The claim of the Tobacco Controller that the main cause of the recent scarcity is that demand has outstripped supply will not be questioned. Such a proposition is the firmest of ground to stand on. Nor, perhaps, in itself, will the release of tobacco from bond on a record scale to meet the demand be very hotly assailed. It is when Mr Maxwell speaks of his "success" in getting tobacco included among the commodities to come from the United States under the Lease and Lend Act that anxiety begins. The argument is quite simple. When Mr Maxwell admits that every dollar has a great deal more to do in the United States besides buying tobacco, he understates the position. It might be more accurate to say that dollars have no business to be buying tobacco at all; and the point is that it is at least equally true to say that there is no justification whatsoever for using shipping space to bring tobacco across the Atlantic. Admittedly, demand has gone up; as the Controller has pointed out, more employment, fewer sweets, night watches and air raids have caused an increase in consumption, and the people of this country are now smoking at the rate of 35-40 million more pounds of tobacco a year than before the war. The Controller's position has become a very difficult one. But these are not reasons for resuming tobacco imports; they are rather reasons for refusing to do so. There is plenty of room for cutting down without the risk of hardship. In wartime, it is the curtailment of consumption that is the objective, not its inflation, and valuable though tobacco may be in preserving the temper of the people, there is no case for pursuing the extraordinary policy of using ships to keep consumption at an abnormally high level. It would be illogical and unfair to treat tobacco so differently from other commodities; and if it is said that the tobacco will simply be stowed in the "spare" corners of other, more precious cargoes, the answer is either that there should be no spare corners or that there are other things better qualified than tobacco to fill them. There will be no real deprivation if no more American tobacco is imported; and what difficulties there are, and they are considerable, are mainly due to the fact that no attempt was made earlier to prepare the smoking public to accept the necessities of wartime.

War Weapons Week

The long series of War Weapons Weeks throughout the country is being brought to a grand climax in London

this week, where all the arts of persuasion and advertisement are being employed in an effort to collect £100 millions in a single week. There has been criticism—in *The Economist* and elsewhere—of some of the incidental phenomena of War Weapons Weeks and, in particular, of the indiscriminate manner in which every variety of funds, whether genuine savings or not, is gisted if it comes to the mill in a given seven days. It must not, for example, be supposed that the genuine savings of the inhabitants of London—personal and corporate together—will amount to anything like £100 millions in a single week—still less that £100 millions' worth of refraining from consumption will be accomplished in the metropolis in seven days or seven weeks. The total will be reached only by bringing in aid the very large subscriptions of financial institutions, whose degree of "genuineness" would require a very careful assay to establish.

*

For some reason that is very difficult to understand, to point this out is to generate a surprising degree of annoyance among some of those who are responsible for the National Savings Movement. It should be common ground that subscriptions of money are of no value at all unless they represent a real abstinence from consumption and consequently, that the degree of success of a War Weapons Week, or of the whole Savings campaign, should be judged not by the money it gets in but by the spending it cuts out. Moreover, there is another misunderstanding involved: to say that the organisers of the movement slip too easily into using the wrong yardstick of success is not to say—and is not intended to say—that they are unsuccessful. On the contrary, no praise is too high for the persistence, the energy, the ingenuity and the persuasiveness with which the whole campaign has been carried through. London's £100 millions will be a triumphant way of "showing the world."

Changes in Spain

While Vichy gives away the pitiful remnants of its independence, General Franco is going quietly on with the task of reconstructing the Spanish Government. The changes began on May 5th, when an army man, Colonel Galarza, replaced a Falangist at the key Ministry of the Interior. This move was followed by a widespread reshuffle among the Under-secretaries, Civil Governors, and Military Commanders, in the course of which the general tendency was to reduce the authority of the Falange and increase that of the Army. It was obvious to interpret these changes as a strengthening of Spain's independence, but some misgiving was expressed that if, as the changes suggested, there was a definite clash of policy between the Army and the Falange as a whole, then the Nazis might know how to profit from this dividing of the Spanish house against itself. The appointments of May 20th which sent Don Miguel Primo de Rivera to the Ministry of Agriculture and Señor Giron to the Ministry of Labour suggest, however, that the Caudillo is riding his two steeds with some skill. The two men are Old Guard Falangists who may perhaps be relied on to be less anxious to sell their country to Germany than the later devotees who streamed into the party at a time when German help was already a dominant factor in the Spanish situation. At the same time, the two Falangists have not been appointed to Ministries of political importance, and the impression created is that while the Caudillo is avoiding a dangerous split between Army and Falange, he is keeping authority

firmly in his own hands and that of Army leaders whom he can trust. The extent to which this makes for continued Spanish neutrality is a military rather than a political question. It may be decided at Suez.

Eire and America

Mr Frank Aitken, Defence Minister of Eire, has been on a mission to Washington to try to obtain arms and food, and ships to carry them in, under the terms of the Lease and Lend Act. The American Government has decided to place two ships at the Eireann Government's disposal and part of the food they are to carry is to be provided by the American Red Cross. But there will be no arms, under the Lease and Lend Act or otherwise. This news is welcome, because there had been some reason to fear that the old Irish influence in American politics, even in its present moribund state, might lead Washington into the same sentimental attitude towards Dublin as it was showing some months ago towards Vichy. Eire is not, of course, in the same position as Vichy-France. Mr De Valera has not promised to collaborate with the Nazis either economically or politically and he has pledged himself to resist a German invasion. But he has stretched the truth in the Nazis' favour—particularly in his statement that the belligerents (in the plural) were blockading Eire; he has made it very clear that he wants arms against the British just as much as against the Germans; and he cannot by any abuse of language be said to be fighting for the maintenance of democracy—the touchstone of American policy. If there is no German invasion of Ireland, Mr De Valera needs no arms. If there is a German invasion, any arms that America has to spare are likely to be much more effectively used if they are in British hands.

Landlord and Tenant

The Attorney-General has introduced a Bill into the House of Commons proposing to amend the Landlord and Tenant (War Damage) Act. In particular, the Bill is designed to improve still further the position of the tenant *vis-à-vis* the landlord. Section four of the Landlord and Tenant (War Damage) Act, for example, which enables tenants to disclaim leases or to retain them on altered terms in case of damage caused by enemy action, does not apply to weekly tenancies. The new Bill provides that the weekly tenant need not pay rent if his dwelling has been rendered "unfit by reason of war damage" and is no longer occupied by him either in whole or in part, even though his furniture may still be there. A dwelling house will be deemed to be fit again "if it has been repaired to such an extent as is reasonably practicable at that time, having regard to the circumstances prevailing in the locality" and if the local sanitary inspector has issued a certificate to that effect. Moreover, if the accommodation has been substantially reduced by war damage a lower rent is to be fixed by agreement between landlord and tenant, or, in the absence of agreement, by the Court. The Bill also proposes, by treating ground leases like other leases, to remove the anomaly whereby the ground lessee, who has been unable to obtain rent in consequence of war damage, has had to continue paying his ground rent. Finally, the new measure is designed to bring the Landlord and Tenant (War Damage) Act into line with the War Damage Act. In case of damage, the former Act enables a tenant to serve a notice of disclaimer if the property has been rendered unfit for use or a notice of retention if he is willing to continue his tenancy after repair. By the new Bill he will still be able to serve a notice of disclaimer but only a conditional notice of retention. If the War Damage Commission decides that a cost-of-works payment shall be made, the tenant will have to carry out his liability, but if it decides on a value payment the conditional notice of retention will be treated as a notice of disclaimer.

The Small Firm

Large firms with mass production methods must be the backbone of the industrial effort in modern warfare. But this fact, and current schemes for concentrating civilian manufacture, should not be allowed to blind atten-

tion to the usefulness of small concerns. There are special and auxiliary jobs which—either because of the craftsmanship required or because of their small scale—cannot be fitted into mass production; the "delegation" of these jobs from large firms, usually by sub-contracting, plays a vital part in war supply; and this industrial dispersal is a necessary complement to concentration. Small firms can be experimenting grounds for new processes or new methods. By adding even slightly to the output of certain "bottleneck" articles, they can help greatly in maintaining the "balance" of production in the mass output plants, by preventing them from having to be stopped or slowed down for lack of minor but indispensable materials. Indeed, the new weapons of war, highly complex machines made up of a multitude of appliances and gadgets, whose production may not be suitable for mass methods, have to some extent actually enhanced the status of small and specialised firms. Apart from these technical considerations, too, one advantage of small firms is, of course, that they make possible decentralised production against the risk of "knock-out blows" by bombing. Moreover, there is a general scarcity of labour, and the use of local pools of labour which cannot easily move or be moved can only be secured by enlisting small local firms in the war effort. Both housing and billeting have become major problems, and the direct advantages of centralised production may often be largely bought at a high price in increased strains on transport and accommodation. A small firm closed down may be a suitable training ground for labour, making it unnecessary to divert machines and skilled workers in the big firms from current production to training; and small firms can contribute vital tools and machinery equipment to the mass production concerns. This is a mass production war, but the small firms are far from dead and useless.

The Finance Bill

The chief interest in the text of the Finance Bill, 1941, which was issued at the end of last week, attaches to the ingenuity with which the Parliamentary draftsman has translated into the lawyers' tongue the intentions expressed in English by the Chancellor of the Exchequer in his Budget speech. In some cases, the translation is not so much into the lawyers' tongue as into the lawyers' shorthand, and there will be much sympathy with Sir Herbert Williams's attempt to replace "legislation by reference" by clauses setting out the effect of what the Bill is intended to do. One whole Part of the Bill deals with the modifications of EPT, which are dealt with in the Investment section (page 694) and of the Income Tax Part of the Bill, the longest and most technical clauses are those relating to agriculture. Of the matters of more general interest, the following may be noted:—

The sums to be repaid on account of earned income and personal allowances will not be subject to death duties if death occurs before they are repaid. Any assignment of or charge upon sums so credited is to be void. The repayment (or, more accurately, the crediting of sums due) is to take place "on such a date as may be fixed by the Treasury being a date so soon as may be after the termination of hostilities in the present war." (In the case of EPT repayments, the phrase is "at such date as Parliament may hereafter determine," and even so only "if such conditions as Parliament may hereafter determine are satisfied.")

Where a scheme for the concentration of industry is in force, any sum paid by a nucleus firm to one whose plant has been shut down shall be allowed as a deduction in computing the profits of the former and shall be treated as a trading receipt by the latter. Wear and tear allowances on machinery in closed-down plants are to be allowed as if the machinery were in normal use.

During the war, property given to the Crown before the death of the donor shall be exempt from estate duty.

Provisions of existing enactments modifying the incidence of death duties in the case of members of His Majesty's forces are extended to "the death of any person from injuries received by him . . . caused by the operations of war."

The legal provision for charging surtax on all incomes over £1,500 is retained in the Bill, though the rates specified for 1940-41 (*i.e.*, the surtax payable on January 1, 1942) begin at £2,000.

* * *

Westminster—and Elsewhere

Lord Moyne's suggestion that the Commons should meet in the Lords' debating Chamber for the time being is a reminder of the former indivisibility of Parliament.

The House of Commons was no deliberately separate creation; it arose from the summoning of elected representatives from the boroughs and shires to the *curia regis*—the Adam of all our governmental institutions, which in full session consisted of all the King's tenants-in-chief, lay and ecclesiastical, and the great officers of State. Beside this great antiquity of Parliament, the destruction of the Commons' debating Chamber in the air raid of May 10th is quite insignificant. Built just over a hundred years ago for only about two-thirds of the present number of elected members, the Houses of Parliament, though externally pleasing in their setting, were internally ugly, cramped and in many respects inconvenient. It is sheer sentiment that bewails the damage done to them; and it was surely a false set of values that gave them first place, with the Abbey, in the list of building casualties, and made historic and beautiful Westminster Hall—perhaps one of the most awe-inspiring buildings in the world to enter—into an also hit. Careful restoration work can perform building miracles, and where æsthetic considerations prevail let us by all means restore if it is possible to do so. But elsewhere the chance should be seized of finally killing the Victorian standard of Gothic for the rich and important, and tenements, or drab rows, for the poor. Modern architecture has been seen at its best in public buildings. After the war, it will have the opportunity of proving its worth in a humbler way—in the slums of London, Liverpool, Glasgow and other towns which have suffered most from enemy action. It will not be necessary, even if it were desirable, to have a master architectural plan; at their very worst, the new buildings will not have the meanness which characterises most of the houses they will replace. London can never be a beautiful city, and it will be enough to lay down general standards of unpretentiousness, utility, space and light.

Shorter Notes

Conscription for Ulster now seems imminent. Northern Ireland was excluded from the operation of the Military Service Act of 1939, and also from the operation of the National Service (Armed Forces) Act, owing, mainly, to objections raised by Mr de Valera on behalf of the Nationalist minority. Since public opinion in Ulster, including the Labour Party, which objected to conscription

before the war, is now strongly in favour of compulsory military service, the statement to be made by Mr Churchill next week is expected to reverse the Government's previous decision.

*

The decision to increase the outfit allowance for officers by £5, with effect from January 1st, is a typical example of a niggardly concession being wrested from the Government after repeated refusals. The chief reasons for the claim for a higher allowance were, first, that the allowance is the same as that given at the beginning of the last war, in spite of the rise in prices since, and, secondly, that purchase tax has to be paid on officers' uniforms and other items of equipment. The extra £5 will not cover the increase in price since 1914, but a more serious complaint is that it is only retrospective to January 1st. It is quite true that purchase tax was not charged on retailers' stocks; but tailors are ranked as wholesale establishments and had to charge the tax on all goods delivered to their customers after October 21st, when the tax came into force, and it is the tailor's charges for making uniforms that take up the greater part of the officer's allowance.

*

The following table gives the number of civilian casualties in air raids since mass raiding began last September:—

	Killed.	Injured and Detained in Hospital.	Total Serious Casualties.
Total Sept.-Dec., 1940...	21,069	30,556	52,225
1941.			
January	1,502	2,012	3,514
February.....	789	1,068	1,857
March	4,259	5,557	9,816
April	6,065	6,926	12,991
	34,284	46,119	80,403

In April, of those killed 2,912 were men, 2,418 were women, 680 were children under sixteen, and 55 were unclassified, compared with 1,956, 1,500 and 598 and 205 respectively in March. In addition to the April figures, 48 men, 6 women and 7 children are missing and believed killed.

THE WORLD OVERSEAS

Germany Over Northern Europe

(By a Correspondent)

May, 1941

DENMARK and Norway and neutral Sweden and Finland have been cut off from extra-European markets for over twelve months. In the past, all these countries depended more upon foreign trade than most other European countries; the value of their imports per head was only slightly smaller than in the case of Great Britain, and the value of their exports per head was greater. Normally, one-fifth of the total imports of these countries were supplied by Great Britain and well over one-third of their exports were sold to Great Britain. Thus, profound changes have been necessary to make the Northern countries a part of German Europe. With the exception of Sweden, they imported a considerable part of their bread grain and their livestock industry was dependent on imported feeding stuffs. Germany is not in a position to supply substantial quantities of cereals and oilseeds; and imports from Russia have so far only been promised. Bread, meat, and fat rationing have had to be introduced and the rations are mostly smaller than in Germany; in ounces per week, the bread ration in Denmark is 90, in Norway 80, in Sweden 69, in Finland 74, and in Germany 85.

Denmark's export industry in livestock and dairy produce was dependent on imported feeding stuffs, and the number of animals has had to be reduced by wholesale slaughter.

From December, 1939, to the end of 1940, the number of cattle fell 9.3 per cent, of pigs 29.8 per cent, and of poultry 65.1. The reduction in Norway and Sweden was smaller. In all three countries agriculture has been put on a new basis. The cultivation of cereals, root crops, and oilseeds is to be expanded, and the livestock and dairy industry adapted to rely on home-grown feeding stuffs. In Denmark and Norway, the compulsory handing over of cereals as is done in Germany has been introduced; deliveries for 1941 by Danish farmers, for instance, have been increased from 730,000 tons to 873,000 tons, which means a further reduction in livestock. Prices for cereals have been fixed, and for a number of other agricultural products compulsory marketing organisations are being formed.

In terms of money, it is true, Danish farmers had a good season in 1940-41. Receipts from sales are reported to have exceeded by 23 per cent the average of Kr. 112 per hectare earned in 1939-40. Moreover, money income will continue to increase as long as the slaughter of livestock made necessary by lack of feeding stuffs goes on. The trouble is, of course, that in a sense this represents living on capital. The ultimate object in Denmark and Norway is a measure of self-sufficiency similar to that in Germany; and it is intended to make up acute deficiencies by imports from Soviet Russia.

Manufacturing for the Continent

The reorganisation of Scandinavian industry within the war economy of German Europe is even more complicated. The loss of the British market for timber, cellulose, and paper resulted in widespread unemployment in Sweden and Norway; and the formation of a European Cellulose and Timber Cartel under German domination could not provide sufficient markets within the area ruled by Germany. Markets have also to be found for timber and cellulose exports from Finland. There is, however, some outlet for forestry products in the increased consumption of firewood, in the use of processed cellulose as cattle fodder, and in the expanded manufacture of artificial textile fibre.

On the other hand, Scandinavia's iron and metal ore industries are fully employed. The most difficult problem is the supply of fuel, of coal, coke, and oil. Before the war, Great Britain supplied between half and four-fifths of total Scandinavian imports of coal and coke. The new German trade agreements concluded with the Scandinavian countries promise, on the average, two-thirds of pre-war coal supplies, and the agreements with Russia provide for the delivery of small quantities of oil. But last year Germany delivered only 80 per cent of the promised coal and coke to Sweden; the coal shortage in Denmark continues and further rationing is expected next winter.

A similar situation has developed in the textile industry, which is dependent on imported cotton and wool. In Denmark, the import duties on artificial textile fibres have been reduced, but those on wool and cotton have been increased; and, at the same time, Germany undertook to supply unspecified quantities of staple fibre. The resources of Norway and Sweden, on the other hand, favour the actual production of artificial textile fibres. The output of staple fibre is to be trebled; and the programme provides for the production of artificial textile fibres amounting to some 50 per cent of former imports. New rayon and staple fibre factories are also planned in Sweden and Finland.

In Norway, British and French owned metal and aluminium plants have been taken over by German firms. The Hermann Goering concern took the lion's share. In January, leading German aircraft firms jointly founded in Norway the *Bordische Aluminium AG*, which will use a Norwegian substitute for bauxite. In Norway, the mining of pyrites was reported to have increased during 1940 from 350,000 to 400,000 tons. The leading Swedish copper producer, the *Boliden Gruben*, is to increase copper output from 11,000 tons in 1939 to 15,000 tons annually; and total copper consumption in 1939 amounted to roughly 50,000 tons. Considerable increases in the output of copper and pyrites are expected in Finland, and by the middle of 1941 the nickel mines at Petsamo will begin operations; whether Germany or Soviet Russia will control the Petsamo output is still uncertain, though recent reports suggest that Germany has been successful in securing the whole output.

The most interesting point is the persistent reports that each of the four Scandinavian countries has begun to expand its iron and steel industry. This expansion is, of course, dependent on either the increase of electric power or the supply of coal or coke from Germany. From Denmark, the building of new electric power stations and new steel works to use considerable quantities of scrap is reported. In Norway, the construction of electric furnaces has begun under German supervision; and, in Sweden, new steel plants will be built with Government subsidies. In Norway, several new power stations are under construction; and a German-Norwegian Committee has published a programme for the export of electric energy from Norway to the Continent.

The foreign trade of the Scandinavian countries is now completely dominated by Germany. Unfortunately, no detailed figures are available. In value, imports and exports in 1940 fell on the average by one-fifth to one-fourth. The new German-Swedish agreement provides for a turnover amounting to roughly Kr. 2,000 millions, against Kr. 1,400 millions in 1940, and Germany will account for some 70 per cent of Sweden's total foreign trade. Germany also concluded additional agreements for Sweden's trade with Norway, Denmark, Holland, Belgium, and Italy. The Finnish-German agreement of June, 1940, provided for supplies of coal, coke, fertilisers, and chemical supplies to Finland, in return for some 85 per cent of Finland's total exports of timber and cellulose. In 1941, Germany's share in Finland's total foreign trade is expected to reach 50 per cent.

German policy intends to increase what the German Press calls Inter-Scandinavian Trade—Norwegian fertil-

isers to Denmark, Norwegian fish, chemicals and oils to Sweden in exchange for foodstuffs, and so on. At the same time, Russia's foreign trade appears to be by agreement supplementary to Germany's foreign trade with Scandinavian countries.

Rice Shortage in the Far East

[FROM OUR SHANGHAI CORRESPONDENT]

April 16th
RICE continues to form the staple foodstuff of all Far Eastern countries, and its present scarcity very adversely affects economic conditions in this part of the world. Japan, China and the Philippines are unusually short of rice this year and find it difficult to secure rice imports large enough to satisfy their demand. In all three countries weather conditions last year were bad for rice, and war conditions in the first two contributed to cut down rice and other foodstuffs crops to levels far below normal. The Philippine domestic rice supply falls short of demand by some five per cent. Japan's import demand for rice for the 1940-41 rice year is being estimated at more than 1,500,000 long tons. The rice shortage in China defies reliable estimates, but rice supplies are completely insufficient in both Japanese-occupied and Free China.

The most important factor in the present Far Eastern rice situation is Japan's extraordinary import demand, owing to the deterioration of Japan's economy resulting from the China war. In normal years, the Japanese Empire is self-sufficient in rice. Rice is a cash crop, but Japan's dearth of foreign exchange makes it impossible for her to put up the cash funds in foreign currencies with which to purchase rice by way of normal trade. Thus she makes use of her military and political power to extract rice by forceful means from other Far Eastern producers. She compels occupied China not only to feed a million men of the Japanese fighting forces stationed in that country, but also appropriates in the Yangtze Valley large quantities of rice for shipment to Japan proper. This Chinese contribution of rice for Japan is being but nominally paid for at far below market prices, and is being exported by Japanese military and governmental institutions, ignoring Chinese Customs, legislation and normal trade channels. It is estimated that these rice shipments from Central China to Japan this year will exceed 300,000 long tons.

Indo-Chinese Supplies

The leading position in the compulsory supply of foreign rice to Japan is involuntarily held by French Indo-China. Under this year's new economic agreements between Tokyo, Vichy and Hanoi, France's richest colony is now forced to yield to Japan 700,000 metric tons of rice a year, which is more than half of French Indo-China's export surplus. Japanese purchases of Saigon rice are financed provisionally with loans advanced to the purchasers by French colonial banks; they are supposed to be recovered with the proceeds from eventual Japanese exports to French Indo-China. The remainder of her rice import demand Japan manages to cover in Thailand under barter agreements, the details of which remain unknown.

As a result of these Japanese rice exactions, Central China's import demand for rice continues to increase, and Shanghai is now entirely dependent upon foreign rice for its monthly consumption of 25,000 tons. French Indo-China, until recently Shanghai's most important source of rice imports, had to enforce a rice export embargo and since February has been selling only broken rice to Shanghai. Confronted with the extraordinary rice demand, not only from Japan but also from unoccupied France, French Indo-China is no longer in a position to supply her normal rice customers, including Shanghai. Thailand has equally ceased to be a willing seller to Shanghai, whose chief remaining source of rice is now Rangoon, already crowded by the rice demand of such sterling bloc Asiatic import areas as British Malaya, Netherlands, Java, etc.

In the northern parts of the Far East, rice is everywhere scarce and expensive, resulting in rapidly rising living costs and a further reduction of the standard of living of the masses. In Japan, rice has been rationed under a ticket

and chit-book system. In Shanghai, hundreds of thousands of poor people recently shifted the emphasis in their food consumption from rice to fodder such as beancake, while rice prices are three times as high as a year ago. The situation is similar in the import centres of Japanese-occupied South China, such as Swatow, Canton and Amoy. The Central and South China interior has started to buy foreign rice from the coast, with even Nanking buying Rangoon rice at Shanghai.

In Free China, the 1940 harvests were much smaller than those of previous years, especially in the Szechuen rice centres. The result is a shortage of rice and unprecedently high rice prices in many parts of the west and south-west of Free China, which during the early years of the Sino-Japanese war were noted for an ample supply of cheap rice.

Eire's Courageous Budget

[FROM OUR DUBLIN CORRESPONDENT]

May 13th
THE Budget, although it contains unpleasant tidings for everybody, is an honest attempt to spread the cost of the emergency fairly over the whole people. Owing to the great expansion of the defence services, the estimated expenditure in the current year amounts to £40,172,000. The estimated yield of existing taxes amounts to £26,045,000, which is £2,781,000 less than last year, the decrease being caused by declines in the customs duty on imported sugar and tobacco. Non-tax revenue is estimated at £5,638,000. Total estimated revenue, therefore, amounts to £31,683,000, leaving a gap of over £8,000,000 to be bridged. The Budget provides that about half of this sum should be met by additional taxation and about half by borrowing. What this means is that 90 per cent of current expenditure is to be met by revenue. In view of the great dislocation caused by the war and the absence of an expansion of incomes resulting from war activities, the Budget cannot be condemned as timid or unrealistic. The financial year starts, at any rate, with good intentions.

The additional taxation covers a wide field. The standard rate of income tax is raised from 6s. 6d. to 7s. 6d. and estate duty is increased on estates over £10,000. The corporation profits tax is extended to all companies with an annual profit of £1,000; the rate is increased by 2½ per cent, and an excess profits tax is imposed on private businesses. The duty on petrol is increased by 5d. a gallon, and that on tobacco by 5s. 6d. a pound. Increased taxes are imposed on matches, newspapers and periodicals, betting and cider. In the field of non-tax revenue, postal rates are increased. The postage on letters is raised from 2d. to 2½d. and on postcards from 1d. to 1½d., while telephone charges are increased by 5 per cent. It is estimated that these additional taxes and charges will yield £4,581,000, leaving £3,908,000 to be defrayed from borrowing. Provision is made for additional allowances, to be paid partly in kind, for recipients of unemployment assistance, old age pensions and poor relief.

Ban on Wage Increases

In introducing the Budget, the Minister for Finance announced the intention of the Government to issue an Emergency Powers Order, which was published immediately afterwards, forbidding increases of dividends and directors' fees in all companies and of wages in a number of scheduled occupations. Civil servants and local government officials have already had their remuneration stabilised for the period of the war, and this Order greatly extends the area within which increases of wages and salaries are prevented. The occupations in the schedule all public utility and statutory occupations and essential sheltered and protected industries. These definitions are sufficiently wide to include practically the whole field of industrial employment. This measure is a courageous step towards the avoidance of inflation, which is certain to incur widespread unpopularity. In order that it may operate without injustice, it should be accompanied by a strict control of retail prices.

A bill has been introduced for the regulation of trade unions. In future, bodies of employers or employees carrying on negotiations for fixing wages or conditions of employment will require to be licensed by the Minister for Industry and Commerce. Licences will be granted only to

authorised trade unions registered under the Trade Union Acts or to foreign trade unions registered under the law of their own country, and substantial deposits of cash or securities will be required. A tribunal is to be established to decide which unions or associations shall be recognised as representing employers or employees in any particular class of business or employment, and no other union or association shall have the right to organise in that class. This measure, which is designed to rationalise the trade union movement and to prevent the results of collective bargaining from being frustrated by inter-union rivalries, is generally welcomed by business men and by the spokesmen of organised labour.

American Banking Movements

[FROM OUR NEW YORK CORRESPONDENT]

May 8th
IN the first four months of the current year, there were a number of marked changes in our banking and monetary figures. Most of these had been foreshadowed for some time, being more or less definitely indicated. The rapidity with which they have developed is, however, worth noting. For example, the "golden avalanche" was clearly diminishing in the last half of last year. In the first four months of 1941, over \$500 millions was added to our gold stock—at the rate of only a little over \$100 millions a month—comparatively a mere trickle. Money in circulation rose rapidly all through 1940, but in the first four months of 1941 it increased by over \$300 millions, although seasonally a decline of nearly this amount might have been expected. In the last half of last year, member bank reserve balances showed a tendency to flatten after their long and meteoric rise; but up to the end of April, under the joint influences of an active demand for currency and an increase in Treasury balances, they actually declined by about \$500 millions. While the movement of Treasury balances varies with Treasury policy and the season, the other trends—the reduction in gold imports and the increase in currency—can perhaps be regarded as significant. As bank credit was expanding rapidly, excess reserves fell more than total reserves; by the end of April, they were \$800 millions below the end of 1940, and about \$300 millions below the end of April, 1940. Their total (\$5,770 millions) was still enormous, but the current trend is markedly different from that of the immediate past.

As would be expected, the expansion of bank credit has proceeded briskly. For the reporting member banks, the increase in total loans and investments was \$2,000 millions in the first four months of 1941, and in April alone amounted to some \$600 millions. The increase in the combined items of Federal and guaranteed securities rose in this four months by over \$1,400 millions—slightly more than in the entire calendar year 1940. Although loans to brokers fell materially in the period, commercial loans of all kinds increased by \$600 millions. This item is not

THE CAMBRIDGE ECONOMIC HISTORY OF EUROPE

Edited by

J. H. CLAPHAM and EILEEN POWER

Volume 1. The Agrarian Life of the Middle Ages

This volume gives the foundations of economic life (and what was in many places the complete superstructure too)—the earth, the crops, the peasant's toil, how villages and fields were occupied and laid out, how and with what cattle and implements they were tilled, what the society was that they maintained.

With 9 plates and 3 maps. 30s. net

CAMBRIDGE UNIVERSITY PRESS

differentiated, but it includes personal and instalment loans; and these may be supposed to be a substantial fraction, as sales of durable consumer goods are large.

While the rise in commercial loans seems general for the reporting member banks, the buying of public securities has centred in New York City. In the four months under record, the New York reporting banks took \$1,100 millions of the Federal and guaranteed issues. The decline in reserves also centred in these banks, amounting to about \$800 millions; outside New York, in the same period, they rose by almost \$300 millions. This illustrates one of the most obscure areas of our entire credit system—the balance of payments between New York City and the United States. Formerly, movements of this type, on an infinitely smaller scale, would have found some reflection in money rates in New York, notably in the call rate; the recent movement has scarcely been reflected at all—to such an extent have the excess reserves taken the place of the defunct money market.

It is extremely difficult to appraise the movement of commodity prices. As this correspondence has remarked, the recent advance in the BLS wholesale index has been substantial, but not remarkable. But Moody's sensitive index of primary commodities has risen more than remarkably:—

End August, 1939	...	...	140
End December, 1939	...	...	169
End July, 1940	...	...	152
End December, 1940	...	...	172
May 3, 1941	...	...	188

In the past nine months the rise has been almost continuous, and exceeds 20 per cent; over the whole war period, the rise is over 30 per cent.

Income Tax for Palestine?

[FROM OUR JERUSALEM CORRESPONDENT]

April 17th

PALESTINE has, up to now, been one of the few countries with a relatively modern administration yet without an income tax. But for some time Mr Straithey, an expert conversant with the methods of income tax in India, has been exploring conditions here, and it seems that the publication of the necessary draft order is imminent. When that is done, discussions will presumably be conducted in public, and many of the arguments hitherto advanced "in camera" will probably vanish into thin air, particularly the assertion that the imposition of an income tax over and above our existing system of duties would constitute too heavy a burden for the country's economy. This argument might possibly have been debatable in peacetime; now it is not, the more so as every other belligerent country has readjusted its system of taxation to war conditions more quickly than Palestine. Somewhat better reasons can be brought up for the difficulties inherent in an income tax in semi-developed countries, especially in one with an economy as complex as the Palestinian. But there can be no doubt that these difficulties can be overcome, even the difficulties of assessment, until the time is ripe for the introduction of sworn schedules. For those, compulsory bookkeeping would be necessary, and this in itself would be a great improvement on the present state of affairs.

The crux of the problem is most probably presented by the money-lender who, as in every undeveloped community, gets a disproportionate share of the national income and whose personal income is absolutely uncontrollable, so long as no compulsory bookkeeping exists. The normal merchant and industrialist keeps books like his European or American counterpart, and all money income in some way or other derived from landed property can be checked by documents such as mortgages. The provision of any reasonable tax-free limit will exempt the whole of the hard-pressed agriculture—not only the citrus growers, who have been exempted from the usual property tax.

Palestine has not yet developed a system of social services such as exists in most other comparable countries. To a certain extent, such services have been provided by the Jewish community for the Jewish sector, but, under prevailing war conditions, funds raised by the new income tax might in part be utilised for establishing or subsidising social services for the entire population.

Industrial Expansion

Inquiries conducted independently by the Jewish Agency and by some banks enable us to get an idea of the developments that have taken place in the industry of the country during the first year of the war. They are the more interesting as the figures for working hours, etc., given in the official statistics are not really representative of industrial development. Before the war, the number of real industrial enterprises in Jewish and in Arab hands may have been about 1,200 to 1,300. During the first year of the war, their number rose by a good 10 per cent, while some of the larger ones which already existed were further enlarged or took up new lines of production. An example of the latter, for instance, is Potash Ltd. They have begun to work up several of their by-products, which were previously either not worked up at all or which went overseas. The same holds good for some tinned goods and pharmaceutical factories. Many of the new enterprises, about 20 per cent, have been opened in the metal trades. Steel and steel alloys for machine-tools, etc., are now made here. In the textile industry, the establishment of a wool-spinning factory constitutes a new line, as does the production of insulin in the pharmaceutical trade. The latter is especially interesting, as it not only replaces an imported product but also utilises raw material hitherto wasted. It is the only insulin produced in the Middle East. If these and similar developments resulted in an excess of production over home and Army needs, they might become valuable for our balance of payments, which has suffered under the impact of war. On account of the great importance that tourists and capital imports had for Palestine, the drop in them has had an especially heavy effect here, though according to reliable estimates about 30 to 40 per cent of the pre-war, or pre-disturbance, capital imports have come in even during the first year and a half of the war.

For this and other reasons, there has been no lack of funds for bona fide industrialists; but to a certain extent the risk of price fluctuations has had an influence upon the stocks and imports of raw material; according to the import figures, they can at least not be uncomfortably small even now. According to an incomplete but probably representative inquiry from about 60 per cent (in numbers) of all industrial enterprises, stocks in the late summer of 1940 covered six months of actual production, or somewhat less. The same statistics reveal the significant fact that only 3 per cent of all the enterprises concerned were working up indigenous raw materials.

Portugal's Colonial Trade

[FROM OUR LISBON CORRESPONDENT]

May 12th

DUE note should be taken of the official correction of statements made in London journals recently to the effect that imports of cotton, oilseeds, and tropical products of Portugal's African colonies were in excess of her own requirements and were being re-exported to "undesirable destinations." Actually, the January cotton imports were but a tenth part of those for 1939, and the vegetable oil products but one-thirty-seventh of the imports for the same year. Imports of sugar, coffee, cocoa, beans and maize, rubber, and sisal for January, 1941, were, in all, 2,694 tons less than the total of these products imported in January, 1939. Owing to irregular arrivals, there has even been a certain local shortage of sugar and vegetable oils, while the control of all maritime traffic by the British authorities has seen to it that arrivals were only sufficient to meet internal needs. It is therefore unjust to say that a purely supposititious excess has gone to enemy countries.

This is as far as the Technical Corporative Council's statement goes. Local commercial opinion confirms its conclusions, though it admits that a small quantity of the goods named may have been acquired by middlemen acting in German interests, the merchandise passing through several hands before its eventual reception, via France, in an Axis country. As no statistics bearing on the subject are available, the subject can be taken no further. It resolves itself into an *ipse dixit*. There is, however, no reason to believe that anything of importance is reaching either Germany or Italy through Portugal, and if sales to Spain have increased somewhat, chiefly of coffee, cocoa and oilseeds, it is known that the actual needs of that country have been a powerful bar to re-exportation.

German Europe

INSURANCE.—At the beginning of the war, there were ninety-eight foreign insurance companies established in Germany. The assets of forty-four British companies were at once confiscated by the German Government, and the British firms themselves were incorporated in German companies. After the occupation of Western Europe, British companies operating in France, Belgium, Holland and other countries were also incorporated by German companies. In March, 1941, the leading German companies held a meeting in Munich, where practically all Continental companies were represented. The result was the establishment of the *Vereinigung zur Deckung von Grossrisiken*, or the "corporation for the cover of major risks." This new body is a kind of European insurance cartel for the centralisation of Europe's insurance transactions in Germany, and the biggest Continental re-insurance company, the *Muenchener Rueckversicherungsgesellschaft*, will transact the business.

It is explained that the new cartel is intended to replace the activities of Lloyd's on the Continent. Each country will first try to cover its own risks. Only if that is not possible, will the new organisation, acting through the Munich company, distribute the cover according to a quota system among the different countries. The actual transfer will then be carried out by the Berlin Central Clearing Institute. Hitherto, Germany, Italy and Switzerland have shared in covering the risks which were formerly covered by Lloyd's; and it is important to note that the new organisation will not be extended to life insurance business.

In Germany, private insurance business, especially life insurance, showed considerable increases during 1939 and 1940. In 1939, the companies benefited by the compulsory insurance of independent artisans and, during 1940, a great number of factories negotiated group insurances for their workers. By far the greatest increases were reported by the insurance organisation of the German Labour Front, founded in 1933. The actual total premium income in 1939 was estimated at Rm. 1,500 millions, and the total capital investments of the companies at the end of 1940 may have reached Rm. 8,000 millions. The resources of the insurance companies have increasingly been placed at the disposal of the Treasury, and the share of Treasury bonds and Reich loans in total investments increased from 8.8 per cent in 1933 to 32.9 per cent. in 1939.

Since the war started, schemes have been announced for a comprehensive system of insurance for the entire population. They have mostly been interpreted as a gigantic merger of the social insurances of the State with the business of the private life insurance companies. Each new announcement, however, at once led to complaints from the insurance companies; and each time responsible State officials assured them that there was no intention of nationalising private insurance.

Social insurance in Germany, dating back to 1883, was developed separately for different groups of workers. There are still different schemes for wage and salary earners, for coal miners and other workers. Private sickness insurance companies are in competition with State sickness insurance. A simple merger of all these different schemes is hardly possible, and even the Nazis have shrunk from centralisation.

On the other hand, the social insurance schemes have proved excellent organisations for the accumulation of capital to be placed at the disposal of the State; and the aggregate capital of the social insurance schemes, including unemployment insurance, may at present be estimated at Rm. 11,000 millions, against Rm. 8,700 millions at the end of 1938. This enormous increase results from the fact that the emergency contributions introduced during the economic crisis 1930-32 have remained unchanged. This is a kind of compulsory savings, and there will hardly be any changes during the war.

The new scheme for a comprehensive system of old-age pensions relates to the post-war period, when 98 per cent of the population are promised pensions; and these promises are coupled with some assurance that the unemployment contributions will be abolished. Old-age pensions for wage and salary earners will be unified, and the whole system of social insurance is to be concentrated on the prevention of sickness and adequate compensation for accidents. It is thus clear from actual developments, as well as from intended schemes of reorganisation, that insurance in Germany will for some time still be characterised by

private companies, State-owned companies and companies owned by party or semi-party organisations; and the danger for the private insurance industry comes rather from the companies under the control of the German Labour Front than from State insurance.

REVENUE AND DEBT.—Secretary of State Reinhardt announced on May 13th that total revenue in 1940-41 amounted to Rm. 27,200 millions, against Rm. 20,405 millions in 1939-40; and revenue during the current year, ending on March 30, 1942, is expected to reach Rm. 30,000 millions. Herr Reinhardt explained that additional receipts during 1941 would increase the total income of the Reich to roughly Rm. 40,000 millions. These additional receipts include the war contributions of the communes, and of the Protectorate Bohemia and Moravia, and the tributes paid by occupied countries. It was announced at the same time that the national debt had increased to Rm. 90,000 millions by March 30, 1941. This means an increase of roughly Rm. 40,000 millions during the financial year 1940-41. That is to say, the Reich had at its disposal, in the financial year 1940-41, some Rm. 76,000 millions from revenue, contributions, occupation charges, and borrowed capital, which (at the rate of Rm. 12 to the £) works out at £6,330 millions.

Taxation has been used for the purpose of developing the annexed, Polish territories—Danzig-Westprussia, the *Warthegau* and Polish Upper Silesia. Germans resident in these provinces were exempted from the 50% war increase in income-tax; and the rates and taxes on profits were also reduced. But the most important point is that capital expenditure and replacement costs are exempted from all taxes. German businesses in these provinces will therefore operate at an advantage compared with the Old Reich. Marriage loans and family allowances will also be introduced. The scheme is not only intended to attract Germans to the annexed territories, but also to promote industrialisation.

EMPLOYMENT OF WOMEN.—Shortage of labour is still the main difficulty of Germany's war economy, and a new drive for recruiting women was officially begun with Hitler's speech on May 4, 1941. Official figures about the total number of employed in Greater Germany, excluding the annexed provinces, are either misleading or not comparable with former figures. The total number of employed is officially stated to be 22,670,000—that is, 14,250,000 men and 8,420,000 women. An estimate based on official figures shows that the total number of employed in July, 1939, was 24,300,000. The total number of employed at the beginning of 1941 includes foreign workers and prisoners of war.

Before the war *Wehrwirtschaft* experts thought it possible to recruit an additional six million women. Actually, the reserves are very much smaller because of the number of women working as "helping members of families, mainly in agriculture and in the small shops of independent artisans." But by the concentration of shops and farm work, and by combing out the unemployed housewives, another 500,000 women may be found for war industries. But that number will definitely exhaust the labour reserves of the Greater Reich.

ORDER BOURSE IN PRAGUE.—On April 25, 1941, the East German "order bourse" held its second session in Prague. Two hundred firms of the iron and metal manufacturing sections of Bohemia and Moravia were present, bidding for the sub-contracts of 70 firms of the Old Reich, and firms from the Sudetenland, with free capacity, were also present. The firms offering sub-contracts came mainly from Berlin-Brandenburg and Central Germany—districts officially described as "bottleneck districts."

GERMAN-DUTCH EXCHANGES.—On April 1, 1941, the exchange control between Holland and Germany was abolished. Bank, postal and other money transfers are now free from restrictions, and no limit is placed on the money which travellers can carry with them. At the same time, the Dutch and German clearing accounts have been closed. The rate of exchange remains fixed at fl. 100 to Rm. 132.7.

THE BUSINESS WORLD

Imperial Chemical Industries

FOR fully a decade before the outbreak of war, the ordinary capital of Imperial Chemical Industries had been regarded as a gilt-edged equity. The directors had, more than once, announced a policy of stable dividends, and, after a period of hoping for slight increases, the investor was resigned to payments of 8 per cent, while convinced that an ultra-conservative financial policy guaranteed that the payment would be maintained in all circumstances, short of national catastrophe. The outbreak of war cast some doubt on the validity of this judgment and the price dropped by about 15 per cent, but it was soon seen that, whatever happened to profits, all the principal products of the group were as essential in war as in peace, however different the end product might be. This impression was greatly strengthened by the accounts for 1939, and is confirmed by those for last year, just published.

The preliminary statement—dealt with in *The Economist* of April 12th—showed that the dividend was maintained, although both profit, after tax, and the earnings percentage showed declines on the year. This statement, however, tells only a small part of the total story, much of which is left to the imagination, even after a detailed study of the full legal accounts and consolidated statement, which this year are accompanied by Lord McGowan's comments. These show the total income for the parent company and such subsidiaries as had been able to prepare accounts—111 as compared with 118 a year before—had increased total income by rather over £3,000,000 to £18,375,000, but that taxation had risen from £3,654,000 to £7,385,000, which, together with a larger appropriation for obsolescence, had reduced the net income from £7,678,000 to £6,756,000. The rise in the tax allocation is mainly due to the doubling of the effective rate of EPT, and the figure gives no indication of the total tax to be found by the group. It includes nothing, in either year, for tax on dividends, while an over-provision of £497,000, made in previous years, has been used up and, more important still, EPT of home subsidiaries has, for the most part, been provided in their own accounts. No figure is given, but it seems reasonable to assume that the total liability for taxes was of the order of some £14 millions. The change in accounting practice means that trading profit does not fully reflect the expansion in earning power, and the comparison

TABLE I

	Years to December 31st		
	1938	1939	1940
Consolidated Income:—

Carried forward	621,245	681,428	882,354

* Central obsolescence: £1,500,000, 1938; £2,000,000, 1939 and 1940. † Also £1,500,000 profit on investments and £483,353 from reserves of subsidiaries.

is further vitiated, from this standpoint, by the charging of ARP maintenance, and £326,000 for war risk insurance premiums, before reaching the published amount.

An analysis of the principal items in the consolidated earnings statement and of ICI allocations is shown in Table I.

These figures are, perhaps, more reassuring as to the extent of the company's contribution to the war effort than as giving any certainty that dividends will be maintained. But they must be read against the background of the price policy, announced a year ago, and of the reserves, disclosed and hidden. It is the group's practice to supply largely on long-term contracts and to reduce price movements to a minimum. To protect themselves, they announced rises, which were only to become effective when circumstances made it necessary, and, in the event, reliance was placed on increased turnover to offset rising costs until towards the end of last year, when a number of increases became necessary. Since the home factories were, in general, working to capacity last year, shareholders will have to rely on price increases and new factories to augment their earnings, but these factors should suffice to counteract in some measure the ill effects of EPT at 100 per cent. Meanwhile, it seems not improbable that the subsidiaries throughout the Dominions will still further increase their contribution to the war effort.

As to exports from this country and the Dominions, the outlook remains obscure, but every effort is being made to maintain and expand markets. The difficulties experienced will be in obtaining supplies and shipping space, for existing contracts, and the removal of German competition places the group in a position of semi-monopoly, even in foreign trade.

Total	20,791,891	21,321,734
Total Fixed and Net Current Assets	97,133,592	98,672,175

* Excess of share considerations over net tangible assets of subsidiary cos.

The much-reduced directors' report contains no reference to capital expenditure, but it may be assumed that it must have been very substantial. From the consolidated statement, summarised above, it will be seen that total assets rose by some £14,395,000 to £134,130,000 odd. Most of this rise occurred in stock-in-trade and debtors, but an increase of £1,500,000 odd in plant and machinery conceals a considerable writing down. Apart from the general rise in assets and liabilities, the chief features are a further fall in quoted investments and the still larger excess of current assets over near liabilities. While this is highly satisfactory, it must be borne in mind, as the chairman points out in discussing the effects of EPT, that liquidity has been reduced.

This is shown by the fact that cash and gilt-edged have only been maintained by the sale of other securities, in fact by the disposal of the whole balance of all investments in the U.S.A., including the last of the holding in General Motors. It will come as a surprise to some to learn that this investment has been entirely liquidated, yielding, over a period of years, a sterling profit of over £6,500,000. Sales last year produced a credit of £1,500,000, which has been added to war contingency reserve. Total allocations to reserves are given in Table I. The drafts on them, apart from £572,615 for war damage premiums, are this year

restricted to £950,000 for the writing down of fixed assets of subsidiaries, whereas, in 1938 and 1939, £1,760,000 and £1,650,000 respectively was taken for writing down investments in these companies. The position of the parent company at the end of 1940 was that it had a surplus, ignoring war contingencies reserve, of £18,397,384 against fixed assets, holdings, in and outside the group, and debtors of some £96,000,000 and an ordinary capital of £50,400,000.

The fall in net revenue of ICI is some 12.2 per cent on the year, and some 7.9 as against the average for the quinquennium 1934-38, but it would require a substantial further decline before the dividends were threatened, ignoring the question of a reduction in reserve appropriations and the EPT cushion. The market, although at first disappointed with the year's results, has found that public estimation is more favourable, and the price is now a trifle under 31s. ex dividend, giving a yield of £5 3s. 3d. per cent—a clear indication that prospects are considered fair—in war as in peace. The throes of re-conversion of plant are not likely to be severe, while caution in the past has placed the group in a very strong financial position, which, it is to be hoped, will not be impaired by undue taxation. The ordinary shares give promise of a stability of return which is seldom equalled among industrial equities.

Finance and Banking

War Weapons and the Money Market

The short-loan position has been dominated this week by London's War Weapons Week. The banks have had to face a continuous and at times heavy drain of funds representing their customers' and their own subscriptions to the odd £100 millions raised during the week. They have consequently been rather diffident buyers of bills. As the market obtained the fair allotment of 38 per cent of its £75 millions quota at last week's tender, the pressure for funds has therefore been keener than for many weeks past. The "special buyer" has been available in case of need, and in fact has helped in some directions by the purchase of June and July bills. The fact that the making up for May balance sheets has already started also helps to explain the greater scarcity of credit this week. The banks would have been even more pressed for cash had they not been freed from any Treasury deposit payments this week. The corresponding maturities totalled £20 millions, and a certain additional amount may have been called in by the banks in order to be converted into Government securities ranking for inclusion in the War Weapons total. The Bank return shows the movement of funds into Government accounts resulting from the heavy subscriptions to Government issues. Public deposits have risen by £25,449,000 to the exceptionally high level of £39,857,000. As a counter-part to this, bankers' deposits are £18,936,000 down at £96,583,000. Open market operations to ease the credit position are reflected in a rise of £6,255,000 in Government securities.

