operative measures between the railways has continued its work during the year, but no agreements were concluded in that period.

STOCK HOLDINGS

The holdings of the capital stock of your company in December, 1939, were as follows:—

	ORDINARY		PREFERENCE		TOTAL
	No. of Holders	Percentage of Stock	No. of Holders	Percentage of Stock	Percentage of Stock
Canada	26,420	18.87	155	7.3	13.50
United Kingdom and other British	19,453	51.76	25,393	95.05	64.58
United States	15,621	22.86	57	3.37	16.20
Other Countries	3,674	6.51	565	3.85	5.72
	<u>65,168</u>		<u>26,170</u>		

Your directors again desire to express their appreciation of the loyalty and efficiency of the officers and employees of your company.

For the Directors,

E. W. BEATTY,
President.

Foreign Bourses

Paris. — There was no marked trend in evidence during the greater part of March, the only slightly upward movement being found amongst the industrial group. Price movements elsewhere were irregular and uncertain. There was, however, a slight general advance in the opening days of the month resulting from the increased powers of the Treasury to borrow from the Bank of France, and a certain demand for Scandinavian issues followed the cessation of the Russo-Finnish war. In the closing days of the month, however, there was a general increase in demand, as a result of the changes in the French Cabinet, and dealings became animated, at rising prices in most sections.

Berlin. — The supply of investment funds continued to be heavy last month, and the demand for equities became increasingly pronounced. Prices were very firm, though the extraordinary interest in machinery and electrical issues has died down. Chemical, cellulose, and textile shares commanded the interest of the buyers. Equities with interests in Spain and in former German colonies experienced a sudden revival. A decree facilitating a limited amount of private building assisted the building group. In addition to the shortage of fixed-interest securities, a similar shortage in equities now appears to be developing. Demand extended to Reich loans, which generally advanced above par. A number of industrial loans were easily absorbed, bringing the total of industrial loans issued since the beginning of the war to roughly Rm. 600 millions.

Rhein-					

Amsterdam. — The Bourse remained quiet and dull throughout the month of March, with minor price movements and a small turnover. Among foreign bonds, however, the Russo-Finnish peace treaty brought about a strong demand for Scandinavian issues, and the Brazilian debt

agreement also reacted favourably on the bonds. Some interest was also evident for Chilean issues. The weak trend of Dutch bonds at the end of February continued throughout March, prices remaining irregular. Satisfactory earnings for home industrial concerns brought about some interest, particularly for companies which have received Government orders.

Foreign Bond Index

The "Municipal and General" index of foreign bond prices (average January-June, 1934 = 100) showed a slight improvement from 60.2 to 60.6 during March. It was largely accounted for by the rise in low-grade Brazilian bonds following the debt settlement announced last month. The index of European bond prices is nearly two points lower and Near- and Far-Eastern issues show a fall of a point. The improvement in defaulted bonds is explained by the substantial rise in junior Brazilian issues.

BONUS SHARES

British Ropes, Ltd.—Existing ordinary capital amounts to £438,119 in 2s. 6d. ordinary shares, and a similar amount is to be issued from undivided profits as 3,504,953 ordinary shares, to holders as at March 6th.

Manganese Bronze and Brass.—A sum of £102,325, part of the share premium account, is to be capitalised and applied in distributing to shareholders registered at the close of business on April 12th 409,300 5s. ordinary in the proportion of one for every ten preference held and two for every five ordinary.

CONVERSIONS AND REPAYMENTS

Brighton Corporation.—The £450,000 4½ per cent. redeemable stock, 1940-60, will be redeemed at par on July 1, 1940. The final six months' interest payment is to be made on July 1, 1940.

ISSUE TO SHAREHOLDERS ONLY

Philco Radio and Television Corporation of Great Britain.—Issue of £50,000 6 per cent. notes at 99. Redemption at 105 at end of five years or earlier at company's option.

Shorter Comments

Company Results of the Week.—NORTH BRITISH LOCOMOTIVE record substantially higher profits, but are not making any distribution either on the preference or ordinary capital. Though there is a larger volume of work on hand, the current outlook is affected by the scarcity of skilled labour and raw material restrictions. A. REYROLLE AND COMPANY are repeating the 12½ per cent. dividend, and report maintained sales in 1939. Orders on hand at the end of the year, however, had risen considerably. CRAVEN BROTHERS (MANCHESTER) total profits after E.P.T. and other taxation are £131,246, against £110,824. The company's products are now on the prohibited export list, machines in process for delivery to foreign countries having been diverted to Government use. SKEFKO BALL BEARING have fully maintained total profits after taxation, and again pay 20 per cent. tax free. Total profits of JOHN BOWES AND PARTNERS are 13 per cent. higher at £249,867, prices having advanced during the year, although costs of production also have risen to a high level. The accounts of NORTHERN GENERAL TRANSPORT show 1939 traffic receipts of £738,615, against £742,451, while operating and maintenance expenses have fallen in a greater proportion. In view of the year's difficulties, the profits of JOHN LEWIS

(Continued on page 660)

Industry and Trade

As the coal and iron and steel industries are now regulated by the Government, the weekly market reports hitherto printed in this section of The Economist in smaller type and narrower columns have been suspended. Any news of importance, however, will in future be discussed in Notes in the main body of the section. A summary of current developments in the principal industries will continue to be given in the monthly Trade Supplement which is included in the last issue of The Economist in each month. The weekly survey of the commodity markets will be continued, and this, together with the regular monthly tables on unemployment, retail trade, wholesale trade in textiles, overseas trade, motor registrations, retail prices, as well as the fortnightly table of wholesale price indices, will in future be published at the end of Industry and Trade Notes in a section entitled Commodity and Industry News. If these tables disclose any significant changes, these will be discussed in the main body of the section.

Fall in Unemployment.—With the fall of 383,000 to 1,121,000 on March 11th the number of registered unemployed in Great Britain has at last fallen below the pre-war level of 1,232,000 (August 14, 1939). The reduction has been much more marked than usual, for the index of unemployment, which is adjusted for seasonal variations and given in our monthly table on page 642, fell from 69.4 (1935 = 100) on February 12th to 54.7 on March 11th. There has been a substantial fall in unemployment in every administrative division and in most branches of activity. The chief changes are shown below:—

REDUCTION IN NUMBER OF UNEMPLOYED BETWEEN FEBRUARY 12TH AND MARCH 11TH

Building	135,718	Stone quarrying	6,424
Public works contracting	30,068	Metal goods manufacture	5,643
Agriculture, etc.	27,338	Engineering	4,932
Distributive trades	23,888	Tailoring	4,785
Coal-mining	17,733	Road transport	4,600
Local Government	10,121	Iron and steel	4,440
Hotels, boarding houses, etc.	9,047	Printing, etc.	4,105
Brick and tile-making	7,840	Shipbuilding & repair	4,090
		Entertainments, sports	4,052

The improvement has been most marked in the industries, such as building and public works contracting, which had been chiefly affected by the severe weather conditions in January and early February; but unemployment also showed a decline in the iron, steel, engineering, shipbuilding, and other metal industries.

Machine Tools.—The rate at which the capacity to produce munition-making machinery and munitions can be increased is largely conditioned by the supply of machine tools, such as boring mills, drilling, grinding, milling, planing and shaping machines, presses and lathes. As the new supplies of machine tools cannot be multiplied at short notice, there was bound to be a shortage of them in relation to the enormous increase in munition-producing capacity which has been necessitated by the war. The question is not so much whether there is a shortage, but whether everything possible is being done to alleviate it as soon as possible. The supplies required for the armament industries can be increased by an expansion in production, coupled with a reduction in exports and bigger purchases abroad, and by a redistribution and better utilisation of existing machines. The Census of Production for 1935 revealed that there were then 123 establishments employing more than ten persons, on the average, engaged in the manufacture of machine tools. The total number of persons employed by them was 21,082 and the value of their output was £8.3 millions gross and £5.6 millions net (after deducting the cost of materials and of work given out). Although later figures are not available, the industry's capacity has probably been substantially extended in 1936 and 1937, when Britain's total industrial equipment was considerably enlarged and when a good deal of the existing plant was replaced. To some extent, however, the increasing demand in those years was met by

bigger imports. The United Kingdom actually imported more machine tools than it exported in 1936 and 1937:—

IMPORTS AND EXPORTS OF MACHINE TOOLS

	Imports (c.i.f.)		Exports (f.o.b.)	
	Tons	£'000	Tons	£'000
1936	20,058	3,601	13,886	2,014
1937	31,591	6,212	11,897	2,152
1938	23,841	4,963	24,167	4,476
1938*	15,764	3,257	13,560	2,549
1939*	19,906	4,593	22,148	3,715

* First eight months.

In 1938 imports fell and exports rose as a result of the decline in home demand. During the first eight months of 1939, when foresight should have dictated the accumulation of stocks, exports rose very rapidly, though imports also showed an expansion.

Efforts have been made since the outbreak of the war to expand output, and some increase has no doubt taken place; but has the Government taken steps to expand the basis of the industry sufficiently? Many machine tools take months to manufacture, and an immediate and substantial expansion in output after the outbreak of the war could hardly have been expected. But if the authorities realised the size of the problem seven months ago and shaped their plans accordingly, output should increase very rapidly in the future. Judged by the degree of official foresight in other directions, it is hardly surprising that many anxious questions are being raised concerning the production of machine tools. To some extent new supplies have probably been increased by a reduction in exports; despite the rise in prices, the value of all machinery exported fell by £1.9 millions to £7.2 millions between the first two months of 1939 and 1940. An immediate increase in imports, on the other hand, was rendered difficult by the fact that some 30 per cent. (by weight) of the intake during the first eight months of 1939 came from Germany. Substantial orders, however, are understood to have been placed in the United States—the principal source of overseas supplies—and reports from machine tool makers in that country suggest that they are working virtually at capacity in spite of the recession in domestic business activity; increased deliveries may therefore be expected from that country. But the present output and import of machine tools is only a fraction of the total supply in existence. Much can therefore be done—and a good deal has no doubt been done—to alleviate the shortage of machine tools for armament production by a redistribution and better utilisation of the existing tools. But are the authorities satisfied that every available lathe, every press, every boring mill and every grinding, milling, planing and shaping machine is now being used as efficiently as possible? The machine tool problem is, of course, only part of the wider problem of expanding the engineering industry as a whole. And the leisurely manner in which the question of dilution is being handled, and not least by the trade unions—it does not yet appear to have come out of the discussion stage—can hardly inspire confidence.

COMMODITY AND INDUSTRY NEWS

RAW cotton prices have been firm in the past few days with an upward tendency in the United States. American metal prices have again been reduced, but apart from these commodities, the general level of prices both in the United States and in the United Kingdom has been very stable for some weeks.

Cotton (Manchester).—Trading continues to be difficult, as numerous producers are not prepared to accept further contracts and manufacturers are harassed by the shortage of yarn supplies. Demand remains active and far exceeds current production. Many ups and downs have been experienced in raw cotton prices, but there has not been any distinct change in the general level. Imports from the United States continue to fall off and the allocation of shipping for the month of May will probably be reduced. No statement has yet been issued by the Controller about a revision of yarn margins, but some change is expected before the end of the week. Very little business has been done in American qualities, but some fair sales have been put through in coarse Egyptian counts. In the cloth market, more business has been offered than manufacturers have been prepared to accept. Export business has been limited, but a few more contracts have been put through, chiefly for South America, Scandinavia and the Dominions. Steady buying has taken place for the home trade and the Government.

Metals.—In the United States the price of copper was reduced from 11.50 to 11.125 cents per lb. this week. This decline was not unexpected as buying had been on a moderate scale in recent weeks. During March American copper sales did not exceed 20,000 short tons, against about 145,000 tons in the short month of February. The American lead price was reduced from 5.10 cents to 5 cents and later to 4.85 cents per lb. in the week before Easter and is now down to the pre-war basis; a corresponding fall in the price of spelter, which stands at 5.75 cents per lb., is expected shortly.

Tin.—Tin prices fluctuated widely this week but closed £4 up at £249 10s. per ton. The backwardation has expanded further and is now £2 10s. Buying remained on a moderate scale this week, and the rise in price must be attributed to the fact that the Malayan tin export duty was raised by 2½ per cent., an increase which would have caused a rise in price by at least £5 if market conditions had been firmer. The March statistics, published on Tuesday, showed a further decline of 1,064 tons to 31,686 tons in the visible supply. New arrivals, at 15,958 tons, were 3,995 tons up on the month, while world deliveries, at 16,838 tons, showed an advance of 3,902 tons on February. Two-thirds of the latter increase occurred in the United States and was the result of old orders.

Grains.—Sales of Canadian and American hard wheats have continued steadily and prices have been firm at about 32s. to 32s. 6d. per quarter f.o.b.

Vancouver for No. 1 Northern Manitoba. There has been some rain in the United States, but not in the areas most affected by the drought and sub-soil moisture deficiency is widespread. Maize prices have weakened recently, under the pressure of the large Argentine surplus. Roumania has also an unusually large amount of last year's harvest in hand, owing to the transport difficulties over the winter, but exports to Germany are likely to be speeded up. Demand for seed oats has slackened in Britain, but feeding oats are still very scarce.

Oils and Oilseeds.—The official schedule of maximum prices operating in March has not been altered. Raw materials are arriving steadily and overseas prices are stable. There has been a fall in the level of linseed shipments from the Plate, where the exportable surplus has now been reduced to less than half a million tons. Substantial quantities of Indian linseed have been bought by the British Control for early shipment. The home demand for oil-cakes is lessening, but there is still considerable pressure on supplies.

Rubber.—Both in London and New York rubber prices have been very stable in the past fortnight. Consumption in the United States was in February up to the high January level, but the steady flow of supplies, partly under the barter agreement, has prevented any rise in New York.

Furs.—An auction of silver foxes was held in London this week at which approximately 100,000 skins, mainly of Scandinavian and Canadian origin, were offered. The quality of the skins was medium to poor. Buying was very keen; London dealers took the greater part, but there was also some buying for foreign countries, mainly South America. Prices were very firm and were higher by 30 and 35 per cent. than those paid at the last sale in January, thus recovering most of the fall experienced during last year.

REPORT OF THE AUDITORS TO THE MEMBERS.

We have audited the above Balance Sheet with the Books in London and the certified Returns from the Branches. We have obtained all the information and explanations we have required. In our opinion such Balance Sheet is full and fair, containing the particulars required by the Regulations of the Company, and is properly drawn up so as to exhibit a true and correct view of the state of the Company's affairs according to the best of our information and the explanations given to us and as shown by the books of the Company.
London, 19th March, 1940.

COMPANY MEETINGS

REFUGE ASSURANCE COMPANY, LIMITED

LIFE ASSURANCE IN A DIFFICULT YEAR

INCREASE IN RESERVES

EXPENSE RATIOS AGAIN REDUCED

ASSETS £72,460,000

INCOME EXCEEDS £13,300,000

The seventy-sixth annual ordinary general meeting of the Refuge Assurance Company, Limited, was held, on the 2nd instant, at the Chief Office of the Company, Oxford Street, Manchester, Mr J. Wilcock Holgate (chairman of the company) presiding.

The secretary (Mr J. W. Moss) having read the notice convening the meeting and the auditors' report,

The Chairman, in moving the adoption of the report and accounts, after referring to the loss which the company had sustained by the death of Mr William Eber Thornton, a member of the board since 1919, said:—

The accounts before you relate to a year which may be divided into two periods, the one very different from the other. Up to September last our operations were carried out in what might be termed relatively normal conditions; and although our new business had naturally been affected by the prevailing atmosphere of uncertainty, our mortality experience had been normal, and our expense ratios in both branches had been reduced. With the most productive period of the year about to commence, we were justified, I think, in anticipating a satisfactory outcome to the year's working; but, unfortunately, our steady progress was interrupted by the outbreak of war, with all that implies in the dislocation of the normal life of the nation, and the consequent effect upon our business. I am happy, however, to put before you figures which to me are most encouraging, indicating as they do the inherent strength of the company and its ability to maintain its progress despite the strain of a very difficult time.

EFFECTS OF THE WAR

Taking the year as a whole, our new business was well maintained, the new sums assured in the ordinary branch being 81 per cent. of the corresponding figure in 1938, as against 89 per cent. up to the beginning of September. The death claims attributable to the war, in both branches combined, amounted to £13,339, and did not materially affect our mortality experience; whilst the expense ratios in both branches were lower than in the preceding year. The gross yields on our funds were almost maintained, but the increase in the rate of income tax was directly reflected in a reduction in the net yields. As regards the staff, by the end of the year the number of members serving in the Forces was 244, a figure which is now considerably higher, and I know I am echoing your hopes when I wish them good fortune and a safe return. In the meantime their pension rights are maintained, and allowances are being paid to supplement their Army pay and Government allowances.

FUTURE POLICY OF THE COMPANY

So far I have dealt with the effects of the war during 1939; but what of the future? To what extent is life assurance generally to be affected by war mortality, higher taxation, increased costs, reduced new business? These questions are at present unanswerable, and your directors take the view that in dealing with risks which are known to exist, but the magnitude of which it is impossible to assess, the policy to be adopted must necessarily be one of caution and conservation of resources; and accordingly, whilst protecting the interests of holders of with-profit policies which mature for payment by death or survival in the ensuing year, and providing for the appropriate shareholders' proportion, they have decided to carry forward unappropriated in the ordinary branch the whole of the remainder of the surplus, whilst a substantial addition has been made to the reserves in the Industrial Branch.

In the past the company has not overlooked the risk of war, and

our pre-war ordinary and industrial branch policies contain restrictive conditions as regards death while on active service. For the present, however, we have decided to suspend the operation of these conditions as regards policies issued prior to the outbreak of war, but naturally in policies issued after that date restrictive conditions have been inserted as regards deaths arising from the war.

COMBINED RESULTS

Turning now to the details of our results, our total premium income for the year amounted to £10,709,525, showing as compared with the previous year an increase of £23,444. The net interest income was £2,561,865, showing a decrease of £115,890, and the amount paid in claims by death or maturity during the year was £8,259,596, including £5,130,755 by way of maturities alone, the total figure representing the payment of over £27,000 each working day. The total sum paid under this head since the inception of the company is now £125,174,648. The aggregate surplus arising out of the year's working of the two branches of the company was £2,372,987, and the total assets now stand at £72,460,262, having increased by £1,295,080 during the year.

TRANSFER OF EIRE BUSINESS

You will remember that in October last, in accordance with a special resolution of the shareholders, the company's industrial assurance business in Eire was taken over by The Industrial and Life Assurance Amalgamation Company, Limited, of Dublin. This step was taken by your company, in common with other British industrial-ordinary offices, after prolonged negotiations; and your directors are satisfied that in the circumstances the transfer was desirable, and that the interests of all parties concerned have been fully protected.

The number of policies taken over was 144,626, with a premium income of £208,540 per annum, occasioning the transfer to the Irish Company of funds amounting to £292,074 on account of the liability under the transferred policies, which is now undertaken by the Irish company.

I should add that our ordinary branch business in Eire has not been transferred. We have, however, ceased to transact new business in that country, and our existing policies there are being serviced on our account by the Irish Assurance Company, Limited.

INDUSTRIAL BRANCH

In the industrial branch our premium income amounted to £6,075,118, showing an increase of £80,410 over that of the previous year. The net interest income was £1,183,041 and the net yield on the life assurance fund was £4 5s. 4d. per cent., having decreased by 4s. 1d. as compared with the corresponding figure for 1938. The life assurance fund increased during the year by £995,206, after the transfer of £250,000 to the investments reserve fund, which now amounts to £2,250,000. The expense ratio was again reduced, being 32.07 as against 32.83 in respect of 1938.

The average duration of the premium paying policies on our books shows a further increase, and is now twelve years and seven months.

A striking feature of our operations in this branch has been the excellence of our collections week by week. Life assurance policies are not lightly to be parted with in times such as these; and our experience of the past is repeated to-day, that current dangers emphasise the need for financial protection and the value in this connection of a "Refuge" policy.

INDUSTRIAL BRANCH VALUATION

The valuation was again made on a 2½ per cent. basis, and the resulting surplus, which includes £138,839 brought forward from the preceding year, was £1,028,556, showing an increase of £134,016 over that of the preceding year.

As was the case last year, £250,000 has been transferred to the investments reserve fund, and it is proposed to set aside £514,000 for allocation amongst the policyholders of this branch, and from the remainder to allocate to the shareholders the sum of £112,543, the amount carried forward being increased to £152,013.

ALLOCATION OF PROFITS TO POLICYHOLDERS IN THE INDUSTRIAL BRANCH

For many years we have followed a policy of building up reserves in this branch, and events have fully justified us in this course. Despite the adverse conditions existing to-day, the surplus is sufficient to enable us not only to repeat, but to increase the allocation to policyholders which has become a feature of our business, and which we are satisfied may well be made within the strength of our accumulated reserves.

The allocation takes the form of permanently increasing the sums assured by certain policies and of making the payment of claims arising by death or survival of endowment terms during the ensuing year on the basis of the latest and most favourable scale of benefit as regards those policies which have not been placed permanently upon this latest scale by this or previous allocations of surplus, together with an addition of 5 per cent. in respect of policies, with certain exceptions, dated prior to January 1, 1935.

ORDINARY BRANCH

In the ordinary branch the number of new policies issued by way of periodical premiums was 40,813, at annual premiums amounting to £361,865, the sums assured thereunder amounting to £6,231,912. In addition there were issued during the year 1,113 single premium contracts, the premiums applicable thereto amounting to £173,459.

It is again interesting to observe that of the total of £6,422,725 new ordinary branch sums assured issued last year, nearly 32 per cent., or over £2,000,000, represents individual assurances of £500 and over.

The ordinary branch premium income for the year was £4,634,406, and the net interest amounted to £1,378,823, and the net yield on the life assurance fund being £3 12s. 7d. per cent., showing a decrease of 6s. 10d. as compared with the corresponding figure for 1938. The expense ratio was appreciably lower than that of the previous year, being 13.52 per cent., as against 14.03 per cent. in respect of 1938; and the life assurance fund now amounts to £38,700,795, in addition to which there is an investments reserve fund of £2,000,000.

ORDINARY BRANCH VALUATION

The annual valuation was again made on a 3 per cent. basis and the surplus in respect of the year's operations was £1,344,430, including £464,272 brought forward from the preceding year. The question of the disposition of this surplus has been very carefully considered, and in accordance with the policy adopted by your board it has been decided to declare on this occasion, in place of a general reversionary bonus, a bonus on participating policies which become claims by death or survival during the ensuing year at the rate of £1 5s. per cent. on the sum assured in respect of each full year's premium due in 1939 and paid. The amount thus allocated is £67,115, including interim bonuses of £9,515 paid during the year, and the company is enabled thereby to carry forward undistributed the very greatly increased sum of £1,269,858, which will be available towards meeting any contingency which may arise out of the present world situation, or to be dealt with subsequently as the board may determine.

This decision must necessarily affect the dividend to shareholders, to whom is allocated the sum of £7,457, which when added to the allocation from the industrial branch makes up a total sum of £120,000.

INVESTMENTS

For the third successive year investors have had a very difficult time, due to circumstances with which you are well acquainted, and

with which I do not propose to weary you; and having regard to the fact that for almost the whole of this period there has been a falling trend in the market value of Stock Exchange securities, my first reference might appropriately be as to the position of our company in this respect. It is with satisfaction that I am in a position to inform you that, based on middle market prices as at December 31st last, in the ordinary branch our Stock Exchange securities exceeded in the aggregate the value at which they appear in the balance sheet, leaving the investments reserve fund of £2,000,000 intact. In the industrial branch there was a small depreciation at the end of the year which was very much more than covered by the investments reserve fund. This fund, including £250,000 added during the year, now amounts to £2,250,000. It will further interest you to know that, due to the rise in market values which has occurred since the end of the year, the values of the Stock Exchange securities in this branch again considerably exceed the value at which they appear in the balance sheet, now leaving the industrial branch investments reserve fund also intact.

I have already referred to the yield on the assurance funds under their respective branches, but may add that the net yield on the combined assurance funds is £3 18s. per cent. against £4 3s. 7d. per cent. in the previous year. This reduction is due almost entirely to the operation of the steep increase in income tax during the year; the low rate of interest available on new investments and the fact that a larger amount of our funds was retained in liquid form, playing only a minor part. The gross yield on the combined assurance funds is £4 13s. 10d. per cent., compared with £4 14s. 11d. per cent. for 1938.

It is worthy of note that our holding of British Government securities, amounting to £26,448,324, constitutes 36.5 per cent. of our total assets and that the geographical distribution of our investments compared with the previous year is approximately as follows:—

	1938	1939
Great Britain ...	83.69 per cent.	84.71 per cent.
Indian and Colonial ...	11.93 per cent.	11.58 per cent.
Foreign ...	4.38 per cent.	3.71 per cent.

In this connection we are perhaps fortunate in that the amount of our investments in continental Europe, even based on cost price, is less than one-quarter of one per cent. of our invested funds. You will be interested to know that the company recently applied for one million pounds of the 3 per cent. War Loan and now holds the relative allotment of over £800,000 fully paid-up.

NATIONAL HEALTH INSURANCE

Turning now to another branch of the company's activities I have to report that on behalf of the National Amalgamated Approved Society we administer the National Health Insurance of a membership of 716,000. During the year payments of benefit amounting to £661,601 were made by our widely spread agency staff at the homes of incapacitated members, including £74,057 in respect of maternity benefits. In addition, the further considerable sum of £66,376 was received by "Refuge" members by way of non-cash benefits. The number of new members of the society obtained during the year by "Refuge" representatives was 45,350.

THE FUTURE

I have referred at length to the problems that now confront us; but every day we are finding solutions to them, as we hope also to find solutions to those other problems which will no doubt arise from time to time. Our business is distinguished always by one great advantage in that life assurance is a necessity, a fact which is appreciated the more when circumstances emphasise the risks in respect of which it is our business to provide financial protection. By no other means is it possible to ensure an immediate estate for one's dependants; and the low lapse rates in both branches show clearly how great an importance our policyholders attach to the benefits their policies confer. New business continues to reach us in a measure which is not unsatisfactory considering the circumstances of the times; and we have made substantial additions to our reserves in the ordinary branch by strengthening the valuation basis and by increasing our carry-forward by over £800,000 and in the industrial branch by transferring £250,000 to the investments reserve fund. Finally, let us reflect that whatever the war may cost us—and it affects us

all, individually—it is in effect the premium we must pay to ensure the protection we are resolved to secure against any future attack menacing the peace and happiness of this nation and its allies.

TRIBUTE TO STAFF

Before I close I wish to refer with appreciation to the efforts which were made during 1939 by the company's staff, both outdoor and indoor, and especially during the last four months of the year, when the "black-out" regulations restricted travelling facilities and disturbances of population made the efficient performance of duties more difficult, particularly so in the case of our outdoor staff. In accordance with "Refuge" tradition, difficulties have been faced with a good spirit, and I have no doubt that the staff will continue to give of their best in the days to come. I am also pleased to say that the relations of the company with the Field Staff Association and the Chief Office Staff Council are maintained on a friendly basis.

CONCLUSION

Gentlemen, I have now much pleasure in moving the adoption of the annual report and accounts.

The report and accounts were adopted. The appointment to the board of Mr Francis H. Thornton was confirmed, and Messrs James Proctor-Pearson and John W. Moss were reappointed directors.

Messrs Walton Watts and Company were reappointed auditors. The meeting closed with a vote of thanks to the chairman.

ERICSSON TELEPHONES, LIMITED

GROWING VOLUME OF DEFENCE WORK

The thirty-seventh annual general meeting of Ericsson Telephones, Limited, was held, on the 3rd instant, at Kingsway Hall, London.

Colonel Sir Harold A. Wernher, K.C.V.O. (the Chairman), said that it was at such times as the present that the strength, or weakness, of a business was put to a searching test and the value of the careful planning and building of former years became more apparent. The accounts showed how effectively the company had been able to meet the initial strain of war conditions.

As was to be expected, the demand in the home market for telephone equipment had been adversely affected by present conditions, but, as in the last war, their plant was being used to an ever-increasing extent on contracts for the Defence Ministries. The Government had rightly drawn attention to the vital importance of maintaining a large export trade during the war period, in order to help finance the country's essential imports of food and raw materials. The company's sales overseas represented a substantial portion of their turnover, and the directors and officials were vigilant in holding and stimulating that branch of their trading.

Their home trade was changing over largely to contracts with the Defence Ministries, but the telephone system of the country was an integral part of National Defence, and there could be no doubt that the Government realised the prime importance of maintaining this great national asset in an adequate condition under war conditions. He inferred, therefore, that the modified programme of the Post Office would not be too drastically cut. Export trade was well maintained, and altogether they had work in hand to keep them well employed for months to come. When peace returned the Government would be faced with the huge problem of absorbing many hundreds of thousands of people into civilian life again. In the public telephone system there was a valuable national asset, suitable for much greater development, producing a satisfactory return on capital outlay and capable of providing a wide and well-balanced range of skilled and unskilled labour.

The report and accounts were adopted and payment approved of a final dividend of 12 per cent. and a bonus of 7 per cent., both free of tax; £20,000 being transferred to general reserve and £10,000 to dividend equalisation reserve, leaving £43,135 to be carried forward.

Every year many hundreds of Companies publish Reports of their Annual General Meetings in *The Economist*, thereby reaching thousands of investors in the quiet of their own homes. Full particulars of the charges for inserting these reports may be obtained on application to The Reporting Manager, *The Economist*, 8 Bouverie Street, E.C.4.

CLERICAL, MEDICAL AND GENERAL LIFE ASSURANCE SOCIETY

STRENGTH OF THE SOCIETY

The one hundred and sixteenth annual general meeting of Clerical, Medical and General Life Assurance Society was held, on the 4th instant, at Southern House, Cannon Street, London, Sir Francis E. J. Smith (the chairman) presiding.

The general manager and actuary (Mr Andrew H. Rowell) read the notice convening the meeting, the minutes of the previous meeting, and the certificate of the auditors.

The Chairman said he hoped that they would agree that, taking all things into consideration, the results disclosed by the accounts for the past year were satisfactory. Some of the figures, however, necessarily reflected the immediate effects of the war. In the life assurance revenue account, for instance, income tax had absorbed £153,000—an increase of some £38,000. It was encouraging to note, however, that after meeting all outgoings, the life assurance fund had increased during the year by nearly £450,000, a striking tribute to the vitality of the Society.

New business suffered in 1939 a reduction of about 25 per cent. to a figure of just over £2 millions. That reduction was typical of the experience of life offices, as a whole, and was entirely due to the war, as at the end of August their total was actually ahead of the previous year. The gross yield, at £4 13s. 9d., was up by 1s. 9d. per cent., and the net yield, depressed, of course, by increased taxation, worked out at £3 13s. 6d., a reduction of only 2s. 8d. per cent. This net yield of £3 13s. 6d. still showed a substantial margin over the net valuation rate of 2½ per cent.

THE NEXT BONUS

In referring to the strength of the Society, the chairman said that reserves existed for all their liabilities—life assurance and annuity contracts alike—upon that conservative net interest basis of 2½ per cent., and that over and above those reserved they had a floating margin of undistributed surplus, upon which all tax had been paid, of over £2 millions. In addition, a number of assets were conservatively valued in the balance sheet, and thus constituted a further margin of security. In effect, a large contingency reserve, although not visible at that moment on the face of the balance sheet, none the less existed.

With regard to the next bonus, due to be declared a year hence, he had already referred to the undistributed surplus of over £2 millions, and there were the earnings of 1940 to come. Thus, if times had been normal, there was little doubt that there would have been available for their participating policyholders, a year hence, the usual good bonus. But, unfortunately, times were far from normal, and it might be that, in order to maintain their customary high standard of security, some portion of these resources would have, in prudence, to be conserved. Taking a long view, however, he remained convinced, in spite of present perplexities and the consequent need for caution, that, as compared with the non-profit contract, the profit-sharing policy would retain its superior attractions.

Since the outbreak of war the Society, in common with most other life offices, had excluded from the cover provided by new policies the risk of death arising "directly or indirectly" from war causes, although enlarged cover could usually be obtained by the payment of an extra premium, of an amount dependent upon the circumstances of individual cases. The past six months of war, however, had produced in their minds a growing dislike and distrust of those words "directly or indirectly" as being incapable of precise legal interpretation, and therefore entirely out of place in the policies issued by a society like the Clerical, which had always prided itself upon the simple and unrestricted character of its life assurance contracts.

The directors felt that the Society ought now to offer a type of policy designed to get back as closely as possible to the pre-war unrestricted form. They proposed henceforth to issue a policy which would contain a simple clause governing active service with the Army overseas, or in the Navy or Air Force, under which the amount payable at death in such service would in the ordinary way be a cash return of twice the premiums actually paid. With that one necessary exception, the policies would be in the familiar pre-war "whole-world and unconditional" form. They would thus afford, in the case of every civilian, complete cover in this country and, if effected on the full-profit or prime cost basis, the policy would carry the normal profit-sharing rights applicable to those tables. For a whole-life or endowment assurance, with profits, the annual premium would be about 5s. per cent. above the pre-war level.

The report was unanimously adopted.

BANK OF SCOTLAND

SATISFACTORY RESULTS OF A DIFFICULT YEAR

STRONG LIQUID POSITION

NEED FOR INCREASING EXPORTS

LORD ELPHINSTONE'S ADDRESS

The annual general meeting of the proprietors of the Bank of Scotland was held within the Head Office, Edinburgh, on the 2nd instant. The Right Honourable Lord Elphinstone, K.T., Governor of the Bank, presided.

In submitting the directors' report, the chairman said:—

My Lord, ladies and gentlemen, I assume that, as usual, we may hold as read the report by the court of directors of the affairs of the bank as at February 29th last, a copy of which you have all no doubt received.

The directors much regret the loss by death during the year of their esteemed colleagues Mr William Brodie, LL.D., and Lord Kinross. Mr Brodie's resignation from the board on account of ill-health was referred to from this chair a year ago. Lord Kinross had been a member of the board since January, 1925. Both had given valuable service to the bank.

The directors also regret the resignation on account of the state of his health of Mr Alexander Wallace, W.S., who had been an esteemed member of the board since April, 1917, and who gave valuable and exacting services as chairman of committees from October, 1922, until January, 1934. I am sure the proprietors will join with the board in extending their good wishes to Mr Wallace on his retirement.

To fill vacancies on the board the directors, in virtue of the powers contained in the bank's constitution, took the opportunity of inviting Mr Robert McCosh, W.S., and the Master of Polwarth to become ordinary directors. I am glad to say that they agreed to accept office. You will be asked to confirm their appointments to-day.

TRADE AND INDUSTRY

The fear of war which hung over us all in the autumn of 1938 and which at our last meeting had not receded far has unfortunately given place to the reality. The uncertainties and difficulties of those days have been replaced by new ones, but in one direction uncertainty has been entirely removed. We now know definitely what we are faced with and have no doubt about our duty to put forth the maximum effort and make the sacrifices necessary to bring the war to a successful conclusion as quickly as possible.

To this end trade and industry have necessarily been equally mobilised with the fighting forces, and in the intensive scheme of work which has followed we, as a bank, have contributed our share in financing the producers of food and munitions of war with temporary capital.

It is a commonplace to us all that in these days we must concentrate upon reducing our civilian consumption of goods and on increasing our savings; also that we must concentrate upon the necessity of paying for our imports, greatly swollen through war needs, by adding largely to our exports; and further that we must increase our home-produced food to conserve for war needs as far as possible the available tonnage space in the ships of our Mercantile Marine. Though these are matters about which there can be no difference of view among us, it is well that we should recall them to our minds with frequency to ensure that we do not forget their importance.

The Export Council, under its capable chairmanship, may be relied upon to promote the greatest volume of export trade that can be achieved under wartime conditions, and we as a bank are prepared to give what assistance we can to finance individual exporters among our customers.

The recent assurance of the Prime Minister, speaking for the present Government, that they were determined that agriculture should not a second time be allowed to collapse as it was after the last war, will be welcomed by those engaged in this vital and staple industry. As the bankers of numerous members of the farming community, with whose interests our own are closely bound up, we are glad to have this indication of policy. We are already giving assistance to farmers in their efforts to increase their production of essential crops and, in common with all the Scottish banks, are co-operating with the Scottish Office in plans for extending this assistance.

In a war such as this we must, as individuals and collectively, expect to be less well off than we would be in peacetime, and we must be determined to face that fact with courage.

THE BANK'S BALANCE SHEET

Turning to the bank's report, you will see that deposits at £42,137,116 show an increase of £4,285,425. Increased deposits, a common experience of banks in these days, are largely due to the considerable sums expended throughout the country by the Government for war purposes.

The note circulation at £3,941,242 shows an increase of £526,517. This also is due to the increase in employment as a result of the war. The average circulation for the year is again substantially in excess of the corresponding figures for the previous twelve months.

The item "Drafts Issued" calls for no special comment.

The increase in acceptances is due to extended business attributable to imports for war purposes.

LIQUID ASSETS

On the assets side, cash, bank balances, documents in transit and money at call and short notice amount to £10,858,825, i.e. fully 21 per cent. of our liabilities to the public. Bills discounted (including £2,000,000 of Treasury bills) and our investments amount to £29,236,962, or fully 56 per cent., giving a total of £40,095,788, or fully 77 per cent. of our liabilities to the public in liquid assets.

ADVANCES

Our advances at £10,508,426 show an increase of £781,029 and we are in a position to meet all further reasonable demands of our customers and connections for legitimate banking accommodation.

All bad and doubtful debts have been fully provided for. Our investments at £26,841,527 show an increase of £1,164,728.

The market value is substantially in excess of the value in our books.

BANK PREMISES AND HERITABLE PROPERTY

During the year, while some contemplated reconstruction work at certain of our branches has been postponed on account of war conditions, the bank's property all over the country has been maintained in good condition. The internal reconstruction being carried out at our head office is almost completed and the whole properties of the bank, including let properties, stand in our books at the slightly increased figure of £473,800 which is much below the market value.

RESULTS FOR THE YEAR

The net profits at £274,548 are £31,086 under those of last year. Lower net profits have been quite a common experience with other banks and the cause is readily explained by the additional expenditure caused by war conditions, including increased taxation, together with increased working costs and the continuance of low money rates.

The net profits are£274,548
Add: The balance from last year 151,918
£426,466

Deduct:
Applied to reserve for contingencies£75,000
Transferred to trustees for Officers' Pension Fund 30,000
Dividend at 11 per cent. per annum less
Income Tax168,000
273,000

Leaving to be carried forward£153,466
The dividend at 11 per cent. compares with one of 12 per cent for the previous year. This, together with the application of £75,000

to reserve for contingencies, has been decided upon as a measure of prudence in view of the uncertainties of the times.

BANK STAFF

Already about 250 men—that is over one-fifth of our entire male staff at the outbreak of war—have left for military service and we must expect a further very considerable loss of staff as more men are called up. In addition many of our men and women are giving in their spare time valuable voluntary help in the various branches of national service. We recognise and appreciate with gratitude the service and sacrifice which all these are rendering to public duty.

The absence of so many members of our staff combined with war conditions generally has called for much extra work on the part of those who are left. They have co-operated in a truly loyal and whole-hearted way in the many difficulties which have arisen and I have great pleasure in expressing our thanks to all concerned.

I should also like to mention in this place the Staff Joint Council including five members elected by our staff and so fully representative of them. The Council continues to perform very useful work.

DIVIDEND

I now have pleasure in moving that the report and balance sheet, as submitted, be adopted and that a dividend for the past half-year at the rate of 12 per cent. per annum, less income tax, be now declared payable on 15th current making with the dividend paid in October last 11 per cent. for the year, less income tax. The motion was agreed to.

The Lord Elphinstone, K.T., and the Lord Henry Scott were unanimously re-elected Governor and Deputy-Governor respectively for the current year.

Mr Robert McCosh, W.S.; the Hon. the Master of Polwarth, Sir Michael Nairn, Bart., and Mr John Craig, C.B.E., D.L., were re-elected ordinary directors.

Mr H. L. Usher, C.A., and Mr R. Arthur Morrison, C.A., were re-appointed to conduct the audit of the bank's books for the current year, and a vote of thanks to the chairman terminated the meeting.

MAPLE AND COMPANY, LIMITED

WARTIME ACTIVITIES

The fiftieth annual general meeting of Maple and Company, Limited, was held, on the 29th ultimo, on the company's premises, Tottenham Court Road, London, W., Mr Charles C. Regnart, the president of the company, presiding.

The Chairman, in moving the adoption of the report and the accounts, said that the outbreak of war, attended as it had been with the evacuation of London and Greater London, fears of bombing and destruction, had had a devastating effect on West End trade, and more particularly on the furniture trade.

Fortunately, up to the present, those fears had proved unfounded, but nevertheless the West End was still a distressed area.

At the same time, the control of timber and other commodities was making production more and more difficult, and he thought the company was to be congratulated on the possession of the largest stock of furniture in the world bought at prices which defied comparison.

The company had naturally suffered severely from lack of patronage from its vast clientele. On the other hand, their removal and warehousing departments had been taxed to the full, and they had also been kept extremely busy supplying blinds and curtains to meet A.R.P. regulations, in which direction business continued brisk.

At the same time, in present conditions the public would refrain from buying home comforts except necessities and so on, and until they reverted to peacetime conditions the luxury side of the company's trade must continue to suffer.

The balance available on the profit and loss account was £19,904 which, less £2,000 transferred to staff benevolent fund, the directors proposed should be carried forward.

It was the first time in the history of the company extending over 49 years that no dividend had been recommended, but he trusted they might look forward to the resumption of dividends at an early date.

The report and accounts were unanimously adopted.

ASSOCIATED ELECTRICAL INDUSTRIES, LIMITED

RECORD PROFIT FIGURES

The fortieth annual general meeting of the Associated Electrical Industries, Limited, was held, on the 29th ultimo, in London.

Sir Felix J. C. Pole (the chairman) presided and in moving the adoption of the report, said that the directors were able to present statement of accounts which they hoped the stockholders would regard as satisfactory. The profit for the year, before providing for depreciation and taxation, was £1,470,265, the largest profit earned in the history of the company, and an increase of £70,766, or 5 per cent., over the previous year. That increase, however, was much more than absorbed by the increased provision for taxation, although, owing to the conservative policy of the board in the past in leaving some of the profits in the business, they were spared the additional burden of the excess profits tax, but they had to provide for National Defence Contribution on their 1939 results instead of excess profits tax and, of course, for income tax. They had also had to make some provision in the accounts for the year for additional income tax on the profits earned in the year 1938. It would be seen that whereas they started with a profit for the year of £70,766 more at £1,470,265, they arrived at a net profit of £477,083, or 28.2 per cent. less than the corresponding amount for the previous year, due to the larger provision for taxation.

The profit for the year, after deducting taxation and depreciation, was £477,083, as compared with £664,308 for the previous year, to which had to be added £251,647 brought in from the previous year, making a total profit available for distribution of £728,730, and the directors recommended a dividend on the ordinary stock at the rate of 10 per cent. per annum, less tax, leaving a balance to be carried forward of £253,118.

THE EXPORT BUSINESS

The directors were continuing their policy of securing as much export business as possible. To that end they were maintaining an efficient organisation abroad and keeping in personal contact with overseas markets. Exports were more than ever necessary in wartime, and were rightly considered by the Government as second in importance only to the essential requirements of the fighting forces. The Government, through the Export Council which had been appointed by the President of the Board of Trade, appeared to contemplate giving more assistance than hitherto to exporting companies. In that connection they had pointed out the difficulty of obtaining large contracts for electrical and mechanical installations because of the risk incidental to quoting firm prices in view of rising costs of wages and materials. Some of their foreign competitors were not faced with that trouble, and they felt that the Government should assist the British manufacturer in dealing with that problem. He observed with interest that that opinion was shared by the chairman of the District Bank, who was in very close contact with the problems of export business.

He was glad to say that they continued to have many orders from the Dominions, the Colonies and foreign countries, the most recent large order being from Turkey for the construction of a large power station at Catal Agzi, the value being about £1,500,000.

Reverting again to the question of exports, might he take that opportunity of saying how glad he was that the Government had embarked upon an enlarged scheme of Colonial development. He had been a member of the Colonial Development Committee from its inception in 1929 and had visited several of the Colonies, therefore he was especially able to appreciate the potentialities of the Colonial Empire and the importance of the new scheme, which was announced by Mr Malcolm MacDonald on February 20th.

With regard to the Metropolitan Vickers Electrical Company, he would point out that they had on hand a larger volume of orders than ever before for turbo-alternator sets, transformers, switch gear, electrical winders, electric rolling mill equipment, hydro-electric installations, electric locomotives and other electrical apparatus. They had a record number of employees, while as regarded all the companies of the Associated Electrical Group, orders on hand exceeded £19,000,000 and the number of employees was the highest in their history. Although theirs was a reserved industry, they had nearly 3,000 employees serving with the Forces and a scheme was in operation whereby the Service pay of married men and single men having dependants was being supplemented by suitable allowances from their various companies. Also much was being done to support the National Saving Scheme.

The report and accounts were unanimously adopted.

THE MERCANTILE BANK OF INDIA, LIMITED

IMPROVED RESULTS DESPITE INCREASED EXPENDITURE

SIR CHARLES INNES ON THE POSITION

The forty-seventh annual general meeting of The Mercantile Bank of India, Limited, was held, on the 2nd instant, at Winchester House, London.

Sir Charles A. Innes, K.C.S.I., C.I.E. (the chairman), in the course of his speech, said:—An immediate effect of the war was temporarily to slow up the business of the bank. The bank has been appointed an authorised dealer in exchange in all the Empire countries in which we operate, and we regard it as our duty to co-operate with the authorities by strict observance, in the spirit as well as in the letter, of all the regulations which have been issued for the control of operations in exchange. But it must be confessed that at first the regulations were not too easy to understand, and for the first few weeks after the outbreak of war transactions which before the war had been just a matter of routine had each one to be the subject of individual consideration in order that we might be satisfied that no regulation was being contravened. Things are better now, for the regulations themselves have been clarified and our officers are more familiar with them, but at first the burden on Mr Crichton, Mr Paton and the branch managers was very heavy.

GERMAN CARGOES

Our experience in these matters was much the same as that of other banks, but the war involved the exchange banks which are mainly engaged in the finance of international trade in special difficulties. The outbreak of war, for instance, found us with many bills outstanding in respect of German cargoes. Fortunately, a large proportion of these cargoes had already arrived safely at their destinations when war was declared, and most of the relative bills were retired in due course. But there were some cargoes in German ships which were on the high seas when war broke out, and these ships at once ran for shelter to the nearest neutral port. They took refuge mainly in the ports in Italy, Eritrea, Japan and the Dutch East Indies. Other cargoes had been shipped in enemy vessels just before the outbreak of war, and these vessels remained in German ports. There were other cargoes again, in neutral ships bound for a German destination, and most of these ships were intercepted by the Allied navies and their cargoes brought before prize courts.

In this matter we had the experience of the last war to guide us, and Mr Crichton lost no time in organising, under the able direction of Mr Kennedy, our inspector of branches, an enemy debt department. Its business was to obtain with the least possible delay particulars of all cargoes in which we were interested and to find out where the ships were. Thanks to the prompt action taken, we were able to secure the release and transhipment to the original destinations of the bulk of the cargoes in Japan and the Dutch East Indies and of some of those in Italian ports without payment to the enemy of any of the charges which they have since tried to impose. We have also established our claim to, and secured the release of, much of the cargo brought before prize courts. But there are a number of cargoes which are still the subject of negotiations now being carried on through the London Chamber of Commerce. I am hopeful that in time we shall be able to secure the release of at least some of these cargoes, but in the meantime we have thought it wise to make full provision for any possible loss. In any case the amount involved has been reduced to small dimensions.

IMPROVED RESULTS

You will see that, in spite of additional expenditure to which I have alluded, we have been able to show rather better results, and our profit at £195,869 is an improvement on last year's figure. We are maintaining the dividend at 12 per cent., less tax, and we are making the same additional allocation of £30,000 to contingencies as last year. We have increased our allocations to the officers' pension fund and to premises account, and we have raised the carry forward by £2,000.

BALANCE-SHEET ITEMS

There are some interesting features in the balance sheet. The balance-sheet total at £22,000,000 is £3,500,000 in excess of the 1938 figure. On the liabilities side current and other accounts have increased by upwards of £3,000,000, while on the assets side cash is

up by £500,000 bills receivable by more than £2,000,000 and loans and advances by £1,000,000. The improvement in loans and advances is the direct result of the war. Prices have gone up, freight space is not always easy to obtain, and merchants require more finance. The increase in bills reflects to some extent increased trade, but it is mainly due to the fact that bills tend to be outstanding for longer periods owing to postal delays.

The only other point which requires comment is the increase in freehold banking premises. You will note that the figure has gone up from £304,724 to £338,422. I have just told you that we purchased a building last year in the outskirts of London, and we also acquired properties in Bombay and Colombo with the object of rebuilding the bank premises in the former city and of building a house for our manager in the latter. As I told you last year, this account is a very healthy one. We own many valuable properties, and the account has been systematically written down each year since the bank came into existence.

DEDUCTION OF INCOME TAX

Before I leave the accounts, there is one small matter which I must mention. Some of you will notice that in the final dividend warrants the "A" shares have been less generously treated than the "B" and "C" shares in the matter of deduction of income tax. You will remember that when the Chancellor introduced his Emergency Budget last September he raised the rate of income tax from 5s. 6d. to 7s. in the £ with effect from the beginning of the financial year. At that time we had already declared an interim dividend of 6 per cent., less tax, and the dividend warrants which had been prepared on the basis of British income tax at 5s. 6d. in the £ had actually been issued. In circumstances like these, as the Chancellor explained in his Budget speech, preference shares and ordinary shares are treated differently.

In the case of preference shares a company can and should correct in its final dividend an under-deduction of tax in the interim dividend, but it has no power to do this in respect of ordinary shares. As you know, our "A" shares are preference shares as to 5 per cent. of the dividend, and to that extent the under-deduction of tax in the interim dividend must be corrected. The effect is that while the "A" shares get a dividend of 12 per cent., less tax, the "B" and "C" shares get a fraction more. The matter is one in which the directors are quite helpless; they are bound by the Articles of the bank.

INTERFERENCE WITH NORMAL CONDITIONS

It has been the custom for the chairman, in his speech at the annual general meeting, to survey economic conditions in the countries in which we operate. This year, however, I do not think that it would be useful to attempt any detailed survey of this kind. The war has interfered with normal trading, and has set up entirely artificial conditions. In most of the Empire countries in which we have branches, imports and exports, shipping and foreign exchange are all controlled, and there have been centralised bulk purchases by the British Government of various commodities of vital importance, such as tea and sandbags. Measures of this kind, of course, are necessary for the successful prosecution of the war, and it is all to the good that the authorities have taken control much more rapidly than in the last war.

There is another point of difference in that payments for some of the purchases in India of the British Government are being made through the Bank of England and the Reserve Bank of India, which of course, was not in existence in the last war. I am sure, however, that the authorities are well aware of the part the Exchange Banks have always played in financing trade between India and this country, and that they will be anxious to interfere as little as possible with normal methods of finance. It is safe to say that it is not a question of profits. The chief concern of this bank is that its long standing connection with the trade between India and this country should not be interrupted or impaired.

A noticeable result of the war has been a large increase in direct shipments of rubber, tin and other commodities from Malaya and India to the U.S.A. This is a natural result, since the insurance

rates on cargoes which do not enter the war zone are much lower. There is also some risk that shipments of this kind may be financed by bills drawn on New York instead of on London, though the regulations just issued may obviate this danger. Time alone can show whether these are merely temporary phases or whether the war, especially if it is prolonged, will effect permanent changes in the course of Far Eastern trade as well as in the methods of financing it.

COMMODITY PRICES

As regards the principal commodities in which we are interested, rubber and tin are commodities of great importance in wartime, and as the result of the war, and also in the case of rubber of the barter agreement with the U.S.A., not only has a higher rate of release been allowed but prices have also improved. In consequence there has been a return of prosperity to Malaya, at any rate for the time being. There has been a rise in the cost of living and some unrest among Chinese labour, but generally the Government has kept a firm grip on the situation.

Ceylon has also benefited by the improvement in the rubber trade and by the fact that a large proportion of the tea crop has been bought by the Ministry of Food at a fair price. Here, too, however, there has been labour trouble on the estates, and some anxiety is felt regarding the future supply of Indian labour owing to an unfortunate dispute between the Governments of Ceylon and India. I mention in passing that we have opened, as an experimental measure, a new branch at Jaffna with the object of extending much-needed banking facilities to the north of the Island.

In India jute is the commodity which reacted most rapidly to the war. The British Government placed large orders for sandbags, and consumers all over the world became keen buyers. Prices rose quickly, and in the latter months of the year the mills were running their machinery to capacity for 60 hours a week. Thus the industry is enjoying a period of prosperity tempered to some extent by the prospect of the excess profit tax which the Government of India have decided to impose. The situation, however, is not without danger. The outbreak of war was followed by a period of intense speculative activity in the jute market in Calcutta, which temporarily forced the price of raw jute to an inordinately high level, and the cost of manufactured jute also rose. The supreme merit of jute as a packing material lies in its cheapness, and high prices give an impetus to the competition of cotton and paper bags.

SPECULATIVE ACTIVITY

The speculative activity in the jute market communicated itself to other markets, particularly those in cotton and silver, and in spite of action taken by the provincial governments to control prices, there was a rapid rise in wholesale and retail prices in the first four months of the war, with the result that there has been some labour unrest, especially in the Bombay mill industry. The war, however, had little effect, except in jute manufactures, on exports in the first three months of the war, and the combined exports of merchandise from India and Burma in 1939 were only 18 crores in excess of those of 1938. But there was a large increase of exports from India in December and again in January, and there is no doubt that the great resources of the country will be fully utilised for the purposes of the war. The agriculturist should benefit by the better prices he is getting for primary products, and it is probable that the war will give a further stimulus to the development of manufactures in India. There is, however, not so much leeway to make up as in 1914. A rather depressing feature of the trade returns of all these countries is that increased exports to the United Kingdom have so far not been counterbalanced by increased imports from the United Kingdom.

In China the Sino-Japanese war still drags on, but in spite of this fact and other hindrances, trade improved in Shanghai. The trade of the port was nearly twice as great as in 1938.

THE FUTURE

The war has brought a measure of prosperity to most of the countries in which we have branches, and there has been some improvement in the accounts which we are presenting to you to-day. But the main point I wish to make is that war prosperity is a prosperity of an artificial and unstable kind, and that when the war is over it will probably be succeeded by another period of trade depression. It is this contingency which your directors have to keep in mind, and we are confirmed in the conservative policy which we have followed for many years.

The report and accounts were unanimously adopted.

HALIFAX BUILDING SOCIETY

ASSETS REACH RECORD AMOUNT OF £129,000,000

The eighty-seventh annual general meeting of this Society was held, on the 1st instant, at Halifax, Brig.-Gen. Sir Edward N. Whitley, K.C.B., C.M.G., D.S.O., D.L., President of the Society, presiding.

In moving the adoption of the report and balance sheet the president said: The annual financial statement and report cover a period of seven months of uneasy peace and five months of war, and they give us great grounds for thankfulness.

As you see, our total assets have increased by more than £895,000 to the record sum of over £129,000,000 and, but for having to find an additional sum of over £200,000 for income tax and N.D.C., our profit would have been even better than last year.

The mortgages are carefully selected, the properties on which the loan is made being all valued by professional valuers, and the amount at risk is reduced each year by periodical repayments.

Turning to the other side of the balance sheet, the amount owing to investing shareholders at £88,000,000 and to depositors at £34,000,000 has increased by £495,942 during the year; other liabilities for income tax, N.D.C. and contingencies amount to £557,035, leaving in the reserve funds and carry-forward £5,800,000, which is 4.49 per cent. of all liabilities as against 4.2 per cent. last year.

Management expenses are less than last year, amounting to only 8s. 7d. in each £100 of mean total assets as against 9s. 1d. last year, which is well below the average of all building societies in Great Britain.

The amount advanced on new mortgages was £12,612,343, a very considerable sum, but of course far less than the £20,000,000 which we have advanced in each of the past five years. Up to the end of August our figures for completed mortgages compared very favourably with those of the corresponding date in the previous year, but since the outbreak of war we have done little more than complete outstanding commitments. The directors have allotted £100,511 to the payment of a bonus to monthly subscription investing shareholders of 15s. per cent. and to paid-up shareholders class 1 of 10s. per cent.

Referring to conditions at the outbreak of war, the Chairman said: At no time was there any sign of panic withdrawals, and after the initial shock of the declaration of war had passed withdrawals speedily returned to normal dimensions.

The effect of war on the other side of our business was much more marked. No new applications for advances were granted, but we completed all those which had been accepted prior to the war.

Another effect of the outbreak of war was the great increase in the number of requests for the temporary suspension of repayments of capital on advances already made, and we have given most sympathetic consideration to all cases where a member who has been a regular payer has found it difficult to go on in consequence either of military service, of evacuation, or of unemployment owing to the sudden dislocation of life.

WAR DAMAGE

Dealing with the question of war damage, the Chairman said: The Government, through the Chancellor of the Exchequer, as far back as January 31, 1939, stated that "When the extent of the damage to property in private ownership is known, such contribution will be made from public funds as the circumstances make possible in accordance with a scale which would at any rate pay in full up to a certain limit of loss, and thereafter would be graded."

This pledge on the part of the Government seems to me to be satisfactory to our Society, and particularly when we remember that our securities are generally in small units consisting mainly of dwelling-houses and spread throughout the whole of Great Britain and Northern Ireland. The promise of the Government to give the maximum compensation out of public funds at the end of the war affords the maximum protection against war damage at present available, and I do not know any other form of security which offers better safety in wartime than building society mortgages.

Although it does not fall strictly within the year covered by the accounts which I am presenting to you, I suppose I must make some reference to the reduction of interest from June 30th next of which we have recently given notice. The board has been very loath to reduce the rate of interest on money which has been with us for some years, but after the most careful consideration we can see no proper alternative.

The accounts were approved.

NATIONAL BANK OF INDIA, LIMITED

PROFITS WELL MAINTAINED

APPRECIATION OF SECURITIES

MR R. LANGFORD JAMES'S REVIEW

The ordinary general meeting of the National Bank of India, Limited, was held, on the 2nd instant, at the bank's premises, 24 Bishopsgate, London, E.C., Mr R. Langford James (the chairman) presiding.

The general manager (Mr E. H. Lawrence) read the notice convening the meeting and the auditors' report.

The Chairman said: There has been an increase of approximately £1,300,000 in current, fixed deposit and other accounts, as compared with the previous year, while the amounts representing bills of exchange, discounts, loans receivable, etc., aggregating £15,000,000, show an increase of an almost equal amount—a welcome indication of expanding trade requirements in the principal centres where we operate, of which we hope to see a continuance. While loans payable outstanding amount to £1,500,000, cash and bullion at £6,860,000 exceed the amount appearing in the previous balance sheet by roughly £2,000,000. Our investments in British and Indian Government securities at £13,382,190 compare with £13,518,824 a year ago, and were valued at or under market prices ruling on December 31st. Since then there has been a considerable appreciation and their present market value is substantially in excess of that appearing in the balance sheet. The proportion of cash and Government securities held against deposits needs no comment beyond what I have made on previous occasions when I pointed out the strength which these figures disclose.

PROFIT AND DIVIDEND

The net profits for the year, amounting to £442,692, are about £1,490 less than those of the previous year. With the amount brought forward there is available the sum of £691,572, out of which an interim dividend at the rate of 16 per cent. per annum, less income tax, was paid last September, and we now recommend the payment of a final dividend at the same rate and to carry forward £246,572. The results have been arrived at after making full provision for bad and doubtful debts and for taxation on the heavily increased basis now in force.

The allocation to property account is the same as last year, when I reported to you the acquisition of this building from the Methodist Missionary Society. This year's meeting is interesting in that for the first time we are in undivided occupancy of the entire premises. We had been the tenants of the society for some 35 years, and gratifying testimony to the harmony of our relations with our landlords was recently conveyed to us in a very cordial letter from them. The sentiments expressed afforded us much pleasure and satisfaction. Our architects are at present preparing suggestions for consideration as to certain necessary structural alterations, but it is not our intention to enter upon any elaborate scheme under present conditions.

It may interest you to know that provision has been made for possible eventualities and that we have purchased a property at Fisher and leased another in the same locality which, combined, should provide us with alternative accommodation if the necessity arose.

INDIA'S FAVOURABLE TRADE BALANCE

India had a favourable trade balance of Rs. 51.54 crores, against Rs. 29.77 crores in 1938, which enabled the Reserve Bank to acquire large resources on this side and has put them in a position not only of being able to meet the India Government's current requirements, but to increase largely the external assets of the currency and to set aside sums for the repatriation of sterling debt. No less than £63,000,000 was obtained during the year as compared with £19,000,000 in 1938.

You will expect me to say a few words concerning the probable effect of the present state of affairs on business in those parts of the world where our interests mainly lie. While the exports of countries with which we are mainly concerned are, and will doubtless continue, in demand at prices above those ruling in recent years, less continue, in demand at prices above those ruling in recent years, it is not to be expected, generally speaking, that we shall see values rise to the levels reached in the last war. Much must depend on the duration of the war, of course, but in the meantime I think it

is a fair appreciation of the position to say that we look for general prosperity in our territories without the inflated prices of the 1915-20 level.

COTTON

As usual, I propose to refer briefly to the principal industries in which we are interested, commencing with the Bombay Cotton Mills. Up to the outbreak of the war raw cotton prices were abnormally low, and, with the demand for their products expanding, the mills were gradually working themselves into an improved condition. In spite of labour troubles—which I trust may prove of short duration—it is to be expected that the pace of this improvement will be accelerated under war conditions, prices of competing imported goods being handicapped inter alia by increased freight and insurance charges. For many years past imports of coarse fabrics into India have dwindled steadily, but possibly the extent to which that country is becoming self-supporting in the manufacture of fine cotton goods also may not be appreciated generally, though, of course, our friends in Lancashire are only too well aware of the fact, the days of the supreme importance of the Indian markets to United Kingdom manufacturers being definitely a thing of the past. While we cannot but sympathise with Lancashire—more particularly, of course, as their trade was of material value to the Exchange Banks—Bombay and other cotton manufacturing centres in India are entitled to congratulation on the success they have achieved.

JUTE INDUSTRY

Last year I called attention to the address of Mr P. S. Macdonald, the chairman of the Indian Jute Mills' Association, at the annual meeting of that body. Reading a few days ago the same gentleman's speech at this year's meeting, I was left with the impression that here indeed is an industry well able to take care of itself and one that is by no means prepared to take misfortune lying down. The history of the Bengal jute mill industry has not been a happy one during the past few years, but even before the war came to its assistance the vigorous steps towards rehabilitation taken by the association were slowly but certainly bearing fruit. As was to be expected, of course, war demands—including orders for over 900 million sandbags for ourselves and our Allies—have increased the activities of the mills materially. It is of interest to observe that, as in the case of the last war, the Allied Governments' requirements are being supplied practically at cost price, in some cases indeed, where manufacturers have found it necessary to replenish their stocks of raw materials after contracts were entered into, at an actual loss.

Unhappily, so far as the free balance of the mills' products is concerned, the market has been dominated by speculators, a well-known state of affairs in Calcutta. Early in the winter prices were rushed up to almost fantastic levels and, though this phase did not last long, values are still on the verge of what may prove an unhealthily high level. For a jute container is, of course, a somewhat rough article—not comparable with a bag made, say, of cotton—and it owes its popularity to its moderate price, an advantage over possible substitutes of which the local gambler in Calcutta is, if not unaware, at least unheeding. While, therefore, the Calcutta mills are at present enjoying a period of prosperity beyond anything they have experienced for many years, taking the long view, it would probably be in their interests were values to subside to a level at which their products would be of greater attraction to the actual consumer. This aspect of their business is kept prominently before the committee of the Mills' Association.

TEA, RUBBER AND SUGAR

Of tea there is not much to say: the industry continues the even tenor of its way under the protection of the International Regulation Scheme, which, worked by a committee of experts, is now in the eighth year of a successful existence. Since September last large quantities of tea have been supplied to Allied countries on terms readily agreed upon between producers and the Government of this country, and a long-term contract, to cover requirements for the duration of the war, is in course of conclusion. The prices payable by Government have been fixed on a basis which should

ensure supplies of tea being available to the public at moderate prices, while leaving the growers with a fair margin of profit.

The improvement in the rubber industry which developed during the early part of 1939 and was reflected in a rise in the London price to over 8d. was further influenced by the abnormal factors of the Barter Agreement with the Government of the United States of America and the outbreak of war. This latter event brought an immediate further rise in prices, and even higher levels were reached in subsequent months, the average for December being 11½d. The rising tendency, however, was checked by additional releases under the regulation scheme; producers have had to face rising costs of production, transit and insurance. World shipments of rubber during 1939 were 1,005,000 tons, and, although complete statistics are not available, reliable estimates indicate that world absorption was in the region of 1,090,000 tons. The experience of the last few years has emphasised the vital importance to the rubber plantation industry of the International Rubber Regulation Scheme. It may not be generally realised that the British Empire produces over 50 per cent. of the world production of plantation rubber, but the consumption of the United Kingdom is only 10 per cent. of the total world absorption. The influence of the rubber plantation industry in the provision of foreign exchange is, therefore, substantial.

With regard to Indian sugar—now an important industry—it suffices to say that, with a not inconsiderable rise in prices, the mills have had a rather more prosperous year. Much of the profit in the industry, however, found its way into the pockets of the growers, cane prices being regulated by the local Governments concerned. As you are doubtless aware, cane growing in India is almost wholly a village industry, the cane being cultivated by the ryot and by him sold to the local mill.

CEYLON, BURMA AND EAST AFRICA

In Ceylon, with the improvement in the position of rubber, tea assured of a reasonable return on capital invested and with better results from coconut properties probable under war conditions, there is every prospect of a return to more prosperous times. It is unfortunate that the working of the present Constitution has not been attended by the success which its progenitors anticipated, the recent deadlock created by the wholesale resignation of Ministers being a particularly regrettable incident. I referred last year to the proposal to alter the currency system of the island and gave reasons why, in our opinion, the step was not only unnecessary but was fraught with risks which it was undesirable to incur. The Bill to give effect to these proposals is now in course of passage through the Legislature and looks like finding its way on to the Statute Book, but we still hold the view that any system which breaks the link with the rupee currency of the neighbouring Continent of India will not be to the ultimate benefit of Ceylon.

In Burma there was some recrudescence of communal rioting in the early part of the year, but this gradually died out and conditions have since been quiet. The rice crop was excellent, and exports at over 3,600,000 tons were the largest since the record year of 1934. Prices were steady at about the same level as in the previous year, and the bulk of the exports went to India, where rice crops were below normal. Demand for teak showed some improvement, and prices recovered somewhat from previous low levels.

With regard to East Africa, while the undercurrent was better, no outstanding improvement in business was discernible up to the outbreak of the war. Since then Government expenditure has been on an increased scale, and it is fair to assume that under war conditions more prosperous times are in store. A considerable increase in the demand for cloves has come to the assistance of the Zanzibar Government's regulation scheme in connection with that commodity.

TRIBUTE TO GENERAL MANAGER

I cannot conclude without a word of special thanks from my colleagues and myself to our general manager, Mr Lawrence, not only for his ever-ready courtesy and help to us, but for his outstanding services to the bank. It cannot but be a fact that the war's problems have imposed an extra strain on the general manager, but, if so, no sign of this is ever allowed to affect the energy and eagerness with which each such problem is tackled and solved. I can assure you that the bank owes much to the general manager and to the executive at head office. (Hear, hear.)

The chairman concluded by moving the adoption of the report and accounts, this being seconded by Mr J. A. Swan (deputy-chairman) and carried unanimously.

GODFREY PHILLIPS, LIMITED

INCREASED PROFIT

MR ARTHUR I. PHILLIPS'S SPEECH

The thirty-first annual general meeting of Godfrey Phillips, Limited, was held, on the 2nd instant, at the Registered Office, 112 Commercial Street, E.

Mr Arthur I. Phillips (chairman and managing director), in the course of his speech, said: The net profit for the year is £281,627 against £259,226, an increase of £22,000, which is arrived at after all the usual annual charges and provisions, together with a provision this year for Excess Profits Tax and temporary A.R.P. costs, and, of course, there has been charged against revenue the very high premium cost in the last quarter of the war risk insurance. I hope you will agree that the result can be considered satisfactory.

Twice during the trading period there have been increases in the duty, both of 2s. per pound, most of which, though not all, has been passed on in the retail prices. The effect of these increases, so far as I am able to judge, has not tended towards any change of habit of the consumer nor much in the choice of brands.

PROBLEMS FOR TOBACCO EXPORTERS

Abroad, in many markets in which our "group" brands sell, we have had to contend, and are still contending, with many increased tariffs and far higher freights and insurances. I am afraid that, desirous as everyone is that the country's export trade should be maintained, and we particularly that the export trade of manufactured tobacco should be, we must face a diminished demand in those countries whose local manufacture is not subjected to similar difficulties.

Here I would like to add that whatever need there may be of the order withholding dollars with which to obtain deliveries of United States tobaccos, some relaxation in the order should apply where this tobacco is required solely for manufacture for export to countries which will give us other and additional foreign exchanges.

NEW ZEALAND FACTORY

I must take the opportunity of referring to the New Zealand factory now in operation. New Zealand has been taking for some years a considerable proportion of our exports both from here and Australia, and a very valuable goodwill in certain of our brands had been built up. More than a year ago the New Zealand Government, taking steps to protect the exchange position, imposed restrictions on the export of sterling and furthermore prohibited certain imports, of which tobacco was one. These actions made it imperative if we were to maintain the big business we had built up in New Zealand, that the manufacture should be transferred from the London and Melbourne factories to Wellington. This has now been done. It has necessitated the transference of some leaf stock, material and plant. It is this which accounts mainly for the increase in current account, etc., with subsidiaries.

Much has been written in the Press, though little is known of the Government's intention, regarding the varieties and use of oriental tobaccos, generally known in this country as "Turkish," which the Government have recently purchased. Whatever the ultimate decision may be, your company is particularly well placed. For many years we have occupied a unique position, and our knowledge and experience in handling and manufacturing this fine cigarette tobacco has brought us the manufacture under our roof of about 75 per cent. of the total Turkish tobacco used in this country.

CURRENT TRADING PROSPECTS

No one can at present be expected to do more than plan from day to day, and this is your directors' daily task, so I ask you not to expect me to do more to-day than express to-day's belief that at the end of this year's trading, the accounts we shall put before you will be no less satisfactory than I trust you agree are those before you this day.

Perhaps it will not be taken amiss if I say that this view is founded on my reluctance to believe that means will not be forthcoming by which currency may be found to allow of further imports of United States tobacco, and I cannot believe that further specific tobacco taxation can be intended.

The report and accounts were unanimously adopted.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

ALL-ROUND INCREASE IN BUSINESS

TRADING CONDITIONS IN THE EAST

MR A. D'ANYERS WILLIS'S ADDRESS

The eighty-sixth ordinary general meeting of The Chartered Bank of India, Australia and China was held, on the 3rd instant, at the bank's premises, 38 Bishopsgate, London.

Mr Arthur d'Anyers Willis (the chairman) presided.

The Chief Manager (Mr A. H. Ferguson) having read the notice convening the meeting and the report of the auditors,

The Chairman, in the course of his speech, said: It has been my custom each year to give a comprehensive review, accompanied by figures and statistics of trade and financial conditions in the various territories served by the bank. On this occasion conditions everywhere having been so radically altered as a result of the outbreak of war and the imposition of Exchange and Trade Control, I propose to confine my principal remarks to the bank's balance sheet and, later on, to refer only briefly and in a general way to the more important points affecting our many and varied interests throughout the East.

THE BALANCE SHEET

The business of a bank such as the Chartered, which is largely concerned in the financing of international trade, has perhaps been affected to a far greater extent than that of many other banking institutions by the application of the very proper measures which the Government have had to introduce to safeguard the economic and financial resources of the country, the Empire, and our Allies. Irksome as they are, these measures are vitally necessary in a time of war, and the authorities may be assured of our complete co-operation with them in their wartime economic and financial policy. I am pleased to be able to say that the effect of these regulations has so far not affected the volume of our business, as a comparison of the figures in the balance sheet in your hands with those of the previous year will show.

There has, however, been a change in what I may call the "domestic" sphere. I refer to the absorption of the business of the P. and O. Banking Corporation, Limited, which I mentioned in my speech last year. This absorption has made it difficult to make exact comparisons with the figures of a year ago—a difficulty which has been accentuated by the changes in the sterling value of the U.S. dollar, the peso, the guilder, and the Chinese dollar—which are the local currencies in which several of our agencies work and keep their accounts.

The grand total of the balance sheet is £67,568,797, an increase of, approximately, £7,000,000, and one of the largest totals in the bank's history. The figure of current and other accounts at £39,691,829 compares with £31,496,582 a year ago, and, although some portion must be attributed to the transfer of the P. and O. Bank accounts, an analysis of our figures shows increases at practically all points. It also, when you compare it with the decrease in fixed deposits from £14,695,385 to £13,970,479, illustrates the desire all over the world on the part of the public to keep their resources as liquid as possible.

Bills payable at £3,605,836 are more than double, and this again is one of the effects of the war. A year ago remittances from the East were chiefly sent home by air, a matter of days, whereas now they come mainly by sea, with the result that, at any date, outstandings are much heavier.

CASH IN HAND AND AT BANKERS

Another striking reduction is in the item of loans payable, which has fallen from £3,824,625 to £795,579. These loans, as explained in previous years, are temporary finance at various points, but under such conditions as are ruling to-day, when strong cash positions are an absolute necessity, large outstandings of this character might be a source of considerable anxiety. This strengthening of our liquid position is further shown by the increase in cash in hand and at bankers of £826,980 to £6,302,760, which is almost 16 per cent. of our call liabilities on current account.

Government and other securities with a reduction from £23,438,763 to £20,624,407 is another sign of the times.

The sale of the securities previously held by the P. and O. Bank, which were transferred to us on the purchase of the undertaking—and here I may recall that in 1938, the date of their last published

balance sheet, the P. and O. Bank held over £4,300,000 of securities—together with a reduction of our own holdings, has enabled us to build up a stronger liquid position, as already mentioned, and at the same time to finance the increased demands on us from our clients, to which I shall refer presently.

The purchase of the undertaking of the P. and O. Banking Corporation, Limited, on February 1, 1939, and the resultant repayment of capital, has eliminated that item from the balance sheet, and, if I may digress here slightly for a moment, I would mention that the necessary bookkeeping adjustments, which are of a "capital" nature, resulting from that purchase, have been made out of contingencies account, as stated in the profit and loss account.

The holding of Allahabad Bank shares is the holding taken over from the P. and O. Banking Corporation, Limited, at the date of purchase.

Bills of exchange, including Treasury bills, show a very substantial increase from £7,945,845 to £11,252,068, for which the longer time taken in transit by sea mail is partly responsible, but we were also holding substantially larger holdings of Treasury bills as compared with a year ago.

BILLS DISCOUNTED AND LOANS

Another large increase of almost 50 per cent. is shown in bills discounted and loans, the actual figures being £24,967,792, as against £16,538,710 at December 31, 1938. You will doubtless recollect that we participated in the loan to the Chinese Government under the guarantee of the British Government, and, in addition to this, must be added the loans and overdrafts transferred from the P. and O. Bank. These items, however, do not account for the whole of the increase, and it is satisfactory that our strong liquid position has enabled us to meet our clients' demands in this direction without undue strain.

Before turning to the profit and loss account, I would like to mention that we were able to transfer into our books practically the whole of the accounts of the clients of the P. and O. Banking Corporation, Limited, and this fact, in my opinion, speaks volumes for the goodwill and hard work of our officers, both at home and abroad, who were engaged in the transfer of that undertaking.

INCREASED PROFIT

Now for a few words concerning the profit and loss account. The profit for the year, after making sundry provisions, shows a small increase of £3,039 at £338,348, but whereas a year ago we provided out of contingencies account a sum to meet the depreciation on Government securities, this year it has been charged against current profits. To anyone who is conversant with the prices of Government securities during wartime it is evident that, on large holdings such as ours, this sum must have been considerable.

Another feature is the increase of taxation, both at home and abroad, and although some may be recovered from shareholders or relief obtained from double taxation when reciprocal arrangements between the Governments concerned have been made, I would remind you that taxes such as National Defence Contribution and excess profits tax, which have been fully provided for, are borne by the bank. Also the profits of many of our branches do not come within the reciprocal arrangements I have mentioned, and so bear very heavy taxation. I would also like to remind shareholders that the directors last September decided not to deduct the full rate of income tax as they could have done under the Supplementary Budget from the interim dividend, which really meant an increase in the dividend of ⅓ per cent. per annum.

This interim dividend absorbed £150,000, and it is proposed to pay a final dividend at the rate of 10 per cent. per annum for the half-year to December 31st last, costing £150,000, to transfer £35,000 to the officers' pension fund, and to carry forward the balance of £182,442 14s. 1d.

TRADING CONDITIONS IN THE EAST

I now pass to a very brief review of a few of the salient features in the economic and financial conditions of the countries in which we operate.

It is a heartening feature of the present conduct of the war that a recognition of the necessity for exports from this country is now almost general, and we welcome the institution by His Majesty's Government of an Export Council under vigorous leadership.

Through our widespread system of branches this bank is well equipped to render service in creating and building up markets for British goods.

On the outbreak of war countries producing raw and war materials immediately assumed greater importance.

CHINA AND JAPAN

In spite of such a large portion of China being under the control of the Japanese, and the Yangtze and Pearl Rivers being closed to foreign shipping, it seems remarkable that trade in no small volume continues to emanate from that country. Hongkong trade figures have been well maintained and local industries and business houses in the main have had a prosperous year.

In Japan a considerable expansion took place in the value of the foreign trade of the country during the past year—exports showing a much greater increase than imports.

Most of our German outstandings at the beginning of September have been liquidated.

THE BANK'S CHARTER

You may remember that after our annual meeting last year there was an extraordinary meeting to apply for a renewal of the bank's charter.

I have now much pleasure in telling you that all the legal and other formalities in connection with this renewal have been successfully carried through.

The new charter has had the approval of His Majesty's Treasury as well as all the other Government Departments concerned; it is now in operation, and carries us on for a further thirty years, until July, 1969.

THE CHAIRMANSHIP

Before I close I wish to refer to a matter affecting myself. I made it known to my directors some time ago that I wished to relinquish the chairmanship after this annual meeting—my reason being that my health has not been good for some time past, and last autumn I was laid up for several weeks. Bearing in mind the fact that I have spent twenty-four years of my life in India, I feel the time has come when a younger man, more recently retired from the East, should take my place. I should like here to mention that during my illness Mr Gubbay has taken on his shoulders a great deal of the chairman's work, and I take this opportunity of expressing to him my thanks, as well as the thanks of the board, for his able services. (Hear, hear.) My colleagues have kindly asked me to remain on the board as an ordinary director, and, if it is your wish, gentlemen, I shall be very pleased to serve you in that capacity. (Hear, hear.)

We have during the year brought on to the board Mr V. A. Grantham, who has been in India, and is closely connected with India and its conditions; the court have every confidence in Mr Grantham, and it is their intention to elect him as your chairman at their full board meeting next week.

WORK OF THE MANAGEMENT

During the time I have been your chairman—now six years—I have learnt to appreciate the exacting problems which the management have to deal with daily, and I would like to pay a tribute to the whole-hearted loyalty and support which I have received from everyone, both at home and abroad, during the period of my chairmanship.

Owing to the far-seeing judgment of your chief manager, Mr Ferguson, there has been brought into the executive, both in London and in our overseas branches, a number of men of experience and of ability whose interests are wholly bound up in a common desire to secure for the Chartered Bank that pre-eminent position which it has deservedly reached in the banking and commercial worlds of the East.

Even if the past six years have not been a period of easy and smooth sailing, I can assure my successor that, whatever the difficulties he has to contend with, he will be able to rely on not only the valuable assistance and co-operation of the principal executives around him in head office, but on the unstinted devotion of the staff abroad.

The report and accounts were unanimously adopted, and, the formal business having been transacted, a vote of thanks to the chairman, directors, managers and staff terminated the proceedings.

AUTOMATIC TELEPHONE AND ELECTRIC COMPANY, LIMITED

NATIONAL IMPORTANCE OF TELEPHONE INDUSTRY

The twentieth ordinary general meeting of this company was held, on the 3rd instant, in London.

Sir Alexander Roger (chairman of the company) said that orders had been maintained at a high level; output had again been increased, and they reported a profit of £276,249, against £265,896. Difficult times had been encountered, but they presented a balance sheet with every known trading risk provided for. It was proposed to pay a final dividend of 7 per cent. on the ordinary stock, making 10 per cent., plus a bonus of 2½ per cent., and a dividend of 10 per cent., plus a bonus of 2½ per cent., on the deferred stock and shares, all subject to income tax.

Continuing, he said: Telephone and General Trust, Limited, in which we have a substantial investment, has again paid a dividend of 8 per cent. on the ordinary stock and shares after increasing their capital and revenue reserve by £25,000 to £315,000 and carrying forward £62,569. We continue to derive much valuable business from this connection.

The war naturally brought to the Telephone Branch of the Post Office new and complex problems, and, as might be expected, the signalling services of the fighting forces made heavy inroads on their engineering personnel. This was unfortunate.

The annual report of the American Telephone and Telegraph Company just published says that good telephone service involves plant facilities and organisation adequate not only to take care of everyday needs of the nation, but also to meet sudden and perhaps unprecedented surges of demand for telephone connection.

This was precisely the policy which the Post Office had been pursuing with success for some years. It strove to provide a no-delay trunk service and an equally rapid local service.

NEED FOR EXPANSION OF TELEPHONE SERVICES

Maximum production of munitions and goods generally, both for home and export, cannot be rapidly achieved without the ample provision of the necessary tools for industry. The telephone is as essential as a machine tool, but I am afraid that this is not generally understood, and there would seem to be a tendency to starve and restrict the expansion of the telephone service. If this is persisted in at a time when all industrial effort must be keyed up to concert pitch, it can only act as a brake on production and on commerce generally. It is pleasant to record that ever since the outbreak of the war the Post Office has taken a broad view of the position they and their contractors faced. They are making every effort to assist the transition stage towards contractors' increased activity in war work whilst endeavouring to preserve a hold on the telephone manufacturing situation and the creation of reserve supplies of equipment.

I would, however, urge upon the Government that every assistance in finance and material should be rendered to this vital branch of our national life, recognising that rapid communication is an essential part of the military and commercial and social system.

EXPORTS

They welcomed the newly-formed "Export Council," and, in particular, the declaration that "there are powerful reasons why the strongest preference should be given to measures which involve the least interference with the existing channels of trade or with established practices and principles." They also welcomed the statement that arrangements should be built on the normal structure of trade on the assumption that the sounder and healthier would be the state of the trading organisation when more critical and testing conditions were likely to be encountered.

Later it was stated that "in many trades merchants customarily play a vital part in the machinery of overseas distribution, and the collaboration of the interested export merchants . . . will be most important." That was a note which industry had found wanting in many directions of Government control since war commenced, and, frankly, some of them had been in despair in case they would never hear it. Late as it was, they welcomed it with relief, and hoped that that attitude would be adopted widely by Government Departments dealing with the trade of the country.

In conclusion, he said that if supplies and man power were maintained they had little doubt that their output for 1940 would show an increase on that for 1939.

The report was unanimously adopted.

ASSOCIATED PORTLAND CEMENT MANUFACTURERS, LIMITED

WARTIME PROBLEMS

EXPORT DRIVE

SIR P. MALCOLM STEWART'S ADDRESS

The forty-first ordinary general meeting of The Associated Portland Cement Manufacturers, Limited, was held, on the 3rd instant, in London.

Sir P. Malcolm Stewart, Bart., O.B.E., D.L., LL.D. (Chairman of the company), said:—The profit on trading amounts to £879,282; it includes the sum due for compensation and receivable under the working agreement with the British Portland Cement Manufacturers, Limited. The profit compares with £1,070,381 earned in the previous year, a reduction of £191,099, largely accounted for by increased provision for taxation.

Interest and dividends on investments at £523,025 show a reduction of £66,999. The final dividend received on the British Portland Cement Manufacturers, Limited, ordinary stock was less by 2½ per cent. than in 1938. Further, the final dividend on the ordinary stock held in Alpha Cement, Limited, which was included in the previous year's accounts, has not yet been declared and therefore is not included in this year's accounts.

The income earned on the total of trade and liquid investments is approximately 14½ per cent. The total revenue for the year, at £1,402,925, compares with £1,661,209, a reduction of £258,284.

PROFIT AND DIVIDEND

On the debit side of the profit and loss account you will see the only notable difference this year is that no addition has been made to general reserve whereas £60,000 was added in the previous year. There remains a balance of profit of £741,981, which compares with £940,306 in 1938. Out of this sum there had been paid at the date of the balance sheet the preference dividend for the first half-year, £68,750, and an interim dividend of 7½ per cent. on the ordinary stock, absorbing together £368,750. Since December 31st there has been paid the preference dividend for the second half-year, absorbing a further £68,750, leaving a balance of £304,481.

We are able to recommend the payment of a final dividend on the ordinary stock of 7½ per cent., making 15 per cent. for the year, which compares with 20 per cent. paid in the previous year. There will remain a balance of £4,481 to be added to the carry-forward, which will then stand at £213,180.

During the year under review we suffered a variety of vicissitudes. In the early months deliveries were disappointing and the outlook uncertain; later on trade improved, and with brighter prospects prices were reduced to the consumer. We felt that with the promise of fairly stable costs of production and the prospect of an increased turnover once again our policy of keeping down prices to the consumer could be embarked upon.

However, the position was speedily changed on the outbreak of war in September, when municipal and private building rapidly eased off. We were, nevertheless, so fortunate as to receive a considerable tonnage of orders in respect of Government and A.R.P. work which it became necessary to accelerate; these sources largely filled the gap. Thus favoured and with the help of the good demand experienced in the summer months we were able to achieve aggregate tonnages of production and deliveries of Blue Circle Portland cement slightly in excess of those recorded in the previous year, despite some falling off in the autumn.

CEMENT MAKERS' FEDERATION

When addressing you last year I referred to the advantages of well-planned trade organisations from a national point of view. It is particularly satisfactory that the outbreak of war not only found the Cement Makers' Federation prepared but demonstrated the soundness of the principles upon which its co-operation is based. You will agree there is justification for this statement when I inform you that the Minister of Supply, after examination of the position in the early days of the war, was satisfied that he could, at any rate for the time being, leave to the War Executive Committee of the Cement Makers' Federation, under the able chairmanship of Lord Wolmer, the responsibilities of carrying on with the Ministry of Supply negotiations on matters affecting the industry.

The Minister further indicated that he regarded the appointment of a controller as unnecessary at the present time in view of the efficiency of our organisation. It has proved most gratifying to those who have for long years worked for co-operation in the industry to find that when the test came our Federation was not found wanting. It is serving a good purpose in wartime, and will, I trust, prove its value when peace comes, for peace will bring in its train industrial problems of a national character and magnitude not yet experienced. For these problems new methods have to be applied and novel solutions found. There will be a call for clear thinking and a progressive outlook when the day comes to grapple with post-war difficulties.

EXPORTS

We were successful in shipping a considerably increased tonnage of Portland cement for export during the first eight months of the past year. It took some time to settle down to the changed conditions brought about by the war, but I am glad to say that our Export Department, under Mr Chapman and his capable staff, succeeded in maintaining the shipments made during the last four months of the year, as compared with the corresponding period of 1938.

Following the call by the Government for an export drive, we are straining every nerve to increase our export tonnage by opening up new markets wherever opportunity affords. In this matter we are working in close collaboration with the Export Council of the Board of Trade.

The Cement and Concrete Association was established by the industry in 1935. Its main object is to give practical assistance to every user and potential user of Portland Cement. When its advice is sought it is prepared to help technically wherever Portland cement is used, be it in respect of structures of magnitude or of the simple requirements of the garden.

Widespread publicity is employed. In five years over ten million brochures, leaflets and technical papers have been issued. These met with great success; that dealing with concrete for garden purposes resulting in over half a million people writing for copies. Thus it is seen that through practical help and powerful publicity an earnest endeavour has been put forth to make Britain concrete minded.

With the advent of the war the functions and duties of the Association have undergone a marked change. Early it offered its voluntary services to the Home Office in connection with A.R.P. work, and the Association and the majority of its technical staff have been taken over to assist in this and a great variety of other work where concrete is in use by many Government Departments.

Shareholders will, I am sure, share the regret which the directors feel through the retirement, at his own request, of Mr Alfred Stevens. This took place at the end of last year. The industry has lost an outstanding figure of recognised integrity and charm. We all wish him long years of good health in which to enjoy his well-earned rest. In September last the board appointed Mr G. H. E. Vivian a managing director.

THE FUTURE

With regard to the prospects for the current year, it is impossible to make a confident forecast. Owing to abnormally hard frost and heavy downfalls of snow bringing building operations generally to a standstill the trading results for the first two months of the year were exceptionally poor. The demand for our products is improving with the better weather, but it is almost entirely dependent on Government, A.R.P., and export orders. The volume of these is uncertain, and I am bound to warn you that we cannot expect, under war conditions, a repetition of the results achieved last year. We are in a sound position to face difficult trading conditions, and you can rest assured we shall do our utmost to overcome them; but it must be remembered that the exigencies of war are paramount and that all individual and collective interests should be subordinated to the securing of victory.

The report and accounts were unanimously adopted.

BRITISH INSULATED CABLES, LIMITED

SATISFACTORY RESULTS FOR PAST YEAR

SIR ALEXANDER ROGER'S REVIEW

The forty-fourth ordinary general meeting of British Insulated Cables, Limited, was held, on the 2nd instant, at Exchange Station Buildings, 37 Tithebarn Street, Liverpool.

Sir Alexander Roger (chairman of the company) in the course of his speech, said:—The profit on trading, dividends on investments, interest, etc., after providing for taxation and for contingency reserves adjustment, amounts to £783,224, being a decrease of £24,650. Bearing in mind the disturbed conditions which prevailed during 1939, I am sure you will agree that the results now submitted are satisfactory. Adding to the profit of £783,224 the balance brought forward of £486,558, we have a total of £1,269,782. Depreciation of fixed assets absorbs £158,617, and, after providing for directors' remuneration, debenture interest, dividends already paid on the preference and ordinary capital, there remains £901,639. Out of this it is proposed to transfer £100,000 to a war contingencies reserve account and £13,334 to reserve account, and to pay a final dividend of 10 per cent. (less tax) on the ordinary stock, making with the interim already paid a total dividend of 15 per cent. (less tax). Your directors also propose, for the fifth year in succession, that a cash bonus of 5 per cent. (less tax) be paid on the ordinary stock; £488,305 then remains to be carried forward to 1940, a figure almost identical with that brought forward. On the basis of 1939 profits of your company is not liable to E.P.T., but you will readily appreciate that the incidence of income tax and also of N.D.C. as the alternative tax to E.P.T. has been a heavy charge in our 1939 accounts.

EXCESS PROFITS TAX

By reason of our standard years being good your company is not at the moment liable for E.P.T., but there are several inequities in the Act which call for correction, and we would like to add our weight to the great and growing body of protest which is being made to the Chancellor of the Exchequer. The inequities not only affect companies but also the tens of thousands of interested shareholders. We refer in particular to our associated company, the Automatic Telephone and Electric Company, in which we have a large investment and which has been contributing substantially to the development of a comparatively new industry in this country—namely, that of telephone manufacture. It finds itself penalised because of the progressive nature of its business in pre-war years, and unless the Act is modified to provide for such cases that pioneer company, which has set up a great business at home and abroad, will have an inequitable burden of taxation to bear.

EFFECTS OF THE WAR

The year 1939 resolved itself into two distinct periods—that for the eight months to the end of August, during which we were at least nominally at peace, and that for the four months from September, during which Germany forced war on the British and French Empires. In the first period trading conditions were difficult but satisfactory, and the 1938 level of business was being maintained in all our departments. With the outbreak of war entirely different conditions arose. Copper, our principal raw material, lead, and many other of our important requirements became controlled; wages and other costs began to rise, and after the first abnormal rush of general orders designed to fill empty shelves there was a partial falling-off in some departments, whilst in others both our personnel and plant were working to day-and-night capacity. Demands from electricity supply authorities have fallen, and work on our important L.N.E.R. contract has been largely suspended.

I am debarred for obvious reasons from giving you as much information as I would wish about our work. You may safely assume, however, that the bulk of our home business, either directly or indirectly, is to meet war requirements.

So far as the subsidiaries are concerned, I would merely add that British Copper Refiners, like the parent company, is out at full stretch, while the other subsidiary companies are more than holding their own.

SERVICES OFFERED TO THE GOVERNMENT

The chairman then referred to a message which was addressed to all B.I. employees by the managing director, Mr G. H. Nisbett, on September 5, 1939, in the course of which it was stated: "We are

now at war, and it is up to each one of us to do our best in whatever way we can to bring the issue to a quick and successful conclusion. The B.I. Company's policy will be to do everything possible to help the national cause, and to that end we are wholeheartedly offering our services to the Government in any and every direction in which we can be of possible assistance, regardless of all other considerations. We fully believe that the company's staff and workpeople will rise to the occasion in such a way as to make this company's war record a credit to all of us and to enhance the good name of the B.I. Company."

Continuing, Sir Alexander Roger said: We manufacturers were not slow to register our impatience with the exuberance exhibited by the various controls. We felt that our willingness to support the Government and put all our energy and wide experience at their disposal was not accepted so promptly as it might have been. We have noticed signs, however, that this situation is changing. At the same time, we would express the hope that sufficient manufacturing capacity outside Government demands may be left to us to fulfil the now modest requirements of our ordinary home business, on which our peacetime prosperity so much depends.

IMPORTANCE OF EXPORTS

I should like now to refer to export business, which is not only of importance to B.I. but of prime concern to the country as a whole. Export trade conditions were not easy, but it will interest you to know that our normal overseas business, excluding large contracts, showed an increase over the 1938 figures. Every endeavour is now being made to achieve a further substantial improvement, and we are glad to note that we may depend on the full co-operation of the Export Council which has been quite recently set up by the Board of Trade.

In order to compensate our people for the extra strain put upon them by war conditions and the increase in the cost of living we have made progressive increases in the wages of our workpeople, and we have granted a special bonus to those members of our staff who are in receipt of less than a certain salary. I am proud to inform you that although we are engaged in a reserved occupation over 600 of our staff and workpeople have been released to serve with His Majesty's Forces. To them generous allowances are being made, the membership of the pension fund is maintained, and an undertaking has been given that re-employment will be found on their return—a policy with which I am sure you are in complete agreement. In addition we have taken active steps to extend the scope of our employees' National Savings Group, which has been kept in being since the last war, by offering to all workpeople as a bonus the last 6d. for every 14s. 6d. subscribed for a National Savings Certificate of the present issue.

CURRENT YEAR'S OUTLOOK

It has been my custom in past years to give you at the annual meeting some indication of the outlook for the current year. At all times this is a risky thing to do, and under war conditions I know you will only expect me to deal with it in a general way. There has been an unavoidable slackening off in the demand for some of our products, while costs have increased and working conditions are difficult. In the aggregate, however, we have a record balance of orders on the books, and it is clear that in certain of our departments at least capacity output will be required for many months ahead. If this general position is maintained throughout the year we should be able to show you satisfactory results. But our future depends on the successful prosecution of the war. Towards this I have consistently urged further use of the unlimited national resources of industry, commerce, and the mercantile marine.

It is generally recognised that our immediate aim is economic—to smash German trade for the duration of the war, to stop its exports and imports and to break the insidious commercial political influence it exerts directly and indirectly through financial holdings in neutral countries. The Government cannot accomplish this alone. British industry, practised in foreign trade and its competition, must be mobilised still further to assist, and Government policy strengthened to achieve this end. The end will justify the means, however boldly these may be conceived.

The report was unanimously adopted.

WESLEYAN AND GENERAL ASSURANCE SOCIETY

STRONG FINANCIAL POSITION

The ninety-ninth annual general meeting of the members of the Wesleyan and General Assurance Society was held, on the 2nd instant, at the Central Hall, Corporation Street, Birmingham, Mr Arthur L. Hunt, F.S.S., F.C.I.I., the Society's chairman and managing director, in the chair.

The Chairman, in the course of his speech, said:—

New business in the ordinary department up to the end of August showed an increase on that for the corresponding period of the previous year, but thereafter, for a time, the public showed a natural hesitation to undertake new commitments, and a smaller number of policies was issued. I am pleased to say, however, that new business is now showing a marked improvement.

The Society's policies have for many years borne a clause excluding war risks, but, on the outbreak of war, the directors decided that, for the time being, the clause should be waived, and that war claims on policies effected before September 3rd last should be paid in full.

CLAIMS

The total of claims paid, in all departments, during the year amounted to £1,835,639, being £594,615 greater than in the previous year. Over £1,000,000 of this amount was in respect of maturing policies, for which proper provision had been made in the valuation of liabilities in previous years. Claims by death were proportionately little greater than in 1938.

VALUATION OF LIABILITIES

The Society's liabilities under its policy contracts were valued on the same bases as last year.

The mortality tables used were such as to leave a considerable margin of safety in times of peace. It was, however, considered a wise precaution to set aside additional reserves towards meeting excess mortality likely to result from the war.

ORDINARY DEPARTMENT BONUS

The directors decided that it would be unwise to allot reversionary bonuses in the ordinary department on the generous scale of recent years, and they accordingly declared a reversionary bonus at the rate of £1 per cent. of the original sum assured. From the surplus of this department they transferred £25,000 to general reserve, increasing it to £125,000.

INVESTMENTS RESERVE

The investments reserve now stands at £550,000, having been augmented by a transfer of £50,000 from the industrial department as a precautionary measure.

NEW GUARANTEED BONUS POLICY

The directors have recently introduced a new type of policy in the ordinary department. This includes the special feature that, for the first five years of the policy's duration, reversionary bonus will be added at the guaranteed rate of £2 per £100 sum assured. After the first five years, the policy will receive such bonuses as may then be declared on with-profits policies.

A generous amount of war risk cover will be given on this new guaranteed bonus policy, namely that, in the event of a claim as a result of war while the life assured is a civilian, a payment will be made equal to the total of (1) one-quarter of the sum assured, (2) the amount of accrued bonuses, and (3) twice the total amount of premiums paid. In the event of a claim as a result of war while the life assured is serving with His Majesty's Forces or in the Mercantile Marine, a payment will be made equal to twice the premiums paid.

This new policy is particularly attractive, and well merits the careful consideration of the many men who have not sufficient life assurance to give their dependants the degree of protection which is their due, particularly in time of war.

WAR COVER UNDER OTHER POLICIES

Similar war risk cover will be given on all the Society's other ordinary department with-profit policies and on all industrial department policies, namely, one-quarter of the sum assured and twice the premiums paid in the event of a claim as a result of war while the life assured is a civilian. The term "civilian" includes all A.R.P. workers and A.F.S. men. I may mention that this benefit will be paid on all ordinary department with-profits

policies issued since the war began, even though they bear a war clause of the less generous type which was at first adopted by practically all offices.

STRONG FINANCIAL POSITION

From a close study of the reports and balance sheet you will see that the Society is in a strong financial position.

Although the Society intends to pay war claims in full on policies issued before the outbreak of war, and although the expenses of administration are likely to increase, these are not in my view the most serious factors affecting its finances. Far more important is the increase in the rate of income tax and the prevailing low rate of interest at which premiums received can be invested. However, this is a burden of the war and it must be accepted philosophically. The Society will support Sir John Simon's War Loans to the best of its ability, even though the rate of interest yielded by the Loans is, for the good of the country, kept at a low level.

TRIBUTE TO THE STAFF

The staff at Chief Office and throughout the country, depleted as it is by many temporary absentees on war service, is carrying on loyally and industriously under the difficult conditions. At the present time no less than 69 members of the chief office staff and 96 members of the field staff are serving with His Majesty's Forces, and I am sure you will join with me in wishing them good fortune and a safe return.

The reports and accounts were unanimously adopted.

COALMINES OF SALGÓTARJÁN (HUNGARY)

The seventy-second ordinary general meeting of the Coalmines of Salgótarján Company, Limited, was held, on the 19th ultimo.

Mr Ferenc Chorin, Privy Councillor and member of the Hungarian Upper House, chairman of the company, presided. In the course of his address to the stockholders he said:—Our task is to supply the increased demand of the country by raising the production. The importance of coal supply under war condition is obvious. The demand has increased considerably, not only from factories working for the army, but also from the civil consumption and export. The consumption has increased by the happy re-attachment of Upper Hungary and by the good harvest, while the excessively hard winter also expanded the demand. Since our mines are exploited to full capacity, we have to widen production on new territories by opening new mines, in spite of the heavy expenditure involved, since the needs of the State require recourse not only to the capital of the company but also to our credit, the solution of our task is not an easy one. Notwithstanding this—as our report states—we continue to follow from year to year our programme of industrial investment.

The report stated that the war compelled industry to raise production. The demand for coal has increased. The production of the company's mines has reached 32,658,000 quintals, i.e. a rise of 16 per cent. In the past year the production reached the level of 1913, although the Peace of Trianon detached mines of the company producing about 13 million quintals. Since 1930 the production has risen by 70 per cent. The cost of production is becoming more and more expensive: the social burdens reached 5 millions this year, compared with 1.9 million in 1925. The price of the most important material of the mining industry, timber for props, has risen by 87 per cent. during the past four years. The financial position of the company had to be safeguarded by severe rationalisation.

The balance sheet for the year 1939 shows a net profit of 2.6 million pengős, which permits of an allocation of 250,000 pengős to ordinary reserve fund, 200,000 pengős to the pensions account, 15,000 pengős to the coal-miners' sanatorium, 29,500 pengős for the employees' fund and 60,000 pengős for charities. After the payment of the dividend of 1.75 pengős per share there remains a balance of 290,000 pengős to be carried forward.

The Hungarian Works for Ferro-Alloys, Limited—controlled by the company—supplied important material not procurable by import.

The turnover of the Hungarian Works for Artificial Fertiliser, Acydsulphuric and Chemicals, Limited, exceeded the previous year, but rising social burdens rendered an increase of dividend impossible.

The Klotild Chemical Works, Limited, has begun the production of new synthetic materials.

The Hungaria Electricity Supply Company, Limited, has raised its production to 34 million kwh. and has considerably increased the development of its network.

The report was unanimously adopted.

MAYPOLE DAIRY COMPANY, LIMITED

ADAPTATION TO WAR CONDITIONS

SERVICE TO PUBLIC

The forty-second ordinary general meeting of Maypole Dairy Company, Limited, was held, on the 29th ultimo, at Winchester House, Old Broad Street, London, E.C.

Sir George Schuster, K.C.S.I., K.C.M.G., C.B.E., M.C., M.P. (the chairman), said that the trading results of the fifty-two weeks ended January 6, 1940, showed a net profit, after provision for Excess Profits Tax, N.D.C. and A.R.P. expenditure, of £345,361, a decrease of about £35,000 on the figure for the fifty-three weeks of the preceding year. This decrease was much more than accounted for by the very large appropriation for E.P.T. Their company was unfortunately placed with regard to this tax in that the years taken as standard, above which profits were regarded as "Excess" were years during which their profits were below what on any reasonable view of their past record must be regarded as their standard earning power. It would be anomalous if, owing to accidental circumstances, a company such as theirs should find itself liable for this tax on a substantial portion of its profit, for it was clear that the effects of war conditions on their business were not likely to be favourable. He was not advancing any complaint about war burdens, but he thought it would have been fairer to companies such as theirs if the standard period had been extended over a greater number of years or had been allowed to include the period up to the commencement of war.

TRADING RESULTS

For the first thirty-two weeks of the year up to August 19th the company substantially maintained the satisfactory level of trading built up in 1938. Sales of butter, eggs, cheese, lard and many other Maypole specialities had continued to show good progress. This period of normal and satisfactory trading was followed by an exceptional period of about ten weeks, beginning ten days before the outbreak of war, during which the public was buying extremely heavily and the profits made by the company were abnormal for the time of year. That exceptional profit could be regarded as going some way to offset the heavy new burden of E.P.T., but it did not go the whole way, and it was an offset which could not be expected in future years. The third and final period covering the last ten weeks of the year was one in which various adverse factors began to be felt, but in which, on the whole, the profits were fairly close to what might have been normal expectations.

Looking back over the whole period, they could claim to have done everything possible to prepare for the eventuality of war and that their preparations had been well planned. They had laid in considerable stocks of their main commodities, and to avoid risk of having too much at one spot had effected a special distribution outside London, and had stocked their branches to the maximum capacity. Apart from that, they had made administrative arrangements for dealing with the situation in which it might have proved impossible to direct the operations of the company from London.

EFFECT OF RATIONING

Looking to the future, there were certain adverse factors to be taken into account resulting from the rationing of some commodities and the reduced supplies of others. Rationing of butter, which was one of the main items in their trade, affected their company perhaps more than others by reason of the limited range of goods in which they dealt. The import and sale of butter was now under Government control, and they were unable to maintain direct supply from their own organisation in Denmark. They could still give certain advantages owing to their special facilities for stocking and serving freshly packed supplies, and endeavoured to give the public the advantages of their large-scale organisation by continuing to sell butter at a penny per pound below the maximum Government price of 1s. 7d.

The restriction in the consumption of butter had been reflected in a considerable increase in the demand for margarine. Though they had been compelled by Government regulations to discontinue marketing two speciality brands, May Queen and Mayfair, which contained a substantial percentage of butter, they still maintained speciality brands of their own which were of exceptional quality and

were being widely appreciated. The war had also affected their supply of eggs from Denmark, but the turnover of their depots in this country had considerably increased.

In his speeches he had always emphasised that one of the most valuable possessions of the company was the high standard of service and loyalty of their branch staff. In the past he had been able to speak of what they had done for the welfare of their staff in wages, bonus and pension arrangements, and also in educational facilities. This year the main feature on which to comment was the large numbers who had joined the Colours. Already some seven hundred had joined up, and a further eight hundred were due to be called up in the next few months. They were making certain grants by way of allowances to dependants.

The question of expenses would have an important bearing on their profit result and, in expenses, wages represented the largest factor. They had already, since the war, made substantial increases. In view of the increase in the cost of living, they had agreed to an all-round increase in the scale of wages, the main feature being an increase of 4s. a week to all male employees of 21 and over. The wages paid by their company, taken together with the bonus distributions, had always been substantially in advance of any standard scale of wages that had been agreed upon.

THE FUTURE

Their prospects for the future depended mainly on four things—Government regulation, the volume of their turnover, which would be dependent upon rationing and supplies, the interpretation of the E.P.T., and rates of wages. Of them all they felt the most important from the shareholders' point of view was the maintenance of turnover. So long as they could keep up the goodwill of the company, that in the long run mattered more than what they were able to earn in profit during the period of a war. It would be their determined purpose to continue to give the best possible service to the public and to regard that as their main objective.

The amount available for ordinary dividends after deducting the higher taxation, was £170,000, or £58,000 less than in the previous year. It was proposed to make the usual allocation of £20,000 to the provident fund and pay a dividend of 7 per cent. on the deferred ordinary shares compared with 9 per cent. last year.

The report was adopted.

To Overseas Readers

Overseas readers may find that, in the disturbed conditions of wartime, *The Economist* does not reach them quickly enough, or that they require more detailed information on individual markets or special topics than can be compressed within the limited space permitted by the necessity to economise paper.

The attention of our readers is therefore drawn to *The Economist's* Intelligence Branch, which is prepared to meet the need for a rapid and objective appraisal of commodity markets, industrial prospects, political factors and other topics of vital concern to the business man. These special services consist of regular cables or mail reports, or both. They are designed to meet individual requirements and are confidential and exclusive to each client.

Enquiries should be addressed to the

Intelligence Branch, *THE ECONOMIST*

8 Bouverie Street, London, E.C.4

BRITISH ALUMINIUM COMPANY, LIMITED

RECORD PRODUCTION AND SALES

The ordinary general meeting of the British Aluminium Company, Limited, was held, on the 29th ultimo, at Winchester House, London.

Mr R. W. Cooper, M.C. (the chairman), in the course of his speech, said: We have further records to report for the year 1939 both as regards production and volume of sales, and in consequence an increase in trading profits of £170,646, which accrued evenly throughout the year. There was a small reduction in revenue from investments, dividends and transfer fees, making the total profit £165,945 higher at £1,075,796 compared with £909,851 for 1938.

The aggregate production at our older works was higher, but the largest increase took place at our Lochaber Works, and we still have a materially greater output to look forward to from this source.

Extensions at our various works which were in progress a year ago were duly completed, and further substantial additions are now in course of being carried out.

TWO DEVELOPMENTS OF THE METAL

During the first eight months of the last year there were two developments of our metal which were making remarkable progress in the face of free competition with other alternatives. One of these was the Brytal reflector, which has reached a stage where large-scale commercial production had already commenced. The other was our free-cutting alloy, to which I have referred on a previous occasion, and which has now become exceedingly popular with machinists wherever a light white metal is required. These two applications of aluminium represent the more recent of our special lines, but at the same time we had good reason to be satisfied with the continued popularity of our metal in the more familiar uses such as for holloware, bodywork of vehicles, foil and paint.

Apart from these specific instances, there was a steady advance in the consumption of aluminium for purposes such as in architecture, both for construction and decoration, and in the distributive trades for containers and packaging of all kinds. For the time being, however, all development work in the commercial and industrial fields has necessarily ceased for the reasons which I shall explain later on. We feel confident that the work which has been done in popularising our metal has been of a kind which will ensure that when happier times return aluminium will not be displaced from the position which it has won.

Meantime I can say that, in addition to the well-established applications of our metal in the construction of aircraft, transport vehicles and ships, ingenuity and research are constantly finding new directions in which it is able to take its place in the equipment of the fighting and defence forces.

The balance sheet total now exceeds £14,250,000. The outbreak of war necessitated the removal of our headquarters from London to Shrewsbury for the time being, and we came under the control of the Ministry of Supply. We were obliged to cancel orders and contracts on our books for commercial uses of aluminium in this country and for export business. No sale or delivery could be made without the express authority of the Ministry. Shortly thereafter the Ministry made arrangements with us under which they purchase the whole of our production of ingot aluminium, and they sell and distribute the metal themselves.

This contract with the Ministry extends up to the end of 1940, and is subject to renewal, the prices being based on those current in this country before the war. The Ministry resell to us the metal required for alloys and for our rolling mills, but the sale of products is limited in all cases to approved users, and no deliveries can be made without permits for both seller and buyer.

EFFORTS TO INCREASE PRODUCTION

In co-operation with the Ministry of Supply, we are engaged in very largely increasing the production of aluminium in this country, and work in this direction is proceeding energetically. You will realise that this is all the information which I am in a position to give you on these matters.

We have built up our organisation to its present important position over a long period of time, with great difficulty and under many setbacks. We can pride ourselves on our achievement, and stockholders will share our satisfaction in the knowledge that to-day we are able to contribute so materially towards the supreme effort required from all of us in the national interest.

The report was adopted.

VICKERS, LIMITED

73rd ANNUAL GENERAL MEETING

Mr A. A. Jamieson, the chairman of Vickers, Limited, presided over the seventy-third annual general meeting of that company held, on the 3rd instant, at the Hotel Victoria, London.

In his review, which was published with the report and accounts, the chairman stated: The balance sheet of Vickers, Limited, shows that a strong position has been maintained.

At the general meeting last year I gave an undertaking that the question of increasing the nominal value of the ordinary stock units would again receive the special consideration of the directors. I can assure stockholders that this undertaking has been implemented on several occasions during the past year.

It is only natural that the stockholders should desire that the capital which was written down in 1926 should be restored, and the directors clearly understand this wish. At the present time, however, the directors do not consider that they would be justified in recommending that effect should be given to this desire. It must be borne in mind that £6,157,742 would be required to bring the nominal value of the existing ordinary stock units up to £1.

I can give you the assurance that the change-over from peace to war conditions was carried out by Vickers-Armstrongs, Limited, without any disturbance and that the company are meeting the requirements of H.M. Government which are entrusted to them.

The necessity to provide for depreciation on a more liberal scale, together with increased taxation and the expense of air raid precautions, has caused a reduction in net profits of English Steel Corporation, Limited. The same dividend is paid and £100,000 put to reserve fund.

We have willingly undertaken extensive schemes for increasing the output of armaments, but I think it right to remind you of the very difficult problems which will arise when this huge capacity is no longer required for the purpose for which it has been created. With this in mind you will no doubt agree that ample provision must be made in order that we may be able to face the costly process of readjustment after the war.

The report and accounts were unanimously adopted and the final dividend of 6 per cent. was approved.

BRITISH ROPES, LIMITED

RECORD PROFIT

The eighteenth ordinary general meeting of this company was held, on the 3rd instant, in London.

Mr Herbert Smith (the chairman), in the course of his speech, said: Although the trading profit increased by £184,093, the final profit is only £29,902 in excess of last year. This is due to the greatly increased charge required to meet current taxation.

The progress made during the last few years has been more than maintained, the final profit for the year, namely, £267,959, being the highest recorded in the history of the company.

It may be thought that the increased results are wholly derived from war work, but this is not so. Up to the end of August our results from normal trading were such as to indicate that the profit for the year would be highly satisfactory and well in advance of last year's figures. In addition we have received a far greater return from subsidiary companies in the form of dividends earned prior to the outbreak of war.

Home trade during the year has been quite satisfactory. We were favourably placed as regards stock, and the Hemp Control which was immediately set up has stabilised the prices of raw materials and obtained good supplies. This has enabled us to carry on our home and export trade, and we are receiving our share of Government wire contracts.

The results of our subsidiary company, Rand Ropes (Proprietary), Limited, in South Africa, for their second year's trading are most encouraging, and the profit of our Canadian subsidiary has greatly improved during 1939 as compared with 1938.

To bring the nominal amount of the issued ordinary capital into closer relationship with the value of the assets employed in the business your directors have decided to recommend the capitalisation of £438,119 of the undivided profits, to be applied in paying up in full 3,504,953 of the unissued ordinary shares of 2s. 6d. for distribution share for share amongst the holders of ordinary shares.

I can see no reason why the profitable trading of your company should not be maintained during the current year.

The report was unanimously adopted.

TELEPHONE AND GENERAL TRUST, LIMITED

STRONG POSITION OF THE TRUST

The fourteenth ordinary general meeting of the Telephone and General Trust, Limited, was held, on the 29th ultimo, in London. Sir Alexander Roger (chairman and managing director), in the course of his speech, said:—The profit is almost the same at £112,529, and after provision for the 7 per cent. preference dividend and an interim dividend of 3 per cent. on the ordinary stock, we propose a final dividend of 5 per cent., making a total of 8 per cent., together with a dividend of 8 per cent. on the "A" ordinary shares. These dividends absorb £96,660, leaving £62,569 to be carried forward, as against £59,662.

We are also able to transfer to the credit of capital and revenue reserves respectively the sums of £15,000 and £10,000 from internal reserves. Capital reserve now totals £265,000 and revenue reserve £50,000. The total reserves and surplus shown on the balance sheet now amount to the substantial figure of £377,569.

After dealing with the progress of the operating companies, the chairman said:—When we last met I made some remarks on the benefits accruing to industry, trade, and employment from the steady progress achieved in recent years in the management of monetary conditions. The contrast I drew between experience under the new order and the old has been heightened by the events of the past year.

In order to be fully equipped to cope with the vast demands of war, the authorities have had to arm themselves with added powers. I am thinking in particular of control over supplies of new capital, for investment both at home and abroad, and over resources and transactions in foreign exchange. Both these branches touch upon our business of raising money in this country for investment in pioneering and expanding overseas enterprise.

WISE APPLICATION OF NEW REGULATIONS

Happily, we have evidence that the new regulations are being wisely interpreted and applied. One of the companies in which we are interested, the Anglo-Portuguese Telephone Company, has been among the very few permitted to raise additional money privately in the capital market for a foreign enterprise—in this case to facilitate further extension of a public service in Portugal, a country with whom our friendship now extends over centuries. Operations of this kind not only promote exports of British goods, but yield added interest receipts from abroad, thus supplementing the nation's power to pay out of income for imports. During 1939, for instance, the trust's group of telephone companies abroad remitted £319,600 of foreign exchange.

I do not doubt that a similarly broad-minded view will be taken in the choice of the capital assets of this country which may have to be requisitioned in order to fill any gap—and we hope that, with the increasing effort in export trade, the gap may be small—between

our current purchases from abroad and our current income from overseas.

I have said on many occasions, and I think it will bear repeating, that the commerce of this country—and it includes foreign investments—is its fourth arm of defence and is indispensable to victory.

It is difficult to make an accurate estimate of our revenue prospects for 1940, and I doubt if you would press me to do so. I can only say that we have started the year well, and we shall hope to maintain at least the strong position of the trust.

The report and accounts were unanimously adopted.

PROVINCIAL CINEMATOGRAF THEATRES, LIMITED

SATISFACTORY RESULTS

The thirtieth annual general meeting of Provincial Cinematograph Theatres, Limited, was held, on the 29th ultimo, in London.

Mr Mark Ostrer (chairman and managing director), in the course of his speech, said: The net profit for the year, including income from investments and transfer fees, is £450,630. Your directors recommend the payment of a dividend for the year of 15 per cent. on the ordinary shares amounting to £75,000.

I am sure you will agree these figures are satisfactory. In considering the results it must be borne in mind that all theatres and cinemas were compulsorily closed for practically two weeks on the outbreak of war. This closure not only caused a great loss of revenue, but in addition we had, quite properly, to bear the burden of paying our staff. Another item which must be taken into account is that in the previous year we showed "Snow White" at the New Gallery for nearly nine months. In the year under review the New Gallery was closed from the commencement of the war until the 18th of this month.

I said some years ago that the cinema had become an integral part of the lives of the people, and under present conditions the need for entertainment is much greater. As an instance, in numerous districts where troops are stationed, commanding officers have requested the local authorities to license the opening of cinemas on Sundays, and I am sure we have been able to relieve the tedium of a large number of His Majesty's Forces.

The outlook for the current year is naturally very difficult to forecast, but I am of the opinion that, given conditions which are no worse than those prevailing since the war began, we shall be able to present to you accounts which will be in every way satisfactory.

I should like to mention that we have been very fortunate in securing the new Walt Disney film, "Pinocchio," which is now showing at the New Gallery, and we have every reason to believe that it will be as successful as "Snow White." After it has finished its run at this theatre it will be shown at all our other theatres throughout the country.

The report and accounts were unanimously adopted.

CURRENT STATISTICS

Finance

GOVERNMENT RETURNS

For the 8 days to March 31, 1940, total ordinary revenue was £23,762,000 against ordinary expenditure of £65,329,000, issues of £11,500,000 under the Defence Loans Acts and £335,000 to sinking funds. Thus, including all sinking fund allocations, but excluding issues from defence loans, the deficit in 1939-40 is £280,231,000, against £12,727,000 in 1938-39. The Revenue return is printed in full on page 662.

EXCHANGE RATES (Monthly Tables)

CENTRAL AND SOUTH AMERICA

THE BANK OF LONDON AND SOUTH AMERICA, LTD., issues the following details relative to quotations for certain of the South and Central American exchanges. All these exchanges, with the exception of Bolivia and Paraguay, are related to the United States dollar, and the approximate sterling rates may be obtained by applying the dollar-sterling exchange rate.

Bolivia.*	Sight selling rate on London was 141.40 bolivianos per £ on January 31, 1940.
Colombia.*	Sight selling rate on New York was 174.57 pesos per 100 U.S. dollars on February 15, 1940. This rate applies to holders of permits buying in the "open" market.
Ecuador.	Sight selling rate on New York was 15.12 sucres per U.S. dollar on February 15, 1940.
Guatemala.	Sight selling rate on New York is maintained at one quetzal per U.S. dollar, but a commission of 1 per cent. is charged by the Central Bank for the sale of drafts.
Nicaragua.*	Sight selling rate on New York for payment of imports was fixed by the National Bank at 5.52½ cordobas per U.S. dollar (including 10 per cent. tax and ½ per cent. commission) on June 9, 1938.
Paraguay.	Exchange is quoted on Buenos Aires; the sight selling rate was 71.20 Paraguayan pesos per Argentine "free" paper peso on February 1, 1940.
El Salvador.	Sight selling rate on New York was 2.50 colones per U.S. dollar on February 17, 1940.
Venezuela.	Sight selling rate on New York has been maintained at 3.19 bolívares per U.S. dollar since April 27, 1937.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued, less income tax at the standard rate, with allowance for redemption. Where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The yield on ordinary stocks and shares is calculated on the latest dividends, account being taken of any increase or reduction of interim dividends.

SHORTER COMMENTS

(Continued from page 665)

Guaranty Trust Company of New York.—Total deposits, March 31, 1940, \$2,343,234,641 against \$1,670,216,227 on March 29, 1939, and \$2,088,427,345 on December 31, 1939. Total resources, \$2,653,187,645 against \$1,988,747,869 (March 29, 1939) and \$2,401,634,265 (December 31, 1939). Total resources and deposits are at their highest level in the company's history. Undivided profits, \$15,154,462 against \$14,701,954 (December 31, 1939) and \$12,956,690 (March 29, 1939).

British Enka, Ltd.—Working profit, 1939, after £7,765 for A.R.P., £165,357 against a loss of £7,977 for 1938. Net profit, £97,172 against net loss £70,204. Debit of £653,537 brought in is reduced to £556,365 before E.P.T., which it is estimated should not exceed £30,000.

Stewarts and Lloyds.—This company is maintaining dividend of 12½ per cent. on the deferred stock for 1939, but it is payable on the capital of £7,779,720 as increased during the year by £1,899,354 through Stanton Ironworks acquisition. Payment May 22nd. Tax will be deducted at rate then ruling. Annual report to be issued about May 7th.

Champion Reef Gold Mines of India.—Profit 1939 increased by £9,205 to £199,756. To taxes, £49,000 (£16,800). To depreciation, £17,000 (£11,000). To insurance reserve, £3,000 as before. Ordinary dividend 40 per cent. as before. Carry forward £14,198 (£14,326).

Craven Brothers (Manchester).—Net trading profit 1939, £131,246 (£110,824). To interest charges, £1,035 (£171). To war risks insurance, £2,503 (nil). To A.R.P., £6,379 (nil). To depreciation reserve, £15,000 (£10,000). Ordinary dividend 22½ per cent. as before. Carry forward, £97,147 (£59,668).

GOVERNMENT GOLD MINING AREAS (MODDERFONTEIN) CONSOLIDATED, LTD.

(Incorporated in the Union of South Africa.)

Issued Capital, £1,400,000 in 5,600,000 Shares of 5s. each.

to carry it in, and we shall no longer have to provide shipping for Denmark's imports. Denmark, in itself, is of much less use to Hitler as a possession than as a neutral; it was occupied only as a stepping-stone to Norway.

Norway itself would be a prize for the Nazis if they could seize and hold it. The gains would not be directly economic, but on the strategic side they would be immense, and on the moral front it would be a major victory to demonstrate to all the world that the neutral which is nearly the most accessible of all to Great Britain could yet be snatched from under our noses. Without much doubt, the Nazis hoped, by seizing the Norwegian capital and government, to secure as immediate an acceptance of their "protection" as in Denmark, so that the British, when they came, could be told that not even the Norwegians wanted them. This plot miscarried. The Norwegian Government was neither captured nor intimidated, but is fighting with bravery and with great success, and though the precariousness of the German communications might not have mattered if the country could have been occupied at a single blow, to fight a campaign across the disputed—or hostile—Skagerrak is a very different matter. It was a terrific gamble; but it seems to have failed.

The position of Sweden is anomalous and mysterious. The Germans have imposed neutrality, which has been accepted by Stockholm. But why did the Germans want a neutral Sweden? Three reasons suggest themselves. The first is that Sweden has a considerable army; since speed was essential to their plan, the Germans did not want to have a fight on their hands, knowing that once they succeeded in occupying Norway and Denmark, Sweden was, in any case, in their power. Secondly, Soviet Russia may have demanded that Sweden be left untouched. Or, thirdly, since the Nazis knew that, even if they held Southern Norway, they could not prevent an Allied occupation of Narvik (whose only communications with the rest of Norway are by sea), they hoped by maintaining Swedish neutrality to prevent the Allies from going on to the iron ore mines,

whose vital importance is explained—together with that of other economic aspects—on a later page.

Now that the Norwegian expedition has turned into a fight instead of a seizure, however, the Nazis must be in a dilemma over Sweden. If she remains neutral, they can get to their troops in Norway only by sea or by air. If, on the other hand, they force Sweden into the war, on either side, the iron ore—on which they depend as much as on any other thing outside their own borders—is in all probability lost to them. That when power politics are being played so ruthlessly on their own borders, the Swedes should take refuge in neutrality lends a touch of farce to the whole affair. Neutrality will not save them from a Nazi attack; it might help to make them defenceless before such an attack when it comes. They cannot stay neutral; they will have to choose their side, if they ever hope to have another free choice to make in the future.

The part that the attack on Scandinavia is to play in Hitler's grand strategy is not yet clear. But it begins to look as if he is staking everything on winning this summer. If he cannot do so, his position will be desperate next winter, for the absorption of Denmark will reduce his food supply while the freezing of the Baltic will virtually stop his supplies of Swedish ore, even if he is by that time undisputed master of the Scandinavian peninsula. If this is his position, we must expect further desperate throws, whatever the outcome in Norway.

There is one other consideration that must not be forgotten. President Roosevelt said on Tuesday that the invasion of Denmark and Norway would make Americans think more than they had done hitherto of the potentialities of war. We who lived in England through 1938 and 1939 know the death agonies of cherished illusions and the bitter pains of resolution from which the Americans are suffering. From the enjoyment of a clear conscience, a clear vision of duty to be done, and a clear sight of where the interest of all who believe in freedom lies, we can offer them our most sincere sympathy.

Putting Men to Work

THERE is sound sense in the Civil Service division of administration into plans, intelligence and operations. The putting of more men and more women to war work, for instance, is first and foremost a matter for broad decisions of policy. Long-range plans are needed for a much swifter rate of war output and for the transfer and training of workers to meet these requirements in advance. But plans are futile and planners helpless without information about the resources available and detailed machinery to fit workers into jobs. The task of intelligence has begun—belatedly; a limited census of labour in war industries has been ordered. But the present haphazard search for skilled workers by individual firms on war work reveals the need for machinery to find and place the men and women needed.

The machinery already exists *in posse*. Thirty-odd years ago Labour Exchanges were set up to do precisely this work of placing; and in the last war the transfer and recruitment of war workers was done to a notable degree by the exchanges of the Ministry of Labour. Unfortunately, the armistice period between 1918 and 1939 saw a deterioration in the positive functions of the exchanges. The continuance of unemployment at between 1½ millions and 2 millions or more meant that the focus of the exchanges' work was the payment of maintenance money to the workless. The bias of work at almost every exchange became paying, not placing.

Yet no country has the machinery Britain possesses to fit workers to work and *vice versa*. At the exchanges all the unemployed are registered and, in theory, all the vacancies for workers are reported. Officials are specialised in keeping contact with the needs of industry and in sifting the qualities of the registered workless. There are regional clearing houses for the pooling of vacancies; and a national clearing house to leave no worker out of touch with any job, however distant. And the bias of the exchanges' duties towards mere payment and maintenance

is ripe to be broken down as the volume of unemployment shrinks and war work grows.

Up to now, the operation of the exchanges has been regarded as merely a departmental matter for the Ministry of Labour to settle. The exchanges have lost the vital qualities envisaged by their pioneer sponsors a generation ago. There is a lack of drive and initiative. Applicants wait long periods, an hour or more, for attention—where a delay of minutes in, say, post offices is regarded as grossly inefficient. And, on the side of vacancy work, the record is one of short staffs, delay and neglect. Less than 30 per cent. of the jobs found by wholly unemployed persons are filled by the Labour Exchanges. Placing is undertaken *gratis* for employers and workers; there is no financial yardstick for inefficiency, as there is on the "dole" an insurance side, where the test is the solvency of the Unemployment Fund, made up by contributions from employers, workers and the Government.

The time is overdue to rebalance the work of the exchanges whose primary function at the outset was employment, not unemployment. The existing machinery for vacancy work is thorough though undermanned, and officers are able but mostly underpaid. There is little doubt that vacancy officers at employment exchanges are strategically well placed to find the right man for the right job. It is their function to select suitable applicants from the live register of the unemployed, to know them personally and to offer their services to employers. In years' records of the experience and qualifications of every worker who falls idle are kept at every exchange. It is clearly wrong and wasteful that this system should be generally by-passed. Employers advertise vacancies in the Press and choose their recruits, often very much at random, from scores of applicants. The fact that a very large proportion of the unemployed are, in fact, moving from job to job is not due only to the changeability of industry and the fluidity of labour. It is due also to

sheer misplacing of workers and the persistence of hit-and-miss methods of recruitment vastly inferior to the care and accuracy of the exchanges. The wastage due to misplacement of labour and intermittent unemployment is as crucial in war as it is lamentable in peace.

What can be done, therefore, to improve and extend the vacancy work of the Ministry's exchanges? It is important to recognise here that the war itself is already rapidly dissolving old resistances to the use of the exchanges. Sheer scarcity of many classes of workers has driven employers, who in the past were prejudiced against the exchanges, to use them. In some districts exchange managers have got together committees of local employers and trade unionists to study the live register of unemployed, to devise ways and means of finding places for unemployed skilled and partly skilled workers. Over-hasty resort to the recruitment of wholly inexperienced persons is thereby minimised; and the Ministry is assisting firms to scour the country for special types of labour.

Great pressure is being put on the whole vacancy mechanism. The effect of this wartime pressure must be that recruitment through casual foremen's contacts, notices posted at factory gates and advertisements in the Press, will be largely replaced by the official system. It is inevitable that a great deal more money must be spent on vacancy work. Better facilities for training officials in knowledge of the manual processes of industry; better space in exchanges for interviews and less congestion; more elaborate provisions for keeping carefully documented records about the qualifications of each worker; all these things are (as one of the admirable PEP broadsheets* urges) essential to the solution of Britain's wartime man-power problem.

Nor is it simply a question of placing the workless of before the war. Under the stress of war conditions, the character of unemployment and distress is undergoing profound changes. The impact of war upon civilian trades and the operation of the Schedule of Reserved Occupations have meant a fundamental change in the personnel of the unemployed. Compared with 1923, the number of people attached to *non-factory* occupations, retail distribution, personal service, clerical work, entertainments, sport and local government service has increased by over 60 per cent. It is these classes, containing a vast number of people who have either never come within the insured groups or are, for peculiar reasons, unfamiliar with the employment exchange mechanism, whose personal lives are being most profoundly affected by the war. And, in addition to women, they are war's great labour reserve. The forces themselves, unlike the Army of the last war, are indeed drawing heavily upon these groups; someone has called the latest age groups called up an "army of clerks"; A.R.P. provides paid work for a quarter of a million people also drawn largely from the same group of non-factory workers. But a walk along any street in any evacuation area shows how the war has

Russia in 1940—IV

Soviet Agriculture

ONE of the fears to which last year's German-Soviet Pact gave rise was that the vast agricultural resources of the U.S.S.R. would be secured by Germany to supplement her war effort. Since then, the difficulties, political, commercial and transport, in the way of any large and rapid expansion have been much stressed in Allied comment; and the actual volume of goods passing to the Reich has not grown alarmingly. But since it is two totalitarian States that are concerned it is realised that many of these difficulties may be overcome by official fiat, though the transport obstacles (canvassed in an article in *The Economist* on March 9, 1940, page 412) must prove more obdurate.

It is clear that great changes in Soviet farming, and still more in Soviet trade policy, would have to be made to reorient Soviet agriculture to meet Germany's crucial war needs. Many of the products which Germany requires are

affected the small shopkeeper and his family; and unemployment is widespread. Distress among these people, who in the main have enjoyed exceptional prosperity during the past decade, was mainly dealt with before the war by the local public assistance committees. Now the bulk of it has been taken over by the Unemployment Assistance Board, shortly to be re-named the Assistance Board. And it is in their and the nation's interest that the exchanges should be capable of finding them war work as soon as the scale of war output is sufficient to fit them in.

These two trends, the enforced greater use of the exchanges as employment agencies and the increased incidence of distress among non-insured people, jointly give a clue to the needed organisation of the unemployment services, not only now, but also after the war. Now it is full mobilisation of the population that is imperative. After the war, it will be necessary for the Ministry of Labour to possess a placing and vacancy service adequate to meet the needs of demobilisation, from the forces and from war work; re-employment will be the main problem facing society; in the short period the problem will be how to find remunerative work of any kind for people who have been munition workers, firemen or soldiers, but who are qualified in peace to be engineers, solicitors' clerks and shop assistants; in the long period the problem will be to get the population back into the employments for which they are best suited. Vacancy work, then as now, will be merged with the care of distress. The vacancy work of the Ministry of Labour will have to be expanded greatly—but along the lines of individual case work on enlightened Assistance Board principles. War and its aftermath give the Ministry and its exchanges a pivotal importance.

The time has come to translate into practice the old principle that vacancy work is the "primary function" of the employment exchanges. As the industrial pressure of war raises the proportion of unemployed persons placed in employment through the exchanges, the number of vacancy organisers and the facilities for their work will have to be increased greatly. It may well be that one of the reasons why the Control of Employment Act, which gives power to the Minister of Labour to sanction the engagement or re-engagement of all workers in industry, has not yet been put into operation is the sheer inadequacy of the employment exchanges to do the job. The moment is very near when the Allied war effort will demand, not necessarily the implementation of this Act, but at any rate the mobilisation by some means of the country's entire resources of labour. Plans must be made; that is the duty of the Cabinet, the Ministry of Supply, employers and trade unions. Intelligence must be gathered as a guide to numbers; that is the duty of the Ministry of Labour. Machinery to execute all demands must be made; that is the operational task of the exchanges. If there is any way, off the high seas, where Britain excels Nazi Germany it is in the efficient use of her man-power; but without the full range of successful plans, intelligence and operations, even that advantage may be lost in delay and wastage.

either not produced at all in the Soviet Union to-day or have not, up to now, been available for export in anything like the required quantities. Almost everywhere Russian exports, which are relatively small, fall short of German needs. Tropical products—rubber most important of all—are not found. Russian production of cotton, jute, oilseeds and other sources of vegetable fats, meat, fish and eggs would have to be greatly expanded. (The figures for food-stuffs were given in *The Economist* of September 16, 1939, pages 515-6. Figures of all important agricultural products will be found in "The Economic Alignment" in *The Economist* of December 16, 1939—also published separately in pamphlet form.)

But, over the rest of the field of agricultural production the prospects of effective Soviet aid to Germany are more favourable. By an expansion of the area sown to wheat and

rye, combined with good harvests and the curtailment of home consumption, it might be possible to build up an export sufficient to meet German requirements of those grains quite shortly. In feeding stuffs Russia could be, and has already been, of considerable assistance. While maize, the most important feeding stuff of all, would be missing (the maize imports of Greater Germany in 1934-37 amounted to 1.5 million tons annually and Russia's average exports in that period amounted to only 39,000 tons), German requirements of barley and oats could be met without great difficulty.

Comprehensive and effective assistance on a scale sufficient to affect materially the outcome of the war is another matter. Twenty-two years of Bolshevik rule have produced some improvement in the total agricultural production of the U.S.S.R. But, as the following table shows, that improvement, which is comparatively recent, has not been very spectacular, even in the last ten years or so, the first period in which the pre-1914 output was caught up and passed.

	1913	1928	1932	1937	1938	1939
Total production (mill. 1926/7 roubles)	...	13,980*	13,072	20,123	...	...

* 1927-28.

Figures from Memorandum No. 12 of the Birmingham Bureau of Research on Russian Economic Conditions.

It has been impossible to show anything in agriculture comparable to the achievements of the Soviets in equipping themselves with manufacturing plant. But, even so, the changes of the last ten years have been striking and fundamental. In brief, the trend has been to replace peasant farming by collective farms and State farms, co-ordinated and equipped by regional machine tractor stations, furnishing machinery and machine drivers. Only stock-raising, where Soviet achievements still stay obstinately below Tsarist levels, has remained predominantly in the hands of individual peasants. In 1938 there were 3,961 State farms averaging 2,691 sown hectares each; 242,000 collective farms averaging 484.6 sown hectares each and embracing 18,800,000 peasant holdings; and only 1,300,000 independent peasant holdings.

The key to these changes in organisation has been mechanisation. In 1938 there were 6,358 machine tractor stations, and in them the bulk of the machinery used in Soviet farming is concentrated. They serve the collective farms on a contractual basis and are paid in kind. They serve well over 90 per cent. of the sown area of Russia; and the concentration of machinery in these stations reinforces, in the context of Soviet central planning, the concentration of production in the collective and State farms.

The spread of mechanical aids tells its own tale. Between 1928 and 1938 the number of mechanical tractors in use rose from 26,700 to 483,500; the number of combines from practically none to 153,800; and the number of lorries from 700 to 195,800. In 1928 the proportion of threshing done by mechanical means was 1.3 per cent.; in 1938 it was 95 per cent. And, in the same period, sowing by hand fell from 74.4 per cent. to 12.8 per cent. and harvesting by scythe and sickle from 44.4 per cent. to 8.5 per cent.

That is not to say that, as yet, the expansion in production has been really commensurate with the spread of machinery. In 1913 Russia, on a comparable area, produced 800-820 million metric quintals of grains. This output was never reached again until 1933; in 1937, a record year, the grains harvest was 1,000-1,200 million metric quintals; and last year, the second best year in Soviet history, it was 950-1,050 millions. The cotton and seed crop last year was four times the 1913 figure; and the sugar beet harvest was double the pre-1914-18 level. Recent improvement is, of course, clearly marked. The average yield per hectare, 7.3 quintals in 1910-14 and 7.5

in 1928-32, was 9.1 in 1933-37. Machinery and collectivisation are having their effect despite peasant conservatism.

Peasant conservatism, however, is a factor that cannot be ignored in any assessment of Soviet farming's future. It has been a brake on the wheel in the past decade, and will still not be easy to overcome in the next few years. The number of collective farms has increased from 33,300 in 1928 to about 240,000 to-day, when collectivisation covers about 94 per cent. of peasant holdings. The change over from individual peasant holdings, accompanied as it has been by the secondary attempt to make the peasants good Communists, has been painful. There has been a shrewd suspicion that the collective farm may be an instrument for the exploitation of the peasants in the interests of the urban workers. Collectivisation was itself introduced on a large scale in the autumn of 1929 with the mere collection of food as its principal object.

The immediate necessity to sacrifice the peasants of Russia to the building up of a vast industrial equipment is now past; and the pressure to export agricultural produce to pay for industrial imports reached its peak in 1931 and has since died down. But it will still take a long time completely to break down the barriers to peasant co-operation that the Bolsheviks themselves have set up.

The peasants' wishes have been and will continue to be important. Since January, 1933, when a limited measure of private enterprise in agricultural production and marketing was permitted at the beginning of the second Five-Year Plan, the tendency has been for agricultural workers to give, wherever possible, more and more of their time to work for wages outside the collective farm and to the cultivation of their own small patches of land. The inclination towards private enterprise has been unmistakable, and it has been admitted—and condemned—in numerous public pronouncements by leaders of the Russian Communist Party.

These are more than growing pains. Socially and politically they are very important; and, economically, they are a great hindrance to Soviet farming. Nevertheless, production has gone markedly ahead with the growing grip of collectivisation and mechanisation; and it is in the largely uncollectivised sector, that is, in stock-raising, where farming has most notably lagged. The number of horses is much below the 1913 level. The number of sheep and goats is also below 1913; the number of cattle is about the same, and only the number of pigs is up. The outstanding failure, however, has been the failure of agricultural output to keep pace with the growth in population—139.7 millions in 1913, 147 millions in 1926 and 170.5 millions in 1939. The urban population has doubled in thirteen years, from 26.3 millions in 1926 to 55.9 millions last year. Nor is the gap—which in most recent years has, admittedly, been lessened by new high harvest figures—made up by imports; in 1929-32, when production was most markedly below the trend of population and food rationing was in force, exports reached their peak.

The fact is—and it is most important in any judgment on the scale of Soviet aid to Germany—that there is no necessary relation at all in the Soviets between the course of agricultural production and the course of agricultural exports. Complete State control over the home market and foreign trade means that it is possible, regardless of the demand for consumption, to withhold any desired proportion of total agricultural supplies for the purpose of export. Exports are not large. They have never reached even half the level of Tsarist days; the greatest annual export of grains since the Revolution, for instance, was in 1931, when 5,057,000 tons were sold abroad, against an annual average of 10,553,000 tons in 1909-13. But it is indicative of the peculiar relation between trade and production in Soviet Russia that 1931, the year of high record grain exports, was also a year when the grains harvest was the lowest on record and ration cards were in general use.

The explanation is that a steadily growing proportion of produce is grown, not for local subsistence or local sale, but for the State. In Tsarist days the bulk of Russian farm produce was not for sale, but for local use. Now nearly two-fifths of all agricultural products are grown for the market, that is, to be bought—or requisitioned—by State trading organisations, the only trading organisations author-

ised. Nearly twice as much grain is grown for the market now as in 1913, and over three times as much as in 1926-27; half as much meat again is produced for sale as in 1913 and three-quarters more than in 1926-27. And the State is the only large seller.

Thus the decision as to the quantity of agricultural commodities that might be made available to Germany will be a political one made by the Government. In 1930, with a grains harvest of 83½ million metric tons, 4½ million tons were exported; in 1931, with a harvest of 69½ million tons, as much as 5 million tons were exported; in 1937, with a harvest of 108½ million tons only 1½ million tons were exported. There are clearly limits to the policy of central pre-emption, political limits suggested by the possible consequences of famine and discontent. But they are very wide limits, as past experience of the Soviet policy of earmarking produce for export or military stocks has shown. Since 1933, it is true, exports of agricultural products have fallen away because the liquidation of external debts for equipment purchases had been largely carried through; but, even so, the supplies available for home consumption have not risen correspondingly, because of the accumulation of a war reserve.

The Taxation of War Profits

TAKING the profit out of war may be an unexceptionable proposition in economic policy and equity. But it is by no means simple to put into fiscal effect. A tax on wartime increases in profits is bound to involve more vexatious problems of assessment than a tax on total profits. The only experience we have of such an experiment in this country is the Excess Profits Duty, which remained in force from 1914 to 1921. During those seven years much trouble was involved in turning the duty into an efficient instrument of taxation, but by the time this had been achieved the day had come for its repeal. Its dusty precedents emerged for a brief spell in the National Defence Contribution (Mark I) in 1937. They have reappeared, though only in part, in the Excess Profits Tax introduced in last September's Budget.

In the interval, an opportunity has been presented to the critics to expose the anomalies and inequities which the tax contains. Sir John Simon promised last September to consider such representations before the next Budget, and the memoranda which have been submitted by bodies like the Federation of British Industries and the Association of British Chambers of Commerce show that E.P.T. has proved an easy target for objection in detail. Indeed, the Treasury might have spared itself and the business community a certain amount of trouble if it had followed the precedents of the Excess Profits Duty more closely, as it did in the first version of N.D.C. No general objection in principle has been offered to a tax on the growth of profits as such, with the important reservation that companies pursuing a steady course of prosperity feel its incidence least. But the root technical difficulty in taxing any growth of profits is to ensure that the basic standard from which such a growth is measured shall be reasonable and fair to the taxpayer without prejudicing the revenue-getting potentialities of the tax. That difficulty forms the basis of the major objections which have been made to the Chancellor.

At the beginning of the last war E.P.D. had a relatively fortunate birth, for the pre-1914 years on which standard profits were based were years of steady trade and reasonable profits. No substantial sector of industry was then suffering from the aftermath of depression, such as, say, the textile industry was still experiencing between 1935 and 1937. Moreover, businesses had the option of choosing to pay E.P.D. on the excess of their profits over a given percentage of their capital (the capital standard) rather than on the excess over pre-war profits (the profits standard), and if they could show that their capital was not fully remunerated before 1914 or if it was exposed to risks which warranted more than the 6 per cent. statutory allowance on capital, they were allowed special treat-

In fine, then, the magnitude of Soviet economic aid (in farm products) to Germany depends upon the closeness of the two countries' political intentions. Physically—apart from transport—there are no insuperable obstacles to a considerable expansion of Russian exports to the Reich, though peasant resistance to the New Farming is stubborn and still serious. The Government can divert supplies to export trade from stocks or consumption at its discretion; and there is no reason, for instance, why the 1938 export total of 2 million tons of grains should not be doubled, or even raised to the 1931 level of 5 million tons, at a stroke of the official pen. Wheat, rye, barley, oilcake, butter and sugar have been the chief agricultural exports; most of these have gone in greatest quantity to Britain in the past; and Russian sugar has almost all gone south to Turkey, Iran, Afghanistan and China. Will the Soviet Government be disposed to divert the greater part of all these exports to Germany? Will the Soviet leaders be willing to squeeze still more for export out of home supplies? Will it prove possible to overcome the difficulties of carrying goods in bulk westward by rail or water? These are the real questions; and they are only slightly connected with actual agricultural technique.

ment and given higher statutory percentages, according to the circumstances of their industry. The objectors to E.P.T. have made out an effective case for the introduction of a similar flexibility now. They have pointed to the limited discretion which the Act now gives to the Board of Referees to settle hard cases. At present the taxpayer cannot of his own volition choose a capital standard, but, in exceptional cases where profits or the volume of business were lower in the standard years than might reasonably be expected, the Board may fix a special standard, but subject to the limitation that it must not be more than would be enough to pay a 6 per cent. dividend on the issued ordinary capital (and, of course, full dividends on preference capital). The Board of Referees have unfettered discretion to make further concession if it is warranted by some "specific cause peculiar to the trade or business"—a phrase which seems inadequate to cover all cases of low profits or even losses in the standard years. The Chancellor, however, has already undertaken to reconsider the question of relief for such cases, and it is presumed that an adequate alternative capital standard will be made available for them.

A capital standard, however, involves a statutory definition of capital. Under E.P.T., the statutory percentage is governed by the amount of issued ordinary share capital, on which 6 per cent. is allowed, and the cost of paying dividends on preference capital. But as the suppliers of the Treasury have been quick to point out, the size of the issued capital of any particular company may be determined by convenience, tradition or even accident, and it bears no necessary relation to the amount of capital employed in the business. In short, it is claimed, not without reason, that a capital standard should be applied to the net earning assets of the company rather than an arbitrary sum of legal share capital. Those who recall the similar provisions in E.P.D. will not need to be reminded of their administrative inconvenience, but that tax at least provided a capital standard which was not arbitrarily determined by the purely technical consideration of the amount of issued ordinary capital.

A further string of difficulties arises from the treatment of holding companies. Under E.P.T., a holding company and all its subsidiaries (a subsidiary company being defined as one whose ordinary share capital is held as to not less than nine-tenths by the parent company) are treated as one unit for a calculation of standard profits. This principle of aggregation is sound, but its detailed application undoubtedly creates anomalies. In the first place, the definition of a subsidiary company conflicts with that laid down in the Companies Act, which defines a subsidiary company as one controlled as to more than 50 per cent. There

are some industrial groups like Imperial Chemical Industries which have established 100 per cent. holdings in subsidiaries. There are others which are none the less effective units, but which are organised on the basis of simple majority holdings in subsidiaries. Any shareholdings in subsidiaries of less than 90 per cent. are presumably to be treated for E.P.T. purposes as investments, and the income from such shareholdings, having already attracted E.P.T. before the subsidiaries pay their dividends, will again be liable for E.P.T. when the parent company takes these payments into its income.

If the status of subsidiary companies were redefined, and if their profits were treated as separate units, their assessments could be finally merged with that of the parent company, and such anomalies of double taxation would be avoided. The development of the holding company method of industrial finance during the past twenty years has raised problems on a scale which was never contemplated under E.P.D., and the detailed method of aggregation laid down in last September's Finance Act certainly warrants fresh consideration.

Objections such as these could be multiplied, though it would certainly be impossible to achieve the ideal of a workable E.P.T. which operated with complete equity on every section of business. Industry has the right to expect rough justice to be done, but it must be prepared to face the broad necessity for E.P.T. once its rough edges have been smoothed. Great play has been made on the stifling effect which E.P.T., in its present form, has upon enterprise. It is, indeed, obvious that a company which has struggled through a period of low profits in the standard years to later recovery, or which was then investing capital in development which only later became fully remunerative, must face with apprehension the prospect of losing 60 per cent. of its legitimately increased profits. Even wartime increases in profits might still provide such companies with no more than normal returns. These cases, however, can be dealt with by greater flexibility, increased discretion in the hands of the Board of Referees, freer use of alternative standards, and by the introduction of differential statutory percentages on capital for different industries such as were adopted under E.P.D. As the tax now stands, such companies have a peculiar incentive to forgo an appreciable amount of the profits which would otherwise accrue to them, by strengthening their goodwill with their customers, either by offering increased service or by accepting reduced

profit margins. By this means, they could, in effect, make the Exchequer find 60 per cent. of any amounts so re-invested in the business. Such a possibility, which recalls the excesses and extravagance under E.P.D., is not satisfactory to contemplate—though the worst examples of it under E.P.D. were in the post-war years, when the scope for such practices is larger than in actual war conditions.

But it is one thing to levy a tax on increases in profits; it is quite another thing to hamper the normal economic working of the profit motive, particularly in wartime. The expectation of profits is still the most effective way of achieving increased output, and a well-directed increase in production is still our first concern on the home front. This proposition, however, has a corollary. In wartime, increased production cannot—or should not—be expected to carry the rewards for the equity shareholder which would normally accrue in peacetime. It is questionable whether the rate of charge of E.P.T. could be increased much above 60 per cent. without encouraging waste and uneconomic expenditure. But it is equally questionable whether the 40 per cent. residuum which is left to swell the ordinary shareholder's earnings should be freely disposable in increased dividends. To distribute them entirely may introduce an undesirable stimulus to private consumption; but if they can be saved at the source, this risk need not arise. In short, institutional saving by the medium of company reserves should be a corollary of the present level of E.P.T. We have not in this country so far adopted measures for the control of dividends, although there is some indirect control over the investment of company reserves. If such measures were taken from the German book, ordinary shareholders as a body would still obtain an enhanced equity arising out of the industrial effort which the war demands, even if their dividends were stabilised.

Objections to the details of a tax on excess profits in wartime must not, for a moment, be allowed to be converted into opposition to the principle, or into an attempt to reduce the total yield. E.P.T. is an essential weapon in the armoury of wartime finance, and if a profits inflation should develop, despite our efforts to avoid it, a watertight E.P.T. will be the more essential. To remove all major anomalies would be prudent budgeting, for an unfair tax begets tax-avoidance. That should be the Chancellor's task. It will be industry's part, once this is done, to meet the bill fairly and squarely.

NOTES OF THE WEEK

Germany's Dependence on Swedish Iron.—During the last war, Germany was able to secure some 70 per cent. of her iron ore requirements from within her own political borders. She could draw supplies from the vast deposits of Lorraine (seized in the Franco-Prussian war just in time for her to be able to profit by the British invented basic-Bessemer process). When ore supplies became scarce and pig iron production fell by several million tons, she managed to keep her armies going through four years of war by cutting civil consumption to the limit. The Versailles treaty completely reversed the position, and before the Nazis came to power Germany had to import some three-quarters of her iron ore requirements. Even the mighty efforts of Hermann Goering and his minions did not change the situation appreciably, and the present war started with Germany dependent on foreign sources for about two-thirds of her iron ore requirements. A substantial proportion of her imports—and the vast bulk of the high-grade qualities—came from Sweden, which had in the meantime displaced Spain as the centre of iron ore strategy. Germany's iron ore imports of 22 million tons in 1938 included about 9 million tons from Sweden and over 1 million tons from Norway. The fifty-year tenancy of the Lorraine ore fields inevitably led Germany to base her steel industry on the basic-Bessemer process. Her iron and steel industry was reorganised after the last war, but continues to be partly based on the Lorraine (now French) ore, and the latest available statistics show that almost one-

half of the Reich's steel output was produced by the basic-Bessemer, better known on the Continent as the Thomas process. This means that Germany requires not only rich ore to mix with the poor quality native mineral, but also high-phosphoric ore to provide the phosphorus necessary for the basic-Bessemer process.

Briefly, therefore, Germany needs the rich phosphoric ore from Swedish Lapland; no other grade fills the bill. The main deposits occur in several veritable iron mountains, about midway between the Baltic and the Atlantic, in an angle formed by the Finnish and Norwegian frontiers. There are two main workings, about sixty miles apart, that of Gallivare, providing a very rich medium-phosphoric ore, and that of Kiirunavaara, furnishing an equally rich but high-phosphoric mineral. The Kiirunavaara ore, which is nearer the Atlantic coast, is therefore of special interest to Germany. The Lapland ore fields were discovered some three centuries ago, but they were not worked extensively until the construction of a railway from Lulea on the Swedish Baltic coast to Narvik at the head of a Norwegian fiord on the Atlantic at the beginning of this century. In recent times, the Lapland ore output has reached about 9 million tons a year, and the bulk of it went to Germany. In the open water months, part of the output is sailed to Lulea and shipped through the Baltic.

During the months when the upper Baltic is frozen the whole output is sent to Narvik, which is open throughout the year. Narvik is also the port of shipment for the Norwegian ore, and it handles more than twice as much tonnage as Lulea. Until very recently Germany contrived to bring a stream of ore-laden vessels down from Narvik, through Norwegian territorial waters, to the Baltic and

North Sea estuaries. The extension of the war will put an end to this traffic, and the most favourable outcome for the Nazis will be that they will have to be content with what they can get through Lulea, now about to be opened for shipping. While the future cannot be foreseen at this stage, the congestion of the railway to Lulea and at the port itself will make it very difficult for Germany, in the most favourable circumstances, to take more than about 5 million tons per annum by that route, if the mines continue working. This will leave her about 4 million tons short of normal ore imports at a time when other foreign sources, except possibly Luxembourg, are entirely cut off. In a long war that might be decisive. For some time, however, Germany could keep up her output by using her stocks of ore and by a ruthless collection of scrap.

Norway's Ships.—Like Britain, Norway has long been a seafaring nation, and the size of her fleet—in which she has invested a large proportion of her wealth—considerably exceeds her own demand for shipping tonnage. While Norway's share of world trade is only about one per cent., she owns no less than 7 per cent. of the world's steam and motor shipping tonnage. In June, 1939, her steam and motor tonnage aggregated 4.8 millions gross—the world's fourth biggest merchant fleet after those of the United Kingdom, the United States and Japan. Norway's success in the world's shipping business has been due largely to specialisation combined with a high level of efficiency; while a large proportion of her vessels consists of ordinary tramps, she has made great strides in establishing regular liner trades. But Norway has been particularly successful in the tanker trade, and her fleet of oil tankers is the third largest in the world after those of the United Kingdom and the United States. In June, 1939, she possessed 2,117,000 gross tons of tankers, compared with 2,920,000 gross tons owned by the United Kingdom and 2,801,000 gross tons by the United States. Last, but not least, Norway owns a large fishing fleet. Her whaling tonnage alone amounts to about a quarter of a million. After the United Kingdom, Norway is the leading whaling country; during the 1937-38 season Norway is estimated to have produced 198,000 metric tons of whale oil, compared with 221,000 tons by

the United Kingdom and 71,000 tons by Japan—the third largest producer. A large proportion of Norway's fleet is normally on the high seas; and whatever be the outcome of Germany's invasion of Norway, this valuable asset is unlikely to fall into the hands of the invaders.

Food from Denmark.—The German occupation of Denmark has the immediate—but not the ultimate—effect of diminishing the food supply of Great Britain and of increasing that of Germany. In 1938, Great Britain took one-quarter of her imported butter, one-third of her imported eggs and nearly half her imported bacon from Denmark. But since the war began, the difficulties of shipping from the Baltic countries have led the Ministry of Food to concentrate on supplies from the Empire, and the loss of the Danish trade will probably not seriously affect British rations. In the long run, however, the occupation of Denmark will mean a net loss to the German food supply, since Danish agriculture is based on large imports of raw materials, imported from countries outside Europe by routes which the Allied navies control. The table below summarises Danish foreign trade in food:—

DANISH FOREIGN TRADE			
Exports:—			
Butter ('000 metric tons)	1937	1938	1939
To U.K.	153.0	158.0	149.9
To Germany	115.7	119.4	...
Bacon ('000 metric tons)	34.7	36.4	...
To U.K.	181.7	178.7	183.9
To Germany	178.2	174.1	...
Eggs (million score)	2.1	4.3	...
To U.K.	80.7	77.9	85.6
To Germany	60.4	57.1	...
Cheese ('000 metric tons)	17.7	19.2	...
To U.K.	9.4	9.1	...
To Germany	1.1	1.1	...
Lard ('000 metric tons)	4.9	5.1	...
To U.K.	13.0	10.5	...
To Germany	1.8	0.1	...
Live pigs (thousands)	11.0	10.3	...
To U.K.	167	114	...
To Germany	157	114	...
Live cattle (thousands)	172	134	...
To Germany	141	121	...
Imports ('000 metric tons):—			
Coal and coke	5,900	5,247	...
Fertilisers	510	641	...
Mineral oils	730	875	...
Maize	6,192	3,081	...
Rye	1,242	1,162	...
Wheat	1,634	1,679	...
Oilseeds	445	376	...
Oilcakes*	417	594	...

* Imports less exports.

The imports of cereals and oilseeds have in the past helped to supply Germany with much-needed fats in the form of oilcakes, beef, butter, lard and pork, and their disappearance will result, now as in 1917 and 1918, in the forced slaughtering of cattle and a drastic fall in the output and export of food, though the stocks of feeding stuffs at present in Denmark, with the summer grass, may postpone the drop until the autumn. When the Nazis have commandeered existing stocks of bacon, butter and cereals, and have eaten most of the existing three millions of pigs and of cattle, they will have closed one of the main sources of food imports for the German people. Their action has enlarged their food supplies at the moment at the expense of an inevitable reduction in the spring of 1941 and thereafter.

M. Reynaud and the Politicians.—The stirring events of this week have had their effect on the political situation in France, where, even more than in Britain, resolute action can always be relied upon to redound to the credit of those in control of affairs. The Senate, which was to have expressed its dislike of M. Reynaud's Government at a secret session on Tuesday—and possibly even to vote against him and turn him out of office—gave him an ovation instead. Even before the Nazi move, however, the indications were that M. Reynaud was winning his struggle with the politicians. Three factors seem to have contributed to this result. The largest of them was undoubtedly the evidence of energy and resolution that M. Reynaud

showed, particularly in the external field. The decisions taken at the meeting of the Supreme War Council in London last week—which now seem so remote—were received in France, as everywhere else in the world, as signs that the Allies were about to take a more decided initiative, at least in the sphere of economic warfare. Secondly, M. Daladier, in whose hands the fate of the present Cabinet very largely rests, was apparently exerting his influence to suppress the revolt among the members of the Radical Party. Some of his actions in the very first days of the new Government could have been interpreted as signs of pique and resentment at his own loss of the first place, but even if this interpretation were correct, M. Daladier's loyalty and good sense have now clearly prevailed. Thirdly, the intriguing politicians have received several unmistakable intimations that the French people are more interested in getting on with the war than in overthrowing Cabinets. It would be a mistake, however, to interpret the improvement in M. Reynaud's position as much more than a reprieve. He will never be popular with the Radical Party. And the Right, which dislikes his inclusion of Socialists in the Cabinet, has also been showing signs of taking a dislike to a foreign policy which it accuses of stirring up bad blood in Italy and being insufficiently severe with Soviet Russia. M. Reynaud is still upon trial. But he has the qualities to establish a position for himself which no party jealousy will be able to destroy.

* * *

Lord Woolton Begins.—Lord Woolton takes over from Mr Morrison a Ministry of Food administratively in good running order. Stocks of important foods are high, and even the sudden loss of Danish imports will not affect the supply of dairy produce so much as it would certainly have done six months ago; as stocks run down, the Empire will be able to fill the greater part of the gap. Lord Woolton has started his Ministerial career by a series of homely and pointed speeches on the need for economy in the kitchen—economy in the sound sense of making the best use of the foods that are available. The education of housewives may indeed be desirable, even essential, but it is to be hoped that Lord Woolton will also set out to educate the Cabinet on the pressing need for a coherent and well-rounded food policy. Much more might be done, for instance, by propaganda and price differentials, to divert consumption from imported foods to a few basic home-grown ones; a larger consumption of potatoes and vegetables and the substitution of browner bread for the un-nutritious white now generally eaten would both improve the nation's health and conserve its supplies of foreign exchange. The rationing of meat, butter, sugar and bacon can be used if needed to cut down the consumption of these foods by the wealthier households, but so far the Ministry of Food has done little to regulate, and nothing to improve, the diet of the poorest classes except to permit, probably perforce, the discriminatory rationing of their foodstuffs by increased prices. The present subsidy to keep down food prices might well be both enlarged in amount and narrowed in scope to, say, brown bread, margarine, cheese, milk and potatoes; any adequate food policy must be firmly founded both on social needs and dietetic requirements.

* * *

Evacuation: Another Failure.—Evacuation has been given a bad name; and the Government's new scheme for sending children away is a complete failure so far as its initial stage of registering the children is concerned. Out of 456,250 school children in the County of London and the 26 neighbouring vulnerable areas, 52,451 have been registered for evacuation. Less than 10 per cent. of the parents have expressed their willingness to let their children go, and the parents of about 75 per cent. of the over 1 million in the other big cities. In Manchester and the Lorraine ore 11,000 and 12,000 replies were received; and steel industry 10,000 children, 4,700 will be evacuated. continues to be partly, 10 forms were issued; only 5,212 were ore, and the latest avail.

returned, and only 3,600 children will be sent away. Even allowing for the general disbelief in air-raids, such apathy is surprising, for under the new scheme the children would not leave until severe bombing had actually started. It can only mean that the known evils of evacuation are thought to be far worse than the unknown evils of air raids—though it is possible that this week's events would have made evacuation more fashionable, as they have made the carrying of the gas mask—and in itself it provides an adequate commentary on the half-heartedness of the Government's whole evacuation policy. There are now signs that the virtues of camps and hostels, urged many months before war broke out, are at last penetrating the official mind. The A.R.P. Co-ordinating Committee (an unofficial body, but of sufficient standing to be asked by the authorities for its advice) has produced a scheme for camp schools to take the majority of the evacuated children. It would cost about £104 millions, and would also require large amounts of scarce materials; but the committee points out that the capital cost, if repayment were spread over only two years, would add less than 6d. to each pound at present being spent on the war, and that a valuable legacy would be bequeathed to peacetime England. And the Board of Education has sent a circular to school inspectors stating that plans for providing hostels for evacuated secondary, junior technical and selective central schools will be considered. But these plans should have been in operation before evacuation started, and in any case before the new appeal to parents was sent out. As it is, evacuation, too, will have as its epitaph "Too Late and Too Little."

* * *

Economic War in the Balkans.—Meetings have been taking place this week, at the Foreign Office in London, at the Board of Trade and at the Ministry of Economic Warfare, between Britain's envoys in Turkey, the four Balkan countries and Hungary and members of the Government; the British Ambassadors in Rome and Moscow have been at hand for consultation. The object of these discussions is to study the background for a fresh Allied economic offensive in South-Eastern Europe, and, like the thrust against Germany's iron ore supplies which prefaced this week's dramatic events in Scandinavia and the waters of Northern Europe, they form part of the more active war decided upon by the Allied Supreme War Council a fortnight ago. The trade struggle in the Balkans, where Germany has been consistently successful for the two years in which Britain has been a confessed competitor, has reached a crucial stage. If Thursday's secret session of the Commons on economic warfare had taken place, there would have been renewed criticism of the Government's disinclination to meet the Germans' trade drive there boldly enough or in sufficient force, of the damming of the Allies' chances by faint aid from the Allied Treasuries, of over-small purchases of the Balkan goods that are vital requirements of the enemy and of over-small credits. There would have been recriminations about the British Government's alleged rejection of Balkan offers to sell oil, animal fats and feeding stuffs, and sinister stories of Germany having purchased Balkan produce in sufficient quantity to export it to Scandinavia in exchange for American dollars. The sponsors of these charges are perhaps prone to exaggeration; they give too little weight to the greater energy in the Balkan trade campaign that the opening months of this year have witnessed; and too little attention to the way in which, in Yugoslavia, for instance, the heads-I-win-tails-you-lose trade technique of the Nazis has to some extent recoiled upon itself by turning the terms of trade so violently against Yugoslav traders that even neutral fearfulness has found a limit to compliance. Germany has at least made no appreciable headway towards greater hegemony in most recent months; and rubber, cotton and even coal and unable to deliver large supplies of arms and munitions for foreign ore, are finding it increasingly difficult to deliver exports in sufficient quantities or with sufficient speed to pay for Balkan imports.

Even so, the critics' accusations are soundly based, and it is not likely that the establishment last week of the English Commercial Corporation, Ltd., to do business in Bulgaria, Greece, Hungary, Roumania, Turkey and Yugoslavia, will have fully allayed their misgivings. In the first place, ENCO illustrates the dragging delay that has consistently characterised British commercial strategy; plans to set it up were made many months ago. Secondly, it exemplifies again the grossly circumscribed view of the financial ammunition needed that has, equally consistently, been a decisive drawback. The report by *The Financial News* that the capital of the company is no more than a mere £500,000 has not been denied; and there is a supposition that the company, whose accounts will not be published, will be compelled to limit its aid to firms engaged in Balkan trade—ENCO is not to supersede existing organisations but to use and aid them—to the scale of its ludicrously small resources. As a co-ordinating body, working not only with individual firms, but also with the Export Council and the export groups that various industries have already set up, ENCO will do useful work. By advice, inquiry and consultation, it will be able to guide British manufactures and Empire raw materials into suitable markets; and, unlike the individual company, specialised in buying or selling, but not both, it will be able to look at both sides of the trade account and work out the usefulness and feasibility of direct barter exchanges. But it is not enough to lead a horse to water, even if special skill has been shown in handling the animal and locating its drinking trough. The horse must be made to drink; and it is still doubtful whether ENCO has the powers and resources, or the Government the imagination and boldness of purpose, to make the new offensive, which comes at a moment when the German grip has momentarily ceased to tighten, really effective. The diplomats in this week's conference will surely have made this plain, just as they must have made it equally clear that, in the inseparable fields of political and economic manoeuvre, it is above all proof of comprehensive and swift action by the Allies that the neutral States are looking for, before they can shake off fear and servility in face of German menaces.

* * *

The Political Background.—In the Balkan war, which is still a "white" war, trade is an instrument of politics. The petroleum, copper, bauxite, animal fats, vegetable oils, cereals and fruit of the Balkans are vital supplies for the blockaded Reich. The constant pressure of German diplomacy, this week alleged to have taken the form of some tentative approach to secure the right to police and patrol the Danubian basin against Allied "intervention," is the measure of Germany's needs—just as the Nazi Press story of Allied attempts to block the Danube by blowing up barge loads of explosives is the measure of Germany's nervousness. The choice for Germany, here as in Scandinavia, is to make the neutral States tools or victims, and it is ominous that the Nazi tales of impending aggression by the Allies in South-Eastern Europe are precisely similar to the allegations which preceded the brutal sloop upon Denmark and Norway. In Turkey, in whose friendship the pedestal of Allied influence in that quarter of the world rests, the Press—including semi-official organs—has been significantly frank in the last few days. They have repeatedly pointed out that the neutrals' fear of German attack too often causes them to court the very dangers they seek to avoid. Events in Scandinavia have given these arguments an added strength; both Lord Halifax and Mr Chamberlain have not delayed in drawing attention to the likely fate of countries that lag too long in seeking aid from the forces that are resisting aggression; and in Turkey, at least, the rôle of the Allies as the "natural" protectors of independent nations is receiving great stress. The conferences of Balkan envoys in London are concerned with measures to intensify the blockade, but for the reason that the most important single factor in the Balkan situation is this unremitting threat of German invasion the discussions must have hinged upon the strategic possibilities and political balance in all the countries concerned.

The presence at the conferences of the British Ambassadors in Rome and Moscow is full of meaning. Whether the Balkan war remains a war of trade, or breaks into military activity, both Italy and Russia hold a big stake there, and they have not been slow in the past week to censure the Allies for seeking every chance to spread the war to new fields. Rumours of Allied intentions to extend contraband control into the Adriatic and the Black Sea, and reports of the presence of Allied naval units in the Adriatic and the Aegean, have roused the non-belligerents to sharp recrimination in their controlled newspapers and news agencies. The Allied "aggression" in Scandinavia, "forestalled" by Germany's swift invasions, serves as an illustration of the machinations of the Western democracies. Indeed, the outlook in every neutral corner of Europe hinges on what happens in Northern waters. If the Allied *riposte* is decisive and successful, then the Balkan countries will feel a new sense of relief and security; and Germany's associates (among whom, judging from the naming of Spanish ports as well as Italian as places of refuge in the German order to Danish and Norwegian ships after the invasions, Spain is being somewhat optimistically included), whose plain object is to gain what they can of trade and influence in neutraldom in the wake of Germany's successes, will need to redefine where they stand. But to give the first sign of ability to meet German force with greater force is only a beginning. The need to plan and organise every possible line of active aid in the Balkans to the fullest degree becomes more urgent than ever; and with this in mind, as well as the course of the clash of arms in Scandinavia, the conference of envoys is well placed to lay the foundation stone for a new and still more successful phase of the war. Peace in the Balkans is the wish of the Allies, no less than of the Balkan countries themselves; but the chance of war in a flash can never be absent so long as the Nazis' efforts to secure the unification of Europe by assault and battery are not estopped.

Italian Indignation.—Officially, Italy's intention is still to keep the peace and prepare for war, but in the last week or so it has been the second part of this "historic mission" that has been most emphasised. Italy may have moved no nearer to war in these days, but the war has been brought closer to her. It was inevitable that any decision by the Allies to prosecute the economic war to the utmost and conduct the blockade with proper efficiency must disquiet the Italians. Hitherto Italy has benefited from the Allies' disinclination to take full advantage of their control of Europe's commercial sea lanes, and has served as a corridor for transit to Germany for goods from Spain and beyond. The first Italian brush with Allied sea power came when ships carrying German coal were stopped a few weeks ago. But those ships were allowed to proceed, and it is only lately, when rumours of the Allies' intention to blockade Yugoslav trade in bauxite through Trieste to Germany have gone about, that the full "iniquity" of the Allied "stranglehold" has been pounced upon by Italian newspapers. Official comment is mainly silent, though staff talks and measures for military preparedness have become daily news; and a draft bill for full civil mobilisation, of women and children over thirteen years of age as well as men, in the event of an emergency, has been published. Unofficial comment is far from quiet. The newspapers, in their attacks upon the Allies, have reached again the full scurrility of their Axis association, and the chief objects of their charges have been Mr Churchill and M. Reynaud. The somewhat crude and entirely unconvincing play made by German propaganda of the "map of Allied aggression" displayed on M. Reynaud's walls in his interview with Mr Sumner Welles has furnished Italian publicists with material for savage onslaughts upon French policy.

The German and Russian thesis that it is the Allies' chief aim to extend the theatre of war and to dominate and control the neutrals by the brutal use of sea power is fully accepted. M. Reynaud is the villain because he has stood out in France against the appeasing suggestions of the Right Wing *Munichois*. Mr Churchill is the villain because it is the overweening ambitions of the British Admiralty that menace every nation in Europe. These accusations are very plainly the accusations of writers who are alarmed about what is going to happen next. If the blockade spreads, effectively, to the Mediterranean; if the Allies, with Turkish aid, manage to activate the latent sympathy which the Balkan countries, distrustful and afraid of Germany, feel for them; and if British naval power finally triumphs in Scandinavia—Italy will be brought much nearer to the realities of European war than she has been yet, and the easy, almost contemptuous, flaunting of a decidedly unneutral non-belligerency will be made much more difficult. It is apprehension for Italian interests, rather than real sympathy with German ambitions, that has once

more lent the Italian Press to Dr Goebbels this week; and it is becoming clearer as the war gains in movement that Italy will be unable to postpone indefinitely her decision as to where her interests really lie. Germany has shown that there can be no neutrals in Europe now. In the last resort there can be no "non-belligerents" either.

Holland and the Blockade.—Holland has stood in the shadow of imminent invasion all this week. German troops have stood ready to march, and the strategical likelihood of such a move, after the invasions of Denmark and Norway and the Allies' reply in force, has seemed considerable. All the time German complaints about the surrender of the neutrals to the "brigandage" of Allied blockade measures have found a new focus in Holland's new trade arrangements with Britain. In the last war, in order to expedite the passage of neutral shipping through the Allied contraband controls and to ensure control over neutral trade with the enemy, agreements were made with corporations of neutral merchants in Holland, Denmark and Switzerland by which undertakings not to engage in illegitimate commerce were given and accepted. The bare outlines of a somewhat similar agreement, arrived at on March 21st between Britain and Holland, have now been made public. An official trading corporation, known from its initials as ANIC, is to be set up in Holland; this body will have power to license all imports; and all imports will be consigned to it. Parallel with this arrangement to prevent the evasion of Allied contraband requirements by individual importers, Holland's exports to Germany will be restricted. In a wide range of goods, mainly foodstuffs, exports to a limited percentage of the exports normal before the war will be allowed; the export of other goods, mainly materials useful for war manufacture and war use, will be entirely prohibited. What advantage these arrangements may have over the existing war trade agreements with neutral countries, which on the whole have probably been drawn too leniently, cannot be told without knowledge of the precise details of the trade permitted. Ostensibly, too, the new agreement is intended to do no more than ease the working of the contraband control. But, whatever the tactical worth of the arrangement may be in the economic conflict, such compliance with British wishes is *ipso facto* an act of provocation in German eyes, and the outlook for Dutch security has scarcely been improved by it—unless Holland, having seen the fate of neutrals elsewhere, is frankly relying on the speediest Allied aid if the worst befalls.

Japan and Germany.—Japan, never far out of the main stream of world politics, is being tempted back into the whirlpool by Nazi blandishments. There has been a distinct increase in recent weeks in the volume of German propaganda directed towards Japan and in the activity of the German Embassy in Tokyo. Germany would, of course, dearly love to get Japan into the war on her side; but for the moment she is angling for smaller fish. The German object is, in general, to create nervousness in Britain and France about their position in the Far East, with a consequent distraction of energy and possible dispersal of forces. There is, however, a more specific and immediate aim in view. Vladivostok is becoming one of Germany's more important ports of entry. It is true that anything brought into Vladivostok for Germany's use has to be carried over the 6,000 miles of the Trans-Siberian Railway, and even though the line has now been double-tracked in most, if not all, of its length, its carrying capacity is obviously limited. But it is quite enough to bring in considerable quantities of some of the special commodities which Germany most lacks and which can be obtained in the Far East. Germany's total annual imports of rubber, for example, were in peacetime only about 100,000 tons, of tin 15,000 tons, and some of the rarer metals even smaller. But if these commodities are to reach Germany, they must first reach Vladivostok, and it is the German hope that Japan will sufficiently impede Allied contraband

control in the North Pacific to allow sufficient quantities to get through. The Japanese have not yet got over the shock of finding that the Nazis did not take the Anti-Communist Pact as seriously as they did themselves. Their difficulties in China have also made them in the last few months more conscious of the harm that could be done them by a breach of relations with the Western Powers. But at the same time the bait being dangled by the Nazis is attractive, for it would be an undoubted affront to Japanese self-esteem if the British Navy were to establish an effective blockade of a port in the Sea of Japan. The situation is obviously delicate; it will require close watching and careful handling.

Shorter Notes

The German invasion of Denmark and Norway has brought two specific actions by the United States under the general policy of neutrality. The "combat zone," into which American shipping is forbidden to enter, has been extended from Bergen round the North Cape to a point east of Archangel. The significance of this action is that it prohibits American ships from going to Russian ports. At the same time, Denmark and Norway have not been declared belligerents, which would impose upon them the penalties of the "cash and carry" clauses of the Neutrality Act. The second action has been to block Norway's and Denmark's assets in the United States until their ownership can be determined.

The primary elections in Illinois and Nebraska have repeated the experience of Wisconsin last week. In the Republican election Mr Dewey has again demonstrated his vote-getting power and strengthened his position. In the Democratic Party there were eight votes in favour of a third term for Mr Roosevelt for every one given in favour of Vice-President Garner. It is becoming more and more certain that Mr Roosevelt will be the Democratic candidate. If Mr Dewey leads the Republicans, a conflict between Mr Roosevelt's foreign policy and outright isolationism can hardly fail to become a major issue of the campaign.

During the first seven months of the war Roumania exported 2,290,000 tons of oil, of which Great Britain took 668,000, France 208,000 and Germany 464,000 tons. The Allied total was thus nearly twice as much as the German. In the first three months Germany took only 100,000 tons, but in the second three months her total rose to 325,000 tons, whereas the Allied total was almost stationary at 377,000 and 368,000 tons respectively. On the other hand, in March Germany only took 39,000 tons, equivalent to a rate of 117,000 tons a quarter, whereas the Allies took 131,000 tons, which is equivalent to a rate of 393,000 tons a quarter.

The recent detention by the British Contraband Control of two Russian ships in the Pacific lends interest to the official Dutch statistics of exports from Netherlands India to Vladivostok. In January to August, 1939, these amounted to 520,000 kilograms, valued at 312,000 guilders. In September to December, 1939, they amounted to 10,611,000 kilograms, valued at 3,251,000 guilders. The latter figures include 3,386 tons of rubber, and as Russia's imports of rubber from the Dutch Empire before the war were negligible, there is hardly room for doubt that most of the increased shipments were for re-export to Germany.

British Overseas Airways has marked its inauguration by the first "preliminary flight" of a Frobisher air liner from London to Lisbon. This service will link up with the Pan-American Clippers that fly between New York and Lisbon. It is true that this link could not be forged until the signing of the Anglo-Spanish trade agreement per-

mitted British aircraft to fly over Spain. But even now a regular twice-weekly service will not start until May 4th. The K.L.M. Dutch service to Lisbon, which began on April 2nd and will, of course, compete with our own, will by then have had a month's start.

From April 9 pork has been unrationed, and in theory the public will be able to buy unrestricted quantities a week in addition to the 1s. 10d. worth of meat. This decision is officially described as "an illustration of the flexibility of the rationing machinery."

All three of the fighting services have been granted increased allowances for the children of serving men. The revised scales provide for allowances of 6s., against 5s., a week for one child, 10s., against 9s., for two children, 12s. for three children, and 3s. extra for each additional child thereafter.

A new stage has been reached in the long-drawn and slowly moving Mexican oil dispute. The American Government, fully aware that Mexico is a test case for the whole of its policy of the good neighbour towards Latin America, has been most reluctant to apply even diplomatic pressure so long as other means were available. But Mexican legal processes have now been exhausted without bringing to the expropriated oil companies anything that they regard as justice. In a note handed to the Mexican Government last week, the United States Government repeated its suggestion of arbitration. Mexico, it is believed, will reject the suggestion and will therefore force the United States to consider whether justice or friendliness is the more valuable to it.

It has been found necessary to revise the second table which appeared on page 508 of *The Economist* of March 23rd in the article on Germany and the Balkans. The amended table giving the percentage share of Greater Germany (including Czecho-Slovakia) in the Balkan countries' total imports and exports is printed below:—

	Hungary	Roumania	Yugoslavia	Bulgaria	Greece	Turkey
Imports—1938	48.1	49.4	50.1	57.9	31.9	51.5
1939	49.0*	56.2	54.2	69.5	31.7	...
Exports—1938	50.0	35.8	49.9	63.4	43.0	47.5
1939	52.0*	43.2	45.8	71.1	29.5	...

* Excluding Czecho-Slovakia. For purposes of comparison the 1938 percentages excluding Czecho-Slovakia are given as follows: imports 41.7, exports 45.8.

Small Accounts

By tradition as well as by deliberate policy, the Westminster Bank has always aimed at fostering the 'small' account. Moreover, there is no sharper line of demarcation between 'big' and 'small' than between 'white' and 'black'; there are many greys between, and it has always been good business for the Bank to encourage the smaller account, with confidence in its growth later on.

Those, therefore, who may have felt that their means hardly warrant a banking account are invited to consult the Manager of any branch and to that find their hesitation may have been groundless.

THE WORLD OVERSEAS

Occupied China: Asset or Liability?

(By our Shanghai Correspondent)

THE occupied areas of China are at present both a considerable asset and a large liability to Japan. Goods made in Japan dominate the import markets of these areas, selling in large quantities and at higher prices than ever before. The Japanese mercantile marine accounts for half the total foreign shipping in all Chinese ports. Japanese manufacturing industries in Shanghai, Tientsin, Tsingtao and elsewhere look back upon an extremely profitable business year. On the other hand, Japan has been unable to turn conquered China into a major source of supply of raw materials and fuel. The huge Japanese development companies of North and Central China are not making any progress. The revenue collected by the puppet regimes and the Japanese military themselves compares but poorly with the continuous huge war expenditure in China of the Tokyo Government.

The Japanese Empire, including Japan proper, Korea, Formosa, and the Kwantung Leased Territory, last year sold in the occupied areas of China £32 millions' worth of goods compared with £12 millions in 1936, the last year before the Sino-Japanese War. According to Chinese statistics, Japan's share of China's imports consequently rose from 18.10 per cent. in 1936 to 34.1 per cent. in 1939, and to 39.86 per cent. in January, 1940. The trade statistics of Japan put exports to China in 1939 at nearly £40 millions, including Yangtse Valley shipments and others continuously withheld from Chinese Customs registration. These exports formed some 13 per cent. of Japan's export total, and the occupied areas of China now rank third among Japan's customers.

The Tokyo Government, however, frowns upon these trade advances in China for two reasons. The first is that Japan is short of most of the commodities which loom large in her China exports. The other is that most of these exports are going to North China (Japan's import share in Shanghai is 15 per cent. only), and that North China fails to yield the foreign exchange which Japan badly needs—because it is included within the yen bloc. Tokyo, therefore, has for some time past been inclined to restrict Japanese commodity exports to occupied China, though with little result owing to lack of co-operation from Japanese business interests.

Prosperity of Private Firms

Private Japanese manufacturing industries in China are, on the whole, doing well. Many, whether of Japanese origin or of Chinese origin under Japanese management, have been fully employed for almost a year, and are yielding large profits. Japanese cotton spinning in Shanghai is particularly prosperous. The Dai Nippon spinning company, one of the Big Three in Japanese cotton milling, last year earned net 40 per cent. of its capital, half of the profits coming from the company's China plants. The Toyo and Kenagefuchi

cotton concerns obtained over one-third of their 1939 profits from spinning and weaving activities in occupied China. Satisfactory earnings are reported also by Japanese private metalware, soap and chemical plants in occupied China.

Development Companies Unsuccessful

The two semi-official Japanese development companies for North and Central China, however, are unable to pay the scheduled 5.5 and 6 per cent. dividends for 1939, and applied to the Tokyo Government for special dividend subsidies. These companies now are the holding concerns of some 24 subsidiary firms which administer the railways, bus lines, canal and river shipping, coal, iron and salt mines, iron industries, power works, gas plants, waterworks and fisheries of occupied China. Most of the North China companies have been unable to earn any profits, but have suffered substantial losses; 6 per cent. dividends paid by some of the Central China companies have been insufficient to cover overhead expenses of the parent companies. A year and a half after their establishment, the two development companies have not yet started upon any genuine development work worth speaking of. All the much advertised big development projects of these companies had to be postponed indefinitely, including the North China coal and iron mining projects, the Shanghai Lower Whangpoo Industrial Area project, and large-scale new railway construction. Both companies are suffering badly from lack of funds. Their capital of 450 million yen is paid up by about one-third, represented for the most part by the book values of seized Chinese property. They have not yet raised a single yen of the 1,400 million yen which they were scheduled to raise as from the beginning of last year. Japan, herself in the throes of an unprecedented economic and financial crisis, has been unable to finance development in China.

The development companies' failure to mobilise funds and to start large-scale operations has resulted in an extremely poor supply of Chinese raw material for Japan. To secure from China proper huge supplies of coal, iron ore and raw cotton was one of the chief objects of the invasion, yet occupied China under compulsion yields less coal, iron ore and raw cotton to Japan than she voluntarily sold to Dai Nippon before the war. Last year, Japan obtained from China 2,853,000 tons of coal; 102,000 tons of iron ore; and 8,800 tons of raw cotton. Chinese iron ore and cotton accounted for but insignificant percentages in Japan's imports of these raw materials. Chinese coal covered about one-third of Japan's import demand, but more than half the coal procured from China was obtained by means of regular commercial purchase from the British-owned Kaiping mines. The Japanese Empire's export share in China last year was less than 10 per cent., and imports from China accounted for only 2 per cent. of Japan's total imports. As a source of supplies, occupied China remained unimportant for Japan.

Eire's Uneasy Finances

[FROM OUR DUBLIN CORRESPONDENT]

Two years ago the Report of the Banking Commission drew attention to the fact that the condition of Irish public finance had shown a marked deterioration in recent years. The latest figures indicate a further serious deterioration which it is impossible to contemplate without anxiety. Rates of duty on many articles have been raised during the year and the standard rate of income tax has also been raised, but the yield from these increased taxes has failed to keep pace

The Plight of the Swiss Hotels

[FROM OUR GENEVA CORRESPONDENT]

THE Swiss tourist industry is hard hit by the war, and a number of hotels are now in a hopeless situation. Owing to international unrest, the summer season was much less prosperous than the year before, and since the end of September the number of foreign tourists in Switzerland had dwindled to almost nothing. Most foreigners had returned home, and the Swiss authorities, with a view to checking espionage, made it extremely difficult for foreigners to come in.

The "Société Fiduciaire Suisse pour l'Hôtellerie," which was responsible for the financial reorganisation of Swiss hotels after the last war, made an inquiry into the situation of 664 hotels, representing 45,000 beds, or 25 per cent. of the available accommodation in Switzerland. These hotels are only open during the summer or winter season. The inquiry revealed that receipts during the 1939 summer season were 16½ million francs, against 22 millions in 1938, a drop of 25 per cent. Out of these 664 hotels, only 91 had assets exceeding their liabilities and were in a position to pay the interest on their mortgages. In most cases 70 per cent. of the running costs was not covered by receipts. The situation is therefore very serious, and it is felt that something ought to be done to lessen the debt burden of the hotels. Some hotels have been commandeered as military hospitals, at Interlaken, Montreux and Territet, and the financial situation of the hotels concerned is safe, at least for the time being. The question is whether the Government will be ready to grant a subsidy, as it did in 1920, to help the industry as a whole.

In 1938, the 5,700 Swiss hotels, totalling 110,200 beds, received 3,485,000 guests, of whom 1,426,000 came from abroad; in 1939, they had only 2,918,000 guests, 1,000,000 of them foreign. During the last winter season, the number of foreign tourists was hardly 10 per cent. of previous winters. The capital invested in the hotel industry is estimated at 2,034 million francs, and mortgages total 902 millions. According to the calculations made by the Association of Hotel Keepers, the average running costs represented in 1937 16.91 francs per night and per bed, while receipts were 19.29 francs; since then running costs have increased, and they are now from 18.70 to 23.40 francs per night and per bed according to the class of hotels. The Association is therefore of opinion that hotels should be allowed to raise their prices, especially as, since September last, the cost of living has increased by at least 5 per cent.

Repercussions on Other Industries

Though not, as often supposed, the chief Swiss industry, the hotel industry plays an important part in the country's economy. Normally, it occupied nearly 75,000 persons, and its profits were about 200 million francs a year, exclusive of indirect profits from which several other industries benefit. It is estimated that in normal years tourists provided 5 per cent. of the earnings of the telegraph and telephone service, 10 per cent. of the postal service, and 17 per cent. of transport undertakings, which suffer greatly from the present state of affairs. Several steamboat companies—on the Lake of Geneva, for instance—will not be able to run their usual services during the present year, and a number of private railway companies are in a very serious situation.

March 27th.

THE COMMERCIAL BANK OF SCOTLAND LIMITED

Incorporated by Royal Charter and Act of Parliament

PAID-UP CAPITAL . . . £2,250,000

RESERVE FUND . . . £3,150,000

ESTABLISHED 1810

with the ever-mounting expenditure with the result that the deficit has grown to a figure of over £2,000,000. The consequent increase in the public debt is to be deplored, especially in view of the Banking Commission's strictures on the debt situation.

The Exchequer Return for the year ended March 31, 1940, discloses the following results:—

	1937-38	1938-39	1939-40
	£	£	£
Revenue	31,208,583	31,883,864	32,388,744
Expenditure	32,052,541	33,110,247	34,395,023
Deficit	843,958	1,226,383	2,006,279

A comparison of the revenue figures in the last two years discloses the fact that the increase of about £500,000 which was realised was due almost entirely to increases in the yield of indirect taxes. It is true that income tax rose by £145,000, but this was more than offset by a fall of £245,000 in estate duty. Motor tax, stamp duties, corporation tax and excess profits duties all registered declines. On the other hand, Customs increased by £488,000 and Excise by £229,000. This growing regressiveness is an unfortunate feature of the Irish tax system, which is likely to become even more accentuated in future as the income tax appears to have lost its capacity to return an elastic yield. An increase of £145,000 during a year when the standard rate was raised must be regarded as very disappointing.

Increased Expenditure

The increase in expenditure was accounted for almost entirely by the increased cost of the Army. While increases took place in some of the social services, for example education, unemployment assistance and old age pensions, compensating decreases occurred in other directions, and had it not been for the needs of the Army, the cost of the supply services would have remained the same as last year. When a longer view is taken, however, it will be realised that the existing budgetary difficulties cannot be attributed solely to the effects of the war, as the cost of government in Eire has been steadily increasing for many years. The total expenditure in the year 1932-33 was £28,849,739, as compared with £34,395,023 last year, which included seven months of war. The estimates for the supply services for 1940-41 show a reduction of £911,000, but he would be an optimist indeed who did not contemplate supplementary estimates in the course of the year. Moreover, the Central Fund services are increasing with the growing debt.

The figures "below the line" in the Exchequer Return show the result of the issue of the 4 per cent. Exchequer Bonds, which brought in £7,000,000. Temporary borrowings outstanding, which amounted to £3,150,000 on March 31, 1939, were entered at "nil" for March 30, 1940. The balance in the Exchequer increased from £638,124 at the opening of the financial year to £3,622,569 at its end, so that the position of the Minister for Finance is comfortable at least temporarily. How long it will remain so depends upon the way in which existing taxes continue to yield and upon the increased rates which will doubtless be imposed in the approaching Budget. There is no gainsaying that the coming financial year will be a difficult one. Many sources of revenue have diminished as a result of the war, while others have reached the limit of elasticity. Further borrowing will almost certainly be necessary in the course of the year.

The difficulties of the Minister for Finance will be fully shared by the taxpayers, who have become resigned to ever-growing burdens. When the revenue of over £32 millions is added the local rates and the widespread concealed taxation imposed by the policy of protection, the Irish taxpayers must be disgoring not far short of £40 millions. As the national income is estimated at about £150 millions the cost of government is unduly heavy. The most serious problem is the failure of the national income to expand while public expenditure is expanding in every direction. The economic condition of Eire calls for the most expert and objective investigation with the object of increasing the national income by exploiting to the full the natural productive resources of the country. The Report of the Banking Commission contains much excellent advice about what errors should be avoided and, if necessary, remedied in the monetary and financial system; but there is now needed a more positive and constructive inquiry with a view to planning an increase in productivity. If some such plan be not prepared the country may prove to have become financially top-heavy with the disagreeable consequences that other countries have experienced in a similar condition.

Slovakia—Captive of the German Clearing

[BY A CORRESPONDENT]

It is exactly a year since the so-called independent State of Slovakia was created—a political event standing, through its economic results, in sharp contrast to the many historical changes of the past two years.

The Austrian Anschluss, the return of former Czechoslovak territory to Hungary, the seizure of the Sudetenland by Germany, the establishment of the "Protectorate" of Bohemia and Moravia, the occupation of Danzig and Memel, and the conquest of Poland signified the incorporation of territories in large economic units. But Slovakia underwent a precisely opposite development. After belonging to an organism that functioned more or less satisfactorily, it was torn away and placed on its own feet. As its feet were weak and unsteady, the new dwarf State was compelled, as its Nazi midwife had intended, to seek the close support of its mighty neighbour, now in control of Bohemia and Moravia, with which Slovakia had previously formed an economic group. Thus it became a vassal State.

The bulk of Slovakia's exports go to territories where the Reichsmark holds sway, and where accordingly all payments take place through clearing arrangements. It was not many months before the country became the bond-slave of German or Protectorate clearing arrangements. For the more or less long-term blocked clearing demands of Slovakia amount to over a milliard crowns, of which 850 millions, according to the recently published report of the Slovak National Bank, are owed by the Reich and the Protectorate. At the same time the National Bank did not possess as much as 100 million crowns in free currency, though the State's total net circulation amounts to about 1,400 million crowns.

Difficulty of Imports

Germany has induced Slovakia to sign an agreement to provide the Reich with 30,000 agricultural workers and 25,000 artisans during the current year. Slovakia has always supplied a large contingent of so-called emigrant-workers who live very modestly abroad and send a large part of their wages home to support their families, but now the German currency authorities no longer permit this practice, and the workers' savings have likewise to make their way through clearing machinery, a process which takes six months or more.

As the workers' families are not able to wait so long, the Slovak Government has to make them advances, and this disturbing position has caused leading Slovaks to urge in Parliament the replacement of exports of men by exports of goods. However, Slovakia has no export difficulties so far as Germany is concerned, for she can easily sell almost all of her surplus products to the Reich. The difficulties are rather with imports, for Germany either cannot supply the goods needed by Slovakia, or can do so only at excessive prices. Even a drastic reduction on December 1, 1939, of tariffs on many German commodities, including iron and steel, textiles, cars and chemicals, had little effect. Recently, Germany has agreed to deliver 100,000 tons of coal and coke a month, in order to reduce the clearing balance. Finally, the clearing account is to be relieved by repatriating from the Protectorate shares in Slovak companies. The official accounts say nothing of one important matter, the payment of transport, billeting and other expenses of German troops, which now enjoy the right of passage through Slovakia.

An Impoverished People

Apart from all other considerations, the rigidity of the clearing arrangements are a danger to Slovakia, poor in raw

materials as she is, since she cannot, in spite of her favourable trade balance, obtain the currency to buy raw materials for her own industry. Thus the textile industry complains that it can get neither raw wool nor worsted from the Protectorate, but only substitute materials at best, for making up which the technical equipment is lacking. Although the milling industry is only 30 per cent. occupied, there is a marked shortage of sacks. There is even insufficient currency to get necessary supplies of lard from Yugoslavia. The extremely low standard of living, which has been depressed still further by recent price increases, constitutes the gravest economic problem of Slovakia's domestic policy, and the Government wishes to meet incipient social tension by vigorous price control. For the Price Commissariat is faced with an almost insoluble task, for it can fight only those factors caused by fears of inflation, such as hoarding of goods. These, however, are secondary. The main factors are the increased cost of raw materials on the world market and, above all, the incomparably higher price level in Germany.

Further restriction of consumption is not possible, and so there remains only the method of wage increases, and this has already been adopted in certain instances. Yet it is felt that this development must be prevented by all possible means, since it would bring inflationary tendencies too strongly to the fore. Inflation would have been far more marked had not the young State administered its financial affairs with discretion, and kept its budget in good order in spite of military expenditure. The budget for the past year was favourable, and that for 1940, with revenue of 1,467 million crowns and expenditure of 1,508 million crowns, shows only a small deficit. The State loan of last year brought in 350 million crowns.

The Government is further seeking to head off social tension by the announcement of great land reforms. The breaking up of large landed holdings in South-East Europe during the past two decades has made tremendous progress, and the Slovak Government aim at splitting up 2,470,000 acres of latifundia. Those economic reforms, too, which do not arise from social considerations, are mainly concerned with agriculture. Slovakia is steering towards a peasant State of fairly small farms, and her economic policy has this structure in mind.

In theory, Slovakia's economic independence will be complete on September 1st of this year, for that is the date when the customs union with Bohemia and Moravia, maintained for a transition period, comes to an end. In fact, however, the country's entire economic policy—and not only economic policy—follows German requirements.

Jugoslavia's Trade Relations

[FROM OUR BELGRADE CORRESPONDENT]

THE hard winter and the war have imposed an unusual economic strain and brought about a general rise in prices. External trade last year showed an export balance of 763.7 million dinars, with exports 5,521.2 million dinars and imports 4,757.4 millions. This, however, was not due to any expansion of export trade, but to a fall in imports.

Under the stress of declining imports and of exports directed mainly to clearing countries, principally Germany and Italy, it is more than ever necessary for Yugoslavia to maintain her present trade relations and to extend her markets wherever possible. It is essential to ensure the import of raw materials, and the growing armament requirements face her with the necessity of obtaining foreign exchange to pay for purchases from non-clearing countries.

In order to maintain present markets, negotiations are in preparation with Italy, Greece, Germany, Hungary and some other States for the adjustment and adaptation of existing agreements. To ensure imports of raw materials and sufficient foreign exchange it is essential that Yugoslavia extend her export markets, since the present markets come under the clearing system. The trade and financial delegations now in London are expected to achieve some concrete results in this respect. One trend, however, is already clear. Since the recent Balkan conference in Belgrade, the Balkan States have been working for the development of mutual trade on the one side and for a unified economic front on the other, and the newly established Chambers of Trade with Roumania and Bulgaria are witness that this policy is being seriously pursued.

March 28th.

"IT'S JUST PLAIN COMMONSENSE"

WHAT is the reason for the constantly growing net sale of the Daily Express?

No efforts have been made to develop it.

Yet nearly every month there is an increase. And, occasionally, a remarkable increase.

The answer is quite plain.

The Daily Express is the newspaper of all men and women who have commonsense.

The Daily Express takes a sound view on public events and occasions.

The newspaper supports a vigorous, determined and aggressive war policy.

It is in enterprise, adventure, audacity and violence in the prosecution of the war that we have the right to hope and expect an early victory.

Yet this war was opposed by the Daily Express. The newspaper did not advise it and did not wish to embark on it.

But now that the war is upon us, the Daily Express is confident that out of it will emerge an Empire completely united on economic lines and with a common political purpose.

And it is this very object for which the Express newspapers were founded. It has been the sole reason for the vigour and energy with which the enterprise has been directed.

2,573,962

copies of the Daily Express were sold each day during the month of March

DAILY EXPRESS

Following is the auditors' certificate for the month:

We have examined the books and accounts of the London Express Newspaper, Ltd., and certify that the average net daily sales of the Daily Express at the recognised trade terms or published prices (as defined by and arrived at in accordance with the instructions of the Audit Bureau of Circulations, Ltd.) during the month of March 1940, were 2,573,962 copies.

DELOITTE, PLENDER, GRIFFITHS & CO.

Germany at War

(An objective account of economic trends in the Reich compiled weekly by the editorial staff of The Economist from German and neutral sources.)

ON April 2nd, a very complex plan for storing household coal during the summer months was introduced. It is, in effect, a rationing scheme for household coal, but the decree gives no figures for the actual ration. The scheme covers the period up to March 31, 1941, and distinguishes three categories of consumers: households with separate stoves; houses with central heating and hot-water service; and agricultural and industrial undertakings which are not already on the priority list for supplies of coal. A percentage (not stated) of the actual consumption during 1938-39 will be supplied directly to consumers or to coal merchants in cases where consumers have no storage accommodation—in big towns the average household as a rule has no storage space at all. Credit facilities will be extended to coal merchants storing coal for small consumers.

Germany is divided in three climatic zones, and the stocks will vary according to the severity of the climate, which is most severe in Central and, especially, Eastern Germany.

* * *

Tax Certificates.—Total issues of the tax certificates introduced under the New Financial Plan on April 1, 1939, amounted to Rm. 4,832 millions, when the issues ended on November 1st last year. The fourth decree supplementary to the original decree which instituted the New Financial Plan was published on April 1, 1940, and finally suspended the use of tax certificates as a means of payment. It will be remembered that 40 per cent. of an account could be paid for in tax certificates at their face value. During last summer the price of tax certificates decreased to the low level of 93½ per cent., which made them a failure as a further means of financing State expenditure. Manufacturers became eager to buy tax certificates in order to effect their payments at an advantage, and the Government had thus to restrict the percentage of accounts payable in tax certificates to only 20 per cent.

Recently, the price of tax certificates followed the general upward trend of security prices. The decree forbidding the use of tax certificates as a means of payment led, however, to an extraordinary supply of them on the Bourse, and prices fell again. From now on, dealings in tax certificates will probably fall to a minimum, and the certificates have assumed the character of an ordinary Reich loan.

* * *

Capital Issues.—The extensive capital issues which reached a record level in the first two weeks of March have come to a standstill. The total value of industrial loans issued since the introduction of the New Financial Plan on April 1, 1939, reached Rm. 911 millions by the end of last month. Thirty-one loans amounting to Rm. 536 millions were issued after the outbreak of war. The leading industrial groups shared as follows in the capital issues made after the war started:—

	Rm. millions	In % of total
Coal and iron industry	221	41.3
Electricity and gas industry	155	28.9
Chemical and potash industry ...	69	12.9

The rest, amounting to 16.9 per cent. of the total of Rm. 536 millions, was shared by companies manufacturing synthetic petrol, cellulose and paper. During the early months of the war the public were reluctant to subscribe to the standard type of loans bearing 4½ per cent. interest, and later most issues changed to 5 per cent.

The present pause in capital issues does not mean that capital issues are to fall off altogether. The programme of industrial expansion has by no means come to an end, though it does appear that new programmes may be carried out by resorting to bank credit. The general increase in security prices, on the other hand, will probably result in a return to the 4½ per cent. type of industrial loans if new issues should be made.

Another interesting example of the activity of the capital market is the growth in the circulation of mortgage bonds issued by the Mortgage Bond banks, i.e. *Pfandbriefbanken*. These banks are the leading institutions for financing building. The net annual increase (+) or decrease (−) in the circulation of mortgage bonds has been as follows.

	Rm. millions
1928	746.6
1930	1,246.9
1932	257.9
Average 1933 to 1938	135.3
1939	664.2

The high figure for last year indicates that private capital again began to participate in building finance. In former years building was predominantly financed by public orders or by public credit. It becomes clear from the annual reports of the Mortgage Bond banks that private credit was increasingly used last year for financing small dwelling houses. The figures are interpreted by the German Press as showing that the capital accumulated by the mortgage banks may go very far even towards financing buildings for war purposes. Private building is hampered by the acute shortage of building materials. The erection of new buildings has been forbidden, but reconstruction of small flats and the building of workers' flats near new industrial plants will be aided by special credits. After the outbreak of the war it was thought possible to carry out a building programme in 1940 amounting to three-quarters of the normal demand, but it now seems doubtful whether this programme will be carried out.

* * *

Industrial Trends.—German industrial companies reporting for the calendar year 1939 show an interesting stability in profits and dividends. The *Frankfurter Zeitung* analysed the reports of 115 companies and found that 70 per cent. of them paid the same dividend as in 1938, 13 per cent. reduced the dividend and 17 per cent. increased it. The companies which reduced their dividends were mostly in the textile industry. A detailed analysis of 31 companies gave the following result:—

	(Rm. millions)	Net profits	Dividend	Taxes
In 1938	23.94	17.41	53.25	
In 1939	25.43	17.47	65.09	

The most remarkable item is the increase in taxes. Generally speaking, the ratio between production costs and earnings remained favourable throughout 1939.

The *Reichswerke Hermann Goering*, which in recent years rapidly grew to be the third biggest German industrial company, have again extended their influence. Several coal mining groups of the leading coal mining company *Harpener Bergbau A.G.*, have been transferred to them, in exchange for lignite mining interests. The transaction is explained by the claim that the national interest demands a new coal basis for the Hermann Goering Works. It may be remembered that the works chiefly use low-grade German iron ore, the working of which demands enormous quantities of coke, and it seems that the experiments in using coke manufactured from lignite have not been very successful. The purchase of substantial coal mining interests had thus become a necessity.

* * *

Coal for Italy.—The Press reports that, since February, the monthly supplies of coal to Italy have amounted to 500,000 tons. This quantity will now be doubled. Each month, 610,000 tons from the Ruhr area, 340,000 tons from Upper Silesia, and 50,000 tons from the Saar territory will be transported to Italy; and 65 coal trains will pass daily through the seven frontier stations. It remains to be seen, however, whether the railway system will be capable of carrying out such a programme. It may be possible that the turn-round of the trains can be arranged in such a way that on their return journey they will carry goods from the Balkan countries, especially Yugoslavia—the transport of Yugoslav bauxite to Trieste may be a pointer to this.

* * *

South-Eastern Europe.—The Director at the German Ministry for Economic Affairs has announced that the Ministry is considering the concentration of all financial relationships with South-Eastern Europe in one body to be called the South-Eastern European Corporation and domiciled in Vienna. It is estimated that the Hungarian wheat crop may be as much as 33 per cent. lower than last year, leaving very little for export. At least 20 per cent. less acreage was sown with wheat than last year.

Books and Publications

German Race and Universal Truth

It is well known that Germans have certain delusions about themselves. They claim that they are a race basically free from alien blood and distinct from any other human strain; that it is their destiny to appropriate an increasing part of the earth's surface because they are superior to its present inhabitants; that this process of expansion must be accomplished under great leaders to whom it is natural and beneficial for Germans to submit; that they lead the way in material progress; and that they round off their greatness by possessing a unique and superior culture.

The constant reiteration of race claims produces dangerous results and denials become a continuing necessity. Refutation is an essential task which must be as well done as possible. The world stands in need of the perfect refuter. He must not be a member of a nation which is, by force of circumstances, anti-German, nor must he be a German himself. He must be above the present conflict and approach the race question in a spirit of detached inquiry. He must be sufficiently learned to know the facts about the evolution of the German people and of sufficient authority and moral stature to pronounce judgment on their claims.

That Thorstein Veblen was such a man is not likely to be denied by anyone acquainted with his life or any of his numerous works. Veblen was an American of Norwegian extraction who stood completely apart from racial prejudice; a great scholar and an authority on precisely those subjects which are relevant to an appraisal of German race claims: a philosopher whose powers of analysis were applied to human history and behaviour; and a subtle and painstaking writer. He cannot be accused of taking sides in the present war, since he died before it began.

His book "Imperial Germany and the Industrial Revolution" first appeared in 1915, when the United States were neutral as between the Allies and Germany. Veblen himself was then, and remained, both practically and morally a neutral. Starting from positive premises, and not from a negative wish to refute any previous argument, he demonstrated with overwhelming historical evidence, close reasoning and abounding good humour that the Germans owed their racial survival and success to the facility with which they mixed with their neighbours; that their tendency to overflow geographical boundaries was due not to envious high destiny (or "Providential nepotism") but to an ascertained (and scientifically explicable) willingness to become followers of ambitious and unscrupulous leaders; that the state in which they were best fitted to survive in peace and happiness was not totalitarianism, but a "quasi-anarchistic neighbourhood autonomy"; that their unambiguously magnificent contribution to material progress was due to their capacity as intelligent imitators rather than as due to their capacity as intelligent innovators; and that far from possessing a superior "culture" they had invented that term to express something which is in fact a hindrance to material progress and with which they have not recently been encumbered.

It is difficult for Englishmen who live in an ever-thickening atmosphere of anti-German propaganda, and who have unconsciously reacted to protect themselves from that atmosphere, to realise that the case against German racial claims really can be scientifically and finally stated. But there is no reason why claims so absurd should not be refuted. The sad thing is that, being absurd, they should be so often and so solemnly repeated and their denial become so essential. Veblen, though setting out only to examine a particular trend in German development, did the job once and for all. It is indeed fortunate that his book is again available to the British public, with all its gracefully presented learning, its tolerant and almost flippant detachment and its pre-eminent readability.

THE BUSINESS WORLD

Steel in War

THE lengths to which Germany went this week—partly in an attempt to safeguard her supplies of Swedish iron ore—emphasises the importance of steel in the present war. Without an adequate supply of steel it will be impossible for the Allies to gain the margin of superiority in equipment which they need in order to defeat the enemy. It is therefore absolutely essential that our steel furnaces should be kept in operation day and night and that available supplies should be distributed to the best advantage.

At the end of 1938 the United Kingdom's capacity to produce crude steel was estimated at about 14½ million tons per annum. Much the most important problem at the moment is not the expansion of this capacity but the maintenance of the flow of raw materials to the existing furnaces. The two principal ingredients of steel are iron and steel scrap and pig iron. The proportions in which they are used can be varied, but in recent years scrap has become the chief ingredient. In 1937, for example, the British steel industry used 11.5 cwt. of scrap and 9.6 cwt. of pig iron for every ton of steel produced. As the United Kingdom's capacity to produce pig iron was assessed at some ten million tons per annum at the end of 1938, it seems at first sight that any shortage of scrap could easily be made good by an increase in the proportion of pig iron charged into the steel furnaces.

This solution of the problem, however, is not very satisfactory, for a substantial proportion of our supplies of iron ore—the chief raw material of pig iron—is derived from abroad. Thus, in 1937, when 8½ million tons of pig iron were produced, the iron and steel industry consumed 13.9 million tons of domestic ore and 6.2 million tons of imported ore. In addition, 9.7 million tons of coke—equivalent to 14.4 million tons of coal—were required to smelt the ore in the blastfurnaces. The output of domestic ore, which is chiefly of a low iron content, cannot be increased substantially at short notice. An appreciable expansion in imports, again, is scarcely desirable, for iron ore is a very bulky commodity and requires much shipping tonnage. Indeed, in case of a serious shortage of steel it might be preferable to import larger quantities of semi-finished steel rather than a heavier volume of ore. Incidentally, a stoppage of ore supplies from Scandinavia, while raising

certain technical problems, would not be disastrous and could probably be made good by increased purchases in Algeria and Tunis, for example.

But the only alternative to an early and appreciable expansion in the output of pig iron is an increase in the supply of domestic scrap. The scrap produced by the steel works and in further manufacturing processes is already being carefully collected, and no net addition to supplies can be expected from these two sources. But there is a potentially enormous supply of scrap in derelict or unused buildings, factories, bridges, rails, park and garden railings, etc. Much of this supply can probably be reclaimed at a reasonable cost. A survey of the potential scrap resources—possibly through its local organisations—should therefore be made by the Ministry of Supply without delay. And if the garden railings are required the public is unlikely to withhold its consent to their removal provided it is informed, with sufficient authority and persuasiveness, that this step is really necessary.

Given a certain measure of foresight, there should be no insuperable difficulty in maintaining the flow of raw materials to the steel furnaces. A subsidiary, though very important, task is to ensure that the available steel supplies are allocated to the best advantage and that the steel thus

assigned is in fact delivered when it is required. So long as steel is scarce—and it is certain to remain scarce during the war—it will be quite impossible to satisfy all requirements. Control was therefore essential. The system of control introduced after the outbreak of the war, by which all consumers with the exception of Government Departments and certain other users had to secure licences for their requirements, was unsatisfactory; it neither ensured the allocation of supplies to the best advantage nor the delivery of the authorised quantities at the dates at which they were required. The Control of Iron and Steel (No. 8) Order (which came into force on April 8th) introduces an entirely novel system of allocation and distribution. The essence of the scheme is that it provides machinery for the equation of demand with supply during quarterly periods, not, of course, by allowing prices to vary, but by the allocation of the estimated supplies of home-produced and (presumably) imported steel to individual consumers and for specific purposes.

To forecast supplies accurately is in itself no mean task, but this has to be done in any case. For this purpose individual steel products have been grouped under various headings. On the basis of the ascertained output capacity under each heading, supplemented by weekly reports from individual manufacturers, it has been possible to forecast the production of each. And as orders for imports are known, the Iron and Steel Control is now in a position roughly to estimate total supplies some time ahead. But these estimates, on which quarterly allocations are based, are not infallible. An interruption of production through lack of raw materials or as a result of air raids, the loss or delay of deliveries from abroad, could easily play havoc with the forecasts of the supply of individual products; and if this happens, some consumers will not be able to secure their rations. The new system, therefore, provides no absolute guarantee of supplies. But in view of the probability that any interruption in production will not affect all plants simultaneously and that there will

be scope for a redistribution of raw materials, it is hoped that the conservative scale of production budgeted for will in fact be attained.

The allocations themselves must needs be based on the forecasts of the supplies of individual products. The Central Priority Committee—which, in case of disagreement, will presumably consult the War Cabinet—is responsible for assigning steel to the main groups of consumers. It will, therefore, depend largely on the Committee's judgment whether steel is used to the best advantage. The main classes of consumer have been grouped under twenty Government Departments; these have the task of allocating the global tonnages assigned to them by the Central Priority Committee to individual firms or users. The Departments, together with the consumers or services for which they are responsible, are listed on the previous page.

These Departments, in conjunction with the Iron and Steel Control, will also have the task of seeing to it that the consumers and services for which they are responsible will in fact obtain the supplies assigned to them. Individual consumers, however, will continue to order their requirements from individual manufacturers, who have been advised not to accept orders in excess of their capacity to supply. And, in order to prevent confusion, consumers, in placing their orders, will have to quote symbols showing the Department responsible for them, contract or reference numbers indicating the purpose for which the steel is to be used, and delivery period numbers with a statement of the quantities involved.

Sound though this scheme for allocating and distributing steel may be in principle, it would be idle to pretend that it will be easy to operate, at least to begin with, or that it may not require amendments of detail in the light of experience. But, looked at in the round, it does represent an attempt to solve the urgent problem of ensuring that the available steel supplies are used to the best advantage and that individual consumers will be able to obtain their rations at specified dates.

GOVERNMENT DEPARTMENTS AND CONSUMERS OR SERVICES FOR WHICH THEY ARE RESPONSIBLE

Government Department	Consumers or Services
Home Office	Home Office services, e.g. prisons, police, approved schools, etc.
Ministry of Home Security	Requirements for camouflage, screening blast furnaces, etc.
Admiralty	Steel for A.R.P. (including Scotland). Navy requirements.
War Office	Mercantile shipbuilding and repairs. B.E.F. requirements, Army buildings, medical stores, fuel and light.
Ministry of Supply	All other requirements for Army. Machine tools, small tools and gauges. French Government requirements, direct or indirect.
Air Ministry	Schools, hospitals, housing schemes, police stations, prisons, special areas factories, agricultural buildings, land drainage works, piers, etc., water supplies, sewerage.
Scottish Depts.	(1) Gas undertakings. (2) All Home Civil requirements except where specifically included under another Department. (3) Miscellaneous agricultural requirements other than agricultural machinery and buildings. (4) Indirect Exports (i.e. exports of finished goods) excluding requirements of B.E.F. and oil companies and French Government requirements. (5) Direct Exports, excluding requirements of B.E.F., India and oil companies and French Government requirements.
Board of Trade	Schools. Ministry of Health services, e.g. hospitals and housing schemes, water supplies, sewerage. Agricultural machinery, including Scotland. Agricultural buildings and land drainage works, excluding Scotland. Railways (including all wagons used on railways), ports, canals, highways, tramways, works and buildings for Ministry undertakings. Motor vehicles and trolley vehicles, gas producers for motor vehicles. Provisions of tins and packing material for food, including food for service requirements. Food factories and buildings for storage and distribution. Certain new factories and buildings and internal requirements thereof. Certain Government stores and equipment. Fire-fighting appliances. Post Office requirements. Requirements of all mines and quarries. Oil companies' requirements, both home and export.
Board of Education	Electricity supply industry covering generating stations, the Grid and distribution systems.
Ministry of Health	All public services for Northern Ireland.
Ministry of Agriculture and Fisheries	All finished steel for direct export to India.
Ministry of Transport	
Ministry of Food	
Office of Works	
General Post Office	
Mines Department	
*Petroleum Department	
*Electricity Commissioners	
Northern Ireland	
*India	

* For the purpose of this scheme these are regarded as a Government Department.

The Future of Private Banks—II

AN article in last week's issue described the contribution which the private banks had made to the development of British banking activities overseas, and we sketched the very valuable specialised position which the merchant banks had carved for themselves in the credit system of this country. We pointed to the difficulties which these institutions have had to contend with since the end of the 1914-18 war—difficulties latent and undetected at first, becoming more apparent in the 1930's, and crystallising into much more specific and formidable shape with the outbreak of the war last September. This last phase has been unhappily underlined by events in Scandinavia during the past week. The immediate future, leading us inevitably into an intensified war economy, can promise no relief from these difficulties. Government controls and monopolies have involved the temporary eclipse of the merchanting community, a tendency which must affect banking as well as the commodity markets. But after this war has run to its successful conclusion, will a world emerge in which the merchant banks will be able to pick up the threads of their unfinished task and to play a useful rôle? For the expression of clear, logical thinking on this subject by the authorities in the Allied countries we have to turn again to M. Reynaud. Here is what he said in a speech before the Senate, discussing the immediate and longer term implications of the Anglo-French monetary agreement:—

What will this post-war period be for which this agreement prepares? . . . Will the country be completely transformed and will the State absorb everything? No doubt the State will at the conclusion of hostilities play a principal part in changing over the country's economy to a peace footing and in linking it with the economies of neighbouring countries. But does that mean that an all-powerful totalitarian State will arbitrarily fix prices and salaries, that it alone will be entitled to conduct production, to control capital, to command profits, to cover losses? That would be a despairing view if it were true. First of all because the first months of war have given a full taste of an authoritarian regime (on that subject everyone is agreed) and, above all, because any State which at the conclusion of hostilities controlled all the wealth of the country and was able to regulate all its activities would thereby have power to oppress freedom of conscience and to suppress all those fundamental liberties which make life worth living. Why, then, fight at all?

The sentiments expressed in this quotation are those that must be echoed by the vast majority of responsible opinion in this country. From them there emerges a picture in which the functions of the merchant banks will not clash uncompromisingly and into which these institutions should be able to merge, given the resilience and adaptability of which they have, in many cases, given proof. In the world which, by implication, may be conjured up from M. Reynaud's remarks there will be room for the activities of the specialist banking institution engaged more particularly in the financing of foreign trade. The knowledge and attributes which such business demands will appertain more readily to the comparatively small, compact unit, able to specialise on certain markets and directed by partners or directors having personal knowledge of their overseas clientèle. The personal element in credit standing will never disappear, and that element, when it has to be weighed and assessed in foreign fields, will escape the impersonal joint-stock institution more readily than the efficiently organised and well-represented private bank. Moreover, merchant banking calls for adaptability and rapidity of decision, qualities which should come more easily to the comparatively small enterprise, directed more often than not by one dominant personality not compelled to refer decisions to a committee of directors and ultimately responsible to no large body of shareholders.

None the less, even the most rose-tinted spectacles will not hide the fact that the merchant banking community cannot enter into this promised land with its ranks unthinned and its sinews strengthened. The blows of the past

decade have left their inevitable mark on the resources and powers of resistance of some of the houses concerned. One or two of them are obviously destined for orderly liquidation or fusion into some other entity. For all others, a problem of adjustment will have to be faced and solved. Some of the business on which they developed has either gone for good or has had its flavour taken from it. With the reckoning which now becomes possible, the time has arrived to admit candidly that international acceptance business, for example, has in recent years been a much overrated form of banking enterprise. Partly owing to the intrusion of the joint-stock banks into this business, the rates charged for it have not, for some time past, borne a reasonable relation to the risks involved. The position is being remedied at this time, but it is rather late in the day. It should have been a guiding principle in international acceptance business that no such facilities could be granted unless the debtor maintained with the accepting bank funds at least adequate to meet all outstanding bills accepted for his account. The merchant banks, moreover, should not have made the mistake of following the joint-stock and American banks in granting large lines of open-credit facilities to foreign banks. When the problem of financing foreign trade is tackled in the post-war world, it is to be hoped that a return will be made to the sounder principles of the documentary credit which will not allow the abuse of the acceptance credit such as occurred during the 1920's. In any case, it will be well not to over-estimate the extent to which London will be able to resume its traditional short-term lending activities in the period immediately following the cessation of hostilities. The scope for such business will depend upon the state of the remaining gold and exchange reserve, and on the balance of our international payments. A period of recuperation is likely to be essential during which, no doubt, all the emergency machinery of bilateral clearings, though being gradually wound up, will still be available for financing the resumption of peacetime international trade.

It must also be realised that, apart from this general argument against the early revival of short-term foreign lending by the merchant banks after the war, there is the more particular argument that the period of enforced idleness to which they are being condemned "for the duration" must militate against an immediate vigorous resurgence on their part. From this point of view the merchant banks might have been treated by the authorities with rather greater benevolence—one might almost say "fair play"—in such matters as the distribution of the available foreign exchange business. The joint-stock banks had made considerable inroads into this sphere during the two inter-war decades. But is there any solid reason why that encroaching movement should receive official support at this time of strain for the merchant banks? It has received such support by the very fact of debarring merchant banks from the list of authorised dealers. Admittedly they are as free to deal in foreign exchange as the authorised joint-stock banks; but few will deny that the more restricted initiative of the unauthorised dealer in "vetting" his clients' business and giving decisions, together with the advantage which authorised banks have over most others in dealing "net of commission" with banking clients, have meant that an increasing proportion of the available foreign exchange business has in fact been passing to the joint-stock banks. When the race for foreign exchange business begins again after the war and is conducted under freer conditions, when ability to deal and to advise on points other than the filling up of forms will again be at a premium, the merchant banks will no doubt recover some of this lost ground. But it is unfortunate and unfair that this handicap should have been placed upon them.

In the period of reconstruction that must follow the war, long-term capital must again be set moving in international circulation—let us hope in a movement more intelligently co-ordinated than was that of the 1920's. In initiating that flow Great Britain must inevitably take secondary place to

the United States, which by the end of the war looks like holding as near the whole of the world's monetary gold stock as makes no matter. Indeed, that gold will have become valueless unless the international circulation of capital is again put under way. In the big international loans that will accompany the progress of this enormous reconstruction, the London merchant banks, working in conjunction with associates in the United States, should find some scope for their specialised knowledge and for the organisation built up over decades of similar activity.

Then there is the domestic field, where two distinct trends of development have been apparent. The first is the repopularisation of the domestic acceptance credit. Here, let us be candid, the results achieved have been far from spectacular. The bill habit, once lost, is very difficult to reinduct, and the main scope for such business has been and remains in the totally new sphere of hire-purchase finance. In this particular business the merchant banks have been active, but they are competing with specialist institutions which probably command the bulk of the business. The other direction is the forging of closer and more permanent financial relations with domestic industry. There has been evidence of such a movement among a few merchant banks, and though it leads in a direction diametrically opposed to the whole traditional trend of British banking, it may hold out profitable scope for certain of these institutions.

The success with which the merchant banks as a whole will meet the challenge of the post-war world must depend to some extent on the success with which they can sustain the lean period with which they are faced in the immediate future and conserve their resources. In tackling this problem it is evident that some concentration of forces will ultimately have to take place within this group of banks. That movement is unlikely to follow the precedents of the earlier development among private banks serving the domestic field. However justified may have been the process by which thousands of private banks in Great Britain fell into the jaws of the joint-stock mammoths over the past century, the parallel cannot be applied even on

a minor scale to the merchant banks. Their type of activity and the qualities for which it calls are not those that can be stereotyped, mechanised and dehumanised to the point at which they will fall logically into the orbit of large-scale joint-stock enterprise. The comparatively few instances in which the public joint-stock company has embarked on this particular field of activity have not yielded results that promise well for this particular solution of the problem. Rather must the integration be a welding of essentially similar and complementary units which will preserve the individuality and traditions of the component firms.

To sum up, it seems that the merchant bank is too typical and solid a product of British banking evolution to be "sunk without trace." As a whole these institutions have been hard hit and must expect uncongenial conditions while the war lasts. Their numbers are certain to be reduced by gradual liquidation—a process which has already begun—and, later, by amalgamations. But the stronger and more adaptable among them should not merely survive the war but live to play an important rôle in the world that will emerge from it. Some of them will no doubt continue a trend already apparent in forging permanent financial links with domestic industry. These may well come to fill that gap of which the Macmillan Committee complained in its remarks on the British capital market—the difficulty which the comparatively modest industrial concern encounters in satisfying its needs for longer-term credit than the deposit banks can grant. But for most of the merchant banks the scope of activities must remain overseas. It may well be that the "merchanting" part of their business will once more become dominant. There will certainly always be room for the alertness and adaptability of the most efficient of them. They have in the past brought a rich harvest to this country—not merely by the direct profits of their ventures, but through all the incidental income from their merchanting and intermediary activities, income which but for them would never have come to this country. We shall certainly have need of that revenue in the future.

Finance and Banking

Danish and Norwegian Crowns.—The control of the foreign exchange market has prevented the dramatic moves in the military and naval situation from having appropriately dramatic effects on the level of foreign exchange rates. After the occupation of Denmark on Tuesday, the Danish crown was suspended from the list of currencies quoted in London. The Norwegian crown was first quoted nominally at the former official rate, but on Wednesday it was also withdrawn from the list of quotations. The suspension of dealings in these two currencies was accompanied by instructions to London banks to block all Danish and Norwegian sterling accounts for the time being. The Belgian and Dutch currencies have sustained some pressure, but only the belga has fallen slightly against dollars. Sterling's behaviour in the free markets has been remarkably good given the absence of support for the rate, the "emotional" disturbances to which it has been subjected this week and the further curtailment in the demand for free sterling arising from the new Argentine regulations described in a subsequent Note. The rate in New York, which had closed last week at 3.58½, was already weakening on Monday of this week, when it touched 3.55. On Tuesday the shock of the Scandinavian developments caused a momentary slump to 3.44, followed on Wednesday by a recovery to 3.49½ with the more auspicious turn of events. On Thursday the improvement continued.

The Golden "Swag."—Reports still differ as to the fate of the gold reserves in Denmark and Norway. Both countries were placed at a disadvantage by their respective statutes in disposing of their gold with the precautionary care which the position has for some time past

demand. The Bank of Norway was forced by statute to keep the whole of the gold ranking for reserve in Norway. The amount thus held on March 30th last was Kr. 120 millions, which at the nominal parity at which the reserve was still calculated was worth some £13 millions. In addition, there was Kr. 65,600,000 of gold not included in the reserve and probably held abroad. There is a great hope that the whole of the above gold may have been got to safety before the German occupation of Oslo. M. Hambro, the President of the Storting, has stated that it left Oslo at the same time as the Government. In Denmark, the reserve of the Central Bank amounted to Kr. 117,100,000 equivalent to slightly over £12,000,000, on March 20th last. The whole of this appears to have been maintained in the capital, and though there are conflicting reports as to the fate of the reserve, it seems all too probable that the suddenness of the invasion provided no chance of its removal to safety. Here again, the obvious precaution of placing the metal in safety many weeks ago had not been taken because it would have involved a change in the statutes, which require the bulk of the reserve to be held at the head offices of the bank. The latest example of German robbery with violence has not yielded a cash return commensurate with the ultimate costs of the coup.

Next Monday's Test.—Conditions in the money and discount markets have remained almost absurdly indifferent to the latest turn of hostilities. Throughout this breath-taking week money has remained in very good supply at ¾ to 1 per cent., the clearing banks have been persistent buyers of the longest eligible July paper at 1 per cent., and the effective rate of discount for three

months' bills has not budged from the previous level of $1\frac{1}{2}$ per cent. Indeed, the business concern of the market has been much more directed to so technical a problem as the huge turnover of funds that must occur next Monday than to the possible reaction of military and naval affairs on the rate structure. Up to last Saturday £137,400,000 had been paid up on the new War Loan, leaving £163,600,000 to be transferred this week and on Monday next, the day when the second and final instalment of 90 per cent. is due. The whole of this sum will not be paid on that day. Official subscriptions to the Loan will have considerably reduced the actual turnover of funds caused by the operation, and there is no doubt that prepayments have been taking place during the past week at about the steady rate they have maintained ever since the loan was issued. But, none the less, it may be assumed that an exceptionally heavy turnover of funds awaits the market on the first day of next week. No one has expressed the slightest fear that it may react harshly on market conditions. The authorities are no doubt taking all the appropriate measures to neutralise this transfer. Those measures will probably be the purchase of very short-dated bills from the clearing banks, a technique which is now the mainstay of open market policy. In any case bankers' deposits shown in the latest Bank return at £123,915,000 are at a level which provides a fair measure of resilience for the big movements of funds that are to come.

The Chancellor on Free Sterling.—Sir John Simon's statement on the free market in sterling made in the House last Tuesday added little to the information available to the public. There are certain points, however, on which the assurances given with the authority of the Chancellor will be read with much interest. The first concerns the relative unimportance of the free market. "I am satisfied that the proportion of transactions carried out out-

side the official market is a very small one . . . and becomes very much smaller still if we allow for the fact that a very great proportion of our purchases are made from sterling- and franc-using areas and do not involve the intervention of foreign currencies at all." Thus, Sir John could deny all suggestions that the rates quoted in the free market were an important factor in the cost of living in this country. The second point was his statement that "it would be a wrong policy altogether to intervene in support of sterling in the free market"—an expression of opinion from which one may, presumably, claim the Chancellor's authority for saying that there has been no such support. Thirdly, Sir John Simon strongly deprecated all suggestions that the offerings of sterling in the free market should be curtailed by "blocking" foreign assets in this country. The decision not to block was taken "in accordance with the principles and traditions on which, in this market, foreigners have always felt able to rely." Sir John asserted that foreign holders of sterling had not used their freedom to take their money out of this country "to any substantial extent."

Sterling Remittances from Argentina.—Steps have been taken by the Argentine and British authorities this week to ensure that all remittances of sterling from Argentina to this country are effectively canalised in the official market. The new instructions apply more particularly to remittances in respect of financial services which under the agreement of 1933 were entitled to the official rate. These remittances must now be made through authorised Argentine institutions at the authorised rates for sterling based on a sterling rate for United States dollars of 4.02. The recent fall in the free sterling rate had meant that a considerable flow of remittances from Argentina to the sterling area had in fact been taking a triangular route

(Continued on page 693)

MONEY MARKET NOTES

THE news of the spreading of the war had an immediate adverse effect on free sterling, and on Tuesday the rate in New York opened 11½ points lower at 3.44, closing at 3.46½. On Wednesday, however, the rate was steadier, and Thursdays war news brought a big recovery, the rate opening at 3.56. In London, there has been almost no change in the official quotations, though fears of a German invasion of Belgium made the belga weaker on Thursday, the rate rising from 23.55-70 to 23.65-80. The guilder, on the other hand, was unchanged. Quotations of Norwegian and Danish crowns have been suspended, but the Swedish crown remains officially quoted at 16.85-95 kr. Wednesday's improvement in free sterling caused the unofficially quoted currencies to move in favour of the pound on Thursday.

The money market has been virtually unaffected by the week's events, although on Tuesday there was a slight diminution in the clearing banks' demands for bills. The following day, however, they were as keen buyers as ever, and bond money was readily available at ½ per cent.

The Bank Return shows bankers' deposits at the unusually high level of £123.9 millions. This is chiefly due to a return of notes from circulation to the amount of £3 millions, which has been allowed to have its full effect on the credit base, for though Government securities and other securities are down by a total of £1.1 millions, discount and advances are up by £2.3

millions. This has offset the small rise in public deposits.

Silver Supported.—The sudden flare up of hostilities immediately led to speculative demands for silver, much of it coming from the Indian market. The spot price thus rose this week from 20½d. to 20½d. in a market which remains exceptionally small, though on Thursday there was a decline of ½d. on the better turn of "free" sterling. For the time being fears of the psychological reactions to a deletion of the clauses in the United States Silver Purchase Act empowering the Treasury to buy imported silver have been brushed aside by the reactions of the Indian operator to the latest change in the military situation.

via the free market for sterling in New York. By this detour the remitters could obtain a much more favourable rate than that to which they were entitled under the existing structure of direct official rates between the two countries. The Argentine railways, for example, had, by utilising the free market for their remittances, been able—quite legally of course—to remit to this country at a rate of approximately 15 pesos to the £ as against the railways' "special" rate of 16 to the £. The concession to the railways had, in fact, become valueless in relation to the rates obtainable in the free market. This was even more true of the facilities given for the remittance of funds for financial services at 17 pesos to the £. These rates will now become effective, as the recourse to triangular operations between pesos, dollars the sterling will no longer be possible. United Kingdom residents, who in transferring pesos into sterling follow the new instructions of the Argentine authorities, will fully comply with the British Defence Regulations defining the control of exchanges in this country. They will not, in other words, be called upon to sell the pesos in question to the Treasury. These instructions mark a further step in the contraction of the free sterling market, and since they do so by contracting the potential demand for sterling, they may well be followed by further weakening in the free sterling rate.

Clearing Banks and the War Loan.—The clearing bank statements for March were primarily scrutinised for the light they might throw on the reactions of the War Loan operation on the credit structure. From this angle the figures reveal very little. In the first place, the banks' investments are up by no more than £2,674,000, even though the latest total includes some of the banks' fully paid participation in the new loan. It is evident, therefore, that many cross currents have gone to create the modest net increase in the total. But even allowing on the most generous scale for these counter-movements, it does not appear that the clearing banks' direct participation in the loan can have been considerable—which is a most welcome conclusion, since it leaves them as virtually virgin soil to be exploited at a later date. The banks' advances are up by £6,350,000, a movement which is, in part, accounted for by special accommodation granted to private investors for the new loan. This contribution to the increase is probably small. The banks' facilities in this respect were primarily intended to help subscribers to even out the payments of the 90 per cent. instalment due next Monday. It is obvious that no one will have prepaid that instalment with the help of bank loans, since the charge on the loans is 3 per cent. while the discount on prepayment is only 1 per cent. The effect of this particular factor on the

banks' advances will thus be revealed in its true proportions when the April figures are published. Discounts and short loans are down in the aggregate by £25,045,000, a movement which compares with the reduction of £60,000,000 in the outstanding amount of Treasury bills issued through the tender over the month of March, and which is thus in accord with the normal seasonal trend of

the floating debt over the final month of the financial year. Deposits, which show a reduction of only £2,358,000, would have been much more sharply down but for an increase of £12,284,000 in cheques in course of collection and other items in transit, which has duplicated the deposits total to the corresponding extent.

Fire Insurance of Government Stocks.—A note describing the agreement reached for covering the marine risks on Government-controlled stocks in the insurance market in *The Economist* of March 16th presaged a similar arrangement regarding fire insurance. This is now confirmed by an announcement that tariff companies, non-tariff companies and members of Lloyd's are to write the fire insurance on the large volume of commodities, home-produced or imported, that are under the control of the Ministries of Food and Supply. A special organisation, known as the Associated Fire Insurers' (Government Commodities) Management Committee, of which Mr A. S. Hinshelwood, the chairman of the Fire Offices' Committee, is chairman, has been set up to manage the scheme. Thus the fears which were expressed among fire insurers at the beginning of the war, that State control of stocks would mean that the Government would follow its peacetime practice of "self-insuring" its property, have been allayed.

INSURANCE NOTES

Clerical, Medical and General.—An indication of the substantial clientele of this society (an associate office of the Employers' Liability) is provided by the fact that in 1940 the average net sum assured per policy was as high as £800. The company suffered a fall in new business comparable with that shown by the other life companies—from £2,733,300 to £2,032,500. Premium income of the life fund for the year at £1,046,000 was, however, only fractionally lower than in 1939 (£1,048,700). There was an increase of 1s. 9d. per cent. in the gross rate of interest; probably this resulted from a more rigorous valuation of some of the assets, for a lowering of values on assets in the life fund automatically produces a higher recorded rate of interest per cent. Over £207,000 was absorbed in the writing-down of Stock Exchange securities and in losses on securities realised. The net rate fell by 2s. 8d. per cent. to £3 13s. 6d. per cent. as a result of higher taxation. The

accounts show an undistributed surplus of over £2,000,000. Loans on medical practices have been reduced from £742,600 to £700,400—a welcome movement in present circumstances; British Government securities, never very large, have fallen from £652,500 to £405,200, and the interest in the Clerical and General Investment Trust, valued at £750,000 in the 1939 balance sheet, was disposed of during the year.

Wesleyan and General.—The new business in the ordinary department declined, from £1,498,100 to £1,178,300, in common with the general experience, and claims by maturity of endowment assurances rose, from £353,900 to £695,100, as a result of the antecedent growth of business, so that the life fund in this department, amounting to £6,501,800 at the year-end, was fractionally lower than twelve months previously. In the industrial department the movements in

new business—which fell from £3,635,000 to £3,204,100—and in claims by maturity were similar but less marked and the resultant life fund was rather higher at the end of 1939 (£8,470,100 compared with £8,220,800 a year earlier). The net rate of interest earned was naturally lower in the ordinary department at £3 13s. 3d. per cent., a fall of 3s. 11d. per cent. In the industrial branch, tax is not paid on interest earnings, but on profits; consequently the earned rate actually increased by 2d. per cent. to £4 10s. 1d. per cent. The society was successful in reducing its industrial expense ratio slightly; including in the expenses the allocation to staff bonus from the annual surplus, the decline was from 36.8 per cent. to 36.3 per cent. Unfortunately, conditions are not now very propitious for more substantial declines in this ratio. From the surplus in the ordinary branch reversionary bonuses of £1 per cent., compared

Investment

Confidence and Calm.—It stands to the credit of the stock markets that the broadening of the war by Germany's invasion of Denmark and Norway has been received with a calm confidence, and that free dealing conditions have been maintained. There has been no artificial element in this week's price movements, and those movements, in the circumstances, have been small. The nerves of so sensitive an instrument as the Stock Exchange are naturally tested when no news, or only unconfirmed reports, of the progress of British action are received, but they have stood firm. In the gilt-edged market, losses of up to half a point were recorded in the "irredeemable" group on Tuesday, and although Wednesday was not a cheerful day, the market was able to recover its optimism towards the close, and so to limit the extent of the day's declines to a quarter of a point on balance. Thursday's opening was

naturally more confident, on the encouraging but unofficial reports which had been received of the course of hostilities off the Norwegian coast, but after gilt-edged had gained an initial half-point, the market adopted a "wait and see" attitude. Trade has never been dead, and it is possible that investment business for the first four days of the week would compare quite well with the volume for the first four days of last week. In groups like home rail stocks and Brazilian bonds, which have recently attracted speculative attention, the intermediate losses were more appreciable, but the recovery on Thursday, by the same token, was correspondingly sharper. Investors are, in fact, disposed to draw encouraging conclusions from the fact that Germany has chosen to extend the war in a direction which involves decisive sea supremacy for its success. The first round of active warfare has tested the market, and not found it wanting either in patience or in logic.

Scandinavian Securities.—The invasion of Denmark and Norway by Germany was inevitably followed by the calling of purely nominal prices for the majority of Scandinavian securities. The following table shows the nominal movements in leading Danish and Norwegian State and municipal stocks between Friday last week and Wednesday this week.

	Official List Quotations			Latest marking and date
	April 5	April 8	April 10	
<i>Denmark</i>				
4% 1912	50-70	50-70	20-50	52 (April 4)
3% Mort. Bank	30-50	30-50	10-40	37 (April 1)
4% Copenhagen 1910	50-70	50-70	20-50	54 (March 28)
4% Assoc. Municipalities ...	40-50	40-50	20-40	40 (April 5)
<i>Norway</i>				
3% Conversion 1888	50-70	50-70	40-60	57 (March 8)
4% Mort. Bank	50-70	50-70	40-60	60 (April 5)
4% Christiania (Oslo)	60-80xd	60-80	50-70	70 (March 26)
4% Bergen 1935	50-70	50-70	30-50	55 (April 3)

Such prices have little meaning. On Thursday the leading Norwegian issues were called 50-60 nominal, and Danish 4 per cent. Associated Municipalities 20-30 nominal. Business was apparently reported in the Norwegian 3½ per cent. Loan, 1904-05, at 65, though this must, in the circumstances, obviously be regarded as a high figure. Swedish industrial securities, which had in recent weeks shown some recovery, became virtually unmarketable. Swedish Match, for example, which at the end of last week was quoted at 10s. nominal, was reduced to 8s. 9d. nominal on Wednesday and recovered to 9s. 6d. on Thursday. The violation of Denmark and Norway may interrupt the record of regular debt payments which these countries have scrupulously honoured in the past, but their bonds will stand high in the defaulted class, if they should be interned there for the duration. Both countries have repurchased their own bonds freely in the London market and hold other securities which would be realisable in foreign exchange. It is all to the good, therefore, that an official notice has immediately been posted that transaction of business on behalf of any resident in Denmark is forbidden except under licence from the Trading with the Enemy Branch. The most careful attention should clearly be given to sales from any neutral source whose good faith is not fully guaranteed, in order that the German Government may be frustrated in any attempt to obtain further supplies of foreign exchange by theft from their latest victims.

Fortnightly Accounts.—It may be assumed that the suggestion that fortnightly accounts should be reintroduced on the Stock Exchange finds no favour with the Committee. At the outbreak of war one of the first steps which the Committee took, doubtless in conjunction with the authorities, was to introduce cash dealings. This step, which ran counter to established practices and involved substantial changes in Stock Exchange rules and procedure, found no critics. Its effect in reducing speculative activity was only incidental to its main purpose—that of maintaining, as far as possible, even positions and of safeguarding both brokers and jobbers against the inevitable risks in wartime of running open positions for as long as a fortnight. From the broker's point of view, cash dealings are not convenient. The task of day-to-day clearings of bargains, instead of the efficient settlement of the normal account, is the more irksome now that Stock Exchange staffs have been so seriously depleted, but that inconvenience is cheerfully borne. And it is probably not greater than the inconvenience which would be imposed upon the banking system if a fortnightly settlement were reintroduced. Both as a financial safeguard and as a measure of relief to the banking system the balance of argument is clearly in favour of the retention of cash dealings. There is little evidence that the system hampers general investment business. And there is no point in granting facilities which might assist speculative activity at the expense of the more serious task of financing the war.

Company Notes

Capital Issues and the Control.—Our quarterly figures of new capital issues, which appear at the foot of this page, can safely be left to tell their own story. During the past quarter the British Government raised £371,825,000 by the issue of 3 per cent. War Loan (of which a 90 per cent. call remained outstanding at the end of the quarter) and by sales of National Savings Certificates and 3 per cent. Defence Bonds to the extent of £71,825,000. The degree of control can be measured by the fact that less than £750,000 was added to the "Old Basis" totals and little over £5 millions to the more comprehensive "New Basis" figures, by industrial issues. Home corporations and foreign borrowers were entirely absent from the market. The absence of the latter is to be understood, but the former might at least have hoped to appear in the tabulation of conversion issues, for they have substantial amounts of debt carrying high rates of interest which are redeemable during this year. The Treasury, however, monopolised the conversion lists, in order to replace the 4½ per cent. Conversion Loan by the new 2 per cent. bonds, 1943-45, and home corporations are still debarred entry to the market. Although the Capital Issues Committee is permitting issues to shareholders for cash and bonus share distributions where good reason can be shown, the past quarter's figures give a vivid impression of a capital market under rigid control. That control is an essential feature of the economic war effort, but it needs to be tempered with a wise discretion in the case of issues which involve no new net investment of funds, and therefore do not, in general, affect the success of the Government's War Loans policy. The 3 per cent. war is now a familiar maxim. It will not be made more effective, in the long run, by preventing local authorities from converting 5 and 6 per cent. obligations to a wartime interest basis when suitable market opportunities occur.

Dunlop Rubber Progress.—The Dunlop Rubber profits announcement for 1939 must be regarded as the most satisfactory of its kind since the war began. Favourable trading conditions, especially overseas, are reported, and it is emphasised that although Government orders have naturally increased since the war, such orders represented only 7½ per cent. of the group's turnover. Net profits, apparently struck after depreciation, debenture interest and fees, total £2,853,133, against £1,501,000. But even after the large increases in tax provisions which have recently been reported, Dunlop's total allocation of £1,527,474, against £386,109, is staggering, although the latest sum includes £500,000 for income-tax reserve towards the 1940-41 liability. After charging preference dividends, equity earnings amount to £1,100,659, against £838,222, and are equivalent to 21.1 per cent., against 13.7 per cent. The distribution is increased from 9 per cent. to 12 per cent. by a 3 per cent. addition to the cash bonus. A sum of £248,228 is provided for a special reserve against investments in subsidiaries, presumably on account of overseas interests, and contingencies reserve receives £200,000. Even after treating the special investments provision as a charge, equity earnings would cover the increased dividend with a 4.4 per cent. margin. Shareholders will await the full report with eagerness for further light on these most impressive results.

British Celanese Arrears.—The announcement that a half-year's dividend on British Celanese second preference shares is to be paid is an obvious indication that the satisfactory trading conditions, referred to at the annual meeting, have been enhanced. Last January all outstanding

arrears on the 7 per cent. cumulative first preference shares were paid off, and in December last Dr Dreyfus pointed out that the rate of profit then being earned was about sufficient to cover annual dividend requirements on both classes of preference shares. The latest announcement thus implements the chairman's statement that if profits continued to increase a start would be made in paying the current dividend on the 7½ per cent. participating second cumulative shares. By the end of this month total arrears on these shares will amount to £3,028,125 gross, and the payment of six months' dividend on May 21st will reduce that sum by £159,375 gross. The new payment will thus make no impression on outstanding arrears. Indeed, it is not intended to; the most that has been foreshadowed is the payment of current dividends. When earnings have run for some time at a satisfactory rate, it is hoped to recommend a suitable funding scheme. Since the stabilisation of the rayon industry has been achieved, such hopes have moved from the nebulous stage towards actuality. On prospects of a funding scheme and the ultimate possibility of dividends, the ordinary shares now stand at 8s. 3d.

Pinchin Johnson Recovery.—From about November 1938, until the beginning of war, there was a sufficient recovery in business to provide Pinchin Johnson with total profits of £363,866 in 1939, against £300,622 in 1938. Both sales and production increased in the earlier part of the year, and although the four war months brought a certain amount of difficulty and dislocation, output was well maintained. The course of profits in the past three years is shown in the following table:—

	Years ended December 31,	1937	1938	1939
Total profit	£	389,344	300,621	363,866
Taxes	£	92,000	104,000	120,000

Invest. depreciation, loss and contingencies	£	...	...	53,486
Carry forward	£	98,251	94,870†	120,882

† Including £16,792 income tax recovery.

Even after increased taxation provision—E.P.T. is not specifically mentioned, and indeed would not seem to be payable, from the published accounts—equity earnings are £55,470 higher. Dividend policy is perhaps the most interesting feature of the latest accounts, for in spite of the recovery in profits, the dividend is reduced from 12½ per cent. to 10 per cent. This is partly due to a provision of £53,486 (including £13,486 loss on realisation of securities) for investment depreciation and contingencies, and if this sum were treated as a charge, equity earnings would amount to 12.1 per cent. instead of 16.3 per cent. But it is also due to the need for conserving cash resources, owing to the higher value of stocks and to the need for maintaining adequate raw material reserves. Already by the end of December, stocks stood at £673,450 against £611,003, while cash had fallen from £406,854 to £295,818. Depreciation of the market value of holdings in a subsidiary has led the company to write down their book value by an appropriation from general reserve. Investments in subsidiaries at market value stand in the latest balance sheet at £542,111 against £629,301, and general reserves at £674,150 against £761,340. Before forming an opinion of the company's prospects under war conditions, shareholders may prefer to await next Tuesday's meeting, but in the meantime they will approve the declared intention

of maintaining the maximum technical efficiency of the business. At a current price of 21s. 1½d. the 10s. shares yield £4 14s. 8d. per cent.

Amalgamated Anthracite Report.—The 3 per cent. rise in Amalgamated Anthracite total profits in 1939 from £296,803 to £307,513 is perhaps rather smaller than might have been expected. But the company's profits from the anthracite trade are not determined by the same factors which control colliery earnings at large. A certain amount of dislocation caused by the war was not corrected until 1940. And as the taxation provision is very small (£20,116, against £16,345), part at least of total profits has presumably been received by the parent company after deduction of tax by the subsidiaries. After meeting fixed charges, including funding certificate redemption and £80,000, against £40,000 (that is, a full instead of a half-year's provision), for reserve for depreciation of group plant and machinery, there remains £76,348, against £88,120, available for dividend. Dividend arrears having been cancelled up to the end of 1938, the £1 cumulative participating preference shares receive for 1939 their full 3½ per cent. cumulative dividend. This absorbs £54,301 net, and the surplus of £22,047 is added to the carry forward. The parent company's balance sheet now shows more completely the effects of reconstruction, since Court sanction to the capital reduction had not been obtained by December, 1938. The assets revaluation deficiency account of £4,918,339 has disappeared, with a corresponding reduction in ordinary capital from £6,718,260 to £1,799,921. In the consolidated balance sheet, actual changes in the past year are not large, the most important being a rise in debtors from £757,437 to £930,261. Since at the meeting last July Mr Szarvasy referred to export trade with France, Canada and the United States, and as home trade was reported as satisfactory, the outlook for the current year may be considered encouraging, in spite of rising costs. The 4s. ordinary shares now stand at 1s. 3d.

"Three Counties" Electric Progress.—This important constituent of Edmundsons' Electricity group does not publish any details of operating results, but the accounts for 1939 provide evidence of a very satisfactory year. Receipts, which are shown net, are 11 per cent. higher, an increase which, in view of the 1939 trend of costs, probably results from a still higher gain in gross revenue. Accounts for the past three years are summarised below:—

	Years ended December 31	1937	1938	1939
Total income	£	819,435	802,109	887,778
Rates	£	65,470	70,376	93,929
Debt int.	£	156,250	156,250	156,250
Other expenses	£	54,033	47,649	63,582
Preference divs.	£	135,000	135,000	135,000
"A" and "B" ord. shares—				
Earned	£	408,682	392,834	439,017
Paid "A"	£	24,000	24,000	24,000
Paid "B"	£	134,750	134,750	134,750
Paid % "A"	%	8	8	8
Paid % "B"	%	5½	5½	5½
To reserves	£	240,000	260,000	315,000
Income tax credits	£	...	Cr. 27,500	Cr. 40,000
Carry forward	£	65,343	66,927	72,194

After a large addition to the cost of rates and a special item of £14,568 for compensation to employees, there remains a substantial addition to equity earnings of £46,183, even without taking income tax credits into account. Distribution, however, remains on the same conservative lines as in the previous two years. The reserve allocation is increased by £30,000 to £290,000, and a new reserve for contingencies has been opened with a provision of £25,000. In accordance with the company's

policy of incorporating subsidiaries' assets into the main undertaking, gross interests in subsidiaries have been reduced from £831,152 to £487,716 and investments, which previously stood at £294,864, have practically been eliminated. This company provides another instance in which capital requirements have been met by resort to temporary finance, for the bank overdraft has risen from £76,309 to £294,935. "Three Counties" has a large industrial load, and prospects for the current year should be satisfactory. At 28s. 6d., the £1 "B" shares yield £3 17s. 2d. per cent.

United States Steel Report.—Those company directors in this country who still consider that accounts should present the minimum of information in the most

unattractive manner may be recommended to study the report of the United States Steel Corporation for 1939. It is a document of absorbing interest; it contains 29 pages of detailed facts and figures; and it presents this information in a most readable manner. It provides an analysis showing the allocation of the total amount received from sales of goods to pay for purchases, depreciation, taxes, wages, interest and profits. As an example in effective public relations statements, this would be hard to excel, and only one company—Triplex Safety Glass—has attempted the same sort of statement in this country. The report itself shows that consolidated income of the Corporation and its subsidiaries rose from \$632.5 millions to \$904.2 millions last year, and a net operating loss of \$2,150,238 in 1938 was converted into a surplus of \$59,952,568 last year. Earnings available for dividends amounted to \$41.1 millions, against

UNION CORPORATION, LIMITED

(Incorporated in the Union of South Africa.)

ABRIDGED REPORT OF THE DIRECTORS

In submitting to the Shareholders the Accounts of the Corporation for the year ended December 31st, 1939, the Directors state:—

The Accounts are drawn up in Union of South Africa currency, United Kingdom currency being taken at par.

The profit for the year is £618,296 18s. 10d., plus £124,340 19s. 8d. brought forward, making a total of £742,637 18s. 6d. A final dividend of five shillings and sixpence (U.K. currency) per share was declared absorbing at par £423,500, making, with the interim dividend of two shillings and sixpence, a total of eight shillings, or £616,000 for the year. £126,637 18s. 6d. remains to be carried forward.

Those shareholders entitled to receive payment of the dividend in the Union of South Africa will be paid at par provided there is no material difference between the Union and U.K. currencies on the day the dividend is payable. Should there be any material difference between the two currencies, payment will be made in Union currency

calculated at the rate of exchange ruling on that day. The amount payable to present holders in South Africa of Share Warrants to Bearer will be on the same basis irrespective of the date of presentation of coupons.

Exploration expenses incurred during the year amounting to £56,516 13s. 3d. have been charged directly to Exploration Reserve Account, leaving a balance of £147,320 15s. 1d. to be carried forward on that account.

Holdings of Shares, Debentures and other securities have been taken into the Accounts at cost or under, but in no case above the market price of December 31st. At present last, or, where no market price exists, above the Directors' valuation. At present market prices, these holdings show a very substantial surplus over the amount at which they stand in the Balance Sheet. The Directors, as on other occasions, have thought it expedient to provide for contingencies by reducing the book cost of certain holdings both below cost and below market price.

The operating results of EAST GEDULD MINES have been as follows:—

	Tons milled	Gold output (and per ton)	Price per oz.	Working costs (and per ton)	Working profit (and per ton)	Dividends (and per share)
1938	1,751,800	£3,598,978 (41.1)	142s.	£1,413,265 (16/2)	£2,185,713 (24/11)	£1,035,000 (11/6)
1939	1,829,000	£3,912,292 (42.9)	148s.	1,435,976 (15/8)	2,476,316 (27/1)	1,215,000 (13/6)

The ore reserves at December 31st last amounted to 11,500,000 tons assaying 5.7 dwt. per ton over a stoping width of 56 inches.

The operating results of GEDULD PROPRIETARY MINES have been as follows:—

	Tons milled	Gold output (and per ton)	Price per oz.	Working costs (and per ton)	Working profit (and per ton)	Dividends (and per share)
1938	1,328,500	£2,323,607 (35.0)	142s.	£967,990 (14/7)	£1,355,617 (20/5)	£1,095,643 (15/0)
1939	1,365,000	2,340,341 (34.3)	148s.	1,013,811 (14/10)	1,326,530 (19/5)	1,168,686 (16/0)

In addition to the profits earned from its own operations, the Company received revenue from other sources amounting to £489,312, which figure includes £460,077 in respect of dividends received on its large shareholdings in East Geduld Mines and Grootvlei Proprietary Mines.

The ore reserves at December 31st last amounted to 8,900,000 tons assaying 4.7 dwt. per ton over a stoping width of 56 inches.

The operating results of THE GROOTVLEI PROPRIETARY MINES for the first full year are as follows:—

	Tons milled	Gold output (and per ton)	Price per oz.	Working costs (and per ton)	Working profit (and per ton)	Dividends (and per share)
1939	947,500	£1,669,916 (35/3)	148s.	£1,066,603 (22/6)	£603,313 (12/9)	£408,750 (3/0)

The extension of the reduction plant to 80,000 tons per month was brought into commission in March, 1939. The plant is giving most satisfactory results and has demonstrated that its actual capacity is well above its nominal capacity.

The ore reserves at December 31st last amounted to 5,250,000 tons assaying 5.5 dwt. per ton over a stoping width of 52 inches.

The ore reserves of MARIEVALE CONSOLIDATED MINES at December 31st last amounted to 1,700,000 tons assaying 5.8 dwt. per ton over a stoping width of 40 inches.

The reduction plant commenced operations on 1st November. Milling results were adversely affected in the initial stages by the usual absorption of gold in the plant and by the high proportion of low grade development rock sent to the mill. While steady

progress is being made, it will be some time before normal milling conditions are reached.

THE MODDERFONTEIN DEEP LEVELS went into liquidation in 1936. For the liquidation year ended September 30th last, 590,900 tons were milled for a profit of 2s. 7d. per ton milled. Liquidation Distributions of 4½d. and 3d. per share were declared in 1939, bringing the total Liquidation Distribution to date to 3s. 10½d. per share.

The ore reserves at September 30th last amounted to 1,100,000 tons assaying 3.0 dwt. per ton over a stoping width of 70 inches.

The operating results of VAN DYK CONSOLIDATED MINES for 1939, the first full year, are as follows:—

	Tons milled	Gold output (and per ton)	Price per oz.	Working costs (and per ton)	Working profit (and per ton)	Dividends (and per share)
1939	1,026,600	£1,836,101 (35/9)	148s.	£1,171,551 (22/10)	£664,550 (12/11)	£412,500 (1/6)

The extension of the reduction plant to 80,000 tons per month was completed by the end of March, 1939. The actual capacity of the plant considerably exceeds its nominal capacity.

The ore reserves at December 31st last amounted to 2,600,000 tons assaying 5.6 dwt. per ton over a stoping width of 40 inches.

The farms in the northern portion of the ORANGE FREE STATE—adjoining the property of the WESTERN REELS EXPLORATION & DEVELOPMENT COMPANY—together with another small area further south, have been retained under option.

As a result of drilling operations in the area south of the Sand River, options over a portion have been abandoned and drilling is now being carried out on the remainder of the ground.

In a portion of the area north of the Sand River drilling by Western Holdings, Limited, with whom the Corporation is collaborating, has revealed the existence of a reef zone. Payable gold values have been found in this zone and drilling thereon is still proceeding.

BAY HALL TRUST net profit for 1939 was £86,433. A dividend of 6½ per cent. was declared absorbing £65,381. The carry-forward was increased by £21,052 to £71,567. The Trust's investments as at December 31st last showed, at their current market prices, an appreciation of £40,522.

BRITISH ENKA ARTIFICIAL SILK COMPANY has benefited by the better prices secured for its Rayon production and the plant is operating profitably.

SAN FRANCISCO MINES OF MEXICO suffered a net loss of £96,520 for the financial year to September 30th, 1939, to be accounted for by low metal prices, high Mexican taxation and continued difficulties with Labour. The mill treated 475,790 tons of ore. A small operating profit is now being earned.

SELECTION TRUST paid a dividend of 9d. per share for the year ended 31st March, 1939. Its principal holdings are in the American Metal Company, Consolidated African Selection Trust and Trepeca Mines.

SOUTH AFRICAN PULP & PAPER INDUSTRIES' plant was brought into production in the early part of the year. Its initial operation was adversely affected by the usual difficulties which are inherent in the establishment of a new industry of considerable magnitude under novel conditions. These difficulties are gradually being overcome. The sale of the Company's products was at first seriously handicapped by severe Continental competition, and the fact that consumers had accumulated important stocks of imported paper owing to the disturbed international situation. With the outbreak of war, the situation changed radically, and the Company's problem became one of increasing its production to full capacity to meet the increasing demand for its products. In the main, however, the improvement in the affairs of the Company was not apparent until the current year and meanwhile the Accounts for the year 1939 show a loss of about £85,000.

RHODESIA AND WEST AFRICA. The revenue of Roan Antelope Copper Mines and Rhodesian Selection Trust was maintained at a fairly steady level. The profits of Consolidated African Selection Trust in the year to 30th June, 1939, reflected the lower level of diamond sales during that period.

HOLDERS OF SHARE WARRANTS TO BEARER CAN OBTAIN COPIES OF THE FULL REPORT AND ACCOUNTS ON APPLICATION AT THE LONDON OFFICE, PRINCES HOUSE, 95 GRESHAM STREET, E.C.2

a deficit of \$7.7 millions in 1938, and after paying the \$7.00 per share dividend on the preferred stock, a surplus equivalent to \$1.84 per common share was earned, compared with a deficit of \$3.79 in 1938. The increased output achieved last year was comparable with that of 1936, although earnings were not restored to that year's level, since lower prices prevailed for a considerable part of the total tonnage. Nor, apparently, were unit costs reduced sufficiently to offset the effect of lower prices. The review of the chairman points out that war orders represent only a fleeting prosperity and also distort normal economic production. The emphasis which the management places on the prospect of enduring peace as a prerequisite of a lasting prosperity is justified, but to the extent that the war influences general business conditions in the United States, the Corporation, which supplies the major construction and engineering industries, can expect to benefit. United States Steel common stock, which stood at one time last year as low as \$44½, now stands at \$77.0. Dealings in the stock by British residents are, of course, restricted.

Mining Reports

Union Corporation Report.—Published profits of Union Corporation, as for other finance companies, are not an exact reflection of trading conditions, for they include capital and revenue profits alike, and are struck after taxation and provisions for writing down investments. A small rise in profit, however, from £674,857 for 1938 to £679,306 for 1939 suggests that higher dividend receipts have offset any further decline in capital profits. After charging expenses, earnings for the ordinary shares amount to £618,297, against £611,535, and the repeated dividend of 64 per cent., absorbing £616,000, is covered with a small margin of disclosed earnings. The balance sheet shows few substantial changes, but it discloses holdings of £3,367,995 in companies other than subsidiaries plus £263,568 interests in subsidiaries, against £3,390,447 for "share and debenture holdings" in the previous year. As usual, the report contains invaluable information concerning the gold industry in general as well as the Union Corporation group. During 1939 the three new mines of the group accounted for 35 per cent. of the group's tonnage milled, against 17 per cent. in 1938, and their necessarily higher costs are responsible for the rise from 16s. 10d. to 18s. 1d. in the group's working costs per ton. The average value of yield, however, rose from 34s. 2d. to 35s. 8d. a ton. At 7½, Union Corporation 12s. 6d. shares yield £5 6s. 8d. per cent.

"Johnnies" Group Results.—The results of the four Rand mines in the Johannesburg Consolidated Investment Group are summarised in the accompanying table, which shows in each case weakened ore reserve positions and reduced profits last year. The ore reserves of *Randfontein* show another serious fall in tonnage. Development was accelerated in the Rock Tunnel Reef and 625,000 tons are included this year in the reserves from this source, and

it is clearly hoped that this reef will produce substantial tonnages in the future. The tonnage milled and profits were reduced, but dividends were maintained at 22½ per cent., upon which basis the yield is 11.5 per cent. The mine probably suffered from labour shortage during the year, but difficulty is clearly being encountered in the endeavour to maintain the ore reserves, which have been showing a falling tendency for some time past. The ore reserve position at this mine will continue to be watched with some concern. There is a slight increase in the tonnage of the *Government Areas* reserves, but another serious fall in grade of 0.5 dwt. Development in the Black Reef and in the Upper Leaders was accelerated and 2,110,000 tons of these lower-grade reefs are included in the reserves this year, an increase of 632,000 tons over the previous year. It appears clear that the grade of the ore reserves will continue to fall as more of these low-grade reefs are

	1939 Ore Reserves	Grade	Change compared with 1938	Profit	Change compared with 1938
	Thous. tons	Dwt.	Thous. tons	Dwt.	£
Randfontein	13,079	3.7	471	0.1	1,319,913
Govt. Areas	9,800	5.2	188	0.5	1,987,601
Van Ryn	3,241	3.1	83	0.2	272,305
New State Areas	4,098	5.3	41	0.5	1,712,191
					£7,717
					202,534
					129,488
					15,381

gradually included in the reserves. The additional plant to deal with a further 30,000 tons a month should shortly be in operation. The yearly profit fell substantially and dividends were reduced from 3s. 6d. to 3s. 4½d., on which latter basis the yield is 10 per cent. This mine appears to have passed its prime. *Van Ryn Deep* shows a further fall in reserves, both in tonnage and in grade. With the decreased tonnage milled and a further fall in grade to under 3 dwts. per ton, profits showed a substantial decline and dividends of 3s. 6d. were paid as against 4s. 6d. for 1938. The increased price of gold should have a material effect upon the future of this old mine, but its life is necessarily very limited. A small increase in tonnage, but a heavy reduction of 0.5 dwt. in grade is shown in the reserves of *New State Areas*. Tonnage milled and profits were approximately the same as for the previous year, and dividends of 6s. were paid, as for the last three years. The grade of the reserves is likely to continue falling and the life of the mine is somewhat limited. On these considerations, the present yield of 13.7 per cent. does not seem to be excessive.

Simmer and Jack and Robinson Deep.—Despite the serious shortage of labour, Simmer and Jack reports a very satisfactory year. Ore reserves were increased by no less than 767,000 tons, with a decline in grade of 0.2 dwt. The expansion programme to increase milling capacity to 180,000 tons a month is proceeding well, and, given an adequate supply of native labour, this tonnage should be attained by the end of this year. This is evidenced by the achievement of a record tonnage of 130,000 tons milled in March, as against 118,000 tons in January. The

company paid two half-yearly dividends of 7d., on which basis the yield is 5.7 per cent., but increasing dividends should be forthcoming. With its long life, Simmer and Jack may be considered a promising mining investment. Robinson Deep, on the other hand, suffered from a serious shortage of native labour for the greater part of the year, so that the full capacity of the plant was not attained

	1939 Ore Reserves	Grade	Change compared with 1938	Profit	Change compared with 1938
	Thous. tons	Dwt.	Thous. tons	Dwt.	£
Simmer and Jack	3,723	4.5	767	- 0.2	722,522
Robinson Deep	6,845	4.5	156	- 0.1	963,069
					£ 57,797
					7,125

and development was retarded. Consequently the ore reserves showed a decline in tonnage, but this will doubtless be remedied in the current year. The air-cooling plant at the Turf shaft worked very efficiently, and a similar plant is to be erected at the Chris shaft. Two dividends totalling 5s. were paid, which provide a yield of 8.5 per cent. The mine has reached its peak of production, but should have many years of profitable life ahead.

Springs and West Springs.—The annual report reveals that ore reserves of Springs Mines show a further substantial decline of 674,000 tons to 8,328,000 tons, averaging 5.2 dwt., which also represents a fall of 0.1 dwt. in value. The reef has been intersected beyond the fault in the southern section of the mine; but unfortunately, owing to further faulting, no reliable information is yet available with regard to the prospects of this area, which will have a most important bearing upon the future ore reserve position of the mine. The company suffered from a severe shortage of native labour, which hampered operations generally. Profits at £1,952,000 show an increase of £114,000, and dividends improved from 52½ per cent. to 53½ per cent., upon which basis the yield is 10 per cent. The northern portion of the mine has now been extensively worked, and the future will be largely dependent upon results of development in the southern section. Pending definite information on this point, the prospects of Springs are somewhat uncertain. West Springs' report shows that, despite the shortage of native labour, the mine had a successful year. Ore reserves fell by a small amount to 4,522,000 tons, averaging 5.45 dwt.—an improvement of 0.2 dwt. over the previous year. Details of development are not given in the report, but the underground plan accompanying it indicates that development from the No. 2 shaft in the southern portion of the mine is going ahead fast. This very large and promising area will gradually become the main source of supply for the mine. For many years West Springs have

had an unsatisfactory mining lease, but the second lease for the southern section was more favourable. It is hoped that within a reasonable time these two leases will be combined to the benefit of the company. Last year profits rose by £69,000 to £622,738, and dividends totalling 13½ per cent. were paid, on which basis the yield is 6.5 per cent. In view of the long life and prospects of the mine the shares should constitute a promising mining investment.

Western Reefs.—The annual report of Western Reefs shows that out of a large development footage less than one-third was on reef, but it is hoped that during the current year development on reef will be substantially increased. Some 10,610 feet of development were sampled, of which 51.2 per cent. was payable, averaging 9.16 dwt. over 45.54 inches, or 417 inch-dwts. Eight separate reefs, sometimes quite close together, are being opened up on three levels from No. 1 shaft. No. 2 shaft was completed and equipped, and it is hoped that underground connection with No. 1 shaft will shortly be made. Finance was recently obtained to carry on intensive development and to instal a plant with a capacity of 100,000 tons a month, which it is hoped will start crushing by the middle of next year. It will be interesting to see if underground development will justify a reduction plant at such an early date. In the meantime, the shares have speculative merits.

The Week's Company Profits.—This week our usual table of profit and loss accounts includes 56 companies, whose total profits of £7,411,000 are 9 per cent. higher and whose net profits also show a small increase, from £3,767,000 to £3,796,000. The week's results include those of a large number of rubber companies, whose 1939 profits are in most cases much better than in 1938. Aggregate profits of 666 companies reporting in 1940 to date are £139,136,000, against £132,284,000, a rise of 5 per cent., while net profits are 3 per cent. lower, at £76,456,000, against £79,024,000. The week's results are discussed in preceding Notes and on page 702 under the heading "Shorter Comments."

Company Meetings of the Week.—Reports of company meetings will be found on page 706 of this week's issue. At the *Standard Life Assurance* meeting, Mr H. A. Jamieson discussed the board's decision to discontinue the system of annual actuarial valuation and distribution of surpluses. The company, of course, will carry out an actuarial investigation on or before November 15, 1943. Meanwhile, it is proposed in the current year to maintain the intermediate rate of bonus. Sir Sydney Skinner reported to shareholders of *John Barker and Company* that the current year had started fairly well, but he declined to attempt any prophecy, remarking that additional expenses and trading difficulties were a daily problem. Mr S. C. Goodwin informed shareholders of *G. Beaton and Sons* that a controlling interest had been acquired during the year in a company developing fuel injection pumps and in another undertaking for the production of special tools. The directors' report of the *Bank of Athens* refers to economic problems of Greece in wartime arising from blockade and interference with Greek supplies of raw materials. Mr C. T. Pott emphasised at the *British Enka* meeting that the company was doing its utmost to further the export trade. This policy will necessitate the reduction of supplies to home customers, but was dictated by national necessity. He emphasised the need for building up the financial strength of the company and reducing indebtedness.

THE STOCK EXCHANGES

London

Note : all dealings are for cash

THE course of dealings this week has been determined solely by the actions off the coast of Norway, following Germany's invasion of Denmark and Norway. On Monday there was an obvious tendency to await the sequel to the Allies' minelaying off the Norwegian coast, and it was not long in coming. Despite the lack of authenticated news, the market calmly faced the impact of Germany's latest aggression and recovered with some spirit at the opening on Thursday, when unconfirmed reports showed that the Allied forces had made a spirited reply. Dealings have been free throughout and in relation to the week's momentous news, price movements have been of small dimensions.

In the *gilt-edged* market a certain amount of selling occurred on Tuesday, which lowered gilt-edged prices by half a point or more. In a late rally on Wednesday about half of the earlier losses during that day were recovered, leaving stocks approximately ¼ down, but Thursday's opening spurt produced net gains ranging up to half a point.

In the *foreign* market, Danish and Norwegian bonds became nominal. The position of Scandinavian securities is discussed in a Note on page 694. There was a shake-out in Brazilian stocks, where a certain amount of speculative buying had recently taken place.

Sharp falls were reported in *home* rails on Tuesday and in early dealings on Wednesday. Losses of a point or more occurred at first in the marginal stocks, but there was no net movement in prices on Wednesday, and on Thursday gains of up to 1½ points were recorded.

Industrials were depressed by the German invasion of Norway and Denmark. Losses, however, remained small, and reaction took the form mainly of declining business, small scattered sales and a precautionary lowering of prices. But on Thursday there was a greater state of tension. Prices were sensitive to events, and on balance industrial share prices held their ground or in some cases recovered. Iron and steel shares hardened at first, and under the influence of general market sentiment, lost fractionally all round on Tuesday. The losses became more pronounced in mid-week, but were never serious. Electrical equipment and supply issues followed a similar course. Motor shares were fairly steady until mid-week, but Dunlop were realised in the equipment section. No interest was taken in aircraft issues. While textile shares were not exempt from general tendencies, declines were not more than a few pence on any one day. Rayon issues also gave way after firmness on Monday. Brewery and tobacco shares moved in accordance with other sections. Swedish industrials were weak.

In comparison with other sections, oil shares were firm. On Monday, more interest than of late was shown in the smaller issues, and oil shares in general were resistant to Tuesday's small re-

cession. Even on Wednesday, prices fell only fractionally, and there was some recovery later. Rubber shares were very quiet and relatively firm, though where changed were usually lower on the week. Tea shares moved against the trend, and hardened slightly in mid-week.

In the *mining* market, prices of Kaffir shares were keyed up to fluctuation in sentiment. Small gains, brought by investment demand, were widespread on Monday. A precautionary marking down of prices on Tuesday most affected the more speculative issues. A firmer tendency was apparent in late dealings on Wednesday and on Thursday. Diamond shares reacted on profit-taking, and then became inactive. Rhodesian copper issues made a mixed showing, with no obvious relationship to the general trend. After a few gains on Monday, tin shares lost fractionally.