Exchange Control in Eire

Although neutral Eire has, since the beginning of the war, proved a loyal and co-operative member of the sterling area and has applied methods of exchange control broadly similar to those in operation in the United Kingdom, its residents have hitherto escaped the rigours of requisitioning of foreign assets. The first step has now been taken to bring this aspect of the Eireann exchange control into line with the British. An Order issued by Eire's Finance Minister compels the sale of U.S. and Canadian dollars held by residents in Eire to the authorities. The assets involved are cash and credit balances, and as such assets accrue to residents in Eire, they will have to be offered for sale to the authorities within fourteen days of their being acquired. No start has yet been made with the acquisition of dollar securities held by residents in Eire, but this will no doubt follow in due course. To round off the control of the authorities over the dollar income of Eire additional Orders have been promulgated prohibiting the export of goods to the U.S. or Canada unless payment is made in dollars within six months of the date of export. Among the reasons which have prompted the Eire Government to tighten up the exchange control in this manner must be an increasing shortage of dollars. Requests for U.S. dollars

from importers in Eire have until now been made to the Bank of England and have been dealt with in the normal way. The dwindling size of the British dollar reserves must, however, have led to some difficulty in satisfying these

EXECUTOR AND TRUSTEE BUSINESS CONDUCTED

COMMERCIAL SERVICE

The Bank has over 380 Branches in Africa, and Agents and Correspondents throughout the world. The closest touch with Trade and Industrial conditions is maintained, with special attention to Commercial and Credit Intelligence. This service is available to Exporters, Importers and others wishing to develop trade with South, East and Central Africa.

requests and to suggestions that this difficulty would increase unless holdings of dollars in the hands of residents in Eire were requisitioned. No final decision has yet been made regarding the treatment of the dollars which will be obtained by the new requisitioning order. If Eire's requirements of dollars are, as in the past, to be satisfied from the U.K. Treasury's reserve through the Bank of England, it follows that the dollar reserves acquired from Eireann residents should be put into the common pool.

Clearing Bank Statements

There was a further considerable expansion in bank credit during April, the total of deposits rising by £64,322,000 to £2,828,575,000, the highest figure yet recorded. Increased Treasury borrowing from the banks on six months' deposits receipts was wholly responsible for the expansion. This item increased by £87,000,000 to £461,000,000. Contrary to the customary seasonal movement discounts fell by £6,386,000 last month, reflecting the increased non-market competition for Treasury bills at the

weekly tenders. Investments also showed a small fall in April, a movement which may be truly described as *reculer pour mieux sauter* in the War Weapons Weeks of May. The most striking change in the statement is a fall of £24,380,000 in advances. This carries the total of this item to £883,748,000, which is about £100,000,000 lower than the figure at which it stood a year ago. The volume of bank cash keeps pace closely with the expansion in credit and the ratio of cash to deposits increased slightly last month, from 10.4 to 10.5 per cent.

Central American Accounts

The network of Payments Agreements with the American continent has been completed this week by a collective arrangement which is to cater for future payments between the sterling area and twelve Central American countries. The machinery of payments is to function through Central American Accounts—a new species of sterling accounts bearing some resemblance to Special Accounts, but yet differing from them in certain important respects. Like the Special Accounts, they will provide the sole means for settling the authorised payments due between these countries and the sterling area. These new Central American Accounts will, however, be opened for any resident in the countries concerned and will not be restricted to banks, as are Special Accounts. This means

that it has been found unnecessary to round off the Central American scheme with facilities for opening Sterling Area Accounts such as had to be given in all cases where the Special Account technique has been applied. Another important and significant difference between the Special and Central American Accounts lies in the fact that the latter, unlike the former, apply to a group of countries which for purposes of their payments to and from the sterling area are regarded as a single unit. A few empirical attempts have been made in the past to give the Special Account technique rather greater elasticity than that provided by strict bilateralism. They have not proved particularly successful. This new attempt to give our clearing agreements the greater elasticity commanded by applying them to a group of countries, as opposed to a single one, will be followed with much interest. Transfers between Central American accounts will be free. Any shortage of sterling in such accounts can be remedied by offering the authorities U.S. dollars or by transfers of sterling from U.S. registered account. No method is specified for dealing with a surplus of sterling accumulating in such accounts, but this is a contingency which is probably not expected to arise. Any existing sterling account in the name of a resident in Central America may be transferred to a Central American Account. If it is not, it will remain a "free" sterling account which may be used for the very restricted objectives open to sterling of this fast-dying variety.

Redemption of India Sterling Debt

Official data of the redemption of India sterling debt during the year to March 31st last have been given by the India Office this week. The relevant figures are as follows:

	Redeemed in 1940-41	Outstanding on 31/3/1941
Undated Stock	£ 6,608,850	£ 160,445,705
Dated Stock	64,710,779	23,671,615
Railway Annuities	2,175,600	31,585,751
Railway Debenture Stock	—	24,660,766
Liability for British War Loan	—	15,466,928
Total	73,495,229	255,830,765

The amount surrendered under the Treasury Vesting Order (included under the dated stock redemption in the above table) was £54,132,975, while a further £5,765,567 was surrendered under the corresponding Order made by the Government of India. A further amount of sterling stock, probably not exceeding £8,000,000, remained to be surrendered on March 31st last. It will thus be seen that in one year India was able to repatriate close on one-quarter of her official sterling debt. It should, moreover, be noted that this achievement was made without any net encroachment on India's exchange reserves. Between the end of March, 1940, and March 21, 1941, the sterling reserves of the Reserve Bank of India had risen almost uninterruptedly from Rs.14,100 lakhs, or £74,000,000, to Rs.21,890 lakhs, or £164,000,000. In the following week, during which the Reserve Bank felt the impact of the Vesting Order, these reserves fell to Rs. 14,450 lakhs, and they have since been recovering slightly. Thus after meeting the cost of the heavy repatriation of sterling securities India's reserve of sterling remains larger than it was at the beginning of the financial year 1940-41. The gap in the Reserve Bank's assets structure caused by the sudden fall in its sterling securities has been approximately filled by the issue to the Bank of rupee securities, on which, incidentally, the Government of India is paying from $\frac{1}{2}$ to $2\frac{1}{2}$ per cent, compared with the rates of 3 to 5 per cent ruling on the repatriated sterling securities.

INSURANCE NOTES

Northern Assurance.—Life business is transacted by the Northern both through the parent office and through the London and Scottish, separate accounts being published for the participating and non-participating funds of the former. Combined premiums totalled £1,001,140, and developments in 1940 in the main followed the common experience. In the case of the Northern funds, the quinquennial period 1936-40 closed on December 31st last, but under present conditions the directors have decided to postpone a valuation for the purpose of

distribution of profits; intermediate bonuses, however, are being maintained at the rate of 30s. per cent per annum for premiums in respect of the five years 1936-40 and at the rate of 20s. per cent per annum for subsequent premiums. Sums totalling £360,000 are being transferred to investment contingency reserves, which are now more than sufficient to cover any depreciation known to exist.

Results of the fire, accident and marine accounts are exhibited below; these figures include, inter alia, those of the London and Scottish, Provident Accident

and White Cross and Indemnity Marine, and profits in the fire and accident departments are arrived at after applying a 50 per cent premium reserve:—

	Premiums	Rise or Fall	Profits	Rise or Fall
Fire	2,028,676	+ 41,588	22,148	— 117,183
Accident	1,552,451	— 271,719	207,334	+ 61,087
Marine	1,333,945	+ 447,053	—	—
Total	4,915,072	+ 216,922	185,186	— 56,096

The disappointing result in the fire department is ascribed by the chairman

of the Aberdeen board, Lord Forbes, to a high rate of loss on the home business and to an adverse balance on the Northern operations in the United States, this for the second year in succession. Rationing of petrol in this country and the loss of large portfolios in the Low Countries are responsible for the substantial reduction in accident premiums; the account, however, more than maintains its profit-earning reputation. The rise in marine premiums is largely due to increased rates and values, and not to any desire to develop the business unduly; no profit is being released, and the fund now stands at 114.5 per cent of premium income.

Profit and loss account receives credit transfers of £382,300, including net interest of £195,776. Income-tax on profits and N.D.C. together take £105,604 and pensions and sundry other items £61,744; interest on debenture stock requires £19,320. The dividend is reduced from 15s. to 14s. per share, and after providing for this and the preference dividend, absorbing together £177,174, the balance to be carried forward is £1,236,296, an increase of £18,457. In the balance-sheet market values of Stock Exchange securities are in excess of ledger values, less contingency reserves, and in addition to the balance of profit and loss account there is a general reserve fund of £2,000,000.

London and Lancashire Insurance.—Accounts of the London and Lancashire include the underwriting figures of the subsidiary offices. The results of the life business, which is transacted through the medium of the Law Union and Rock, may be summarised thus:—

		Rise or Fall
New Business:—		
Net sums assured	£ 1,411,192	— £644,248 (31.3%)
Income:—		
Net premiums	£ 738,827	— £20,000 (2.6%)
Net interest	£ 369,552	— £25,580
Net interest rate	£ 3.5.4%	— £0.3.10%
Outgo:—		
Claims by death	£ 448,236	+ £20,982
Claims by maturity	£ 473,980	— £28,441
Surrenders, including surrenders of bonus	£ 110,437	+ £20,606
Commission and expenses	£ 116,337	— £9,160
Commission and expenses — ratio to premiums	15.7%	— 0.8%

The decline in new business is in accordance with general experience, and, apart from the increase in surrenders, the accounts show no abnormal features; war claims are stated to form only 3 per cent of the total.

Underwriting experience in the main non-life accounts is shown in the following table:—

	Premiums	Rise or Fall	Under-writing Profits	Rise or Fall
Fire	2,878,908	+ 34,701	221,262	— 46,433
Accident	2,264,241	— 203,911	153,603	+ 48,802
Marine	2,088,964	+ 416,958	215,549	+ 74,921
Total	7,232,113	+ 247,748	590,414	+ 77,380

The Governor (Sir Frederick Pascoe Rutter), in his statement to the shareholders, referred to the considerable increase in fire losses at home: in the United States the company incurred a loss on fire operations for the first time since the San Francisco catastrophe of 1906, aggravated by a severe tornado in the Middle West costing £1,500,000, of which the London and Lancashire had its share. In the circumstances the profit of £221,262 is extraordinarily good. Developments in the accident account, which also includes a United States portfolio, are in keeping with the experience of other offices; relative to the very gratifying marine profit, which is arrived at after applying a 40 per cent premium reserve—an uncommon procedure in marine accounts—the Governor uttered a warning that a continuance cannot be expected, since notwithstanding the steps

taken to improve the rates both for hulls and cargoes, ordinary marine business is still not on a paying basis.

Transfers to profit and loss, including net interest of £389,500 aggregate £988,574. Provision for British taxation absorbs £258,486, and staff pensions and widows fund together take £60,000; after providing for a dividend at the same rate as last year, requiring £499,422, the balance carried forward is higher by £260,666 at £3,388,604. The balance-sheet position is exceptionally strong; apart from an undisclosed margin in the value of the investments and the balance of profit and loss account, there are "additional reserves" in the fire, accident and marine accounts aggregating £4,400,000 and a general reserve fund of £2,000,000.

Royal Exchange Assurance.—Total premiums and annuity considerations of the Royal Exchange group amounted in 1940 to £9,647,000. Unfortunately, the underwriting accounts of the parent office do not include the figures of subsidiaries—the latter being treated as investments—so that they present an incomplete picture of the group's activities. The Royal Exchange alone has a premium income of £4,693,000. Extracts from the life account are given below:—

		Rise or Fall
New Business:—		
Net sums assured	£ 2,220,597	— £744,667 (25.1%)
Income:—		
Net premiums	£ 1,376,945	— £11,089 (0.8%)
Net interest	£ 469,083	— £24,641
Outgo:—		
Claims by death	£ 473,917	+ £133,021
Claims by maturity	£ 610,108	+ £25,114
Surrenders, including surrenders of bonus	£ 126,732	+ £9,759
Commission and expenses	£ 197,380	— £18,673
Commission and expenses — ratio to premiums	14.3%	— 1.3%

The quinquennial valuation was made on a strengthened basis, with interest at $2\frac{1}{2}$ per cent, against 3 per cent five years ago. The surplus disclosed of £1,474,309 includes the profit brought forward from the previous quinquennium, after deducting which and making certain adjustments, the one-tenth share allocated to the proprietors is £85,655. The Royal Exchange is one of the few offices to maintain a reversionary bonus, albeit at the reduced rate of £1 per cent. per annum.

Premiums and underwriting profits (excluding interest) in the other leading departments are as follows:—

	Premiums	Rise or Fall	Under-writing Profits	Rise or Fall
Fire	1,504,084	+ 61,137	649	— 146,802
Accident	1,078,304	— 121,805	131,337	+ 11,709
Marine	497,658	+ 100,499	— 16,076	+ 1,854
Total	3,080,046	+ 39,831	115,910	— 133,239

Conditions at home, together with an unprofitable result in the United States, account for the disappointing year in the fire department. In the accident department a lower premium income, coupled with an increased profit, is in line with the experience of other offices; the same may be said of the substantial jump in marine premiums.

Interest income (excluding life, annuity and capital redemption) amounts to £152,170, against £188,250 in 1939; the fall is explained in part by the absence of dividends from certain foreign subsidiaries. The aggregate of credits to profit and loss account (including £30,229, being one-fifth of the proprietors' share in the quinquennial profits of the life, annuity and capital redemption funds) is £309,279. £20,000 has been written off office property, and provision for taxation, pension fund, ARP expenditure and expenses not otherwise charged, together absorb £123,071. A transfer of £100,000 has been made to the annuity revenue account for the purpose of writing down the value of investments; the dividend is at the same

rate as last year, and the cost during the year £176,862, the balance carried forward being lower by £110,655 at £1,047,869. In the balance-sheet assets are certified to be fully of the value stated, Stock Exchange securities having been taken at or below market prices; in addition to the balance of profit and loss account, forming a general reserve, there are "additional reserves" in the fire and accident accounts totalling £1,300,000.

The principal subsidiaries are the Motor Union and Car and General; as their names imply, both offices are chiefly interested in motor insurance. The accident account of the Motor Union discloses a heavy fall in premiums of £428,927, from £1,458,000 to £1,029,073, doubtless owing largely to a lower motor income at home and the loss of business from the Continent; the Car and General, on the other hand, has a higher accident premium income at £1,634,586, against £1,613,691, for which the stabilising influence of the United States portfolio is presumably responsible. Both companies are able to show higher profits. The other important subsidiary, the State, has a small loss on the fire account, which with a premium income of rather over £500,000 is the major interest.

North British and Mercantile.—The following is an epitome of the life revenue figures of the North British and Mercantile:—

		Rise or Fall
New Business:—		
Net sums assured	£ 1,065,010	— £3,924,162 (66.0%)
Income:—		
Net premiums	£ 2,480,821	— £79,468 (3.1%)
Net interest	£ 1,039,436	— £16,757
Outgo:—		
Claims by death	£ 1,098,555	+ £145,325
Claims by maturity	£ 1,505,746	+ £120,413
Surrenders, including surrenders of bonus	£ 300,895	+ £109,557
Commission and expenses	£ 374,537	— £44,233
Commission and expenses — ratio to premiums	15.1%	— 1.3%

By way of explanation of the heavy fall in new business the deputy chairman (the Hon. Arthur O. Crichton) points out in his statement to the shareholders that, whereas many of its contemporaries had already shown some effect of the war in their 1939 figures, the North British and Mercantile then experienced a "bumper" year, owing partly to one or two exceptionally large blocks of business. Mortality has been within expectation, notwithstanding the inclusion of many claims due to enemy action.

Fire insurance is transacted both by the parent office and by the Fine Art and General. Accident business is written through the medium of the Railway Passengers and marine through the Ocean Marine. Results are recapitulated below:—

	Premiums	Rise or Fall	Under-writing Profits	Rise or Fall
Fire—				
N. Brit. & Merc.	3,407,803	+ 126,724	95,572	— 207,636
Fine Art & Gen.	377,443	+ 20,324	30,141	+ 7,812
Accident—				
Rly. Pass.	1,305,548	— 72,674	164,389	+ 13,536
Marine—				
Ocean M.	634,689	+ 237,115	50,000	+ 10,000
Total	5,725,483	+ 311,499	340,102	— 176,288

As with most of the leading offices, the North British and Mercantile suffers heavily from the adverse fire experience at home and in the United States. The accident business does not include an American portfolio and developments in this and the marine account have followed the general trend.

In the profit and loss account and balance sheet of the parent company the interests in subsidiaries are handled on an investment basis. Taking profit and loss first, credit transfers total £580,406, the principal item being net interest of £443,621, which includes tax-free dividends from the subsidiaries aggregating

(Continued on page 694)

Investment

EPT Concessions

The Finance Bill throws light into some of the dark places left by the Chancellor's statements as to amendments of the Excess Profits Tax, in his Budget speech and in the debates which followed. The clauses which will most repay study are Nos. 22 and 28, dealing respectively with additions to standard profits of mining and oil companies, and with the treatment of EPT in cases of industrial concentration. Clause 19, which covers the post-war return of 20 per cent of all tax, leaves the date of repayment to be determined by Parliament. The concession with regard to metal and oil mining companies takes the form of an increase in the standard profits of the concern, the datum line from which EPT is calculated. This increase may be as much as 30 per cent in cases where, but for the war-time increase in output, the property would be exhausted between 1946 and 1950, falling to 20 per cent in the next quinquennium; to 10 per cent in the decade 1961-70, and 5 per cent in the twenty years to 1990. It will be the function of the Treasury to determine whether a company shall rank for a concession, while the Commissioners will fix its amount, subject to an appeal to the Board of Referees. The Treasury is also to determine what deposits are to be taken as ranking in the determination of the life of an undertaking, a fact which makes it impossible to form any exact idea of the effect of the concessions. It seems probable, however, that it will not be very large, and that it will be greatly delayed if the method suggested for determining reserves is not altered. With regard to the concentration of industry, any sums paid to a firm closed down by a nucleus undertaking will be treated, for both EPT and income tax, as though they were the trading receipts of the former, and will be excluded from the accounts of the latter for tax purposes. Firms closed down are to be permitted normal depreciation allowances, and it seems probable that these and similar items will absorb a substantial part of any profit coming to them. Under these arrangements, the effect of the Lyttelton scheme will be a reduction in current tax revenue as against what would have accrued had concentration been effected by pure competition.

Depreciation Allowances

Section 15 of the Finance Bill implements the promise of exceptional depreciation on machinery or plant installed after January 1, 1937, which has become obsolete or unnecessary. The concession is only granted when the fall in value, beyond that provided for by normal depreciation, is due to conditions arising out of the war, and, pending

a final assessment, the maximum additional allowance is 10 per cent per annum. As was mentioned in an article appearing in *The Economist* of April 5th, this provision is insufficient, in some cases. In his statement to shareholders of ICI, Lord McGowan takes up this point and puts forward the view that every taxpayer should be entitled to a lien on his excess profits sufficient to write off capital expended in the national interest on purely war time projects. Since April 5th, income tax has been raised, and a good deal has occurred to suggest that post-war prices will be very materially above even current levels. Both these factors aggravate the shortage of liquid capital, which payments of EPT at 100 per cent make probable, while increasing the amount eventually required for reconstruction. The concessions made in the Finance Bill are real and valuable, but it may well prove that they will be insufficient to fulfil their purpose.

Rio Tinto Problems

The full accounts of the Rio Tinto Company for 1940 show a further deterioration in the position, arising both from the policy of the Spanish authorities and from high taxation of the Rhodesian copper interests. These developments have made it necessary to draw much more heavily on accumulated peseta balances in Spain, previously written off. At the current rate, it seems probable that these will be exhausted by mid-1942. For the time being, the preference dividend is covered with a fair margin, but for the tenth year in succession there is nothing for the ordinary shareholder. The table below shows the trend of receipts and expenditure for the past three years:—

	Years to December 31st		
	1938	1939	1940
Revenue:—			
Sales, net.....	234,762	224,194	86,213
Peseta balance used	3†	64,611	441,776
Dividends, etc.	340,495	284,331	241,892
Total net	575,260	573,136	769,881
Expenses:—			
Administrative, etc.	266,410	273,346	269,655
Debt, int. and red.	160,694	160,640	160,685
Provision for Taxes	—	—	200,000
Preference shares	81,250	81,250	81,250
Earned for ordinary	66,906	57,900	58,393
Earned %	4.3	4.4	5.5
Carry forward	451,820	509,720	568,113

†15,000,000 pesetas as written down to 3.

(Continued from page 693)

£170,000; the fire profit of £95,572, life profit (one-fifth of the quinquennial profit) of £35,114 and sundry items totalling £6,099 make up the balance. On the outgoing side United Kingdom taxes take £87,113, foreign and colonial taxes not otherwise charged £26,319 and super-annuation and widows' funds together £60,000; £80,000 is written off the cost of businesses acquired. After providing for dividends at the same rate as before, costing £371,083, the balance to be carried forward is £2,558,143, a reduction of £44,109. In the balance sheet, assets are certified to be fully of the value stated and apart from the balance of profit and loss, there is a contingency fund of £1,000,000 and an additional reserve of £3,000,000 in the fire account.

Yorkshire Insurance.—The life revenue account of the Yorkshire exhibits features in keeping with the majority of comparable offices. At £1,396,567 new business is lower by 50.8 per cent., but the effect on premiums, which at £856,039 show a fall of 3.4 per cent., is relatively slight. Death claims are a little higher, owing to enemy action, and the net rate of interest at £3 13s. 1d. per cent and combined commission and expense ratio at

12.5 per cent. are both reduced. On the other hand annuity income at £418,885, against £150,084, displays a very substantial increase. Consideration to the payment of interim bonuses is being deferred until the next valuation.

In the other important departments the figures are as follows:—

	Premiums	Rise or Fall	Under-writing Profits	Rise or Fall
Fire	917,185	— 10,881	53,554	— 45,048
Accident	1,302,910	— 167,832	100,528	+ 6,026
Marine	800,089	+ 306,022	20,000	+ 10,000
	3,020,184	+ 127,309	174,082	— 29,022

Here again the results, which are arrived at after setting up additional reserves for war contingencies of £23,500 and £55,500 in the fire and accident departments respectively, give testimony to the common experience.

Profit and loss account receives total credit transfers of £278,015, including net interest of £75,682. Of this various expenses not otherwise charged take £49,164, Dominion and foreign taxes (which are not debited to the underwriting accounts as is the usual practice) £55,272 and reserve for income tax and N.D.C. £57,000. Interim dividends and provision for final dividends at the same rate as last year absorb £105,055, leaving

a balance to be carried forward of £88,157, an increase of £11,524. Stock Exchange securities are taken at or less than market prices on the 31st December, 1938, the date of the last quinquennial valuation, and other fixed assets remain at the 31st December, 1939, balance sheet values, acquisitions subsequent to these dates being included at cost price. There is a general reserve fund of £1,500,000.

Caledonian Insurance.—Life new business in 1940 amounts to £627,450, a reduction of 56.9 per cent., and premiums at £591,838 show a decline of 3.1 per cent. The average net interest yield is £3 9s. 9d. per cent., a fall of 2s. 11d. per cent. Death claims are rather higher by reason of enemy action. The valuation of the life fund, which in the ordinary course of events would have been made at the end of 1939, covering a triennial period, has been postponed until December 31st, 1941, and will embrace the quinquennium ending on that date; in the meantime it has been decided to allot interim bonuses of £1 per cent. in respect of each year's premium for the years 1937 to 1940 inclusive.

In the fire and accident departments, after setting aside war contingency reserves of £3,600 and £46,000 respectively, the profit margins are very slender (Continued on page 710)

Despite the difficulties of the position, there is some improvement in the cash position, for the net increase in near and distant liabilities is only £53,000, while liquid assets are up by £21,000 and the net debt of the company to its subsidiaries is lower by £180,000. Assets, apparently outside Spain, make up almost half the total, but of these it is certain that the Rhodesian holdings are undervalued. Current dividends from investments cover debenture service and preference dividend. The £5 ordinary shares stand at £7, a value which discounts a very material recovery in the receipts from Rhodesia and, possibly, some improvement in the future of the Spanish undertaking.

Shipping Dividends Resumed

The payment of dividends of 5 per cent on the ordinary capital of the *Union Castle Mail Steamship Company* and of 4 per cent on that of *Cairn Line* must come as a pleasant surprise to shareholders in these companies after at least a decade without any return. The latter company's revenue has, of course, shown a steady recovery in recent years, and gross profits of £69,120 for the year

ended December 31, 1940, against £44,947, have continued the improvement to the highest level since the depression of the early thirties. With a transfer of £40,000 to fleet replacement account, against £30,000 to general reserve, the sum available for dividends amounts to £18,235, representing a rate of 6.1 against 8.5 per cent. After meeting the 4 per cent dividend, the carry-forward is increased from £3,481 to £9,716, with classification repairs of £1,262 against £21,885 being charged to general and classification reserve as before. The continued improvement in receipts argues that the terms of agreement with the Ministry of Shipping are proving satisfactory, at least as far as current income is concerned. It remains to be seen whether adequate arrangements for replacement of fleet can be made under the agreement. The creation of a reserve of £40,000 on this account is a first step, but the balance sheet shows a decline in steamers, etc., from £336,502 to £29,774. Cash items are correspondingly swollen. Investments jumped from £39,469 to £225,669 nominal, with a market value of £215,750 at the date of the accounts. Cash is up from £83,565 to £273,105, and debtors from £181,243 to £199,172 against an increase in creditors from £24,471 to £86,439. It is to be hoped that the directors will

REPORT OF THE AUDITORS TO THE MEMBERS.

We have audited the above Balance Sheet with the Books in London and the certified Returns from the Branches. We have obtained all the information and explanations we have required. In our opinion such Balance Sheet is full and fair, containing the particulars required by the regulations of the Company, and is properly drawn up so as to exhibit a true and correct view of the state of the Company's affairs according to the best of our information and the explanations given to us and as shown by the books of the Company.

Auditors.

London, 9th May, 1941.

continue to restrain dividends in the interests of fleet replacement. The full figures of *Union Castle*, when available, should add considerably to the picture. The 20s. ordinary stock units rose 2s. 3d. to 12s. 9d. on the news, giving a yield of £8 13s. 10d. The *Cairn Line* 10s. ordinary shares at 5s. 4½d. offer a yield of £7 14s. 8d. per cent.

Babcock and Wilcox Investments

The full accounts of Babcock and Wilcox for last year show that the earnings, before tax, discussed in *The Economist* of May 17th, revealed only part of the story. Income at £885,000 fell by £107,000 odd, and, while normal expenses were reduced, and only £54,894 was set aside for war losses, against £124,936, it was necessary to provide £25,000 for war damage premiums. The tax provision is reduced by £50,000 at £225,000, owing to the fact that it excludes tax on dividends, and, as already disclosed, there is a small margin of cover for the 11 per cent distribution on the ordinary capital. The above figures must be read in conjunction with the fact that, out of a special reserve of £451,393, £310,368, against £97,319, is estimated to be required to provide for depreciation of investments in enemy countries. Fortunately there is an improvement in holdings of gilt-edged in excess of £40,000. Unexecuted orders, according to the report, still stand at a record high level, and the balance-sheet value of stock and work in progress is up from £1,539,910 to £2,308,938. A slight stringency of working capital is argued by the creation of bank overdrafts to a total of £315,248 and a jump in creditors, including tax provision, from £1,357,336 to £2,044,493. The increase is by no means compensated by a rise in debtors of some £100,000 to £1,860,075. Lower cash holdings, at £110,389 against £226,377, have served to raise holdings of Government securities by some £70,000 to £1,928,991. The turnover of the group is bound to be below normal owing to the loss of subsidiaries, but that of the company should be well maintained. Whether gross profits can equal those of last year is doubtful, but the need for heavy special appropriations may be past. The £1 ordinary shares, at 41s., yield £5 7s. 3d. per cent.

United Molasses Report

The full accounts of United Molasses for 1940 reveal a decline in the balance-sheet value of fixed assets from £1,854,175 to £1,491,199, due largely to the transfer of the company's tanker fleet to a newly-formed, wholly-owned subsidiary, Athel Line. Thus, it is clear that United Molasses has now substantially the character of a holding company, and no allocation requires to be made to ships' survey and renewals reserve, against £50,000 in the previous fifteen months. Contingencies reserve receives £150,000 against £360,000. Moreover, a total of £1,222,493 due from the Ministry of Shipping, which represented a substantial current asset in the company's balance sheet at the close of 1939, has now disappeared from the accounts of the group. The transaction has financed a rise in British Government securities from £985,914 to £1,808,283. The consolidated account, at December 31, 1940, shows total fixed assets at £1,606,788 against £1,983,444. There remains, however, an unexplained drop in the total of vessels and steamships from £3,073,790 to £1,601,326, the depreciation provision being also reduced from £2,161,085 to £916,929. Total stock holdings for the group are some £50,000 higher at £275,279, and £112,400 is credited from tonnage replacement account. On the liabilities side, general reserve, as before, stands at £1,000,000, while the total of current liabilities, with contingencies and other reserves, now classified separately, amount to £1,045,725 and £1,225,725 respectively against a total of £1,314,843.

FAMOUS SINCE 1795
OTARD'S
COGNAC BRANDY

On the profits position, the full accounts add little to the preliminary statement discussed in *The Economist* of May 10, 1941. The most serious problem remains that of replacement of tonnage. It is highly satisfactory that the chairman, Mr F. K. Kielberg, is able to state, in his speech circulated with the report, that all fixed assets in danger zones have been written off or provided for. The 6s. 8d. ordinary stock, at 23s. 10½d. ex dividend, yields £6 5s. 6d. per cent.

Spinners and Slubbers

Further light is cast on the experience of the textile trades by the appearance of the full reports of *Fine Cotton Spinners and Doublers* and the *British Cotton and Wool Dyers' Associations*, both for the year ended March 31st. Despite the inclusion of a considerable period of restriction of home demand, both show profits, after tax, which are the highest for over a decade. The *Fine Spinners* figure is £673,861 against £614,761, and, but for the need to provide £100,000 for war damage premiums, 16.9 per cent would have been earned on the ordinary capital, against 9.4 in 1939-40. This year, the bulk of the surplus goes in establishing a war contingencies reserve of £200,000, so that once more there is no dividend for either preferred ordinary or equity holders. In the case of the *Dyers' Association*, an increase of almost 80 per cent in the charge for repairs and renewals reduces the net amount available for dividends from £73,591 to £45,902, after a slightly more ample transfer to depreciation, and the ordinary dividend is cut from 6½ to 5 per cent. The earned percentage is 7.8 against some 10 per cent. This company shows only a 20 per cent rise in stock in trade, and a marked expansion in cash and creditors doubtless reflects a large tax provision as much as a better turnover. The *Fine Spinners* balance-sheet shows surprisingly few large changes. Liabilities are up by £500,000, largely as a result of allocations, and this is balanced by rises of £300,000 in stock-in-trade and of £200,000 in cash. Despite substantial Government orders and reports of improvement in the export trade, it seems highly problematical whether either company will repeat these earnings in the current year. The *Dyers'* payment is, however, almost exactly the average distribution of the nine years to March, 1940, and, from the greater diversity of the material coming to it for treatment, is perhaps sufficiently well placed to maintain its dividend. The 5s. shares of *Dyers* at 4s. ex dividend give a yield of some £6 5s., while the 20s. units of *Spinners'* 5 per cent cumulative preference capital, covered some 6½ times by earnings, stand at 12s. 3d.

Two Colliery Results

Together, the accounts of *Yorkshire Amalgamated Collieries* and *Pease and Partners* provide an illuminating indication of the experience of collieries in the year to March 31, 1941. The first company, a holding concern interested almost exclusively in coal mining, suffered a fall in income from dividends from £258,897 to £168,521, caused by EPT and war damage premiums. After reducing the ordinary dividend from 7½ to 6½ per cent, and halving the allocation to general reserve at £25,000, the carry forward is slightly higher, at £124,750, against £119,233. Grossed up at the higher standard rate of tax, the cover for the ordinary payment is reduced only from 9.9 to 8.5 per cent. *Pease and Partners*, with gross receipts before tax of £617,446 against £605,774, is maintaining the previous year's allocations despite an increase in tax provision of £50,000 to £200,000. Net revenue has gained, and will benefit further this year, by the repayment of some £450,000 of 4 per cent debenture stock. After repeating the provision of £70,000 for depreciation and £60,000 for renewals and contingencies, the earnings percentage is reduced from 11.0 to 10.3 per cent, providing narrow cover for the ordinary payment maintained at 10 per cent. The carry-forward is slightly higher at £300,194 against £298,207. While both companies were hampered by the interruption in the coal export trade last year, the relatively better result achieved by *Pease and Partners* is probably to be explained by the greater spread of interests. The consolidated balance-sheets of both companies show a rise in stock, in the case of *Pease and Partners* from £508,526 to £624,684 and in that of *Yorkshire Amalgamated* from

£264,549 to £346,969. The *Pease and Partners* secured loan is reduced from £297,162 to £286,763. The 10s. ordinary shares, at 9s. 9d. ex dividend, yield £10 5s. per cent. The £1 ordinary shares of *Yorkshire Amalgamated*, now quoted at 14s. 4½d. ex dividend, offer a yield of £9 0s. 9d. per cent.

B.A. Western Moratorium

The news that the directors of Buenos Aires Western have found it necessary to propose a moratorium on the 4 and 5 per cent debenture stock and on the 4 per cent three-year bearer notes newly re-issued this year, is, of course, more disappointing since it is unexpected. It is, of course, clear that all Argentine railways are gravely affected through interference with the Argentinian export trade, and that rising running costs have pressed heavily on earnings. In the last complete financial year, to June 30, 1940, operating receipts rose for the third year in succession, and total profits, at £819,486 against £657,731, reached the highest level since 1936-37, the last year in which a preference dividend was paid. To meet prior charges involved a draft on the carry-forward of £7,764, but no draft on general reserve, compared with £125,000 in the previous year. Last year's improvement was mainly due to an excellent wheat crop. In the current year, crop prospects have been reduced in importance through the increasing difficulty of securing transport. The balance sheet at June 30, 1940, shows a total of £1,192,730 for capital and general reserves. Failure to continue meeting the claims of debenture holders from capital is no doubt due to recognition that the profit position must continue to get worse until the conclusion of the war. The company's stock was sold on the announcement of the moratorium, the 4 per cent debentures dropping 5½ points to 27½ in three days.

Anglo-American Corporation Group

The *Brakpan* report shows that milling grade is above the average of ore reserves. Development continues to expand in the Southern and Witpoortje sections. Dividends are reduced and, since the mine has now passed its prime, payments must be expected to decline further. *South African Lands* had another satisfactory year in which development was accelerated. The additions to plant will increase milling capacity to at least 120,000 tons a month, against 345,000 tons crushed last quarter. Profits expanded substantially and the dividend was increased. The report of

Springs Mine, on the other hand, shows no improvement. Development in the Main Reef declined and no discovery of value was made in the Kimberley Reef. The position should be improved when the shaft to serve the southern portion of *Springs* and *West Springs* eventually comes into commission. In the meantime, *Springs* is mainly dependent on its northern area, now almost fully developed. Development of *West Springs* is almost entirely confined to the southern section from No. 2 shaft, and development in this large area, which continues to be very satisfactory, will in future be the main source of supply to the mill. The ore reserve position is strong compared with the milling

	Years to Dec. 31.				Dividends			
	Ore Reserves		Grade		1939		1940	
	Actual	Change	1939	1940	s. d.	a. d.	s. d.	a. d.
	1,000 tons.		dwt.	dwt.

tonnage, and, in due course, the proposed vertical shaft, which is to serve the southern portion of the property (in conjunction with *Springs*) will enable development to be expedited. The present yield of about £8 per cent appears to be somewhat high for a mine with the long life and potentialities of *West Springs*. *Daggafontein* had another very good year and satisfactory development on the Kimberley Reef continued. Both tonnage milled and profits showed a substantial increase. The mine has a prosperous career ahead and the position is most satisfactory, although it is hardly likely that there will be any material expansion in operations. *East Daggafontein* enjoyed excellent development, while that on the Kimberley Reef continued to add substantial tonnage to reserves. With an increase in tonnage milled and prospects of a long life, *East Daggafontein* should raise dividends in due course. *Western Reefs*, a vast new area situated in the Klerksdorp district near property which has formerly proved unprofitable, has frequently been regarded with scepticism. Yet, the latest report of underground development is again highly satisfactory. The reduction plant to mill 100,000 tons monthly is near completion and the dividend stage should be reached next year. Should present prospects continue, *Western Reefs*, with its large number of separate ore bodies, should become one of the great mines of the Rand and has considerable speculative possibilities.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

THERE has been little business in any section of the markets this week. Fresh military developments in Syria and Crete inclined investors to take a cautious view, while, at home, publicity for the London War Weapons week served to reduce interest in the stock markets. The funds suffered moderate losses, more through absence of buyers than from selling pressure. Other sections were mainly easy with business at a minimum. In the industrial market, shipping, textiles and breweries made an exceptionally firm showing. Commodity share markets moved irregularly and again turnover was slight.

The gilt edged market closed last week dull and opened on Monday without improvement. Before the week-end, 4 per cent Consols and 3½ per cent Conversion closed ½ down and on Monday a long list of losses in the order of ½ included

2½ and 4 per cent Consols, and 3½ per cent Conversion and War Loan. Dated issues were somewhat firmer and later in the week, Monday's prices were mainly held, although business remained essentially cautious. In midweek, shortage of stock and restrained buying raised 3½ War Loan ½ and 2½ per cent Consols by ½, but 4 per cent Funding lost the same amount. The foreign bond market was remarkable for the strength of Chilean and Japanese issues, the latter inspired by unsubstantiated rumours of the conclusion of hostilities in the Far East. Thus, on Monday, the majority of Japanese issues improved ½ point. Other features were the firmness of Egyptian, Czech and Belgian stocks.

The home rail market saw little business except among ordinary issues. Here price movements were not considerable, but most stocks are lower on balance. Great Western ordinary lost as much as 1 point before the week-end, while LMS ordinary, after moving irregularly, dropped ½ on Tuesday. Later in the

week prices were mainly firm, but few quotations changed. London Transport "C" lost ½ in midweek. Among foreign rails, Canadian Pacific ordinary was higher on balance, but Argentine issues declined on the news of the B.A. Western moratorium, the 4 per cent debentures of that railway losing 3 points at the beginning of the week.

Despite a general paucity of business among industrial shares, a number of sections showed considerable strength this week. Textile issues were strongly in demand, with attention focussed on Coats. Bradford Dyers and Lancashire Cotton also improved, but Courtaulds was marked lower against the trend. Breweries were also in favour. Bass continued their recent steady progress and, on Tuesday, gained 2 points on the ex dividend quotation, while Courage, Guinness, Distillers and Mitchell and Butlers were also bought. The shipping section, encouraged by the Cairn Line and Union Castle resumption of dividends, staged a recovery in which these

(Continued on page 698)

Industry and Trade

Coal

Towards the end of March, the Government, realising the need to accumulate stocks for next winter during the summer months, issued an appeal to the coal-mining industry to increase its output, which was then barely adequate for current needs. Steps have since been taken to prevent a further depletion of the industry's labour force by the application to coal-mining of the Essential Works Order. But after two months of the issue of the appeal for increased production, there are still no indications of a serious improvement in output. Reports from the principal mining districts suggest, in fact, that the supply position is scarcely any better than at the end of March and that production is still only barely sufficient to meet current demand. True, the persistence of cold weather has retarded the seasonal fall in the demand for coal and coke for heating purposes, but in view of the drastic curtailment in exports after the collapse of France, the accumulation of substantial stocks this summer is well within the capacity of the coal-mining industry. But unless drastic measures are taken to speed up production immediately, Great Britain will face the next winter without the coal dumps in the principal centres of consumption that are essential if a shortage, harmful to health and to the production of munitions, is to be avoided.

Further Fall in Unemployment

Unemployment continues to dwindle. Between March 17th and April 21st the number of unemployed on the registers of the employment exchanges of Great Britain fell by 47,407, from 457,918 to 410,511. Almost the whole of the reduction took place in the category of wholly unemployed. On April 21st these numbered only 318,772, against 364,308 on March 17th. The number of wholly unemployed men fell from 159,638 to 139,895 and that of women from 165,319 to 133,056. There was an increase in the number of wholly unemployed boys and girls from 39,351 to 45,821, but this is explained by the registration of the Easter school-leavers. In view of the small number of registered unemployed, the war industries now have to rely for additional recruits mainly on transfers from unessential and over-staffed industries. In the case of industries whose labour force has been depleted during the past decade, the Government has rightly adopted the method of

recalling the skilled workers who have taken up other occupations. This week, for example, the Ministry of Labour and National Service has made an Order for the registration of all men with experience of marine-engine building or repairing or heavy engineering work of a similar nature, in order to speed up the production and repair of ships. The Order applies to all men aged twenty or over who have worked for twelve months or more since January 1, 1929, on marine-engine building or repairing as fitters, assemblers, erectors or turners. Since the training of these specialists takes years, workers who have already had experience can make a greater contribution to the expansion in production than new recruits drawn from cotton mills, for example.

The John Lewis Partnership

In a paper read recently before the Royal Society of Arts, Mr J. Spedan Lewis described the co-partnership scheme which his firm has developed during the past thirty years. All the workers, regardless of age and length of service, are partners. The charges on profits are: first, the pay sheet; secondly, help to partners in special need; thirdly, a fixed rate of interest on such capital as the partnership does not own; fourthly, the formation of reserves; fifthly, the provision of collective benefits. The remainder is distributed to the partners in proportion to their wage or salary during the relevant period. It is distributed in the form of shares, but these, apart from certain temporary deposits by way of fidelity guarantees, are the unconditional property of the recipients. Some 300,000 shares have already been distributed in this way, but Mr Lewis is hardly justified in his statement that "in almost any other business in the world all of the profit represented by these shares would have been taken by the owners of some part of the capital or by the most powerful member or members of the management." Though his firm's scheme is one of the most comprehensive, co-partnership schemes are not as rare as he seems to imply. The firm's arrangements for securing freedom of speech, which they believe to be of greater importance in keeping employees contented than the actual exercise of power, are ingenious. There are committees, elected by ballot by and from the rank and file, whose function is to maintain contact between employees and management. Their meetings are attended by a principal member of the management, and care is taken to

prevent fear of victimisation. The recipients of the highest votes at the elections to these committees are also members of the Council, which, in addition to liaison duties, exercises control over substantial funds which are applied to the relief of hardship and to the financing of various social activities. A weekly newspaper which encourages anonymous correspondence provides a further opportunity for the outspoken, and yet another is offered by the general meeting, at which any subject can be discussed by previous request, and the request may be made anonymously. After years of informal experiment the system was given legal existence, in the form of an irrevocable trust-settlement, in 1929, and the company can legitimately claim that it has made a contribution to the evolution of "personal" organisation.

Democracy in Industry

On the basis of his thirty years' experience of the system, Mr Lewis made suggestions concerning the principles on which co-partnership schemes should be based. He regards some form of self-government as indispensable to modern businesses, since redistribution of income, without a substantial increase in the total, cannot effect a great increase in human happiness, and a great increase in the national income can only be brought about by contented workers. He enumerates seven principles which he feels essential to the organisation of a successful scheme: paternalism must be avoided; workers must not be asked to play a part in the management which is beyond their ability; their desire for more pay, more security, better status and more power should be satisfied; and, lastly, some motive must be found which, when the profit motive is absent, will bring businesses into existence and keep them active. On the subject of pay Mr Lewis advocates a rather high minimum wage for mature workers, and the payment of their full market value to workers of earning power above the minimum, expressing a rather vague hope that the co-partnership benefit will fill the gap between a worker's market value and his own estimate of his value. This gap is surely a crucial problem not to be so easily dismissed. The need of the worker for more security is another of the most vital problems, but here the experiments made by Mr Lewis's firm, which lead to the conclusion that some people are fitted to be permanent members of the organisation to which they belong, and work better if they know they have security of tenure, whereas others can only be kept up to the mark by the constant fear of dismissal, seems to leave the problem precisely where they found it. The desire of the workers for

a better status seems, in Messrs Lewis's experience, to be fairly easily met by tact and good manners in the widest sense. The fostering of contact between the different grades, the provision of a high quality of everything in the way of "collective benefits," such as sports and other recreation facilities, and the careful safeguarding of freedom of speech, go a long way, according to Mr Lewis's experience, to satisfy this desire. The desire for more power he thinks greatly overrated. When he comes to the question of finding a substitute for the profit motive, which co-partnership to a large extent removes from the promoters of industry, Mr Lewis discusses almost exclusively the position, qualifications and powers of the head of the firm, which hardly meets the question. It is on the "labour" side that the long consideration and experience he brings to the problem is most fruitful.

Further Ship Chartering Control

On May 22nd there came into force a new Order of the Minister of War Transport, entitled the "Use and Hire of Ships Order, 1941." It provides that no person shall, without authority from the Ministry, agree or offer to enter into an agreement for the use or hire of any ship, or for the carriage of goods in any ship which is not a fishing-boat or a Government or licensed ship and which has a gross tonnage of 1,600 tons or more. As all British ships of this size are already either requisitioned by the Ministry of War Transport or licensed by it, the new Order only affects vessels owned outside this country. The supply of free foreign-owned shipping has been greatly reduced during recent months, and the effect of this Order is to bring the chartering of the remainder under the control of the Ministry.

Record U.S. Tanker Construction

As the shipment of petroleum products requires special vessels a shortage of such ships—tankers—would imperil Great Britain's supplies of a vital war material. While there is no reason to suppose that there is a serious shortage of tankers, it is reassuring to learn that American shipyards have a record tonnage of such vessels under construction. Orders for 72 vessels were recently placed by the United States Maritime Commission and a further 70 are reported to be under construction for the various oil groups—15 for the Standard Oil Company (N.J.) alone. The tonnage of these vessels, 25 of which are expected to be in service this year, reaches the remarkable aggregate of 1,800,000 tons deadweight, a figure which compares with a previous record of 700,000 tons, established at the end of the last war. Many of these new vessels

(Continued from page 697)

two concerns, P. and O. deferred and Clan Line, were prominent. Elsewhere, there was little interest, although in the miscellaneous group, Lever and Unilever was consistently firm.

Kaffirs reacted strongly to news of the threat to Syria, but Cape support served to maintain the majority of prices. Johnnies were sold in a small way and, before the week-end, Sub Nigel and Crown Mines were also marked lower. Among developing concerns, Western Reefs rose. The stagnation of the previous week was continued in the rubber share market, but Rubber Trust and United Sua Betong enjoyed small and isolated gains. In the oil market, geographical proximity to the conflict zone appears to have had little effect on prices, but last week's recovery was interrupted. At the beginning of the week, small improvements in the order of 7½d. were realised by such market leaders as Shell Transport ordinary and Burmah Oil, but most prices were lower on balance and in midweek irregular movements were general. Anglo-Iranian and Burmah ordinary continued to improve.

New York

Both the latter half of last week and the current week have seen very slow trading on Wall Street. While the international situation continued to give rise to cautious dealing, the most important influence on market sentiment was, probably, the expectation of further wage demands. Price movements have throughout been narrow and irregular with little change on balance. On Tuesday steel, oil and aircraft issues were prominent and some increase in business took place, but, while the undertone became firmer, trading was generally lethargic. Sentiment in midweek remained quietly firm

until the close, which was somewhat irregular. The Iron Age estimates steel mill activity at 100 per cent of capacity against 99.5 per cent in the previous week.

Issues to Shareholders Only

Llanely and District Electric Supply.—Issue of 60,000 6 per cent Cumulative £1 Preference and 60,000 £1 Ordinary shares. Holders have the right until May 30th to apply for the shares in units composed of one Preference and one Ordinary at 43s.

Australian Renewal Result.—Acceptances of the Australian Government offer to renew the 3 per cent 1939-41 loan for three years have amounted to over £8,000,000. The amount of loan is £13,469,981. The result will leave about £5,000,000 of stock to be paid off on October 1, 1941.

Shorter Comments

Svenska Handelsbanken.—Gross profit for 1940, before taxes, increased by Kr.1,039,239 to Kr.41,758,841. Net profit after Kr.8,110,421 (Kr.5,938,458); tax was Kr.1,132,723 below figure for 1939. Dividend 9 per cent. Forward Kr.707,501; funds total Kr.160,000,000.

Western Union Telegraph.—Gross operating revenue for 1940, \$99,704,353, an increase of \$4,043,950; expenses \$65,262,349; increase \$1,784,089. Net balance from operations \$6,113,794, increase \$2,081,490. Net income \$3,621,581, increase \$2,241,467. Dividend \$1 per share \$1.045,038. Forward \$78,167,954 (\$75,741,790).

British Columbia Power.—Net revenue, 1940, \$4,292,952 after provision for taxes. Bond interest. Preference dividends, etc., \$2,231,687. Dividend \$2,000,000 on "A" shares. Surplus for year \$61,264.

Rand April Profits.—Total estimated working profit gold mines of the Witwatersrand for April, 1941, £3,755,596. Profit for March, 1941, £3,897,732.

will be required to relieve the present shortage of tankers in the American trade, brought about by the requisitioning of fast tankers by the United States Navy, transfers to foreign registry, the growth of coastwise shipments from the Gulf coast to the Atlantic seaboard, and by the obsolescence of numerous vessels now in service. But there can be little doubt that a sizeable surplus will remain available for the replacement of British losses. Allowing for war losses, the world's tanker fleet, according to a recent American estimate, at present amounts to some 17,600,000 tons deadweight. Of this aggregate about 50 per cent. is already owned by Great Britain and the United States (in approximately equal proportions), while a further 20 per cent flies the Norwegian flag and is mostly operating on behalf of the Allies. The tonnage at Great Britain's disposal should suffice this year, especially if civilian consumption is reduced without delay by the application of a needs test. And in view of the magnitude of the building programme now under way in the United States, it should be possible to look forward to 1942 and 1943 with reasonable confidence.

Slump in Cotton Exports

The blockade of the Continent and the scarcity of shipping have been responsible for a slump in the international trade in raw cotton, reflected in the accompanying table. There was an increase in the combined exports of the seven leading producing countries between the six months ended January, 1939, and the corresponding period in 1939-40, due largely to the heavy intake of American cotton by Great Britain; exports from the United States to this country actually rose from 300,000 bales to 1,401,000 bales during this period. But during the six months ended

January, 1941, the combined shipments of the countries shown in the table, exclusive of British India, were only 30 per cent of the quantity exported during the same

EXPORTS OF RAW COTTON, AUGUST-JANUARY,
(In thousands of bales)

(a) Not available

period in 1939-40. The United States bore the brunt of the reduction in trade. Her exports during the six months ended January, 1941, were only 16 per cent. of the quantity shipped in 1939-40. Her shipments to Great Britain fell from 1,401,000 bales to 349,000 bales; her exports to Japan declined from 601,000 bales to 41,000 bales, and the quantity of cotton sent to the Continent was only 18,000 bales, against 1,752,000 bales in 1939-40. On the other hand, Russia, who purchased no cotton from the United States in 1939-40, took 147,000 bales in 1940-41. Egypt also suffered a reduction in exports, due partly to transport difficulties, but Brazil was able to increase her shipments, mainly as a result of heavier Japanese, Canadian, and Spanish purchases.

COMMODITY AND INDUSTRY NEWS

Tin prices weakened considerably during the week, Wednesday's price for standard cash being £266 10s. - £266 15s. compared with £270 - £270 5s. per ton a week earlier. The three months forward quotation was £266 5s. - £266 10s. per ton, compared with £267 15s. - £268. The Board of Trade has informed the Metal Exchange that licences are not now to be granted for the export of tin to the United States, and it is unlikely that the ban will be lifted for a considerable time. The Hemp Control has raised the c.i.f. price of sisal from £26 per ton for Grade I to £30; prices of other grades will be in proportion.

Rubber Quota Unchanged.—A meeting of the International Rubber Regulation Committee was held on May 20th, at which the export quota for the third quarter of the year was decided. The quota was fixed at 100 per cent, the rate which has been in force since the beginning of the year. Smoked sheet spot closed at 14d. per lb. compared with 14½d. a week earlier.

Cotton Business Improvement.—More business has been under consideration in the market than for several weeks past. Transactions have been irregular but the sales in yarn and piece goods have shown some improvement. Most of the orders have gone to nucleus firm producers. Raw cotton consumption in the United States continues on a very high level, the total for April of 920,000 bales being a record for all time and compares with 854,000 bales in March and 624,000 bales in April last year. The higher prices for raw cotton in the United States have been maintained. In piece goods for export most of the buying has been for Argentina, Java, South Africa and Canada, and printed and dyed fabrics have attracted more attention than other cloths. Increased sales have been reported in essential goods for the Home Services. Yarn business has been on a rather freer scale and spinners have received from the Controller more permits to sell.

Cotton Concentration.—The Board of Trade is now considering concentration

in the doubling and waste spinning and manufacturing sections of the cotton industry. Proposals for voluntary schemes may be submitted to the Cotton Controller, who will advise firms in their preparation. June 18th is the latest date for the submission of these schemes.

Vegetable Oils and Oil Seeds.—Supplies of vegetable oils at the disposition of the Control are generally satisfactory. Production of the oils of primary importance is maintained at a fair level and enables substantial allocations to be made to the consuming industries, more particularly those concerned with edible products. Paint manufacturers, soap makers and other technical users are supplied on a restricted yet reasonable basis. The official schedule of maximum prices will continue in operation until May 31st but was due for review and adjustment this week. The market for oil seeds is steady but quiet, with the U.K. Control a moderate buyer of Indian ground nuts and linseed. Shipments of Plate linseed are on a very moderate scale and make but little impression on the huge quantity still to be marketed. The Argentine Ministry of Agriculture report the exportable surplus to be 1,264,000 tons, compared with 368,000 tons a year ago when oilseed crushing countries on the Continent of Europe were still able to do business. The position is very different to-day and Plate growers have good ground for anxiety regarding the disposal of their product.

Food Control.—Licences will have to be obtained after June 16th for the manufacture of cocoa, chocolate and sweets. The Order applies to all undertakings whose output was more than 25 tons during 1940.

The Minister of Food has made Orders fixing maximum prices for the following articles: tapioca, sago, processed cheese, canned sardines, damsons and purple egg plums. Perch from the Lake District is now being canned in Liverpool and will be on sale in a few weeks.

An Order made by the Minister of Food, which comes into force on June 2nd, prohibits the manufacture or sale of

vitamin C, except under licence. Vitamin C for medicinal, pharmaceutical or scientific purposes is exempt from the Order.

COMPANY MEETINGS

THE NATIONAL BANK OF INDIA LIMITED

TOTAL DISTRIBUTION OF 16 PER CENT.

COMMENTS BY THE CHAIRMAN MR. R. LANGFORD JAMES

The following is the statement by the chairman (Mr. R. Langford James), which is to be submitted at the one-hundred-and-twenty-seventh ordinary general meeting of the National Bank of India, Limited, to be held on the 27th instant.

Following the lead of many other companies it has been decided that the proceedings at our general meeting this year will be of a formal character. I take the opportunity, however, on the occasion of the issue of the directors' report and the accounts, to address a few brief remarks to the shareholders instead of making the comprehensive survey of the Bank's business, usually expected from the chairman at the annual meeting.

Shortly after our last meeting we lost our deputy chairman, Mr. J. A. Swan, whose sudden and untimely death is deplored deeply by all who knew him. A greatly respected and popular member of our board, with wide knowledge of business and possessed of shrewd judgment, his colleagues desire to record their appreciation of Mr. Swan's valuable services to the bank. Since we met last the board have appointed Mr. J. K. Michie and Mr. E. H. Lawrence, Directors. Mr. Michie succeeded Mr. Swan as chairman of Messrs Steel Brothers and Company, Limited, and we have reason to congratulate ourselves on having secured his valuable services.

It gave us great satisfaction to invite Mr. Lawrence, our general manager, to occupy a seat on the board where his unrivalled knowledge of our business is of great value. In March last Mr. Lawrence completed fifty years in the bank's service, a unique event in the record of the bank's general managers, and one on which he received congratulations from many quarters.

NET PROFITS ONLY SLIGHTLY LOWER

For reasons already explained it has been impossible to present our accounts for the year ended December 31, 1940, at a time approximating the date when our annual meeting is usually held. Full returns from our branches are now to hand enabling us to give the information which, in normal circumstances, would have been in the possession of shareholders earlier in the year.

The net profits, which have been arrived at after making full provision for bad and doubtful debts and for taxation, amount to £439,943, and are only slightly lower than those earned during the previous year. The sum necessary to provide for taxation liability was considerably in excess of the previous year's requirements.

ADVANCE IN CURRENT FIXED DEPOSIT AND OTHER ACCOUNTS

One of the principal features of the balance sheet is the increase in the amount representing current, fixed deposit and other accounts which aggregate £34,750,000 against just over £29,000,000 at the end of the previous year. This is coincident with a decrease of over £2,000,000 in the total of discounts, loans receivable and other sums due to the bank—an indication of the restriction in the demand for banking accommodation due to the general disabilities created by war conditions. In this connection it is interesting to note that the statements furnished by the scheduled banks to the Reserve Bank of India on December 27th last disclosed demand liabilities amounting to Rs.174,94,00,000 as against Rs.146,57,00,000 on December 29th, 1939, whereas their advances aggregated Rs.101,45,00,000 against Rs.143,16,00,000. Our cash on hand increased and the figure at which it stood, viz., £9½ millions odd, was £2,660,000 higher than at the close of the previous year, while the item on that occasion of £1½ millions representing Loans Payable has disappeared. Indian Government Securities show little change while British Government Securities are £1,335,000 higher. These assets together amount to £14,646,000 and appear in the balance sheet at a figure below the market value on the date our accounts were made up. Taken in conjunction with the large cash balance already alluded to the ratio to the Bank's liability on current, fixed deposit and other accounts is slightly under 70 per cent.—a proportion which we should prefer to see lower with a corresponding increased outlet for our resources in financing the trading requirements of India and the other countries in which we operate.

The only other item of note in the balance sheet is the increase in the amount of bills of exchange outstanding of over £2½ millions, principally due to the longer period occupied in transit of the bills.

DIVIDEND DECLARATION

The directors thought it desirable in view of the unavoidable delay in submitting the accounts to declare, instead of awaiting the approval of a final dividend, a further interim dividend, which was paid on April 3rd, making a total distribution for the year of 16 per cent.

They now propose to allocate a sum of £50,000 to the Staff Pension Fund and £70,000 towards reduction of House Property Account. Provision under the latter heading will then have aggregated £220,000 during the last three years. The amount we propose to carry forward to the current year is practically the same as that brought in from the previous year's accounts.

THE OUTLOOK

In the present circumstances it is not my intention to make the customary survey of conditions in the countries and the industries in which we are mainly interested but a few remarks as to prospects appear to be called for. Primarily we are an exchange bank, which means, of course, that we are interested in the flow of commodities from and to the countries in which we operate. When we take into account the fact that European markets outside those of the United Kingdom, and other markets also are closed to our constituents for both outward and inward trade, and when we consider the strain imposed on shipping space by war conditions, the effect on our business must be obvious. While there is no reason to suppose that we shall not continue to secure our usual share of such business as is being transacted, I must confess to viewing the immediate future as more likely to show results below the average than the reverse. Nevertheless, it is the case that often in business and usually in war the unexpected happens, and so I trust my forecast may prove to be unduly sombre.

Our expressions of appreciation of the services rendered by our staff have never been of a perfunctory nature; under present conditions they are more than ordinarily cordial. Many of the staff are serving in the Forces of the Crown. We wish them Godspeed, and we extend to them our heartfelt hopes for their safe return. A burden of extra work is, of course, being borne—willingly and cheerfully—by those who have had to stay behind. In thanking them let me say that we are deeply sensible of all they are doing to keep the flag flying.

THE LIVERPOOL & LONDON & GLOBE INSURANCE COMPANY, LIMITED

105TH ANNUAL REPORT

In a statement circulated with the 105th annual report of the Liverpool and London and Globe Insurance Company, Limited, the chairman, Mr. A. Kentish Barnes, indicated that the company's report for 1940 showed satisfactory progress, though not quite attaining the 1939 standard.

New life figures were lower at £1,390,963, reflecting the average experience of offices generally. Fire business, at home and overseas, showed well-maintained premiums at £3,826,861, but higher losses at £1,761,384. Good progress had been made in the accident department, premiums being £4,606,441, and claims £2,345,813. Marine premiums rose to £885,597.

Underwriting profits totalled £644,458. Interest to profit and loss account was £374,205, and the balance carried forward was £1,459,211.

The directors recommended a dividend payment of 13s. 6d., making 27s. per share, less tax, for the year, being the same as for 1939.

IMPERIAL CHEMICAL INDUSTRIES, LIMITED

HOME FACTORIES WORKING TO CAPACITY

EVERY EFFORT MADE TO MAINTAIN EXPORTS

LORD MCGOWAN ON TAXATION

The annual general meeting of Imperial Chemical Industries, Limited, will be held on the 29th instant in London.

The following statement by the chairman (the Rt. Hon. Lord McGowan, K.B.E., D.C.L., LL.D.) has been circulated with the annual report and accounts:

In the home trade the war has been the source, direct or indirect, of ever increasing requirements for nearly all our products, and in general the company's factories at home worked to full capacity during the whole of 1940.

In particular we had during the year to meet increased demands owing to the reduction or cessation of competing imports, to the necessity to expand agricultural production at home and to the fact that many of our goods are of direct importance in the manufacture of war material.

At our meeting last year I told you something of our price policy. We were able in 1940 to continue the course I described for our main products almost up to the close of the year. But the growing pressure of rising costs outside our own control then forced us to advance certain prices in the home trade and to warn our customers that we might have to make further increases at intervals during the present year. Our customers have expressed their appreciation of the policy we have followed and their gratitude at the efforts we have made to meet their requirements.

OVERSEAS ACTIVITIES

War-time conditions have presented us with new problems affecting the company's activities overseas. I need not tell you we have not neglected our export trade. This branch of business is still of great national importance, for it furnishes purchasing power to pay for imported materials vital to the war effort. We have therefore regarded it as a duty to do everything possible to maintain our exports and shall continue so to do.

We have had to meet the difficulties of irregular shipping facilities and progressively more severe exchange control, while the demand abroad for the company's products in many cases increased owing to the cessation of supplies from enemy sources. The practical steps taken by the Government to foster export trade, notably the organisation of the Export Council and Export Groups, the extension of export credit facilities, and the establishment of the United Kingdom Commercial Corporation, have proved of great assistance in this sphere.

CONTINUED EXPANSION

Our main manufacturing subsidiary or associated companies in the British Empire—Imperial Chemical Industries of Australia and New Zealand Limited, Canadian Industries Limited, and African Explosives and Industries Limited—continued to prosper and expand. They are subject to the same forces which affect us. Their relations with their respective Governments grow closer and closer. Their object, like ours, is to serve the Empire need to the full. In sympathy with the urgent necessity in war conditions for local sources of supply, they continue to expand their own manufacturing capacity. In their respective countries they too are undertaking fresh tasks for their own Governments and ours, and are doing all they can to help in the establishment of new factories for war purposes. We are proud to record what they have accomplished.

These companies have also been of very material assistance to us in our export trade, since in certain directions urgent needs at home interfered with our ability to supply from our own works and the overseas companies enabled us to maintain our markets by meeting the demand from their factories. We are also greatly indebted in this respect to our friends Messrs E. I. du Pont de Nemours, of Wilmington, U.S.A.

RESEARCH

The research in our laboratories during 1940 was largely directed to efforts to assist the better prosecution of the war. In addition

to service requirements, manufacture of products either to replace those previously imported or to supply new demands under war-time conditions and the development of new products for sale to export markets involved considerable research in devising processes to make use of available raw materials. Our agricultural research station is co-operating with the Government on various problems related to the increase of domestic food production including the national silage campaign. Considerable progress is being made on a process for the production of feeding stuffs from straw for cattle.

THE STAFF

The number of our employees serving with H.M. Forces at December 31, 1940, was 9,664, and the company has continued to pay the allowance instituted at the outbreak of the war, while their membership of the pension funds has been maintained.

It is with regret that I have to announce that from the outbreak of war to the end of 1940 71 employees lost their lives on active service, 29 more are known to be prisoners of war, while a further 23 have been posted as missing.

Among all our employees there is a noteworthy spirit of voluntary contribution to the war effort. For example, every factory has a fully trained and qualified A.R.P. personnel, while many of our staff and workers not so engaged are members of the Home Guard.

CONSOLIDATED ACCOUNTS

We have again been able to place before you both the legal accounts contained in the annual report of the directors and the consolidated accounts in a separate document.

The consolidated accounts show the combined assets and liabilities at December 31, 1940, and the combined income for the year 1940, of Imperial Chemical Industries, Limited, and 111 subsidiary companies. A note on the balance-sheet tells you that the audited accounts of certain subsidiaries are not available for consolidation. Six of these, situated in enemy or enemy-occupied countries, have each a written-down book value of £1. The others we know have all made profits, but their final accounts are delayed.

The total gross income shown in the consolidated income statement is £18,375,000, compared with £15,343,000 for 1939. This increase of £3,032,000 is chiefly due to additional manufacturing and trading profits brought about by the larger volume of business.

EFFECT ON TAXATION BURDEN

Net consolidated income, however, has declined from £7,678,000 to £6,756,000, a fall of £922,000. The factor which almost alone turns an increase of £3,032,000 in gross income into a reduction of £922,000 in net income is the charge for taxation shown on the statement. Here it is seen that the net taxation burden to be borne by the company and its subsidiaries is £7,385,000, against £3,654,000 in the previous year, an increase of £3,731,000.

The standard rate of income-tax was raised to 8s. 6d. for 1940-41, as against 7s. for the previous fiscal year, but, as shown in the legal profit and loss account, we used £497,000 from provisions made in previous years against future additional liabilities, whilst the amount of income-tax recoverable from stockholders' dividends rose with the standard rate. The increased taxation charge is in the main, therefore, on account of heavier provision for Excess Profits Tax. Due to the application of the varying rates of this tax for broken periods, the average rate appropriate to our excess profits for the calendar year 1940 was 90 per cent., against 45 per cent. for 1939. For 1941 it will be the full 100 per cent., although we now have a welcome concession made by the Chancellor of the Exchequer in his recent Budget, viz., that 20 per cent. of the net tax paid at the 100 per cent. rate will be repaid by the Government after the war under certain conditions. This concession gives the taxpayer a valuable deferred asset maturing when it will be most needed, although

the conditions attaching to eventual repayment—other than the certainty that it will be subject to income-tax at the standard rate then in force—are yet to be defined.

DISADVANTAGES OF PRESENT RATE

Whilst I fully believe in maximum taxation as a vital necessity in the present war economy and have never been amongst those who have cavilled at an E.P.T. rate of 100 per cent., yet I foresee difficulties and disadvantages in the continuance of such a rate. The most important of these—and the concession just mentioned does not afford any relief—arises in that the taxpayer is obliged to hand over the whole of his excess profits in cash whilst such profits are certain to be locked up to a great extent in increased stocks at higher price levels and in the larger book debts which of necessity accompany expansion of business. Stringency in supply of liquid capital thus occasioned, apart from its detrimental effect on the smooth running of any kind of business, might well have a serious consequence in the hindrance of natural and possibly nationally beneficial development.

Again, this rate of 100 per cent. does not enable the taxpayer to provide adequate depreciation on capital expended in the national interest on purely war-time projects. The Finance Acts contain provisions designed to meet this difficulty, but they do not entirely remove the risk of capital loss. In my view, every taxpayer should be entitled to a lien on his own excess profits to the full extent necessary to write off capital so expended—much of it at the direct request of the Government—and I hope that at the proper time it will be found possible for industry to be given this safeguard.

The effect of special war taxation on our results for 1940 may be illustrated by the fact that 70 per cent. of our consolidated income is required for taxation, 25 per cent. for net dividends to stockholders, and only 5 per cent. goes to free reserves of the company and its subsidiaries. For 1939 these figures were respectively 51 per cent., 35 per cent., and 14 per cent.

MISCELLANEOUS EXPENDITURE

Of the other charges in the consolidated income statement, the miscellaneous expenditure written off includes £454,000 for air-raid precautions. In addition, however, to this charge, which mainly concerns new expenditure of a structural nature, there has been charged, before arriving at the manufacturing and trading profit, all expenditure in the maintenance of air-raid precaution measures formerly provided together with that on other kinds of defence precautions and preparations. The total amount under all these headings in 1940 was nearly £1,100,000, whilst the cumulative total to December 31, 1940, was over £2,000,000. In addition, War Risks Insurance of stocks and stores, also charged before arriving at the manufacturing and trading profit, amounted to £326,000 in 1940. The drain on our cash resources in respect of all these special war-time measures is, of course, very severe. There is, however, a substantial, though unfortunately delayed, recovery in this respect in that for a portion of the A.R.P. expenditure repayments in cash will be obtained, whilst the remaining charges will be partially recovered either by way of direct allowance against profits for current taxation or by adjustment of Excess Profits Tax after the war under certain provisions in the Finance Acts.

The charge for obsolescence and depreciation in the accounts of Imperial Chemical Industries Limited was £2,000,000, the same figure as in 1939, and in addition subsidiary companies provided in their own accounts £1,070,000.

INCREASED TOTALS

In the consolidated balance-sheet the totals of current assets and current liabilities show considerable increases which reflect both the expansion of trade and the increased taxation liability. Assets at December 31, 1940, consisting of investments, debts and stocks in enemy or enemy-occupied territories, were reserved against in full.

The surplus of combined assets over combined liabilities and share capital rose from £14,666,000 to £16,204,000 during the year.

Dealing now with the legal accounts of Imperial Chemical Industries, Limited, itself, the net income shown in the profit and loss account is £6,418,000, as against £7,313,000—a reduction of £895,000, occasioned by the incidence of heavier taxation charges already referred to. The appropriations made by your

board and its recommendation in regard to the final dividend on the ordinary stock are set out fully in the report of the directors.

BALANCE-SHEET ITEMS

The company's legal balance-sheet calls for little detailed comment. The directors' report has explained that Excess Profits Tax provisions have this year been made in the accounts of home subsidiary companies and not in the accounts of Imperial Chemical Industries, Limited, itself as was done in 1939. In consequence the liability for "Sundry Creditors and Provision for Taxation and Contingencies" does not show any large increase, as would otherwise have been the case, whilst the figure of "Dividends (less tax) due from Subsidiary Companies" reflects a diminution mainly attributable to the change in procedure.

The marketable investments figure shows a reduction due to the requisitioning of our remaining investments in the U.S.A. by H.M. Treasury under certain Acquisition of Securities Orders, 1940, though as some part of the proceeds was not received until 1941 the sales were not wholly reflected in the cash balance at December 31, 1940.

REALISATION OF AMERICAN SECURITIES

Stockholders have in the past been made familiar with the company's policy of gradually realising American securities and we no longer hold any investment in United States industries. It might here be appropriately mentioned in regard to the former large holding of shares in the General Motors Corporation originally owned by Nobel Industries Limited which came into the I.C.I. merger in 1926 (and in 1928 distributed its assets in a specie liquidation) that, as between the original sterling cost of those shares and their ultimate total sterling realisation, there has arisen during a period of years a profit of over £6,500,000. Such portion of this amount as has accrued to Imperial Chemical Industries, Limited, has been applied from time to time either in transfer to the published reserves of the company or in the specific writing down of assets.

ADDITIONS TO RESERVES

Particulars of the company's reserve accounts are given in the annual report, and it will be noted that the war contingency reserve, in addition to £339,000 appropriated from profits, has received £1,500,000, being surplus arising on the final sale of the U.S.A. investments referred to above.

To war contingency reserve there have also been transferred as at December 31, 1940, certain free reserves from subsidiary companies amounting to £483,000 and from the total there has been deducted a provision of £572,000 to meet estimated premiums under the War Damage Act, 1941, covering the proportion of the insured period up to December 31, 1940. As the Act itself provides specifically that such premiums are of a capital nature and are not allowable as a deduction for taxation, your board decided that this was the correct method of treatment. The war contingency reserve is now therefore increased by a net figure of £1,750,000 and stands at the substantial amount of £2,750,000 as compared with £1,000,000 at December 31, 1939.

The company's total reserves and carry forward amounted at December 31, 1940, to £21,147,000, an increase of £3,000,000 over the corresponding total last year.

THE GENERAL POSITION

In present circumstances I am sure you will not expect me to make any prophecy as to the future. This will only be revealed as the war progresses.

You will not need to be reminded of the bad moments and the good through which we all passed last year, or of how, following the precarious situation of the early summer, the nation showed amazing fortitude during the air attacks of the autumn until, saved by the indomitable courage of the Royal Air Force, it had by the winter regained its breath.

Words are almost inadequate to express our feelings of gratitude to our brave airmen, to our splendid Navy, and to the home and Imperial forces.

We are fortunate in this life and death struggle in having such a brilliant leader as our Prime Minister, Mr Winston Churchill; his unique qualities, his shining courage, his staunch conviction, which we all share, that final victory must and will be ours, inspire all of us to still greater efforts, and we hope Mr Churchill will be spared to lead us to such a peace as will remove the menace of military aggression for all time.

THE STANDARD LIFE ASSURANCE COMPANY

STRINGENT VALUATION OF ASSETS
LARGE INVESTMENTS IN GOVERNMENT SECURITIES

INTERMEDIATE BONUS MAINTAINED

MR. H. A. JAMIESON'S REVIEW

The one hundred and fifteenth annual general meeting of the *Standard Life Assurance Company* was held in Edinburgh on the 20th instant. Mr H. A. Jamieson, chairman of the company, was in the chair.

The manager and secretary having read the auditor's report, the chairman said: Gentlemen,—May I take it to be your wish that the directors' report, which is in your hands, be held as read?

The year covered by the report has been another difficult year for life assurance companies. Under wartime conditions we cannot expect a large flow of new life assurance business, and the difficulties in the way of investment are too well known to require elaboration.

Nevertheless, the report which we have before us is a satisfactory one. You will see that new life business, including group life assurances, amounted to a total of £2,245,000, which is 56 per cent. of the corresponding amount completed during the financial year ended November 15, 1939. When we consider these figures, bearing in mind that a large proportion of our outdoor staff is serving in the forces, we may feel that this total reflects great credit on those who are carrying on the work at the present time. Their task has not been made easier by our decision to transfer our two London offices to Kingswood and our Bristol office to Edinburgh. The work of these branches continues, but inevitably the changes have rendered our new business organisation in those districts temporarily less efficient.

The amount of deferred annuities granted during the year is substantial although considerably less than the amount granted last year. It is satisfactory, however, to note a large proportionate increase in the amount of new immediate annuities. In the year under review the purchase price secured by the sale of immediate annuities was £346,000 as compared with the previous year's total of £87,000.

INCREASED PREMIUM INCOME

The revenue account of the life assurance and annuity fund shows an increase in our premium income of £28,000 over the corresponding figure for the previous year, bringing the total up to £2,570,000. It is satisfactory that we have so far been able to maintain and even to increase our premium income in these uncertain times. The interest revenue after deduction of income-tax is £1,306,000, being £25,000 greater than last year. This represents a net rate of interest earned on the life assurance and annuity fund during the year of 4 8s. 4d. per cent., which, although lower than that earned last year, will no doubt give satisfaction to members. In addition to the interest income, over £41,000 was transferred as surplus income from the guarantee fund to the revenue account of the life assurance and annuity fund.

Turning to the other side of the accounts we find that the total of the claims by death is £693,000, a decrease of £85,000 to that of the previous year. Included in this total is a sum of £50,000 due directly to enemy action. Claims by maturity own for no special comment. Commission and expenses of too management taken together are about £40,000 less than last year, ourselves because of the reduction in new business. The increased premium income and the lower expenses combine to produce an expense ratio (i.e., the ratio of commission and expenses to premium income) of 10.5 per cent. This low expense ratio will be regarded as a favourable feature of the accounts. It will be seen that a sum of about £69,000 has been transferred to the staff pension fund and that the life assurance and annuity fund at the end of the financial year stood at £31,128,000.

STRINGENT VALUATION OF ASSETS

The total assets are shown in the balance-sheet at a figure of £34,362,000, representing an increase of £1,803,000 over the figure of the previous year, and members will be glad to note that the directors were able to state that in their belief the value

of the assets was in excess of the balance-sheet figure. There is, of course, a very real difficulty at the present time in estimating the true value of many of the company's investments; but the directors, after they had made a most careful and rigorous valuation of all the assets of the company, making use in the case of Stock Exchange investments of the lowest quotations in the official lists less accrued interest or dividends, found that the excess mentioned above was of considerable amount.

As I have already indicated the past year has not been an easy one from the point of view of obtaining a remunerative rate of interest on new investments. In common with other financial institutions the company is supporting the Government by subscribing largely to Government loans and the total holding of British Government securities shown in the balance-sheet at £7,826,000 represents an increase during the year of £1,731,000. When this figure is compared with the increase in our assets mentioned above it will be seen that a large proportion of our available resources is being invested in accordance with the expressed desire of the Government. I might here state that from the outbreak of the war to the present date the company has increased its investments in British Government securities by no less than £3,149,000, of which total £1,957,000 represents investment in new War Loans. Moreover, the policy of the directors at present is to invest in new War Loans all excess income over outgo arising in this country and in addition a substantial proportion of other available funds arising from the sale or redemption of existing investments. Members may therefore be satisfied that the sums they pay in premiums are contributing to the savings policy which very rightly is being insisted upon by the Government.

INTERMEDIATE BONUS MAINTAINED

In June last year intimation was made of a new rate of intermediate bonus. It was then decided that the bonus payable in respect of the period since the actuarial valuation on November 15, 1938, under policies which become claims by death or maturity would be at the rate of 30s. per cent. per annum compound under the reversionary bonus series with corresponding bonuses in other classes. Whilst this rate of intermediate bonus is being kept under constant review by the board it is not felt that any change is desirable at the present time.

APPRECIATION OF STAFF

As I mentioned last year, three members of the board, Messrs G. P. S. Macpherson, J. H. Richardson and J. R. Gifford, are serving with the forces. As regards the staff, members will be interested to know that nearly 50 per cent. of the home male staff are serving in the forces and that many members of our overseas staffs have also joined up. There is every indication that we may have to face an increase in this percentage shortly. I should like to take this opportunity of sending to those of our staff who are temporarily absent on service our very best wishes and our assurance that we look forward to the time when we shall extend to them a hearty welcome on their return. It is with deep regret and with an expression of sincere sympathy that I report that of those of our staff serving in the Royal Air Force one has been killed and another posted as missing and that a third member of the staff has been permanently disabled whilst serving in the army. The absence on service of such a large proportion of our staff places upon those who remain a grave responsibility and a greatly increased burden of work. I am sure members would wish me to record their appreciation of the loyalty and excellent spirit shown by the staff who are cheerfully bearing this heavy burden—many of them in conditions of danger and hardship.

I now move the formal adoption of the report, revenue accounts and balance-sheet submitted.

Mr F. D. Murray Baxter seconded this motion and the report was unanimously adopted.

ROYAL INSURANCE COMPANY, LIMITED

96TH ANNUAL REPORT

STATEMENT OF MR A. KENTISH BARNES

In a statement circulated with the ninety-sixth annual report of the Royal Insurance Company, Limited, the chairman, Mr A. Kentish Barnes, referred to the services rendered by insurance companies in the administration of various Government insurance schemes arising out of the war.

FIRE DEPARTMENT

Fire premiums totalled £5,546,224, and losses £2,588,663, or 46.7 per cent., whilst underwriting profit was £256,396, or 4.6 per cent. Home fire premiums showed a moderate advance but losses were substantially higher. This was only to be expected in war conditions; the company's results merely reflected the general experience. The accounts showed a loss of business in those countries which had successively been overrun by the enemy. Business in the United States had shown a further expansion, whilst loss experience had been heavier. In other areas, normal development was reported and trading results presented no special feature.

ACCIDENT AND GENERAL DEPARTMENT

Accident and general premiums at £5,970,064, showed a small reduction to which the loss of Continental business had contributed. Losses amounted to £2,895,535 or 48.5 per cent. Underwriting profit at £508,036 or 8.5 per cent. was nearly the same as in 1939. The motor account had produced a moderate profit, and in this country a feature had been a reduction in the premium income, though less in fact than had been contemplated, due to the laying up of cars. Road accidents had, unfortunately, continued to take their toll of life, and with black-out conditions accentuating the difficulties of driving, the chairman appealed to all road users, motorists and pedestrians alike, to exercise ever greater care.

LIFE DEPARTMENT

New life business declined substantially and, at £2,981,000 net, was only two-thirds of the 1939 total. Death claims, at £897,000, showed an increase of £63,000, and included was £59,000 paid on account of war deaths.

In recognition of conditions due to the war, the company had been extending to policy holders a generous interpretation of their contracts. Thus, although a large proportion are free from occupational or geographical restrictions, a number of policies issued before the war expressly excluded service with the armed forces outside this country. The company was giving full war risk cover without extra charge under such policies to all who before the war had no liability for such service, whether they were still civilians or serving with the Armed Forces, Home Guard or Civil Defence services. Again, where in consequence of the war, policy holders found difficulty in meeting premiums on pre-war policies, the company had undertaken to do everything possible, over and above the terms of the contracts, to help them to maintain their policies in full force.

MARINE DEPARTMENT

In the Marine Department, the 1939 account had been closed with a profit of £88,195. Marine insurance was particularly affected by war conditions. The hazards to which ships and cargoes are exposed were subject to frequent and violent change and were obviously quite different to those of normal times. The many complex problems arising, however, had drawn the market together, and the chairman was encouraged to hope that this co-operation would persist even when war-time problems were past. Apart from direct war risks, ordinary marine hazards were sharply increased. Many losses had occurred which, though not strictly war losses, were nevertheless due to war conditions, and they had fallen heavily upon the relatively slender rates which had prevailed for ordinary marine risks. Fortunately, some improvement in rates had been obtained in recognition of the greater risks run.

Total underwriting profit (including £46,000 on account of shareholders' proportion of life profits) was £898,627.

Interest income showed a shrinkage of £153,000 due to the increased rate of income-tax.

The balance of £2,133,000 carried forward was approximately £130,000 higher than the amount brought in.

EXPENSE RATIO

The expense ratio in the fire and accident departments worked out at 45.6 per cent. against 45.5 per cent. for 1939, and the difference was more than accounted for by heavier foreign taxation. This was no time to attempt to analyse insurance companies' expenses, but the chairman was prompted to focus attention on just one or two essentials. The public, when insuring, expected not only cover but also a high level of skilled technical service and detailed attention. Insurance, as practised by the great composite companies was in fact a widespread retail distributive service covering town and country alike, consisting of a multiplicity of small items, and dealing with millions of policies, all of which required individual consideration and treatment if the protection of insurance was to be adequate and the needs of the insuring public fully provided. The cost of this service should clearly be regarded as an essential part of the insurance protection granted, rather than an expense of management, in the ordinary sense.

COLLABORATION AND HELP FROM U.S.A.

In the final paragraphs of his statement, the Chairman referred to the collaboration and help which Great Britain was receiving from the United States. "No help could be more appreciated, as none could be more valuable. With our companies wide spread and friendly connections throughout the whole United States deep-rooted through close contacts ranging over nearly a hundred years, I would like it to be known to every one of our United States friends how sincerely grateful we are in this country for all their help. We believe, and we think every American also believes, that in this gigantic battle we are fighting not for ourselves alone but in defence of interests which it is imperative to preserve for our mutual well-being in the future. Without our fight, and our victory, the free way of life, prized equally by Americans and throughout the British Empire, is in grave danger of being lost to us all for ever."

LONDON AND MANCHESTER ASSURANCE COMPANY, LIMITED

STATEMENT OF THE CHAIRMAN, MR A. H. DAWES

Extracts from the statement by the chairman, Mr A. H. Dawes, relating to the accounts submitted to the seventy-second annual general meeting which was held, on 21st instant, in London.

I am pleased to say that the work of collecting the premium payments has been conducted steadily, in spite of the enlistment of a considerable proportion of our agency staff in the armed forces, savage aerial bombardment and widespread movements of policy-holders.

The total income for the year amounted to £4,491,694 as compared with £4,439,066 a year ago, i.e., an increase of £52,628. The premium income increased by £14,859 to £3,509,836; the gross interest income at £970,486 showed an increase of £40,835 but owing to the increased income-tax the net interest was lower by £31,664 at £681,668. Total death claims at £1,032,096 showed an increase of £20,636, while maturities showed little change at £751,148. The total assets amounted to £22,550,164 compared with £21,471,397 a year ago—an increase of £1,078,767.

It cannot too often be emphasised that money devoted to life assurance is money bound, in due course, to find its way into the new Government Loans and so help the war effort of the nation. In this connection perhaps reference should be made to the following extract from an article recently contributed to *The Times* headed "Thrift in War-Time," as a result of investigations conducted under the auspices of the National Institute of Economic and Social Research: "There are many varieties and methods of saving. We investigated 22. The most important are industrial life assurance and the national savings groups. The former is the most popular of all."

During the year we invested over one million pounds in the new war loan issues, bringing our total holding of British Government securities to 36.6 per cent. of our Stock Exchange securities.

The aggregate market value of our Stock Exchange securities as at March 24 last (taken at middle market prices, less accrued interest) was in excess of the value at which they appear in the balance-sheet.

COMMERCIAL UNION ASSURANCE COMPANY, LIMITED

SIR BERTRAM HORNSBY'S STATEMENT

The annual general meeting of the Commercial Union Assurance Company, Limited, will be held on the 27th instant.

The following are extracts from the statement of the chairman, Sir Bertram Hornsby, C.B.E., which has been circulated with the report and accounts:

When addressing you last year I referred to the difficulties of giving any indication of the probable effect of the war on our business, but drew attention to the fact that a very substantial proportion of our total premium income (other than life business, which is almost entirely confined to the United Kingdom) was derived from countries in which we might reasonably expect to be able to continue our operations. It is fortunate that this should be so, for at this moment almost the entire Continent of Europe is closed to us, and although we regret the temporary severance of ties which in many instances have been of long standing, you will note from the revenue accounts that it has been possible substantially to maintain the volume of our business, the total (fire, marine, and accident) net premiums being £14,426,005, as compared with a corresponding figure in 1939 of £14,447,997.

After dealing at length with the various departments, the statement continued:

Our current bonus period ends on December 31, 1942. In view of the uncertainty as to the immediate future, the question of the interim bonus to be allowed on policies becoming claims has been under constant consideration. At the present time we are allowing a bonus on "with profit" policies which, in the old series, is equivalent to a minimum cash bonus of 16 per cent. of the premiums due and paid since December 31, 1937, and, in the new series, to a reversionary bonus of £1 per cent. on the sums assured for each year's premium paid. The directors hope to be able to continue these rates for the remainder of this year (1941), but must obviously reserve the right to change them at any time should circumstances so demand.

PROFIT AND LOSS ACCOUNT

The gross amount received from interest, dividends, and rents, £987,190, shows a reduction of £24,213 compared with last year, and is a consequence of enemy occupation of Continental countries and of further refundings of maturing securities at lower interest rates. Transfers from departmental accounts amount to £950,000, an increase of £150,000 compared with 1939, but as we have adopted this year the more usual practice of charging Dominion, Colonial and foreign taxes in the profit and loss account instead of in the departmental revenue accounts the real increase in the transfers is about £30,000.

The sum of £25,000 has been applied in writing down freehold premises, £100,000 has been transferred to Guarantee and Pension Fund, and £335,000 to general reserve. The balance remaining will suffice to meet the cost of the final dividend recommended by the directors of 3s. 6d. per £1 stock, leaving £94,655 to be carried forward, an increase of £12,056.

BALANCE-SHEET

Since Government war borrowing in the market began, new investment has been confined almost entirely to purchases of war issues. In the case of the life fund the balance-sheet on page 9 reveals a total holding of British Government securities of £7,845,091. This is an increase of more than £870,000, and exceeds the £752,000 by which the total fund advanced during the year. The investment of so large a sum in securities bearing very low rates of interest entails a sacrifice on the part of the "With Profit" life policyholders, but with such great issues at stake the successful prosecution of the war on the financial front is a matter of paramount importance. Since the first War Loan in March, 1940, we have invested to date altogether £2,250,000 in the various war issues.

The only other point in the consolidated balance-sheet to which I should direct attention is the increase of some £600,000 in foreign Government securities and a fall of some £900,000 in railway and other debentures. These movements reflect exchanges from United States utility and railroad bonds to United States Government issues.

The general reserve fund has increased by £162,695 to £4,723,928.

INCORPORATED ACCOUNTANTS

CONCENTRATION OF PRODUCTION

The annual meeting of The Society of Incorporated Accountants and Auditors was held, on the 22nd instant, in London.

Mr Percy Toothill (the president) said that the fact that accountancy was recognised as work of National importance and that in consequence it was scheduled as a reserved occupation had not prevented large numbers of the Society's members from joining and serving with the armed forces of the Crown, while others were serving in administrative and executive positions in military and civil services. As a result, accountancy firms had been seriously depleted and it was increasingly difficult to meet the normal demands for professional service in connection with auditing and taxation.

GOVERNMENT POLICY

It was inevitable that important divisions of the economic policy of the Government had been subjected to criticism but the several schemes, if taken together, presented a measure of coherence. Economic policy must be directed to the fullest possible transfer of resources to war production and to vital exports. This could be achieved in two ways and two ways only—firstly by reducing civilian home demand and secondly by reducing supplies; so far the emphasis had been mainly on the second method while spending power, curbed though it was by taxation, by savings and by rating, remained at a high level. The reduction in supplies by means of raw materials controls and limitation orders was now to be followed by the concentration of production programme of the Board of Trade. This policy of concentration was as necessary as it was unpalatable, but the manufacturing concerns displaced, whether voluntarily or by action of the Board of Trade, should be made to feel that they were being treated fairly. Concentration should be based on individual circumstances and not on general rules, and Mr Toothill, therefore, suggested the need for an Advisory Committee, acting under the Export and Production Council, to give advice as to how concentration could be achieved. Compensation should be so computed that it made no difference to profits whether a business was closed or became a nucleus firm.

On the other hand, concentration should not be attempted where it would not release personnel, materials or factory space for war production. Transfer of quotas or agency agreements were preferable to mergers as the identity of the "closed" firm was preserved thereby. In selecting nucleus firms the test should be efficiency—not size—and temporary concentration should not lead to eventual cartelisation or permanent rationalisation. Smaller firms exhibited a high degree of efficiency, but sometimes it was too readily assumed that large scale production was invariably more efficient. Under the concentration scheme it was not necessary for the smaller concerns to gravitate automatically toward the larger. Nevertheless, there were serious grounds for doubt as to whether in some directions this definite aspect of Government policy was being observed as it should be. It was not possible to look very far ahead in these difficult days, but it was clear that at the end of the war we should have to distribute our resources between capital goods and consumption goods in proportions yet unknown. It was, therefore, important that the Government's policy should, as far as possible, provide for the re-employment of labour, the development of our markets and the re-establishment of the small independent concern.

DIFFICULTIES OF PRICE CONTROL

The Prices of Goods Act presented many problems to accountants, who would have preferred to judge "profitability" on the results of a year's trading rather than on single transactions. An attempt to fix maximum prices might lead to certain goods being driven off the market; further, there were technical difficulties in segregating costs to a single article and in relating permitted increases to a pre-war standard—now two years out of date. Industry was already over-burdened with forms and investigations and it was to be hoped that price control would not be unduly extended. In his view taxation was nearing its effective limit, and there was strong evidence that EPT at 100 per cent. had hindered the war effort. It was, therefore, necessary to explore other methods of restricting consumption.

BRITISH MATCH CORPORATION, LIMITED

DIVIDEND 8 PER CENT.

The fourteenth ordinary general meeting of British Match Corporation, Limited, was held on 21st instant in London.

Sir Clarence E. Bartholomew, O.B.E. (chairman and managing director of the company) presided.

In the report submitted to the meeting it was stated that the net revenue for the year ended April 30, 1941, as shown in the accounts, amounted to £391,566, as against £451,269 for the previous year, the reduction being entirely due to increase in income tax and National Defence Contribution. To this sum had to be added the balance of £87,000 brought forward from the last account, and after allowing for the dividends already paid, £105,420, there was a balance of £373,146 available for distribution.

It was proposed to place £100,000 to dividend equalisation reserve, and to pay the dividend on the preference stock for the half year to April 30, 1941, at the rate of 5½ per cent. per annum.

The recommendation as to dividend on the ordinary stock was that a final dividend of 5½ per cent. should be paid, making a total of 8 per cent. for the year compared with 7½ per cent. last year.

Importations of matches had practically ceased, but a reduction in consumption and increased home manufacture had, so far, sufficed to meet the National needs.

The profits of subsidiary and associated companies were entirely satisfactory, though the amounts available for distribution were curtailed by the inevitably high rates of taxation.

The report was unanimously adopted.

STEWARTS AND LLOYDS, LIMITED

SOUND POSITION

The fifty-first ordinary general meeting of Stewarts and Lloyds, Limited, was held, on the 20th instant, at the registered office of the company in Glasgow.

Mr A. C. Macdiarmid, the chairman, presided.

The notice calling the meeting was held as read, and the secretary (Mr William Stewart) read the auditors' report.

The chairman said: A copy of the directors' report has been sent to each stockholder, and I presume that, in accordance with your usual custom, you will agree to hold it as read. I am not at liberty to make at this meeting a speech on the usual lines. I shall, however, read to you the statement which I circulated with the report and accounts:—

Stockholders may find it difficult, owing to circumstances arising from the war, to attend the annual general meeting to be held in Glasgow on 20th instant. I am, therefore, circulating with the report and accounts this statement in place of the speech which, under normal circumstances, I should have delivered at that meeting. Cards of admission to the meeting, which will be formal, are not being issued. A quorum has been arranged, but any stockholder who wishes to be present will be welcome.

Stockholders will appreciate that it is not possible for me to make the usual detailed review of the company's activities. I can, however, give the assurance that our whole energies and effort are concentrated both at home and in the Dominions on work of importance in connection with the war. At the same time it is evident from the accounts submitted that the company's affairs are in a sound condition.

THE DIRECTORATE

I refer with deep regret to the loss suffered by the board through the death of Mr H. Eliot Howard. Mr Howard joined the service of Lloyd and Lloyd, Limited, in 1895, and became a director of Stewarts and Lloyds, Limited, in 1925.

It gives me great pleasure to refer to the acceptance by Sir Walter Benton Jones, Bt., chairman of United Steel Companies, Limited, of an invitation to join our board. At the same time I accepted an invitation to join the board of United Steel Companies, Limited. These appointments are of a personal character and are an indication of the friendly relations that exist between the two companies.

The board wish to express their appreciation of the services rendered by the whole body of staff and employees of the company under most difficult and trying conditions.

I move that the report and accounts for the year 1940 as submitted to this meeting be hereby received and adopted.

Mr Wm. Forbes seconded the resolution, and it was adopted. The chairman: I move "That the dividends as detailed in the directors' report to the stockholders dated May 9, 1941, be paid—these dividends to be paid on or after May 24, 1941, to the stockholders whose names are on the register at the date of this meeting, and that £182,689 be carried to the accounts for the year 1941."

Mr Forbes seconded the resolution, and it was adopted.

The retiring directors were re-elected and the auditors were reappointed.

The chairman: That concludes the business.

CHAMPION REEF GOLD MINES OF INDIA, LIMITED

ENCOURAGING DEVELOPMENTS

The annual general meeting of the Champion Reef Gold Mines of India, Limited, was held at Thames House, London, E.C.

The Hon. A. T. J. Fraser, D.S.O., the chairman of the company, who presided, after referring to the loss suffered in the comparatively sudden death of Mr Kenneth Taylor, said that during the year under review the tonnage crushed had amounted to 135,470 from which 65,511 ounces of fine gold had been recovered. Bullion sales had amounted to £553,791; the net income was £497,954 and working costs were £287,857. Additional Royalty of £19,137 brought the profit for the year's working down to £190,959—a decrease of nearly £9,000 on last year. With £14,000 odd brought in and £1,716 for dividends received, the sum of £206,875 was shown at the credit of profit and loss. A final dividend of 17½ per cent. or 1s. 9d. per unit of stock was paid on March 21, 1941, bringing the total dividend for the year to 32½ per cent.—a decrease of 7½ per cent.

SATISFACTORY DEVELOPMENTS ON BOTTOM LEVELS

Looking at the year's working from a broad point of view it must be considered satisfactory. Underground there had been no striking developments, but the bottom levels on both the southern section and the northern folds continued to open up as well as ever. The main cause of the reduction in dividends paid was due to the increase in taxation and Royalties both in India and in this country. He was afraid that during the current year they must inevitably expect a rise in costs. In the first place they had had to enter into a new agreement with the Mysore Government for the supply of electric power under which the total charge would be considerably increased; in the second place it had been found necessary to increase the wages paid to labour, and then there was the inevitable rise in the cost of all stores and commodities together with a high increase in freight and insurance.

It had been hoped to have had the new hoist at Gifford's Shaft in operation by the end of 1940. Delays entailed by the war had prevented that, but it was expected to be in commission by the end of June, which would complete the programme of the lay-out to depth commenced some four years ago, and together with the new cooling system should make a great improvement in the working of the mine. The ore reserve stood at 539,000 tons averaging 10.99 dwts.—almost identical with twelve months ago.

MR. SYDNEY TAYLOR'S VIEWS

Mr Sydney E. Taylor, D.S.C., in seconding the motion, said that the development results during the past had been good and the prospect of opening up further ore in depth remained eminently satisfactory. In the northern section of the property where the quartz occurred in large folds, the development of the folds at the 83rd level had been completed, and compared with the 82nd level the results showed a gratifying increase of 3½ dwts. in average value with an increase of 2.6 ins. in average width, while the total length was only slightly less. The development on the 84th level was proceeding on all limbs of the fold, and they had every reason to anticipate that the results would be quite as good as those of the 83rd level.

The satisfaction with which one could regard the mining position, and the approaching successful conclusion of a long

period of construction work which gave the property magnificent hoisting and ventilation facilities to carry work efficiently down to much greater depths, was tempered only by the inroads made on the profits by increased taxation and power rates.

The report and accounts were unanimously adopted.

OOREGUM GOLD MINING COMPANY OF INDIA, LIMITED

INCREASED PROFIT

The ordinary general meeting of the Ooregum Gold Mining Company of India, Limited, was held on the 20th instant in London.