New York

THE broadening of hostilities produced considerable activity on Wall Street on Tuesday. Domestic news was disregarded and leading steel and aircraft shares rose sharply in the early dealings. But the spurt lasted for no more than an hour or two, and even at Tuesday's close a considerable degree of nervousness was apparent, the Dow Jones industrial average, in fact, closing one point lower at 150.31. Nervousness continued in mid-week, and the volume of trade, which on Tuesday had reached the highest level since September at 2,141,000 shares, declined to 1,290,000 shares, and a further appreciable fall in the industrial average was recorded. A decline in steel activity for the current week from 61½ to 61 per cent. of capacity is not regarded as significant by *Iron Age*, which reports renewed confidence that the decline in production has reached a trough.

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values calculated on closing prices (1926 = 100).

Canada

THE market remained in a sluggish and depressed condition during March and statistics indicate that the total volume of trading was substantially lower than a year ago. The uncertainty of the European situation ruled out any speculative interest, but in contrast the bond market was fairly consistently supported. Despite the satisfactory earnings of industrial concerns, prices have shown no tendency to improve, and pulp and paper stocks, after a show of liveliness at the beginning of the month, were adversely affected by the Russo-Finnish peace treaty in view of the possibility of a resumption of Finnish competition in forestry products. Copper stocks benefited from the rise in the price of copper, but gold stocks have been weak.

Shorter Comments

As a result of full employment in all departments during 1939, BARROW HÆMATITE STEEL report substantially increased profits, and are resuming dividends with a 5 per cent. payment. COLTNESS IRON, whose experience in 1939 has varied as between different departments, report some reduction in total profits, from £316,522 to £341,016. Contrary to expectations, deliveries of cement by TUNNEL PORTLAND CEMENT rose in 1939, both for home and for export, but taxation more than absorbs the increase in total profits. UNITED GLASS BOTTLE MANUFACTURERS report increased total profits by 15 per cent., to £456,053. The report offers no comment on this satisfactory result. ANGLO-PORTUGUESE TELEPHONE are repeating their 8 per cent. dividend, after making total profits of £364,338 against £341,217. An 11 per cent. increase in the total profits of PRIMITIVA GAS COMPANY OF BUENOS AIRES is more than offset by higher taxation and exchange losses. In common with other London stores, ARMY AND NAVY STORES report reduced total profits, which are £601,545 against £643,273. MOSS' EMPIRES report that in 1939 up to mid-August profits increased, and so far this year profits are higher than in the same period of 1939.

MISCELLANEOUS

Edmundsons Electricity Corporation, Ltd.—The results of operations of the Edmundsons group of companies in March, 1940, as compared with March, 1939, show an increase of 15 per cent. of units sold.

Vogelstruisbult Gold Mining Areas.—Working profit 1939, £469,546 (£361,946). The company paid its first dividend in June with a payment of 5 per cent., and in December declared a further dividend of 7½ per cent. These dividends required £314,286. To expenditure on plant, £67,634 (£248,339). Surplus carried forward, £195,326 (£120,926).

Whitbread and Company.—For 1939 ordinary dividend is maintained at 14 per cent., together with bonus of 3 per cent. against a bonus of 4 per cent., making 17 against 18 per cent. for year. Profit 1939, after depreciation and taxation, £339,422 (£342,579). To property reserve, £50,000 (£60,000). Carry forward, £280,205 (£262,970).

Army and Navy Stores.—Net profit year to January 27, 1940, £104,905 (£133,306). Gross profits from trading, plus miscellaneous income, £601,544 (£643,273). Working expenses, depreciation, £496,640 (£509,968). Ordinary dividend reduced from 12½ per cent. to 10 per cent. To: N.D.C., £4,500 (£5,000); pensions, £16,590 (£14,831); Indian good service, £2,000 (same). Carry forward, £111,845 (£112,030).

Brewers and Distillers of Vancouver.—Combined net profits 1939, £525,918 (£451,959). It is proposed to pay a dividend of 10 per cent. and a bonus of 5 per cent. as before.

Tunnel Portland Cement.—Trading profit 1939, £345,883 (£326,380). Interest and dividends received, £120,578 (£96,565). To depreciation, £71,418 (£74,064). Net balance, £390,043 (£343,882). To taxation, £200,000 (£92,462). Preference dividends, £23,400 (£26,100). Ordinary dividend reduced from 22½ to 20 per cent. To reserves, nil (£50,000). Carry forward, £141,829 (£98,822).

Coltless Iron Company.—Profit 1939, £316,522 (£341,016). To tax, £50,000 (£22,500). To redemption and depreciation, £85,000 (same). Net profit £177,522 (£224,516). Ordinary dividend reduced from 23½ to 20 per cent. To reserve, £25,000 (£35,000). To staff retiring allowances, £2,500 (£5,500). Carry forward, £259,860 (£253,713).

United Glass Bottle Manufacturers.—Trading profit 1939, £367,778 (£301,810). Other income, £88,275 (£95,236). Total profit, £456,053 (£397,046). To taxation, £150,000 (£84,000). Net profit, £248,443 (£257,592). Ordinary distribution maintained at 12 per cent. To: debenture redemption, £18,350 (£17,570); general reserve, £50,000 (£17,570); staff fund, £25,000 (£15,000); A.R.P., £10,000 (nil). Carry forward, £41,096 (£42,255), after deducting special provision for packing stores, £15,000.

The Stock Exchange.—Profits (before taxation), year to March 25, 1940, £268,607 (£308,463). Income, £467,155 (£506,186). Expenditure, £198,547 (£197,723). To income tax and N.D.C., £103,000 (£27,250). Net profit, £150,607 (£266,213). Year's dividend down from £12 10s. per share to £5 per share. Carry forward, £192,320 (£141,713).

Mysore Gold Mining Company.—Total revenue 1939, £735,365 (£679,877). Working costs, £387,359 (£380,816). Profit, £328,967 (£283,142). Income tax reserve, £70,000 (£50,000). E.P.T. and N.D.C., £32,000 (£11,000). To: writing off buildings, plant, etc., £19,000 (£17,000); depreciation of works underground, £35,000 (£30,000); insurance and contingency reserve, £4,000 (same). Ordinary dividend, 27½ per cent. as before. Carry forward, £10,715 (£10,586).

Aktiebolaget Separator.—Net profit for 1939, Kr.7,731,814 (Kr.7,919,152). Tax reserve receives Kr.2,600,000 (Kr.1,600,000); distribution maintained at 6 per cent. Carry forward, Kr.2,008,076 (Kr.1,778,263).

United Molasses Company.—The preliminary statement of this company was discussed in *The Economist* of April 6, 1940, on page 630. The balance sheet at December 31, 1939, compares with the balance sheet dated September 30, 1938. Total assets, £6,222,100 (£5,647,909). Stocks, £42,593 (£551,101). Estimated amount receivable in respect of stocks taken over, £1,162,123. British Government securities, £985,914 (£1,423,523). Cash, £112,719 (£257,581). Debtors, £238,288 (£84,841). Creditors, £166,828 (£231,396).

Hudson's Bay Company.—Net profit from trading in year to January 31, 1940, £72,269 (£110,503), after U.K. and Canadian taxation of £228,493 (£111,095). Dividend from trade profits 1 per cent. (subject to tax), and distribution from surplus of land account of 1½ per cent. (tax not payable). For previous year dividend was 2½ per cent., and land surplus payment was 1 per cent.

Barrow Hæmatite Steel.—Net profit 1939, after tax, £111,394 (£55,994). Ordinary dividend 5 per cent. against nil. To general reserve, £75,000 (£50,000). Carry forward, £19,064 (£18,033).

Bryant and May.—Ordinary dividend maintained at 25 per cent., tax free, with a final of 15 per cent., tax free. Bonus dividend is also proposed of £200,000 out of general reserve, to ordinary shareholders. British Match Corporation, who own all ordinary shares, will carry this bonus dividend to reserve.

(Continued on page 711)

Dividend Announcements

Rates are actual unless stated per annum or shown in cash per share. Rate for previous year refers to total dividend, unless marked by asterisk to indicate interim dividend.

CRITERION RESTAURANTS.—No dividend is to be paid in respect of year to March 31, 1940, against 7½ per cent. for 1938-39.

MAWCHI MINES, LTD.—Final dividend 60 (against 50) per cent., making for 1939 90 against 80 per cent.

SAN PAULO (BRAZILIAN) RAILWAY COMPANY.—Ordinary stock dividend for 1939 2½ per cent. tax free, against 2 per cent. tax free.

LEGAL AND GENERAL ASSURANCE.—Final dividend 40 per cent., making 60 per cent. for 1939 less tax. Total dividend and bonus for 1938, 45 per cent., tax free.

PHENIX ASSURANCE.—Total dividend for 1939, 60 per cent., the same as for 1938.

LIVERPOOL AND LONDON AND GLOBE.—This company has maintained its dividend, with a final of 33½ per cent., making 67½ per cent. for year.

ROYAL INSURANCE.—A final of 3s. 3d. per share (26 per cent.) brings the year's total dividend up to 6s. 6d. (52 per cent.). In previous year 6s. per cent. was paid, plus a capital bonus of 25 per cent.

Industry and Trade

As the coal and iron and steel industries are now regulated by the Government, the weekly market reports hitherto printed in this section of *The Economist* in smaller type and narrower columns have been suspended. Any news of importance, however, will in future be discussed in Notes in the main body of the section. A summary of current developments in the principal industries will continue to be given in the monthly *Trade Supplement* which is included in the last issue of *The Economist* in each month. The weekly survey of the commodity markets will be continued, and this, together with the regular monthly tables on unemployment, retail trade, wholesale trade in textiles, overseas trade, motor registrations, retail prices, as well as tables on unemployment, retail trade, wholesale trade in textiles, overseas trade, motor registrations, retail prices, as well as the fortnightly table of wholesale price indices, will in future be published at the end of *Industry and Trade Notes* in a section entitled *Commodity and Industry News*. If these tables disclose any significant changes, these will be discussed in the main body of the section.

Britain's Trade with Scandinavia.—Until communications can be reopened with the Swedish and Norwegian ports our trade with these countries is necessarily at a standstill. As far as Britain's imports from Sweden are concerned, the timber, paper and steel trades will suffer most from the interruption. In 1938, Sweden provided the following proportions of British imports: wood pulp and paper and cardboard, one-fifth; iron ore, also one-fifth; wood and timber, one-eighth; as well as fair quantities of

probably be maintained and, until exports can be increased again, arrangements will be made to divert the surplus to home consumers anxious to accumulate stocks.

* * *

More Coal.—The need for an expansion in the output of coal remains unchanged. Domestic requirements are likely to be heavy during the war, while exports—apart from the provision of France—should be increased as much as possible in order to secure foreign exchange. After the outbreak of the war the Mines Department asked the mining industry to produce at least 260 million tons—and, if possible, 270 million tons of saleable coal—per annum during the war. In 1937, the best year since 1929, the output reached 240 million tons, but in 1938 it fell to 227 million tons as a result of the recession. It is not only doubtful but highly unlikely that the industry has been producing at the rate of anything like 260 million tons per annum since the outbreak of war. Consequently the Mines Department announced on Friday last week that the Secretary for Mines had decided to set up a Coal Production Council whose task will be to "promote a substantial increase" in the production of coal, in collaboration with representatives of the owners and miners. The Council will have as chairman Lord Portal, and it will comprise three representatives of the miners, three of the owners and one each of the Ministries of Transport and Shipping and of the Mines Department. During the last war output actually fell, from 287 million tons in 1913 to 266 millions in 1914, 253 millions in 1915 and 228 millions in 1918. The Council's task will not be easy, but there is no reason why it should not achieve the desired output.

Coal Shipments to Scandinavia.—Pending instructions from Scandinavian sources, shippers of coal from the North-East Coast, who met on Wednesday in Newcastle, decided to hold up all neutral vessels loading at local ports for Scandinavia; in addition, all customs clearances for vessels with cargoes intended for the Scandinavian countries have been stopped. This action does not involve any serious financial loss, for the greater part of the business was being done on a "cash-and-carry" basis. The effect of Germany's aggression in Scandinavia on the coal and coke industry of the North-East is difficult to ascertain at the moment, but it would seem that there will be some temporary dislocation of trade, particularly in the North-umberland steam coal and in the Durham coke sections. However, there are other countries that are anxious to secure North-East coals and coke. Meanwhile output will

Mr Burgin on Machine Tools.—Mr Burgin's review of the supply of machine tools in a speech at Wolverhampton last Saturday did not provide an entirely reassuring answer to the questions raised in a Note on page 639 of last week's *Economist*. He agreed that an increase in supplies was essential, and he exhorted machine tool makers to see that their plant was kept in operation day and night. He also informed his audience of a scheme by which machine tools in France and Britain were to be treated as tourists. Thus, any tools not required for some months in either country are to be sent across the Channel in order to keep them continuously in operation. But Mr Burgin did not indicate whether the Government had taken steps early in the war to expand the basis of the industry in relation to the magnitude of requirements; nor did he convince his audience that every tool is now being used as efficiently as possible. In fact, as in most of his recent speeches, Mr Burgin almost confined himself to exhortation—a sure sign that the position is not altogether satisfactory.

Cotton Spinners' Margins.—Owing to the increase of 7½ per cent. in the wages of cotton operatives which came into force in the first week of April, it was expected that the Cotton Controller would issue revised margins between the cost of raw cotton and the selling prices of single yarn. When we went to press, however, revised schedules had not yet been issued. It is understood that the new spinning margins had been drawn up in Manchester, but that at the last moment some difficulty arose with the Ministry of Supply. The delay has given rise to disappointment, for a considerable volume of business appears to have been held up by the uncertainty. At the same time, the orders on the books of spinners and of cloth manufacturers are substantial, and the absence of any action by the Controller has not hampered production. The leaders of the industry accepted war control as a necessary evil, but some irritation is now being shown. Attention is again being focused on the fact that, although the profits of spinners are limited, there is no restriction on the prices in other branches of the industry. It is held that the reduction in the margin of spinners which took place last January has not been passed on to consumers, that manufacturers of cloth are in a position to secure abnormal profits and that consequently export business has been adversely affected.

C.W.S. Turnover.—In the year ended on January 13, 1940, the turnover of the Co-operative Wholesale Society amounted to £131.4 millions, an increase of £10.1 millions, or of nearly 9 per cent. over the total for the previous year. The increase was due both to higher prices and to an expansion in sales. In the 33 weeks preceding the war, sales were 3½ per cent. higher than in the previous year, although prices were rather lower. Since September the weekly turnover has been about 8 per cent. greater than a year earlier, due very largely to the rise in prices. In the grocery department, for instance, which supplies three-quarters of the trade of the Co-operative Wholesale Society, the rise in prices in the last quarter of the year made the average level of grocery prices for the whole of the year 5 per cent. higher than in 1938. Of the total turnover of £131.4 millions, the Society's own works provided £44.2 millions, an increase of 4 per cent. over last year's figures; the flour mills provided £8.3 millions and

the seven boot and shoe factories nearly £2 millions. The profit for the year, after allowance for taxation, interest and depreciation, amounted to £2,974,832, a slight increase compared with last year; the dividend remains unchanged at 4d. in the pound on the trade of societies in membership, with an additional dividend of 3d. in the pound on purchases of the C.W.S.'s own productions.

Chrome, Wolfram and Magnesite.—Under a new Ministry of Supply Order, the home trade in chrome, magnesite and wolfram is to be regulated by a licensing scheme. For the first two products this scheme will come in operation on April 15th, while the wolfram control came into force on April 8th. By a special direction a number of chrome, magnesite and wolfram products have been exempted from the licensing restrictions, which aim at securing military requirements without interfering with the trade in products not required for war purposes. Hitherto home requirements were secured by export restrictions and import duty concessions. The new licensing schemes will not increase total supplies, but will ensure a more efficient distribution. As was shown in a Note on page 116 of *The Economist* of January 20th, the Allies' supply position in wolfram is better than that of any other country or group of countries. The same conclusion is justified in the case of chrome, which is largely used for the production of special steels of great hardness, toughness and heat resistance, as well as in refractory materials, dyestuffs, chemicals and tanning materials. Of a world output of, say, 1,200,000 long tons per annum, the British Empire (mainly Southern Rhodesia, South Africa and India) produces between 400,000 and 500,000 tons. Another 50,000 tons are produced in French New Caledonia. In addition, the British Government has bought large parts of the Turkish and Greek supplies and is about to buy part of Yugoslavia's output. These three countries together supply over 300,000 tons per annum. As regards magnesite, the Allies' position is less satisfactory. The world's output of this light metal amounted to 25,000 metric tons in 1938, of which 14,000 tons were produced in Germany. Great Britain was the second largest producer with 4,000 tons, while France was fourth with 1,800 tons. The magnesite industry, however, is still in its infancy, and as the metal is the sixth most abundant element in the world, its output may experience a steep expansion, similar to that of aluminium, in the years to come. The British price of magnesite has advanced by only 1d. to 1s. 6d. per lb. since the outbreak of war, a fact which does not suggest that supplies are short. The price of 48 per cent. chrome ore is now 125s. per ton c.i.f., against 90s. in August last, while tungsten ore has risen from 48s. to 50s. per unit f.o.b. The present price, however, is nominal and therefore not strictly comparable with the pre-war figure.

Farm Labour.—The steady decline in the number of regular farm workers in the last twenty years has been in part a symptom of greater efficiency in the use of labour and of a change in farming methods adopted to ease the burden of rigid wage rates in times of falling prices. The fact that British farmers can now produce a given amount of food with less labour than in 1916 is a direct help to our present war economy, though it also means that there is a smaller margin of labour available now than in 1916 to handle an increase in production. The regular work can probably be fitted in, though certain districts have already been denuded of their skilled men by the competition of camps and aerodromes under construction. Here the Women's Land Army is helping to fill the gap and is now calling for more volunteers to be trained. But the real difficulty is likely to be the shortage of labour to cope with the seasonal rush of haymaking, harvesting, fruit picking and root lifting. The Prime Minister gave an assurance that sufficient labour would be available, but so far little

has been done by the authorities to implement this pledge. Some help may be forthcoming from the Army, if the military situation permits. The Women's Land Army has opened a register for women who could undertake farm work for periods of one to six months at a time. Private enterprise has also begun to organise week-end gangs, and much has been written, but little done, to form a boys' land army for youths between school and military age. The need for some official assistance is urgent, not only because the area to be harvested is larger, but also because local sources of casual labour have diminished and because the war has

checked the usual seasonal influx of Irish workers. If some guarantee could be given against the entry of members of the I.R.A., the official encouragement of a steady flow of men from a country which is suffering from rural unemployment to one whose farms will be hampered by a shortage of labour would benefit all concerned. Most of these potential immigrants are already trained in agricultural work, and it should not be beyond the ability of the Ministry of Agriculture to arrange for the engagement from Eire not only of seasonal workers, but also of men who would serve on the British food front for the duration.

COMMODITY AND INDUSTRY NEWS

THE extension of the war to Scandinavia brought an abrupt rise in many commodity prices during this week. Cotton prices are higher both in Manchester and New York and there was also some recovery in rubber prices from the levels reached at the end of last week. With the exception of spelter, all the major non-ferrous metals were marked up in New York; in London, the price for standard cash tin rose by £2 per ton compared with last week.

Cotton (Manchester).—The delay in the publication by the Cotton Controller of the revised margin for spinners is discussed on the opposite page. Raw cotton prices have advanced rather sharply, the political development being considered bullish. No decision has yet been reached over the allocation of freight for the import of American cotton to this country after the end of this month. Liverpool and Manchester merchants are supplying the authorities with particulars of their commitments up to the end of this season. The yarn market has been stagnant. Sales of American qualities have been few and more Egyptian spinners of coarse counts have refused to entertain business. Trade in piece-goods has again been impeded by the refusal of manufacturers to sell. Only isolated transactions have been put through for export, though some buying of standard makes for the home trade has taken place on long delivery terms. Fairly substantial Government contracts have been arranged.

Metals.—In the United States lead and spelter prices remained unaltered this week, although demand has increased. The American copper price, which was cut from 11.50 cents to 11½ cents per lb. earlier this month, recovered to 11½ cents this week on a revival of buying.

Tin.—The London price of cash tin gained £2 15s. to close at £252 5s. per ton; the backwardation has narrowed this week from £2 10s. to £2 5s. The rally was largely due to better buying as a direct result of the intensification of the war. In addition, the substantial selling pressure from the East has slackened.

Grains.—Slight rains in the United States wheat belt brought a fall in wheat prices in Chicago, but reports of large sales of Canadian wheat had a steadying influence on the market. Shipments from the Canadian eastern coast are expected to begin on a large scale before the end of the month. Private estimates of the United States winter wheat crop indicate a harvest of about 430 million bushels, compared with 563 million bushels in 1939. Shipments of Argentine maize from the new crop are now on a large scale, but prices remain firm; the small remaining surplus of wheat and linseed in the Argentine will release tonnage for the transport of maize. The invasion of Norway and Denmark will temporarily stop supplies to these countries, which are considerable net importers of overseas grain and oilseeds.

Oils and Oilseeds.—Trade consumers have fairly substantial allocations of seeds and oils at unchanged prices. Plate shipments of linseed continue on a fair scale; those from India are still very small, as the new crop has not yet reached the ports. Linseed prices remain steady with a small advance for Plate under a fair weight of American buying. The seeding of the new linseed crop in the United States is being done in favourable weather conditions and a large increase in acreage is expected owing to the premium now held by linseed prices over those for cereals. Home demand for oilcakes is still maintained.

Rubber.—In the early part of the week, the London market continued to stagnate, but with the extension of the war into Scandinavia, prices both in London and New York recovered from the lowest levels of the week.

COMPANY MEETINGS

THE STANDARD LIFE ASSURANCE COMPANY

SATISFACTORY RECORD FOR PAST YEAR

HIGH INTEREST EARNINGS

GREAT STRENGTH OF COMPANY'S POSITION

The one hundred and fourteenth annual general meeting of The Standard Life Assurance Company was held, on the 9th instant, in Edinburgh. Mr H. A. Jamieson, chairman of the company, was in the chair.

The manager and secretary having read the auditors' report, the chairman said:—
Gentlemen,

It is needless for me to point out that the year under review has been a difficult one for life assurance companies. Even prior to the outbreak of war the condition of tension was not favourable to the transaction of our business, and it is hardly necessary to say that with income tax at the rate of 7s. 6d. in the pound, in conjunction with the low rate of interest now to be obtained on first-class securities, the problem of finding suitable investments for the company's surplus funds is not an easy one. The closing of the American field of investment and the fact that our existing dollar securities in the United States are at the disposal of the Government have had the effect of increasing the difficulty.

NEW LIFE BUSINESS

In spite of these adverse features, however, the record of our work during the past year is a satisfactory one. From the report you will observe that new life business, including group life assurances, amounted to a total of over £4,000,000 after deduction of reassurances. This figure represents a considerable reduction on the amount of life assurance business transacted during the previous year, but considering the circumstances ruling during the year under review it may, I think, be regarded as satisfactory. A large volume of pension business was also transacted, and this is included in the total deferred annuities purchased from the company stated in the report at no less than £237,560 per annum.

PREMIUM INCOME AND INTEREST RATE

The revenue account of the life assurance and annuity fund shows that our premium income for the past year was £2,542,000, an increase of some £200,000 over the figure for the previous year. Interest revenue after deduction of income tax is £1,281,000, and represents a net rate of interest earned on the life assurance and annuity fund during the year of £4 11s. 7d. per cent. Although this rate is 2s. 7d. per cent. lower than the corresponding rate last year (largely owing to the sharp rise in the rate of income tax), I am sure that members will be satisfied that our funds are earning such a satisfactory rate. The surplus income from the guarantee fund, after meeting interest charges, amounts to almost £41,000, and this, in accordance with our custom, is transferred to the life assurance and annuity fund.

The increase in claims both by death and by maturity as shown by the expenditure side of the account is a natural result of the company's development. The decrease in commission is, of course, on account of the smaller volume of new business, and expenses of management also show a slight decrease. The expense ratio, i.e. the ratio of commission and expenses to premium income, at 12.2 per cent. must be considered very favourable. The sum of £81,932 has been transferred to the staff pension fund, and, as can be seen from the figures published, the life assurance and annuity fund increased during the year by over £1,400,000. This substantial increase, representing additional funds which required to be invested, renders the comparatively small fall in the net rate of interest earned on our total funds all the more satisfactory.

The total assets are stated in the balance sheet as £32,559,000, and notwithstanding the low prices ruling at November 15th last you will see that the directors were able to state that, in their belief, the value of the assets at that date was in excess of the balance-sheet figure. The excess, I may say, was of very considerable amount, and has, of course, increased on account of the rise in security values since the date of the balance sheet.

BOARD'S SOUND VALUATION DECISION

All members of the company holding with-profit policies received intimation, shortly after the close of the year, that the directors did not think it desirable on this occasion to carry out a formal annual actuarial investigation with a view to distribution of surplus. As

you may be aware, it is not obligatory for a life assurance company to carry out actuarial investigations at more frequent than five-yearly intervals. At one time it was our regular practice to make our investigations every five years; but some years ago the directors decided that it would be to the advantage of the members to have an annual valuation and distribution of surplus. On account of the fact, however, that at the end of the financial year under review we were entering upon a struggle the duration and severity of which it was impossible to estimate, the directors felt that it was only prudent, in the meantime at least, to discontinue the system of annual distributions of surplus. It is clearly in the best interests of the members that the resources of the company should be conserved in the face of a difficult and unknown future, but I may say that when an actuarial investigation is next carried out (which will be on or before November 15, 1943) holders of with-profit policies which are then in force will participate in any bonus distribution in respect of each premium due and paid since November 15, 1938, so that their interests are fully protected. A full investigation into the value of our assets has, however, been carried out, and, as I have already indicated, the directors were satisfied that they were of greater value than the figure stated in the balance sheet. I may say further that an interim actuarial valuation of the liabilities of the company was undertaken for the information of the directors and that the position revealed was one which enables us to face the future with a considerable degree of confidence. The company is in a strong position, but no one can tell to what extent its strength may be tested in the years to come.

INTERMEDIATE BONUS MAINTAINED

Up to date the intermediate bonus, that is the bonus payable under policies which become claims by death or maturity, in respect of premiums due and paid since November 15, 1938, has been maintained at the rate of £2 2s. per cent., with corresponding bonuses in other classes. The question of a possible change in the rate of intermediate bonus has received and must continue to receive the careful consideration of the board. The directors feel, however, that an immediate reduction would not be justified and that in fairness to those members whose policies mature by death or survival during the current financial year the present rate should be continued until November 15, 1940, unless in the opinion of the directors circumstances arising before that date should render a change desirable. This decision—which is, as I have indicated, necessarily of a character which may require revision—is not to be taken as implying any forecast of what future bonuses may be. Future bonuses depend upon profits which may be earned, and in this connection we must bear in mind the possibility of adverse mortality experience due to the war and of a diminution in the interest income from our invested funds.

LIFE ASSURANCE SCHEME TO ASSIST WAR LOAN

Realising as they do the duty, and in fact the necessity, of a large financial institution such as ours supporting the Government in its financial policy, the directors have invested nearly £900,000 in British Government securities since the commencement of the war, and in connection with the recent issue of 3 per cent. War Loan they instituted a life assurance scheme to assist the public in purchasing this security. The duty has been laid upon the public to save as much money as possible at the present time, and one method of saving which is well worthy of consideration is by effecting a life assurance policy. The premiums constitute a real saving on the part of the policyholder, as well as giving him and his dependants greater security. Further, as the money requires to be invested by the assurance company in the comparatively limited field allowed by Government restrictions, the result is that the Government's financial policy is assisted either directly or indirectly.

In conjunction with other life assurance companies, we have entered into an arrangement to assist such of our members as may have difficulty owing to altered circumstances due to the war in keeping their policies in force. Everything is being done as far as possible to assist our members in this direction.

The report was unanimously adopted.

G. BEATON AND SON, LIMITED

RECORD TURNOVER

MR S. C. GOODWIN'S REVIEW

The annual general meeting of G. Beaton and Son, Limited, was held, on the 11th instant, at the Waldorf Hotel, London, W.C.

Mr S. C. Goodwin (the chairman), in the course of his speech, said:—My first duty, and a very pleasant one, is to introduce to you Sir Eugene Ramsden, who joined the board in August last. We are convinced that his knowledge of public and company affairs will prove to be of immense value to the board. In accordance with the policy of the board to extend the scope of activity of your company, several propositions were examined during the year. The first of these is E.H. Fuel Injection, Limited, a company which, since its incorporation in 1932, has been engaged almost entirely on developing under patents pumps for the injection of fuel. In view of our close connection with the motor and aircraft industries, this project was deemed to be eminently suitable for your company to become interested in, and accordingly your directors entered into an agreement to supply the necessary working capital on terms which they considered favourable and which provide us with a controlling interest.

PRODUCTION OF SPECIAL TOOLS

The second is an undertaking which has been created jointly with another company for the production of special tools. These tools have a regular demand which, incidentally, is not confined to trades in which we were hitherto primarily interested, and consequently this enterprise represents a broadening of our activities. We have also found it necessary to again increase our capacity for the production of aircraft components, and accordingly, towards the year-end, two factories were taken on short leases. It should be added that our accounts for 1939 do not reflect any benefit from the acquisitions and extensions referred to, as they were not in full production in that year. The trade agency which we had held for some years was, by mutual consent, terminated during the year, under an arrangement which provided for the payment to us of suitable compensation and the disposal of our holding of shares in the company.

Up to the outbreak of war our turnover in motor accessories was on a par with that for the corresponding period of 1938, but there was an inevitable fall in the post-war months. Our total turnover was, however, substantially higher than in the previous year, and again created a record, and the profits of £47,319 15s. 3d. are higher by some £14,530. This balance of profits is struck after charging depreciation, our expenditure on A.R.P. as well as certain initial outgoings in connection with our new factories, and your directors consider the results to be satisfactory.

DIVIDEND DECISION

It is with regret that your directors are recommending a distribution below that of last year. This decision was only reached after serious consideration of two main factors, viz. taxation and the necessity under existing conditions of conserving resources. As regards the former, no less a sum than £30,650 is required to meet the liability under this head, which figure is almost equal to the profit of 1938 and considerably exceeds that of the years 1936 and 1937. For a company of our size this contribution to the National Exchequer is a very heavy one, and its severity can only be mitigated by the fact that it is helping to provide the funds which are so vitally necessary for the successful prosecution of the war.

As to the second point, it will be readily appreciated that funds for the development of the company's interests must be found out of current resources, and that in order to provide such resources adequate amounts must be allocated to reserve. Some time must inevitably elapse before new enterprises reach a profit-earning basis, and in the interim period their operations necessitate the provision of adequate working capital, and it is for this reason that we recommend the comparatively substantial appropriation of £6,500 to general reserve. The surplus of assets over liabilities has increased by approximately £6,000 during the year and now stands at £165,110, compared with shareholders' capital of £100,000.

With regard to the figure at which our stocks and work in progress have been brought into account, in view of existing conditions, it has been considered necessary to apply extreme caution in valuing the stocks in our motor accessories department.

The report and accounts were adopted, and the meeting concluded with a vote of thanks to the officials, staff and workpeople of the company.

BANK OF ATHENS

STRONG POSITION MAINTAINED DESPITE EUROPEAN CRISIS

The Directors' report for 1939 was presented at the annual shareholders' meeting on the 23rd ultimo.

The following were among the more salient points:—

Last year was marked by successive crises provoked by a series of alarming events, the evolution of which completely upset the political and economic situation throughout the Continent, and led to a new war from which it is difficult to foresee the extent of the consequences to affairs all over the world.

In Greece, the constructive effort undertaken by the State to develop the resources of the country has been continued, particularly in the branches of agriculture and industry. However, the reaction of the unfavourable conditions was also felt in our country, which, on account of the rigorous commercial blockade exercised by the belligerents, was deprived in a large measure of the principal outlets for its products. On the other hand, problems have arisen in the supplies of raw materials, the lack of which has been felt by the industry, and particularly in construction works.

Despite the very unfavourable conditions, and the further restrictive measures imposed on the outbreak of hostilities, the turnover of the bank has been satisfactory, as is shown by the balance sheet which is to-day submitted for your approval.

A new item in the balance sheet is the "Account created by Law 1767/1939" and "Greek State—Law 1767/1939" in the assets and liabilities respectively. These two accounts arise out of the agreement concluded between the bank and the State, terminating the differences which have been under discussion for several years in connection with the Drachmification of the accounts previously held in foreign currencies. Following this agreement, a new evaluation of the assets has been effected, on the basis of the rates prevailing on December 31, 1939.

The profits for 1939, after deducting the usual provisions and amortisations, amount to Drs. 18,089,839 as against Drs. 18,920,242 for the preceding year. This allows us to propose the distribution of a dividend of Drs. 10 per share, leaving a balance to be carried forward of Drs. 4,940,571.

JOHN BARKER AND COMPANY LIMITED

RESULTS SATISFACTORY

The forty-seventh ordinary general meeting of this company was held, on the 9th instant, in London.

Sir Sydney Martyn Skinner, J.P., chairman and joint managing director, who presided, said the result of the past year's trading was a net profit of £306,663, which the directors considered satisfactory, having regard to the prevalent conditions, particularly since the outbreak of war. The decrease of £41,278, as compared with the previous year, was substantial, but the results compared not unfavourably with those of undertakings of a similar nature. Up to the end of August the profits showed increase, which indicated how seriously war had affected the position.

The outbreak of war, however, changed the whole situation. It became impossible to proceed with the building operations according to schedule, but the work was proceeding wherever possible, having regard to existing circumstances. The building could not be completed by the time originally fixed, but from what could now be seen of the frontage of the new building, with the lovely sweep of arcade windows and internal arrangements, it would be agreed that, when completed, it would fully justify all the thought and effort expended.

Large but necessary expenditure had been incurred to provide efficient and up-to-date service to customers, including an unseen service of heating, lighting, ventilating and air-conditioning plant, all necessary to ensure comfortable shopping facilities. During the year they brought into use the splendid escalator installation, which was second to none in this country or elsewhere.

The gross profit, rents receivable, etc., for the year amounted to £1,474,695, or a decrease of £73,047, while economies had been effected of £31,768, leaving a difference of £41,278. Immediately on the outbreak of hostilities the position was surveyed from the point of view of expenses and drastic economies were introduced to meet, at least in part, any drop in profit arising from the inevitable dislocation of trade. Expenses over which they had no control—rates, taxes, war risk insurance, etc.—had increased by

approximately £27,000, or about 20 per cent., with the prospect of further increase in the current year. But for these charges they would have been very little short of the net profit for the previous year. In addition they had had to face the loss of trading arising from black-out conditions. Having all these factors in mind, it would be agreed that the net profit of £306,663 was satisfactory.

The current year had started fairly well, but it would be a bold man who would attempt any prophecy. Additional charges for rates, taxes and other uncontrollable expenses were already in operation and increasing difficulties were a daily problem. But all that human foresight and energy could do to further the company's interests would be done. The reduction of the dividend on the ordinary share capital from 15 to 10 per cent. was, in the directors' view, the right and prudent course to take.

The report and accounts were unanimously adopted.

BRITISH ENKA LIMITED

IMPROVED RESULTS

The 15th ordinary general meeting of British Enka, Limited, was held, on the 11th instant, at the Hall of the Chartered Insurance Institute, 20 Aldermanbury, London, E.C., Mr C. T. Pott presiding.

The Chairman, in the course of his remarks, said: The year's trading resulted in a profit of £97,172. As we made a loss for 1938 or £70,204, the improvement by comparison is £167,376. The profit, however, is subject to Excess Profits Tax, which should not exceed £30,000. Unfortunately, our profits standard for E.P.T. is very low, but we are hopeful that the forthcoming Budget will give consideration to businesses such as ours which were suffering particularly from depressed trading conditions during the standard years. No part of our increased profit can be attributed to the war, which as a matter of fact has affected us adversely.

The co-operation between the rayon manufacturers has yielded many benefits to producers such as we are, and to the rayon trade as a whole. We have done our utmost to further general co-operation in the industry. In that regard we are much indebted to Mr A. D. Carmichael, who, as a director of this company, has been particularly active and successful in fostering goodwill. It is noteworthy that Mr Carmichael is now acting as Chairman of a Committee on which all the rayon producers in the United Kingdom are represented.

(Continued from page 693)

with £1 18s. per cent. in 1938, are declared; £25,000 is transferred to the general reserve. From the industrial branch surplus, as in 1938, nothing is allocated to policyholders by way of divisible profits, but the interim bonuses on policies becoming claims are maintained at the same rates, and £50,000 is transferred to investments reserve. At present prices market values of the assets considerably exceed book values.

★

Standard Life.—Unlike a number of offices, the Standard Life, a mutual office, effected a fairly considerable increase in its life and annuity funds last year. In the year ending November 15, 1939, they rose from £27.9 millions to £29.3 millions. In addition there is a guarantee fund of £1.7 millions available for the security of policyholders. The increase in the life funds occurred despite a fall in net new business from £6,466,300 to £4,030,400. The company has been one of the leading offices in the transaction of group life assurances, but in 1939 the new sums assured on this type of business decreased from £1,816,700 to £358,100. This was no doubt largely the result of deliberate policy, for war conditions produce unfavourable factors in group assurances and the offices have not been anxious to develop this business as freely as in the past. The company has usually recorded a net rate of interest on the life funds considerably larger than the other offices, partly, no

doubt, because its holdings of debentures and ordinary stocks (which last year represented 43.9 per cent. of the assets) are relatively higher. Last year the net rate of interest was 4.58 per cent. against 4.71 per cent. in 1938, the fall being due to higher taxation. The average net rate of the offices whose accounts have so far appeared was in the region of 3.75 per cent. for 1939. Expenses of the Standard Life were 12.2 per cent. of premiums in 1939 against 13.8 per cent. in 1938; this considerable reduction in a difficult year continues the trend of several years past. The directors have postponed the valuation and profits distribution, which used to be annual but need only be quinquennial if they so decide. They have not announced when the next valuation will be, but it cannot be later than 1943. The interim bonus is maintained at £2 2s. per cent. Market values of the assets as at November 15, 1939, exceeded the book values of £32,559,500.

★

Employers' Assurance.—The Employers' Liability Assurance Corporation transacts a very large part of its business in North America and its fortunes, therefore, closely depend upon conditions in the United States and Canada. The report and accounts suggest that experience in these countries was rather less satisfactory in 1939 than in 1938, but it must be remembered that in the latter year the results were unusually good. The corporation has merged the accident account with

Thanks to the greatly increased demand in 1939, we were able to gradually raise our production. We also benefited from much better operating efficiency brought about through the many improvements made in our works during the previous two years.

The high quality of our products has been maintained even under the difficult war conditions, and so long as we can get the necessary quality in labour and raw materials there seems no reason why there should be any falling off in this standard.

EXPORT TRADE

Although we do not export directly any large quantity of our yarn, we are doing our utmost to further the export trade. A proportion of our production is being used by the Services and we estimate that about 25 per cent. of our output is exported in the form of fabrics. We are endeavouring to regulate our business so that a considerably higher proportion will go into the export trade. This has necessitated, and will necessitate, the cutting down of supplies to customers whom we have had for many years in the home trade market, but we hope they will recognise that only national necessity compels us to do this.

We have continued to receive assistance and collaboration under our agreement with the Dutch A.K.U., and although we are no longer able to make the usual frequent contacts with Holland, we still have the advantage of their technical advice and assistance and we are indeed grateful.

For the rayon trade as a whole we believe there is a good future. Through improved methods of manufacture rayon is becoming more and more popular and finding ever wider markets. World production of rayon yarn in 1939 rose to approximately 1,125 million pounds. Although we hear of the invention of new fibres there is none as yet which is even in sight of competing with the type of yarn which we manufacture.

You will doubtless want to know whether our much improved position brings us to within reasonable sight of a reconstruction of the company's capital and the payment of dividends. Your directors feel that the financial position of the company must be strengthened. We must, of course, get rid of our indebtedness which has been incurred largely to finance the many improvements of our plant, and this must be done without denuding ourselves of working capital. Once these objects are achieved, and subject of course to a continuance of favourable trading conditions, the time should be ripe for shareholders to begin to receive some reward for their long wait.

The report and accounts were unanimously adopted.

the general account so that the new "accident and general account" comprises all business other than fire (dealt with in a separate account), life (transacted through the associated company, the Clerical, Medical and General, whose accounts are analysed on page 693) and marine (written by the Merchants' Marine).

The earned premiums on the accident and general business amounted to £6,036,300 in 1939, compared with £6,427,900 in 1938. In 1939, the underwriting profit, at £203,300, was 3.37 per cent. of earned premiums; in 1938, the profit was £307,000, or 4.78 per cent. Claims rose slightly last year, from 55.6 per cent. to 56.2 per cent., and in keeping with the general trend of expenses in most parts of the world and not least in the United States, the expense ratio increased from 39.6 per cent. to 40.5 per cent. The problem of enlarged expenses abroad, resulting mainly from Government action—taxation alone accounted for more than one-half of the increase in the expense ratio—is one of the major problems confronting the non-life departments of British companies operating abroad.

Earned premiums on fire business were practically unchanged at £398,100 against £397,200 in the previous year. The underwriting profit was £25,000, or 6.3 per cent., compared with £28,100, or 7.1 per cent. in 1939. The dividend is maintained at 3s. 6d. (less tax) per £1 share (5s. paid). The assets total £11,576,400, of which £4,810,400 consists of U.S. Federal securities.

CURRENT STATISTICS

Finance

GOVERNMENT RETURNS

For the 6 days to April 6, 1940, total ordinary revenue was £20,812,000 against ordinary expenditure of £48,552,000, and issues to sinking funds of £259,000. Thus, including all sinking fund allocations, the deficit for the 6 days is £27,999,000, against £10,095,000 for the corresponding 8-day period a year ago.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued, less income tax at the standard rate, with allowance for redemption. Where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The yield on ordinary stocks and shares is calculated on the latest dividends, account being taken of any increase or reduction of interim dividends.

Prices, Year 1939		Prices, Jan. 1 to Apr. 10, 1940		Name of Security		Price, Apr. 10, 1940	Ch'ge since Apr. 3	Yield Apr. 10, 1940	Prices, Jan. 1 to Apr. 10, 1940		Last two Dividends		Name of Security		Price, Apr. 10, 1940	Ch'ge since Apr. 3	Yield Apr. 10, 1940

Help for Norway

THE battle for Scandinavia is still in its early stages, and it is not yet possible to get a clear picture of the state of affairs in Norway. To judge by the slowness of their advance, the Germans in Oslo are still few in number and weak in artillery; but some transports are getting through the British mines and submarines; and the fact that the Germans are advancing at all shows that the Norwegians are still weaker. The German outposts at Bergen and Trondheim are still separated by hundreds of miles of mountains from their main force at Oslo; but they are growing stronger daily, as they receive reinforcements by air.

The place of Norway in Hitler's strategy, however, has become much clearer in the past week. What is happening is not by any means what he planned. He intended to seize Norway as he seized Denmark—in an hour and without a blow. The way had been well prepared; there are ugly stories of treachery and corruption coming out of Oslo, and the Nazis had good reason to believe that they would be able to take peaceful possession of the whole country. Their small landing parties at Christiansand, Stavanger, Bergen and Trondheim would have been relieved from the land long before the British could arrive and we should have been faced with the impossible task of landing troops on a strongly-held hostile coast. This explains what has puzzled many observers; they have asked why Hitler should have done anything so obviously foolish as to choose to fight in a country where he is at a strategic disadvantage. The answer is, of course, that he did not expect to have to fight at all; it was to have been another of his bloodless victories. It explains also why Sweden was left alone when Norway and Denmark were attacked. To have invaded Sweden on April 9th would have slowed down the whole time-table. But with Norway and Denmark fully occupied, Sweden would have been entirely at Hitler's mercy, and must also, in its turn, have surrendered, so that even the garrison at Narvik would have been relieved from the land, and Hitler would have

had all the Swedish ore. There was nothing rash at all about Hitler's plan—provided that Norway surrendered. The Allies would have been faced with a total and almost instantaneous engulfing of Scandinavia before they could have moved; Hitler would have won his greatest victory and the Allies would have suffered a crushing defeat. It was a brilliant plan, of majestic scope, cleverly conceived and efficiently carried out—in all save the vital detail. The Allies and the democratic cause have been saved by the courage and patriotism of King Haakon, Her Nygaardsvold and Professor Koht. Norway cannot to-day be very proud of her policy of neutrality and pacifism à outrance; but she can be proud in full measure of her king and her statesmen.

The seizure of Scandinavia was obviously intended only as a prelude to the campaign of 1940. Whether the curtain will now go up we do not know, though the turn of events in Norway has made it more rather than less likely. Hitler's intention was that Scandinavia should distract the Allies' attention and assist him to strike his main blow elsewhere. But he now needs to distract us from, not to, Scandinavia, and the main blow is all the more necessary. He intended to make a feint; but he has presented us with the opportunity we wanted and could not otherwise get, that of outflanking him in Scandinavia with the help of the Scandinavian peoples. What was intended as a side-show may become a main theatre, to his dismay.

To do this, however, and pass from the defensive in Norway to the offensive in the Baltic we must hurry. We must not be diverted to Narvik, which is now, in the changed circumstances, a mopping-up operation. We must move with all speed to the main Norwegian front. There is no reason to doubt that we are moving fast, that we shall interpose a strong force between Oslo and Trondheim, Oslo and Bergen, before the various German forces can join hands. But we must hurry, hurry, hurry. When a general uncovers his flank, his opponent must strike with lightning speed. There is not a day to be lost.

The Budget

THE Budget which Sir John Simon is to lay before the House of Commons on Tuesday will decide whether our fiscal policy for the duration of the war is to be inspired by financial realism or by political cowardice. Hitherto it has been possible to justify a policy that hesitated to pile new burdens on the taxpayers' shoulders. The only virtue of restricting the taxpayers' consumption is to set free resources of man-power or materials for the war effort; and if the war effort is not ready to receive them, restriction of consumption merely creates unemployment. The fact that so small a part of the increase in expenditure since September has been met out of revenue is, therefore, neither a necessary cause for complaint nor a guide towards future policy. Even so, the Chancellor's failure to give the public any guidance on the main lines that financial policy is to follow when the transition period is over—indeed, his explicit suggestion that the further increase in income tax will be very small—has created an atmosphere of dangerous illusion. It is inevitable, at the sudden onset of a war, that there should be a certain amount of living on capital and drawing on stocks. But a prudent Government would check this tendency and reverse it as soon as possible. Sir John Simon's silence has encouraged the British public to believe that the present comfortable paradox of rapidly rising Government expenditure, together with hardly any restriction of popular consumption, can continue indefinitely.

This mistake can be redeemed by Tuesday's Budget if it is of such a nature as to make the public face the facts at last. But the decision cannot be put off any longer. It is true that we are still in the transition phase, with the unemployment register still over a million. The Budget, however, covers a whole twelvemonth, and though there might be a case for postponing the actual collection of additional taxes for a few more months, the announcement should be made now, so that we may all know where we stand. If the opportunity is let slip now, it will hardly be possible later to catch the ebbing tide of public resolution—or, indeed, to arrest the undertow of inflation.

The size of the expenditure to be provided for will have to be guessed even by the Chancellor. Reasons were given in an article in *The Economist* a fortnight ago for believing that the total will possibly be as much as £3,400 millions, and almost certainly over £3,000 millions; any lesser figure will be the sign of a grievously inadequate war effort. Against this expenditure, the taxes already in existence and those already announced can be estimated to bring in about £1,300 millions. Is this enough? Or, more appositely, is the balance of £1,700-£2,100 millions a sum that can be raised by borrowing without recourse to inflation? The question answers itself; if the matter is looked at as a problem in economic realism, it can be stated as a simple fact that more taxes, to the tune of several hundred millions, are imperative if inflation is to be avoided. Perhaps, even at this late hour, it is necessary to insist once again that taxation does not impose a burden that could otherwise be escaped; the burden is imposed by the expenditure, which takes men and materials away from their peacetime function of supplying the needs of the public, and it will have to be borne, whether the Government covers the expenditure by taxation, by borrowing or by inflation. The Nazis have seen this very obvious point and drawn the necessary conclusions. Are we so in thrall to delusions that we cannot do as much?

Nobody, of course, would suggest that it is humanly possible to cover the whole cost of the war out of taxation. But it is fully possible to lay down the policy now that, throughout the war, half its cost shall be raised out of imposts laid compulsorily on the people. The burden, by that means, will be no greater than if taxes are left at their present level; indeed, it will be lighter, since the weight can be scientifically adjusted. And the future dislocation will be much less.

The 50 per cent. policy would envisage the imposition in next week's Budget of new taxes to bring in from £200

to £400 millions. Obviously, this is no small task. How could it be accomplished? Let us mention first of all the various special devices that might be adopted to bring in small amounts. Postage rates can be put up; the 2d. letter can be restored and more can be charged for telegrams and telephones (though the mechanical problem of the telephone call-box must not be forgotten). The phase of transition to a full war economy might be turned temporarily to revenue account. There is a long list of luxuries and semi-luxuries whose production will before long have to be limited or prohibited entirely; let them be named now and a stiff excise tax placed upon them. There are adjustments to be made in the definitions of the Excess Profits Tax, and, once we are sure that it is equitably levied, it might be appropriate to provide that any excess profits not taxed away should be compulsorily lent to the Government. The arguments against a levy on excess incomes other than excess profits, never very convincing, would be lessened if it were adopted as a means of securing compulsory loans rather than tax revenue. It is hard to imagine cases where it would be unjust to require an individual who has an increase in income during the war to lend all, or at least the greater part, of the increase to the country. The petrol duty, in present circumstances, could be very considerably increased without much reduction in consumption or any real hardship, except perhaps to road transport undertakings. There are other possibilities in the realm of excise taxes and stamp duties.

But these devices, though useful, are not the means to produce hundreds of millions. To secure that result, levies must be placed directly on the incomes or on the ordinary general expenditure of everybody—rich, middle-class and wage-earners. Not much more, it is true, can be got from the rich. As has been pointed out in *The Economist* before, a limitation of all incomes to £2,000 a year (after taxation) would not bring the Exchequer more than £60 millions a year. But perhaps the importance of taxation on the rich is not best represented by its yield. After paying his income tax at 7s. 6d. in the £ and his surtax at the current rates, the average surtax-payer will have about £2,650 left. Can he be exempted from further levies if his fellow-citizens with only a fraction of that income are to be asked to assume heavy new burdens?

In the middle ranges of income, more revenue can best be obtained by an increase in the income tax. But so long as that tax is calculated by reference to a standard rate far higher than any but a tiny majority pay on the whole of their income, any further increase would be interpreted as a piece of fiscal terrorism. There were some hints in Sir John Simon's speech when introducing the War Budget last September which suggested that he was thinking of reconstructing the basis of the tax so that it would be in appearance, what it is in fact, a progressively graded tax. If the standard rate were lost to sight—save for special purposes such as the deduction of tax from dividends—it would be possible to increase the effective rates by one-third without more than a shadow of the alarm that would be caused by the announcement of a 10s. standard rate. Moreover, such a change would make it possible to grade the progression more effectively. In particular, it would make it possible to tackle the problem of the incomes which are at present heavily hit neither by direct nor by indirect taxation—those incomes of £5 to £12 a week, which, as Lord Stamp was most unjustly criticised for pointing out, now bear proportionately less taxation than others either above or below them.

A recasting of the income tax might also make it possible to overcome the very difficult political and technical problem of taxing the wage-earner. He cannot escape some part of the burden of the war; but the discussion aroused by Mr Keynes's proposals has shown that any tax which is aimed specifically at the wage-earner will meet with fierce opposition. To include him within the purview of a general tax, levied on all alike, raises technical problems. Indirect taxes are easily levied, but inequitable in their incidence.

Direct taxes, to be administratively feasible, must be at a flat rate and collected at the source—both requirements that are difficult to reconcile with a progressive income tax. It might be possible, however, to meet all these objections, political and technical, if a flat-rate deduction were made at the source from all incomes above a small exemption level; in the terminology to which we have become accustomed, the standard rate of income tax might be reduced to, say, 2s. in the £ and deducted from all incomes at the source, with surtax beginning at, say, £250. Such a tax would hardly be fair in its incidence without a system of family allowances placed alongside it. But it would have the merit of producing revenue promptly, and it could be adjusted so as to bring in a very heavy yield. And the principle of extending the income tax to cover the great majority of citizens would be one which it would be difficult for any democratic legislature to oppose.

The week before the Budget Speech is, of course, far too late to make specific suggestions. What has been said in this article is meant to be taken less as a set of proposals than as illustrations of the possibility of increasing tax revenue if we set our minds to it. But the increase of taxes

must necessarily be considered in its proper framework. The Budget, on its revenue side, covers only one facet of the general problem of war finance, and an increase in taxation, if it were left to stand by itself, might have the result of reducing the savings that would otherwise be available. But if we are to raise only half the cost of the war by revenue, and if at the same time inflation is to be avoided, it is apparent that savings must be very greatly increased. This, too, is a problem that cannot be ignored any longer and must find a place in any comprehensive survey of the economic problem. The Chancellor of the Exchequer has succeeded in maintaining his supreme control of the machinery for economic planning, and we are told that it succeeds in taking the broad view and the bold decision. Now is his chance to prove his case. Let him survey the whole field—not merely that part recorded in the Exchequer returns—and propose the drastic measures that such a survey dictates. His task is not to be envied; but he has the opportunity, for which every Chancellor of the Exchequer should pray, of showing that the British fiscal system, hitherto the world's preceptor, has not lost its power of seeing problems clearly and seeing them whole.

Italy's Choice

IF we are to believe the Italian Press, matters stand at a crisis between Italy and the Allies. Signor Ansaldo's recent warning that "all Italians who believe our country can stay out of the present conflict up to the end are mistaken" should take no one by surprise. Since the outbreak of war there has only been one Italian question: would Germany's ally and Axis partner move from non-belligerency to hostility, and if so, at what moment? The Allies have tried to meet and if possible counter the possibility by methods which are simply an extension of the old policy initiated after Sanctions, a policy of tact, conciliation and forbearance. To give a few examples: our blockade was engineered so as to do a minimum of harm to Italian interests, concessions and exceptions were made, pledges of good faith accepted, buying Commissions sent out in the hopes of making it economically worth Italy's while to divert certain supplies to us. It was possible during the winter months to allow our policy some measure of success. Italy was still out of the war. France had succeeded in placing important orders. Our trade negotiations were advancing steadily, and we were contemplating the purchase of over £20 millions of Italian goods, including munitions—more than three times our 1938 purchases. True, there were certain leakages through to Germany, but it was possible to attribute them to the profit-seeking ingenuity of individual firms and not to impugn the Government's good faith. The political background of all this promising economic activity was a new cordiality in certain circles hitherto markedly hostile to the West and a general atmosphere, largely inspired by the very fair and unbiased reporting of the Press, of confidence and détente. There grew up among the Allies a certain tendency to discount the possibility of Italian intervention. The Axis was broken. Italy *farà da se*.

So much optimism has been shown to be misplaced. Even at the time there were various pointers. In the *Popolo d'Italia*, for example, the Duce's own paper, the section which is reputed to be from his own hand never once abandoned a bitter jibing attitude towards the "pluto-democracies." Nor could it escape careful observers that some of the help afforded by Italy to Germany in order to outmanoeuvre the blockade suggested anything but a broken Axis. On the contrary, it seemed as though Italy's "non-belligerency" was exactly what her Axis partner needed most. Involved in war, Italy might well have become an immediate economic and military liability to Germany. Out of the war and winning favourable treatment from the Allies by her equivocal attitude, Italy occupied a key position in that ring of neutral States which protected Germany from attack and helped in varying degrees to secure her supplies. "Non-belligerency" in this sense served both German and Italian interests, and

could continue to do so just so long as the Allies were content to allow the blockade to leak.

By the end of the first six months of war France and Britain were obviously growing more and more perturbed at the comparative ineffectualness of their economic war. M. Reynaud's formation of a Cabinet pledged to put more vigour into every branch of the Allies' war effort coincided with assurances in London that the leaks would stop. The possibility of an effective blockade placed Germany under the necessity of elaborating a new policy and the new policy demanded a new type of Italian collaboration. The first sharp reminder of Germany's interpretation of "non-belligerency" came with the breakdown of the British trade talks after months of negotiation. The meeting of the two Dictators at the Brenner was significantly prefaced by the open bombing and sinking by Nazi planes of three Italian cargo boats, and whatever the scope of the colloquy, one of its immediate consequences was the launching in Italy of a frenzied anti-Allied campaign, which still rages in Press and radio and has reached unequalled heights of misrepresentation and bias in the reporting of the onslaught on Norway. Finally have come warnings, war talk, rumours of mobilisation and troop concentrations, of naval manoeuvres, reinforcements to Albania, and of a possible Balkan offensive. Even if the break so far exists largely on paper, Italian non-belligerency has entered a new phase.

The new phase is not easy to interpret, for interpretation carries us beyond the reach of known facts. The fact of the Brenner meeting is useless without precise information on the nature of the conversations which took place. Did Hitler propose a new policy to the Duce? If the Duce acquiesced, what type of collaboration is to follow? If not, what independent line does Italy hope to pursue? It is hardly likely that Hitler made the long journey merely to grasp Signor Mussolini's hand and bid him continue. He had no intention of waiting till the net of the Allied blockade had been drawn closer. He may therefore have announced a coming offensive and demanded Italian intervention, pointing out that once a severer blockade had been introduced by us, Italy's most hopeful moment for entering the conflict would have already passed. We have no means of establishing what type of offensive Hitler had in mind, but Norway was probably thought of as a side-show, to be seized without fighting, and intended to paralyse the Allies while he struck elsewhere. If so, the main blow is yet to fall, and from Hitler's standpoint the hour of launching the great offensive would obviously be the most opportune moment for Italy's entry into the war. It is for this reason that the possibility of an onslaught on the Balkans cannot be ruled out. It is in the Balkans that a joint Italo-German offensive would have the most immediate and crushing effect, and in Yugoslavia the two

Dictators have a state with which they both have common frontiers and which is cut off from all immediate Allied assistance. However, even if we are satisfied that Hitler at the Brenner meeting proposed a joint offensive to put an end to a "non-belligerency" whose economic advantages to Germany would shortly be destroyed by the tightening of the Allied blockade, and even if we place a Yugoslav campaign high on the scale of our possibilities, we are still left with the enigma of the Duce's reaction to the scheme.

Some commentators are convinced that the Duce refused compliance. The press campaign they explain away as being the least the Duce could do to compensate Germany for Italy's defection. Italy will remain "non-belligerent" even at the risk of the strongest German pressure and renewed attacks on Italian shipping. There is no lack of good reasons to support this interpretation. The people of Italy have a genuine horror of wars of any sort, but quite especially of a war in which they would be fighting beside Germany. The whole influence of the Vatican together with that of the House of Savoy would be thrown on the side of continued Italian neutrality, and certain influential leaders are known to oppose the hazardous adventure that war at this juncture would mean. Germany would provide the Allies with a battlefield and front on Italian soil just at a time when (after radical reorganisation) the Italian army is easily the least efficient of the three services. Economically, the outlook is even more gloomy. The first effect of intervention would be the extension to Italy, under conditions which make its effectiveness certain, of the Allied blockade. In her most important raw materials, Italy is largely dependent upon extra-Mediterranean and especially American supplies, and even though Germany, by a vast effort, is guaranteeing to cover the Italian coal demand, the outbreak of hostilities, especially in the Balkans, would put an immediate stop to the elaborate transport arrangements necessary to make the delivery of the million tons a month at all possible. The excessive cold of the winter has, moreover, played havoc with water supplies, and hence with Italy's entire hydro-electric system. Nor is the food situation happy. Nowhere in Central Europe will the harvests be good. Italy is reported to be below her necessary autarkic figure. Small wonder, then, that starvation is what her people fear most when they envisage war.

Were rational arguments likely in the last resort to settle the problem of Italian intervention, then it might be safe to prophesy the continuance of non-belligerency. But beside the rational arguments, there are a host of countervailing desires, beliefs, urges, feelings, half-truths, which are likely to play at least as decisive a rôle. In the economic sphere the arguments based on the inability of Italy to go to war owing to her economic straits may work in exactly the contrary direction. Faced with the slow econo-

mic hæmorrhage which is gradually sapping the country's standards and resources, the Italian leaders may prefer a desperate venture now to the slower defeat of increasing bankruptcy. Italy's war stocks stand higher to-day than they are ever likely to do again. At immense cost to herself, reserves of vital raw materials, especially of oil, have been accumulated in the last six months. If the Allies tighten the blockade, say, by some system of rationing, stocks can no longer be replenished. There is thus an economic price factor to be considered.

It is, however, factors of prestige and psychology which defy the drawing of any certain conclusions. In Britain we perhaps under-estimate the extent to which our policy in Italy for years past has missed its mark. Sanctions were the initial error—not because they were imposed but because they were not imposed to the full. They were sufficiently hostile for a lasting resentment to be sown among the Italian people, and sufficiently ineffective to breed a growing scepticism in our imperial strength. "Plutodemocratic decadence" has been so drummed home in Italy that certain leaders now believe in it and our miserable failures *vis-à-vis* Hitler, culminating in Munich and Prague, have only confirmed the impression. Some Italians do not think we can win the war, and as the *Regime Fascista* naively put it, it is "absurd that our people, which does not renounce its great future, should not take a share in the transformation of the map of Europe and perhaps of the world." Convinced of our impotence, certain circles press that Italy join the jackals marauding round our corpse. The passive first six months have given them little cause to modify their belief. It is possible, therefore, that the fate of Italy hangs on the slender thread of the campaign in the north. One smashing Allied victory and one of Hitler's chief levers might be destroyed.

Actually the decision rests with one man. It is important to remember that four years' conciliation has not caused him to modify one jot of his antipathy towards us, an antipathy which is perhaps thirteen years older than Sanctions and has been a permanent undercurrent in his regime.

It follows that the possibility of Italian intervention now or in the near future must be seriously considered. We have not sought the quarrel, but our conciliatory gestures have been interpreted as weakness, our patience as a sign of senility. Mr Cross was certainly summing up the common conviction of the Allied peoples when he said "We have no quarrel with Italy . . . but we are plain-dealing and plain-speaking people, and we should like to know where we stand with her." This is firmer language than has been heard for many years, but it is not likely to be misunderstood on that account. We have more than proved our willingness for peace. It is perhaps time—should the Italians thrust the decision upon us—to show our readiness for war.

France's War Effort

THE German libel that this war is being fought for Britain by Frenchmen is believed nowhere. The complacent view current among a section of Englishmen that all the economic effort of the *Entente* is being made by them and their own rich trading country is equally false, but much more prevalent. Economically, it is true, Britain has more to contribute to the common cause than France; but, equally truly, it is the French people and not the British who are so far bearing much the heavier proportionate burden to meet the cost of war.

France is a military nation; Britain a nation of shopkeepers. That is the starting point alike for the German jibe and our own complacency. Actually, this is also the explanation of the heavy economic sacrifices that the people of France have been called upon to make. As soon as war started, all able-bodied Frenchmen between the ages of 18 and 49 were called to the colours. Only those men with essential civil duties, such as certain civil servants over 40 years of age or those engaged in work of national importance, have been exempted. Something like 4½ million men are still under arms, and all the men exempted from

service for the moment because of the essential nature of their work are under military jurisdiction and liable to instant calling up.

It is this fact of general mobilisation that dominates the war economy of France. There is no schedule of reserved occupations as in Britain. If there were, perhaps two million fewer Frenchmen would now be under arms—a calculation which affords some measure of the vast military effort made by our Allies. It measures, too, the sharp blow suffered by French industry, agriculture and trade, deprived in general of all their labour except that of women, youths and men of 50 or more. France has been set a special problem in war economics: to keep up output in the war industries and export trades with a critically depleted personnel. The wartime need to cut down civilian consumption in order to release resources for war work has been correspondingly augmented, and the considerable sacrifices that French civilians are being called upon to make under the realistic direction of M. Reynaud, first Minister of Finance and now Prime Minister, spring directly from the colossal conversion of civilians into soldiers. They are sacrifices that

the British Parliament and the Chancellor of the Exchequer might usefully employ next week to assess the comparative severity of Britain's own second War Budget.

With 4½ to 5 million men standing ready in the Forces, France's first task was to increase the output of the workers left at home. One way was to require more work from those already in employment; the other was to bring in new recruits. At a stroke in September permitted working hours were raised to 60 a week; and in defence factories working day and night 72 hours a week for three months may be allowed. In coal-mining, where many miners were called up and many mines in the war areas closed, a working week of 52½ hours was made lawful, and coal output has not fallen off at all.

The new hours have been accepted with the same willingness as mobilisation itself. The forty-hour week remains only a statistical norm, and all work done in excess of it is accepted as nationally necessary overtime—though no increased overtime rates of pay are given until 60 hours have been worked. Neither employers nor workers can alter the collective bargains that bound them when the war started, and it is the feeling that the Minister of Labour is equally protecting the pre-war and post-war interests of both parties with regard to hours of work, working conditions and rates of pay that accounts for industry's acceptance of the onerous new war regime. There are safeguards; daily working hours must not exceed 11 for men or 10 for women and juveniles except in extraordinary circumstances, and then only with official sanction.

But no mere intensification of labour could fill the gap. A chief problem has been to find new workers and, in particular, to bring in women. A first step was to ensure that the drive for more workers in industry would not draw away farm workers and finally cripple a partially disabled agriculture; the Minister of Labour was given the strictest powers over the movement of labour from place to place; and, on February 28th last, a decree specifically forbade farmers, rural workers and peasants to seek different work elsewhere. A second step was to train and absorb the unemployed; a close examination is going on to find how many of them are really employable; and for three months an organisation has been in building by the Marseilles Chamber of Commerce to retrain the workless for war work.

In the long run, however, the battle for production can only be won by France's women. The first act was not conspicuous, though it was the indispensable basis of mobilisation; straightaway in September women took over the farms, shops and businesses of their called-up men. Since then women have flowed steadily into all sorts of employment. At present there are 300,000 women at work in war factories, and in munitions works directly controlled by the Government just under 30 per cent. of the staffs are women.

Even so, only a start has been made, and if output is to be adequate many more women workers will be wanted. So far the principle of their recruitment has been voluntary, and the flow of recruits has been sufficient. But, at the same time, it has been haphazard and uncontrolled. Accordingly, on February 28th, a decree gave powers to mobilise all women for war work, to compel their registration and employ them compulsorily. The powers have not been used, but it is plain that the aim of France's wartime man-power policy is to mobilise the nation's workers according to a conscious plan, and a law is being drafted to compel certain industries to include a specified proportion of women among their working staffs. The aim is to carry through a controlled process of substitution, whereby the intake of women will automatically release a corresponding number of men for the Forces.

Thus, man-power is the basis of France's wartime economic policy. Since September, when not far short of six million men were mobilised, nearly 1½ millions have been released for essential duties on the home front, and even the addition of the British Expeditionary Force to the front-line strength of the Allies leaves a gap of 750,000 to a million still to be filled. For the spring sowing, farmers and rural workers of the 1912-15 classes were temporarily released from active service. A sudden offensive on the Western Front now would almost certainly mean the abrupt and dislocating withdrawal of half a million men or more from civil work; and the Allied aim must be,

by the recruitment of more women workers in France and the addition of more British soldiers to the forces along the Maginot Line, not only to fill the gap but also to reduce the upper limit of France's need for mobilised men to no more than, say, four millions. The maintenance of a Near Eastern Army and the opening of a new theatre of war in the North makes the need more pressing.

Industrial establishments working for national defence have, like man-power, been mobilised. The new Minister of Armaments has full powers over plant, materials and labour for munitions and over capital extensions. But not even the boldest and most far-reaching plans to mobilise France's resources have abated the necessity to cut down civil consumption drastically. The urgent need to cut down is a corollary of the country's shortage of men. To satisfy the vast needs of the army for men and materials, to conserve resources for military uses and to prevent any sharp rise in prices—these have been the principles of policy.

The restrictions imposed upon consumption are not confined to the home front. The French private receives less than 1d. a day when he is behind the line, and about 1s. a day, against the British soldier's 2s. to 2s. 6d., when he is at the front. A soldier's family of wife and three children living outside of Paris, where the rates are higher, receives 17s. a week; the equivalent allowance in the British Army is 36s., to which the husband contributes 7s. Prices and living standards are too different for much weight to be given to comparisons like these, but it is at any rate illuminating to notice that it has been estimated that, if the French Army were paid on the British scale, it would cost well over £400 millions more a year than it does to maintain.

The sacrifices made by soldiers set the standard for the treatment of civilians far more in France than in Britain. Levies and taxation take a heavy toll of the incomes even of the poorest, and consumption is kept stringently down. There are three main direct taxes on income in France. The largest is the *impôt général sur le revenu* which is levied on incomes of over 10,000 francs (say £60) a year at rates varying from 1½ per cent. to 5½ per cent. The second is the *contribution nationale* of 5 per cent. on incomes of over 7,000 francs (with further exemption for children). The third is the *impôt cédulaire* levied at rates that vary according both to the size and the nature of the income. On wages and salaries the *impôt cédulaire* begins at 10,000 francs, where the rate is 4 per cent., rising to 8 per cent. over 20,000 francs. These taxes, it will be seen, are by no means light. But there are two further sets of levies. In addition to the allowances granted to married and family men under the taxes already mentioned, there are special taxes (*taxes de compensation familiale*) on bachelors (3 per cent. on incomes from 10,000 francs to 60,000 francs, rising to 20 per cent. on incomes over 810,000 francs), and on childless married couples (at rates about one-third less than for bachelors); these finance the new family allowance system, which, of course, is a considerable offset to taxation for large families. Secondly, two levies are made for the national solidarity fund, out of which the allowances and pensions for soldiers and their families are paid. A man of military age but not conscripted pays not 5 per cent. but 15 per cent. in *contribution nationale*, and a special tax of 40 per cent. is put on all wages paid for hours in excess of 40 a week. The excess profits tax is also paid into this fund. The cumulative effect of these taxes is very heavy, as can be seen from the following figures of direct taxation on a bachelor whose income comes from salary or wages (the case of a bachelor is, of course, that where the French taxation is heaviest):

	Frs.	Frs.	Frs.
Net income	35,000	105,000	875,000
	(£200)	(£600)	(£5,000)
Impôt cédulaire	1,600	7,200	68,800
Contribution nationale	1,750	5,250	43,750
Impôt général	584	7,917	402,513
Taxe de compensation familiale	750	4,200	122,500
Total	4,684	24,567	637,563
£ equivalent (approx.)	£26.8	£140.3	£3,642
British income tax and surtax	£12.5	£119.1	£2081.6

These calculations do not include the two levies that go to the solidarity fund.

The problem of cutting civilian consumption and keeping

down prices has been met straightly. Only the essential supplement of rationing to reduce purchases is so far lacking, though the distribution of ration cards for many articles is now planned. So far, apart from meatless days and restrictions on the sale of other foods and drink, the method has been to curtail, not purchases but purchasing power. The means has been swingeing increases for every class of Frenchman in direct taxation, and recourse to heavy indirect taxation has been avoided. A series of decrees has fixed prices (other than agricultural) at their pre-war (September 1st) level; no increase in any price is permitted without special authorisation—the level of retail prices has in fact gone up by about 12-13 per cent. Similarly, in undertakings on defence work, wages may not be increased above their September level without the per-

mission of the Minister of Labour, and in other undertakings all wage agreements are subject to regulations by the Minister.

It is a very realistic policy that France has chosen to pursue. Its basis is the mobilisation of the nation's men. Its severity is sanctioned by the sense of national solidarity of a conscript country at war, and its symbol is the fund into which, not only the 40 per cent. levy on wages for hours worked over forty a week, but also the proceeds of the excess profits tax, will be paid—and out of which allowances and pensions for soldiers and families will be paid. To pay for the war the French have accepted a steep lowering of their standard of life, but they have done it on principles of concerted sacrifice which should both inspire and instruct their Allies.

NOTES OF THE WEEK

The Northern War.—The third round in the war in Norway has started. The first was won on points by the Germans: their successful surprise descent on all Norway's ports, aided it seems by Norwegian traitors, flouted Allied sea power; but the expectation that Norway would give in, like Denmark, without resistance was belied—a serious setback. The second round was won by Britain: it was a sea fight, marked by the courageous action of the second destroyer flotilla at Narvik, the revenge taken for the destroyers' wounds by *H.M.S. Warspite*, the harrying by submarine and bomber of German transports and supply ships, the laying of mines on Germany's own Baltic coasts, the swift and safe carriage of Allied troops to Northern Norway and the use of naval guns to cover the German

retreat at Narvik and to break up the German airfield at Stavanger. The German navy was mutilated; one battle-cruiser, one heavy cruiser, four light cruisers and ten destroyers were reported by the Allies sunk; a pocket battleship was torpedoed and another battle-cruiser badly damaged. And against this loss of something like half the enemy's navy, the losses reported by the British Admiralty, four destroyers and a submarine sunk and a cruiser lightly hit, are derisory. The third round, the struggle for Southern and Central Norway, is in essence a struggle for Norway's few routeways, for railheads such as Namsos, Trondheim, Romsdal and Bergen, and rail junctions such as Staenker, Dombas, Hamar and Elverum. It is command of the wheel spokes hubbed at Oslo that is the prize. By Thursday the Germans held all the rail routes to Sweden—from Narvik, Trondheim, Oslo via Kongsvinger and Oslo via Halden; they had lost Narvik itself and had

not been in Namsos and Romsdal; but they were in occupation of Trondheim, Bergen, Stavanger and Oslo. Fighting from Oslo in the South and Trondheim in the North-West, their aim was to secure full hold of the railway network; north of Oslo, Kongsvinger had fallen and Hamar and Elverum were threatened; north-east of Trondheim, Staenker, on the line from Namsos, was being invested. The Norwegian resistance against only small German forces, sometimes moved up by plane, was proving brave but not very effective, as they were forced back almost everywhere upon the Swedish frontier.

The question was: could the Allied troops, landed on Monday at unspecified points on the north-west coast, make contact in force with the Germans before their hold on the country's arteries became too tight? In this context the battle for Narvik, still reported to be raging on Thursday, was irrelevant. The key points for the Allies to seize and advance from were the railheads of Namsos, Trondheim and Romsdal; and the Germans, already in Trondheim, were astride the lines to both the other two—though with only very slender strength. Without knowledge of the whereabouts of the Allied troops, withheld for reasons of State, comment is hardly possible, except to say that the repeated British attacks on Stavanger aerodrome, nine times by the Royal Air Force and once by the Navy, show the importance that must be given to air fighting in this Northern war. To tranship, land and move large numbers of men on the difficult Norwegian terrain is extremely dangerous, and might even be disastrous without local command of the air; but without air bases in Norway (Trondheim aerodrome as well as Stavanger has been bombed) Germany would find it hard to resist the Allied advance backed by support from the sea. So far, the air conflict has hardly begun, the land conflict between the chief rivals not at all. Only the sea battle has been fought—and won; all the time German lines of communication and supply with Denmark and the Reich will be exposed and frayed. But the war, which may last a long time, will be won or lost on land, and for the moment speed into action must be the essence of Allied strategy.

Norway's Minerals and Metals.—Apart altogether from iron ore, which is mined near and shipped through Narvik, Norway is also an important producer of a number of non-ferrous metals and ferro-alloys, but these industries, as the bulk of her other trades, are located almost entirely south of Trondheim. Contrary to the general impression, the country is not particularly rich in metallic minerals. Most of the smelters and refineries owe their origin to the availability of cheap sources of energy—in the old days charcoal fuel, and nowadays hydro-electric power. With no coke resources to warrant the foundation of a large-scale iron and steel industry, Norway has to be content to export her ore, and she is a minor producer and shipper of pig iron and steel. Though the small quantities of elementary

ferrous metals exported are of high quality, their loss hardly affects either this country or Germany. On the other hand, Norway is an important producer or refiner of non-ferrous metals, such as copper, zinc, aluminium and nickel, and of ferro-alloys, like ferro-silicon, ferro-chrome, ferro-manganese and silico-manganese; her exports of these to this country have been substantial. A shortage of these metals would be a very serious matter to the United Kingdom. Fortunately, however, there are alternative sources of supply, and, especially in ferro-alloys, our stocks are substantial. But as Norway has to import most of the ore, Germany would gain little, even if she succeeded in seizing all the smelters and refineries south of Trondheim. Norway's metallurgical industry is least dependent on foreign supplies of copper ore. Nevertheless, her own output has to be heavily supplemented by imports of copper-nickel matte from Canada. In the case of zinc, Norway imports about nine times as much ore as she produces; the ore is reduced by the electrolytic process, which is the *raison d'être* of the trade. Small tonnages of nickel ore are raised, but here again the vast bulk of the primary mineral is imported from Canada. In aluminium, the considerable Norwegian production is entirely based on bauxite supplies from abroad, and Germany cannot get enough bauxite for her own works. In ferro-alloys the dependence on foreign supplies of ore is even more striking. Norway produces neither chrome ore nor manganese ore nor wolfram. Without foreign supplies Norway's production of the typical ferro-alloys used in steel-making must fall to zero, for Germany certainly cannot fill the gap. At the best the Nazis might seize the stocks, but these cannot be large, for the practice of the industry has been to dispose of its current output. It is true that Germany might get possession of Norway's molybdenum ore, but this is not required by this country, while Germany has to use it as a second best to tungsten. Apart from metals, Norway produces substantial quantities of chemicals, and she has been an important source of our supplies of calcium carbide. The cessation of these supplies may cause some inconvenience, but there should be no difficulty in time in expanding domestic production and imports. In short, while the loss of iron ore imports from Narvik may be decisive for Germany, her temporary control of Norway's metal and chemical industries south of Trondheim is not likely to assist her war effort to any significant extent or to cripple ours.

Norway and the Neutrals.—The eyes of all the smaller neutrals are fixed on Norway. Now that news is beginning to reach the outside world of the astonishing extent and terrifying efficiency of the Nazi plot by which the key positions in Norway's cities and harbours were sacrificed to the invader almost before he had set foot on land, the other neutrals are attempting in a mood not far removed from panic to cope with the problem of their own "Fifth Columns." In Holland, the maximum penalty for espionage has been raised, and stronger measures are being taken behind the scenes to tighten the control of foreigners. Belgium is preparing fresh internment camps, and the visa control along her Dutch and Luxemburg frontiers is to be reinforced. In Sweden, where the problem is particularly grave, emergency measures have been passed in the Riksdag to combat sabotage and espionage, and the Defence Minister even called for the "extirpation of those who have clearly shown that they are working for a foreign Power." In South-East Europe, Yugoslavia is faced with a situation which may well get out of hand. For years, German commercial penetration, incitement of the non-German minorities and organisation on Nazi lines of the large German groups have been going on. In recent months it has been intensified. Yugoslavia is riddled with German "tourists" who talk to the troops, distribute pamphlets, settle at strategic points and invade the cities carrying suspicious and unaccountable pieces of luggage. If the grim earnest of the plot in Norway did not reinforce the tales, it would be hard to take seriously reports so fantastically compounded of Baron Münchhausen and the Arabian Nights. It may, of course, be that Germany intends no offensive and the high colour of the rumours is simply designed to keep everyone guessing and the Balkans on

tenterhooks. But the Yugoslavs are taking the threat seriously. The police have orders to proceed against all suspect foreign visitors. Two-thirds of the foreigners resident in Belgrade alone are to be expelled and the Press reflects the shock to public opinion dealt by the standing and influence of the Norwegian traitors. The papers protest that the death of patriotism is the end of national freedom, and urge that not only foreigners, but dissidents and agitators at home, should come under the ban. Roumania and Turkey are not so seriously affected, but are planning counter-measures. Sofia, on the other hand, has succumbed to the same plague of tourists as Belgrade. Here, too, vigorous measures are under discussion. The failure of the Norwegian *coup* (for failure it was, since the Norwegians were not paralysed into complete acquiescence) has thus given a salutary lesson to every small State. The Fifth Columns of Europe will find their work at least handicapped, possibly checked.

The conflict in the North is being watched with grave anxiety for other reasons. If the saboteurs and traitors are Hitler's back door into every small country, his military forces are ready to batter on the front, and the success or failure of Allied counter-measures is of crucial importance to every neutral State. It is useless to lock the back door if the key to the front is missing, and no small neutral front door can be closed without Allied backing. Norway is thus a test case. With the tide of battle, the hopes of all the smaller Powers ebb and flow. The news of the sinking of a large part of the German navy heartened Sweden into a resolute attitude with regard to her own neutrality. The landing at Narvik and the destruction of the German naval forces lying there very probably helped Roumania to impose her wheat ban, Yugoslavia to launch her anti-tourist campaign, Holland to extend her state of emergency, and Turkey to announce fleet movements. Similarly, any failure now, any weakening of our attack or falling off of our military reinforcements will have repercussions far beyond the merely strategic implications of the Norwegian campaign. The smaller Powers have watched, hypnotised, for the last three years while, one by one, the victims of German aggression have succumbed to Jugernaut. Last week, for the first time since the rape of Vienna, there came news of a German setback. The joy with which the news was greeted is the measure of the smaller neutrals' support of our cause, but it would also be the measure of their disillusion if Hitler were once again to prove that aggression can be made to pay.

Towards a Balkan Offensive?—The spectres which were first evoked by the Brenner meeting, then exorcised by the comparative inactivity which followed, are once more abroad. Germany is making her contribution in the form of rumoured troop concentrations in Slovakia. Italy has crowned four weeks' press campaigning against the Allies with the threat that her intervention may take place at any moment—in which case there is only one direction in which her offensive could be launched. Naval units are concentrated off the Straits of Otranto, four classes have been called up, 25,000 workmen are said to be en route for Albania, and Bari, the port used for the Albanian invasion last year, has now been declared a special area. Everything has been planned to point to an attack from the Adriatic. Greece, with her British guarantee, close alliance with Turkey and her accessibility to the British Navy, is an unlikely victim. Yugoslavia, enjoying none of these advantages and susceptible, moreover, to German pressure, is the obvious target of Italy's potential outbreak. Finally, the third conspirator is added in the shape of Russia, who has in the last week issued a sharp protest to Roumania on the subject of frontier violations along the Dnieper. Coming on top of Molotov's speech and its reference to "Bessarabia, the lost province," the incident may well take a graver turn. Thus the stage appears to be set for the *pas à trois* forecast by the German press at the time of the Brenner meeting. Joint action will establish pre-arranged German, Russian and Italian spheres of interests, Balkan

supplies will be secured once and for all to the Axis Powers and their adjunct, Russia, and Allied influence will be finally and completely destroyed in the South-East. The reason for the new activity is obvious enough. The Allies have promised to make their blockade effective in the South-East, and the establishment of our recently founded trading company, on however limited a scale, is evidence of new activity. In the Balkans as elsewhere the Germans have therefore to reconsider their line of action in the light of the Allies' latest plans. If we make it impossible for Hitler to secure his Balkan supplies by peaceful means, his only alternative is an extension of the war in the way most damaging to our interests and prestige. The association of Russia and Italy with his policy would greatly increase its propaganda value by completing the picture of invincibility and, if sufficiently skillfully exploited, might even secure the exclusion of the Allies without the necessity of resort to force.

How near Hitler is to completing a successful stroke of Balkan strategy it is impossible to say. The situation is still fluid, and while the battle in Norway remains undecided, it is likely to remain so. If Hitler, by a military success, gives another proof of invincibility, then possibly Russia and Italy *voleront aux secours du vainqueur*. But several points are very obscure. Italy has repudiated collaboration with Russia and is attempting friendly relations with Roumania. Turkey is watching the situation warily, and has let it be understood that a conflict with Roumania brings her into the war and presumably the Allies into the Black Sea. The pro-German party are not in power in Budapest, and there is no sign that the Teleki Government would be compliant in the matter of allowing German troops passage to Hungary or Yugoslavia, a concession which would greatly simplify Hitler's strategic problem. All the Balkan States have in recent weeks given clear evidence of the store they set by their independence and of their determination to defend it. Roumania's ban on wheat exports and her partial ban on key commodities in order to stock her military reserves are one example, the vigorous measures against espionage and sabotage in Yugoslavia, Roumania and Turkey another. Finally, there is an unknown factor in the degree of solidarity which an attack on one Balkan State would evoke in the others. It is not certain that they would repeat Scandinavia's disastrous mistake. It would therefore be difficult even if not impossible for Hitler to strike in the Balkans as he hoped to strike in Norway, in such a way as to secure his objectives without calling in Allied military opposition. And it would be difficult to crush the Balkan peoples' resistance so speedily that help when it came would come too late. Mr Churchill has gone out of his way to remind Italy that our Mediterranean fleet is not operating off Stavanger, the Allied Near Eastern army grows steadily, in a conflict Italy's industries and Russia's oil supplies would be very vulnerable to an attack, all reasons for supposing that the *pas à trois* may after all turn out to be a *pas seul*.

Limitation of Textile Sales.—It has long been widely recognised that the labour resources available for ministering to the consumer must decline with the expansion of the output of munitions and of the Defence Forces, and that the raw materials allocated to the manufacture of consumption goods must be curtailed in order to economise foreign exchange and shipping space. The supply of a number of consumption goods has already been curtailed in bulk or rationed to individual consumers. The new Board of Trade Order restricting sales of cotton and rayon piece-goods to retailers during the 5½ months from April 16th to September 30th to 75 per cent. of those made during the six months ended September 30, 1939, and those of linen piece-goods to 25 per cent., is therefore unlikely to cause a public riot. (The allocation of wool for manufacture into goods for civil consumption has already been reduced.) The limitation of supplies of cotton and rayon piece-goods is anything but drastic. First, during the

initial restriction period something like 5 per cent. of the adult population will be clothed by the Government. Secondly, the volume of purchases per head of the population would in any case probably have been appreciably smaller than last year. The reduction in supplies of linen piece-goods, on the other hand, is severe; but this was necessary in view of the fact that Germany has been able to cut off some of the principal sources of our flax supplies. But the consumption of linen is normally much smaller than that of cotton goods; and, in any case, cotton can be substituted for linen for the majority of purposes. The value of materials that the reduction in supplies to domestic civil consumers will set free for export is estimated at about £15-£20 millions per annum.

The new Order is to be regarded as only a first step in a policy of setting free machinery and labour for more urgent purposes. In announcing the limitation of textile supplies to domestic civil consumers in the House of Commons on Tuesday, Sir Andrew Duncan pointed out that it may be necessary to add to the list. It is surely not only necessary but a matter of considerable urgency to devote more of our resources to the munitions and export trades. Sir Andrew Duncan need only look at the overseas trade returns for March published this week by his Department. In its present temper the public is only too willing to assist the Government in the effort to win the war. Consequently, excessive timidity, born of the fear of a wave of public indignation, is surely out of place at this stage. So far as the method of limiting the consumption of textiles is concerned, rationing in bulk is undoubtedly preferable for technical reasons to the rationing of individuals adopted in the case of foodstuffs; but this method is only justified (and the comparatively mild initial turn of the screw was probably designed to accustom the public to it and thus to ensure its success) so long as the poorer section of the community is not deprived of its essential requirements by an inordinate rise in prices. If that were allowed to happen, there would indeed be a public outcry, and it would be fully justified.

Railway Fares.—At the time that the financial agreement between the Government and the railway companies was announced it was predicted in these columns that the working of the agreement would run directly counter to the obvious main interest of general economic policy in keeping prices down. Proof of this prophecy could hardly have been expected in such early and drastic shape. The Minister of Transport announced in the House of Commons on Wednesday evening that there is to be an addition of 10 per cent. to all railway charges, including fares on London Transport's railways, from May 1st. This is to bring in £18 millions a year towards the railways' estimated increased costs of £26½ millions in the first nineteen months of control. The increase is presented as a *fait accompli*, since the only possibility of upsetting it is the very remote one of an adverse vote by the House of Commons. The gravest objection must be taken to this procedure in a matter of such high public importance. The argument for a speedier method of deciding increases in railway charges than by an application to the Railway Rates Tribunal can readily be accepted; but it is hard to see why speed should necessitate close secrecy for the preliminary discussions or why it should absolve the railway companies from the obligation to make their case in public. Again, much was made, when the new procedure was announced three months ago, of the fact that trading organisations would be taken into consultation. But how much remains of this consultation if it is not to take place until after the Order is tabled? It is not only to the procedure that objection can be made, but also to the substance of the increase. The justification for it is that charges were, according to the agreement, to be raised in relation to changes in "working costs and certain other conditions arising from the war." It is apparent that the interpretation put upon this phrase is to be entirely one-sided. The rail-

ways are to be compensated for any increase in their *direct* costs, but the reduction in their *indirect* costs owing to the increase in traffic is apparently not treated as one of the "conditions arising from the war." Again, it is difficult to see why benevolent allowances made to employees on active service should be charged to the transport user rather than deducted from the rapidly rising revenues of the proprietors of the railways. There will be no objection in any quarter to fair play for the railway companies, and it has frequently been argued in *The Economist* that they can make out a strong case for financial compensation on a scale higher than their earnings of recent years. But this sort of thing is much more than fair play. The railways are being assisted to increased revenues by a method which forces up the cost of transport, one of the most vital elements in the whole price structure. Moreover, the present increase is only a beginning. It is not difficult to see what will be the next step—an application for increased wages, which the companies will have no incentive to resist. It would be hard to imagine a more disastrous example of economic impolicy.

Winning the War?—Only one speaker in Tuesday's debate in the Commons was wholly satisfied with the Government's manpower policy. That was Mr Ernest Brown. The Minister of Labour told the House that the allocation of men between military service and industry "bristled with difficulties"; but he was satisfied about the 30,000 soldiers who have been indefinitely or temporarily released for work on the home front. He was satisfied with the 40,000 men whom it is proposed to train annually in Government centres for war work in future years—though this year less than half that number will be trained. He was satisfied that there was no room for women in these training centres. He was satisfied that it was not his job to see that manufacturers took on or trained more potential war workers than at present. He was satisfied that all the employable engineers, shipbuilders and coal-miners available had been, or would almost certainly be, put to work and that the shortage of skilled labour in these industries could not be helped. He was even satisfied with the large total of unemployed workers who made up, he said, an invaluable "reserve" of labour—in happy contrast, presumably, to luckless countries like Germany, where almost every man and woman has already been given a place in war production. No one else, in a meagre House, even on the almost deserted Government benches, was at all satisfied. One after another, shocked by the contrast in the vital use of labour between the conscript democracy of France and our own easy-going freedom, they cited the example of our great Ally as well as of Germany—virtually the whole of two nations mobilised for fighting or war work. Still looking abroad, they were unimpressed by Mr Brown's suggestion that the task of building up a large army was so arduous and complicated that the equally important task of drafting the remaining men and women into essential industries must necessarily make almost imperceptible progress. They had no patience with a "reserve" of idle labour, of unemployed persons, women and normally unoccupied persons, the chief virtue of which, apparently, was to stay in reserve unused. The Minister's attempt to persuade the House that what is awry with our war employment is simply an act of God and beyond his (Mr Brown's competence signally failed.

No one would, or could, deny that the registration of 1,700,000 men for military service, the application to them of the schedule of reserved occupations and the combing-out of soldiers essential to industry without impairing the army's efficiency is a very complex and delicate business—and one for which Britain, in the Ministry of Labour, has a uniquely suitable instrument. But there are well over 20 million workers or potential workers still left on the home front, and it is in the allocation of these to their posts in the war effort that vision and energy have been most lamentably lacking. It is no use for Mr Brown

to say that he has not the power to secure the recruitment and training of war workers. The simple fact is that they must be recruited and trained in their millions; they are willing and anxious to be recruited and trained; and if manufacturers will not do it—only factory training is really satisfactory—they must be made to. If they, in turn, claim—as they might quite reasonably do—that there still is not a sufficiency of war orders, actual or prospective, to justify a wholesale expansion of their potential labour force, then Mr Brown must bring his "balanced" oratory to bear on Mr Burgin. It is not a matter for leisurely democratic discussion. There is no alternative. Every available man and every available woman must be pressed into essential employment without any more needless delay—if winning the war is a war aim.

Mobilising the Home Worker.—The new Minister of Food (writes a Correspondent) has called upon the housewives of the country to mobilise in defence of the nation's food supplies. An army marches upon its stomach; to-day the whole nation is the army, and the commissariat is in every larder. The home workers—men with spades and women with saucepans—are as relevant to victory as any other providers of necessities. It is to be hoped that this appeal indicates a livelier realisation in high quarters of what the home worker may be worth and of the handicaps under which he—or she—labours. These are not few. We are told to Dig For Victory; but the man whose newly cleared allotment will yield him a bumper crop of potatoes and (as every pioneer gardener knows) precious little else in the first season, may not sell his surplus to help feed the towns. If he thinks of keeping hens and so using up kitchen and garden refuse, he cannot count on getting the little food which that refuse needs as a supplement. The prospective keeper of a pig or two runs up against a tangle of restrictions calculated to scare the boldest. The housewife, too, has her grievances. The just-ended marmalade season was a bad joke for her. She had to buy marmalade and twiddle her thumbs during the hours she would have spent in making it—the marmalade sugar ration being a fraction of the normal family's consumption and, moreover, in relation to the number of oranges needed to get it, about one-third of that required by any recipe known. If she preferred Empire grapefruit to foreign Seville, she got no sugar at all. (Here, surely, was a case for preference rather than penalty.) Days elapsed between the purchase of the oranges and the receipt of the sugar; one wonders what will happen when, in summer, perishable soft fruit replaces the patient orange. And then, it seems, only home-grown fruit will qualify for a supplementary ration—if that. The commercial fruit-grower must sell to the jam factories or not at all; and these must employ industrial labour to do the job most housewives are glad to do for themselves. The housewife nowadays is not the all-round handywoman she once was; but there is a sufficient store

of working ability embodied in women who cannot for family reasons take employment outside their homes to release a perceptible contingent of industrial workers if it were not deprived of the materials on which to work. There may be good reasons for the deprivation. If so, the public should be told. Let the Ministries of Food and of Agriculture jointly secure the services of one practical allotment-holder and one hardened housewife to advise them; and, thus instructed in nicely blended domestic and political economy, let them in addition hire a competent advertising agent to sell the home workers how they may apply their skill and energy—and if not, why not.

* * *

Japan and the Indies.—M. Arita's statement to the Press that Japan would oppose the extension of the war to the Dutch East Indies should come as no surprise to those who have followed the evolution of Japan's "East Asia" policy according to which the Dutch East Indies form an obvious part of Japan's *Lebensraum*. As we have learnt in Europe, "anxiety for the peace and stability" of a small and defenceless country is a usual prelude to the forcible bestowal on it of "armed protection" and, in the present anarchy, we cannot suppose that Japan will show more forbearance than other predatory powers. Nevertheless, she will keep a wary eye on British and American reactions. Mr Cordell Hull has already issued a statement that "intervention in . . . the Netherland Indies" by violent means would be "prejudicial to the cause of stability, peace and security not only in the region of the Netherlands Indies, but in the entire Pacific area." It is hard to say how seriously this warning must be taken. Japan might dare to bluff the American navy, but not for one moment could she ignore a threat to her vital American supplies. Here the United States could cripple Japan overnight.

* * *

Price Control.—The committees set up by the Board of Trade nearly four months ago under the Prices of Goods Act to prevent profiteering have no powers over foodstuffs. There is no set limit to the goods that can be brought under their control by Order, but it is taken for granted that foodstuffs and raw materials, already regulated in price in many cases by the Ministries of Food or Supply, ought not to be included. The trouble is that the committees, whose function of hearing individual complaints about prices is probably as important as their power to fix prices and enforce them, have had more complaints about food prices than about anything else. Only the main staple foods are regulated in price by the Ministry, and the question now is whether the uncontrolled foods (e.g. dried peas), about which allegations of excessive charges are most frequent, should be regulated—either by the Ministry or by the Board of Trade's committees. The view of the Central Price Regulation Committee is that these prices should be fixed, but (quite plausibly) that it would be confusing for any body but the Ministry of Food to deal with them. The fact is that some danger exists of frontier disputes being allowed to obscure the main aim, which is to prevent onerous increases in the price of necessary articles of general use not justified by corresponding increases in cost. Other prices should probably be left to rise freely, if only to restrict consumption. Should the price committees extend their control over a much wider range of clothing, including men's suits? Is it possible for price regulation to be fair and effective when it is mainly, though not exclusively, concentrated on retail prices? Ought it not to be focused more on the price of materials? All these questions, which are current talk, bring the committee close to the province of the Ministry of Supply. This is inevitable. Price is a function of supply and, in any sound programme of price control, supply policy and rationing must all be closely co-ordinated. Any rigid and arbitrary departmentalisation is impossible. The solution of the present difficulties is for the Board of Trade and the Ministries of Food and Supply to work together in the administration of a uniform scheme, dividing the task between them according to administrative convenience and

using the local price committees—and the local food committees—as sounding boards for consumers' grievances. Two things are certain. Complaints about excessive charges for uncontrolled foods and clothing cannot be left much longer unanswered; and it is ploughing the sand to attempt to regulate prices except in strict accord with the regulation of supplies and the restriction of consumption by rationing.

* * *

Shifting Industry.—On Wednesday, in the hush of expectant waiting for news about the Allied Expeditionary Force in Norway, the House of Commons debated the location of industry. Their time was not wasted. Due tribute was paid to the invaluable collection of facts and views about industrial movements and their effects made by the recent Barlow Commission. The general agreement, reflected in the Reports of the Commission, that steps are needed to arrest the undue expansion of urban centres like London and to avert the creation of fresh distressed areas, was echoed on all sides. Even London's Londoner, Mr Herbert Morrison, admitted that, proud as he was of London, he was far from proud of Greater London. But, in the main, the discussion was needlessly academic. The view of the Minister of Health, that a debate on this subject in wartime might appear unreal, was too easily accepted. It is, of course, true that it will be after the war when the major problems of industrial redistribution will return to be solved. But industrial movements, sharply distorted by war needs and war conditions, are going on now; and they will not only affect decisively the unbalance of industrial Britain when the war is over. They greatly influence the problem of war economy itself. The migration of evacuees and workers; the spread of new factories and new housing needs; the renewal of the old hectic expansion of the munitions and export trades that lag in peacetime—none of these can be shelved and set aside until Hitler has been beaten. From day to day, Government departments and local authorities will have to deal with them as they come up, and it is more than arguable that a planned approach according to some common policy, such as every member of the Royal Commission advised, would be preferable, even in wartime, to the disparate piecemeal methods that have previously prevailed. Even a purely advisory body simply to carry on the facts and analysis of the Royal Commission in war conditions might be invaluable. To suggest, as the Parliamentary Secretary to the Board of Trade did on Wednesday, that the present hurried census of labour resources in three war industries is a sufficient substitute is absurd.

* * *

Road Deaths.—Last month's road casualty list is again shocking, and the big improvement in February, when the new speed limit of 20 miles an hour in built-up areas after dark first came into force, must, therefore, have been mainly due to the severe weather at the beginning of the month, which kept the majority of cars off the roads. In March, the number of deaths was 496, compared with 416 in February and 457 in March last year, so that the longer hours of daylight are clearly having very little effect. In fact, the number of daylight deaths rose from 151, or 36 per cent. of the total, in February, to 261, or 53 per cent. of the total, last month. On the other hand, there is evidence that the new speed limit is doing some good. Deaths on unrestricted roads in black-out hours were 17 higher than in February, but on roads subject to the speed limit they were 47 fewer and only amounted to 29 per cent. of the total, compared with 45 per cent. But the fact remains that the total number of deaths is higher. Publicity, summer-time, speed limits have, therefore, in the net result, been of no avail, and the debatable remedy of large-scale road construction has naturally been indefinitely shelved. There only remains the possibility that in the long run petrol rationing, higher petrol prices and heavier motor licence fees will achieve an improvement, as the snow and ice did in February, simply by reducing the number of cars on the road. But there is little sign of this at present.

Danubian Tug-of-War.—The obscure incident which occurred a fortnight ago when British agents were supposed to have attempted to sabotage the free passage through the Danube's "Iron Gates" has been cleared up to this extent, that it is now possible to fit it into the general framework of another piece of Nazi strategy. The original tale almost certainly originated in Dr Goebbels's perfervid imagination. Its dissemination was used as an excuse for Germany to put forward the proposal, apparently through Hungary, that she should undertake the policing of the Danube in order to protect the riverain States from "Allied aggression." Had the Hungarian Government proved more compliant, Germany's fine fleet of gunboats might have been promptly despatched from Vienna, and the Allies, since they are represented on the International Danube Commission, would have suffered another setback. The Hungarian Government, however, merely transmitted the request to the other riverain States, and after a week's negotiations Germany's plans have suffered a check, in that a new scheme covering possible cases of sabotage and military activity has been approved by the International Commission. Control is vested in the riverain States, and warships and near-warships are banned from the river. The Norwegian campaign came just in time to stiffen the attitude of the Danubian Powers. The last word, however, has not been said, and Germany is still building gunboats at Vienna.

* * *

The American Census.—The decennial census of the population of the United States has begun. This is only one of six censuses to be taken this year—the others are of business, manufactures, mines, agriculture and housing. In the population census alone, thirty questions are to be asked of every person, including inquiries about income and hours worked. In addition, a further 15 questions are to be asked of an arbitrary sample chosen by taking every tenth person; these include such miscellaneous matters as language spoken, war service, social security status, number of children, etc. The housing census has 31 questions for each house, including, for example, sanitary facilities, fuel used, mortgages, etc. Before such an array of questions the British statistician—inhabitant of a country where it is indelicate to inquire about an unmarried mother's previous children—can merely stand in impotent envy, knowing that unless he is very lucky he will not get a decennial census at all next year.

* * *

Shorter Notes

There is a grouping of anniversaries at the present time from which some significance could surely be drawn. This issue of *The Economist* bears the date of Adolf Hitler's birthday. The House of Commons has just marked the fiftieth parliamentary birthday of Mr Lloyd George, whose name stands, more than that of any other, as the proof of what an embattled democracy can do in a test of strength. It would be pleasant to believe that the same significance deliberately attaches to the opening of a crucial Budget on St. George's Day, the anniversary of Zeebrugge. And last Sunday was the seventy-fifth anniversary of the assassination, on Good Friday, of the man who dared to call upon the people of the United States to take risks, "that government of the people by the people for the people shall not perish from the earth."

*

In the pompous language that is always reserved for Parliamentary questions and answers on the most trivial subjects, it is announced that the name of the new Balkan trade organisation is to be changed from "English Commercial Corporation, Limited," to "United Kingdom Commercial Corporation, Limited," in order that "the title of the company should have a wider territorial significance than the word 'English' might suggest." If we are to carry respect for our minorities to such lengths, ought we not to have contrived to incorporate in the title the Channel Islands and the Isle of Man?

North Battersea, which once returned a Communist member of Parliament, gave only 791 votes to the anti-war candidate at this week's by-election, or 8.6 per cent. of the total number of votes cast.

*

The 1938 Board of Trade bankruptcy report gives some interesting facts about the failures of women in various trades and occupations. The highest place is taken—perhaps naturally—by milliners and dressmakers among whom there were 66 failures. Those with no occupation came next with 59 (these, incidentally, had by far the largest liabilities), and drapers and haberdashers were third with 33. Other unusual feminine occupations which had failures were coal and coke merchants, 5; directors and promoters of public companies, 5; butchers and meat salesmen, 4; dairymen and cowkeepers, 4; millers, 1; and timber merchants, 1. One would like to know more about the two women labelled as "occupation unknown," who failed, as well as the sixteen called "miscellaneous." Most interesting, perhaps, are the three who, coming under the general heading of "Entertainment and Sport," are simply described as "persons."

*

According to the Registrar-General's Statistical Review of England and Wales for 1938, the number of live births registered in that year was 621,204. This gives a birth-rate of 15.1 per 1,000 persons living, or 0.2 above the 1937 figures, 0.3 above 1936 and 0.7 above that for 1933, which was the lowest rate ever recorded. The death-rate, adjusted for the increasing proportion of old people among the total population, was 8.5 per 1,000, which is 0.5 less than 1935, the previous best recorded year.

*

The following table shows total entries at Vladivostok of certain commodities during the twelve months preceding the war and the seven months from September, 1939, to March, 1940, together with exports from the United States of America of the same commodities:—

	Total Entries		From U.S.A.	
	12 months prior to war	Sept., 1939, to Mar., 1940	1938	Sept., 1939, to Mar., 1940
Copper tons	70,000	70,000	50	60-70,000
Tin tons	13,500	7,500	Nil	2,200
Rubber tons	27,500	40,000	Nil	6,000
Molybdenum . . . lbs.	3,000,000	6,030,000	3,000,000	6,900,000

As this traffic, with the exception of about 5,000 tons of rubber, did not start until November, the contrast between pre-war needs and recent imports is even greater than is shown in the table.

*

In the table on Danish foreign trade on page 677 of last week's *Economist* the unit for the import of maize, rye and wheat should have been given as hundred metric tons and not as thousand metric tons.

THE WORLD OVERSEAS

Battle for Hungary

(From a Special Correspondent in the Balkans)

IN more than one small State of Europe, the steady condemnation of German diplomacy that had marked the currents of their public opinion before September, failed on the outbreak of war to prevent their Governments from adopting an attitude of deference to German interests. And it must be counted as a debit to the Allies, just as much as a neutral fault, that this failure of nerve should have been perhaps most noticeable among the small neutrals whose geographical position could afford them, if necessary, direct Allied help. The countries of South-Eastern Europe have shown a better spirit of resistance; and for the most part they have rejoiced with Allied successes and wept with Allied failures.

Standing apart from the Balkan countries by her ties with the Anti-Comintern States, Hungary has provided a surprise of her own. The ready assumption that Hungary would automatically side with Germany has proved false, and false in more than a merely formal sense. Had general war broken out in September, 1938, instead of a year later, the assumption might have been justified. Flushed with their success in Slovakia and Ruthenia, more than ever impressed with the power of Germany, eager to take on the flood a tide that might never flow again, the ruling class in Hungary, the army and the great mass of conservative voters could scarcely have resisted the opportunity of invading Roumania and seizing whatever the chaos of European war might have yielded them. But in the twelve months after Munich there was a change. The extremists lost in strength so greatly that, by the summer of 1939, it was possible for the moderate Government of Count Paul Teleki to take active measures against them; and with the outbreak of war this policy developed to the point where the Nyilas parties—sympathetic to Nazi doctrines—had been deprived of nearly all the firm footing they had had twelve months before. By February this year they had so little backing that two of their parliamentary deputies, Gruber and Gál, could actually be suspended and sent to gaol for participation in terrorist activities.

Two main reasons brought about this change. The first was a matter of internal politics. Hungary is ruled by a comparatively small number of men who demand and receive the loyalty of a high percentage of the middle class, of the army, and of those sections of the lower class who are swayed by traditional ideas. Nazi doctrines, except as a means towards the end of Greater Hungary, could never hold out any strong appeal to any of these parts of the population. Hungary wanted no revolution in manners and morals such as Nazi government would have entailed. The second reason sprang straight from the matrix of German diplomacy. An invasion of Poland, Hungary's sentimental friend, following and only made possible by a cynical deal with Soviet Russia, Hungary's potential enemy, shook the whole foundations of Hungarian friendship for Germany. And these shocks served only to confirm the disappointment of the Belvedere Award, by which Germany had refused Hungary much of what her extremists had claimed.

The effect of these happenings, with the growing realisation that Berlin had ominously donned the mantle Vienna had worn for so long—that Germany had become another but infinitely more puissant Austria—was to strengthen those who sought to maintain Hungary's independence, even at the cost of her ambitions. The war found the traditional elements in power. The Regent united in his person the virtues of moderation. It was argued that Hungary must remain neutral in order to bring all her influence to bear at the peace settlement.

The Nazi Drive

Against this view the extremists, whether under Nazi influence or merely ultra-conservative, urged that the Allies were going to lose the war, and that even if they won it Hungary could expect nothing from them; and that Hungary must therefore give Germany every support she needed in order to earn as large a reward as possible. To-day it is over this issue that there is a split in public opinion which becomes steadily wider. It is the more surprising that the Western Powers should not have healed this breach by convincing all those who sympathised with the Allied cause that Germany was certainly going to be beaten.

The Germans have not failed to understand the position. In the last resort, they must obviously reckon on being able to invade Hungary or to force permission for the free passage of German troops. The realisation that the Nazis could and would treat Hungary just as they have treated Czechoslovakia and Poland, if it suited their interest, has played a big part in destroying pro-German sympathy. The Germans may also reckon on Hungarian support for any scheme which appears to coincide with Hungarian interests. But, short of military pressure, the Germans are still under the necessity of playing their Hungarian fish, hooked though it be, with a great deal of care.

The main preoccupation of the Nazis, therefore, is to change the Hungarian Government. For a long time they favoured the Arrow-Cross movement in Hungary until its internal divisions and diminishing hold on the popular imagination robbed it of most of its value; and during the last few weeks it has become evident that German interests might be well served by a return to power of M. Béla Imrédy. The memory of his Jewish grandmother does not seem to have deterred M. Imrédy from taking up an active pro-German attitude. It would not be too much to say that he regards himself as Count Teleki's most formidable rival; and, were he to obtain power, Hungary's neutrality might become at least "non-belligerency." Until the early days of April M. Imrédy's challenge to the Government did not amount to much. As far as is known his policy was opposed to the personal views of the Regent. He had only a handful of convinced followers; his support in the Lower House amounted to no more than about 35 deputies; and his means of propaganda were restricted to one newspaper, the *Uj Magyar-sag*—with the uncertain hospitality of two or three others.

Besides M. Imrédy, the Germans have other irons in the fire. It seems that they have agreed to continue direct help to the Nyilas parties, only if these are able to sink their differences under a unified leadership, and provide less questioning loyalty to Germany than some of them have given in the past. This is taken to mean that Count Pálffy, or someone equally susceptible to German influence, will direct a coalition of his own faction with those of M. Hubay and M. Mecser, and that the coalition will then campaign for closer ties with Germany. It goes without saying that the Germans are willing to provide whatever money and promises may be necessary. It is understood, for instance, that they have offered to return the Bohemian and Moravian estates of the Grand Duke Albrecht, son of the late Grand Duke Frederick and first cousin of Prince

Otto, if he will openly support the cause of Germany. At least two leading Hungarian generals are playing the German game; and, among the lesser ranks of the army, conducted tours of Germany have worked wonders. The whole of Hungary, it sometimes seems, is soaked and pickled in German propaganda.

M. Imrédy's Challenge

The first phase of M. Imrédy's campaign for the premiership came to a close on April 5th. On that day there was a crucial meeting of the Government Party—ostensibly to provide Count Teleki with a chance of reporting on his visit to Rome, but really to test the strength of the Imrédy movement—and the meeting concluded with the Prime Minister's leadership unchallenged. The gravity of the issues at stake, and the certain fact that the bulk of the country is still behind Count Teleki, seem to have deterred M. Imrédy from attempting revolt. Doubtless that will come later on. Early in May there will be elections in the Félvidék—the "redeemed territories"—and the Imrédyists expect to increase their strength there by 15 to 20 seats.

M. Imrédy may reckon, too, that time is on his side. Unless the Allies are able to produce convincing evidence that the re-constitution of Central and South-Eastern Europe, in the event of an Allied victory, will not be left to the unfriendly hands of the Little Entente's successors—and that Hungary, therefore, may expect that her voice will not only be heard but listened to with respect—the rivals of the present regime in Hungary may reasonably hope for a drastic change in public opinion. The Allies will lose favour. The Nazis will gain.

To Western eyes these details may seem unimportant, even irrelevant. In fact they are neither. In a very real sense, Hungary holds the key to the Danube Basin; so long as she remains neutral, the German Army is separated by hundreds of miles from the frontiers of Roumania and from the open wheatfields of the Yugoslavian Voivodina. It is more than silly to scoff at Hungary's slender power of resistance and simply to calculate the speed at which Germany's *panzerdivisionen* could traverse the Hungarian plain. During the first six months of this war the Hungarian Government—with the active and courageous approval of the Regent—defended their neutrality in a way that deserves far more recognition by Western opinion than it has been given. But no small nation surrounded by potential enemies—its only friend, Italy, far away behind a massive mountain barrier—can for long follow a continental policy without receiving at least moral support from outside its frontiers. And unless that moral support is forthcoming from the West, it may well be that the present regime in Hungary will be overturned—in Germany's favour.

The key to the situation lies in Hungary's isolation. If she enters the war on Germany's side, and Germany wins, she can hope for very little extension of her sovereignty; on the contrary, she might reasonably fear a marked contraction of her sovereignty. If she fights with Germany, and Germany is beaten, then everything is lost. The present regime has shown no signs of wanting to fight on Germany's side; and, for obvious reasons of strategy and geography, Hungary cannot enter the war on the Allies' side. Hungary's best course seems, therefore, to be at all costs one of neutrality. But to maintain public support the regime must be able to show that neutrality will lead to positive gains at an eventual peace settlement. Here is the problem; and it is one that the Western Powers, if they wish for a continuance of Hungary's neutrality, which has been, and will continue to be, their gain, must help to solve.

April 16th.

Mistrust in Yugoslavia

[FROM A SPECIAL CORRESPONDENT IN BELGRADE]

THE report of British naval successes found in Yugoslavia a public enthusiastic for an Allied victory and a Government still deeply troubled by the political situation at home. The outbreak of war caught Yugoslavia in the middle of internal changes. The agreement between Dr Matchek, for the Croat People's Party, and M. Tsvetkovitch, for the Regent and Government of Yugoslavia, had scarcely come into force; none of the details of this far-reaching federal settlement had been worked out; the consent of the peoples concerned was not assured. As one observer remarked: "In the past the Serbs and Croats never came to an agreement

because they began with the details; now they have made a general agreement before settling the details, and the details, of course, are as hard to agree upon as ever."

Jugoslavia can withstand Great-Power pressure from the North and North-West only if she is internally united. The cement is too new along the country's frontiers to allow much optimism about the result if Germany and Italy were to agree upon a plan for partitioning Yugoslavia. But the outlook would become radically changed if Serbia and Croatia were really united in their determination to defend themselves and each other. This was the aim of the Serbo-Croat agreement, made and signed in months of great international tension. Now its details are under discussion while the whole future of the country is at stake.

For the moment, it must be said, the internal situation is very far from satisfactory. It is already a common saying among Serbs that "this agreement was made between the Crown and the Croats without the consent of the Serbian people." The old distrust between Zagreb and Belgrade is as profound as ever. Little that has happened in the past few months has served to weaken the rooted suspicion of the Croats that Belgrade aims really at founding a Greater Serbia at Croatia's expense or, on the other side, the no less rooted Serbian suspicion that Croatia is willing to compact with Germany at Serbia's expense.

Competing Claims

When the agreement was signed, towards the middle of last year, three main questions remained to be settled. They were, respectively, the delineation of federal boundaries; the distribution of administrative expenditure; and the degree of federal autonomy in matters of police, justice, security and similar branches of administration. Commissions were set up to work upon these questions. Weeks of earnest discussion ensued. The fate of the Bosnians, who by this time were claiming the right to federal autonomy of their own, hung in the balance. In the first place, the Croats had asked for boundaries stretching right down into Montenegro, including the whole Dalmatian coastline from Susak to the mouths of Cattaro and a mixed population of Croats, Serbs and Bosnians (Serb and Croat Mohammedans). They were dissuaded from pressing these claims and, in the end, were contented with boundaries that reached only as far as Dubrovnik. Even so, the *Ban* of Croatia was to include over a million Serbs.

The details of the financial settlement have just been passed through the Sabor. The *Ban* of Croatia has the right to retain for its own expenditure the income from direct taxes and from law, land and consumption duties. In Croatia's first Budget, passed through the Sabor in Zagreb on April 1st, this income is estimated at 1,300 million dinars (about £5 millions).

The precise degree of federal autonomy has yet to be settled. Agreement has been reached on a number of details; but it remains to be seen, for instance, whether the Serbs will find it possible to agree to Croatia's retention of the People's Party's peasant guards as a regular armed militia.

Dr Matchek's Hold

In Croatia itself, the agreement was followed by frantic agitation on the part of the Germanophil extremists, whose claims stop short only at complete independence. The newly-created Croatian Government found itself obliged to fill the gaols with would-be mischief-makers. For a time, it seemed that Dr Matchek was losing his hold on the wide mass of the population. Then, gradually, saner feelings returned until, to-day, it may be said that Dr Matchek is as strong as ever. Yet, that is not to say that the strength of his position—any more than the strength of the Regent's

position—is any guarantee that the Croats—any more than the Serbs—can be got to support the details of an agreement upon which a majority of both peoples have never looked with much favour.

Unhappy though the present situation may be, there is probably no need to fear an open breach. Both parties surely understand too well the risks they would run by pressing their respective viewpoints too far, and the disaster that an open breach would be likely to entail. The aim of German and, to a lesser extent, also of Italian, policy, is far too clear. For it will obviously serve best the interests of Germany—and, at least so long as she is “non-belligerent” and not neutral, also of Italy—if Yugoslavia remains in her present uneasy condition, her splendid fighting strength weakened and demoralised by internal difficulties and misunderstandings.

April 11th.

United States and Reciprocal Trade

[FROM OUR NEW YORK CORRESPONDENT]

THE extension of the powers of the State Department to continue its programme of reciprocal trade agreements has passed the Senate by the narrow margin of 42 to 37. The voting was extremely mixed: the Republicans voted solid in favour and were joined by a large group of the so-called Progressives or New Dealers, especially from the West. The majority included most of the so-called Conservative or anti-New Deal Democrats and some New Dealers. The vote and the debate which preceded it showed a curious combination of partisanship, sectionalism and tradition. On the whole, the majority group took it both as a vote of confidence and as an expression of conviction that the reduction of trade barriers is the *sine qua non* of world order. The minority took it as a vote of confidence, and as an expression of sectional grievance, and a conviction that world circumstances had so greatly altered since the powers were originally granted that the premises of the idea had been invalidated. The net result of these cross currents was the close vote.

While the closeness of the vote was no surprise—indeed, many had predicted that it would go the other way—it was significant. The reciprocal trade agreements had enjoyed support from both sides' parties up to very recent months; and the change in this attitude came after the recent wave of currency depreciation. Nevertheless, there were official affirmations that no evidence had been adduced of undue hardship to interested parties, and this statement is supported by the figures. In recent months our exports have increased and our imports have first risen and then fallen, which seems to indicate that the movements of exchange rates have had little influence.

Even before the immediate past in which extraneous forces have been clearly decisive, the actual achievements of the reciprocal trade programme were not easy to measure. A good part of the increase in our exports since 1935 at least has

been attributable to re-armament programmes, and our imports have moved violently with the fluctuations of our domestic trade cycle. Moreover, the existence of the most-favoured-nation clause implies that certain consequences of a trade agreement may appear in a country other than that with which the agreement was negotiated.

The Lowered Barrier

The United States has a large and important free list; in an average year nearly half the actual imports are duty free. But for articles not on the free list, the schedules, especially those enacted by the Hawley-Smoot Tariff of 1930, were so high that it was really open to question if they were not designed to be not protective but exclusive; and, indeed, apart from the free list, the trend of tariff making up to the election of 1932 seemed to be in the direction of exclusion. The Hawley-Smoot Tariff, however, designed as a recovery measure, became subject to a wave of revulsion when it failed to produce a millennium. In this wave of revulsion, the general desirability of reducing trade barriers gained adherents, and while the idea of reciprocal agreements was politically expedient, the inclusion of the most-favoured-nation clause generalised the effects, which therefore lost their statistical identity. If the intent was to lower trade barriers, the most-favoured-nation element was as important, or almost as important, as the reciprocity element; and the proper statistical method of measuring the success of the programme is not by comparing the export and import trade with specific signatories, like the “before” and “after” photographs in a proprietary medicine advertisement. The only fair, simple method, crude and open to objection though it may be, is to compute the ratio of duties paid to the total of all imports or to the total of all dutiable imports. This indicates that the average tariff rate has fallen steadily and substantially as these treaties came into operation. In other words, the net result of the reciprocal agreements was to effect a general but not absolutely indiscriminate reduction in the American tariff. Whether there was an equivalent reduction of the trade barriers to which our exports are subject is far more difficult to ascertain.

The arguments in favour of the agreements rested, however, on certain premises of *rebus sic stantibus*; they presumed, for one thing, approximate stability of the exchange rates. Most, if not all, of the agreements contained an escape clause available, but not automatic, in the event of a material alteration of the premises. In a great many instances, the exchange rate between the dollar and the currency of the signatory powers has undergone a change of sufficient magnitude to open the question, but with exports rising and imports falling in the immediate past, it was impossible to generalise the argument that the escape clause should be invoked. If specific escape clauses were not invoked, it was still harder to argue that the idea as a whole was demonstrably injurious. The solid Republican vote may then be set down as more political than economic; but with an economic basis of potential effectiveness.

The Farmers' Vote

The vote of the Democratic agricultural Senators is not so readily rationalised. It must, however, be remembered that the argument for agricultural subsidies has always rested on the theory that they were mere compensations for the tariff because the farmer exported his crops in an unprotected market and made his personal purchases in a protected market. Furthermore, the customs resources are partially allocated to agricultural payments. The net effect of farmer with the idea that a threat to the theory of industrial protection is a threat to the theory of agricultural subsidies, and to establish a statistical connection in his mind between tariff resources and sums available for agricultural subsidy. This may possibly explain why agricultural senators voted against the treaties, although their party loyalty urged them in the opposite direction.

It is possible that the vote might have been less close if it had not been for the severe decline in the foreign exchanges over the past 18 months; it might have been closer if it had not been for the feeling that the escape clauses provided relief in case the pressure (political or economic) should become greater. Perhaps the whole affair can be summed up as follows: the United States has made an effort to reduce trade barriers. It has effected a material reduction in the barriers surrounding this country. Through its representatives in Congress it has reaffirmed its approval of this programme, but only a very qualified approval. The greatest threat to the programme lies in the vulnerability of its premise of mutually satisfactory rates of exchange.

April 11th.

Lottery Loans Abroad

[BY AN AUSTRIAN CORRESPONDENT]

FINANCING the war has become more and more a main point of public discussion in Britain. Taxes have been heavily increased in the first days of the war and will rise further. A successful campaign of selling National Defence Bonds and Saving Certificates is going on. A new War Loan of £300 millions has just been issued. The great interest which Mr Keynes's plan for compulsory saving has aroused shows clearly the readiness to discuss all possible ways and means. Something might be learned from the very varied experience of Continental countries, e.g. with lotteries and lottery loans.

On the Continent, for instance, the issue of lottery loans (or premium bonds) is a well-known and popular institution. The Turkish Lottery Bonds were, up to the last war, one of the most popular investments among the small private investors of Central and South-Eastern Europe. They were to be found in the home safes of thousands of families; and Russian, Serbian and Italian premium bonds had a wide circulation all over Europe.

Financial changes after 1918 dealt a severe blow to this kind of loan. But, wherever lotteries appeared in any form, there has always been a strong tendency for the State to assume exclusive rights. In most countries lotteries have become State monopolies, and as a rule they are abundant sources of revenue. Two extreme examples may be mentioned: the thousand-million turnover of the Italian popular Lottery, in which the participants make their “business plans” by recourse to the Egyptian Dream Book; and, at the other end of the scale, the French Defence Bonds, which were successfully offered to those investors who, while seeking a solid capital investment, are attracted less by a high rate of interest than by the chance of drawing a big prize.

Austrian Loans

Both lotteries and lottery loans were operated in pre-Nazi Austria. The little Austrian Popular Lottery, which was always about to be abolished on moral grounds and always retained on budgetary grounds, was an ordinary game of

chance. Twice a week, five out of ninety numbers (1 to 90) were drawn, and of these one to three numbers had to be forecast. The prize amounted to about four thousand times the average stake of threepence to sixpence. The Class Lottery was a higher stage of development. Twice yearly there was an issue of 60,000 tickets worth about ten pounds each. Each lottery was worked off in five drawings of tickets, nearly half the tickets in the lottery being drawn—most of them with a prize only amounting to the value of the ticket itself. The first prize was a million schillings, or roughly £40,000. This again was a game of chance, and the public lost half of the total issue.

The State Lottery loans, however, were different. In the years immediately following the last war numerous lottery loans were issued, and through the agency of instalment payment organisations were sold everywhere, even to the villagers in the most remote mountain passes. These loans were practically nullified by the inflation. But, when the Austrian State was again in need of money in the year 1933, it floated a Prize Loan, which at a time of severe crisis achieved the remarkable subscription success of 265 million schillings. The interest it carried was 4 per cent., which was relatively low in view of the high rates then being charged for credit in Austria, and the attraction was that the bonds also offered the chance of a prize. Every 200,000 bonds of 500 schillings each formed a block, and every year a first prize of one million schillings, 30 prizes of between 10,000 and 50,000 schillings, and a further 2,000 or so small prizes were drawn for each block. After the first ten years of the fifty-year span of the loan the prizes were to be greatly curtailed, the amortisation of the bonds beginning from 1943. The loan had therefore the character of a high-class bond which grew in popularity and demand; and it was one of the very few Austrian Government stocks quoted above par on the exchange.

The basic idea of these loans is to link the desire of the Government for cheap money with the betting and gambling instinct of the people which has to be satisfied in any case.

In English life there seems (to a foreigner) to be a latent passion for betting which the State is unable to eradicate by legislation. To-day, the State is in urgent need of money. The question therefore arises whether the State could exploit this passion for its own purposes.

Germany at War

(An objective account of economic trends in the Reich compiled weekly by the editorial staff of The Economist from German and neutral sources.)

THE long expected reduction of the Bank rate was announced on April 8th—from 4 per cent. to 3½ per cent.—but the difference between Bank rate and the discount rate for day-to-day money, 1½ per cent. to 2½ per cent. for trade bills, is still considerable. The general conditions of the money and capital markets would undoubtedly justify a further decrease of the Bank rate, which had been at 4 per cent. for nearly eight years. Shortly before the outbreak of the war increasing liquidity and consequent reductions of the private discount rates made the Bank rate almost nominal.

Apart from the immediate effect on the money market, the reduction of the Bank rate points to a long-term policy intended to reduce the average rate of interest. The greater part of the 4½ per cent. securities have already reached or exceeded par. The reduction of the Bank rate must thus be considered as an important step towards preparing the capital market for a big Reich loan. Short-term credits of the Government for financing the war will become cheaper immediately, which is of considerable importance, because of the enormous increase in the short-term debts of the Reich. The immediate effect on the Reichsbank itself is probably not very great. The greater part of the Rm. 12,200 million holding of bills and cheques consists of Treasury bills (there has lately been a remarkable increase in these), which were unofficially charged at a rate below 4 per cent.

The latest figures about Germany's internal debt relate to the end of last December:—

	(Rm. millions)	Dec., 1938	Nov., 1939	Dec., 1939
Long-term debt	22,167.6	26,578.8	26,895.2	
Short-term debt.....	5,013.0	12,601.1	14,140.0	
Total Debt.....	27,180.6	39,179.9	41,035.2	

To the total at the end of December, 1939, must be added the total issue of tax certificates amounting to Rm. 4,670.5 millions. During the year the total debt (excluding the tax certificates) has increased by 51 per cent., but the short-term debt has increased by 281 per cent. During December Rm. 165 millions of tax certificates were used for paying taxes.

Banking.—The reports of German banks for 1939 are now complete with the publication of the report of the biggest bank, the *Deutsche Bank*. The report confirms the analysis made in *The Economist* on March 30th; the total assets of the bank increased from Rm. 3,748 millions at the end of 1938 to Rm. 4,184 millions at the end of 1939; during the year the bank opened branches in all the newly incorporated territories, and total deposits increased by 14 per cent. to Rm. 3,734 millions. As shown in the reports of other banks the average size of advances increased also from Rm. 13,360 in 1938 to Rm. 15,370 in 1939; and the increasing part played by the bank in financing the Reich is shown by a further increase in the holdings of Treasury bonds from Rm. 529.7 millions to Rm. 1,148.8 millions.

The aggregate increase in the total holdings of Treasury bonds by the Big Five amounted to 114 per cent.; they rose from Rm. 1,229 millions at the end of 1938 to Rm. 2,627 millions at the end of 1939. Based on the reports of the leading German banks the *Frankfurter Zeitung* estimates an increase in the total deposits of the reporting German banks

from Rm. 19,000 millions at the end of 1938 to Rm. 22,000 millions at the end of 1939. The total holdings of bills and Treasury bills are estimated at Rm. 14,000 millions, against Rm. 9,000 millions at the end of 1938. Yet Treasury bills and bonds alone have only increased from Rm. 3,500 millions to Rm. 9,250 millions.

Wages and Prices.—The recent appointment of Dr Todt as Minister for Munitions foreshadowed increased activity in the production of war material and munitions. The consequent employment of more women and the possible effect on prices are being discussed by the press. Hitherto the methods of price control have hardly differed from the methods employed before the war. It is pointed out that the immediate result of greater munitions activity would be a further increase in purchasing power. It is also feared that the widespread retraining of workers for skilled jobs will result in an increase in wages. It is therefore expected that the Price Commissar will extend his activities to controlling wages. The price control itself will concentrate on bringing down the prices of war materials. By the official indices, prices have remained almost unchanged since the beginning of the war.

	August, 1939	January, 1940	February, 1940
Wholesale index (1913=100)	107.1	108.2	108.4
Agricultural products	108.8	108.2	108.1
Industrial raw materials and semi-manufactures	94.9	97.8	98.2
Finished goods	126.0	126.9	127.2
Index of cost of living (1913-14=100)—total	126.5	127.0	127.2
Foodstuffs.....	123.9	123.5	123.7
Clothing	131.4	135.1	135.8
Fuel and light	123.6	125.5	125.4
Rent	121.2	121.2	121.2
Sundries	142.0	124.7	143.1

The actual movement of wholesale prices as well as retail prices is somewhat different from the indices. A great number of wholesale prices are kept down by levies and subsidies. Furthermore, the inevitable increase in wholesale prices by using costly products of the substitute industries is very often veiled by levies or direct subsidies. The cost of living index covers only rationed goods, and the considerable increase in the prices of a number of "free" articles is thus not recorded. There are quite a number of articles whose quality has deteriorated since the beginning of the war, especially branded goods; and the increase in milk prices has had hardly any effect on the index.

Civil Aviation.—The report of the *Deutsche Lufthansa*, the sole agency for Germany's civil air services, shows in 1939 a fall in passengers and freight and an increase in luggage and mail. The figures are as follows:—

	1938	1939
Passengers	255,000	243,000
Luggage, in tons.....	388	408
Freight, in tons	1,322	1,026
Mail, in tons	5,289	5,913

The flown mileage fell by 19.6 per cent. to 14.3 million kilometres, though during the first eight months of the year the flown mileage increased by 10 per cent. After the outbreak of the war the South Atlantic and the Teheran-Kabul routes were suspended, but the air services to South-Eastern as well as Northern countries were increased. High quality goods were frequently shipped by plane; a considerable part of the exports of furs, for example, was exported by air to the North as well as to Southern European countries. This year new routes have been introduced between Berlin and Moscow, and all the routes to the East and to the South of Europe are working as before. Recently an agreement about air services to Spain was concluded, but no details have been announced by the German press.

THE BUSINESS WORLD

Shipbuilding Shares

THERE are seven ages of man, but only three of shipbuilding. In the ideal state, which comes too rarely, orders for new ships flow evenly, materials are regularly and punctually delivered, skilled and unskilled labour is comfortably adequate but not excessive, costs of production are steady, and overheads at a minimum. Contract prices combine reasonable profits for builders with an incentive to shipowners to take a courageous view of their future tonnage requirements. Over and over again, however (as that authoritative publication the *Burntisland Shipping Journal* recently reminded its readers), this desirable condition has vanished almost overnight, at the first breath of doubt among owners of the indefinite continuance of shipping prosperity. By way of the second phase, when yard and shop activity tapers off as existing contracts are completed, the industry has reached the third, when a dearth of orders has dictated a painful choice between dispersal of skilled labour or depletion of resources, or both.

To-day, when war has brought a demand for every ton of shipping, naval and mercantile, which British builders are capable of producing, it is natural that the industry should pitch its grievances high, the more so when a Government department—the Admiralty—has taken over responsibility for all mercantile shipbuilding and repairs, and the question of what is "reasonable" remuneration for services rendered has not been finally decided. Yet shipbuilding shareholders have every reason to know that the picture drawn in the preceding paragraph is not exaggerated. That is shown by the table at the foot of page 734, which sets out, for every year from 1913 to 1939, (a) British launchings of new merchant tonnage, (b) Government expenditure on naval contracts, and (c) the net earnings, before preference dividend, of four of the largest shipbuilding concerns. The data set out in the first section of this table are re-expressed in the second section in a series of indices on the base 1913 = 100.

This survey shows that the last troubled quarter-century falls into four periods (the fourth being somewhat reminiscent of the first) which may be dubbed respectively "war and boom," "twilight," "darkness" and "revival." The Great War of 1914-18 brought, not an increase but a substantial decrease in merchant tonnage construction, but Government expenditure on naval contracts rose nearly eightfold before the war was over. In the short-lived post-war boom new launchings of merchant vessels in fact rose only slightly above the 1913 level, while naval expenditure fell sharply to its pre-war figure. Three years after the collapse of the boom, merchant launchings had dropped to one-third of those of 1913, and a victorious Britain had entered one of its recurrent phases of stringent naval "economy." In the later 1920's demand showed some revival. But all the difficulties which were destined to endure right up to the outbreak of the Second Great War in 1939 were already revealing themselves—strong competition abroad, based frequently on State subsidies for shipping and shipbuilding, a significant decline in the ability of British shipyards to secure foreign orders, and severe competition for a limited volume of tonnage contracts. But even these unsatisfactory conditions seemed

like prosperity itself by contrast with those of the early 'thirties, when new orders almost disappeared and the industry encountered unperceived depression.

The revival which came, none too soon, about half-way through the decade, was based partly on the industry's own efforts to improve its earning capacity, of which the formation of National Shipbuilders Security, to buy up and dismantle redundant and inefficient yards, was a strikingly successful example. Another factor was a new disposition on the British Government's part to give limited financial assistance to the national Mercantile Marine. But the fundamental influence was a world-wide shipping revival founded on increasing trade activity, plus re-armament. When the former of these twin influences faltered, the latter became increasingly important.

The profits figures of the companies chosen, for the purposes of this article, as representative of the industry suggest that the upward trend of shipbuilding earnings in the last war was due much more to naval than to mercantile building. The post-Armistice period of inflated tonnage values and change-over in the yards was actually a period of falling shipbuilding earnings. In the "twilight" years, earnings steadily fell away until those of the more stable concerns were running at about one-half to three-fifths of the pre-war figures, while other companies were barely meeting their fixed charges, or were accumulating debit balances. In the acute phase of the depression of the early 'thirties only the strongest concerns managed to "break even," while others lost a substantial part of their capital, and had to endure reconstruction before they could begin to pass on the fruits of the ensuing recovery to their shareholders. Revival, however, when it came, was not half-hearted. Two of the three companies whose figures in the accompanying table go back to 1913, had

SCIENTIFIC DISTRIBUTION

by R. SIMMAT, M.A.

This new book deals with a question always prominent in discussion and never more so than at the present time. The author, well known as a marketing expert, describes the whole technique of marketing goods under modern large-scale production methods, and the book contains a mass of information which the economist will find of absorbing interest. 10s. 6d. net.

PUBLISHED BY PITMAN

surpassed that year's recorded profits by 1937, and their latest published figures show earnings ranging from 1½ times to twice those of that far-off year.

Undoubtedly, while the war lasts, the outlook for shipbuilding shares will be satisfactory. The industry will have no ground for complaint if the rate of payment agreed with the authorities for wartime construction is adequate rather than handsome. Regularity and sufficiency are the factors in wartime orders which best ensure economy of working. There may be difficulty in obtaining due supplies, both of workers and material. The position under each heading, however, will be determined by the Government's priority policy. And the Government has every reason to be generous, because the industry subserves every part of the national war effort, military and economic. Prices are only one of the constituents of wartime expenditure beyond the control of the shipbuilding industry, which is more an "assembling" industry than many people realise. But its own level of efficiency was never higher than to-day. Stark necessity resulted in the cutting away of much dead wood in the depressed years (though quantity of output might have been sacrificed a little less to quality if a new European war had been foreseen), while prosperity in the immediate pre-war years enabled many companies to replenish their depleted working capital resources.