The Hon. A. T. J. Fraser, D.S.O. (the chairman), after expressing regret at the death of Mr Kenneth Taylor, senior partner of Messrs John Taylor and Sons, said that in the year ending December 31, 1940, the mill had crushed 159,880 tons for a total recovery of 53,827 ounces of fine gold, which was 117 ounces more than in the previous year. After deducting Mysore Government Duty amounting to nearly £28,000 the net sum realised for the sale of the gold amounted to £426,765 or £7 18s. 6½d. per ounce against £7 14s. 9½d. in 1939. After subtracting £21,200 for Royalty on net sales and adding £5,790 for other receipts, the net income stood at £411,354.

Working costs and additional Royalty amounted to £294,159 and that left a profit of £117,195, an increase of more than £13,000. The disposal balance was £37,813, and the directors recommended a final dividend of 9d. per share, making 2s. or 20 per cent. on the preference shares and 1s. or 10 per cent. on the ordinary, a decrease of 2½ per cent. on the previous year due entirely to higher taxation in Mysore State and this country.

During the summer of last year a strike of native workmen had occurred and had lasted for practically a month. The loss of revenue entailed had been to a considerable extent made good by raising the grade of ore milled during the remainder of the year. The ore reserves at the end of the year amounted to 307,000 tons, averaging 9.76 dwts., an increase of 2,500 tons and a decrease of .32 dwts. in grade.

Mr Sydney E. Taylor, D.S.C., describing the result of the past year's development work, said that the final result for the year was an increase of profit of £13,368 over the previous year, a result which was the best attained for many years past, and indicated how well the mine had recovered from the lean zone around the 76th level. The company had now been brought back to a good profit-earning basis. It was therefore most unfortunate that just at this time the dividend had had to be reduced because of the new duty on gold and the incidence of Excess Profits Duty.

Although the mining position and outlook was reasonably satisfactory, he must add that the financial outlook for 1941 was clouded by the inevitable prospect of further rises in the price of materials, accompanied by increased labour and power costs. It would also be necessary in the next year or two to make provision for winding equipment for the New Auxiliary Main Winze to serve the mine below the 94th level, and for replacement of Bullen's surface steam winder, which had given over 30 years of satisfactory service.

The report was unanimously adopted.

INDUSTRIAL AND GENERAL TRUST, LIMITED

RESULTS EXCEED EXPECTATIONS

The fifty-third ordinary general meeting of The Industrial and General Trust, Limited, was held, on 22nd instant, in London.

Mr W. Sandford Poole (the chairman) said that the results they were able to place before stockholders exceeded their highest expectations of twelve months ago. The gross revenue amounted to £475,829, a diminution of only £17,691, or less than 4 per cent. One contributory cause to the fall in revenue had undoubtedly been the levy of 100 per cent. EPT borne by some of the companies whose equity stocks they held. The increase in United Kingdom direct taxation was £26,978, the total charge under that head being £175,052. In respect of the year 1939-40 they were eventually able to agree with the Inspector of Taxes that they had no direct liability for EPT. As the gross income in the accounts now presented was less than that of the previous year, it followed that the Trust would not be liable for EPT for the year 1940-41.

The net revenue, after providing for debenture stock interest

and all working expenses, was £218,851. They had transferred £30,000 to dividends equalisation account, increasing the total of that account to £230,000. That was a prudent precaution in view of the uncertainties of the times and possible difficulties of the post-war period. The preference dividend was again covered more than five times by the year's net revenue and they were able to recommend a dividend of 12 per cent. on the ordinary stock.

They had not attempted to submit a valuation of the investments this year, as they felt that an estimate of values made on the basis of so-called market quotations under the conditions prevailing would be illusory and unreliable. In the past their valuation results had compared favourably with those shown in the *Bankers' Magazine*, but even if their portfolio showed an all-over decline of as much as 10½ per cent. on the year, the depreciation so called would be covered by their reserves, with a margin of more than £1,000,000.

The report and accounts were unanimously adopted.

KONONGO GOLD MINES, LIMITED

TAXATION BURDENS

The annual general meeting of Konongo Gold Mines, Limited, was held, on 16th instant, in London.

Mr Robert Annan, M.Inst.M.M. (the chairman), who presided, in his statement of the year's operations, said that the profit and loss account, reflected the changed conditions under which they were working. The value of gold produced had increased by £112,840 over the previous year, but costs had increased by £51,592, export duty by £28,481 and provision for taxation by £47,040, so that the available profit was actually £14,371 less than in the previous year. Taxation included six months' EPT at 60 per cent. and six months at 100 per cent., so that with the full rate of EPT and the increase in income-tax, their burden would be still heavier in the current year.

In common with many of the Gold Coast producers, they were unfortunate that they had not reached full production in the standard years, with the result that their present rate of profit was due to increased output and not to the higher price of gold, which was largely nullified by the higher export duty. The value of their gold, less export duty, was only £20,000 more than if it had been sold at pre-war prices, yet their EPT liability was over £80,000, and the total of taxation, including export tax, amounted to £3 per ounce of gold produced.

That, however, was not the whole story. In order to maintain production, they must continuously open up the deeper levels of the mine. That entailed a heavy expenditure on shaft sinking, which must be provided out of earnings, but which was regarded by the Inland Revenue as a capital expense.

Faced with that situation and the fact that they still had to provide upwards of £50,000 for completion of the Odumase Shaft and for additional plant already on order, the directors did not feel justified in declaring an interim dividend as they had done in the past. They felt that the accounts showed quite clearly that the transfer of £20,000 to reserve was essential to protect the development programme, and that a dividend of 10 per cent., less tax, now recommended, was the most that could be justified in the circumstances.

On the technical side, the results gave every cause for satisfaction. The tonnage milled averaged 11,500 tons per month, which might be regarded as full output until more power was available. The cost per ton treated had increased by 21.6 per cent. That was partly due to the rise in cost of all supplies, but in part to working to a smaller stopping width. Development had been curtailed, first to conserve fuel and later on the internment of Italian miners and contractors. With a result the ore reserves showed a small decrease, which was not a matter for the least concern as they still represented well over three years' supply.

The results of the development done were most encouraging, and the exposures on the lowest levels of the Odumase Vein were particularly good, where at the end of February, 1941, the 7th level had exposed 1,285 feet ore averaging 21.3 dwts. over 43 ins., with both ends still in ore. Sinking of the Odumase shaft had continued steadily, but delivery of the main hoist and the additional engines for the power plant had been greatly delayed. Delivery of those items was expected in the near future, but a definite date could not be set under present conditions.

The report was unanimously adopted.

CURRENT STATISTICS

Finance

GOVERNMENT RETURNS

For the week ended May 17, 1941, total ordinary revenue was £25,827,000, against ordinary expenditure of £70,720,000, and issues to sinking funds of £130,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £375,636,000 against £205,970,000 for the corresponding period a year ago.

Forward Rates

Forward rates for one month have remained unchanged as follows:—United States ½ cent pm.-par. Canada. ½ cent pm.-par. 3 cents pm.-par. Sweden. 3 ore pm.-par. Dutch East Indies. 1½ cents pm.-par.

MONEY RATES, LONDON

The following rates remained unchanged between May 16th and 22nd:—Bank rate, 2% (changed from 3% October 26th, 1939). Discount rates: Bank Bills, 60 days, 1½%; 3 months, 1½%; 4 months, 1½%; 6 months, 1½-1½%. Treasury Bills: 2 months, 1-1½%; 3 months, 1½%. Day-to-day money, ½-1½%. Short loans, 1-1½%. Bank deposit rates, ½%. Discount deposit at call, ½%; at notice, ½%.

(Continued from page 694)

indeed; no profit at all is being released from the marine account:—

Premiums	Rise or Fall	Under-writing Profits	Rise or Fall
Fire	732,755 + 48,075	14,665 — 31,324	
Accident	510,930 — 57,428	16,520 — 7,247	
Marine	255,794 + 133,947	...	7,500

1,499,479 + 124,594 31,185 — 46,071

Aggregate credits to profit and loss, including net interest of £54,588, come to £85,806. Foreign and colonial income tax—not debited to underwriting, as is the customary practice—takes £19,143 and British income tax and N.D.C. £14,375. There is an item £666 for bad and doubtful debts. After allocating £20,000

to staff pensions and setting aside £58,125 for the dividend at the same rate as last year the balance to be carried forward is lower by £26,503 at £115,275. Stock exchange securities in the life balance sheet are taken at prices at the last valuation on December 31st, 1936, and in the case of investments made since that date, at or under cost, a depreciation being shown of about 3½ per cent; in the general balance sheet stock exchange securities stand at less than market values. There is a general reserve of £650,000 and additional reserves in the fire and accident accounts aggregate £750,000.

Provincial Insurance.—The main theme of insurance accounts this year has been substantially reduced fire profits, lower accident premiums and greatly enhanced

marine premiums; all these features are faithfully reproduced in the Provincial figures—embracing those of its subsidiaries, the Drapers and General and Hull Underwriters' Association—a summary of which is given below:—

Premiums	Rise or Fall	Under-writing Profits	Rise or Fall
Fire	231,357 + 246	10,765 — 26,041	
Accident	969,333 — 144,157	73,515 — 41	
Marine	335,173 + 118,739	...	36,000
	1,535,863 — 25,172	84,280 + 3,918	

Credit transfers to profit and loss, including net interest of £48,079, total £132,367. After providing £44,192 for taxation and various expense accounts, (Continued on page 713)

(Continued from page 710)

£3,000 for war charities and £31,625 for dividends—at the same rate as before—the balance carried forward is higher by £53,550 at £77,333. The market value of investments is certified to be in excess of balance sheet figures, and in addition to the balance of profit and loss account there is a general reserve of £600,000.

family allowance principle, increasing with each dependent child. Another practice which merits imitation has been the provision, for members of the staff and their families working in the bombed areas, of hostel accommodation in the Lake District, where they may enjoy a week's rest and quiet free from stress and strain.

EAST DAGGAFONTEIN MINES, LIMITED.

(Incorporated in the Union of South Africa.)

CAPITAL: Authorised £2,000,000. Issued £1,865,000 in 3,730,000 Shares of 10s. each, fully paid.

The 130,000 shares subscribed for by Rietfontein (No. 11) Gold Mines, Limited, as detailed in the last Annual Report, increased the issued capital of the Company to £1,865,000 as above.

EXTRACT FROM ANNUAL REPORT TO 31st DECEMBER, 1940.

Tons Milled.....827,000.	Yield (per ton 5.21 dwts.).....215,360 ozs.		
Revenue (per ton milled 43/10.7)	£1,815,033	Government Taxes	£97,754
Working Costs (per ton milled 27/8.4)	1,145,608	Reserve for Liability under Miners' Phthisis Act	192
Working Profit (per ton milled 16/2.3)	£669,425	New Share Issue Expenses	414
Expenditure, less Sundry Revenue	314	Dividend No. 1—7½%	139,875
	£669,081	Dividend No. 2—15%	279,750
Add—		Directors' Special Remuneration	8,750
Balance to credit of Appropriation Account at 31st December, 1939	61,373	Appropriated for Capital Expenditure	86,725
	£730,454	Balance unappropriated at 31st December, 1940	116,994
			£730,454

No amount was payable to the Government under the Mineral Lease due to the offset of excess taxation. Capital Expenditure during 1940 amounted to £81,416 and, in addition, £133,420 was charged to various Capital Accounts in respect of part of the purchase consideration for assets acquired from Rietfontein (No. 11) Gold Mines, Ltd.

ORE RESERVE.—The Ore Reserve was recalculated at the end of 1940, and disclosed the following:—

	1940	1939
Tons	2,852,000	2,501,000
Slope Width (inches)	36.39	36.51
Slope Value (dwts.)	6.08	6.24
Inch-dwts.	221	228

Included in this is a total of 613,000 tons of ore developed on the Kimberley Reef Series at 7.31 dwts. over 36.96 inches.

DEVELOPMENT.—The development accomplished during the year was:—

	Feet	Percentage Payable	Average Reef Width (ins.)	Average Assay Value (dwts.)	Inch-dwts.
Main Reef Leader	36,515	46.6	10.31	26.66	275
Kimberley Reef	16,698	42.0	12.38	25.04	310

In addition to the above figures, 245 feet on the Main Reef Leader horizon and 5,349 feet on the Kimberley Reef horizon were developed in Daggafontein Mines ground.

GENERAL.—The purchase of the property and assets of Rietfontein (No. 11) Gold Mines, Limited, was completed during the year. The expenditure on Capital Account contemplated for the current year is estimated at £100,000, the greater portion of which will be in connection with an additional hoist at No. 1 Shaft and the reduction plant extension. It was anticipated that this extension to increase the nominal capacity of the reduction plant to 80,000 tons per month would be completed during the year under review, but conditions overseas have considerably delayed deliveries of import orders, thus temporarily curtailing the monthly milling tonnage.

THE FULL REPORT AND ACCOUNTS CAN BE OBTAINED FROM THE LONDON SECRETARIES OF THE COMPANIES, ANGLO AMERICAN CORPORATION OF SOUTH AFRICA, LTD., 11, OLD JEWRY, LONDON, E.C.2.

THE SOUTH AFRICAN LAND & EXPLORATION COMPANY, LIMITED.

(Incorporated in the Union of South Africa.)

CAPITAL: Authorised £500,000. Issued £433,125 in 2,475,000 Shares of 3s. 6d. each, fully paid.

EXTRACT FROM ANNUAL REPORT TO 31st DECEMBER, 1940.

Tons Milled.....4,213,500.	Yield (per ton 5.50 dwts.).....360,935 ozs.		
Revenue (per ton milled 46/2.6)	£3,035,224	Government Taxes	£795,879
Working Costs (per ton milled 20/7.8)	1,356,036	Government Participation in Profits (1939)	30
Working Profit (per ton milled 25/6.8)	1,679,188	Dividend No. 4—100%	433,125
Sundry Revenue, less Expenditure	5,283	Dividend No. 5—100%	433,125
Total Profit	£1,684,471	Directors' Special Remuneration	7,500
Add—		Appropriated for Capital Expenditure	6,167
Balance to credit of Appropriation Account at 31st December, 1939	77,849	Balance unappropriated at 31st December, 1940	86,494
	£1,762,320		£1,762,320

Owing to the excess taxation under the set-off clauses in the Lease only £30 was payable to the Government as participation in profits for 1939. It is estimated that nothing will be payable for 1940.

ORE RESERVE.—The Ore Reserve was recalculated at the end of the year and disclosed the following:—

	1940	1939
Tons	4,061,300	3,187,280
Slope width (inches)	43.60	43.24
Slope value (dwts.)	6.00	6.06
Inch-dwts.	262	262

DEVELOPMENT.—The footage of 56,999 feet accomplished during the year was 6,827 feet more than that for 1939. The percentage payable was 48.9, average reef width 31.94 inches, average assay value 10.34 dwts., inch-dwts. 361.

GENERAL.—During the year work was started on certain minor additions to the reduction plant, which when completed will enable the mill to deal with 120,000 tons per month.

THE FULL REPORT AND ACCOUNTS CAN BE OBTAINED FROM THE LONDON SECRETARIES OF THE COMPANIES, ANGLO AMERICAN CORPORATION OF SOUTH AFRICA, LTD., 11, OLD JEWRY, LONDON, E.C.2.

DAGGAFONTEIN MINES, LIMITED.

(Incorporated in the Union of South Africa.)

CAPITAL: Authorised £2,000,000. Issued £1,750,000 in 7,000,000 Shares of 5s. each, fully paid.

EXTRACT FROM ANNUAL REPORT TO 31st DECEMBER, 1940.

Tons Milled.....1,911,000.	Yield (per ton 5.72 dwts.).....546,080 ozs.		
Revenue (per ton milled 48/0.8)	£4,592,959	Government Taxes	£1,067,871
Working Costs (per ton milled 20/10.9)	1,991,143	Government Participation in Profits	475,475
Working Profit (per ton milled 27/2.8)	2,601,816	Reserve for Liability under Miners' Phthisis Act	2,915
Sundry Revenue, less Expenditure	68,315	Dividend No. 15—30%	525,000
Total Profit	2,670,131	Dividend No. 16—30%	525,000
Add—		Directors' Special Remuneration	7,569
Balance to credit of Appropriation Account at 31st December, 1939	79,067	Appropriated for Capital Expenditure	56,710
	£2,749,198	Balance unappropriated at 31st December, 1940	88,658
			£2,749,198

ORE RESERVE.—The Ore Reserve was recalculated at the end of 1940, and disclosed the following:—

	1940	1939
Tons	8,771,000	8,135,000
Slope Width (inches)	40.47	40.63
Slope Value (dwts.)	6.25	6.40
Inch-dwts.	253	260

The Reserve includes ore developed on the Kimberley Reef Series, which totalled 384,000 tons averaging 5.44 dwts. over a width of 47.58 inches.

DEVELOPMENT.—The development accomplished during the year was as follows:—

	Footage	Percentage Payable	Average Assay Value (dwts.)	Average Reef Width (ins.)	Inch-dwts.
Main Reef Leader	50,263	58.6	19.11	18.11	346
Kimberley Reef	11,011	35.2	8.41	37.19	313

Included in the above are 5,349 feet on the Kimberley horizon and 245 feet on the Main Reef Leader horizon, driven by East Daggafontein Mines in Daggafontein Mines' ground.

GENERAL.—The Company's holding in East Daggafontein Mines, Limited, remains unchanged at 449,892 Shares.

THE FULL REPORT AND ACCOUNTS CAN BE OBTAINED FROM THE LONDON SECRETARIES OF THE COMPANIES, ANGLO AMERICAN CORPORATION OF SOUTH AFRICA, LTD., 11, OLD JEWRY, LONDON, E.C.2.

WESTERN REEFS EXPLORATION & DEVELOPMENT COMPANY, LIMITED.

(Incorporated in the Union of South Africa.)

CAPITAL: Authorised £1,500,000. Issued £1,000,000 in 4,000,000 Shares of 5s. each, fully paid.

EXTRACT FROM ANNUAL REPORT TO 31st DECEMBER, 1940.

DEVELOPMENT.—During the year the footage accomplished was 52,555 feet, and it will thus be noted that satisfactory progress was made with the development of the property.

Connection between the shafts on the 23rd Level was effected in April, resulting in improved ventilation conditions. The work done on this level from No. 2 Shaft was in lava, but two boreholes sunk from the level disclosed payable reefs. No. 1 Borehole, situated approximately 1,000 feet from the shaft was in lava to a depth of 824 feet, and at 876 feet intersected a reef assaying 10.95 dwts. over 20 inches. No. 2 Borehole was put down at approximately 2,000 feet from the shaft and was in lava to a depth of 799 feet, when it entered into a zone of reefs and quartzites. Among the reefs intersected were the following:—

At 799 feet	3.3 dwts. over 79 inches.
At 850 feet	3.0 dwts. over 68 inches.
At 907 feet	5.7 dwts. over 24 inches.

With a view to following up these indications and their probable extensions, preparations were made at both shafts. At No. 1 Shaft a haulage was advanced from 26 Level. At No. 2 Shaft an incline haulage was commenced from 23 Level. In addition, a station was cut in this shaft at a depth of 3,243 feet, and, when this was completed, cross-cutting towards the above-mentioned boreholes was commenced.

On 40 Level, No. 2 Shaft, the haulage being driven towards borehole No. 5 was advanced a distance of 2,017 feet in quartzite. Diamond drilling from this haulage, at a point approximately 800 feet from the shaft, located a reef at the lava contact, 734 feet in the hanging; this reef assayed 2.25 dwts. over 95 inches.

On various levels at No. 1 Shaft reef development has been proceeding actively throughout the year with very satisfactory results. The total footage developed on reef was 24,940 feet disclosing exposures of individual reefs of 27,950 feet, and sampling showed a payable of 52.4 per cent. and a value of 410 inch-dwts.

ORE RESERVE.—The Ore Reserve was recalculated at the end of the year, ore of 3.0 dwts. and over being included. The new Reserve as compared with that at 31st March, 1940, to which reference was made in the Chairman's speech at the Seventh Ordinary General Meeting, is as follows:—

	Tons.	Slope Width, Inches.	Slope Value, Dwts.	Inch-Dwts.
At the end of 1940	1,509,000	62.22	5.70	355
At the 31st March, 1940	747,000	69.87	5.37	375

GENERAL.—On the 2nd March, 1940, shareholders were advised that arrangements had been completed with the Anglo American Corporation of South Africa, Limited, to provide funds estimated to be sufficient to bring the Company to production with a nominal capacity of 100,000 tons per month. The Company had availed itself of the loan facilities to the extent of £700,000 at the 31st December, 1940. The erection of the reduction plant has been proceeding satisfactorily, notwithstanding some delay in deliveries of certain plant from overseas.

THE FULL REPORT AND ACCOUNTS CAN BE OBTAINED FROM THE LONDON SECRETARIES OF THE COMPANIES, ANGLO AMERICAN CORPORATION OF SOUTH AFRICA, LTD., 11, OLD JEWRY, LONDON, E.C.2.

BRAKPAN MINES, LIMITED.

(Incorporated in the Union of South Africa.)

CAPITAL: Authorised and issued—£1,150,000 in 4,600,000 Shares of 5s. each, fully paid.

Sundry Revenue, less expenditure	133,473	Dividend No. 56—30%	345,000
		Dividend No. 57—30%	345,000
		Directors' Special Remuneration	7,531
		Capital Expenditure	33,493
		Balance unappropriated at 31st December, 1940 ..	78,764
Total Profit.....	1,432,179		
Add—			
Balance to credit of Appropriation Account at 31st December, 1939	80,757		
	£1,512,936		£1,512,936

ORE RESERVE.—The Ore Reserve was recalculated at the end of 1940, and disclosed the following:—

	1940	1939
Tons	6,980,400	7,024,600
Stope Width (inches)	45.95	45.24
Stope Value (dwts.)	5.29	5.41
Inch-dwts.	243	245

In the Witpoort Section the Reserve amounts to 2,221,740 tons having a value of 5.89 dwts. over an estimated stoping width of 41.52 inches. This tonnage is included in the total of 6,980,400 referred to above.

DEVELOPMENT.—The total development accomplished during the year was 59,325 feet, a decrease of 988 feet on that done during 1939. The percentage payable was 33.9, average channel width 42.02 inches, average assay value 8.81 dwts. inch-dwts. 370.

GENERAL.—The Company's holding in the South African Land & Exploration Company Limited remains unchanged at 361,067 shares. THE FULL REPORT AND ACCOUNTS CAN BE OBTAINED FROM THE LONDON SECRETARIES OF THE COMPANIES, ANGLO AMERICAN CORPORATION OF SOUTH AFRICA, LTD., 11, OLD JEWRY, LONDON, E.C.2.

SPRINGS MINES, LIMITED.

(Incorporated in the Union of South Africa.)

CAPITAL: Authorised and issued—£1,560,000 in 6,240,000 Shares of 5s. each, fully paid.

EXTRACT FROM ANNUAL REPORT TO 31st DECEMBER, 1940.

Tons Milled.....1,938,500.		Yield (per ton 5.44 dwts.).....527,187 ozs.	
Revenue (per ton milled 45/10.4)	£4,445,601	Government Taxes	£784,417
Working Costs (per ton milled 21/8)	2,059,894	Government Participation in Profits	740,489
Working Profit (per ton milled 24/7.4)	2,385,707	Reserve for Liability under Miners' Phthisis Act ..	11,141
Sundry Revenue, less Expenditure	8,510	Dividend No. 42—26½%	409,500
		Dividend No. 43—25%	390,000
		Directors' Special Remuneration	7,500
		Capital Expenditure	36,733
		Balance unappropriated at 31st December, 1940 ..	92,704
Total Profit.....	2,394,217		
Add—			
Balance to credit of Appropriation Account at 31st December, 1939	78,267		
	£2,472,484		£2,472,484

ORE RESERVE.—The Ore Reserve was recalculated at the end of 1940, and disclosed the following:—

	1940	1939
Tons	7,124,200	8,328,500
Stope Width (inches)	43.41	43.40
Stope Value (dwts.)	5.07	5.22
Inch-dwts.	220	227

DEVELOPMENT.—The footage accomplished for this year on the horizon of the Main Reef Leader totalled 27,802 feet, an increase of 4,622 feet compared with the previous year. The percentage payable was 34.0, average reef width 27.81 inches, average assay value 11.82 dwts. inch-dwts. 329. Exploratory work was continued on the Kimberley Reef Series without disclosing any payable values. Development in the Southern portion of the mine continued mainly in country rock on account of steeply dipping strata and the occurrence of further faulting.

GENERAL.—The sinking of the Joint Ventilation Shaft should be completed by the middle of 1941, but owing to prevailing conditions it is impossible to state when the fan will be put into commission.

THE FULL REPORT AND ACCOUNTS CAN BE OBTAINED FROM THE LONDON SECRETARIES OF THE COMPANIES, ANGLO AMERICAN CORPORATION OF SOUTH AFRICA, LTD., 11, OLD JEWRY, LONDON, E.C.2.

The Strategy of Prices

THE announcement last week that an increase in the wages of coal-miners was to be followed by a rise in the industrial price of coal came as an unpleasant surprise. It is a characteristic of drunkards and other addicts that they are perpetually on the point of turning over a new leaf; their latest aberration is always their last one. When in public policy, it is even more deplorable. Last April, in the first war Budget of the war, the Chancellor of the Exchequer promised to "go straight." In place of the usual barren balancing of accounts, he produced what appeared to be at least the outline of a rounded plan for war economy; and this rise in coal costs comes into sharp conflict with Sir Kingsley Wood's statement that the key prices of fuel, light, power and transport would be stabilised by subsidy, as well as with the Chancellor's "hope" that wages could then be pegged.

For over eighteen months, the Government had possessed no price policy at all. Many prices were, of course, controlled. The prices of a number of foodstuffs were held down; raw material prices were fixed in various ways; and the machinery of the Prices of Goods Act had been extended piecemeal to restrain certain retail prices. But there was no coherent plan or common purpose in these scattered controls; there was nothing parallel to the attempted "stop" in Nazi Germany on the whole range of prices and wages. Wages were going up generally. There was no attempt to hold down the so-called "strategic" prices—fuel, transport and labour—which enter most influentially into the costs of production and living. The self-generating process, by which increases in costs beget increases in prices and increases in prices beget increases in costs again, was not opposed. By the

terms of the agreement between the railway companies and the Government it was actually encouraged.

It is for these reasons that the details of Sir Kingsley Wood's programme of stabilisation have been eagerly awaited. Already this year there have been test cases. Employers in both engineering and road transport have claimed that it is contrary to public policy to grant repeated increases in wages. Trade unionists and the public, conscious that employers are hardly disinterested parties in these matters, have waited for the Government to speak. It is not, of course, the Government that has now raised wages and prices in the coal industry; but these increases are sufficient evidence of the Government's continued reluctance to carry out the Chancellor's promise.

Coal was specifically mentioned in the Budget promise; and it is no more than a quibble to claim that its price to domestic consumers, continually harassed by the inability of the Government and the industry to store and distribute sufficient supplies of coal, will not be raised. The price of coal enters importantly into all manufacture, of consumption goods as well as of capital goods. Under the present financial regime on the railways, higher coal costs, unless they can be compensated by higher charges, must represent a loss. In the fixing of prices, the coal industry has been well treated for several years. It has had the power from Parliament to dictate its own price to both industrial and domestic consumers. It has not carried out its corresponding duty to remould its methods and organisation; and the rest of British industry and the community have suffered.

But the issue is not merely one of coal. Whether coal-miners' wages should or should not have been raised is not material, though (as a Note on page 722 suggests)

the claim of the coalminer to special treatment is by no means so strong as it was some years ago; and, as an article on page 731 demonstrates, the official index of the cost of living is, in any case, a very poor guide to wage policy in wartime. Whether the coal industry should or should not be capable of carrying the increase in wages, when granted, without raising prices, is immaterial, too. This is a broader question of fundamental economic policy and political good faith. Put shortly, it is the problem of warding off inflation. The point is that it is inefficient and dangerous, industrially and financially, to allow—let alone encourage—prices and costs to chase each other in this unending pursuit. It is socially unfair because, when prices soar and wages follow raggedly after, the devil must needs take the hindmost.

It may be answered, of course (as so often it has been answered before), that even after many months of un-wisdom, there is, in fact, little or no inflation. In his Budget, Sir Kingsley Wood was optimistic about what had happened in 1940-41, and even more optimistic about the capacity of genuine savings to foot the bill in 1941-42. It is true that an examination of price statistics and other pertinent data shows no formidable fall in the value of money so far. But there is no doubt that, to some extent, the war is already being financed perforce by the creation of credit; and when the gigantic task of making ends meet next year is considered, there is no less doubt that the gap will tend to widen as the war effort grows. It is not enough to point belittlingly to the inflation that has happened so far. The inflation to come is the danger. This is the seed-time; the harvest is ahead; and every effort is indispensable to root out the tares before they spread.

It is not simply a question of holding down wages. This is the commonest mistake made in this country, and it converts the examination of a vital economic problem into a class battle. The Chancellor of the Exchequer was right in his Budget speech when he spoke of stabilising key prices. These are the prices which fundamentally affect all other prices, and the price of labour is only one among several. Sir Kingsley Wood was wrong when he distinguished between his promise that the price of fuel, power and transport would be stabilised and his vaguer hope that wages or the price of labour could then be pegged.

To say that all prices except the price of labour should be held down is as fatuous and futile as it is to maintain

(as is so frequently and widely maintained in this country) that all prices except the price of labour should be allowed to "find their own level"—in other words, to "rip." Here discussion is concentrated on wages; in the United States, in the steel industry, prices have been fixed, but not wages; and both these partial approaches are equally useless. It is impossible to stabilise the price structure by pegging mere sections of it; and the need in every country that is faced with the inflationary consequences of wartime scarcity, in the United States no less than in the United Kingdom, is an all-in policy of control over strategic prices.

This coal announcement is only one straw in the wind. Every week there is news about changes in wages or prices which, added up, foretell a gale; and now there will be more. The cost of transport and the cost of production in general will go up with the price of coal. There will also be increased pressure on the cost of living. To believe that, because the domestic price of coal will not be raised, the vicious circle—more expensive living, more wages, higher prices, still more expensive living—will therefore be broken, is to act like an ostrich with one eye in the sand. At bottom, there is no difference at all between this step and all the other *ad hoc* blunderings which have brought the waste and unfairness of inflation so much nearer.

It is time for cards on the table. The hope that Sir Kingsley Wood's Budget plan might represent a change of heart and mind has been dashed. It seems plain enough now that his Labour colleagues will not, or dare not, entertain any scheme which includes the control of wages. Is it also the case that the representatives of industry, too, are unwilling to accept a plain stop to the prices of their products? If these are the political considerations at work to hide the national interest, they are shortsighted to the point of blindness. What have the trade unions to gain from a policy of drift which will undermine the purchasing power of every pay packet by driving up the price level? Or what have the industrial barons to gain from a policy, or lack of policy, which permits all their crucial costs—not only labour—to rise steadily?

In April, the Chancellor announced a plan to stabilise strategic prices. It won wide approval. The man-in-the-street welcomed it as well as the pundits. Now, at least, the nation is entitled to ask whether the policy of stabilisation remains the War Cabinet's intention. This is still a democratic country; and it is at war.

The New Monroe

MR ROOSEVELT'S speech has disappointed none of his vast world-wide audience—unless the emotion being recorded in Berlin can be so described. Neither the frenzy of the isolationists at home nor Nazi Germany's attempts at intimidation have deterred the President from giving the American people a clear and stirring summons to the path that lies before them.

The revolution in American policy is now all but complete. One by one the provisos and the limitations that have clung round the march of America's purpose like a hobble skirt—not changing its direction but limiting its speed—are being discarded. "Neutrality" is still on the statute book; but there was no breath of neutrality in the President's speech. "Cash and Carry"—the cash part has gone already and carry is on its way out: "all additional measures necessary for the delivery of the goods will be taken." "Short of war"—the President's policy is short of nothing: "We will not hesitate to use our armed forces to repel attack . . . We will decide for ourselves whether, when and where our American interests are attacked or our security threatened."

In the place of these remnants of a policy that has been discarded, the President has put two cardinal principles of American action. The first is to recognise that America's security would be endangered if Nazi forces were to effect a lodgment anywhere on a great strategic arc which runs

from Greenland through Iceland, Great Britain, the Azores, Dakar and the Cape Verde Islands to the coast of Brazil. Notice has been served on the world that the United States will not tolerate the presence of Nazis anywhere on this arc and will use its armed forces to keep them out. The second leading principle is that "every possible assistance" will be given to Britain and China, which by their resistance are giving America time to arm and room to manoeuvre.

To ensure the carrying out of these two principles, the President has proclaimed a state of unlimited emergency and has taken over the large powers that the Constitution reserves in such times to the Commander-in-Chief. They will be used to ensure that neither capital nor labour obstructs the "production and transportation of the machinery of defence." Mr. Roosevelt had a word for the "timid ones" who fear that democracy will lose itself if it fights a total war in its own defence. "Our freedom has shown its ability to survive war; but it would never survive surrender." In America as in Britain, democracy will not be endangered by the concentration of power to act in the hands of those who can act quickly. In war, as in peace, a democracy is distinguished from a dictatorship by two things: the right to criticise and the right to depose. If they remain, they will serve as trustees for the re-establishment of all the other liberties that must for the

duration be put into pawn. In America, as in Britain, it is only the blindly partisan, the incorrigibly doctrinaire and the wilfully malicious who cannot see this truth.

The importance of the speech for the course of the present war is too obvious and too welcome to require any comment. But in the light of history its importance as a restatement of America's place in the world is even greater. All through the 1920's and the 1930's it was a fundamental weakness of the comity of nations that by far the strongest Great Power in the world had no foreign policy. Mr. Roosevelt's enlightenment of his fellow-countrymen promises a change. These great strategic truths once perceived, it is inconceivable that the American public should ever drift back into isolationism.

The line of argument is correct; but Englishmen should beware and beware again of how far they carry it. In this emergency, the enemy to be fought and the time and place to fight him are all too obvious to permit of disagreement. But before it can be assumed that the two great English-speaking democracies hold similar views on foreign policy, it must first be asked on what basis the President builds his new policy. He did not conceal the foundations; on the contrary, he was at pains to make them clear. The first is "hard-headed concern for our own self-interest"; the second is that American self-interest is conceived in terms of defence only. The novelty that Mr. Roosevelt introduces into the policy of defence is that it is extended in time and space, in answer to modern methods of warfare. Defence of America must now begin across the oceans, and before the adversary attacks. But it is still defence. The new policy is fundamentally as negative and as restricted as the Monroe doctrine—it is merely mechanised Monroe. Mr. Roosevelt's personal views on foreign policy are probably further advanced than those of his countrymen; but, even so, his references to the world beyond the oceans were hardly positive. There was a statement of the conditions in this further world that the American people will not accept; there were no Wilsonian promises of assistance to build up a better world.

Work and Workers

THE next big step in war economy is to harness fresh labour to war production. But the task of mobilising labour does not end with the enlistment of workers. The men and women already enlisted, especially those with special skills, must be kept fully occupied. It has been a source of anxiety for some considerable time that, from a number of essential industries, including aircraft manufacture, there have come reports that many men are working short time or taking days off from work capriciously.

The conclusion of the Commons' Select Committee on National Expenditure, which has done a service by devoting the time of a sub-committee to a thorough examination of this problem in the aircraft industry, is that lost and wasted time are common. Although some firms are seriously short of workers, there is idle labour in others. In the air-engine branch of the industry there is no surplus; but an official inquiry is now going on into the use of labour in the manufacture of air-frames. Until the Essential Work Order was made, which prevents workers from moving at will and can be applied to any essential undertaking, firms were always liable to lose key men to other firms, for uniformity in pay scales is surprisingly lacking. Finally, thousands of man-hours are lost every week throughout the industry because of absenteeism, which sometimes reaches rates of 10, 12 or even 20 per cent.

It would be intolerable if output were to go on being lost because men are idle or absent. Aircraft manufacture is the best known, and perhaps the most vital, case. But many other essential industries, from coal-mining to the whole range of engineering, are not free from these failings; and it is clearly necessary to track down and

These observations are not, in the slightest degree, set down by way of complaint, but rather in the attempt to induce clear thinking among Englishmen. The air has been full in recent months of apocalyptic visions of Anglo-American co-operation after the war to enforce peace and encourage freedom throughout the world. Perhaps the visions will come true; we must all hope they will. But there is no justification for them in the President's speech. As Lord Lothian remarked to a private gathering shortly before his death, America now clearly sees that it is in her self-interest to prevent Britain's defeat; but it is doubtful whether she will ever conceive it to be in her interest to assist Britain to the domination, however benevolent, of the European continent. There was perhaps a warning to this effect in the President's inclusion, among the things that America would not accept, of "a world like the post-war world of the 1920's." America has had a new vision of her self-interest; but it is still her self-interest. The unmistakable oceanic tinge of the whole speech gives an assurance that Britain will have American support in anything she does to preserve the freedom—that is, the democratic control—of the seas. So far, British policy, based on British self-interest, and American policy, based on American self-interest, will surely march together. But the further British policy, in pursuit of British security, ventures on to the great land masses of the Eurasian Continent, the less sure will it be of American backing.

These are not wholly comforting thoughts; but they are salutary and they may help to prevent the repetition of a historical misunderstanding. The Monroe Doctrine emerged from a situation very similar to the present, and George Canning can be claimed as co-author of it, just as Mr. Churchill and Mr. Roosevelt are to-day the co-authors of the same policy of oceanic collaboration to protect the outer world from European dictators. But America's fundamental purpose, then as now, is to protect herself. Being called in to redress the balance of the Old World was not in 1823, and is not now, a policy which appeals to the New.

There is some inefficiency in management and slackness among some workers. But simply to say that men stand idle because of bad management, or that other workers stay at home because of original sin, is to invite the sort of futile dog-fight that went on in the Commons on the last occasion upon which the Minister of Labour replied to criticisms on these points. The Select Committee's approach is the right one. They seek to show what there is in the working conditions of the aircraft industry to encourage these wastages; and they make plain what steps the Government can take to end them.

Labour is often idle because men are waiting for work to do. Materials may be lacking or plant may be being adjusted. There are bottlenecks in the flow of supplies and components which slow work down. The men must wait, and employers are reluctant to pay off useful workers. Often they hang on to them though there is no quick prospect of work for them. This is understandable, but there is a reasonable limit. Idle time which arises from unbalance in the flow of supplies can only be cured at the sources of supply; and the widening of every bottleneck will put men to work again. But it is unreasonable that firms should retain surplus labour while other firms are short of men. "It is indefensible," too, the Committee urge, "that the Ministry of Aircraft Production should seek to retain in aircraft production a supply of labour over and above the amount that is now fully employed or can be seen to be necessary in the near future." It is astonishing that many firms do not even trouble to keep a record of the men on "waiting time."

The distribution of labour within the aircraft industry, and between industry and industry, is the responsibility

of the Government. If Mr. Bevin believes that men are under-employed or idle in any industry, because of bad management, he has the power to order the remedy. The chief fault seems to be ignorance. It is imperative that, with the co-operation of every firm, the Government should know what is going on, from week to week. It is astonishing that a special inquiry should be necessary to find out the facts about "waiting time" in air-frame manufacture. The conclusion must be that here is yet another case where the chief obstacle to full production is a weakness in intelligence and running control. It is impossible for the Government to allocate the nation's labour to the war effort in order of urgency if it is not known, despite a complicated central and regional organisation, what use each firm and industry is making of its personnel.

The notorious fault is absenteeism; and the Select Committee have no doubt about its causes. In the aircraft industry, the general level of wages—though by no means so high as report makes out—is very high; and there is regular Sunday work at high overtime rates. It is not unnatural that men who are tired, ill or disinclined to work take weekdays off and make up their earnings at the week-end. Slackness is not the main cause. Aircraft works have been going full blast since Dunkirk without respite. Staffs are jaded and inclined to snatch rest periods; and their pay is high enough not to make the financial loss grave.

The remedy is not bell, book and candle against the defaulters—though ways and means must be made for dealing with them. It is a restoration of holidays and rest-periods—and, according to the recommendations of the Select Committee, the discontinuance of Sunday labour except for maintenance and repair. The seven-day week and the 24-hour day were post-Dunkirk devices. Indeed, they are still the right means of bringing output to a peak if the labour force is big enough for every worker

to work no more than a normal week; and there is no reason, in conditions of continuous working, why the premium on Sunday work should be so high. But the labour force is still too small. The burden on those who are at work is heavy; and it is the pressure of its weight which makes workers seek these rests by the wayside.

So the argument comes back to the need for more war workers in every essential industry. Surplus labour within those industries can be found and moved by intelligence and command. Key men can be kept at their jobs by the Essential Work Order; and their temptation to move on can be removed by the strict enforcement of uniform wages—maximum as well as minimum—in parallel factories. There is no reason why the Essential Work Order should not be used as a sanction against absentees.

But the need is still to mobilise the nation. It will not be enough to create the conditions in war work which will enable every man and woman to be busied to the best advantage—though this is imperative. It is necessary also to create the conditions throughout the nation's economic life which will induce men and women in hundreds of thousands to leave tasks that can be spared for work that is vital to the nation's continued existence.

"Although the Ministry of Labour have power to recruit women for factory work, it is their declared policy to persuade rather than compel"; and women in work are not encouraged to come forward. Most of them do not know. "There has been too little publicity advising women exactly what is required of them," the Committee claim. The women still do not know what jobs are open and what they are; and neither the advice of the employment exchanges nor the general advertisements that are now in the Press meet their wants. The war effort is at last being organised; but, neither in war work nor in civilian life, has the war environment for a free and willing people been devised.

Money for Health

SICKNESS benefit under Health Insurance is to be raised from 15s. to 18s. a week; and disablement benefit is also to be increased by 3s. These advances are overdue, but they will not receive an unmixed welcome. For a long time, two things have been apparent about the whole range of social service payments and allowances. There is a wide discrepancy between the payments made for the same purpose under different schemes; and many of the payments are far from matching the minimum sums regarded by experts as necessary to maintain mere health and efficiency. There is no common measure of need for the allowances given to men in the services, civil defence workers, the unemployed and workers in training for the maintenance of wife and children. And the outstanding feature about Health Insurance is that, even when measured against the cost of living at poverty level, sickness benefit has fallen well below average minimum needs.

This new increase recognises the special inadequacy of Health Insurance benefits. It does not remove that inadequacy. No provision is made for dependants. While, with unemployment benefit, a disability pension or even aid from a public assistance committee, a man can obtain sufficient to keep his family from the acutest deprivation, under Health Insurance there is no guarantee of that—even now. A man with a wife and two or three young children will get 18s. a week if he is off work because of sickness. The only safeguard against starvation for the families of sick persons is that they can apply to the Assistance Board for relief.

Thus the inadequacy of Health Insurance payments is only thrown into relief by the latest "improvement." But it would be shortsighted simply to single out Health Insurance for its failure, in the case of poor families, to

cover bare human needs. It may be the prime example, but there are others. In Workmen's Compensation, for instance, thirty pieces of silver is the measure of household requirements. In the case of total disablement, when the breadwinner has no working future to look forward to, he is entitled to no more than half his former average weekly earnings, with a maximum of 30s. In the case of partial disablement, when some part-time work may be possible, the payment is one half of the difference between his earnings before the accident and his earnings after, with the same maximum of 30s.

These are small sums in any event—derisory for large families. It may be impossible in the thick of total war to make the radical reforms of Health Insurance and Workmen's Compensation which are patently needed. But it is obviously unsatisfactory to do no more than patch on the old lines, leaving it to public assistance, with its obstinate stigma of charity and the workhouse, to ward off destitution. The real point which emerges from the impossibility of adjusting Health Insurance and Workmen's Compensation to wartime conditions is the failure of the typically British method of giving fixed, uniform, flat-rate benefits. In any reform, two principles would have to be taken into account: the method which is common in other countries of paying a set percentage of a worker's normal earnings as benefit; and the need, over and above this basic benefit, of adjusting payments to the size of the family to be supported.

This is a family problem. Probably the 18s. paid under Health Insurance would just support a single worker. Under Workmen's Compensation, he might be better off. But, in neither case, would the task of maintaining a family be feasible without extra aid. At the moment, an inquiry is being made on behalf of the Treasury—and not

improbably under the inspiration of Mr. Keynes, who is in but not of that august department—into the cost and practicability of a general family allowance scheme of 5s. a week per child. It is certain that, if family allowances were a general complement to the structure of wages, the hardships which befall a family when its breadwinner falls ill or injured, hardships which cannot be cured merely by tinkering with the present system of benefits and compensation, would be notably lightened. It is, in fact, the case for family allowances that, in wartime and peacetime alike, poverty is specially spread among large families by every economic difficulty that comes along.

Even so, this does not exhaust the matter. It is no credit to Health Insurance that its deficiencies, like those of Workmen's Compensation, can be made up by family allowances instead of by resort to public assistance. In principle, the test of the public health services, which are focused for the ordinary citizen by the Health Insurance scheme, is their capacity to ensure the good health of citizens; and it is an aggravation of the plight of the sick worker that there is no provision of any kind for his dependants. They are not entitled to maintenance while he is sick, and they are not insured against sickness themselves.

Moreover, even for the sick man himself, the provision, regarded purely as his own insurance against ill health, is insufficient. His treatment may be expensive, it may involve specialist treatment. There may be long drawn-out trouble with his teeth or eyes. Whether he gets any "additional" benefit over and above his 18s. a week, to cover these costs, depends upon the financial position of the approved society he has chosen out of the thousands of independent bodies which operate Health Insurance; it will, in any case, be small. It may be true that family allowances, more money from benefits and other financial aids might stave off the worst distresses from a sick or injured man and his family. But the aim of Health Insurance should be to make a man well, and the aim of Workmen's Compensation to

make him fit again; and it is in these directions that the target of longer-range reform will be found.

The new changes will be accepted by Parliament. Presumably they have been agreed by the party leaders in the Government; and the inclusion under Health Insurance of non-manual workers earning up to £420 a year, instead of £250 as now, will be generally welcomed. So, too, in itself, will the increase in benefit. But it would be a slur upon the social conscience of the Commons if the occasion passed without strong criticism of the insurance scheme as it stands. It should be made plain—and will probably be made plain by Labour and Liberal back-benchers who support the Government but still speak freely—that any sufficient system of social insurance should ensure two things for every worker who is put out of work by illness, injury or bad trade; first, that he will be restored to health, fitness and employment as soon as possible; and, secondly, that his family shall not want.

The broader changes which will bring into line with these aims the present tripartite medical system, with its specialists and general practitioners dependent on fees, its voluntary hospitals dependent on contributions and its public health services dependent on rates and taxes, may have to await the end of the war. It is probably impossible at this moment to do more than pledge Parliament and the Government to a comprehensive health scheme which will cover everybody by insurance and make specialist and consultative treatment available to all; and to a scheme of compensation which will make the rehabilitation of injured workers its main objective. But there are more immediate aims which are relevant now. It is only by the aid of all the social payments and allowances given to serving men and other unfortunate people that a large section of the population is kept going at all. It could at least be laid down straight away that every dependent wife and child should receive enough to live on as a right; and that the same definition of what is enough to live on, the same measure of needs, should be used whenever payments are made. This is not only logical; it is necessary as well.

NOTES OF THE WEEK

The Bismarck

The sinking of the *Bismarck* after a five-day hunt through the length and breadth of the Atlantic constitutes one of the most memorable and dramatic actions in the long history of the British Navy. The *Bismarck* was first sighted on May 23rd and on the 24th brought to action by HMS *Hood* and HMS *Prince of Wales* in the Den-

mark Strait between Greenland and Iceland. Here disaster befell the British forces, for the *Hood* blew up after a direct hit received on one of the magazines from a range of thirteen miles. The *Prince of Wales* received some damage. The *Bismarck*, also damaged, raced away south-west and although aircraft from HMS *Victorious* were able to

score another hit, the Atlantic fog swallowed the *Bismarck* up in the early morning of May 25th. By this time, the hunt was up. The Home Fleet steamed out from Scotland, HMS *Rodney* and HMS *Ramillies* left convoy work to the North Atlantic to join in the search, from Gibraltar came *Renown* and *Ark Royal* and from the coasts of Newfoundland in the West and of Britain in the East, flying boats scoured the Atlantic. It was not until some thirty hours later that a Catalina aircraft of the Coastal Command, and later, naval aircraft from HMS *Ark Royal* located the *Bismarck*. Then the last phase opened, about 400 miles west of Brest. Torpedoed by naval aircraft, the *Bismarck* lost speed and control of the steering gear. In the very early morning of May 27th, a force of destroyers, led by HMS *Cossack* of *Altmark* fame, crippled the *Bismarck* still further, though the ship's fire was still accurate. Details of the last stages of the action are not yet known, but HMS *Dorsetshire* appears to have given the *coup de grâce* when the *Bismarck* sank at 11 in the morning of May 27th. The most vivid impression created by the terse and magnificent communiqué issued by the Admiralty is that of the "whole apparatus of our ocean control" coming into play. Warships and aircraft converging from every quarter of the ocean, the action passing from destroyer to flying boat to cruiser and back again, the precision of the orders and of the movements of naval units over thousands of miles of grey, fog-ridden ocean—all these are the visible embodiment of that proud phrase "command of the sea." None can have read the Admiralty's communiqué without a stirring of the heart. Behind the dramatic quality of the action lie other more practical matters—the confirmation of the extraordinary value of aircraft carriers already proved at Matapan, the balance of loss as between HMS *Hood* and the *Bismarck*, the effect in Germany—and in America—of the loss within a week of its maiden action of the first of the great battle-ships which were to restore the might of the German Navy.