The problem for investors in shipbuilding shares in 1940 is to estimate the right price to pay now for an investment which is assured of a satisfactory return, so long as the war lasts, but whose peace prospects are much less certain. If an investor were buying on war prospects alone, he would probably vote for the shares of companies like Harland and Wolff, which, having suffered most, have most to gain; or for those of concerns like Cammell Laird and John Brown, which have important interests in industries outside shipbuilding proper, and have shown, over a fairly long period, a greater propensity to wide variations in earning power between depression and prosperity than those of such a company as Swan Hunter. But if shipbuilding history is likely to repeat itself, even partially, after the war, then the more stable shares will hold out much the best long-term prospects. Actually, as the table opposite suggests, the market is valuing the former shares on a rather lower yield basis than the latter.

The industry is vulnerable to E.P.T.; for revival came too late to afford any company a profits standard comparable with present earnings, and a 6 per cent. ordinary

capital standard would give little assistance to an industry which has pruned its ordinary capital drastically during the past decade. On the whole, however, the wartime earnings position is sufficiently assured to allow of at least the maintenance of and possibly a moderate increase in dividends, quite apart from the incidence of war taxation. But the further outlook seems to be too hazardous to permit of an answer at this stage to the real problem. Certainly, there will be some falling off in shipbuilding

output and earnings after the war. But how much? The answer depends partly on the competitive power of British merchant shipping against foreign owners whose coffers will have been substantially replenished during the war years, but mainly on the kind of international trading background which will be the war's legacy. The perpetuation of economic nationalism could not possibly serve the true long-term interests of either British shipping or shipbuilding. But an Allied victory, far-sightedly used, might be the best guarantee against that possibility. All that the industry can do is to ensure that its own mistakes, after the last war, are not repeated. The rest lies with the world's governments when, after victory, they tackle their duty of reconstruction.

English Canals

FEW people realise the existence of the network of canals which was spread over England and Wales in the latter half of the eighteenth century. It was possible, a hundred years ago, to send a loaded barge from London across the Wiltshire downs to Bristol, or up the Thames Valley and across the watershed of the Cotswolds to Gloucester, or through the Chilterns to Birmingham and the Potteries. From Birmingham, the centre of the spider's web, there was through transport to the estuaries of the Mersey, the Dee and the Trent, to the upper waters of the Severn on the west and of the Nene on the east. Three canals had been cut across the Pennines, linking Manchester and Liverpool to Leeds, Huddersfield and Hull. Without the cheapening in transport costs brought about by canals, the industrial revolution could never have developed until the advent of railways; until 1840, only canals could move the growing quantities of coal, pottery, cotton, iron and steel and timber, and could bring the huge supplies of corn and food needed in the industrial areas.

The decline of the canals before the competition of the railways and the steam coaster was inevitable. Between 1840 and 1845, the railways had bought, either by choice or by blackmail, one-third of the canal mileage; falling revenues made extensions impossible, and for close on seventy years no improvements or modifications were made to the canal system. The only new developments were the Manchester Ship Canal, and in Scotland the Forth and Clyde canal (both undertaken at the end of the nineteenth century). The Royal Commission on Canals and Inland Waterways listed in 1909 the difficulties of the canals: the multiplicity of companies owning separate stretches of the same route; the varying size of locks which kept the size of barges down to that of the smallest lock; the divergences in policy between companies that owned the waterways, those that owned the barges plying for hire, and those that were subsidiaries of the railways. The Royal Commission recommended the unification of all waterways under a Waterways Board which should undertake the improvement and enlargement of the four trunk routes—those connecting Birmingham with the Mersey, the Humber, the Thames and the Severn.

That was too bold a suggestion for the free trade era. The canals continued to decay until the last war, when they, together with the railways, came under Government control. The suspension of control left them with arrears of maintenance, but also with some idea of unified working and certain lump payments in compensation. In the post-war years there was a considerable consolidation among the independent canal companies. The route from London to Birmingham, for instance, came entirely under the control of the Grand Union Canal Company which rebuilt the locks and bridges, improved the loading facilities and introduced diesel-engined motor barges. The interest on the loans raised was partly provided by the Government. Similar developments took place on the Birmingham-Severn route.

These improvements have brought about a certain revival in long-distance traffic on the canals, particularly in those goods transported to and from the Midlands and the estuaries in the course of foreign trade. But it is still true to-day as in 1909 that the bulk of the canal traffic is local. Coal is still the main cargo; it supplied in 1938 just about half of the 13 million tons of canal traffic. The Grand Union Canal has a large trade in coal moved from the Thames to factories in North and West London; sugar beet is carried by water in East Anglia; the Weaver navigation transports salt; timber is the main item on the Lea and Stort Navigation, and canals directly connected with estuaries do a fair trade in petrol and oils. About one million tons of petrol, of agricultural produce and of building materials went by inland waterways. But the development of road transport in the years after the last war was a further severe blow to the canal companies, and meant the loss of much of their local traffic. The fall in canal traffic in the last ten years is shown by the following table; it

includes the ten canals (excluding the Manchester Ship Canal) with the largest volume of traffic:—

TRAFFIC* IN THOUSAND TONS

	1929	1938	Of which Coal
Aire and Calder	2,520	2,400	1,704
Birmingham†	3,684	2,034	1,205
Bridgewater‡	1,209	1,045	508
Gloucester and Berkeley	378	643	51
Worcester and Birmingham	2,910	1,811	575
Grand Union	1,653	1,459	888
Lea and Stort	458	738	486
Sheffield and S. Yorkshire	477	589	11
Trent	769	567	0.4
Weaver.....	...	...	...

* Traffic originating on each canal. † Controlled by L.M.S.R. ‡ Owned by Manchester Ship Canal Company. § Not available.

In the last ten years the Aire and Calder Canal has paid between 4 and 5 per cent. on its ordinary capital, while the interest paid by the Birmingham canals has been largely supplied by the L.M.S. under the terms of its guarantee. With these exceptions, none of the other canals which are public companies has paid more than a negligible dividend.

ENGLAND'S CANAL SYSTEM

Under the terms of the new railway agreement between the railways and the Government, the working of the railway-owned canals was included with that of the railways themselves. These canals are, therefore, assured of their upkeep and may benefit from any increase in railway revenue. But the position of the independent canals is not so secure. Financially, they were doing none too well before the war, owing to the competition of railways for long-distance traffic and of road transport for local hauls. Petrol rationing has somewhat restricted the services provided by road operators, and it is possible that pressure on the railways may eventually lead to a transference of some traffic to the canal system, though the immediate effect of the war was a fall in traffic on some canals. But here the problem of rates becomes acute. The rate structure of the canal companies (most of whom are now also carrying companies) is necessarily based on that of their far stronger competitors, the railways, and any change in the general level of rates has to be justified before and approved by the Railway and Canal Commissioners. An increase in canal rates alone would probably serve even now only to depress their total

net revenue; their operating costs are largely fixed, and the demand for their services probably inelastic, yet their operating costs have considerably increased in the past six months, due to the higher costs of coal, petrol and maintenance work. Unless there is a general increase in railway rates, therefore, the financial position of the independent canals is likely to deteriorate considerably; hence the plea that they should, as in the last war, receive from the Government the same guarantee of revenue that the railways have obtained.

There seems, indeed, no reason why the independent canals should be left out in the cold, and, in fact, if the best use is to be made in wartime of the transport structure of this country, canals, both railway-controlled and independent, should be brought under unified control. The inclusion of certain canals, such as the Trent and Mersey, the Shropshire Union and the Birmingham canals, in the Government-controlled structure, merely because they are financially connected with the railway companies, has only intensified the disunity which exists within the canal system, whose centre is the Birmingham area. Canals and railways resemble each other (and differ from road transport) in possessing private permanent ways constructed at great expense and needing a steady minimum expenditure for repairs and maintenance to keep the capital equipment

in working order. A co-ordinated transport policy, whether for war or peace, should deal with both canals and railways on a uniform basis.

The fact that few canals are now a financial success may suggest that the whole system of waterways has become uneconomic and should simply be abandoned, if not during the war, at least after it. Competition from railways and roads has, in fact, led to the closing of a considerable mileage of canals in the last hundred years, as the accompanying map shows. But the arguments for preserving the main canals are as valid to-day as when they were listed by the Royal Commission on Canals and Inland Waterways in 1909 and by the Royal Commission on Transport in 1930. Some industries and many firms depend largely on canal transport, and the closing of canals would cause considerable, if localised, hardship. Further, once the structure of a canal—its bed, locks and reservoirs—has fallen into decay, restoration is expensive; while for a minimum of maintenance work the permanent way might still be kept in use. And it may be noted that, until the outbreak of war, the main canals usually earned enough revenue to cover their expenses, even if their share capital went unpaid. Under a unified transport policy, the four trunk routes, with their feeder canals, could play a useful part both as subsidiaries and as alternatives to railways and roads.

Finance and Banking

War Loan Payments and the Market.—The money market stood the test of the payment of the final call on the recent War Loan with complete equanimity. The weekly Exchequer returns show that up to the end of last week just over £172,000,000 had been received from 3 per cent. War Loan. Thus there remained some £128,000,000 to be paid over last Monday as the balance of the final instalment. The actual transfer of funds to Government accounts must have fallen appreciably short of this total, given the size of official applications for the new loan. But, none the less, the sum to be transferred on that day from bankers' to Government deposits at the Bank of England must have been such as to set the authorities a considerable task of neutralisation. How well that task was accomplished may be seen from the fact that neither on Monday, nor on Tuesday, when the full effects of the payments would have been more apparent, was there the slightest indication of stringency. On both days there was even some buying of bills by the clearing banks. Apart from some calling of funds by certain of the Scottish and Colonial banks the discount market would have been unaware of the enormous turnover of funds which was under way during the first days of the week.

In tackling this considerable offsetting problem, the authorities revealed another refinement of their open market technique. Last week the clearing banks were exceptionally well supplied with cash. The ordinary expenditure of the Government at £38,796,000 had exceeded revenue by no less than £26,765,000, and partly for this reason bankers' balances at the Bank of England were at the exceptionally "comfortable" level of £123.9 millions. The Bank of England, acting for various public departments, took this opportunity to sell to the clearing banks substantial lines of Treasury bills having no more than a few days to run and thus maturing on the days when the clearing banks would be feeling the effect of War Loan payments. By this means the authorities skimmed the surfeit of cash which became apparent during the course of last week and restored it to the banks at the beginning of this week, when the need for reinforcement arose. In addition to this, the position at the beginning of the week was helped by appreciable official purchases of short bills from the clearing banks. These latest indications of open

market technique emphasise again how far the methods of open market operations have changed during the past twelve months. The bulk of open market transactions is now done by the authorities with the clearing banks. The former dependence on the discount market has disappeared. That market is fast losing its traditional rôle of buffer state between the central bank and the joint-stock banks in this country. The firm which acts for the authorities in the market is always ready to provide help for any house needing an outlet for bills which it cannot for the time being find with the banks. But its rôle *vis-à-vis* the market is becoming largely passive, and when any positive open market action is required the discount market is now by-passed and the approach is made direct to the clearing banks. It is the magnitude of present-day open-market transactions which is probably responsible for this comparatively recent change in practice.

The Dollar Security Purchases.—The issue of the second Vesting Order for the mobilisation by the Treasury of dollar securities comes as a reminder of the void in the Allied balance of international payments which must be made good by the export of gold and of the best of our foreign securities. Market estimates place the value of the 117 securities covered by the latest order at between £50 and £60 millions, or about double the figure represented by the first Order issued last February. No guide as to the amounts involved is provided by the Exchequer returns. The securities acquired by the Treasury are, in fact, purchased through the Exchange Equalisation Account, which at the outbreak of the war was empowered to hold foreign securities as well as gold and foreign exchange balances. As the E.E.A. acquires dollar securities, Treasury bills are issued on its behalf and sterling is thus made available for payment to the former holders. These operations thus form part of the many factors at work in determining the distribution of Treasury bills issued through the tender and by tap. But the other factors responsible for this distribution are so numerous and, since the recent issue of 3 per cent. War Loan, have acquired such magnitude, that it is quite impossible to unravel the tangle sufficiently to obtain from this direction even the vaguest estimate of the amounts involved in the dollar security mobilisations.

United States and Free Sterling.—The recent depreciation in the sterling rate as quoted in New York has received the closest attention from the United States authorities. Mr Morgenthau has made several pronouncements on the subject, all of them suggesting that the position was being closely watched. This week we have had the first action prompted by this scrutiny of the exchange situation. The United States Customs authorities have been instructed to calculate the dollar equivalent of goods entering the United States under sterling invoices at the official rate of \$4.03½ and not, as has hitherto been the custom, at the prevailing free rate. The fall in the free rate has undoubtedly caused the stimulation of goods from the sterling area for which payments may still be made in sterling obtained in the free market. That advantage will still be available to the United States importers, but it will be to some extent diminished by the compulsion to pay import duties on the dollar equivalent calculated at the official rate. The official rate is also to apply to Australian pounds and to Canadian and Newfoundland dollars, all of which are quoted in New York at rates appreciably below the parities indicated by the respective official rates fixed in the London official market. This move on the part of the American Treasury has no doubt received the complete approbation of the British authorities, since it serves the claims of the official sterling-dollar rate as being the true rate.

Allied Currency in Norway.—The haste with which the Allied expeditionary forces to Norway have had to be organised and dispatched, and the immediate German occupation of the Bank of Norway's head offices, have necessarily involved the introduction of pounds and francs in the circulation of those parts of Norway in which the Allied forces operate. By a special decree issued by the Norwegian Government, British and French currency have been given legal tender attributes for an indefinite period

in Norway. This is clearly an emergency and temporary measure which will disappear as soon as the machinery for issuing Norwegian currency returns to Allied control. As yet such details as the conversion rate at which pounds will circulate in Norway have not been published, but it is probable that a rate of 20 Norwegian crowns to the pound will be fixed both on grounds of convenience and of economic justification. The machinery for the ultimate settlement of the debts thus incurred by the Allied countries to Norway will be ready to hand in the shape of the Anglo-Norwegian Payments Agreement. For the time being that agreement and the clearing accounts that go with it are in suspense. There will be ample work for it in the future.

Silver Arbitrage.—There has been some evidence during the past week of silver being bought in London for shipment to New York on an arbitrage basis. The amounts have been very small—necessarily so as the market here remains exceptionally narrow. The resumption of silver arbitrage between London and New York has been made possible by the depreciation in the free sterling rate against dollars. At the silver prices which have been current in recent days there has been a theoretical profit margin on shipping silver to New York ranging around 3d. per ounce. If we allow for the fact that there is a 50 per cent. tax on the profits made by selling imported silver to the United States Treasury, this profit margin seems none too generous given the considerable uncertainty in which the immediate future of American silver policy is shrouded. The shipper cannot sell his silver forward and must run the considerable risk of a further reduction in the official buying price for imported silver or even of a complete discontinuance of such purchases, while his silver is in transit to New York. It is probable, however, that the purchases in question had an alternative commercial character. Important industrial consumers of silver in the United States—the

MONEY MARKET NOTES

STERLING has not maintained the improvement noted in the free market last week. There has been no marked weakness, but from a close of 3.52½ last Saturday the rate has since fluctuated around 3.49-50. Officially quoted rates in London have been mostly unaltered, though the belga on Thursday showed a depreciation of 10 points to 23.85-24.00. Based on the free sterling-dollar rate the belga would be quoted at about 21 to the pound. Among unofficial rates the lira has fluctuated with the free rate for sterling.

The payment of War Loan subscriptions has had no effect upon money and discount rates, which are completely unchanged. Moreover, the war

news was ignored at last week's Treasury tender, when total applications, though lower on the week, were still at a high figure—£90.6 millions—and the average rate of discount was slightly lower at £1 0s. 8.16d. per cent. Another indication of the present abundant monetary conditions is provided by the result of the tender for the £500,000 Bristol bills. Applications totalled £2,950,000; and, though they are six-month bills, the average rate of discount was only £1 0s. 6.325d. per cent., which is nearly 2d. less than that for last week's Treasuries.

The Bank Return shows the effect of the War Loan payments, but, considering the size of the payments to be made, the movements in the items are

small. Public deposits are up by £5.8 millions, and bankers' deposits are down by only £8.9 millions and are still at a comfortable level. They have been helped to a certain extent by the return of notes from circulation to the amount of nearly £2 millions. The fall in Government securities of £7.8 millions may be explained by the authorities' offsetting operations at the end of last week, when they sold to the clearing banks large quantities of bills which matured at the beginning of this week, when the War Loan payments fell due.

The market for silver continues to be very narrow, and a little general buying on Tuesday and Wednesday was enough to cause the small rises that took place on those days.

photographic industry, for example—would under existing circumstances find the London market the cheapest in which to buy their material. Given the stocks which they must maintain in the United States, they can engage in arbitrage operations on a covered basis and therefore undeterred by the uncertainties of official silver policy in their country. If by the time the silver reaches New York it can no longer be sold at a profit to the United States Treasury, it merely goes to swell the stocks which these industries must maintain.

* * *

War Risks Cover in Life Assurance.—Some time ago, it was hoped that all British offices would maintain a common line of action in covering civilian war risks. The majority of offices are still covering the war risk by charging an extra premium of £1 per cent. or £1 ls. per cent., as described in *The Economist* of February 3rd. But an increasing number of offices are now departing entirely from a percentage addition to premiums. Some months ago the Scottish Widows Fund introduced a scheme to cover the war risk under participating policies without extra premium, under which the cost of war claims is to be met by reductions in the profits bonuses. A number of other offices reduce the benefit under participating policies according to a formula. Thus, according to the plans of the United Kingdom Provident Institution and the Royal London Mutual, the amount payable under with-profits policies will be one-half the sum assured, plus accumulated bonuses, if death is caused through war. The amount payable by the Pearl and the Wesleyan and General under such policies will be one-quarter of the sum assured plus accrued bonuses plus twice the premiums paid; in the last case bonuses of £2 per annum for the first five years are guaranteed. The Equitable has a similar scheme under which the payment will be two-thirds of the sum assured (or the whole of the surrender value, whichever is the greater) plus the accrued bonuses. This applies to those

over 40; for those under 40, one-half of the sum assured is substituted for two-thirds in the formula. In all these cases no extra premium is payable for the war cover as specified, but the United Kingdom Provident will grant full war cover on payment of an extra 10s. per cent., limited to five years. The National Mutual similarly charges no additional premium under participating assurances but will grant no bonuses on new policies during the war period, though if experience warrants it bonuses will afterwards be declared retrospectively. The Royal Exchange Assurance has boldly announced its willingness to write both with-profits and without-profits policies in approved cases with no extra premium and without variation in the benefits offered. Practically all the offices named stipulate that cover on the lines mentioned is confined to persons in the United Kingdom who are civilians at the time of death, though the National Mutual covers members of H.M. Forces on the same terms as civilians.

* * *

It is, on the whole, regrettable that there is not a more uniform treatment of war risks in life assurance among the British offices. So far, the public, which is not very willing to effect new assurances at all, certainly prefers the non-war risks cover, under which, if death comes through war, only the premiums paid or the surrender value, whichever is the higher, is payable. A more uniform treatment would probably encourage new assurances. It is interesting to note that the French offices have evolved a scheme which at least ensures such uniformity, though it introduces a far-reaching element of State interference. A pool of life assurance companies, domestic and foreign, is to have the exclusive privilege of writing the war risks cover on life assurances up to a maximum amount of Frs. 300,000 for one assured. Membership of the pool is voluntary, but no non-member office may cover the war risk. The pool will operate in co-operation with and under control of the Government, but it will remain an autonomous body.

Investment

Increased Railway Charges.—The 10 per cent. increase in railway charges and fares doubtless surprised the general public but it has not put much heart into the railway market. On Thursday, to the dismay of holders who awaited the announcement of increased charges to take their profits, marginal stocks reacted by as much as two points and shed all the gains recorded on the previous day. Movements are shown below:—

	Low, 1939	Feb. 6, 1940	Feb. 8, 1940	Apr. 12, 1940	Apr. 17, 1940	Apr. 18, 1940
L.M.S. ord.	9¼	16½	17¾	22½	23¼	21¾
L.N.E. 2nd pref. ...	7½	16½	17½	20	20¼	19½
G.W.R. ord.	21½	42¼	44½	47¾	48½	46½
Southern def.	7	14¾	16½	20½	20¾	20

The Minister of Transport's statement gives little information either to the railway user or to the railway stockholder. He has satisfied himself that increased working costs to the extent of £22½ millions have been "proved" by the railways out of total claims amounting to £26¾ millions. These estimates apply to the nineteen months from September 1st last year, when control commenced, to March 31, 1941, and they are made up of £9¾ millions for increased labour costs, £2½ millions for allowances to railwaymen now serving with the Forces, and £10 millions for increased prices of fuel and materials. The balance of £4½ millions represents increases due to the black-out and other precautionary measures and is to be examined "in the light of further experience." Possibly the railways themselves might have been willing to supplement these bare figures by details of increased costs under various headings, but none have been published. The Minister has found that the proved increases justify an all-round addition to railway charges of 10 per cent., which is estimated

to yield £18 millions in a full year, and he has made an Order authorising such an increase, as from May 1st next, to all railway charges, including fares on London Transport's railways. Fares on the Board's road services are being examined by the Consultative Committee (in other words, the permanent members of the Railway Rates Tribunal), who will advise the Minister on the best means to obtain a corresponding increase from the Board's road services. The Board's financial problem is not less pressing than that of the main lines, yet for its road services a deliberative procedure has been adopted.

* * *

The Increase and Prospective Earnings.—Possibly the market's reaction to the increase may have been due to somewhat mysterious statements by the Minister that "this deficit has been running for some time" and that under the terms of the financial agreement "the Government is liable to reimburse to the controlled undertakings a sum approximating £400,000 a week." Under the terms of the agreement, the Government is liable to make good any shortfall of net revenue below £40 millions. Hence if the weekly liability of £400,000 to which the Minister referred represents an effective charge, it would necessarily mean that net railway revenues are running well below £20 millions a year. That is surely improbable. The expectation from the 10 per cent. increase is £18 millions in a full year. In 1938 the gross railway receipts of the four main lines (ignoring for convenience the railways of London Transport) amounted to £159.8 millions. It was generally assumed that, but for the outbreak of war, gross railway receipts last year would have shown an increase of possibly £10 millions. It would, therefore, seem that the aggregate gross receipts contemplated by the

10 per cent. addition—of the order of £200 millions—are probably £30 millions higher than the normal expectations in 1939. Railway stockholders should surely regard such figures with satisfaction. Indeed, they—possibly like transport users in general—do not yet appear to have grasped the full implications of Clause 10 of the agreement, by which the railways may apply for an increase in charges to offset increases of working costs and other war conditions. That arrangement implies that the companies are automatically protected against increased costs, and that their net revenues are determined largely by the volume of traffic which they handle.

* * *

Second Dollar Securities Requisitioning.—The Treasury has issued a second Order, dated April 13th, requiring the vesting of 117 dollar securities (S.R. & O., 1940, No. 527). The second list includes a greater number of important market leaders than the first, which was issued on February 17th, such as Bethlehem Steel, United States Steel, Chrysler Corporation, General Electric and New York Central. Moreover, 25 dollar bonds, largely railroad issues, are requisitioned on this occasion. The list of stocks called up is given on page 753 of this issue. Prices specified in the Order are the sterling equivalents at the official rate of 4.03½ of the latest New York levels. Payment will be made to banks or stockbrokers by whom securities are lodged, with the Bank of England or Bank of Ireland, on April 29th, provided that the securities are received not later than April 19th. It is obvious that the new list will make much deeper inroads into the American portfolios of British investors than the first. Between the two vesting Orders, Wall Street has made slight net progress. The Dow-Jones index of industrial stocks stood at 148.72 on February 17th and at 149.66 on April 13th. Thus the two months' respite given to holders of dollar securities in the second list does not appear to have brought them any outstanding advantage. It should not be assumed that the second vesting Order, any more than the first, implies that the authorities have taken the step to counter immediate pressure on our exchange resources. The vesting Order may, in fact, be designed as much to reinforce the authorities' control over the domestic market, by releasing new investment funds, as to meet any immediate need for dollars. Wall Street has in the past week shown some response to the possibility of a more active war. The vesting Order will enable the authorities to take advantage of any advance in future by realising vested securities at some profit to themselves, in a manner which Wall Street can most comfortably absorb.

* * *

Austrian 4½ per Cent. Bond Service.—The trustees of the Austrian 4½ per cent. guaranteed loan, 1934-59, have this week announced a second payment of 25½ per cent. of the face value of coupons due on December 1st last on the sterling, French franc, and Swedish crown tranches of the loan, and a first payment of 78½ per cent. on the belga issue. A first payment of 53 per cent. on the former group of issues has already been made, and the trustees are now distributing amounts received under the Czechoslovak guarantee of 24½ per cent. (paid from Czech assets held in this country) and the 1 per cent. guarantee payment by Denmark. A 54 per cent. distribution has also been made available on the December 1, 1939, coupon of the Swiss issue. Of the eight guarantors, Great Britain, France, Czechoslovakia, Belgium, Sweden and Denmark have made full payments in respect of interest due on December 1, 1939, to the trustees. Holland (which is responsible for 1 per cent. of the total liability) has reached a separate arrangement with Germany, and no payment has yet been received in respect of Italy's 20½ per cent. guarantee. Owing to the technical default of the Austrian Government, it is understood that amortisation purchases below par cannot be effected, under the terms of the general bond. Drawings at par have recently been made, however, under the sinking fund provisions, which operate

between March 15th and April 15th each year. It does not follow, of course, that these drawn bonds will be repaid in full on June 1st next, the due date. The trustees must first receive from the guarantors the requisite payments in respect of guarantees of principal, and these are not due until May 1st. The present quotation of 53 for the bonds is probably in line with future expectations under the heads both of interest and principal. On a 78½ per cent. basis, the bonds yield £6 13s. 2d. per cent., but the period for which payments can be anticipated under the Czech guarantee is not known.

* * *

"Grid" Finances.—The Central Electricity Board so comfortably exceeded revenue estimates that in 1938 it ceased to charge interest on any of its stocks to capital, though its powers did not expire until the end of last year. In 1939, the impact of war was not apparently severe for the Board, although the growth in electricity output was arrested during the last four months. But from the technical safeguards which the Board is introducing in wartime, such as the pooling of spare equipment and the maintenance of a larger reserve of spare generating plant than would normally be required, it is evident that for the next few years the Board's financial progress will be more noticeably affected. The Board's finance is, in fact, based upon economies from the reduction of inefficient generating plant and upon the growth of maximum demand made upon it by authorised undertakers. Those conditions will be appreciably affected by war, and the latest report shows that some increase in the Board's tariffs must be contemplated in due course, although it is hoped to avoid any rise in tariffs during 1940. This point is of importance for electricity supply shareholders. As for the Board's own revenues, the credit balance of general trading account last year was £3,134,128, an increase of £379,360 over 1938. The corresponding increase in 1938, however, was £739,860. The effect of a fall in maximum demands by authorised undertakers at the end of the year owing to the war is clear from these figures. The Board's revenues are, of course, protected against the effect of rising costs, through the operation of the coal clause, and the aggregate demand as the war develops may not prove entirely static. Stockholders must be prepared, however, to modify their expectations of revenue resulting from economies of generation over the next few years. They may also note that the Board has provided £325,000 for Excess Profits Tax, though it is hoped that the liability will not mature. Meanwhile, the balance of revenue carried forward has been increased by £243,244 to £2,433,716, compared with total charges for interest and redemption fund of £3,664,866 last year.

* * *

Directorial Changes.—Two important announcements of directorial changes have been made this week. Imperial Chemical Industries, whose management system was reorganised two years ago, have appointed three directors to be deputy chairmen, namely Messrs John Rogers and J. G. Nicholson and Lord Melchett. Two former executive managers, Mr F. W. Bain and Mr A. J. Quig,

**FOR ALL
INSURANCE
NEEDS**

Head Offices:
LIVERPOOL LONDON
North John St. Lombard St.

have been appointed to the board. The object of the changes in 1938 was to relieve Lord McGowan of the considerable strain of detailed work as managing director and he was then appointed chairman of the management board. The latest appointment of three deputy chairmen has naturally given rise to conjecture regarding the reversion of the chairmanship. On this point it can only be said at this stage that the board's decision is an interesting experiment for which there can be few, if any, precedents. The second announcement, which on Thursday was officially confirmed by the company itself, is of the removal of Sir William Firth from the chairmanship and board of Richard Thomas and Company. The severance of Sir William's connection with the company follows a decision of the Control Committee, and arises from an "irreconcilable difference" with the board. Indeed, it is not difficult to perceive in the various changes in the directorate some evidence of long-standing disharmony in the management of the concern, since control was instituted in 1938. The Ebbw Vale project, for which Sir William Firth was peculiarly responsible, cost more than was anticipated, and could only be completed with special banking assistance when the company's own finances proved inadequate. But his conception of the new plant has been technically justified, and Richard Thomas shareholders may reasonably expect some fuller statement of the circumstances which have led to Sir William's break with the company.

Company Notes

Dunlop Rubber Report.—The preliminary announcement of Dunlop Rubber Company's profits (discussed on page 695 of last week's issue) has been followed by an impressive report, drawn up on the usual informative lines. The aggregate profits of the group amounted to £4,154,807, against £2,265,469 in 1938. Of this remarkable increase, rather over half came from overseas business, and any facile explanation of the results in terms of re-armament and war is set aside by the directors' statement that Government orders represented only 7½ per cent. of last year's turnover. The subsidiaries have provided £861,252 for taxation, against £434,107 in the previous year. The parent company has increased its provision for taxation from £386,109 to £1,027,474, and in addition has set aside £500,000 against the 1940-41 liability. Of the group's total profits of £4,278,199, no less than £2,388,726 has thus been absorbed by taxation. The parent company's net profits and their allocation are shown below:—

	Years ended December 31,		
	1937	1938	1939
Aggregate profits of group	2,478,000	2,265,469	4,154,807

* Of which £500,000 provision for income tax 1940-41; £200,000 to contingencies; £248,228 against subsidiaries.

† After paying £108,750 on Dunlop Plantations preference.

Dunlop is among the few companies this year to achieve an increase both in trading profits and in net profits and to declare an increased dividend. And these figures show that it has done so without any departure from conservative canons. The directors could have distributed a 30 per cent. dividend, had they so chosen, but they have preferred to write £563,228 off subsidiary interests (of

which £248,228 is provided from profits), to place £200,000 to contingencies, and to keep in hand £500,000 towards the current year's tax liability. As a result the German subsidiary now stands in the books at £1, though it has been greatly fortified by untransferred profits in recent years. The group's fixed assets, which amount to £14,274,782, show a reduction of £190,000 during the year, despite further extensions. The book value of interests in countries with controlled exchanges has been reduced by £522,000 to £836,055, while the net current assets of the group stands at the impressive total of £11,587,588, against £10,200,626 at the end of 1938. Thus the report combines a highly satisfactory financial position with an impressive advance in earnings. The group is doubtless making an important contribution to defence supplies. It is also well situated to participate in the drive for exports, to compensate for any reduction in civil business at home, provided that raw materials and key operatives are adequate. Before the preliminary statement, Dunlop Rubber ordinary stood at 33s. 9d. At their present price of 35s. 6d. ex dividend they yield £6 15s. per cent.

J. and P. Coats' Increased Profits.—The preliminary profits statement of J. and P. Coats is impressive. Net profits for 1939, after charging depreciation and the company's proportion of income tax, amount to £2,187,797, compared with £1,535,297 in 1938. After charging preference dividends (£330,000 gross) a balance of £1,857,797 is available for ordinary dividends—sufficient to meet a 14 per cent. payment. The distribution is maintained at 10 per cent., and absorbs £1,475,000 gross. Exchange and contingencies reserve absorbs the surplus together with £117,203 from the carry-forward, which is reduced to £364,662. These figures are very satisfactory, particularly since earnings of such dimensions must involve a substantial charge for E.P.T., in view of the indifferent trading experience in the base years. The ordinary stock stands at 38s. 3d.

Cable and Wireless Dividend.—For a short period on Tuesday afternoon Cable and Wireless (Holding) ordinary stock was encouraged by the declaration by Cable and Wireless (the operating company) of a total distribution of 4 per cent. against 3¼ per cent. in 1938. After the market had closed, however, the holding company announced that its ordinary dividend would be maintained at 4 per cent. The operating company's distribution corresponds, in fact, to the standard revenue agreed in 1938 between the company and the Government. It represents an increase in the gross amount to be received by the cable companies of £225,000, which is available for them to distribute to Cable and Wireless (Holding). In 1938 Marconi's Wireless Telegraph, whose share capital is largely held by Cable and Wireless (Holding), increased its distribution from 9 to 12 per cent., and declared an additional payment of 3 per cent. free of tax. The maintenance of the holding company's dividend may, therefore, cover some reduction of income from the Marconi's Wireless company. It is, perhaps, a fair inference from the dividend declaration that the operating company has achieved a net increase in traffic as a result of the war and presumably the Empire flat rate scheme has provided further benefits. The holding company's ordinary stock now stands at 60 and yields £7 3s. per cent. after allowing for the accrued 4 per cent. dividend.

Colvilles' Profits.—Trading profits of Colvilles, Limited, in 1939 substantially increased from £919,596 to £1,058,462, and including dividends received from subsidiaries the parent company's total income advanced from £1,048,601 to £1,205,984. Total profits of the subsidiaries, after provision for contingencies, showed an increase from £648,856 to £865,191. It is evident, therefore,

that the recent extensions carried out by the group have been opportune, and the report states that the coke-oven and blast-furnace scheme is now in operation and is fulfilling expectations. Ordinary stockholders, however, receive no direct benefit from the company's recent enterprise, for the dividend is maintained at 8 per cent. and earnings are actually reduced owing to the enormous increase in the taxation provision from £285,000 to £600,000:—

	Years to December 31,

They may take some consolation, perhaps, in the admission of the directors that the liability of the company to Excess Profits Tax cannot yet be determined, since it suggests the possibility that generous provision has been made. Colvilles is not favourably situated for E.P.T., in view of its expanding profits since 1935-37, but the trading position and the company's technical advancement is good. Hence, the current yield of £7 5s. 6d. per cent. on the ordinary stock at 23s. should be justified.

Mining Reports

West Rand Consolidated.—This mine suffered from a serious labour shortage during the year. To minimise the effect on milling, labour was diverted from development, and ore reserves consequently fell by 303,000 tons to 10,447,000 tons, averaging 4.4 dwt., the same grade as for some years past. In view of the mine's strong position, this fall is of no significance and should soon be rectified. The increased plant was unable to crush to full capacity, but a substantially higher tonnage was milled, and, despite the lower milling grade, profits rose by over £208,000 to £1,443,000. Taxation absorbed over 40 per cent. of the total profit. The deferred shares are entitled to 25 per cent. of the amount distributed in dividends, and the dividends on the ordinary shares were maintained at 2s. 6d., giving the satisfactory yield of 7 per cent. The mine should have a very long life, and the present satisfactory position should be maintained for many years to come.

Vlakfontein.—Very satisfactory progress was made by Vlakfontein last year. The main haulage from Sub Nigel connected with the Vlakfontein workings and greatly improved ventilation. As the west sub-vertical shaft has reached its final depth and is sufficient for development requirements, sinking has been temporarily suspended in the east sub-vertical shaft in order to conserve funds. The total footage on reef sampled amounted to 9,850 feet, of which 26 per cent. was payable, averaging 38.7 dwt. over 7.2 inches, or 279 inch-dwt. Some details of development are given on three levels, and very good values are being obtained at the lowest point. The shoot system is very highly developed in this sector of the Rand, and the next report may provide some interesting comparisons of the prospects of Vlakfontein as compared with the Sub Nigel mine. Meanwhile, the quarterly reports have recently shown a marked improvement. Sub Nigel is at present capitalised at about £17,000,000, against approximately £5,000,000 for Vlakfontein, but a substantial amount of new money will, of course, be required before Vlakfontein reaches pro-

duction, and some will be needed shortly for development. Present indications suggest that Vlakfontein may well develop into a very fine property, comparable with Sub Nigel.

Rand Leases.—Rand Leases ore reserves were increased by 318,000 tons to 5,987,000 tons, averaging 4.8 dwt., an improvement of 0.2 dwt. in grade. With the high percentage of payability in development of the different reefs, ore reserves should continue to rise, and development is, moreover, to be started on the Kimberley Reef. Owing to labour shortage, the plant could not be run to full capacity, but nevertheless milling increased by over 300,000 tons and profits to £890,221, an increase of £243,000 over the previous year. Dividends rose from 2s. 3d. to 2s. 9d., and the shares give a yield of 5.3 per cent. In view of the strong ore reserve position, the reduction capacity is to be further increased from 175,000 tons to 200,000 tons a month, and higher dividends may be expected over a period. The mine should have a very long life and the shares may be considered a sound mining investment.

Vogelstruisbult.—This mine suffered from shortage of labour during last year, so that development footage was reduced and the mill could not run to full capacity. Nevertheless, ore reserves were increased by 322,000 tons and now amount to 1,773,000 tons, averaging 5.6 dwt., or about two years' supply to the mill at the present rate of crushing. Profits rose by £107,600 to £469,546, and dividends totalling 1s. 3d. per share were paid, upon which basis the shares yield 5.2 per cent. The normal width of the reef is narrow, averaging about 14 inches, so that a large development footage must be carried out if the ore reserves are to show any substantial increase to warrant later a higher milling tonnage. Generally speaking, the mine has not fulfilled the first optimistic expectations, and in present circumstances the shares appear to be fairly valued.

Marievale Consolidated.—A satisfactory year's working was achieved by Marievale Consolidated. Ore reserves rose by 600,000 tons to 1,700,000 tons, but showed a fall in grade of 0.3 dwt. to 5.8 dwt. Milling started last October, and the plant is now crushing to its nominal capacity of 40,000 tons a month. Development at Marievale is concentrated on the central portion of the property and little is known of the prospects in the eastern or western sections of the mine. The eastern section adjoins the derelict Rietfontein No. 11, whilst the western section adjoins the eastern portion of Nigel Gold, in which no development has as yet been carried out. Working costs at present are about 29s. per ton, and it is unlikely that

a mine in this position on the Rand can reduce working costs materially, but the company should benefit substantially from the increased price of gold. Marievale's prospects, however, do not appear to outweigh those of other companies in the early stages of production.

* * *

The Week's Company Profits.—Our usual table of profit-and-loss accounts on page 755 includes the results of 46 companies. These again show the conflicting trends of higher total profits (£10,379,000, against £8,403,000) and reduced net profits (£4,891,000, against £5,067,000). The 712 companies whose reports have been received this year show an increase in total profits of nearly £9 millions, but net profits are £2½ millions lower at £81,347,000. The week's results are discussed in earlier Notes and on page 743 under the heading "Shorter Comments."

* * *

Company Meetings of the Week.—Reports of company meetings begin on page 747 of this issue. Sir Courtauld Thomson informed shareholders of *Employers'*

Liability Assurance that the direct effect of the war on the company's activity had so far been small, thanks to the large proportion of business transacted in the Dominions and the United States. Sir James Lithgow, addressing shareholders of *William Beardmore*, was unable to give detailed information regarding the company's activities for military reasons, but he emphasised the difficulty of estimating even approximately the liability for E.P.T. in view of the settlement of prices in numerous Government contracts and the apportionment of profits throughout the years in which they were running. Sir Max J. Bonn referred to the setting up of a "1940 profit and loss suspense account" by *United Glass Bottle Manufacturers*, to which the profit on forestalling orders at the end of last year has been carried. Addressing shareholders of *Anglo-Portuguese Telephone Company*, Sir Alexander Roger emphasised the importance of Portugal and the Portuguese Empire as a field for British exporters. Brig.-Gen. Sir Frederick Gascoigne described the difficulties of retail trading in wartime to shareholders of *Army and Navy Stores*, and disclosed that since the close of the financial year the stock position had been fortified.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

ONLY activity in the railway market on Wednesday has relieved the subdued tension on the Stock Exchange this week. Investors in any case would have shown little buying incentive before next Tuesday's Budget, but as the week proceeded they became more preoccupied with the development of Italy's non-belligerency into a warfare of words and the fear of further outbreaks of Nazi aggression in Central Europe—and, indeed, nearer home—has grown on balance. In the result, some modification of the early firmness of the markets, which were responsive to British naval victories at the beginning of the week, has occurred, though they have been quiet rather than definitely reactionary.

*

Small changes were registered in gilt-edged stocks throughout the week. Although Thursday was an unimpressive day, Old War Loan managed to close at 99½ bid.

Foreign bonds were directly affected by increased political nervousness. Japanese issues were lower and Italian bonds were a heavy market, while trading in Central European issues was difficult.

Home rail stocks enjoyed brief buoyancy on Wednesday afternoon on the announcement of the 10 per cent. increase in charges (discussed on pages 724 and 738). Great Western ordinary closed at 48 on Wednesday, having been as low as 46½, but even a moderate volume of profit-taking on Thursday found the market in a thoroughly soft condition, incapable of absorbing any volume of stock. Prices were disappointingly flat throughout the group. Some demand for Argentine rail debenture stocks was reported, particularly earlier in the week.

*

A few features were reported in the industrial market, which opened fairly firm, with fractional rises among the leading stocks. Cable and Wireless (Holding) jumped in anticipation of an increased distribution, after the operat-

ing company had announced a higher dividend, but reacted in mid-week on the maintenance of last year's payment. Publication of the Dunlop report (discussed on page 740) brought some support for the stock, although it shared in the mid-week easiness of the market. Chain store issues, including Marks and Spencer and Woolworth, were depressed by the restriction of supplies of cotton and linen to retailers, and Lever and Unilever were vulnerable to the tension in Holland. The Indo-China Steam Navigation dividend disappointed the market.

Continental nervousness was responsible for the continued fall in Royal Dutch, and the majority of the other leading oil shares declined in sympathy. Little business was reported in rubber shares, and but for some Cape buying on Tuesday, the Kaffir market spent a listless week. In the base metal group, Trepsa declined further owing to fears regarding the security of Jugoslavia.

New York

EARLY this week war stocks were restored to something like their old popularity, and aircraft stocks closed on Monday at the best. Wall Street's interpretation of the absence of news from Scandinavia, however, was a signal to take profits, and on Tuesday an increased volume of trade was reported at significantly lower prices. The tone of the market at the close was heavy.

No noticeable movement of trend either up or down has since occurred, and traders continue to follow a cautious line. *Iron Age* estimates this week's steel mill activity at 62 per cent. of capacity against 61 per cent. last week, and there are suggestions that the recent cuts in steel prices may be withdrawn.

BY TENDER

Bristol Corporation.—Tenders invited for £500,000 six months bills payable October 22, 1940, in amounts of £1,000 and £5,000. Tenders received by Westminster Bank, 41 Lothbury, April 18th. Accepted tenders to pay up in full April 22nd. The consent of the Treasury has been obtained for this issue.

Luton Gas Company.—Sale by tender with Treasury consent of 5 per cent. preference stock to realise £21,789 at minimum £103 per £100 stock. Redeemable at par January 1, 1955.

BY STOCK EXCHANGE INTRODUCTION

Tottenham and District Gas Company.—Issue of £100,000 4½ per cent. debenture stock redeemable at par April 1, 1950. Interest payable January 1st and July 1st. First payment July 1, 1940, for three months to June 30, 1940. Stock has been purchased by Laurence Keen and Gardner at £102½ per cent., less ½ per cent. brokerage.

PRIVATE PLACING

British Overseas Airways Corporation.—Issue of £4,250,000 3 per cent. Airways stock redeemable 1960–70 was placed on April 1st. Guaranteed principal and interest by Treasury. Temporary borrowing by the Corporation from bankers up to £2,250,000 also guaranteed.

Shorter Comments

Company Results of the Week.

One of the best industrial results of the week is that of CURRYS, LTD., whose net profits have increased from £41,537 to £50,138 and whose dividend is raised from 7½ to 10 per cent. A further batch of rubber company results also show an appreciable rise in total profits and a steady increase in net profits. In some cases, however, such as SELANGOR, distribution policy is distinctly conservative. In the retail trade group, HOPE BROS. and WILLIAM McILROY enjoyed a substantial improvement in trading last year, and their dividends have been increased. BRITISH UNITED SHOE MACHINERY maintains its usual high level of earnings and the 19 per cent. tax free dividend is repeated. BRYANT AND MAY net profits were slightly higher at £566,602, and the 25 per cent. tax-free dividend has been maintained. JOSEPH CROSFIELD profits were also slightly higher at £777,672, and the ordinary dividend is repeated at 35 per cent. Net profits of SUNDAY PICTORIAL showed an increase last year from £150,726 to £193,644, while those of DAILY MIRROR were slightly lower at £290,508. The dividends have been maintained at 10 and 15 per cent. respectively. The trading profits of LAURENCE, SCOTT AND ELECTROMOTORS showed some improvement last year, but net profits were reduced. The 15 per cent. dividend, however, is covered with only a slight reduction in the carry-forward.

MISCELLANEOUS

British United Shoe Machinery.—Gross profit, 1939, £563,919 (£542,919). Net profit, £550,429 (£529,571). Dividend, 19 per cent. tax free, as before. Carry-forward, £181,862 (£179,284).

Daily Mirror Newspapers.—Net profit year to February 29, 1940, £300,509 (£313,560). To reserve, £20,000 (£20,000). Ordinary dividend, 15 per cent., unchanged. Carry forward, £137,583 (£141,075).

Globe and Phoenix Gold Mining.—Mining profits, 1939, £210,884 (£181,056). Taxation, £94,063 (£58,060). Net profit, £107,801 (£167,494). Dividend, 70 per cent. against 80 per cent. tax free. Carry-forward, £4,482 (£36,682).

Anglo-Portuguese Telephone Company.—Gross profit figures for this company are £129,867 for 1939 and £124,244 for 1938. The figures of £364,338 and £341,217 respectively which appeared in last week's issue represented gross operating revenue.

Spillers, Ltd.—Final ordinary dividend 12½ per cent., making 15 per cent. for year to January 31, 1940, as before. Dividend on deferred and co-partnership shares maintained at 15 per cent. Annual meeting on May 8th will be adjourned sine die until final accounts are available. The directors have sufficient information to show that trading results have been as favourable as the previous year, when the net profit was £652,256.

Consolidated Diamond Mines of South West Africa, Ltd.—Revenue, 1939, £394,599 (£343,760). Mining expenses, £140,126 (£286,881). Net profit, £198,863 (£19,532). Full year's preference dividend paid, bringing it up to June 30, 1939. Carry-forward, £110,439 (£93,303).

Cow and Gate, Ltd.—Net profit year to September 30, 1939, after tax, £36,299 (£73,225). No dividend on ordinary shares against 10 per cent. Carry forward, £51,303 (£47,629).

Bank of Adelaide.—Ordinary dividend 5½ per cent. for past financial year against 5½ per cent. for preceding year. Profit, £71,392 (£71,121). Carry forward, £33,484 (£30,841).

(Continued on page 744)

Industry and Trade

As the coal and iron and steel industries are now regulated by the Government, the weekly market reports hitherto printed in this section of The Economist in smaller type and narrower columns have been suspended. Any news of importance, however, will in future be discussed in Notes in the main body of the section. A summary of current developments in the principal industries will continue to be given in the monthly Trade Supplement which is included in the last issue of The Economist in each month. The weekly survey of the commodity markets will be continued, and this, together with the regular monthly tables on unemployment, retail trade, wholesale trade in textiles, overseas trade, motor registrations, retail prices, as well as the fortnightly table of wholesale price indices, will in future be published at the end of Industry and Trade Notes in a section entitled Commodity and Industry News. If these tables disclose any significant changes, these will be discussed in the main body of the section.

The Supply of Electricity.—The twelfth annual report of the Central Electricity Board, published this week, lacks many of the factual data contained in its preceding surveys. The aggregate maximum demand for electricity has fallen substantially since last September as a result of the black-out and the curtailment of non-essential services, and in the view of the Board it is unlikely to show any material increase during the war. On the other hand, the United Kingdom's capacity to produce electric power will be further increased by the completion of the pre-war plant extension programmes for 1940 and 1941 and by the modified programme for 1942. The margin of reserve capacity, essential during the war, will therefore be substantial. Moreover, the greater part of the orders for the pool of switchgear, transformers and other apparatus from which equipment damaged or destroyed by enemy action is to be replaced have now been delivered. The danger of serious breakdowns has thus been appreciably reduced.

Cotton Margins.—The new yarn margins for cotton spinners, which came into force on Wednesday with the publication of three Orders by the Minister of Supply, vary according to different counts, but the maximum advance is about 3 per cent. This is generally considered to be a fair allowance for the spinners' increased costs. As trade has been held up for some weeks by the uncertainty over the new margins, a rush of new orders was expected immediately after the schedules were issued, which might have interfered with production on Government orders. The Cotton Controller has consequently forbidden spinners to accept for one month any new orders except those placed by the Government or by merchants for export. The rationing of home sales of textile goods, discussed elsewhere, should also help to relieve the pressure on the cotton industry. The new Orders also provide for the collection of the levy of 5d. per 100 lbs. of yarn spun which is to be used for research and for the development of the export trade; in future, also, agents' commission on yarn transactions is to be paid by the buyer, except where a spinner has agreed to dispose of his whole output through a single agent.

The Jute Industry in War.—At the outbreak of war the jute industry was immediately placed under the control of the Ministry of Supply, and by an Order dated September 1, 1939, the disposal or acquisition of jute was forbidden. The Order applied to raw jute, jute waste,

jute cuttings, jute yarns and jute twists. At the same time a schedule of maximum prices was issued above which future transactions were prohibited, and power was given to the Minister of Supply to ask for returns relating to stocks or any other information, from concerns dealing with, or trading in, jute. Dealings in jute were thus impossible, but the Control of Jute (No. 2) Order, which came into force on September 26th, substituted a licensing system for the prohibition and revoked the schedule of maximum prices. A licence is necessary for the purchase or sale of jute and for its spinning, weaving or other manufacture. As soon as the restrictions were removed there was an immediate rush to obtain supplies. Buyers who normally used Calcutta goods clamoured for delivery of Dundee fabrics, as shipments from Calcutta were considerably delayed, and spinners and manufacturers in Dundee were unable to satisfy all requirements. Prices naturally advanced rapidly. The price of yarns rose from 2s. 10d. for common 8 lb. cops to 5s. 10d. in a very short time, and that of hessians advanced from 3½d. for 10½ oz. 40 in. and 3¼d. for 8 oz. at the end of August to 8d. and 6d. respectively. The full group of raw jute (Daisee-2/3, shipment to Dundee) jumped from £21 17s. 6d. per ton to £56. The peak was reached at the beginning of December, but the price of Daisee-2/3 has since declined to £33 10s., common cops to 5s., 10½ oz. 40 in. hessians to 6½d. and 8 oz. to 4½d. Prospects for the next jute crop are very favourable, and, as there should be a fair carry-over from the present crop, supplies of raw jute will be plentiful, and prices in consequence will probably be kept within reasonable limits.

The prosperity of the trade during the first months of the war was due largely to Government orders for sandbags and camouflage hessians. The Indian jute mills were asked to supply 300 million additional sandbags, while Dundee's quota was increased to 4 millions a week. The market experienced a setback in the third week in January, when the Government cut the Indian deliveries of sandbags by 50 per cent., namely, to 54.5 million bags per month instead of 109 millions. Indian deliveries will continue at the lower rate until August, while those from Dundee manufacturers will be completed by April 11th. New business in Dundee is scarce, chiefly because of the much larger imports of Calcutta goods into the United Kingdom, and several firms are working only four days a week. Employment since the war has been good, but unless fresh Government orders are forthcoming many workers will soon be placed on short time. In July, 1939, there were 28,410 insured persons engaged in the jute industry, and on February 12, 1940, 12.3 per cent. of these were

SHORTER COMMENTS

(Continued from page 743)

Ever Ready Trust Company.—Final dividend on ordinary and deferred shares 6 per cent., making 9 per cent. for year to March 31, 1940, compared with 8 per cent. for previous year. Net revenue, £28,470 (£28,084).

Olympic Portland Cement.—Net profit 1939, £32,000 (£28,981). To sundry reserves, £12,000. Carry forward, £32,469 (£29,745). Final dividend 5 per cent.

making 7½ per cent. for year and bonus 2½ per cent. less 10 per cent. U.S.A. withholding tax and British income tax. 1938 dividend 7½ per cent.

Crosfield (Joseph) and Sons, Ltd.—Profit 1939, £927,672 (£765,834). Ordinary dividend 35 per cent. as before. £150,000 towards funding of staff pensions before inauguration of contributory pensions. Carry forward, £158,727 (£133,555).

Amalgamated Collieries of South Africa.—Profits 1939, £287,090 (£277,693). Amortisation reserve, £60,000

(£42,500). Carry forward, £42,738 (£37,406). Ordinary dividend maintained at 10 per cent.

Ragusa Asphalte Paving Company.—Final ordinary dividend 12½ per cent., making 17½ per cent. for 1939 (the same). Net profit, £34,537 (£34,527).

Ransomes and Rapier, Ltd.—Net profit 1939, £22,503 (£26,282). Ordinary dividend 6½ per cent. tax free against 7½ per cent. tax free. Gross dividend 10 per cent. against 10.3 per cent.

(Continued on page 757)

unemployed, compared with 15.5 per cent. on August 14, 1939. Some works which have been in the habit of running day and night shifts have had to cease night working, as many young men have been called to the Colours and women are not allowed to work at night. Both merchants and manufacturers have increased their overseas sales in recent months. Sellers have wisely reduced their prices to obtain orders, which they could afford to do, as profits in the earlier months of the war were considerable, amounting to as much as £20 to £25 per ton on yarns and cloth. But as Scandinavia has been a good customer of the Dundee jute industry—Denmark purchased large quantities of bacon wrappers—it will be adversely affected by Germany's latest moves.

Cut in Paper Supplies.—Finland, Sweden and Norway supplied something like three-quarters of Britain's requirements of wood pulp before the war. Imports of paper-making materials from these sources, already curtailed before the extension of the war to Scandinavia, have now been virtually cut off. It was consequently necessary to reduce consumption still further, and this has been done by an Order of the Ministry of Supply issued on April 13th. The cut has been severe, for consumers, whose supplies from March 3rd to June 1st this year had already been limited to 60 per cent. of the quantities delivered between March 1 and May 31, 1939, will now have to do with only 30 per cent. of the amount used during the reference period. This reduction will involve a further drastic cut in the size of newspapers and periodicals, and, coming hard on the heels of the rise in prices on April 1st, has naturally aggravated the difficulties of publishers. While Canada and Newfoundland should be able to increase their exports of paper and paper-making materials to the United Kingdom, the two countries cannot be expected to be able to replace Scandinavian supplies at short notice. Meanwhile, it may be necessary for the Government to discriminate rather more closely between the purposes for which available supplies are used.

Stable Exports.—It would certainly be over-optimistic to expect the activities of the new Export Groups to have borne fruit in time to affect the March trade returns, but the figures published on Thursday again emphasise the urgent need for greater exports. Compared with March, 1939 (a month which had two more working days than March, 1940), the value of British exports showed a small decline of 0.5 per cent.; the fall in exports of machinery was not entirely compensated by higher values for exports of textiles and chemicals. On a working day basis, too, there was no improvement in export trade between February and March, 1940. But the value of imports continues to in-

	1938	1939	1940	Change between 1939 and 1940

crease. Imports of grain and flour, of dairy produce, of "other food," of all raw textiles except silk, and of oil-seeds were all higher a year ago by more than £1,000,000, signs both of high food stocks and increasing activity in

the textile trades. Among manufactured articles, imports of iron and steel manufactures, of textile materials other than cotton, wool or silk (sandbags from India?), of manufactured oils and of paper and cardboard were also up by more than £1,000,000 compared with March, 1939. Detailed tables of the month's foreign trade will be found on page 757.

Swedish Industry.—Swedish Industry is based on her three great natural resources, metal ores, timber and water power. The metal content of the output of iron ore, both from the deposits on the Narvik-Lulea railway and from those in Central Sweden, amounted to more than 9 million tons in 1937, the year when output was largest. The production of crude steel was 1.1 million tons in the same year, produced mainly in Central Sweden by electrical power and imported coal. On these raw materials there has been based a large and varied engineering industry. In 1935, the output of the various branches of the engineering industry was valued as follows:—

OUTPUT OF ENGINEERING PRODUCTS
(Million kr.)

Agricultural machinery ...	21.1	I.C. motors.....	24.8
Woodworking machinery ...	5.8	Motor vehicles	70.5
Pulp and paper machinery ...	15.4	Bicycles	38.2
Machine tools	10.2	Shipbuilding and repairs	78.1
Generators & transformers	33.7		

The armament works at Bofors are in the central region north-east of Lake Vanern. There is a considerable export of electrical machinery and parts, such as ball bearings.

About 40 per cent. of Sweden's exports (by value) are products of timber. The major saw mills are concentrated at the ports on the Gulf of Bothnia, while there are a number of smaller mills scattered over central Sweden west of Stockholm. The Bothnia coast and the northern shore of Lake Vanern are also the main sites of the paper and wood pulp trades. Production of wood pulp amounted in 1937 to 3½ million metric tons and that of paper and paper boards to nearly one million tons. The extensive distribution of electric power through long-distance transmission and the ease of river transport for timber has enabled the wood-using industries to be widely spread along the eastern coasts and in central Sweden.

Finnish Timber.—Finnish exports of sawn and planed woods have averaged during the last few years about a million standards per annum, of which Britain has taken one-half to a third. It is not possible to estimate the

OFFER TO NEW READERS

Any reader who makes his first acquaintance with this journal with this week's issue is invited to fill up the attached:

To The Publisher, The Economist Newspaper Ltd.,
8 Bouverie Street, E.C.4.

In order to test the value of your publication I should like you to forward it to me by post for the next four weeks. If I then decide to become a subscriber, it is understood that there will be no charge for the copies thus received, but otherwise I shall be willing to pay 4s. to cover the cost.

Name

Address

loss of standing timber which Finland suffered from ceding territory to Russia, but the loss in saw mills is considerable. According to *The Timber Trades Journal*, saw mills with an annual output of some 200,000 standards were situated in the lost districts. In addition, the transport system in south-east Finland has been disorganised, since both the railway running on the north side of Lake Ladoga and the Saimaa canal ended at Viborg, which is now in Russian hands. The capacity for export of the saw mills which remain in Finnish territory will therefore be reduced. But as most of the Finnish timber is shipped from the Baltic ports, exports are at present limited more by the problems of sea carriage caused by the extension of the war into Scandinavia than by internal difficulties.

* * *

Jugoslavia's Metals.—After considerable delay the Government's negotiations with Yugoslavia for the conclusion of war trade agreements have now entered a decisive stage. In Germany and Italy these negotiations have naturally aroused concern, for Yugoslavia is the only metal producer of significance in the Balkans. Apart from small quantities of other metals, she supplies between 40,000 and 50,000 tons of copper, a like amount of zinc, over 70,000 tons of lead, over 50,000 tons of chrome ore, some 350,000 to 400,000 tons of bauxite, and 150,000 tons of pyrites per annum. In recent years Yugoslavia has also become a large source of antimony, of which about 3,500 tons were produced in 1939. In the past, Italy has not imported Yugoslav metals to any great extent; but if Italy decided to throw in her lot with Germany, Yugoslavia would be the only country on which she could rely for metal supplies with some degree of certainty. For Germany, who has always been the main buyer of Yugoslav

minerals, Yugoslavia is at present the only major foreign source of copper, lead, chrome and antimony. In bauxite, Germany is less dependent on Yugoslavia, as additional sources of supply are available in other countries, especially in Hungary. In her war trade agreement with Yugoslavia, concluded last October, Germany obtained large concessions in metals. She now obtains metals by a special compensation agreement and no longer has to pay for them with foreign exchange. On December 23, 1939, France also concluded an agreement with Yugoslavia; this came into force on January 1, 1940, and provided, among other things, for the supply of certain quantities of metals. These supplies, however, are not nearly as large as those delivered to Germany. Great Britain, on the other hand, pursues more ambitious aims, and regards the supply of Yugoslav metals to Germany as one of the major loopholes in the blockade which should be stopped so far as possible. The British Government is in a very strong position in its negotiations with Yugoslavia. According to official Yugoslav sources the capital invested in Yugoslav mining enterprises amounted to 882 million dinars in 1937. Of this total, over two-fifths was British (invested chiefly in the lead, zinc and chrome industries), while another three-tenths was French (invested mainly in copper enterprises). The Allies, therefore, have a strong case in demanding a diversion of Yugoslav metal exports to them. They can strengthen their position still further by supplying Yugoslavia with those colonial raw materials and products that Germany is unable to provide and by paying in a currency which is acceptable in all parts of the world. Mr A. Chester Beatty, the head of the Trepca Mines, Ltd. (Yugoslavia's largest metal mining concern), was made a director of the newly formed United Kingdom Commercial Corporation, Ltd. If Britain succeeds in laying her hands on a substantial part of Yugoslavia's metal supplies, she will have won an important bloodless battle.

COMMODITY AND INDUSTRY NEWS

SPOT tin prices have risen in both London and New York in the last week, partly because of smaller offerings and partly through fear of the spread of the war to the Dutch East Indies. War fears were also responsible for the rise in American prices of grains and rubber, but the rise in cotton prices has been checked.

*

Cotton (Manchester).—The fixing of new margins for spinners, to operate from April 17th, is discussed in a Note on page 744. Business in Manchester has been almost at a standstill both for yarns and piece-goods. Exports to India have fallen off to such an extent that, under the clause of last year's trade agreement, Indian import duties have been reduced by 2½ per cent.

*

*

Metals.—In the United States prices remained unchanged after last

week's rise in the domestic copper price from 11.375 to 11.50 cents per lb. and in lead from 4.85 to 4.95 cents per lb. The United States March copper statistics made an unfavourable impression. Total American deliveries, including those for export, fell from 72,809 short tons in February to 71,893 tons in March, the lowest level since last June. Production of refined copper advanced from 82,761 to 86,295 short tons, the highest level since the 1937 boom. As a result producers' stocks rose to 159,795 short tons at the end of March, an increase of more than 14,000 tons in the month and of more than 24,000 tons compared with the end of January.

*

Tin.—After an initial setback the London tin market became very firm, standard cash closing at £255 per ton, an advance of £2 15s. on the week; the backwardation widened from £2 5s. to £5 7s. 6d. Both these changes were due to smaller offerings for immediate delivery and to the fresh decline in home warehouse stocks, which fell by 282 tons to 1,247 long tons. Since the beginning of March the level of these stocks has been halved, but invisible stocks in this country and stocks of concentrates at the smelters are substantial, so that no shortage is likely.

*

Grains.—Wheat prices in all exporting countries were marked up sharply after the extension of the war to Scandinavia, though the elimination,

if only temporary, of these countries' grain imports might have been expected to have a depressing effect. Australia has sold 100,000 tons of flour to the Far East and the Argentine surplus of wheat has also been reduced by heavy shipments. The new Argentine maize crop is estimated at 50.6 million quarters, double the size of the previous harvest, and with fewer countries importing, a large carry-over is expected at the end of the season.

*

Vegetable Oils.—Fairly substantial allocations of edible oils have been made to manufacturers of margarine and cooking fats at unchanged prices. Imports are arriving in fair volume, though somewhat irregularly, owing to the convoy system. Exports of Plate linseed are heavy and the exportable surplus was estimated by the Argentine Ministry of Agriculture last week at 440,000 tons, compared with 845,000 tons a year ago. Exports of oilseeds from India to Scandinavia have been prohibited, so that a larger proportion than usual of the Indian exports will be available for British use.

*

Rubber.—American rubber consumption in March was slightly below the February level on a working day basis and there was a small increase in stocks. The extension of the war, however, brought a firmer tone to the New York market, though in London prices remained unchanged during the week.

(Continued on page 750)

COMPANY MEETINGS

WILLIAM BEARDMORE AND COMPANY, LIMITED

CONSIDERABLE INCREASE IN PROFIT

DIVIDEND OF 10 PER CENT.

WORKS EMPLOYED TO FULL CAPACITY

SIR JAMES LITHGOW'S REVIEW

The ordinary general meeting of this company was held, on the 12th instant, in London.

Sir James Lithgow, Bt., M.C., D.L. (chairman of the company), presided.

The secretary (Mr D. M. Cameron, C.A.) read the notice convening the meeting, and the auditors' report was read by Mr H. MacRobert.

The chairman, in moving the adoption of the report and accounts, said: In these days of strict censorship there is little which can be said in regard to the activities of a concern like yours, so largely engaged as it is on armament work, and I therefore propose in my remarks to confine myself to a short explanation of the main differences in the accounts as compared with the previous year and, perhaps, to a few general observations.

Under the heading of loan capital, you will notice that the interest for the half-year to December 31, 1939, is shown as a liability. Normally this interest which is due to be paid on that date would not so appear, but it so happened that on this occasion December 31st fell on a Sunday.

I mentioned to you last year that the temporary loans as shown in the accounts had been paid off, and as the company had a substantial cash balance at December 31, 1939, that item no longer appears.

The item sundry creditors, credit balances and provision for taxation is up by approximately £588,000. This is accounted for by an increase in trade creditors and the provision made for Imperial taxation.

EXCESS PROFITS TAX PROVISION

As you will appreciate, it is very difficult to estimate, even approximately, the company's liability to Excess Profits Tax as, in addition to the difficulties which will arise in adjusting a standard profit, there is also the question of a settlement of prices in numerous Government contracts and the apportionment of the profits on these contracts throughout the years in which they were running. We have, however, set aside a sum which we are confident will meet the needs of the case.

The remarks I made with regard to the half-year's interest to December 31, 1939, on the debenture stock apply equally in the case of the preference dividend for the same period.

The amount shown under the head of final dividend on ordinary stock represents the rate recommended by the directors under deduction of tax, upon which I shall comment later. You will note that this year we have given effect to this recommendation in the published figures altering those of last year in the comparison column so as to make them exactly comparable. The alteration seems to me to give a clearer view of the position.

THE RESERVES

The reserves, as you will see, have been considerably increased since last year. Depreciation and obsolescence have gone up by £145,000, a figure which your directors consider will, in addition to covering for depreciation, look after any maintenance and repairs, the carrying out of which may have been deferred due to the reasons given in the directors' report.

This year the directors have decided to create a general reserve, and you will be asked later formally to confirm the placing to the credit of that account of the sum of £300,000, as recommended.

The balance at credit of profit and loss account carried forward has, as you will see, been increased by the substantial sum of £71,012. With regard to our guarantee to the Empire Exhibition, a call of 4s. in the pound has been paid (£1,000), and it is unlikely that there will be any further payment. I am confident that the total cost to the company arising from the exhibition has been fully justified.

Turning to the assets side, you will observe there is a small

increase of £4,196 in the item of land, buildings, plant and machinery, etc. This represents the difference between additions during the year and the book value of assets sold, comprising the works at Anniesland, which I indicated in my speech last year had been sold early in 1939, and the old motor works at Paisley, which were disposed of later in that year. These sales resulted in a small surplus, which has been applied in writing down another property.

THE SUBSIDIARY COMPANIES

With regard to subsidiary companies, in view of the details which I gave you last year I need only say that their results are very satisfactory. I ought to mention, however, that our interest in Beardmore Motors, Limited, which I then indicated was of no direct advantage to your company's business, was exchanged during the year for a 100 per cent. interest in a subsidiary of that company. That exchange was effected so that Beardmore Motors might be developed by its owners in their own interest and to enable us to realise the assets of the subsidiary. Although that subsidiary company has made a loss, it is only technically a revenue loss; the realisation of the assets is proceeding satisfactorily and should produce a satisfactory capital return. It was, however, considered necessary in order to comply with the Companies Act to make a reference to the revenue loss on the face of the accounts, which explains the note thereon to that effect.

The additions to the subsidiary companies of £39,482 represents the transfer of the investment to which I have referred from "investments in associated and other companies," plus a call by John Broadfoot and Company, Limited (£7,232), which now makes the holding in that company fully paid and accounts for the substantial reduction in contingent liabilities. The uncalled capital under this latter heading is now reduced to negligible proportions, and arises from small trade development investments.

The increase in the figures shown under the head of "current assets," while substantial, does not call for special comment, as it is merely a reflection of the increased activity of the company.

DIVIDEND AND TAX DEDUCTION

While the profit for the year shows a considerable increase, the directors feel that with so much uncertainty as to the future they would not be justified in distributing more than a dividend of 10 per cent. for the year, and in recommending a final distribution of 7 per cent. they consider that stockholders will support them in what is necessarily a prudent policy. In regard to income tax on the dividend, the exact rate will not be known until after the Budget. We propose, however, to deduct tax at the current rate of 7s. 6d. and if there is a difference it will fall upon the company.

The works have been employed to their full capacity during the year. Every opportunity has been taken to improve the practice followed in the various manufacturing processes and the efficiency of the plant generally.

In periods of activity such as the present it is of prime importance to keep the works and plant thoroughly up to date and, in order that your company may be in a position to meet the competition which must inevitably follow in the train of a conflict such as that in which our country is at present engaged, a policy with this end in view is very definitely being carried out.

The future is all very uncertain, and it therefore behoves us, particularly a company like yours which depends to such an extent on armament work, to conserve its resources. Many schemes are on foot to increase the country's output of armaments. Certain of these have been entrusted to your company to carry out, and will be managed by us on behalf of the Government. The successful accomplishment of such work in addition to the timely execution of very large orders on hand demands, as will be readily understood, an ever-increasing effort on the part of those concerned.

The report and accounts were unanimously adopted.

UNITED GLASS BOTTLE MANUFACTURERS, LIMITED

HOME AND EXPORT TRADE EXPANSION

SIR MAX J. BONN'S REVIEW

The twenty-seventh ordinary general meeting of this company was held, on the 18th instant, in London.

Sir Max J. Bonn, K.B.E. (the chairman) in the course of his speech, said:—There are many difficulties in presenting the position of the company and the results for the year 1939, against the background of the national emergency. A somewhat slower movement of our trade in the earlier months was followed by an unprecedented onrush of business during the closing period of the year, representing both fresh demands and delivery instructions existing contracts.

BALANCE SHEET

Dealing with the balance sheet, it will be seen that the additions to freehold and leasehold property amount to £8,562. Plant and machinery, at £598,052 (after writing off depreciation, £102,130), compares with £645,071. The items of fixed and loose plant, machinery, etc., are now shown under the one heading of "Plant and Machinery" in order to simplify the presentation of the accounts. The expenditure to date on air raid precautions is £24,763, of which £10,000 has been written off in this year's accounts. After allowing for a decrease in bottle stocks and, on the other hand, an increase in raw materials and stores, the aggregate of £623,001 shows a decrease of £65,472 on the previous year. Debtors, including dividends due from subsidiaries and since received, after making ample provision for any doubtful items, have risen from £471,619 to £650,105. Cash at £209,420 has increased by £60,736. On the liabilities side of the balance sheet, sundry creditors including provision for taxation and contingencies, at £554,198, compares with £453,295.

Our increased liquidity is largely explained by the heavy decreases in bottle stocks, of which I shall have more to say. You will be pleased to know that the board has made a substantial investment on behalf of the associated companies in the recent issue of the 3 per cent. War Loan. Throughout the organisation most enthusiastic support has been given to the U.G.B. National Savings Group, which is affiliated to the City of Westminster Committee.

Ever since the September crisis of 1938 it has been our policy to carry increasingly large supplies of raw materials, within the limits of their availability and our own storage capacity. The various extensions to factory space during recent years have been more than justified by the course of events. Since the National emergency our transport and buying departments have been confronted with daily changing problems and difficulties, and the board wish to render due tribute to Mr Roberts and Mr Biram, the respective heads. You will be interested to learn that of late months we have made good progress in the development of various sand deposits, which promise to render us less dependent on foreign supplies.

PROFIT AND LOSS ACCOUNT

Turning to profit and loss account, it will be seen that the net profit is £248,443, as against the previous year £257,592. The satisfactory results—allowing for the steep increase in taxation, necessitating a provision of £150,000 as against £84,000—are mainly due to two factors: firstly, the greatly increased volume and velocity of trade during the last five months of the year; secondly, an adjustment in prices early in the autumn, sufficient to absorb the immediate upward movement in our main production costs, i.e. increases in wages, fuel, freight and insurances. At the present moment costs are running ahead of prices charged; but provided trade remains at the present volume, and our own costs remain around the existing level, we do not anticipate further increases.

Your board are fully alive to the dangers of the "vicious spiral," and our industry as a whole is keeping a careful watch on this whole question, probably one of the most important in the home front problem.

After comparison with other peak periods, we have come to the conclusion that during September and December, delivery demands—after allowing for increased consumption in certain lines and

new developments arising from the war—must, in some degree, have been in the nature of customers' anticipations. To that extent—obviously at best only an estimate—these over-deliveries would have been at the expense of the earlier part of 1940, short of some certainty that renewals of contracts would be at the very high level of 1939. We have, therefore, with the ready concurrence of your auditors, carried an amount representing the normal profit-rate on this amount of business to the credit of a "1940 Profit and Loss Suspense Account." This is not a provision, but a proper adjustment, just as discount applied to a bill, not yet due.

ALLOCATIONS

The board has allocated £18,350 to debenture redemption reserve, bringing it up to £164,121; £50,000 to general reserve, now standing at £500,000; and £25,000 to staff benevolent fund, which is brought up to £44,246. In previous years you have endorsed my submission as to the need of gradually building up a substantial discretionary fund, in addition to our pension scheme. The increased allocation of £10,000 this year should require little pleading on my part, in view of the many uncertainties which are likely to confront us.

The year's dividend on the preference shares, £58,566, and the interim dividend on the ordinary shares, £28,344, have been paid and it is now proposed to pay a final dividend on the ordinary shares of 6 per cent., making 9½ per cent. for the year (same as last year) and a cash bonus of 2½ per cent. (same as last year), both less income tax, £59,341, and to carry forward a balance of £41,096. We have received a satisfactory contribution by way of dividends from our main subsidiary companies, British Bottles, Limited, and Kork-N-Seal, Limited, the difference being due to increased income tax deducted. Again the mathematics on which the merger arrangement was based have been maintained for all practical purposes.

THE FUTURE

As to the future, we have made an excellent start this year; beyond that I can only promise you the board's unremitting efforts amidst growing difficulties.

The greater the demand, the greater the strain on our factories, whether measured in terms of skilled manpower and/or supplies. No words of mine can do justice to the splendid achievements during war conditions on the part of all our factories—especially during the recent days and nights of frost-bound endeavour.

We have endeavoured to adjust overwhelming demands in the following priority:—

- (1) Actual Government requirements.
- (2) Bottles to be filled for export purposes.
- (3) Our own export of empty bottles.
- (4) General trade—where necessary rationing old customers slightly or even turning down new enquiries.

Although the markets for our direct exports are limited, I am happy to say that they have shown a very marked increase. On the other hand, the aggregate value and importance of the various commodities and products exported in glass containers is far in excess of general appreciation. I have seen estimates which justify in feeling that we are making, no matter how humble, a contribution to the national effort.

In conformity with Government policy, a Glass Industry Export Group has been formed within the last few days; Mr W. H. Pilkington has been elected chairman, and our Mr Judd vice-chairman, as representing the Glass Container Section of the industry. I therefore feel assured that the dependency of our export business on a broad basis of home trade, owing to the problems of mass resist paying a special tribute to the head office organisation, with which I am in more personal touch.

The report and accounts were unanimously adopted and the proceedings terminated with a vote of thanks to the chairman, directors and staff, proposed by the Hon. W. B. L. Barrington.

THE EMPLOYERS' LIABILITY ASSURANCE CORPORATION, LIMITED

SATISFACTORY PROFIT

The fifty-ninth ordinary general meeting of this company was held, on the 17th instant, in London.

Sir Courtauld Thomson, K.B.E., C.B. (the chairman), said that their total premiums, other than for life and marine business, were £6,272,000. Though the volume was less than in 1938, they actually had written more policies. The underwriting profit was £228,000, a satisfactory figure well above that earned in most recent years. Their investments, on market values at current rates, showed a considerable appreciation on book values.

After providing for reserves on a high standard, for heavy taxation, and for dividends at the same rate as a year ago, they had added £63,000 to the amount carried forward, which now stood at £469,000. He thought they would consider that a satisfactory result, particularly for a year partially affected by war conditions.

EFFECTS OF THE WAR

Shareholders would, not unnaturally, wish him to tell them something of how the war had affected, and might affect, the business of the Corporation. The direct effect of the war had so far been small. At home their motor business had dropped with the widespread laying-up of cars. They had been hardly affected at all on the continent of Europe, where their commitments were relatively small. On the other hand, the large proportion of their business which was transacted in the Dominions and in the United States was now a source of greater strength and stability than ever before. They had the added satisfaction of knowing that for that reason they were able to produce valuable "invisible exports" through their interests overseas, and so to contribute to the country's economic war effort.

The fire account once again showed satisfactory results. The general growth of fire business had continued, particularly in the home field. The healthy state of their United States business was strikingly shown by the fact that in spite of reduced premium income the number of policies written in 1939 was the highest for several years past.

With regard to life business, he was glad to say that their associated company, the Clerical, Medical and General Life Assurance Society had been able to report satisfactory results. Although naturally affected by the war, the net new life business completed was over £2,000,000 and the life assurance fund had been increased by £442,000.

There were few changes of special interest in their investments. The larger amount shown at the end of the year in British Government securities had been added to recently by the amount of the new Three per Cent. War Loan which they had been allotted.

Their investments in bonds, stocks and shares, when valued at market prices at the current rate of exchange, showed an appreciation of £1¼ millions compared with values.

APPROPRIATION OF PROFITS

Dealing with the profit and loss and appropriation accounts, he said that when they added the underwriting profit of £228,000 to the net interest received, amounting to £206,000, and deducted £26,000 for sundry expenses and provisions—mainly covering A.R.P. expenditure—they had £408,000 to carry to the appropriation account. The directors declared last September an interim dividend of 1s. 6d. per share, less tax, and now recommended the payment of a final dividend of 2s. per share, less income tax at the appropriate rate in force at the time of payment. If that remained at 7s. 6d. in the pound the final dividend would cost £96,000, making a total of £180,000 in respect of dividends for the year.

The directors recommended that the surplus remaining, £63,000, be added to the amount brought in, making the total carried forward £469,000.

No business could be altogether immune from the effects of war, but, taking into account the geographical distribution of their business, with its high proportion in the British Empire and the United States, its strength in North America, and their comparatively small stake on the Continent of Europe, they could feel that they had certain advantages which made it possible for them to face the countless and inevitable difficulties which lay ahead, with a reasonable degree of confidence.

The report and accounts were unanimously adopted.

ARMY AND NAVY STORES, LIMITED

DIVIDEND OF 10 PER CENT.

The annual general meeting of the Army and Navy Stores, Limited, was held, on the 17th instant, in London.

Brig.-Gen. Sir Frederick Gascoigne, K.C.V.O., C.M.G., D.S.O. (chairman and managing director), said that it was inevitable that there would be a fall in their sales last year, and that fall was reflected in their gross profit, which was down by £38,011, but, owing to the measures of economy which had already been put into operation against the possible coming of the evil day, the net profit was down only by £28,401, notwithstanding certain expenses amounting to some thousands of pounds which they had had to meet on account of the war.

The diminution of profit was due to the falling off in trade. Several factors had contributed to the loss of turnover, the principal ones being the increase in income tax, the evacuation, the black-out, restrictions on the use of petrol, and the frequent admonitions by the Government to the public to spend less. While it had always been their policy to sell a good article at a reasonable price, never had they been more determined than now to pursue that policy. War, with consequent rises in prices, afforded many opportunities for undue profits to be made, but he could assure shareholders that such profits would not be made by them. The customer would be given the advantage of any foresight they might have shown in buying, and prices would be advanced only when such a step became necessary. That was not a policy dictated only by morality; it was a matter of good business.

HINDRANCES TO SHOPPING

The evacuation had taken away from London and its environs many of their customers, and no doubt those districts to which they had repaired had benefited. The black-out and restricted shopping hours were obviously a hindrance to shopping, and in regard to the restrictions on the use of petrol, those had hit the business in two ways. Customers had found it impracticable to go there so frequently, and they had had to curtail their motor delivery service very considerably. They made the very most of their petrol allowance: their customers realised the situation and co-operated with them by giving perhaps more forethought than heretofore in making out their orders, in a mutual endeavour to minimise the inconvenience of the curtailed service.

Stock-in-trade, at £654,035, was no less than £154,420 higher than in the preceding year. Stock was the life-blood of their business, and he could assure shareholders that their business had been duly protected in that respect. Since the close of the year the stock position had been further fortified.

As to the profit available, there remained a sum of £196,434 after adding the amount brought forward last year, £112,030, and deducting £20,500 already paid as interim dividend. In view of the situation which had arisen last September, the directors had thought it advisable to keep the interim dividend at a low figure and to pay out 3d. per share, or 2½ per cent. only. The total results for the year seemed to justify their present recommendation of a final dividend of 9d., making a total of 1s., or 10 per cent. for the year, and accounting for £61,500. It was also proposed to allocate £2,000 to the Indian Good Service Fund and £16,590 to the pensions fund. He was conscious that he had held out hopes that the latter allocation would have been considerably less this year, and so it would have been but for the special circumstances which had prevailed.

For the last two years at their meeting he had refrained from attempting to foretell the future. He certainly did not feel competent, nor would shareholders expect him on that occasion to make any prophecy in regard to the results of the current year. They could not shut their eyes to the fact that the disabilities under which they had suffered for the past year or more could not be expected to diminish so long as the war lasted. They might even increase. They had a loyal clientele, which counted for a great deal; they had an organisation ready to cope with any difficulties which might arise; they had good stocks; they had good reserves, and shareholders might rest assured that, come what might in the way of restrictions or burdens, they would, with the shareholders' support, on which he knew they could count, do their best cheerfully to keep the flag flying in Victoria Street until victory and peace came along and better conditions prevailed.

The report and accounts were unanimously adopted, and a final dividend of 9d., making 1s. or a total of 10 per cent. for the year, was approved.

ANGLO-PORTUGUESE TELEPHONE COMPANY, LIMITED

CONTINUED GROWTH

The fifty-third ordinary general meeting of the Anglo-Portuguese Telephone Company, Limited, was held, on the 12th instant, at the Incorporated Accountants' Hall, London.

Sir Alexander Roger (the chairman) said that the continued growth of the system was reflected in the operating revenue, which had risen by £23,121 to £364,338. Operating expenses had increased by £16,513, partly due to increased provision for depreciation on a larger plant. They had provided £13,000 for contingencies that might be drawn upon during 1940 for writing off debenture issue expenses, and it also formed a reserve for taxation. Net profit amounted to £81,853, compared with £78,967, and they again recommended a final dividend of 5 per cent., making 8 per cent. for the year on the ordinary stock, and a dividend of 8 per cent. on the "A" ordinary shares. The successful placing, in accordance with Treasury requirements, of 5 per cent. first debenture stock early in the present year was an illustration of the advantages which the company derived from its association with the Telephone and General Trust.

After stating that the remittance position continued to be satisfactory, as there was in Portugal a free exchange of currencies of all countries, he went on to say that the stations had increased by 1,408, the total number at the end of the year being 52,506, and they were meeting every demand for service without delay. Since he had become connected with the company in 1927 the number of stations had risen from 21,127 to 52,506, or, putting it in another way, the system had multiplied two and a half times. They were satisfied with the rate of increase, and were glad to note that the calling rate per subscriber, which might be regarded as the true index of telephone activity, was being maintained at a good level. That indicated that the communities which they served were steadily becoming more telephone-minded, and was evidence of the increasing importance of their telephone system to the governmental, commercial and social population in Lisbon and Oporto.

They modestly took credit for the bold expansion policy which they had laid down in 1927, and which they had pursued in good times and in bad, feeling confident that if they provided a first-class modern service it would be appreciated. In spite of the unsettlement caused by the war, their gross capital expenditure for 1940 was expected to amount to some £125,000.

ANGLO-PORTUGUESE TRADE

Portugal was now seeking energetically new outlets for her commerce, and that of her colonies, to replace those markets which the war had restricted or closed, and it was very apparent that neutral countries whose business with Portugal hitherto had been small were fully alive to the reciprocal trade possibilities of the Portuguese market. British national spokesmen were constantly stressing the vital importance of British export trade, and he would emphasise afresh the value and wide range of the field which Portugal and the Portuguese Empire offered not only to British exporters but to firms dealing in imports for home consumption and for re-export to the rest of the world.

Good opportunities for reciprocal trade with Portugal undoubtedly existed, and it was important that they should not be missed because of a too rigid adherence to procedure appropriate to more normal times. Under war conditions British trading regulations should be adjusted as far as possible to meet the requirements and outlook of the Portuguese trader.

The report was unanimously adopted.

PINCHIN, JOHNSON AND COMPANY, LIMITED

A SATISFACTORY YEAR

The annual general meeting of Pinchin, Johnson and Company, Limited, was held, on the 16th instant, at the Hotel Victoria, London, S.W.

Mr Edward Robson (the chairman), in moving the adoption of the directors' report and balance sheet for the year 1939, said:—The profit and loss account balance is £258,942, as compared with £179,880—which is a highly satisfactory improvement upon the previous year, bearing in mind the extraordinary conditions which obtained for the last four months of the year and the obviously depressing influence which preceded that period.

It is gratifying to record that with two exceptions foreign and overseas units have bettered their positions.

With reference to the trading of the past year, I would say that we have made very rapid progress in commercial development of new type materials.

Generally speaking, all sections of our business, which is a very widely spread one, have shown good increases.

It would not, in my opinion, be in the national interest to complain off, or ventilate here, the many troubles we have been experiencing. Naturally, our chief anxiety has been to obtain adequate material with which to operate. Raw material is, of course, the most important single item of our business.

INCREASED DEMANDS

There have been tremendously increased demands for certain articles which are essential to war-time production. As an offset, I am very pleased to say that our own technical resources have evolved many alternatives and replacements that may prove to be of inestimable value and permanent utility.

Competition is still severe and, in some cases, is quite un-economic.

Whilst we can view our own future with confidence, we must realise that, in reality, our whole existence depends upon the successful issue of the struggle with which we, as a nation, are faced to-day.

The company is still by far the largest exporter of paint products in the British paint and varnish industry, and we would like to express our appreciation of the support afforded the industry by the Board of Trade.

The report was unanimously adopted.

CURRENT STATISTICS

Finance

GOVERNMENT RETURNS

For the week to April 13, 1940, total ordinary revenue was £12,032,000 against ordinary expenditure of £38,796,000. Thus, including all sinking fund allocations, the deficit accrued since April 1 is £54,763,000 against £18,658,000 for the corresponding period a year ago.

Irving-Fisher Index (U.S.A.)	100.4	85.4	83.4	89.7	...	

* This figure relates to March 16th. † Highest level reached during 1932-7 recovery.

In calculating yields of fixed interest stocks allowance is made for interest accrued, less income tax at the standard rate, with allowance for redemption. Where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The yield on ordinary stocks and shares is calculated on the latest dividends, account being taken of any increase or reduction of interim dividends.

(a) Interim dividend.	(b) Final dividend.	(c) Last two yearly dividends.	(e) Allowing for exchange.	(f) Flat yield.	(g) Yield worked on 4% basis.
(h) Yield on 4½% basis.	(i) Yield worked on 12% basis.	(j) Yield worked to average redemption—end 1960.	(k) Based on redemption at par in 1946.	(l) Yield based on 43% of coupon.	(m) Yield based on 47% of coupon.
(n) Based on payment of 2½%.	(o) To redemption at par in year shown.	(p) 1½% paid free of tax.	(q) Yield on 1523% basis.	(r) Yield based on 43% of coupon.	(s) Yield based on 47% of coupon.
(t) Yield worked on a 15% basis.	(u) Yield based on 47% of coupon.	(v) Yield based on 47% of coupon.	(w) 1% paid free of tax.	(x) 1% paid free of tax.	(y) 1% paid free of tax.

(a) Interim dividend. (b) Final dividend. (c) Last two yearly dividends. (d) Yield on 18.95% basis. (e) 12½% basis. (m) Including bonus of 5% free of tax. (n) Yield worked on a 22½ per cent. basis. (o) Yield worked on a 25 per cent. basis. (p) Annas per share. (q) 8½% paid free of Income Tax. (r) For 15 months to December 31, 1939. Also cash dividend 10 per cent. out of capital reserve. * Bid and offered prices are free of Commission and Stamp Duty. † Free of Income Tax.

IMPERIAL JAPANESE GOVERNMENT

FIVE AND A HALF PER CENT. EXTERNAL LOAN OF 1930
FOR \$71,000,000

NOTICE IS HEREBY GIVEN that the COUPONS due 1st May, 1940, will be PAID on and after that date (Saturdays excepted) between the hours of 11 and 2 at The Yokohama Specie Bank, Limited, where lists may be obtained.

Coupons must be left three clear days for examination prior to payment, and will be PAID at the fixed exchange of \$4.8665 to the £1.
For THE YOKOHAMA SPECIE BANK, LIMITED,
H. KANO, Manager.

7, Bishopsgate, London, E.C.2.
16th April, 1940.

THE ALEXANDRIA WATER COMPANY, LIMITED
PAYMENT OF DIVIDEND

NOTICE IS HEREBY GIVEN that a dividend of Eleven Shillings per £5 Share will be paid without deduction of British Income Tax but less Egyptian Government Tax at 8 per cent., making 10s. 1.44d. net, on Coupon No. 103 on and after April 15, 1940, at the National Bank of Egypt in Alexandria at Rue Toussouin, or in London at 6 King William Street, E.C.4.
Net profits for the year ended December 31, 1939, £168,000 (last year £168,000).

Dated, Alexandria, Egypt, April 4, 1940.

By Order of the Board,
T. D. KEY,
ROBERT WALTON,
Joint Managers.

ROYAL BANK OF CANADA

DIVIDEND No. 211

NOTICE IS HEREBY GIVEN that a DIVIDEND of 2 per cent., being at the rate of 8 per cent. per annum, upon the paid-up Capital Stock of the Bank has been DECLARED for the three months ending 31st May, 1940, and will be PAYABLE at the Bank and its branches on and after 1st June, 1940, to Shareholders of record 30th April, 1940.
By Order of the Board,
E. B. McINERNEY, London Manager.

6 Lothbury, London, E.C.2.
April 18th, 1940.

THE CUNARD STEAM SHIP COMPANY LIMITED

NOTICE IS HEREBY GIVEN that the Sixty-third Ordinary General Meeting of THE CUNARD STEAM SHIP COMPANY LIMITED will be held at Cunard Building, in the CITY OF LIVERPOOL, on Wednesday, the 24th April, 1940, at ELEVEN o'clock a.m.
Owing to circumstances arising out of the War, the Statement of Accounts and Balance Sheet cannot be submitted and the Stockholders will be invited to pass a Resolution adjourning the Meeting to a later date.

By Order of the Board,
H. J. FLEWITT, Secretary.

Offices: Cunard Building, Liverpool.
10th April, 1940.

BOUND

TO BE

HANDY

For many years we have been supplying special binders to hold three months' issues of *The Economist*. These Binders have no wires, clips or metal contrivances and each issue can be bound up in an instant in such a way that it can be read as easily as a well-bound book.

In response to numerous requests we are now also supplying a Reading Case, made on similar lines, to hold two issues.

Both are bound in full cloth (blue) and lettered in gilt.
The price of the Binder is 5s. 6d. post free (Overseas 6s. 6d.) and of the Reading Case 4s. post free (Overseas 4s. 6d.)

A Budget of Delusions

SIR JOHN SIMON has missed his opportunity. He could have introduced a Budget on Tuesday that might have served at once as a promise of resolute action, as a proof of realistic foresight and as an instrument by which the people could demonstrate their passionate desire to serve the State. Instead he has preferred to muffle the emergency, to foster delusions and to encourage the citizen to believe that his help is neither needed nor desired in much more than the present offhand degree. The lowest conceivable figure has been put on the financial measure of the State's activities and even that inadequate sum is left to be raised, as to more than half of it, by the easiest (and most dangerous) method. Even the keenest desire to foster confidence in the national finances must yield to a sense of bitter disappointment.

In a usual year, discussion of the Budget naturally turns mainly on the details of the taxes imposed; the total figures are taken largely for granted. But this year it is to those total figures that the severest criticism has rightly been directed both in Parliament and in the responsible Press. The Chancellor explained at some length the unavoidable difficulty of estimating expenditure in war conditions; but there was nothing in his speech to indicate that his figure of £2,000 millions for war purposes and £667 millions for civil purposes was intended to be other than a genuine forecast of what was in fact likely to be spent. The figure of £2,000 millions is, of course, huge; but it is also miserably inadequate. In fact, it can be bluntly stated that if we spend money at that rate only we shall lose the war. A few comparisons will illustrate the point. The sum of £2,000 millions a year represents £5½ millions a day. But in the first seven months of the war we spent on war purposes an average of £4¼ millions a day. Are we invited to assume that the average expenditure of the twelve months just beginning will only be a quarter larger than in those first months, when so much was being improvised, so much

just starting up, so much only in paper existence? In the eight weeks from mid-January to mid-March, expenditure on the war was running at about £5 millions a day; last week it was only a shade lower. Does the Government really wish us to believe that the most it can manage in the next twelve months is a war effort only one-tenth greater than at present? And behind these comparisons there is a more sinister one. The Nazis are spending at least £2,500 millions and probably £3,000 millions or even more this year on the war. Is there any pretence that we shall win with a smaller effort than theirs?

It is, of course, perfectly true, as the Chancellor pointed out, that the amount of expenditure is determined "by the man-power available for production and by the supply of war material." Finance, in wartime, is necessarily a camp follower, which cannot move until the armies themselves are on the march. But if the Chancellor relies on this explanation of his inadequate figures the position is only made worse. If his figure of £2,000 millions is a true estimate, then the supply position must be bad beyond belief. If, on the other hand, it is a deliberate under-estimate, then, since all the arguments and proposals of the Budget were based upon it, it will have the effect of deluding the public about the extent of the burdens they will have to bear and of postponing the inevitable awakening to reality until it will be far too late to improvise a realistic policy. In either case, for those with the imagination to translate financial figures into strategic facts, nothing more utterly disheartening than this figure of £2,000 millions has emerged since the war began.

This main issue of economic policy is that on which the eyes of the public should now be trained. The question of by what precise financial means the total of expenditure should be met—the Budget problem proper—is, of course, important. But its importance is secondary: to make the wrong choice between taxation, borrowing and inflation

may cause us endless sorrow and social disturbance; but it will not lose the war. To set the limits of our war effort too low, on the other hand, to proceed with timidity rather than boldness, will mean the losing of the war.

Even when we turn from the major aspect of economic policy in general to the comparatively minor matter of methods of finance, it is difficult to feel any satisfaction with this week's Budget. The total expenditure of £2,667 millions is—we must devoutly hope—an absolute minimum. But of this absolute minimum only 46 per cent. is to be covered out of revenue—less than half of an inadequate figure and not much more than a third of what our expenditure ought to be this year. But it is surely reasonable that the lower the estimate that is put on total spending, the higher should be the proportion covered by taxes. If we do our strategic duty, the expenditure in this twelvemonth will be not £2,667 millions, but more like £3,300 millions, with still more to come next year. Compared with either figure, a revenue total of £1,234 millions is hopelessly inadequate.

The taxation proposals contained in the Budget bear heavily only on the specific points on which they are imposed. The increases on the duties on beer, spirits and tobacco are undoubtedly stiff, and the increases in postal rates penal. But the increase of taxation as a whole is light. The lowering of the starting-point for surtax from £2,000 to £1,500 is unlikely to exact an extra payment of more than about £30 from any individual—and to pay as much as that he must have an income of at least £2,000. The increased burden on the £5-£12 a week class—who now, by general admission, bear the lightest proportionate burden of any income group—is also slight. The Chancellor quoted the case of the married man without children earning £300, who will pay £15 in income tax this year, against £7 last year and £5 the year before. His tax, it is true, has gone up by 200 per cent. in two years. But his net income after tax—which is what matters, since it determines his consumption—has only been reduced from £295 to £285, or by about 3½ per cent. Sir John is deluding himself—or the public—with the simple fallacy of proportions when he quotes examples such as this as “striking increases.” How can the public be expected to take seriously the need for restricting consumption when the Chancellor thus encourages them to squeal long before they have been hit?

The chief novelty in the field of taxation is the Purchase Tax. Some reasons are given on a later page for thinking that the yield of this tax will not be very great. Indeed, like any other indirect tax, it inevitably falls between two stools; if, in the attempt to produce a large revenue, it is levied on necessities, it is unfair and regressive in its incidence; but if in the attempt to avoid placing the lion's share of the burden on the shoulders of the poor, necessities are exempted, very little revenue will be obtained. The Purchase Tax is an interesting and ingeniously contrived newcomer to the fiscal gallery; but it is not a major contribution to the problem of paying for the war.

The result of this timid approach to taxation is that the Chancellor of the Exchequer is left with £1,433 millions to borrow—at least £1,433 millions and probably a great deal more. Not all of this sum, it is true, has to be raised from the public. The recent loan operations have left the Exchequer with £100 millions “in hand” (though the collection of this sum will surely reduce by the same amount the savings available for other loans). Drafts on our dollar assets reduce the need for new borrowing, though not more than a very few hundred millions a year can be derived from this source. Purchases from sterling area countries may lead to the accumulation of balances that can be lent back to the Treasury. But, even with these deductions, the amount to be sought from the savings of the public in the present year cannot be less than £1,000 millions and may well be half as large again. The national savings, including expenditure on the maintenance and replacement of existing capital, have never in peacetime reached this figure. It follows that the total of savings must, by one means or another, be increased.

Having arrived at this point, Sir John Simon was naturally led to pronounce upon Mr Keynes's proposals for compulsory savings or “deferred pay.” This was the moment for which the House of Commons had been most

anxiously waiting, since the Keynes plan, apart from its precise proposals, has come to stand as a symbol of the need for a novel and imaginative approach to the problem of war finance. The Chancellor's decision was to reject the Keynes plan on the ground that the use of compulsion would diminish the yield of voluntary borrowing. “Why should we assume that the willing exertions of our people if properly aroused and directed will produce less results than if we attempted to apply a cast-iron formula and compel people to lend? . . . I would advise the Committee to rely on the results to be obtained by stimulating to the utmost the response to our existing methods of borrowing.”

This is a line of argument that can always be relied upon to raise a cheer; but it cannot be conceded very much logic. As Sir John himself pointed out, the fact that taxes are compulsory is the reason why so few voluntary gifts to the Exchequer are made. But he does not draw from this fact the conclusion that compulsory taxes should be avoided. On the contrary, he assumes, every day, that “the willing exertions of our people” would produce far less than the application of a “cast-iron formula” of compulsion. It is, of course, perfectly true that the imposition of a scheme of compulsory savings would reduce the amount of voluntary savings; but so will an increase in income tax, a lowering of the surtax limit, an increase in the duties on tobacco, beer and spirits, and the imposition of a Purchase Tax. Every part of the financial problem impinges on every other, and if we were never to undertake any measure that might reduce voluntary savings there would be no Budget at all. It is not by arguments such as these that the Keynes plan can be rejected.

The weakness of the Keynes plan is that it was ever associated with borrowing. Any proposal to put compulsory levies on the people, whether they are called taxes or loans, raises heated arguments about relative equity and consumes a very great deal of political energy. If we are to increase tax revenue to the required extent, we shall need all the political energy we can command; it is a pity to squander any of it on proposals for borrowing, which is a problem that should not arise until after taxation has been pushed to the uttermost limits.

Compulsory saving by an assessment on each income is a second-best idea, for the simple reason that if the assessment can be achieved it can be used for an outright tax. But it does not, of course, follow that the necessary increase in saving can be left to be achieved by mere exhortation. Sir John Simon did not suggest that that was possible; his policy of “stimulating to the utmost the response to our existing methods of borrowing” includes the forcible restriction of expenditure. The limitation of dividends is one small step in this direction, the control of imports is another, the limitation of raw materials for civil uses a third, the new Purchase Tax a fourth. The element in the Budget speech that deserves the most commendation is this recognition of the fact that savings can only be increased if consumption is limited. This is a sound and an essential policy; but it suffers from the defect that to be effective it must be complete. To limit some forms of expenditure is merely to increase others. If the object is to produce an increase in total savings, all forms of expenditure must be brought under control. If the policy is carried through to a conclusion, it will produce savings (as it has in Germany) far greater than could be done by any system of assessment on specific incomes. But, alas, there is little reason to believe that the Government have the resolution necessary to carry this, or any other, painful policy far enough. Without it, Sir John's endorsement of the need for restrictions on consumption, like his avowal of determination to avoid inflation, is likely to be as ineffectual in practice as it is praiseworthy in principle.

The Chancellor has gravely misjudged the economic needs of the situation. If we go through the year with no change in the financial policy outlined in this Budget, we shall be in a financial morass from which no Chancellor will be able to rescue us. We must pin what hopes we can to the possibility that, by the autumn, the need for a revised Budget will be too pressing to be denied, and that by that time, through a change of personnel or some other minor miracle, a breath of realism and courage will have blown through the windows of the Treasury.

Italy and the Allies

IN spite of the open declarations of the Italian Government that Italy is not neutral and may at any moment enter the struggle against us, many people still find it hard to believe in Italy's hostility towards the West. They remember that she was our ally in the last war and are conscious of no immediate clash of interest. There exists very little desire to fight Italy, rather surprise and regret that Italy should—apparently—want to fight us.

The regret is justified, but possibly not the surprise. Ever since Italy achieved national unity in 1870 her path to expansion and Great Powerhood (which could only lie through the Mediterranean) has been blocked by the old-established Powers who had achieved their positions while she was still struggling for freedom. The war did not ease the position, for whereas France and Britain held that Italy was well served at Versailles with Trieste, Trentino, Gorizia, Istria, the South Tyrol and control of the Adriatic, Italy herself looked on these acquisitions as a mere completion of the work of national unification and bitterly resented her exclusion from the division of the German and Turkish Empires. Apart from the consolidation of her position in the Adriatic and the Dodecanese, the last war did not improve Italy's position in the Mediterranean. She came out of the war a discontented Power.

The years which followed, especially after the advent of Fascism, were filled with Mediterranean bickering over Corfu, over Tunis, over naval parity. The elements of future misunderstanding existed long before the Abyssinian war brought about a new deterioration in Italy's relations with the West. We tend to look on sanctions as an attempt to enforce a new standard of international behaviour which was frustrated by France's overmastering fear of Germany and the British Government's indifference to the fate of the experiment. The focus of interest in this country was the upholding of international law, not the crushing of Italy. There was no thought of her as a possible imperial rival, and comparatively little hostility. Italy, somewhat understandably, took another view. Sanctions was a hypocritical plot to prevent her competing in the imperial field, a desperate endeavour on the part of the old imperialist Powers to enforce their monopoly. The country emerged from the ordeal in a state of mind which must be fully understood if we are to see the significance of her present position.

On the one hand, her hostility towards France and Britain and her desire to turn them from the Mediterranean were enormously reinforced. On the other, their startling failure to make their policy effective encouraged Italy to believe that their day was over and that they were empires in decline. Since 1936 our *decadentia pluto-democratica* has been so widely advertised that the Italians have come to believe in it. And it must be admitted that the Allies' policy has given the propagandists some valuable assistance. Once her fear of isolation and her need of reinforcement in Spain had driven Italy into the arms of Germany and the Axis had come into being, Italy was offered the intoxicating spectacle of her two great Mediterranean rivals in steady retreat. In the Rhineland, in Spain, in Austria and finally and most devastatingly in Czechoslovakia, the Allies suffered a series of political setbacks so serious in their cumulative effect that by the end of 1938 Italy appears to have believed that Axis pressure

would secure without fighting a transfer of power in the Mediterranean. No other belief can have underlain the “Tunis, Corsica, Nice” outburst or the open canvassing in the Italian Press for a “Mediterranean Munich.” The Allies appeared to be in full retreat, and their conciliatory policy—the gentlemen's agreement and Mr Chamberlain's letter in 1937, the Anglo-Italian pact and France's offer of a general understanding in 1938, Mr Chamberlain's post-Munich visit to Rome in January, 1939—convinced Italy not of their good-will but of their weakness, while, in that spirit of contradiction which distinguishes Italy's attitude towards the West, their consolidation of friendly relations with Turkey and the guarantees to the Balkans were loudly denounced as “encirclement” and “power politics.” France and Britain were at once imperialists and decadents, warmongers and pacifists, a deadly threat and a spectacle of impotence.

These, then, were the unsatisfactory relations existing at the outbreak of war. It is still a matter of conjecture why Italy did not at once enter the conflict at the side of her ally, but from Count Ciano's speech of December 16th

last it is possible to deduce that the chief reason was unpreparedness. At Milan and again at Salzburg, Italy made it clear that she was not yet ready to fight, and even mentioned a three-years' delay. The sweeping changes in the Italian Government which took place in October were connected with such matters as low reserves, lack of military stocks, and tardy reorganisation in the Services.

Another reason may very well have been pique in that Germany, in her violent career of aggression, had left no time for the looked-for “Mediterranean Munich,” and Italy was not anxious to join in a war for Poland when her immediate

aim was Tunis—without a war. But her abstention meant no fundamental change in her attitude towards the Western democracies, and they in their turn did little to convince her that her attitude had been mistaken. The quick destruction of Poland, the Finnish war and the general passivity of the first phase tended to confirm Italy's low opinion of the Allies' fighting power. Their overtures to her, their concessions, their attempts to make her “non-belligerent” economically worth while increased her suspicions of their imperial strength. On the other hand, the Treaty with Turkey, with its provisions for “the maintenance of peace” in the Mediterranean, the massing of a great army in the Near East, and, above all, our contraband control, were as many irritating reminders of the reality of our hold on the Mediterranean.

In spite of the “holdback guarantees” and the navicert system, which reduce the actual searching of Italian ships to a minimum, the Italians feel it intolerable to have to pass through our controls at Gibraltar and Suez when entering *Mare nostrum* or to be invited to stop at Malta on their way to Italian ports. There is another difficulty. We expect neutrals to accept our contraband control as a means to a victory which will be as much to their advantage as to our own. But Italy is Germany's “non-belligerent” ally. If she is interested in anyone's victory it is Germany's. Acceptance of our contraband control thus puts her in the paradoxical position of helping to defeat her own apparent interests. She does not resent the control less on that account.

There is thus nothing in Italy's recent relations with

the West to suggest that she will remain permanently neutral. She resents our presence in the Mediterranean and she has come to have serious doubts on our powers of remaining there. This general attitude, however, throws little light on her immediate intentions. The crucial point may well be our contraband control. Since the Brenner meeting the system of "holdback guarantees" has been working less satisfactorily, and more leakages of goods to Germany occur, a fact which may entail a greater use of the right of search. Behind this particular aspect of the blockade lies the general necessity of making it more effective, a problem which is peculiarly delicate *vis-à-vis* Italy. In the last six months her war reserves have been greatly reinforced. Her purchase of certain war materials have exceeded the level of previous years to a serious extent. We can perhaps accept her guarantee that the excessive purchases are not being passed on to Germany, but since she openly promises intervention and that intervention can only be directed against us, it is certainly a curious situation in which we stand passively by and watch a hostile power stock herself to the point at which she feels ready to strike. Yet any action on our part might precipitate a conflict we have shown every anxiety to avoid.

The problem of intervention does not, however, solely concern our relations with Italy. We have to take into account the possibility of German pressure. Had the Norwegian *coup* been immediately successful, Germany might have suggested intervention on the grounds of an immediate Allied capitulation. Now that Norway is developing into a major campaign, the Nazis may need a diversion elsewhere and so press for intervention on that account. And even if Italy were unwilling, it is possible that she could not afford to allow Hitler a free hand in the Balkans and would be obliged to march at his side in order to safeguard her own interests.

There are, however, a number of grounds to suggest that Italy will continue in the way of caution. So long as the issue is undecided, she stands to gain by neutrality and the waging of the war itself would be a tremendous risk. It is hard to base an estimate of the outcome on comparative military strength, for so many vital problems—the effectiveness of air power against sea power, the extent to which the vulnerability of a long coastline can be offset

by air action, the results of intensive submarine warfare in closed waters—are still unresolved. But it would be folly to under-estimate Italy's military effectiveness. With an army which can be quickly raised to 4 million men, a front line air force of 1850 'planes and a navy which has concentrated on speed and agility and is especially adapted to Mediterranean conditions, Italy would be an adversary to be reckoned with, even though her accessibility and vulnerability would lay her open to a type of attack which cannot yet be launched against her ally, Germany.

It is in the economic sphere that Italy's problem is almost insoluble. The campaign for autarky and the repeated assurances of its complete success have lulled the Italian people into false security. Their war economy is, in fact, vulnerable not only by what it lacks but also by the ease with which—at Suez and Gibraltar—its vital supplies could be cut off. War stocks would carry the country through a short war, but not even Hitler can promise the Italians that. Naturally, the reminder of our potential stranglehold exasperates Italy. It reinforces the feeling of being a prisoner in the Mediterranean. It may therefore lead not to peace but to war in a desperate attempt to break the "foreign servitude."

The tragedy of the present situation is that the two facets of Italy's attitude towards the West are both based on a misunderstanding. It is not true that we are weakly prepared to surrender our heritage without combat. A policy based on this assumption must lead Italy astray. It follows that our repeated attempts at conciliation in the face of repeated rebuffs spring not from fear but from genuine good will. Italy is therefore equally wrong when she pictures us as imperial rivals. In the words of M. Reynaud in his latest conciliatory advance, we are "in search of a Mediterranean understanding which . . . constitutes one of the indispensable bases of peace." Perhaps it is too much to hope that Italy can still revolutionise a manner of thinking which has been slowly created during the last twenty years, and it would entail a revolution indeed to look on the West as friendly and powerful rather than hostile and weak. Nevertheless, it is our duty to continue to impress both our present strength and our ultimate friendliness upon her, a task as delicate as it is vital to Mediterranean peace.

Food Policy

THE war has given the subject of food an even greater interest than it normally attracts. Housewives are concerned at the rise in prices of most foods; the Cabinet has recognised the importance to industry of a stable cost of living and has provided a subsidy of £50 millions a year to cheapen bread and meat; the Ministry of Food buys, sells and distributes most staple foods and has been more successful in maintaining a high level of supplies than a stable level of prices; the publicity department of the Ministry of Agriculture is working overtime to persuade farmers to plough more land and to grow more crops. The Government's activities, however, appear excessively departmentalised, and even the Cabinet has got no further than its subsidy towards a national food policy. What, in fact, are the functions of the Ministry of Food? Should it be authorised to cut down civil consumption of food to the minimum by rationing and high prices? Should consumers be dragooned into eating only those foods which are largely home grown? Should the Ministry attempt to supply foods in the same quantity and at the same prices as those available in August, 1939? Should it go further and try to improve the diet of the poorest classes, whose expenditure on food, even at pre-war prices, was admittedly inadequate to maintain full health and efficiency? At present, the Ministry seems to be aiming at the third of these objects; the subsidy for meat and bread prices was expressly provided to prevent a further rise in the cost of living. Rationing and diversion of food consumption from imported to home-grown supplies seem to be regarded as necessary evils, to be excused and apologised for.

The Chancellor of the Exchequer, in his Budget speech, stressed the need for reducing civilian expenditure in

general and in particular that on imported goods. Clearly the Ministry of Food could help considerably in attaining these objects. The diet of the upper and middle classes in this country could be simplified and cheapened without any falling off in health, even if the range of choice was narrowed. If, in fact, the nation was a uniform social unit, a moderate rise in the price of those foodstuffs for which the demand is elastic and a drastic rise in those considered unessential would do the trick. But such a policy is impossible in our existing society. A rise in prices necessary to reduce the expenditure of the upper classes would reduce the poorer to starvation, unless wages were linked to the cost of living; in that case, which is to-day largely true, a rise in prices of staple foods defeats its own ends and causes also much discontent.

Consequently, while higher prices may be a useful ally they cannot form the Ministry's sole weapon in the battle against unnecessary expenditure. As a method of discrimination between classes, direct rationing is more effective. A meat allowance of 1s. 10d. or a quarter of a pound of butter per head per week does not affect the poorer housewives, who cannot afford such quantities; it does not affect the cost-of-living index, while it does directly cut down the expenditure of the more wealthy. The main difficulty of rationing is the expensive machinery needed to operate and enforce it; consequently, it is best kept for those few foods which are semi-luxuries of fairly wide consumption. And, if need arises, the machinery can be used to spread equally any real deficiency in one particular food.

If necessary, people could be kept in health and efficiency (if not in contentment) on a diet of vegetables (particularly potatoes), milk, butter or vitaminised margarine

oatmeal, brown bread and cheese; a little fish, meat, sugar, fruit and tea might be provided to relieve the monotony. Sir John Orr urges* that we should all be put immediately on to this diet. The nation's health probably would be improved, and the adverse balance of trade certainly diminished, but such a radical and abrupt change in habits might have psychological reactions very unfavourable towards a vigorous prosecution of the war. It would certainly be a hard blow for farmers both in this country and in the Dominions whose agriculture has been developed on a free entry to the British market of large quantities of meat, fruits and luxury foods.

But if the policy as a whole is too drastic, the actions of the Ministry of Food should certainly tend in this direction. The consumption of meat, for instance, an expensive item to import, could be steadily reduced by rationing until it equals the amount which British farmers can produce from roots and grass (fresh in summer and preserved in winter), together with the minimum amounts which we can persuade the Dominions and other sterling-area countries to send. A subsidy to keep down meat prices should, therefore, be combined with strict rationing to ensure that consumption is not increased. It should certainly not be combined—as it is at present—with an increase in the financial inducement offered for the production of home beef. And the production of potatoes and other vegetables should be stimulated in every way, so that consumption can be directed on to them and away from competing imported goods. Farmers are chary of increasing their output of these crops, since, with normal yields, home production of most vegetables is in the marketing season almost sufficient to supply the demand at prices which they consider profitable. Consequently they fear a glut, in spite of the promises of Mr Morrison and Sir Reginald Dorman Smith about potato factories and "appropriate" prices. Neither of the two Ministries seems to have grasped that an appropriate level of wartime prices for vegetables is that level at which the largest possible production can be fully absorbed; if this level is unprofitable for farmers, the subsidy now paid on meat might well be transferred. The production of meat should probably be slowly diminished and the prices paid for livestock by the Ministry of Food should certainly be adjusted to stop entirely the production of early spring lamb and of highly finished beef carcasses.

* "Feeding the People in Wartime." Orr and Lubbock. Macmillan. 1s. 6d.

The Budget Accounts

IN presenting his first full-year Budget of the war, Sir John Simon did not attempt to deviate from the classic formula of describing first the results of the past financial year, then the estimated expenditure of the current year and how far revenue on the existing basis of taxation would go to meet it, and finally the proposed changes in tax and other revenue.

The emergency Budget of last September provided for a total ordinary expenditure of £1,933 millions. Of this, defence—or rather war—expenditure was to account for £1,249 millions (including a vote of credit of £500 millions), against an April Budget estimate of £620 millions (including issues under the Defence Loan Acts). In the event, actual issues in 1939-40 were £116 millions less than the estimate, largely owing to the underspending of the vote of credit by £91½ millions. As revenue brought in £54 millions more than the September estimate, the deficit was only £768 millions instead of £938 millions—a book-keeping nicety from which small comfort can be derived in time of war.

On turning to the current year, the Chancellor presented an estimate for war expenditure which he admitted was mostly guesswork. It is to be hoped that his guess errs badly on the low side, for the figure he gave of £2,000 millions is only £500 millions higher than the rate of war expenditure in the first seven months, which, as has been pointed out, was itself below the estimate made at the beginning of the war.

In war we cannot afford quality; we must concentrate on that quantity of meat which can be grown without the extensive use of imported feeding stuffs. And if farmers are to be bribed, persuaded and compelled to alter their cropping system to feed more humans and fewer animals, the Ministry's attentions should also be directed towards a reform in the distributive system. War, with its accompanying shortage of labour, should make it easier for the Ministry of Food to embark on schemes of cheap distribution of milk and vegetables.

Can such a policy of limited consumption and increased home production serve at the same time to improve the diet of the underfed? Sir John Orr, in his latest book, says that it could. By subsidies, the prices of milk, potatoes, oatmeal, vegetables, bread, margarine and sugar could be held at such a level that even the poorest could buy sufficient for health. Sir John estimates that such subsidies on these seven foods would cost about £100 millions per annum. But even half that amount—the level of the existing food subsidies—if spent in providing cheap potatoes and oatmeal and cheap milk to all children and expectant mothers would cause a great improvement in health. The experiments already made in schools and in the distressed areas with cheap milk and potatoes show how surprisingly far people will modify their habits to take advantage of low prices.

As a first step in a national food policy, therefore (a step which should have been taken last September), the home production of vegetables and milk—the two foods which combine the advantages of being nutritionally valuable and produced at home in sufficient quantities to meet the demand—should be increased by every possible method. These can then be sold at a price which will ensure their absorption. Consumption of the less essential foods can be adjusted by prices and by rationing to the level of supplies, which, in turn, will be dictated by the competing demands for land, labour, ships and "hard" currencies. Housewives must be guided by intelligent and purposeful publicity towards those foods which are cheap or seasonally plentiful. Abrupt and compulsory changes in diet should, indeed, be avoided, since they are apt to lead to both indigestion and resentment. But a consistent policy of guided production, selective prices, discriminatory rationing and forceful propaganda could by next year have saved some dollars needed for munitions, much purchasing power for investment in War Loans, and might, as well, have started a steady improvement in the nation's health.

Having given his estimate of war expenditure, which is the crucial part of the whole Budget, Sir John briefly dismissed the other items of expenditure. He has maintained the fixed debt charge at £230 millions in spite of the fact that it was insufficient last year to pay the statutory sinking funds, in spite of the prospective and actual big increase in borrowing and the doubling of the tender Treasury bill rate; he was able to do this because of the set-off arising under the Defence Loan Acts by which the Defence Departments pay interest at 3 per cent. each year on the amounts borrowed by them under the Acts in previous years. In addition to this arrangement, under which £15 millions more will be available this year than last, he could take into consideration the saving in interest by the conversion of the 4½ per cent. Conversion Loan, and he assumed that future borrowing would not cost more than 3 per cent. A reduction on last year's issues of about £9 millions in civil and revenue estimates to £420 millions brings the total ordinary expenditure to £2,666,790,000.

In accordance with tradition, Sir John then showed how far short of this figure revenue on the basis of existing taxation would fall. This year the analysis seemed more than ever academic, for not only was it known that the gap was enormous, but it was also clear that even heavy tax increases would only close it a fraction and the most eagerly awaited Budget pronouncement—the rate of income tax—had already been revealed in September. The

Chancellor had then announced that in a full year he proposed to raise the standard rate to 7s. 6d. He had also incorporated in that Finance Act the raising of the reduced rate of tax to one-half of the standard rate, with an increase in the zone to which the reduced rate applied from the first £135 of taxable income to the first £165; a reduction in the exemption limit from £125 to £120; a reduction in the earned income allowance from one-fifth of such income to one-sixth; and reductions in the personal allowance for married taxpayers from £180 to £170 and in the allowance for children from £60 to £50 for each child. All these changes now come into force, and together with the rise in the rate they are estimated to increase the yield of income tax this year by £42½ millions and in a full year by £61¼ millions.

Surtax was increased in the September Budget and the rates have been left untouched. But the zone over which it operates is determined a year in advance, and Sir John announced that the surtax payable in 1941-42 on incomes of 1940-41 will operate on incomes of over £1,500 a year instead of £2,000 as at present.

Indirect taxation has been increased by heavy additions to the hardy annuals—the duties on beer, spirits and tobacco. The beer duty is to be increased by the equivalent of 1d. a pint, the spirits duty by 1s. 9d. on a bottle of whisky and the tobacco duty by 3d. an ounce. These increases will produce together £42,500,000 this year, and with the proposed doubling of the match duty—equivalent to an increase of ½d. on a box of 50—will mean a total increase in indirect taxation of £46 millions in 1940-41 and £52 millions in a full year.

These are the only increases in taxation that are to come into force this year. But as in the last war, the Post Office is to contribute to revenue. The inland letter rate will go up to 2½d. for two ounces; for postcards the charge will be 2d.; and there will be corresponding increases in the rates for printed matter, newspapers and imperial and foreign letter posts, but the rate for parcel

post at home and abroad is unaltered. The poundage on postal orders will be raised by ½d. on orders of 1s. 6d. to 2s. 6d. inclusive, and 6s. to 15s. inclusive. Telephone charges will be subject to a general 15 per cent. increase with rises in the cost of trunk, toll and other calls and of telegrams. The Post Office Fund is exhausted, and for the time being the whole of the Post Office revenue will be taken into the Exchequer. On the basis of the new charges this will bring an extra £12½ millions this year.

The Chancellor then disclosed his one new tax, the purchase tax, which is discussed in detail on page 767, and will take the form of a percentage on the price at the stage when the wholesaler sells to the retailer. As neither the machinery nor the rate has yet been decided, it cannot enter into the Budget Accounts, and we are left with a total ordinary revenue of £1,234 millions—an easy figure to remember, but which leaves a deficit of £1,433 millions.

It is here that the classic formula has been abandoned. Tradition dictated the budgeting of a formal surplus even when a large part of defence expenditure was met by borrowing. Now, however, this pretence has had to go, and the Chancellor had to conclude his speech with a discussion of ways and means of borrowing. He rejected Mr Keynes's proposals because they would damage voluntary saving, on which he intends to rely and which he is encouraging among the wage-earning classes by exempting from the means test any war savings up to £375. But an element of compulsion has been introduced by the limitation of the dividend distribution of public companies to the rate paid in any one of three pre-war years, which has the dual purpose of restricting consumption and encouraging the investment of undistributed profits in Government loans. With E.P.T. and N.D.C., together estimated to bring in £70 millions this year, and the limitation of dividends, the Exchequer will probably be getting the maximum contribution from industry. It is difficult to see how private voluntary saving can fill the gap that will be left even on the present low basis of expenditure.

NOTES OF THE WEEK

Hostilities in Norway.—Details of the campaign in the new Norwegian theatre of war are still obscure, and probably only the post-war historian will be able to chart its course with any confidence. It is reasonably sure, however, that the Allies' counter-blows have been delivered swiftly and shrewdly enough to hinder the Germans in taking full advantage of their surprise attack; and the resistance of the Norwegians themselves has apparently been notably stiffened by the arrival of the British and French forces. The Germans are well established in the south; they claim to be in complete control of all the area between Oslo and Stavanger; and they hold the country eastward from Oslo to the Swedish frontier. In the north they are installed in Trondheim. The aims of the campaign are this far clear; the Germans are trying to link up the territories they hold (Oslo and Trondheim) by winning control of the two north-south valleys through which the railways run—the Gudbrandsdal route

north via Hamar, Lillehammer, Dombas and Stoeren to Trondheim, and the Oesterdal route to Stoeren via Elverum, Koppang and Roeros. The Allied forces, landed (among other places) north of Trondheim at Namsos and south-west of Trondheim near Molde and Andalsnes on Romsdal Fiord, are trying to prevent this operation. From Namsos, Allied troops, moving directly on Trondheim along the north-eastern spur of Trondheim Fiord, have apparently been checked by combined land, air and naval action from the flank near Steinkjer. From Andalsnes, light Allied forces seem to have advanced with remarkable speed via Dombas into the Gudbrandsdal to meet the Germans moving north from Oslo and Hamar near Lillehammer; and further east in the Oesterdal, where the Germans have apparently pressed forward considerably north of Elverum, Allied forces are collecting south-east of Trondheim to stop their progress.

So far, the Germans retain the initiative. In the two key valleys the twin junctions of Hamar and Elverum are in their hands; their grip on southern Norway is fast; and their hold on Trondheim will be difficult to loosen. But their only route for troops and supplies to Trondheim—as to Narvik in the far north—is by air, and if they can be prevented from forcing a passage through the Gudbrandsdal or the Oesterdal, they must lose Trondheim and the north in time. The fact that they have not estab-

lished land communication between Oslo and Trondheim is almost certainly a setback; and they have failed to secure control of the railway due east from Trondheim to Storlien on the Swedish border, because of stout Norwegian resistance at the fortress of Hegra. Indeed, the rôle of the Norwegians at every point, in the Gudbrandsdal, in the Oesterdal and all around Trondheim, is to delay and harass German operations until the Allied forces can be sufficiently strengthened to cut and hold the north-south waterways. The greatest obstacle to Allied plans is the Germans' superiority in the air. It is reported that Namsos harbour has been rendered scarcely tenable by bombing—though the Navy itself has apparently suffered only slightly despite daily raids. Dombas has been bombed constantly to check the flow of troops into the Gudbrandsdal and Allied lines of march have been subjected to incessant attack from the air. That is why a major feature of operations has been attacks by the R.A.F. on German air bases in Norway and Denmark. So far, the Allies have no Scandinavian air bases of their own, which they must secure if their attack on Trondheim is to be pressed home and if their recent check near Lillehammer is not to be extended. Meanwhile, the possibility of the Germans seeking new avenues of attack and supply from an invaded Sweden is ever-present, and stories of troopships moving towards the Aaland Islands and the Gulf of Bothnia are widespread. It is this possibility that gives the west-east railways from Narvik and Trondheim into Sweden a special strategic importance.

Lull or Checkmate?—There remains the question whether the signs of new energy among the smaller neutrals will have the effect of modifying Hitler's plans of aggression. It is difficult to answer, for the simple reason that no one yet knows where and when the next blow will fall. The conversion of Norway into a major campaign makes a diversion elsewhere more rather than less likely, and if the activity of the Quislings of Sweden and Yugoslavia is any indication of Hitler's intentions, it may be that these two countries are singled out for the next attack. Yet anxiety in the South-East is not as acute as it was a week ago. Many of the German "tourists" have been expelled; Britain has allowed her interest in the Yugoslav situation to become known in circles where such knowledge could have a salutary effect; Turkey is acting as a stabilising influence on her immediate neighbour, Bulgaria; Roumania has packed off Dr Clodius with very few concessions and glad to have even preserved the economic *status quo*; and finally, the news from Italy is rather more encouraging. The garrison in Albania, which stands at 68,000 men, is not big enough to cause heart-searchings across the frontier, and although the violent anti-Allied Press campaign continues, the Balkan countries have the impression that Italy is watching the news from Norway with a rather sober attention. In his recent speech Signor Mussolini gave Italy the watchword "Work and arms," and Italy's neighbours to the South-East remember with some relief that in the past the Duce has usually associated work with peace.

It is therefore to Scandinavia rather than the Balkans that interest is directed at present. The Swedes have passed an anxious week. It is announced that the German Minister presented a request to the Swedish Foreign Office requesting the passage of German troops and armaments to Norway. If so, he was answered by the Swedish Government's determined announcement that no such permission would be granted to any belligerent. There followed a series of violations by German planes of Sweden's air. One plane was brought down by a Swedish fighter, and is reported to have contained evidence that the purpose of the flight was to obtain photographs of the Swedish terrain. Sweden immediately delivered a strong protest in Berlin. On April 23rd rumours of activity in Germany's Baltic ports and of the departure of troopships caused fresh alarm in Sweden; everything, however, indicates the Swedes' resolute spirit and their determination to be spared the fate of Denmark. If invaded, there is no doubt that they will fight back. We may recall Mr Chamberlain's statement: "Nothing will save them [the neutral States] but a determination to defend themselves and to join with others who are ready to aid them in their defence." To-day the will for self-defence is present from Narvik to the Hatay. Were the equally binding necessity of collective defence as freely recognised, none of the smaller neutrals would stand in their present state of jeopardy.

* * *

The Kremlin Looks On.—Russia's attitude to the war remains an unsolved riddle. The Norwegian campaign has brought the fighting once more within measurable distance of her zone of interest, and the meagre news on the matter points to the likelihood that there exists no joint Russo-German scheme for dividing the sovereignty of Scandinavia. Reports from Sweden even suggest that the Swedish Government has received discreet backing from Moscow in taking a strong line with the German demands for free passage (if they were ever made). The rumoured concentration of the Russian fleet off Hangö may mean an added reinforcement to Swedish independence or merely a counter-measure in case of a German occupation of the Åland Isles. In the Balkans, too, Russia appears to be taking an independent line, and the announcement of forthcoming trade talks with Yugoslavia (whose Government has so far refused Russia diplomatic recognition) is sufficiently unusual to have revived talk of pan-Slavism and of a joint Bulgaro-Yugoslav (or South Slav) bloc under Russian leadership. This possibility might mean that Germany and Russia have come to terms over the division of Roumania, or alternatively, that Stalin has decided to put a stop to Hitler's Balkan advance. In all these obscurities, the attitude of Turkey is a useful guide to the maze of power politics. From the time of M. Sarajoglu's fruitless visit to Moscow last October until the end of the Finnish campaign, Russo-Turkish relations were described as "correct but cold." Only a week ago, however, Ankara let it be understood that a touch of the old cordiality was returning. This fact suggests that Turkey at least has no fear of Russia's aggressive intentions in the Balkans. If a judgment can be risked on a subject as essentially hazardous as a Dictator's intentions, it is perhaps possible to suggest that Germany's hopes of Russian collaboration are already suffering the setback which the end of the Finnish campaign was bound to bring; in which case, the British Government's decision to welcome in principle the opening of trade negotiations with Russia has probably come at the right moment. It is obvious that we shall need safeguards to ensure that we do not begin supplying Germany *via* a Russian intermediary, but if some sure safeguard can be secured, then it is obviously in our interests to see that no Russian supplies reach Germany which could be diverted to ourselves.

* * *

More Quislings.—The purge of Quislings and Fifth Column men in most of the neutral countries of Europe still continues. The Norwegian experience has given other

governments useful hints on procedure, while the arrival of Allied troops in Norway has created the necessary atmosphere of confidence in which to put the hints into legislative form and executive practice. Switzerland, for example, has issued a decree particularly warning all citizens, in the event of invasion, to take no notice of any broadcast announcement that the Government has resigned and telling soldiers to go to their appointed posts whatever counter-instructions they may receive. Thousands of aliens have been interned in Belgium. The Dutch have extended their state of siege to cover the Press, which from Saturday next will come under strict military censorship. The greatest activity is, however, apparent in Yugoslavia and Sweden where, during the last week, the danger of invasion has appeared greatest. Yugoslavia has taken energetic measures against her German "tourists," and the purge of Yugoslav suspects has included two such notable figures as M. Stoyadinovitch, the former Prime Minister, and M. Atchimovitch, a former Chief of Police and Minister of the Interior, while the ruthless elimination of Quislings from the State police is reported to have brought valuable (and sensational) evidence to light. Sweden's precautions were taken on the morrow of the invasion of Norway, but have now been extended to include the evacuation of all foreigners from Northern Sweden, a veto on the sale of maps, and a number of raids on the local Nazi organisations. How effectively Hitler's spy rings have been scotched it is impossible to say, but at least a part of the Nazi's vast underground work of espionage and sabotage will have to begin again "from the ground up" before the efficiency of a fortnight ago is restored.

* * *

Terms of Requisitioned Ships.—War inevitably brings Government intervention and control in many industries, and in the main the present Government's policy has been to proceed by agreement with, and through the medium of, the representatives of the industry. Shipping, however, has been an exception to the rule of willing agreement. The shipowners did not welcome the policy of requisitioning ships, as distinct from licensing them. And the settlement of compensation to be paid for requisitioned ships has led to protracted and difficult negotiations. Last month there was still a margin outstanding between what the Government offered and what the shipowners would accept; in the standard case of an 8,000-ton tramp the two figures were 5s. 9½d. and 6s. 3d. a ton deadweight per month, the Government taking the responsibility for war risk insurance. Last week agreement was reached (though with reluctance on the owners' side) on a figure of 6s. This figure is compounded of three elements. First is the assessed current cost of running the ship, which would appear to have been calculated on a basis sufficient to provide rather more than peacetime profit. Second, there is an allowance of 5 per cent. for interest on capital, and, third, a further allowance of 5 per cent. for depreciation and obsolescence; both these are calculated on capital value, to be independently determined. The crux of the matter lies in the provision for obsolescence. Shipowners have memories of the cost of shipbuilding after the war, and they wish for sums large enough to insure them against a similar rise this time and against being outbuilt by neutrals, who are meanwhile reaping a good harvest. But any attempt to provide now for the cost of rebuilding in an unpredictable future is clearly impossible. The only way of being fair to the owners and the community alike would seem to be to evolve some scheme by which every ton sunk or grown obsolete during the war will be replaced by an equivalent ton after the war. This could be done on a ton-for-ton basis, by which shipowners were credited, not with so many pounds sterling, but with so many tons out of the post-war programme; or if that were thought too radical, an alternative solution would be to pay obsolescence allowances at a rate appropriate to the pre-war level of costs and values, to credit them to a fund and increase the total amount at the end of the war in proportion to the change in the cost of shipbuilding. To follow the present plan of trying to guess at an appropriate figure is sure to produce one that is unfair either to the country or to the industry or perhaps to both at once.

Fifth Columns and the Fourth Estate.—In November last year, when the immediate fear of a sudden assault upon these islands from the air had somewhat faded, a notable victory was won in Parliament. Powers to prevent all attempts to influence opinion and to restrain all manner of publications quite arbitrarily had been given to the executive in the first Defence Regulations of the war. Parliamentary protests, based upon the sound view that democracy must not commit suicide in self-defence, secured a change in the Regulations. The fundamental rights of appeal and legal trial were restored; the principle that restrictions should only be imposed upon opinion in cases of strictly proven necessity was re-established; and the return to the rule of law, which, far more than Parliaments or suffrage methods, is the essence of democratic ways, was generally welcomed. Since then a growing nervousness has weakened the courage of British convictions. Saboteurs, military and political, have sucked at the strength of Germany's neutral neighbours. The fall of Norway was engineered by traitors from within. And, in Britain itself, tales of information handed to the enemy have been accompanied by indiscreet outpourings from the supporters of peace at any price, whose moral and religious opposition to warfare has been dangerously allowed to become overlaid, in their printed and spoken views, by bitter political animus against the conduct of this particular war.

* * *

In consequence, a demand for the repression of all opinions opposed to war has appeared. A section of the Press, in its opposition to the Nazis, has gone all Nazi. A return to the *lettres-de-cachet* Regulations of September is wanted by some Members of Parliament. The internment of all aliens, whatever their record, is called for, regardless of the fact that Hitler's spies and Quislings in other countries seldom bear German names or are of German origin. The suppression of all pacifists, regardless of Mr Chamberlain's pre-war pledge that sincere conscientious objection to war would always be treated tenderly, is demanded. The re-examination now going on of uninterned aliens is politic; the exclusion of aliens from port areas is just common sense; the constant attempt to seek out enemy propaganda in the ingenuous propaganda of anti-war advocates is wise; the stronger powers against demonstrably subversive activities that Sir John Anderson is to discuss with representatives of opposition parties may be needed. But the fact still remains that the fundamental difference between Britain and Nazidom, the difference for which above all the people of this country have gone to war, is epitomised in the treatment of aliens and pacifists. It will be nothing but a clear sign of unjustified alarm and weakness if arbitrary and indiscriminate action is taken simply to suppress a meagre minority. The fact that the influential Press, after permitting some concessions to hysteria, now explicitly appreciates this point is a bull-point for freedom; and, when the supporters of peace themselves, above all in their own Press publications, learn to distinguish more intelligently between liberty and licence, the danger of stupid repression will be appreciably lessened.