The Fight for Crete

Against the brilliant success of the Navy's action in sinking the *Bismarck* must be set not only the loss of HMS *Hood* but the losses incurred in the defence of Crete. Two cruisers and four destroyers in a single action are a heavy toll indeed on Britain's naval strength, and although the objective of the action north of Crete—the prevention of a German landing from the sea—was achieved, the lack of fighter support and the narrow waters in which the ships were engaged made them an all too open target for the attacks of German bombers. Meanwhile, the battle of Crete continues and after a week's fierce fighting, the advantage appears to be going to the Germans. Although their first attempts to hold Rethymno and Heraklion were unsuccessful, their seizure of the aerodrome at Maleme provided them with a base to which a constant stream of reinforcements was ferried by troop-carrying aircraft and on which, once the German hold was consolidated, it was possible to land artillery and probably light tanks. From Maleme, the German attack has developed eastwards and the defenders have been forced back to new positions, but at the moment of writing it appears that the Germans have reached Canea but are not yet in control of Suda Bay. Elsewhere fighting continues, either against isolated groups of paratroops or against larger forces landed in the neighbourhood of Rethymno and Heraklion. The British defence was desperately crippled by lack of air support. For a day or two, the troops had to stand up to intensive dive bombing without any air support whatsoever. Now British bombers are again on the scene, bombing Maleme, and some long distance fighters are taking a very heavy toll of the troop planes and dive bombers. But it was in the interval between the withdrawal of the RAF and its reappearance that the German hold on Maleme was consolidated.

Staying for An Answer

It has apparently been realised by the Government that the first requisite in the direction of war production is to know what is actually going on in the factories. The idea now is said to be to make greater use of the area boards in gathering and passing on intelligence; and it is reported that a central advisory body is to be set up to make a running record of news from the factories for the Production Executive. The realisation that, unless progress is promptly known and all delays reported at once, an output programme can be thwarted or distorted beyond recognition, is a long step forward. Every Minister in a production department has a similar need for some kind of swift, impartial, fact and fault finding arrangement. Ministers might then actually be able to base their arguments, their actions and their apologia on facts and not on projects, on achievements and not on plans, on deliveries and not on orders. The greatest danger in any vast organisation is that those at the head tend to live in a world of legend, assiduously sheltered from rude truth. Whether the new means of finding out facts, which will be quite separate from the reports of the supply departments and a check upon them, is difficult to decide. Consultative committees are not usually the best of ferrets. Nor are they noted for blunt speech. The best machinery would probably be a sort of detective agency with Lord Beaverbrook (or the chairman of the Production Executive) as chief sleuth, aided by a very few experts in production and management. At any rate, this is a job, not for a representative body, at the centre or locally, but for "experts and executives."

Concessions to Coal Miners

The imperative need for producing a surplus of coal this summer in order to prevent a shortage next winter, needs no emphasis. As long ago as last March, the Government issued an appeal to the industry to speed up its production. But current output still does not appear to be yielding any surplus that can be put to stock. With its present labour force, the industry is held to be capable of an output of some 4½ million tons per week—but only with the active collaboration of the miners. By applying to coal-mining the Essential Works Order, the exodus of labour has been arrested. And by the introduction of a guaranteed pay week, supplemented by an increase in adult wages of 1s. per shift, payable, however, only for full attendance, the disparity between the earnings of coal miners and

munition workers has been largely removed, especially as miners' wages remain linked to the cost-of-living index. In order to meet the expenditure involved by the guaranteed pay week, the Government has decided to set up a central compensation fund, financed by a levy not exceeding 6d. per ton on all sales of coal, which, on the basis of the total turnover in the first quarter of this year, should yield between £4½ and £4¼ millions per annum. The attendance bonus for adults of 1s. per shift, which means an increase of some eight per cent in earnings, is to be paid by the consumer; the price of coal is to be raised by 10d. per ton, representing an additional £8½ to £9 millions to the annual coal bill. Although not all of their demands have been satisfied—they included a demand for the establishment of a national wages board to replace the local wage-fixing machinery and for a minimum wage of £4 per week—the guaranteed pay week and the attendance bonus represent handsome concessions which should secure the good will and collaboration of the miners in the effort to accumulate a reserve for the winter. The wider implications of the further rise in coal prices are discussed in a leading article on page 717; and consumers of coal are used by now to scanty consideration. But if the miners, in return for the improvement in their position, produce the additional coal required, the concessions may be worth their price.

The Wrong Way

Great Britain depends on imports for her requirements of petroleum products. True, liquid fuel is shipped across the Atlantic in specially designed vessels that cannot, as a general rule, be used for other purposes. But tankers, like other cargo vessels, have to run the Nazi blockade, and losses are inevitable. The replacement of tanker losses in the shipyards must inevitably reduce their capacity to construct other cargo vessels. In fact, the need for economising tankers and the fuel they carry is as urgent as the need for economising other imported commodities; and the growing consumption of petroleum products by the armed forces underlines the need for economy in civilian consumption. Indeed, the time has come for the application of a stringent needs test to all private consumers, and for seriously considering the suspension of the basic ration. Far from injuring the morale of the people, the application of a needs test would remove the misgivings and indignation caused by the sight of hundreds of cars parked near football grounds, dog-racing tracks, and outside shops. The Government has decided to secure economy in consumption by a tighter control over the issue of supplementary rations, and by giving Board of Trade and police officials the right to stop cars on the road, and to ask drivers to produce their coupons. It appears that the Army has instituted a petrolless day, and has taken measures to prevent the use of fuel on unnecessary errands. All these measures are to the good, provided they do not lead to false economy by hampering essential traffic—through an indiscriminate reduction in supplementary allowances to commercial users, for example. But the Government still clings to the principle of a basic ration, to which every owner of a licensed car has a claim, irrespective of the purpose for which the petrol is used. There may be a Treasury interest in keeping cars on the road. But this is to make finance a master instead of a servant; and reasons are mounting for superseding the present wasteful and illogical systems of allocation by a straightforward needs test, rigidly and uniformly applied.

No Conscription in Ulster

The Government's decision not to enforce conscription in Northern Ireland came as a surprise, since all the preliminary indications—especially the visit of members of the Northern Ireland Government to ask for conscription—had prepared the public for the contrary decision. Several newspapers had accepted it as an accomplished fact and Mr de Valera had taken the probability sufficiently seriously to call an emergency meeting of the Dail in protest. But if the decision came as a surprise, there can be no doubt that it is the right decision. Indeed, to have imposed conscription on a population about a third of which would resist it, with greater or less determination, would have been a political blunder. As the Prime Minister said, it would be far more trouble than it is worth, since the numbers involved are not large. Since the decision followed so closely

on the heels of Mr. De Valera's speech in the Dail, it is important to emphasise that the reasons for it have nothing in common with his reasoning. To him "the six counties are part of Eire; they have always been a part of it; all their inhabitants are Irishmen and no Act of Parliament can alter this present and historical fact." In other words, it would be an outrage to impose conscription on any inhabitant of Ireland, however willing he might be to be conscripted. This reasoning (if the description is not too much of a compliment) is quite unacceptable. The majority of the people of Northern Ireland wish to remain subjects of the United Kingdom; and so long as that is their wish, it will be the wish of the British Government. If any Englishmen have had doubts on this score in the past, they have been convinced by Eire's conduct in the past two years. The reluctance to impose conscription on the people of Northern Ireland is not due to any unwillingness to conscribe the Protestant Unionists of Ulster; it is due to the knowledge that these Protestant Unionists are not synonymous with the inhabitants of the Six Counties. Perhaps the Belfast Government will learn from the incident that it would be more completely master in its own house if it were less anxious to keep within the borders of Northern Ireland large numbers of people who would rather be in Eire. It was a mistake nearly two decades ago to leave the boundary where it is now, and it is still a mistake to-day. Putting it right is the only concession that British opinion can conceive of making to Mr. De Valera, who has killed any hope there may have been of ending the "partition" of Ireland.

Offensive in Libya

The Germans have launched a new attack in Libya, and, from its weight, it appears to be the most serious offensive the British forces have yet had to meet. Four mechanised columns are engaged, and the first has already retaken Halfaya Pass, captured from the Germans a week before. Two more are being held to the south of Sollum, while the fourth appears to be advancing cautiously towards Siwa. In spite of the great length and the exposed nature of his lines of communication, the enemy has succeeded in bringing up tanks and heavy mechanised vehicles, and the British defenders have once more—in a painfully familiar way—been driven back by "sheer weight of metal." However, the advance is anything but a blitz attack. The first German column took over twenty-four hours to go from Fort Capuzzo to the head of Halfaya Pass, and the covering columns to the south have been successfully held. Tobruk is unreduced, and it was possible in the week's lull which preceded the German attack to strengthen and consolidate its defences still further, and it is very encouraging that the Germans find its cross-fire disturbing enough to complain in the German Press that the barrage from Tobruk is heavier than that of the Somme. It is a risky business to thrust out into Egypt, leaving Tobruk on the lines of reinforcement and supply. It would also appear risky to launch an attack in force in the fierce and growing heat of an African summer. The Germans have reversed many of the accustomed beliefs in the limits imposed by time and space, but sun and glare and sand and flies may tax even their ingenuity. Taking the two months' frontier fighting as a whole, nothing has happened to reverse Mr Churchill's judgment that General Rommel might well prefer to change places with General Wavell.

The Threat to Syria

Although Rashid Ali is still in control in Baghdad and in Mosul, where German reinforcements have reached him, there are signs that the revolt is petering out. It has failed to take any hold on the people of Iraq; any hope of Arab support from the surrounding countries has proved fruitless; and the amount of aid the Axis Powers can send appears, for the time being, to be strictly limited. Even if it is premature to say that the Rashid Ali *coup* has failed, it can be said that the civilian Ministers involved in it believe that it has, and are discreetly withdrawing from the danger zone. The Ministers of Finance, Foreign Affairs and Communications have arrived in Iran, the Minister of Finance bringing his family with him. Even Rashid Ali appears to have his doubts, since his family is already in Ankara. The situation in the Middle East is, however, very grave, for the Germans are consolidating their hold on Syria, and the

Syrian aerodromes are no longer being used simply for transit. German aircraft, based on Rayak, Aleppo and Palmyra, have launched attacks on the British forces in Iraq, and although the fight for Crete is occupying Germany's main forces, a disaffected Syria thoroughly infiltrated by German agents, merely waits the transference of troops from the present battle zone to become a strong German position from which, if Rashid Ali still held out in Mosul, the capture of Iraq could be launched. Libya is a lesson that in a war with Germany no territory can be thought safe unless it is being well defended all the time. Syria is therefore as great a military problem as Iraq. Any hope that the French would rally to the defence of their Mandate has been disproved. The gesture of Colonel Collet in crossing over to the Free French did not create a precedent, and there is no guarantee that the replacement of the Anglo-phobe General Fougères by General de Verdillac will put an end to the compliance of the French in Syria. Clearly the British Government is faced with a major decision of policy. The chances of a rapid and successful Anglo-French occupation of Syria and the repercussions of such an occupation in Vichy, Casablanca and Dakar must be weighed carefully against the certainty that if the situation is allowed to drift, Syria will be simply waiting for the Germans when they are ready to move in. It is not a decision that can be made without a full knowledge of the facts, but it may be hoped that the undoubted risk of any positive action should be offset by the certain danger of doing nothing at all.

The Civil Defence Controversy

A good background for the forthcoming full-dress debate on civil defence has been provided by the fourteenth report of the Select Committee on National Expenditure, which gives a complete description of the ARP side of civil defence; the welfare side—evacuation, rest centres and so on—has been left for another report. Rightly, the Select Committee is mainly concerned with economising manpower rather than money in making its recommendations, and there will be little disagreement with its conclusion that some of the civil defence services are overstaffed while others, notably the AFS in certain areas, are still deficient. Overstaffing is particularly true of first aid parties and first aid posts. Large numbers of paid nursing auxiliaries are standing by for long periods while there is a serious shortage of nurses in hospitals; and the recommendation that first aid posts should be associated with hospitals, so that nurses can be employed there when not wanted at the post, is sound. But the chief interest of the report lies in the recommendations on administration. The complaint is made that there has been a lack of control by the Central Department, which has too often circularised authorities without following up the instructions, the division of responsibility between the Ministry of Home Security and the Ministry of Health is criticised. Some measure of administrative control has been achieved through the delegation by the Ministry of Health to the Regional Commissioners of authority in respect of the establishments of first aid posts and ambulance services and in respect of shelter welfare. But, generally speaking, the functions of the Regional Commissioners are limited to the functions of the Ministry of Home Security, so that there are two separate regional organisations—their own and that of the Ministry of Health. In default, therefore, of the establishment of a single Ministry of Civil Defence, which the Committee strongly recommends, it proposes that all the civil defence functions of the Ministry of Health (with the exception of evacuation and the hospital services which should still be evacuation and the hospital services which should still be controlled centrally) should be delegated to the Regional Commissioners, to whom all regional officers with civil defence duties would be responsible. There is the germ in this suggestion of the decentralised Civil Defence Ministry that many people believe would meet the case best.

The Cost of ARP

Some idea of the cost of civil defence can be gathered from the Select Committee's report. The biggest single item of expenditure has been shelter provision. By the end of last March the programme of Anderson shelters was to have been completed at an estimated total cost of £17,600,000 for the 2½ million shelters; unfortunately, about 35 per cent of them require water-proofing, which, if it is properly carried out, will cost another £3 10s. a shelter, or a total

of over £3 millions. Since February, a new programme of indoor shelters has been started for families with an income limit of £350, the cost of each being provisionally estimated at £7 4s. 6d. Exchequer grants for shelters provided in factories, mines and commercial premises in specified areas are estimated at £6,400,000, with an additional £800,000 to be paid in respect of newly specified areas where shelter provision is still in progress. Total expenditure by local authorities on shelter provision was nearly £37 millions up to the end of last September; of this nearly £9½ millions was in respect of trench shelters, which, as the Select Committee points out, have been little used as they were made for daylight, not night, raiding. Public shelters other than trenches cost £6,960,000. The total of £16,404,000 spent by local authorities on public shelter provision was shared between them and the Exchequer on a grant-aided basis, varying from 60 to 85 per cent; but in October, 1940, it was decided that thereafter all new public shelter expenditure should be borne entirely by the State. The second biggest item of civil defence expenditure—and the biggest continuing item—is salaries to whole-time paid civil defence workers. Including, presumably, the members of the AFS and the Emergency Medical Service, the pay of these 250,000 workers amounted to £39½ millions in the financial year 1940-41. The Select Committee's report does not give the total for all the different services, but it gives the EMS salary total—£1,360,000—and the proportion taken by the AFS may be judged from the White Paper on the Votes of Credit for 1941-42 (Cmd. 6279), which estimates expenditure on the pay of whole-time AFS personnel at £12,800,000 in the current year and of whole-time ARP personnel at £31,800,000.

Expenditure by the Ministry of Health in 1940-41 on "measures to deal with casualties and disease" was, according to the Select Committee's report, £15,703,000. The biggest items were payments for reserved hospital beds, £7,671,000, provision and maintenance of additional hospital accommodation, £2,913,000, medical stores and equipment, £1,753,000 and the EMS £1,360,000. But the most expensive civil defence service of the Ministry of Health, including the Department of Health for Scotland, is evacuation. The Votes of Credit White Paper estimates billeting allowances at £22 millions (net) in 1941-42 and grants to local authorities for evacuation purposes at £3½ millions. These estimates are probably bigger than actual expenditure in 1940-41, since a large-scale evacuation took place in September, 1940, and in succeeding months. The figures given above by no means exhaust the total cost of civil defence. In addition, there are a host of smaller items, such as Exchequer grants for water supplies, pipes and pumping stations, etc. (amounting to £925,000 up to last March), the cost of the Regional Organisation (£545,000 in 1940-41), the cost of extending the London Tubes (£1,330,000) and the cost of bunking public shelters (estimated at £2,300,000 in 1941-42).

No Picketing

London raised nearly £120½ millions in its War Weapons Week, over £21 per head of its people. It was an impressive effort. Speculation as to the proportion of this total which may represent genuine new savings, and not simply transfers or an extra large quota of institutional investment in the London area last week, has been given zest by an odd episode in the House of Commons. A Member complained in a question that loud-speaker vans had picketed certain popular stores and exhorted shoppers not to shop there; and a solemn assurance was given in reply that these ungentlemanly tactics would not be used again in the cause of saving. Actually, in any true view of the aim of war weapons weeks, the picketers appear as men of verve and enterprise. The idea is to cut down consumption *pari passu* with the rising total of savings, and "do not shop" and "save" should be almost synonymous. It is surely ludicrous to combine war weapons and shopping weeks in a single celebration, as some centres seem to do; and there is, unfortunately, no record yet of any entry in a district total reading "Blanks Stores contributed a turnover of £x thousands by closing down for War Weapons Week." Probably the picketers were rude. They certainly appear to have discriminated with undoubted unfairness against certain shops. But, given picketers of courtesy and discretion, there seems no reason why, in every war weapons week, there should not be similar loud-speaker vans outside every shop.

Two Broadcasts

Within the last week two Frenchmen have broadcast, Admiral Darlan to the French people, Pierre Laval to the Americans. It is curious to reflect that only six months ago the substitution of Darlan for Laval was thought to mean a significant change in the policy of the Vichy Government. To-day they speak with the same voice. There is the same violent condemnation of France's democratic past as the cause of France's present disasters, and, by contrast, no word of blame for the Germans who invaded the country by force, have seized two-thirds of it and are pillaging it all. There is only "gratitude" for their generous decision not to do even worse. There is the same incomprehensible insistence that France is "free," that she is exercising full liberty of choice which, in view of the events in Syria, to give but one example, leaves the British people to choose between despising the Vichy Government for its prostitution of words or scorning it for its freely chosen military collaboration against a former Ally. There is finally the determination to continue in the policy of building with Germany a new European order. At this point, differences between the two speakers begin, for while Laval is remarkable for what he says, Darlan is remarkable for what he does not. Laval has the whole future of France clearly mapped out. A "rejuvenated, reorganised and prosperous" republic will be the link between the "new order" in Europe and the new order in America, the pivot of the new Continental system of exchange. This "new order" is a "national order" under the leadership of a victor "imbued with the march of history"—a significant echo of Lindberghism with its "wave of the future." But to this happy consummation there are two conditions. One is that America shall "work for peace by peace." American intervention would destroy the dream of Hitler's natural order. The other is that France be prepared for "total collaboration." The cat which Admiral Darlan tried so hard to smother a few days earlier is out of the bag. Realising after his hostile reception by the people at Beauvais the intense unpopularity of his policy, Darlan gave no details of this "total collaboration." He defined it by negatives. Hitler has not asked for colonial territory, he has not asked France to declare war, he has not asked for the French Fleet. The guarantee is, therefore, the fact that Hitler has not asked. And when he does? But clearly he will not. He has not asked for two-thirds of France. He has only occupied it—provisionally. Why not Dakar, too? He has not asked France to declare war. He never does so himself, and Vichy is already talking the jargon of "protective action." As for the Fleet, it will not be surrendered now. But then the Syrian airfields, the use of Marseilles, the freedom of Morocco were not surrendered at once. How far will the disintegration of Vichy's pallid resistance have advanced in six months' time?

Finance Bill—Second Reading

Inevitably much of the discussion in the debate on the second reading of the Finance Bill was devoted to the detail of committee points. The basic features of the Bill, the steep rise in income tax, adoption of the "Keynes" plan in modified form and a change in EPT ruling, are broadly favoured by the House and aroused little serious criticism. As before, the most cogent charge levelled at the Chancellor was of failure to pursue his precepts to the bitter end. The total to be raised in borrowing in the current financial year, even after deducting all overseas borrowings or drafts on capital, exceeds by £100 millions the total to be raised in taxation. In the absence of thoroughgoing price and wage control, accompanied by some form of statutory limitation on total consumption, it is easy to understand the anxiety expressed on many sides that the revenue-expenditure gap will not be closed without recourse to inflation. It is, however, futile to challenge at one and the same time the extent of the Chancellor's borrowing and the burden of taxation. The point is that the prosecution of the war forbids the waste of energy and social dislocation involved in a severe scramble for goods, and, to avoid this, surplus spending power must be drawn off and standards of living must be reduced. The trouble about leaving so large a sum to be accounted for by borrowing is that evasion by potential lenders is infinitely more possible than if they were subject to tax and—hardly less important—the difficulty of distinguishing "real" saving from capital consumption and simple transfers must provide an over-optimistic picture of the financial front. From the social and psychological stand-

point, as was pointed out in the course of the debate, the essential difficulty of reliance on new savings is that it requires a voluntary reduction in expenditure on consumption at the very time when money incomes are rising. The 1941 Budget, embodied in the Finance Bill, did not quite go to the root of the problem, and, more or less dimly, this was recognised by the House. It was perhaps less clearly realised that the necessary cuts in consumption will be made automatically through brutal absence of supplies. If they are not made by taxation or savings, they will come about less agreeably by the operation of higher prices. Political circumstances may demand that some part of the necessary retrenchment is made by the latter means, but if so it is very doubtful whether the alternatives, which in no case include the ability to maintain consumption, have yet been brought home to the public—or even to the House of Commons.

Caudillo and Falange

Last week it looked as though the intense internal struggle in Spain had, with the appointments of Señor Primo de Rivera and Señor Giron to the Ministries of Agriculture and Labour, ended in a compromise which, while leaving the Falange materially weakened, nevertheless preserved a measure of agreement between the radical and conservative wings of the Spanish Government. Although the Ministry of Agriculture is a post of first-class political importance in a country where the agrarian question is paramount, Señor Primo de Rivera is not an enthusiast for the large State farm of the Falangist version of collectivisation, but for the splitting up of the big estates on a distributist basis—a move which the totalitarians of either Right or Left have always opposed. The first hint that the earlier obvious deduction—of a state of restored tranquillity under Franco's unquestioned leadership—was premature came when, after the first meeting of the new Cabinet, the Press censorship was transferred from the Ministry of the Interior to the Falange. Now it was the decision of the Falangist Minister of the Interior that the Falangist Press should not be submitted to censorship, which caused Franco, nearly a month ago to appoint his friend, Colonel Galarza, to the Ministry of the Interior, and one of the new Minister's first acts was to re-extend Press censorship to the Falangist Press, conducting at that moment a violent campaign against the "pluo-democracies" which had just lent Spain £2,500,000. It is both curious and significant that after three weeks of reshuffling Spain's ministerial and civil appointments, the outcome should be to restore the state of affairs against which the original steps were taken, and not only to restore it, but to strengthen Falangist control in a sphere which, during a war of nerves, is in the front fighting line. It must not, therefore, be taken for granted that the situation in Spain has been stabilised. Suñer is still in office. The Falange still has immense power. The German Embassy is still in Madrid. The German network of Gestapo agents has not, presumably, been touched. And now the Germans are pressing Vichy France to surrender the Pyrenees frontier to German occupation. General Franco probably wants peace as much as he ever did, but it must not be too lightly assumed that he can preserve it—for the asking.

Mr Menzies and Mr Curtin

It must have been disheartening for Mr Menzies, after his long visit to England at an epoch-making time, to return to Australia and to be plunged immediately back into party politics. His address this week was a stirring call to the citizens of Australia to recognise that "this year is a year of fate," to follow the honoured example of their fighting forces in the Near East, to realise, "every man of us, that this war is his business and nobody else's." He made a passionate appeal for party co-operation—"whoever is to do the job of Prime Minister must have behind him a united purpose, action and spirit." Fortunately for his own position, the result of the Boothby by-election has gone in his favour, the Government candidate securing a majority of about 9,000 over his Labour opponent. Unfortunately, Mr Curtin is still obstinate. He has refused Mr Menzies' offer of half the portfolios in a National Government, and the political deadlock continues; the only chance of it being resolved seems to lie in the possibility that

public opinion will become disgusted with it, and it is significant in this connexion that at the Boothby election the Government candidate put the formation of a National Government in the front of his programme, while the Labour candidate put in his the right of the Labour party to govern if he were returned. Now that his majority has been saved by the election result Mr Menzies might well feel inclined to give up the struggle for Labour's co-operation, and be content with his present precarious position. It is to be hoped, however, that he will act as though he had lost the election, that is, continue to make every possible offer to Labour which is consistent with true political unity. As for Mr Curtin, it is sheer nonsense for him to say that the political formula of a National Government "would be the signal for a political and industrial disturbance as dangerous as it was inevitable." It is true that a National Government, formed from the party leaders, is not an end in itself. But political unity is an essential first step towards the formation of an administration of all the talents, irrespective of party affiliations.

The Holiday Muddle

The arrival of yet another public holiday, which is to be freely observed by many who do not particularly need it, while some who work hardest are held to be barred from its enjoyment by the national interest, suggests strongly that Government policy in this matter still needs drastic overhaul. There can be no doubt that, prior to the collapse of France, the average working week in this country was too short, or that the correct response to Dunkirk was an intensive effort by all those who could make a real contribution. Such a spurt cannot, however, be kept up indefinitely. Hours of work and holiday arrangements ought, before now, to have been placed on a basis which, while making some concession to pressing short-term needs, takes account of the certainty that the effort will have to be sustained for a lengthy period. It appears to be frequently assumed that the means to maximise output is to secure an increase in the number of hours worked, but it is a commonplace that there is a point at which the gain in hours is more than offset by a fall in the quality and quantity of the product. Actually the objective should be regular attendance for an "optimum" number of hours. What constitutes the optimum is doubtless capable of being affected by a number of factors, of which the prospect of a more prolonged rest at reasonable intervals is one. Whether, say, one week once a year is sufficient is a matter for the expert, though it can hardly be maintained that it is in cases where an intensive effort is maintained almost daily for a period of months; and, if this sort of effort is necessary—and can be made without loss of quality in workmanship—holidays should be proportionately longer when they come. Holidays without reasonable hours of work will, however, not solve the problem of keeping the labour force, whether it uses mainly its hands or its head, in good condition. The figures of the Health of Munitions Workers Committee in 1917 showed that a reduction of working hours of up to 20 per cent resulted in a material expansion in output. The findings of the Committee—confirmed by subsequent experience—suggest an optimum working week of fifty-six hours. This means a three-shift system, which, as was pointed out in *The Economist* of January 25th, entails dilution and training or re-training on a scale which even yet is scarcely more than a remote objective. A much more intensive effort to expand the labour force, coupled with sufficient periods for rest and relaxation, will go a long way to remove some of the drags on production, and, possibly, help to cure the all too prevalent absenteeism.

FOR ALL CLASSES OF INSURANCE

A Vote of Thanks

The King's appointment of General Smuts to the rank of Field Marshal on his 71st birthday, Empire Day, 1941, in recognition both of his personal services and qualities and of the gallant part played by South African forces in the successful conclusion of the East African campaign, has a unique interest. It is, first and foremost, of course, a tribute to the vigorous statesmanship with which Field Marshal Smuts has set himself to define South African policy ever since his notable work in the last war. It is probable that his greatest claim on British gratitude for his services since 1918 is the sympathy with which he has interpreted British policy to the citizens of South Africa. He brought the Union into the war in 1939 against a strong body of opinion in favour of neutrality, led by General Hertzog, his own associate and then Prime Minister. In a country where British Imperial policy of earlier years has left a legacy of bitterness and misunderstanding intermingled with widespread recognition of the best progressive Imperial tradition, Smuts has proved a staunch advocate. He is disliked, distrusted and bitterly assailed by his political opponents; but it is his lead that South Africans, British and Afrikaner alike, have freely followed in increasing numbers, until neutrality has plainly become a dying cause. The grant of a specifically military honour—which in itself creates a precedent, since no other Dominion citizen has yet been raised to the rank of Field Marshal—is an indication of the importance attached in this country to the performance of the South African fighting services. British policy to-day permits no pressure to be brought upon the Union to extend its willingness to send units to serve outside the African continent; but the recent feats of the South African army and air force are no less welcome because the liability of the combatants has been geographically limited. And it is probable that, if the need arose, the new Field Marshal would readily be given permission by the Union Parliament to send South African troops to fresh fields in other Continents. The Opposition, which is still strong, is sure that "England" is losing the war. The Field Marshal is convinced that the British Commonwealth will win, and the great majority of the people of the Union believe him.

Workers in Transit

Injuries by accident to workers travelling to and from their homes to work have greatly increased during the war. The black-out, greater fatigue, the dislocation of home life and increased night work are obvious reasons. Yet, under the law of workmen's compensation in this country, workers meeting with accidents on the way to and from their places of work do not get compensation. This also applies to members of civil defence organisations, and (as was stated by a Member of Parliament on May 1st in the House of Commons) the widow of a full-time air-raid warden, who was killed by a first-aid vehicle on his way to report for duty, but ten minutes before his duty actually began, gets no pension. Under the law of workmen's compensation, the term "accident" is narrowly defined by the condition that it must arise "out of and in the course of" employment, so that travelling to and from work is not covered; and the compensation scheme for civil defence workers was drafted, in consultation with the Trade Union Congress and the Employers' Federation, on the understanding that it should coincide as far as possible with the law of workmen's compensation. In Germany, where injuries of that kind are compensated, there are every year some 4,500 compensated accidents to workers travelling to and from work, most of them to industrial workers, and these constitute over 5 per cent of all new cases of compensated industrial injuries during one year. Moreover, these are only the serious cases. There is a much greater number of "reported accidents on the way to work," 85,000 or more a year, which, being only minor injuries, are paid for by the German sickness fund. These figures give some idea of what the figure might be in this country; and there is no obvious reason why the law of workmen's compensation here should not have been similarly devised.

Coinage in 1940

Although the 1940 output from the Royal Mint showed no great change from that of 1939, the figures are very high compared with those of previous years. Large additional quantities of coin are now needed to pay, not

only the men in the Services, but also the great numbers of ARP and other war workers who hitherto had not been wage earners. Although wartime conditions may have caused some local scarcity of coin from time to time, there is no shortage. Indeed, the quantity of coin now in circulation, estimated at around £90,000,000, is greater than ever before—even more than in the inflationary period of 1920. The striking of pennies was stopped last June and has not been resumed. This is not the first time in recent years that the issue of pence has been suspended, but in the past the Mint's action has been due to a heavy surplus of bronze coin, whereas the present suspension is made to conserve copper supplies. Large additional supplies of nickel-brass 3d. bits have been issued to take the place of the pennies.

COINS STRUCK DURING 1939 AND 1940

Silver	1939	1940
	15,478,635	17,948,439
Half-crowns	20,850,607	18,700,338
Florins	21,316,569	21,012,215
Shillings	28,670,304	20,875,196
Sixpences	1,355,860	7,914,401
Threepences	5,255	5,309
Maundy		
Nickel Brass	1939	1940
	5,603,021	12,636,018
Threepences		
Bronze	1939	1940
	55,560,000	30,927,600
Pence	28,924,800	32,162,400
Half-pence	31,440,000	18,360,000
Farthings		
Total	209,205,051	180,541,916
Colonial and Foreign	120,142,803	147,534,920
Grand Total	329,347,854	328,076,836

During 1940 there was a larger demand for halfpence, owing partly to the increase of the rd. fares of London Transport to 1½d. and to the odd halfpence which creep into the prices of small quantities of rationed foods. The number of halfpennies struck in 1940 was 32,162,400, compared with 28,924,800 in 1939, but obviously the Royal Mint, having suspended the issue of pennies in order to economise metal, could not allow an unlimited increase in the issue of halfpence. Indeed, halfpence are relatively more costly to make than pence. One ton of bronze will make £448 of pennies but only £373 of halfpence or farthings.

Shorter Notes

British ignorance about the affairs of the colonial empire is well-known. Six months ago, the Fabian Colonial Bureau was established to collect and collate information in colonial subjects and to interest Parliament, the Press and the public generally in colonial affairs. This week, the Bureau has published the first number of its bi-monthly journal *Empire* (price 3d.), which promises to be a very useful source of knowledge about current events and problems in the colonial empire.

*

A writ of *habeas corpus* has been granted to Captain Budd, who has been detained under Regulation 18B for eleven months. In giving judgment, Mr. Justice Humphreys strongly criticised the order made by the Home Secretary. On it, Captain Budd was stated to be a member of the British Union of Fascists, but there was no mention in the order that the Home Secretary was satisfied that it was necessary to exercise control over him, a condition of detention which the judge held to be essential. An order covering 25 persons, such as this one, was necessarily couched in vague and general terms, and he considered that the Home Secretary had not paid sufficient care and attention to Captain Budd's individual case. It was quite impossible, therefore, to say that the Secretary of State had reasonable cause to believe that Captain Budd should be detained. Moreover, on his detention, Captain Budd was given a document purporting to be a copy of the Home Secretary's order. Actually it was a completely different document declaring him to be a person of hostile associations, over whom control should be exercised.

THE WORLD OVERSEAS

Canadian Budget Debates

(From our Ottawa Correspondent)

May 13th

THE Budget has occupied most of the time of the House of Commons since the reassembly on April 28th. It is still in the committee stage, and all the Opposition groups have been criticising certain details of the proposals. The Minister of Finance has made an important concession to protests from both Canada and the United States against his proposal to raise the special tax of 5 per cent, now payable by foreign holders of Canadian securities on the interest (when payable in Canadian currency), to 15 per cent, and to extend the scope of the tax to cover interest on all bonds held by non-residents, except Dominion or Dominion-guaranteed securities; he has now agreed not to tax interest on Canadian bonds held by non-residents when it is payable in foreign currency. But this concession does not satisfy Premier Hepburn of Ontario, who has sent a strongly worded message of protest to Ottawa and demanded that the Federal Government reconsider the whole tax; he contends that the exemption of Dominion securities constitutes an unfair discrimination against the holders of provincial securities which will destroy provincial credit.

A number of the provinces have signified their willingness to accept the arrangement proposed by the Federal Government, whereby in return for adequate financial compensation they will waive their right to collect personal and corporation income taxes for the duration of the war, but Ontario has withheld its decision and may now refuse to co-operate. It was disclosed in the Budget debate that, in the fiscal year 1940, twenty-seven persons in Canada had net taxable incomes of more than \$200,000 per annum, twenty-eight had incomes between \$150,000 and \$200,000, sixty-six between \$100,000 and \$150,000 and 102 between \$75,000 and \$100,000.

Conscription and Recruitment

The Government would like to achieve prorogation before the issue of full military conscription, which has been hanging over it like the sword of Damocles, becomes acute. Ministers are well aware of the political dangers inherent in it, and want to avoid facing it if possible. But in recent months the flow of recruits for the active service force has dried up, and, unless it can be stimulated, the demand for full conscription will gather such momentum in the English-speaking provinces as to become irresistible. The Government has, therefore, launched a special recruiting campaign designed to secure 32,000 recruits for Canada's fighting forces in the next three months. Last week, Dr H. A. Bruce, a prominent Conservative, brought the question of full conscription into the parliamentary arena, arguing that the present system of voluntary recruiting had become cumbersome, slow and wasteful. He urged that Parliament before it adjourned should give the necessary authority for full conscription. However, Colonel Ralston, the Minister for National Defence, expressed confidence that the recruiting campaign would bring in the required number of men and criticised Dr Bruce for raising an issue which could not fail to disrupt national unity. Meanwhile, the Government has decided that the first batch of trainees, who are being trained under the four months' plan, will not be released from duty when their period of training ends in July, but will be retained in coastal defence or at points in the interior, in order to set free men who have volunteered for active service. If the recruiting campaign is successful, Ministers will escape the political crisis which the introduction of full conscription could scarcely fail to create.

The returns for foreign trade remain very satisfactory. In April, the value of domestic exports was \$124 millions, a gain of nearly \$39 millions over April, 1940; for the first

four months of the year exports were valued at \$413 millions, compared with \$327 millions in the same period of 1940.

The first crop report of the Bureau of Statistics estimates the wheat acreage of all Canada for 1941 at 21,655,500, a decrease of 7,070,000 from the record total of 28,726,000 in 1940. The reduction of the wheat acreage in the three prairie provinces is 6,868,000, or 25 per cent, which is substantially below the Government's objective of a reduction of 35 per cent. The bonuses offered for substituting coarse grains for wheat have resulted in the oat acreage for all Canada being increased by 12 per cent to 13,827,000 acres, the barley acreage by 24 per cent to 5,393,000 acres, and the flax seed acreage by 40 per cent to 555,900.

There has been little change in general business conditions, and the weekly economic index of the Bureau of Statistics has moved upwards only slightly in recent weeks:—

Week end	Car-loadings	Wholesale Price	Bank Clearings	Weekly Index
May 4-40 ...	82.1	83.0	97.6	106.5
April 19-41 ...	99.4	86.5	108.3	111.2
April 26-41 ...	98.9	86.4	109.6	111.3
May 3-41 ...	98.1	86.7	110.8	111.4

According to the Bureau of Statistics, the national income of Canada in the first quarter of 1941 was \$1,248 millions, compared with \$1,133 millions in the same period of 1940. A substantial share of this gain has fallen to the workers, and their increased purchasing power has improved retail trade; its level is well ahead of last year's, and in April the sales of Canadian department stores were 26 per cent higher than in March, 1940.

The boom in industry continues, and the output of munitions and war materials is mounting steadily. The first of the 300 large tanks being manufactured in the Canadian Pacific Railway's shops in Montreal will roll off the assembly lines next week, and good progress is being made with the light tank programme. The motor manufacturing plants have had their output of private cars curtailed, but they are very busy with war orders, and in April their output was 27,584 units, compared with 19,687 in April, 1940. The forestry industries are still prospering, and the output of newsprint in April was 279,996 tons, or 76.7 per cent of the total capacity of the mills, compared with 75.5 per cent in March and 73.4 per cent in April, 1940. Newsprint stocks are benefiting by the decision of the Government that the industry will be treated as a "depressed" one in the pre-war years, and will accordingly be given special consideration in the computation of the Excess Profits Tax.

Tinplate for Portugal

[FROM OUR LISBON CORRESPONDENT]

May 21st

TINPLATE is essential for the Portuguese packers of sardines, tunny and fish products generally, the normal annual demand being 200,000 boxes. England takes the bulk of the pack (90 per cent last year), and is doing all it can to meet packers' needs. There is a shortage, however, for imports between July, 1940, and the end of March were only 25,000 boxes; this is made into matter for German propaganda, on the familiar line that England is deliberately strangling Portuguese trade. Navicerts for 60,000 boxes of tinplate are reported to have been issued, but makers in the

United Kingdom are swamped with orders and American exporters need licences.

It is a serious matter for Portugal. Many of the smaller packers have no stock of plate in hand, and buy for seasonal trade through importers. In all, the packing industry employs some 20,000 hands, excluding the fishermen, and the yield in Portugal's export trade is close on £3,000,000 annually. The majority of packers recognise that England is doing everything possible to increase supplies, but German influence has worked on several of the smaller concerns, urging them to voice their protests whenever possible, and this is backed up by broadcasts from Berlin stressing the sinister influence of Britain. Increasing arrivals of tinplate, wherever possible, will be the best counter-attack.

Argentina's Financial Problems

[FROM OUR BUENOS AIRES CORRESPONDENT]

May 2nd

EARLY in April, the Government's financial estimates for 1941 were presented to Congress. Expenditure at 1,110,976,193 pesos (including 259,390,002 pesos for debt services) is substantially the same as for the previous year, but a promised saving of 50,000,000 pesos in administrative economies would reduce total expenditure to 1,060,976,193 pesos. Revenue is estimated at 786,733,600 pesos; this would be supplemented by 80,500,000 pesos after proposed changes in existing taxes, which would raise the additional revenue as follows:—

Income tax	...	40,000,000 pesos
Stamp duties	...	6,500,000 pesos
Death duties	...	4,000,000 pesos
Oil royalties	...	30,000,000 pesos
		80,500,000 pesos

On the other hand, the Budget message points out that import duties are likely to produce 40 million pesos less than the calculated revenue from this source if the two dollar loans, totalling U.S. \$110 millions, granted to Argentina by the United States, are not ratified by Congress. If the promised administrative economies produce the expected reduction in expenditure, and if the loans are ratified, there remains an estimated deficit of approximately 194 million pesos.

The Cabinet of Vice-President Castillo, which has undergone repeated changes since he became Acting President in the middle of 1940, has failed to obtain Congressional sanction for its most important measures, owing to the refusal of the powerful Radical bloc to debate these until the alleged irregularities in two provincial elections were thrashed out in Congress. The much-discussed "Pinedo plan," a measure to mobilise the country's monetary resources for a far-reaching programme of industrial and housing development in order to counteract the dislocation of foreign trade, was thus left in abeyance. And the extraordinary sessions of Congress, which were notably barren, have now been adjourned without discussion of the 1941 Budget.

Government by Decree

Some days before the adjournment, the Acting President announced to the Press: "It is not possible for the Government to follow the inertia of Congress at a time when legislation is indispensable. The Government must supply by decree what the country needs and has not obtained through legislation. Firm, effective action by the Government starts now." He added that the Government's solutions of important problems resulting from the international situation, which were discussed at a recent Cabinet meeting, would become known to the country as decrees were issued. The first step in this expedient of government by decree has been the Government's decision to put into effect provisionally the 1940 Budget.

Meanwhile, an indication of the Government's tax proposals has been given by two Bills recently presented to Congress by the Finance Minister. The first of these proposes an excess profits tax, which would apply to all indus-

trial and commercial profits exceeding 8 per cent of invested capital, on a sliding scale ranging from 10 per cent (on profits from 8 per cent to 10 per cent) to 30 per cent (on profits exceeding 25 per cent). In his message sponsoring the Bill, which establishes a validity of three years for the law, the Minister announces that it has been drawn up to meet, not only the present situation, but also "the prolongation of the causes which gave rise to it." He also states that the total additional revenue expected from all tax sources by modified legislation is 150 million pesos. His second measure introduces sweeping modifications in the present income-tax legislation, and has been designed, in his own words, "to secure a moderate increase in revenue from income tax in such a way as will ensure that the incidence of taxation will be borne by those contributors best able to pay without serious consequences to their individual economy, while according exemptions and reductions in the case of present contributors whose economic situation does not permit them to continue to support the present burden of taxation." While wholly or partially exempting 70,000 taxpayers in the lower income classes, the project provides for a graded surtax (in addition to the basic rate of 3 per cent), ranging from 2 per cent on incomes of 5,000 pesos per annum up to 10,000 pesos per annum to 22 per cent on incomes of 1,000,000 pesos per annum. An important innovation is contained in the clause abolishing the freedom from income tax of future national bond issues, the holders of which will require to declare their holdings to the income-tax authorities or in default pay income tax (to be deducted at source) at the rate of 25 per cent on services payable within the country and 12½ per cent on services payable abroad. The Minister claims that this step to meet tax evasion, which will apply to all taxable income from bonds, shares and debentures, will ensure an additional 20 million pesos annually.

The ordinary sessions of Congress will begin in the middle of May. It remains to be seen whether the pressing legislation which has so far failed to find a quorum owing to the intransigence of the Radical representatives will then be debated, or whether the country must expect a continuance of government by decree. The Acting President's opening message is awaited with interest.

Egyptian Defence

[FROM OUR ALEXANDRIA CORRESPONDENT]

March 25th

WHEREAS for the first war year expenditure and receipts were estimated at £E47,718,000 and £E45,818,000, respectively, which necessitated recourse to the general reserve, for the 1941-42 financial year both expenditure and receipts are estimated at £E46 millions. Such a fact nowadays would have been remarkable even in a neutral country far removed from the theatre of war; it is the more so in the case of Egypt, situated as it is at the centre of the Battle of the Mediterranean.

Yet more remarkable is the fact that in the new Budget expenditure for national defence is placed at £E6,635,000 and expenditure for the execution of the Anglo-Egyptian treaty at £E340,000, against £E7,252,400 and £E460,000 respectively in 1940-41. The fall in national defence is due to the completion, in many cases, of initial outlay. According to the Minister of Finance's Budget note, outlay for aerodromes, buildings, workshops, purchases, special eventualities, etc., will amount to £E1,500,000, against £E2,675,000 in 1940-41, while current expenses will increase by £E578,000. National defence now ranks second in the Budget—after communications, which, incidentally, are largely benefiting from increased receipts resulting from British military traffic.

In 1939, receipts of the Suez Canal Company totalled roughly £E8,000,000, but in 1940 they fell to only £E800,000. A military order was therefore issued on January 5th laying down that payment on bonds should be made on the basis of the franc valued at P.T.3.8575 and not on the basis of gold, as the company's revenues from dues were no longer sufficient to meet even the expenses of administration and already a recourse to reserves had had to be made. The military order is only a temporary measure, not affecting the rights of bondholders and not intended to exempt the company from Court judgments in respect of the bonds; nor does it prevent bondholders from reserving their rights.

American Economic Trends

(From Our New York Correspondent)

Rise in Farm Prices

May 17th

THE rise in primary commodity prices in the past three months has been little short of spectacular. At the end of February, Moody's index of primary commodities was 175.5; at the end of March it was 185; at the end of April, 185; and in the second week of May, 196. The movement of this index is primarily a reflection of markets in agricultural commodities.

The impulses making directly for the current price movement derive from two different sources. First, all this spring there has been continuous and wide insistence by organised labour for wage increases. Sometimes these have been granted only after more or less prolonged strikes; more often, the threat of a strike has sufficed; in other instances the demands were anticipated. The result has been to lift hourly wage rates by roughly 10 per cent over a great part of American industry, mostly since the end of February.

This was not unnoticed by the guardians of the farmer. The demand for farm products was already fairly strong, as increased consumption was undoubtedly accompanying fuller industrial employment; but this demand was supplemented by active operations by various Federal agencies. Several commodities, including butter and eggs, were stabilised in the late winter at prices well above levels prevailing shortly before. To these efforts have been added legislative proposals to lift the "parity loan" percentages applicable to crops which must be processed before reaching the consumer.

The Fair Price

The parity loan is a mixture of the ancient concept of the "fair price" and the doctrine of economic equilibrium. It is assumed that, at a selected period in the past, the several prices of basic farm products stood in an ideal relation to the price of non-farm products as a whole. This relation is "parity." When the price is below this parity, loans are given on the basis of a designated percentage of this parity—actually 75 per cent. The original idea was that such loans would prevent forced marketing; but as events have developed, it is difficult to detect the difference between the loan and a sale under repurchase agreement. The tendency was for the loan value to become the market price. Hence the insistence by a majority of Congress that the loan percentage be lifted. The current legislation names the figure of 85 per cent; the Bill, however, has not yet been signed. But it must be remembered that this parity is related to a general price level which is itself moving upward, under a variety of impulses, only one of which—wage increases—was mentioned above.

In this respect, therefore, American policy has differed from that of most European countries. There, governmental effort since the war has been largely concerned with restraining the prices of agricultural products. In this country, the official effort has continued to be directed toward lifting agricultural prices.

Despite these efforts, the wholesale price index of the Bureau of Labour Statistics still displays a remarkable spread. For example, in the second week of May, the index of building materials was 100; of metals and metal products, 98; and of hides and leather products, 105. At the same time, farm products were 75 and foods 79. But the efforts have not been in vain; in the middle of last July building materials were 93, metals 95, and hides and leather 100; while farm products were 66 and foods 70. That is, over the recent period, farm products and food have risen more than most other groups. This impression is qualified by the fact that the general wage increases of the past ten weeks have not yet been fully reflected in "other" commodities. Broadly speaking, this war has as yet not duplicated for the farmer the bonanza days of "the other war"; but neither has it materially worsened his relative status in the economy.

New Highs for Industry

THE business indices for March showed an advance, whether they are adjusted for seasonal changes or not.

FRB BUSINESS INDICES (unadjusted)

1935-9 = 100 for industrial production
1933-5 = 100 for other series

Feb. 1941.....	40.0	28.66
Mar. 1941.....	—	—

These tables confirm each other. In the past six months, there has been no great change in the non-durable goods industries; in durable goods, there is an increase in production of well over 10 per cent, and an increase in employment of a little under 10 per cent, and an increase in payrolls of about 10 per cent. In manufacturing generally, the week has lengthened, until it is at the legal limit of 40 hours—a limit which can be passed for overtime. Of course, at the 40-hour average, a great many persons are working overtime; in other cases, two or more shifts are employed.

Comparisons with a year ago are more conspicuous. Factory employment is over 15 per cent higher and payrolls over 25 per cent higher. In February, average weekly earnings were about 15 per cent (over \$3.00) higher than in February, 1940—much of which is the consequence of longer hours, as average hourly earnings are only 5 per cent higher than a year ago. In March, there was a rather widespread epidemic of strikes, and in March, and more especially in April, there has been a number of fairly steep wage increases in several major industries. These are not reflected in the data given above, as February is the last month covered.

THE BUSINESS WORLD

Building Societies in Wartime—I

TWO devastating years have passed since *The Economist* last reviewed the position of building societies in detail. From a special survey of the movement made on July 1, 1939, one principal conclusion emerged: even abstracting from the risk of war, building societies would have to adapt themselves to a spell of declining new business. A decade of unmatched growth appeared to have reached a climax; it seemed that there was no obvious alternative outlet for building society funds comparable with the financing of moderate-sized, owner-occupied houses. That class of business, having expanded to unforeseen dimensions, had clearly passed its zenith. Competition between the societies, always keen, threatened to become acute. There were signs, in some directions, of undue interest in the more speculative risks of large business premises and flats. Undeniably, there was a feeling among sober observers of the movement, that the progress of the 'thirties had been heady, and in some cases even intoxicating. A pause for reflection and consolidation was indicated, and it promised to be beneficial.

In peace-time terms, the question confronting the movement in the early months of 1939 was whether its ability to expand would be matched by comparable powers of adaptation to more stable conditions. Two years of war have swept this question aside. Adaptation there has certainly been, but in response to changes of a catastrophic order. New business has not declined; it has virtually disappeared. Instead of rare and unwelcome manifestations of the "mortgage strike," the societies have had to cope with the inability of many mortgagors, whose personal probity was above reproach, but whose incomes had been sharply reduced, to maintain their contractual payments. And for many months in the early stages of the war, when air bombing was a threat, but not a fact, the societies still remained in doubt about the eventual value of their mortgage assets, if they should be destroyed by enemy action. Now they have a collateral bulwark in the Government's insurance scheme, for which they pressed long before war broke out, even though they may complain of the cost which it imposes upon them.

It is intended in this article to measure the effects of some of these major changes, leaving for a second discussion the difficulties of balancing the profit and loss account under present conditions, and the many delicate questions of policy which must be expected as the war grows more acute. For this first statistical article, we may build upon the survey already cited. But while in peace-time an elaborate statistical review of the position of over 100 leading societies could be presented, wartime research must be more modest. Fifteen leading societies have therefore been selected, whose figures are likely to be representative of the entire movement, and whose total assets accounted for 53 per cent. of the total assets of all societies in 1937. For some important figures, however, four of these societies appear to have taken advantage of a wartime relaxation in the normal form of accounts, and have issued abridged figures which do not reveal new shares and deposits and withdrawals, nor mortgage repayments during the year. Probably, the remaining eleven societies are sufficiently characteristic of the mass to make their figures reliable as an indication of trend. The figures are summarised in the table in the next column.

It is obvious from the first line of this table that there have been no sharp contractions in the total assets under the control of building societies. The fifteen societies whose reports were analysed show a decline in total assets of no more than 3 per cent between 1939 and 1940, and the latest total of £391,393,700 is not appreciably below the 1938 level. For the movement as a whole, these figures would suggest that total assets may have declined from £758.9 millions in 1938 to about £743 millions at the end of 1940. But behind this relatively small change in local assets some important transfers have occurred. They

are reflected partly in the decline in the proportion which outstanding mortgages bear to total assets from 89.7 per cent in 1939 to 88.2 per cent in 1940, and in the rise in cash and investments from 9½ per cent to 11½ per cent of the total.

The explanation, of course, is that a decline in new mortgage business has produced the expected result—namely, that there would be an increase in liquidity, provided that the total investment in the societies, in the form of shares and deposits, remained reasonably stable. The figures showing the total amounts due to shareholders and depositors reveal that no "run" has been allowed to weaken the societies' financial position. Many societies have, of course, availed themselves of the permissive right to require six months' notice of repayment of shares or deposits. But, while this measure has provided a useful financial "buffer," it would be unfair to suppose that, in its absence, the societies would have been confronted with unmanageable demands for repayment. It is regrettable, perhaps, that the deposit balances have fallen more, both absolutely and relatively, than share balances, for the latter are four times as large as the former, and carry a substantially higher rate of interest. But the eleven societies whose de-

BUILDING SOCIETY FINANCE—1937-40

	1937	1938	1939	1940
Total Assets, end year	£000's	£000's	£000's	£000's

	30,629.2	30,921.5	28,220.6	20,815.2

Note: Figures relate to fifteen Societies (Halifax, Abbey Road, Woolwich, Huddersfield, Leeds Permanent, Northampton Town and County, National Park, Cheltenham and Gloucester, Portman, Bingley and Temperance Permanent) except where marked *. The latter exclude Halifax, Leeds Permanent, Leicester Permanent, and Cheltenham and Gloucester.

tailed figures of members' investments and withdrawals are disclosed, can surely congratulate themselves that new shares and deposits have replaced over half of the amounts withdrawn.

The truly spectacular changes, however, are to be found in the figures relating to mortgage business. Between 1936 and 1938, new mortgage advances occupied a lofty plateau from which, normally, the descent would have been fairly steady. In 1939, however, new mortgage business fell by roughly one-third—it can conveniently be said to have ceased on the outbreak of war—and last year, new mortgage business represented a mere 9½ per cent of the pre-war total of the eleven societies. Mortgage repayments on the other hand, fell by about one-third from the 1938 level to £20.8 millions for the same societies. Although this is a substantial fall, it is not out of line with major changes, such as the calling-up of large numbers of mortgagors to the forces, evacuation of certain areas, and damage caused by air-raids—all of which have inevitably affected the repayment of mortgage money. The societies generally have met these problems of their borrowing members with understanding, and have adopted the principle of "freezing" outstanding balances until the end of the war. The schedules of properties in possession and arrears, of course, have been considerably lengthened as a result of the war and some measure of permanent default has been inescap-

able. But, in all the circumstances, the measure of mortgage repayments continues to reflect the long-proven value of borrowers' personal covenants. It may be difficult to maintain such a high standard of performance during the present year, but there should still be a substantial re-flow of mortgage money from advances made in past years.

It seems fitting to bridge this statistical study and the discussion on policy which is to follow by some consideration of a crucial matter—the structure of building society interest rates. Figures have been extracted (though they are not shown in the table on page 730) which make it possible to compute the average level of interest rates paid and received by the societies, by the method shown on pages 12 and 13 of the survey of July 1, 1939. The results are given in the following table:—

COMPUTED RATES OF INTEREST
(per cent.)

	Shares	Deposits	Mortgages
1933*	3.8	3.4	5.6
1934*	3.7	2.8	5.5
1935*	3.6	3.0	5.2
1936*	3.4	2.8	4.9
1937*	3.3	2.7	4.9
1938*	3.3	2.7	4.8
1938†	3.3	2.6	4.9
1939†	3.4	2.7	4.9
1940†	3.2	2.6	4.8

* Based on 108 Societies. † Based on 15 Societies.

During the last three years, it is clear that no major changes in interest rates have occurred. The slight net

reduction in the rate of return on shares has been offset by a fall in the average rate paid on mortgage advances. In fact, the stable rates paid on members' shares and deposits have represented an ever-increasing gross rate of interest to the societies (and to tax-paying members), since they are paid free of tax. The societies have been compelled to pay an ever-increasing compounded rate of tax on their assessed profits in keeping with successive increases in the standard rate of tax. The margin of net return from building societies' business was already small, before the last budget and the contribution to the War Damage Insurance scheme were added to their outgoings.

One thing is clear. The traditional assumption that building society investors, as small men, are outside the normal scope of income tax assessment has been fundamentally changed by the direct taxation of lower incomes. Further, a tax-free rate of 3.2 per cent—which is equivalent to 6.4 per cent gross—is completely out of keeping with the structure of interest rates on gilt-edged securities. Would any move to bring these tax-free payments into line (a step which, it may be presumed, is being considered by the Chancellor of the Exchequer in his examination of tax-free payments) threaten the financial structure of the movement? In other words, would healthier revenue accounts mean weaker balance sheets, because funds would be withdrawn? The dilemma is not so formidable in a context of wartime controls as in peacetime, but its solution may have far-reaching effects on the structure of building society finance, the examination of which must be left to a succeeding article.

The Illusory Cost-of-Living Index

THE Ministry of Labour's cost-of-living index has come to be regarded by many as an almost sacrosanct measure of changes in the money cost of maintaining the standard of living of working-class families. A rise in the index by a given percentage is often cited as unanswerable proof of an equivalent increase in the cost of living all over the country in justification of claims to higher wage rates. Some 2½ million workers have their wage rates linked directly to the index. Even the Chancellor of the Exchequer lent some support to this view by implication when he announced on April 7th his intention of holding the index at 25-30 per cent above the pre-war level, in the hope that this would arrest the pressure for higher wages.

In view of the authority with which the official index has been invested as a kind of final arbiter in claims to higher wages, it is pertinent to examine its validity in the present scarcity conditions. The average cost of living of working-class families depends on the quantity of goods and services actually available and on their prices. To have any validity in the present emergency, a cost of living index must therefore take account not only of changes in the prices of consumers' goods, but also of alterations in the proportions in which they are available to the public. An index that does not satisfy these conditions, and is nevertheless widely employed for the purpose of adjusting wage rates, may give rise to the most unfortunate consequences upon the national economy.

The Ministry of Labour's index certainly does not satisfy these conditions. And, it must be said in fairness to them, the civil servants who calculate the index do not claim for it the authority with which it is widely regarded. Each month they carefully define the index in the *Ministry of Labour Gazette* as a calculation showing the average increase in the cost of maintaining unchanged the standard of living prevailing in working-class families prior to August, 1914, and they emphasise that no allowance has been made for any changes in the standard of living since 1914 or for any economies or readjustments in consumption and expenditure since the outbreak of the present war. When trade unions therefore press for higher wages by reference to a rise in the index, they are in fact demanding compensation for an increase in the prices of goods and services weighted in the proportions in which they were consumed before the last war. There is a double irrelevance in such a demand. First, the standard of living which it is sought to maintain is, by now, a mere historical curiosity, with only very indirect reference to the actual standard of living that prevailed among working-class families on the eve of the present war. But, secondly, even if this defect were corrected—even if there were to be a new cost of living index based on the results of the 1937-38 inquiry into working-

class family budgets, and therefore accurately reflecting the 1937-38 standard of living—it would still be absurdly illogical to apply a peacetime index to wartime conditions. For example, the 1937-38 inquiry established that the average working-class family consumed 40 ounces of butter and margarine a week, and a revised cost of living index would *inter alia* measure changes in the cost of buying that quantity of butter and margarine. But what relevance has that to a situation in which the average family of 3½ persons can only buy 22½ ounces of butter and margarine? If wages are raised to cover the increased cost of buying 40 ounces, families will be receiving money to spend on non-necessaries—or to save. Such a result may or may not be desirable—that is not the point that is at issue at the moment—but it certainly cannot be insisted upon as a necessity for maintaining the standard of living. Every wartime argument based on the cost of living index makes the tacit assumption that the working-class family consumes the same goods and services, of the same quality and in the same proportions in wartime as in peacetime—which is absurd.

Even during the last war, when the reduction in supplies was less marked than now, the index lost touch with reality. Indeed, the Ministry of Food of the time was quite aware of the fact that the index had become misleading, for it made an attempt to measure the change in actual expenditure on the main foods included in the index on the basis of current consumption and prices. The results, which were confirmed by the budgets examined by the Working Classes Cost of Living Committee set up in 1918, showed that the increase in the average expenditure per family was considerably smaller than the rise in the official cost-of-living index. Unfortunately this method appears to have been adopted rather late in the last war, but in February, 1918, when the official index showed a rise of 108 per cent. over the July, 1914, level, the actual average expenditure of working-class families on the staple foods included in the official index showed an advance of only 44 per cent. Even if allowance was made for the substitution of more expensive foods for those usually consumed, the official index still exaggerated the actual increase in the cost of living, measured by the volume of goods available. As Professor Bowley put it bluntly in his history of prices and wages in 1914-18 (The Clarendon Press, 1921), the cost-of-living index is illusory in time of stringency. If the index was unreliable in 1914-18, it is no more reliable in the present war, when supplies of a greater range of commodities have had to be drastically cut down. The Ministry of Food has so far refrained from publishing an index of the average family's expenditure on food since the outbreak of war; but it is possible to make a

rough calculation of changes in the cost of the majority of foodstuffs included in the cost-of-living index. The *Ministry of Labour Gazette* for December, 1940, contained an analysis of the volume and cost of the food consumed, on the average, by 8,905 working-class households during one week in each of the four months October, 1937, and January, April and July, 1938. By calculating the change in the retail prices of individual foods between 1937-38 and March 1, 1941, on the basis of the prices given in the *Ministry of Labour Gazette*, and by allowing for the reduction in consumption in the case of rationed foods, it is therefore possible to obtain a rough estimate of the change in expenditure. The results of this calculation are set out below. With the exception of fish and eggs, the table covers all the foodstuffs included in the official cost-of-living index; and the expenditure on the foods included accounted for some two-thirds of the total outlay on food by working-class families before the war, as ascertained from the 1937-38 inquiry into the budgets of 8,905 industrial households.

The decline in expenditure on meat has probably been somewhat smaller than this calculation suggests, for it has not been possible to make any allowance for poultry and rabbits and other minor unrationed items included in the meat group. Moreover, the consumption of bread, flour and potatoes, which are unrationed, may have shown some increase since 1937-38; but a 10 per cent increase in the con-

EFFECT OF RATIONING AND CHANGE IN PRICES ON EXPENDITURE ON BASIC FOODS

	Weekly consumption of average family of 3.75 persons (week in Oct. 1937, Jan., April and July, 1938)		Per cent change in Price to March, 1941	Present Ration per head	Present Maximum weekly expenditure	Per cent change in expenditure
	Quantity	Cost				
		s. d.	%		s. d.	%
Meat (incl. Poultry Rabbits)	22.4 oz.	6 2½	+19.8 (c)	1/-	3 9 (a)	-39.4
Bacon, Ham	11.2 p/s.	3 0½	+28.5	(b)	3 11½	+19.9
Milk	28.8 oz.	2 5½	+22.1	(b)	3 11½	+28.5

Potatoes	13.5 lb.	1 1½	+15.2	(d)	1 3½ (e)	+15.2 (e)
Total	...	21 11½	...	...	17 7½	-19.6

(a) No allowance has been made, on the one hand, for the fact that poultry, rabbits and certain other items are unrationed, nor, on the other hand, for the fact that the allowance for children under six is only 6d. (b) Consumption restricted to pre-war level. (c) Increase in price calculated on bacon only. (d) Unrationed. (e) Calculated on assumption that pre-war consumption has been maintained.

sumption of these three items would raise the total expenditure on the foods included in the table by only 5½d.

Subject to these qualifications, the calculation shows that, after allowing for rationing and price changes, the expenditure of working-class households on the basic foods included in the table has been reduced by nearly 20 per cent between 1937-38 and March 1, 1941, compared with a rise of 18.4 per cent in the food component of the Ministry of Labour's cost of living index! True, fish and eggs are excluded. But expenditure on both of them is now certainly lower than before the war, since the reduction in supplies since the outbreak of war has been proportionately greater than the rise in prices, as recorded in the *Ministry of Labour Gazette*. While the calculation shows that there is no relationship between the rise in the food component of the cost-of-living index, and the amount of money that can actually be spent by the average household on the basic foods on which it is based, this does not mean that its expenditure on all foods has declined by 20 per cent since 1937-38. As usual in times of scarcity, there has probably been some increase in expenditure on substitutes. But the supply of all forms of food is limited, and it is a perfectly safe conclusion that the increase in actual expenditure on food has been much less than the official index would suggest—if, indeed, there has been any increase at all. The index affords no guidance at all to the extent of the increase in expenditure; this can only be ascertained by a fresh investigation.

So far the argument has related to food alone. The indices of rent and of fuel and light may be less misleading (though the latter does not include electricity). But, in view of the reduction in the supply of textiles and other personal and household goods, it is difficult to see how the average household could have increased its aggregate expenditure on these items to the extent of the rise in their prices.

In fact, there is sufficient evidence to show that the cost-of-living index has become a purely theoretical conception. It merely records what would be the changes in the cost of purchasing a given collection of goods if the average working-class family chose to want exactly that collection (which it does not) and could get them (which it cannot). It takes no account of the decline in the quantities of goods actually available. And the increase in the average household's expenditure on the items included in the index cannot have been as big as its rise since the outbreak of war. Yet it is still invoked almost every day in justification of claims to higher wages, as though it were still possible to purchase goods in their pre-war proportions and qualities. It is surely high time for the Ministry of Labour officially to discourage the use of the index, and to put in its place an index based on the current volume and prices of the goods actually available.

Finance and Banking

Money Market Stringency

The position in the short-loan market during the past week has been painfully reminiscent of the bouts of stringency which punctuated the life of Lombard Street in more normal times. In the present-day equivalent of the term the market has, in fact, been "in the Bank" to the tune of as much as £13,000,000. It is true that there has been no direct borrowing from or rediscounting at the Bank of England at the official rates, but instead the market has had to sell substantial lines of bills to the agent of the Bank of England. These sales may be termed "open market operations," but they differ from such operations in pre-war days both by reason of their scale and because the initiative which formerly rested with the authorities now lies with the market. If the market is in difficulties with its money position it knows that it can go to Secombe, Marshall and Campion, the agents of the Bank in the discount market, and sell them bills at the market rate. The initiative in such help as has been given to the market during the past week has come from the market houses in question, and there is nothing to distinguish the help thus obtained from official rediscounting at the Bank, except that it is obtained without the penalty of discounting at Bank rate. The market, too, appears to evince the same dislike of seeking such help as it would of going direct to the Bank for accommodation. Part of this is the distaste of all "special" assistance, part of it is due to the knowledge that within the next few days the banks will again be keen buyers of bills, and that the market will have so many fewer bills to sell them.

The Bank Return

For these reasons there has been a strong undercurrent of criticism in the market of the manner in which the monetary position has been handled by the authorities during the recent spasm of stringency. That stringency has been the product of several factors—some of them rather unpredictable. In the first place, London's War Weapons Week involved the transfer of £120 millions of funds from bankers' to Government accounts. Secondly, the clearing banks have been engaged in their monthly making-up. Thirdly—a factor of which the importance has probably been under-estimated—large payments in the aggregate have been made in respect of premiums for the private chattels scheme of war damage insurance. Finally, the Government have in the normal course been accumulating resources in anticipation of the early June War Loan dividend. As, in addition, the market obtained a 38 per cent allotment of its £75 millions quota at last week's tender for bills, the demand for short loans has been well up to normal. Under these circumstances, stringency was bound to develop. The latest Bank return, however, shows that the position is being rapidly eased. By the close of Wednesday bankers' deposits had recovered by £14,321,000 to £110,904,000—a figure which is not excessive given the "window dressing" with which it synchronises. As public deposits are £7,524,000 down, it may be assumed that much of the special buying of bills this week was for account of public departments and not of the Bank of England.

Privilege Money

In the present phase of stringency all supplies of cheap outside credit have disappeared, and the market has had to pay up to 1½ per cent for its bond money as against the customary rate of ½ per cent at which it has obtained such loans from non-clearing banks. On some days, market houses have been pressed to the point of claiming their privilege money or "rights" from the clearing banks. These are long-standing facilities granted to some of the older houses in the market to draw on the banks up to comparatively modest amounts without giving notice of such drawings and without brooking the possibility of refusal by the lending banks. They are only utilised in real emergencies. The methods chosen by the authorities to ease the position, apart from the special purchases of June and July maturities, were to under-allot the Treasury bill issue by £10 millions and to abstain from all Treasury deposit borrowing this week. On these two counts, there should have been a net repayment of £20 millions of floating debt this week. But this, together with the amount distributed in respect of the net revenue deficit, was clearly inadequate to offset the various influences making for stringency in the short loan market. The position should tend to become normal again next week with the distribution of War Loan dividend. The discount market, for its part, will be little the worse off for having had, for once in a while, to bestir itself in the task of balancing its day-to-day position.

"Outside" Banks and Treasury Deposits

On a number of occasions in the past few months the total of Treasury deposits demanded from the customary rota of clearing and Scottish banks has been rather smaller than the total issued. The margin between the two figures has usually been £500,000. It has generally been assumed that the Treasury deposits thus collected from sources other than the clearing and Scottish banks have been reserved for clients of the Bank of England. The Chancellor of the Exchequer was questioned on this subject in the House this week, and though he refused to break the practice of not publishing the names of subscribers to Government loans, the indications he gave on the subject were fairly informative. He stated that the Treasury deposits scheme, while applying principally to the clearing and Scottish banks, "had also been made available to other banks operating in the sterling area which have accumulated sterling balances here." In answering a supplementary question, Sir Kingsley Wood stated that there was nothing objectionable in taking such deposits from central banks. The "outside" lenders on Treasury deposits are, therefore, central banks in the sterling area. Their participation in this form of short-term lending to the Government is probably designed to curtail the competition for Treasury bills at the weekly tender, and thus give the discount market—and through it the banks—slightly more generous allotments of bills than they would otherwise obtain.

The Currency War in China

Another Japanese move in the currency war in China has been reported this week. The Japanese authorities in the Northern Provinces and in Central China have decided to exclude the national currency, i.e., the yuan of the Chungking Government, from the financial settlement of all trade between the districts under their control. Such trade is henceforth to be expressed and settled in terms of Japanese yen, or one or other of the two puppet currencies. It is evident that this decree will not command universal acceptance. It will, of course, apply to the barter arrangements between North and Central China, and to the trade handled by the Japanese-sponsored boards and agencies in both territories. But these quarters have all along done their utmost to exclude the currency of the National Government from their transactions. It will need more than this injunction to cause the vast bulk of private commerce, even in the occupied parts of China, to be settled in any currency other than that of the Chungking Government. The exchange rate of that currency has improved from 3½d. to 3½d. since the news of the establishment of the Stabilisation Board, and of the dollar and sterling credits with which it was fortified.

War Workers and Exchange Remittances

The exchange control regulations have recently been somewhat eased to meet the case of persons normally resident in non-enemy countries outside the sterling area who come to the United Kingdom to do war work and have dependants to support in their own country. Henceforth such persons will be allowed to remit to their own country a part of the sterling income they derive from their war work. The definition of "war work" will in most cases occasion no difficulty. Most of the persons concerned are serving with the armed forces or are employed in one of the Ministries. Where the position is not so clear—for example, in the case of industrial workers—the facts of the case are to be submitted to the Bank of England, which will give its ruling. The permitted percentage of such income to be remitted will be up to 50 per cent in the case of married persons and 25 per cent in the case of single persons. It has been emphasised that these percentages apply to the sterling income earned by war work and not necessarily to the whole sterling income of the persons concerned.

Palestine Currency

Annual reports of the various Colonial and Mandatory Currency Boards appear with delays which are inexplicable even under conditions of war. The report of the Palestine Currency Board, which has just come to hand, covers the year ended March 31, 1940. Over this period the circulation in Palestine rose from £P6,574,134 to £P8,541,635. Within this growth there were, however, considerable fluctuations, and the circulation reached a record figure of nearly £P11,000,000 in September, 1938. This sudden expansion was in response to a hoarding demand for currency, which followed the declaration of war. The main counterpart of the increased circulation was to be found in larger holdings of Government securities by the Board. One may assume that during the current year, given the large reinforcements of troops in Palestine, and the increased alarms in the Eastern Mediterranean, the demand for currency—both for genuine commercial and for hoarding purposes—has again risen appreciably.

Bank of France Statutes

A number of amendments to the statutes of the Bank of France were decreed by Marshal Pétain towards the end of last year. Detailed information about them, which, in the normal course, would have been received in this country within a few hours of their promulgation, has had to await the lengthy journey of the appropriate *Journal Officiel* from Vichy to the United States and the mailing of the amendments from New York to this country. The amendments are of no great importance in themselves, but are significant in that they make for closer Government control of the Bank of France. The membership of the General Council of the Bank and its composition have both been altered. Previously the Council consisted of 26 members, the Governor, two Vice-Governors, 20 councillors and three censors. The majority of the councillors represented various economic interests in the nation (labour, employers, etc.). By the new statutes the Council has been reduced to a membership of 18, including four censors or auditors, of whom two will be nominated by the Government (formerly the three censors on the Council were elected by the shareholders). The councillors have been reduced to 11, of whom three will be appointed by the shareholders, five by the Secretary of State for Finance, and the other three will be the heads of three public financial agencies (themselves appointed to these positions by the Government). The Council, on which there will thus be a large majority of direct Government nominees, will be expected to prove a more active executive body than it was formerly. The permanent Committee of the Council, to which most of its executive functions were delegated, has been abolished and the Council is now required to meet at least once a week. The other significant feature of these amendments lies in the fact that they represent the first tampering with the Bank of France statutes made by decree of the Chief of State under the application of the "Fuehrer principle" which Vichy has copied so slavishly from its new masters.

Investment

After the Fair

Conditions during the past fortnight or more have been exceptionally unfavourable to Stock Exchange business. To the uncertainties associated with the battles of Crete and the Atlantic and the delay in Mr. Roosevelt's fire-side chat—from which so much was rightly expected—have been added the anticipation and the occurrence of the London War Weapons Week. This meant the holding back of investment by institutions and individuals. It will almost certainly prove to have also produced some anticipation of normal purchases, so that its shadow may linger for some time. These difficulties have affected turnover rather than prices; but, even so, there have been a few fairly good days, and the pressure of money, coupled with the con-

fidence of the investor, is reflected in a rise in both fixed interest and equity indices. In both sections, buying has been highly selective and moderate in amount. In the former, with the notable exception of 3 per cent Local Loans, the Funds were lower until Wednesday. There has, in fact, been a continuance of the reduction in price and yield margins within the fixed interest section, which had already been in progress for some months. This is the result of the search for higher yields which is accentuated by every rise in taxation and the cost of living. In consequence, the widely based *Financial News* index shows an improvement on the fortnight in fixed interest stocks of almost 2 per cent. Over this period, the rise in equities is less than $\frac{1}{2}$ per cent. This rise has, however, occurred in the face of the appearance of accounts, which increasingly reflect the effects of

higher taxation or restriction of supplies, or both, and despite a number of dividend reductions. When the yield figures for the period are available, it will probably be found that May has brought a further decline in a number of the equity groups. It is evident that the search for yields, with or without the prospect of early capital appreciation, has been going on quietly throughout all sections of the market, and there is evidence of this in a number of modest rises, amid the general marking down which has usually accompanied really bad news. With the intensive savings campaigns of recent weeks past their immediate peak, it is reasonable to look for some revival in business, although it is not likely to be striking until there is a period of respite from news which is at best indifferent—a relief not at present in sight. The tendency will be strengthened almost at once by the receipt of interest on $3\frac{1}{2}$ per cent War Loan, to a total of some £16,750,000 net, and by the payment for the latest group of American securities, announced on April 19th and commencing June 3rd, two days after the War Loan payment. Despite the approaching exhaustion of American securities, it can scarcely be doubted that there will be further injections of cash into the investment stream as the year progresses. While the general outlook must remain unclear, and even threatening, for some time, some of the fog which obscured the outlook for equities is gradually being blown away by the gentle breeze—it is as yet scarcely more than that—designed to rid British industry of superfluous occupations. In these circumstances, some selected equities should certainly share in any increase in business which occurs.

Company Notes

J. Lyons Dividend Maintained

The payment of a final dividend of 15 per cent on ordinary and "A" ordinary capital, making 20 per cent for the year to March 31, 1941, indicates that the management of Lyons have not abandoned the stable dividend policy. After the previous year's reduction in dividend from 22½ per cent, paid for more than a decade, to 20 per cent, despite virtual stability in net profits, at £1,011,452 against £1,011,980, the latest payment must come as an agreeable surprise to shareholders—the more so since profits, on a comparable basis, are disclosed as no more than £883,600. Consequently, the cover for equity payments is sharply reduced from £521,099 to £393,600, which, grossed up at the current standard rate of income tax, represents a rate of 22.4 against 33.0 per cent. The fall in net profits, for which, of course, war taxation is substantially responsible, is due to a variety of causes. Property losses, and the necessity of making provision out of income, have been an important factor. On the supply side, the concern has been faced not only with rationing and restriction, but, in addition, with complete inability to obtain various raw materials. These difficulties have inevitably hampered the factory, as well as the catering, side of the business. In view of all existing complications, it must remain doubtful whether the management will see its way to maintaining a 20 per cent payment throughout the war. The £1 ordinary shares, at the present price of £4 ex dividend, yield £5 per cent.

The Viscose Sale

The news that the capital of the American Viscose Corporation has been sold in New York at the rate of \$107.50 a preferred and \$24 a common share, caused considerable misgivings among shareholders in Courtaulds. The gross yield on this basis is some \$62 millions odd, giving the British Treasury a return of about £14 millions on their 90 per cent interest. This is far below even the most modest estimates of the value of the company. It appears, indeed, to be below its break-up value. According to New York reports, the excess of current assets, including stock, over current liabilities was some £11,500,000 at the end of March, while total assets exceeded £30,384,000. First quarter earnings amounted to 93 cents per common share, and a dividend of 50 cents was announced. Actually, the ordinary shares of Courtaulds have fallen only a few pence, for, on the one hand, the price has never discounted any but the most conservative valuation, while, on the other, it is upon the British Treasury's agreed valuation, and not on the dollar price they receive, that the compensation to the company is to be based. Unless the figures are completely misleading, the price obtained can only be regarded as the exploitation of a forced sale. The compensation should be based on what the investment would probably have produced over a substantial term of years. There is, however, more than a trace of suspicion that the whole affair has suffered from a desire to get results quickly rather than to drive a reasonable bargain.

INSURANCE NOTES

Phoenix Assurance.—The Phoenix, in common with the other leading composite offices, experienced a sharp fall in life new business, but notwithstanding this the premium income was slightly higher. Claims include 42 deaths from causes directly connected with the war, and these are responsible for £70,000 of the total:—

		Rise or Fall
New Business:—		
Net sums assured ...	£2,029,703	—£1,997,313 (49.6%)
Income:—		
Net premiums ...	£1,357,992	+ £14,282 (1.1%)
Net interest ...	£631,289	— £46,596 (7.4%)
Outgo:—		
Claims by death ...	£763,515	+ £50,098 (6.6%)
Claims by maturity	£593,122	+ £290,408 (48.9%)
Surrenders, including		
surrenders of bonus	£181,755	+ £18,584 (10.2%)
Commission and ex-		
penses ...	£174,939	— £13,896 (7.9%)
Commission and ex-		
penses — ratio to		
premiums ...	12.9%	1.2%

The quinquennial valuation was due at December 31st last, but the directors have thought it prudent to postpone any general declaration of bonus until after the conclusion of hostilities. In his statement to the shareholders, the chairman (Mr. R. Y. Sketch) explained that had it not been for the need for taking precautions and increasing reserves satisfactory results would be apparent. Until the subject receives further consideration, interim bonuses will be allowed at the rate of 30s. per cent. for each year's premium paid during the past quinquennium and at the rate of 20s. per cent for subsequent premiums.

Developments in departments other than life are portrayed in the table below:—

	Rise or Fall	Rise or Fall
Premiums		
Fire ...	2,928,872	+ 160,713
Accident ...	3,545,104	— 236,718
Marine ...	1,443,092	+ 534,776
	7,917,068	+ 458,771
Profits		
Fire ...	54,529	— 147,251
Accident ...	293,400	— 36,674
Marine ...	30,000	+ 30,000
	377,929	— 153,925

Larger home losses, the incidence of which is not confined to any particular trades or industries, but is general over the whole field, coupled with a less favourable experience in the United States, account for the modest proportions of the fire profit. In view of the loss of revenue from the Continent and the diminution in the number of cars on the road, the fall in accident premiums is less severe than might have been envisaged, and the profit realised in this department is excellent. A substantial rise in marine premiums is in conformity with the general trend; after releasing £30,000 the fund exhibits a position of even greater strength than last year.

Credits to profit and loss, including net interest of £323,093, aggregate £702,190. Office premises account, pensions reserve and various expense charges (including provision for war damage contributions) take £209,785 and reserve for British taxes £150,000. Interest on debenture stock costs £33,845, and the reserve for the dividend at the same rate as before absorbs £346,725. A special reserve of £200,000 has been established for contingencies in respect of transactions in enemy-occupied territories; this is a purely precautionary measure, not relating to any known liabilities, and but for it the balance carried forward, which at £1,235,511 shows a reduction of £238,165, would have been substantially unchanged. In addition to setting up this reserve the whole of the assets in enemy and enemy-occupied territories has been written off, this being the principal reason for a reduction of some £350,000 in the investment and contingencies reserve, and the directors deserve commendation for having thus made full provision for all eventualities. Taking the investment and contingencies reserve into account, assets are certified to be fully of the value stated in the balance sheet, and Stock Exchange securities stand at less than market prices; in addition to the balance of profit and loss account, there is a general reserve of £2,500,000.

Employers' Assurance.—Life business is transacted by the Employers' exclusively through the medium of the Clerical, Medical and General, and the experience in 1940 is revealed in the appended table:—

	Rise or Fall
New Business:—	
Net sums assured ...	£829,138 — £1,203,316 (59.2%)
Income:—	
Net premiums ...	£957,236 — £88,762 (8.5%)
Net interest ...	£547,867 — £20,128 (3.7%)
Outgo:—	
Claims by death ...	£583,916 + £183,124 (31.4%)
Claims by maturity	£245,197 + £7,858 (3.2%)
Surrenders, including	
surrenders of bonus	£146,960 — £30,632 (20.8%)
Commission and ex-	
penses ...	£124,232 — £16,501 (12.5%)
Commission and ex-	
penses — ratio to	
premiums ...	13.0% — 0.5%

Death claims include some £120,000 suffered in respect of war service deaths and civilian casualties. A quinquennial investigation of the assets and liabilities of the Clerical, Medical and General was made at the end of 1940, and with interest at 2½ per cent disclosed a gross surplus of £1,986,329. Some £800,800 of this is being distributed, one-tenth to the proprietors and the balance to the

policyholders, and after reserving £125,000 for war mortality and £100,000 for future intermediate bonuses £960,529 is being carried forward. War damage to properties represents less than 1 per cent of book values; Stock Exchange securities have been revalued at market prices, and, taking into account the unappropriated sums carried forward, the assets are certified to be fully of the value stated.

The fire and accident accounts, in which United States and Canadian dollars have been converted at \$5 to the £, produce the following results:—

	Rise or Fall	Under-writing Profits	Rise or Fall
Premiums			
Fire ...	417,143	+ 21,714	4,054
Accident ...	5,851,070	— 26,127	230,016
	6,268,513	— 4,413	234,070
			+ 5,725

That the company has been able virtually to maintain its premium income is doubtless largely due to its outstanding dependence on the large United States account, which provides some £4,900,000 of the accident premiums, as well as to its relatively small interests in enemy-occupied territories. To the underwriting profit of £234,070 must be added net interest of £186,123, making a total credit to profit and loss of £420,193. Provision for British taxes takes £180,000, and sundry items not otherwise charged £26,717; after maintaining the dividend at 3s. 6d. per share, absorbing £143,328, the balance carried forward is higher by £70,148 at £539,312. The market value of investments is £1,430,000 in excess of book value if taken at current rates of exchange, and if the other assets and liabilities are revalued on the same basis there is a considerable net appreciation in the assets. In addition to the balance of profit and loss account, there is a general reserve of £2,500,000.

Marine insurance is written through the Merchants Marine, and the premium income is £316,000, against £190,000; there is a profit of £4,000 on the 1939 account.

Scottish Union and National.—Life new business, at £474,341, shows a reduction of 65.2 per cent, and premiums are lower by 4.6 per cent at £795,874. The net rate of interest earned is £3 os. 11d. per cent, against £3 8s. 10d. per cent. Death claims advanced from £394,410 to £451,643, but the increase is very largely accounted for by deaths caused directly by enemy action; despite these war deaths, claims are well within expectation. The commission and expense ratio is lower by 3 per cent at 12.6 per cent, this doubtless being

(Continued on page 738)

Another Australian Conversion

It will be recalled that, at the time of the passing of the Public Works Loans Act, designed to implement the Treasury's measures for the conversion of municipal securities bearing high rates of interest, and convertible at the option of the borrower, the possibility was mooted that the similar measures might be applied to one or other of the Dominions. It now transpires that the machinery is to be used by Australia. In announcing this in the House, the Chancellor of the Exchequer stated that the operation would be limited to loans bearing interest of more than 4 per cent, and that a Vote of Credit would be granted to cover any and that a Vote of Credit would be granted to cover any stock not converted. The exact significance of the latter provision is not clear, for the Commonwealth Government has ample balances here to deal with the operation. Probably these are required for other and more important purposes, and the measure adopted represents a further development of the close collaboration between this country and the Dominions. The amount of stock affected is considerable, but by no means unmanageable. There are three issues, all maturing 1940-60, namely, rather over £18 millions of Queensland 5 per cent stock and 4½ per cent stocks of Australia and Victoria, of which, according to the latest particulars, each had rather less than £6,000,000 outstanding, a total of rather over £30 millions in all. At the moment no terms are available, and the success of the operation must depend on these. It is to be remarked, however, that the response to the offer to extend the £13,470,000 of 3 per cent stock, finally falling due on October 1st, does not appear to have met with the success which was generally expected. The extension was to £1943-44, and the amount of acceptances, £8,082,469. The wide margin may be accounted for by repayments by the Commonwealth Government prior to the announcement. It is also to be supposed—on the probable assumption that the terms will prove popular—that the operation will have no great effect on the volume of sterling balances held here, and that the possibility of repayment of stocks not yet due remains a possibility.

A Water Board Offer

Seven out of eleven of the municipalities, which are repaying a substantial proportion of the stocks now offered for conversion, have already closed their lists, having received all that they are prepared to convert. The way is thus considered open for further operations, of which an offer by the Staffordshire Potteries Water Board is the first. Notice is given to repay, on December 1st, £899,800 of

Marks and Spencer Accounts

The profits position of Marks and Spencer for the year to March 31, 1941, was fully revealed by the preliminary statement discussed in *The Economist* of May 10th. The company's balance sheet, and the statement of Mr Simon Marks circulated with the report, contribute one outstandingly important indication of the present scale of business. In the past industrial year, at the dictates of the war effort, Marks and Spencer has for the first time turned from an expanding to a—temporarily—contracting enterprise. Mr Marks points out that the impact of limitation of supplies, rationing and industrial concentration were, even last year, not felt with full force, partly since the war effort only gathered momentum after the summer, and partly because the company started the year with very substantial stocks. The balance sheet shows a fall in stocks from £2,234,044 to £1,999,681, accompanied by a rise in cash from £1,759,897 to £2,110,184. The fall is, of course, greater in volume than in value on account of rising prices and the imposition of purchase tax. Moreover, £402,600 against nil has been invested in various forms of war loan. Mr Marks points out that the company, with its widespread branch activity, is well placed to serve shifts in the population, such as the past year has seen, and to adapt the distribution of supplies. It is also true that this geographical dispersal of interests has saved Marks and Spencer from the loss of customers which has severely affected stores not organised on the "chain" principle. It is also probable that the company's policy of centralised buying and, as Mr. Marks indicates, of close association with producers has minimised supply difficulties. There can, however, be little doubt that the scale of business has contracted. The balance sheet gives trade creditors at £470,298 against £647,943, and, although sundry creditors, including tax provision and specific reserves, are substantially up from £1,566,312 to £2,334,007, it is probable that the two latter items account for most of the rise. Debtors show a real increase from £236,899 to £392,569. In one sphere, however, the company is released from the necessity of marking time, and even restricting activity, in harmony with the war effort. The interesting experiment embodied in the formation of the Marks and Spencer Export Corporation to promote exports to the United States and Canada is now being actively developed. The 5s. ordinary shares, at 31s. ex dividend, offer a yield of almost £5 13s. per cent on the 35 per cent payment.

Goodlass Wall and Lead Industries

The 1940 accounts of Goodlass Wall and Lead show a reduction in net trading profits from £267,719 to £266,425. In view of a serious contraction in demand for the company's products during the second half of the year, for which the reduction in private building is chiefly responsible, the directors consider the earnings figure to be satisfactory. With a steep rise in tax liability from £99,781 to £155,945, it is inevitable, even after halving the allocation to staff pensions at £5,000, that equity earnings should be sharply reduced. In fact, the available surplus at £36,434 is less than half that earned in 1939, and the rate of 6.05 per cent, which compares with 10.2 per cent, provides exceedingly narrow cover for the dividend, which is repeated at 6 per cent. The 1 per cent bonus paid in the four previous years is inevitably dropped, and, in order to raise the carry-forward by £295 to £79,615 no allocation is made to general reserve, against £25,000. The decline in business activity, for which severance from export markets, as well as a reduction in home demand, is responsible, is reflected in the consolidated statement by a virtual stability of creditors, including taxation at £1,001,920, and an actual decline in debtors from £825,294 to £680,632. Moreover, stocks have piled up to the extent of £441,787, bringing the total to £1,324,408. A rise in holdings of Government securities in the company's balance-sheet of some £90,000 to £244,402 is accompanied by a moderate decline in cash. The review of the year by the chairman, Mr Clive Cookson, circulated with the report, places an optimistic interpretation on results. Although rising taxation, war risks insurance, and the failure of service contracts to compensate for the decline of private building have necessarily impaired earning capacity for the present, Mr Cookson considers that adaptation has been satisfactory. Unfortunately, the Indian subsidiaries, which are newly formed, have an unfavourable standard for EPT assessment, while development of the Greenside mine has not fulfilled expectations. The 10s. ordinary shares at par ex dividend, offer the yield of £6 per cent.

Philip Hill Investments

No strict comparison is possible between total profits of Philip Hill and Partners of £190,955 for the year to March 31, 1941, and of £183,066 earned in the previous nine months. The directors point out, however, that the previous year's earnings, after deduction of directors' fees, represent an annual rate of £239,827 against a comparable figure of £186,608. The reduction is attributed largely to the virtual cessation of the company's financial business, for which the war is responsible. Before transfer of £100,000 to investment depreciation reserve, the year's earnings, at a rate of 26.4 per cent on equity capital, provide ample cover for the 10 per cent dividend. In the previous nine months, ordinary shareholders received 10 per cent actual less tax, being a rate of 13½ per cent yearly, covered by a yearly rate of 29.6 per cent. The 1940 distribution, however, involves no draft on the carry-forward, which, after receiving £19,000 refund of income tax is increased from £57,913 to £70,660. Far the most interesting aspect of the accounts is the information provided on depreciation of investments. Quoted securities, at March 31st last, stood at £2,566,267, against a nominal value of £3,510,156 and a market valuation twelve months previously of £2,948,132. With the transfer of £300,000 from general reserve, leaving the total of that fund at £700,000, and the current allocation of £100,000, investment depreciation reserve stands at £955,434. The directors state, however, that the greatest actual depreciation realised by the company's investments is in respect of real property holdings, some of which have suffered directly from enemy action, some indirectly owing to prejudice to their revenue-earning capacity. Thus, some 64 per cent of the depreciation suffered by the company's holdings is in respect of property companies and multiple-shop companies; the remaining 36 per cent relates to general investments, of which 10 per cent is represented by aircraft and engineering companies. It is clear that nothing but the conclusion of hostilities can reverse the position or guarantee a sure revival in profits. In the circumstances, it is satisfactory that the total of the company's secured overdraft is reduced from £435,258 to £335,973. The 5s. ordinary shares, at 6s. ex dividend, yield £8 6s. 8d. per cent.

Further Gold Mining Results

Development footage on *Robinson Deep* was accelerated last year, and ore reserves are now some 4½ years ahead of the mill. Part of the increase in reserves is, of course, due to automatic inclusion of low-grade tonnage, following the rise in the price of gold, and there would otherwise have been a fall of 450,000 tons. The air-cooling plants will permit stoping to be carried on to about 9,000 feet. Mining in the large Central Rand mines may later be carried on to a depth of 13,000 feet, but new deep-shaft systems will be required. Taxation relief is essential if such enterprising operations are to be undertaken, which, in the case of *Robinson Deep*, would result in the creation of a new deep-level mine with prospects

of long life. In its present form, the company has reached its prime, and it will be difficult to maintain dividends at their present level. The shares now give the satisfactory yield of some 4.95 per cent. *Rietfontein Consolidated* had another very successful year and milling tonnage was again increased. Development footage in *Modderfontein B.* declined substantially and prospecting on the "black reef" has stopped. Upper leaders in the western section are becoming exhausted, although, in the eastern portion, some tonnage of the low-grade leaders may still be raised. Shaft pillars are now being extracted, and very little other ground remains to be opened up. Considerably increased development was accomplished in *Durban Roodepoort Deep*, with a payability of over 60 per cent. A vast area is available to be mined in depth with excellent prospects. The present yield is some 5.2 per cent.

London

Note: all dealings are for cash

ON Tuesday, the prospect of the delivery of President Roosevelt's fire-side chat and the announcement of the sinking of the *Bismarck* brought about a welcome revival in business. Both before the week-end and Monday, this was on a very small scale with prices distinctly easy. At the end of last week the concentration of interest on London's war weapons week continued to restrict the scale of dealings and, at the beginning of the present week, uncertain news from Crete and the loss of HMS *Hood* inspired a cautious attitude. Later in the week, most sections remained strong on the prospect of stronger support from the United States in the prosecution of the war.

Before the week-end, the gilt edged market remained quietly firm, 3½ per cent Conversion gaining ½ and Local Loans ¼. On Monday, Local Loans again improved by the same amount despite a generally falling trend. Later in the week, a moderate rally, succeeded by a further increase in business and firm prices, stimulated many rises. Two and a-half Consols improved ½ on Tuesday when Local Loans rose by ¼ to a new high level for recent years and a long list of securities were ¼ up. Among dominion and colonial issues, the three Australian issues due for conversion, rose moderately. The foreign bond market was again remarkable for the strength of Chilean issues. Japanese stocks eased considerably at the beginning of the week, falls including the 5 per cent S. Manchurian loan and the 5½ per cent City of Tokyo issue. Among Chinese stocks which realised gains on Tuesday were the 5 per cent issues of 1912 and 1913. Greek and Egyptian stocks declined on the news from Crete, and German Potash 6½ and 7 per cent bonds each lost 2½ points at the beginning of the week.

Interest in home rails was discouraged by the prospect of further pressure for wage increases and the rise in coal prices. Before the week-end, selling was mainly confined to ordinary issues, LMS ordinary losing ½ then and on the first two days of the current week, while Southern preferred dropped ¼ on the Friday and Monday. Later, the senior issues also lost favour and, on Tuesday, the only gain recorded was that of ½ point for Great Western 4 per cent debentures. Among foreign rails, Canadian Pacific reversed a loss of ½ on Monday, while the preference issue remained firm. There was little business among Argentine railways, although Central Argentine issues suffered a number of losses.

Business was not on a large scale in the industrial market. Support for breweries continued until the end of last week, Bass, Guinness and Ind Coope all gaining 1s. on the Friday. This week, buying was concentrated on certain issues in the miscellaneous group, including Associated Portland Cement, London Brick, Lever and Unilever, and Turner and Newall. Shipping shares continued to attract attention, with P. and O. deferred, Union Castle and Furness Withy leading the market, but, of these, the first suffered a reaction in mid-week. The textile group moved irregularly. Courtaulds were sold on news of the details

THE STOCK EXCHANGES

of the Viscose transaction, but later on the Coats and Patons and Baldwins realised steady gains. Heavy industrials enjoyed a wide range of small gains which included Guest Keen, Hadfields, Stewarts and Lloyds deferred and Bolsover.

Interest in *kaffirs* was rather slight and no definite trend was discernible. Sub Nigel and Grootvlei were marked down before the week-end. Losses on Monday for "Sallies" and West Wit Areas were reversed later in the week, while Marievale was higher on balance. Among copper shares, Rhokana was strong, although losses were suffered by Selection Trust and Roan Antelope. The rubber market enjoyed more business than of late, and many shares, including Malayalam, Labu and Sendayan, enjoyed fractional gains. The general trend in the oil market remained downward over the week-end, Burmah Oil losing ½ on three successive days. In mid-week, however, sentiment improved and both Anglo-Iranian and Shell Transport ordinary registered modest gains. V.O.C. was higher on the dividend announcement, and Mexican and Canadian Eagles, arresting the recent decline, rose in response to a moderate demand.

New York

WALL STREET dealing was overshadowed by the imminence of President Roosevelt's fireside talk on the first two days of the week. Before the week-end, excellent business reports were more or less cancelled by the serious tone of the war news. Steel issues shared in the general stagnation and business remained virtually at a standstill until sentiment was stimulated by the announcement on Tuesday of the sinking of the *Bismarck*. In the general idleness, aircraft and copper stocks made a relatively firm showing. On Wednesday, President Roosevelt's declaration of a state of full national emergency caused the re-appearance of cautious trading pending clarification of its implications. The *Iron Age* estimates steel mill activity at 99 per cent of capacity against 100 per cent in the previous week.

CONVERSIONS AND REPAYMENTS

Canadian Pacific Railway.—Holders of Twenty-year Four-and-a-Half per cent Sinking Fund Secured Note Certificates have been notified that the whole of the outstanding certificates will be redeemed on June 15, 1941, at 100½ per cent, with accrued interest. About £18,473,000 of the certificates are outstanding.