* * *

Censorship and Information.—The common-sense changes in the censorship, announced by the Prime Minister on Wednesday, had been generally expected ever since Sir John Reith became Minister of Information. The secession of the Press and Censorship Bureau from the Ministry last October to become an independent unit was due rather to the vices of the Ministry than to the virtues of the new dual arrangement; and it has always seemed more reasonable that the Minister of Information should himself be responsible for the Bureau's work of giving news to and censoring the Press. The Ministry of Information will now resume these functions, and Sir Walter Monckton, formerly head of the Bureau, will become Deputy Director-General in the Ministry. The undoing of last autumn's sweeping decentralisation will be carried still further. The Department of Postal and Telegraph Censorship, formerly under the War Office, is also to be transferred to the Ministry of Information. Co-ordination between publicity in neutral countries, done by the Ministry, and enemy pro-

paganda, watched over by the Foreign Office, will be secured by the appointment of Sir Walter Monckton, Janus-headed, to be an extra Deputy Under-Secretary of State for Foreign Affairs. By this oddly ingenious arrangement, which seems to depend to a precarious extent upon the tact and imagination of a single individual (though it is a tribute to Sir Walter's qualities that most people believe that it will work), two much criticised and somewhat maligned bodies, Chatham House and the British Council, will emerge some way from the shadowy irresponsibility in which they have spent the last six months. It will now be possible for Sir John Reith and Sir Walter Monckton to deal impartially with all instances of overlapping and duplication in the collection or distribution of information—*inter alia* with what *The Times* has happily called "the whole mustard club of digesters." But these changes are merely administrative. In themselves they mean only more efficient organisation. The root question of policy is still undecided. Who, in the last resort, is responsible for deciding what news shall be made public and when? According to Mr Chamberlain's statement, the Defence Departments will remain responsible for censorship "in all matters where it is necessary to prevent information from reaching the enemy"—"subject to advice from the Ministry of Information on general censorship policy" and with the aid of specially appointed representatives from the Ministry in each department. The expert opinion of the Services must, admittedly, always count for most in such matters, and the new provisions for liaison with the Ministry should smooth the censorship's working. But someone must have the last word in disputed decisions, and it is difficult to see where final authority should reside, under the War Cabinet, if not in Sir John Reith himself.

* * *

The Purchase Tax.—The new Purchase Tax, foreshadowed in the Budget speech is a novelty in British fiscal legislation, and has no exact parallel in any other country. Its distinguishing feature is that it is to be levied not, as is usual, at the stage of retail sale, but at the wholesale stage. The reason for this is obviously administrative convenience. A universal sales tax, levied on everything sold in a shop, might be administratively feasible, but a tax which, like this, is to be levied only on some goods would pose problems that the shopkeeper might find beyond his power to decide or the State's power to control. The mechanism of the Purchase Tax is to be the compilation of a register of wholesalers, and the tax will fall whenever there is a sale (except of exempted goods) by someone on the register to someone off the register. This is an ingenious device to get over the major difficulty of such a tax; but it leaves many knotty points of definition behind. What is a wholesaler? How, in border-line cases, are the exempted goods (food, drink, exports, "articles already subject to a heavy duty, such as tobacco or

petrol" and all services) to be defined? What provision will be made for rebate on goods exported by an unregistered person? For answers to these questions we must wait at least until the text of the Bill is issued, and perhaps much longer.

* * *

The Chancellor gave no indication of the rate at which the new tax is to be levied, but a first approximation to the yield can be given by an estimate of the volume of sales on which it will fall. According to the most recent estimate of national expenditure (that compiled by the London Press Exchange on the basis of Mr A. E. Feavear-year's original figures), the total amounted to £4,820 millions in 1937. Of this total, however, services accounted for £1,990 millions, leaving £2,830 millions for retail sales of goods. The composition of this last figure was as follows:—

GOODS TO BE EXEMPTED FROM PURCHASE TAX

(£ millions)

Foodstuffs	1,360	
Drink	260	
Tobacco.....	160	
Petrol and oil	25	
Coal.....	65	
		1,870
GOODS LIABLE TO PURCHASE TAX		
Groceries	37	
Women's clothes	168	
Men's clothes.....	143	
Boots and shoes.....	70	
Piece goods	67	
Furniture	118	
Hardware.....	75	
Drugs, fancy goods	148	
Sport and travel goods	34	
Cars and cycles	50	
Newspapers	50	
		960
Total retail sales		2,830

The sums that could be got from such a tax are, therefore, in the context of war finance, not large. A levy at the rate of 10 per cent. of the retail value (2s. in the £) would produce less than £100 millions; at the rate of 8½ per cent. (1d. in the shilling) only about £80 millions. Since the tax is to be levied at the wholesale stage, the actual rates specified would have to be from a quarter to a third higher. A rate of charge of 5 per cent. of the wholesale value, which has been mentioned in the Press, would bring in only some £30 millions. The new tax will obviously mean a mountain of labour for the Customs and Excise; if it is to be worth while it must be made to produce something less mouse-like than that.

* * *

Votes of Credit.—Following a precedent of the last war, a White Paper has been issued giving some details of the services on which the estimated war expenditure of £2,000 millions will be spent. The only details that are given are of salaries paid in the various Ministries, accounting for only a fraction of the total, but the divisions between the different Ministries of the total expenditure is shown. The main items are as follows:—

	(£'000)
Navy, Army, Air Force and Ministry of Supply ..	1,615,000
Ministry of Food	2,099
Ministry of Shipping (part cost)	382
Ministry of Economic Warfare	432
Ministry of Information	1,883
Ministry of Home Security	96,314
Ministry of Health (War Services)	35,110
Department of Health for Scotland (War Services) ..	4,961
Ministry of Agriculture & Fisheries (War Services) ..	4,775
Dept. of Agriculture for Scotland (War Services) ..	560
Reserve of Plant and Building Materials.....	300
	1,761,816

These constitute Group A of the votes. Group B, amounting to £18,547,500, consists of various war activities of civil departments, which, though accounted for under the votes of these departments (and therefore appearing in the

Civil Estimates), fall to be paid for out of Votes of Credit. Group C, amounting to £73,136,500, consists of a number of services not elsewhere accounted for, including any net loss on the trading of the Ministries of Food (£55 millions) and Supply (£15 millions). Group D is a balancing figure of £146,500,000 to bring the total up to £2,000 millions; it will be used for any excesses over the previous figures.

* * *

The Railways Ten Per Cent.—It was appropriate that this week's hastily-called Commons debate on the imminent increase of 10 per cent. in railway charges should have taken place on Budget Day itself. Expounding his proposals over the wireless on Tuesday evening, Sir John Simon emphasised the Government's wish to keep down prices and the cost of living; and almost simultaneously in the House members were protesting against an increase in the vital cost of transport, decided in secret without the consultation of railway users and upon distinctly doubtful principles of equity. The House is seldom happy in the discussion of railway problems because prejudice and political nostrums are usually allowed to cloud the issue. It is a pity that Tuesday's debate, which in the main avoided these pitfalls, was not more fully reported. Three points were made in criticism; first, that to allow an increase in charges on the basis of increased war costs without also taking into consideration increased war traffics was unfair in every way; secondly, that to absolve the companies from the need to state their case in public before the die was cast in their favour was equally unjust—and contrary to what the Opposition believed the Minister of Transport had promised; and, thirdly, that the increased charges would be unduly burdensome upon traders, travellers and members of the Forces, as well as running directly counter to the proper aim of economic policy in wartime. The Government had no reply at all to these criticisms. It was startlingly revealed in the course of argument that the agreement upon which the railways' wartime finances are to be based is not even yet settled in detail; the Government would not even pledge itself to put out a further White Paper after the agreement's final signature to inform Parliament and the public more fully about it. When all negotiations about railway finance are given the status of official secrets it is natural that the public, like Parliament, should draw their own conclusions.

* * *

Germany's Trade Drive Continues.—It is difficult to give a satisfactory picture of the state of Germany's Balkan trade drive. In Turkey she appears to be making up some of the ground she lost with catastrophic suddenness at the beginning of the war. Turkey, it is true, is refusing to supply chrome or other minerals which could be used in German armament production, but since January each successive temporary agreement has tended to provide for a greater volume of trade. In February it stood at £T5 millions, later at £T7,500,000. A new agreement is now announced, allowing for a figure of between £T13 millions and £T20 millions. The reason for this steady increase is obvious enough. Until recently Germany accounted for about 50 per cent. of Turkey's foreign trade, and Turkey's dependence upon Germany for machines and machine tools was almost complete. Now her need for renewals and spare parts compels her to negotiate. Her plight provides a lesson to all countries heavily engaged in trade with Germany, and Turkey is the first to underline the moral; the Turkish Press has gone out of its way to warn the Balkan countries that Nazi economic methods, whatever their temporary advantage, end in complete economic slavery. Certain reactions in the Balkans suggest that other countries are not blind to this danger. Yugoslavia's willingness to negotiate with Russia may be taken as a counter stroke to renewed Nazi pressure, and there are even rumours that she is demanding free exchange in payment for a number of agricultural exports. In Roumania the situation is more obscure. It is obvious that Dr Clodius has not secured the sweeping success expected by the Nazis. The oil

quota and the exchange rate of the leu remain unchanged, but special terms are to be arranged for an exchange of German armaments for Roumanian oil and wheat, and these terms are said to be favourable to Germany and to counteract the advantage Roumania gained by preserving the existing exchange rate. Whatever the result, Germany has by no means fired her last shot. On the contrary, her trade campaign is still in full swing.

* * *

Shorter Notes

Lord Zetland's speech in the India debate appears to have had a good reception in India. It certainly deserved it, for it was a fair and well-balanced survey of the situation and contained an eloquent appeal to all the great political interests in India to make a new attempt to solve the constitutional problem. Neither the Moslem nor the Congress solutions are acceptable as they stand. The only way is through a compromise which both will accept. But they cannot expect the British Government to find a solution if they contribute nothing to the search.

*

The establishment of the principle that women should have the same pay as men for the same work has gone a step further with the decision of the Industrial Court on the rates of pay for women employed by local authorities as bus conductors. The local authorities argued that women's wages were generally lower than those of men, that absenteeism was greater among women and that the wages of men allowed for their responsibilities as heads of families. The Court's decision that women over 21 should have the same scale of pay and increments as men does not, however, necessarily mean that in wartime all women taking the place of men will be equally fortunate. In the last war,

women bus conductors were given the same pay as men, but this treatment was not extended to industry.

*

It appears to be believed in this country that Trondheim is a German form of the name of Norway's third city and that Trondhjem is more patriotically Norwegian. This is the reverse of the truth: Trondhjem is the Swedish, not the Norwegian, form of the name. Some years ago there was a movement in Norway to abolish foreign names for towns. Christiania—so-called for a Danish king—became Oslo. Trondhjem was changed first to its antique form of Nidaros and then (this change apparently proving too severe) to Trondheim, in which form it is referred to in all Norwegian publications.

*

The Chancellor of the Exchequer gave a definite assurance in his Budget speech that if individual fortunes were made out of the war they would be subject to a post-war levy. This is good news, but it is difficult to understand why he has not given an earnest of his intentions by at least setting up the machinery for the assessment of fortunes as they stood on the outbreak of war.

*

British civil aviation, which was already sadly lagging behind its chief competitors, has suffered another setback by the decision not to start the regular North Atlantic service this year. The reason given is that the aircraft intended for the service are to be diverted for defence purposes. This may explain the postponement, but it does not excuse the Air Ministry for its dilatoriness in the last few years in securing an adequate number of planes for both civil and defence purposes.

THE WORLD OVERSEAS

Poland under German Rule

(By a Correspondent)

ROUGHLY two-thirds of Poland have now been under German occupation for more than six months, and become a territory sealed against the outside world. The only information available comes from German sources. Reports of refugees and the information coming from the Hungarian or Lithuanian border naturally relate to individual experiences of atrocities, food shortage, compulsion and regimentation. There is no doubt, however, that life has become more normal again now. German administrative machinery, as distinct from the activities of the German army of occupation, has begun to operate and the mass of decrees reported daily by the German Press allow some picture to be drawn.

The latest decree, introducing the Four-Year-Plan machinery into the *Gouvernement General*, makes it clear that Poland's resources will be fully exploited for Germany's war economy. The political as well as the economic administration of the German-occupied part of Poland distinguishes between the new German *Ostgaue*, i.e. Eastern Districts of Greater Germany, and the *Gouvernement General*, whose capital is Cracow. The parts incorporated in Greater Germany have been formed into two new *Gaue*, i.e. *Danzig-Westpreussen* and *Warthegau*. The latter *Gau* includes not only the former German province of Posen, but also the district of Lodz, the largest textile centre of Poland—the mills are now working again to one-third of their capacity and the raw material found there will last for 18 months. Polish Upper Silesia has been made a fourth district of the German province of Silesia, and the "Ziechenau" and the

Suwalki areas form parts of the province of East Prussia.

The *Gouvernement General*, on the other hand, is the Central and South-Western part of Poland. It measures roughly 43,000 square miles with a population of 14.5 millions. Among them are two million Jews, 500,000 Ukrainians and 70,000 Germans. The *Gouvernement* has been divided into four districts, i.e. Cracow, Lublin, Radom and Warsaw. The Governor-General, Dr Frank, is chief of the administration, which is divided into several departments resembling the Ministries of an ordinary Government. Some Reich institutions have permanent representatives in Cracow, while the Cracow administration keeps a kind of High Commissioner in Berlin. The *Gouvernement General* has its own customs system, and has retained the Polish currency. Its Budget is separate from the Reich's. Three-fifths of the total revenue is derived from six State monopolies, i.e. tobacco, salt, matches, alcohol, a lottery, and mineral oil. The oil monopoly was added by the Germans to the reconstructed five Polish monopolies. Income tax has been reconstructed after the German model and begins with 1.2 per cent. rising to 60 per cent. of the highest incomes. An excise is levied on sugar, beer and yeast. Railway and postal services have become State property. Official reports maintain that the total number of German civil servants occupying only the key positions in this new administration is 2,500. This does not include the German police, whose chief occupies a position on the same footing as the Governor-General. No information is available about the strength of the German armies stationed in Poland.

On March 1st, the new Central Bank began operations, replacing the temporary *Reichskreditkassen*, which were instituted in September, 1939. The notes in circulation will be gradually replaced, and the cover of the note circulation is to be formed by a kind of global mortgage on the entire land property. It is limited to 3,000 million zloty. During the first months of the occupation the German economic administration confined itself to fixing maximum prices for all goods. After that, compulsory delivery of 80 per cent. of the total harvest of cereals and root crops, as well as food rationing, was introduced. The next step was the introduction of a Central Control Board for the iron and steel industry. With the establishment of the Four Year Plan department in the central administration, the principles of control, and of "steering" industry, finances, and agriculture are being introduced one after the other. The agricultural programme to be carried out will concentrate on an increase in root crops, flax, and oilseeds. The number of horses and livestock, especially pigs, has greatly decreased during the short war, and in the district of Cracow, which is very densely populated by small farmers, even cereals had to be imported from the Reich in order to prevent famine. The only surplus the *Gouvernement* had, namely, in man power, is rapidly being transported for work to Germany.

Conditions in Warsaw are the worst of all. The population is reported to have increased from 1.3 millions to 1.8 millions. The destruction of the town and the primitive system of supply by individual peasants living near Warsaw must have created conditions which are hardly imaginable. There are uncensored reports about fantastic price increases. One kilogram of bread is said to cost 6 zloty. In 1938 the retail price for one kilogram of rye bread amounted to 0.32 zloty. Butter is sold at 60 zloty per kilogram, against 3.50 zloty in 1938. The price for one hundredweight of potatoes is quoted at 100 zloty against 5 zloty in 1938. These prices are obviously paid in illegal trade. Information given in German papers is emphatic about a very strict control of prices, which does not necessarily mean that German authorities are able to prevent a rise in prices, under conditions of a very severe shortage of foodstuffs. Meanwhile, one-quarter of Warsaw's considerable industry is reported to be working again. Public life is, however, still restricted. Cafés and restaurants are working nearly normally, but there are only seven cinemas. Warsaw has been made the centre for the transport of workers to Germany. The total number of Poles to be sent to Germany is intended to reach one million, in addition to the 300,000 Polish prisoners of war already working in Germany. A considerable percentage of them will be employed in German industry, particularly in the coal-mining industry.

For the exploitation of the oil fields, mainly situated near Jaslo, two new companies have been formed. The output of these fields amounted to 150,000 tons in 1938. German papers have become sceptical about an immediate increase in output. There are, however, rumours that the Russians gave the Germans a concession for working the oilfields under Russian occupation, which produced 350,000 tons of oil in 1938. It may be possible that the utilisation of natural gas in this district will rapidly increase. Reports about the repair of destroyed roads, railways, bridges and telephones vary considerably. In the district of Cracow alone three tunnels, 370 miles of railway tracks, 60 bridges, and 3,000 miles of telephone cable have been repaired.

Poland in Germany

The picture provided by the parts incorporated in Germany is very different. In these parts German administration included the Nazi Party and labour organisation is already complete. Apart from East Upper Silesia, Lodz and Danzig, the country is predominantly agricultural. All land owned by Poles has been declared State property. Elaborate compulsory marketing organisation has been introduced in a very short time. It is claimed that winter sowing was 80 per cent. of normal. At present the cultivation of root crops, potatoes and oilseeds is being extended. The Polish war reduced the number of livestock, and cattle, pigs and sheep have to be imported from the Reich. The extensive resettlement policy will probably prevent any substantial increase in cultivation during this year. The total number of Germans transferred to these new provinces is variously estimated at from 160,000 to 200,000; it is proposed to resettle 100,000 Germans from South-Western Germany over a period of several years.

The surplus of cereals normally produced in these provinces will be just sufficient to cover the demand of the highly industrialised area of Upper Silesia, but the surplus of sugar is considerable. The *Warthegau* produced in 1938 roughly 12 per cent. of the total sugar output of Germany.

The area under forests is relatively smaller than in the Reich. The timber resources of Poland are situated in the Russian-occupied territory. The main asset is the coal, steel, zinc and lead of Upper Silesia.

The total coal output in German and Polish Silesia amounted in 1938 to 55 million tons. A rapid increase is quite possible. Conditions, especially in the Polish coal fields, are similar to the richest mines in the United States of America. Zinc output in Upper Silesia amounted to 108,000 tons in 1938. The "Olsa" territory ceded to Poland after Munich produced in 1938 an additional 7 million tons of coal.

Transport Development

Lastly, there remains the problem of communications. The intentions of the Germans are to develop the inland waterways of Poland and to link them up again on the one hand with the system in Germany and on the other hand with the waterway system in Russia. Here the main connection is from the River Dnieper via the Pripet canal to the River Bug and the Vistula, which establishes direct connections between the Black Sea and the Baltic. The destruction of railways and bridges in the Central and Western provinces of Poland was far greater than in the South. German reports speak of 600 bridges to be repaired. The Baltic ports of Gdynia and Danzig will be developed jointly, i.e. Gdynia—called "Gotenhafen" by the Nazis—for staple goods, especially coal, iron ore and timber, and Danzig for manufactured goods. Coal exports and iron imports were already resumed at the end of October.

Destruction in the war, the prolonged and unusually cold winter, the extensive resettlement, and the temporary disorganisation caused by the establishment of the German system of controlled economy—will probably hamper the recovery of agriculture during this year. Only the coal and iron industries may be able to increase production without delay. Apart from some timber, potatoes, and sugar, there will probably be no agricultural surplus available. This would, however, change in the second and third years of occupation. Conditions are thus different from those during the Great War, when a purely military administration developed no plans for maintaining production, let alone plans for increasing production.

The Nuremberg Anti-Jewish laws are put into practice with even more brutality than in Germany. The wholesale transfer of Jews to the Jewish Reserve near Lublin is hardly mentioned in the German Press. There are, however, many stories about the ghettos in Warsaw, Lodz and Cracow—in the usual Nazi style. The great number of Jews who were independent artisans in Poland are debarred from economic activities. This must have created a shortage of artisans. Their shops in the incorporated part will be filled by independent artisans from the Old Reich. The only hope for the Jews seems to be emigration. But there are hardly any possibilities. The only agency still working in Poland is the Triestino Lloyd, of Italy, which does seem to be active in providing facilities for emigration.

Labour and the Election

[FROM OUR WASHINGTON CORRESPONDENT]

ALL three of the major economic groups in the United States—agriculture, industry and labour—are facing some stiff decisions as to strategy for the coming elections. Most difficult of the current choices is probably that before labour: is this the year to attempt independent political action, or not?

Nobody believes that an American Labour Party could nominate and elect a Presidential candidate in 1940. Against it are, not only the history of third parties in the American past, but also the present divisions in labour. On January 26th, Mr John L. Lewis, head of the Congress of Industrial Organisations, speaking before the biennial convention of his own union, the United Mine Workers, attacked President Roosevelt and prophesied defeat should he run for a third term. The next day, Mr Sidney Hillman, President of the Amalgamated Clothing Workers, and second only to Mr Lewis in importance as a C.I.O. leader, affirmed his support of Mr Roosevelt. The two statements indicate the current division on the third-term issue within the ranks of the four million American workers who belong to the C.I.O.

At the same time, political co-operation seems impossible between the C.I.O. and the four million members of the American Federation of Labour, the national organisation

of craft unions from which the C.I.O. split in 1935. Locally, members of the two organisations have at times joined forces for municipal or State elections, but at other times they have killed each other off by putting opposing candidates in the field. Less than a week after Mr Lewis's speech, the American Federation of Labour Council warned that "any candidate for public office who seeks and accepts the support of the C.I.O. and places himself in bondage to its leader has received the 'kiss of death.'"

If the prospects for independent labour action are as bad as these divisions indicate, why is it even being suggested? The forces which are pushing Mr Lewis in that direction are clearer for a backward glance at the previous history of American labour in politics. Large-scale labour organisation did not begin until after the Civil War. The first successful national movement, the Knights of Labour, did not gain real strength until the mid-eighties. The Knights were the American equivalent of the Chartists—with a broad programme of social reform, and with political action as one means of securing it. But, with the rise of craft unionism, their social approach was superseded by the strictly economic interests of the American Federation of Labour.

The American Federation of Labour organised skilled workers. The "business unionism" on which it concentrated aimed at securing to its members in the building trades, the metal trades and the cigar industry a fair share of the returns from the product they manufactured. Mr Samuel Gompers, who became American Federation of Labour President in 1886, believed that European Socialist Parties had done little good for labour; during his thirty-seven-year term of office the American Federation of Labour maintained a non-partisan relationship with all political parties. In point of fact, the method of labour's "rewarding its friends and punishing its enemies" normally resulted in support of Democratic Party nominees; but the Democratic Party was in no sense a labour party.

In the years following 1929, a number of new considerations became prominent. The ranking American industries of the twentieth century were not staffed on a craft basis. Mass production had diminished the proportion of skill required, and the endless belt linked together unskilled, semi-skilled and skilled workers. Just as the disappearance of the geographic frontier had produced the Populist revolt of the West in the 'nineties, so the disappearance of the technological frontier after 1929 induced a comparable mass unrest over the whole country.

The Unions and the Democrats

Through no forethought of its own, the Democratic Party became the party of the forgotten man, of the third of a nation that is ill-housed, ill-clothed, ill-fed. The way to recovery was seen to lie in his increased consumption, in his increased purchasing power, in his increased wages and decreased hours, in his collective bargaining. The new Administration was not a labour administration, but its objectives were the objectives of labour. In 1933, the American Federation of Labour had 2,125,000 members. In 1939, the C.I.O. and the American Federation of Labour together numbered eight million members—and another quarter million were in independent unions. Labour votes contributed no little to the Roosevelt landslide in 1936 and labour donations to Democratic campaign funds totalled nearly three-quarters of a million dollars.

Social security legislation, the National Labour Relations Act, the U.S. Housing Authority, the Wages and Hours Law, were established in rapid succession in the years 1933-38. But the Democratic Party was still not a labour party. The legislation of those years was produced by Liberals for labour. By 1938, the party which had supported labour legislation willy-nilly began to weaken at the hyphen and divide into the willy and nilly faction. The willy faction lost in its effort to reorganise the Supreme Court and in its attempt to purge the nilly faction in the 1938 elections. Since then, there have been few new developments, and the Garner candidacy and the Farley candidacy are here to show that the Democratic Party is traditionally based on the Solid South and the metropolitan machines.

So a choice is up to labour. Its immediate tactics are clear enough—to put as much pre-convention pressure as possible on the choice of the Democratic candidate. Mr Lewis's speech of April 1st did just this, when he declared that unless a candidate "acceptable to labour and the common people" is forthcoming, he would call a mid-summer convention of labour, youth, old age, Negro and farmer groups "and we'll see whether mere machine politics in this country are going to be more powerful than the voice of the people of this land."

April 12th

Canada's Spring Revival

[FROM OUR OTTAWA CORRESPONDENT]

THE only surprising feature of the result of the Canadian general election was the size of the Liberal majority. The Liberal Party is still considerably over-represented in Parliament in the light of the popular vote, but a provisional tabulation shows that it secured about 53 per cent., a substantial improvement upon the percentage of 46.8 secured in the election of 1935. Dr Manion's pledge to form a "National Government," representative of all parties, if he was returned to power, proved a boomerang, as its only real effect was to antagonise thousands of Conservatives and make them feel free from any party obligation to support him and his candidates. The *Winnipeg Free Press*, the ablest Liberal paper in Canada, expresses some disquietude at this infiltration of Rightist influences into its party; it suggests that the Government, having secured the adhesion of thousands of voters who "never were and never will be Liberals," may have forfeited the right to call itself a Liberal Ministry, and declares that it is incumbent upon all genuine Liberals to adopt an attitude of vigilant independence.

The result of the election was simultaneously an emphatic endorsement of the war policy and programme of the King Government and a decisive rebuke to the misguided tactics of the Opposition. There are supporters for the theory also that the overwhelming mandate given to the King Ministry represented a widespread anxiety among the Canadian people that they should not be drained to exhaustion of their young man-power and wealth in another attempt to settle the age-long feuds of Europe. They could not feel sure that Dr Manion, if returned to power, might not, under pressure from the British Government and his own Imperialist followers, be induced to cast all Canada's resources to the last man and dollar into the scales for victory. So it is suggested that, while the result can be construed as a mandate for the Government to continue the national war effort, there was implicit in it an accompanying caveat that certain limitations should be set to it.

new regulation under whose authority it will hereafter decline to provide United States funds in exchange for Canadian coin and currency imported from foreign countries. This move is designed to check the activities of exchange manipulators in the United States who have been discounting Canadian currency there at a rate higher than the Board's official rate of 11 per cent., and by transferring it to Canada and getting United States funds for it at the official rate have been reaping profits, but it is difficult to see how the practice can be completely stopped.

The foreign trade returns for February showed the value of imports almost unchanged and a seasonal shrinkage in exports. But with the month of February, 1939, the comparison is very favourable, as the data below reveal:—

	Feb., 1939	Jan., 1940	Feb., 1940
	\$	\$	\$
Imports	40,380,234	71,104,145	71,041,553
Exports (Domestic) ..	57,571,572	90,100,133	71,078,946
„ (Foreign)	671,278	753,704	1,235,125

The trade experts of the Government are disturbed by the new Australian import restrictions and particularly about their effect upon the fish-packing industry, and they estimate that their effect will be to reduce Canadian sales of sardines, canned salmon, smoked fish and other commodities in the Australian market by about \$3 millions per annum.

Good Business Prospects

The spring thaw has now arrived and the accumulated snowfall is melting rapidly, but although cultivation of the land has started in the more southerly areas, it will not be general for a fortnight. Business conditions remain satisfactory and are benefiting from the usual stimulus provided by the advent of spring. The latest employment bulletin covering up to March 1st recorded a slight slackening of industrial employment in February, but the employment index on March 1st at 113.5 was 7 points above the figure for March 1, 1939, 106.5, and was at the highest point ever recorded for this date. The construction industry continues to gain ground, largely as the result of the extensive contracts being placed by the Government. Anxiety in the West about the lack of reserves of soil moisture has been relieved by a very heavy snowfall, and the new crop has now a chance to get off to a good start.

April 14th.

Irish Opportunity

[FROM OUR DUBLIN CORRESPONDENT]

THE seizure of Denmark by Germany creates a wonderful opportunity for Irish farmers to increase their exports of bacon, butter and eggs. For many years Danish competition has been one of the dangers to Irish agriculture, and Danish methods have been held up to Irish farmers as the models on which they should develop their production. Now that this competition is temporarily removed, it is important that the opportunity for expansion should be used to the utmost. The question is whether the peculiar inelasticity of Irish agricultural output, to which attention has previously been drawn in this column, is capable of being surmounted. In the case of pigs, for example, the number of pigs in Eire in 1901 was 1,014,828, while the number in 1939 was only 930,907. The quality of the pigs and the value of their products had greatly increased, but the failure of the number of pigs to expand, in spite of a steadily rising demand for bacon in Great Britain, has been, to say the least, disappointing. If the output cannot be increased in the present unique emergency, the prospects for the future of Irish agriculture are indeed dark.

Since 1935, the pig and bacon industries have been regulated by marketing boards with the objects of preventing undue fluctuations in price and maintaining production at a profitable level. Much dissatisfaction has been expressed by the farmers at the operation of these schemes, which, they allege, have proved unduly profitable for the curers at the expense of the primary producers. At the same time the price of bacon has been raised so much in the home market as gravely to reduce domestic consumption. It is obvious that, in the long run, Irish bacon cannot hope to be exported on a subsidised basis, and the fundamental problem is one of costs in relation to prices. The rise of prices which will probably occur in the near future will doubtless stimulate output, provided that the price of feeding-stuffs does not

rise even more. Agricultural experts attach great importance to the need for increasing the use of potatoes as pig feed. Potatoes are cheaply grown in Ireland and modern developments in ensilage enable them to be stored and preserved.

The situation in regard to butter is somewhat similar. The number of dairy cattle has grown since 1901 only from 1,188,050 to 1,216,500, and is now tending to fall. The quality of Irish butter has greatly improved, but the rate of expansion of the industry is not satisfactory. Here again, the problem of cheap feeding-stuffs is pivotal. It is absolutely essential that modern methods of grass production and utilisation should be widely adopted. Every variety of home-grown fodder, hay, roots and cereals, should be intensively produced and the latest improvements in ensilage pressed into service. The health of the dairy herds could be materially improved by better feeding and by further veterinary attention; and the average milk yield could be substantially increased. It is to be hoped that the Department of Agriculture will display appropriate vigour and energy in this unprecedented opportunity to supplant our chief competitor in the British market.

An increase in exports is particularly desirable at present, because of the serious deterioration in the balance of payments. The prices of many imports have soared, while two of our invisible exports, namely, the sweepstakes and the tourist trade, have temporarily collapsed. The sweepstakes, in addition to providing large sums for the construction of hospitals, gave considerable employment in Dublin and yielded an annual income to the Exchequer of £500,000. They were certainly qualified to rank as an export industry since most of the subscriptions came from the outside world, principally the United States. Needless to say the war has interrupted this highly profitable activity. The tourist trade also depended largely on American visitors, and even British tourists cannot be expected to visit Ireland in anything like their normal number during the war. An attempt is being made to attract holidaymakers from Northern Ireland in the coming summer.

April 22nd.

Jugoslavia's Needs

[BY A CORRESPONDENT]

THE war has put the Balkan countries under a very heavy strain. Dr Schacht's system of trade by clearing arrangements resulted in the concentration of the exports of the Balkan countries on Germany. Increased exports to Germany, as well as mounting clearing credits, compelled the Balkan countries to take imports of German industrial articles. This resulted in a decrease of exports to the "free foreign exchange" countries, and as a result imports of necessary raw materials to be got only by paying with free *devisen* had to be restricted. Since September the shortage of raw materials has been serious.

Jugoslavia's imports of raw materials and semi-manufactures in the first eight months of peace in 1939 and then in the first four months of war may serve as an example. The following table shows Jugoslavia's imports:—

	('000 tons)		(Million dinar)	
	1938	1939	1938	1939
Raw materials	565	303	1,045	700
Semi-manufactures	351	471	10,030	1,077
Partly finished articles	139	136	591	736
Wholly finished articles	136	145	2,005	1,945

The fall in imports is most marked in raw materials; the quantity fell by 46 per cent., the value by 32 per cent. The increase in imports of semi-manufactures happened during the first eight months of the year. The next table shows how the war influenced Jugoslavia's supplies of important goods.

	Peace Months, January to August				War Months, September to December			
	Tons		Mill. dinar		Tons		Mill. dinar	
	1938	1939	1938	1939	1938	1939	1938	1939
Cotton, raw	12,150	12,600	152	156	9,490	5,470	112	76
Wool, raw	2,770	3,210	78	83	2,000	490	55	17
Cotton yarn	10,030	10,820	213	249	3,940	1,360	95	36
Yarn, manufactured from other natural fibres	4,350	2,950	44	52	1,500	620	17	15
Woollen yarn	950	1,560	67	100	570	240	38	17
Pig iron	46,000	24,160	99	61	9,700	6,860	23	20
Coal	36,320	30,760	139	104	13,450	8,730	43	38
Skins, undressed ..	7,090	1,360	97	22	1,520	165	17	2
Tallow	4,360	3,960	20	17	2,150	750	9	3

During the first eight months of last year the textile industry was able to secure adequate imports of raw materials—the fall in imports of yarns and other textile fibres was the result of restrictions placed on imports of sisal and Manilla yarns in the spring. Imports of pig iron fell because stocks had been accumulated during 1938—the number of workers employed in the iron industry at the beginning of 1939 exceeded the number a year before, and the output of pig iron increased from 59,300 tons in 1938 to 62,000 tons in 1939. Smaller imports of coal are explained by the attempt to replace imported coal by domestic lignite.

The Allies' Chance

Import difficulties during the first four months of war were most marked in the imports of textile materials. Compared with the corresponding months of 1938 (September, October, November and December), raw cotton imports fell 32 per cent. in value, raw wool 69 per cent., woollen yarn 55 per cent., cotton yarn 62 per cent., jute and flax yarn 59 per cent. Before the war Jugoslavia imported the greater part of her yarns from Germany, Czecho-Slovakia and Italy. Germany is now no longer able to export yarns. Germany does not even seem able to export yarns manufactured from artificial fibres.

Jugoslavia is thus more than ever dependent on the Allies for importing necessary raw materials. In order to be able to import raw materials and semi-manufactures from Britain and France, Jugoslavia is about to reorganise her system of foreign trade. Logically, the result would be an increase in exports to non-clearing countries, which is possible only to the disadvantage of Germany. During the last months of 1939 this tendency was already at work. Germany's, i.e. the Reich and Austria, share in Jugoslavia's exports fell from 42 per cent. in 1938 to 32 per cent. in 1939.

One must take into consideration, too, that a considerable part of Jugoslav exports used to go to Czecho-Slovakia. The former Czecho-Slovakia held a considerable clearing credit in trade with Jugoslavia of roughly 150 million kronor. This credit has disappeared. There is now a debit, which is steadily growing, and amounted to 80 million kronor at the beginning of March, 1940.

Jugoslav trade authorities have estimated that during 1940 they must import raw materials obtainable only in Allied countries amounting in value to 2,000 million dinar. In 1939 Jugoslav exports to the United Kingdom amounted to 367 million dinar; exports to France amounted to 140 millions; and to the U.S.A. to 281 millions. This adds up to 788 million dinar. In other words, a considerable increase in exports to these countries is now necessary to pay for raw materials. This increase may be made easier by the fact that Great Britain and France are now ready markets for Jugoslav products, such as minerals, timber, meat and dairy produce.

The Allies are in a position to divert Jugoslav exports from Germany to themselves. Their key position in supplying Jugoslavia with indispensable imports makes it possible for them to exercise considerable influence on Jugoslavia.

THE BUSINESS WORLD

Limited Dividends and Equities

SIR JOHN SIMON occupied two hours and ten minutes in outlining his Budget proposals on Tuesday afternoon. For the equity investor, the odd minutes contained the most important news of the day. For, in a few concluding sentences, the Chancellor sketched the rough details of legislation for limiting the size of ordinary share dividends. The possibility of such legislation had not been overlooked as a weapon in our economic war armoury. Indeed, only a fortnight ago, *The Economist* urged that stabilisation of dividends and institutional saving by the medium of company reserves should be a corollary of the present level of E.P.T., on the ground that distribution in dividends of the 40 per cent. residuum after paying E.P.T. might involve an undesirable stimulus to private consumption. The Chancellor, in rejecting Mr Keynes's proposals for deferred earnings, has, in fact, proposed a not dissimilar measure for deferment of increased company profits. It is a measure which, as Germany has shown, can be a powerful instrument of wartime financial policy, and it can be justified in a wartime context. But it introduces the most profound consequences for equity investment, which require immediate examination by ordinary shareholders.

First, it is essential to set down exactly what the Chancellor has said on the subject of dividend limitation. The Bill (it will be a separate measure, apart from the Finance Bill) will propose that a public company shall not distribute a greater dividend on ordinary shares than was distributed in any one of three pre-war years. This statement is not simple to interpret in exact terms. The market assumes that a public company will be allowed to distribute a dividend up to the highest rate paid in any of three pre-war years—including the year 1938, which is not allowable for E.P.T. purposes. And it finds support for this assumption in the further remark of the Chancellor that "a business which has been able to distribute in the past a big dividend will not be prevented from doing so again, but it cannot increase it." But if the Chancellor's words are examined more closely, they are capable of the interpretation that the dividend shall be limited to the lowest rate paid in any one of three (unspecified) pre-war years. Indeed, this is what the words mean; they forecast a prohibition, not a permission. The Chancellor did not say that companies would be allowed to distribute as much as in any one of three pre-war years, but that they would not be allowed to distribute more than in any one of those years and—as was discovered in the case of the standard dividend provisions for London Transport "C" stock—there is a great deal of difference between the positive and the negative form. If a company has distributed, say, 8 per cent. in 1936, 10 per cent. in 1937 and 5 per cent. in 1938 (assuming these to be the three pre-war years), and if it now proposes to distribute 8 per cent., could it not be said that it was "distributing a greater dividend than was distributed in any one of the three pre-war years"—i.e. in 1938? This seems to be repugnant to the main sense of the Chancellor's statement, but it is the legal meaning of his words—and Sir John is a lawyer. Clearly, the text of the Bill will have to be closely examined. There are other matters of definition still in doubt. It would seem, for example, that private companies are to retain their freedom in dividend policy. Moreover, on a strict definition of "public" companies, statutory companies, such as the railways, would also appear to be excluded.

A minimum rate of dividend will be allowed, however,

for companies which in the recent past have been unable to pay that minimum. In cases where no complications (such as participating rights) exist, the minimum will be 4 per cent. The introduction of a minimum rate into a system of dividend limitation, without any indication of a maximum rate, has perplexed many ordinary shareholders, and its implications are certainly far from clear. Since, however, provision will be made for new companies and for hard cases under a dispensing power to be exercised by the Treasury, on the advice of the Capital Issues Committee, it is to be presumed that maximum rates for hard cases will be determined on their merits. The final proposal is to prohibit the issue of bonus shares during the war, save in such exceptional circumstances as amalgamations.

The first reaction of the ordinary shareholder to these proposals might well be to ask if there is any remaining scope for equity investment for the duration of the war—and even, looking farther ahead, if dividend limitation does not introduce permanent changes in the established canons of ordinary share investment. It is clear that the proposal tends to increase the attractions of fixed-interest stocks, which responded generously on Wednesday. Broad groups of companies will fare differently under the limitation scheme. Those whose ordinary dividend payments had been steadily stepped-up in the pre-war years may find themselves already at the ceiling. Their shares will now become "fixed-interest equities" while distributable profits are maintained, and "negative equities" if profits should fall. Companies whose dividends have declined appreciably from the maximum in the early pre-war years, and whose current profits are still below the peak, may have an equity in future increases in profits (after meeting E.P.T.)—assuming that the maximum, and not the minimum, pre-war rate is to be the standard. Those companies with substantial preference arrears—they are still to be found among the textile groups—will retain an equity in recovery until their arrears are paid off, when they will presumably receive a minimum ordinary dividend standard. Finally, the position of concerns which have distributed regular scrip bonuses in the past must be given serious consideration.

In the accompanying table, a selection of important companies have been arranged in three groups, according to their dividend record—stable, rising or falling. Dividend limitation probably matters but little to shareholders in companies in the first group. They would not, in general, have expected any appreciable increase in distributions during wartime, judging from their peacetime dividend experience, though there is some slight scope for future dividend increases by Imperial Tobacco, Watney, Combe, Reid, and Imperial Chemical Industries. In the second group of companies, with rising dividends, the consequences of limitation are more plain, particularly in cases such as Dunlop Rubber and Swan, Hunter, whose recent dividends for the calendar year 1939 have indicated the directors' willingness to acknowledge the existence of a wartime equity in increased distributions. Last year does not count, presumably, as a pre-war year, so that these two companies and also Home and Colonial (subject to a special dispensation of a minimum dividend standard) will, in effect, have their recent equity gains lopped off.

It is among the falling record companies that equity possibilities will have to be sought in future. That is not to say, of course, that they will be automatically found. It would be optimistic to suppose that London Brick will

be able to restore its former 20 per cent. dividend in the near future, or that Odhams Press or Bowater's Paper Mills will experience a marked recovery in profits in wartime. On the other hand, companies like Courtaulds, Inter-

national Tea, Prices Trust, and Turner and Newall might well show some improvement in earnings as the war proceeds. If so, they should have some equity in the possible restoration of pre-war payments. It is, of course, a corollary of their recent profits experience that several of these latter companies have a favourable E.P.T. base.

These, however, are the broadest generalisations, to which any number of complications may be added. What is the dividend standard of companies like Distillers, British Oxygen, and Austin Motor, which have made bonus share issues since war broke out? How will the maximum permissible dividends of companies like Tate and Lyle and Crompton Parkinson, which distributed scrip bonuses some time before the war, be determined—by the maximum gross sum distributed or the maximum percentage rate? And what of the companies which have hitherto made a regular practice of making share bonus distributions each year? It has always been impossible to give any rational capital value to the expectation of regular share bonuses. What, then, is the proper value of a share like Marks and Spencer, whose earnings in the last two financial years approached 75 per cent., but whose cash dividends were limited to 42½ per cent.? British Electric Traction would provide an even more pertinent case, had the directors not decided, last December, to discontinue the issue of regular scrip bonuses in wartime. Marks and Spencer shareholders may be pardoned for feeling that they have been singled out by a hard fate. The company's growth of profits attracts heavy E.P.T., as a reward for its enterprise; it is vulnerable to the limitation of supplies of textile manufactures to retailers; it will be hit, inevitably, by the new Purchase Tax; and its shareholders must, it would seem, content themselves in future with the expectation of cash dividends not exceeding 42½ per cent. It is not surprising that the 5s. shares fell from 47s. 6d. to 43s. 9d. on Wednesday this week.

The position of textile shares also provides some interesting comparisons. Lancashire Cotton ordinary, having gone dividendless for years, received 7½ per cent. for the year to October last. In this case, presumably, a special dispensation could be successfully pleaded. British Celanese 10s. ordinary, which have recently been standing as high as 8s. 10½d. in the lively hope of dividends in the not far distant future, must also count on special treatment. Bradford Dyers, with preference arrears since 1932, and Calico Printers with preference arrears since 1935, might provide some equity interest in their defaulted preference capital but for the probability that if a recovery in earnings occurs the immediate consequence is more likely to be a refunding scheme than cash repayment.

The lot of ordinary shareholders, and their advisers, in

a regime of E.P.T. and dividend limitation, is clearly not enviable. It is true, of course, that profits retained in company reserves, instead of being paid out in dividends, do represent an effective enhancement of the ordinary shareholder's equity. But their significance in the determination of share values in wartime is bound to be restricted. The equity theory of investment, which holds that earnings, and not distributed profits, are the crucial factor for ordinary share valuation is true in its proper context—that of normal and progressive economic conditions. The capitalisation of "ploughed-back" earnings depends on the underlying assumption that the company can reinvest its profits to better advantage than the shareholder could obtain elsewhere. To the extent that these conditions are qualified in wartime, the equity theory has a diminished force, and an important sector of equity investment will accordingly be removed by dividend limitation. Exceptional far-sightedness would be required of the ordinary shareholder before he could value the possible significance of accumulating reserves in wartime in terms of future dividends or capital bonuses. The post-war period may well bring demands for replacement of capital which can only be met with the help of accumulated wartime profits. In such circumstances, reserves built up from wartime profits would protect the ordinary shareholder against capital losses, but they would not necessarily be available to augment his post-war income.

To discount accumulated wartime profits at anything like the rate which might be applicable in peacetime conditions, when the length, intensity, and outcome of hostilities are quite unknown, would therefore be hazardous. Companies whose dividends are limited will still retain an equity in profit increases, but it will be difficult to impute any rational Stock Exchange value to it. Meanwhile, the ordinary shareholder will await the precise terms of the new Bill with impatience, since, for the time being, intelligent share dealing will be virtually impossible.

COMMERCIAL SERVICE

The Bank has over 380 Branches in Africa, and Agents and Correspondents throughout the world. The closest touch with Trade and Industrial conditions is maintained, with special attention to Commercial and Credit Intelligence. This service is available to Exporters, Importers and others wishing to develop trade with South, East and Central Africa.

The Case of Ebbw Vale

THE recent history of Richard Thomas and Company, Ltd., leading to the removal from the company's board of Sir William Firth, its chairman, under somewhat mysterious circumstances, is much more than the tale of the personal fortunes of an outstanding industrialist. It is the story of movements and trends which may cause an upheaval in the British sheet and tinplate industry, and in the steel trade at large. The removal of Sir William Firth is merely a telling symptom.

To grasp the full import of the recent development, the inquiring student must go back some centuries, to the time of the Restoration, when Yarranton and his fellow travellers brought the art of tinplating from Germany and Bohemia. Cornwall had its ancient tin mines, so that the tinplaters had to build their works in or near that region. Later, when Hanbury found that iron sheets for tinplating could be made by a simple rolling process, he had perforce to start his new mills in or near South Wales, where the local deposits of ore could be worked with native charcoal or coal fuel, close by the tin mines of Cornwall. These were the factors which led to the foundation of the South Wales tinplate and, later, the sheet industry. The district retained its pre-eminence for the best part of two centuries, long after the original factors had lost their pristine power, providing one of the clearest examples of "industrial inertia."

Towards the close of the eighteenth century Cort discovered how to roll bars through grooves in two parallel rolls. For long the whole art of iron rolling, and later of steel rolling, consisted in passing pieces of metal back and forth between two rolls, but the early metallurgists soon began to toy with the idea of passing bars from one set of rolls to another, in other words of rolling continuously. Continuous bar-rolling became a reality several generations ago, though it was left to more modern times to perfect the method. For a variety of technical reasons the rolling of thin sheets or strips by the continuous method offered greater difficulties, but by the end of last century narrow strips were being rolled continuously through sets of mills arranged in tandem; but the art of making *wide* strips of a size and gauge obtainable from the old-fashioned single-stand mills remained a problem still to be solved. Though many detailed improvements had been introduced, the South Wales sheet and tinplate industries stuck to the essentials of the age-old processes. None the less, for lack of a rival, they managed to keep their strong market position. It is true that the South Wales mills received a heavy blow through the fencing off of the United States market by the McKinley Tariff of 1890, and that the coal strike of 1926 allowed newcomers, and especially the Americans, to penetrate areas for long held as virtual monopolies of South Wales. But this did not alter the essential position, so long as the fundamental technology of the industry remained unchanged.

But a dark cloud was rising over the Welsh valleys. In the early 'twenties of this century the American steelmen began to interest themselves in earnest in perfecting the process of rolling long, wide strips of thin steel. Being able to draw on the accumulated precision experience of mechanical and electrical engineers, they at length solved the problem, and continuous wide strip rolling became a commercial undertaking, just about the time when the Americans were establishing a sound footing in export markets for flat rolled products.

With ample funds available, and urged on by keen competition, huge mills were rapidly erected in the United States, and to-day about two dozen plants are in operation. They have a capacity in finished sheets and tinplate equal to the whole ingot-producing capacity of the British steel trade. The new wide strip is turned out under extremely fine control, and is virtually a new product, quite capable, under free conditions, of driving the older-fashioned goods from the cream of their markets. Especially in the high-grade ranges, the Americans increased

their selling drive and forced a way into British home markets, right on the doorstep of the British makers. The motor car manufacturers in this country went on public record about their preference for United States material, and even threatened to build their own mills to obtain satisfactory steel.

The full effect of the powerful new market factor could not be exactly computed, but it was clear that the South Wales sheet and tinplate industries (the two branches are intimately connected) were up against a serious difficulty just when the geographical advantages which had led to their founding had almost entirely disappeared. At this point, Richard Thomas and Company, Ltd., come into the story. Under the direction of Sir William Firth, that firm, the biggest sheet and tinplate combine, decided to erect continuous wide strip mills on the American model. Casting about for a suitable site, Redbourne, in Lincolnshire, was the obvious choice. There the company already had a steelworks to provide a nucleus. More important still, Redbourne is near a coastal orefield, and ore rather than coal is now the determinant in locating iron and steel works. By this time, with the wasting of the specific local advantages, places like Ebbw Vale, in Monmouthshire, were rapidly becoming derelict. But by this time, too, the steel trade was moving into corporate organisation on a national scale and with Government help, and in siting new works it had to take account of social and industrial dislocations. An outcry was raised from Ebbw Vale, and by various means, not the least being direct pressure by members of the Government, the Richard Thomas concern was induced to abandon the Redbourne scheme and to develop an old site at Ebbw Vale. This, no doubt, prevented a great deal of social misery, but it was the beginning of the personal troubles of Sir William Firth, and it made little difference to the basic problems raised by the erection of the new mills.

In general, Ebbw Vale has few advantages as an iron and steel-making centre. The strategic advantage, important from a national and defence viewpoint, brings no commercial dividends. In detail, the site chosen was cluttered with old founds and the remains of obsolete works. For this and other reasons, the estimates of the cost of erecting the new plant were over-run by several millions. Moreover, part of the capital had been left to be found out of future profits, and the severe recession of 1938 removed both the profits and also the possibility of raising funds on the capital market. Richard Thomas and Company had to approach the banks. The banks could not refuse the needful assistance, but effective control of the company passed out of the hands of the directorate into those of a control committee of which the Governor of the Bank of England is chairman.

If the concern had stuck to the original Redbourne project, the estimates might not have been so greatly in error, and it is possible that the company would have completed the building programme without direct or large-scale bank help. In that event, the personal position of Sir William Firth would have been much stronger and he might have been able to maintain his post and ideas against the inevitable opposition. That is conjecture, though it has the elements of possible truth. The fact is that the mill, when it was completed and ready for operation, was not in the hands of an independent firm, but of a firm controlled by an outside body, some of whose members presumably represented the public interest, while others certainly represented the interests of the steel industry as a whole. This was hardly an arrangement which could be expected to lead to harmony in the management of the company, for the mere existence of the new plant creates the gravest problems for the other members of the industry. It disturbs the whole system of production quotas which has become the basis of sheet and tinplate marketing. This quota system has its advantages when the participating firms work much the same type of plant and consequently turn out much

the same quality of product at much the same cost. But it is unstable when one company can offer a new and superior product at the same price, or even less, and when that company cannot operate to full advantage save at a high working load. There is little doubt but that the new mill would attract, under free conditions, the best of the sheet and tinplate business and would achieve a fully economic rate of production. This is clearly seen in the comparative success of the American sheet and tinplate exporters and is implied in evidence presented before the Australian Tariff Board by representatives of the Richard Thomas firm. Countering a proposal to erect old-style tinplate mills in Australia, this evidence claimed that these mills would not be able to turn out material comparable with that obtainable from Britain, in effect from Ebbw Vale. Under normal conditions, the obvious cure would be for the threatened firms to get together and erect a parallel plant. This has been the traditional method by which all technological progress has been achieved. But, in present circumstances, it is hardly possible, as in the first place they would have grave difficulty in finding the funds, and, in the second, another mill might prove to be one too many, the more so since in the meantime John Summers and Sons, Ltd., have begun the erection of a new plant incorporating some of the new methods.

The problem thus posed is obviously a difficult one. If the new plant remained in independent management, the competing firms—chiefly Guest Keen Baldwin's and Lysaght's—would be hit very hard. If the quota system is maintained, they might jog along comfortably enough; but then the Ebbw Vale plant would be seriously hampered and little progress could be made in recapturing export markets. When, through financial stringency, Richard Thomas and Company was forced to submit to control from without, the form of the control clearly implied a decision to solve the problem by co-operation between the firm and its competitors.

To be the vehicle of co-operation, the banks' control committee appointed directors from affected firms to the board of Richard Thomas and Company, Limited. It might have been foreseen that the position of these outside directors would be very difficult, if not untenable. The interests of Richard Thomas necessarily ran counter in some respects to those of their own companies. In due course, the outside directors, appointed expressly to lubricate inter-company co-operation, resigned and were replaced by other men drawn from the steel industry, but not from its tinplate or sheet sections. It was widely reported at the time that the change was due to an inability of the Richard Thomas management and the "outside" directors to agree on the scale of operations, but the resignation of the outside directors was coupled with a retirement of Sir William Firth from the managing directorship.

In short, the referee, the Control Committee, called it a draw.

The new solution did not, however, get over the real difficulty, which is whether to give the new mill fairly free rein and let it attract the most desirable business, with all the disadvantages that that means for the other firms, or whether to keep a tight grip and hamper the new mill, and with it the export trade. On the surface, the position has been obscured, but its phases will show up in bold outline as soon as the end of the war ushers in more normal times. Last year the Anderson shelters rescued the sheet trade at large from a deep depression and blurred the Ebbw Vale problem. About a million tons of very ordinary sheets, which did not require the Ebbw Vale technique, were needed for their production. The war has brought along new demands to close the gap caused by the approaching end of the steel shelter orders.

The removal of Sir William Firth, however, shows that the problem, though obscured, has not disappeared. The public has not been given the material to enable it to form a judgment on the specific issue between Sir William and his colleagues. In many respects he has been personally unfortunate in his laudable design to improve the technique of the industry. He had to yield to political considerations; and the trade cycle inflicted a double blow, first by raising the cost of the new mill, and then by making it impossible to cover the cost by normal methods. But the failure of his plans was not entirely due to bad luck. There were elements in the plan of finance which carried boldness too far, and if Sir William now joins the ranks of those who have paid the penalty for taking risks, he can at least console himself that he is in eminent company.

What is much more important is the use that is now to be made of the plant at Ebbw Vale. During the war, special considerations obviously have to be borne in mind; but after the war the public interest will call for the production of steel by the most efficient and least expensive processes. If Ebbw Vale is then run at half-cock in order to reduce the damage done to other firms, the public interest will unquestionably be prejudiced. What policy will be followed by those now in control of the firm, who may, without any abuse of language, be called trustees for the cartel? Ebbw Vale will be a test case for one of the most serious economic questions this country has to face in the present generation: can a centralised, cartel-like organisation of industry, in which the interests of an individual firm are subordinated to those of the industry as a whole, be reconciled with the community's interest in the utmost speed of technical progress? We must not prejudge the actions of the Control Committee; but they should not be left in any doubt about what the public interest requires.

Finance and Banking

Money and the Budget.—From the point of view of the money market and banking situation the most striking feature of the Budget is the further advance which it marks in the direction of complete official control of the capital market. The limitation of dividends on ordinary shares and the compulsory savings which are thus to be extracted from a large number of joint-stock undertakings will canalise a substantial flow of funds to the capital market, which, as far as can be seen, will in the main seek investment in short-term gilt-edged securities. Companies which are thus compelled to accumulate undistributed profits will tend to invest them in fairly liquid form. The Government's proposal, both by its direct effect of redistributing investment demand from equities to fixed interest-bearing securities and by its later influence in causing the investment of undistributed profits, will accentuate the plethora of funds seeking short-term investment. The move must consolidate the cheap money policy of the

Government. The money and discount markets should therefore resign themselves to a maintenance of the existing conditions, with all rates so adjusted to a basic 1 per cent. short money rate that the margin of profit on running or reselling bills and on investment in very short bonds is kept down to an irreducible minimum.

* * *

The weekly tendering for Treasury bills is now reduced to a monotonous procedure, in which the only element of uncertainty is the allotment which the market syndicate will obtain at the virtually stereotyped rate of $1\frac{1}{2}$ per cent. The profit made on reselling bills obtained at this rate to the clearing banks at their buying rate of 1 per cent. is £79 for every £1,000,000 of full-dated paper. (It does not matter that the bills have to be kept for at least a

week before they can be turned over to the banks, since during this period they are run on bank money for which the rate is also 1 per cent.). Thus for every £100 which the discount market turns over it earns precisely 1½d. Fortunately there are more Treasury bills to turn over, but even with the syndicate quota enlarged to its present figure of about £50 millions and with the market obtaining between £20 millions and £30 millions of bills a week, the aggregate profits on this business can do no more than cover overhead charges, and in many cases probably fail to do that. To the continuance of this stalemate the discount market must be resigned. The results of the Bristol bills which, though of six months' maturity, went at a lower rate than the three months' Treasuries proved that. This, however, does not mean that the market as a whole is doing badly. The bonds are still there to earn the butter and even the jam to spread on the bread. There is none the less an increasing shortage of eligible shorts. The new 2 per cents. of which the market has rather more than its fair share are slightly too long to be held in the really substantial quantities which their predecessors, the 4½'s, justified. It is therefore the hope of the discount market and of the banking community in general that when the next War Loan is discussed the merits of an essentially short-term operation intended for the banks and discount houses will not be overlooked. The recent issue of War Loan will take some time to digest. The need for raising additional funds, now that the lean revenue period is upon us, will occur fairly soon, despite the £100 millions which the Chancellor had "in hand" on starting the new financial year. The banks gave little support to the War Loan. That support was fortunately not needed and was not asked for. But it would be readily forthcoming if in providing for the due distribution of debt maturities it were decided to make the next Government loan an issue of, say, three-year bonds bearing interest at 2 per cent.

The Course of Sterling.—The free sterling rate has reacted significantly to the Budget proposals. From the level of \$3.59 to which the rate had recovered in New York last week, it has gradually fallen to slightly under \$3.50. The course of military operations in Norway, which was partly responsible for the recovery last week, may have played some part in the subsequent reaction. But the main factor in the mid-week decline of the rate seems to have been the unfavourable impression caused by the Budget estimates and the gulf which they reveal between prospective revenue and expenditure. The fears of inflation which these figures conjure up have been responsible for the departure of a certain volume of funds previously held in sterling by foreign institutions. The supply of such sterling is not limited to the "pre-zero" holdings of non-residents. Although sterling has become a controlled currency a good deal of trade which does not actually touch the sterling area is still invoiced in sterling and certain large international organisations continue to accumulate sterling in the normal course of their trade. The practice of invoicing in sterling in such cases is gradually being abandoned, but traditions of long standing are often difficult to break, while in certain trades where there is competition from sterling companies, the practice has more than tradition behind it. It is these sterling assets which have been liquidated at a rather faster pace since the appearance of Sir John Simon's Budget. The market in free sterling, however, remains fairly small and there are clear signs that the recent regulations, compelling the payment for certain specified exports to be made in foreign currencies or sterling obtained from the control, have considerably curtailed its scope. Additions to the list of specified exports are likely to be made in the near future. In addition the free market in sterling is expected to be further reduced by payments agreements which are being negotiated with a number of neutral countries.

(Continued on page 779)

MONEY MARKET NOTES

STERLING opened the week in New York with a fairly firm tone, but the Budget statement was responsible for a weaker tone on Tuesday, when it closed 1½c. lower at 3.52½. The decline continued on Wednesday and Thursday. There has consequently been the usual appreciation in London in the currencies linked to the dollar. Lire fell from 68½-70 at the beginning of the week to 68-69½ on Thursday, and yen have risen from 1s. 3½d.-1s. 4½d. to 1s. 3½d.-1s. 4½d. Among officially quoted rates the only change has been in the belga, which on Thursday appreciated by 10 points to 23.75-90.

★

Conditions in the money market were not quite so comfortable at the begin-

ning of the week, although the firmer undertone was only relative and did not represent any stringency. On Monday, there was a certain amount of calling-in by some non-clearing lenders, and on Tuesday one or two of the clearing banks were non-buyers of bills. But on Wednesday and Thursday conditions had again become as easy as before, and the rates for bond money and the three months' draft are still quoted at ¾-1 and 1½ per cent., respectively.

★

The Bank of England return shows a rather unexpected transfer from bankers' to public deposits. This probably represents payments of War Loan, for which cheques had been held up in the clearing. The fall in bankers'

deposits, however, from £115.0 millions to £103.4 millions probably explains the slightly firmer conditions in the money market at the beginning of the week. The other changes in the return are unimportant. The note circulation is £400,000 lower with a corresponding increase in the reserve, and movements in the security items are only small.

★

Silver continues to fluctuate in a very narrow market. Some buying on Indian account on Monday caused a sharp rise in both cash and forward; but resales on the following day, with very little demand, brought a reaction, and the forward price remained unaltered on Wednesday and on Thursday, though cash was ¼d. higher on Wednesday.

Sterling Rate in Norway.—Agreement has now been reached regarding the rates of exchange at which British and French currency are to circulate in the areas of operation of the Allied armies in Norway. The French franc is to circulate at 10 francs to the crown and sterling at 17.65 crowns to the pound. The choice of these rates reveals scrupulous, one might almost say pedantic, fairness to the Norwegian currency. The rates are approximately those that obtained before the German invasion of Norway, and therefore, while taking into account the effect on the Allied exchanges at the outbreak of the war last September, they ignore altogether the effect of Norway having been drawn into the sphere of hostilities. The arrangements made for the use of Allied currency in Norway are a temporary makeshift, and such currency will be withdrawn as soon as the issuing machinery of the Norges Bank can again be set functioning under Norwegian control.

★ ★ ★

Swedish Exchange and Gold.—The events in Scandinavia have seriously interfered with foreign exchange business between Sweden and the rest of the world. Communication between London banks and their Swedish banking correspondents can only be maintained by telegraph, and it is still possible to remit money to Sweden by telegraphic transfer. But, in view of the uncertainties in the situation, it is now the agreed practice to regard such a deal as completed only on receipt of the confirmation from Sweden. If for some reason or other that confirmation is not forthcoming, the deal is automatically cancelled. The rate of exchange between London and Stockholm has remained unchanged at Kr16.85-16.95 to the £. In New York the Swedish rate has been moving against the crown, falling over the past week from \$23.80 for Kr100 to \$23.50. The market has been somewhat disorganised and dominated by withdrawals of American banking funds from Stockholm. Meanwhile the Swedish Riksbank has been making full use of the opportunity to export the country's gold reserve provided by the recent changes in the central banking statutes. At the beginning of the war the gold reserve of the Riksbank amounted to the equivalent of £46 millions (at present rates of exchange). Since the beginning of last September the imports of gold from Sweden into the United States have amounted to the

equivalent of £36 millions. As some of the gold was already held abroad seven months ago it may be assumed that the whole of the Swedish gold reserve has now been moved to safety.

★ ★ ★

A New Bank of England Branch.—A branch office of the Bank of England will open for business at Southampton next Monday. This is the first branch of the Bank to be opened in the provinces since the Plymouth branch was established in 1834. It will bring the number of provincial branches up to eight. The latest development must not be regarded as the inception of a new phase of branch extension. Nor does it suggest a reversal of the policy by which the Bank has for many years past turned its back on a private commercial clientèle. The new branch will be concerned mainly with the transaction of Government business and with the distribution of currency. Under existing circumstances the arguments for greater decentralisation of the currency distribution machinery gain considerably in strength. But it is the growing importance of Southampton and the big increase in Government business transacted there that provides the main reason for the opening of a Bank of England branch in that town.

★ ★ ★

Union Bank of Scotland.—The accounts of the Union Bank of Scotland for the year ended April 2nd last show the tendencies common to most British banks during the past twelve months—an increase in earning assets due to the heavy armament expenditure, which has not been reflected in profits owing to the heavy A.R.P. expenses and taxation for which they have had to provide. Thus, the net profits for the Union Bank are £303,162, against £310,407, in spite of an increase in loans and advances of £511,088. There is, it is true, a decline of £724,071 in investments, but against this bills discounted are up by £1,680,634 to £2,481,098 (including £2,180,000 of Treasury bills). Cash is also up, by £695,728, so that the bank has managed to combine increased liquidity with expanding business—the balance sheet total is £43,336,646, compared with £40,359,886—and, in spite of the small fall in profits, the dividend is maintained at 18 per cent.

INSURANCE NOTES

The London Assurance.—Like the other chartered insurance corporation, the Royal Exchange Assurance, the London Assurance report and accounts for the year 1939 are distinguished by an exceedingly good underwriting profit in the accident department, the balance being considerably better than in the previous year. In the fire department, also, the profit, though smaller than in the accident department, was satisfactory and rather larger than in 1938. There was a substantial increase in the earned premiums on fire business. The figures, which include those of the associated companies, are given below:—

Earned	Fire		Accident	
	1938	1939	1938	1939
premiums	2,122,761	2,231,403	1,469,040	1,452,406
Claims				
ratio	43.2%	43.7%	57.8%	54.5%
Expenses				
ratio	50.4%	49.7%	34.4%	34.5%
U'writing				
profit	6.4%	6.6%	7.8%	11.0%

The marine department of the corporation represents an important part

of the total business. As in 1938, it again provided £50,000 for the profit and loss account. The marine fund at the end of the year increased to £1,260,653 (or 126.4 per cent. of the year's premiums of £997,660), compared with £994,358 (121.3 per cent. of the 1938 premiums of £819,876).

The transfers to the profit and loss department were as follows:—

	1938	1939
Fire	135,291	148,056
Accident	114,837	159,878
Marine	50,000	50,000
Life (from 1935 valuation)	22,500	22,500
Interest	233,571	213,496
Fees	145	124
	556,344	594,054

After allowance for the recommended dividend of 11s. 3d., less tax, per ordinary share of £2 10s. (the same as last time) and charging taxation, pensions and sundry expenses, the carry-forward from the profit and loss account was £858,092, compared with £799,572 brought forward at the beginning of the year.

In the life department, new business

declined to £2,100,256 net, against £2,679,181 in 1938. The premium income amounted to £863,496, an increase of £1,678. Earned interest was 3.58 per cent. compared with 3.73 per cent. The total assets of the corporation and associated companies amount to £21,797,700.

★

Royal Exchange Assurance.—The noteworthy feature of the Royal Exchange accounts for 1939 is the exceptionally good profit margins earned in the important fire and accident departments. Excellent results on fire business were again obtained last year, and the accident department, after a spell of less remunerative years, and in the face of many adverse factors arising from the war, more than doubled the ratio of underwriting profit obtained in 1938. The following table summarises the experience in these two departments. The accounts of subsidiary and associated companies are

(Continued on page 780)

Investment

A "Gilt-edged Budget."—The market's first reaction to the Budget was, perhaps, over-emphasised. Dividend limitation, coupled with the expected changes in sumptuary taxation, has limited the scope for equity investment. Therefore, the market immediately concluded, the Funds must necessarily benefit, and the maintenance of the standard rate of tax at 7s. 6d. as foreshadowed in last September's Budget has reinforced this conclusion. Whether the logic of a Budget which leaves so substantial an amount uncovered by taxes that voluntary savings can hardly make it good in full necessarily points in the direction of higher gilt-edged prices, is perhaps arguable, but that at least is the market's contention. There was some

Fixed Interest Ordy. Shares						

disposition, however, to modify these first impressions on Thursday, when gilt-edged remained firm rather than progressive, impetus slackened among home rails, and some of the dejected equities of the previous day partly recovered their spirits. Among industrial shares, the balance of advantage from the modifications of E.P.T., which the Chancellor has promised, against the limitation of dividends and the impact of the new Purchase Tax on a wide range of industrial concerns, will involve a nice calculation for each individual company. The market, however, has acted wisely, on such facts that are known, by substantially marking down Marks and Spencer and leaving Woolworth almost unchanged, and by lowering securities like Boots Pure Drug and British Electric Traction deferred, whose current values have for years been determined by the expectation, unfulfilled in the first case and recently discontinued in the second, of free capital bonuses. The various considerations which will govern the impact of dividend limitation on different companies are discussed at length in a leading article on page 774.

The substantial advance in marginal home rail stocks may be explained by two considerations. First, the companies are statutory undertakings and appear to be beyond the scope of the proposed dividend limitation. Secondly, the debate on increased fares, after the Budget Speech was defended for the Government against telling opposition. Rand mining companies, the only substantial group of companies on the Stock Exchange which are registered abroad, are presumably not affected by the dividend limitation announcement and as a result Kaffir shares received fairly considerable attention on Wednesday this week, while West African issues, for converse reasons, were dejected. The City does not lack those who argue that the Budget is a more comfortable instrument of wartime financial policy than we have the right to expect, but for the moment it is the shorter view which prevails. Sir John Simon, like Mr Chamberlain in 1937, has depressed equities and encouraged the Funds and Kaffirs, but his dividend limitation proposals will be harder to assail, in wartime, than the first version of N.D.C.

Changes in E.P.T.—The changes in the Excess Profits Tax, which the Chancellor of the Exchequer promised on Tuesday, should go far to remove the anomalies and inequities which at present exist, and which were discussed in the leading article in *The Economist* of April 13th. The changes, as Sir John Simon assured the Committee, will not consist of a list of concessions to the taxpayer. In a number of cases, in fact, the changes will make the machinery for collection of the tax more efficient and satisfactory—a reference, presumably, to the point that under existing law E.P.T. is payable within a month after the agreement of the assessment. As a result, those concerns who prolong their discussions with the taxation authorities can effectively postpone the date of payment. The substantive amendments, however, are evidently concerned with the now notorious Section 13 sub-section 7 of last year's second Finance Act. This deals with the powers conferred upon the Board of Referees to grant a substitute standard when previous profits would not constitute a reasonable basis for E.P.T. The Chancellor emphasised that this provision was never intended to provide an alternative capital standard for general application, and taxpayers will not be able to opt for such an alternative standard in future. Concessions are to be granted for depressed industries or concerns still in process of development during the standard period and—a point of major importance—the present calculation of the standard as a percentage on issued share capital is to be revised in favour of a percentage on actual trading capital.

Two other tax changes, of minor actual importance to investors, though of considerable interest in taxation law, are also foreshadowed. The first, which is to secure the charging of tax on rents which are not covered by the existing charge on Schedule A, is presumably the consequence of what has become known as the "Salisbury

House Case." The second refers to "grossing up" and arises from the recent decision in Culls' case. The latter decision, in fact, enabled at least one public company to declare a dividend "without deduction of tax," and it challenged the entire basis of deduction of tax at the source. Tax evaders rightly incur the Chancellor's opprobrium, but the odd feature about Culls' case was that a long-standing and essential part of the tax-collecting machinery was found to have no legal foundation. The gap, however, has been promptly stopped.

From Gross to Net.—It was once said, in happier days, that the ideal combination for the investment analyst was a dollar rate of 5 to £ and income tax at 5s. in the £. Perhaps a dollar rate of just over 4 to the £ and a standard rate of 7s. 6d. in the £ represents the next best substitute in wartime. The new standard rate certainly facilitates the conversion of net into gross dividends by the simple multiplication of the net amount by 1.6. Conversely, net dividends can be calculated from the gross rates by multiplying by 0.625 or, more simply, by taking $\frac{5}{8}$ of the gross amount. The broader problem, however, is whether the need for such "net to gross" calculations will not narrow perceptibly in these times of high taxation. A number of companies have, in recent years, abandoned their previous practice of declaring dividends free of tax and their total is likely to increase, rather than diminish, in wartime.

Railway Charges.—The debate on Tuesday on the 10 per cent. increase in railway charges, the announcement of which last week caused remarkable perturbation in the home rail market, has thrown some diffused light on the current earnings position of the main lines. Captain Euan Wallace's statement revealed—as was suspected—that his reference last week to the Government's "liability" to reimburse to the controlled undertakings a sum approximating to £400,000 a week was merely an alternative way of expressing the proved increase in costs and the proposed increase in charges in very round terms. This sum could only be regarded as a contingent liability in the future, assuming that traffics continued at the current rate and that the full estimated increase in costs was experienced. He also disclosed that the first 32 weeks of the war, that is, to April 13th, had provided an increase in freight receipts of £13½ millions, representing 20 per cent. over the corresponding period of the previous year, and a reduction in passenger receipts of £4 millions, equivalent to 7 per cent. The net increase of £9½ millions represented an 8½ per cent. advance on the corresponding period of 1938-39. In the earlier half of the period covered by these figures, passenger receipts were affected by reduced services, while in the latter half the natural growth in goods receipts was interrupted by the severe winter. Hence, they may provide a rather tempered impression of what might be called "normal" traffics in wartime. The balance of net revenue which will result when increased costs in the current year are set against increased receipts from traffics and charges, lies in the realm of pure guesswork. So far as the market is concerned, it would seem that the rise in the marginal stocks this week has little more justification than their dejection last week.

SIX SHIPS are required to import the necessary raw materials for new tyres

ONE SHIP only is required for necessary raw materials for Tyresoling an equal number of tyres

LEAVING FIVE SHIPS free to import food, munitions and essential materials

Thousands of smooth tyres are needlessly discarded every week, and thousands ruined by being run too long. Every smooth but sound tyre should be Tyresoled and given guaranteed new tyre mileage over again at half the cost of a standard new tyre.

Reduce your tyre bills by removing tyres for Tyresoing before it is too late. Every make and size can be Tyresoled. Large stocks also available for immediate fitting.

don't scrap smooth tyres — have them

	1938	1939	1938	1939
Fire			Accident	
£	£	£	£	£
Earned				
prems. 1,451,523	1,445,365	1,219,351	1,211,593	
Claims				
ratio 40.9%	42.4%	54.2%	51.7%	
Expenses				
ratio 48.2%	47.4%	41.3%	38.4%	
U'writing				
profit 10.9%	10.2%	4.5%	9.9%	

The remarkably good accident results provide an increase in the total transfers to profit and loss account from the various departments (after taking account of interest credited thereto)

compared with 1938. Details are given below:—

	1938	1939
TRANSFERS TO PROFIT AND LOSS		
Fire	206,052	191,907
Accident	92,091	155,087
Trustee	9,911	7,375
Life (from 1935 valuation)	42,907	42,907
Interest not credited elsewhere	104,326	90,403
Fees, etc.	344	79
	455,631	487,758

As in 1938, there was no transfer between the marine account and the profit and loss account. The premiums fell from £728,366 to £397,160 and the marine fund from £957,092 to £710,603. Evidently this resulted from

the reorganisation of the department, made some time ago, which has not yet had the beneficial effects which are expected ultimately to ensue. In the life department, net new business fell from £4,358,600 to £2,965,300, and premium income, at £1,388,033, was slightly lower than in 1938 (£1,400,255). Net interest earned fell, as a result of higher taxation, from 3.84 per cent. to 3.52 per cent.

The assets totalled £25,778,700 at the end of 1939. Stock Exchange securities being valued at or under market values. The dividend is 30 per cent. (less tax), as for 1938.

the companies and the Ministry of Transport gives only the heads of the agreement, whose full terms have yet, in fact, to be completed. Clause 10, which compresses into three lines the method by which railway charges are to be adjusted to variations in working costs, has attracted much publicity. Railway stockholders might also recall that Clause 11 provides for the possible revision of the arrangements at the end of this year.

* * *

An Undefaulted German Bond.—Hypothecated revenues do not always provide their intended security for bondholders. It is even more rare to find a case in which they have proved effective in wartime for bonds issued by an enemy. Special interest, therefore, attaches to the announcement by J. Henry Schroder and Company that, as agents for the German Potash Syndicate 7 per cent. and 6 per cent. bonds, they still have in hand funds which are estimated to suffice at current rates of exchange for the payment of the equivalent of dollar values of coupons due on May 1st and November 1st next of the 7 per cent. issue and coupons on drawn bonds due on July 1st and January 1st next of the 6 per cent. issue. These payments are limited to bondholders who were resident in the United Kingdom on September 3, 1939, and who remained resident on March 1st last. The market has always regarded the security of the bonds with special favour, and their service has been regularly provided from moneys received before the war from the German Potash Syndicate's sales outside Germany, which were remitted to London and applied in part to the bond service.

* * *

Dunlop Rubber Achievement.—Dunlop Rubber is one of the few companies since war broke out (as the Note on the company's results on page 740 of *The Economist* of April 20th indicated) to have succeeded in retaining a substantial net increase in profits after taxation, and to have made a generous increase in its ordinary dividend. Sir George Beharrell's survey this week of the company's results in 1939 indicated that they were mainly achieved through normal trade activities. Even as a proportion of the turnover of the home companies in the group, direct Government orders represented only 14 per cent., though presumably some advantage has been obtained from new orders which have resulted indirectly from defence requirements. Export and foreign business, however, accounted for over half of the increase in total profits of the company last year, and the chairman rightly emphasised the importance of increasing export and foreign sales—even if this branch of the trade, together with direct Government orders, should involve a further encroachment on supplies for the home market. As a consequence of the prudent financial policy which the company has followed in recent years, it finds itself with conservatively valued fixed assets, with investments and advances in countries with controlled economies written down to a cautious basis; and, for the group as a whole, with more than half of its total issued capital represented by surplus current assets. In view of the prolonged difficulties in Central European markets, shareholders should be well satisfied with the chairman's statement showing the broad geographical distribution of interests in subsidiaries, which stand at the very large figure of £15,546,000. Of this total, 28 per cent. is invested in the American continents, 53.6 per cent. in the British Empire (excluding Canada), 5.4 per cent. in the Far East, 12.4 per cent. in Allied or neutral

European countries, and a mere 0.6 per cent. in enemy and enemy-occupied territories. The German subsidiary, in particular, now stands in the books at £1, having been written down last year from £355,000. As for the future, Sir George wisely declined to prophesy. He emphasised the increasing proportion of output which might be required by Government demand, on which profits are closely controlled, the likelihood of shortages of labour and materials, and the future trend of prices and taxation. These, however, are conditions which apply to many other companies whose finances do not begin to rival those of the Dunlop concern. The ordinary shareholder, however, will appreciate that, measured by recent earnings, the Dunlop group is vulnerable to E.P.T., and that if the limitation of dividends to the maximum paid in pre-war years is strictly observed, the maintenance of the 12 per cent. payment for the calendar year 1939 may not be allowable. That possibility accounts for the decline in Dunlop Rubber £1 ordinary units from 36s. 6d. to 35s. between Tuesday and Thursday this week.

* * *

East Rand Proprietary.—Development in the central portion of the mine continues to be good, but this section is nearly 8,000 feet deep, and underground conditions are unsatisfactory owing to the heat. A large air-cooling plant is, therefore, being installed at the surface to improve mining conditions. In the western portion of the mine, development in 1939 was generally disappointing, while the eastern section still shows erratic results. Ore reserves fell by 87,000 tons to 10,652,000 tons, averaging 5.1 dwt., a fall of 0.1 dwt. in grade. Payable ore developed during the year averaged 4.5 dwt., which is a reduction of 0.5 dwt. over the previous year. Dividends were repeated at 3s. 6d. per share, giving a yield of 7.6 per cent. Heavy capital expenditure is likely to be incurred during the current year. This mine should have a long life, but the general development position is not wholly convincing.

* * *

Anglo-American Development Progress.—The following table provides a résumé of the latest quarterly development reports of the Anglo-American group:—

	Quarter, January-March		Compared with previous quarter		Compared with last financial year	
	Percentage of pay-ability	Inch-Dwts.	Pay-ability	Inch-Dwts.	Pay-ability	Inch-Dwts.
Brakpan	28	315	+ 11	— 76	— 9	— 83
Springs	28.5	252	— 9	— 39	— 13	— 72
W. Springs	50.9	359	— 2	— 163	No ch'ge	— 58
South African Lands	56.6	381	+ 4	+ 20	+ 1	+ 13
Daggafontein—						
Main Reef Leader	62.5	320	+ 8	— 30	+ 11	— 3
Kimberley	60.4	338	+ 38	— 55	+ 42	+ 34
East Daggafontein—						
Main Reef Leader	45.1	262	— 8	— 32	— 5	— 28
Kimberley	48.4	358	+ 1	+ 48	— 8	— 25
Western Reefs	45.8	400	No ch'ge	— 77	— 5.4	— 17

The South African Lands, Daggafontein and East Daggafontein returns are all highly satisfactory. The footage on the Kimberley Reef in the latter two mines is being increased regularly and results still continue to be good. Development on West Springs was satisfactory, but below the exceptional results obtained in the previous quarter. Both Brakpan and Springs again showed disappointing results, with a low percentage of payability, and the tendency for poorer development in each of these mines continues. Development on Western Reefs remains satisfactory.

* * *

Company Results of the Week.—During the current week 40 industrial companies' reports have been received and are analysed in the usual table on page 798. The gross profits of these companies show an increase from slightly over £5 millions to £5.4 millions, but net profits

show a decline from £3.3 millions to £3.2 millions. The reports are discussed under the heading "Shorter Comments" on page 784.

* * *

Company Meetings of the Week.—Reports of company meetings will be found from page 788 of this issue. Sir George Beharrell's speech to *Dunlop Rubber* shareholders is discussed on page 782. At the *Agricultural Mortgage Corporation* meeting Sir Harry Goschen indicated that the Corporation had cash and free investments of more than £2,000,000 and that they would welcome the rapid absorption of that amount in new loans. Addressing stockholders of *International Nickel*, Mr Robert C. Stanley declared that the contract price for the supply of electrolytic copper to the Ministry of Supply was lower than the present world price but that it was equitable and showed the desire of the company to assist the British Government. Mr H. J. Welch, at the *Rubber Plantations Invest-*

ment Trust meeting, declared that the current price of rubber was no more than sufficient to give a reasonable return on restricted production. The maintenance of an 80 per cent. quota for the whole year would doubtless produce much more rubber than the market could absorb at a reasonable level of prices, and he therefore anticipated a substantial reduction in the quota allowance during the second half of the year. At the *Moss' Empires* meeting Col. J. J. Gillespie stated that only two of the company's theatres were still closed, of which one would shortly be reopened as a cinema. Addressing *General Accident* shareholders, Sir Francis Norie-Miller referred to the extremely satisfactory profit on the fire account, and anticipated a net premium income of £1,000,000 in this branch before long. Mr John Cowley outlined to members of *Sunday Pictorial Newspapers* some of the current difficulties in newspaper production. The Hon. A. T. J. Fraser strongly criticised the expropriation of 75 per cent. of the gold premium over 150s. by the Mysore Government at the *Champion Reef* meeting.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

The Budget was given a gilt-edged reception on Wednesday. A keen demand for the Funds was accompanied by sharp readjustments in the equity groups following the announcement of limited dividends. Senior home rail stocks also shared in the buoyancy of the fixed interest groups and Kaffir shares were stimulated by their presumed exclusion from the dividend limitation provisions.

*

The advance in *gilt edged* was typified by the rise in 3½ per cent. War Loan by well over a point to 101, while new War Loan reached par for the first time. The former stock went xd. on Thursday and closed firm, in keeping with the rest of the gilt-edged list, at 99½.

Some renewed interest in Brazilian funding issues was shown and Belgian bonds became firmer on the easing of political tension.

The advance in *home rails* anticipated the Budget but did not become fully effective until Wednesday, when substantial gains were recorded by L.N.E.R. first preference and L.M.S. 4 per cent. preference. Argentine railway stocks continued firm.

*

The *industrial market* was pre-occupied by the necessary adjustment of values to conform with the dividend limitation proposals, and on balance share prices moved lower. Store issues were affected by the purchase tax and in the case of Marks and Spencer by the ban on bonus issues. The fear that Lancashire Cotton ordinary, which in the current year obviously had good prospects of an increased dividend, might be subjected to the maximum rate fixed by the Capital Issues Committee, was responsible for a sharp fall in the shares and similar considerations explained the noticeable weakness of British Celanese. Falls were general among heavy industrial shares, though United Steel, which has some leeway to make up, thanks to the latest year's reduction in dividend, was rather firmer. The changes in the beer, spirits and tobacco duties had little effect upon the leading shares and had evidently been fully discounted in ad-

vance. Among the few movements not directly traceable to the Budget was the recovery in Lever and Unilever N.V. on the relaxation of tension in the Low Countries.

Oil shares improved partly on the ground that current earnings, when they are known, are likely to leave an appreciable margin before highest pre-war dividends can be restored. Trinidad Petroleum Development was an exception, however, in view of its rising profits and distribution trend in recent years. *Rubber and tea* shares showed little movement.

The *Kaffir market* was stimulated by its immunity from dividend limitation and useful gains were shown by the dividend paying issues. A further advance was recorded by diamond shares but Rhodesian copper shares remained dull.

New York

REPORTED sales from Holland and this country affected Wall Street's temperament on Monday, though prices, if anything, were slightly better and conditions were steady. The market later in the week found difficulty in interpreting the Scandinavian news but managed to improve on Tuesday, Bethlehem Steel being particularly strong with a rise of three points as a result of a \$9 millions order for three ships. There was a cautious turn in midweek, though the volume of turnover remained surprisingly stable. Paper stocks were lower despite the continued advance in pulp prices, and copper shares were affected by reports of a possible curtailment of produc-

tion. Steel mill activity this week is reported at 60 per cent., a decline of 1 per cent. compared with last week.

1939 (Old Basis)	12,657,435	928,447	5,313,189

NOTE.—“Old Basis” includes only public issues and issues to shareholders only. “New Basis” includes all new capital in which permission to deal has been granted.

ISSUES TO SHAREHOLDERS ONLY.

Ketton Portland Cement.—Issue of 100,000 £1 ordinary shares at par, one new for every two held. Rank *pari passu* with existing ordinary from July 1, 1940.

RESULT OF TENDER

Bristol Corporation Bills.—Total amount tendered for £500,000 six months bills, £2,950,000. Amount allotted, £500,000. Tenders at £99 9s. 8d. receive about 62½ per cent.; at higher prices in full. Average rate of tenders accepted, £1 0s. 6.325d. per cent. per annum.

CONVERSIONS AND REPAYMENTS

Brownlee and Company.—£100,000 outstanding 4 per cent. mortgage debenture stock to be repaid at 105 November 11, 1940.

Shorter Comments

Company Results of the Week.—The principal industrial report of the week is that of VAN DEN BERGHS, the Lever and Unilever subsidiary, whose total profits are increased from £1,257,668 to £1,527,622, though net profits are rather lower than those of the previous year at £1,016,465. SOUTHERN AREAS ELECTRIC reports a small reduction in net profits from £31,985 to £30,042, and the dividend has been maintained at 5 per cent. In the brewery group CHARRINGTON AND COMPANY, whose trading profits were virtually maintained at £1,224,842, report a fall in net profits from £701,496 to £660,323, and the dividend is reduced by 1 per cent. to 16 per cent. The ordinary dividend of JAMES SHIPSTONE has also been reduced from 2½ per cent. to 20 per cent. Net profits of EVER READY TRUST show a slight improvement at £28,470, and the dividend is increased from 8 per cent. to 9 per cent. A further batch of rubber companies reveals a generally improving trend, although individual companies, such as SELANGOR RIVER, have not always participated in it.

Net profits of AUSTIN REED show a decline from £65,042 to £54,260, and the ordinary dividend has been reduced from 10 per cent. to 8 per cent.

MISCELLANEOUS

South-Eastern Gas Corporation.—Net revenue available for ordinary dividends on the increased capital, year to March 31, 1940, £97,540 (£107,468). To general reserve, £10,000; ordinary dividend reduced from 6 to 5½ per cent.

Central Mining and Investment Corporation.—Profit, 1939, after providing £23,200 (£12,000) for N.D.C. is £514,284. This figure is not comparable with 1938 net profit £444,921, as it does not take account of depreciation and amounts written off for which £853,085 has been provided. Ordinary dividend reduced from 10 to 5 per cent. A transfer of £100,000 is made from depreciation reserve and £500,000 is taken from reserve fund. Income tax £50,000 (£45,000).

Rio Tinto Company.—Profit on sales, 1939, £288,805 (£234,765); other income, £284,331 (£340,495); expenses, tax, etc., £345,652 (£343,025); to debenture redemption, £88,334 (£84,078); preference dividend, £81,250 (£81,250); carry forward, £509,720 (£451,819); investments, £3,179,184 (£3,101,186), of which 87 per cent. represents book value of holdings in Rhodesian copper companies; cash, £212,460 (£142,399).

North British Rubber Company, Ltd.—Trading profit, 1939, £139,268 (£69,046 plus £11,668 tax reserve, making £80,714 for 1938); directors' fees, £2,216 (£2,047); debenture interest, £18,511 (£18,511); depreciation, £31,703 (£30,000); special depreciation, £10,000 (nil); ordinary dividend, 5 per cent., against nil; carry forward, £76,167 (£54,329).

English Sewing Cotton Company, Ltd.—Net profit, 1939, £214,329 (£135,064); ordinary dividend maintained at 7½ per cent.; to pension fund, £10,000; carry forward, £119,862 (£115,533); in 1938, £50,000 was transferred from the dividend equalisation reserve.

Nchanga Consolidated Copper Mines.—Plant is to be extended to produce concentrates equal to 5,000 tons of copper per month. Additional funds of £1,500,000 to be provided by principal shareholders.

Electric Supply Corporation.—Although Treasury consent has been received for the capitalisation of £258,759 from reserves by a three for five share bonus, the directors will move at annual meeting on April 29th that the proposals be not proceeded with.

Austin Reed, Ltd.—Trading profit, year to February 20, 1940, £110,777 (£118,406); net profit, £61,761 (£77,042); dividend reduced from 10 to 8 per cent.; to income tax and N.D.C., £7,500 (£11,000); to general reserve, nil (£5,000); carry forward, £40,007 (£39,947): London trade affected by evacuation but provincial trading has improved and some substantial Government contracts have been received.

Van den Berghs and Jurgens, Ltd.—Trading profit, 1939, £1,527,622 (£1,257,668); gross charge for taxation, £565,572 (£378,942); net charge for taxation, £461,595 (£297,208); ordinary dividend 12½ per cent. tax free against 12½ per cent. less tax; to contingencies reserve, £50,000 (£50,000); to general reserve, nil (£100,000); to staff pensions, £50,000 (nil); carry forward, £200,115 (£187,963).

San Paulo (Brazilian) Railway Company.—Main line receipts, 1939, £1,638,319 (£1,674,922); operating costs, £1,211,573 (£1,174,319); net revenue, £463,349 (£464,000); ordinary dividend increased from 2 to 2½ per cent. tax free; carry forward, £112,207 (£86,445); passengers increased by 798,592 and 83,080 more tonnage was carried than in 1938.

(Continued on page 796.)

Dividend Announcements

Rates are actual unless stated per annum or shown in cash per share. Rate for previous year refers to total dividend, unless marked by asterisk to indicate interim dividend.

(a) Equal to these rates per present A and B share. (b) Payable in equal instalments. (c) Includes special tax-free payment 3 per cent. from reserves. (d) Paid on larger capital. (e) Free of income tax.

BERGER (LEWIS) AND SONS, LTD.—Ordinary interim dividend maintained at 6 per cent.

BROKEN HILL PROPRIETARY COMPANY.—Dividend 3½ per cent. half-year to March 31, 1940, payable on increased capital, against 6¼ per cent.

DALGETY AND COMPANY.—Interim ordinary dividend 3 per cent. against 2 per cent.

MARCONI'S WIRELESS TELEGRAPH.—Final ordinary dividend 3½ per cent. making 7 per cent. for 1939, against 12 per cent. plus special dividend of 3 per cent. tax free.

NATIONAL BANK OF AUSTRALASIA.—Final dividend 3 per cent. making 6 per cent. for year to March 31, 1940, as before.

PENINSULAR AND ORIENTAL STEAM NAVIGATION.—Interim dividend maintained at 2 per cent.

RHOKANA CORPORATION.—Interim dividend in respect of year to June 30, 1940, maintained at 25 per cent. Tax deduction 5s. in £ being 7s. 6d. United Kingdom standard rate less provisional Dominion income tax relief at 2s. 6d. in £.

ROAN ANTELOPE COPPER.—With regard to recent interim dividend of 6d. per unit of ordinary stock, income tax will be deducted at 4s. in £, representing standard rate 7s. 6d. in £ less 3s. 6d. for Dominion income tax relief.

ROLLS ROYCE.—Interim dividend reduced from 7½ per cent. to 5 per cent.

ROYAL MAIL LINES.—Interim dividend in respect of 1939, 5 per cent. No further dividend will be recommended. This is the same as for 1938. Report and accounts delayed, but will be issued as soon as possible.

TUBE INVESTMENTS.—Interim dividend maintained at 10 per cent.

Industry and Trade

Compensation for Requisitioned Ships.—After protracted negotiations, the Ministry of Shipping has at last reached agreement with the shipowners concerning the rates of hire to be paid for requisitioned ships during the war. The principle of the scheme is to pay rates of hire which will cover running and maintenance costs and allow 5 per cent. for depreciation and 5 per cent. for interest. While this principle will presumably be applied to all classes of vessels—tramps, cargo and passenger liners, tankers and other ships—the actual rates of hire have been calculated on different bases. Thus the basic monthly rate of hire for tramps has been fixed at 6s. per ton dead weight for an 8,000-ton tramp steamer, with allowances for different types and sizes of vessels. The rate for smaller vessels, for example, is to be slightly higher, and an additional one shilling per ton is to be paid for motor ships. In the case of cargo liners, the proposal seems to be that running costs should be covered by a flat rate of 8s. per gross ton per month, with an allowance of 10 per cent. for depreciation and interest. Detailed comment on the scheme, however, has to be deferred until the publication of the White Paper.

Cotton Trade Regulations.—There has been a considerable amount of confusion in the cotton industry as a result of the new regulations by the Cotton Controller and the statement by the President of the Board of Trade. Certain adjustments have been made in spinning margins, and on the whole spinners are not dissatisfied; but there has been a storm of opposition to the change in the regulations for agent commissions, which are now to be paid by the buyer instead of by the spinner. In Manchester, on Tuesday, there was a meeting at the Chamber of Commerce of about 150 yarn agents, when it was decided to draw up a memorandum to be submitted to the President of the Board of Trade, and Sir Andrew Duncan is being asked to receive a deputation. The opinion is held that this alteration in an old trade custom will not in any way benefit the industry as a whole nor result in any decrease in the costs of production, while at the same time there is a danger of old-established yarn agency firms being driven out of business. The decision of the President of the Board of Trade to restrict the requirements of retailers to 75 per cent. of a year ago is not likely to cause much hardship, as during the last few months the retail establishments have not been able to secure such a percentage of former supplies. But the export trade still languishes owing mainly to the very high prices in this country. Unless the Cotton Controller can bring about a fall in the level of prices at which exporters can quote to overseas buyers, no amount of propaganda will have much effect.

Raw Cotton Stocks.—Since the beginning of the war no particulars have been available of stocks of raw cotton in Great Britain, but estimates can be made from the figures of exports from the United States and of deliveries to spinners. Total supplies are equal to over eight months' consumption at the present rate of about 125,000 bales per month for Lancashire only; in American qualities, the stock is even greater than this. At the end of last week the Ministry of Shipping announced that freight space for raw cotton from the United States from May 1st would be reduced to 50,000 bales, as compared with 100,000 bales during the last few months. Of the 50,000 bales promised, only 30,000 bales will be available for the trade, as 20,000 bales will be barter cotton in exchange for rubber. Arrangements have also been made for increased imports from South America and Africa.

The Match Trade.—In the last ten years, the import of matches has about equalled the volume of home production. Total consumption has been very steady at about 18 million gross of boxes, of which some 16½ million gross contained between 20 and 50 matches. Since 1933, the home manufacturers have had a preference of 7d. per gross of boxes; the Excise duty was 4s. 2d. and the Customs duty was 4s. 9d. per gross of boxes. The Chancellor of the Exchequer expects that the doubling of these rates (with an increase in the British preferential margin from 7d. to 8d.) will result in a doubling of the total revenue, which amounted to £4.2 millions in 1938-39. He has assumed, therefore, that both demand and supply will be unaffected by a rise in the price of an ordinary match box from 1d. to 1½d. It is possible, however, that both imports and home production will be affected by the course of the war. Home output is dependent on timber, largely imported, which may not be available in the same volume as in pre-war years. Imports of matches are very largely derived from the Baltic and Scandinavian States, as the following table shows:—

BRITISH SUPPLIES OF MATCHES
(Thousand gross boxes containing more than 20 matches)

	1935	1938
Home production†	10,949	...
Imports, total	9,846	8,335
of which from		
Russia	2,865	1,504
Sweden	1,637	2,194
Finland	666	663
Norway	431	568
Belgium	3,026	3,111

† Thousand gross boxes of 50 matches.

It is possible, therefore, that more drastic measures will be necessary before long to restrict the consumption of matches. They have in the past been so cheap that economy in their use has been unnecessary, but now the spills and other match substitutes of the last war are due for revival.

Food from Scandinavia.—In *The Economist* of September 23, 1939, a table was given on page 579 of the amounts of British imports of certain commodities which were drawn from the Northern States. The main points of that table are repeated below:—

BRITISH IMPORTS FROM BALTIC AND NORTH SEA COUNTRIES IN 1938

	Bacon and Hams	Butter	Eggs in Shell	Fish, fresh and frozen	Iron Ore and Scrap	Wood and Timber	Wood Pulp
	Mil. cwt.	Mil. cwt.	Thou. dozen	Mil. cwt.	£ mil.	£ mil.	£ mil.
Baltic States	0.73	1.16	33.9	...	...	13.72	5.62
Percent. of total British imports	9.7	12.2	12.2	...	...	32.0	36.3
Scandinavia	3.65	2.68	101.5	0.94	2.94	6.54	7.25
Percent. of total British imports	48.5	28.2	36.6	57.3	27.3	15.2	45.2

Canadian supplies of bacon and hams are being steadily increased, and from an export to this country of 1½ million cwt. in 1938, the level of exports in the four months from September, 1939, reached about double that quantity. Supplies both of bacon and hams could also be drawn if necessary from the United States, whose pig population is at a

SITES FOR WORKS Apply to above address for particulars

record size. New supplies of butter are not so easily found, since in 1938 the principal non-European suppliers, notably New Zealand and Australia, already sent more than 90 per cent. of their total exports to this country. Butter production in these countries could be somewhat increased by a diversion of milk supplies from cheese-making or from the home market, and it is possible that some South American countries, notably Argentina, could increase exports to Great Britain. The loss in egg imports may also be difficult to replace. Nearly all the Australian, South African and Irish supplies are already consigned to this market, and the total exports of the other main exporters—the Balkan States and Argentina—were not quite equal in 1938 to the gap left by the disappearance of Danish supplies. The Norwegian fishing fleet may still be able to supply considerable quantities of fish, but attempts are also being made to develop a trade in frozen fish from Newfoundland.

* * *

Woollen Exports to Scandinavia.—Sweden, Norway and Denmark have been important buyers of wool textiles from this country. Denmark, in particular, has taken considerable quantities of woollen piece-goods, while Sweden has imported wool as well as woollen and worsted tops for her own textile mills. The table below summarises British exports of wool and woollen goods to these three countries in 1938:—

BRITISH EXPORTS OF WOOLLEN GOODS IN 1938

	Total	Sweden	Norway	Denmark
Wool (mill. lb.).....	42.4	1.3	0.4	0.3
Tops (mill. lb.).....	32.5	3.7	0.6	1.9
Yarns (mill. lb.).....	34.7	1.4	1.0	2.3
Piece-goods, woollen (mill. sq. yds.).....	58.9	0.9	0.5	3.6
Piece-goods, worsted (mill. sq. yds.).....	31.6	0.4	0.7	2.0
Carpets (mill. sq. yds.)..	5.6	...	...	0.3

This trade has now come to a standstill. Since last September a good many export houses have shipped only on the basis that payment was made before the goods left this country, but this rule has sometimes been waived in favour of Scandinavian buyers, whose credit has been excellent. There was also a fair volume of work in hand against Scandinavian orders. As, however, the industry is very busy and pressure from the War Office for supplies continues, some of it may be transferred to other uses with considerable advantage.

* * *

Whale Oil.—As a result of the adoption of mechanical warfare against whales, their number has been seriously depleted in recent years. Certain species have been virtually exterminated, while others are threatened by the same fate. In the Arctic, where the hunting season falls in the summer, the production of whale oil has long ceased to be of decisive influence on supplies, and in the past ten years approximately nine-tenths of the world's whale oil was derived from the Antarctic. Even there limitations of hunting, such as the restriction of the whaling season in the waters south of latitude 40 deg. S. from early December to early March, the prohibition of catching certain species of whales, the creation of sanctuaries and limitations in the use of "whaling factories" and land stations had to be introduced by international agreement in recent years in order to maintain whale stocks. These limitations have led to a reduction in the world's whale oil production from the record of 614,000 long tons in 1931 to between 500,000 and 575,000 tons during the past four years. Even at this reduced rate of production, however, the whale population continued to decline. Germany, who produced between 10 and 15 per cent. of the world output of whale oil before the war, is now no longer in a position to send out its factories. The Norwegian fleet, which produced between one-third and one-half of the world's whale oil in the past ten years, is now on its way back from the Antarctic and will almost certainly make the United Kingdom its base so long as Norway is partly occupied by

Germany. As this country is the second largest whale oil producer (its share is almost one-third of the world's total), between two-thirds and three-quarters of the world's whale oil supply will be under British control for the duration of the war. In the past ten years Germany has absorbed more whale oil than any other country and, although her imports have declined in the past three years as a result of increased British competition, she took nearly one-third of world production until the outbreak of the war. In addition, more than one-quarter of world supplies was absorbed by Norway, Holland and Denmark. Although Britain's consumption rose from 62,000 tons in 1929 to about 180,000 tons in 1939 and may be raised further—whale oil is mainly used for making margarine and soap—she cannot absorb anything like the tonnages that are now prevented from reaching Germany and her adjoining countries, especially as large stocks have been accumulated by the Government since 1938. The intensification of the war in Europe may thus lead to a relaxation of the war in the Antarctic.

* * *

Germany's Chemical Industry.—At the outbreak of the last war Germany was the leading producer and exporter of chemicals. Yet without the capture of some 50,000 metric tons of Chilean saltpetre in Antwerp, she would not have had time to construct the plants for the production of synthetic ammonia, which was not produced in sufficient quantities until the end of 1916. During the whole war she remained short of nitrogen for fertilisers. The total consumption of nitrogenous fertilisers decreased from 210,000 tons in 1913-14 to 92,000 tons in 1917-18. The shortage of sulphur became serious, but the chemical industry was able to supply adequate quantities by producing sulphuric acid with the aid of gypsum and from industrial gases. As the war dragged on, the shortage of fats for the manufacture of glycerine became more pronounced. Sugar had to be used as a raw material. Later, nitro-cellulose replaced nitro-glycerine. Lack of natural textile fibres rapidly led to the production of artificial fibres, and, lastly, the foundation was laid for the manufacture of synthetic rubber. Actually no far-reaching inventions were made in 1914-18. The processes for manufacturing artificial textile fibres were already in use, and the Haber-Bosch method of fixation of atmospheric nitrogen was already known before the war. Light metals, particularly aluminium and duraluminium, were produced on a larger scale during the war. After the war, Germany's chemical industry rapidly recovered and led her other industries in the process of rationalisation by the formation of the "I.G. Farben Industrie," with a capital of Rm. 1,100 millions.

* * *

When the Nazi Party came to power in 1933, Germany's chemical industry was actively engaged in manufacturing synthetic petrol. The production of artificial textile fibres was expanding, and experiments in the production of synthetic rubber were conducted on a large scale. Plastic materials, used in manufacturing crockery and electric appliances, were already familiar products. Staple fibre had made its appearance, and light metals were increasing in number. In short, the stage was set for the industrial self-sufficiency drive of the Hitler regime. During the present war Germany's chemical industry will play an even more important part than in 1914-18. The most important raw materials for a successful expansion of the industry are to be found in abundance in Germany, i.e. potash, coal, lignite and magnesite for light metals. Artificial resins have replaced natural resins. There will be no shortage of rock phosphates and pyrites so long as she can maintain her imports from neutral countries, and the output of sulphuric acids, used chiefly in the production of fertilisers and artificial textile fibres, is likely to cover requirements. On the other hand, there will again be a shortage of natural fats. Based on figures relating to the production before

the war, Germany will be able to produce during 1940 approximately the following quantities of chemicals:—

ESTIMATED OUTPUT OF CERTAIN CHEMICALS IN 1940	
	Metric Tons
Sulphuric acid	2,500,000 to 2,800,000
Synthetic petrol	2,000,000
Synthetic rubber	60,000 to 80,000
Synthetic fatty acids	40,000
Plastic materials.....	50,000
Electrolytic chlorine.....	150,000

To this list could be added a great number of other products, such as synthetic sugar from wood for feeding purposes and the new artificial fibre produced from coal and limestone called PeCe. Efforts are being made to secure an adequate supply of fertilisers for agriculture. So far as potash and nitrogen fertilisers are concerned, there will be no difficulties, but the supply of phosphates may decrease gradually. Since the beginning of the war nearly all chemical companies have increased their capital expenditure, and a new wave of amalgamation has set in, especially in the potash industry. The magnitude of Germany's chemical industry is revealed by the fact that even in 1936 the net value of its output was Rm. 2,524 millions, or 7.4 per cent. of the net value of the output of all industries. This estimate includes the cellulose and artificial textile fibre industries. In the same year the industry's employees numbered 300,783, or 3.8 per cent. of the total number of workers employed in Germany's entire industry. Since then the size of the industry has been substantially increased.

* * *

Industrial Orders in America.—Another useful series of indices has been added to the multitude of American statistics by the National Industrial Conference Board. It consists of indices relating to the value of stocks in the hands of manufacturers, to new orders

VALUE OF MANUFACTURERS' STOCKS, NEW ORDERS AND DELIVERIES (1936 = 100)

	New Orders	Deliveries	Stocks (end month)
1929—Average	134	134	127
1930— "	99	105	125
1931— "	66	71	100
1932— "	41	46	78
1933— "	47	51	70
1934— "	61	65	87
1935— "	74	79	90
1936— "	100	100	100
1937— "	100	118	133
1938— "	79	85	118
1939—January	93	97	113
February	88	97	112
1940—January	108	121	131
February	97	116	130

placed with manufacturers and to deliveries. The indices are all adjusted for seasonal variations. Although the samples are still small, they cover virtually all the leading industries. The indices are likely to be of considerable assistance in an attempt to appreciate the probable course of business activity. As will be seen from the accompanying table, for example, the value of new orders continued

to decline in February, pointing to a further contraction in industrial production; preliminary information suggests that output did, in fact, show a fall last month. The accumulation of stocks, on the other hand, appears to have been arrested in February, and this suggested the possibility that the downward movement of production might slow down. Needless to say, there are no comparable statistics for this country. The new series will in future be published with the other American statistics in the monthly Trade Supplement.

* * *

Is There Enough Oil?—There was a time, not so many years ago, when fears of a coming oil shortage were widely entertained and when even the oil companies themselves had doubts about the adequacy of their underground reserves. In view of the vital rôle played by petroleum products in the modern world—in war and in peace—it is perhaps only natural that such fears should reappear from time to time. Fortunately, however, the oil industry has in recent years discovered far more oil than it has extracted from the soil. Thus the oil industry of the United States, which supplies two-thirds of the world's output, added 2,399 million barrels to its proved reserves last year, compared with a production of only 1,264 million barrels. At 18,483 million barrels—the estimate is that of the American Petroleum Institute—the industry's proved reserves are now higher than at any time in its history. The latest figure, moreover, is in no sense an estimate of the total quantity of oil in the subsoil of the United States. It is a conservative appraisal of reserves actually proved by drilling operations and recoverable by existing methods of production; it makes no allowance for the potential reserves of areas known to be favourable, but as yet untested by the drill. Of the gross addition to reserves last year, 341 million barrels are attributable to new pools and new producing horizons discovered during 1939 and 2,058 million barrels to the development and extension of existing fields. The greatest increase (805 million barrels) was recorded in Texas, whose reserves (9,768 million barrels) amount to more than one-half the national total. As an example of what is possible even in an old oilfield, the proved reserves in Illinois rose from 41 to 382 million barrels in the past two years, notwithstanding a record production during this period. In the light of the past year's results it may be of interest to recall that in 1914 the quantity of oil "in all known and possible oil-bearing areas" of the United States—whatever method of production might be employed—was put at 6,000 million barrels. Though almost 20,000 million barrels have since been taken from the ground, the country's reserves are now estimated, on a conservative basis, at more than three times that figure. There is no reason why similarly impressive results should not be achieved in many other producing countries, the potentialities of which have been explored far less thoroughly than those of the United States. Hence, although the trend of consumption will doubtless remain upwards, there is every reason to suppose that discovery will continue to exceed production for many years to come.

COMMODITY AND INDUSTRY NEWS

GRAIN prices remained very firm in North American markets, but those for cotton, rubber and tin tended to fall during the week. In London, there has been a sharp advance in the price of Para grades of rubber and raw cotton was also dearer on the week.

Cotton (Manchester).—Trading in the market has been dominated by the several new regulations issued by the Cotton Controller and the Board of Trade. The revised margins for spinners have been much as expected.

The change in the position of yarn agents is causing much resentment and strong representations are about to be made against the alteration. More spinners and manufacturers have been prepared to sell and there has been some increase in the amount of business done, although the total sales have not been so numerous as expected. Rather more export cloth orders have been booked, especially for South America, West Africa, and the Dominions. Fairly substantial Government contracts have been arranged.

COMPANY MEETINGS

DUNLOP RUBBER COMPANY, LIMITED

SUBSTANTIAL JUMP IN PROFITS

NOTABLE IMPROVEMENT OVERSEAS

SIR GEORGE BEHARRELL'S ADDRESS

The forty-first ordinary general meeting of the Dunlop Rubber Company, Limited, was held, on the 24th instant, at the Edward VII Rooms, Northumberland Avenue, London.

Sir J. George Beharrell, D.S.O., the chairman of the company, who presided, in the course of his speech, said: My lords, ladies and gentlemen, I take it that you will all have read with pleasure the satisfactory results disclosed by the directors' report and accounts for 1939.

These did not come altogether as a surprise to your board. They are the outcome of many years of spade-work and careful preparation and planning.

You will remember that when I addressed you last year I said that the underlying economic conditions were healthier than they had been at the beginning of 1938, and that the improvement in trade which had marked the last half of that year was continuing at the time at which I was speaking.

That improvement continued, in spite of the threatening international position, right up to the outbreak of war. Moreover, it was not confined to our own country, but applied practically to the whole of our world business. There seemed to be a real increase of demand and if only a peaceful solution of international problems could have been found, there is every probability that the world might have enjoyed a considerable period of genuine prosperity.

AN EXCELLENT POSITION

Your company found itself in an excellent position to benefit by these improved conditions.

You know how for many years your board has been working to improve the structure and efficiency of the world-wide Dunlop organisation.

Its basis had been broadened in two ways, first by a wider range of products and second by a greater spread of manufacturing units in well-chosen territories. As you will remember, we had acquired various businesses, now included in our rubber products division, and these have been reorganised and their profit-earning capacity increased by concentration on the most profitable lines. Years ago, companies had been allowed to acquire the Dunlop goodwill overseas. These have been purchased, reorganised and welded into the Dunlop family. Other overseas Dunlop companies had fought their way successfully through the difficulties of the years succeeding the last war, when they were trying to build up a business in highly industrialised territories. Important new factories had been established in British overseas territories in order to conserve and develop our trade there. The group had been relieved of financial burdens, and the balance-sheet position gradually strengthened; purchasing, research, manufacturing and sales policies had been carefully studied and improved, and a first-rate personnel built up by careful selection. By these means the Dunlop name had been made one of the most important and respected in the commercial world.

In these circumstances it was only reasonable to expect that, with favourable trade conditions, your company would enjoy a good year in 1939, but events have gone beyond this, and, had it not been for the war, I think I should have been able to present results even better than those now before you. In fact, everything seemed to go the right way for us. The demand for our products was good with very few exceptions, both at home and abroad, and prices remunerative; the rising price of rubber, which averaged 9d. over the whole year, as against just under 7½d. in 1938, benefited the plantations companies, and in its purchases of our main raw materials, especially rubber and cotton, your board's policy has proved a wise one.

I want to make it quite clear that this result was mainly obtained through our normal trade activities, only 7½ per cent. of the total turnover of the Dunlop group of companies for the year being due to direct Government orders. If we take the turnover of home companies alone, this business only represented 14 per cent. of the turnover. The proportion of Government business increased after the outbreak of war, and to-day is, of course, considerably higher.

We have responded promptly to all demands made upon us, demands which have involved the company in considerable capital outlay.

It is a source of great encouragement to us for the future to realise how little our success in 1939 was dependent on direct Government orders, and how much was due to export and foreign business.

THE ACCOUNTS

The net profit for the year amounted to £2,853,000, compared with £1,501,000 in 1938. A reference to the comparative results of the years 1934-39 shows at a glance how the level of profits in 1939 is far in excess of those of the preceding five years. While paying due regard to the uncertainty and difficulties which are ahead of all large undertakings, the board decided, after providing for the preference dividends, to recommend a dividend of 8 per cent. on the ordinary stock and a bonus of 4 per cent., and this dividend and bonus, if approved, will be paid on May 8. In the accounts income-tax has been deducted from this dividend and bonus at the rate of 7s. 6d. in the pound.

This recommendation was, of course, made without any knowledge of legislation affecting the dividends of public companies outlined by the Chancellor of the Exchequer in opening his Budget in the House of Commons yesterday. If a limitation is imposed by Parliament we shall be subject to it, of course, in future during the period for which the legislation operates. Incidentally, it may be worth observing that the Dunlop shares, after the huge losses incurred in the post war period, were reduced to one-third of their original nominal value, so that on the original par value the distribution is only equivalent to 4 per cent.

FINANCES STRENGTHENED

After providing for this increased distribution, the directors have been able to increase still further the financial strength of the company, and I am sure this decision will be wholeheartedly approved.

The total charge to the year 1939 for taxation on profits is £1,527,000, in addition to which there has been borne by subsidiary companies a taxation charge of £861,000, making a total for the Dunlop group of companies for the year of £2,388,000; the comparable figure for the year 1938 was £820,000.

These facts will make clear to you the great burden that industry carries in time of war. You will all, I know, agree that every company should make its fair contribution to the cost of the war, but the law regulating the Excess Profits Tax, as it stands at present, leads to many serious inequities which, in our opinion, will increase unfairly the burden falling upon companies similarly situated to ourselves. Probably the most serious is the treatment of the profits of foreign subsidiaries. The problem bristles with difficulties far too technical for discussion here. In association with others, strong representations are being made to the Chancellor of the Exchequer, and I hope his promise to amend the Act will be carried out in the very near future.

In my view, the only equitable basis is that Excess Profits Tax should be levied only on the amount of profits remitted to this country.

DUNLOP PLANTATIONS

At our meeting last year I told you that it had been decided to transfer the administration and control of the company's rubber estates to Malaya. Effect was given to this decision on April 1, 1939, when the new Malayan company, Dunlop Malayan Estates, Limited, commenced operations. Accordingly from that date Dunlop Plantations, Limited, became a holding company. The prospects for the current year, so far as dividends from the Malayan company are concerned, appear to be exceptionally bright, but taxation may absorb a very substantial part of the balance available for distribution by the Plantations Company. This is one of your

subsidiaries with an unfavourable base year for calculating Excess Profits Tax liability.

We have received excellent reports of the working of the Malayan company. The extensive budded areas are giving excellent results, and are fulfilling the high hopes entertained when this important development in rubber planting was decided upon.

HOME COMPANIES AND DIVISIONS

The Dunlop Cotton Mills were, from the beginning of the year, called upon for maximum output, and records in weekly production were achieved in both spinning and weaving departments. In spite of war difficulties, we have adequate stocks of raw materials in our warehouses, and arrivals from overseas continue satisfactorily.

TYRE DIVISION

Dealing now with the business of the tyre division, the mechanisation of our land forces entails the use of both pneumatic and solid tyres, many of which are of specialised construction. The importance of the tyre as a factor of mobility needs no emphasis, nor need I do more than refer to its importance in aerial warfare.

The sales of motor covers for the first eight months of 1939 promised a record year. This situation was entirely changed by the severe restrictions on private motoring necessitated by the outbreak of war. At the end of the year it was estimated that one million cars had been laid up by their owners, and the car manufacturing business, which had shown a splendid recovery in the first part of the year, suffered a serious reverse. Replacement sales of motor-car tyres for the complete year were below those of 1938, and sales for original equipment had to fall into line with the reduced volume of car production. The position of commercial vehicle tyres was better, as commercial transport was not interfered with to the same extent by war conditions. As a result, our total sales of commercial vehicle tyres for the year constituted a record.

We also had record sales of aero covers, due, of course, to the armament programme, and the replacement business in cycle tyres was the highest we have ever known. With the assistance of these compensating factors, the net profits of the tyre division showed a substantial increase over those of 1938, in spite of the setback in regard to motor covers, normally our most important line of business.

Our rim and wheel companies also had a successful year, the falling off in cycle and motor-cycle rims and motor-car wheels after the end of August being in some degree compensated by the high level of production in other sections.

RUBBER PRODUCTS GROUP

Turning to the rubber products group, the general rubber goods division made further progress, sales reaching a record high level, though the ratio of profits to sales fell in comparison with 1938, owing to rising costs and the increased proportion of Government business, which has a relatively low profit margin.

Our subsidiary, the India Tyre and Rubber Company, Limited, continues to operate from Inchinnan, Scotland, as a separate but co-ordinated entity. From the point of view of production, sales and profits, the year has been one of excellent progress. The board's policy of controlling an auxiliary tyre-producing unit within the British Isles had been amply justified before the outbreak of war—obviously war conditions emphasise this justification.

OVERSEAS COMPANIES

This group shows the greatest improvement. Its profits are nearly nine times greater than in the previous year, and account for over half the increase in the total profits of the company.

When I spoke to you last year I said that subject to the continuance of the improved general trading conditions in America, the outlook of the American Dunlop Company for 1939 was more promising than it had been for many years. I am glad to be able to tell you that the improvement was maintained and my hopeful forecast has been amply justified. In spite of a price war in the American tyre industry, during June and July, the company's net sales increased substantially over 1938 and a satisfactory profit was made. I expect that 1940 will also be a profitable year for the American company.

The improved position of the Dunlop Tyre and Rubber Goods Company in the Canadian market has been well maintained, and the company was able to benefit by the general improvement of Canadian business in 1939. Net sales advanced substantially and a small profit was earned. The company now holds a much more

satisfactory share of the total replacement business of the Canadian tyre industry than it did five years ago.

In spite of difficulties caused by war conditions, the Japanese Dunlop Company's sales and profits showed an improvement over 1938 and a satisfactory dividend in respect of the 1938 profits was remitted to this country.

The Irish Dunlop Company again had a good year, with an improvement in net turnover. Our status in the market is exceedingly good, and I would like to say how much we appreciate our cordial relations with the Irish Government and its officials.

There was a noteworthy expansion in the business of the two latest additions to the company's factories overseas—those in India and South Africa—and substantial profits accrued to the parent company.

EXPORT SALES PROFITS HIGHER

In export sales the company had a remarkable year, both as regards volume and turnover. In spite of the increasing restriction of markets through currency difficulties, largely increased profits were made. This is a matter of the greatest national importance at the present time, and we hope still further to improve the position in 1940.

The outbreak of hostilities found us prepared for the event, in the sense that we had taken all possible steps to safeguard the company's interests against difficulties which might otherwise have arisen. In the countries overrun or dominated by Germany and Russia in 1939 our losses have been quite insignificant.

EFFECT OF WAR CONDITIONS

The war has presented industry generally with an entirely new set of problems. Companies have found themselves suddenly called upon to meet largely increased Government demands for their products, or to undertake entirely new lines of manufacture. At the same time, shortage of materials has necessitated rationing arrangements, and caused inevitable interference with the delivery of goods to the trade, since, of course, Government requirements have to be given preference where sufficient material for all is not available.

Our customers have been most patient and considerate of the difficulties in which we are placed, and I am glad of this opportunity to thank them for their indulgence and co-operation—it is very gratifying to have such unmistakable evidence of the goodwill existing between Dunlop and the trade. The volume of supplies which will be available to the trade in future will depend upon Government demands and availability of materials. It must not be forgotten that the urgent national need for export trade, to which I have already referred, may make further encroachment on the supplies available for the home market.

PROSPECTS

This brings me to the end of my story of the year 1939. It has been a very great pleasure to me to be able to tell you such a story, and I have no doubt it has been a satisfaction to you to hear it. What can I say of the future? Had the war not come upon us, I firmly believe that we should have had an even more prosperous year in 1939 and might have looked forward to equal prosperity in 1940. The strength of our organisation and the solidity of our financial position would, I think, have justified such optimism. But as things are to-day, in this war-shaken world, you will hardly expect that degree of optimism from me—indeed, you will hardly expect me to prophesy at all. There are too many unknown and unknowable factors.

We are better fitted than we have ever been to take advantage of whatever opportunities may arise for normal trading at home and abroad, but as the war goes on, trading conditions are likely to become more and more abnormal. An increasing proportion of our output will probably be required to meet Government demands, the profits on which are closely controlled and will be below those which are usually regarded as adequate, and even necessary, for sound trading. We may have to contend with shortages of labour and materials. Profits will be dependent on prices both here and overseas, the trend of which no one can foresee with certainty. The already staggering burden of taxation may increase.

I can only say that our goodwill is more valuable all over the world than ever before; that our organisation is in better shape than at any time within my experience, to cope with any difficulties that may confront us; and that, like the rest of the country and the Empire, we face the future with determination and confidence. (Applause.)

The report and accounts were unanimously adopted.

GENERAL ACCIDENT FIRE AND LIFE ASSURANCE CORPORATION, LIMITED

A POSITION OF GREAT STRENGTH
ORDINARY DIVIDEND 70 PER CENT.

The fifty-fourth annual general meeting of this company was held, on the 24th instant, in Perth.

Sir Francis Norie-Miller, Bt., the chairman, who presided and moved the adoption of the report and accounts, first referred to the patriotic efforts of the Corporation and everyone connected with it. A contribution of £1,000 had been made to the Red Cross Fund of the Lord Mayor of London, their group had applied for £260,000 of the 3 per cent. loan and the staff had already taken up 13,484 War Savings Certificates. But what made them prouder than anything else was that more than 750 of their staff in the British Isles had volunteered for service at home and abroad; to them the company was paying the difference between their salaries and their pay and allowances in the Forces.

Dealing with the accounts, the first presented under war conditions, the chairman said that the figures demonstrated the inherent strength of their great company. In the life department they would note a saving of some £21,000 had been effected during the year. The funds of the department, as also the premium income, had doubled in amount since the affiliation of the "General Life" company with the "General Accident."

Their fire account again showed an extremely satisfactory profit. The net premium income after deducting all reinsurances was £747,243, showing an increase of some £15,000. The profit was £182,270, and there was an additional reserve of £300,000, so that the reserve on that very remunerative account was no less than around £599,000. Their fire business was on such lines that he felt confident they would, before long, have a net income of £1,000,000.

In the accident and general account the net premium showed a reduction of £190,705. Although the war had been a factor in bringing about that reduction, it was not the only factor, as conditions in the United States had tended towards a decrease in business. The net profit of £312,103 was not unsatisfactory in the circumstances, especially as ample provision had been made for unexpired risk and outstanding claims.

A WONDERFUL SHOWING

The profit and loss account must bring to all of them keen satisfaction at the magnificent position to which their company had attained. Notwithstanding the war and the difficulties to which he had referred, they were paying the same dividend, namely, 70 per cent., which was about £30,000 less than the net interest earnings. That in itself was a wonderful showing, but he would point out again that their carry-forward, which was now £860,000, was their equalisation of dividend fund and they had in addition a general reserve of £2,000,000 over and above every other reserve, after all the company's liabilities had been amply provided for. That extremely satisfactory position was the result of conservation of their funds for many years past.

With regard to the question of depreciation of investments, he rejoiced to tell them that the fund set up in previous years, to which £200,000 had been added last year, actually showed a substantial surplus in excess of what was required to provide for the difference between the book values of current assets and liabilities, and their market values at rates of exchange ruling at December 31st, while at the date of the issue of the report the investments had improved by a very large sum over the prices of December 31st last.

Mr Frederick Richardson (deputy-chairman), in seconding the motion, paid a tribute to the chairman's activities in all good works with especial appreciation of his unique achievements in the field of insurance. Their company did business in nearly every part of the British Empire, and in foreign countries, wherever there was a fair prospect, they had gone far and near to establish connections. It was a comforting thought in these days of depreciated exchange that the company possessed a flourishing business in the United States and the Dominions. They had large funds abroad in good, safe democratic countries and no commitments in places which need give them any but the slightest financial concern.

Dealing with the company's motor business, he said that though while war lasted the company was bound to suffer a reduction in premium income the falling off had not been as great as anticipated and with the return of milder weather there had been encouraging signs of renewed activity.

The report and accounts were unanimously adopted.

SUNDAY PICTORIAL NEWSPAPERS (1920), LIMITED

GRATIFYING PROFITS

The twentieth ordinary general meeting of this company was held, on the 24th instant, in London.

Mr John Cowley, who presided, said: Ladies and gentlemen, the profit for the year ended February 29, 1940, after providing for taxation, working, office and other expenses, contingencies, etc., amounted to £203,643 10s. 6d., which is £47,917 more than the profit of the previous year. The sum of £20,000 has been placed to reserve account, £25,000 to reserve for taxation, and £5,000 has been applied as a provision for pensions. During our year we paid an interim dividend of 2½ per cent. and recommend the payment of a final dividend of 7½ per cent., which will make a total of 10 per cent. on the ordinary shares. There will remain a sum of £134,540 7s. to carry forward, which is more than the amount brought in from last year by £8,644. The reserve account has been made up to £340,000 by the addition of the £20,000 I have mentioned, and we have thought it prudent to transfer £25,000 to reserve for taxation, bringing the total amount under this heading on the balance sheet to £50,000. The addition of £5,000 to the provision for pensions brings this account up to £75,000. The item creditors, surplus on sale of investments and reserve for contingencies is down roughly £9,000 at £486,550. This reflects a reduction in the amount we owed at the date of the balance sheet, the reserves included being higher than a year ago.

INVESTMENT POSITION

Investments at cost or under at £2,277,662 18s. 8d. are down by the small sum of £4,711. Since the close of the year we subscribed £25,000 to the new War Loan. You will notice a footnote on the balance sheet regarding the value of our investments. You are aware that we hold large blocks of shares in companies in the newspaper, pulp and paper-making industries. The market value of some of these holdings has fallen very considerably, and you will not be surprised to learn that the dividends we received during the year were much lower. I will, a little later, make a further reference to our large investment in Anglo-Canadian Pulp and Paper Mills, Limited. Taking debtors and cash together, these items show an increase of around £72,000, reflecting in some measure the improvement in our trading during the year.

You will understand the many difficulties of newspaper production in these days. Most of the material for paper-making has to be imported, and by a recent paper control order the amount of paper supplied by mills to customers has been drastically reduced. The price of paper has been sharply advanced, and in July we shall be paying £25 per ton, against a pre-war figure of only two-fifths of this cost. To meet the situation we have, in agreement with other newspapers, reduced the size of the *Sunday Pictorial* to 24 pages. Further reductions in the number of pages of all newspapers appear to be inevitable. This, of course, means that the space devoted to advertisements will be curtailed.

A year ago when we met I made particular reference to the position of Anglo-Canadian Pulp and Paper Mills, Limited, in which company we are largely interested. A scheme for its financial reorganisation has been prepared which, if carried out, I hope will place that company in a much sounder position. Business in the newsprint industry in Canada is improving, and we are confident as a result that the Anglo-Canadian Company will enjoy a fair measure of prosperity.

It is a pleasure to be able to tell you that during last year the net sale of the *Sunday Pictorial* greatly increased, and its advertisement revenue was well maintained. We have in the *Sunday Pictorial* a very excellent property. The profits of the past year I think were gratifying, and, without making any promise with regard to the future, I can safely say everyone in our business will continue to work whole-heartedly to obtain the best possible results. You all will appreciate that we are conducting business in wartime. Increases in cost of materials and services—and I would again emphasise the constant rise in the price of paper—difficulty of obtaining supplies of necessary materials, particularly paper, the continual readjustment of the personnel owing to people being called up for service, are matters which necessarily must be closely watched and dealt with. However, in spite of our troubles and difficulties, I think we are entitled to look forward with a good deal of confidence.

The report and accounts were unanimously adopted.

AGRICULTURAL MORTGAGE CORPORATION, LIMITED

CHANGED CONDITIONS

The eleventh ordinary general meeting of the Agricultural Mortgage Corporation, Limited, was held, on the 24th instant, in London.

Sir Harry Goschen, Bt., K.B.E. (the chairman), said that during the past year they had granted further long-term loans of £409,170, bringing the total amount advanced up to £13,298,910, secured on first mortgage of 902,102 acres of agricultural land, together with the necessary farmhouses and buildings, valued in all at £20,873,527. In addition, advances of a further £123,520 had been sanctioned, and the amounts would be paid over as soon as the necessary formalities had been completed. The total of loans granted under the Improvement of Land Acts had increased to £121,791.

Interest and capital repayments due on their loans continued as a whole to be promptly met. War conditions had created special difficulties for many of their borrowers, and they had endeavoured to afford them all reasonable assistance by allowing postponements of the dates of payments and by various other concessions granted to those who had been particularly hard hit by present conditions.

The conditions prevailing in the farming industry had changed very quickly after the outbreak of war. The plough had again been called upon to safeguard the nation's food supplies, and the task of converting the 2,000,000 acres asked for by the Government from grass to arable was nearing completion, so that they could look forward to a properly balanced agriculture being established.

From the production point of view the past year had proved reasonably satisfactory. Corn crops had been fairly up to the average, although in some districts wheat had been disappointing and showery weather had added to the difficulties of the harvest. Root crops had yielded fair returns and sugar beet had proved particularly good.

Livestock of all classes, with the exception of sheep, had met a fairly good market during the year; beef prices had been better and the good trade for dairy cows and heifers had been a prominent feature.

HELP FOR FARMERS

During the year there had been much legislation affecting agriculture and rural interests. That had been designed to enable farmers to carry out the tasks allotted to them, to pay better wages to their workers and to attract capital.

The Agricultural Development Act, 1939, contained a provision for the payment of not more than £60,000 per year for 20 years to the Corporation to enable it to continue to grant loans at its present basic rates of 4½ per cent. per annum for mortgage loans and 4 per cent. per annum for improvement loans. Much had already been done to restore faith in the farming industry, and the Prime Minister's pledge of the Government's intention to maintain a stable agriculture after the war had created an atmosphere in which the new programme of increased production could be pushed forward with every confidence.

As to the accounts, during the year they had granted new loans of £409,000, but special repayments at £389,000, in addition to normal reductions, had brought down the balance of loans outstanding to a figure some £60,000 below that of last year. They still had cash and free investments of more than £2,000,000, and they would be very glad to see that amount quickly absorbed in the granting of new loans. The advantage of borrowing at a reasonable rate of interest fixed for a long term of years should be particularly evident to farmers at present.

The profit and loss account showed a further fall in interest on loans. That was due to the increasing proportion of loans now running at the lower rates of interest, and it was to meet the consequent deficiency in revenue that a payment of £22,500 under the provisions of the Agricultural Development Act, 1939, had been made to the Corporation by the Minister of Agriculture and Fisheries. After bringing in £5,000 from general reserve, making provision for all bad and doubtful debts and setting aside a sum sufficient to cover all interest payments due from borrowers up to December 31, 1939, and not received by the end of the corporation's financial year, the amount available on profit and loss account was £14,836. Of that amount £2,664 had been transferred to special reserve and £3,333 written off discount on issue of debenture stock, leaving a balance of £8,839.

The report was unanimously adopted.

INTERNATIONAL NICKEL COMPANY OF CANADA, LIMITED

INCREASED SALES

The annual meeting of the International Nickel Company of Canada, Limited, was held, on the 24th instant, at Toronto.

Mr Robert C. Stanley (chairman and president) said that sales of nickel in all forms totalled 210,194,135 lb., an amount slightly in excess of the previous peak year 1937, in which 207,700,943 lb. of nickel were sold.

Sales of copper were 324,850,921 lb., comparable with 292,129,727 lb. in the previous year. This amount was somewhat more than their refining capacity and was accounted for by sales from stock to meet initial orders from the British Government. He wished to confirm press announcements that the company contracted with the British Ministry of Supply to deliver during the period from September 1, 1939, to September 1, 1940, approximately 80 per cent. of its output of electrolytic copper, or 240,000,000 lb. This metal was being delivered f.a.s. Canadian port and the price, in Canadian currency, approximated that ruling on the London Metal Exchange just prior to the declaration of war. While this price was less than the present world price, it was equitable and reflected the desire of the company to do its part in assisting His Majesty's Government during the present crisis.

The company was now the world's predominant producer of platinum metals. These strategic metals were of importance to the war programme, and were subject to Government control and were being dealt with in the same manner as their nickel. During the year the company sold 240,778 ounces of platinum metals, comparable with 193,195 ounces in 1938.

METAL PRICES AND TAXATION

The net profit for 1939 was \$36,847,466. Since sales of nickel, copper and platinum metals were in each instance greater in quantity than in 1937, shareholders might question why the net profit was \$13,452,158 less for 1939 than for 1937. The difference was due principally to two factors: lower realised prices for metals sold and increased taxes.

In the case of copper, for example, the average realised price in 1939 was 3.34 cents less per pound than in 1937. This difference, applied to the tonnage sold, amounted to \$10,834,870.

In the case of platinum metals, the average realised price in 1939 was \$6.30 per ounce lower than in 1937. The lower prices, applied to the respective quantities of platinum metals sold in 1939, accounted for \$2,269,686.

As to the item of taxes, we all knew that the war must be financed and that increased taxes must be levied. The increase in their composite tax rate for 1939 over that of 1937 accounted for an additional charge of \$3,099,572 against net profit. These three items accounted for \$16,204,128, thus exceeding the figure of \$13,452,158 by which the net profit for 1939 was lower than the net profit for 1937. It was therefore evident that the relative decrease in earnings in comparison with 1937 was due to uncontrollable causes.

In conclusion, the Chairman quoted from the section entitled "Outlook" in the annual report, as follows:—

"With the world at war, channels of trade are so badly disorganised that it is impossible to forecast with any certainty the immediate prospects for your company.

"It may be assumed that, whether the conflict be of short or long duration, the requirements of His Majesty's Governments in Canada and Great Britain will provide, during the war, an outlet for a substantial portion of the company's output of metals. From the long-range view-point, however, the company should not rely solely on Empire markets, but must now anticipate and consider conditions which all industry must face when the war is over.

"The most effective safeguard at that time against unemployment and paralysis of industry generally would be a firmly established export trade such as your company has always enjoyed and desires to augment.

"Your company is so well equipped with plant facilities and experienced personnel that, with Government co-operation by way of easing trade restrictions, it can reasonably hope to continue without interruption, in available markets, its essential long-range programme of developing and increasing the use of its products.

"Your company will thus not only safeguard the Canadian nickel industry, but will contribute its part in fostering the Empire's foreign trade so indispensable in establishing world peace which, to be lasting, must depend primarily upon a freer exchange of commodities between all countries."

RUBBER PLANTATIONS INVESTMENT TRUST, LIMITED

DISTRIBUTION OF 10 PER CENT. MAINTAINED

The thirty-first ordinary general meeting of the Rubber Plantations Investment Trust, Limited, was held, on the 24th instant, in London.

Mr H. J. Welch (the chairman), in the course of his speech, said:—Since our last meeting we have passed through an almost continuous period of political and financial disturbance, accompanied throughout last year by a reduction of dividends upon our investments. Having regard to these adverse conditions, you may not consider the results for the year unsatisfactory.

Our £3,192,936 of investments cover some 250 holdings, of which over 50 per cent. are within the British Empire and 48 per cent. within the Netherlands East Indies. The changes in 1939, however, have made little difference in the agricultural distribution. Over 54 per cent. of the employed capital is in rubber, over 30 per cent. in tea, 5½ per cent. in other plantation products and about 10 per cent. in the shares of leading bank, insurance, trust and other financial institutions. There has been a slight increase in the percentage of investments held in the form of ordinary shares, since at December 31st last we held a little over 96½ per cent. in equity stocks, as compared with 94 per cent. in 1938.

At December 31st last the value of our investments was in excess of their book cost by over £130,000. A valuation made within the last day or two shows a surplus over book cost.

The gross revenue of the company for the past year was £193,880, as compared with £273,480 for 1938. The directors propose to transfer £40,000 from dividend equalisation reserve to revenue account, and to pay a final dividend of 6 per cent., maintaining the distribution at 10 per cent.—the same as for the two previous years.

As to prospects, the excess profits tax must adversely affect the amount of distributable profits of a large number of companies, but at present it appears that the profits of our subsidiary company, Sumatra Tea Estates, will show an increase, and there is every indication that the income we shall receive from our other plantation investments will be considerably higher than last year.