Industry and Trade

Ships from America

Since June last year the losses of British, allied and neutral merchant shipping tonnage have averaged about 100,000 gross tons per week. At present this rate of loss considerably exceeds the rate of replacement from British and American shipyards. But if the following estimates of the prospective output of merchant ships in the United States, published by the *New York Journal of Commerce*, are realised, that country alone will launch ships, as fast as they are at present being lost, in the spring of next year:—

ESTIMATED OUTPUT OF MERCHANT SHIPS IN THE UNITED STATES

(In Thousands of Gross Tons)

1941, January-March	126 (a)	1941, October-December	310
" April-June	210	1942, January-March	765
" July-Sept.	270	" April-June	1,155

(a) Actual Output

In view of the achievements of American shipyards during the last war and of the technical progress made since then, there is no reason why actual launchings should fall below these estimates. Moreover, there are solid grounds for the hope that Great Britain will be able to maintain her lifeline during the present year with the existing stock of ships, and such replacements as she may be able to secure from her own and American shipyards.

Tanks

According to the latest reports from the United States the production of tanks in that country is now making rapid headway. American Car and Foundry has already completed the delivery of 329 light tanks of 12 tons, and is now working on an order for 3,089 units of the same model. The preparations for the production of medium tanks of 25 tons—the most useful type of fighting vehicle—have reached the stage when the vehicles will begin to leave the factories in growing numbers. American Locomotive holds an order for 685 25-ton tanks, valued at \$35 million. Chrysler has started on the production of 1,000 units of the same type, while Baldwin Locomotive, also engaged on the construction of medium tanks, is building heavy-weights. Technical collaboration with British engineers has assisted American producers in reaching the production stage fairly quickly, and it will not be long before the vehicles are turned out in hundreds each month. Meanwhile, the output of tanks in Great Britain appears to have shown a very satisfactory increase in recent months, which augurs well for the future.

U.S. Industrial Production

Despite many difficulties, industrial production in the United States continues to expand. Thus, the Federal

(Continued from page 734)

associated with the fall in new business. Results in the principal other departments, in which the reserves for unexpired risks are calculated on a 50 per cent basis, are set out below:—

	Premiums	Rise or Fall	Under-writing Profits	Rise or Fall
Fire	1,049,244	+ 88,112	8,715	— 69,010
Accident	338,360	+ 28,162	35,360	— 32,492
Marine	707,696	+ 212,896	30,000	— 30,000
	2,095,210	+ 272,846	74,075	— 6,518

Including net interest of £104,755, total credits to profit and loss amount to £178,883. Dominion and foreign taxes, which are not debited to underwriting, as is customary, take £31,610 and expenses and other items not charged to underwriting £53,710. Imperial taxes absorb £99,079. The dividend, which is reduced from 5s. 6d. to 4s. 6d. on the "A" shares and from 20s. 7½d. to 16s. 10½d. on the "B" shares, requires £67,500, the balance carried forward being lower by £73,015 at £112,358. With currencies converted at the rates of exchange ruling on December 31st last, the directors are able to certify that the assets

Reserve Board's index of industrial production rose from 113 (1935-39=100) in March, 1940, to 141 in February and 143 in March, 1941. Again, according to the National Industrial Conference Board the number of persons employed in the various branches of activity in the United States increased from 45,470,000 in February, 1940, to 48,429,000 in February this year. But there were then still 7,039,000 persons without employment. Moreover, despite the expansion in the output of aircraft, ships and other military equipment, the greater part of American industry is still producing peacetime goods. The magnitude of the resources that are used in the manufacture of automobiles, for example, is enormous. According to the returns for 1939, the motor industry consumed in that year 49 per cent of the total consumption of strip steel, 44 per cent of the sheet steel, 33 per cent of the bar steel, 55 per cent of the alloy steel, 25 per cent of the nickel, 34 per cent of the lead, 10 per cent of the aluminium and 80 per cent of the rubber. The reduction in the output of motor cars to essential needs would therefore set free for the manufacture of war tools millions of tons of metals. While the industry has already decided to reduce its output of cars and vehicles by 20 per cent in 1942, further and more substantial cuts may be necessary with the expansion of the country's munition-making capacity.

Exports of Woollen Goods

Exports of woollen and worsted goods during the first quarter of the year show a sharp decline compared with the corresponding period of 1940. Since the valuable European markets had been lost in the intervening period, it is hardly surprising that the trade was almost halved. Compared with the immediately preceding quarter, however, the position was rather better, as the following table shows:—

EXPORTS OF WOOL TEXTILES (000's omitted)

	Quantity			Value		
	Jan.-Mar., 1940	Oct.-Dec., 1940	Jan.-Mar., 1941	Jan.-Mar., 1940	Oct.-Dec., 1940	Jan.-Mar., 1941
Woollen tissues	Sq. yds. 14,375	Sq. yds. 7,358	Sq. yds. 8,907	£2,482	£1,490	£1,802
Worsted tissues	12,188	5,357	6,406	2,327	1,161	1,506
	lb.	lb.	lb.			
Worsted yarn	4,130	2,137	2,114	855	593	614
Tops (combed wool)	8,349	4,929	4,278	1,217	809	721

The export of tissues is slightly higher than in the last quarter of last year, and that of yarn and tops only slightly lower. To some extent the maintenance of exports may

(Continued on page 741)

are in the aggregate fully of the value stated in the balance-sheet. In addition to a special reserve of £900,000 in the fire account, there is a contingency fund of £100,000 and a general reserve of £500,000 as well as a capital account of £400,000 and general reserve of £100,000 for the Maritime subsidiary, through which marine business is transacted.

Sun Insurance.—In keeping with other offices, the Sun shows a much reduced fire profit for 1940. Contrary to the general experience, however, it has been able to maintain its accident income, and this must be considered a remarkable performance bearing in mind not only the loss of business from the Continent, but also the lower motor revenue at home. An excellent profit is realized from the marine account:—

	Premiums	Rise or Fall	Under-writing Profits	Rise or Fall
Fire	2,315,312	+ 28,762	102,902	— 167,831
Accident	1,940,872	+ 9,199	144,310	+ 17,019
Marine	826,839	+ 174,374	100,000	+ 50,000
	5,083,023	+ 212,335	347,212	— 100,812

Including net interest of £185,585, transfers to profit and loss aggregate £533,442.

On the debit side various charges, including £89,552 for British taxes and £100,000 for pensions, take £213,649. £250,000 is transferred to investment, exchange and contingency reserve, and after maintaining the dividend at a cost of £181,750 the balance unappropriated is £1,124,498, a reduction of £111,958. In the balance-sheet the investment, exchange and contingency fund, after the above transfer of £250,000, amounts to £239,658, against £342,013; a large part of the discrepancy of £352,355 doubtless arises from the decision to write off assets in enemy and enemy-occupied territories. The general reserve at £977,500 shows a reduction of £22,500 being the share contributed by a subsidiary in enemy-occupied territory. There is also an unexplained difference of £80,210 between the balance carried forward from the 1939 accounts and that brought into the 1940 accounts, which is presumably accounted for by the defection of a second subsidiary. Assets are certified to be fully of the value stated, and in addition to the free reserves mentioned above aggregating £2,341,656, there are additional reserves of £2,330,000 in the departmental funds.

COMPANY MEETINGS

ALLIANCE ASSURANCE COMPANY, LIMITED

SATISFACTORY RESULTS DESPITE DIFFICULTIES

The annual general court of the Alliance Assurance Company, Limited, was held on 28th instant in London.

Mr Lionel N. de Rothschild, O.B.E. (the chairman), said that the year under review had been full of complications and difficulties, but the results of the company's operations could, in the circumstances, be considered satisfactory.

In the life department the net new business completed during the year amounted to £1,226,174, as compared with £2,794,227 in 1939. This was a considerable reduction, but he could not hold out much hope of any material increase while hostilities continued. The purchase money for immediate annuities amounted to £61,086, which was about one half the purchase money received in 1939. The mortality experience was not favourable, the claims by death being £826,027. The experience in 1939 was an exceptionally favourable one at £589,794. At the close of the year the Alliance Life and Annuity Funds amounted to £22,822,735, an increase of £35,700 for the year. In view of the low net rate of interest obtainable on fresh investments, the actuary had recommended that the rates for new non-profit assurances should be revised in an upward direction. This recommendation had been accepted by the board.

DEPARTMENTAL RESULTS

In the fire department the net premiums amounted to £2,175,619, being £20,789 less than those in 1939. The home premiums had again shown an increase, but this had been more than offset by the reduction in the foreign premiums due to the cessation of business in enemy-occupied territories, and this loss of business had also affected both the accident and marine departments. The claims, including contributions to fire brigades, amounted to £874,250, being £134,202 more than in 1939. The loss ratio was £40 3s. 8d. per cent. After having made ample provision for doubtful debts an amount of £50,000 having been set aside for this purpose—for the adjustment of reserves for unexpired risks, and after the inclusion of interest (less tax) of £108,991, a balance of £351,342 had been carried to profit and loss account.

In the accident department there had been a still further reduction in the premium income, amounting to £122,095. The results in the motor section had considerably improved, the section showing an underwriting profit of £27,811. The premium income in the workmen's compensation section showed an increase, and the result of their operations had been satisfactory. The surplus in the combined accident accounts for the year amounted to £134,744, and this sum, together with interest (less tax) of £50,021, making a total of £184,765, had been transferred to profit and loss account.

In the marine department the net premiums were £951,675, an increase of £369,103 over last year's figure. This increase was largely due to premiums on war risks, increased rates on hulls, and surcharges to cargo rates. The underwriting account for 1938 had now been closed with the very satisfactory balance of £83,834, or some £49,581 higher than the 1937 account. Out of this balance £9,610 had been set aside to meet any further claims, which would maintain the reserve fund for previous years at £300,000. The resulting surplus—viz., £74,223, together with interest (less tax) on the marine fund, viz., £27,823, making a total of £102,046—had been carried to profit and loss account—a very satisfactory result.

PROFIT AND LOSS ACCOUNT

Turning to the profit and loss account, expenses not charged to other accounts disclosed a gratifying drop of more than £62,000, and they had transferred £100,000 to a reserve for contingencies and £50,000 to the staff pension fund. The balance shown was some £36,000 less than 1939. The amount required for the dividends payable in 1941 in respect of the past year would, however, cost the company about £63,000 less than last year. The balance then remaining to the credit of the account would be slightly larger than a year ago.

The report was unanimously adopted.

EQUITABLE LIFE ASSURANCE SOCIETY

PREMIUM REVENUE MAINTAINED

The 179th annual general meeting of the Equitable Life Assurance Society was held on 28th instant in London.

Mr Desmond Abel Smith (the President) referred to the death of Mr H. L. M. Tritton, who had been a director for 38 years and president from 1930 until shortly before his death.

The annual premium revenue had been well maintained; expenses had fallen considerably, and, bearing in mind restrictions in spending power and limitation of staff, new business at rather less than one-half of the pre-war figure was satisfactory. Claims by death were heavy, but relief from liabilities by deaths of annuitants was higher. £350,000 had been written off the revenue account for depreciation. The society's premises in London and elsewhere had suffered only superficial damage, and damage to property owned by or mortgaged to the Society had not been heavy.

The President then spoke of the valuation as at December 31st last saying that increased mortality during the war and considerable reductions in the rate of interest earned (the society had taken the view that it should help the Government by taking up new Government loans) and other considerations made it abundantly clear that to increase liabilities permanently by allotting bonuses would be most unwise. However, a valuation on a 2½ per cent. "net premium basis" gave a surplus of nearly £550,000 which would be carried forward and policies which become claims during 1941 would receive an interim bonus that would have been given had they become claims just before December 31, 1940. At the end of the year and of each future year until a declaration was made, the directors would consider whether the interim bonus could be increased. If the society could maintain a net rate of interest of 3½ per cent. and conditions did not affect profits, it might in three years give a quinquennial bonus of about five-sixths of the rates declared after the 1935 valuation.

The rate of interest on policy loans had been reduced to 6 per cent. gross. It had now been decided to reduce the rate to 5 per cent. gross for loans of £500 or more.

The report was unanimously adopted.

LONDON ELECTRIC WIRE COMPANY AND SMITHS LIMITED

MR. W. J. TERRY'S SPEECH

The thirty-second annual general meeting of the London Electric Wire Company and Smiths, Limited, was held, on 28th instant in London.

Mr W. J. Terry, chairman and managing director, in the course of his speech, said: The most interesting feature of the balance sheet is again the favourable balance arrived at by deducting current liabilities from current assets, amounting to £948,989, which is £68,430 higher than last year. The profit and loss account shows a reduction of £15,511 on last year's trading after providing for taxation, compulsory insurances and contingencies.

Investments show a decrease of £120,012 as compared with the total shown last year. This company's investments cover a wide range, and although the present time could not be considered as an appropriate one for realisation, the amount shown of £529,219 could be realised at present-day market quotations.

We have been fortunate in that the primary commodities in which your company is chiefly interested have been available to meet demands.

Our home sales have increased. All of your company's factories have done their utmost to meet the immediate needs of our customers, and selling prices have been maintained at a low level. Outstanding contracts and orders carried forward into 1941 are higher than at the beginning of 1940. Export sales have been necessarily reduced owing to increased home consumption and for reasons outside our control.

I am glad to report that excellent relations exist between the company and its employees.

Present working conditions could be improved by the official recognition of established trade associations for collective effort, which is just as logical as the recognition of trade unions.

The company is busy and likely to remain so, and the excellent quality of our products is being maintained.

The report and accounts were unanimously adopted.

NORWICH UNION LIFE INSURANCE SOCIETY

RECORD VALUATION SURPLUS

The 133rd annual general meeting of the Norwich Union Life Insurance Society was held on 27th inst. at Norwich.

Mr Ernest Hicks (the President) said he thought it would be agreed that a new business total of £6,791,319 reflected the greatest credit upon their representatives in this country and throughout the Dominions. This figure represented 58 per cent. of the production of their peak year of 1938.

He was sorry he had to report a considerable decrease in the rate of interest in their invested funds. The gross rate of £4 8s. 2d. per cent., a reduction of 5s. 11d. per cent. on the 1939 figures, and the net rate fell to £3 10s. 4d. per cent., showing a reduction of 7s. 9d. per cent. However, the society had for 40 years maintained its reserves on a 2½ per cent. net interest earning basis, so that even in the unprecedented conditions of to-day they had a margin of over £1 per cent. between their valuation rate and the net rate of interest actually earned on the funds.

They were fully satisfied that a conservative value had been placed upon the investments, and the Stock Exchange securities stood in the balance sheet at or below the middle market prices ruling on December 31st last. On the conservative bases he had indicated the Actuary reported a net surplus of £5,174,554 after paying £396,731 in respect of interim bonuses during the quinquennium. This was the largest surplus ever disclosed in the history of the society and policyholders might perhaps have expected that this would have justified the directors in declaring a bonus. They felt, however, that it was necessary to exercise the utmost caution in these days. In the best view, therefore, the directors would have considered it necessary to carry forward a very large sum of money, which would have necessitated a considerable reduction in their bonuses. They would provide for a valuation to be made as soon as practicable after the close of hostilities and any bonus then declared would be in respect of the period elapsed since December 31, 1935. In the meantime they were continuing to pay for the four years 1936-39 inclusive interim bonuses at the full pre-war rates.

The report was unanimously adopted.

NORWICH UNION FIRE INSURANCE SOCIETY

INCREASED PREMIUM INCOME

The annual general meeting of Norwich Union Fire Insurance Society, Limited, was held on 26th inst. at Norwich.

Mr Ernest Hicks (the Chairman) said that there was no escape from the horrors and handicaps of being at war, but members would be pleased to observe that there was an increase of £169,937 in the fire income which stood at £1,978,636. The profit, however, was a slender one of £32,627, or 1.65 per cent. This result was due to a very considerable increase in the losses in this country and to their business in the United States being unprofitable in 1940. He was glad to say that there was an improvement in both these fields in the current year.

The accident account was very satisfactory, particularly as he was able to say for the first time for a number of years that the overseas section of the business had contributed to the good results. The premium income was £1,443,547, which showed a decrease of £164,126 from the previous year. This was primarily due to the decline in motor business in this country, and to the suspension of business in enemy occupied countries. The result of the account, however, gave a profit of £179,011, being 12.4 per cent., which was the best result achieved for many years past.

The Marine premium income showed the large increase of £298,635 and now reached £632,413.

The profits from the three trading departments totalled £235,314, and the aggregate premium income of £4,054,596 showed an increase of £304,446 over 1939. The profit and loss account had also a credit of £111,567 for net interest, making a sum of £719,167 at their disposal. The carry forward was £325,995 and the total assets were £7,057,458, or £646,452 more than last year.

After paying a tribute to the executive and staffs at home and overseas, the Chairman concluded with an expression of the Board's determination to carry on the business, to support the Government to the utmost of their power in prosecuting the war, and to prepare for the happier days to come.

The report was unanimously adopted.

ASSOCIATED GAS AND WATER UNDERTAKINGS, LIMITED

ORDINARY DIVIDEND MAINTAINED

MR. W. H. BENNETT'S SPEECH

The eighth ordinary general meeting of Associated Gas and Water Undertakings, Limited, was held on the 27th instant at the registered office, 2, Chart Lane, Reigate, Surrey.

Mr W. H. Bennett, M.Inst.Gas E., chairman of the company, said: It has been the practice at our annual meetings to review not only your company's finances but the activities and development of the public utility undertakings from which it derives the greater part of its revenue.

Recently the Government, by an Order under the Defence Regulations, prohibited the publication of statements of accounts and directors' reports of gas and electricity undertakings. Despite the fact that the accounts of our subsidiaries for the year 1940 had been published before the embargo, I am sure you will agree that I should act within the spirit of the Order, which is intended to prevent information of value reaching the enemy. Consequently I propose to depart from our usual practice and simply say that the companies which form our group have experienced the anxieties and difficulties which are common to all trading concerns under war conditions.

DIFFICULTIES SURMOUNTED

How these difficulties have been satisfactorily surmounted may be judged by reference to the revenue account, to which I call your attention.

The dividends received amounted to £112,418, a reduction of £5,183 compared with the previous year. This is largely due to the inequitable operation of the "Sliding Scale" as applied to statutory gas undertakings, by which the permitted dividend is reduced as the charge for gas is increased. Increased revenue has been derived, however, from a full year's receipts from freehold properties acquired in 1939, from new ones purchased in 1940 and from increased services rendered to our subsidiaries and other companies. The result is that the gross revenue from all sources fell short of that for the year 1939-40 by only £726.

With regard to expenditure, increased taxation, discount on debenture stock and war damage insurance, coupled with larger amounts written off investments and leasehold property (now standing in our books at the nominal figure of £1), reduce the net divisible profit to £63,758, as compared with £74,574 for 1939-40.

THE DIVIDENDS

This amount is sufficient to provide for the preference dividend and a distribution of 6½ per cent. upon the ordinary shares, but having regard to present conditions your directors recommend adherence to the rate of 5 per cent., which has been paid since the inception of the company. This will absorb £55,147 and increase the sum carried forward by £8,611 to £41,162.

This sum is equal to nearly 1¼ years' ordinary dividend at the current rate, forming a useful reserve against any vicissitudes which may occur in the future.

The balance-sheet calls for little comment. The issued share capital at £2,329,799 remains unaltered, whilst investments (less amount written off but including the cost of acquiring direct control of the Langport, Huish and Curry Rivel Gas Undertaking) at £2,961,535, shows an increase of only £1,359. Cash at bankers has increased to £29,020, and as little opportunity for extension of the company's activities is likely to present itself during the war, your board has, since the close of the year, invested the greater part of this sum in new Government loans, an action which I know will meet with your approval.

OFFICERS AND STAFF

Results such as those shown in the accounts now before you could not have been achieved without the loyalty and enthusiasm not only of the officers and staff at headquarters but of the local directors, officers and all the employees of our subsidiary companies. I wish to tender our sincere thanks to them for all they have done, and are continuing to do, in the interests of this company.

The report and accounts were unanimously adopted.

BRITISH BORNEO PETROLEUM SYNDICATE, LIMITED

TOTAL DISTRIBUTION MAINTAINED

The 27th ordinary general meeting of the British-Borneo Petroleum Syndicate, Limited, was held, on 29th instant, in London.

Mr Walter MacLachlan (chairman and joint managing director) said: The revenue for the year amounted to £65,582, from which has to be deducted administration and management expenditure of £3,808, leaving a net profit for the year of £61,773. Adding of £22,544 of undistributed profit brought forward, there is a credit balance of £84,318. We recommend the payment, in respect of the year to March 31st last, of a final dividend of 5 per cent. and a bonus of 5 per cent, both less tax, making a total distribution of 15 per cent for the year. There is no need for me to stress to you the difficulties under which business has been carried on during the last year, or to refer to the effect that war conditions have had on that part of our business which is concerned with

(Continued from page 738)

have been due to the acceptance by some firms of relatively low prices in their anxiety to be in a favourable position in the concentration scheme.

India's External Trade

The war has brought about a substantial rise in India's external trade and has changed its direction very noticeably. The following table shows the principal countries of destination and origin in the last two years:—

	TRADE OF INDIA (Rs. 00,000's omitted)			
	Exports		Imports	
	1939	1940	1939	1940
United Kingdom	57.36	78.42	40.61	41.16
British Empire (ex. U.K.)	36.43	49.37	51.47	52.51
Germany	4.01	—	10.42	.12
Netherlands	2.74	.64	1.39	.91
Belgium	3.19	1.12	2.41	1.82
France	6.20	7.95	1.49	1.01
Italy	1.79	1.28	1.99	1.09
Japan	13.53	11.10	17.91	20.83
U. S. A.	20.94	26.67	11.78	24.58
Others	34.13	32.19	21.56	18.92
Total	180.32	208.74	161.03	162.95

Exports were higher by 15¼ per cent in 1940 than in 1939. The United Kingdom and the rest of the Empire respectively took 37 and 36 per cent more, France 28 per cent and the United States 27 per cent more of Indian exports. The United Kingdom's increase consisted mostly of food-stuffs, raw materials, jute and woollen manufactures and leather goods. Other Empire countries have taken increased quantities of cotton manufactures and of industrial raw materials. The United States imported larger quantities of strategic raw materials and continued to take jute and jute manufactures in considerable quantity. The fall of 18 per cent in exports to Japan was largely due to the greater use by Japan of alternative sources of supply in the Far East and in Latin America. Total imports showed only a small increase, but those from the United States more than doubled, mainly owing to increased purchases of manufactures, machine tools and chemicals. An increase of 17 per cent in imports from Japan partly represented purchases in place of European supplies which were no longer available, for example, artificial silk yarn, which used to be imported from Italy. A fall in India's total imports of grain and flour and of cotton yarn and manufactures was almost balanced by a rise in imports of oils and of raw cotton.

Dinners à la Woolton

The Ministry of Food has staged a very attractive exhibition of dishes designed to show the housewife how to make the most of her meat ration. If the show is in the

share dealings. We are therefore the more pleased to report that the revenue which we derive from our investments and royalty interests has stood up excellently to the existing conditions and has very largely contributed to the satisfactory profit for the year.

It is useful to consider the position of the company as it stands to-day in spite of all the difficulties which have been experienced. Our capital is intact, our general reserve stands at £70,000, and a substantial part of our resources is in liquid form. From the profits of the year, although taxation has absorbed £12,000, we have been able to apply over £10,000 in reduction of the book value of investments and, at the same time, maintain the dividend at the satisfactory rate of 15 per cent., and carry forward undistributed profits totalling £22,576. I think you will agree that this is a position that affords us every satisfaction.

As far as the future is concerned, it would be rash to attempt to forecast the course of events during the testing year which lies ahead, but I trust that we shall meet next year under better general conditions, and that I shall then be able to give you an equally good account of the progress and position of our company.

The report was unanimously adopted.

tradition of the school of dramatic entertainment in which the producer's work counts for overwhelmingly more than that of the author, it is Hitler and not Lord Woolton who must bear the blame. Better an attractive unsatisfying dish than an unattractive satisfying one, for an attractive appearance at least predisposes the eater to find it palatable. Two series of main meals, each covering a week, are displayed: one assumes the entire meat ration to have been spent on a joint, the other spreads it over a series of more economical cuts. Experience at British Restaurants has taught the Ministry that vegetable dishes such as Woolton Pie are not in demand unless some small amount of meat is incorporated as a flavouring. Perhaps the housewife's slowness in recognising this may have something to do with the curious fact observed by the Ministry, that with the reduction in the meat ration the consumption of vegetables has also declined. This undesirable development must be countered, as the Ministry is trying to do. The nation may have to live largely on vegetables next winter, and the sooner it learns to use them intelligently the better. It is a pity that the Ministry, in providing suggestions for those conservative people who adhere to the traditional practice of buying a large joint, does not stress the fact that the dishes they make from the reheated cold meat could be made more cheaply from the humblest cuts of fresh meat, and would be far more digestible and palatable.

Tungsten Deposit in America

In order to render the United States less dependent on distant supplies of essential non-ferrous and steel alloy metals, her Government has sponsored a thorough-going survey of domestic mineral deposits. The survey, carried out by the United States Bureau of Mines and by the United States Geological Survey, has so far been confined to antimony, tungsten, chromium, manganese, mercury, nickel and tin. While no details have been published concerning the progress of the survey, the Bureau of Mines recently announced the discovery of a high-grade tungsten-antimony deposit in the Yellow Pine District, Valley County, Idaho. While the magnitude of the deposit has yet to be ascertained, the indications are that it is of considerable importance. Since shipments of tungsten from China, the world's largest producing country, have recently tended to decline and might even be temporarily interrupted, the significance of the discovery of a high-grade deposit in the United States needs no emphasis. In 1939, the last year for which official statistics are available, the United States produced 3,603 short tons of tungsten ore from widely scattered and small mines in Arizona, California, Colorado, Idaho, Montana, Nevada, Utah and Washington. In the same year, 1,372 short tons were imported, and one-half of these imports were added to stocks. Since 1939, however, the consumption has risen by some 50 per cent. Apart from the search for domestic tungsten deposits, the United States Bureau of Mines is also carrying out a survey in Bolivia and Peru. Since the search in these two countries has apparently not been in vain, the United States may soon be able to reduce her dependence on supplies from other continents.

(Continued on page 746)

CURRENT STATISTICS

Finance

GOVERNMENT RETURNS

For the week ended May 24, 1941, total ordinary revenue was £18,555,000, against ordinary expenditure of £73,880,000, and issues to sinking funds of £35,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £430,996,000 against £236,763,000 for the corresponding period a year ago.

COMMODITY AND INDUSTRY NEWS

THE sharp drop in tin and rubber prices is reflected in *The Economist* Sensitive Price Index (1935 = 100). On Wednesday the figure for raw materials was 170.4, compared with 172.6 a week earlier and 173.4 a month earlier. The tin market is discussed below. Rubber closed on Wednesday at 13½d. per lb. for smoked sheet spot, compared with 14d. a week earlier.

Fall in Tin Prices.—The tin market has been dull and prices have fallen sharply. Standard cash closed on Wednesday at £261 10s.-£262 per ton, compared with £266 10s.-£266 15s. a week earlier and £269 5s.-£269 10s. four weeks earlier. Another feature of the market this week was that forward tin quoted on some days was at a higher rate than cash. Three months' tin closed on Wednesday at £263 17s. 6d.-£264 per ton; it was £266 5s.-£266 10s. a week earlier and £266 15s.-£267 four weeks earlier. The fall in cash prices appears to be due to the ban on exports.

Tea Quota Raised.—Last February the International Tea Committee lowered the export quota for the year ending March 31, 1942, from 92½ per cent to 90 per cent in view of the reduction in purchases by the British Government. It now appears that, following a desire to accumulate reserve stocks in markets outside this country, demand and prices have risen. To meet this new situation the International Tea Committee has decided to raise the quota for the current period to 95 per cent.

Voluntary Cotton Concentration.—The Board of Trade is giving encouragement to the submission of voluntary schemes for concentration in the cotton industry by promising that firms taking part will be exempt from making payments to any general compensation pool that may be formed. They will not, on the other hand, be entitled to draw from any such fund. A further condition is that any voluntary scheme must entail the same degree of concentration as that of other firms which are dealt with compulsorily.

Cotton.—The improvement in business noted last week has continued, and freer negotiations have taken place between

shippers of piece goods and manufacturers. Buyers have sought nucleus weaving concerns in order to be assured of deliveries. Some very fair lines have been put through in a variety of goods for South Africa and steady buying has taken place for the Dutch East Indies and the Argentine, while fine fancy materials have been wanted for Canada and the United States. Government buying recently has not been heavy, but inquiry has broadened and some fairly substantial orders have been placed in heavy materials and in cloths for proofing. The Controller has released a further 5,870 bales of Government barter cotton: 3,970 bales for Liverpool merchants and 1,900 bales for Manchester merchants. Trade in yarns has been irregular and chiefly in coarse American counts. Cloth prices have risen, 36 in. shirtings, 75 yards 19 x 19, 32's and 40's, rising from 38s. to 39s.

Wool Clip Requisitioned.—The Minister of Supply is once again to requisition the British wool clip. The Control of Wool (No. 17) Order, 1941, prohibiting the disposal of the 1941 clip except to the Minister, came into force on May 24th. The Order provides as well for the making of necessary returns, and for the issue of directions about transport, storage and disposal. The Order does not apply to wool clips in the Orkney Islands, the Shetland Islands and the Outer Hebrides. Wool from these islands, however, may not be brought to the mainland except by licence granted by the Minister of Supply, under an Order which came into force on April 26th. A schedule of authorised prices, settled in consultation with the Agricultural Departments, which has been issued with the Order shows advances in last year's prices in all cases. The Government is prepared, should it prove necessary in the light of the experience of the current season, to continue the special measures of assistance to hill sheep farmers which were adopted last winter.

Hosiery Quota.—The quota percentage for Class 3 goods under the Limitation of Supplies (Miscellaneous) Order has been increased by 10 per cent to

60 per cent for the next restriction period, from June 1st to November 30th. Class 3 comprises hose and other knitted apparel. Previous changes were announced on April 7th.

Campaign in Syria

THE decision to occupy Syria was clearly the only decision possible. In spite of belated and rather half-hearted French denials, it became daily more likely that Germany would shortly have effective control of the French Mandate. The menace a Nazi-occupied Syria would offer to the whole of Britain's Near Eastern position is obvious enough. It would be difficult, if not impossible, to hold either Iraq or Cyprus; and Suez would then be threatened from the east as well as from the west. German air bases in Syria would complete the ringing round of Egypt, and both the British fleet in the Eastern Mediterranean and Allied shipping in the Red Sea would be in jeopardy.

The move had been half expected ever since it became known that Vichy had permitted the Nazis to use Syria's air bases. The only preoccupation was whether General Wavell, with Abyssinia, Libya, Crete and Iraq on his hands, had men and munitions to spare for a new campaign in which it was difficult to gauge in advance the extent of resistance. Colonel Collet's gesture in crossing over to General de Gaulle seemed to rouse little response, and in Generals Dentz and Fougère, the Germans had willing allies. Moreover, there was no easy line of approach in the field of propaganda. To promise the Syrians independence might win both them and the Arab world, but it would alienate the Vichy authorities and give them an opportunity to throw doubt on the patriotism of General de Gaulle as a man who had "bartered the birthright of France." The Allies, however, have decided to announce their support for the independence of Syria.

The repercussions of this pledge to Syria have not yet been made manifest in the campaign. British, Australian and Free French armoured units, with supporting air-

craft, crossed the frontier from Palestine and Trans-Jordan at dawn on June 8th. Two columns advanced on Damascus, and a third, which was delayed by demolitions on the coast road, had Beirut as its objective. French resistance is officially reported to be "patchy." Some Frenchmen are fighting, some have joined the Allies. On the whole—as might have been expected—they seem to have preferred to remain non-combatants. Even Vichy, after a week of threats and protests, has apparently decided, while defending Syria, not to regard the occupation as an act of war.

It is difficult to understand why the resistance of the French was not immediately reinforced and strengthened by the arrival of more Nazi men and machines. Coming on top of the collapse in Iraq it suggests that, for the time being, the Germans are not yet ready for land operations east of Crete. A direct attack could only be launched from the air; but their reorganisation will be completed in less time than the British tend to calculate. That is the lesson of Greece and Crete. If the occupation of Syria can be completed speedily, then immediate steps must be taken to ensure its defence. That is the lesson of Crete and Libya. The way is open to damaging reverses and humiliating withdrawals if British forces cannot both take and hold. The battle of Crete has given them their chance in Syria, but the real battle may well come not before but after occupation.

Behind the Battle

THE critics in Tuesday's debate on Crete were not silenced by the news of the advance of the Allied forces into Syria. The conduct of the war, as it has been revealed in recent battles, is still in question. Mr Churchill was right to say that it is hard for lay critics to question the actual conduct of operations. Only the soldiers and statesmen who have been in charge of this year's operations in the Near East really know how much substance there is in the charge that the resources actually at their disposal might have been differently and better used. The lay critic often forgets that there are too many unknowns in his knowledge of the strategic situation for his criticisms to be final. Following the new fashion of giving out important information in Australia—or even the United States—before it is revealed in this country, Mr. Menzies has stated that the lack in Crete was fighter planes; and that this shortage was due to the scarcity of ships to take them out there. The charge made by the Labour Opposition in Australia that Anzac troops were given insufficient air support because too many planes were being held in Britain against invasion, Mr. Menzies firmly denied.

Obviously this is a matter in which the critic cannot speak with certainty. Whether the difficulty was scarce airfields or scarce aeroplanes he cannot tell; that and the distribution of anti-aircraft guns between Britain and other theatres are questions for the experts. The critic does not know the total of fighters available. He does not know how many might be needed if invasion were to be attempted. He does not know the size of the fighter force in the Near East. All he knows is that over Greece and Crete it was insufficient; that aircraft production, with American contributions, had been officially stated to be ahead of schedule; and that there was open confidence that Crete could be defended—after more than six months of occupation in which to make ready. He may well believe that there is every sign that the authorities still underestimate their task whenever the Germans attack; that the targets they set themselves in production as well as in operations are too elementary; and that the Allies cannot yet match the thorough plans and mighty blows of the enemy. But he is not in a position to say with any sureness that the result—in Greece or in Crete—might have been otherwise if a different disposition of the forces actually available had been adopted. There is more than a presumption that the methods used in land combat have been behind the needs of modern warfare. Always the enemy seems to move more swiftly and in more dimensions. But the enemy has plain advantages in numbers and material, as well as in geography; and it is this, more than any other factor, that gives him mastery. The single foundation of Mr Churchill's reply to the criticism was the fact that this country does not possess the material strength yet to frustrate the enemy abroad.

The root of these military ills is in production and economic policy. That there appear to be clear faults in the liaison between the Army and the RAF, in the construction and defence of airfields and in the mustering and employment of airborne troops cannot be denied. Mr Churchill's promise to give Army commanders tactical control over Army Co-operation Command aircraft has been generally welcomed; and it is even debated whether these reforms should extend to the wider operational use of these squadrons, which are to be reinforced. But it would be unfair and unhelpful to indict the Service leaders who have won the first Battle of Britain, driven the Italians from East Africa and held the seas, before it is asked whether the assistance given to them by the politicians and the people has been, or is, sufficient. Many of the alleged military errors and blunders can at least be explained away, if not always convincingly excused, on grounds of inadequate supplies. The cut of the coat is important; but the size of the cloth is even more so.

Mr Menzies has given the starting-point for the

criticism that can perhaps help most: too few planes, too few ships. It is to be doubted whether the production of war supplies in this country is, even yet, in top gear. There is substance in the charge that the British people are still living and working in a manner which is not appropriate to the desperate peril they are in. War factories are short of labour, even to carry out their present programmes, while millions of men and women are doing work in shops and offices which could be set aside. The inability of tobacco supplies to meet a rising and insatiable civilian demand produces a "crisis." The authorities stoutly maintain the right of every car owner, whatever his need, to a basic ration of petrol.

This is not the true atmosphere of a great nation at war. Nor does it reflect the real mood of a free and determined people. It is in part the product of the fears that play on politicians' minds, the fear of requiring hard and distasteful things from voters and the fear of surrendering a vested interest that has been fought and worked for. It is in part again the product of a habit of bargaining that is second nature to the leaders of business and labour as well as to the leaders of political parties. The technique of co-operation tends to be compromise and the watchword *quid pro quo*.

Yet there are some people who believe that everything possible to speed the war effort is being done. They resemble the high Cabinet Minister who, early in the war, replied to suggestions for some drastic economic action by hoping that it would not be necessary and that Germany would collapse first. Their attitude is that "Rome was not built in a day." The equipment of the forces when the war started, they point out, was very inadequate; it was still inadequate at the time of Dunkirk; and there has been no time to catch up the leeway since, they say. It is true that "there are many months of deficient equipment before us." As Mr Lees-Smith said on Tuesday, these sombre battles are delaying actions until we have the strength to do more than defend. But the blame for this inferiority cannot for ever be laid upon the shoulders of the administrations that have gone. It would indeed be hard to maintain that the present Government has done everything, within the remarkable powers that Parliament gave it a year ago, to mobilise the nation's economic resources. Only Ministers know the actual rate of production and the programmes that are aimed at. But no high office is needed to pick out the resources of labour and plant that are still unused or wasted.

It is fruitless to argue, from the outside, about unknown rates of output, though no one in contact with tanks can be wholly contented, and there are bottlenecks in assembling aircraft from America. The point is that, whatever these rates may be, even more can be done. The fact that Mr Churchill himself admitted that, though output was high, it might not be "fast" enough, is a sufficient invitation for critics to assist where they can. One step would be to impose upon every man and woman who is not doing unquestionably essential civilian work the obligation on call, whether engaged in full-time, paid employment or not, to transfer to, or train for, direct war employment. Mr Bevin's scheme for mobilisation, with its registers and its appeals, is running into the sand. Even if more war workers were not wanted now—and they are—they will be wanted in six months' time, and the recruits must be ready, trained and waiting. There are workers who need not be either transferred or trained; from the garages and workshops and the railway shops many more munitions could be forthcoming than are now being turned out, if the present piecemeal approach to these sources could be replaced by comprehensive and single-minded direction.

It is no use crying for the moon. The nation's power to produce is sharply limited by the men, the tools and the materials available. But this is the precise reason for bringing in every man—and woman; for setting every industrial establishment that can possibly produce machine

tools or drop-forgings to work at once; for making still fewer the non-war uses that materials can be put to; and, above all, for basing the whole of war economic strategy on the most subtle and effective use of shipping space. To say that more still could be done in production and shipping policy is not to under-rate the vast effort that is in train. It is the extra ounce of work and wisdom that will hasten the day when the resources of the Commonwealth in face of its great armoured enemy will match the courage of its fighting men.

Shipping is the key. The supply of materials would set no limit to production if shipping space were not scarce. It is by ship that finished goods of war come from the United States and Canada to reinforce British output. It is by merchant vessels that the distant battle-fronts are nourished; and it is the supply of ships—and the long time taken to round the Cape—that has placed the greatest restriction on the equipment of the Near Eastern forces. British and American yards cannot make good more than half the vessels lost by sinking; many ships are damaged but not sunk; ships compete with airfields and troops for anti-aircraft guns; maritime hazards are multiplied in wartime; shipbuilding capacity is diverted to repairing. These are explanations for the Government's difficulties. But they are also reasons for doubting, for instance, whether the determination of the Ministry of Food not to ration bread, which is being consumed much more heavily than before the war, is really wise, when a cut in bread consumption, the mixture of potatoes in bread flour and the greater use of wholemeal bread would release some millions of tons of shipping space in the year. Imports of meat, cheese, sugar and fats ensure a larger supply of calories for the shipping space used than imports of wheat; and it is a significant fact for the makers of food policy that over twice the 6 or 7 million tons of imported food that nutritional experts say would do at a pinch, if properly selected, are probably being brought in during this shipping crisis.

A food policy of this sort would involve more than economic decisions. It would mean comprehensive control over the production and distribution of foodstuffs. It would mean general rationing; much more communal feeding; a wage and allowance policy deliberately contrived to secure a minimum diet for every family; and a communal policy for agriculture as distinct from a farmers' policy. Indeed, a sound and rounded war economy involves social decisions at every point which are not easily made when progress is piecemeal and empirical. The process of mobilising men and machines, for instance, is grievously hampered by a tradition-bound reluctance to compensate *entrepreneurs* and traders for the losses which these changes must impose upon them. Still expected to do business at their own risk, they strive to hold up the policies which, however essential they may

be for the war effort, threaten their individual livelihoods. They obstruct; and in seeking to keep up their incomes as their turnover falls, they join the profiteers. Labour follows suit in this worried struggle for sectional advantage, and the spirit of national unity is broken. There is small excuse for the vested interests, on either side, when the consequences of defeat are counted or when the sacrifices of fighting men are considered; there can be none for the real profiteer. But a policy which would make all producers, and distributors, in effect, the war-time agents of the community, without prejudice to their post-war liberties, ensuring their livelihood and equating their burdens, would leave them with no vestige of justification; and it would make possible the maximum utilisation of manpower, plant, management, materials, willingness and loyalty.

This is the background. In the foreground, there are the factories at work, making more materials of war every month than in the month before. But more is needed. Crete, it seems, has taught many lessons, but none more telling than this fact that there can never be a sufficiency of the weapons of war. The control of war production is still loose. It is departmental and formalised. The Production Executive has given command and authority to the Government's plans and orders for tanks, guns, aircraft, equipment and the rest. But there is still too little liaison between what is planned and what is actually achieved from day to day. One firm turns out planes to schedule like clockwork; another does not. There is an ample supply of materials here and stringency there. It is a matter of management and control; and what is wanted is a system of expert intelligence to mark down what is happening, as it happens, and to report it forthwith, with no deference to industrial or departmental susceptibilities, to a Minister with authority to order redress, to call for explanations, to move managements and to have nothing unknown and unsuspected. Lord Beaverbrook could have these powers. With technical spies to inform him, and standing above the different supply departments who have their own axes to grind, such a Controller could make output taut, balanced—and bigger.

Probably the Prime Minister did not intend to imply on Tuesday that open criticism of the conduct of the war was to be deprecated. His own record and the experience of this war deny it. The function of the Commons is twofold: to speak the doubts and desires of the people; and to strengthen the Government's hand—by criticism as well as by acquiescence. No critic denies the transformation that Mr Churchill's administration has made in a twelvemonth. No critic can condemn the Prime Minister for a strategy that has been hobbled by material weaknesses. But to win, Mr Churchill and his commanders must some day be in a position to lead from strength; and the sooner that day the sooner the victory.

United States of Europe

IT appears that Hitler is about to announce his completed scheme for a United States of Europe. Within a centralised, planned economy, the nations will find their "independent" cultural place under the joint suzerainty of Germany, Italy, France and Spain, which, as Great Powers, will decide in common the major political and economic problems of the Continent. In spite of their political dependence, so runs the argument, the nations will achieve a new level of economic stability and prosperity and, instead of cramping their national existence, the new system of co-ordination and co-operation will open to them new vistas of freedom and development.

The odd thing is the extent to which this prospectus of the "new order" coincides with the plans of reformers both of the Right and of the Left in democratic communities. The union of Europe has been under discussion for two decades. Now it is an accomplished fact. The need to create a unified European economy under centralised planning and control has received the most enthusiastic recognition. Now the need is fulfilled. Work

for all, stabilised markets, the destruction of the "slavery of finance"—all these have been common ground to social reformers of most diverse outlooks. Should they not be content now that Hitler has done what they talked about for so long? The "new order" is, of course, an obvious travesty of their ideas. Europe has been united by destroying all freedom—personal and national—save that of a small gang in control in Germany. Even the hierarchy of "master-nations" is a farce, for the Latin bloc is industrially powerless and economically and politically dependent upon the Nazis. The centralised European economy is an economy for war and an attempt to make siege economics the norm. Jobs for all depends upon the maintenance of the war machine. Further conquests alone can prevent Europe's standards falling still more and "stabilised" markets under these conditions merely mean an assured share in a steadily diminishing cake. The tyranny of finance has gone. The tyranny of *Wehrwirtschaft* has taken its place.

It is easy enough to explode the fallacies of this New

Order, but the more ruthless reformers, on the one hand, and the more casual exponents of *laissez aller*, on the other, may be given pause by it. The reformers can learn how heavily all completely systematised and centralised organisations weigh upon their component parts. Injustice, compulsion, loss of initiative, and a vast extension of bureaucracy—these are all evils inherent in any system as rigidly co-ordinated as that of German Europe. All are agreed that the ends of the New Order are detestable. It will have taught a salutary lesson if some grow to a common detestation of many of its means.

On the other hand, the English-speaking world is still very far from removed from this danger of over-planning. The lesson of the New Order which most needs to be absorbed in this country is that the age of enterprise has given place to the age of security. It is not a complete coincidence that Hitler and the social reformers have so much in common, for the reformers have been trying to find a solution for the grievances which the Nazis are exploiting to their own ends. Every category of producer—worker, peasant, industrialist—was weary of the struggles and uncertainties of the competitive organisation of Europe. For many industrialists and peasants, an assured market seemed worth the sacrifice of a higher potential profit; for many workers, an assured job was worth the sacrifice of bargaining rights and freedom to choose their work. It may well be that even the control itself which the Nazis have come to exercise is not altogether unwelcome. The desire for independence is not one that goes easily with the search for security. The Nazis found what was to some extent a tired and listless European community, no more jealous of its economic independence than of its political liberties.

The extent therefore to which the Nazis have found willing collaborators is not altogether surprising. Save in the dairy farming areas of Holland and Denmark, the farmers are not discontented with the new conditions. The Balkan peasant is selling all his grain, his tobacco or his soya beans, and is getting steady payment in return. In the west—to give the most telling example—the fruit and vegetable growers of Holland have had a bumper season and are looking forward to another equally as good. After years of destroying surpluses, they can now sell all they produce to Germany and get good prices in return.

Industrialists have, of course, been driven into collaboration by their need for raw materials, but there is no doubt that many of them would have been ready for it without this compulsion. It is, after all, only extending to the whole of industrial Europe the practice of monopoly which has long been the goal of the average business man and his associations. The heavy industries of France, Belgium and Holland were already inextricably bound up with German industry and one of the reasons why there has been so little resistance is that the Nazis are not altering economic relations so much as abolishing the political frontiers which, until 1940, hindered the unlimited cartelisation and merging for which many industrialists were perfectly prepared.

The Nazis are, of course, using their political power to ensure that economic control is vested almost completely in Germany. Foreign interests in German industry are being bought out. Germany is buying up a controlling share in French, Belgian, and Dutch heavy industry. There is thus a shift in the power relationships; but it is important to remember that the framework of economic collaboration existed already. It is also true that the Germans are extending the area of control. In France, Belgium and Holland, other industries beside those which were previously affiliated are being brought under German control. This has been done for textiles in France and Belgium,* for cars in Italy and France. There is some opposition to these moves in Holland, where, although Dutch industry can hardly avoid collaboration, the industrialists are fighting the gradual extension of German control. Resistance is even stouter in Norway, but here the whole industrial system was orientated towards Great Britain and Germany has no

* The process is described in greater detail on page 794.

basis of pre-war industrial collaboration upon which to build.

While the elements of strength in Hitler's system should be recognised, there is no need to be hypnotised by them. The Nazis face formidable difficulties and their task is not made easier by the constant and sustained sabotage—political and economic—which they have to meet. As might be expected, resistance appears to be least among those who have most to lose; but it is the sturdy business men of Norway who have been largely responsible both for the failure of the Quisling party and for the Nazis' inability to secure willing economic co-operation from the Norwegians. Workers and peasants are constantly at organised and unorganised acts of sabotage which the Germans attempt to meet—so far ineffectually—by imposing collective fines. In Poland, arson is particularly widespread, while from Czechoslovakia comes the highest percentage of reports of industrial sabotage. In Norway, Denmark and Czechoslovakia there are clearly attempts—in Denmark by direct Trade Union action, in other countries by the pressure of public opinion—to prevent workers from working in the Reich.

Less damaging to the New Order but even more trying to the nerves and tempers of the new orderers is the attitude of contempt and insolence which the subject peoples in the main adopt towards their masters. It is on the whole passive and perhaps more trying on that account, since it cannot be punished without loss of German dignity. What can a German soldier do to a Paris *gamin* who walks behind him in exaggerated imitation? But there is some evidence of violent resistance. In peaceful Copenhagen, arrests for political violence increased from 40 in 1939 to 2,000 during 1940. There are sporadic outbursts of violence in Poland, while the Dutch appear to have a secret society which quietly "eliminates" Nazis and Dutch traitors.

One effect of resistance is to increase the Nazis' already formidable problem of administration. It is possible, for example, that the "supervisional maximum" in agriculture has been reached, for it was found impossible to employ prisoners of war for agricultural work in Western Germany, since there were not enough reliable overseers. The German papers are almost as full as the English of complaints of lack of leadership. They also lack trained men to run the vast new empire. When it is remembered that the number of people in territory directly administered by Germany has grown from about 68 to 109 millions since February, 1938, the magnitude of the problem can be grasped. And Nazi education is not designed to reproduce the reliable and duty-loving German civil servant of tradition.