TEA AND RUBBER

At the outbreak of war the Ministry of Food requisitioned the whole of the bonded tea stocks in this country and the subsequent arrivals in the United Kingdom. They later entered into a contract with Indian and Ceylon producers which covered Indian tea required for this country produced up to the end of 1939, and Ceylon tea required for this country shipped up to the end of 1939. The teas were taken at prices based on the level of values ruling in London public auctions during the week commencing August 21st. The Ministry of Food have agreed to take from India, Ceylon and British East Africa about 530 million lbs. of tea at prices based on the average prices of the crops for the three calendar years 1936, 1937 and 1938, subject to certain adjustments for increased costs, etc.

The current price of rubber is no more than sufficient to give a reasonable return on restricted production. The outlook for the remainder of 1940 is naturally rather obscure. In the United States, although another recession in business activity has set in, it is not generally expected to be severe. So far as rubber is concerned, the American questionnaire figures are reassuring, for they showed American consumption amounted to 155,000 tons during the first quarter. Probably there will be an increased demand for tyres for original equipment because the output of new automobiles is expected to be greater than it was last year, and although replacement demand may be less, it seems likely that the United States will use as much rubber in 1940 as in 1939. There is little sign of any serious decline in the absorption of the Allied countries or of the European neutrals, but with Germany and Poland eliminated from the market, the absorption during 1940 may prove to be substantially below that of 1939. If the percentage were to remain at 80 for the whole year, nearly 1,350,000 tons of rubber could be exported, of which about 80,000 tons would be barter rubber and about 1,270,000 tons would be available for ordinary trade purposes and additions to stock. This quantity could be produced, but it would doubtless prove to be a great deal more than the market could absorb at a reasonable level of price. A substantial reduction in the percentage during the second half of the year may therefore be expected.

The report was unanimously adopted.

CHAMPION REEF GOLD MINES OF INDIA, LIMITED

SATISFACTORY YEAR'S WORKING

DIVIDEND OF 40 PER CENT.

The ordinary general meeting of the Champion Reef Gold Mines of India, Limited, was held, on the 25th instant, in London.

The Hon. A. T. J. Fraser, D.S.O. (chairman), said that during the year the mine produced 69,058 oz. of fine gold from 161,220 tons crushed. The total income was £514,236, and total expenditure £314,480, leaving a profit of £199,755, which was £9,200 more than in the previous year. A total dividend of 40 per cent., or 4s. per unit, the same as for 1938, was being paid. Ore reserves at 543,323 tons, averaging 10.88 dwts., showed an increase of 12,000 tons, but a decrease of a quarter of a dwt. in average grade, over the previous year. That was eminently satisfactory as a smaller amount of development had been done on the high-grade Glen ore shoot, many working faces being closed down at the hottest period of the year. It had been hoped that the new air cooling plant might have been in operation by early May, but with the inevitable war delays the present estimated date of early July might be considered satisfactory.

The Board considered the expropriation by the Mysore Government of 75 per cent. of the amount by which the price of gold exceeded 150s. per ounce to be most unjustifiable. It was true that other countries had taken similar measures, but in those cases it was quite definitely as a war tax, and the South African Government, realising the unfairness of the measure, had substituted a profits tax. As regards British taxation, burdensome though it might be, they had no valid objection. The Mysore Government would in any case take a very considerable proportion of the extra value and profit represented by the 13s. 6d. per ounce that they were now swallowing wholesale. No allowance was made for the serious rise in stores and material, and the action of the Mysore State would hinder the policy of milling lower grade ore as the price of gold rose, thereby eventually shortening the life of the mine. It would also reduce the amount paid in taxation to the British Government.

MR SYDNEY E. TAYLOR'S SPEECH

Mr Sydney E. Taylor, D.S.C., said that last year he expressed the hope that the scheme for carrying the mine to greater depths would be in operation within the original estimate of four years from the time of commencement early in 1936. Unfortunately, the completion of the scheme had been held up owing to the delay in the delivery of certain parts of the new winding engine for Gifford shaft. Those parts had now reached the mine, and the erection of the winding engine was proceeding. Consequent upon this delay, the full benefit to the ventilation of the mine had not yet been obtained. The neighbouring Oregum Mine had obtained such beneficial results from the installation of an air-conditioning plant that it was decided to erect a similar plant for Champion Reef. Most of the plant had now reached the mine, and it was hoped to bring it into operation within the next few months.

Development results continued to be very satisfactory. The development of the folded ore body in the Northern section and Glen ore shoot in the Southern section continued to yield satisfactory results. On the folds a large tonnage of ore of over 6 dwts. grade had been added to the ore reserves during the year, and there was a further large tonnage of somewhat lower grade that had not been brought into the reserves which would be mined and go to the mill. The productive length of Glen ore shoot was somewhat less than it was two or three years ago, but it continued to be a most important ore body.

The working costs in 1939 were 2s. 7½d. per ton higher than in 1938, due in part to more work being done in supporting the ground in the stopes on the folds in the northern section consequent upon the expansion of work in that section and in part to the trying conditions in the hot weather which impaired efficiency and increased the cost of ventilation.

The report and accounts were unanimously adopted.

Every year many hundreds of Companies publish Reports of their Annual General Meetings in *The Economist*, thereby reaching thousands of investors in the quiet of their own homes.

Full particulars of the charges for inserting these reports may be obtained on application to The Reporting Manager, *The Economist*, 8 Bouverie Street, E.C.4.

MOSS' EMPIRES, LIMITED

SATISFACTORY RESULTS

The forty-first ordinary general meeting of Moss' Empires, Limited, was held, on the 19th instant, in London.

Colonel J. J. Gillespie (the chairman), in the course of his speech, said:—Reductions in debenture debts formed the only change of real importance in the balance sheet.

Contingent liabilities representing guarantees of bank advances to allied companies have been reduced from £34,000 to £4,000 since the close of the accounts. At the present time nothing is outstanding and owing on such contingent liability.

Profit from trading at £160,727 was about £13,000 less than in 1938, the decrease being wholly due to the international situation in August and the subsequent outbreak of war. Trading profit for the first seven and a half months of 1939 was substantially in excess of the corresponding period of 1938.

Only two of the theatres are still closed, one to be shortly reopened as a picture house and the other on the completion of alterations.

ations resolved upon prior to the outbreak of war but since held in abeyance.

Net profits are £15,400 less than for 1938 after providing for £6,000 of additional income tax, which result the directors regard as satisfactory considering the difficulties with which the management have been faced.

A dividend on the ordinary stock is recommended at the rate of 3 per cent., less income tax at standard rate, making 8 per cent. for the year, as against 10 per cent. for 1938.

Trading results for 1940 so far as the year has gone show an improvement over the corresponding period of 1939. I cannot say what is before us, but, so far as talent is concerned, we are standing better than we did twelve months ago. People in wartime must have relaxation, and we are doing our best to meet the public taste.

I mentioned in my speech at the last annual meeting that there were rumours about our rebuilding the London Hippodrome Theatre. That has been abandoned, and we have done our best to satisfy the Lord Chamberlain's requirements instead.

The report and accounts were unanimously adopted.

COMMODITY MARKETS

(Continued from page 787)

Metals.—The United States lead statistics, published this week, showed an advance in deliveries from 39,200 short tons in February to 46,400 tons in March; production rose from 43,300 to 48,400 short tons, so that stocks in producers' hands rose by another 2,000 tons to 74,700 tons in the course of last month. American metal prices were unchanged, in spite of some improvement in demand.

Tin.—After a setback to £252 15s. on Monday, the standard cash price for tin recovered to £254 5s. and thus showed a net loss of 15s. on the week. The backwardation narrowed from £5 10s. to £5 this week. The setback in the earlier part of the week was largely due to fears that a German invasion of Holland might lead to a breakdown of the tin scheme. Supplies in this country are still tightly held, especially as stocks in official warehouses in this country showed a further decline from 1,247 tons to 1,061 long tons in the course of last week. Ore arrivals at British smelters, however, are known to be large, so that no genuine shortage is expected. According to the International Tin Research and Development Council, international smelter stocks of tin amounted to 15,579 long tons on March 31st last against 14,803 tons a month before. The end-March figure is the highest since the middle of 1938. A further increase is likely to take place in April, the first month of the new quota period.

Grains.—North American markets remain firm, in spite of heavy deliveries. The Cereals Import Committee is now so well supplied with Canadian wheat that no more shipments are being made until June. Exports of grains from the Balkans are slowing down; most of last year's surplus has been cleared and the prospects for the coming harvest are at present very poor. Exports of wheat from the Plate are good and the low price of Argentine maize, compared both with those of American maize and of other cereals, should stimulate its shipment.

Oils and Oilseeds.—Shipments of oils and oilseeds from producing coun-

tries are well maintained. Exports of linseed from India are improving as the new crop becomes available, and prices are firm. Supplies in this country are satisfactory, though the minor users are strictly rationed. The output of margarine and cooking fats is estimated at about 7,000-8,000 tons a week.

Rubber.—In London, Para grades were marked up by 2d. per lb. to 1s. 2d. per lb. at the end of last week, but prices for standard sheet were unaltered. There was a further fall in American prices.

Export Groups.—In *The Economist* of April 6th we gave a list of industries which had organised export groups. Since then many more groups have been formed, a list of which is given below:—

EXPORT GROUPS

Bag Frame and Bag Fittings
Belt Fastener
Boilers (Water Tube)
Brassfounders
Cake and Biscuit Manufacturers
Carpet
Cement
Clock Manufacturers
Electrical Goods and Apparatus
Gas and Coke Oven Industries
Glass Manufacturers
Hearth Furniture and Art Metalware
Hollow-ware (Wrought Steel)
Hosiery
Insulated Conductors
Ironfounders (Light Castings)
Lace
Leather Cloth, Imitation Leather and Table Oilcloth
Pharmaceutical
Precision Chain
Printing and Allied Machinery
Proprietary Remedies
Radio Manufacturers
Safety Razors and Safety Razor Blades
Saw Trade
Soap
Tinware
Typewriter

CURRENT STATISTICS

Finance

GOVERNMENT RETURNS

For the week to April 20, 1940, total ordinary revenue was £18,777,000 against ordinary expenditure of £47,170,000 and issues to sinking funds of £70,000. Thus, including all sinking fund allocations, the deficit accrued since April 1st is £83,226,000 against £16,099,000 for the corresponding period a year ago.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued, less income tax at the standard rate, with allowance for redemption. Where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The yield on ordinary stocks and shares is calculated on the latest dividends, account being taken of any increase or reduction of interim dividends.

above par. The yield on ordinary stocks and shares is calculated on the basis of 100.

The First Test

THE events of this week, culminating in the news that the Allied troops have been withdrawn from all of Norway south of Trondheim, provide, for the British people, the first real test of the war. Those events themselves we should, of course, deplore. But that the test has come we can rejoice. Now, perhaps, it will be possible to begin fighting this war.

It is now apparent that the British public has, from the start, taken a wildly optimistic view of the strategic possibilities of the campaign in Norway. Until only a few days ago, popular discussion was still busy with the question whether the Nazis would be turned out of Norway before or after midsummer. Their rapid advance at the week-end, the realisation that, so far from leading a triumphant offensive, the Allied expeditionary force was fighting a rear-guard action, the final announcement of the evacuation—these events have followed one another so quickly and have borne an aspect so different from the popular picture of events in Norway, that they have unquestionably administered a severe shock. There are more shocks to come. The Prime Minister expressed himself as satisfied that the balance of strategic advantage lay on our side—that the occupation of Southern Norway was worth less to the Nazis than the occupation of Northern Norway and the destruction of half the German fleet was to us. In the light of history, that may well be right. But it is not the way in which the world will regard the matter now. The immediate repercussions will be all in our disfavour. A triumph will be staged in Berlin and the might of Nazi Germany will once more be paraded before the neutrals. All of them will steer a point or two closer to Hitler—the large through cupidity, the small through fear. More particularly in the Mediterranean, the political effect will tell more against us than our naval reinforcements will tell in our favour.

There will, as a matter of course, be a national inequity into the causes of the defeat—we cannot give it another name. The House of Commons is to debate the subject

next week, and in the meantime, especially until the very meagre present supply of information is supplemented, judgment must be deferred. But the deferring of judgment cannot stop the asking of questions. Could we have got to Norway sooner and in greater force? Was the expedition conceived on an inadequate scale? Is there any truth in the story, which has been repeated in public, that the Navy was forbidden to follow its intention of forcing Trondheim Fjord? The Prime Minister's statement on Thursday was the reverse of comforting. He exalted the enemy's successes; he raised all the possible bogies; he came close to saying outright that we could not spare enough troops to carry our action to success.

We can be glad that the test has come thus early in the war, for if the right things are now said and done we may still be in time to win a short war. It is greatly to the good that nobody will now be able to pretend that all is for the best in the best of all possible wars. We shall not, for a time, be told that Hitler has missed the bus. We shall not be feeling ten times more confident than we were at any time in the past. And we shall be very much better for facing the truth. We shall perhaps be able to tackle the evils of which Mr Ernest Bevin spoke on Wednesday—obstruction, lack of drive, absence of imagination and complacency—we shall be able to trace them back to their sources and root them out.

To a people like the British, setbacks early in a war act as a tonic; we cannot fight without them. The ancient courage of the race is not diminished. There has been no complaint about the burdens that the war has imposed and is imposing. The only criticism—and it can be heard on every lip—is that the burdens are not being imposed fast enough. That, we may hope, will now change. The evacuation of Southern Norway will not interfere with our ultimate victory. It will help us to remove the one thing that could defeat us—lack of courage and of resolution in the nation's leadership.

The Crisis of Production

SIR JOHN SIMON'S Budget has had no better reception than its half-heartedness deserved. In the Press and in Parliament it has been praised only by the dutiful, and criticised by the rest, and it has been particularly encouraging to observe that the strongest and most sustained attack, especially by the nominal supporters of the Government, has been delivered upon the point that is manifestly weakest. The detailed proposals of the Budget have not been severely handled, except for a general dislike of the increases in postage rates and some preliminary admissions from the Labour Party on the new Purchase Tax. The general attack has been concentrated on the right spot—the alarming inadequacy of the total expenditure provided for. Closer inspection of the White Paper giving details of expenditure under Votes of Credit makes it clear that the figure of £2,000 millions for war expenditure is not just a random guess by the Chancellor, which might have been excused as evidence of conservatism in guessing, not of timidity in planning; it is a fairly close estimate, the sum of a number of itemised figures. The £2,000 millions, in fact, is precisely what the public has spent the past week hoping it was not, a measure of the scale on which the Government plans are being laid.

A financial figure is, of course, at best an imperfect guide to the realities of the war effort. Increasing expenditure, if it were accompanied by increasing waste, might represent no greater real contribution to the war effort. Extravagance inevitably accompanies any rapid swelling of the governmental machine; but the measures that have been taken to keep it in check are numerous and must be in some degree effective. If there is a great deal of waste expenditure, then the figure of £2,000 millions is all the more inadequate. Unceasing vigilance in the cause of economy is an imperative duty of the House of Commons, which it is taking steps to discharge. But the need for economy does not lessen in the least the need for the most rapid and extensive increase in the total expenditure that can possibly be contrived.

A great deal was made in the debates in the House of Commons of the comparison between our rate of expenditure on the war in this country and the rate at which the Nazis are spending. It is a grim comparison, so disturbing that the Financial Secretary to the Treasury was driven to the lame device of suggesting that the figures of German expenditure that had been quoted were inventions of Nazi propaganda. On that subject some facts are set out in a Note on a later page. A much more valid objection to the comparison is that the expenditure of France and the Dominions should be added to our own. If the aim is to show which side is spending the more, that is correct, though even then the comparison will not be found to be unduly encouraging. But there are two good reasons why the Allies should aim at a much larger expenditure than the Nazis, that is, at a much larger effort; the first is that we have a great deal of leeway to catch up; the second is that we aim at a complete victory, not a dead-heat. And in any case, the object of any such comparison is not, by manipulation of figures, to show that one side or the other has a slight advantage—that will be tested in battle. The object is to determine whether we ourselves are making a big enough effort. To say that we are planning a rate of expenditure only one-tenth larger than at present, or to say that it is only two-thirds of the German rate, are only two ways of demonstrating that we are not doing as much as we can do. Expenditure, imperfect measure though it is, is the only measure that is available to the public, and comparisons with other countries and other periods are the only comparisons that are possible. But the thought behind all the numerical comparisons and criticisms is that voiced by Mr Amery, that "the Budget has only reflected the general outlook and limitations of His Majesty's Government in the whole field of our war effort."

It is the more necessary to insist that it is the concrete realities behind the figures that matter because the whole subject of war economics is in some danger of being con-

ceived of as a purely financial problem. There has been so much talk of inflation and of the necessity for limiting the volume of money spent by the public that we are running the risk of forgetting why this restriction is necessary. There are two sides to the problem of war economics: the restriction of the public's expenditure, so that resources of labour and capital can be set free for war purposes; and the harnessing of those liberated resources to their new tasks. Both sides must advance together; but of the two, it is the second that is the more vital; and it is the second that, on the evidence of Sir John Simon's figures, is being most woefully neglected. That the Chancellor has not faced with sufficient resolution the problem of meeting the expenditure of the State is unfortunate enough, since it bids fair to open the door to inflation. But to that danger the public is alive. The penalty of an inadequate scale of expenditure, however, is far greater. It is the losing of the war; and to that far less attention has been directed. No one who has contact with business men throughout the country can fail to have heard disquieting stories—let us put it no higher than that—of the slowness with which the supply programme is developing. Until Budget Day it was possible to hope that these were merely initial dislocations that would shortly be put right and that soon a mounting flood of supplies of all sorts would come sweeping in. But we now know that any such hopes are delusions. The flood of materials may figure in the optimistic speeches of the Minister of Supply; but the Chancellor of the Exchequer is not expecting to have to pay for them. Last week's expenditure, on war and peace alike, was at the annual rate of over £2,600 millions; Sir John Simon expects an average of £2,667 millions for the whole year. Here we are; here we look like sticking fast.

In short, the Budget, when figures are transmuted into realities, shows that we are caught in a Crisis of Production. We seem to have got as far as we can go with the present methods and the present men. It is precisely the same dilemma, reached at precisely the same stage of the war, as the shell shortage of 1915; and it must be solved in precisely the same way: by more radical methods and more energetic men.

What are the causes of the inadequacy of supply which is holding up our whole effort? The outside observer cannot base his judgment on more than the casual glimpses that he gets when one corner of the very necessary veil of secrecy is lifted. But enough can be pieced together from one source and another to suggest very strongly that the root cause of the trouble is a failure to lay plans on a complete enough scale. There has been a tendency to plan only the final stages of production, to leave the suppliers of component parts, often five or six layers deep in the subcontracting process, to get along as best they can. Even for steel, the basic raw material, a complete system of allocation by priority has only just been adopted. For the supply machine to work smoothly, every industrial process must be traced back to its first origins in mine, forest, farm or workshop, and every link in the chain must be tested and, if need be, reinforced, so that it can bear the strain of quantity production. This lesson was learnt by the Ministry of Munitions in the last war; apparently it has to be learnt again from the start by the Ministry of Supply in this war.

Behind all supply problems, however, there is one great, unresolved difficulty—labour. An observer sufficiently detached to have no interest in the issue of this war could afford to laugh at the extraordinarily illogical way in which we go about the business of mobilising for war. Everyone is agreed that this war will be won in the workshop rather than in the field, that the fighting forces are only the cutting edge of a gigantic instrument, that the men in uniform are only a fraction of the man-power that is needed. For this fraction we employ an elaborate technique of compulsory and progressive calling-up, we distribute man-power to the points where it is wanted, and we provide training, at the expense of the State, for the tasks that have

to be done. But for the greater numbers needed in the industrial machine we provide a Minister of Labour who makes complacent speeches; we undertake to train the magnificent number of 40,000 men a year, provided they will accept the status and living standards of the unemployed; we make vague references to the need in industry of a million women workers; and beyond that we do nothing at all. The only reason that seems to be given is that there is still an unemployment register of over a million. Everybody knows that the unemployed who are capable of absorption will disappear in a month or two, and that there will then be a crucial shortage of labour. But nobody, apparently, will move in advance of that happening. It is as if we refused to recruit for the army so long as the Nazis had not set foot in England.

It is too much, in this country, to suggest that the problem of industrial man-power should be tackled on exactly the same lines as the problem of military man-power—though that is the solution adopted both by our

enemies and by our allies. But is there any over-riding reason why we should not recruit a large industrial army by purely voluntary methods? It could be recruited from all, men and women, who are ineligible for the armed forces. Recruits would be promised training and maintenance at the public expense if thereafter they would work at the task for which they have been trained. There is nothing in the declarations of the trade unions that would lead one to suppose they would be opposed to such a scheme, provided their reasonable requirements in the matters of collective bargaining, maintenance of standards and post-war demobilisation were met. But whether or not some such scheme as this could be carried out by agreement, it is not until we have something like it that we shall be able to feel confident that we are mobilising our greatest asset, those resources of man-power that provide us in time of peace with our higher standard of living and in time of war with our greater potential production of all the munitions of war.

The Balkans Next?

THERE are signs that a decisive point has been reached in the struggle for the Balkans. So far the campaign has been carried on purely in the economic sphere, and during the first six months of the war, although our blockade in the South-East cannot be said to have been more than moderately effective, our counter-measures were still sufficient to give the Nazis food for thought. Turkey had been withdrawn from the German trade orbit to such good effect that whereas Germany accounted for 50 per cent. of Turkey's exports in February, 1939, the corresponding figure for 1940 had fallen to 2 per cent. Greece, too, was breaking the German stranglehold with Allied help. Further north, the Allies' achievement was not so striking and less was bought of a wide range of commodities than had been the case before war broke out. Yet even here, France and Britain overhauled and sometimes outstripped Germany as purchasers of Yugoslav horses, lead, copper and timber, Roumanian wheat and Hungarian beans, flax and oakum, while winter transport difficulties made it possible for the Allies to secure a larger share of Roumania's oil than Germany (in January and February, whereas 38,746 tons of oil went to Germany, Britain's share was 194,000 tons).

Thus, even in the first unsatisfactory six months, Germany could not prevent our trade offensive from having a limited success. The Nazis had, therefore, every reason to reconsider their grand strategy when the advent of the Reynaud government, the recalling of our Balkan envoys to London to report, and the creation of the United Kingdom Commercial Corporation all combined to give the impression of a new determination and a new energy in our conduct of the economic war.

The last few weeks have given various indications of the nature of Hitler's new plans. It is still possible that he does not wish to spread the war, for his immediate answer to the evidence of a new energy behind the Allied blockade—his demand to police the Danube—is a project which he can still hope to realise by "peaceful means." Only if he fails to secure the control of the Danube and if at the same time, by favourable war agreements or other means, the Allies encroach still further on his Balkan preserves, will Hitler resort to war. The flood of tourists, the suspicious troop movements in Carinthia and Slovakia, the repeated infringements of Yugoslavia's air by German planes serve a double purpose. On the one hand, they bring pressure to bear on the Balkan States in order to induce them to collaborate in Germany's economic plans; on the other, they prepare the strategic ground for an invasion, should an invasion become necessary. Warnings to the Press, complaints of Allied intrigues in the Balkans and threats that if France and Britain are planning a Balkan coup "Germany will know how to defend herself and will not allow herself to be surprised" likewise serve the double purpose of alarming the Balkan States into acquiescence and of providing the excuse for aggression if acquiescence is not

secured. For the time being, therefore, the possibility of war appears to depend more on the reactions of the Balkan States than on Hitler's intentions towards them.

During the last weeks a notable stiffening in their attitude towards self-defence has undoubtedly taken place. Germany's onslaught on Norway coincided not only with movements of troops and tourists, but also with a sudden increase of subversive activity to the South-East. The government in Hungary suddenly came under fire (the German candidate, M. Imrédy, had returned from Berlin a significantly short time before the attack was launched); King Carol faced a recrudescence of the old propaganda against himself and the National Renaissance Movement; the Croats were flooded with rumours of Belgrade's "Great Serb" policy, while the Serbs were called upon (in a leaflet raid carried out in broad daylight) to make peace with Germany and avoid the fate of the Czechs and Poles.

The reaction of the governments concerned was the contrary of that which the Germans must have hoped to excite. In Hungary, Count Teleki's ministry stood firm, responsible Croat leaders reaffirmed their loyalty to the Yugoslav State, and in Rumania King Carol carried the process of internal consolidation a step further by issuing another amnesty to political offenders and by inviting the one-time National Peasant leader, M. Ion Michalache—the leader of the real, though informal, Opposition to the King's government—to join the Royal Council. The unhappy warning of Norway led to a violent attack upon foreign spies and Quislings. The "tourists" began to be bundled unceremoniously home, permits for foreign residents were strictly limited, the Yugoslavs (whose territory had suffered the worst tourist invasion) put under arrest men as distinguished and highly placed as M. Stoyadinovitch and M. Atchimovitch, Prime Minister and Minister of the Interior in the former government. Even in the sphere of economics a new independence was discernible, for Dr Clodius left Bucharest after a six-weeks stay with only very moderate concessions, and the Yugoslavs were reported to be asking for free currency in return for a wide range of their products.

Germany's most serious setback was, however, the refusal of the Danubian States to accept her demand, put forward about April 10th, that she should participate in the policing of the Danube. Their riposte was rapid and cleverly conceived. Within a fortnight it was announced that the International Danube Commission (on which the Allies as well as the riverain States are represented) had decided to counter the possibility of sabotage or hostilities along the Danube by enforcing a number of regulations (including the prohibition of armed vessels) and by entrusting the policing of the river to the riverain States themselves. Of all the setbacks encountered by Germany in the last four weeks, this was probably the most disturbing to her time-table of aggression.

Were this the whole of the picture, the Balkan front might be regarded as comparatively reassuring. Unfortunately, it is not. However magnificent the determination of each individual State to resist, its efforts are predestined to failure so long as it stands alone; the whole security and independence of the Balkan States depend on their willingness to co-operate in face of a common danger. To-day that willingness is as far off as ever. The hopes raised after the Balkan Conference in February that a common defence policy would be completed by the adherence of Hungary and Bulgaria came rapidly to nothing. It is true that both countries have declared their intention of leaving open all questions of territorial readjustment until the end of the war and that the Bulgarian Foreign Minister pledged Bulgaria's loyalty to "the common Balkan family" in a recent speech. But such assurances cannot carry much weight unless they are accompanied by specific guarantees, such, for example, as Bulgaria's willingness to come to the aid of Yugoslavia, were she attacked, or at least to authorise the passage of Turkish troops. There is no evidence that such guarantees have been given, and the State members of the Balkan Entente must be permitted to regard it as an unhappy omen that Germany's demand to police the Danube was made public simultaneously in Hungary and Bulgaria.

This internal lack of cohesion plays into the hands of the predatory Great Powers. Although there is still no evidence that Germany's plan to divide the Balkans into spheres of influence with Italy and Russia has come to anything, Hitler's two partners are only second to him in keeping the Balkan States in a damaging atmosphere of fear and suspense. Russia's relations with Turkey are better, with Roumania much more uncertain and both Turkey and Roumania have reason to fear that Russia is playing her pan-Slav card in Bulgaria and Yugoslavia, a policy which, if successful, might force Roumania into dangerous isolation. That Russia is not, however, co-operating with Berlin is suggested by Prince Paul's sudden announcement of the opening of trade talks with Russia at the moment when the German pressure of the last few weeks was at its height.

Italy's attitude is even more ambiguous. Since the war began she has made a great show of encouraging cordial relations between Budapest and Belgrade, which the Roumanians look on suspiciously as an Axis manoeuvre to isolate their country. On the other hand, in the last few weeks the focus of attention has shifted from Roumania to Yugoslavia, and Italy, who as recently as March was ex-

changing cordial telegrams on the anniversary of the Italo-Yugoslav Pact of Friendship, has been more active than Germany in working up a threat of hostilities. It may be, of course, that she has no serious intention of entering the war and is merely helping her Axis partner to extort more economic concessions (Yugoslavia alone among Germany's Balkan neighbours has been exporting less to her than in previous years.) On the other hand, Hitler, in shifting his attentions to Yugoslavia, may have done so simply in order to force intervention on a hesitant Duce. Italy could hardly permit Germany to take possession of Italy's Adriatic neighbour without securing some of the spoils. Both prestige and self-defence would forbid it.

The possibility of war brings us to a final weakness in the Balkan position. The Great Powers who have declared their intention of supporting Balkan independence, who have given guarantees to Roumania and Greece and are in close alliance with Turkey, are geographically remote and have so far cut a poor figure as defenders of small peoples. When Germany threatens the Balkan States with the fate of Czecho-Slovakia and Poland, she is on strong ground. If Norway is added to the list, the ground will be even stronger. We cannot console ourselves with the thought that since (as Mr Chamberlain has pointed out) peace is our aim in the Balkans, doubts about our military efficacy are not immediately important. Long before the question of war arises, the amount of military support we could supply in an emergency has a profound effect upon the success of our economic policy. We want peace in the Balkans provided always that Hitler cannot use the lull to reinforce his economic predominance. Peace is what we want provided our trade offensive succeeds. Peace is what Hitler wants provided it does not. We cannot, therefore, hope for much success in ousting Germany unless we are fully prepared for the military consequences. That is the lesson of Norway. It must be learnt.

There can be no question in the Balkans of our having been "taken by surprise." Every permutation and combination of aggression has been considered. Any blow ought, therefore, to be parried in a way which proves our prescience and our strategic grasp of the situation. The Balkan peninsula, perhaps more than any other region, challenges us to remember M. Reynaud's watchword, "Lucidity and daring." We must be lucid in our assessments of the strategic possibilities, daring in their execution if and when the moment comes.

Food Stamps in America

SO many plans for curing modern economic ills have been propounded in the United States that when one survives the discussion period and is actually put into force it deserves attention on that ground alone. And when it succeeds in reconciling both agricultural and consumer interests, it becomes a phenomenon of more than domestic news value.

Such is the Food Stamp Plan. Operated by the Federal Surplus Commodities Corporation, it is directed primarily towards farm surpluses arising from lack of domestic purchasing power rather than from contraction of world markets; and it aims at reducing them by the obvious—but unusual—method of increasing the consumption of food by the poorest section of the population. Recent studies of family expenditure at various income levels in the United States have thrown light on the malnutrition of families with low incomes. In 1935 some 29,400,000 families spent \$13,700 millions on food, but as many as 4,200,000 families, or 14 per cent. of the total, accounted for only \$848 millions of the whole food bill. These families, with an average annual income of \$312, spend about \$1 on food in a week for each member of the family, which works out at about 5 cents per person per meal. The family with an income of \$1,000 to \$1,500 a year spends about twice as much. And, divided into kinds of food, the difference means that under \$500 families are buying 41.6 per cent. less vegetables, 61.7 per cent. less fruit, 57.1 per cent. less dairy produce and 54.4 per cent. less meat than their far from wealthy neighbours.

Under the Stamp Plan families receiving some form of public assistance may buy, with the funds supplied by public agencies, from \$1 to \$1.50 worth of orange stamps in a week for each member. These stamps can be used to purchase any kind of food at any grocery store, and represent the average food purchase made by families on relief without the Plan. Then, for each dollar's worth of orange stamps bought, the family receives, free, an additional 50 cents of blue stamps. The blue stamps can also be used to buy food, but only food of which the Secretary of Agriculture decides there is a surplus. The list of surplus foods is inclined to vary with the season. First on it, when the Plan was put into effect last May, were butter, eggs, wheat and wholewheat flour, corn meal, prunes, oranges and grapefruit, and dry beans. In July, oranges and grapefruit were temporarily dropped, and fresh peaches and pears were added, together with rice and various vegetables; other changes were made in October and December. In this way families on relief are provided with additional food to eat. The apparent complication of orange and blue stamps is necessary to ensure that the consumption of surplus commodities is *additional* and not merely substituted for previous food consumption. No family can consume "blue stamp" foods until it has spent its usual amount on "orange stamp" foods.

The Government's part in the operation of the Plan is, therefore, to see that the food stamps are available to eligible families, to determine what commodities are in surplus and to redeem the stamps with which they are

purchased. (The food bought with the orange stamps is, of course, paid for out of the ordinary relief funds; the blue stamps are redeemed in part from an earmarked proportion of the gross annual Customs receipts and in part from an appropriation made by Congress.) In the rest of the mechanism the Government does not interfere. The ordinary private channels of the food trades are exclusively relied upon to procure the foods from the producers and distribute them through the retailers; and the latter cash the stamps they receive either with their banks or with their wholesalers, who in turn cash them with the contributing public agencies, or with the Federal Surplus Commodities Corporation itself.

The Plan caught on from the very beginning. Inaugurated in Rochester, New York, on May 16, 1939, it had been extended to thirty-five other cities by March 1st this year and will cover about a hundred by July. Up to March the redemption of blue stamps amounted to \$5½ millions, February alone accounting for \$1,738,000; and the number of families using them in the thirty-six cities was 303,525. Even more significant of the Plan's popularity, perhaps, is the fact that the Senate recently voted by 79 to 0 in favour of an \$85 millions appropriation requested for its operation during the coming year.

Judged solely from the American standpoint it has several merits. Probably no Government programme of the last decade proved more unpopular than the cotton plough-up and pig slaughter of 1933. Both schemes were in force for a few weeks only, but the death of the little pigs—made near and dear, perhaps, by the production of Walt Disney's *Three Little Pigs* in the same summer—has for seven years remained fresh in the memory of the non-farm population. The competitive, individualist basis of American farming causes farm commodities to be produced whether or not there is a market for them, and dumped milk and rotting fruit and vegetables in the midst of near-starvation provided direct evidence of social and administrative incompetence. Under the Stamp Plan, families on relief are being given an opportunity to "eat the surplus"—or at all events part of it—and the urban response to this policy of distribution has been as enthusiastic as it was negative in the policy of reducing production. For the producers the increased sales of the surplus commodities have made prices firmer; the food trades have profited from a bigger volume of business; and persons on relief have had 7½ cents' worth of food per meal instead of 5 cents—it is worth noting that the blue stamps are an additional form of relief and not a substitute. And though the Plan is open to abuse—it was widely held at the discussion stage that the blue stamps would be traded not for food but for alcohol and tobacco—very few abuses have, in fact, been reported.

Outside the United States the Plan has points of interest for both peace and war. It is too early to form any definite opinion on an improvement in nutrition; but in a test taken in five widely separated cities during the winter it was found that, out of every blue stamp dollar, 17 cents on an average were spent on butter, another 17 cents on eggs, another 17 cents on fresh and dried fruits, and 23 cents on pork; that is, just over half went on dairy produce and fruit, in which the diets of poor families, in England as in the United States, are notoriously deficient, nearly a quarter on pork and the remainder on cereals and vegetables. Before pork was added, butter and eggs were each taking a quarter of the blue stamp's purchasing power. So far it has not been possible to determine how far sales of agricultural commodities have been increased; but in one city there was an increase in food sales in the poorer districts of 16 per cent. per week during the first twelve weeks of the Plan compared with the six weeks before it was put into operation. In the city as a whole the increase was only 5 per cent., so that 11 per cent. may be attributed to factors other than a general improvement in the food industry. But it appears that only half of the net increase was directly attributable to the use of food stamps; the rest was probably an indirect result, for it is possible that the advertising of listed foods influenced consumers, of low incomes but outside the scope of relief, to increase their purchases.

It should be emphasised that the Food Stamp Plan is not primarily an experiment in social services. The fact that it is operated by the Federal Surplus Commodities Corporation of the Department of Agriculture is evidence enough that the real interests at heart are those of the farmers. Moreover, even if it is extended to a hundred and fifty cities—the maximum which can be covered by available funds—it will only have touched the fringe of the twenty million families certified as eligible for some form of public assistance. And it relies too much, perhaps, on the good sense of the local traders, which, allied with the competition between them, has so far kept the prices of the listed commodities at reasonable levels. Nevertheless, it teaches the vital lesson that the right way to solve agricultural problems is to start at the consumer's end, and in improving the diet of the poorer section of the community it leaves far behind our own half-hearted scheme for supplying milk to schoolchildren. It has, too, a more topical importance. For though it is essentially a peacetime measure, adopted by a country suffering from an abundance of food, it provides a country at war, possessing all the machinery of price fixing and food control, with a technique by which the policy of reducing food consumption in general could be combined with increased consumption for those who are already ill-nourished.

NOTES OF THE WEEK

The Budget Debates.—The reception of the Budget in the House of Commons has been the opposite of that which has become customary in recent years. There have been plenty of criticisms of its general structure and very few complaints against its specific details. In the general debates last week, Members from both sides of the House took a highly critical line and even those who supported the Chancellor seemed to have the air of excusing rather than defending his figures. Two of the outstanding speeches were those of Mr Amery and Mr Clement Davies, both of them nominal supporters of the Government, and more than one Member must have been compelled to reflect on the change that would come over the whole appearance of the Government's war effort if these powerful arguments on the place of finance in modern war could come from the mouths, not of bank-benchers, but of a Chancellor of the Exchequer and of a Financial Secretary to the Treasury. In the detailed discussion of the Budget Resolutions, one by one, there has been surprisingly little criticism or complaint—the beer and spirits duties went through without discussion and the tobacco duty without opposition. The debates, in short, have been little more than a series of

further elucidations of his proposals by the Chancellor of the Exchequer. Three topics excited particular attention. The first was the proposal to limit dividends, which is fully discussed in the Investment section of this week's issue of *The Economist*. The second was a discussion between the Chancellor and Mr Pethick-Lawrence on the subject of direct taxation, in the course of which Sir John Simon took the opportunity of removing any illusion there may be that a standard rate of income tax of 7s. 6d. in the £ represents the limit or that increases in direct taxation can be confined to the rich. "If in future years of this war we are to ask for a great additional amount of money by the imposition of income tax, it has got to be on a curve which . . . is bound to cut deeply into the incomes which are at the lower end of the scale."

The third and most interesting topic was the new Purchase Tax. The Chancellor was not able to give the House a great deal of additional information. In particular, the time of imposition is not to be revealed in advance, and the rate of tax is undetermined—though the Chancellor

emphasised that it could not be small. The tax is to be imposed by a separate Bill, and the details are apparently still unsettled. But Sir John held out very few hopes of exempting any further classes of goods from its operation—he specifically refused to exempt clothes—and he was not encouraging on the possibility of applying lighter rates of tax to necessities than to luxuries—a refinement that would obviously add enormously to the administrative complications of the tax. Sir John did not attempt to meet the argument (similar to one which he himself used against Mr Keynes's proposals) that any increase in prices due to the tax would inevitably lead to demands for increased wages and so give another twist to the "vicious spiral."

Labour's Financial Policy.—The Labour Party has published a pamphlet entitled "Paying for the War," by Mr Douglas Jay, which, since it presumably embodies the considered policy of the Party, deserves widespread attention. The greater part of the pamphlet is an admirably simple exposition of the fundamental realities of war economics—the necessity for a reduction in the consumption of the people and the inadvisability of achieving that reduction by the method of inflation. It is the more regrettable that the pamphlet should show a consistent tendency to discuss the whole matter in terms of class conflict and even to ignore manifest facts in so doing. It is stated, for example, that as a result of the methods employed in the last war (i.e. too much inflationary borrowing), "far too much of Britain's national income has been going to rich property-owners ever since." But the effect of the finance of the last war was to *reduce* the share of property in the national income. According to Mr Colin Clark's estimates, profits, interests and rents took 44.9 per cent. of the national income in 1911, 32.5 per cent. in 1924 and 31.6 per cent. in 1929. It is true that inflation increases the share going to those property-owners who make large profits while the inflation is going on; but they are the minority of property-owners, and the majority are hurt by inflation worse than any other class of the community. The point is very important, since the whole of the Labour Party's case, as exemplified by this pamphlet, and by the advocacy of a heavy annual tax on all forms of property, seems to be built up on the belief that war finance brings benefits to property-owners *as a class*, so that it is legitimate to put discriminating taxes on them *as a class*. The truth is, in fact, the opposite. The redistribution of property by means of taxation is a perfectly legitimate object of advocacy. But if it has not been accepted in peacetime, there is nothing in the changed circumstances of wartime to enhance its appeal.

Germany's War Expenditure.—The measurement of Germany's current war effort is by no means so difficult and obscure a subject as the statements of Ministers would seem to imply, even though the absence of complete figures makes some element of estimation inevitable. The most important figures for an estimate are in existence; for example, we know the pre-war yield of taxation, and the volume of borrowing is still published. At the beginning of the financial year of 1939-40 tax revenue for the year was estimated at Rm. 22 milliards. The rates of taxation were increased at the outbreak of war with the avowed intention of at least offsetting any declining yield due to war dislocation, and the results of the December quarter seem to indicate that there has, in fact, been a net increase in the yield of taxation. It is probable that in a full year the present level of taxes will bring in between Rm. 24 and Rm. 26 milliards. To arrive at a figure of *war* expenditure, the civil expenditure, including net payments to local authorities, must be deducted; but, on the other hand, certain sources of funds which are not included in tax revenue must be added. These are the surpluses of the unemployment and other social insurance funds, the profits from State enterprises, the levy on the Jews, and so forth. The effect of these adjustments is to give a figure for the total resources available to the Reich for war expenditure from sources other than borrowing of Rm. 20-24 milliards. As for borrowing, the published figures of the Reich debt,

which certainly do not overstate the amount of borrowing, have shown an average increase in recent months of rather over Rm. 2 milliards a month. Adding borrowing to revenue, we reach a final figure of expenditure on the war of between Rm. 44 and Rm. 48 milliards.

This Reichsmark figure has now to be converted into a sterling equivalent. As an article on page 815 of this issue of *The Economist* shows, various species of Reichsmark are now being quoted on the world markets at rates ranging between Rm. 8½ and Rm. 80 to the £. But, for this purpose, the rates of exchange quoted on the world markets are of no use whatever. The only way of putting an intelligible sterling equivalent upon the German expenditure of, say, Rm. 45 milliards is to attempt a direct comparison between the purchasing power of the Reichsmark in Germany and the pound in Great Britain over the particular varieties of goods and services that are, in fact, needed for war. A comparison of the rates of pay in the fighting forces (including dependants' allowances) indicates that, for this purpose, the £ is worth no more than Rm. 7-9. The Reichsmark has a somewhat smaller purchasing power in industrial labour—say, between Rm. 11 and 12 to the £. The same figure could be taken for the cost of those raw materials which are in more or less adequate supply in Germany. In materials which have to be procured from abroad by devious routes at very high prices, and in *ersatz* materials which have to be produced at a very high cost in labour and raw materials, the real purchasing power of the Reichsmark is much lower, and its value in these uses may be no more than Rm. 25 or Rm. 30 to the £. A rough attempt to strike an average between these varying values of the Reichsmark suggests that a rate of exchange of Rm. 15 = £1 is not likely to overstate the value of the Reichsmark or consequently to give an exaggerated notion of the real scope of Germany's war effort. An expenditure of Rm. 45 milliards, converted at this rate, produces the figure of £3,000 millions, which has appeared in the columns of *The Economist* on several occasions and is now becoming the subject of public controversy. As is apparent, the figure is not exact and is open to a substantial margin of error. But it is more likely to be too low than too high.

The Allied Withdrawal.—From the Prime Minister's statement to the Commons on May 2nd something of the serious setback which has befallen our campaign in Southern Norway can be inferred. Germany's initial advantage in seizing the principal harbours and gaining control of all the existing airfields before an Allied expeditionary force could begin even to attempt a landing meant that once the landings began they took place under conditions of hideous difficulty. Our troops were submitted to constant bombing, it was impossible to land effective counter weapons and the men had to be hurried forward to the assistance of the Norwegians inadequately equipped to meet the kind of attack Germany was in a position to launch—a motorised attack, fully supported by constant aerial bombardment. The German columns, advancing rapidly up the Gudbrandsdal and the Osterdal, made use of difficult mountain roads to bring mechanised units into play in the Dombaas-Stören sector even before the main body of their advance had reached the head of the Gudbrandsdal. The Allied troops in this sector were thus faced with the alternative of captivity, annihilation or evacuation, and so long as evacuation by way of Andalsnes was still possible, it is difficult to question the wisdom of the decision to evacuate. Now the withdrawal has taken place. The Nazis have achieved the desired junction between their Oslo and Trondheim forces. Their control of Southern Norway is therefore virtually complete. For the rest, we are in the dark. The Prime Minister suggested that we shall dig ourselves in north of Trondheim and hold Namsos. Narvik was not mentioned, yet surely control in this area is absolutely vital if we are to prevent the Norwegian campaign from degenerating into complete disaster. In a very few weeks the ice in the Gulf of Bothnia will have broken up. The Germans will be in a position to reach the iron port of Lulea, and it is at least possible that they will press

Sweden to allow the passage of German troops up the Lulea-Kiruna railway to go to the assistance of their beleaguered countrymen across the frontier. Sweden would probably refuse, but her problem would be far less embarrassing if we had first ensured that there were no "fellow-countrymen" to assist.

The chief feature of the campaign has been to establish once and for all the overwhelming importance of the air arm in modern warfare. Our landing and our operations were harassed out of all semblance of efficiency by constant and gruelling air attacks, and it is possible that naval operations in the long land-locked fjords were also rendered impossible by Germany's mastery of the air. One of the most important elements in our counter offensive has thus been the heavy bombing of German air bases at Stavanger,

Aalborg and Fornebu, and although it is difficult to gain any certain information about the results of these raids, the damage done in the course of bombing attacks lasting from twilight to dawn must have been considerable. It could not, however, offset our inability to send fighter planes into action, and could not, given our bombers' distance from their bases, be sufficiently sustained to interfere seriously with Germany's aerial timetable. Now that the lesson of the aeroplane has been driven home in this particularly painful fashion, we must at least have the wisdom and elasticity to learn it. Our need is a vastly increased output of aeroplanes. It is unfortunately not yet a question of superiority in the air. We have first to draw level with our formidable adversary. Nothing short of a total effort on the side of production must content us now. There must be no more Norways.

Sweden in Danger.—Sweden's May Day celebrations were designed to advertise her unity and her fighting spirit. All the democratic parties took part in a "Citizens' March," and the Prime Minister, Hr. Hansson, made a stirring speech, in which he repeated Sweden's determination "to assert and defend her neutrality with all the means" in her power. Further measures have been taken against foreigners this week, a number of new areas have come under special regulations, the country's defence system is manned, Sweden will fight to the last man if her soil is invaded. It is, however, possible that the threat to Sweden is not that of invasion or military force. Finland, after a gallant and solitary combat, is no longer in

a position to resist any form of Soviet pressure. The fate of Norway, though ultimately secure, is sufficiently desperate for the next months. Germany is in occupation in South Norway, hence her troops are in a position to dominate the whole of the undefended Swedish-Norwegian frontier. What assurance have the Swedes that the kind of pressure which Hitler and Stalin are now in a position, jointly or separately, to exercise upon their Government may not rapidly turn to a mockery the independence which they are pledging themselves to defend? There are more ways of losing freedom than by invasion, as was perhaps illustrated by last week's incident of a British news-letter banned "at the request of a foreign Power" in a country whose press is free. Hr. Hansson no doubt expressed the feelings of the Swedes when he said: "We are deeply grieved by what has happened. But, in spite of all, we look forward to the day when the free nations of the North can together resume their peaceful work." But is this pious hope enough? Are peace and freedom to come flowing gently from the hand of Hitler? Isolated between two of the most brutal autocracies in the history of man, Sweden's position is one of the utmost jeopardy, to which determined but unaided self-defence is only half the answer.

Mediterranean Counterpoint.—Our relations with Italy mirror a double preoccupation—on the one hand to spare no effort to secure her continued neutrality, on the other to have our preparations in good order should the situation deteriorate. "Cordial and informative" talks have taken place between Lord Halifax and the Italian Ambassador, a further attempt is being made to resume trade talks not in a general setting, but on the basis of particular commodities and particular orders (a method already followed with some success by the French), and we are trying to work our contraband control with as little provocation as possible to Italian feelings sensitive on the issue of *Mare Nostrum*. On the other hand, the British Government has issued an order diverting our merchant ships from the Mediterranean, and this has been followed by reports of extensive defence measures in Egypt. It is only to be hoped that the two sides of our policy do not cancel each other and that our readiness to go far to meet Italy's wishes in the matter of trade talks and important orders will not lead the Italian Government to interpret our decision to close the Mediterranean to our shipping as a sign of fear, not determination. That interpretation has already made its appearance in the Italian Press, which continues to blackguard the Allies with a very far from non-belligerent energy. Doubts about the effects of our friendly overtures are felt and expressed in this country simply because of the reception conciliatory gestures on our part, including M. Reynaud's most recent offer, have received in the past. The Allies are, on the whole, indifferent to the attacks launched on themselves and their policy by such distinguished politicians as Count

Russo-German Trade

(By a Correspondent)

THE Soviet's share in Germany's total imports was only 0.4 per cent. in the first six months of 1939. Since Russia's total exports have recently been equivalent to from 12 to 19 per cent. of Germany's total imports, even a complete monopoly by the Reich of Russian trade would not make good the loss, amounting to more than half Germany's imports, inflicted by the blockade.

The Russo-German Agreement of last August stipulated that Russia was to send to Germany 1 million tons of fodder grain, while she obtained credit facilities at the rate of 200 million marks for the purchase of German industrial goods. Up to the present, however, only a very small part of the cereals has arrived in Germany and the total volume of Russia's export to the Reich seems still to be small. This may be due, to a certain extent, to the war conditions of the last few months, but even if full allowance is made for this the results of a half-year's German-Russian trade co-operation are by no means encouraging to the Germans.

The Nazis seem to realise that something more than a trade agreement is required if Russia is to be a valuable economic asset to the Reich during the war. Significantly, the two countries have now concluded what they call an "Economic Agreement" and one of its first aims will probably be to help the Russians to increase their output for export and to improve their system of communication.

Before the Nazis came to power a comparatively large number of German technical experts were working in Russia and it has occurred to the present German rulers that this practice might now be resumed. The dispatch of a number of highly qualified German experts to the Russian factories, railways and oilfields would probably be appreciated by the Soviets, who are always encouraging the introduction of new methods of production. It is difficult for the Germans, however, to spare an adequate number of technical specialists, as they are badly needed in the Reich itself, and it will be practically impossible to accompany them by German skilled workers.

Another important help that an industrial country might give to the Soviet Union is the sale or loan of first-class machinery, but here again the Germans are facing serious difficulties. Though Germany has certainly huge plants for machinery production, she is hampered by the lack of labour and raw materials and by the necessity of concentrating on the production of arms and ammunition. The recent Leipzig International Spring Fair has revealed to foreign buyers how few first-class goods the German industrialists are able to offer at present.

One important example of the existing obstacles to Russo-German trade is provided by the position of the Russian railways, where foreign assistance would be specially welcome in the interest of both the Russians and their German trading partners. While Germany's locomotive and railway industries have a very great capacity they are fully occupied for the next year or two with the overhaul of that country's own railway system as well as with the reconstruction of the Polish railways; it is difficult to see how, in these circumstances, they could give any substantial assistance to the Soviets. Nor is Germany able, in view of her shortage of gold and foreign currency, to give Soviet Russia the necessary credit facilities. Much parade has been made of the so-called credit for the purchase of industrial goods which was promised to the Russians at the beginning of the war. In actual fact, however, as it was stipulated in the same agreement that the Soviets should immediately provide the Reich with foodstuffs and raw materials, it was they who sold on credit to the Nazis; the Germans would only eventually repay by delivering industrial products.

Bureaucratic Hindrances

The assistance that Germany will give to the Russians is limited in every direction. Moreover, even if Germany were

in a position to part with more engineers and larger quantities of machinery than she actually is, it would still be doubtful if any profound change in the Russian economic situation would result from her action. Bureaucracy hampers the efficiency of the Soviet economy and causes much waste of every kind of material. The difficulties which arise out of the attempt to direct the distribution of products from one single centre are partly reflected in the fact that though the standard of living is still comparatively low, the exportable surplus of goods produced in the Soviet Union is much smaller now than before the drive for an increasing production started in 1928.

It is almost certain that the Bolshevik leaders do not contemplate at the present moment the reintroduction of a more elastic system of production. On the contrary, the present tendency seems to be in the opposite direction. It is perhaps significant that recently the farmers were expropriated from their smallholdings which had hitherto allowed them to do at least a little gardening on their own account.

The Germans are not likely to recognise the real cause of the Soviet economic problem, much less to be able to alter it. The proposed Nazi-Soviet economic co-operation is the first of its kind to be practised between two totalitarian Great Powers. An economic collaboration such as that between Britain and France means that each partner delegates part of its own economic-political power to some sort of joint body. A political sacrifice of this kind is obviously much less acceptable to an authoritarian than to a democratic regime; the very omnipotence of the State which on the surface appears as an advantage of totalitarianism turns out to be a serious setback if it is desired to increase economic strength by the joint action of two or more countries. The position will be especially difficult in the case of Germany and Russia, whose governing political parties differ so widely in their outlook.

Soviet Russia has a vast output of many valuable raw materials, and her potential resources are practically unlimited, but her present contribution to Germany's economic war effort could not possibly make up for the losses endured by the Reich as a result of the blockade, nor is this position likely to be altered in the course of the present war.

April 20th.

Scandinavian Balances in United States

[FROM OUR NEW YORK CORRESPONDENT]

THE Treasury has established a "control" or "protectorate" over dollar balances of nationals of Denmark and Norway. The initial description as "freezing" these balances appears to have been inaccurate. The Executive Order requires the assembling of data of the accounts of nationals of the two countries, but authorises withdrawals or transfers under licence. The Press gave a variety of interpretations, none of which could be regarded as official, but whose general purport was that, as this country continued to recognise the previous *de jure* status of Denmark and Norway, it wished to ensure that the status of private property in this country of nationals of Denmark and Norway would not be altered by the *de facto* situation. It is possible that the Order was of a precautionary nature, for there has been no report of a refusal to grant the requisite licence to withdraw or transfer. Although the Order was issued under legislative Acts of long standing, there are no operating precedents, as no such action was taken on the occasion of the occupation of Austria,

Czecho-Slovakia, or Poland. Credits opened by the Export-Import Bank to Denmark, Norway, Iceland, and Sweden have been held in suspense pending clarification of the situation.

On April 16th the Treasury announced that for purposes of customs valuation only the official rate of \$4.03½ for the pound sterling would be recognised, even though the goods invoiced had been purchased with "free sterling," on that day quoted at about \$3.50. This action came as a surprise, as it had been repeatedly affirmed in official quarters that there had been no complaints from interested parties; and this statement was reaffirmed at the time the announcement was made. The same ruling is applied to Dominion imports, and presumably to those of France.

War Boom Subsidies

The production index fell from 109 in February to 103 in March on the adjusted basis. The unadjusted index fell only from 110 to 106. Construction contracts (unadjusted) rose from 54 to 63 and department store sales from 71 to 87. The following table illustrates a curious feature of the production statistics:—

PRODUCTION OF MANUFACTURES (Adjusted for seasonal variations) (1923-25 = 100)		
	Durable goods	Non-durable goods
1939—		
January	88	110
February	84	109
March	80	110
April	76	106
May	71	108
June	82	110
July	88	110
August	92	115
September	103	117
October	123	119
November	130	118
December	141	120
1940—		
January	122	114
February	103	111
March	93	107

The rise in durable goods production was almost exactly 100 per cent. from April to December, and the subsequent decline has erased about five-sevenths of the rise, leaving the March index somewhat above a year ago. The rise in non-durable goods was scarcely more than 10 per cent., and that has been entirely lost. This indicates how completely last autumn's boomlet was a function of war—not that the demands of the belligerents caused it, but that domestic demand was stamped by recollections of the super-heated export trade of 1915-16. At the present time the index of durable goods somewhat exaggerates the level of domestic demand, since it is largely influenced by steel production, and export demand figures more heavily than usual in steel output.

April 18th.

Economic Anomalies in Argentina

[FROM OUR BUENOS AIRES CORRESPONDENT]

THE Central Bank of the Argentine Republic in its report observed that war conditions had removed the disequilibrium in the balance of payments which had existed for many months. It drew attention, however, to the fact that the cost of imports as a result of the war had actually risen by 36 per cent., while the prices realised by Argentine exports showed an average rise of only 18 per cent. For this reason the bank recommended prudence in granting credit.

On March 15th an agreement was concluded with Japan under which Japan will buy from Argentina products to the value of 30 million yen in 1940. The agreement specifically mentions 6,000 tons of wool, 4,000 tons of frozen and preserved beef, and 4,000 tons of casein. Argentina undertakes to grant permits for the importation of Japanese goods within the limits imposed by the interests of the local textile industry and the participation of various countries in the supply of the Argentine textile market.

Perhaps the strangest anomaly caused by the war to Argentina has been in the foreign exchange market. Owing

to the decline of sterling in New York, the free market rate in Buenos Aires is around 15.9 pesos to the pound, while the Argentine authorities are maintaining the official import rate for the great majority of imports at 17 pesos to the pound. Thus, foreign exchange control, originally introduced to prevent too great a depreciation of the currency, is now maintained to keep its value from recovering.

Loss of Customers Abroad

There is much annoyance caused to Argentine producers, especially stockbreeders, because the policy of the Allied Governments not only prevents Argentina selling to Germany, but by the "navicert" system reduces their sales to countries contiguous to Germany, while at the same time the volume of Allied purchases and still more the prices paid for Argentine products are considered insufficient to compensate for the customers lost. The Argentine position is difficult because it is well-nigh impossible to replace Great Britain as a customer, especially since the breakdown of trade negotiations with the United States.

The greatest obstacle to British exports to Argentina is that British prices are very high. The result of this has been to stimulate enormously Argentine domestic industry, which has made extraordinary progress in six months of war. The United States, too, has benefited considerably, since she is the only country relatively unaffected by the war and capable of replacing Great Britain in nearly every line.

Another problem confronting the Argentine Government is that of disposing of a large maize crop when foreign demand is slack, prices are very low and shipping space is scarce. Maize, indeed, is one of the very few Argentine products which have fallen in value as compared with this time last year. Taking average prices in the first two months of 1939 and 1940, maize has fallen 11.1 per cent., preserved meat 10.7 per cent., butter 8.9 per cent., and quebracho logs 7.1 per cent. All other important products have risen in value, the most important increases of price being casein, which is up 135.8 per cent., washed wool 53.5 per cent., frozen meat continental type 43.3 per cent., salted ox-hides 40.4 per cent., wheat 39 per cent., and linseed 26.3 per cent. As this year's wheat and linseed crops were extremely poor, the benefit from higher prices is less than appears.

Canada Settles Down

[FROM OUR OTTAWA CORRESPONDENT]

THE decisive result of the recent general election has produced a state of complete tranquillity in the Canadian political world and it is not likely to be seriously disturbed, as the Opposition forces have been further enfeebled by the defeat of most of the leading members of the Conservative front bench and of some able and experienced figures in the Leftist groups.

Meanwhile, Premier Mackenzie King, before leaving for a holiday in Virginia, announced that he had used authority given by Parliament to create a new Department of Munitions and Supply which will assume all the functions and duties hitherto performed by the War Supply Board. The new department has for the time being been placed under the charge of Mr C. D. Howe, the Minister of Transport, who had been responsible for the Board. The members of the War Supply Board, with the exception of the Chairman, Mr Wallace Campbell, will form an advisory committee to assist Mr Howe, but otherwise the department will function in the same way as other departments.

The Bank undertakes general banking business and with its numerous branches offers special facilities in Canada, Newfoundland and the United States

In some quarters apprehensions are voiced that political patronage and favouritism, which were supposed to have been eliminated under the regime of the War Supply Board, will now get fresh scope with a Minister assuming direct responsibility for war contracts, and some criticism is being directed at the allocation of two departments to a single Minister, but Mr King hinted that this arrangement might only be temporary.

It was recently disclosed that the British Munitions Mission had since its arrival placed in Canada contracts for munitions and war materials of an aggregate value of 70 millions dollars and is on the verge of placing an additional 17 million dollars' worth of orders. According to a statement issued by the Canadian Bureau of Information the British Government has appropriated a total sum of 445 million dollars for purchases in Canada during the first year of the war; a large proportion of this sum is being spent on foodstuffs, raw materials, aircraft, supplies and manufactured products of various kinds apart from munitions. The preliminary preparations for the Commonwealth air-training scheme have been making good progress, and with the advent of spring the construction of new aerodromes and other establishments required for it is being pushed ahead.

Effect of Scandinavian War

The German seizure of Denmark and invasion of Norway promises to have a considerable effect upon the economic fortunes of Canada. For one thing it will deprive her of substantial markets for her grain and aggravate the problem of the disposal of her huge surplus of wheat, which on March 31st had, according to the Bureau of Statistics, reached a total of 371 million bushels. On the other hand, although the Canadian Bacon Board has announced that no enlargement of the present monthly quota for exports of Canadian bacon to Britain is contemplated until reserve stocks now in Britain are more or less used up, it is regarded as inevitable that Canada will have to be drawn upon to make good the deficiencies created by the cutting off of the large supplies of bacon, butter and eggs which have been procured from Denmark, and that Canadian farmers will benefit as a result. And it is being suggested that Canada, who has been making steady efforts to raise the standards of her export of foodstuffs, may have to sacrifice quality in the interest of quantity.

The Canadian producers of pulp and paper products, who have been profiting since the outbreak of war by the curtailment of the competition of the Baltic countries in the American market, expect that for some time to come this competition will be reduced almost to vanishing point and that they will be able to command almost their own prices from American consumers, at least for certain of the more specialised types of pulp. The price of newsprint, however, is being maintained without any advance for the third quarter of 1940, but those of various kinds of pulp are rising.

Winter has taken its departure, except in the upland regions where there is still a considerable carpet of snow, and the cultivation of the land has begun. During March there was some recession in the general level of business, and a provisional survey of the Bureau of Statistics placed the index for the month's physical volume of business at 122 as compared with 131 in March, 1939. Below are data about the weekly economic index:—

Week ending—	Car-loadings	Wholesale Prices	Bank Clearings	Weekly Index
March 30, 1940	71.3	83.2	90.8	101.6
April 6, 1940	80.8	83.2	89.5	103.5
April 15, 1939	68.0	73.3	97.3	102.4
April 13, 1940	82.0	83.2	98.1	105.6

The setback experienced in March is expected to be only temporary, as underlying conditions are satisfactory.
April 19th.

War Finance in Australia

[FROM OUR MELBOURNE CORRESPONDENT]

FOR some time it has been increasingly evident that the Central Bank is endeavouring to exercise very careful control over the Australian market for Government securities with the object of reducing the rate of interest. A review of the Australian gilt-edged market during the past eighteen months indicates that this attempt has met with a considerable degree of success. As international tension grew increasingly acute, control became more difficult, and the redemption yield on Government stocks rose steadily during the first nine months of 1939 until it stood at £4 1s. 8d. per cent. in September. Since war broke out and direct control measures were imposed under the National Defence (Finance) Regulations, the authorities have been placed in a much stronger position to influence the rate of interest. Central Bank purchases of securities to prepare the market for new loan flotations have been supplemented by the Defence Regulations preventing the export of capital, restricting imports and exercising direct supervision over most forms of public and private investment.

Since September, when interest rates reached their highest point for some time, there has been a steady reduction in the yield on Government stocks. On March 1st the first Australian War Loan was opened for subscription and bore the interest rates of £3 7s. 6d. per cent. for five years and £3 12s. 6d. per cent. for ten years. The average yield on Government securities was £3 10s. 4d. per cent. on the day the new loan opened, but when it closed the yield on existing previous issues was £3 9s. 11d. per cent. Although the gilt-edged yield rose slightly during the following days it had fallen to £3 8s. per cent. on April 2nd. Since then it has fallen still further, reaching £3 1s. 7d. per cent. during the week ended April 12th.

Another influence in the direction of lower rates of interest has been the considerable increase in investible funds. The latest Australian banking statistics show that the improvement which was evident last November is continuing:

NINE TRADING BANKS

Liabilities and Assets within Australia

	Feb., 1939	Sept., 1939	Feb., 1940
	£A mil.	£A mil.	£A mil.
Deposits:—			
Total deposits	322.3	314.6	350.5
Advances	284.3	295.8	277.1
Ratios:—			
Cash to deposits %	10.95	10.36	13.13
Advances to deposits %	88.21	94.02	79.05

In February, 1940, total deposits of the nine trading banks had risen by £A28 millions, compared with a year before, and by £A35 millions, compared with September, 1939. At the same time advances showed a decided fall of £A7 millions from the figure in February 1939 and £A19 millions from September last. The ratio of advances to deposits dropped rapidly from the high figure of 94 per cent. in September, 1939, to 79 per cent. in February, 1940. This compares favourably with the ratio of 88.21 per cent. in February, 1939. The ratio of cash to deposits rose to 13.13 per cent., against 10.95 per cent. in February, 1939, and 10.36 per cent. in September last. The figures reflect the increased returns from exports and the earlier export receipts due to the Imperial Purchase Scheme. Exporters' incomes have accumulated and the volume of funds available for investment has markedly increased.

There are, in addition, certain technical factors which have helped to force down the yield on Government securities. The wartime methods of financing exports have tended to divert overseas funds to the Central Bank. The result is that trading banks' deposits with the Central Bank in Australia have risen, and a proportion of these deposits is available for investment in suitable short-term securities and Treasury bills. Further, the terms of the War Loan do not include the clause exempting holders from liability to pay Federal income tax at a rate higher than that ruling in 1930. The Treasurer has also announced that this exemption will not be included in future war loans. A premium has thus been placed on existing loans which do carry tax concessions, and the demand for previous issues by large investors to whom the tax redemption would represent an appreciable benefit has been a factor tending to force up prices.

Existing conditions seem to be favourable for the flotation of additional war loans at low rates of interest. Uncertainty

about the possible future course of interest rates is, however, a deterrent to investors at present. Subscribers to the March loan numbered only 14,000. This suggests that many investors have refrained from subscribing for fear that rising interest rates might later cause a fall in prices involving them in a capital loss. The recent course of interest yields might help to dispel this fear, and the announcement of further restrictions on imports indicates that the authorities will continue to reduce the field open to private investment. If the Government can pursue this policy and give adequate proof of its determination to maintain low interest rates, it will have done much to ensure the success of its war finance.

April 15th.

British Malaya's War Contribution

[BY A CORRESPONDENT]

BRITISH MALAYA is solidly behind Great Britain. During the last war the rulers and peoples of the Federated Malay States presented the battleship H.M.S. *Malaya* to the British Government as well as a number of aeroplanes. And in the last twenty years Malaya has contributed more than £20 millions towards Imperial defence, of which £15 millions has taken the form of cash grants, no mean achievement for a territory populated by less than six million inhabitants. Last year the Straits Settlements alone paid \$15.6 millions for defence—a tremendous sum when it is recalled that the Colony's total revenue was only about \$40 millions.

Penang is no longer the "open town" it was when the *Emden* paid her memorable visit during the last war. Before the naval base at Singapore was constructed in 1938, at a cost of £9,735,000, the nearest docking and repair base for heavy ships was at Malta, nearly 6,000 miles from the Straits of Malacca. To-day the King George VI Dock is capable of accommodating the largest warships afloat. Its situation on the southern side of the Straits of Johore and northern part of the Singapore Island makes it impervious to direct bombardment from the sea. The naval base as well as the city of Singapore is defended by fortified positions along the coast and on the islands guarding the entrance to the harbour and the Straits of Johore. The R.A.F. station at Seletar is continuously expanding; it has flying boats that possess a patrolling range as far as Darwin in Northern Australia and several squadrons of torpedo bombers.

In addition to cash contributions the Straits Settlements, Federated Malay States, Johore and Kedah maintain efficient volunteer forces, and all the States of Malaya combine with the Colony and the F.M.S. in bearing the cost of equipping and maintaining a Royal Naval Volunteer Reserve and a Volunteer Air Force. The Federated Malay States, moreover, by virtue of treaty obligations, defray the cost of a battalion of infantry of the Indian Army stationed at Taiping, and have in addition raised and equipped a Malay regular regiment, which is now an integral part of the defence system of Malaya. Johore, too, maintains a regular military force, which is at the disposal of the Imperial Government in wartime.

Moreover, Malaya is a valuable source of supply of foreign exchange, particularly American dollars, to the Empire. Last year Malayan sales to the United States exceeded purchases from her by at least 12 million United States dollars monthly, and in wartime this figure should be greatly exceeded, thereby contributing materially towards cash payment for British war purchases in the United States. Malaya's trade in merchandise for 1937 to 1939 has been:—

	Exports	Imports
	£	£
1937	104,664,000	84,323,000
1938	66,419,000	63,771,000
1939	85,922,000	72,404,000

The buoyant condition of trade has enabled the F.M.S. Government to wipe off the bulk of an anticipated deficit for the current year, despite \$2.3 millions spent on unemployment relief works at the beginning of 1939 and \$4 millions grant to the Imperial Government for defence. This year large sums are being allocated for irrigation to extend the area under rice. The tin smelting industry has benefited by the closing down of the Arnhem smelter, and most of the Dutch concentrate is smelted in the Straits Settlements.

Germany at War

(An objective account of economic trends in the Reich compiled weekly by the editorial staff of The Economist from German and neutral sources.)

FROM time to time the newspapers redefine the character of Germany's war economy. The first view during the transition to a complete war economy was that Germany had begun to realise economic socialism pure and simple. Recently the *Voelkische Beobachter* termed the whole process a transformation of private capital into social capital. In a real sense of the word there is nothing left that can be called private. Prices formerly settled by private industrialists are now regulated by the Price Commissar. The principles of book-keeping are laid down uniformly for each industry. New inventions are exchanged between industries under the control of the State. Economic control boards require regular returns about stocks. The nature and quantities of raw materials to be used in factories are settled by the control boards; and wages and working conditions are regulated by the Trustees of Labour, who have power to change individual agreements between manufacturers and workers. The private office of a works manager, once the headquarters for all matters concerning the factory, has become the "executive organ" of the economic as well as the social policy of the State; the private capitalist or industrialist is now the vassal of the State and the community. Private individuals exist no longer in Germany; every German belongs to some organisation, i.e. the Party, semi-party organisations, or economic organisations.

The economic organisations largely responsible for Germany's State-controlled economy have now developed central and regional forms, and the so-called self-governing economic organisations have lost the last vestige of their freedom. Wartime economic organisation centres in the Reich Economic Boards, established by extending the peacetime Boards responsible for the control of foreign trade and the exchanges (*Reichswirtschaftsamt*), with regional branches, the district economic boards (*Bezirkswirtschaftsaemter*). The former self-governing organisations, i.e. *Reichswirtschaftskammer*, industrial groups, the commercial organisations, and the groups of independent artisans have been reduced to being simply advisory bodies. The Reich Economic Board has become a kind of planning centre, and the actual distribution of all industrial orders is carried out with the assistance of the district economic boards. The Reich Economic Board is, in fact, a modern statistical centre, where a census of productive capacity, labour resources, stocks and orders is kept up to date.

A new concentration of industrial activity in the war sector proper of industry and trade has begun. There are more complaints that small industries are overlooked when armament orders are distributed. With the appointment of Dr Todt as Minister of Munitions and the opening of a more active phase of the war, the closing-down of civilian industries has increased.

Coins and Metals.—The minting of coins is of some interest because of the withdrawal of nickel and copper coins to be gradually replaced by aluminium and zinc coins. Minting during the period January-March, 1940, ran as follows:—

	(Rm. thousands)				
	Minted	Previously minted	Total	With-drawn	Remaining Total
Silver, Rm. 5.00	...	1,089,498	1,089,498	292	1,089,206
" " 2.00	...	252,707	252,707	22	252,685
Nickel, Rm. 1.00	...	419,394	419,394	91	419,303
" " 0.50	...	117,017	117,017	136	116,881
Aluminium, Rm. 0.50	50,924	11,800	62,724	0.5	62,724
" " " 0.10	297	106,035	106,332	116	106,216
" " " 0.05	...	44,660	44,660	25	44,635
Copper, Rm. 0.02	670	9,175	9,845	9	9,836
" " " 0.01	531	12,709	13,240	5	13,235
" " " 0.01	...	...	...	...	2,066,634
" " " 0.01	...	...	...	...	2,091,793
Total, Jan.-Mar., 1940	52,423	...	...	...	2,114,721

The actual increase in the total value of metal coins is thus not considerable, whereas the rise in notes of the denominations of Rm. 2.00 and Rm. 5.00 has been very substantial. The figures show that the withdrawal of nickel coins is a slow process. The withdrawal of copper coins had not begun at the end of March. It may also be seen from these figures that the metal derived from withdrawn nickel and copper coins is negligible compared with the war demands.

The non-ferrous metal collection which ended on April 19th has again concentrated interest on Germany's metal supplies. It was part of Germany's war preparation to increase the output of aluminium in order to substitute it for copper, for which Germany is almost totally dependent on foreign sources.

A recent American estimate shows aluminium production as follows:—

	(Thousands of tons)					
	1937	Per cent. of total	1938	Per cent. of total	1939	Per cent. of total
WORLD	490.6	100	579.9	100	625.0	100
Germany	131.2	26.7	165.6	28.6	185.5	29.7
U.S.A.	132.8	27.1	130.1	22.5	144.2	23.1
Great Britain	19.4	3.9	22.5	3.9	25.5	4.1
Canada	42.6	8.7	64.5	11.1	66.5	10.6
France	34.5	7.0	45.3	7.8	50.0	8.0
Norway	23.0	4.7	29.0	5.0	32.0	5.1
Italy	22.9	4.7	25.8	4.9	28.0	4.5
Soviet Union	45.0	9.2	48.0	8.3	60.3	9.6

(Figures for 1937 and 1938 from the report of the *Metallgesellschaft*, Frankfurt; figures for 1939 are estimates, and Germany includes Austria.)

In 1929 Germany, including Austria, produced only 36,000 tons, or 12.8 per cent. of the total world output. The cheap electric power which Germany gained by the incorporation of Austria made the increase from 1937 to 1939 possible. It is interesting to note that Hungary's exports of bauxite (for aluminium production) increased from 362,000 tons in 1938 to 570,000 tons in 1939. These additional exports were probably bought entirely by Germany to make good the losses in seaborne imports from Yugoslavia during the first months of the war. This year, Yugoslavia, Italy and the United States of America considerably expanded their capacity. Germany aims at an output of 200,000 tons in 1940, but the success of this is dependent on a steady supply of bauxite from Hungary, Italy and the Balkan countries.

* * *

The Reichsbank.—The annual report for 1939 shows another increase in the activities of Germany's Central Bank. Total turnover increased by 21 per cent. to Rm. 1,751,000 millions. The most important items of the report are as follows, in million Reichsmarks:—

	Dec. 31, 1936	Dec. 31, 1937	Dec. 31, 1938	Dec. 31, 1939
Total assets	15,824	18,653	21,223	27,147
Gold reserve	66.5	70.6	70.8	70.8
Foreign currencies, bills and cheques	114	190	197	224
Treasury bills	62	119	121	...
Other bills and cheques	5,756	5,847	7,959	11,201
Advances	74	60	45	30
Securities for note cover	221	106	565	804
Other securities	312	298	299	418
Notes in circulation	4,980	5,493	8,223	11,798
Reichsbank notes in circulation	368	391	382	957
Metal coins in circulation	1,597	1,595	1,784	1,747
Total money in circulation	6,945	7,479	10,389	14,502

* Included in Other bills and cheques.

During 1939 the bank increased the total holdings of bills, cheques, advances, and securities from Rm. 9,139 millions to Rm. 12,574 millions, or by 38 per cent., the biggest annual increase on record. Reich banknotes in circulation increased by the same amount of roughly Rm. 3,500 millions. Total money in circulation increased during 1939 by 39.6 per cent. In 1938 the increase amounted to 38.9 per cent. From 1932 to 1937 the annual increase of the total money in circulation may be termed almost normal, ranging from 1.2 per cent. in 1933 to 9 per cent. in 1936, and only 7.7 per cent. in 1937. The holdings of Treasury bills are no longer shown separately. There is, however, no doubt that they have risen considerably above the Rm. 121 millions reported at the end of 1938. Net profits increased from Rm. 40.7 millions to Rm. 117 millions. During the year several new branches were opened in the occupied territories. The dividend, which was maintained at 12 per cent. until 1937, of which 4 per cent. was paid into the loan stock, remained unchanged at 5 per cent. Rm. 97.8 millions of the net profits were delivered to the Reich Treasury.

THE BUSINESS WORLD

The Remnants of the Reichsmark

THE bewildering kaleidoscope of the German exchange market has lost none of its variety since the outbreak of the war. If there has been a change, it has been to emphasise the contrast between the rigidity of those rates of reichsmark exchange which are dictated by the Government and the violent fluctuations in those which still retain some semblance of freedom. Wherever there is freedom in the German exchange market, as, for example, in the markets for register and security marks, rates have since the beginning of the war moved violently against Germany—so violently as to put in the shade the depreciation of free sterling in which the German propaganda machine seems to find such an unending source of combined glee and self-satisfaction.

For many years past the basic characteristic of the German exchange market has been its watertight sectionalisation and its adaptation to the structure of strictly bilateral clearing agreements through which the bulk of German foreign trade is conducted. This diversification of the exchange market and the exceptionally strict and effective control that goes with it rendered the mechanism readily adaptable to war conditions. The transition from peace to war has called for no appreciable change in the German exchange control system. For eight years it was being gradually forged and perfected to meet the very conditions that arose last September.

To-day, more than ever before, the rates of exchange which count in the German economy are those applied to the clearing agreements operating with those countries with which Germany remains in commercial contact. The paucity of German foreign exchange and gold reserves has completed the dependence of the country's foreign trade on clearing and compensation agreements. The rate of exchange between the reichsmark and the other currency concerned is in each case a matter of negotiation. It is a resultant of politico-economic bargaining and not of any attempt at precise economic adjustment. The artificiality of this structure of clearing rates would be immediately apparent if the balances accumulated in the clearing accounts were in any way interchangeable. But as long as the principle of strict bilateralism obtains, the door is open to every inconsistency in the relation of these clearing rates. One interesting illustration of the process by which they are fixed is provided by the long drawn-out and as yet unresolved dispute concerning the rate to be applied between the reichsmark and the leu in the German-Roumanian clearing agreement.

These rates, it should be added, are but one of the artificial elements entering into the settlement of such barter trade. Others are the often fictitious figures at which German exports are invoiced and the degree of subsidisation which they may receive from the German authorities. The result is to make any comparison of the comparative terms of international trade impossible. There can, for example, be no exact comparison of the prices which Great Britain and Germany are paying for Roumanian oil. The clearing rates of reichsmark exchange, important as they are to German trade, provide no guide whatsoever to the economic parity of the reichsmark. Indeed, the concept of such a parity vanishes in a totalitarian economy such as Germany's, where price control, draconic rationing, selective subsidisation of exports, complete State control of essential imports and prohibition of non-essential imports, have removed every factor making for the natural adjustment of the external value of the currency to its domestic purchasing power. The only indication of gross maladjust-

ment of such clearing rates would be the abnormal accumulation of clearing balances against one or other of the two parties. But even that can be corrected without touching the exchange rate, namely, by the appropriate adjustment of the nominal price of exports from Germany and of the prices paid for imports from the clearing partner.

The danger of these clearing agreements from the point of view of Germany's commercial partners has been adequately illustrated by the fate of the balances owing by Germany to countries with which she is no longer able to trade. The Allied navies stand between Germany and the various South American republics with which a highly ingenious variety of compensation agreements had been negotiated by Germany in recent years. Most of these were based on the use of Aski marks. Although such marks were only available to finance the strictly bilateral trade between Germany and each country concerned, the mechanism differed from that of the ordinary clearing agreement in that the rate of exchange between the mark and the Brazilian milreis or Peruvian soles, or one of the other currencies concerned, remained free to fluctuate within the limits of this bilateral trade. The Aski marks due to Brazilian exporters of coffee to Germany could not, for example, be used to pay Germany for the import of machinery into Peru. There were consequently substantial discrepancies in the quotations for Aski marks in the various South American republics, and during the months preceding the outbreak of war the general drift of these rates was against Germany. The outbreak of the war found most of the South American countries large holders of Aski marks, the quotations for which have become entirely nominal. In Brazil and Chile, countries with which Germany conducted an important volume of trade, the market has ceased to quote a rate for marks. In Peru the rate has been marked down from 2.31 to 1.82 soles to the mark, but there are "sellers only" at the present figure. The "Aski" part of the German foreign exchange market has disappeared in common with the trade which Germany is now prevented from transacting owing to the Allied blockade.

What, then, remains of the German exchange market? There is, of course, that museum piece, the official rate for free reichsmarks, which retains an imposing stability but at which no business is transacted. The official rate is quoted in New York at \$40.20 for 100 reichsmark, equivalent to about 10 marks to the £ at the official sterling rate and 8.75 to the £ at the free rate. There it is likely to remain in undisturbed grandeur. But the sole function of this rate is that of providing a point of departure from which to measure the discount on those species of marks which are still dealt in on the free markets. These are the travel marks, composed of a mixture of "dego" and register marks, and "gift" or benevolent remittance marks, which consist wholly of register marks. The principal markets for travel marks are to be found in Amsterdam and Switzerland. The biggest potential supply of register marks under existing German standstill agreements is that held by American banking creditors, but the outlet for travel marks in the United States is virtually non-existent. The travel mark "cocktail" is now made up as to 25 per cent. of dego marks provided by the Gold Diskont Bank and sold at 30 per cent. of the official rate, that is, at \$12.06 per 100 marks—or about Rm. 33 to the £, taking the official sterling dollar rate, and about Rm. 28 to the £, taking the free sterling rate in New York. The other 75 per cent. of the travel mark is composed of register marks, for which the latest wholesale rate is 20

to 21 per cent. of the official rate, i.e. about \$8.04 per Rm. 100, or say Rm. 50 to the £. In order to derive a rate for travel marks from this concoction one must add the licence fee, which now amounts to \$4.50 per Rm. 100. This fee is retained for the foreign creditors and applied in gradual repayment of their claims.

Out of the sale of travel marks, the German authorities thus collect exchange only in respect of the minor proportion of dego marks which enter into the mixture. Even this, it would seem, is not providing a net equivalent *devisen* income, since the Gold Diskont Bank appears to have satisfied the demand for dego marks, in part at least, by buying up security marks in the international markets. These security marks, which are only available for long-term investment in Germany, have fallen to as little as 6 per cent. of the official free Reichsmark rate. In New York, for example, they would be quoted at about \$2.40 per Rm. 100, or, taking the official sterling equivalent, Rm. 160 to the £. As the Gold Diskont Bank resells these security marks as dego marks at 30 per cent. of the official rate, it makes a very handsome turn in terms of foreign exchange. Though the profit is not as great as it would have been if the dego marks in question had just been created, the operation serves the additional purpose of repurchasing, at a very cheap price, the remnants of foreign investments in Germany.

In the case of the gift, or benevolent remittance, mark, the position is somewhat different. The German authorities obtain no foreign exchange from the sale of these

marks. They consist wholly of register marks sold by foreign banking creditors of Germany, who at present get a rate based on the wholesale price for register marks—about 20 to 21 per cent. of the official rate, plus a licence fee of \$3.75 per 100 gift marks. Before the war there was a limit of 300 marks per month on the amounts which any individual could remit to Germany by this channel. That limit seems to have been removed as far as remittances from the United States are concerned.

In those markets for Reichsmarks which retain some kind of freedom, the position has therefore deteriorated violently against Germany—or, it would be truer to say, against the foreign banking creditors of Germany. On the basis of the data given above, it may be calculated that travel marks in terms of dollars would be quoted at \$15.12 per Rm. 100, and that of this rate \$3.12 would go to the German authorities in respect of dego marks, \$7.50 to the creditors in respect of their proportion of register marks in the mixture, and the remaining \$4.50 also to the creditors in respect of the licence fee. The rate for benevolent marks has recently ranged around \$13.75 per Rm. 100, of which \$3.75 represents the licence fee. The abysmal discounts to which these types of marks have fallen—70 per cent. in the case of dego marks, 79 to 80 per cent. for register marks, 94 per cent. in the case of security marks, and the appropriate figures for the mixtures of these ingredients, are a sufficient measure of the confidence in German currency in the markets that still have the freedom to express it.

Coal in War

THE coal-mining industry has a vital part to play in war as a source of energy for the munition factories, of foreign exchange for the import of essential commodities, and of heat and light for the population. The policy of the industry must be guided by three considerations. First, there must be a sufficient and regular supply of coal for essential purposes at home; the wheels of industry must not be allowed to slow down—as they were earlier this year—through a lack of fuel. Secondly, a special effort must be made to increase exports as much as possible. Thirdly, there must be strict economy in man-power, for not only does coal-mining employ almost exclusively male labour, but the value of the net output per person employed in the industry is still well below the average of all industries—it was £159 in 1935, against the national average of £223; in other words, the estimated requirements of coal must be produced by the smallest possible number of miners.

The first thing that must be determined is the quantity of coal that is likely to be required for domestic and export purposes. In 1937, when industrial production was at its highest level since 1929, the quantity available for home consumption was estimated by the Mines Department at 182 million tons. Owing to the immense demand for munitions it is doubtful whether consumption can be reduced below that level during the war, even if the strictest economy is practised in its use in industry and in the home. (Too severe a limitation of supplies for heating, by increasing sickness, may do more harm than good.)

Exports of coal and of the coal equivalent of coke and of manufactured fuel in 1937 were 44½ million tons; in addition 11½ million tons were shipped to bunkering stations for the use of ships engaged in foreign trade. What are the possibilities of a substantial expansion in exports? In 1937, 3.3 million tons—or 8 per cent. of our total exports of coal—went to Germany, while another 10.2 million tons—or 25 per cent. of the total—were sent to the countries bordering on the Baltic Sea. All these markets, which together absorbed no less than one-third of our total exports in 1937, have been virtually cut off, at least temporarily, as a result of the war. On the other hand, Germany (including Poland) has lost the greater part of her markets in Western Europe and overseas. In 1937 the combined exports of Germany and Poland to

Western Europe, the Mediterranean countries and North Africa, and America were 27 million tons; on balance, it is evident, there is considerable scope for an expansion in British sales. So far as Italy is concerned, the prospect is obscured by political factors. In years of active business conditions, that country imported some seven million tons from this country; but as a result of the imposition of sanctions in 1935 she turned to other sources of supply—chiefly Germany—and in 1937 and 1938 her purchases in this country averaged only 2¼ million tons. It is impossible at this stage to estimate the size of our potential exports in 1940; but a determined search for markets will be necessary if the export trade is expected to absorb the greater part of the increase of 20 million tons in total output called for by the Mines Department.

If total requirements are rightly estimated at a minimum of 260 million tons per annum, means must be found to produce this quantity. But as the programme involves an increase in production of 20 million tons over the 1937 output—the highest achieved since 1929—its realisation is by no means easy owing to the need for economising man-power. (During the last war the output of saleable coal actually declined, from 287 million tons in 1913—the highest level ever reached—to 228 million tons in 1918.) Given an unlimited supply of labour and materials, and ample time, the target figure could be attained without difficulty. But the supply of labour is not unlimited; nor can we hope to add substantially to production by the sinking of new pits, which, besides involving considerable capital expenditure, requires not months but years of preparation. Is the industry in a position to increase the rate of output to 260 million tons per annum from existing pits with the labour force employed in 1937? This is the problem which will have to be solved. It is quite true, of course, that, as a result chiefly of the industrial revolution in coal-mining during the past two decades—the quantity of coal cut by machinery, for example, rose from 8 per cent. in 1913 to 59 per cent. in 1938—a considerably smaller labour force is now required to produce a given quantity of coal than in 1914-18. Thus, in 1913 the total quantity of coal raised (as distinct from the saleable output) per person employed was 260 tons; on the assumption that 98 per cent. of the coal raised in that year was saleable (an assumption based on the experi-

ence of 1920 in respect of which figures are available both on a "raised" and on a "saleable" basis), the output of marketable coal per person employed was about 255 tons. As the corresponding figure for 1937 is 315 tons, the output per person employed in that year was no less than 23½ per cent. higher than in 1913, in spite of a reduction in working hours. Even if no allowance is made for the change in working hours, some 943,000 instead of 763,000 persons would have been required in 1913 conditions to produce 240 million tons of saleable coal raised in 1937. The mechanisation of coal-mining and the consequent saving in man-power of such magnitude which, added to the fall in demand, caused so much unemployment and social distress after 1914-18, is thus proving of considerable advantage in the present war. But the fact that the labour force of the industry has been so greatly reduced in recent years should not lead to the argument that the best way of increasing production is by increasing the labour force. As in every other form of production in wartime, so most particularly in coal-mining, the chief objective must be to save man-power. In any case, the majority of the coal miners who were thrown out of work in the years after the last war and have not yet retired have been absorbed by other industries; for example, the proportion of the total number of persons insured in the industry unemployed on March 11th was only 6 per cent.

Although the fact that coal is by no means a homogeneous product complicates the task, there is no reason why the industry should not be able to produce 20 million more tons per annum than in 1937 from existing pits and with the labour force employed in that year. There are at least three ways in which production could be speeded up: first, by maintaining output at the winter level during the summer months; secondly, by a reduction in absenteeism among miners; and, thirdly, by an increase in working hours.

The maintenance of an even flow of production would not only prevent the waste of labour and plant during the summer, but it would also enable stocks to be built up against an emergency, such as the dislocation of transport which occurred during the cold spell in January and February. The potential increase in production by this means is quite substantial; thus, if the daily output of saleable coal in 1937 had been maintained throughout the year at the level reached in December, the year's production would have been some 15-17 million tons higher than it was. An alternative way of arriving at the same result is by calculating the additional output which could have been achieved if the pits had not been idle, on the average, for 17 coal-winding days through lack of trade (in years less active than 1937 the loss of output through lack of demand has been appreciably greater). If production could be maintained throughout the year with the labour resources employed in 1937, it would therefore be possible to raise at least 255 million tons per annum. And if, in addition, avoidable absenteeism could be reduced and labour disputes eliminated, the Mines Department's figure of 260 millions could be reached. But the practical difficulties in maintaining output throughout the year are many. The chief of them is probably the problem of storage. In the first place, storage capacity is limited; secondly, merchants and consumers (many small private consumers have virtually no storage facilities) cannot be expected to lock up part of their resources in heavy stocks of coal during slack periods. But with Government assistance these difficulties could be largely overcome.

As a last resort, production could be increased by an increase in working hours. Before and during the last war the maximum hours of labour below ground were eight, compared with the present seven and a half. On the assumption that the present rate of output would be kept up during the additional half-hour, an eight-hour day in 1937 would have yielded a further 16 million tons. In practice, however, the additional output would probably have been slightly smaller.

By continuous working, a reduction in avoidable absenteeism, the elimination of trade disputes and an increase in working hours below ground from a maximum of seven and a half to eight per day, the output of saleable coal could thus be raised to 265-270 million tons per annum with the labour force employed in 1937. This

policy requires some far-reaching changes in methods and much closer collaboration between miners and employers. But the changes in method are surely justified by the war; in France and Germany working hours have already been substantially increased. The constitution of the Coal Production Council early in April with the object of speeding-up production suggests that the rate of output has hitherto been disappointing and that the Government is about to make an effort to raise it to the desired minimum level. And as the Council is composed of representatives of both coal miners and owners, with civil servants from the Ministries of Transport and Shipping and from the Mines Department as additional members, the required changes in methods should be facilitated. The failure of the Council through lack of co-operation would be inexcusable.

Lastly, the available coal must be utilised to the best advantage, with special regard to the need for economising it in domestic consumption. This requires a system of priorities and an efficient distribution machinery. Moreover, as coal is likely to be scarce during the war, its price must be controlled. The plan for the regulation of supplies and prices, which came into operation at the outbreak of the war, was discussed on page 181 of *The Economist* of July 22, 1939. It provided for the utilisation of the existing coal marketing machinery in the control of supplies, distribution and pithead prices, and for a system of priorities, supplemented by a rationing scheme. While this machinery remains in existence, the Government tightened its control of distribution in March, when the Mines Department, through its local coal officers, assumed the direction of the flow of coal from pithead to consumer; as a result of this change the Government is in a stronger position to secure the most advantageous utilisation of supplies. So far as prices are concerned, control continues to be exercised through the marketing schemes, subject to an arrangement between the Government and the Central Council of Colliery Owners by which the latter undertook not to raise the general level of pithead prices during the war, except after consultation with, and subject to the consent of, the Mines Department. Wholesale and retail prices were also stabilised at pre-war levels, subject to adjustments justified by higher pithead prices and distribution costs. In view of the rise in costs after the outbreak of the war, some increase in pithead prices was unavoidable; since last September they have risen by 16-17 per cent. In recent months, however, prices have been fairly stable, and it is understood that the colliery owners have not applied for any advance in prices to cover the increase in wages from January 1st and April 1st.

To conclude: if the coal-mining industry is to play its part in the war effectively and efficiently, it will have to depart boldly from the pre-war routine. Much has already been done in adjusting the machinery of distribution and price control to war conditions. But the biggest task will be the expansion of production and exports, with due regard to the need for economising man-power and for ensuring an uninterrupted flow of supplies to domestic and overseas consumers.

A FEDERATION 3/6 for WESTERN EUROPE net

By W. IVOR JENNINGS

Author of *Cabinet Government* and *Parliament*

A really concrete contribution to the problem of Federation. Dr. Jennings, the well-known constitutional lawyer, discusses in detail a Draft Constitution for a Federation of Western Europe which he thinks will work; he invites his readers to consider it, criticise it, and, if necessary, to improve upon it.

CAMBRIDGE UNIVERSITY PRESS

Finance and Banking

Abundance of Money.—Conditions in the money market during the past week have been easier than at any time since the outbreak of the war. The dominant factor in this plethora of loanable credit has been the payment by the Treasury of moneys due on dollar securities acquired by virtue of the second Vesting Order. Market estimates of the total represented by this second batch of dollar securities mobilised by the Treasury range between £60 millions and £70 millions. The authorities do not appear to have gone out of their way openly to neutralise the impact of these disbursements on the credit situation, though there may have been some special selling of bills to the big banks. It is only next week that the issue of Treasury bills is again exceeding maturities, so that the transfer of bills from the tap to the tender issue which has accompanied such operations as the acquisition of dollar securities by the Exchange Equalisation Account and the participation of public departments in the last War Loan must have been effected by direct sales of tap bills to the banks. The switch will become more apparent in the published figures after the time lag required to allow the bills thus sold to run off. They will then have to be renewed by bills openly issued through the tender. The transfer of funds to former holders of the dollar securities is reflected in the latest Bank Return in a fall of £20,947,000 in public deposits and a rise of £22 millions in bankers' deposits. The latter, at £125,447,000, are at a level which fully explains the abundance of funds experienced in the money market during the past week. The impact of these repayments on the short loan situation has been exceptionally direct, because the uncertainties of the war situation have induced many institutional recipients to hold their sterling in liquid form for a time at least. It has certainly been apparent that the Scottish banks, which would hold the accounts of the Scottish investment trusts so largely affected by the latest Vesting Order, have been

particularly overburdened with resources which on certain days of the week have been largely unlendable. The discount market has been induced by the superabundance of funds to resurrect its hopes of some downward adjustment in clearing bank money rates, but for the time being these hopes appear to have little justification.

* * *

Empire Exchange Control.—Canada and Australia have taken steps this week to implement their part of the Empire exchange control scheme and the mobilisation of their gold and exchange reserves. In Canada, an Order-in-Council has been issued requiring resident holders to sell their holdings of foreign exchange to the Foreign Exchange Control Board. These holdings had to be registered with the Control Board soon after the outbreak of the war, and any disposal of such holdings has had to receive the sanction of the Board. This, however, is the first requisitioning order that has been made in respect of Canadian residents' foreign currency assets. These assets are almost exclusively expressed in United States dollars. According to the Federal Reserve Board estimates, the balances of Canadian residents in the United States amounted to \$89,000,000 on the outbreak of the war. In addition there were marketable security holdings of \$125,000,000. No part of the latter has yet been mobilised. This first requisitioning Order is to apply to the Bank of Canada, and the whole of its gold and foreign exchange reserve is being transferred to the Control Board. Canada is thus following the British precedent of concentrating all the gold and exchange reserve in the exchange authority. According to the return dated April 17th, the Bank of Canada held gold and foreign exchange reserves to the tune of \$277.4 millions. In Australia, the first vesting Order for the compulsory acquisition of certain dollar securities by the Commonwealth

Treasury has been issued this week. The Order refers to twenty stocks which probably represent the majority of Australian residents' investments in the United States and Canada. The machinery proposed for the disposal of these securities differs from that applied in Great Britain. The disposal of the specified securities is left to the individuals concerned, who are merely instructed to sell half their holdings within three months and the other half within six months, and to lodge the net proceeds of their sales in the Commonwealth account in New York. This procedure is made possible, and is indeed justified, by the comparatively modest proportions of the potential selling from this source.

* * *

Direct Purchases of Empire Gold.—Arrangements have now been completed for the direct purchase of South African and Rhodesian gold during the war by the Bank of England, acting for the British Treasury. Under these agreements the Bank takes delivery of the gold in South Africa, where it pays the full official price of 168s. per ounce and takes upon itself the cost of shipping the gold to its ultimate destination. As far as South Africa is concerned, the Union Government is expected to take the whole of the benefits accruing from the agreement. Under the proposed modification in mining taxation embodied in the recent South African budget, the companies are to be allowed the official price of gold but will be debited with the full realisation charges—whether or not they are actually borne by the South African Government. As hitherto, the mines will sell their gold to the Reserve Bank for account of the Union Government. In the case of the Rhodesian gold, the cost of packing and delivery to the South African Reserve Bank will be borne by the producers who, incidentally, will continue to bear the tax on the excess of the price over 150s., which was imposed soon after the outbreak of the war. The principle of direct British Treasury purchases of South African gold is far from new. It came into operation soon after the setting up of the Exchange Equalisation Account, which, by special agreement with the South African Reserve Bank, bought the South African gold which until then had been disposed of in the open London market. During the course of 1939 the gold so purchased was in part earmarked in South Africa in order to disperse the country's gold reserve. The new feature of the recent agreement is the implication that London is no longer the centre to which newly mined gold converges and from which it is redistributed. There are cheaper ways of getting that gold to its ultimate resting place at Fort Knox, Kentucky.

* * *

German Standstill Receipts.—Although every British bank with claims under the German Standstill agreement decided on the outbreak of the war to write these off and remove them from the balance sheet, this does not by any means indicate that all revenue from this source has been abruptly stopped. In the first place, certain

moneys derived from the fees payable on pre-war sales of travel marks which had been accumulating in sterling with the paying agents in London are now being distributed to the London creditors. The amount is not large, but on an investment written down to zero it constitutes a welcome return. Once this little nest egg has been emptied, however, there will be no further revenue from this source. Certain banking creditors of Germany—both in respect of Standstill and other credits—have moreover shown a commendable resourcefulness and fighting spirit in endeavouring to recover part at least of their claims. One of the devices used has been to transfer to a trust, established in a neutral country, the claims which became repayable at call with the outbreak of war and the repudiation of the Standstill agreement. Such a trust, domiciled in Holland, has instituted proceedings for recovery from the German debtors in question who happened to have assets in that country. The necessary "stops" were immediately placed on these guilder assets and this week the matter came before an Amsterdam tribunal. Its finding was in favour of the creditors in respect of claims amounting altogether to £46,590. This is not only good business, it is excellent economic strategy.

* * *

Hambros Bank.—The course of recent events in Scandinavia and the knowledge of the intimate ties which link Hambros Bank with such countries as Denmark and Norway have caused the accounts of that bank to be studied with more than usual interest, and they have emerged with credit. The most immediate effect of the war was the complete writing off of the bank's claims under the German Standstill Agreement. The provision for these and other bad and doubtful debts has been made from contingency account, to which the whole of the £1,400,000 held in the general reserve account has been transferred for this purpose. Since the report states that the inner reserves have been maintained, it is permissible to assume that the amount in question proved fully adequate to write off these now doubtful assets. The acceptances have been reduced over the year from £11,410,000 to £3,667,000, a movement which must register a considerable reduction in earning power. The latest total, it should be noted, represents new credits granted since the outbreak of war, which have received the sanction of the authorities. On the outbreak of the war, all outstanding facilities to overseas clients had to be cancelled in accordance with the Defence Regulations. The report states that the deposits held on Norwegian and Danish accounts exceed in the aggregate the engagements of clients in those countries to the bank. The big reduction in acceptances is accompanied by a fall in deposits from £15,249,000 to £10,508,000. This last item was covered on March 31st last to the extent of about 70 per cent. by cash, bills and British Government securities. The position is thus one of the most reassuring liquidity. The lower earning power is reflected in a fall of £59,000 to £211,000 in profits. The dividend has been reduced from 18 to 12 per cent.

MONEY MARKET NOTES

ONCE again the only change among the officially quoted currencies has been shown by the belga, which on Thursday depreciated from 23.75-90 to 23.85-24.00. On Wednesday and Thursday unofficial rates tended to move against sterling in sympathy with the weaker trend of sterling in New York, where the Norwegian news has probably caused the decline in the rate. On Wednesday it closed at 3.49½, a drop of 1½c. on the day, and it opened weak on Thursday. An interesting movement on that day among the unofficially quoted currencies in London was a slump from 4½d. to 3½d. in the Chinese dollar. This was probably the result of speculation in Shanghai, for it is understood that there has been no change in the policy pursued by the Stabilisation Fund.

The extraordinary ease experienced by the money market this week is discussed in a Finance Note. As a result Greenock Corporation has been able to secure very favourable terms for £100,000 six-month bills, which were placed at an average rate of 1½ per cent. At last week's Treasury tender the discount market syndicate only obtained a 36 per cent. allotment quota, and the average rate of discount was again slightly lower at £1 0s. 4.98d. per cent. This week the amount of bills on offer—£60 millions—is greater than the maturities for the first time since the seasonal reduction of Treasury Bills began in January.

The chief movement in the Bank Return is the big increase to £125.4 millions in bankers' deposits, with a

corresponding decline in public deposits, owing to the payments for dollar securities made under the Vesting Order and also to the first-of-the-month dividend distributions. This readily explains the plethora of credit in the money market. The note circulation shows a small rise of £3.9 millions, presumably owing to end-of-month requirements.

*

Silver has had a firm week, although the market continues to be very narrow. There has been a sharp advance in Bombay, possibly due to expectations that the Silver Purchase Act will not after all be withdrawn, and London has followed the upward trend to a level which has not been reached since the beginning of February.

* * *

Legal and General.—The Legal and General is one of the most progressive of the offices writing life business. Even in 1939, when conditions were decidedly unpropitious for life assurance, its large life fund increased from £41.1 millions to £44.3 millions. New sums assured admittedly declined, but the total reached £13.67 millions, against £16.57 millions in 1938, and the major part of the decline was on decreasing term and group business, which totalled £7.24 millions against £9.27 millions. Excluding reversions, the rate of interest earned on the life and annuity fund was 4.06 per cent. net, compared with 4.13 per cent. in 1938. In view of the much larger burden of taxation, this is a particu-

INSURANCE NOTES

larly small decline, and the rate was higher than that recorded by most offices, even when calculated on the total funds, including reversions.

The following table shows that total premium income was almost as great as in 1938:—

TABLE I Premiums		
	1938	1939
Life	4,807,174	5,075,729
Annuities	1,159,350	868,853
Cap. Red.	315,341	204,791
Perm. sickness	12,304	11,730
Fire	352,639	378,740
Accident	209,293	202,538
	6,856,101	6,740,381

Both the fire and accident departments recorded excellent results. Underwriting profits were consider-

ably larger than in 1938 and amounted to 13.4 per cent. of earned premiums on the fire business and 12.5 per cent. on the accident. These are very satisfactory ratios. The company has charged a loss on realisation of investments to profit and loss account. Net transfers to that account were as follows:—

TABLE II Profit and Loss Transfers		
	1938	1939
Fire underwriting profit	32,067	50,682
Accident do.	9,874	25,280
Interest (ex. life ann. and cap. red.)	80,046	75,374
Prof. on invests.	69,404	Dr. 89,328
	191,391	52,008

* Bank of England's official price.

the reserve for taxation, the carry-forward is £271,996, against £353,774 brought forward at the beginning of 1938. The directors recommend a dividend of 2s. per share on July 1st next, making a total of 3s., less tax, per £1 share. This compares with 2s. per share plus a bonus of 3d. per share, both free of tax, for 1938. The assets total nearly £51 millions; there are investment and general reserves of £2 millions.

★

London Life.—This mutual office makes an annual valuation. In 1939, interest was assumed at only 3 per cent. instead of 3½ per cent. However, the bonus reserve method is used, which takes account of future bonuses at given rates, and the lowering of assumed interest earnings was rather more than offset by the reduction in these rates. In the result, the total surplus was £392,376, against £535,885 the previous year. Allocations to policyholders were lowered by about one-half in total and £315,000 was transferred to reserve, £109,358 being unappropriated (against £151,487 in 1938). New life assurance business totalled £2,010,369, against £2,700,913. The directors applied the whole of the investment fluctuation reserve of £1.4 millions to write down the value of the assets, which stood at £29.8 millions in the balance sheet. In consequence, the book value of securities was less than the market value at the end of the year. Net interest earned was 3.54 per cent. against 3.75 per cent. in 1938. The office pays no commission and therefore its expense ratio was at the low figure of 5.24 per cent. for 1939, ignoring the allocation to staff superannuation from the surplus (£15,000).

★

Eagle Star.—The Eagle Star accounts for 1939 are remarkable for an increase in underwriting profit in every department except the life department, where the incidence of valuations makes a strict comparison impossible. Total premiums also increased. The figures include those of subsidiaries:—

	1938	1939
	Earned Pre-miums	Under-writing Profit to P. & L.
Fire	812,864	54,447
Accident	100,779	12,995
Emp. Lty.	296,520	900
Motor	1,616,834	18,402
General	494,150	94,973
Marine	275,060	426,900
Life & Cap. Red.	1,367,692	*99,548
Annuities	136,417	1,301,638
Trustee, etc., fees	...	169,941
Interest (ex Life and Cap. Red.)	5,100,316	300,633
		5,156,752
	358,901	336,007
	659,534	608,326

* 1938—Shareholders' profits from "Star" fund, 1938 valuation (£53,348), from non-participating policies (£40,000), and from capital redemption profits (£1,200); 1939—Shareholders' profits from "Sceptre" fund, 1938 valuation.

There was a slight falling-off in premiums in the important motor department, no doubt resulting from the war, but a small profit was nevertheless earned. The marine department showed great expansion and made a welcome contribution to profits. Fire premiums increased and the profit ratio was 7.3 per cent.—a satisfactory figure. Life new business declined drastically, the net total of new sums assured being

£5,835,877, against £10,313,261. The sharp diminution was no doubt largely in group life assurances, but this particular type of business, in which the company specialises, has improved considerably recently.

After allowance for the 1939 dividend, certain expenses not charged to other accounts and taxation, the carry-forward from the profit and loss account was £493,365, against £402,134 brought forward.

Net interest earnings (excluding those on the life, annuity, and capital redemption funds) were sufficient, after deducting the company's preference dividends, to meet the unchanged dividend of 30 per cent., less tax, on the ordinary shares, with 9 per cent. to spare—a performance which few companies can equal. Assets totalled £28.8 millions at the end of 1939, and the investment reserve of £650,000 was more than sufficient to make good the depreciation on securities. In addition, general reserve stands at £2.5 millions.

★

Atlas.—The two most important of the non-life departments of the Atlas showed slightly less favourable results last year:—

	1938	1939	1938	1939
	Fire	Life	Employers' Liab., Accdt. and Genl.	Life
Earned prem.	1,769,500	1,745,812	650,767	663,318
Claims ratio ...	42.0	42.4	50.4	53.2
Expenses ratio ...	48.5	49.8	41.4	40.1
Underwriting profit	9.5	7.8	8.2	6.7

Total underwriting profits in both departments, which were transferred to profit and loss account, amounted to £179,707 in 1939, against £222,185 in 1938. The marine department, which showed a considerable increase in premiums from £157,061 to £186,128, contributed £30,000 to profit and loss, against £40,000 in 1938. A sum of £29,587, compared with £34,081 in 1938, was transferred to the profit and loss account from life premiums for shareholders in lieu of a part of life profits. Allowing for the interest on non-life funds credited direct to profit and loss (£107,876, compared with £120,247) and for fees received (£1,455, against £1,124), the total amount to the credit of profit and loss, including the sum of £359,572 brought forward, was £708,198 (against £744,457).

The directors have applied £75,000 of this amount towards writing off securities and property, in addition to £257,535 transferred direct from the life account for writing down investments. The dividend for 1939 is 10s. 6d., less tax, compared with 8s., free of tax, in 1938. The amount carried forward from the profit and loss account is £367,052 (compared with £359,572).

The life fund totalled £15.7 millions at the end of the year, and the year's life premiums were £1,164,038. Consideration money for annuities was £476,868. New sums assured fell from £4,042,720 to £2,999,429 and the net interest earned from 4.16 per cent. to 3.81 per cent.

Total assets of the Atlas and subsidiaries at the end of the year were £21.9 millions, the book value of Stock Exchange securities being less than the market value.

★

General Accident Fire and Life.—Most of this company's business is in accident insurance (despite

its rapid development in recent years in other classes), the United States being an important source. Thus the accounts for last year reflect the rather less favourable conditions which prevailed in American casualty insurance. The outbreak of war also had adverse effects upon accident business, especially in the motor branch. In the circumstances, it is very satisfactory that earned premiums in the accident and general account for 1939 were only slightly lower at £8,428,220 against £8,541,303. The ratio of claims to earned premiums was 58.3 per cent., compared with 56.3 per cent., and expenses also were rather higher at 38.0 per cent. against 37.1 per cent. Consequently the underwriting profit was reduced to £312,104 (3.7 per cent. of premiums), compared with £561,295 (6.6 per cent.) in 1938. Fire business brought in premiums of £741,231, an increase of £13,578, and yielded an extremely satisfactory profit of £182,270—no less than 24.6 per cent. of earned premiums. In 1938 the corresponding figure was £176,494, or 24.1 per cent. The marine account drew upon profit and loss to the extent of £10,000, but this was an improvement on 1938, when £66,000 was needed. The net transfer to profit and loss from the fire, accident and marine accounts was £484,374, against £671,789 in 1938.

There was naturally a falling-off of new life business last year, the year's total being £1,507,119, against £2,611,070 in 1938. But the life assurance fund increased by £191,898 to £5,721,723. The directors, in suspending the interim bonus until after the next valuation, have adopted the conservative course followed by some other offices. Net interest earned (excluding that received on the life and capital redemption funds and deducting the preference dividend) amounted to 114 per cent. of the cost of the dividend of 70 per cent., less tax, on the £1 ordinary shares—an outstanding achievement.

★

Scottish Union and National.—A satisfactory feature of the Scottish Union accounts is the increase in total premiums last year. This is mainly due to a sharp advance in marine premiums, presumably resulting from higher premium rates and war risk business. There was also an increase in premium income on employers' liability business. Miscellaneous premiums also expanded, and declines in fire, accident and life premiums were small.

	Premiums		Underwriting Profits to Profit and Loss	
	1938	1939	1938	1939
Fire	£ 984,600	£ 968,938	£ 86,573	£ 77,725

* Special reserve of £100,000 extinguished.

Thanks to a profit on miscellaneous business, against a large loss in the previous year, total underwriting profits rose from £49,312 to £80,593. The miscellaneous account includes advances on medical practices; these involved considerable losses in earlier

(Continued on page 821.)

Investment

Gilt-Edged to the Fore.—Nothing has illustrated the power of investment funds operating in a closed capital more strikingly than the rise in the Funds this week. The release of purchase moneys for the second requisition of dollar stocks has succeeded, against adverse news from Norway and ominous rumblings from Italy, in lifting Old War Loan by a point, compared with the end of last week, and substantial rises have occurred in other long-dated stocks. The market's reaction to the Budget—to favour gilt-edged rather than equities—has thus been powerfully reinforced. Moreover, the advance in gilt-edged has been

FIXED-INTEREST AND EQUITY SECURITY MOVEMENTS (July 1, 1935 = 100)
Financial News indices of 20 fixed-interest securities (converted to new base) and 30 ordinary shares.

concentrated on the long-dated stocks in preference to the shorter-dated issues. There are those, indeed, who argue that the traditional value of a date is no longer worth paying for on the old scale. Old War Loan, on a 3½ per

cent. basis, now compares with short-to-medium stocks on a 3 per cent. level. That is the scale which the Chancellor himself has laid down, and it has introduced a certain rigidity in the relationships of different sections of the gilt-edged market, which formerly were sensitive and plastic. By contrast, the equity market this week has moved in counterpoint to gilt-edged, thus continuing a trend which has been apparent for a month or more, as the attached chart suggests. For the time being, dividend limitation has frustrated what little incentive existed in the equity sections. The actual task of working out its implications for individual companies is giving brokers much correspondence, but little or no business. And the market has shown considerable concern regarding the possible consequences of the Purchase Tax (on which Sir John Simon shed some slight additional light this week) for such companies as Marks and Spencer and Woolworth. The success of these organisations in the past has been largely based on a rising standard of living and falling prices, and both conditions are likely to be negated during the war.

★ ★ ★

Dividend Limitation Explained.—The Budget Speech is the Chancellor of the Exchequer's most important parliamentary occasion. He expects the most careful attention, and receives it. Members and the public are entitled to feel, in return, that the Chancellor means what he says. Unfortunately, on the subject of dividend limitation, Sir John Simon said very little in detail in his Budget Speech, and even part of that little was, strictly interpreted, the reverse of his "present ideas" on the question. It is hardly surprising that the Chancellor has not been a popular figure in the equity market this week. His amplification of dividend limitation was given late on Thursday last week, after the article on "Limited Dividends and Equities" had been passed for the press, and it answers some of the questions which were then posed. Companies are, as we

(Continued from page 820.)

years, but changes effected to put it on a remunerative basis have apparently had effect, for the directors have not had to replenish the special reserve of £100,000 which was absorbed during the year. Fire yielded a rather smaller profit, but there was a slight improvement in the accident account balance, and the loss on employers' liability business was reduced. There was again no transfer to profit and loss from the marine account. New life sums assured totalled £1,365,089, against £2,539,368.

Last year the sum of £300,000 was absorbed from accumulated profits to double the shareholders' capital. The latest dividends of 5s. 3d. on the "A" shares and 20s. 7½d. on the "B" shares have thus failed to maintain the total distribution, since the 1938 dividends on the smaller capital were 13s. and 48s. 9d. respectively. Assets totalled £17.5 millions at the end of 1939.

★

Caledonian.—Taking all departments together, the earned premiums of the Caledonian Insurance Company in 1939 were higher than in the previous year, thanks to a rather surprising advance in the accident department and an even greater relative increase in marine premiums. The accident account did not, however, contribute quite so much to profit and loss as in 1938, but the transfer from the marine account was increased. The fire profit was not quite so satisfactory; the percentage to

earned premiums was 6.6 per cent. The figures are given below:—

	Earned Premiums		Underwriting Profit to Profit and Loss	
	1938	1939	1938	1939
	£	£	£	
Fire	705,969	695,456	51,782	45,989
Accident	540,983	564,550	29,501	23,767
Marine	111,187	121,847	5,000	7,500
Life, annuities and leasehold redemption	754,768	735,292	12,872*	...
	2,112,907	2,117,145	99,155	77,256
Interest (on life, annuities and leasehold redemption)			74,775	70,430

* One-third shareholders' profits at 1936 valuation.

Owing to unsettled conditions, the directors decided to postpone the valuation in the life department, which would normally have taken place at the end of the triennium 1936-39, but which need be made only at five-yearly intervals. There is, in consequence, no transfer to the profit and loss account from the life account. Life new business fell from £2,102,749 net to £1,454,772, and earned interest declined to 3.63 per cent. net (excluding reversions), compared with 3.84 per cent. in 1938.

After provision for taxation and bad debts, transferring £50,000 to general reserve and £10,000 to accident additional reserve, the carry-forward is £231,528, against £283,158 brought forward. The dividend is maintained at 15s. per £5 share, less tax.

Stock Exchange securities in the life

fund (£8.7 millions) showed a depreciation of 3½ per cent. at the date of the balance sheet, but securities included among the non-life assets (totaling £3.4 millions) recorded no depreciation.

★

Provident Association of London.—A large part of this company's assets (about 54 per cent. of the total of £15.2 millions) consists of advances on house property to its assured. It specialises in the combination of life assurance with house mortgages—the advances being mostly of moderate amounts. The company's investments on house property are naturally subject to the war risk, but it should be remarked that there is an investment reserve of £550,000 and a general reserve of £750,000. Despite last year's conditions, the amount outstanding on mortgages increased by £361,961, and the total funds by £487,669. The market value of Stock Exchange securities at the end of 1939 exceeded book values. The total credited to profit and loss from the various accounts was £179,847, which, with last year's carry-forward of £222,577, made a total of £402,425 available. The ordinary dividend is repeated at 10 per cent., free of tax, and after making a transfer of £50,000 to investment reserve, the carry-forward was £239,334. Following the annual valuation, the directors have allotted a reversionary bonus of £1 12s. per cent. in the ordinary branch, compared with £2 10s. per cent. the previous year.

presumed, to be allowed to distribute a dividend not greater than the largest distribution made in three pre-war years, which are the three accounting years ending after June 30, 1936, and before July 1, 1939. The limitation is not governed by the rate of dividend, but by the gross amount of the dividend, before deduction of tax. Hence, for companies whose dividends are shown net, after tax (whether declared gross or free of tax) the investor will have to compute the equivalent gross sum at the standard rate of tax which applies—a point which will affect Imperial Tobacco and "Shell" Transport shareholders, among others. Secondly, it transpires that when the Chancellor referred to the alternative dividend standard as a minimum of 4 per cent., he really meant maximum, at least in the lay sense, though he argued for his use of the word that it represented a minimum right to pay. But plainly it is a maximum for the only companies to which it applies—namely those whose highest dividends did not reach the equivalent of 4 per cent. in any of the standard years. Provision is to be made for new companies, and the Chancellor intends to provide for increases of capital (presumably for cash, since bonus share issues before the Budget ban do not affect current profits). Moreover, applications for a higher dividend standard will be considered in special circumstances. Finally, payment of arrears on preference capital will not, apparently, be affected, though the ordinary shares of such companies will, of course, be limited to the 4 per cent. standard. If these relatively simple details had been clearly disclosed in the Budget Speech, the ordinary share investor would have been spared much unnecessary confusion.

Maximum Railway Dividends.—This week, Sir John Simon has disclosed that main-line railway ordinary stocks are to come under the dividend limitation rules. The railways have not been spared on the grounds that they are statutory companies, and the marginal stocks have been shaken by the news. Great Western ordinary (which actually paid the maximum dividend within the standard years) fares worst, for already at Stage 2 earnings under the agreement it would be earning 4.6 per cent. At the other extreme, Southern stockholders escape, for the preferred ordinary stock (which in any case received full payment in the base years) would presumably not be strictly regarded as an equity, since its maximum dividend is limited, while the deferred stock is only entitled to 3.2 per cent. at its maximum earnings stage. This point, however, clouds the dividend possibilities of L.N.E.R. preferred ordinary, though these belong to a fairly advanced phase of Stage 3 earnings. Finally, L.M.S. ordinary would be subject to a 4 per cent. maximum before earnings reached London Transport's maximum. It may be noted that Sir John Simon's answer did not include any reference to London Transport. Presumably the Board does not rank as a public company, nor its "C" stock as ordinary capital.

Non-Registered Dollar Stocks.—The requisitioning orders taking over the dollar stocks from British holders have technically referred only to securities registered at the Bank of England. Foreign securities which should have been transferred to the Treasury under the requisitioning orders, but which, in fact, were not transferred because they were not registered at the Bank at the date of the orders, will now be subject to an additional rule in the Defence (Finance) Regulations. This empowers the Treasury to acquire such securities "at a price not less than either the original acquisition price or the current market price, whichever be the lower." The effect of the

order, which does not appear to lay any new penalty on holders who failed to register their securities at the outbreak of war under the original regulations, is apparently to discourage postponement of registration on any false hope of receiving more favourable prices than the Treasury has offered, should the market improve later.

Company Notes

Marks and Spencer Omit Scrip Bonus.—Sir John Simon's Budget statement regarding dividend limitation was clear on at least one point—that scrip bonuses would, in general, be prohibited. The directors of Marks and Spencer have immediately conformed with this rule, and have broken the long succession of 10 per cent. capital bonuses. Profits (apparently struck after depreciation and debenture interest) have increased substantially from £1,781,958 to £2,378,954, but the claims of taxation have raised the charge from £374,444 to the vast total of £1,165,745—a figure which is actually increased by tax deducted at source from shareholders' dividends, since the latter are shown gross in the accounts. The figures given in the preliminary statement suggest that ordinary share earnings have been reduced from £1,265,018 to £1,069,979, and the latter sum, if confirmed, would mean that, in the absence of dividend limitation, the maintenance of the cash dividend and the 10 per cent. scrip bonus would have been covered with only a small margin, in contrast to earlier years. In the following table, the latest profit figures are based on the preliminary statement:—

	Years to March 31st		
	1938	1939	1940
Profits, after depreciation and debenture interest	1,092,149	1,781,958	2,378,954
Debiture redemption	11,760	12,495	13,230*
Taxation	325,699	374,444	1,165,745
Staff fund	25,000	25,000	25,000
Preference divs.	105,000	105,000	105,000
Ord. and "A" ord. shares—			
Earnings	1,134,990	1,265,018	1,069,979*
Paid	742,605	816,865	898,552
Earnings " "	73.5	74.7	55.5
Paid " "	42½	42½	42½
Capital bonus " "	10	10	Nil
Properties contingency reserve	64,598	93,022	Nil
General reserve	324,730	342,203	Nil
Carried forward	85,641	98,569	269,990

* Estimated.

No allocation has been made to properties contingencies reserve nor to general reserve. The 5s. shares recovered smartly before the bonus decision was announced to 46s. 6d., but they have since reacted to 42s. 9d., at which they offer a dividend return of £4 19s. 6d. per cent., and an earnings yield of 6½ per cent. The cash return has thus been brought into line with that obtainable on other front-rank equities which have not offered regular scrip bonuses in the past.

Ford Motor Dividend Limited. Technically, the Ford Motor Company's directors were quite in order in declaring, on Thursday last week, a dividend of 7½ per cent. on the ordinary capital. At the time of their decision, the Chancellor of the Exchequer had yet to give his fuller explanation of dividend limitation. When he spoke, later in the evening, he appealed for observance of the spirit of the rules, even though they lack statutory force as yet. The Ford directors on Monday decided, in accordance with the Chancellor's wish, to conform with the amplified dividend limitation provisions. They have, therefore, revised their recommended dividend from 7½ per cent. to 6 per cent. This is the highest rate paid by the company during the financial years ending after June 30, 1936, and before July 1, 1939, and was actually distributed for 1936. The market's reaction to the change was to mark down the £1 stock units from 18s. to 17s., but they have since recovered to 18s. The Ford case obviously represents the dividing

line between uncontrolled and limited dividends. For companies which have already increased their dividends, on the recommendation of their directors and with the approval of shareholders, before dividend limitation was announced, the increased payment will presumably stand. A typical instance among the small number of companies of this sort is Dunlop Rubber, whose increased distribution of 12 per cent. will apparently hold good. But in calculating the dividend yield on the ordinary stock, it will be necessary to disregard the additional 3 per cent. over the company's uniform rate of 9 per cent., paid in the three pre-war calendar years.

Johnson and Phillips Dividend Policy.—The directors of Johnson and Phillips, in recommending a final dividend of 7½ per cent. for the calendar year 1939, appear to suggest that the company's circumstances provide a special case for which dividend limitation may be modified. They state that they had intended to recommend a final dividend of 10 per cent., making 17½ per cent. for the year, but that, in view of the Chancellor's Budget statement, they feel it their duty to recommend a final dividend at the same rate as declared for 1938. The interim payment announced last November, however, was raised from 5 per cent. to 7½ per cent., so that the total dividend for 1939 is, in fact, increased to 15 per cent., compared with payments of 12½ per cent. for the previous two years and 10 per cent. for 1936. In his amplification of the dividend limitation proposals last week, Sir John Simon specifically stated that dividends would be limited by reference to the total gross amount paid out in any one of the three standard years. For Johnson and Phillips this amount would be £100,000, compared with £120,000 which would be required by the proposed 15 per cent. dividend for 1939. In such circumstances, the view of the directors that the Chancellor would not intend to interfere with the interim dis-

tribution of last November appears to have limited relevance. It will be interesting to note whether the Johnson and Phillips decision is followed by any official action. It may also be asked whether the directors of Ideal Boilers and Radiators have observed the spirit of Sir John Simon's request. In this case, however, the report states that the dividend of 50 per cent., tax free, has "already been paid" on the £700,000 ordinary capital, which is controlled by American Radiation and Sanitary Corporation, and is not quoted on the London market. The maximum dividend paid in the standard years was 22½ per cent., tax free, for 1938.

Morris Motors Profits.—A preliminary statement indicates that the net profits of Morris Motors, Limited, for 1939 amounted to £1,992,880, compared with the net profit of £1,357,220 in the preceding year. This figure is struck after provision for repairs and depreciation, but before charging taxation. The latter factor doubtless accounts for the decision of the directors to reduce the ordinary dividend from 45 per cent., less tax, which has been regularly paid in the preceding three years, to 40 per cent. for 1939. By this decision Morris Motors ordinary shares enter the list of equities with the possibility of higher dividends under the limitation rules. Whether this will in due course be translated into an effective equity, by increased profits, is of course a different problem. But the profits figures are certainly impressive, in view of the collapse of the home market after the early months of last year. They suggest that the delays in introducing the 1938 new models owing to material shortages may have assisted the 1939 figures, while the company has doubtless largely turned over its organisation to Government work and export trade. The ordinary stock units at 26s. yield £7 13s. 9d. per cent. The market's cool reception of the profit figures suggests that it is disposed to await the full report before making any move.

GENERAL MINING & FINANCE CORPORATION, LIMITED

(Incorporated in the Union of South Africa)

ABRIDGED REPORT OF THE DIRECTORS FOR THE YEAR 1939

To be submitted at the Annual General Meeting to be held in Johannesburg on 4th June, 1940

Profit for the year ended 31st December, 1939	£162,286 13 6
Unappropriated Balance brought forward from 1938	132,582 16 8
Total available profit	£394,869 15 2
Which has been dealt with as follows:—	
Interim Dividend No. 27 of 10 per cent., equal to 2s. 6d. per share	£126,457 18 0
Proposed Final Dividend No. 28 of 15 per cent. (making a total of 25 per cent., or 5s. per share, for the year)	189,666 17 0
(since declared)	15,000 0 0
Amount provided for taxation	10,513 10 0
Provision for Directors' remuneration in accordance with Articles of Association	125,000 0 0
Amount appropriated to establish Investment Reserve	466,638 5 0
Balance of profit unappropriated at 31st December, 1939	£128,211 11 2

The Company's investments are taken into account in the Balance Sheet at £2,587,866, which represents their book value after providing for such depreciation as existed at 31st December, 1939. All investments appear in the books at or under cost, but in no case above the market price ruling at the end of the financial year. The market value of investments largely exceeds the book value shown in the Balance Sheet. In addition to the large internal reserve, £125,000 has been provided to meet future contingencies by the creation of an Investment Reserve. The principal interests of the Corporation are in the following companies: Van Ryn Gold Mines Estate Ltd., West Rand Consolidated Mines Ltd., East Rand Proprietary Mines Ltd., Durban Road-poor Deep Ltd., Phoenix Oil and Transport Co. Ltd., Metal Traders, Ltd., and Castor Lubricants, Ltd. The Corporation also holds various mining properties, real estate and leasehold property, &c.

BALANCE SHEET at 31st December, 1939

Dr.		Cr.
To Capital—		
Registered: 1,500,000 Shares of £1 each	£1,500,000 0 0	
In Reserve: 235,421 Shares of £1 each	235,421 0 0	
Issued: 1,264,579 Shares of £1 each, fully paid	£1,264,579 0 0	
Deposits (with interest accrued)	1,024,095 15 10	
Sundry Creditors, Accrued Liabilities and sundry Provisions	116,066 4 7	
Creditors for Stock Bought not yet taken up	36,426 19 1	
Unclaimed Dividends	906 19 11	
Provision for Final Dividend of 15 per cent. on 1,264,579 Shares in respect of the year 1939	189,666 17 0

Canadian Pacific Prospects.—There was little by way of new explanation of the directors' decision to omit any payment on Canadian Pacific preference stock in Sir Edward Beatty's speech at Montreal this week, save in one important respect. After stressing the current uncertainties (which would appear, from later passages in the chairman's speech, to be giving way to a clearer outlook) he emphasised that the preference capital was itself subject to prior charges on which interest must be paid, and the capital repaid or refunded on a satisfactory basis when it fell due, if the credit of the company was to be maintained. The company has, of course, certain obligations which mature next year, totalling \$17 millions, and there are \$19.3 millions of 4½ per cent. note certificates repayable finally in 1944. It may be wise to take heed of these obligations well in advance, but they do not appear to be of an order which demands the mobilisation of all available free resources for their repayment or replacement. Preference stockholders will welcome the chairman's reference to the net earnings for the first quarter of the year, which rose to \$5,302,489 against \$3,834,568, and also the directors' expression of hope that "conditions will soon warrant a distribution to the preference shareholders." At the moment, there appears to be some lack of moisture in the prairie provinces, though this can be made good by rains. Meanwhile, the company has the advantage of cross-continent timber traffic from British Columbia; passenger traffic is expected to increase; and other income, particularly from steamships, should improve. At this stage, there is no reasonable doubt that the preference dividend will again be fully earned. The value of the preference stock, which now stands at 42, depends, however, on the directors' interpretation of the word "soon," and the size of the distribution if and when it comes. Stockholders cannot infer from the past policy of the directors that they are likely to exceed in generosity in either respect.

"Sofina."—The eleventh annual report of this Belgian holding company—which includes the usual dissertation, this year on the subject of economic propaganda—shows that the parent company's income from shares and other interests amounted to 154.7 million francs, compared with 152.1 million francs last year. The balance available for dividends, after providing for "amortisations" (which absorbed 71.9 million francs) was 53.3 million francs. It is proposed to pay a 50 per cent. dividend on the ordinary shares, absorbing 55 million francs, against 88 per cent. in the preceding year, and to carry forward approximately the same amount as was brought in. The report records that several associated companies withdrew deposits from "Sofina" or applied for fresh advances to meet their commitments or extend their plant. The claim on the banking house of Mendelssohn and Company has been deducted from the cash item and appears among the debtors at a heavily reduced amount, on which no further loss is expected. The net changes in the group's current assets position are, in fact, relatively small, but they involve special charges on the profit and loss account and a reduction in the dividend. Shareholders may draw some consolation from the statement that the group's largest interests operate in countries that seem unlikely to be affected, except perhaps indirectly, by the European war.

Higher Rubber Profits.—Recent rubber company reports have reflected the substantial improvement in working conditions last year. In some cases, substantially increased profits are shown, and increased dividends are general. Yet interest in the share market has failed to broaden. The results of five leading companies are summarised in the table which appears in the next column. Profits of *Bikam* have increased to £57,223, against £31,659, while *Pataling*—another member of the *Harrisons and Crosfield* group—has shown an increase to £55,369, against £30,874. The former company pays 7½ per cent., against 5 per cent.; while the latter has increased its distribution from 7½ per cent. to 12 per cent. The maximum

dividend allowable to these companies under the dividend limitation provision is 10 per cent. for *Bikam* and 15 per cent. for *Pataling*. *Bikam's* total planted area will be 13,261 acres at the end of 1940—310 acres are to be planted up during the present year—the par capitalisation per cultivated acre being £41. Replanting is to be resumed,

Company	Crop	Price	Estate Profit	Earnings for Ordinary	Paid	Ord. Shs.*	Price	Yield
(Accounts to Dec. 31st)	'000 lbs.	d. per lb.	£	£	£			
<i>Bikam</i> —								
1937	4,687	8 50	82,940	72,894	11½	10		
1938	3,144	7 65	34,856	31,159	6	5		
1939	3,525	9 16	59,648	50,222	10½	7	1 9	8 6

1937	2,493	...	19,851	44,458	18½	12½		
1938	2,081	...	34,947	26,879	10½	10		
1939	2,425	9 05	43,789	34,611	13½	10	3 3	6 1
<i>Henrietta</i> —								
1937	1,588	8 22	29,303	23,714	19½	15		
1938	1,518	7 40	16,542	11,612	9½	7		
1939	1,323	7 90	24,115	15,426	12½	10	2 3	8 9
<i>Labu (F.M.S.)</i> —								
1937	2,702	...	52,613	38,060	16½	15		
1938	1,838	...	32,552	23,316	10	10		
1939	1,972	9 43	39,844	30,217	14½	10	45 -	5 7
<i>Pataling</i> —								
1937	4,139	8 24	69,470	63,740	22½	15		
1938	2,851	7 73	33,635	27,373	9½	7½		
1939	3,472	9 40	60,378	46,369	17½	12	28 -	8 6

* 2s. shares except Labu and Pataling (£1).

though the older areas are still giving fairly good yields. *Pataling's* total area under rubber is 10,059 acres—capitalised at par at the low figure of £30.3 per acre—and it has been decided gradually to replant 966 acres. Both companies have sold forward substantial amounts of their current year's crops at excellent prices.

Among companies which have maintained their dividends were *Cheviot* and *Labu*. Both of these concerns paid 10 per cent. for 1939. *Cheviot's* profits amount to £43,831, against £35,451, while *Labu's* are £40,617, against £34,680. Although both companies offer smaller yields than those of *Pataling* and *Bikam*, they have scope for increased payments under the dividend limitation scheme. *Cheviot's* maximum is 12½ per cent. and *Labu's* 15 per cent. They are, of course, among the most progressive in Malaya, and both have large areas of young rubber. *Henrietta Rubber Estate* fared well during 1939, profits having risen from £13,279 to £20,189, while the dividend has been raised from 7 per cent. to 10 per cent., against a maximum permissible dividend of 15 per cent. If the average quota for the current year is put at a potential 70 per cent. of standard, and if rubber prices can be maintained at their present level, the expectation of a further increase in estate profits this year should be enhanced.

Company Profits of the Week.—The usual table on page 843 analyses the results of 56 company reports received this week. They show a small reduction in total profits from £5,057,000 to £5,025,000, but net profits are actually slightly higher at £2,821,000 against £2,804,000. The results are discussed in preceding Notes and under the heading "Shorter Comments" on page 837.

Company Meetings of the Week.—Reports of this week's company meetings begin on page 831 of this issue. Sir A. Steven Bilsland, at the *Union Bank of Scotland* meeting, discussed the considerable increase in loans and advances which the Bank has achieved in the fourth successive year and pointed out that the heavy industries in Scotland had been working at high pressure since the outbreak of war. The insurance chairmen at this week's insurance meetings paid particular attention to wartime problems. At the 220th Annual General Court of *Royal Exchange Assurance*, Lord Bicester pointed out that the Royal Exchange has decided for the present to cover the

enemy air risk for approved civilian lives at the normal rate of premium. Sir Edmund Mountain, at the *Eagle Star* meeting, pointed out that the investment reserve of £650,000 more than provided for the difference between the book and market values of the securities at the end of the year. At the *Caledonian Insurance* meeting, Mr W. J. Fraser disclosed that the depreciation on the company's investment portfolio at the end of last year had largely disappeared by the middle of last month. Sir Dennis Herbert frankly warned shareholders of *Equity and Law Life Assurance* that investment depreciation may affect the dividend and bonus rates when the triennial valuation is made at the end of this year. Mr J. K. Wiseman informed members of the *Royal London Mutual* of the scheme for covering war risks on new policies. Some 50 per cent. of the full sum assured is allowed on participating policies issued at ordinary rates to civilians in the event of death due to war. At the *Alliance Trust* meeting, Mr James Prain discussed the effect of requisitionings of the Trust's dollar securities and emphasised that their sale to the Government would involve a loss in earnings. Addressing members of the *Institute of Chartered Accountants* at the annual meeting, Mr C. J. G. Palmour raised an interesting point, arising out of the Prices of Goods Act, whether materials

should be included in cost estimates at their original or replacement cost. Mr John Cowley, at the *Daily Mirror Newspapers* meeting, referred to the difficult newsprint position and to the steps which have been taken by curtailing the number of pages to meet it. Mr F. K. Kielberg disclosed at the *United Molasses* meeting that the agency remuneration due to the company from the Ministry of Supply from January 1st to the present date represents less than 20 per cent. of the company's estimated total earnings for the period. Mr W. W. Parish declared to *River Plate Trust Loan and Agency* shareholders that, while Argentina should derive some advantage from the needs of the Allies, the view that the history of twenty-five years ago would be repeated needed careful weighing. Mr Oliver Bury gave figures to stockholders of *San Paulo (Brazilian) Railway* showing the trend of traffics during the first four months of this year which reflected the increased rates introduced last October and the improvement in the exchange. The Hon. A. T. J. Fraser criticised the taxation demands of the Mysore Government at the *Ooregum Gold Mining* meeting. Mr R. Olaf Hambro, addressing the *London Assurance* meeting, referred to the additional rate of 10s. per cent. to cover war risks on civilian lives in this country.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

GILT-EDGED have led the way this week with consistent advances each day. The market refused to be deflected by adverse reports from Norway and thunder from the Mediterranean, and gave instead a striking display of the strength which free investment funds, resulting from the re-investment of purchase moneys for dollar securities and dividends, can exert in a closed capital market. The industrial markets, on the other hand, felt the week's news more keenly and business shrank to abnormally low proportions owing to the great difficulty of the market in working out the implications of dividend limitation for individual companies.

The rise in gilt-edged continued to such effect on Tuesday that both Old and New War Loans were quoted above par. On Thursday the rise continued, 3½ per cent. War Loan rose further to 100½, while the New War Loan closed at 100½. Funding issues were also well supported. The spectacular movements were concentrated on the undated stocks.

European bonds were naturally affected by political nervousness and Japanese loans became weak. The home railway market, which had been unsettled owing to doubts whether dividend limitation would apply learned the hard truth on Wednesday and prices reacted further, Great Western ordinary being particularly depressed since it has the most to lose under the limitation rules.

In the industrial market Ford Motor fell on the revised dividend decision and store shares were throughout a weak feature on fears regarding the Purchase Tax. The heavy industrial group remained dull and tobacco shares, after a slight improvement on Tuesday, resumed their decline. A rise in Raleigh Cycle was the only outstanding feature of the miscellaneous market.

Oil shares remained weak and rubber shares, despite the appearance of satis-

factory company reports, showed no response. Trading in Kaffirs was restricted but West African shares showed some rallying power.

New York

TURNOVER on Wall Street has remained low throughout the week, and although the trend at the opening promised to be slightly firmer stocks have subsequently reacted and moderate falls have been recorded in quiet trading. Shipbuilding shares have shown an occasional improvement, but there has been little animation in the market as a whole. Steel mill activity is estimated by *Iron Age* at 63 per cent. of capacity, against 62 last week.

Canada

THE Canadian stock markets have remained dull during the past month. Trading was still at a low ebb and prices fluctuated within a narrow range, though with a falling trend. Following the German invasion of Norway and Denmark, pulp and paper stocks rose on the belief that curtailment of supplies from the Baltic countries would provide increased business for the Canadian companies, but the rise was checked by apprehension about the effects of hostilities on a wide scale in Europe. In terms of earnings, many stocks now seem cheap, but speculators

(Continued on page 826.)

Industry and Trade

Unemployment and Production.—The output of munitions is being held up by the lack of equipment and the shortage of skilled labour. This difficulty is due very largely to the absence of foresight and preparation on the part of the Government. Before the war only nine ord-

nance factories, for example, were in operation. Even now less than twenty appear to have reached the production stage. The construction of these elaborate workshops naturally takes much time; but this only goes to show that preparations should have been made long before the war. So far as labour is concerned we are faced with acute shortages in essential industries and a good deal of unemployment in others. The accompanying table shows the changes in unemployment in the principal industries between August, 1939, and March, 1940, together with the percentage of the insured persons without work on March 11th. The labour shortage could have been considerably mitigated if steps had been taken immediately before and after the outbreak of war to retrain the unemployed. (Germany is reported to have retrained no less than 500,000 workers during the first five months of the war.) There is no more time for leisurely discussion and the pre-war routine must now be discarded in favour of a bolder policy.

Railway Unions Demand Higher Wages.—The railway unions are certainly losing no time; they have intensified their pressure for higher wages since the announcement of the decision to raise railway fares and charges by 10 per cent. on May 1st. Last October they obtained concessions by the award of the independent tribunal, but it was then clearly stated that these were

justified by the improvement in the railways' financial position before the war. Subsequently the unions put forward a claim for an additional 10s. per week for the traffic grades and £20 per year for the clerical staffs. These demands were met in part on January 1st by an increase of 4s. per week in the wages of the traffic grades and of £10 a year in those of the clerical section; the shopmen obtained an advance of 5s. per week. The annual cost of these wage increases is likely to reach £6,000,000. The unions made it quite plain at the time that they regarded these concessions merely as instalments, and they are now pressing for the remaining 6s. per week for the traffic grades and for an additional £15 per year for the clerical section. Allowing for a corresponding advance in the wages of shopmen, these claims would cost something like £9,000,000 per year. The new demands were discussed on Friday last week by representatives of the Railway Executive Committee and of the three unions—the National Union of Railwaymen, the Associated Society of Locomotive Engineers and Firemen, and the Railway Clerks' Association—who justified them by reference to the rise in the cost of living. By the agreement between the railways and the Government, advances in costs are to be passed on to the users. So why not milk the cow? The time has clearly come for the application of a national wages policy. Quite apart from the inequalities arising from the present position, when those unions who can bring the strongest pressure to bear on the employers are most successful in extracting concessions, the resistance of employers to claims for higher wages is much smaller than in peacetime because the Government, whose payments are based largely on costs of production, is now the principal buyer in many industries.

and Northumberland; thus, in 1938, Durham produced 31,553,000 tons and Northumberland 13,437,000 tons of saleable coal. In view of the urgency of an increase in the production of coal, there should be no difficulty in finding alternative outlets for the loss of the Scandinavian markets. Anything but a very temporary dislocation of production in the two districts would be inexcusable. Owing to the pressure for supplies from other consumers, Scotland, which normally also exports substantial quantities of coal to Scandinavia, has been scarcely affected by the loss of these markets.

A New Scottish Colliery.—In Scotland one of the most important developments of the past few years has been the recent opening of a new coalfield by the Fife Coal Company. It measures approximately 6,000 acres and lies on the boundaries of Fife, Kinrosshire and Clackmannanshire. This coal belongs to the mountain limestone series of the carboniferous system and contains good steam and household fuel. The new colliery is expected to be opened in July, and when fully in production will be one of the largest, if not the largest, in this country. An output of 4,000 tons per day is aimed at. Fourteen seams were exposed during the boring operations, and the company intend to work seven. The colliery will probably be the most modern in Great Britain. American practice will be adopted in regard to the underground haulage system, use being made of large cars and locomotives on the main level in association with skip winding. The achievement of the output aimed at will, however, depend largely on the availability of the necessary labour supply.

Foreign Bourses

Paris.—The German invasion of Denmark and Norway restrained dealings and prices were marked down in most sections, though falls were generally small. Operators adopted a cautious attitude until the political situation became somewhat clarified by news of the naval successes of the Allies in the early days of the Norwegian campaign. In the latter part of the month sharp rises were seen in most sections, led by Rentes, which throughout the month had continued to find some support. Industrial stocks, after a fairly sharp fall, recovered their ground and were marked higher at the close than in the opening days of the month.

Berlin.—The spectacular wartime advance of equity prices was halted at

the beginning of the month, and a general reaction has occurred, for which official intervention to equalise price levels in different industrial groups is partly responsible. Turnover decreased continually until the market reached a standstill later in the month. Reduced earnings in civil industries and renewed uncertainty about the future taxation policy of the Government are undoubtedly influencing the market. The reduction of Bank rate from 4 per cent. to 3½ per cent. encouraged a continued demand for fixed-interest securities in contrast to equities. Actual turnover, however, remained very small.

Amsterdam.—Those investors who had awaited an improvement in the Dutch political position before taking advantage of favourable company reports found their opportunity early in April, when a general improvement occurred. The advance, however, was short-lived, and the German invasion of Denmark and Norway created sharp falls in all sections. The bond market, in fact, fell to the lowest level recorded since the outbreak of war. The new 4 per cent. Dutch bonds fell to a 5 per cent. basis in mid-April, and the bonds of some companies returned 5½ per cent. Some demand for American securities was attributed to threatening political danger, and the month closed with prices at their lowest levels.

(Continued on page 837.)

Steel Distribution.—The apprehensions that the new system of allocating and distributing steel supplies (discussed on page 688 of *The Economist* of April 13th), while sound in principle, would not be easy to operate, at least to begin with, do not seem to have been fanciful. In order to allow more time for the change-over, it had been decided to suspend the operation of the new scheme until April 29th for orders placed on and after April 8th (the date of the new Order) and until May 31st for contracts arranged before April 8th. Special meetings have been held in the iron and steel centres to smooth the path of the change-over. Reports suggest, however, that a number of consumers have failed to acquaint themselves with the formalities of the new scheme. Unless these laggards can be brought into line, there is some danger of dislocation, for they will not be able to obtain deliveries from the producers without compliance to the new regulations. Any hold-up in the industry at this stage, due to the unwillingness of certain consumers to comply with the new regulations, would be deplorable, to say the least.

North-East Coast Coal Exports.—Representatives of coalowners and of miners in Durham and Northumberland, as in other districts, have been discussing ways and means of increasing the production of coal. But the chief immediate problem of these districts—especially in Northumberland—is to find alternative markets for Scandinavia. As the following table shows, more than one-half of the United Kingdom's coal exports to Denmark, Norway and Sweden came from the North-East Coast in 1938:—

	North-East Coast Tons	U.K. Tons
Denmark	1,100,000	2,997,000
Norway	812,000	1,366,000
Sweden	1,695,000	2,655,000
Total	3,607,000	7,018,000

These exports, however, represent only a comparatively small proportion of the total production of Durham

American Exports of Farm Produce.—In 1938, exports of agricultural products supplied 27 per cent. by value of the total exports of the United States. Cotton, tobacco, grains, fruit (both fresh and preserved), meat and animal fats were the main farm exports. The table below shows how the first five months of the European war affected the American export trade in these products:—

U.S. EXPORTS: SEPTEMBER-JANUARY	Unit	1938-9	1939-40
Pork	Million lb.	41.5	69.0
Lard	" lb.	103.6	116.4
Wheat and flour	" bushels	37.5	19.6
Tobacco, leaf.	" lb.	271.9	158.9
Cotton (ex linters)	" lb.	1,053.5	2,088.0
Apples, fresh	" bushels	8.1	2.3
Pears, fresh	" lb.	127.1	71.9

The suspension of British purchases of tobacco has brought a drastic fall in American exports, in a year when the crop of flue-cured tobacco was of record size and the end-of-season stocks the second largest in history. Arrangements

were made by the Agricultural Adjustment Administration and the Commodity Credit Corporation in October to finance the purchase, for storing, of tobacco of the usual exports grades at certain minimum prices. Exports of raw cotton nearly doubled in these five months, compared with the corresponding period in the previous year. The greater part of this increase was caused by the huge buying of the Allies, but various European countries have also been laying in stocks for future use. Since the early part of the year, however, the flow of exports has slackened considerably. Exports of fresh fruits, of which Britain has been a good buyer, have fallen heavily, and the expectation of a small harvest in 1940 is also partly responsible for the smaller exports of wheat. Exports of pork and lard were up, but, in view of the record pig production in the autumn and the low prices for pork and lard on American markets, the increase in exports was not larger than could normally have been expected.

Argentina's Maize.—The Argentine maize crop which is now being harvested is officially estimated at 50.6 million quarters, compared with an average yield of 37.2 million quarters over the previous five years. Argentina's own consumption of maize may be estimated at 6.7 million quarters, leaving a surplus available for export of more than 40 million quarters. Only once, in 1936-37, did Argentina in fact export more than this amount and then Austria, Czecho-Slovakia, Denmark and Germany (whose imports of maize were then exceptionally large) took 14.6 million quarters of Argentine maize. Those markets are now lost, and the principal buyers are restricted to Britain, France and the Low Countries, who bought in 1937 not quite 30 million quarters from the Plate. Such a level of purchases is not likely to be reached in wartime. Freights from the Plate to Europe have, indeed, fallen considerably in the last few weeks, and prices

for Plate maize have fallen sharply from nearly 24s. per quarter early in the year to less than 15s. at the present time. At these levels Plate maize is a cheaper feeding grain than wheat or other cereals, but the volume of sales will be influenced not so much by the price level as by the amount of shipping available and by the amount of foreign exchange the Allies are willing to expend on animal foods. A considerable proportion of this huge crop will therefore have necessarily to be carried over in the hope of eventual disposal in 1941.

Rhodesian and Chilean Copper.—The Nchanga Consolidated Copper Mines, Ltd., has announced that its pilot plant has begun trial smeltings, and that the capacity of the plant is to be enlarged immediately to 60,000 tons per annum. Full operations may be begun early next year, when the total Rhodesian output of copper will reach about 400,000 tons a year; potential output is, of course, considerably greater. The expansion in the copper production in Rhodesia in the last ten years has enabled the British Government to rely completely on Empire supplies, while in the last war the Allied copper imports came largely from Chile. The Chilean export trade has been severely hit by the transference of British purchases of copper since last November to Rhodesia and Canada; Chilean exports of copper fell from 349,320 metric tons in 1938 to 312,245 tons in 1939, and her exports to this country from 126,272 tons to 60,515 tons. Exports to the United States were increased in the last months of 1939, but the rate of expansion has now slackened; most of the American imports were destined for re-export in some form of copper or of copper manufactures, and a substantial tonnage appears to have been unsold at the end of last year. The outlook for the Chilean copper industry is therefore not encouraging; more than half of the total value of Chile's exports is normally provided by the sale of copper concentrates.

COMMODITY AND INDUSTRY NEWS

ALL grain prices are lower in North America than a week ago, due partly to rain in the wheat belt and partly to the knowledge that the British Cereals Import Committee is well supplied for the next few weeks. Other prices, both in Britain and America, are little changed.

Cotton.—Although numerous spinners are very busy on Government work, the total of new Government and export orders is considerably smaller than current output. Export business is very disappointing owing to the high level of prices and is not sufficient to compensate for the restriction on home sales. Yarn agents have sent a memorandum of protest against the change in the commission regulations to the President of the Board of Trade and to the Cotton Controller.

Metals.—British maximum prices for copper, lead and spelter remained unchanged and deliveries are adequate to meet the huge armament requirements. The United States markets were very quiet this week, but official quotations were maintained at last

week's levels. Customs smelters, however, are once again offering copper at 11.25 cents per lb., against the producers' price of 11.50 cents. Russia has been trying to re-sell in the United States 10,000 tons of copper bought during the Finnish campaign at a price of about 13.50 cents per lb.

Tin.—While the price of standard cash tin lost £1 2s. 6d. this week to close at £253 2s. 6d. per ton, the three months' price closed 10s. up at £249 15s. The backwardation, therefore, has narrowed from £5 to £3 7s. 6d. this week, due partly to the check to the decline in home warehouse stocks, which increased during the week by 315 tons to 1,376 tons. It was announced this week that the International Tin Committee will meet on May 27th to decide on the quota for the September quarter of this year. World production and consumption of tin in the first quarter of this year are estimated by the International Tin Research and Development Council at 52,600 tons and 62,400 tons, respectively.

Grains.—Considerable rains in the American wheat belt and the

absence of British buying of near wheat led to some reaction in prices this week in North America. In Argentina, continued large sales of a rapidly diminishing wheat surplus brought a rise in wheat futures. The reduction in Argentine-European freight rates during the past few weeks has stimulated Argentine trade in both wheat and maize; maize prices were also

SOCIÉTÉ FINANCIÈRE DE TRANSPORTS ET D'ENTREPRISES INDUSTRIELLES, S.A. (SOFINA)

EXTRACTS FROM DIRECTORS' REPORT TO THE SHAREHOLDERS PRESENTED AT THE ORDINARY GENERAL MEETING OF APRIL 25, 1940

Following our usual practice, we examine this year an economic problem which, although it does not specifically concern our undertakings, affects their interests and consequently those of our shareholders. In anxious times like these, when war is focusing attention on graver subjects, the topic we have chosen—Economic Propaganda—may seem of negligible importance and perhaps even inopportune. International trade is obstructed on every side; on a number of internal markets, private consumption is restricted to bare necessities; it may well be asked whether in these conditions economic propaganda can serve any purpose other than to preach abstinence.

We believe it can. We see in it a means of promoting a more efficient economic system for the days when peace has been restored, and of helping to establish that peace on a more solid foundation; and we are convinced that, now as ever, it can give valuable guidance to producers and consumers, and contribute towards harmony between supply and demand. Hence we feel that an examination of its methods and uses is timely.

REMARKABLE PROGRESS OF TECHNICAL PROCESSES

From 1920 onwards the technical processes applicable to market research and to commercial publicity have made remarkable progress. These developments, however, are still little known outside the United States and Great Britain, and even in those countries the new methods are inadequately applied.

It has become a commonplace that, while the machine age has seen a vast expansion in the power to produce, it has failed to raise consumption correspondingly. Certainly it cannot be denied that periodically in the course of the past century there was a disproportion between potential supply and actual demand. Some maladjustment obtained in 1914, on the eve of the War; up to the Armistice, and subsequently under the impulse of policies aiming at national self-sufficiency, it was accentuated by abnormal extensions of equipment and by fresh hindrances to the flow of trade. The cause of this disequilibrium, however, is not to be found, as some imagine, in defective distribution of purchasing power. In a previous report we indicated the various contributory factors; our present study stresses one of the most important, namely, insufficient knowledge on the part of potential consumers of the existence, quantities, and merits of the goods and services on offer, coupled

with an equal lack of information among potential suppliers regarding the nature, quality, and amount of things demanded.

For an up-to-date undertaking—whether it supplies manufactured goods or electricity—the expansion of its sales is a matter of no less concern than the lowering of its costs by improved production.

As the market expanded, producers were increasingly obliged to appeal to a clientèle with whom they had no direct contact; and as suppliers specialised and consumers' requirements became more varied, the necessity developed of advising prospective customers both of the places where they could find articles answering their requirements, and of the specific features of the goods offered for their choice. At the same time free competition—which tends to be restricted by protection, though not so severely as by the old-time trade and craft monopolies—has made it profitable for buyers and indispensable for sellers to be acquainted with rival offers.

Commercial information, developing from trade signs to small trade notices, and then to trade cards, handbills, price-lists and illustrated advertisements, has continually expanded since the end of the sixteenth century. To-day, official and private information bureaux and a vast number of newspapers, reviews, and trade magazines place at the disposal of sellers and buyers a profusion of statistics and other data relating to market conditions. Yet there are still numerous gaps in this information, partly because many of those who could help to complete it refrain from doing so; they do not realise what a valuable service they would be performing or else they are afraid lest their contribution might in some way be used to their own disadvantage.

Studies on the business outlook in general or on the prospects of a particular trade are published in superabundance; but usually they are based on data that are too fragmentary or too unreliable to fulfil the purpose of such forecasts, which is to reduce the risks of producing, buying, or selling.

In addition, the market for each article—and indeed each section of that market—requires special study. This is where the modern research technique to which we have alluded comes into play.

NEW PROCESSES OF "MARKET ANALYSIS"

The new processes of "market analysis" make possible a methodical preparation of commercial propaganda. They bring

THE ALLIANCE TRUST COMPANY, LIMITED

SUCCESSFUL RESULTS DESPITE YEAR'S DIFFICULTIES

EFFECT OF REQUISITIONING OF AMERICAN SECURITIES

MR JAMES PRAIN'S ADDRESS

The annual ordinary general meeting of the Alliance Trust Company, Limited, was held in the company's registered office, Meadow House, 64 Reform Street, Dundee, on the 26th ultimo.

The chair was taken by Mr James Prain, and after formal evidence of the proper calling of the meeting had been submitted, the Secretary, Mr Alan L. Brown, read the auditors' report to the shareholders.

The Chairman, in moving the adoption of the annual report, said:—

REVENUE AND DIVIDEND

It is now my duty to submit for your approval the directors' report and accounts for the past year.

The revenue from our investments amounts to £668,000, as compared with £676,000 a year ago, a result which may be regarded as quite satisfactory in the circumstances. Following the outbreak of war a number of companies in which we are interested, although continuing to enjoy active trading conditions, found it advisable to modify their dividend policies in view of the uncertain outlook and the calls made upon them by the Supplementary Budget. As is mentioned in our report, however, the gaps in revenue account have been filled by the improved exchange value of our dollar income.

Although somewhat below the results of our peak year of 1937-38, when we raised our dividend to 25 per cent., revenue as a whole still shows an excellent return on the funds employed and enables us not only to maintain that rate of dividend but, what is equally important, to set aside once again a substantial sum to contingency reserve. After making these appropriations the amount to be carried forward is £59,000, the surplus for the year being greater than that of a year ago by some £27,000. That it should be greater, notwithstanding the small decline in gross income, is due, of course, to the incidence of taxation from which the company has gained a temporary benefit in the year under review.

BALANCE SHEET ITEMS

Turning to the balance sheet, you will observe that the special taxation reserve no longer appears in the accounts. This reserve, you may remember, was set up following a decision of the Inland Revenue to make an alteration on our basis of taxation. The necessary adjustments are now completed, and the balance of the income tax reserve, amounting to £35,900, which is no longer required, has been transferred to contingency reserve.

The valuation of the investments at January 31st showed a small depreciation of 2.81 per cent. on the book value. Our investments, as a matter of fact, could not be replaced at anything like that figure, and the whole matter appears to me relatively unimportant at the present time. With a reserve fund of £2,100,000, the balance sheet shows the company to be in a strong position to withstand those repercussions on our business which we are bound to expect from the stresses and strains of the present conflict.

The march of great events, in which so much is at stake, so fills the eye and imagination that the mind is little attuned to a recital of the many day-to-day difficulties which beset the management of an investment trust, but I know that you will appreciate that these have much increased and will continue to increase. I shall content myself, therefore, with assuring you that in dealing with these problems we are constantly devoting our attention to your interests.

AMERICAN INVESTMENTS

There is one matter, however, to which I must make reference, if only for the purposes of record. Our investments in the United States were placed at the disposal of the Treasury at the outbreak of war, in accordance with the provisions of the Defence Acts.

As and when dollars are required to meet national requirements these securities will be taken from us. So far, two requisitions have been made, the company receiving the sterling equivalent of the market prices of the stocks taken over. We must anticipate a continuation of this process and envisage a time when all, or nearly all, our American bonds and stocks will have been taken from us. That, briefly, is a situation which is well known and no doubt familiar to you. No one will challenge the right of the Government to acquire assets which can contribute so materially to the national effort, and few will criticise the procedure hitherto adopted or the terms of the requisitions. But so far as our domestic affairs are concerned, it is right that you should realise that in parting with our American securities we have made a contribution which involves some sacrifice. We have a large and varied portfolio of dollar bonds and stocks representing over 20 per cent. of our total funds. This has not been acquired in a day or in any haphazard manner, but is the result of many years' work of an experienced management whose efforts have been directed towards building up a sound investment in that field yielding a satisfactory income and not without potentialities. To a going concern, therefore, the liquidation of a large part of its earning assets cannot but be unwelcome and unprofitable, and will tend towards a reduction in the earning power of the company. It may suggest itself to you that we, together with other similar institutions, who have acquired in the course of time valuable holdings in the United States, are being penalised rather than rewarded for our initiative in that field. That may be so. I see no satisfactory alternative, however, and I think we must accept this war measure as inevitable.

EXCESS PROFITS TAX

There are other war measures which, if applied without consideration and understanding, will tend to bear unfairly in some directions, and which I see no reason to accept as inevitable. I refer more particularly to the Excess Profits Tax. There are innumerable concerns which appear to be liable to an amount of this tax out of all proportion to the source and nature of their profits—companies which in recent years by enterprise and expansion, or for other reasons quite unconnected with war expenditure, have improved their position. Under the existing Finance Acts these companies will be penalised for their energy and efficiency, while those which have enjoyed a steady level of prosperity throughout are untouched. It is regrettable to my mind that companies suffering hardship should have to seek relief from a Board of Referees instead of from the terms of the Statute itself. No one will take exception to the main purpose of the tax, but that this purpose will be achieved in an equitable way by the arbitrary selection of standard years I venture to doubt. I am glad to note, however, that the attention of the Chancellor of the Exchequer has been directed to the injustices involved, and I trust that adequate provision will be made in this year's Finance Act.

THE NEW FINANCE ACT

It would be premature to comment on the various provisions of the new Finance Act which was introduced by the Chancellor this week, as the full implications of that measure have as yet to be examined in detail. One must acknowledge, however, the obvious desire and intention to spread the burden in an equitable manner and the instinctive urge to criticise, should the shoe happen to pinch too tightly here and there, must be tempered by the knowledge of the issues at stake and the difficulties involved in the collection of such vast sums. There is one proposal in the Chancellor's speech to which I might refer as it will have a direct bearing on our affairs here—the limitation of the rate of dividends to be declared by public companies. That, of course, will have some effect on our income as naturally we have a number of investments which were purchased

to light definite information regarding the requirements and purchasing power of the potential clientele and the extent to which its demand is already satisfied. Once these facts are established it becomes comparatively easy to find means of meeting the demand. Propaganda then steps in with a view to convincing the prospective customers that the article offered answers their requirements and is worth the money.

Sellers have always had to use persuasion; but the art of attracting and holding the attention, and then of inducing to buy, has been brought to such a pitch as to become a veritable science. Its scope is increased by additional media for appeals and more striking means of presenting them—illuminated signs, moving pictures, broadcasting—to say nothing of the progress made in photography and printing.

Advertising is to-day an important part of the mechanism of distribution. It tends to stimulate trade and to stabilise markets.

Up to a point, the extension of the use of brands to an increasing variety of goods encourages standardisation and mass production; furthermore, it provides a safeguard for consumers, since producers or groups of producers who attach their name to a particular variety of goods make themselves more clearly responsible for the quality of their products.

Unfortunately, the classes of goods for which the bulk of advertising is carried on are still too few. Abuses, now fast disappearing, have discredited publicity, and many firms are still afraid that by resorting to it they might damage their reputation. In most countries, however, the authorities, supported by associations of suppliers, advertising agents, and even consumers, are increasing their endeavours to eliminate wilful deception from commercial publicity.

WIDER USE OF ADVERTISING RECOMMENDED

A much wider use of advertising would be in the general interests. As it is, the community is already greatly indebted to advertisers, not only because by attaining their immediate purpose they have promoted the output and consumption of goods, but also because they have, incidentally, spread valuable notions of hygiene and comfort and a desire for more diversified satisfactions, such as travel.

Moreover, advertising provides the daily and periodical Press with a measure of income without which newspapers and magazines would have to be sold at much higher prices.

Other forms of economic propaganda may be noted. Governmental and academic institutions seek to diffuse better production and sales methods; and some of the major industries, as well as associations of agricultural producers, are beginning to realise how important it is for their undertakings that the public should know of the ways in which they are furthering the interests of the community, and of the obstacles that hinder them from doing better. This is a new kind of publicity that deserves to be more extensively applied.

Public opinion is, indeed, very badly informed on economic prin-

ciples and facts. Misunderstandings between social classes and between nations arise largely from ignorance of the mutual services that might be rendered, and even of those which are in fact being rendered. At the present time, governments are conducting intense propaganda in order to justify their policies in the eyes of their people and of the world. It is to be hoped that after this war they will apply the same energy and perhaps a little more method to disseminating economic truths. Yet in this field, as in so many others, it is private initiative, conscious of its strength and of its worth, that could and should take the lead.

Such are, in substance, our comments on the art of spreading knowledge and understanding—comments set out more fully in the essay which forms the supplement to our report and which purports merely to be a modest effort at economic propaganda in favour of that very propaganda.

During the past year several of our associated companies withdrew part of the deposits placed with us, or applied to us for fresh advances, with a view to discharging commitments, extending plant, increasing their holdings of securities, or making other investments. On the other hand, our claim on the banking house of Mendelssohn and Company, Amsterdam, has been eliminated from our "cash at banks" account and transferred to "debtors" account, where it is entered at a heavily reduced amount on which no loss may be expected. The net total of our cash and claims on debtors, after deduction of our liabilities to third parties, is only 4 per cent. less than the corresponding sum shown by our preceding balance sheet.

After amortisations, our security holdings stand at 16 million francs less than a year ago, the value of new acquisitions having practically offset that of items sold and amounts paid off. A valuation based on stock exchange quotations at the close of the past year would give a higher total than that shown in the balance sheet.

The income for 1939 exceeded that for the preceding year, but the amounts written off in respect of the above-mentioned debt and of our security holdings reduce the balance of the profit and loss account to 64½ million francs. This will allow the distribution of a dividend of 250 francs net on the ordinary shares.

As shown by the details given later in this report, practically all the undertakings in which our company has interests have made satisfactory progress during the past year. For some of them the disturbed conditions resulting from the war are rendering remittances abroad more difficult, while at the same time tax burdens have increased. However, those companies in which we hold our largest participations operate in countries that seem unlikely to be affected, except perhaps indirectly, by the European conflict.

Other sections of the report deal with developments in the field of electricity during the past twenty years, and give the usual particulars regarding the undertakings in which the company has its principal interests.

and continue to be held in the expectation of increasing returns. The proposal, as broadly stated by the Chancellor, would have undesirable and inequitable results in many cases, but I have no doubt he will make an effort to meet such cases in the course of adjusting the exact provisions of the Bill.

I need not exaggerate the effect of this and the other matters I have referred to on our revenue account for the current year. That effect is bound to be adverse, but it is at present a question of degree. We have a large surplus over our dividend requirements, and I have every hope of being in a position a year hence to submit a reasonably satisfactory result.

Before moving the adoption of the Directors' report and accounts, I must once again express my appreciation of the services rendered by our staff here and by our agents in America during the past year.

I now beg formally to move that the directors' report and accounts be adopted and that final dividends be declared as therein recommended, viz.:—On £700,000 preference stock at the preferential rate of 4½ per cent. per annum; on £650,000 preference stock at the preferential rate of 4 per cent. per annum; on £750,000 preference stock at the preferential rate of 5 per cent. per annum; on £100,000 "A" preference stock at the preferential rate of 4 per cent. per annum; and on £1,050,000 ordinary stock at the rate of 14 per cent. actual, making 25 per cent. for the year, all subject to deduction of income tax.

The report and accounts were adopted and resolutions declaring dividends, re-electing the retiring director and appointing auditors were unanimously passed.

OOREGUM GOLD MINING COMPANY OF INDIA, LIMITED

INCREASED PROFIT AND DIVIDEND

The ordinary general meeting of the Ooregum Gold Mining Company of India, Limited, was held, on the 26th ultimo, at Southern House, Cannon Street, London, the Hon. A. T. J. Fraser, D.S.O. (the chairman), presiding.

The chairman, in the course of his speech, said that there was a gratifying increase in the annual profit which had been reflected in an increased rate of dividend. The cause of that increase lay partly in a slightly higher grade of ore having been milled and partly in increased price of gold.

The profit, at £103,826, showed an increase of £47,084. The directors recommended a final dividend of 9d. per share on both preference and ordinary, thus making 2s. 3d. per share, or 22½ per cent. on the preference and 1s. 3d., or 12½ per cent., on the ordinary shares.

The ore reserves stood at 304,700 tons of an average grade of 10.08 dwts., a gratifying increase of more than 44,000 tons, the grade to all intents and purposes being the same.

Development had been pushed ahead well, thanks to improved air conditions, and the results had been satisfactory but not sensational. It was unfortunate that the revival in the fortunes and increase in the dividend-earning capacity of the mine should have coincided with the difficult financial times that were being experienced. It was impossible to forecast what the effects of these would be on the future dividends of the company.

ARBITRARY DEMANDS OF MYSORE GOVERNMENT

With regard to the British Government's demands, although they were grievous, at least they were fully justified, but the demands of the Mysore Government were by no means easy to bear with equanimity. When shareholders considered the enormous benefits which, over a period of fifty years, that Government had received both directly in revenue and indirectly in employment for their workmen, traders and cultivators from the Kolar Gold Field, they must come to the conclusion that the direct appropriation of some 13s. 6d. for every ounce of gold won, while gold stood at its present figure, was an arbitrary act which was very difficult to justify.

It was the more unfortunate in the case of Ooregum, because that mine had, as they all knew, just come through a very lean period. For some years ordinary shareholders had had to be content with a meagre 3d. and 6d. as dividend, and even that dividend had only been made possible by the most careful husbanding of resources.

The report and accounts were unanimously adopted.

THE UNION BANK OF SCOTLAND, LIMITED

SATISFACTORY RESULTS

The annual meeting of shareholders of The Union Bank of Scotland, Limited, was held, on the 1st instant, Sir A. Steven Bilsland, Bt., M.C., chairman of the bank, in the chair.

The chairman, in submitting the directors' report, said that with reference to the balance sheet, it would be observed that deposits amounted to £36,000,000, which showed an increase of £2,784,000 as compared with last year. Deposits, of course, varied within moderate limits from day to day, but it was interesting to note that this year's figure was the highest yet recorded at April 2nd, and this also applied to the balance sheet total of over £43,000,000. The removal of the Central Clearing House from London had caused some delay in the normal clearing of cheques, and this, in turn, had the effect of expanding all bank deposits to some extent. Acceptances by the bank showed little change, but, following upon increased trade activity, net circulation at £2,933,000 showed a substantial increase of £285,000.

On the assets side, cash and money at call and short notice, which showed an increase of £1,600,000, amounted to £9,074,000. This represented over 23 per cent. of the liability on deposits plus notes in circulation. Taking into account their holding of rather more than two millions of Treasury Bills, it would be seen that the bank's position was an extremely strong and liquid one. In addition, they had investments amounting to £19,325,000 available, a moderate decrease of £724,000 on last year. Although there had been many ups and downs in values during the past twelve months, the market value of these investments, in the aggregate, showed a substantial surplus over the book values.

For the fourth successive year they were glad to be able to report a considerable increase in loans and advances, which were £511,000 up as compared with last year. The total of £11,000,000 compared with £7,700,000 at April, 1936, and this increase in advances, which were numerous and well spread, was a very welcome one from the point of view of beneficial and remunerative employment of their funds.

YEAR'S PROFIT

Their profit, which was arrived at after making full provision for every known liability, amounted to £303,000, a reduction of approximately £7,000 compared with last year's figure. They would agree that, in view of rising costs, increased taxation and other expenditure arising out of the war, the results of the year must be regarded as most satisfactory.

When addressing the shareholders a year ago, he had referred to the anxious times through which they were passing. Unfortunately, in spite of all the efforts of our Government to preserve peace, we, in conjunction with our French allies, had for eight months been involved in war with Germany, for the second time in twenty-five years. The country and the Empire had never been more united than they were to-day. They were firmly resolved to carry the war through to a successful conclusion.

The heavy industries, comprising iron and steel, shipbuilding and engineering, in which Scotland—particularly the Western district—was so greatly interested, had been busy before the outbreak of war in connection with the re-armament programme, and since last August they and the textile industry had been working at the highest pressure.

Last week the Chancellor of the Exchequer had presented his Budget, which increased the already drastic taxation rendered necessary by the vital struggle in which the nation was engaged. Nobody liked high taxation, but the burden would no doubt be borne cheerfully. The need for personal economy, restriction in the consumption of commodities and saving in order to lend to the nation, could not be over-emphasised. He had no doubt that they must accept much more severe restriction in several directions in the near future. Reference had frequently been made at the bank's annual meeting to the need for increased exports; that was doubly necessary to-day so that we might be able thereby to pay for as large a proportion as possible of the vast imports required to carry the war to a successful conclusion. The amount of gold and foreign investments available which could be used to pay for such imports was definitely limited. They must not only achieve a very great increase in exports but they must also drastically curtail non-essential imports.

The report was unanimously adopted and a dividend at the rate of 18 per cent. per annum declared.

THE LONDON ASSURANCE

PROGRESS IN A DIFFICULT YEAR

The annual general Court of the London Assurance was held, on the 1st instant, at 1 King William Street, London.

Mr R. Olaf Hambro (the Governor), after saying that they were majority shareholders of a German insurance company, the Securitas, concerning the trading of which they were without knowledge since the outbreak of war, and that their income situation was not likely to be very much affected by events in Scandinavia, proceeded to deal with the life department, in which, he said, there was a drop in the volume of business transacted. Right up to the early days of September last there had been every prospect that their new business production figures would at least reach an amount equal to the previous year, and, in fact, they had given promise of producing a record, but on the outbreak of hostilities new business had seriously diminished. Since the beginning of the current year new business production was moving along reasonably satisfactorily.

Their total net new business expressed in sums assured for 1939 amounted to £2,100,256, a decrease of £578,925 compared with 1938, a fall of some 22 per cent., and, when regard was had to the fact that quite a substantial volume of new life business was invariably transacted in the closing period of the year, the fall was not unduly large.

ABNORMAL RISKS

In these difficult times the "London" maintained its tradition of service. They were desirous that life assurance should still be available on an equitable basis, and, while it was beyond their capacity to say what was adequate in the way of extra premiums for additional abnormal risks, they were anxious that those seeking life assurance with them should obtain it. Their additional rate for new assurances on civilian lives to include war risks in this country was but 10s. per cent. per annum of the sum assured, and they were granting cover where the hazards were greater by virtue of actual service and at moderate extra premiums. Policies issued prior to the war were unconditional and worldwide.

FIRE AND ACCIDENT RESULTS

Once again the fire and accident departments exhibited progress, showing together an increase in premium income amounting to £26,000. The fire department's increase amounted to £68,514, bringing the income to £2,201,186. The transfer to profit and loss was £148,057, being 6.7 per cent. of the premium income. The total fund amounted to £880,474. The accident income was £1,458,942, a decline of £42,374, but the amount transferred to profit and loss account was £159,878, being 11 per cent. of the premium income as against 7.6 per cent. in the previous year, representing an increase of £45,040.

They had had an exceptionally good year in the accident department, making substantial progress both geographically and sectionally, and each of the associated companies had made contribution to the excellent results. Motor business had been seriously affected by increased taxation and petrol rationing, and there had been a heavier incidence of claims on account of black-out conditions and otherwise, which were abnormal when related to the volume of income.

The marine premiums amounted to £977,660, an increase of £177,783. Losses represented 54.2 per cent., against 69.3 per cent. They were making a transfer to profit and loss account of £50,000, the same as last year, leaving a marine fund of £1,260,653, being 126.4 per cent. of the premium income as against 121.3 per cent. in the previous year.

The total brought into the profit and loss account was £1,393,626, and the dividends paid had been within their interest-earning capacity, calling for no contribution from underwriting profits. The balance carried forward of £858,092 was £57,054 in excess of the amount brought in, and was a free reserve in addition to their general reserve fund of £3,000,000. The market value of their investments showed a surplus of just over £200,000 above book values. Their total premium income for the year for all departments was £5,541,542, and their total assets stood at £21,797,712.

The report and accounts were unanimously adopted.

The formal business was duly transacted and the proceedings terminated with hearty votes of thanks to the Governor, directors, management and staff.

EQUITY AND LAW LIFE ASSURANCE SOCIETY

EFFECTS OF THE WAR

The annual general meeting of Equity and Law Life Assurance Society was held, on the 30th ultimo, at 20 Lincoln's Inn Fields, London.

The Rt. Hon. Sir Dennis Herbert (the chairman), in the course of his speech, said:—The consequences so far as the society is concerned of the abnormal conditions of the last twelve months have been a sharp decline in new business done, and further depreciation in investments.

Our net rate of interest earned last year was £3 16s. 3d. per cent. As in the case of most offices, this is less than that of the preceding year, largely on account of the increase in income tax. Our mortality experience during the year was very satisfactory; the favourable mortality in respect of life assurances, even when compared with up-to-date mortality tables, indicates a careful selection of lives.

Turning to the published accounts, you will observe that we have added £400,000 to the £100,000 investment reserve which we now call the mortgage and investment reserve, making a total of £500,000. In recent years we have carried forward a surplus of profits without placing any of it to any reserve fund; but in these uncertain and difficult times your directors have thought it well definitely to earmark this amount as a reserve.

STOCK EXCHANGE INVESTMENTS

As regards stocks, bonds and shares which for convenience I may term our "Stock Exchange investments," there is little which calls for comment, except the depreciation which is larger than last year. On December 31st last the depreciation was nearly £1,900,000—as compared with nearly £1,150,000 at the end of 1938—and this increase may, I think, be fairly put down to the war and conditions immediately preceding the outbreak of war. I am happy to be able to tell you that according to a valuation made about a fortnight ago, the depreciation was then reduced by about £500,000 to £1,400,000. A sum of £100,000 has been placed to a special reserve against the investment in the shares of the Freehold Building and Land Development Company.

I think it will be generally admitted that the Stock Exchange quotations or market values of investments under present conditions are to some extent meaningless, and in many cases the values thus arrived at only mean that there is no free market. None the less, as the next triennial valuation of the society is due to be made at the end of this year, and as it will then be necessary to adopt suitable measures to deal with any depreciation that may then be existing, your directors feel it right that I should call your attention now to the possible effect on the rate of dividend, and rates of bonuses to be declared at the end of this triennium.

In these times it is difficult to see even a short way ahead into the future, and it would be more than rash to hazard any opinion as to the conditions which may be existing at the end of this year. But assuming that no great change for the better has taken place in the international situation, prudence may well lead your directors to carry forward, or carry to some reserve, the whole of what would otherwise be surplus available for distribution or to use it in writing down values of our assets. This would mean a substantial reduction in the rate of dividend on the society's shares, and the temporary suspension of bonuses allotted to the with-profits policies.

Continuing, he said that, following the retirement of Mr Thorne last September, Mr Kirton had been appointed general manager and the executive staff had been reconstructed. The directors also had under consideration a reconstruction of the society's board. The directors proposed that their fees should in future be paid free of income tax at 5s. 6d. in the £ only instead of free of all income tax.

The directors had now decided that under new policies the society would cover civilian war risks (except while flying) within Great Britain and Northern Ireland.

New and attractive schemes had also been devised to suit the particular circumstances of the present time and it was hoped that these would enable the society to obtain its full share of new business.

The report and accounts were unanimously adopted.

ROYAL EXCHANGE ASSURANCE

220th ANNUAL GENERAL COURT

The two hundred and twentieth annual general Court of the Royal Exchange Assurance was held, on the 1st instant, at the Royal Exchange, London.

Lord Bicester (the Governor), in the course of his speech, said: In the life department total sums assured during the year amounted to £3,399,000, a figure which, after deduction of reinsurances, stands at £2,965,000. The premium income of the department was £1,388,000. The claims paid and outstanding amounted to £926,000, an increase of £82,000. The life assurance fund now amounts to £14,571,000, an increase of nearly £615,000 for the year.

Few of us would have cared to hazard a guess at the possible extent of casualties among the civilian population from air attack in the event of the outbreak of a major European war. As far as I know, general opinion would have placed them at a high figure. It seemed at first sight, therefore, that a risk of such potential magnitude, while included under the terms of life policies already issued, could not be included in new policies that would be taken out after war commenced, without some additional premium being added. While we appreciate that it is a decision that must be subject to review from time to time, the Royal Exchange has decided for the present to include this risk for approved civilian lives at the normal rate of premium, and in so doing has, I think, extended a facility of great service to the general public.

FIRE DEPARTMENT

The results of our fire department show a total underwriting profit for the year of £147,000. With the addition of £44,000, being net interest received, there has been transferred to the general profit and loss account £192,000. Throughout the whole of the year, and certainly after the outbreak of hostilities, fire insurance business was confronted with questions of the utmost importance.

While the likelihood of extensive damage to property by hostile aircraft naturally led to a demand for insurance facilities to cover this risk, I think it can hardly be questioned that the possibilities of such damage were potentially so great that the matter became one for Government consideration alone. The Weir Committee was set up to review the problem in all its aspects. Side by side with this demand there was the necessity for some form of insurance cover against war risk to commodities and stocks. In this matter the insurance companies acted as agents of the Board of Trade in helping to administer the War Risks (Commodities) Insurance Fund, and the Corporation took their share in this work. Although the results of our home business were excellent, in the foreign field we could hardly expect to escape some repercussion from war conditions.

ACCIDENT DEPARTMENT

Despite a slightly lower premium income, the underwriting profit of the accident department was £120,000—a record figure for this department—against £55,000 for the previous year. Together with net interest, the amount transferred to profit and loss account is £155,000. The Corporation has for some time been concentrating on improving the quality of our overseas and foreign accident business, and the result of these efforts has coincided with a good year in the home markets.

The decrease in the premium income is in some respects due to a pruning of the account, but it also foreshadows a falling off of motor car insurance owing to cars being laid up, because of the rationing of petrol, the increased taxation, and through general war conditions. Claims in respect of motor car business are likely to show some increase due to the larger number of accidents which have unfortunately occurred during the black-out.

The group as a whole has again experienced a very excellent year's trading, and we have, I feel, every cause for satisfaction in the steady progress that is being maintained throughout our organisation, and at the continually mounting figure of our assets which in a combined total for the Royal Exchange Group now exceeds thirty-three and a quarter million pounds. In any normal year I would be prepared to suggest that we might look forward to this steady arithmetical progress. But we are meeting here to-day under no ordinary conditions. Our country is again at war, against the same relentless, but, if possible, more unscrupulous foe. The future, therefore, must of necessity hold many uncertainties for us, and in many ways our business progress may for a time be impeded.

The report was adopted.

EAGLE STAR INSURANCE COMPANY, LIMITED

HIGHLY SUCCESSFUL YEAR

PROFITS FROM ALL DEPARTMENTS

Presiding at the annual general meeting of the Eagle Star Insurance Company, Limited, held, on the 29th ultimo, in London, Sir Edward Mountain, Bart., said that during the year 2,324 new life policies were issued for £5,891,684 gross (£5,835,877 net), practically the whole of which was transacted in the United Kingdom. The combined life and annuity funds now stood at £15,330,878, showing an advance of over £218,000 during the year.

FIRE DEPARTMENT

The premium income was £841,682, an increase of £33,218, and from this there emerged a profit of £60,842.

ACCIDENT DEPARTMENT

The premium income from ordinary personal accident and sickness insurance amounted to £82,450. Owing to the cancellation of newspaper insurance contracts during the year, there had been a considerable reduction in the premiums under this heading. Claims payments were £41,420, and after providing for outstanding claims and reserving 40 per cent. for unexpired liability, there was a profit of £18,077 to transfer to profit and loss account.

GENERAL INSURANCE

In the general insurance account, dealing with the various miscellaneous classes of accident business, the premium income again showed an increase and now stood at £511,509. A profit of £100,234 was carried to profit and loss account.

MOTOR DEPARTMENT

Petrol restrictions and increased cost of car taxation were responsible for a decrease in the income of that department from £1,607,231 in 1938 to £1,573,584 in 1939. Claims paid and outstanding amounted to £887,555, and a profit of £19,882 had been transferred to profit and loss account.

MARINE DEPARTMENT

In that account £318,108 was brought forward, while the net premiums amounted to £426,899, making a total of £745,007, against which they had settled claims for the year 1939 and previous years amounting to £174,184. Expenses of management, including taxes, amounted to £64,029. After having transferred £25,000 to the profit and loss account, the marine fund stood at £481,793, or 112.85 per cent. of the premium income.

PROFIT AND LOSS ACCOUNT

The amount brought forward last year was £402,134. Interest earnings, plus fixed fees and credits from various departments, amounted to £608,327, together producing a total on the credit side of £1,010,461. After providing for the dividends, expenses of management not charged to other accounts, taxes, including N.D.C., office equipment, bad debts, and writing off fully an item of £41,748, expenses in connection with air raid precautions, the balance carried forward was £493,364. The carry forward in profit and loss during the last two years had been increased by approximately £200,000. The interest earnings alone more than cover the total dividend.

INVESTMENT RESERVE

In order to provide for the depreciation which occurred during the year in the values of securities held by the company, they had transferred £350,000 from their contingencies account to investment reserve, which now stood at £650,000 and was more than sufficient to provide for the difference between the values at which those securities stood in their books and the market values at the end of the year. The heavy depreciation which had occurred during the last three years had been fully provided for each year without touching their general reserve of two and half million pounds.

The report and accounts were unanimously adopted.

CALEDONIAN INSURANCE COMPANY

SATISFACTORY RESULTS DESPITE YEAR'S DIFFICULTIES

The one hundred and thirty-fifth annual general meeting of this company was held, on the 2nd instant, in Edinburgh.

The chairman, Mr William Henry Fraser, W.S., in moving the adoption of the report, said: The net new life assurances granted during 1939 amounted to £1,454,772, the premiums thereon being £50,197, including £10,695 by single payments. The net new sums assured compare with £2,102,749 for the previous year. But for the outbreak of war, I have no reason to doubt that our new business figures for 1939 would have shown little variation from those for the previous year.

The death claims for the year 1939 were £267,739 compared with £239,171 in the previous year, but are still within the amount expected under the mortality table used in the valuation. Surrenders amounted to £57,278 against £67,350 in 1938. The total net premium income for 1939 was £610,603 compared with £614,489 in 1938.

The expenses for the year 1939, excluding those applicable to annuities, showed a ratio of 16.5 per cent. compared with 16.4 per cent. in 1938.

The average rate of interest on the combined life assurance and annuity fund (excluding reversions purchased) was £3 12s. 8d. per cent. after deduction of income tax, against £3 16s. 9d. per cent. for the previous year, the reduction being mainly accounted for by the increase in the rate of income tax from 5s. 6d. to 7s. in the £.

The valuation of our Stock Exchange securities as at December 31st last showed that, in the aggregate, the market values at that time were less, by about 3½ per cent., than the values appearing in the balance sheet. I may add, however, that this depreciation had to a large extent disappeared when we made a further calculation of the market values as at the 15th of last month.

I would draw your attention to the statement in the annual report that it had been decided to allot an interim bonus of £1 per cent. per annum on ordinary participating whole life, endowment and double endowment assurances becoming claims by death or maturity in 1940, and that the bonus would be allotted in respect of each year's premium due and paid since the last triennial investigation at December 31, 1936.

FIRE DEPARTMENT

The premium income for the year 1939 was £684,680 against £711,621 in 1938, and the profit was £45,989 compared with £51,782. The total fire fund at December 31, 1939, amounted to 113 per cent. of the premium income for the year.

ACCIDENT DEPARTMENT

The combined account shows that the total premium income for 1939 was £568,358 against £558,839 for 1938. The profit was £23,767 compared with £29,501 for the previous year. The total accident fund at December 31, 1939, amounted to 84 per cent. of the premium income for the year, after including the transfer of £10,000 from profit and loss account for additional reserve.

MARINE DEPARTMENT

The premium income for 1939 was £121,847 against £111,187 for 1938. The first year's claims in 1939 were £24,381, being 20 per cent. of the premium income.

After a transfer of £7,500 to the profit and loss account, the marine fund at December 31st last amounted to £208,236, representing 171 per cent. of the premium income for the year.

GENERAL RESERVE FUND

This fund, which is additional to the departmental funds previously mentioned, has been increased from £600,000 to £650,000 by a transfer of £50,000 from the profit and loss account at December 31, 1939.

PROFIT AND LOSS ACCOUNT

The balance at credit of profit and loss account at December 31, 1939, including the sum brought forward from the previous year, amounted to £231,528. Out of this sum the directors recommend that £20,000 be carried to the staff pension fund as at January 1, 1940, and that a dividend be declared at the rate of 15s. per share, subject to deduction of income tax, to be paid by equal half-yearly instalments on May 15th and November 11th next.

The report and accounts were unanimously adopted.

THE ROYAL LONDON MUTUAL INSURANCE SOCIETY LIMITED

SUBSTANTIAL PROGRESS

TOTAL ASSETS £46,000,000

The seventy-ninth annual general meeting of this company was held, on the 30th ultimo, in London.

After the secretary (Mr J. J. Pipe) had read the directors' report and auditors' certificate,

Mr J. K. Wiseman, joint managing director, who presided, said: Ladies and gentlemen, the directors have great pleasure in again reporting substantial progress.

The combined premium income of all branches for the year amounted to £7,355,796, an increase of £181,871 over the previous year. The total income for the year amounted to £9,178,891, an increase of £267,549. The total claims paid during the year, including annuities and surrenders, amounted to £3,860,674, bringing the total of claims paid by the society since its foundation to £53,643,000. The total assets amount to £46,017,825, an increase of £1,884,505.

The market value of investments at the end of the year, after taking investment reserve and contingency funds into account, exceeds the book values, as set forth in the balance sheet.

ORDINARY LIFE BRANCH

The premium income in the ordinary life branch for the year (including consideration for annuities granted, amounted to £1,949,333, an increase of £20,346 over the previous year. The total amount paid in respect of claims by death or maturity, annuities and surrenders amounted to £1,349,829, an increase of £337,254.

As regards war risk on new policies, it has been our object to provide a high degree of cover for civilians, although active service risks, of course, have had to be excluded. We have, therefore, introduced a scheme under which 50 per cent. of the full sum assured will be allowed on with-profit policies issued at the ordinary rate of premium should death occur in consequence of war or hostilities while the life assured is a civilian. Air raid cover is therefore provided without an additional premium being charged, service in any form of A.R.P. being included. Full cover may be secured on payment of a small extra premium. In the case of men serving in the mercantile marine, the war risk benefit on with-profit policies issued at the ordinary rate of premium will be 25 per cent. of the full sum assured.

INDUSTRIAL LIFE BRANCH

In the industrial life branch the premium income for the year amounted to £5,303,610, which is an increase of £156,185 over the previous year. The amount paid in respect of claims by death or maturity and surrenders amounted to £2,510,846, an increase of £190,131.

As regards war risks on new policies, we have adopted a similar scheme to that in the ordinary branch.

BALANCE SHEET

The balance sheet shows that the assets total £46,017,825, an increase of £1,884,505 over the previous year. Stock Exchange securities represent 75.5 per cent. of the total, the remainder consisting mainly of mortgages, loans on public rates, freehold and leasehold properties and ground rents.

British Government securities represent 18.9 per cent. of the total assets, loans on parochial rates and municipal and county securities 17.5 per cent., the aggregate of these two groups representing 36.4 per cent.

Of the Stock Exchange securities 95.9 per cent. are made up of investments within the British Empire.

I now beg to move the adoption of the directors' report, statement of accounts and balance sheet for the year ended December 31, 1939. I will ask Mr J. H. Skinner, joint managing director, to second the motion.

The report and accounts were unanimously adopted.

Every year many hundreds of Companies publish Reports of their Annual General Meetings in *The Economist*, thereby reaching thousands of investors in the quiet of their own homes.

Full particulars of the charges for inserting these reports may be obtained on application to The Reporting Manager, *The Economist*, 8 Bouverie Street, E.C.4.

INSTITUTE OF CHARTERED ACCOUNTANTS

FINANCIAL PROBLEMS OF THE FUTURE

MR C. J. G. PALMOUR'S ADDRESS

Mr C. J. G. Palmour, President of the Institute of Chartered Accountants in England and Wales, in the course of his address to the members of the Institute at the annual general meeting, held on the 2nd instant in London, said: Reference has been made in many quarters to the flood of legislation arising out of the war and much of this concerns us professionally. The most important from our standpoint is, I think, the E.P.T. introduced by the Chancellor in the second Finance Act of 1939. Few people will disagree in principle with a tax on excess profits in wartime and where controversy usually arises is in regard to the standard by reference to which excess profits are to be measured. This was especially so in the case of the 1939 Act. It is very essential, with taxation at its present high level, that the tax-paying community should be convinced of the general fairness of the provisions under which taxes are levied and I therefore hope that inequities and anomalies will be rectified by the 1940 Act.

WARTIME REGULATIONS

The power to buy goods abroad is one of this country's most important assets in time of war. The need for mobilising that power and using it to the best advantage has necessitated the imposition of currency regulations, the prohibition of certain classes of imports except under licence and the compulsory acquisition of many classes of dollar securities held by persons resident in this country. Whilst we cannot be expected to have a detailed knowledge of all these currency, import and security regulations, we must be in a position to advise our clients generally in regard to them and to furnish the certificates that are required by the Bank of England in connection with applications for permits to pay sums due to foreign creditors. Thus our field of study is further enlarged.

The Government have rightly resolved to check profiteering in wartime and many of our members are serving on the committees set up under the Prices of Goods Act. As time goes on I think that there will be many calls on us from our clients for reports and certificates to substantiate increases in their selling prices. These will give rise to many problems, one of the most important of which will be whether materials should be included in cost statements at original or at replacement cost. In view of the difference of opinion which exists on this subject, I refrain from giving any definite ruling, but I conceive that there are many instances in which replacement cost is justifiable under present circumstances. We must, however, indicate clearly in our reports or certificates which basis has been adopted. These remarks must, of course, be read in regard to their context and imply no suggestion of writing up stocks from cost for balance sheet purposes.

QUESTION OF COMPULSORY SAVING

In my view the rates of direct taxation, with the possible exception of E.P.T., have reached their productive limit and whilst further indirect taxes have recently been imposed, the primary object of these and any subsequent increases is probably to curtail consumption rather than largely to increase revenue. In any event, the cost of modern warfare is so great that further heavy borrowing is inevitable and whether the balance over the yield from taxes is to be raised wholly by way of voluntary loans or in part by a scheme of compulsory saving is a matter which can only be decided by the Government. I trust it will not be thought necessary to resort to the latter basis, but if it so be I am convinced that it will be loyally accepted by the whole community and that it will not be made the subject of acute political controversy. On this question of saving I know there are varying views of the way in which we should respond to the exhortations of the Chancellor of the Exchequer and others. My view is that we should all modify our expenditure, whether of an essential or non-essential nature, to the greatest degree compatible with our mode of living, but at the same time endeavour to maintain such a standard as will assist in ensuring employment and thus bring continued happiness and contentment to our fellows.

The report was unanimously adopted.

DAILY MIRROR NEWSPAPERS, LIMITED

LARGE INCREASE IN NET SALES

MR JOHN COWLEY'S REVIEW

The twentieth ordinary general meeting of the Daily Mirror Newspapers, Limited, was held, on the 26th ultimo, at the Memorial Hall, Farringdon Street, London, E.C.4. Mr John Cowley (chairman of the company) presided.

The Chairman, in the course of his speech, said:—The profit amounted to £300,508 11s. This is about £13,000 less than a year ago, but out of our profits this year we have had to make a very substantial provision for excess profits tax. We recommend the payment of a final dividend of 10 per cent. on the ordinary shares, making a total of 15 per cent. for the year.

EXCESS PROFITS TAX BURDEN

During the year the *Daily Mirror* made a very successful appeal to the vast newspaper reading public. For the first half of our year—that is, to the end of August, practically up to the outbreak of war—our trading showed very good results indeed, and we were looking forward to a period of real prosperity. The second half was also very good, all things considered, but owing to the necessity of providing £80,000 for Excess Profits Tax the net result falls below that of last year. It is a paradox that we should be liable for such a sum by way of this special taxation, which applies in our case to a company in no way benefiting from war conditions, but rather the reverse. I may mention here that at a meeting of the debenture stockholders of this company held last month resolutions were passed sanctioning an arrangement under which we shall receive common shares in exchange for the debentures we at present hold in Anglo-Canadian Pulp and Paper Mills, Limited.

In my address to you last year I went fully into the position of that company and foreshadowed a possibility of reconstruction. When the scheme of financial reorganisation has been carried out, we hope that company will be placed on a sounder footing. We are indebted to two of your directors—Mr C. H. King and Mr A. S. Fuller—who visited Canada in connection with this matter.

The board unreservedly recommended the acceptance of the scheme. We are, as you know, holders of preference and common shares as well as debentures in the Anglo-Canadian company.

You will no doubt be aware that by a recent paper control order the amount of paper supplied by mills to customers has been drastically reduced and the price has been sharply advanced. In July we shall be paying £25 a ton, against a pre-war figure of only two-fifths of this cost. The shortage of paper and the greatly increased price of that commodity have given us many problems.

SHORTAGE OF PAPER-MAKING MATERIAL

The shortage applies not only to paper, but to all articles manufactured from wood pulp. The bulk of the raw material comes in normal times from Norway, Finland, Sweden and Estonia. You all will realise how much the war has affected the trade of these countries, for shipping from Baltic and Norwegian ports has almost ceased. The home paper mills, therefore, are confronted with a difficult situation, for stocks of raw material for papermaking are not large. Steps are being taken to procure from Canada and Newfoundland supplies of paper and pulp, the Paper Controller and the Newspaper Proprietors' Association being interested in this matter, which involves the important question of shipping.

The difficulty has been partly met by decreasing the number of pages in our paper. This in turn means a very severe curtailment in the space devoted to advertisements and consequent loss of revenue. In view of the very large increase in the net sale of the *Daily Mirror*, which is now over 1,750,000 copies a day, we are justified in making an adjustment in our advertisement rates, apart from any increase caused through the advance in price of newsprint. We have, at any rate for the time being, set our faces against any increase in the price of our paper to the public, and I hope, whether in Penzance or Aberdeen, you will continue to be able to purchase the *Daily Mirror* for one penny.

The question of arranging to print the *Daily Mirror* outside London should occasion arise has received full consideration, and complete plans made to produce our paper in various centres in case of need. This is a costly proceeding, but you will understand how necessary it is for us to maintain continuity of production.

The report and accounts were unanimously adopted.

SAN PAULO (BRAZILIAN) RAILWAY COMPANY, LIMITED

SATISFACTORY YEAR

The ordinary general meeting of this company was held, on the 30th ultimo, in London.

Mr Oliver R. H. Bury, M.I.C.E. (the chairman), said that the immediate effect of the commencement of hostilities in Europe appeared to have been some revival in their important traffic in coffee, which was apparent up to the end of November. During that period, there was also an appreciable improvement in exchange and, towards the end of the year, equal to 11½ per cent. On October 1st last an increase in rates was granted, designed to give them an increase of 13,800 contos of reis on a normal year's traffic.

The results for the year on the whole could be regarded as satisfactory. The net profit was £347,000, compared with £344,000 in the year 1938. They proposed a dividend of 2½ per cent., free of income tax, on the ordinary stock.

The volume of both passengers and goods was again in excess of any previous year, and that in spite of considerable diversion of goods traffic to the Sorocabana Railway, due to the operation of their Mayrink to Santos Extension.

It would be noted that among the assets they showed 26,760 contos cash in Brazil or £341,769 as at December 31st last. Since that date they had made a deposit of 18,330 contos of reis with the Bank of Brazil with a view to taking exchange in respect of profits and dividends as such exchange became available.

With regard to the prospects for the current year, the coffee crop 1940-41 was estimated at 14,000,000 bags, compared with 15,000,000 bags in 1939-40. The cotton area under cultivation should equal, if it did not exceed, that of last year, and the outlook generally in relation to production was encouraging.

So far their traffic returns to April 21, 1940, showed that the gross receipts in currency to that date were 41,760 contos of reis, compared with 39,849 contos of reis in the year 1939. The sterling equivalent was £536,268 in the present year, compared with £465,735 last year. The receipts reflected both the effect of the higher rates and an improving tendency in exchange.

The report was unanimously adopted.

RIVER PLATE TRUST, LOAN AND AGENCY COMPANY, LIMITED

OUTLOOK IN ARGENTINA

The meeting of the River Plate Trust, Loan and Agency Company, Limited, was held, on the 29th ultimo, in London.

Mr Walter Woodbine Parish, the chairman, who presided, said that the result of the year could be summarised as follows. The revenue, at £315,892, was under £25,000 less than that of 1938. That reduction was accounted for in the main by an exceptional amount of interest, some £20,000, having fallen in during 1938, as the result of the closing up of a long outstanding mortgage transaction. With the exception of interest on mortgage loans, every other source of income showed an increase. The net result was an available profit of £187,140, which enabled the board to recommend a final distribution of 9 per cent. and 3 per cent. on the "A" and "B" shares respectively, thus maintaining the dividends

(Continued from page 826.)

Combined profits, before taxes and depreciation: 1937, £213,182; 1938, £245,006; 1939, £249,996.

BY TENDER

West Hampshire Water Company.—Sale by tender, £12,000 4 per cent. perpetual debenture stock at minimum price par, also 3,500 4½ per cent. £10 preference shares at minimum price par. Closing date for tenders, May 7th.

ISSUE TO SHAREHOLDERS ONLY

Laporte (B.)—Issue of 58,333 £1 ordinary shares at £2 10s., two new for every nine held. Treasury consent has been obtained.

Shorter Comments

Company Results of the Week.—This week's company results include a number of important rubber company reports, a selection of which is discussed on an earlier page. The reports show a general recovery in profits and an appreciable increase in dividends. Among industrial companies, a further reduction in net profits of AULT AND WIBORG from £41,552 to £28,120 has been accompanied by a reduction in the dividend from 14 per cent. to 7½ per cent. The net profits of CALCUTTA ELECTRIC are moderately reduced from £353,246 to £340,029, but the dividend has been cut from 10 per cent. to 8 per cent. LONDON ELECTRIC WIRE profits show their usual stability; net profits in the latest year amount to £112,508, and the dividend is maintained at 7½ per cent.

Net profits of SCHWEPES are slightly lower at £136,021, and the dividends are maintained. The net revenue of SOUTH EASTERN GAS has shown a reduction of approximately £10,000 to £152,632, and in this case the dividend is reduced from 6 per cent. to 5½ per cent. Two subsidiaries of the Distillers Company have published their reports. That of W. P. LOWRIE shows a reduction in net profits but has maintained ordinary dividend, while JOHN WALKER AND SONS reports a substantial increase in net profits from £463,077 to £561,449, and in the ordinary dividend from 42½ per cent. to 50 per cent.

MISCELLANEOUS

British Match Corporation.—Ordinary dividend maintained at 7½ per cent. for year to April 30, 1940. Net profit, after tax, £451,269 (£447,371).

(Continued on page 841.)

of 14 per cent. on the "A" shares and 4 per cent. on the "B" shares, less tax, carrying forward £110,726.

No one would expect any forecast as to what the year 1940 would show. The greater part of the company's income to-day was represented by investment income, and in considering that, a sub-division of their investments showed that 14.70 per cent. were in dated British Government stocks; 28.39 per cent. were in debentures; 32.91 per cent. were in preference shares or stocks, and 24 per cent. were in ordinary shares or stocks. From those figures they would realise that the investment income stood to be less affected by the stress of war than might be the case if the holdings of equity shares and stocks were greater.

He was loth to think that they would not see in the future some improvement, even though slight, in mortgage income, but it was difficult to be optimistic in regard to the immediate future.

It was not difficult to visualise Argentina deriving some measure of advantage from the needs of the Allies, but the view that the history of twenty-five years ago would be repeated in similar form needed to be carefully thought over.

The report and accounts were unanimously adopted.

UNITED MOLASSES COMPANY, LIMITED

FAVOURABLE OUTLOOK

The fourteenth annual general meeting of this company was held, on the 26th ultimo, in London.

Mr F. K. Kielberg (chairman and managing director) said: All the company's tankers are safe and continue to render invaluable services under the direction of the Ministry of Shipping.

Final agreements have not yet been reached with the Ministry of Supply and Ministry of Shipping. I am satisfied, however, that the amounts included in the accounts as being due from the two Ministries will prove substantially correct and err, if anything, on the conservative side.

In spite of the many handicaps and uncertainties facing the company in consequence of the war, the present outlook, taking the company's activities as a whole, does not appear unfavourable.

In regard to the prospects for the latter part of the current year, it would be foolhardy to attempt to prophesy, but estimates of trading results since January 1st show that present earnings are at a rate which, if maintained, will amply cover the established annual rate of dividend on the ordinary capital.

It may interest stockholders to know that the agency remuneration due to the company from the Ministry of Supply for the period from January 1st to the present date represents less than 20 per cent. of the company's estimated total earnings for this period. Expressed as a percentage, the remuneration amounts to less than 5 per cent. per annum of the value represented by the capital assets and the stocks of molasses taken over by the Ministry.

At a time when the country is fighting for its very life, it is distasteful to have to discuss profits arising out of dealings for and on behalf of the Government, and I mention these figures merely to put on record how modest the remuneration is that the company is receiving for the services rendered to, and the large and world-wide facilities placed at the disposal of, the Ministry.

The report was unanimously adopted, and the final dividend of 5½ per cent., less tax, as well as a cash distribution of 10 per cent., free of income tax, was approved.

CURRENT STATISTICS

Finance

GOVERNMENT RETURNS

For the week to April 27, 1940, total ordinary revenue was £10,553,000 against ordinary expenditure of £46,440,000. Thus, including all sinking fund allocations, the deficit accrued since April 1st is £119,113,000 against £34,965,000 for the corresponding period a year ago.

EXCHANGE RATES (Monthly Tables)

CENTRAL AND SOUTH AMERICA

THE BANK OF LONDON AND SOUTH AMERICA, LTD., issues the following details relative to quotations for certain of the South and Central American exchanges. All these exchanges, with the exception of Bolivia and Paraguay, are related to the United States dollar, and the approximate sterling rates may be obtained by applying the dollar-sterling exchange rate.

Bolivia.*	Sight selling rate on London was 141.40 bolivianos per £ on February 29, 1940.
Colombia.*	Sight selling rate on New York was 175.15 pesos per 100 U.S. dollars on March 18, 1940. This rate applies to holders of permits buying in the "open" market.
Ecuador.	Sight selling rate on New York was 15.14 sucres per U.S. dollar on March 14, 1940.
Guatemala.	Sight selling rate on New York is maintained at one quetzal per U.S. dollar, but a commission of 1 per cent. is charged by the Central Bank for the sale of drafts.
Nicaragua.*	Sight selling rate on New York for payment of imports was fixed by the National Bank at 5.52 1/2 cordobas per U.S. dollar (including 10 per cent. tax and 1/2 per cent. commission) on June 9, 1938.
Paraguay.	Exchange is quoted on Buenos Aires; the sight selling rate was 71.10 Paraguayan pesos per Argentine "free" paper peso on March 15, 1940.
El Salvador.	Sight selling rate on New York was 2.50 colones per U.S. dollar on March 15, 1940.
Venezuela.	Sight selling rate on New York has been maintained at 3.19 bolivares per U.S. dollar since April 27, 1937.

* Exchange controls are operative in these countries.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued, less income tax at the standard rate, with allowance for redemption. Where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The yield on ordinary stocks and shares is calculated on the latest dividends, account being taken of any increase or reduction of interim dividends.

EXAMINATIONS

The next Examinations will be held at Taunton School, Somerset, and Sedburgh School, Yorkshire, and also at Glasgow, Dublin and Belfast, as follows:—

Preliminary Examination, July 31st and August 1st, 1940.

Intermediate Examination, August 1st and 2nd, 1940.

Final Examination, July 31st and August 1st and 2nd, 1940.

Applications on the appropriate forms must be lodged on or before May 21st, 1940, with the undersigned.

A. A. GARRETT, Secretary.

Incorporated Accountants' Hall,
Victoria Embankment,
London, W.C.2.

GOUVERNEMENT IMPERIAL DU JAPON

EMPRUNT 4 PER CENT. DE 1910

FRANCS 450,000,000

NOTICE IS HEREBY GIVEN that the COUPONS due 15th May, 1940, will be PAID on and after that date (Saturdays excepted), between the hours of 11 and 2, at The Yokohama Specie Bank, Limited, where lists may be obtained.

Coupons, which must be left three clear days for examination prior to their payment, will be paid at the rate of exchange on Paris ruling at the time of their presentation.

For THE YOKOHAMA SPECIE BANK, LIMITED,

7 Bishopsgate, London, E.C.2.
30th April, 1940.

H. KANO, Manager.

SUEZ CANAL COMPANY

NOTICE IS HEREBY GIVEN that the General Meeting of shareholders will be held at the Salle d'Iena, 10 Avenue d'Iena, Paris, on Monday, 3rd June, 1940, at 2 p.m.

Holders of not less than twenty-five shares who are desirous of being present or represented at the Meeting must prove at the Head Office of the Company, 1 Rue d'Astorg, Paris, before 2 p.m. on the 20th May, 1940, that they have deposited their shares with the Company or with any of the Company's appointed Agents.

Shares may be deposited in London with Messrs N. M. Rothschild and Sons, who will in due course deliver a card of admission for the meeting.

DOMINION OF CANADA

THREE AND A QUARTER PER CENT. REGISTERED STOCK, 1958-63.

For the purpose of preparing the Interest Warrants due 1st July 1940, the BALANCES will be STRUCK on the evening of the 1st June, 1940, after which date the Stock will be transferred ex-dividend.

For BANK OF MONTREAL, Financial Agents of the Government of the Dominion of Canada, in London.

47 Threadneedle Street, E.C.2.
1st May, 1940.

EDWARD POPE, Manager.

PROVINCE OF ONTARIO

THREE AND A HALF PER CENT. REGISTERED STOCK, 1940, AND FOUR AND A HALF PER CENT. REGISTERED STOCK, 1945-65.

For the purpose of preparing the Interest Warrants due 1st July 1940, the BALANCES will be STRUCK on the evening of the 1st June, 1940, after which date the Stock will be transferred ex-dividend.

For BANK OF MONTREAL,

47 Threadneedle Street, E.C.2.
1st May, 1940.

National Inquest

THIS week's great debate in the House of Commons has indeed turned out to be a national inquest. It seems likely to have done what even a week ago was inconceivable; it has brought Mr Chamberlain's Government down. Never can there have been a clearer demonstration that the House of Commons is ultimately sovereign in Britain or that sincere oratory is still the most potent democratic weapon. The Government went into the debate on Tuesday afternoon confident and secure; they emerged on Wednesday night shaken to their roots.

The verdict followed the merits of the debate. The attack was brilliant, insistent, unanswerable; it came from every quarter. The defence was lame and apologetic. The Prime Minister's speech was itself the clearest revelation of his greatest weakness: his inability to see that sincerity and devotion to duty—two qualities that nobody would wish to deny him—are not in themselves enough. He appealed for unity in the face of danger—without a shadow of realisation that he has made himself an obstacle to unity. He declared that the public did not appreciate the magnitude of the emergency—when the burden of the public's complaint against him is that he himself has refused to act with the vigour that is called for by the urgency of the peril we are in. Mr Chamberlain has many great qualities, which will be fully recorded in the history of England; but democratic leadership is not among them.

The other spokesmen for the Government were hardly more convincing. Mr Stanley and Sir Samuel Hoare could not rise above the departmental and Mr Winston Churchill added to the evidence for the prosecution on the major issue by defending it on the minor, since the reason he gave for the Norwegian disaster was the failure in times past to maintain air parity, a failure of which he himself has been the sternest critic. Back-benchers in support of the Government were few and their interventions ineffec-

tive. Against them was a coruscation of invective—Mr Atlee and Mr Morrison from the Labour Party, Sir Archibald Sinclair from the Liberals, Mr Amery, Mr Duff Cooper, Lord Winterton from the Conservative benches. But by common consent the two outstanding speeches were from Admiral of the Fleet Sir Roger Keyes, who told how he had offered to take Trondheim and been rebuffed, and from Mr Lloyd George, whose wholly devastating speech ended with the blunt statement that Mr Chamberlain owed the country the sacrifice of resigning. Plain speech, such as this and Mr Amery's quotation from Cromwell ("in the name of God, go"), is very rarely heard in Parliament. To survive an attack such as this, a Government needs a large and freely-given majority. But it could only muster a majority of 81; 42 nominal supporters voted with the Opposition, more than 100 abstained, and many of those who gave their votes to Mr Chamberlain did so with the most obvious reluctance.

The cause of this most unexpected defeat was not primarily the events in Norway. Indeed, the debate contributed little save corroborative detail to the public's knowledge of that ill-fated campaign. There was little criticism either of the decision to go to Norway's help or of the decision to withdraw the Allied troops when their position was seen to be hopeless. The mystery of the naval attack on Trondheim is still unresolved. We know that it was planned, and then abandoned when it was thought that the military attack had a greater prospect of success; but it is still to be explained why such a disastrous error of judgment was made, or why the plan was not taken up again when the military attack ended in failure. But the campaign in Norway was only the match to the train of dissatisfaction with the general conduct of the war by the present Cabinet. The main theme of the debate was the need for vigour, for foresight in laying plans and

ruthlessness in carrying them out, for imagination, for courage—the heads of the indictment have been drawn up so often in *The Economist* that it is unnecessary to recall them. With the most brutal frankness, the House of Commons told Mr Neville Chamberlain, Sir John Simon and Sir Samuel Hoare that it did not believe in their capacity to win the war.

What now? Mr Chamberlain has, it appears, promised a radical reconstruction of the Government, and nothing that did not include his Conservative opponents and the Labour and Liberal Parties will meet the needs of the moment. But after the bitter things that have been said this week, it is inconceivable that any of these would take office under Mr Chamberlain. So his resignation seems most probable, and some one else must be left to build a truly national administration. Who that will be, we do not yet know; but it is clear, when it comes to the point, that the argument, so often repeated in recent months by apologetic Conservatives, that there is no alternative to Mr Chamberlain is simply not true. Mr Churchill, Lord Halifax or Mr Eden from the Government, Mr Amery from the rebels, Mr Lloyd George, Mr Morrison, Mr Atlee from the Opposition—no one of these may be a perfect Prime Minister,

but each one, in present circumstances, can command more support than Mr. Chamberlain.

A change in the Government can hardly fail to be for the good. The hour is admittedly grave; but its very gravity is an argument for a quick and decisive change, for, as an Italian newspaper has observed, "Mr Chamberlain in power is a guarantee that the conduct of the war on the British and French side will remain weak, tardy and inconclusive." But certain conditions must be fulfilled if the full benefit is to be drawn from the opportunity. The new Cabinet must, for example, be made up of persons, not of party places. The choice of persons implies a choice of policies; but their mere enunciation in the Cabinet room will not be enough. Swift and thorough execution of policies is almost more important than their first adoption. What is needed is a new spirit of brisk resolution running through the whole machinery of government, penetrating to its utmost corners, stinging Whitehall into new activity, goading into intelligence the members of all the innumerable committees, substituting courage for docility in politicians and imaginative vigour for critical detachment in civil servants. We desperately need a New Deal of energy and courage; pray God we get it.

The Lesson of Norway

THE immediate and obvious losses of the Norwegian campaign are serious enough. The Baltic is closed to us; our trade with the Scandinavian countries will presumably come to an end. Sweden, encircled by Germany, has, even without an invasion, little alternative but to fulfil Germany's requirements, however drastic. Unless we bring the Narvik campaign to a surprisingly successful conclusion, Hitler's chances of getting Swedish iron ore have not been materially diminished as a result of his adventure. The long coastline of Norway provides innumerable hide-outs for German submarines; the airfields of Denmark and Norway offer new bases for an attack upon the north of Britain. Even when we set against these disquieting facts Germany's own difficulties, the damage to her fleet, the usage of war material, the lengthening of her front, the addition to her "empire" of two more unwilling subject peoples, there is still no reason to suppose that Hitler is not satisfied with the Norwegian balance sheet or that he is unduly worried about having "missed the bus."

The damage done to us by the Norwegian affair is not, however, confined to our commercial and strategic reverses in Scandinavia. There is a general context in which the disastrous Norwegian campaign must be set, the context of European and world opinion. In most countries—all of those whose immediate decisions are important—nothing is allowed to speak for itself, every important event filters its way to the public through a haze of propaganda, so much so that the interpretation of events is as important as the events themselves. Perhaps we do not sufficiently realise the comprehensiveness of Nazi propaganda, its adaptability, its drive, its fiendishly accurate flair for timing. The Norwegian campaign is a poor advertisement for our capacities even as it stands, but we must not suppose that it is being allowed simply to stand. Like skilful advertisers, the Nazis have been writing us up for years. Their word picture of us is already complete. Norway has simply been fitted into its appropriate place.

The view of the Allies which the Nazis are "selling" to world opinion is designed in the first place to disparage our strength. Since Abyssinia, they argue, the West has been in steady retreat. Since 1938 the retreat has become a rout. Our intervention could not save Czecho-Slovakia; our alliance could not save Poland; our offer of help could not save Finland; the actual presence of our troops on Norwegian soil could not save Norway. How is it, the argument continues, that the two richest Empires in the world are so strikingly ineffectual in action? Because riches are no substitute for energy and virility; because the Allies are old races, worn out in the imperial struggles of earlier years, decadent empires clinging, without plan or hope of development, to the vast resources of which they are no

longer capable of making effective use. At once grasping and cowardly, rich and spent, obstructing others and betraying themselves, they wait on the brink of dissolution for a *coup de grâce* delivered by the young, rising and aggressive nations.

However little we may recognise this unflattering picture, the Nazis have been spreading it for years with that energy and insistence we must allow their propaganda. Norway is simply added as an embellishment. Our confident speeches about ridding Norwegian soil within a measurable time of "the Nazi pollution" made all the more devastating the impression of weakness created by our decision to withdraw our troops after a week in the fighting line. The tales of our lack of equipment, our failure to give the Navy an effective rôle in our plans for Trondheim, the news that the Norwegians were fighting on in the Osterdal while the last Allied troopship sailed away from Namsos—all were ably assembled by the Nazis to form a devastating chronicle of inefficiency and cowardice. Sweden's bitter comment that small peoples from henceforth must depend upon their own strength only, and Italy's ironic amusement at the work of the Allied "amateurs" are two typical reactions to our very unsuccessful campaigning.

We might perhaps have blunted the edge of criticism if we could have said that the Norway coup caught us before our war machine was properly forged, that our relative lack of essential equipment was simply due to Germany's long lead in the armaments race, a lead we were steadily overhauling. Unfortunately the Budget, coming in the middle of the Norwegian campaign, suggested that a war machine forged at this snail's pace would continue to be ineffective for many years to come. The Budget played fairly and squarely into the hands of the propagandists. Here was the richest empire in the world fixing her expenditure below that of "starved, encircled" Germany; Norway proved that Britain could not fight for victory, the Budget that she could not even spend for it.

The effect on the larger Powers of our failures and of the Nazis' exploitation of them is naturally to make them sceptical of our ability to defeat Germany. They have therefore to consider what their attitude would be should Germany receive the reversion of the Allies' possessions. It is not simply a question of coming to terms with the victor. If the terms are concluded early enough in the campaign, there is at least a chance of securing some share in the redistribution of the spoils. Italy has not yet decided on intervention, but since the chief deterrent is her anxiety to be certain of a German victory before risking war, success in Norway has surely strengthened Germany's chances of forcing her in. The same may possibly be

true of Spain with *terra irredenta* in Gibraltar and Tangier. If those who interpret Stalin's German policy as a desire to come to terms with the strongest Power in Europe, Russia's neutrality will not become less benevolent to Hitler on account of Norway. If, on the contrary, Russia's game is to hold the balance of advantage steady until both combatants are exhausted, her recent overtures to Britain are a fair commentary on her estimate of the Allies' comparative strength.

It is, however, with the smaller Powers that Germany can make the most of the Norwegian disaster. The example of Norway may have helped them, by their purge of Quislings, to ward off one of Germany's weapons, treachery, but the other, the suddenness of the invasion and the slowness of the counter-stroke, may well be repeated in every small European country, with the possible exception of Holland and Belgium. Germany asks her small neighbours why they wish to risk becoming the battlefield of a lost cause when a little compliance on this score of economics or that score of strategy will give them not only peace but security within the German orbit. We may protest that such compliance is slavery; they may prefer slavery to annihilation. When our Government spokesmen complain that our help is ineffectual because we are not

called in until after the blow has fallen, the small neutrals retort that the complaint does not come well from men who bear a heavy responsibility for the destruction of collective security.

The lesson of Norway is obvious and straightforward. Since we were outmanoeuvred in strategy, surpassed in material equipment and driven to withdraw very largely because we could not afford to risk a serious dispersal of our forces, it follows that no small nation will have particular faith in our guarantees until we have achieved a more energetic and far-seeing leadership, until we have thrown aside our financial cowardice and set ourselves to forging a war machine capable of defending not only our own but other people's interests, until we are in a position to issue the challenge on whatever field we choose. We have to rid ourselves of the complacency and incompetence of recent years. We have to realise that offers of help backed by a half-hearted and glaringly deficient war effort create not confidence but contempt. It is not too late to restore our damaged prestige. It is not too late to renew faith in our cause. It is not too late to throw off senility, cowardice and cupidity and fight in earnest for the defence of freedom and the rule of law. But to do so we need other measures and other men.

Under the Million

IT is striking and melancholy evidence of the difficulty that the public mind has in adjusting itself to thinking in terms of the war economy that the fall of the unemployment total to the lowest figure since 1920 should be greeted as if it were an unqualified boon. It is, of course, pleasant to know that less than a million people are now idle; it is gratifying that the level of activity is rising so rapidly. But the speed with which the reserve of employable man-power is being exhausted should also be taken as a warning. The structure of our social order and of our unemployment insurance system being what they are, a total lack of employable labour might well be combined with an unemployment register of half a million or even three-quarters of a million. At the present rate, then, we are within two months of an extreme labour shortage, when, in default of some drastic action being taken, it will be impossible to secure any further general expansion in the production of arms.

The fall of the unemployment figure below a million should therefore be taken as a sign that we are courting disaster if we continue for a day longer with our present aimless planlessness in this vital matter of industrial man-power. That there would certainly be a very serious shortage of industrial man-power in wartime is the most obvious prophecy that could have been, and was, made years ago. That unless some means were found to relieve this shortage all other plans for doubling the war effort would come to naught, was no less obvious. That methods of increasing the supply of labour—especially of skilled labour—cannot be improvised and carried to fruition in a day or two is another self-evident fact. Yet with the problem, in its acutest form, on top of us, the few little gestures towards a solution that have been made are so derisory that they look like a bad joke.

The responsible authorities are not yet even properly informed of the dimensions of the problem. There may be estimates available of the numbers and varieties of labour that will be needed to carry out the various programmes of supply. But there is no estimate of where the labour is to come from or where it might be looked for. Except for the partial and embryonic census that was taken in a handful of industries last month, there is not even any precise knowledge of the number of people employed. Dilution has been put forward as the subject of a series of debates between representatives of the employers' and workers' organisations; but the debaters have been allowed to spend their time on such points as the proper rates of pay for women. The intake of new workers has so far been negligible and, if allowance is made for the time necessary to train them, they will have no influence at all on the rate of output before the autumn at the earliest. As for training in general, the position is ludicrous. According to a re-

cent statement in the German Press, the Nazi Labour Front has 16,000 full-time instructors and every factory has its quota of trainees. In Great Britain, so far from having 16,000 *instructors*, we have less than half that number of *pupils* at the Training Centres. Yet a contrast of this kind is apparently not of a nature to shatter the monumental calm of the Minister of Labour.

Meanwhile, the labour market is becoming chaotic. The Government has combined with its protestations against automatic rises in wage-rates a collection of the most varied inducements to employers to offer higher wages. Supply contractors are pressed for prompt delivery and they are paid on a system which, whatever may be its theory, is in fact "cost plus." What more natural than that they should offer ever higher inducements to get labour? Every employer knows what is happening as a result; men are being tempted away and the labour force is being shifted round without any consideration of the relative urgency or importance or even skill of different jobs. There is an Act on the Statute Book, the Control of Employment Act, which was designed specifically to prevent exactly what is happening every day in every industrial centre in the country; it has remained a dead letter. It is as if we organised the army by permitting the colonels of different regiments to promise higher pay, or more overtime, in order to get recruits—the colonels of battalions in reserve being allowed to induce men to leave the firing line. (The metaphor is not so exaggerated; cases have been quoted of skilled men in aircraft production or export industry leaving to undertake less skilled but better paid work in less important industries.) The net result of our present lack of system is not merely to promote an inefficient and haphazard distribution of man-power, but to give a powerful impetus to the vicious spiral, which the Government, in another sphere of its activities, is also urging on through its policy of forcing up transport costs.

The failure to take Trondheim can be dramatised into the material for a political crisis. But in the long run the failure to organise the supply of industrial man-power is much more culpable, and there is no Minister against whom the charge of lack of foresight and courage can be more forcefully pressed home than Mr Ernest Brown. Two excuses are sometimes offered for inaction. One is that nothing can be done without the trade unions; the other is that it is impossible to lay plans for re-training labour while there is still a large unemployment register. Both excuses are singularly unconvincing. There is no good reason for believing that the unions will shirk such an obvious issue if it is responsibly and imaginatively put to them and if their obvious preoccupations in such matters as collective bargaining and post-war demobilisation are met. As for the

unemployment register, it is becoming more irrelevant as each day passes. The unemployed are within a few weeks of ceasing to be a source of additional labour; the manpower that the munitions industries need is not to be found in sufficient numbers in their ranks. It is the unoccupied population and those who are now employed in unessential trades who form the raw material for a manpower policy, and neither category, in present conditions, frequents the employment exchanges.

The main outlines of the remedy are obvious; the needs

must be surveyed; the men and women must be recruited with the vigour that went into Kitchener's Army twenty-five years ago; they must be trained at the public expense and every factory in the country must take its share in training them; and they must be used to reinforce the productive machine of the country where it is weakest, not where the highest wages can be offered. These are the obvious main outlines; the working out of the details is a task for Mr Ernest Brown and the Ministry of Labour—or for another Minister and another Ministry.

Publicans and Tax Gatherers

“THE proposals I make are to add to the existing duties on beer, spirits, tobacco and matches.” Sir John Simon's recourse to drinking and smoking for more war revenue was not unexpected; for the tax-gatherer has found the habits of publicans and sinners especially lucrative. *Autre temps, autres mœurs*. “They have in England no taxes on wines and beer and other necessities of life, as we have in all parts of Italy,” wrote a Venetian Ambassador regretfully in 1557, and a generation later Queen Elizabeth straitly refused to tax beer. “Peacocks, Hops and Heresie came into England at one and the same time,” it was commonly said, and the only duties on drink were levied on wines from abroad—a Royal right.

It was the soberer statesmen of the Commonwealth period who first tapped the rich stream of revenue from alcoholic drinks—6d. a barrel on beer and 2d. a gallon on spirits. And the Restoration did not restore the Ambassador's envy, tax-free drinking. A beer tax, a malt tax, a hops tax, a spirits tax, licence duties—they mounted up for two hundred years until, throughout last century, between one-third and two-fifths of the entire tax revenue came from the trade in liquor. “Through your agency (the Chairman of the Board of Inland Revenue told the Brewers' Society in 1897) I am enabled to extract from the pockets of the people a considerable sum of money—without their knowing anything about it at all.”

The people's pockets have remained open, though the share of total tax revenue derived from liquor had fallen to a fifth in 1929-30 and a seventh in 1935-36; £100 millions from liquor taxes and licence duties in 1935 compared with £10 millions in 1801, £20 millions in 1860, £30 millions in 1873 and £40 millions in 1900; a peak of £200 millions in 1921; and nearly all (always well over 90 per cent.) from the sale and manufacture of beer and spirits, not wines. It is over two centuries since the Methuen Treaty with Portugal shut out the light French wines and confined wine-drinking to a “small coterie” of port and sherry drinkers. “After the thunderous heroism of the epic Latour 1869 the Margaux of 1871 comes in with the dainty sweetness of lyric poetry”: it was an Englishman who wrote this tribute to the wines of France; but, as Mr George B. Wilson, staunch temperance advocate and encyclopædist *extraordinaire* to the liquor trade,* puts it, “the *non-illuminati* among the coarser palated Northern nations have preferred to drink beer and spirits.” The quantity of wines imported into England in 1850 was only twice the quantity imported in 1700, despite a three-fold increase in population. And even in 1935, when the population had gone up sevenfold, barely three times more wine was imported than 235 years before.

In 1800, three-quarters of a proof gallon of spirits per head of the population were drunk, less than half a gallon of wine and 33 gallons of beer; since then the trend of drinking, unlike the course of revenue from drinking, has been generally downward.

It is the marked fall in the consumption per head of spirits and beer in the last two generations or so that

* “Alcohol and the Nation.” By George B. Wilson. Nicholson and Watson. 456 pages. 63s. A remarkable social study and compendium of all the facts and figures about the history of the trade in liquor, from which the information in this article, as necessarily in every such article, is mainly derived. With Shakespeare Mr Wilson says “O thou invisible spirit of wine, if thou hast no name to be called by, let us call thee devil”; but he knows all about alcohol in these islands since Ireland's first usquebaugh.

	LIQUOR CONSUMPTION PER HEAD		
	Spirits Proof gallons†	Wine Gallons	Beer Standard gallons
1830	1.17	0.27	22.0
1860	0.93	0.23	25.0
1880	1.07	0.45	31.5
1900	1.12	0.38	31.6
1910	0.65	0.28	26.3
1920	0.47	0.32	20.8
1930*	0.24	0.30	15.7
1935*	0.19	0.31	13.3

* 1930 and 1935 figures for Great Britain and N. Ireland only, others for United Kingdom including all Ireland.

† Spirits for drinking in G.B. are retailed “under proof” so that the number of *proof* gallons consumed is less than the actual liquid consumption—in 1935, for instance, 100 gallons of spirits were actually consumed for every 70 proof gallons recorded.

stands out most in the social annals of drinking. The historiographer of drink himself, Mr Wilson, calculates, comparing the periods 1871-75 and 1931-35, that the *per capita* consumption of spirits fell 83 per cent. and of beer 61 per cent.; and in the 60 years—though mainly after 1914—beer had become 20 per cent. weaker in alcoholic strength. Moreover—a point of importance in the early stages of the second great war of our generation—that fall was speeded up before and after 1914-18. In 1918, the consumption per head of beer and spirits was the lowest ever recorded before or since—a third of a proof gallon of spirits and a mere ten gallons of beer.

During the last war, in fact, drinking habits were transformed—in defence of the realm. Hours of sale were reduced from 19½, 17 or 16 a day to 5½; closing time at night became 9 p.m. instead of 10, 11, 12 or 12.30 (a.m.); treating and the sale of liquor on credit were forbidden; all spirits were diluted; and these restrictions, imposed under the Defence of the Realm Act of 1915 and administered by a Central Control Board, were, after first applying only to proclaimed military, naval or munitions areas, extended to cover 38½ out of the 41 million inhabitants of Great Britain. Fear of drunkenness weakening the war effort was a first motive in the programme of control; but shortage of shipping and the possibility of food shortage became potent influences. Beer output was cut down in order to save raw materials from 36 million standard barrels to 12½ millions; imports of spirits and wine were at one point cut down by half by regulation.

The liberal drinking of before 1914 was never restored. The restriction imposed by only brief permitted hours of sale remained—though there was some relaxation. The beer duty which was 7s. 9d. a barrel in 1900 became 23s. in 1914, 24s. in 1916, 25s. in 1917, 50s. in 1918, 70s. in 1919, 100s. in 1920, 103s. in 1930 and 134s. in 1931. In 1933 the basis of charge was altered to 24s. per *bulk* barrel (of a gravity of 1.027°); now, in the latest Budget, it is 65s. The spirits duty, which was 14s. 9d. a proof gallon in 1909, became 30s. in 1918, 50s. in 1919 and 72s. 6d. in 1920; it is now 97s. 6d. These are remarkable increases in tax; and the fact that revenue from liquor taxes was halved between 1920 and 1935, despite the high rate of taxation, underlines the sharp post-war fall in drinking.

Even so, it would be a distinct over-simplification to put that fall down exclusively to increased taxes and higher prices—though it is significant that “the reduction in spirit duty in 1823 and in the wine duties after 1860 and in beer duty in 1933 were all followed by increased consumption.” Nevertheless, the money available among working- and

middle-class people for spending, over and above the purchase of necessities, has on the average steadily increased since 1871-75—though it has fluctuated steeply with each trade cycle. And the fact that a smaller and smaller share of spending has gone on drink—at present expenditure on alcohol amounts to 7 or 8 per cent. of the national income—is accounted for, apart from price and taxes, by the decline in facilities for drinking and the increase in facilities for other amusements. The number of on-licences for the sale of liquor fell from 102,000 in 1855 to 75,000 in 1935, a fall of more than a quarter;* and in the same period expanded and cheapened transport facilities, the rise of the modern entertainments industry, improved housing conditions and the spread of popular education brought into being a host of alternative ways of passing spare time.

The public-house has more competitors nowadays than it had in Queen Victoria's reign, and there are fewer public-houses. There are, it is true, more “potential” drinkers now than there were 60 years ago, not only because the population has gone up by a third, but also in addition because, relative to the population as a whole, there are many more people of “drinking ages”; and drinking has lately spread among new classes of women. But public-houses are much less visited, and much less liquor is drunk in them by their frequenters than was the case.

So far, the story, told with every available historical and statistical detail by Mr Wilson, reads like the tale of a declining industry. Falling consumption, mounting taxation, growing restrictions, stringent war control—all these suggest insuperable obstacles for manufacturers. Actually something very like the reverse has been the case. “We are not here (said Dr Johnson at the sale of Thrall's brewery to Messrs Barclay in 1783) to sell a parcel of boilers and vats, but the potentiality of growing rich beyond the dreams of avarice.” That was putting the prospects rather high; but, by a steady process of amalgamation, by the creation of larger units of manufacture and distribution, by consequent economies in expenses and overhead charges—in short, by rationalisation, the liquor trade has more than weathered all the storms of the last century or so. A Select

* It is worth noting, on the other hand, that the number of clubs where intoxicants can be sold rose from 2,000 in 1887 to 16,000 in 1935.

NOTES OF THE WEEK

Non- and Pre-Belligerency

A fog still hangs over Italy's intentions, and in spite of the adoption of the new terminology of “pre-belligerency” it is still not certain that it is a fog of war. Germany is obviously doing everything she can, short of a brutal command, to bring her ally into the conflict. The Nazi propaganda machine has been particularly busy in the last few days propagating rumours designed to prove the Allies' aggressive intentions in the Mediterranean area. Reports of a mythical Reynaud-Chamberlain telephone conversation during the course of which Mr Chamberlain demanded to know how soon General Weygand would be ready for action were followed by the rumour, tacked on to the British Ambassador's routine visit to the Duce, that Britain had requested a clarification of Italy's position before May 15th—the day which, for one reason or another, the Nazis are putting round as the zero hour of a great Allied offensive. The rumours and reports are so fantastically transparent that one wonders why the Nazis are at such pains to propagate them. Germany can hardly hope to justify her next aggression by rehearsing the Norwegian excuse of “Allied plans of intervention”; indeed, Hitler needs no justification, since it is the successful use of violence and not successful moralising that has given him his present pre-eminence. Again, it is not Germany's moral case that is of interest to Signor Mussolini, but the chances of success which would attend a joint Axis “knock-out blow” in the next week or so. These chances are as difficult to assess as ever. Although the Norwegian campaign dealt a hard knock to Allied prestige, the results are not over-illuminating from the military standpoint, especially when examined from the Italian angle. Hence the Nazis' enthusiastic propagation of the theory that Norway proves once for all the superiority

Committee on the Alleged High Price of Beer and Its Inferior Quality referred as early as 1818 to the “ring” of the eleven great London brewers. In 1835-39, there were 45,000 brewers in the United Kingdom; in 1935-36 there were just over 1,000; and the average quantity of malt used annually per brewer had risen from 248 to 7,838 cwt. The publican-brewer and small local brewer have mainly fallen by the wayside. A movement to limit the number of public-houses by means of the old-established licensing system was brought under way towards the end of the eighteenth century; and, since the number of retail outlets was thus restricted, there was a drive among large brewers to buy up or control public-houses. By 1890, 70 per cent. of the on-licences in existence were for tied houses; and the steady elimination of “redundant” licences more recently intensified the process of concentration.

So far from the last war, with all its taxes and restrictions, ruining the trade, it gave the trade a new life. Between the '80s and the war brewing had run into trouble; reckless flotations had inflated the industry's capital; and in the years before 1914 there was a slump. The ordinary share capital of one leading brewery company was written down in 1905 from £3,185,000 to £796,000; and in 1913 its market value was £44,000. “Then came the war, and out of its holocaust of horrors the brewing trade rose phoenix-like to hitherto undreamed of heights of wealth.” In 1930, the above-mentioned brewery company's ordinary shares were worth £9,875,000. Brewery profits, as returned to the Inland Revenue, were £10 millions in 1913-14, £30 millions in 1918-19, £25 millions in 1929-30 and £31 millions in 1937-38.

It is a strange picture. The place of drink in national life has shrunk remarkably. Drunkenness has fallen steeply away; the number of persons found guilty of drunkenness per 10,000 of the population was 60 in 1870-74, 70 in 1875-79, 60 in 1900-04, 55 in 1905-09, and 50 in 1910-14, but only 21 in 1915-19, 16 in 1925-29 and 11 in 1930-35. There has been something like a revolution in this corner of social behaviour. But the manufacture of drink is still a paying and profitable trade, with the memory of one stringent war well weathered to steel the drink-makers against the growing rigours of this one; and the tax revenue from drinking is still in high esteem at 11 Downing Street.

★

The closing of the Mediterranean to British shipping and the return of part of our Mediterranean fleet to the Eastern Mediterranean have had, on the whole, a calming effect. After threatening intervention for a week, Italy greeted our counter-measures with round-eyed and innocent amazement and made acid comments on our “provocation.” There are two ways in which the arrival of the Fleet may help to keep Italy out of the war. It may, in a straightforward military sense, discourage her from adventures by a show of strength. Alternatively, the fact that newspaper agitation and a few provocative broadcasts in Italy can (as was revealed in this week's debate, notably in Sir Roger Keyes's indictment) prejudice a major Allied naval operation elsewhere and lead to timidity in the use of Britain's naval striking power allows the Duce to argue that “non-belligerency” is sufficiently served by an Italian war of words and a few carefully calculated troop movements whenever Germany and the Allies are involved on a new front. In this way, Italy does not risk an unpopular war, Germany is spared support which might rapidly become a military liability, and the Allies are seriously embarrassed in

their conduct of the campaign. There is, however, another possibility, that the reinforcement of our fleet will deepen the sense of frustrate claustrophobia and lead to an explosion. Such, at least, appears to be the view, discussed in another Note, of the Roosevelt administration. In Italy, the last week has seen new activity in the Pope's efforts for peace. He has on three different occasions prayed publicly for peace and on one at least openly condemned "unbridled ambition and lust for power." The visit paid him by the Prince of Piedmont has also some significance, if only because of the Italian people's firm conviction that the House of Savoy will in the last analysis refuse to declare war. The unpopularity of the war shows no sign of waning. The Pope's appeal for peace in S. Maria sopra Minerva was cheered to the echo by a large congregation. Unfortunately neither unpopularity among the masses nor opposition in the highest quarters can finally determine the issue. The decision rests with Berlin.

* * *

The Low Countries Prepare

The sudden cancellation of military leave and the introduction of fresh defence precautions in Holland have come as a surprise only to those who have not been following the general strategy of the war. Once Hitler's control on most of Norway was complete, it was almost inevitable that he should try in some new military sphere to profit by the momentum of his previous success, and the rumours on the immediate likelihood of a *Blitzkrieg* against the British Isles are too widespread and too well-documented to be disregarded. Germany's chief hope of victory lies in an attempt to smash the Allies while their political leadership is uncertain and their war effort far from fully deployed. Everything, therefore, suggests sudden action in the near future. But sudden action against Britain is only conceivable once the neutrality of Holland and possibly Belgium has been annihilated and the flat fields and convenient harbours of the Low Countries are available for aerial and naval bases against our coasts. Thus a threat to Holland is an inevitable preliminary to a threat to Britain, and the Dutch are to be congratulated that they have anticipated the possibility of a German ultimatum and have put themselves in a state of preparedness to meet any attack the Nazis may see fit to launch. The forbidding of ships to enter certain areas is an especially wise precaution in view of the number of German ships in Norwegian harbours which, when the blow fell, turned out to contain the shock troops of the invasion. Belgium, too, is alive to the danger, and, after a special Cabinet meeting, 50,000 more men have been called to the colours. It is difficult to suppose that Hitler can count on a walk-over in the Low Countries or hope now to catch them unprepared and undefended. Both Belgium and Holland have given solid proof of their determination to stand firm, and, if they stand together, they are backed by the fighting forces of France and Britain, which this time, at least, can be thrown into battle under no crippling strategic handicaps. If Hitler risks the invasion, it is clear beyond all doubt that he cannot afford a long war.

* * *

Aircraft in War

The experience of the first eight months of the war, and especially the campaign in Norway, has decisively answered some of the controversial questions concerning the scope and function of the air weapon in the present war. First, it has proved that the bomber is no match for the fast and heavily armed shore-based fighter; secondly, the bomber has little chance of hitting a small and moving target (such as is presented by a vessel) if it can be prevented from coming down low by concentrated anti-aircraft and machine-gun fire. On the other hand, the bomber has been shown to be a devastating weapon against all except small, moving and armed targets if unopposed by fighters. Stationary targets, even if heavily protected by guns, cannot escape serious damage from the air, though precision bombing during the night is considerably more difficult. The lessons are obvious. First, daylight bombing attacks on this country can be met by an adequate supply of fighters; enemy losses are likely to be very heavy, even if the bombers are accompanied by long-range fighters. During the night, or on clouded days, however, indiscriminate bombing cannot easily be countered, either by means of fighters or anti-aircraft fire. Secondly, the movement of troops, unprotected by fighters, within reach of enemy aircraft is virtually impossible. The same holds good for warships, not on the high seas, but in the vicinity of enemy bases from which they can be attacked by large numbers of bombers. On the high seas, where ships can manoeuvre and are not likely to encounter concentrated and

repeated attacks, they can hold their own against the bomber.

*

The necessity of gaining superiority in the air is absolutely vital, especially as the Allies, unlike Germany, are compelled to disperse their aircraft over a wide field. In this week's debate the Government spokesmen admitted that we are still far from having reached superiority. Sir Samuel Hoare said that the one thing he thought about day and night was how to expand production. Unfortunately, there is reason to believe that production has not been increased in recent months as fast as should have been possible. But this is surely not the time for protracted argument by the experts. It is generally agreed that the quality of British aircraft is superior to that of the American, and that, in any case, American manufacturers cannot supply large quantities this year. We must therefore rely largely on our own resources. The production of fighters, as weapons of defence, must be increased as rapidly as possible. In addition, it will be necessary to speed up the output of long-range fighters to support distant operations and to develop and produce improved types of short-range machines for use against the latest enemy fighters in France, for example, and of bombers. If time is not wasted by controversy over types, there is no reason why, with our bigger resources, we should not be able to attain superiority in the air within a fairly short time. The recruitment of Sir Charles Craven to the Air Ministry last month is a welcome indication that a more determined effort is at last to be made to expand production. Other signs of a more vigorous policy are the appointment of Brigadier-General Jones as Controller of Light Alloys and the decision to reorganise and speed-up the training of personnel. But time is of the essence.

* * *

Free Sterling

All this week sterling has been slumping in the free market in New York; it touched \$3.32 on Wednesday. The official policy of His Majesty's Government is still that no harm is done by fluctuations of the free rate, and that nobody in London need concern himself about the price at which one foreigner chooses to sell his pounds to another foreigner. As was pointed out in a full examination of the whole question in *The Economist* of April 6th, this could be made to be true. If we took steps to ensure that neither our imports nor our exports were financed through the market, and that the rates of exchange in none of our clearing agreements were affected by fluctuations in the free rate, then it would not matter to us what the free rate was; the only thing that would then matter would be the volume of business transacted in the free market, since every sale of free sterling is, of course, a loss of gold or foreign exchange to us. But as things are the story is very different. Many of our imports and of our exports are still financed in free sterling or at rates that fluctuate with it; the effect of a fall in the rate is to ensure that we get less foreign exchange for our exports and pay more for our imports. Moreover, the size of the market is growing—and the size of the market is the same thing as the leakage of our reserves.

*

The policy of the Chancellor of the Exchequer, it need hardly be said, is to leave matters as they are—but that can hardly be tolerated any longer. Of the two alternative courses of action, that of cutting off the supply of free sterling by blocking foreigners' balances has been ruled out. We are, therefore, left with the second: that of cutting off the demand for free sterling by making all British exports payable in foreign currencies. This would have the disadvantage of driving the free rate down to nothing, but it would have the advantage of reducing the size of the market—if it were put into complete effect. Perhaps best of all would be the suggestion put forward by the *Financial News* that two free markets should be recognised, one for sales of sterling arising out of current trading, the other for sales arising out of capital balances held in this country by foreigners. It would then be possible for the authorities to escape from their present dilemma: if they intervene to push the free rate up, they confer a bonus on those who are taking their capital out of the country; if they let the free rate fall, it turns the terms of trade against us. If the free market were split in two, the "current trade" section of it could be kept up to, or nearly to, the official rate, while the "capital" section could cheerfully be left to go to the devil—if it is really thought to be more healthy to a banker's reputation to let his clients withdraw their money at a bankrupt rate than to offer a standstill. But in any case, the position cannot be allowed to drift any longer if our foreign exchange assets—one of the scarcest of all the raw materials of war—are not to be squandered.

The Campaign in the North

The news from the North is still very confused. From this week's debate we know that the Narvik aerodrome is in Allied hands, which is encouraging news, for it may after all be possible to see our fighters in action in Norway in spite of the setbacks of the first four weeks. Snowstorms, however, still hamper operations, and beyond the fact that Narvik itself, and most of the hinterland, is still in German hands, it is impossible, on the basis of existing reports, to establish the position of the opposed forces. German communiqués speak of air attacks on naval units in Narvik Fjord and of a determined drive north by light units from the Trondheim area. The Allies appear to have made fresh landings and to have shelled the town of Narvik during the course of the week, but there is still not much evidence of air activity. Further south, the Norwegians report that the German advance has been held up short of Mosjøen and Mo, which can well be believed if the configuration of the country and the lack of roads are taken into account. In the south, although fully organised Norwegian resistance is coming to an end, guerilla warfare continues in many districts and many indomitable Norwegian fighting men must have been encouraged by news of King Haakon's declaration that he and the legitimate Government of Norway are determined to hold out until the end. This continued resistance, however, can be at the most an embarrassment to the Germans. Their hold on south and central Norway is virtually complete. Sweden is thus faced with an incredibly delicate situation. However much she may be prepared to defend her neutrality against invasion (and the recent calling up of more men in spite of the possibility of damage to the harvest suggests that she is in bitter earnest) invasion is perhaps the danger which she has least to fear now that she is trapped in the Baltic and shares miles of undefended frontier with Germany's new "colony." The exchange of letters between King Gustav and Hitler has exactly the value that can usually be attached to Hitler's written or spoken word except that, in this contest, he can probably secure his ends without resort to force. Sweden's future relations with the U.S.S.R. will be interesting to watch. Russia is the only power in a geographical position to counterbalance the extension of German influence, and it appears that Stalin has already intervened in Berlin to ensure Sweden's continued neutrality. For the time being he holds the balance both in the Baltic and the Balkans, and there is reason to suppose that Hitler finds him a quite infuriating ally.

* * *

Neutrality in Action

Within the strict but benevolent limits of its neutrality, the United States has done the Allies notable service during the last week. At a moment which may well have been crucial, the American Ambassador in Rome conferred twice with the Duce himself, and the White House allowed it to be known that the interview had been concerned with the United States' desire to prevent any spreading of the war. Italy has an especial interest in American goodwill, for not only does a large proportion of certain key commodities (among them oil and cotton) come from the United States, but Italian and American bottoms are responsible (so it has been reported) for 90 per cent. of Italy's sea-borne trade, and in the event of war the extension of the "combat zone" to the Mediterranean would prevent the arrival of American ships, and the Allied blockade would presumably prevent Italian sailings. In the Far East, America has of her own accord put a stop to the excessive shipments of certain war materials destined for Vladivostok and thence to Germany, while in the delicate problem of Japan's attitude to the *status quo*, America's intervention has been decisive, since the Allies are at a strategic disadvantage when it comes to the concentration of military and naval forces in the Pacific. Japan's policy, for all her declarations of "non-involvement" (a new type of non-belligerency?) is bound to be that of fishing in troubled waters, and a German invasion of Holland would be a very large stone flung into the comparatively calm seas of the Pacific. Some weeks ago Mr Arita's provocative communiqué on Japan's "interest" in the status of the Dutch East Indies caused such a stir that the Japanese are now at great pains to write it off as a "contribution to the stabilisation of Eastern Asia." Whether they would have been so anxious to do so without a stern hint from Washington is open to question. Mr Cordell Hull's immediate reminder of the United States' interest in the peace and security of every area in the Pacific has now been backed by the significant decision to leave the American fleet at Hawaii in order "to continue further manoeuvres and tests." Coming as it does on top of renewed rumours of a Nazi threat to the Low Countries, the moment is well chosen, and offers a useful reminder that, however strong the desire of the United

States for isolation, there are certain areas in which immediate and vital American interests are at stake.

* * *

Balkan Third Degree

The Balkans are passing through another period of tension. Two weeks ago it was "tourists," and, having dealt faithfully with them, the Balkan states face a new menace in the shape of extensive troop concentrations on Germany's south-eastern frontiers. S.S. *Verfügungstruppen*, who were the advance guard of the lightning attack on Poland, are said to be 50,000 strong, and, for the first time, definite news of their distribution and of the arrival of fresh reinforcements in Galicia have been allowed to leak through. It is quite impossible to say whether Germany seriously intends an immediate invasion. The Balkan preparations may be part of the scheme for a *Blitzkrieg* on every front in a ferocious effort to break the Allies before the autumn, and Germany's activity on every front from Trondheim to Klagenfurt does give the impression of a great beast crouching and quivering on the verge of a tremendous spring. Yet all through the winter the tactics of troop concentrations and rumour campaigns have been employed with no more purpose apparently than to keep Germany's small neighbours in a reasonably docile frame of mind. Thus it is perhaps insufficient docility on their part rather than immediately aggressive intentions on Germany's that accounts for the present activity. In the last few weeks, Germany has suffered some severe setbacks, of which the latest is Dr Ciolău's departure from Sofia, leaving the German-Bulgarian trade agreement in its present unsatisfactory state, with a German debt to Bulgaria of £7 millions and Bulgarian business circles frantic at the delays in German deliveries. Another matter for Nazi pre-occupation is the steadily improving tone of Bulgaro-Turkish relations. The Nazis are doing all in their power to revive the old feelings of distrust and hostility, but the sensible settlement of recent frontier incidents testifies to a much greater spirit of mutual confidence which the British Ambassador to Turkey, who is on visit to the British Minister in Sofia, is no doubt doing all he can to foster. The situation is altogether too calm for Germany's liking. Hence troop concentrations, rumours, misleading press reports and all the other normal instruments of the Nazis' "Third Degree."

The War Effort

The culminating clash between Mr Chamberlain's administration and its critics did not start with the Norway debate. It began with the Budget, and the long-delayed success of years of criticism in bringing its points fairly home came, not in Wednesday night's division, but in the forced admission from Sir John Simon that his financial measure of the nation's war effort was still low. In Committee last week he spoke of further severe direct taxation to come. In an address to a National Savings gathering this week he said outright that there was "no limit to war expenditure," and laid stress upon the fact, which he had apparently denied in his Budget speech, that he "would not shrink" from Mr Keynes's compulsory saving scheme if the need arose. Sir Robert Kindersley had earlier complained that the Keynes proposals had damaged voluntary saving, but the voluntary method, the Chancellor said, was on trial. Meanwhile, Supply Service expenditure last week was £3 millions below the weekly average for the first quarter of the year. A single week is no criterion, and the year-end rush of spending in March inflated last quarter's figures. But it is abundantly clear and, at last, generally agreed that to avoid defeat our expenditure and the flow of war supplies must mount steeply in the testing months before us.

Costs and Prices

The rise in coal prices, justified though it may be by the rise in costs, is deplorable. Like the 10 per cent. increase in railway charges on May 1st, which was one of the causes of the advance in coal prices, it is likely to bring in its train a series of demands for higher prices by other industries, such as iron and steel, cement, gas, electricity—and the railways themselves. If conceded, these, in turn, will raise the costs of a multitude of other industries. Indeed, there are indications that the spectacle of costs chasing prices is about to begin, unless the Government is prepared to take immediate and drastic action. The cause of this tendency is to be found chiefly in the successful pressure for higher wages by the trade unions. It is useless, however, to blame the unions, for they are doing only what they are paid for. The real cause of

the trouble is the Government's failure, after the initial wage advances last year due to the rise in the prices of imported commodities, to curb the trade unions' pressure by the adoption of a national wages policy and by the application of the Control of Employment Act. The growing scarcity of labour is likely to strengthen still further the unions' bargaining power, and they will certainly use it unless the Government chooses to adopt a bolder policy. On the other hand, there is no reason to believe that the unions would not accept a limitation of their powers to press for higher wages if they are regulated on a national basis.

Ebbw Vale and Sir William Firth

A demand has been raised in several quarters for a public inquiry into the circumstances of the dismissal of Sir William Firth from the chairmanship of Richard Thomas and Company, Ltd., which was discussed in an article in *The Economist* of April 27th under the heading "The Case of Ebbw Vale." That the machinery of public inquiry should be set on foot to examine whether or not a particular individual was treated justly by the committee of bankers and competitors who now control his business is doubtless an exaggerated suggestion. But there is nevertheless a strong case for an inquiry—not into Sir William Firth's dismissal but into the state of affairs at Ebbw Vale. Are the competitors of Richard Thomas, either in their individual capacities or in their corporate state as the British Iron and Steel Federation, the appropriate people to entrust with the task of seeing that the technical progress embodied in the new mill at Ebbw Vale is used for the community's benefit, without fear or favour? And if the insatiable demand for steel prevents any policy of deliberate restriction in wartime, will the same hold good after the war? These are the real questions, to which nobody has yet given the answers.

War Trade Policy

A political crisis has come without the secret session on economic warfare, promised and then put off because of the war in the North, having been held. Nevertheless, the

undertones of this postponed debate were loud among the sounds that shook Jericho's walls on Wednesday, and the first guarantees of more effective Government policy in the future will be sought in the economic field. Mr Churchill himself has laid bare the crisis in aircraft production; and the crucial issue of trained industrial man-power is discussed in a leading article on page 849 of this number of *The Economist*. The easy faith in a war won by sea-power and rough blockade has gone, and subtle questions of trade policy in wartime, questions upon which despised experts have voiced advice for months and years, have become pressing and urgent. An article in the current *Banker* on "Commodity Control in Wartime" restates tellingly the case for special wartime devices. The aim of trade in war is to maximise the Allies' purchases of indispensable supplies and materials; or, in other words, to maximise the proceeds in foreign exchange from the sale of exports in order to buy those essentials. In the agenda of ways and means the sale of the Empire's primary products, gold, rubber and tin, bulks large, and there are two alternative ways of maximising exchange receipts from these. One is to raise prices, which is not possible when the price has already been brought to a peak by control schemes, when the market is not largely dominated by British production or when the market's ruling price, as in the case of gold, is fixed by a large neutral buyer. The other is to increase production by every means, even at the expense of future output. These points are A B C, but since September they have not always been readily seen in official circles, where for a time the view was even canvassed that the price of all essential basic commodities should be kept as low as possible. An energetic, clear-sighted and comprehensive trade policy is needed more than ever now, when, against Germany's undoubted economic losses in Scandinavia (despite large immediate gains), we must set the need to make up our own temporary losses of special steels, ferro-alloys and calcium carbide normally got from Norway and iron ore from Sweden.

Stocks and Shares of Food

The speeches of the new Minister of Food are both candid and stimulating. Addressing the Liverpool Chamber of Commerce last week, Lord Woolton pointed out the danger to food supplies which might result from a temporary breakdown of transport under intensified air attacks, and emphasised his determination to create and maintain adequate and well-distributed reserves, even if their creation involved some reduction in the amount available for immediate consumption. Lord Woolton referred in particular to a possible cut in the weekly sugar ration, which has remained unchanged at 3 lb. per head since it was first introduced. Three-quarters of our sugar supplies are normally imported; the yield of the home crop, which is lifted in the late autumn, is erratic owing to the vagaries of the climate; this season uncertainty about labour supplies has, it is believed, counteracted the Government's appeals for an increase in the area sown to beet. If imports of sugar have to make way for more urgent traffic, it is comforting to know that Lord Woolton will reduce the ration rather than the stocks. He was confident, he declared, that the public would not mind a certain amount of stringency if it felt that the stringency was being intelligently imposed. It is a pity that Lord Woolton cannot convince other members of the Government of the truth of his belief.

Shorter Notes

Sir John Anderson has now announced the measures he is taking to tighten up the Defence Regulations, but he has made it clear that the new regulations had been carefully drawn to avoid penalising mere expression of opinion and that there is no question of repressing honestly held minority views. At the same time, power is given to deal with mischievous activities directed towards impeding the war effort, and anyone concerned in systematic publication of matter likely to foment opposition to the successful prosecution of the war will, after being warned, be liable to penal servitude for seven years or a fine of £500 or both. A Bill has also been introduced which makes death the penalty for serious cases of spying or sabotage.

The new Proclamation signed by the King on Thursday extends the liability to be called up for military service to all men aged 19 to 36 inclusive. About 2,500,000 will be included in the nine new age groups involved, compared with 2,000,000 under the earlier Proclamations.

The apparent slowing down of Germany's submarine campaign, which has been noticed in recent weeks, is illustrated by the latest Admiralty figures of merchant shipping losses. (These are now given out some ten days after the week to which they refer in order to avoid disclosing information of value to the enemy, and details such as the names of the ships and the place of the sinkings are withheld.) In the week ended April 28th four British ships of a total tonnage of 6,689 were sunk, one Allied ship of 1,458 tons, and two neutral ships of 298 tons. This brings the total tonnage of British losses in April to 18,249, which is the smallest monthly total since the beginning of the war. On the other hand, the German losses of merchant shipping in April were 300,000 tons, almost all of which was sunk during the Norwegian campaign.

Since the beginning of the war Great Britain has lost some 720,000 tons of merchant shipping and Germany 600,000 tons. But British shipping will now be reinforced by the greater part of the Norwegian and Danish fleets, together amounting to about 6,000,000 tons. Of the Norwegian tonnage, 4,500,000 was away from Norway at the time of the invasion; the whole of this has been requisitioned by the Royal Norwegian Government, and will be placed under the control of the Norwegian Shipping and Trade Mission which has been established in this country.

Almost exactly a year after the dismissal of M. Litvinov it is announced from Moscow that Marshal Voroshilov, Soviet Defence Commissar for fifteen years, has been relieved of his duties and appointed to a higher but less important post as deputy to M. Molotov. No reason has, naturally, been given for the removal of the man who was responsible for the creation of the Red Army, but it is possible that it is the outcome of the bad impression of that Army's strength and effectiveness which the Finnish War gave to the world at large. He has been succeeded as Defence Commissar by Marshal Timoshenko, Commander of the Kiev military district.

Portugal's neutrality is being further emphasised by the conversion of all her external debt, amounting to about £27 millions, into an internal loan. That she has been able to do this is another tribute to the wise financial and economic policy of Dr Salazar, who celebrated the twelfth anniversary of his assumption of the office of Minister of Finance on the day the lists opened for the new loan.

The new stage in the two-year-old Mexican oil dispute, opened a few weeks ago by the United States Government's offer of arbitration, has been concluded with the Mexican Government's refusal to accept the offer. In the Note announcing its decision the Mexican Government emphasised that the controversy was a purely domestic one, and was in any case nearing solution by agreements between itself and the American companies concerned.

Small Accounts

By tradition as well as by deliberate policy, the Westminster Bank has always aimed at fostering the 'small' account. Moreover, there is no sharper line of demarcation between 'big' and 'small' than between 'white' and 'black'; there are many greys between, and it has always been good business for the Bank to encourage the smaller account, with confidence in its growth later on.

Those, therefore, who may have felt that their means hardly warrant a banking account are invited to consult the Manager of any branch and to find that their hesitation may have been groundless.

THE WORLD OVERSEAS

British Guiana's Possibilities

(From our Georgetown Correspondent)

By any of the standards customarily applied to years since 1931, last year was satisfactory for British Guiana's trade and finance. Exports were \$14,505,552, as compared with \$13,065,606 for 1938, while imports totalled \$10,724,671 as against \$10,610,262. The Colonial Treasury's statement of revenue shows that the colonial income for 1939 (\$6,229,625) was higher than at any time since 1920.

The business community has settled down to war conditions and there has been remarkably little disturbance. As the official journal of the Chamber of Commerce of the City of Georgetown remarks: "It is a fortunate circumstance for British Guiana that in its war economy a strong sense of the Colony's duty to the Empire will not conflict with the Colony's self-interest."

This statement is illustrated by the expansion of the bauxite industry. In a long war British Guiana's bauxite exports, which amounted to \$136,364 in 1920, may easily increase to more than \$5,000,000. They were close on \$3,000,000 last year and the rate of expansion for the first three months of 1940 is already very promising. This is distinctly helpful to the revenue, since the Government levy an export tax on every ton, and the "aluminium steamers" which take the bauxite to Canada contribute handsomely to harbour dues.

No Loan for Woodpulp?

The development of the mineral and forest industries of the hinterland is indeed the great hope of British Guiana. There have been in city and country the warmest expressions of praise and gratitude over the Royal Commission's recommendations. The psychological change among the masses of workers and unemployed has been complete and instantaneous. Similar reports have been received from all the West Indian capitals.

Regret is, however, being expressed here that in cabled summaries of the Commission's report there should have been no specific recommendation for loan assistance to establish a wallaba woodpulp industry. British Guiana's forests, which occupy 86 per cent. of its area, contain the only commercial source of greenheart in the world. The pulp potentiality of an area of 367 square miles, which is excellently situated for starting the industry, has been conservatively estimated at 200,000 tons a year. The pulp and the paper which has been produced from it have been considered by reputable experts to be of an exceedingly high standard, the paper being of the class of the more expensively manufactured papers made from esparto grass. The pulp can be delivered c.i.f. New York for not more than \$28.80 per ton and is of the quality of Poplar Soda Pulp currently priced at \$51 per ton c.i.f. New York. Exports of 200,000 tons would in peacetime amount to \$12 millions per annum and the Colony's export trade would thus be practically doubled. Greenheart, the best timber in the world for piling and other marine constructive work, and mora, which for use as railway sleepers, outlasts without creosoting other woods now in general use, would be more easily extracted from the forest, given a parent industry like wallaba pulping, which would make clear-felling of the greenheart and mora possible.

There is no doubt whatever of the part this industry must play in opening up the hinterland; there is equally no doubt of the part a developed British Guiana can in turn play in solving the economic difficulties of the West Indian islands. And it is to be assumed that the United Kingdom Government will neglect no opportunity of reducing the extent of public assistance which the United Kingdom taxpayer is being asked to provide for British Guiana and the West Indian colonies as a whole.

Since the visit of Lord Halifax (then Mr Wood) in 1922, it has been a principle of policy, if not among West Indian Governments at least among West Indian editors, that a developed British Guiana is the natural outlet for the surplus

population of the West Indies, and there is no doubt that the poverty which the Royal Commission deplores is to a large extent due to the maldistribution of population among the seven colonies.

Coast Drainage Problem

In its references to British Guiana, the cabled summary of the Royal Commission's recommendations lays emphasis on reforms in the financing of drainage works and on "steps for the relief of the public indebtedness." Both the age-old problem of drainage and the \$80-a-head public debt are due entirely to the low-lying rainy coastland which has to be simultaneously protected from the Atlantic, with an expensive sea wall, and from flood-waters, with an elaborate but still incomplete system of canals and pumps. The equally serious need for State irrigation schemes, a need rendered all the more acute by the growing importance of the rice industry, has had to be all but neglected. It has long been believed that if the other two geographical areas into which the country is sharply divided could be developed by providing communications and capital assistance to new industries, the financial troubles of the coast would disappear.

April 15th.

Defending China's Currency

[FROM OUR SHANGHAI CORRESPONDENT]

THE recent decline of the China dollar's exchange value and the operations, in this connection, of the Hongkong Anglo-Chinese Stabilisation Fund had world-wide repercussions entirely unintended and unforeseen. More than once during the past few weeks sterling sales on behalf of Shanghai dominated the New York market for sterling, and comparatively unsubstantial selling or buying orders from Shanghai would move the New York quotation for sterling up or down by several points.

Shanghai exchange selling rates for spot delivery against Chinese dollars in the eleven-week period from February 1st to April 20, 1940, declined from almost 5d. to 4½d. on London, and from 8c. to 6c. on New York. During the latter half of this period the Hongkong Fund maintained the 4½d. rate unaltered, but only by means of continuous sales of sterling. After running almost out of exchange last summer the Fund replenished its exchange holdings throughout the four months following the outbreak of war, which coincided with a re-affirmation of the Chinese dollar's exchange value. By January 31, 1940, the Fund again held £7 millions in exchange, which sum through intervention sales has been reduced since to some £3 millions.

At the present level of Shanghai exchange requirements, the Fund would be sold out within two or three months if the quotation of 4½d. were to be continuously defended. The Fund's managers apparently hoped to tide over until June, when the new Chinese crops of silk, tea, cotton and food-stuffs would begin to be available. It was expected also that the increasing monetary tightness in Shanghai would compel speculators to reduce or discontinue forward buying of exchange. The Fund is selling against cash only, and every sale of £1,000,000 reduces the cash supply in Japanese-occupied China by 3 per cent. Interest rates for cash have sharply increased in Shanghai, but speculators continue to borrow for monthly change overs at rates up to 40 per cent. per annum.

No Outside Assistance

The Shanghai business world expects, therefore, that the Fund will either have soon to let the Chinese dollar drop below 4½d., possibly to the vicinity of 3½d., or to run entirely out of exchange and then let the dollar find its "natural" level. Even in the latter case the Fund would not end its existence. It holds the equivalent in Chinese currency of the exchange sold, and will be able to buy back exchange at any favourable opportunity. But each time the Fund sells out, or almost out, and replenishes afterwards, replenishment is effected at lower exchange rates than the previous sales, and thus the Fund's total exchange capacity, and with it its influence upon the general exchange situation in China, steadily declines.

There seems to be no chance that either the Hongkong and Shanghai Banking Corporation, the Chartered Bank of India, Australia and China, or the Chinese National Government in Chungking, will put up the capital necessary to refill the Fund from outside. There is a new prospect that additional currency assistance may be rendered China by the United States, but this assistance is unlikely to take the form of a participation by the United States in the Fund. The Chungking Government seems rather inclined to discontinue exchange spendings upon Shanghai, Tientsin and the Japanese-occupied areas, but so far has been reluctant to do so, chiefly owing to political considerations.

The four State banks of the Chungking Government continue to hold abroad, besides their investment in the Hongkong Fund, substantial amounts of foreign exchange, though these may be partly mortgaged. No public account of them has been given. They are considered a sort of last reserve or final war fund. The total circulation of national currency in all China, for the beginning of this year, was officially stated as slightly above \$C3,000 millions. Its actual extent at the present time is being estimated, in Shanghai banking circles, at about \$C4,000 millions. This is about £69 millions at current Shanghai exchange rates. It is obvious from this sum that no very large new exchange loan or credit would be needed by China to back up present exchange rates for a long time to come. If present prospects of American assistance, to be rendered within the discretionary powers of President Roosevelt, and independent of the Hongkong Fund's weakening activities, should quickly materialise, Shanghai exchange speculation may be severely punished, and sterling sales on account of Shanghai may be stopped altogether.

April 20th.

Wartime Finance and Trade in Greece

[FROM OUR ATHENS CORRESPONDENT]

THE public finances of Greece have inevitably been affected by the war. The original estimates for 1939-40 anticipated a deficit of Drs. 655 millions. In the course of the year, however, the international crisis, while affecting the receipts from certain taxes, necessitated an additional expenditure of Drs. 1,437 millions, of which no less than Drs. 1,167 millions represented extraordinary military expenses. Equilibrium was rapidly restored, nevertheless, by economies. Borrowing and an increase in taxation, so that the final deficit is now put at Drs. 547 millions only, against which may be offset the surpluses left by previous years, thus leaving a net deficit of Drs. 54 millions.

Budget estimates for the new year, April, 1940-March, 1941, are as follows: Revenue, Drs. 14,851 millions (of which Drs. 817 millions are proceeds of loans); expenditure, Drs. 15,514 millions; deficit, Drs. 663 millions. In comparison with the previous year, expenditure shows a decrease of Drs. 427 millions, which, the Finance Minister stated, testifies to the effort made to restrict all unnecessary outlays. This effort, he said, did not interfere with national defence or general welfare. Military expenditure is estimated at Drs. 4,112 millions—Drs. 2,958 millions ordinary and Drs. 1,154 millions extraordinary—while a sum of Drs. 355 millions is set aside as a reserve for additional credits, if required.

The impact of the war is also noticeable in the foreign trade of Greece. For the first eight months of 1939 its volume was larger in comparison with the corresponding period of the previous year, though the value was smaller. Since September, 1939, however, and up to January last, the volume as well as the value of both imports and exports

declined. In February, while the volume continued to decrease, an increase in value took place, as compared with February, 1939—the result of rising international prices. The import surplus in 1939 was appreciably smaller than in the previous year (Drs. 3,076 millions as against Drs. 4,612 millions), and that for the first two months of the current year amounted to only Drs. 190,000, as compared with Drs. 90 millions in the corresponding two months of 1939.

Imports from Germany slightly increased in 1939, but exports to it declined appreciably. Inversely, imports from Great Britain and the United States were a little lower, but exports show an important expansion. Again, for the first two months of the current year total trade with Germany, the United States and Russia shows a contraction, in comparison with the corresponding months of 1938, while that with Great Britain and, to a lesser extent, with Italy and France has increased.

Headway in Hongkong

[FROM OUR HONGKONG CORRESPONDENT]

"THE Statement of Policy on Colonial Development and Welfare" does not seem to have made much impression here, outside the higher ranks of the Civil Service. It is obvious that the Statement is a landmark in the history of the British Colonial Empire and foreshadows closer attention to Colonial affairs on the part of Parliament. The shock given to public opinion at home by the events of recent years in the West Indies has awakened a sense of responsibility towards the Crown Colonies which even the urgency of the present war may fail to subdue.

The failure of the promise of enlightened interest and possible material assistance to evoke response on the part of the inhabitants of this far-off but by no means obscure fragment of the Empire may be attributed to various reasons. Primarily, Hongkong has managed to pay its way so far and its public debt is very small. It has never been a "problem" since it got over its growing pains and ceased to be regarded as a white man's grave. The Chinese and British races who have built up the fortunes of the Colony are strongly individualistic and have fought shy of Government interference. And as, until recently, there was little expression of public opinion, a new departure in the policy of the Imperial Government towards the Colonies can very easily escape observation.

Growth of Social Consciousness

As Hongkong approaches its centenary, however—to be celebrated next year—there is a perceptible growth of political consciousness. Until comparatively recent years the bulk of the population possessed a dual nationality and looked to China as its mother country. The Japanese invasion has driven hundreds of thousands into this city of refuge and has cut the bonds between many permanent residents and their native land. There is now growing up a generation which is Hongkong born and bred, and is becoming strongly susceptible to Western ideas in education, sport and good citizenship. There is developing a keen sense of social duty which has already produced a large number of Chinese welfare workers who, in co-operation with Government officials and European voluntary helpers, have done much to relieve the appalling distress which has ensued from the

influx of refugees. The problems of public health are now being brought home to the educated Chinese resident, but it will require many years of propaganda work and expenditure beyond the present means of the Colony before the standard of Western countries is approached. Nevertheless, progress is being made and no doubt the Hongkong Government will not lose sight of the Colony's claims to a grant from the new Colonial Fund for financing health and housing reforms.

There are, of course, other grounds on which Hongkong could base a strong claim to assistance from the Colonial Development Fund. Education is one, and although it might be contended that schools should receive first consideration, if the revenue of the Colony earmarked for education can be supplemented, it is generally felt that the University has prior claim. This institution has battled with adversity for most of its twenty-eight years' life, and can never expand until the authorities at home recognise their responsibility for what is, undoubtedly, not a local but an Imperial charge. The University has never been of greater value than it is at present, as the academic centre to which the refugee scholars of China look for encouragement and guidance.

A further realisation of the value of the imperial connection is also apparent in the sphere of commerce. While Hongkong remains predominantly an *entrepôt* of trade the steady progress of industrialisation during the past ten years has received a tremendous stimulus from the demand for wearing apparel, electric torches and batteries, and rubber footwear for the markets of Great Britain. When the Ottawa Regulations were drawn up it is doubtful whether the authors visualised the rapid growth of manufacturing industry in a Crown Colony such as this. The main object of the regulations was, presumably, to encourage the development of agricultural and mineral production in the Colonies in order to provide the Mother Country and the Dominions with raw material for their industries.

The advantages of Imperial preference soon convinced the manufacturers of Hongkong that it paid to specialise in the export trade, for under a preferential tariff Hongkong goods could enter the Crown Colony markets and compete against Japanese goods. A few years ago local exporters began to test the markets of Great Britain, but except in the case of rubber footwear and electric torches little progress was made. The outbreak of war, however, brought a flood of enquiries for which the black-out was partly responsible. The disappearance of Czecho-Slovakia and Poland and the rising cost of production in Japan left the way open to Hongkong as a source of supply for cheap wearing apparel.

Unfortunately, home manufacturers have been alarmed by the appearance of a new, although actually a substitute, competitor, and the Board of Trade has intervened. At present exporters here are in the dark as to the Board of Trade's intentions and serious dislocation of local industry has resulted through shipments being held up or manufacture suspended because import licences are being withheld. It is not only the Board of Trade which is holding up business, but also the Customs authorities, who appear to be under the impression that Hongkong articles are really Japanese goods which have been sent here to be re-packed and disguised as British. This suspicion is entirely unwarranted, for full reliance can be placed upon the factory costings drawn up by qualified accountants to show the required percentage of Empire content, and Hongkong Government inspectors are particularly zealous in ensuring that manufacturers of articles for export

under preference regulations do not indulge in malpractice. Despite these safeguards the United Kingdom Customs, without any legislative authority so far as can be discovered, demand that Hongkong textiles shall be composed of cotton grown as well as spun in the British Empire. This demand appears to have overlooked the fact that Lancashire spun yarn is usually composed of cotton grown in America, but so far the representations made to the home authorities by the Hongkong Chamber of Commerce as well as by the Government do not appear to have been accepted.

April 27th.

Portugal's Sound Position

[FROM OUR LISBON CORRESPONDENT]

WITH imports down by 239,000 contos and exports up by 197,000 contos, the final figures for 1939 trade compare favourably with those of 1938. Imports of foodstuffs at 268,000 contos are almost halved, yet Portugal is not starving herself, for exports of food, which represent the controlled surplus after home needs have been met, have risen from 591,000 contos in 1938 to 703,000 contos for 1939. Machinery, tools, ship materials, and vehicles were imported on an average level comparable with the 1937 and 1938 purchases, 353,000 contos as against 381,000 contos in 1938. Exports are up except for pit props, turpentine, pine-apples, and vegetables. Compared with 1938, oil exports are up by 47 per cent., rosin by 42 per cent., sardines, etc., in oil by 31.7 per cent., and minerals by 31 per cent. Increases are also shown by wine, almonds, and cork.

With prices steady, production satisfactory, and the supply of needed raw materials reasonably well assured, Portugal's commercial and financial outlook is highly satisfactory. Confirmation of this statement is to be found in the success of the recent scheme for the conversion of the external debt into internal bonds at 4 per cent. Though optional, the proposal has met with general acceptance, and 88 per cent. of the holders have accepted the new terms.

Germany at War

(An objective account of economic trends in the Reich compiled weekly by the editorial staff of The Economist from German and neutral sources.)

THE recent reduction in Bank rate from 4 to 3½ per cent. has now been followed up by a general reduction of the interest rates of all other banking institutions. The reduction has been made compulsory by an agreement concluded by the Reich Credit Control Board (*Reichsaufsichtsamt fuer das Kreditwesen*) and the Reich Credit Group (*Reichswirtschaftsgruppe Kreditwesen*). The latter organisation is the federation of bankers. As in other sections of the economy, these two organisations, the State Control Board and the former Employers' Federation, as it were, represent the means for "steering" this particular section of the economy; and the financial section of Germany's economy is now being "steered" towards a cheap money policy. At present cautious preparations are being made for a general conversion of loans, similar to the Schacht conversions in 1935.

One reason for the reduction in interest rates is the war-time liquidity. But the main reason is the necessity for adjustments in methods of war financing. It seems to be a growing view that the actual as well as the psychological limit of increased taxation has been reached. This is interesting because, so far, the chief defence against inflation has been a remarkably rigorous taxation policy. If this is to be changed, then to avoid inflation *indirect compulsion*, forced savings, rationing and so on, will become the main means. At any rate, the financial demands of State and industry, particularly the coal, electricity and iron and steel industries, are steadily increasing, and the State wants credit as cheaply as possible. Discussions have shown that even the old idea of "breaking interest slavery" has been revived by the proposal to abolish all interest on short-term deposits. The actual reduction may best be seen from the following table:

	Former interest rate Per cent.	New rate Per cent.
Daily maturing liabilities	1	1
Savings deposits	3	2½
Deposits—1 to 3 months	2½	1½
do. 3 to 6 months	3	2½
do. 6 to 12 months	3½	2
do. over 12 months	3½	3½

The banks were anxious to retain the rate of 1 per cent. on daily maturing liabilities in order to prevent their withdrawal. The daily maturing liabilities of three leading Berlin banks increased during 1939 by Rm. 713 millions against an increase in long-term deposits of only Rm. 260 millions. Formerly debtors to banks were charged on the average 6½ per cent. interest, including a premium. From now on the average rate will be 6 per cent.

The direct result to the banks will be lower earnings, and they have therefore been advised to save costs by further rationalisation. Some concern is felt about the effects of lower interest rates on the saving public at a time when increased savings are of paramount importance; and it is clear from past experience that the development of savings deposits is very susceptible to changes in interest rates. It is, however, hoped that wartime increases in total earnings, together with the general rationing of consumption goods, will maintain the present upward trend of savings deposits.

The recent boom in the capital market has already gone very far to prepare the market for a general conversion of loans. The price of 4½ per cent. Treasury Bonds, issued at 98½, has risen to 101½. Five per cent. industrial debentures have risen to 105. The actual interest rate on Reich loans is now roughly 4 per cent., whereas the interest rate on short-term Reich loans is 3 per cent. The significance of the reduction of Germany's rate of interest from the extraordinarily high level during the post Great War years becomes clearer when the enormous overhead costs of Germany's agricultural, as well as of the substitute industries, are taken into consideration. Every step taken to "steer" the financial sector of Germany's economy is influenced by the great fear of inflation. A 100 per cent. taxation of all wartime increases in incomes, German papers argue, would defeat its own purpose by killing all initiative. The Reich must thus revert to issuing war loans, and the Government is determined to get loans as cheaply as possible. But it is still all-important to force savings to the required level.

Unemployment and Training.—Opening a new Labour Exchange in Berlin, the Minister for Labour, Dr Seldte, spoke about unemployment in Germany since the beginning of the war. He gave the following figures, relating to Greater Germany:—

September, 1939	120,000
December, 1939	128,000
January, 1940	256,000
March, 1940	137,000
April 10, 1940	105,000

In default of any precise information about short-time work, these figures are merely nominal. The large-scale importation of foreign labour proves that there is an acute shortage of labour. And the re-training of workers from civilian industries for work in war industries is still the most interesting feature of Germany's war economy. Recently however there was a curious reaction to the rationalisation drive in war industries affecting the skilled workers. Highly rationalised work, it was said, makes the skilled worker almost superfluous. This opinion is hotly contested by the Labour Front, and the organisation is now redoubling its efforts to get every boy into an industrial apprenticeship. The point is that re-training workers is largely concentrated on unskilled workers, who are trained for semi-skilled work. A great number of skilled jobs, particularly in the metallurgical industries, have, on the other hand, been simplified in such a manner that semi-skilled workers are now quite sufficient for them.

But there are still great difficulties in the long-term training of highly skilled workers. Too many shops of independent artisans, formerly the most important training shops for highly skilled workers, have been closed down. The compulsory technical schools for boys and girls complain of a shortage of instructors and teachers; and boys after leaving school find semi-skilled jobs with earlier wages obviously more attractive than long apprenticeships. New regulations have been issued to secure an adequate number of apprentices for highly skilled jobs. Soldiers at the front are at the same time being interested in maintaining their technical knowledge.

Industrial Policy.—The Compulsory Cartel Law plays an important part in the control of Germany's industry. Since 1934, for instance, the expansion of existing capacity or the building of new capacity has been prohibited in a number of industries. Under war conditions new capacity problems have arisen, and the latest decree (relating to the iron and steel and metal manufacturing industries) extends control measures, hitherto dealing mainly with marketing regulations, to direct control of capacity. A decree empowers the industrial group for iron and metal manufacturing industries to decide whether new capacity may be built or whether closed-down capacity may be reopened.

THE BUSINESS WORLD

Chain Store Shares

HOW far is the war likely to check the phenomenal progress of the chain store companies? Their geometric development was the most striking feature in retail trading history in the twenty years preceding the present war, just as the rise of the department store was the most interesting evolutionary change in the two decades before the last war. The progress of companies like F. W. Woolworth and Marks and Spencer has been based on simple basic ideas. Limitation of trading to low price ranges is not a new conception itself—Marks and Spencer had reached this stage in the rudimentary "Penny Bazaar" days. The distinctive feature of the chain stores' success is the wedding of efficient merchandising with the control of production from the retail end.

F. W. Woolworth became a public company only nine years ago, while investors have had a share in the fortunes of Marks and Spencer only for the last fourteen years. Gross profit figures of the two companies are available for the last eleven years and their showing must be unparalleled by any other group of trades. The figures are shown below, with data illustrating the economic background against which the companies achieved their progress:—

CHAIN STORE PROFITS, REAL WAGES AND PRIVATE CARS LICENSED

Years	Gross Profits				Index of Real Wages in British Industry (1929=100)	No. of Private Cars Licensed	
	F. W. Woolworth		Marks & Spencer (a)			Total (000)	1929 = 100
	Amount (£000)	1929 = 100	Amount (£000)	1929 = 100			
1929 ...	3,326	100	438	100	100	981	100
1930 ...	3,684	111	624	142	104	1,056	108
1931 ...	4,394	132	862	196	108	1,083	110
1932 ...	4,672	141	1,041	238	109	1,128	115
1933 ...	4,734	142	1,258	287	111	1,203	123
1934 ...	5,109	153	1,389	317	111	1,308	133

1936 ...	6,127	184	1,868	426	110	1,642	167
1937 ...	6,781	204	2,107	480	109	1,798	183
1938 ...	7,276	219	2,381	543	113	1,944	198
1939 ...	7,957	239	...	...	112	...	...

(a) Twelve months ended March 31st of following year throughout.

Since the customers of the chain stores are drawn mainly from the wage-earning and lower salary-earning classes, the trend of real wages must obviously be one of the most important of the factors outside the companies' control. In the years preceding the outbreak of the war, this trend was almost uniformly favourable. Despite severe unemployment in the early nineteen-thirties, real wages were steadily rising. Later, the rise of real wages was checked, but total employment increased, and chain store profits showed uninterrupted progress. The growth of popular spending power is indicated by the number of private motor cars licensed, whose growth closely fits the trend of F. W. Woolworth's profits.

Contrasts in the individual achievements of the two companies suggest, however, that internal policy has also played a considerable part; under less favourable general conditions, progress might have been slower, but it would still have been considerable. In 1929, Marks and Spencer had reached a much less advanced stage than Woolworth and in the subsequent decade its relative progress was much the more rapid. By 1937, Woolworth had doubled its profits, but Marks and Spencer did so within a couple

of years, and its 1937 earnings were nearly five times those of 1929. Both companies have fully maintained their average rate of growth up to their latest financial year, which includes four months of war for Woolworth and seven months for Marks and Spencer. The differences in the position and policies of the two companies deserve examination in greater detail, in the light of the figures given in the next table:—

WOOLWORTH AND MARKS AND SPENCER: SOME COMPARISONS
(Calendar years for Woolworth: To March 31st of following year for M. & S.)

	1934	1935	1936	1937	1938	1939
Rate of annual profit increase (%) (a):—						
Woolworth	7.8	8.7	10.5	10.8	7.2	9.4
Marks and Spencer	11.4	16.1	16.0	12.7	13.0	...
Number of branches:—						
Woolworth	597	637	677	711	737	759
Marks and Spencer	202	209	218	228	234	...
Profits per branch (£'000):—						
Woolworth	8.57	8.72	9.05	9.54	9.87	10.49
Marks and Spencer	6.87	7.71	8.57	9.25	10.17	...
Stock-in-trade per branch (£):—						
Woolworth	4.23	4.01	4.65	4.67	4.41	5.47
Marks and Spencer	3.75	4.33	5.41	6.61	7.01	...
Ord. dividends per cent.:—						
Woolworth { Cash	80	100	75½	60	65	65
Woolworth { Scrip	...	...	100	...	...	...
Marks & Spencer { Cash	35	40	40	42½	42½	42½
Marks & Spencer { Scrip	10	10	10	10	10	Nil
Ord. earnings per cent.:—						
Woolworth	122.5	135.3	76.4	81.2	86.7	89.2
Marks and Spencer	74.1	77.3	75.3	73.5	74.7	55.5d
Distribution of earnings (f):—						
Woolworth:—						
Paid in ord. divs. (£'000)	2,325	2,906	3,431	3,375	3,534	3,253
Retained in business (£'000)	1,235	1,027	938	1,193	1,177	1,214
Marks and Spencer:—						
Paid in ord. divs. (£'000)	435	574	634	743	817	899d
Retained in business (£'000)	376	408	420	392	448	171d

(a) Percentage increase in gross profits: each year compared with preceding year. (b) Equivalent to 120 per cent. on capital before scrip bonus. (c) Equivalent to 152.8 per cent. on old capital. (d) Estimated. (f) After taxation provision.

During the years covered by the table, the profits of both companies were "geometric" in the true sense. The average ratio of increase was about 9 to 9½ per cent. per annum for Woolworth and 12 to 13 per cent. for Marks and Spencer. But these excellent results were based on a policy of physical development which, broadly speaking, was extensive for Woolworth and intensive for Marks and Spencer. Between 1934 and 1938, Woolworth opened 140 new branches, and Marks and Spencer only 32. In the latter year, Woolworth had more than three times as many branches in its chain as Marks and Spencer. Both companies invested large amounts of new capital (obtained mainly from profits) in their businesses, but Marks and Spencer broadly used them to extend existing stores, while Woolworth employed a larger proportion in establishing new points of contact with customers. That both policies "paid" is evident; for the profits per branch rose consistently, in each case, during this period. But whereas in 1934 Marks and Spencer's profits per branch were 20 per cent. less than those of Woolworth, by 1938 they had begun appreciably to exceed them. And while stocks carried in

the average Woolworth store have risen only slowly, and not very consistently, in recent years, the average Marks and Spencer establishment doubled its stocks between 1934 and 1938.

The differences between the two organisations, in fact, lie much deeper, and suggest that the two businesses are essentially complementary rather than competitive. Woolworth, with its low price limit, carries a wide variety of lines, for customers who are not particularly discriminating. This, in practice, has involved a considerable concentration on hardware and similar goods which have a relatively slow "stock turn," and a proportionately high "mark-up." Marks and Spencer, with its higher price range and more discriminating clientele, carries far more seasonal drapery goods, whose successful handling involves exceptional care for quality and price, a relatively low "mark-up" and a fairly rapid "stock turn." On the financial side, however, the policy followed by the two concerns has been fundamentally the same. Both have relied mainly on their own profits to provide new capital. In the six years 1934-39 inclusive, Woolworth ploughed back no less than £6,784,000 into its business—an amount equal to nearly twice the nominal value of its ordinary capital in 1934. In the five years 1934-38, Marks and Spencer put back £2,044,000, representing much the same proportion of its equity capital in the earlier year. Both companies have readjusted their capital periodically by issuing scrip dividends, but Woolworth have declared big capital bonuses at infrequent intervals (the last being 100 per cent. in 1936), while Marks and Spencer have favoured regular annual distributions of 10 per cent. Under a regime of wartime dividend limitation, Woolworth consequently comes off the better. The Chancellor, in effect, has insisted on Woolworth's continuing, for the duration, the practice it was already following. In Marks and Spencer's case, however, the ban on bonus issues deprives the shares of a selling point among investors, particularly surtax payers, whose effect could never be precisely measured, but was always appreciable.

The effect of the last two Budgets on shareholders in these companies is, in fact, somewhat complex, and the Purchase Tax will introduce further complications, though it is difficult to see why chain stores should suffer more severely than other retail traders. In the first place, E.P.T. will take 60 per cent. of the fruits of the companies' geometric development since 1936-37—which, as the first table shows, is a fairly serious matter. In the second place, dividend limitations will deny Marks and Spencer shareholders the dividends of (presumably) 42½ per cent. or thereabouts, on the 10 per cent. annual capital increments which are ruled out during the war. Thirdly, both companies should accumulate resources throughout the war

representing (a) the difference between earnings and dividends in the standard years for E.P.T. and dividend limitation, plus (b) 40 per cent. on any excess profits—the whole, less (c) income tax at increased wartime rates. Neither concern has, in the past, held large reserves outside its own business. But opportunities for the extension of both businesses will be severely limited in wartime. The decision of Woolworth to go beyond the sixpenny price limit for its wares is a defensive measure, to maintain the largest possible range of stocks following the wartime rise of prices. It is entirely different from the proposal which was considered, but not proceeded with, three years ago, to raise the limit in order to increase the company's range. Hence, the enforced piling up of resources during the war is unlikely to bring more than a modest "gilt-edged" return, though both companies should be in a good position for further expansion when the war is over.

For this reason, a higher dividend yield is appropriate on chain store shares in war than in peacetime. Market quotations have always allowed something for the bird in the bush as well as the bird in hand, but the bush is now further away. Present prices, however, appear already to have discounted that factor, as the following table (which includes two more recent entrants to the chain store business) suggests:—

SHARE PRICES AND YIELDS

	Woolworth	Marks & Spencer	British Home Stores	Great Universal Stores
Shares { Designation				
Denomination				
Ordinary	5/-	Ordinary 5/-	Ordinary 1/-	Ordinary 5/-
Current price	57.9	40.6	5/-	10/-
Yield { On last dividend				
On last earnings				
	5.6	5.3	5.0	12.5
	7.7	6.9	9.2	19.6

A dividend yield of 5 to 5½ per cent. on the shares of the leading store companies (the main interests of Great Universal Stores are largely in mail order business) is not far removed from the average of 5.98 per cent. on industrial equities as a whole, shown by the Actuaries' Index. On that basis, the shares appear reasonably valued, for companies should be able to maintain their dividends during the war, even if the growth of earnings is checked. Though a wartime environment is not, naturally, the most favourable to any form of retail business, the tactical and geographical position of the chain stores is stronger than that of most other retailers. And now competition from other quarters is likely to be put into cold storage until the war is over. Efficiency, in the last analysis, has been the secret of chain store progress, and efficiency is an asset whose value does not depreciate in wartime.

Currency in the Colonial Empire

THE currency systems of the Colonial Empire are as varied as the dependencies themselves. In the Far East, there is the Hongkong dollar, formerly on a silver standard but now regulated by an Exchange Fund; and further west the Straits dollar and the rupee of Ceylon. In the West Indies, American currency circulates with British currency. The notes of the banks operating in the islands (whose head offices are in London or Montreal) are accepted, and are sometimes legal tender, along with Government notes. In some islands, there is a local coinage, and in others the American or British coinage has been adopted. The groat, or silver fourpenny piece, is a picturesque survival in British Guiana.

In tropical Africa, the cultivation of export crops and the opening up of foreign trade naturally led to the introduction of western currencies to take the place of barter. The new currencies did not at first percolate far, and even to-day the price of a bride may vary from a head of cattle to a pinch of tobacco; nevertheless, her value is generally measured in terms of pounds, shillings or pence. It was in British West Africa that the first attempt was made to introduce a uniform currency system, exclusively for the

territories concerned, but regulated from London; and the principle adopted, that of a Currency Board, has since become sufficiently widespread to deserve special examination.

In West Africa, before the last war, the currencies circulating and accepted as legal tender included French, Spanish and American gold and silver coins, as well as coinage of the United Kingdom. But the chief reason for the introduction of a special West African currency was the danger inherent in the fact that the British silver coinage issued for circulation in West Africa in 1909 and 1910 exceeded the amount issued at home. The possibility that a trade setback would lead to a return of large quantities of silver coin from the colonies, which would upset the regulation of the silver currency in the United Kingdom, outweighed the consideration that the Colonial Governments themselves might benefit from the large profits made on issuing currency in the colonies.

By the establishment of the Currency Board both these objectives were gained. A special silver currency for the West African colonies was issued against a reserve of gold and securities, and the Board was authorised to pay

contributions out of its profits to the revenues of the West African Governments when its financial position justified them. It was also authorised to issue currency in West Africa against prepayment in sterling to the Board in London, and similarly to issue drafts or telegraphic transfers on London in exchange for currency tendered for redemption in West Africa, with the right to charge a premium for such issue or redemption within a limit which should not exceed the actual cost of transferring specie from the United Kingdom to West Africa or *vice versa*. In this way the exchange value of the new currency with sterling, which was fixed at par, was to be maintained.

The West African Currency Board was appointed at the end of 1912, and war broke out at the beginning of its second year of operations. In the first few months of the war, the cessation of normal trade made a large part of the currency in circulation redundant; but the enormous demand for oilseeds which arose later caused a correspondingly big increase in the demand for currency, and the net increases in the war years were £1,048,225 in 1915-16; £985,806 in 1916-17; and £1,396,221 in 1917-18. Another abnormal factor was the rise in the cost of transporting specie, which at one time in 1917 was as high as £6 10s. per cent., so that the Board was compelled to increase the premium charged on the issue of currency from 15s. to 25s. per cent. The redemption premium had already been raised from 15s. to 30s. at the beginning of the war in order to discourage the return of currency.

Several other Currency Boards have since been modelled on the West African Currency Board, but the one set up to give a uniform currency system to the East African dependencies did not have the same success. The East African Currency Board, which was appointed at the end of 1919, had an unfortunate start; for, besides inheriting an excess of liabilities over assets amounting to £246,000, it was subject to considerable confusion for which it was not altogether to blame. It was understood that the Indian rupee, which was then circulating in East Africa, was to be stabilised in India at about 2s. 9d., and it was decided to replace it by a local rupee issue which would be stabilised at 2s. After rupee coins and notes had been minted and printed, it was decided that the new coinage should be expressed in terms of florins instead of rupees, and later still that the shilling should be the standard coin in order to facilitate wage reductions, in view of the depressed state of trade. The expense caused by this triplication of currency was bad enough, but worse was to come when the Indian rupee was eventually stabilised at 1s. 6d. For the 263,19,630 Indian rupees repatriated to India the Board paid out 2s. each, or £2,631,963, and realised for them in India £1,715,653, making a loss of £916,310. Further losses of £610,024 and £57,920 were made on the redemption of German rupees and subsidiary coinage in Tanganyika. And, in addition, in preparation for the issue of its own currency, the Board bought, at an average price of 4s. 5d., over 2,900,000 ounces of silver, which depreciated rapidly.

Besides these losses on the issue of the new currency, the Board had to face heavy redemptions from 1925 onwards. Normally colonial trade is seasonal; and demands for sterling at one time can be offset against demands for the local currency during the period when the crops are marketed. Thus it is not necessary for the Currency Boards always to realise their investments to meet demands for sterling, as if it is a seasonal demand they meet it out of their cash resources or by temporary loans. The East African Currency Board, however, had to face persistent redemptions of currency, which from 1925-26 to 1931-32 inclusive amounted to £2,157,000 net. In 1931 the premium was raised from 20s. to 30s. per cent. to discourage further redemptions; but on June 30, 1932, the currency reserve fund was reduced to the low figure of £356,032. Instead of assuming responsibility for the maintenance of the exchange value of the currency, the Imperial Government authorised the three East African Governments to borrow sterling funds amounting to £1,500,000 and place them at the disposal of the Board. The interest and repayment charges on these loans would have added to the burden of territories already suffering from an acute depression. Fortunately, the loans were never raised, as the

low money rates in London checked the return of funds and the rise in commodity prices turned the balance of trade well in East Africa's favour; and net issues of currency from 1932 to 1939 amounted to £2,715,000, exclusive of issues in Zanzibar, where the East African currency system was adopted in 1936. With the sterling thus accumulated the Board's investments had risen to £2,733,540 by June 30, 1939; but the currency in circulation and other liabilities still exceeded the actual assets of the Board by £2,897,216, or by £1,397,216 if the potential asset represented by the power to call on the three Colonial Governments for £1,500,000 is taken into account.

The West African Currency Board, on the other hand, had a surplus of £1,038,613 in the same year and the Palestine Currency Board one of £623,377. Nor has the East African Currency Board contributed anything to the revenues of the Colonial Governments, whereas the West African Currency Board has paid out £4,900,000—last year being the first since 1920 in which its financial position did not justify any payment—and the Palestine Currency Board, which has only been operating since 1927, £810,000. And though the redemption premium charged by the East African Board is back to 1 per cent., this compares with $\frac{1}{2}$ per cent. for West Africa and $\frac{1}{8}$ per cent. for T.T. redemptions from Palestine, drafts on London from Palestine being issued at par.

The currency in circulation per head of the population was roughly 9s. for West Africa and 10s. 6d. for East Africa (including Zanzibar) on June 30, 1939, and £5 for Palestine on March 31st. The accounting date for the African Boards is in the middle of the off season; and the trade depression experienced by their territories in the last two or three years has considerably reduced the circulation, whereas in Palestine this factor has been offset by currency hoarding in view of the international situation. Nevertheless, the low purchasing power of the African native is illustrated by these figures and is one of the justifications of having a currency system which can meet the special requirements of the colonies. In his report last year on labour conditions in the West Indies, Major Orde-Browne pointed out the great disadvantage to the islands that their domestic transactions are generally carried out in the coinage of one of two wealthy countries, Great Britain or the United States. The fact that the halfpenny or the cent is the smallest coin prevents the middleman from passing on small reductions in price. In East Africa, on the other hand, the shilling is divided, not into twelve pennies, but into 100 cents, and in West Africa the nickel-bronze coinage, which includes a tenth of a penny, is growing in popularity. The wider use of coinage, however, is not altogether an unmixed blessing; for the West African native is an unusually keen forger, and the alloy coinage, which was issued to replace the original West African silver coinage, is counterfeited to an extent that constitutes a perfect nuisance for officials, traders and banks alike. To pleas that better ingredients should be used the Board might reply that it would encourage hoarding. But as the African native always tends to hoard coins in a period of good trade, just as he produces them, along with a motley collection of manillas, brass rods and wires, and cowries, when trade is bad and money scarce, the excuse would be hardly adequate.

But imperfections such as this should not be allowed to obscure the undoubted advantages of the Currency Board principle, which are becoming widely recognised. Mauritius now has its rupee notes issued by Commissioners with much the same duties and powers as the Currency Boards, and a Currency Board was recently established in the self-governing colony of Southern Rhodesia. The chief disadvantage is illustrated in the history of the East African Currency Board—that a persistent trade depression may exhaust the Board's reserves if the exchange value of the local currency with sterling is to be maintained at its ordained level. It is to be hoped, therefore, that under the new colonial policy, which will be inaugurated by the Colonial Development and Welfare Bill, the financial responsibility in such an event will be assumed by the Imperial Government and not left to be borne by territories already qualifying for the status of distressed areas.

Finance and Banking

Uneven Money Conditions

The position in the money market remains one of exceptional ease. The superabundance of the previous week due to the Treasury payments for requisitioned dollar securities has, however, largely disappeared. The latest Bank return shows a reduction of £17,322,000 in bankers' deposits, bringing them down to £108,125,000. Most of this has gone into Government deposits which are £13,389,000 higher on the week, while an increase of £2,911,000 in the circulation accounts for the bulk of the balance. Although there has been a fully adequate supply of money, it has been apparent that the abundance of loanable resources has been concentrated with certain of the banks. They have been very ready buyers of bills and have made it possible for the market to take up its larger allotment of bills without the slightest difficulty. The explanation appears to be that some banks with particularly intensive representation in the industrial Midlands and North have benefited more than others from the acceleration of payments on Government contracts noticeable in the recent past. The rhythm in these Government disbursements is becoming an increasingly important factor in the money market situation. Another is the huge scale of Government operations in the foreign exchange and gilt-edged market which are reflected in the distribution of "tap" and "tender" Treasury bills. Over the three weeks to last Saturday the volume of tap bills fell from £708,400,000 to £637,100,000 and then recovered to £707,900,000. The sudden fall in this item was probably connected with the help given by public departments to the War Loan and to the absorption by the Exchange Equalisation Account of recently purchased dollar securities. The subsequent recovery in the total of tap bills probably represents the converse of these operations—moderate sales of gilt-edged in the exceptionally resilient market of the past fortnight, foreign exchange payments to the United States and, in addition, the steady accumulation of money by extra budgetary funds. Among these the Unemployment Insurance Fund must rank high with the unemployment total again under the million mark.

Free Sterling Weakens

The Allied withdrawals from Southern and Central Norway and the resulting slump in British and French prestige in neutral countries have been reflected in the markets for sterling and French francs in the free neutral centres. In New York the sterling rate depreciated to 3.32, which is lower than any level touched since the outbreak of war, and, measured in terms of gold, lower than any depths previously plumbed by sterling. The French franc has moved step by step with its Allied currency. These movements have answered so closely the day-to-day changes in the political and military situations that the presence of speculative operations must be strongly suggested. It is evident that such speculation has, in fact, taken place, though not on a serious scale, since at no time during the past few weeks has the market been sufficiently large to accommodate more than a modest volume of transactions. Much of the apparent speculation taking place in markets such as New York and Amsterdam is, in fact, justifiable hedging either against receipts of sterling due at some future date or against the holding of sterling assets which for one reason or another it is not desired to liquidate at the moment. But over and above such hedging some outright speculation is also proceeding, and in this category of operations the Far Eastern markets are still taking an exceptionally important part. In this respect it would pay the authorities in this country to scrutinise with rather greater care the sterling facilities which the London market makes available to banks operating in such centres as Shanghai. The bulk of these may be of *bona fide* commercial character, but it would be surprising if a part were not used for outright speculation in sterling. The downward movement in the free sterling rate has also been helped by the revival of rumours in New York that the list of commodities exported from the sterling area for which payment is to be made in specified foreign currencies or, which is the same thing, in sterling obtained from the control, is to be enlarged in the near future. The commodities mentioned are textile articles, cocoa and man-ganese. If the list is extended and nothing is done to limit

the potential offerings of sterling in the free market, it stands to reason that a further depreciation in the free rate must be expected.

French Exchange Regulations

The French *Journal Officiel* of May 2nd publishes the text of the new regulations on the export of capital, exchange and gold operations which recently came into force in France. The main effect of the new decrees is to restrict gold and exchange operations arising from the repatriation of French capital to the Bank of France and other banks authorised by it to deal in foreign exchange. This means that French nationals repatriating capital previously invested in foreign currencies will no longer enjoy the attractive facilities of the free market for their operations. The new decrees do not, however, introduce any compulsion on French nationals to repatriate their foreign assets. These have had to be registered with the Bank of France, and it is now forbidden for any French national to switch from one foreign asset into another. The only such operation which is authorised is the investment of cash resources into short-dated securities expressed in the same currency having no more than two years to run. The new decree also defines more clearly than has hitherto been done what is meant by an export of capital and, in particular, specifies such devices as holding in foreign currency the proceeds of export trade or payments for services tendered as forbidden under the regulations. These regulations tighten the French exchange control measures, but still leave them appreciably more lenient than those applied in the United Kingdom.

Chinese Dollar Control Weakens

The break in the rate for the Chinese national dollar from 4½d. to 3½d. which occurred towards the end of last week has been followed by a period of great uncertainty and difficulty in this market. The rate, apparently left to its own devices by the Chinese Stabilisation Fund, has drifted downwards, and the market has narrowed to a point at which business has become exceptionally restricted. The abandonment of the rate by the Stabilisation Fund has had its precedents in the past fourteen months of the Fund's existence. It need not be regarded as an indication that its resources are exhausted. They must be considerably lower than the £10,000,000 with which the Fund began its operations in March, 1939, but reports from Shanghai and Hongkong suggest that the reserves have recently been fortified from Chinese quarters and that adequate funds remain for continuing the control. But apparently the measure of support required to keep the rate at 4½d. had become unexpectedly large in recent weeks and the authorities decided, as they have done under similar circumstances in the past, to withdraw their support and allow the rate to find a new natural resistance level before re-entering the market as supporters of the national currency. The pressure on the local dollar may in part have been due to speculative activities resulting from the renewal of the Japanese offensive in Honan and Hupeh.

Despite this further weakening in the exchange value of the national dollar, all reports from China suggest that as a domestic currency it is successfully resisting the encroachments of the various puppet currencies. Moreover, some kind of "deal" seems to have been made between the National Government and the Japanese authorities in control of the Treaty ports, making it possible for such important crops as tea to be exported and for a substantial part of the exchange proceeds of this trade to find its way into the coffers of the Chungking Government. It is from this foreign exchange income that the Stabilisation Fund is still being replenished. The point must, however, arise fairly soon at which replenishment will have to come from an external source if the Government is to be able to continue its struggle against Japan. From the Japanese point of view the further depreciation of the Chinese dollar has come as an unwelcome development, since the yen, which now follows the movements of the United States dollar in relation to free sterling, has been appreciating strongly in terms of sterling, and even more,

therefore, in terms of the Chinese currency. This movement militates against the puppet currencies, tied as they are to the yen, in their competition against the money of the Chungking Government.

* * *

Mr Morgenthau on Gold

Mr Morgenthau, speaking at the end of last week to the Institute of Government for Democratic Women, had some very reassuring things to say about the gold policy of the United States. (Can one imagine a British counterpart to this function—Sir John Simon unburdening himself of his doubts on the future of sterling to a meeting of the Women's Advisory Committee of the Conservative Party?) The burden of his remarks was that the United States would continue to accept gold in the normal course of its trading operations, and would do nothing artificial, such as reducing the dollar price of gold, to arrest the inflow of the metal. If such a cut were moderate, he said, it would be ineffective; if it were big enough to reduce the inflow of gold, it would introduce the same conditions that would follow a total prohibition of gold imports, i.e. it would decrease United States trade and increase unemployment. The huge reserve of gold that was being built up would be available to help repair the world-wide economic ravages of the European war after peace had been restored. In any case, it constituted a reserve from which future demands on the monetary system of the United States could be met without shock to the domestic economy. The only threat he saw to the value of gold was the emergence of one or two dictatorships ruling most of the world. He did not fear that such an event would happen. Meanwhile the United States will continue to help friendly Powers by supplying the materials of war against their gold. "I prefer gold pieces to foreign paper," said Mr Morgenthau, adding, "We do not want to repeat the experiment of war debts."

Clearing Bank Figures

The clearing bank statements for April provide several surprises. It had generally been expected that the £300 million War Loan operation would dominate these statements, in which it was for the first time reflected to the full,

that deposits would be well down, mainly at the expense of cash and bills, and that the banks' own participation in the issue would be seen in an appreciable increase in investments, while advances would also show some increase following the special accommodation given to clients to help their subscriptions to the issue. In almost every respect these anticipations are falsified. Deposits are down, it is true, but the drop of £9,321,000 is much more than explained by a reduction of £12,762,000 in cheques in transit. The investments are slightly over £6,000,000 up on balance, but one would be erring seriously to regard this movement as being even primarily connected with the banks' participation in the War Loan issue. Advances provide the main surprise of all, by a fall of nearly £23 millions. This is apparently the result of repayments of loans by big industrial customers and must in all probability be connected with the acceleration of payments to Government contractors to which reference has been

made in an earlier Note. The portfolio of bills discounted has increased slightly despite the continued fall in the total of "tender" bills over the month of April. Any close correlation between the bills issued through the tender and the banks' holdings can hardly be expected now that direct dealings in bills between the banks and the authorities have reached such considerable proportions.

MONEY MARKET NOTES

Most of the interest in the foreign exchange market has centred in the unofficially quoted currencies which have been adjusting themselves to the heavy fall of sterling in New York. Lire on Thursday were quoted at 64½-66½, compared with 67½-69 at the beginning of the week, and the Latin American currencies have also appreciated against the pound. In addition there has been a slump in the Chinese dollar which is discussed in a Finance Note. On Thursday the rate improved slightly to 3½d. Sterling opened in New York on that day a little bit firmer at 3.34, compared with a close of 3.33½ on Wednesday. Officially-quoted rates in London continue to be unaltered, except for the belga which, owing to fears of an invasion of Belgium, weakened again on Thursday by 10 points to 23.95-24.10.

No reflection of the military and political situation is apparent in the money market, where conditions remain very easy, although payments for new bills have this week exceeded maturities for the first time for many weeks. At last week's Treasury tender applications for the higher amount on offer, £60 millions, totalled £113.2 millions. The average rate of discount was slightly lower at £1 0s. 4.81d. per cent., but the discount market succeeded in obtaining the better allotment quota of 45 per cent. compared with 36 per cent. in the preceding week. In spite of this the market has not been able to satisfy all of the clearing banks' demand for bills. Bond money has been readily obtainable at ½ per cent.

The Bank Return shows another increase of about £3 millions in the note circulation owing to the approach of the

Whitsun holiday. The only other noticeable movement is a reversal of last week's switch-over from public to bankers' deposits. It is unlikely that all of the money paid out by the Treasury under the recent Vesting Order has been re-invested, and the fall of £17.3 millions in bankers' deposits with a rise of £13.3 millions in public deposits is probably due to the incidence of Treasury Bill payments and maturities.

The silver market was nervous at the end of last week, as it was announced that the Townsend Bill to repeal the Silver Purchase Act was to come before the Senate on Monday. By Thursday there was still no news as to the reception it had been given, but confidence that it would be greatly modified was being restored and the price for both spot and forward recovered by ½d.

INSURANCE NOTES

The remaining securities, included among the non-life assets, stood in the books at or below middle market prices.

*

Alliance.—The Alliance accounts are always conspicuous for the excellence of the fire results. Year after year, extremely good profits are shown and the annual increase in premiums is of long standing. Last year, despite the difficulties impeding fire insurance operations in the foreign field, this excellent record continued. The underwriting profit transferred to profit and loss account was £325,763, representing no less than 14.8 per cent. of earned premiums, and was struck after placing £100,000 to additional reserve. Premium income again increased, though in the circumstances the advance was moderate. The transfer to profit and loss account was slightly larger than in the previous year, when after placing £100,000 to additional reserve, £322,224 (14.7 per cent.) was transferred. The 1939 claims ratio was only 33.6 per cent. and the expenses ratio 47.1 per cent.

The large accident account yielded satisfactory profits which were only fractionally less than in 1938, despite the war. Premiums fell only slightly. There was a marked increase in marine premiums but the amount transferred to profit and loss declined. The figures below include those of the subsidiaries:—

	Premiums		Underwriting Balances to Profit and Loss	
	1938	1939	1938	1939

			927,247	873,638

* One-fifth of members' life profits from previous valuations.
† One-fifth of capital redemption transfer to members' account.

In the life department, new business declined, in keeping with the general experience. New sums assured amounted to £2,794,227 net, compared with £4,205,415 in 1938, and, largely as a result of this decline, premiums were rather lower. The rate of interest earned on the life funds was 3.13 per cent. against 3.50 per cent., but the low interest earnings are partly offset by the very economical working of the department, the expense ratio being only 9.8 per cent. of premiums. Consideration money received on annuity business was rather less and premiums in the capital redemption department fell off slightly. In the conditions prevailing last year, the company would hardly have desired any pronounced increase of annuity and sinking fund contracts, having regard to the limited investment possibilities.

Together with the carry-forward from 1938 (£1,206,967), the year's profit of £873,638 provided a total of £2,080,605. Provision has been made for expenses not charged to other accounts, taxation, staff pensions and widows' fund, while premises were written down by £23,744 and £50,000 was applied to the general reserve. The latter now stands at £1.9 millions. After meeting the dividend of 18s. per share (unchanged), the balance carried forward is reduced slightly to £1,150,943.

Total assets stand at £42.6 millions, of which £26.2 millions applies to the life business. The book value of securities among the life assets exceeded the middle market values by less than 2 per cent.

Guardian.—The premium income of the Guardian has been seriously affected by the war, for the Albingia, a German subsidiary acquired in 1932, previously contributed a fair part of the total business. The 1939 accounts show the effects most noticeably in the accident department, where there was a reduction in earned premiums from £1,312,103 to £848,095, despite a practically stable income outside Germany. Fire premiums declined from £1,096,800 to £948,460—again owing to the loss of the German business. The movement of premiums gives no indication, however, of the underwriting margins, at least in the accident account. Every branch of accident insurance was profitable and the total transfer to profit and loss (including approximately £30,000, representing a special reserve no longer required) was £123,577, against only £48,491 in 1938. Thanks to this substantial increase, the total transfers of underwriting balances to profit and loss plus non-life interest and fees rose slightly, despite the inevitable decline in interest caused by higher taxation and the exclusion of the Albingia business. The figures include those of the other associated companies:—

	Premiums		Underwriting Profit to P. & L.	
	1938	1939	1938	1939

Fees			74	98

* One-fifth shareholders' profits at 1934 valuation = £18,545; at 1939 valuation = £12,102.

The quinquennial valuation in the life department at the end of 1939 was based on the new A1924/29 table with interest at only 2½ per cent., compared with 3 per cent. five years ago. In addition to the actuarial reserves thus created, a special war reserve of £150,000 was set up. The resultant surplus was £702,817, of which £605,112 is distributed, nine-tenths to policyholders and one-tenth to shareholders (spread over the next five years). Bringing in £103,824 carried forward last time, this leaves £121,529 to be carried forward to the next valuation, after applying £80,000 to investment reserve. The rate of bonus on with-profits policies is 1 per cent. per annum compound on most classes of contracts, a reduction compared with the last bonus, which, however, was allotted on a special plan which is not exactly comparable. But the company has maintained its fine record—difficult enough in the conditions of December, 1939—of never having passed a bonus. New sums assured last year were £1,362,953, compared with £1,719,379, and the net rate of interest, excluding reversions, was 3.53 per cent., compared with 3.70 per cent.

After charging, with other items, the dividends for 1939 (11s., less tax, was declared on the £3 ordinary shares, as for 1938) the carry-forward from the profit and loss account was £117,188, compared with £109,175 brought forward.

The assets total £16.7 millions. Securities stood in the balance sheet at less than the market value at the end of 1939 and properties had been written down substantially. Nothing was included among

the assets in respect of the holding in the Albingia. The general reserve stands at £1,875,000.

*

Scottish Life.—The life fund increased by £163,785 to £9,038,762 during 1939. The increase was less than usual, owing to a fall of 26 per cent. in new sums assured, which totalled £1,722,638 net, and to rather higher payments on maturity of endowments (£384,409 against £302,457). The year's net premium income was £654,433, compared with £658,483, and £62,376 against £54,660 was received as consideration money for annuities. Higher taxation accounted for a fall in net interest earnings from 4.11 per cent. to 3.94 per cent. The dividend for 1939 was 5s. 6d. per £5 share, less tax (unchanged), and the usual interim dividend of 2s. 9d. per share, less tax, will be paid in September next on account of 1940. Following the conservative course adopted by a number of the life offices, the directors have reduced the interim bonus from 40s. to 10s. per cent. per annum for claims occurring by death during 1940. Securities and fixed assets have been taken in the balance sheet at or under the actual values at the last valuation in 1935, and at or under cost in the case of investments made subsequently. Market values of securities at the end of 1940 were not stated.

*

Yorkshire.—The profit balance earned by the Yorkshire on its fire business last year was £98,602. Though this was smaller than in 1938 (£120,702) it represented the satisfactory ratio of 10.9 per cent. of premiums. In the important accident department, underwriting profit increased from £80,343 to £94,502 (6.4 per cent. of premium income), a good result in a difficult year. A larger marine income provided a transfer of £10,000 to profit and loss account, against nil in the previous year. Adding to these profit balances one-fifth of the shareholders' portion of the life surplus, allotted at the 1938 valuation (£19,300), together with one-fifth of the profit (£8,950) realised on reversions, total trading profits were £231,354. Interest on non-life funds was £92,507, so that a total of £323,861 was credited to profit and loss account, compared with £326,100 in 1938. The figures include those of the fully-owned subsidiaries:—

	Premiums		Underwriting Profits to P. & L.	
	1938	1939	1938	1939
	£	£		
Fire	879,478	904,733	120,702	98,602

Cap. red.	117,708	96,961	...	...
	3,975,671	4,002,221		
Reversions			18,950	18,950
Int. (ex life annuities and cap. red.)			102,535	92,507

* One-fifth of shareholders' profits at 1933 valuation = £13,570; at 1938 valuation = £19,300.
† One-fifth of profits of reversions.

The sum brought forward was £75,393, giving a credit total of £399,254. The company has changed its dividend from a tax free basis to a less tax basis, the 1939 interim dividend being 3s. 6d. per £1 of paid-up capital tax free, and the final dividend 8s. less tax. The gross dividend is slightly in excess of the gross equivalent of the 1938 dividend (9s. 6d. per £1 of paid-up capital, tax free). After charging the 1939 dividend, sundry expenses, provision for taxation and contribution to superannuation fund, and applying £36,000 towards writing down

(Continued on page 866)

Investment

The Paradox of Gilt-Edged

The behaviour of the gilt-edged market this week has hardly conformed to Ministerial warnings that the country is faced with the most serious situation since the Great War. Its isolation from the political battle at Westminster, and from the public sense of a serious reverse in Norway, has indeed been splendid. The apologists for the gilt-edged market after the Budget could hardly have expected their prognostications to hold good in such a week. Yet Old War Loan achieved a new war record of 101½, and the advance among other undated stocks was even more spectacular, at least until mid-week. And even on Thursday, when the market's spirits were at first chastened, gilt-edged managed to close with gains on the day. It is hardly surprising that both among investors and dealers the feeling is growing that gilt-edged are "better than they ought to be." Dealing has lost touch with normal considerations. The closed economy has revealed its potency as a pressure-pump for gilt-edged. Even the relatively small amount of business passing this week has impacted on a market short of stock. The reinvestment of funds from dollar securities taken over by the Treasury is of necessity first directed towards the gilt-edged market. But some of its force has filtered through to other high-grade investment stocks, and on Thursday there were signs, for the first time since the Budget, that investment ordinary shares were sharing its benefits. The interim conclusion, after a remarkable week, is that gilt-edged and equity values have been forced too far apart. The "closed economy" argument surely applies, at second remove, to equity shares. They alone have borne the brunt of this week's political forces.

Dividend Limitation and Tax Free Dividends

The change in the basis of the Boots Pure Drug tax-free bonus (discussed on a later page) and the decision of the British United Shoe Machinery Company to amend its tax free distribution from 19 per cent. to 17½ per cent. have

Share (and price)	Stand- ard Div. tax free	Year ending	Equi- valent gross for year	Latest div. t.f.	Equi- valent gross at 7½ in £	Gross yield on stand- ard	Gross yield on latest div.
Bass Ratcliff & G. (122/9)	25	Sept. '38	34.5	25	40	5.6	6.5
Brit. Am. Tobacco (51g)	21½	Sept. '37	28.4	19.17	30.7	5.5	6.0
Fairey Aviation (15/3)	15	Sept. '38	20.7	12½	20	13.9	13.1
Guest, Keen & N. (22.4½)	7½	Mar. '38	10	6	9.6	9.0	8.6
"Shell" Transport (68/9)	20	Dec. '38	27.6	20	32	8.0	9.3

drawn attention to the incidence of limitation rules upon tax-free dividends. The outline of the Chancellor's intentions regarding tax-free dividends was given on page 821 of *The Economist* last week. For companies whose dividends

(Continued from page 865)
properties in the balance sheet, £76,633 is carried forward, against £75,393 brought in.

New sums assured in the life department totalled £2,841,074. The fall compared with 1938 was £188,667, which is relatively less than that recorded by the majority of offices. The life funds earned 3.90 per cent. net compared with 4.15 per cent. in 1938. At the end of 1939 there was no depreciation in the total assets, valued at £18.3 millions in the balance sheet. There is a general reserve of £1.5 millions.

Northern.—Premium income in all departments increased in 1939. There was, however, a sharp decline in the fire profit and the accident underwriting balance was slightly smaller. Fire claims rose from 41.3 per cent. to 44.6 per cent. of premiums so that, despite a small but welcome fall in expenses from 51.0 per cent. to 50.6 per cent., the margin of profit was only 4.8 per cent. (£95,035), compared with 7.7 per cent. (£148,989). Accident business contributed profits of

£146,247 (8.0 per cent.) against £149,404 (8.2 per cent.) in 1938. In view of the effects of the war in motor business, this decline is much smaller than might have been expected. The substantial increase in marine premiums doubtless resulted from a larger volume of war risk business and higher rates. As in 1938, however, there was no transfer to profit and loss account.

The comparative experience is given in the following table. The figures include those of the six subsidiaries:—

	Premiums		Underwriting	
	1938	1939	Profit to P. & L.	
	£	£	1938	1939
Fire	1,940,428	1,966,326	148,989	95,035
Accident	1,831,525	1,838,114	149,404	146,247
Marine	829,742	886,892	...	...
	4,601,695	4,691,332		
Life & annuities cap. red.	1,096,488	1,108,653		
	5,698,183	5,799,985		
Interest (ex life, annuities & cap. red.) ...			238,780	221,255
Fees			129	114
			537,302	462,651

are declared free of tax, the standard dividend will be determined by the maximum equivalent gross sum in any one of the three accounting years falling between June 30, 1936, and July 1, 1939. In the accompanying table examples have been calculated to show the effects of this proposal. It sets out the maximum gross equivalent of tax-free dividends paid in any year during the standard period by seven leading companies. This rate is compared with the equivalent gross rate, taking tax at 7s. 6d. in the £, if the tax-free dividend for the latest year had been maintained. It is somewhat remarkable that for the majority of companies shown, the maximum gross return permitted under the dividend limitation rules is, in fact, slightly higher than the gross equivalent of the latest dividend. This is true, for example, of Fairey Aviation, Guest, Keen and Nettlefolds, Staveley Coal and Iron, and Woolcombers. Moreover, British American Tobacco is not greatly affected by the restriction of its maximum gross dividend to the equivalent of 28.4 per cent. For Bass, Ratcliff and Gretton and "Shell" Transport the difference is more substantial, and in such cases shareholders must recalculate their current returns on the basis of the permitted maximum, and not on the gross equivalent of the latest dividends.

Lever and Unilever Dividends

Ordinary shareholders of Lever Brothers and Unilever Limited, like shareholders in Ford Motor and British United Shoe Machinery Company, have already felt the effects of the dividend limitation proposals. The directors of the twin companies, "Limited" and "N.V.," announced at the end of last week that they had intended to maintain the total dividend of the Dutch company for 1939 at 7½ per cent. In that event, the corresponding payment on the ordinary shares of "Limited," under the equalisation agreement between the two companies, would have been 12 per cent. The maximum dividend under the limitation rules, however, is 10 per cent., and the directors of "Limited" have decided to limit the total distribution to that rate. Hence the dividend equalisation agreement will involve a reduction in the intended rate on "N.V." ordinary shares from 7½ to 6½ per cent. It is evident from the terms of the directors' announcement that the Lever and Unilever group has earned satisfactory profits in 1939, although the figures will not be available until next month. A year ago the chairman forecast net profits for the group at approximately £12 millions, making the necessary reservations regarding politics. This sum, divided between the two companies, could have provided comfortably for the maintenance of the "N.V." rate of dividend at 7½ per cent. and the corresponding increase in the "Limited" dividend to 12 per cent. For the duration of the war, however, any prospect of increased distributions for "Limited" is necessarily ruled out. "Limited" ordinary shares now stand at 27s. 9d., compared with a high level this year of 34s. 3d.; while "N.V." shares have been particularly depressed owing to political uncertainties in Holland and now stand at 24s., compared

with their highest level of 32s. "Limited's" yield of £7 9s. 6d. per cent. is not unsatisfactory in relation to their investment standing.

New life business of the Northern and subsidiary companies amounted to £2,645,930, against £3,369,581, a decline about equal to the average. Adding the amount brought forward (£1,194,444) to the departmental profits shown in the foregoing table (£462,651), the total amount to the credit of the profit and loss account was £1,657,095, and the balance available, after meeting interest on debentures, interim dividends and charges, was £1,350,993. The final payment for 1939 of 8s., less tax, on the £10 ordinary shares will bring the total dividend to 15s., less tax. A further 5s. 4.477d. per share, less tax, is to be paid on the £7 10s. participating preference shares in addition to the fixed dividend of 9s., less tax. These distributions are the same as for 1938. After allowing for dividends and for a transfer to staff pensions, the carry-forward is £1,217,839 (compared with £1,194,444).

The assets totalled £26.9 millions at the end of 1939: the market value of the securities exceeded book values after deducting investment and contingency reserves.

with their highest level of 32s. "Limited's" yield of £7 9s. 6d. per cent. is not unsatisfactory in relation to their investment standing.

Stewarts and Lloyds Report

The payment of a 12½ per cent. dividend by Stewarts and Lloyds was announced more than a month ago. The full report which has been issued this week shows that the distribution is again conservative, for earnings for the deferred stock were equivalent to 22.1 per cent. compared with 23.3 per cent. for the previous year. The directors have disclosed the latest profits after charging an unstated amount for taxation. Consequently, the apparent decline in profits from £2,049,991 to £1,991,562, after taxation and A.R.P. expenditure, may mask increased trading profits and an increased taxation provision, which in the previous year absorbed £600,000. The report reflects the acquisition of the preference and ordinary stock of Stanton Ironworks. An interim dividend of 10 per cent. has been received on the ordinary shares of Stanton Ironworks, whose financial year does not end until March 31st. This interim distribution, however, is equal to the total paid in the preceding year and represents the maximum which the company would have been entitled, as a public company, to pay under the dividend limitation rules. The latest figures are summarised in the following table:—

	1937	1938	1939
Profit, after taxation	1,956,882*	2,049,791*	1,991,562
Stock reserve	300,000	75,000	...
Depreciation	623,581	508,388	539,790
Employees' funds and fees	76,487	132,669	20,532†
Debiture service	127,500	127,500	127,500
Preference divs.	100,443	107,300	144,856
Deferred and liaison shares:—			
Earned	728,871	1,098,934	1,158,884
Paid	579,468	589,549	656,619

Contingencies	150,000	500,000‡	500,000
Carried forward	170,159	179,544	181,809

* Tax provisions £550,000 and £600,000, respectively.
† After crediting £90,000 from employees' benefit reserve.
‡ Export trade reserve.

In 1939, it will be recalled, the directors provided £500,000 as an export trade reserve. For the latest year they have made a provision to contingencies account of £500,000, and the balance carried forward is slightly increased. Big changes are shown in the balance sheet, reflecting the Stanton Ironworks acquisition. Shares in subsidiary companies, less amounts written off, have increased from £1,464,243 to £5,451,733, and the parent company has substantially increased its advances to subsidiaries on current account. A large rise in debtors and advances to allied companies from £1,921,956 to £3,082,348 is also recorded, and the cash balance is in consequence sharply reduced. In normal times the export trade in tubes is a key factor affecting the company's profits, and while the war has doubtless increased the demand for home and military purposes, maintenance of a satisfactory export turnover is still probably not a negligible factor in its business. For this purpose, the company is well endowed with financial resources, and so far as war conditions permit, it may be expected to contribute to a much-needed expansion in export trade generally. Meanwhile, the deferred stock units at 44s. 9d. yield £5 11s. 9d. per cent., a lower return than that obtainable on many other steel shares, though it is satisfactory in view of the proved investment qualities of the deferred stock.

Morris Motors Advance

Impressive progress is recorded by Morris Motors for 1939. Gross trading profits, including income from subsidiaries, have advanced from £1,751,181 to £2,385,122, and earnings before tax showed a comparable increase from £1,355,852 to £1,991,947. The taxation charge was naturally higher at £628,721, compared with £470,497; but since the 1939 figures, satisfactory though they are, are not superior to those of 1936, the company does not appear to be liable for E.P.T., and the taxation provision, in fact, covers normal income tax and N.D.C. Certain special provisions for investment depreciation (£85,644), Air Raid Precautions (£119,967),

and provision for post-war production and war contingencies (£100,000 each) have been charged against the latest year's profits, and as a result the improvement in ordinary share earnings from £660,355 to £732,615 is relatively moderate. As the following table shows, the 40 per cent. dividend, compared with 45 per cent. paid in each of the preceding three years, represents a conservative decision, for earnings would have sufficed to pay 44.2 per cent. after charging the special appropriations set out above, or 68.8 per cent. before allowing for these charges:—

	YEARS ENDED DECEMBER 31ST		
	1937	1938	1939
Gross profit	2,168,530	1,751,695	2,385,568

‡ Dividend equalisation. † From div. equalisation.

The directors' report does not review these trading results in detail, though it naturally refers to the serious effect on trading of the last four months in 1939. The company has acquired from Lord Nuffield the undertaking now known as Mechanisations and Aero, Limited, the share capital of which consists of 110,000 £1 shares. This concern is undertaking Government work, but since its accounts have not been com-

THE BALTIMORE AND OHIO RAILROAD CO.

SUMMARY OF ANNUAL REPORT FOR THE YEAR 1939

The Company's annual report of its operations and affairs for the year 1939 is being mailed to stockholders. The following presents a CONDENSED COMPARATIVE STATEMENT OF OPERATING RESULTS

	1939	1938	Increase 1939 over 1938
	\$	\$	%
Total Railway Operating Revenues	161,030,252	134,722,330	26,307,922 19.53
Total Railway Operating Expenses	119,901,075	104,984,021	14,917,054 14.21
Net Railway Operating Revenue	41,129,177	29,738,309	11,390,868 38.30
Railway Tax Accruals	10,767,991	10,412,774	355,217 3.41
Equipment and Joint Facility	4,836,086	4,473,741	362,345 8.10
Rents	28,525,100	14,851,794	10,673,306 71.87
Net Railway Operating Income	4,647,564	4,207,959	439,605 10.45
Income from Investments, etc. (Net)	30,172,664	19,059,753	11,112,911 58.31
Income available for Fixed Charges	20,421,656	32,184,284	
Interest and other charges remaining Fixed under the Plan (referred to below)	9,751,008		
Income Available for Other Purposes	7,111,820		
Other Interest Accrued but not paid—	4,261,395		
Secured Contingent Interest	11,373,215		
Unsecured Contingent Interest			
Total Contingent Interest Accrued	1,622,207	13,124,530	
Net amount by which total interest charges were not earned			

Net Income Available for Interest and Other Charges for 1939 is \$30,172,664, compared with \$19,059,753 for 1938, an increase of \$11,112,911 or 58.31 per cent., and shows income for the year only \$1,622,207 short of covering entire interest charges. From the Net Income Available there was deducted \$20,421,656 for interest and other charges remaining fixed under the Plan, leaving Available Net Income for other purposes of \$9,751,008.

Pursuant to the provisions of the Plan, the President and Board of Directors, in the exercise of the discretion vested in them, determined to apply \$2,000,000 of the Available Net Income to Capital Fund, and the remaining \$7,751,008 to increase Net Working Capital. By reason of these appropriations, no contingent interest is payable on May 1, 1940, out of income of 1939.

The contingent interest accrued in 1939 and not paid is \$11,373,215, and that for 1938 \$883,337, a total of \$12,256,552, which is carried to Deferred Liabilities in the balance sheet.

The Plan herein referred to is that for the Modification of Interest Charges and Maturities, dated August 15, 1938, which, after being accepted by the holders of \$76,489,928, or 87.79 per cent. of the \$87,810,628 of securities affected, was submitted to and, after hearing, was approved by the District Court of the United States for the District of Maryland on November 8, 1939, acting under Chapter XV of the Bankruptcy Act, entitled "Railroad Adjustments."

Under the Plan \$166,270,421 of near-by maturities were extended for a period of from five to ten years, and fixed interest charges of the Company and its subsidiaries, which had been \$31,421,742, were modified so that \$19,644,679 remains fixed and the payment of \$11,376,435, for the period of eight years, becomes contingent on earnings as ascertained and applicable pursuant to the Plan. The deferred charges continue as an obligation of the Company and are payable at or before the maturity of the respective obligations.

During 1939 the total interest-bearing obligations of the Company were reduced by \$6,654,249, largely through the payment of equipment trust certificates.

DANIEL WILLARD, President.

pleted, owing to delays connected with contract terms, the acquisition of the share capital is not shown in the latest balance sheet. The loan account of £775,500, however, has been taken over by Morris Motors, Limited. The company's balance sheet shows a fall in stocks and work in progress from £1,520,091 to £1,324,372, which suggests that the collapse of normal motor production has not yet been made entirely good by special wartime production. Even the consolidated statement shows that for the group as a whole stocks are very little higher than in 1938, though there is a significant increase in debtors from £609,946 to £851,443. Plant and buildings required by Government contracts are represented by a new assets item of £47,583 in the consolidated balance sheet which is to be amortised. The directors' decision to pay 40 per cent. in respect of 1939 will leave a margin of 5 per cent. under the dividend limitation rules, by which the distribution may be increased in subsequent years, if profits suffice. The prospects of such an increase may be clarified by Lord Nuffield at the meeting on May 24th. For the time being, however, the accounts suggest the possibility that the group has yet fully to transfer its immense resources to special wartime production. The 5s. ordinary stock units stand at 26s. 6d. to yield £8 3s. 3d. per cent.

Ford Motor Report

The full report of Ford Motor Company shows that shareholders' expectations have been more severely affected by dividend limitation than the revision of the original dividend suggested. Trading profits last year reached a new record of £2,728,996, compared with £1,416,627 in 1938. A rise of this order has naturally involved a painful increase in taxation provision from £231,979 to £1,113,000, but even so the amount earned for the ordinary shares has jumped from £169,006 to £605,787. The latter sum would have sufficed to pay a dividend of 10.8 per cent. The directors, in keeping with Sir John Simon's request, have revised their original proposal to pay 7½ per cent. to one of 6 per cent. The past year's impressive profits figures are analysed below:

	Years to December 31		
	1937	1938	1939
Gross profits, less directors' fees	1,565,465	1,388,744	2,744,417
Depreciation	815,065	863,723	845,222
Taxation	229,641	231,979	1,110,000
Employees' funds and A.R.P.	145,296	†122,593	†171,643
Exchange differences	Cr. 176	1,453	11,765
Loan interest	574	Nil	Nil
Ordinary shares:—			
Earned	375,065	169,006	605,787
Paid	326,250	326,250	337,500
Earned (%)	5.7	2.6	10.8
Paid (%)	5	5	6
Carry forward	912,994	755,750	*1,044,037

* Includes £20,000 reserve against Spanish company not now required. † A.R.P.: 1938, £2,241; 1939, £50,000.

The surplus earnings are not appropriated, but are simply carried forward. No income (as in recent years) was received from subsidiary companies, which now stand in the balance sheet at £1,632,123, compared with £2,988,676 in the preceding year. The reduction is, of course, due to the transfer of the Luxembourg holding company to Guernsey, which resulted in a substantial increase in the cash holdings of the Ford Motor Company from £1,567,596 to £2,935,774. The past year's profits are largely due to a substantial improvement in business for the first eight months of the year both in home and export trade. Indeed, trading profits for that period were much greater than for the whole of 1938, and, despite a certain reduction in home and export turnover during the last four months of 1939, the year's total business exceeded that of 1938. The directors' report also mentions that "several contracts" have been received from

Government Departments and accounted for approximately 15 per cent. of total turnover. No estimate is provided in the report regarding trade for the current year, to which presumably Lord Perry will devote some attention at the meeting on May 16th. Home trade, however, must obviously be listed among the war victims, and while some compensating increase in export trade should be achieved, the company will presumably have to look to Government orders to a far greater extent than last year if the impressive results for 1939 are to be repeated. The 6 per cent. dividend, however, should be satisfactorily covered, and on this basis the £1 shares at 17s. 9d. x d yield £6 15s. 3d. per cent.

J. and P. Coats' Report

The fiftieth annual report of J. and P. Coats adds little to the information provided by the preliminary profits statement, which was discussed in *The Economist* of April 20th. The report offers no comment on the substantial recovery in profits and investment income, after provision for depreciation and taxation, from £1,452,619 to £2,132,100, which provides an advance in net profits from £1,535,297 to £2,187,797. Nor is any real light to be gained from the balance sheet, which is drawn up, as usual, on rather uninformative lines, since interests in subsidiary companies and other investments account for over £32 millions out of a balance sheet total of £36,850,625. The 10 per cent. dividend, which is the maximum payable under the limitation rules, was comfortably covered by last year's profits, for earnings represented 14.2 per cent., and the transfer of £500,000 to exchange and contingencies reserve was largely provided out of surplus profits of the year. The report, however, gives the stockholder no assistance in striking a balance between improved conditions in the home market and any further disturbance in the company's overseas interests due to the war. The current yield of £5 8s. which the ordinary stock offers at 37s. is not unduly exciting in relation to the static character of profits in earlier years, and to the restriction of dividends to a 10 per cent. maximum.

Boots Pure Drug Distribution

For many years Boots Pure Drug shareholders have accepted a low dividend yield in the expectation, which has been consistently disappointed, of a large scrip bonus. Such expectations must now be postponed for the duration. The latest profits figures for the year to March, 1940, show a satisfactory improvement in net profits of £6,175 to £782,467. The company has hitherto distributed gross quarterly dividends totalling 24 per cent. and a tax-free bonus of 5 per cent. which, for 1938-39, were together equivalent to a total distribution of 30.9 per cent. gross. This basis has been changed to conform with the dividend limitation rules, and the bonus recommended is 4.1379d. per 5s. ordinary share, which represents the maximum payable in accordance with the dividend limitation rules, being equivalent to the preceding year's grossed-up bonus of 6.9 per cent. The 5s. shares have recently been a dull market and have declined since April 23rd from 43s. 1½d. to 38s. 3d. In addition to disappointed bonus expectations, the market is also far from clear how the company may be affected by the new purchase tax. Out of an estimated total of £960 millions for retail sales to be covered by the tax, drugs and fancy goods account for £148 millions, and a substantial rate of tax might have appreciable consequences for Boots' turnover. Since, however, the company is both wholesale manufacturer and retailer, and will therefore be governed by special considerations, which Sir John Simon outlined in last week's debate, the possible effects of the tax upon the group's earning power cannot yet be estimated. The 5s. ordinary shares yield £4 0s. 6d. per cent.

Two Shipbuilding Reports

Reports have been published by two companies interested in naval and mercantile shipbuilding during the past week. Babcock and Wilcox, Ltd., the boiler-making concern, has reduced its total distribution for 1939 from 12½ per cent. to 11 per cent. by a cut in the cash bonus from 2½ per cent. to 1 per cent. After providing £124,936 for war losses, the company shows a profit, before tax, of £756,663, compared with a corresponding figure of £848,694 earned in 1938. This is a point of some importance, since the present dividend rate leaves a margin of 1½ per cent. below the maximum distribution of 12½ per cent. under dividend limitation.

The subsidiaries most seriously affected by war are the German Babcock and Wilcox company, and the Polish company, Zieleniewski Fitzner Gamper Company, in which Babcock and Wilcox, Ltd., held a 49 per cent. interest. These holdings account for some £97,319 of the war losses against which the directors have provided. The company has also considerable interests in the Far East. At the current market price of 42s. 6d., Babcock and Wilcox £1 ordinary shares yield £5 3s. 7d. per cent. For the first time the Harland and Wolff "B" ordinary stock, now quoted at 12s. 6d., offers a yield of £6 8s. per cent. This stock is to receive a 4 per cent. dividend, while the "A" ordinary stock, which ranks for 4 per cent. non-cumulative and an additional 2 per cent. *pari passu*, receives 6 per cent. The company's capital reconstruction in 1937 was well timed, for it has since received important contracts for naval ships. Trading profits at £817,151 show a considerable improvement on the 1938 figure of £638,815, though that figure itself represented a marked increase on the profits of £26,727 earned in 1937. Harland and Wolff have greatly strengthened their financial position during the past three years, and "B" ordinary stockholders may feel some disappointment that dividend limitation has robbed them of the full fruits. But war, with its naval and mercantile shipbuilding materials, should enhance the company's financial improvement.

General and Central Mining Reports

The reduction in the profits of *General Mining and Finance Corporation* from £526,578 to £462,287 in a difficult year for share dealing must be regarded as moderate. Hence the dividend of 25 per cent., as for 1938, is again well covered, for the earnings percentage is still as high as 36.5 per cent., against 41.6 per cent. in 1938. The sum of £125,000 has been transferred to open an investment reserve, against securities with a book value of £2,587,866. This, however, is a precautionary move, for the securities are, in fact, shown in the books after providing for such depreciation as existed at December 31st last year, and, in the aggregate, book values are largely exceeded by market values. The portfolio position thus shows considerable strength, and in addition to the investment reserve there is a general reserve of £1,000,000, while the cash position has been substantially enhanced. The Corporation's record in paying 25 per cent. dividends in each of the last four years, despite difficult conditions in the mining share market, justifies the present quotation of 82s. 6d. for the £1 shares. The *Central Mining and Investment Corporation* report for 1939 shows that the total income of £587,964 is not comparable with the figure of £506,538 for 1938 nor with earlier profits, since the latest profits did not take into account any provision for depreciation on the investment portfolio. For this purpose, a total of £853,085 has been provided, of which £500,000 comes from general reserve, £100,000 from the depreciation reserve (which is now exhausted) and £253,085 from the latest year's profits. It is evident from the report that this large provision arises mainly from the reduced market prices of shares in developing mines and certain holdings have, in fact, been written down to a nominal figure. It would also seem that profits owed little, if any, benefit to share dealings, for which limited market opportunities were offered. The adverse conditions of the past year fully explain the decision to cut the dividend from 10 per cent. to 5 per cent., and shareholders may hope that, in the current year, profits will not be required to provide for investment depreciation on last year's scale. The £8 ordinary shares stand at £12 15s.

Rio Tinto Outlook

There is little evidence in the Rio Tinto Company's accounts for 1939 or in Sir Auckland Geddes's speech at last week's meeting to justify the current price of £12 10s. for the £5 ordinary shares. Regarding the Spanish interests, which are still the company's most important asset, the chairman frankly admitted that earning capacity in the past year had been prejudiced not only by continued dislocation in Spain, but also by the outbreak of war with Germany. Owing to the cessation of ore shipments to Germany, formerly the largest single customer, and to transport difficulties, the quantity of ore shipped in 1939 fell to 819,927 tons, compared with 1,282,972 tons in 1938 and 1,424,998 tons in 1937. The rise in prices in Spain has, however, increased the company's expenses in Spain, though these have been met from blocked peseta balances. These balances on various accounts rose from Ptas. 6,315,416 in 1936 to a high level of

Ptas. 36,275,071 in 1938, and were reduced during 1939 to Ptas. 33,716,481. Since blocked pesetas stand in the company's accounts at a nominal figure of £1, the sterling sum of £64,610 16s. 10d., arising from the release of Ptas. 2,558,590 last year, has been credited to revenue. On the basis of this conversion, which corresponds to a rate of approximately Ptas. 40 to the £, it appears that Rio Tinto still has the equivalent of some £900,000 locked up in blocked pesetas. The proceeds of the liquidated balances have raised the trading profit of the company to £288,805, for sales of produce alone amounted to no more than £224,194, compared with £234,765 in 1938. Income from dividends, to which the company's Rhodesian interests make the most important contribution, was reduced from £340,464 in 1938 to £284,299. It is doubtful if any immediate recovery in this source of income is likely, for Rio Tinto will have, in effect, to bear a double liability for E.P.T. on its Rhodesian income. In view of current trade problems, the liquidation of peseta balances appears to be the main hope for Rio Tinto shareholders, but it is surely generously valued by the market.

Palmietkuil

The annual report of Palmietkuil discloses little new information. Ore reserves amount to 2,070,000 tons, averaging 4.9 dwt., and mainly situated in the southern portion of the property. Development from the northern shaft was suspended at the end of 1938, in order to conserve funds to carry on development in the more promising southern section. It had been hoped to raise new capital for the erection of a reduction plant, but market conditions last year made this impossible, and the Union Government has not come to the company's assistance. Consequently, all work has ceased, the mine has been allowed to flood, and all perishable equipment has been removed. The future of Palmietkuil must remain obscure for the present. Taken as a whole, development results have not been inspiring and difficulty may be experienced in obtaining further capital. Possibly the mine may eventually be absorbed by the adjoining Grootvlei, for the underground workings in the southern sections of the two mines are separated by only about 7,000 feet.

Company Profits of the Week

The usual table on page 886 analyses the reports of 53 companies received this week. These show an increase both in total profits and in net profits from £13,220,000 to £15,619,000, and from £6,974,000 to £7,973,000 respectively. For the 861 companies whose reports have been received this year to date, total profits have increased by approximately £11½ millions to £175 millions, while net profits are slowly gaining the previous year's figure, the total to date of £95.4 millions being only £1.8 millions lower than the corresponding figures for 1939. The week's results are discussed in preceding notes and under the heading "Shorter Comments" on page 871.

Company Meetings of the Week

Reports of company meetings begin on page 874 of this issue. The contribution made by insurance companies to the war economy was discussed by Sir Frederick Pascoe Rutter at the *London and Lancashire Insurance* meeting. Sir Frederick emphasised the importance of facilitating insurance business so that it could contribute most fully to invisible exports. Mr Erskine Jackson, speaking at the *Scottish Union National Insurance* meeting, drew attention to the need for vigilance in the choice of business in the accident section, where black-out conditions were increasing the number of claims. At the meeting of *Legal and General Insurance*, Mr Ernest E. Bird drew attention to the fact that

A REASONABLE PRECAUTION

is for every responsible citizen to protect his dependants by securing Life Assurance now. Obtain advice on a suitable Policy from the

NATIONAL PROVIDENT INSTITUTION

for
MUTUAL LIFE ASSURANCE

ESTABLISHED 1835

NORANDA MINES, LIMITED

DIVIDEND NOTICE

Notice is hereby given that an interim dividend of \$1.00 per share, payable in Canadian funds, has been declared by the Directors of NORANDA MINES, LIMITED, payable June 15th, 1940, to shareholders of record at the close of business May 20th, 1940.

By order of the Board.
Toronto, April 19th, 1940.

J. R. BRADFIELD,
Secretary.

of the total of £14,409,077 net new sums assured during 1939, £13,671,288, were life insurance contracts. The *Guardian Assurance*, as Col. Lionel H. Hanbury pointed out at the meeting, had suffered by the loss of its holdings in the Albingia Insurance Company of Hamburg, which have been completely written off, and by the discontinuance of other German business. Lt.-Col. J. Beaumont Neilson congratulated the shareholders of the *Midland Employers' Mutual Assurance* on the moderate increase in claims during a year of rising employment, but he warned his audience that proposed legislation might add as much as 20 per cent. to the cost of workmen's compensation claims. Sir Auckland Geddes's review at the *Rio Tinto* meeting is discussed on page 869. Sir Malcolm A. Robertson assured shareholders of *Spillers* that the appropriate relations between the company and Government Departments under war conditions were being effected with all possible zeal. Mr. Henry Gardner disclosed that the *Amalgamated Metal Corporation's* metal stocks were handed to the Ministry of

Supply practically at pre-war prices. Hence, the company now held a far higher proportion of cash and short-dated Government securities than before the war. The chairman of *London Asiatic Rubber*, Mr. H. J. Welch, reported that the price obtained for rubber last year was the highest since 1928, but rising costs left the company with a profit of less than 1d. per lb. Mr. John Ismay at the meeting of *F. Francis and Sons* reported that the company had secured a large increase in turnover in the first four months of 1940 compared with the previous year. Mr. W. J. Terry, at the meeting of the *London Electric Wire Company and Smiths*, emphasised the value of securing stocks of non-ferrous raw materials to assist war production and exports. The replanting of a considerable area of old rubber was announced by Mr. H. Eric Miller to shareholders of *Pataling Rubber Estates*. Addressing *North British and Mercantile Insurance* shareholders, the Hon. Robert H. Brand reported that a decline in life department business in the first four months of the war had been more than compensated by excellent results early in the year.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

The gilt-edged market this week has shown an almost magnificent disregard of the political crisis. This has been due rather to the operation of modest re-investment buying in a closed market short of stock, from which direct political factors have been insulated. The rise in prices has been spectacular in relation to the volume of business and even on Thursday, when the market opened under the shadow of the previous day's pungent debate, with losses of up to half a point, the market nevertheless managed to close higher on the day.

The opening gains in *gilt-edged* were led by Local Loans, with other long-dated issues, like Old Consols and War Loan, closely in company. Anticipations of the debate on Norway did not affect this progress and Local Loans and Old Consols on Tuesday rose $\frac{3}{4}$ of a point while a smaller gain in Old War Loan raised the price to 101 $\frac{1}{4}$, a new wartime record, which was temporarily supplanted on Wednesday when War Loan rose at one time to 101 $\frac{1}{4}$. Other investment stocks were strong in sympathy with these movements and the scarcity of home corporation and Dominion Government issues was reflected in useful rises in prices.

In the *foreign bond market*, Japanese issues have fallen throughout the week. They opened with falls of up to two points and stocks fell further on Wednesday and Thursday on nervous selling owing to fears regarding the Dutch East Indies situation.

Home rail marginal stocks have been consistently weak. Great Western being no better than 44 $\frac{1}{2}$ in midweek, while other equity issues were similarly depressed. The guaranteed and debenture stocks were, however, supported by the movement in *gilt-edged*. Some minor losses were recorded among Argentine debentures but Canadian Pacific preference rose rather smartly.

The influence of dividend limitation has been generally discounted in the equity market, but *industrial shares*, unlike *gilt-edged*, were exposed throughout the week to political factors and falls have been steady and general. Brewery and tobacco shares continued to fall. Losses were recorded by Guinness, Mitchells and Butlers and Ind Coope and Allsopp. Imperial Tobacco, Godfrey Phillips, Carreras and other leading issues. Heavy industrials were dull and the gains recorded early in the week by Harland and Wolff and Tube Investments were not maintained. Renewed declines were recorded in the stores group. Among textiles J. and P. Coats held up against the trend.

Oil shares have remained weak and Mexican Eagles lost ground on the news

of Mexico's refusal to accept arbitration. Little support was forthcoming for *rubber shares*. Interest in *Kaffirs* revived on Wednesday, when a number of dividend-paying shares rallied slightly. Tin shares improved on Thursday.

ACTUARIES' INVESTMENT INDEX

The fixed interest and ordinary share indices and yields comprised in Actuaries' Index fully reflected the influence of the Budget on *gilt-edged* and equity securities last month. The *gilt-edged* and debenture indices show a general upward movement compared with the end-March figures. In the ordinary share market, almost every section lost ground. The combined index of 158 industrials fell from 59.3 to 58.0. The biggest setback was recorded in coal shares, where the upward trend of the past few months was sharply reversed with a fall from 100.2 to 94.5. Home Rails lost three points to 56.9 and the Stores and Catering Section touched 42.5, the lowest level since the beginning of the year, on a combination of factors such as restricted supplies, limited dividends, and the new Purchase Tax.

New York

TRADING on Wall Street, which opened dull and irregular at the beginning of the week under the influence of political events in Europe, received a further setback from the news of the Supreme Court's decision to uphold the Government in the anti-trust case. Later the market reacted favourably to reports of reduced crude oil output and fractional gains were general. The *Iron Age* estimate of steel mill activity shows an increase from 63 per cent. of capacity a week ago to 66.5 per cent.

Foreign Bond Movements

THE German invasion of Denmark and Norway caused depression throughout the foreign bond market. The "Municipal and General" index of foreign bonds showed a fall compared with March in every section except South American provincial bonds. The European index slumped by nearly six points from 46.5 to 40.9, a new low level since the outbreak of war which compares with 46.3 for September, 1939. The complete index of 106 bonds fell from 60.6 in March to 57.9. That this figure is still higher than the levels of the first three months of the war is due to the substantial recovery in South American issues.

RESULT OF TENDER

West Hampshire Water Company.—The 4 per cent. debenture stock realised £12,626 9s. 7d., average price £105 4s. 4.9d. £55,140 applied for; lowest tender accepted £105 1s.; tenders ranged from minimum price to 107; issue of 4 $\frac{1}{2}$ per cent. preference shares, resulted in average price £11 8s. 7.07d.; total applied for 13,079; allotted 3,000; tenders ranged from minimum to £11 11s. per share; lowest tender accepted £11 8s.

Shorter Comments

Company Results of the Week.—An impressive rise in the total profits of PRESSED STEEL COMPANY is reported from £387,780 to £653,427, but net profits are actually slightly lower and the dividend is unchanged at 27 $\frac{1}{2}$ per cent. A further batch of rubber company reports shows consistent improvement in estate profits, distributable earnings and dividends. In the tea group, NUWARA ELIYA, which is one of the highest grade growers, shows an increase in total profits from £52,731 to £57,673. Net profits after depreciation are slightly lower, but the dividend has been maintained at 11 per cent. Among industrial companies BRITISH MATCH CORPORATION reports rather lower net profits at £341,269, though trading profits and the 7 $\frac{1}{2}$ per cent. dividend have been maintained.

Industry and Trade

Unemployment Below a Million

Between March 11th and April 15th the number of registered unemployed in Great Britain fell from 1,121,000 to 973,000; this is the lowest level reached since 1920. As in March, the decline exceeded the normal seasonal movement, and *The Economist's* index of unemployment, given in the table on page 880, fell from 54.7 (1935 = 100) to 48.1. The reduction in unemployment was fairly widespread; it affected all the administrative divisions and the majority of industries. But, as the following table shows, it was most marked in the industries not directly engaged in the manufacture of munitions, though engineering and metal goods manufacture also registered further declines:—

FALL IN UNEMPLOYMENT BETWEEN MARCH 11TH AND APRIL 15TH
(Industries chiefly affected)

	Number
Building	31,965
Distributive trades	19,422
Agriculture, horticulture, etc.	16,717
Hotel, boarding-house, etc., service ..	9,323
Public works contracting	7,895
Coal mining	6,294
Local government service	5,006
Entertainments, sport, etc.	3,864
Metal goods manufacture	3,520
Furniture making	3,455
Dock, harbour, etc., service	2,823
Engineering, etc.	2,786
Printing and bookbinding	2,569
Road transport	2,492
Brick and tile making	2,362
Dressmaking and millinery	2,361
Tailoring	2,176

Despite the sharp decline since February, however, the number of registered unemployed on April 15th was only 259,000 smaller than on August 14, 1939. Since then, on Mr Ernest Brown's own showing, 1,700,000 men have been registered for calling-up or for reservation, while more than 300,000 have joined the Colours as volunteers. In sum, in spite of the reduction in the number of registered unemployed, the number of persons actually at work on the home front is still appreciably smaller than before the war.

Dearer Coal

Since the outbreak of the war the central selling bodies of the coal-mining industry have been periodically authorised by the Mines Department to revise their price schedules to meet the rising cost of production. The most important revision took place last November, when, mainly to meet the cost of a war wage advance of 8d. per shift to adults and 4d. per shift to boys, prices were increased by 1s. per ton in England and North Wales and by 1s. 4d. per ton in South Wales. At the same time, prices for long period inland supply contracts containing no war clause were raised by 1s. per ton. Two instalments since January 1st this year brought the war wage increases up to 1s. 5d. per shift for adults and 8½d. for boys. Moreover, stores and materials have become dearer, particularly pitwood. In the South Wales coalfield the cost of timber is regulated by a local regional organisation and supplies are derived almost exclusively from France and Portugal. Owing to the closing of the Baltic, the English and Scottish coalfields have been compelled to rely to an increasing extent on Canada and Newfoundland, and the heavy freight cost is met from a pool to which the English and Scottish colliery owners contribute a levy of about 5d. per

ton of coal produced. Further, since May 1st the delivered and f.o.b. prices of coal have had to bear the burden of the 10 per cent. increase in railway charges. To meet these additional costs the Mines Department authorised increases of 8d. per ton for inland supply and 1s. per ton for export from May 2nd, and for the first time the principle of differentiation between different grades of coal was applied. Thus, the price of South Wales anthracite has been increased by 1s. per ton for inland delivery and by 2s. per ton for shipment. The ascertained under the district wage agreements have not been published since the war, but there is reason to believe that during the March quarter the pithead proceeds per ton were about 2s. higher than at the outbreak of the war; while the Board of Trade index of coal prices for March was 14.3 per cent. higher than in August, 1939. It is noteworthy that the increase in prices took place at a time when they are normally reduced in order to encourage the accumulation of stocks during the summer, which is now vital as a precaution against a recurrence of a shortage of supplies in winter. In any case, the maintenance of coal production during the summer at the winter level is vital if the total output is to be increased without an addition to the industry's labour force. Rumour has it that Lord Portal, the chairman of the Coal Production Council, has come to the conclusion that a substantial increase in the industry's labour force will be required in order to expand output. In view of the need to economise man-power, nothing but a complete lack of imagination could suggest this way out, except as a last resort.

Steel Supplies and Scrap Prices

The latest reports from producing centres suggest that the supplies of raw materials for steel-making and of imported semi-finished steel have shown some improvement. As a result of the extension of the war to Scandinavia, the exports formerly made to these countries can now be diverted to the home market, at least temporarily. In 1938, our combined exports of iron and steel to Finland, Sweden, Norway and Denmark amounted to 137,000 tons, valued at £2,261,000. This reduction, however, can scarcely be entered on the credit side, for it reduces our supplies of foreign exchange. On the other hand, Belgium and Luxemburg, who, in 1937, exported 458,000 tons of iron and steel to Finland, Norway, Sweden and Denmark, should be in a position to send larger quantities to this country as a result of the partial loss of their Scandinavian markets. Meanwhile, costs of production in this country were increased further by the 10 per cent. advance in railway freight rates on May 1st and by the rise in coal prices on May 2nd. The price of steel scrap has already been raised (on May 6th) by 6d.-1s. 6d. per ton in consequence of the increase in railway charges. And, needless to say, the pressure for a general upward revision of steel prices has recently been growing.

Difficulties in the Cotton Trade

The month's embargo on sales of cotton piece-goods to the home market expires on May 17th, and much speculation exists in Lancashire on the question of its extension. The Cotton Controller has called for a return of all outstanding orders placed with spinners, of stocks of cotton and waste yarn, and of orders held by weavers and merchants for rayon and cotton piece-goods. These details were to be supplied by May 10th, but it is doubtful if the returns can be completed in so short a time. If the embargo is to be extended, there may be a considerable amount of machinery standing idle, as the total of Government orders and the diminished export trade are not sufficient to occupy all capacity. It is understood that the Controller is considering schemes for the standardisation of certain types of cotton cloth in the hope of stimulating exports. A reduction of prices is urgently needed if sales of textile goods abroad are to be increased, but the tendency in costs and prices is still upward. Operatives in the textile finishing trades have just obtained a further increase in wages, amounting to 2s. 6d. per week for men and 1s. 6d. per week for women; this increase covers some 80,000 workpeople engaged in the dyeing, bleaching and printing of cotton and woollen goods.

Slump in World Petrol Prices

After many months of poor trade, petrol prices on the Gulf export market last week suffered a sharp decline. The price of 68 octane petrol of a representative specific gravity, for example, fell from 5.50-6.25 to 4.625 cents per gallon, the lowest level for twelve months; and for some specifications the fall was even greater. Thus the whole of the rise that took place immediately after the outbreak of war has been lost, and prices are now lower than they were a year ago. The causes of the slump, which, incidentally, was forecast on page 394 of *The Economist* of March 2nd, are not far to seek. So far from increasing, as most refiners had been led to expect, export demand for American petrol has fallen below the previous year's level since the outbreak of the war. Thus, in September-February, the latest period for which statistics are available, shipments, at 75,725,000 barrels, were 7 per cent. smaller than in the same months of 1938/39. Output, on the other hand, has been maintained at a high level throughout the winter—partly in consequence of an unprecedented demand for heating oils, which has forced many refiners to increase their crude oil intake. As an inevitable consequence, stocks of petrol in the United States have been steadily mounting and, at the record level of 102 million barrels, are now some 16 million barrels higher than at this time last year. Though domestic demand has been good, the weakness of the export market is thus readily explained. Nor is there much prospect of an early improvement; for both crude oil production and refinery operations remain excessive. For the Allies, the prospect of the continuance of low petrol prices is, of course, satisfactory. Though there is reason to believe that the British and French Governments have reduced their purchases of American petrol to a minimum, in order to conserve their dollar resources, contracts for the supply of petroleum products are almost invariably based on the Gulf export price, so that any reduction there brings an immediate advantage to the importer from other countries. Last week's price reduction may also benefit the British motorist, for a fall of one cent per gallon at the Gulf is almost exactly equivalent to a decline of ½d. in the British import price. Assuming, therefore, that the current price on the British market is sufficient to provide the Petroleum Board with a profit margin, the decline in the world market price should justify a reduction of ½d. per gallon in the price of "pool" petrol in this country.

Molybdenum in War

Although molybdenum has been known as a metal since 1782, its use was confined until the Great War to parts of electric lamps and electric furnaces. During the war Germany used the limited Norwegian supplies as a substitute for tung-

sten in steel alloys, and this practice was widely followed after the discovery of the huge deposits in Colorado. In 1937, the United States produced about 438,000 cwts. of molybdenum (in terms of metal); Norway's production amounted to some 11,000 cwts., and small amounts were also produced in Mexico, French Morocco and Peru. The American output fell noticeably in 1939, as operations were restricted from April to September, in order to check the steady increase of stocks, but since the war both output and sales have again been increased. Exports of molybdenum (in terms of ore and concentrates) in 1939—the first year in which this item was separately distinguished in the American trade returns—amounted to 389,000 cwts., valued at more than 14 million dollars, but no details are given as to the destination of these exports. In 1937, Britain and Russia were the main importers of molybdenum ore, while Belgium had a considerable export from imported ore. Molybdenum has been included among those commodities whose export from the United States to aggressive countries is subject to a moral embargo, but consumption both by the United States and by the Allies is likely to be sufficiently large to make good any loss in other markets.

Norway's Water Power

The total useful water power resources of Norway are reckoned at 12 million kilowatts, or almost half of the hydro-electric power of the United States. At the beginning of 1938, Norway had 2,715 power plants with a rating of nearly 2 million kw.; 36 of these plants accounted for two-thirds of the power capacity. More than 80 per cent. of the total developed water power is situated in the districts south of Ramsdalen and Dombaas, which are now in German occupation, and further extensions were being made. It was proposed to erect five new sets of 25,000 kilowatts each which were to supply more power for Norwegian industries and also to provide power by two lines from Southern Norway via Denmark to Northern Germany. This additional power could be of great assistance to the overburdened German electrical system, but such an undertaking would require many months for construction. Norway's electric power has been developed partly by the State and by private companies, but local authorities account for about one-third of the power already available. The biggest individual producer (and consumer) of electricity was the chemical combine, Norsk Hydro, operating six plants aggregating 348,000 kw. State-owned plants provided about 250,000 kw., but one of these plants was also partly owned by the Oslo municipality. The disruption of the transmission system in the battlefields of southern and central Norway must seriously affect the efficiency of local industries.

COMMODITY AND INDUSTRY NEWS

THE tension in the Mediterranean brought a rise in the prices of various commodities, notably rubber, tin and linseed. Cotton prices are lower both in Britain and the United States, as shipments between these two countries have fallen off.

Cotton (Manchester).—Raw cotton is slightly cheaper, after considerable fluctuations in its price. Trade is generally uncertain and supplies of yarn are still hard to find. The sale of piece-goods has been very difficult. The embargo on home sales for a month has brought some fall in the prices of certain cloths. The export trade is still most unsatisfactory; prices remain excessive and the system of priority certificates is working very irregularly.

Metals.—The United States price for lead declined by 10 points to 4.85 cents per lb. this week; buying is now well below the country's production, which is slightly below 50,000 tons per month. Other prices were not altered in spite of easier conditions.

Tin.—In London, the price of standard cash tin improved by £2 to close at £255 per ton, while the backwardation continued to contract. At times there was very heavy demand on both sides of the Atlantic, a direct result of the improved American consumption and of the tension in the Mediterranean. British warehouse stocks rose from 1,376 tons to 1,977 tons this week, so that stocks have nearly doubled within a fortnight, a direct proof of high smelter activity.

COMPANY MEETINGS

LONDON AND LANCASHIRE INSURANCE COMPANY, LIMITED

GRATIFYING RESULTS OF A DIFFICULT YEAR

WAR RISK PROBLEM

SIR FREDERICK PASCOE RUTTER'S REVIEW

The seventy-eighth ordinary general meeting of shareholders of the London and Lancashire Insurance Company, Limited, was held, on the 8th instant, at the company's chief administration offices, London.

Sir Frederick Pascoe Rutter, Governor and chairman, presided.

Mr G. Albert Rutter, secretary, read the notice convening the meeting and the auditors' report.

Sir Frederick, in his speech, said: How does the war, in which we are again fighting to the death, not only for the continued existence of our Empire, but for the root and basic principle of democracy, affect this company? It has naturally had its influence upon us, with constant anxieties and puzzling questions, constituting a severe task upon our officers, who have had to consider, often in conjunction with the Government, what steps we should wisely take; whether, for instance, any scheme could be devised which would provide protection for buildings and property against war risks. It was quite impossible for companies to contemplate with equanimity such a liability which might in any 24 hours have become so tremendous that scarcely any company could have survived. The Government looked at the matter very much in the same light, and whilst the enormous possible liability could not be ignored it has so far been held in suspense.

The other aspect of the war risk problem on land relates to commodities. In the Government scheme for their insurance against war risks the insurance companies willingly undertook to act as Government agents without remuneration on other than out of pocket expenses, and the premium rate of 5s. per cent. per month is entirely the concern of the Government, as to which we are not consulted. The correct rate for war risks is quite speculative and dependent upon varying circumstances.

INSURANCE AND THE NATION

There arises the larger question of the place of insurance in our national economy. The need for an increase in our export trade has been more and more realised; it is a paramount necessity. A war of such magnitude must cause a vast increase in our imports which can only be paid for by exports or by drawing on our overseas capital. The importance of our invisible exports in the national balance sheet is thus emphasised and enhanced. The question is not only the profits we earn on our world-wide business but also the volume of our foreign investments and the interest earned on them, and the encouragement and help given to British trade overseas by the security of British insurance. The Government may rely on the initiative and enterprise of insurance companies to maintain and increase this national asset, and I welcome the ready and sympathetic help we have experienced from them, indicated particularly by the specific statement of the Chancellor of the Exchequer that the fullest arrangements have been made to enable British insurance companies to carry on their overseas business without impediment and to meet claims by Allied neutral or British claimants, whether expressed in sterling or in foreign currency. I have no doubt we may count on the Government's continued cordial co-operation.

UNITED STATES

A word about the United States, which is every year a predominant consideration. So far as fire and accident business were concerned, the outcome was not satisfactory, for contrary to our general experience in America it was a year when several factors intervened to diminish its prosperity. But our marine business very nobly maintained its usual high standard. As I have so often reminded you, the strength of British insurance has been fortified and helped by our association with the United States. It stands to-day as a valuable buttress to our international stability.

FIRE AND MARINE DEPARTMENTS

The fire department has again demonstrated the high quality of our underwriting. At home and throughout the general foreign field, excluding U.S.A., our result was quite up to the standard. The accident department showed a welcome improvement all over the world, again excluding U.S.A. Neither from motor cars nor workmen's compensation do we expect high ratios of profit, and with the liabilities placed on motorists to-day it is only by careful selection we come out on the right side in this department. Workmen's compensation insurance, always conducted on a narrow margin, showed an improvement.

In the marine department the premiums show an increase of £233,615—entirely accounted for by war risk premiums. Naturally on the outbreak of war the demand for this protection was intensified. That demand has been met by the various Government war risks schemes and by the marine market, so far with reasonably satisfactory results. On the other hand ordinary marine business has been rendered more difficult during the year because of war conditions, to meet which some increase in rates for both hulls and cargoes has been obtained. Under present circumstances we cannot look for more than very moderate profits on our normal marine account.

GRATIFYING RESULTS

Summarising our actual underwriting results I am glad to say the total has turned out in such a year better than I had anticipated. There is an increase in our fire income premiums mainly from our Empire of £88,681. On the other hand, there has been a reduction in our accident accounts of £90,468, approximately half due to motor cars, and the other half to our U.S.A. business.

The profit accruing from these three departments is respectively £267,695 for the fire; £104,711 for the accident; and £140,628 for the marine. Taking all the figures in the aggregate we showed an increase of premium income of £231,828; a profit of £513,034 as compared with £434,257 in the previous year; and after deducting income tax and N.D.C. a net underwriting surplus of £341,924 as compared with £286,574.

I may be wrong, but I think we are entitled to regard this result in the abnormal circumstances through which we have been passing as quite a satisfactory contribution to that record which this company has built up. (Applause.)

The interest for the year, less income tax, is £439,095 against £481,363 last year. This reduction is, of course, explicable by the heavily increased income tax, which we do not grudge, recognising the necessity for all of us to contribute our share to financing the war. The dividend on the other hand, whilst remaining at the same figure at which it has stood for a number of years past, costs the company less because, conversely, of the greater income tax.

LARGE INCREASE IN BALANCE CARRIED FORWARD

The net result, therefore, is that whilst the balance brought forward from 1938 was £2,880,128, the balance now carried forward is £3,127,938—eloquent evidence that 1939, with all its trials, has yet substantially enhanced the financial strength of the company. At this moment the value of our investments as compared with the figures which passed through our books is much larger than it was last year, taking into account the present value of our American investments consequent upon the rise in the value of the dollar.

I wish to bear testimony to the willing and loyal manner in which the staff have responded to the special calls made upon them to assist the company and their country, and to the excellent supervision and guidance evidenced by their officers, who have tactfully met the difficult circumstances and worked with the great body of our employees as one man. (Applause.)

The report was adopted.

SCOTTISH UNION AND NATIONAL INSURANCE COMPANY

OPERATIONS IN WARTIME

DEPARTMENTAL RESULTS

MR ERSKINE JACKSON'S REVIEW

Mr G. Erskine Jackson, O.B.E., M.C., chairman, presided at the one hundred and fifteenth annual general meeting of the shareholders of the Scottish Union and National Insurance Company, held at Edinburgh, on the 8th instant.

In moving the adoption of the report and accounts for the year 1939, he stated:—

LIFE DEPARTMENT

The gross life business in sums assured was £1,459,391, against £2,921,386, the net figures being £1,365,089 and £2,539,368 respectively. The number of new policies was 2,489 against 3,622. The decrease in sums assured is due partly to a change in the procedure in this company and partly to circumstances affecting life offices. In common with a number of other offices, our life premium rates were increased in consequence of the imposition of higher income tax involving a lower net interest yield on new investments. The higher rates of income tax in the April Budget and lower interest yields have involved still further revision of our non-profit premium rates.

Life premiums at £833,982 are down by £7,164. Premium income, however, was very well maintained up to the outbreak of war, but after that date began to decline owing to the increasing number of surrenders and the falling away of new business.

The premiums under new policies amounted to £50,396, showing a reduction of 27 per cent. as against reduction of 31 per cent. in the new net sums assured. The average premium of the 939 new business was £3 13s. 10d. per cent. compared with £3 9s. 3d. per cent. in 1938. These figures show the result of the higher percentage of the more solid business which is now being transacted.

FURTHER REDUCTION IN CLAIMS

Following a reduction of £38,263 in 1938, the year 1939 showed a further reduction of £18,207 in the claims by death, which amounted to £394,410. It may be mentioned that there were no claims which had occurred as a consequence of the war. Matured endowments reached a total of £504,324, being an increase of £131,973. Full provision had, of course, been made for the whole amount. The fact that the increase in the life fund is only £53,000 is partly due to the maturing of this large volume of endowment assurance effected in the peak life assurance years 1919 and 1920, following the close of the last war. Considerations for annuities at £45,388 were down by £12,820. The net annuity payments were down by £4,449.

The net life interest is £409,829, which is £32,665 less than the 1938 figure and represents a yield of £3 9s. 2d. per cent. net and £4 10s. 7d. per cent. gross. The item of commission amounting to £39,146 is lower by £7,783. Expenses at £90,121, or 15.5 per cent. of the life premiums, are lower than in 1938 by £22,028.

FIRE DEPARTMENT

I have now to report upon the fire account, from which you will notice that the premiums for the year are less by some £15,612. This drop in fire income has in a large measure been due to the falling-off of revenue from America, the causes being very similar to those which ruled some twelve months ago. The fire loss experience in this part of the world has been consistently good for a number of years and we believe that this has been the experience of most offices. This feature, however, becomes one of the causes for premium concessions resulting in a drop for which new premiums have not been able fully to compensate. The loss experience at home and overseas was generally satisfactory, there being a slight improvement in the loss ratio at 44.02.

In our 1938 account, American losses were swelled by claims arising out of the serious tornado which did such extensive damage on the New England coasts, but, fortunately, no comparable occurrence took place in 1939. Although our American losses consequently showed a reduction when compared with those of 1938, the diminution in premiums has had the effect of making our loss

ratio for North American business somewhat higher than in the years immediately preceding 1938.

ACCIDENT DEPARTMENT

In the accident department, the results as a whole can be considered more satisfactory than those of a year ago. The small loss in the employers' liability account is negligible, and it is a pity that the picture could not have been completed, as it will be noticed that the other accounts are now showing profits. Particular reference is made to the miscellaneous account in which is embodied the medical indemnity section. It was suggested last year that we might consider setting aside one sum for the future of this business. Having the experience of another year before us, with a further substantial reduction in liability, it is considered that in combining the miscellaneous account special reserve with the sum regularly set aside for outstanding claims, we have made ample provision in all the present circumstances.

In regard to the motor section, we have made a profit on our home business, but we have suffered somewhat of a setback from our overseas trading. This position has our attention and will be righted during the course of the current year. Apart from this, there is a tendency towards steadily increasing motor claims due to war conditions. Although increasing vigilance in the selection of our business is being exercised, it is extremely difficult to combat losses due to war conditions, particularly with regard to the "black-out." During the earlier part of the year much was done towards the reorganisation of our accident department, but these efforts have been retarded to some extent by the state of affairs which has prevailed since September 3rd. We are doing everything possible under the circumstances as they exist to improve this account.

MARINE DEPARTMENT

The trading of our marine department has been conducted most efficiently under very trying conditions. New problems of marine underwriting are of almost daily occurrence and demand the utmost skill in solution. The year 1938 gives promise of satisfactory results, and we hope that 1939 will yield a reasonable profit. Premium income shows an increase of £89,500, and claims are about £1,000 more. Expenses of management, including foreign taxation, are nearly £800 higher. The underwriting fund increased to £519,521. No transfer to profit and loss is made this year, as it is considered advisable to increase the marine fund. Such profits as have been made are included in the above figure.

PROFIT AND LOSS ACCOUNT

Referring now to the profit and loss account, there is a small increase in interest dividends and rents at £71,400, while the departmental profits, less the loss of £141 on the employers' liability account, total £139,539. Allowing £300,000 for the transfer to shareholders' capital, £68,198 for imperial and foreign taxes, and £40,808 for expenses not charged to other accounts, there is a balance of £284,372. Since the outbreak of war the Government has taken steps in the national cause to maintain interest rates at a low level. In this and in other directions this company will have to bear its share of sacrifice in the struggle to produce order in international relationships. The present circumstances warrant a policy of caution, and it is therefore proposed to pay dividend at the reduced rate of 5s. 6d. per "A" share and 20s. 7½d. per "B" share.

BALANCE SHEET

Examination of the balance sheet figures shows that the total assets of the company at £17,522,948 have increased during the year by £191,620. The market value of the stock exchange securities as at December 31, 1939, is in the aggregate in excess of the balance sheet figures.

The report and accounts were adopted.

THE MIDLAND EMPLOYERS' MUTUAL ASSURANCE LIMITED

CONTINUED PROGRESS

ASSETS EXCEED £2,000,000

Presiding on the 3rd instant, at the forty-first annual general meeting in Birmingham, the chairman, Lieut.-Colonel J. Beaumont Neilson, C.M.G., D.S.O., C.A., said: The accounts of the year 1939 are not directly comparable with the previous accounts in that the latter covered a period of fifteen months. The following points, however, are worthy of comment.

The premium income, less reinsurances, for the year 1939 amounted to £1,281,760, and showed a satisfactory increase over the corresponding twelve months of 1938. The expenses of management at £139,070, and commission at £64,932, remain substantially the same in relation to premium income at approximately 11 per cent. and 5 per cent. respectively.

Expenditure in connection with claims amounted to £1,001,137 during the year. The cost of lump sum settlements has continued to increase, more particularly in common law cases. In estimating the liability in respect of outstanding cases as at December 31, 1939, this factor has been borne in mind. Since these estimates were prepared, however, the question of compensation to workmen has been materially affected by proposed legislation. One of the proposals is that the supplementation of compensation shall not be limited to cases of accident occurring after the proposed legislation comes into force.

The revenue account of the year 1939, after crediting net income from investments, shows a surplus of £35,553. This compares with the surplus for the fifteen months to December 31, 1938, of £47,116. The surplus for the year, together with the amount brought forward from last year of £3,295, gives a total of £38,848. From this total there has been deducted expenditure on air raid precautions, £1,621; an amount in respect of leasehold buildings, etc., £7,836; and the sum of £6,000 which has been transferred to investment reserve. There remains a balance of £23,391, and out of this there is recommended a dividend of 10 per cent. per annum, free of income tax, in respect of the year ended December 31, 1939. The dividend will absorb £859, and leave the sum of £22,532 to be carried forward to 1940, subject to excess profits tax (if any).

In recommending the dividend the directors have not lost sight of the appeal by the Chancellor of the Exchequer regarding voluntary restriction pending the passing of the Finance Act. The work of preparing the warrants for dispatch to-day was well in hand before the Chancellor's announcement, and it is thought that any violation of his wishes is a technical one only, having regard to the small amount involved.

BALANCE SHEET

In considering the assets of the company as at December 31, 1939, there is little variation as compared with a year earlier, with the exception of the increase in investments of some £94,000.

The insurance fund now stands at £1,633,235, which is £69,029 over the previous year's total. In this connection it is encouraging to note that, during a period of increasing employment with consequently more accidents, the number of outstanding claims at the close of the year showed a relatively small rise. This is due to the fact that a large number of old claims was terminated during the year under review.

When dealing with the results I referred to the contemplated new legislation. It is not possible, until fuller details are known, to express a considered opinion on the probable increase in cost to the company in respect of the current year cases, but some authorities put it as not less than 20 per cent. on compensation paid. Some general rating increases will be necessary, but they will be in accordance with the desire of the company to provide for its members insurance at minimum rates by the application of mutual principles.

During the year protection for the staff has been provided on lines laid down by the authorities. The cost has been met out of the revenue balance of the year.

During recent weeks a war savings scheme has been inaugurated for the encouragement of the purchase of War Savings Certificates by members of the staff. This scheme is working well.

I should like to thank the management and the staff for their continued good work in difficult circumstances.

The accounts were unanimously adopted.

NORTH BRITISH AND MERCANTILE INSURANCE COMPANY, LIMITED

SATISFACTORY RESULTS

RECORD LIFE BUSINESS

The one hundred and thirtieth annual general meeting of this company was held, on the 9th instant, in Edinburgh.

The Hon. Robert H. Brand, C.M.G., D.C.L. (deputy chairman), said that at December 31, 1939, the market value of their investments showed a surplus over the figure at which they were taken into their balance sheet, and in the four months since that date there had been a substantial appreciation in market values.

LIFE DEPARTMENT

In the life department the extra rates of premium and the various restrictions necessitated by the existence of a state of war had resulted in a general falling away of new business, but the company had been able to secure one or two exceptionally large blocks of business early in 1939, which more than compensated for the falling off in the closing four months and enabled them to finish with net new sums assured amounting to £5,889,172, the highest figure for new business they had ever recorded. An investigation into the position of the life business had been made as at December 31, 1939, and a satisfactory surplus resulted on the stringent basis employed in the valuation.

Out of that surplus a bonus was recommended at the rate of £1 per cent. per annum for each of the four years covered by the investigation. A large surplus still remained after providing for the cost of the bonus now recommended. In respect of policies which might become claims after December 31, 1939, and before another investigation was made, the directors recommended that an interim bonus be paid at the same rate and on the same principle as that now declared for the past four years, namely, £1 per cent. per annum calculated upon the sum assured and existing bonuses.

FIRE AND MARINE

In the fire department they had experienced a small decline in premium income of rather over 2 per cent., the bulk of which was in respect of business in the U.S.A. and Canada, but their results from all sections of the field were again satisfactory, and whilst not quite so good as in the previous year, they felt that in present circumstances an underwriting profit of £303,207 was one with which they could be well pleased.

All their casualty insurance business was transacted through their allied company, the Railway Passengers Assurance Company, whose accounts exhibited a position which in the present state of affairs might be considered highly satisfactory. The underwriting profit, after making full provision for unsettled claims and unexpired liability, totalled £150,853 as compared with £171,118 last year.

The premium income of the marine department, which was administered by the "Ocean Marine" Company, amounted to £397,574, a figure nearly £100,000 in excess of the income for the previous year. This increase reflected both the higher rates which had been obtained on Hull business during the year, and the greater volume of war risk premiums received during the closing months. They were transferring to profit and loss account £40,000 from the profit of past years which were now closed, and they were satisfied that the reserve for 1938 and previous years was amply sufficient to provide for all outstanding claims in respect of these years.

Following a long series of favourable years, culminating in a record profit in 1938, the "Fine Art and General" produced in 1939 less satisfactory results than those which they had become accustomed to expect from it. Premium income was well maintained at £357,109 compared with £360,055 in the previous year, but claims in the fire, motor car and workmen's compensation departments were unusually heavy, with the result that the profit emerging was restricted to £22,328, being 6.25 per cent. of the premium income.

The aggregate balance carried forward, subject to dividend, was increased by £123,744, to £7,102,811. The directors recommended a dividend of 6s. 3d. per share, less income tax, one-half payable on May 15th, and the other one-half on November 11th. On the whole, the trading results for the year could be regarded with satisfaction.

The reports and accounts were unanimously adopted.

GUARDIAN Assurance Company Ltd.

ANNUAL GENERAL MEETING—

6th MAY, 1940

Extracts from

COLONEL LIONEL H. HANBURY'S Speech

LIFE DEPARTMENT
QUINQUENNIAL VALUATION

After strengthening valuation bases and setting aside special contingencies reserve of £150,000, proposed to distribute out of the profits of the Quinquennium £605,000, of which proprietors' share is £60,500, the balance being divisible amongst with-profit policyholders by way of reversionary bonuses at a minimum rate of one per cent. per annum calculated on sums assured and existing bonuses and at somewhat higher rates in certain groups to keep in line with method of distribution previously employed. Balance of profit carried forward, £121,000.

FIRE DEPARTMENT

After provision for unexpired risk on basis of 50 per cent. of premium income, surplus in the Account £114,000, which had been transferred to Profit and Loss Account.

ACCIDENT AND GENERAL DEPARTMENT

Surplus on the Account transferred to Profit and Loss, including a special reserve of approximately £30,000 no longer required, amounted to £123,000.

MARINE DEPARTMENT

Profit in respect of 1938 Account of £14,000. After the settlement of claims and expenses in 1939 and the transfer of £5,000 to Profit and Loss, the fund stood at £572,000, equal to 185 per cent. of the premium income for the year.

The premium revenue in the Fire, Accident and General and Marine Departments considerably affected by the non-inclusion of the accounts of the Albingia Insurance Company, of Hamburg, and the discontinuance of other German business.

VALUE OF INVESTMENTS

Value of stock exchange securities at middle market prices at 31st December last, less accrued interest, exceeded the amount at which they stood in the Balance Sheet. The value of holding in the "Albingia" had been completely written off.

PROFIT AND LOSS ACCOUNT AND APPROPRIATION

£25,000 had been transferred to the Staff Pensions Fund, £17,000 to write off certain securities, and £61,000 to General Reserve, which stood at £1,875,000.

A dividend was declared of 11s. on each Ordinary share, leaving a balance to be carried forward of £117,000, as compared with £109,000 at the end of the previous year.

AMALGAMATED METAL CORPORATION, LIMITED

POSITION UNDER WARTIME CONDITIONS

MR HENRY GARDNER'S STATEMENT

The eleventh ordinary general meeting of Amalgamated Metal Corporation, Limited, was held, on the 1st instant, in London, Mr Henry Gardner (deputy chairman) presiding.

The Chairman, in the course of his speech, said:—"The directors' report gives you full information regarding investments, profits and the proposed distribution, with comparative figures for the previous year. At that time we had stocks instead of cash. In 1939, after the outbreak of the war, we handed over our metal stocks to the Ministry of Supply at practically pre-war prices, and in consequence we held at the end of the year a considerable proportion of our assets in cash or Government securities.

The note on the German securities in the directors' report gives all the information which we think is advisable at this stage. I can only add to it by saying that the contract under which these shares are deliverable to the Swiss company was entered into in 1930 and was expressly designed to cover the possibility of a war in which Germany and England were opposing belligerents.

I must recall to you that the British Metal Corporation was formed immediately after the last war at the suggestion of the then Government, and that the Government still has the right to appoint a director to the board. It was therefore no surprise that at the outbreak of war Captain Oliver Lyttelton was appointed Controller of Non-Ferrous Metals, under the Ministry of Supply, who also took over the whole organisation of the British Metal Corporation.

EMPIRE'S NATIONAL CONTRIBUTION

The overseas Empire has made a great contribution to the national effort by supplying this country with the whole of her needs in time of war of non-ferrous metals. When I tell you that these supplies have been secured at fixed prices which are approximately equivalent to those ruling in August, 1939, you will realise what a debt of gratitude is owed to the Empire producers. The saving to the nation compared with the last war amounts to a stupendous sum.

Your two constituent companies, who are closely connected with a great many of these producing interests in the Empire, played a useful part.

The British Metal Corporation did not trade after September 1st on its own account, and consequently made no profits for the last third of the year; whilst, of course, in common with the experience of other members of the Metal Exchange, our trade in metals, other than tin, done by Henry Gardner and Company, was reduced to practically nothing.

The British Metal Corporation also received no allowance from the Government on account of its expenses and for its services in running the Non-Ferrous Metals Control. When these payments are made, the revenues of the company in 1940 will receive an additional benefit from payments made on account of expenses incurred and disbursed during the last four months of 1939.

RUBBER

The London rubber market has been free of any control, and it is hoped that this will continue.

Soon after hostilities commenced shipments were disorganised and heavy inroads into stocks for war purposes resulted in some mal-distribution of exports, and for a short time the value of rubber for near delivery went to a premium. The highest price paid was 1s. 1½d. The rate of release of exports in the Far East, however, has been raised to an 80 per cent. basis, and, provided no serious interruptions occur to cargoes on the high seas, the general situation should be considerably eased in the near future.

World consumption is probably running at a level which will necessitate the continuance of the present rate of release of exports, and it is reasonable to expect that the price will not fluctuate very much from its present level of 11d.

I now beg to move:—"That the directors' report, balance sheet, and profit and loss account for the year to March 31, 1940, as now presented, be and are hereby approved and adopted, and that a dividend of 7 per cent., payable less tax in respect of the year to March 31, 1940, upon the ordinary shares of the corporation, be and is hereby declared payable on May 15, 1940, to the members now on the register."

Colonel the Hon. R. M. P. Preston, D.S.O., seconded the motion and it was carried unanimously.

SPILLERS LIMITED

SATISFACTORY TRADING RESULTS

POSITION UNDER GOVERNMENT CONTROL

The Rt. Hon. Sir Malcolm A. Robertson, chairman of Spillers Limited, presided at the annual general meeting of the company, on the 8th instant, at the Hotel Victoria, Northumberland Avenue, London, W.C.2.

He informed the stockholders that the directors were unable to lay before them the accounts of the company for the financial year ended on January 31, 1940, owing to circumstances arising out of the war, and in particular by the imposition of a large measure of Government control on the business of the company and its subsidiary and associated undertakings.

EFFECT OF THE WAR ON THE INDUSTRY

Immediately upon the outbreak of war orders were issued by the Government that as from that date the import of all wheat and grain to the United Kingdom would be undertaken by the Government and that the manufacture of all flour other than that coming within certain special categories should conform to a common standard as laid down by the Government; and, further, that the selling prices of all flours and animal foods should be in accordance with those laid down by the Government from time to time. Those regulations were of the most far-reaching character and represented in effect the complete control of the greater part of the company's business.

The effecting of appropriate arrangements between the milling industry and the Government, whereby the position and earning power of an industry so essential to the national needs should be safeguarded, was a question of first importance and one of great anxiety to the directors. In that connection negotiations were still proceeding and it would not be proper for him to make any further reference to the matter beyond saying that a special committee of the industry on which the company was represented was prosecuting the matter with the utmost zeal, and the stockholders could rest assured that everything possible would be done to safeguard their interests.

DIVIDENDS MAINTAINED

The trading results of the company from the commencement of the financial year to the outbreak of war were wholly satisfactory, but owing to the impossibility of preparing final figures in respect of the period between the outbreak of the war and the close of the financial year, it would be necessary to adjourn the meeting *sine die* for the future reception of the accounts. The directors were, however, satisfied that the results for the year as a whole had been sufficiently favourable to enable them to recommend the payment of dividends in respect of the year ended January 31, 1940, at the same rates as those for the previous year. Every effort would be made to expedite the production of the final accounts, but that, of course, would be dependent upon the time which it took to conclude the negotiations with the Government. In those circumstances it might be necessary to summon an extraordinary general meeting in order to alter the company's articles of association, under which, if the accounts were made up to January 31st, they must be laid before the stockholders within six months of that date.

It would be wise to postpone any remarks in relation to the detailed conduct and position of the company's business until the stockholders were in possession of the final accounts.

In the meantime it would be realised that the abnormal conditions at present ruling made the conduct of any business, particularly one subject to Government control, fraught with anxiety and difficulty. Insofar as it was possible, however, the company's position was being well maintained and its resources conserved.

TWO DIRECTORS' GOVERNMENT POSTS

Sir Norman Vernon, who had been intimately concerned for a considerable time before the war with the Food Defence Plans being made by the Government against possible emergency, was now fully engaged in a high capacity at the Ministry of Food, where he was a member of the Cereals Control Board and Vice-Chairman of the Flour Mills Control Committee.

Mr A. F. Forbes had been entrusted by the Air Ministry with the highly important and responsible post of Director of Capital Finance, but it had been possible to arrange for his part-time and highly valuable services to be retained by the company.

The Company might be proud that two of their directors had been chosen for important posts for which they were eminently well equipped.

TRIBUTE TO STAFF

A high tribute should be paid to the staff of the company and its subsidiaries for the manner in which they had performed duties always arduous, but now heavily increased as a result of the exigencies and dislocations of war and control conditions. Their task had been made even heavier on account of depletions caused by the loss of 562 employees of the parent company and its subsidiaries who were now serving with H.M. Forces. In that connection it was often overlooked that those who remained engaged in an essential industry were performing services which were equally indispensable to the community. There were many employees of the company, both staff and workpeople, who were anxious to bear arms, but by reason of the wisdom of the regulations concerning industrial reservations, they had been called upon to remain in their present posts. They could be assured that they were serving their country in the manner best adapted to their capacities.

The directors' report was adopted.

RIO TINTO COMPANY, LIMITED

DIFFICULT TRADING YEAR

The sixty-seventh ordinary general meeting of this company was held, on the 3rd instant, in London.

Sir Francis L. Joseph, K.B.E., presided in the absence of Sir Auckland Geddes, the chairman, and read the speech which Sir Auckland had prepared. In the course of his speech, he said:—"In my speech last year I told you that the year 1938 had been an extremely difficult one for the company. It is true to say that 1939 has been even more difficult, for we have had, added to our difficulties in Spain, the effects of the European war.

After dealing with the difficult conditions in Spain, the Chairman said:—"In these days one cannot make any forecast for the future, but at the moment work is proceeding quite normally at Rio Tinto, although in respect of export ore, on a reduced scale. Our shipments of ore for the past year were only 820,000 tons, as against 1,283,000 tons in 1938. This falling off was chiefly due to the fact that, since May, 1939, we have made no shipments of ore to Germany, normally our largest customer, nor to any of those countries which she has overrun and subjugated. No copper produced at Rio Tinto has been exported to any country during the year under review because it was all required in Spain.

I hope that this precise statement, added to previous denials, will stop the circulation of the falsehood that Rio Tinto was supplying the Nazis with 35,000 tons of copper ore per month. This lie was presumably designed to suggest that the directors of the Rio Tinto Company are so lost to all sense of decency that they would help the mortal enemy of their nation.

The balance carried to the appropriation account is £227,000, which is some £5,000 less than last year, and I hope you will consider this not unsatisfactory.

As the final preference dividend now recommended by your directors represents once again a division not of trading profits but of investment income it carries the rate of Dominion income tax relief received thereon. As this could not be calculated at the time of the payment of the interim dividend, it is accumulated in the final dividend and amounts to 4s. 7d. in the £.

The report and accounts were unanimously adopted.

Every year many hundreds of Companies publish Reports of their Annual General Meetings in *The Economist*, thereby reaching thousands of investors in the quiet of their own homes.

In time of war the value of this practice is greatly enhanced because *The Economist* provides valuable information which is not otherwise available to investors, who therefore read it more carefully than ever.

Full particulars of the charges for inserting these reports may be obtained on application to The Reporting Manager, *The Economist*, 8 Bouverie Street, E.C.4.

LONDON ELECTRIC WIRE COMPANY AND SMITHS, LIMITED

EXPORTS AND COPPER SUPPLIES

The thirty-first annual general meeting of the London Electric Wire Company and Smiths, Limited, was held, on the 9th instant, at the Hotel Victoria, London.

Mr W. J. Terry (the chairman), in the course of his speech, said:—"An outstanding feature of the balance sheet is that the company's total current liabilities amount to £338,517, as against current assets of £1,219,076 and total assets of £2,034,890.

All of your company's factories are working under great pressure in an effort to meet the heavy demands of the various Services and practically the whole of the company's output is now either directly or indirectly connected with the provision of armaments.

The company is taking an active part in the formation of Export Groups connected with our section of the industry as required by the export drive recently initiated by the Government. It must be clearly understood, however, that this country's exports cannot be divorced from imports, and it is imperative that plentiful supplies of raw material are made available to give effect to this export movement in order to maintain and extend our position in world markets and to obtain the required currencies.

Trade agreements and export credit guarantees should be extended as far as possible, but these must be supported by an adequate supply of non-ferrous raw materials, otherwise the exports of the electrical industry will be seriously handicapped.

It is essential that key men are retained in industry to supply the needs of the Services and it cannot be over-emphasised that there must be ample supplies of non-ferrous raw materials to meet both home and export demands. Buffer stocks of such materials which would constitute an unshrinkable national asset could be secured at a relatively small cost when compared with the enormous total sum expended daily for armaments purchased from overseas. A copper reserve is as essential as a gold reserve.

The report and accounts were unanimously adopted.

F. FRANCIS AND SONS, LIMITED

ENCOURAGING CURRENT BUSINESS

The thirty-ninth ordinary general meeting of F. Francis and Sons, Limited, was held, on the 7th instant, at Southern House, Cannon Street, London.

Mr John Ismay, the chairman of the company, who presided, said:—"With your permission we will take the report and accounts as read. (Agreed.) The large expansion in our profits is due primarily to the satisfactory completion of the building extensions and installation of additional plant referred to at our last annual meeting, which has enabled the company to handle a greatly increased turnover. This increase in volume was continuous throughout the year, and any acceleration during the latter end, subsequent to the outbreak of war, so far as it benefited your company was to a great extent offset by the dislocation which took place during that period to enable us to execute urgent orders of national importance.

Whilst we propose increasing the dividend to the same rate as that paid for the period ended December 31, 1936, being our most favourable pre-war period under the proposed war standard by the Chancellor of the Exchequer, the amount we are distributing is still less than we could have paid for the previous financial year. This conforms to the interpretation which the directors place upon what the Chancellor has said about his proposed new Bill.

After making full provision for tax and other contingencies and bringing up our general reserve to the round figure of £25,000, by transferring to it the sum of £3,551 11s. 8d., we carry forward £16,529 5s., against £14,746 12s. brought in.

With regard to the future, whilst it is dangerous to prophesy what is going to happen, we are pleased to state that our works for the first four months of the present year again show a large increase in turnover over the corresponding period of the previous year, and, unless anything very untoward happens, we can look forward to the results of the present year with every confidence.

The report and accounts were unanimously adopted in the absence of question or comment, and the recommendation of a final dividend of 8½ per cent., making 12½ per cent. for the year, was approved.

A hearty vote of thanks to the chairman, directors and staff closed the meeting.

LONDON ASIATIC RUBBER AND
PRODUCE COMPANY, LIMITED

DIVIDEND OF 10 PER CENT.

At the annual general meeting of the London Asiatic Rubber and Produce Company, Limited, held on the 6th instant, the Chairman, Mr H. J. Welch, said:—

The sale price was the highest obtained since 1928 and was 2d. higher than in the previous year. As, however, the costs were increased by 3d. per lb. and we spent about 1½d. per lb. on purchase of export rights the net increase in profit per lb. was just under 1d. After paying the dividend and making the other allocations proposed to-day, the issued capital will represent £30 13s. 7d. per planted acre, and if you deduct from the capital the net surplus liquid assets amounting to £305,286, you get a net cost per planted acre of £20 12s. 2d. without taking into account the value of our 15,882 acres of reserve lands. The net cost per planted acre is the lowest on record for this company and compares with £41 in 1919.

From the net credit balance of £139,335 the company has paid an interim dividend of 4 per cent. It now proposes to pay a further 6 per cent., to make 10 per cent. for the year, and will carry forward £82,701—a sum slightly larger than that brought in.

This year the heavy amount of £57,500 has had to be reserved to provide for income tax payable in respect of profits made prior to the end of 1939.

Other allocations include £20,000 to general reserve, £1,500 (and a special grant of £778) to the employees' staff retirement fund and £200 to the subordinate staff reserve.

We are replanting 600 acres of old rubber and planting 634 acres of new rubber adjacent to our estates. When this has been done our immature areas will amount to about 4,300 acres, or only 14 per cent. of our total planted acreage. We have made forward sales for 1940 of about 2,000 tons at 10.85d. London equivalent and 9½d. net. Under the dividends limitations proposals of the Budget our maximum distribution permitted during any year will be 12½ per cent.

The report was adopted.

PATALING RUBBER ESTATES,
LIMITED

DIVIDEND 12 PER CENT.

The twentieth ordinary general meeting of the Pataling Rubber Estates, Limited, was held, on the 10th instant, at 19 Fenchurch Street, London.

Mr H. Eric Miller (the chairman) said in the course of his speech: The periodical reports made on our properties by the visiting agents all indicate that the estates are in their usual sound agricultural condition and that the special cultivation programme to which I have made reference on more than one occasion at our annual meetings is thoroughly justifying itself. That special cultivation is being continued, but your board does not feel that by itself it is sufficient to keep Pataling in the front rank of rubber producing companies. Approximately 18 per cent. of our rubber is now 30 or more years old. This rubber is still an economic proposition under present conditions, but it is definitely past its prime, and by comparison with modern high yielding trees is inevitably losing competitive value.

It has therefore been decided gradually to replant the whole of Bukit Blimbing Estate over a period of years and the replanting of some of the older areas on our other estates is under consideration.

The credit balance for 1939 was £55,369, or 18 per cent. on the issued capital. It is necessary to reserve £9,000 to cover the estimated liability for income tax. It is proposed to raise the reserve for cultivation and replacement to £30,000 and to pay a final dividend of 8 per cent., making 12 per cent. for the year. As to the outlook for the current year, it seems certain that the present rate of release will have to be reduced, but even so we shall no doubt account for a larger crop. We have protected the position by entering into forward sales for delivery during 1940 of 1,592,640 lbs. at an average price of over 10½d. per lb. London terms. Costs, I trust, will not be unduly increased. The company is in a sound position and we look forward to presenting a good account a year hence.

The report was adopted.

COMMODITY MARKETS

(Continued from page 873)

crop brought a slight fall in wheat prices in North American markets early in the week, but some of the loss was recovered later. The St. Lawrence is now open to shipping and wheat stored at eastern centres is being moved. The prospects for the European crops has been improved by warm weather, but both acreage sown and winter survival have been diminished by the severe cold. Argentine maize prices are steady, but there is little international trade in barley or oats.

Oils and Oilseeds.—The diversion of British shipping from the Mediterranean is likely to increase the cost of Indian linseed in this country. The new schedule of maximum prices, valid for May, is unchanged except for linseed and linseed oil; the price of the latter was raised by £5 to £47 10s. per ton naked ex mill for large lots. The Ministry of Food is contemplating some control of the prices of English lard.

Rubber.—With the closing of the Mediterranean and the consequent delay in shipping, prices were firmer than in the past few weeks. Standard spot sheet recovered to 11½d. per lb. in London and to 20½ cents per lb. in New York; near futures were advanced even further.

Furs.—The London spring sales, which were held during last week and the beginning of this week, have proved a success. Supplies were better than was expected; demand was keen and offerings were fully absorbed. Most prices were considerably higher than those paid in January, 1940; fox prices were up by 20 to 75 per cent. and those of mink by more than a third.

Export Groups.—The formation of the following export groups has been announced since we last published a list

in *The Economist* of April 27th:—

EXPORT GROUPS

Engineers' Tools.
Gramophone and Gramophone Records.
Heavy Chemical.
Locomotive Industry.
Refrigerating Machinery.
Silo Machinery.
Textile Machinery.

Weighing Machine and Testing Machine Manufacturers.
Woodworking Machinery.
Metallic Bedstead.
Paper Machine Wire.
Photographic Goods.
Pin and Allied Trades.
Railway Brakes and Signalling.
Ships' Bronze Propellers.
Steel Pen.

CURRENT STATISTICS

Finance

GOVERNMENT RETURNS

For the week to May 4, 1940, total ordinary revenue was £15,591,000, against ordinary expenditure of £17,040,000 and issues to sinking funds of £250,000. Thus, including all sinking fund allocations, the deficit accrued since April 1st is £160,812,000, against £54,364,000 for the corresponding period a year ago.

RALEIGH CYCLE HOLDINGS.—Ordinary interim dividend maintained at 5 per cent.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued, less income tax at the standard rate, with allowance for redemption. Where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The yield on ordinary stocks and shares is calculated on the latest dividends, account being taken of any increase or reduction of interim dividends.

political situation. The personnel of the War Cabinet is perhaps the best illustration of this fact. Ideally, it should be a group of men best fitted to give the whole machine of Government its supreme direction; if its members have to be selected from the different parties, they should be selected for their personal qualities rather than for their party rank. But it can hardly be said that these are the criteria that have chosen the four men who, with the Prime Minister himself, make up the War Cabinet. Mr Chamberlain and Lord Halifax, Mr Attlee and Mr Greenwood—are these the most competent, or merely the most eminent, men in their parties? In form, the War Cabinet is what the Government's critics have been asking for, a supreme directorate with a majority of members unencumbered by departmental duties. In fact, it is hardly more like Mr Lloyd George's War Cabinet than Mr Chamberlain's. The new Prime Minister has himself given a hint of a limitation on its scope by creating himself Minister of Defence. Final judgment must necessarily be suspended. Mr Chamberlain has the reputation of an excellent committee chairman and Mr Attlee and Mr Greenwood may rise to the height of their opportunity. If drive comes from elsewhere, the War Cabinet may provide the essential element of balance. But at first sight it looks more like a political formula than a weapon of action.

If judgment be thus reserved on the War Cabinet itself, it must be said that the departmental appointments—with one crying exception—are good and that some of them are excellent. The trio of Service Ministers—Mr Alexander at the Admiralty, Mr Eden at the War Office and Sir Archibald Sinclair at the Air Ministry—will provide vigour and courage and yet work well under the Prime Minister's direction. The two crucial Ministries for the economic mobilisation of the country—Labour and Supply—have been put in charge of two of Labour's strongest characters, Mr Ernest Bevin and Mr Herbert Morrison. Mr Bevin stands as a guarantee of fair treatment for the workers, and he has promised to call on them to "work like hell" provided only they are not working for war profiteers. Two more of the new wartime Ministries, Information and Economic Warfare, have been given new chiefs of strong personality and driving force in Mr Duff Cooper and Mr Hugh Dalton. A new Ministry of Aircraft Production has been created and filled with all the dynamic energy of Lord Beaverbrook—certainly the most novel and not the least excellent of Mr Churchill's choices.

Certain of the other appointments are more questionable. The energy and abilities of Lord Lloyd and Mr Amery are rightly enlisted; but they could be better employed than at the Colonial Office and the India Office. The choice of members of the last Government to stay and of those to go is, in some cases, peculiar. Is Lord Caldecote preferable to Mr Oliver Stanley, Mr Cross to Mr Elliot? But some criticisms of this sort are inevitable in the very delicate business of Government making and if it were not for one downright bad appointment, the conclusion might be that the various Ministries have been well filled and the political balance kept without any interference with administrative efficiency. This exception is, of course, the nomination of Sir Kingsley Wood as Chancellor of the Exchequer. The Treasury, at this moment of time, is the crucial department, not only because of the high

importance of a sound financial policy, but also because of its dominating position in the whole mechanism of Government. If the bureaucratic machine is running sluggishly, if there is delay and timidity and half-heartedness, the remedy is to be found at the Treasury as much as at 10 Downing Street. The Chancellor of the Exchequer should be a man with a broad grasp of the essential problems, with a ruthless energy, with a personality that dominates and galvanises his colleagues—such a man as Mr Lloyd George was when he was Chancellor of the Exchequer. That the post should have been given to a man who is not known to have any qualifications of technical competence or personal character for it and has always been a ringleader of the "Better-Notters" is a disaster—unrelieved by any compensating change in the Financial Secretaryship. This appointment may have been the price that had to be paid for the continued support of that section of the Conservative Party which until last week formed the Government. If so, the price is too heavy.

The change of Government is the beginning, not the end, of the house-cleaning that is necessary. New blood is wanted in the Ministries as well as in the Cabinet; dilution is nowhere more urgently needed than in Whitehall. What has hitherto hamstrung the nation's effort and turned unity into irritation, patriotism into frustration, has been the impression given that the winning of the war was regarded as private property, reserved for those who had the right qualifications of rank, opinion or training. This has been shown not only by the attitude to those members of Parliament who dared to criticise, but also by the treatment of those outside specialists who were taken into the various Ministries. The former have been ostracised and excluded from the power to assist; the latter have seen their abilities sterilised. At Westminster, a majority of the able men have been kept at bay by the insistence on unquestioning loyalty. In Whitehall, the recruited brain-power of the nation has been wasted because the established Civil Service constitutes itself a bottleneck through which all decisions must pass. The one has led to disunity, the other to inefficiency. The one has now, we may hope, been corrected; but the other is no less vital. Twenty-four years ago the formation of Mr Lloyd George's Government brought a change that was felt in every office in Whitehall, and the whole tempo and atmosphere of Government were accelerated and invigorated. On its ability to perform a similar miracle now, Mr Churchill's Government—and Britain's fate—depend.

The new Government is thus on trial. But the main point is that it is an enormous improvement on what went before, in personal competence and, above all, in the national unity of which it is at once the cause and the consequence. Even without the compelling force of a new and much graver external peril, the formation of a Government such as this would have been the signal for which millions of patriotic citizens have been waiting—the signal to give their all, for their all will now be taken and used. There is a passionate desire in all ranks of the nation to give in full measure the "blood, toil, tears and sweat" that Mr Churchill asked for. Roused by slogans such as this, not lulled by complacent sedatives, Britain can again to-day reach the highest pinnacles of her power and her greatness.

tobacco and coffee. True, sea-power has given the Allies access to these ever since September, and cut the Germans off. But now the advantage must be greater still. Belgium and Holland have been forcibly made Allies; joint currency and credit arrangements will mean that the proceeds in foreign exchange from the sale of their colonial produce will be available for the Allied purchase of raw materials, munitions, aircraft and foodstuffs elsewhere; and no foreign exchange will be needed by the Allies to obtain the vital raw materials of these Empires. The Netherlands East Indies' trade with the United States is considerable, and there is a valuable balance in dollars. A third of the world's rubber output

is in the Dutch Empire and a fifth of the world's tin. In the Belgian Congo there is copper. The Amsterdam diamond trade—with most of its diamonds—has escaped the invader; and the famous *materia medica* of the Low Countries, quinine from Java, cinchona, caffeine, aloes from Curaçao, valerian, caraway and camomile, was mostly processed in Belgium and Holland, not produced there.