Moreover, behind the immediate difficulties created by purely passive resistance and administrative insufficiencies, there are other more fundamental obstacles to the smooth functioning of the New Order, in spite of the extent to which, on paper, it meets both the dreams of the reformers and the needs of the man in the street. When everything in its favour has been said, it remains a travesty of men's real hopes and necessities. It is based upon war, upon turning butter into guns, and when the German people had sacrificed all beyond the food necessary to keep them efficiently at work, the Czechs, the Poles, the peoples of western Europe were asked to repeat the sacrifices. The first consequence of Nazi occupation is the disappearance of all surpluses and many necessities. As more and more consumption goods are sacrificed to the war effort, inflation within Europe and further predatory conquests without are the inevitable consequence. Thus, while the market gardener in Holland or the peasant in Roumania, this year and next and the year after, gets his regular payment for all his produce, the money he receives has less and less value. The whole offer of "stability" in such a system is illusory. Employment, markets, regular payments all depend upon the armament industry and the armament industry sucks up the substance of Europe and must be prepared to extend its sphere when Europe is sucked dry. Nor need it be supposed that the peoples of Europe are completely unaware of this. "Rationalising the labour force" or "consuming export surpluses" or "closing down redundant

industry" is only another way of saying forced labour, looting and squeezing out non-German competitors.

It may be that Goebbels has made a mistake in producing the "new order" at once in such concrete terms. People know it too well and know how singularly un-Utopian it is. Whereas as a ground plan for future organisation—the present could have been explained away

as a wartime necessity forced on peaceful Europe by Britain—it would have acted as an added incentive to finishing the war. It follows that the propaganda possibilities of the "new order" are not exhausted except by the Nazis. It is for the English-speaking peoples to take them up and prove that they are determined to exchange a genuine "new order" for this Nazi travesty.

NOTES OF THE WEEK

The Weygand Mystery

Even if General Weygand's two private conversations with Marshal Pétain made no difference to the policy of Vichy, and the whole story was put about by Berlin, it is nevertheless true that a sudden change in Vichy's manner and statements occurred at about the time of General Weygand's visit. Before that, the outbreak of hostilities between France and Britain seemed unavoidable. Admiral Darlan's hatred of the English, and his desire for "collaboration" with the Germans, were more apparent in each public utterance; and the policy of collaboration was widely believed to include the joint defence of Syria and the French African Empire, the joint use of French naval bases, and even joint action against the Free French Colonies. Then, in a day, the atmosphere changed. Vichy let it be understood in a surprisingly moderate Note to London that the attack on Syria was not a *casus belli* while the growing suspicion and resentment of the United States was somewhat checked by the announcement that Admiral Robert, the High Commissioner of Martinique, had agreed to a United States patrol of the French islands and to the posting of an American naval observer at Fort de France. Behind this open change of front rumour went much further—Weygand had withstood Darlan to his face, had refused either to allow any modification of the *status quo* in North Africa in Germany's favour, or to associate himself in any way with a joint defence of Syria, or to countenance a joint attack upon the territories of General de Gaulle. Finally, he is said to have demanded that a joint Commission, consisting of himself, General Huntziger, Admiral Esteva and Admiral Platon, should supervise any further proposals of military collaboration Darlan might make. There is no possibility of checking these reports. All that can be said for them is that they do to some extent fit the facts. On the other hand, it is not only possible, but extremely likely, that Berlin has dictated the change of front just as it dictated the front itself. The Germans probably wish to avoid forcing on to both the French people and the United States Government the dilemma of choosing between Vichy and Free France—as they would have to choose if fighting between France and Britain broke out. The Nazis have too shrewd a suspicion which way the choice would go. And since the Germans have a reason for dictating a change of policy, it must not be assumed that one swallow, even so important a swallow as General Weygand, makes a summer of resistance. Admiral Darlan's latest broadcast to the French people again defended to the uttermost the policy of collaboration, and it is Darlan not Weygand who is to remain at Vichy.

Before the Storm

Whether or not the Germans are ready for the next phase of their Middle Eastern campaign, they have allowed the first Allied advance into Syria to go by unchallenged, save by an increase in bombing over the whole scattered front. Alexandria has suffered some vicious night-bombing. The purpose is no doubt to scatter the population, to create chaos in the face of a possible air-borne invasion, and, at the same time, to terrorise the Egyptians into violation of their treaty with Britain. Haifa has also been heavily bombed by German aircraft, based on Aleppo, a fact which is difficult to reconcile with Vichy's assurances of the departure from Syria of the last Nazi. The Germans claim, too, that Cyprus has been unmercifully bombed for forty-eight hours, and here again it is possible that bombing is a preliminary to invasion. Yet the fact remains that even where, as in Libya, the Germans have men, material and presumably planes as well, no attempt has yet been made to complicate General Wavell's task in Syria by a full-dress diversion elsewhere. There are several possible explanations,

of which the most likely is that the Germans do nothing until their plans are fully matured and they are not yet ready to strike. In Libya, the much-publicised heat may be a further deterrent, but clearly the whole Middle Eastern

situation is trembling on the edge of a furious general conflict—a conflict in which, for the first time, Britain may prove to have taken the initiative by the advance into Syria.

First Things First

The Prime Minister admitted the need for a closer control of priorities in the filling of arms contracts some time ago, by deputing Lord Beaverbrook, as deputy-chairman of the Defence Committee in matters of supply, to be "referee." Actually, there is still considerable confusion as to what "priority" means. One meaning is that broad categories of production—aircraft, tanks, anti-aircraft guns—are placed in order of urgency, and materials, labour and capacity are allocated accordingly. Another is that individual contracts are placed in order of urgency within their broad categories, so that contractors know which to fill first, with the knowledge that, according to the specific priority given, raw materials will be made available by the Controls and workers by the Ministry of Labour. Unfortunately, priority as it is interpreted in Government practice does not seem to have escaped entirely from the first general stage, and it is hard to see how the appointment of a mere "referee" can bring about the precise specification of individual priorities that must be made if delay and unbalance in arms output is to be avoided. The experience of one large engineering works, employing thousands of workpeople, is illuminating. Last June, in the post-Dunkirk burst, this company was informed that orders for aircraft and associated equipment would receive the highest (A1) priority, other categories like tanks and ships coming below. Since then no single official instruction has been sent out to this firm on the question of relative priority; and representatives of the Ministry of Aircraft Production, the Ministry of Supply and the Admiralty have competed with one another in persuasiveness to induce this company to fill their respective orders for equipment, each of them claiming the "highest priority" for his orders. Without further official guidance, the firm has had two alternative courses before it: either to

continue giving precedence to *all* work for the Ministry of Aircraft Production, although several of its contracts for MAP have been plainly of less urgency than some orders offered by other Ministries; or to pick and choose among these orders according to what seemed to be their relative importance in the light of developments in the war situation—as reported in the Press. Asked to make equipment for tanks, this company is told by the Ministry's representative that the contract is of the highest urgency, but there is still no ruling to supersede the instructions of last June. It may be, of course, that the Government hopes that, if industrialists are given the idea that every order for every Ministry is equally urgent—and this claim is made by the Ministries for all their orders—they will be spurred on to greater and still greater efforts. But this is not "priority"; it is the old policy of exhortation. This state of affairs may not be general. But, where it exists, it leaves manufacturers unguided; it permits Ministries to compete for custom; and it gives no assurance that work in progress is being controlled and held in balance in relation to strategic needs.

* * *

The New POGA

The Goods and Services (Price Control) Bill arms the Board of Trade with fresh powers. Under the Prices of Goods Act of 1939, which remains in force, the Board did not have the power to fix maximum prices which will be given by this Bill; the obligation was laid upon traders to price their goods as the Act set out—that is, at the price charged immediately before the war plus a reasonable increase to cover increased costs. The Board of Trade's work was limited to specifying such prices if asked to do so by the Central Price Regulation Committee or by bodies of traders. By now more control has become imperative; supplies of goods have been drastically curtailed; rationing has been extended to clothing and boots and shoes; and the combined effect of all kinds of rationing (including food) and general scarcity has been rising pressure on prices especially in unrationed markets. An ugly rash of profiteering has shown the need for controlled prices (or margins) at every stage between manufacture and import and final sale. The new Bill does not cover food, where price-fixing and price-subsidising are the function of the Ministry of Food; and it is not intended to use it generally to the exclusion of POGA. For the moment, it is an annex to clothes rationing. To fix maximum prices, or maximum percentage margins of profit for manufacturers, wholesalers and retailers dealing in clothing, and boots and shoes, is a necessary corollary to rationing; and to impose similar control on the prices charged for repairing, laundering, cleaning, retailing or second-hand clothes follow no less essentially. Indeed, the Bill will not long be able to remain restricted in scope. Just as one ration leads to another because of the scramble for unrationed goods which grows as rationing spreads, so for the same reasons is an all-in price policy the only effective one; and it would be a great aid to the success of this latest offensive against onerous charges if the promise of the Chancellor of the Exchequer to stabilise the "strategic" prices of fuel, light, heat, transport and, hopefully, labour were to be made good soon. Piecemeal price control is impossible; and if the target of this Bill is strictly limited its usefulness may be sorely crippled.

The Post-War Ration

Last week Mr Morrison, the Home Secretary and Minister of Home Security, talked to the foreign Press in London about the world after the war. His stress was upon the achievement—for everyone in all countries—of "internal economic security," of a "really high standard of health, of diet, of physical well-being, and of education." Industrialists and farmers the world over would want markets; the peoples would want goods and services. Mr Morrison was right to point to minimum standards of social and economic security as the gain that this war can bring; and it is to the study of precisely this problem, under Mr Greenwood, that Sir William Beveridge is going from the Ministry of Labour. He was right, too, to deny the fallacious but popular view that the belligerent nations need be either destitute or "bankrupt" when the war is over. They will have their man-power, their factories, their fields and their material resources, however the monetary obligations arising from the war may be adjusted between class and class

and between nation and nation. It is only if demobilisation is done again by restriction and deflation—and this was the policy after the last war only because an uncontrolled post-war boom had piled Pelion on Ossa—that "post-war" may come once more to mean deprivation instead of plenty. Mr Morrison mentioned rationing as a policy for peacetime. Immediately after the war, before trade and shipping have been restored to peaceful pursuits, and when certain materials are still scarce, a degree of rationing may be needful; it is part of the physical task of reconstruction. But rationing, as the eking-out of scarcity, should have no place in the peacetime picture. Actually, by rationing, Mr Morrison probably did not mean rationing; he almost certainly only meant the aspect of rationing which ensures to every individual a minimum quantity of essential foods and equipment; and it is true that in peacetime the ordinary play of markets will not necessarily do this. In fact, Mr Morrison was really pleading for the National Minimum that so many of his Labour colleagues distrust because of its possible effects on wages; and it would be a pity to leave him on record as having advocated a policy which suggests controlled scarcity rather than the plenty that every post-war reorganisation in industry, agriculture and trade should be designed to secure.

* * *

Thinning the Herd

A joint announcement of the Ministries of Food and Agriculture has announced an open season for slaughtering between June 9 and the close of October next. New grades of cattle, for which special prices are payable, have been instituted during this period to induce farmers to "cull" their herds. Where necessary, compulsory measures are to be employed. Only the most profitable beasts are to be retained among either beef or milk producers, the test being roughly that the farm must be self-supporting in fodder, the occasional distribution of imported oil cake being regarded as a bonus. Shortage of fodder next winter is, of course, the prime reason for the new slaughtering measure, which itself, it may be assumed, is the reason for the temporary unrationing of offals. Cattle on the hoof are an important part of the country's iron ration, its basic reserve of food. Thus, while the latest insistence on culling is inevitably dictated by the shipping position, and also has some sound reasons of "good farming" to back it, it is, in a sense, disquieting. The matter is not unconnected with the refusal of the Ministry of Food to ration bread. Supplies of both bread and meat depend in large measure on the import of cereals. It is clear that the recent large increase in the consumption of bread, and, it may be supposed, in the import of wheat flour, have prejudiced the ability to feed the existing stocks of cattle. The rise in bread consumption, however, is itself due to the restricted meat supplies as well as to the high price of fish and vegetables. It is probable that an all-in control over the distribution of all foods, including a generous but limiting bread ration, as well as maximum prices and regulated distribution in the case of fish, eggs and vegetables, might ease the fodder position and prevent a deterioration in diet.

* * *

Self-Sufficiency on Farms

It is not sure that the Ministry of Agriculture has grasped the need for revolutionary changes in farming practice. Farmers are urged to make their farms "self-supporting" by growing more fodder crops and by turning more grass into ensilage for consumption by farm animals. But what is needed from British agriculture, in the present state of the Battle of the Atlantic, is the maximum output of human food, and that can only be obtained by the sale off the farm of such crops as wheat, potatoes and sugar beet. The nutritional importance of milk does indeed justify the growing of fodder crops, especially for dairy cows; "self-sufficiency" for the predominantly dairy farm is therefore a desirable slogan. But for the lowland arable farm the object should be the largest possible "export" surplus of human food; and the attainment of that object must involve a drastic reduction in the numbers of beef cattle and lowland sheep to the level that can be supported on the by-products of crops grown for other purposes. In the past, sheep and beef cattle, fed partly on imported foods, have provided on lowland farms much of the soil fertility,

but there is reason to believe that the importance of these animals has been over-estimated and that the same results can be achieved by a judicious combination of other practices. At any rate, the country can no longer afford to grow oats or roots to feed the cattle to provide the dung to grow more oats and roots; the first and only object must be the largest possible output of wheat, potatoes and milk, and the production of meat must become an incidental part of the new lowland agriculture.

* * *

American Defence Measures

In the sphere of American defence, the week has seen one or two vital developments. On Monday last President Roosevelt signed the Bill authorising him to transfer to the pool of merchantmen for Allied use all foreign ships lying idle in the United States. So far, 84 vessels are known to be involved, with a gross tonnage of 459,140 tons. One of the ten French vessels is the crack Atlantic liner, the *Normandie*. There are 28 Italian and 2 German ships, and by the time the count is completed, probably about 100 ships will be available for transfer. The Navy had its day with the launching of the 35,000-ton battleship, *South Dakota*, four months ahead of schedule, while the Army distinguished itself by bringing in an Army Bill of £2,250 millions, the largest ever voted in time of peace, and only once surpassed in time of war. These moves form a significant background both to the wave of strikes in defence industries, and to the sudden spate of peace rumours which coincided with Mr Winant's arrival in the United States. The Nazis are unquestionably perturbed by the scale of America's preparations. They must therefore do what they can to sabotage the country's will and ability to act. On the psychological front, rumours that Britain is "cracking" and "talking peace" encourage the Isolationists and strengthen Mr Lindbergh and his like. On the industrial front, strikes both paralyse war output and encourage impatience with the processes of democracy. Mr Roosevelt gave in the most absolute manner his assurance that Mr Winant had not brought with him "the tenth cousin of a peace offer," and went on to give an interesting illustration of the method of timing of the Nazi propaganda machine, which in this instance had worked to produce an atmosphere of uneasy peace talk exactly to coincide with Mr Winant's arrival.

* * *

Strikes or Sabotage?

It is possible that a turning-point has been reached in the ugly problem of strikes in the United States. Such is the history of American labour relations that many people, probably including President Roosevelt himself, are inclined to give organised labour the benefit of the doubt. Now, however, it is becoming clear that it is not a question of organised labour or even of labour as a whole. Official estimates state that some 96 per cent of the workers of America are wholeheartedly behind their country's war effort. The other 4 per cent, however, which include all too many local labour officials, are engaged in a campaign which seems calculated to sabotage the defence industries rather than to secure better conditions for defence workers; and the fact that the owners of American industry have shown a notable capacity for adroit manoeuvring in their attempts to exploit the defence demand to their advantage ceases to be relevant. This was brought out with unpleasant clarity by the events at Ingleside, Los Angeles, where men of the CIO Automobile Workers Union came out on strike and by doing so put a complete stop to work on billions of dollars worth of vital military aircraft of all kinds. The facts of the case illustrated the complete irresponsibility and malice of the local union officials. The strike was called while the case was still under consideration by the National Defence Mediation Board; it was unanimously condemned by CIO and AFL leaders alike; the Administration's order to the men to return to work was frustrated by 1,000 picketers; the president of the Automobile Workers was howled down when he attempted to address the strikers; and the union officials refused to allow a vote on the strike. President Roosevelt took the only action possible. Troops cleared the picket lines and a majority of the men returned to work. But Ingleside is not the only strike. Fresh strikes have broken out at Cleveland and Detroit, and the Office of Production Management have publicly stated their fear that all bomber output will cease unless these strikes are settled. The country is impatient for more vigorous action.

Australian Misgivings

Once again Australia and New Zealand have suffered heavily in the fighting in the Middle East—Australian troops left behind in Crete as prisoners or killed are estimated at 3,599—and once again it is very naturally being asked in both Dominions whether the losses could have been avoided. In a very frank broadcast last Sunday, Mr Menzies admitted that the rapidity of the German attack had again been under-estimated and implied that there had been a lack of adequate preparation in establishing good, well-protected air bases. It is understood, moreover, that the Advisory War Council, on which Labour is represented, has made strong representations to the United Kingdom on the necessity for air support and mechanised equipment for the Australian forces. Mr Beasley, one of Labour's representatives on the Council, is reported to have said that "It is tragic that our Forces should have suffered so much through lack of proper equipment and air support. . . . The Australian Government must insist in all future dispositions of the AIF that the United Kingdom Government should give a guarantee that there must be adequate air support." Expressions such as these will be heard sympathetically in this country, where the failure to give such fine fighters as the Anzacs the equipment they deserve is universally deplored. It is, however, worth pointing out that Australia can help to equip herself. At the Delhi Conference the Commonwealth was designated the chief source of supply for the Far East, owing to the great progress made by her armament industry, but it is as true there as it is in this country—and indeed in other Empire arsenals as well—that the maximum industrial effort has not yet been made. The Nazi sneers that Great Britain is now willing to fight to the last Australian is patently ridiculous, since, as Mr Menzies pointed out, of all the troops in the Middle East Australia supplied one-sixth. But, equally, Germany should not be given the chance of saying that Australia is only willing to fight to the last British tank—and pilot. Is, for instance, the Empire Air Training Scheme producing, in each Dominion, the maximum target of trained pilots aimed at? And would a critical survey of the standard of living in the Dominions show that they are sacrificing butter for guns, as they must if the Empire's potential superiority is to be translated into fact? An Imperial Conference, which Mr Churchill said he was hoping to arrange, would be of great value if it led to frank discussion and co-operation on matters such as these.

* * *

A Ministry of Fuel?

On May 28th, Mr. Grenfell, Secretary to the Mines Department, informed the House of Commons that the output of coal was insufficient to meet current demands. Even if the drive to increase production does yield a surplus over consumption during the next few months, coal will still be scarce. Even if the output of coal were plentiful, rigorous economy in consumption would still be necessary, for the coal-mining industry is a heavy consumer of male labour. The argument for rationing coal in its crude form,

as well as in the form of gas and electricity, is unanswerable, and the report that this is to be done is timely. In view of the dearth of shipping space, the application of a needs test to consumers of petrol and other petroleum products is equally urgent; and the case for a separate department responsible for the distribution of all the major fuels is therefore strong. Rumour has it that the need for a Ministry of Fuel, charged with the control of the distribution of fuels, has been recognised by the Government and that it will be set up soon. But any such Ministry, to be effective, must also be given power to plan a programme of supplies, embracing production and imports, in relation to essential requirements—and with due regard to the possibilities of substituting one kind of fuel for another; it could not be effective as merely a distributive department. In fact, the substitution of a national fuel policy for the present haphazard arrangements of production, imports and distribution, has become imperative.

Concessions to Coal Miners

The differences of opinion between the coal owners and miners over the conditions attached to the payment of the bonus of 1s. per manshift were resolved on Friday last week. The principle of the attendance clause has been retained. But the owners have agreed not to deprive the miners of the bonus if they have a legitimate excuse for non-attendance—if they are absent owing to sickness, trade union work, or civil defence duties, for example. Mr W. Lawther, president of the Mineworkers' Federation, pointed out after the conclusion of the agreement that no man would now be debarred from receiving the bonus, except those who would not face their obligations. "We can assure the nation," said Mr Lawther, "that the Mineworkers' Executive and local leaders will be in the vanguard of the drive to get every ton of coal it requires." Now that the ground has been cleared for the production drive, it is to be hoped that no more time will be lost in getting it under way. Mr Grenfell has said that the supply position would not be safe unless at least 20 million tons of coal were added to stocks before the end of October. If this target cannot be reached with the industry's present labour force, steps should be taken to strengthen it by recalling miners from other industries and from the fighting services.

Rationing Pitfalls

By slow stages, the scope of rationing is being extended. No further move has yet been made with regard to milk and fish, but the rationing of eggs is to start on June 30th. There is little doubt that this further partial extension of rationing will accelerate still more the scramble for the goods that remain unrationed—the most obvious examples being sausages and other cooked meats, canned goods, biscuits and confectionery. A new rationing period is about to begin, and measures will no doubt have to be taken soon to bring the distribution of these foods under control. It is to be hoped that the net will be cast very wide, for the problems of distributing unrationed foods, which include a deterioration in their quality, profiteering and hoarding, must become more acute as fewer foods remain outside the ration. The whole rationing system is now at a turning-point. Rationing is at last becoming the rule rather than the exception; and while there is good reason to suppose that vegetables can remain indefinitely in free supply, it is more than ever important that they should be retailed at "reasonable" prices. As it is, the prices of spring vegetables, for instance, have risen in a spectacular manner in the last three months and need immediate attention. The difficulties of equitable distribution, in the absence of all-in rationing, were strikingly illustrated last week-end, when a persistent rumour of the imminence of soap rationing caused long queues to assemble outside many shops. The maldistribution of supplies which must result from these scrambles, whether for soap or for cigarettes, is clearly unfortunate; and, as rationing proceeds stage by stage, the public is peculiarly liable to be impressed by this kind of rumour. It was likely from the outset that a shortage of oils and fats might well at some stage necessitate the rationing of soap as surely as the rationing of butter and margarine. Whether soap rationing has or has not, in fact, been decided upon yet is beside the point. The question is: should the authorities in any case have waited until the

public in panic has started large-scale maldistribution and caused needless scarcity? If supplies of soap are ample, the ration can be generous; but at least the distribution should be controlled, if the fantastic false scarcity which is making tobacco a major political issue is to be avoided in the case of soap.

Egyptian Unity

It is unfortunate that the recent attempts to secure a truly representative government of national unity for Egypt have again failed. The unwillingness of the Wafdist Party to be represented in the Cabinet while they are unrepresented in the Chamber is understandable, as is also the hesitation of Hussein Pasha Sirry, the Prime Minister, to hold elections during the present crisis. The matter appears to have reverted to deadlock—despite clear evidence of good will on both sides. It is all to the good that the Saadist Party, which favours more active support of the Allies, is now represented in the Cabinet, and, since the Wafdists support the official policy on most questions relating to the war, their absence from the Government need not be disastrous. None the less, the recent German terror raid on Alexandria indicates that Egypt will for the present be increasingly involved in the hostilities. Egypt more than ever needs an all-party government; and it is good news that General Aziz el Masri Pasha, who will go down to history as a singularly inept imitator of both Quisling and Hess, has been captured and will be brought to justice.

Home Security or Civil Defence

This week the Government rejected, though not finally, Mr Kenneth Lindsay's motion to establish a separate Ministry of Civil Defence, which would amalgamate the Ministry of Home Security and the civil defence functions of other departments. The chief reason given by Mr Morrison for the Government's decision was that the proposal would be impracticable because of the great number—nearly fifteen—of the departments involved. Provided that co-ordination can be secured between all these central authorities—and Mr Ramsbotham asserted that the Ministers concerned met at least three times a week to discuss civil defence problems in which they were mutually interested—there is no real reason why Mr Morrison should be divested of such a large part of his title and duties. But the Select Committee on National Expenditure was not convinced that co-ordination at the centre was adequate. Far more obvious, however, is the lack of co-ordination locally, and no good reason was given why the proposal to make the administration of civil defence regional rather than local was also rejected. The Government has already realised that fire fighting must be nationally controlled and regionally administered, and as an overture to the debate the establishment of a Fire Service Council to assist the Home Secretary in the administration of the fire services was announced. Moreover, civil defence conscripts can be drafted to any part of the country, like any other servants of the Crown. Why, then, is it said that a system under which regional authorities would control the administration of all civil defence duties would be bureaucratic and undemocratic? It might be more bureaucratic, but it would also be kinder and more efficient to evolve a system which would see that people in the bombed towns were properly housed, sheltered and fed and were not allowed to drift into the country every evening and sleep in the open as no-one's responsibility. Mr Morrison claimed that there was no destitution from air raids. This may be true, but there is a great deal of discomfort, worry and irritation and some distress, which could be avoided by more efficient administration. The argument that a greater use of the regional machinery would be undemocratic seems to be based on the fact that local authorities are elected whereas Regional Commissioners are appointed by the Crown. There might be some sense in this argument if the local authorities were responsible for civil defence policy. But they are not. Policy is centrally controlled, and the Ministers responsible have, of course, to answer for it to Parliament. The local authorities in this matter are merely administrative agents like the Civil Service, and it has never been held in this country that administration should be subject to the elective principle.

Thwarting the Land Speculators

Although Mr Justice Uthwatt's Committee to advise Lord Reith on the best means of thwarting speculation in bombed sites was appointed as long ago as last January, no indication has yet been given that any measures are imminent. The Land Agents' Society urge in their memorandum of evidence submitted to the Committee that legislation should be passed immediately. They suggest that, in towns which have been heavily bombed, the public authority should be given an opportunity of obtaining powers for the compulsory acquisition on an equitable basis of all the interests in the sites involved. Having exercised such powers, the authority would then be enabled to plan and re-develop the area concerned, either by doing the rebuilding itself and subsequently letting the property, or by selling the sites or letting them on building leases—in either case subject to any necessary restrictions to provide for zoning or re-zoning. The society claim that such powers would enable the public authority to control the development of the property, subject only to the directions of the central planning authority, and this claim is probably justifiable in towns where the local authority is constructive, energetic and disinterested. But the legislation suggested is merely enabling, and there would still be the grave danger that in some places the powers would not be exercised, with a consequent recurrence of the land exploitation horrors of the pre-war years. The Ribbon Development Act was an enabling measure, and it did not prevent ribbon development from continuing at will in places where the local authorities, from inertia or for more discreditable reasons, took no action under it.

Batavian Trade Talks

After dragging on for several months, the trade negotiations between Japan and the Netherlands East Indies have been broken off by Tokyo. This decision was apparently precipitated by the "stiff" Dutch reply to the "final" Japanese note, which was designed to conclude the discussions. The inevitable Press campaign in Tokyo is pouring out the usual Axis mixture of threats and bribes, while current rumours suggest that the Japanese Government consider the matter to have passed from the economic to the political and military sphere. There is no longer any attempt to disguise the fact that these trade talks were only a device for bringing the entire resources of the Netherlands East Indies within the orbit of Japanese control. The Dutch colonies, in participating in the blessings of "Greater East Asia Co-Prosperity," would naturally "enjoy" the political as well as the economic consequences of the scheme; and the Dutch East Indies' close relationship with the Allied Powers would be effectively disrupted. Such, no doubt, is the opinion of the Japanese Government. The Dutch, according to Japanese sources, are reported to have stood out for an absolute Japanese guarantee that the conclusion of a trade pact with Japan would not directly, or indirectly, release supplies for shipment for Germany.

Wartime Nurseries

The Government has announced its decision to bear the full cost of the provision by local authorities of wartime day nurseries for children under five. These nurseries may now be set up in any type of area—"evacuation," "neutral" or "reception." They may be used by women in any kind of employment. No distinction will be made between nurseries for evacuated children and nurseries for the children of women in employment, but there will be two types: whole-time day nurseries providing complete day-time care and maintenance for children of all ages up to five, at a cost of 1s. a day; and part-time nurseries for children of two to five, which will be open during school hours at a cost of 3d. a day without meals. The part-time nurseries will be under the supervision of teachers; the others are to have trained nursing staffs. So far, so good; this should go a long way towards solving the problem of the working mother *qua* working mother. But as the mother of children who spend their nights in shelters her problem remains. True, the provision of day-nurseries in reception areas will make the billeting of the under-fives a little easier; but nothing short of residential nurseries in the reception areas will avoid the danger to child health in the

bombed towns. The reluctance of mothers to let their children go—and it is, in any case, only a very small proportion of the under-fives who are eligible to go unaccompanied—is not so unreasoning as it sometimes appears. They may well argue that a tiny child, forcibly thrust as an unwelcome guest into a strange household, will suffer more at the time, and may sustain more permanent damage, than it will from exposure to physical danger surrounded by people who are deeply concerned for its happiness. The great obstacle to establishing residential nurseries is the difficulty, first of securing suitable buildings and, secondly, properly trained staffs. Accommodation is a small—but important—part of the national housing problem; it cannot be solved by itself. But the question of staff, provided that the right woman could be secured to act as head of each small colony, might be solved by appointing, under her supervision, carefully chosen but relatively untrained, young helpers. Part-time voluntary help could probably be had on a considerable scale, for many women would surely welcome such a congenial form of war work.

Italy's First Year

In a speech on Tuesday at the end of Italy's first twelve months of war, Mussolini put the best face he could on his country's disastrous record. Abyssinia would continue to resist and would be reconquered; Italy would occupy the whole of Greece; Britain would be driven from the Mediterranean; the United States could enter the war or not, as it pleased; since in effect it was in the war already; an Axis victory was certain; perfect understanding existed; the battles were cemented by common sacrifice; and so on and so on. Of the loss of Libya, not a word; of the effective occupation of Italy by the Germans, not a word; of Corsica, Tunis, Nice, not a word. It is tempting to speculate how the cynical Italian takes the faded eloquence and weary verbosity of these commentaries on Axis relations. The Italian people know that they have been beaten in Africa, in the Mediterranean, in the air and in Albania. They know that Italy's position has been restored only by German intervention and at the cost of total subservience. They know that snippets of Yugoslavia and an occupation of Greece are sops to make up for the loss of all those claims on France for which Italy entered the war. They know from their daily encounters with the new German bureaucracy the contempt the Nazis feel for them. But they are in the strait-waistcoat.

Rehousing in the Provinces

Large-scale evacuation from London has prevented serious congestion in the Metropolis despite considerable destruction of housing accommodation. Even where bombing has been concentrated on a particular area, and workers have had to move away from their work, the vast network of transport services in and round London has succeeded in avoiding any lasting difficulty in travelling. No such happy combination of circumstances exists in many of the main provincial cities which have suffered heavy bombardment. In these centres, evacuation has been on a much smaller scale, and the destruction of living accommodation has raised an acute housing problem. Moreover, overcrowding and social distress are only the beginning of the matter. Some industrial towns are within sight of a situation in which it will not be physically possible to house workers within reasonable distance of their work unless immediate action is taken. The problem is beyond the control of the local authorities. Its solution requires compulsory billeting over wide areas, coupled with the general requisitioning

of all available large or empty houses and public halls. It requires the immediate construction of new accommodation in the form of huts, hostels or temporary houses; and it requires a more vigorous evacuation policy. Most important of all, rehousing must be considered by a central, national authority, say, a special officer of the Ministry of Works and Buildings working in consultation with the Ministry of Health. Rehousing is not simply a post-war problem; in some areas it is a problem which, on a temporary basis at least, must be solved before next winter, if output and morale are to be maintained.

News from the Foreign Office

The plans which Mr Eden has announced for the reform of the Diplomatic Service do not mark any dramatic departure in policy. There will be one combined Foreign Service, parallel to the Home Civil Service, and embracing the Consular Service as well as the Diplomatic Service and the Foreign Office, which continues the process of reform begun after the last war when the Diplomatic Service and the Foreign Office were brought together. Changes in methods of recruitment and remuneration will be made with the intention of considerably widening the field of choice for members; within the new Service there will be no watertight doors between the three sections; and provision will be made for the retirement on pension of men proved unfitted for further promotion. These changes, too, carry on a development that has been proceeding ever since 1918; the area of selection has been widening; and the need for entrants to possess a specified private income no longer holds. To say that these reforms are not as novel as some commentators have made them out to be is not to grudge them a wholehearted welcome. It cannot be assumed that the new recruits of the next decade or so will easily attain the traditional, mannered efficiency of their predecessors in work for which social ability, in the widest sense, is indispensable. But it is certain that the new provisions for drawing to the greatest possible degree upon the nation's fund of talent and experience—all missions are to be furnished with commercial, financial, labour and welfare experts—will bring fresh life and vigour to a service which has worked too much in seclusion and often in archaic ways. To ensure that lack of financial means will be no bar will in itself be a great step forward, even though no great change in the type of man taken in can be expected at once; and to make sure that the rise of talent will not be blocked by the mere claims of seniority will be a triumph.

The object of these reforms is to make the Foreign Service more representative, and this aim would be a justification by itself for them. The nation is represented abroad by its diplomats, and the Foreign Office has also come to claim the right to speak for the nation in foreign countries. Only this week the Minister of Information and his chief permanent officers are reported to have risen in revolt against the dead hand of the Foreign Office on the distribution of news abroad. In the United States, when the fullest and most pointed news is imperative, two appointments by MOI are said to have been vetoed by the Foreign Office. The appointment of Sir Malcolm Robertson to be in charge of the British Council, which dispenses publicity far and wide in other countries, was unknown to MOI before its public announcement. It is the exclusive and secretive habits of the Foreign Office as it is at present constituted that are in question. It is Foreign Office custom to conceal and hold back, just as it is the custom of the Service departments to conceal and hold back all Service news; and it is against these stifling limitations that Mr Duff Cooper and his aides have now revolted.

A New Liberalism?

Mr Hore-Belisha seems to have acquired the strong displeasure of Mr Churchill for his gloomy utterances in the country and his sustained criticism of the Government on all possible occasions. This may be regarded as a personal matter; but when Mr. Hore-Belisha, speaking as a Liberal leader to Liberals, redefines his creed as completely as he is reported to have done in a recent speech in Scotland, it is reasonable to ask where the ex-Secretary of State for War is going. The profit motive (he is stated to have said) must be done away with, and be replaced by the motive of service. This may, of course, be no more than the formula which springs automatically to the lips of good people who want to solve economic problems by bringing

about a change of heart among business men, a formula which is also common and profitable currency among the members of Rotary. It may represent the fact that Mr Hore-Belisha, in the rôle of reformer, has the very best of intentions; it probably does. It may merely be a loose and inaccurate way of saying that every individual must work for the State in times of national emergency. But the speaker was a politician of a particular designation talking to other politicians of the same kind; and it is pertinent to point out, first, that no brand of Liberalism yet known has rejected the profit motive or, more generally, the capitalist system; and, secondly, that if the National Liberals, excluding presumably Lord Simon, from whom hitherto they have derived their label, are to take this plunge, they are dooming themselves to even greater political frustration than they have enjoyed in recent years. Profits and service are not mutually exclusive; indeed, the one is, or should be in the society that Mr Hore-Belisha presumably wants to see, the reward of the other. The fact is that it is as nonsensical to speak of abolishing profits as it would be to talk about abolishing wages or any other payment for services rendered or goods received. It is possible to claim, at any point of time, that the reward of capital or of managerial services is too high in relation to other rewards. It is certainly possible to say that, in any well-organised post-war community, profits must be associated with plentiful production, and not, as in recent decades, with economic restrictionism. For it is precisely because of this relationship between profits and plenty in the past that the power to produce climbed quickly, and with it, though not equally, the standard of living of all classes. The decision as to whether this or that activity shall be carried on, or this or that article or service be produced, must be made according to some criterion of profitability—even under conditions of complete State control. For a Liberal to advocate the entire abolition of the arbitral functions of free markets is to cease to be a Liberal; and it is uncertain, on the existing evidence, whether it is Heaven or Totalitarianism that Mr Hore-Belisha would put in the place of these ancient and dynamic liberties.

Money for Health

In the article on Health Insurance which appeared on page 720 of *The Economist* of May 31st, the sentence "The only safeguard against starvation for the families of sick persons is that they can apply to the Assistance Board for relief" should, of course, have read "The only safeguard against starvation for the families of sick persons is that they can apply to a public assistance committee for relief."

Shorter Notes

For the first time the names of British regiments engaged in military operations were revealed when Mr Churchill gave the names of those regiments and units taking part in the fighting in Crete. They were the Rangers, the Black Watch, the Argyll and Sutherland Highlanders, the Leicester Regiment, the Welch Regiment, the York and Lancaster Regiment, the Royal Artillery, the Royal Engineers and the Royal Marines, "who formed the rearguard and suffered the most heavily of all."

A sharp reminder of the four-year-old war in the Far East has been given by two heavy Japanese air raids on Chungking. Last Sunday, 63 aeroplanes took part in the raid—not a great number by European war standards, but their effect on a city whose air-raid defences must be elementary at the best can well be imagined. Actually, human casualties from this raid were slight, but on the previous Thursday a horrible tragedy took place during a smaller raid, when nearly 2,000 persons were suffocated in a tunnel shelter.

After the High Court judgment allowing Captain Budd a writ of *habeas corpus*, the Home Secretary ordered the release of 12 other persons whose position was the same as his. Mr Morrison, however, stated in the House of Commons this week that since "a release necessitated by technical defects of procedure does not relieve the Home Secretary of his responsibility for public safety," he had considered the cases anew and had come to the conclusion that it was necessary on security grounds that Captain Budd and 11 of the other persons should be detained. Fresh detention orders have, therefore, been made for them, and a fresh application from Captain Budd for a writ of *habeas corpus* is before the court.

THE WORLD OVERSEAS

War Approaches Palestine

(By a Correspondent)

June 9th

WHEN Italy entered the war, just a year ago, Palestine suddenly found the enemy at her gates. The Mediterranean and the Red Sea became the front line; the withdrawal of French forces from Somaliland enabled the Italians to occupy British Somaliland; and Italian troops invaded Egypt. Italian planes bombed Haifa and Tel Aviv.

The population of Palestine faced the change calmly. Anti-British and anti-Jewish activities of Arab extremists ceased. Some 80,000 men and 40,000 women volunteered for national service and the whole community adapted itself quickly to the new conditions. The victory of General Wavell in the Western Desert; the re-occupation of Somaliland; the invasion of Italian Somaliland; and the British victories in Abyssinia—these removed for a time the danger from Palestine; and Jews as well as Arabs looked upon General Wavell as the hero who had saved the country from imminent danger.

Now the latest developments in the Balkans and Libya have brought the enemy to the gates of the Levant once more. Palestine is passing through a feverish stage of preparation. The aim of the Germans seems to be to advance towards Palestine by a pincer movement from Africa through the Western Desert and Sinai Peninsula and from the Balkans through Turkey, Syria and Trans-jordan. The ground was prepared by the Fifth Column activities of anti-British Arab groups. The Rashid Ali revolt in Iraq; the anti-British activities of the former Mufti of Jerusalem; the presence of Fawzi El Kawakji amongst Rashid Ali's army leaders—these show clearly the Nazis' intentions. The suppression of the Rashid Ali revolt has shortened one hand of the Nazi pincer movement; the Allied advance into Syria may shorten it still more. But the danger has not yet been averted. The Levant remains the centre of the strategic struggle.

The Country's Riches

The importance of Palestine, with its well-developed port of Haifa and oil station and oil refineries, cannot be over-estimated. The modern industries of the country and the facilities available for the supplying and repairing of military equipment are also of great value.

At the outbreak of the war, the economic situation of Palestine seemed ominous. The foundations of the country's economy were shaken: the stoppage of migration deprived the country of the regular inflow of Jewish labour and capital; the export of citrus fruit was cut to 25 per cent in the first year of the war and entirely stopped in the second; growers and traders were faced with bankruptcy; regular sources of raw materials were stopped; and the supply of vegetable and other foodstuffs from Syria and the Jewish community then showed great elasticity ceased. The Jewish community to the new conditions. In adapting the country's economy to the new conditions. The presence of the Imperial and Allied Forces increased the demand for all goods and the consumption of the home market increased. Deliveries to the Army compensated to a great extent for the losses due to the curtailment of citrus exports. The Palestine Administration helped. New credits were granted through the banks to the grove-owners, regardless of the fact that many of them were already in debt and had not managed to meet their usual interest and sinking fund obligations.

Many new industrial establishments have started during the last few months. The production of vegetables and food has increased, and new factories for canning and preserving fruit and vegetables have been established. New machinery and repair shops, working mainly for the military, have been opened and the building trade has been busy building huts and barracks. The chemical industries

based on the Dead Sea have increased their production; and exports of valuable chemicals, such as potash, magnesium, chloride, sulphur, rock salt, etc., have reached new high levels.

It is the danger from without that causes anxiety. A Nazi invasion of Palestine would lead to great bloodshed. German troops would have to fight not only the British Imperial Forces and the embittered Polish and Free French divisions, but also the entire Jewish population. The Nazis would vent all the hatred against the Jews which has been cultivated by their philosophers. German troops in Palestine would mean not only the destruction of the half a million Jews living in the country, but also the wiping out of the enormous effort Jews all over the world have made in the building up of modern Palestine.

A Jewish Army?

It was natural that the Jewish population of Palestine should express concern about the position and demand the formation of a Jewish Army for the defence of their National Home. The proposal was not accepted. The Palestine Administration suggested to the Jews that they should join the Palestine units which are composed of volunteers of both Jews and Arabs; and the number of Jews serving in these units is already three times greater than that of the Arabs, in spite of the fact that the Jewish population is only a third of the total. But the number of Palestine Jews serving in the forces is still comparatively small, for there exists a reluctance to join up as long as there does not exist any Jewish national force similar to the Polish, Free French, Czech and other national forces. The Jewish population in Palestine could provide an army about 60,000 strong; but the policy of the Palestine Administration is necessarily still concerned with promoting Palestinianism and not with creating a separate racial army.

Now the fight is on in Syria, and the problem of recruiting the able-bodied men of Palestine and putting them under arms is more urgent than ever. It may be that the German forces in Libya will try to create a diversion and attack without delay along the Egyptian frontier, and so attempt to force the Allied Armies in the Middle East to fight on two fronts. The use of any available man power in Palestine would then become urgent.

Between Two Wars

[FROM OUR SHANGHAI CORRESPONDENT]

May 9th

GENERAL business conditions in Shanghai this spring did not compare favourably with last year. It is true that the value of foreign trade increased, owing partly to higher prices, freight and marine insurance rates, and partly to an

extension in the volume of trade resulting from Shanghai's greater dependence upon foreign cereals, textile fibres and coal, which now form 60 per cent of all local imports. This greater dependence, in turn, results from stronger Japanese measures to isolate the city from its hinterland, blockade the Free Chinese ports and export to Japan Chinese agricultural produce and coal formerly available for consumption here. But the continued decrease in Shanghai's inter-China trade offsets the increase in foreign trade. Local industrial activity is some 20 per cent below the peak it reached just before the crash in May last year.

On the other hand, in trade as well as in industry, Shanghai's business has recovered remarkably from the low point touched in last summer's depression. The city maintains its outstanding position as the one great Far Eastern port with an entirely free exchange market; a free sterling quotation of its own; complete absence of foreign trade control; commodity warehousing and capital movements; and an extremely light burden of taxation upon business. Some 65 per cent of all China's foreign trade is still concentrated here, and the British Empire maintains a leading 40 per cent share in Shanghai's foreign commerce.

In addition, Shanghai is amply supplied with large funds of repatriated Chinese liquid capital, available easily at low rates of interest and eager for speculation and investment. Half a dozen share issues of new British companies, incorporated under the Hongkong Ordinance and floated here during the past eight months, were all heavily over-subscribed. Banking is still doing well and registers satisfactory earnings. Confidence in Shanghai's business future prevails locally, though difficulties, both threatened and actual, have increased. These are reflected in the average prices of general shares—chiefly British—traded on the Shanghai Stock Exchange, which remain more than 30 per cent below the boom quotations of May last year.

Shortage of Shipping

Adverse factors include the prolongation of the European war; the continued closure of the Suez route; the disappearance of prospects of an early peace in China; Japan's increased pressure upon other foreign interests in China and increasing aggressiveness in the direction of Singapore; and the now serious threat of a general Pacific war. Besides these general factors, it is the shipping difficulty which worries Shanghai most. The past few months saw the withdrawal from the Shanghai run of additional British shipping, including all vessels of the Blue Funnel and Canadian Pacific lines; no British and Allied bottoms are permitted to sail to the north of Hongkong. The American and Japanese mercantile marines are unable to step into the place evacuated by the British and cannot now increase their regular Shanghai calls, while tramp shipping in Chinese waters becomes even more scarce. Freight and insurance rates, though sharply increased again this spring, still remain, out here, far below the peak reached in 1917, but for many purposes actual bottom space has simply become unobtainable for Shanghai. This situation is being felt the more heavily since Shanghai's dependence on foreign supplies continues to grow. Depending for half of its fuel supply on Indian soft coal, and without a single vessel at present available for the Calcutta-Shanghai coal run, the Shanghai Power Company has to enforce a 30 per cent curtailment of industrial sales of electricity, and most local industries have to reduce production correspondingly.

Since last summer's depression was overcome in the autumn, the earning conditions of Shanghai's industries have again improved and to-day maintain a very high level. In many industries, lower production was more than made good by increased profit margins resulting from time-lags and the inability of wage and salary adjustments to keep pace with commodity price increases. Ewo Cotton Mills, Shanghai's leading British manufacturing enterprise, earned for 1940, in depreciated Chinese dollars, 20 per cent more than its pre-war capital, and in terms of pre-war currency 30 per cent of that capital. The company reserved, wrote off and carried forward half its earnings, and with the remainder paid Ch\$6 in dividends on its five taels shares. The Shanghai Stock Exchange rates this share at between five and six times its pre-war value, while Chinese currency, in terms of sterling, retains little less than a quarter of its pre-war exchange value. Another British-owned cotton mill paid for 1940 a 150 per cent dividend, and sees its share rated nine times above its nominal pre-war value.

Port and shipping business is doing less well. But the Shanghai and Hongkew Wharf Company, the leading

British firm in this line, earned in 1940 45 per cent of its capital and paid a 35 per cent dividend, which in pre-war Chinese dollars means 10 per cent earnings and 8 per cent profit distribution. Real estate corporations, mostly with large sums of outstanding debentures, also show higher earnings. A turn for the worse is to be observed only in public utilities which cannot raise their charges with the pace and to the extent of the increases in their expenditure. Of British-owned Shanghai utilities, the tramways cut its 1940 dividend to 2 per cent (1939, 5 per cent; 1938, 8 per cent); the buses suspended dividend payments; and gas and water complain that their earnings are insufficient to provide for adequate depreciation. The American-owned utilities (power and telephone) are also unfavourably placed.

Ireland's Industry— Now and Post-War

(FROM OUR DUBLIN CORRESPONDENT)

May 27th

In the course of the debate on the Budget, Mr. Erskine Childers made an impressive speech in which he reviewed the whole economic situation in Eire, present and future. The first twenty years of self-government, he stated, had been disappointing; the national income had failed to expand, no new export markets had been established, and the fertility of the land had not been maintained. Irish prosperity in the past had depended upon the existence of conditions which might not prove permanent—shelter in the British market for certain agricultural exports, free emigration and the possession of large external investments. It is imperative to prepare a careful plan for the period after the war when Ireland would have to fit into a new international system. Efficiency based on low productive costs and a reformed marketing system would be essential, and agriculture would need either to be conducted on large farms or, if the enlargement of farms is impossible, with a considerable amount of co-operation. There would be a post-war demand for pedigree stock, pedigree plants and seed potatoes which Ireland should prepare to supply.

The rate of progress of the co-operative method in Irish agriculture is disappointing. The annual report of the Irish Agricultural Organisation Society states that the milk supply handled by the creameries has fallen in the last two years and that the number of agricultural and credit societies is decreasing. The failure of the co-operative credit societies is regrettable, but it is partly the result of the excellence of the Irish joint stock banks. Farmers are supplied with abundant credit by the banks, which they find the most convenient depository for their savings. When the Agricultural Credit Corporation was established in 1927, it was intended that it should foster co-operative credit, and it has, in fact, lent a certain amount to creameries who re-lend to their members. In general, however, the attempt to build up a system of co-operative credit has failed.

At a conference with representatives of employers and organised labour, the Minister for Industry and Commerce stated that industries which depend upon supplies of imported raw materials are confronted with difficulties of increasing perplexity. The unemployment problem is becoming more acute. On May 10th the number of people claiming unemployment benefit was 25,036, or 3,732 more than last year and 7,364 more than two years ago. The Minister urged manufacturers to formulate production programmes to maximise the number of workers in part-time employment by means of short-time or rotation working. Such devices would tend to increase costs of production, but this would be a lesser evil than an increase in whole-time unemployment. In so far as wages would be reduced, the Acts dealing with unemployment assistance would be amended to enable unemployment benefit to be paid to supplement the wages of workers in short-time employment. While devices of this kind to spread work over as many workers as possible are objectionable in normal circumstances, they are probably justified in the present emergency, especially since practically none of the industries concerned have to compete in export markets.

The annual report of the Sea Fisheries Association states that 1940 was a good year for the industry. The gross turnover of the Association amounted to £77,930, of which £43,452 had been paid to members in respect of catches disposed of on their behalf. Difficulty had been experienced in obtaining supplies of oil and in transporting fish to market, but the limiting factor on the development of the industry is the lack of demand among the Irish public for fish, the consumption of which is commonly regarded as a form of penance. During the last war the Irish fisheries expanded to a remarkable degree, but the post-war fall of prices and the renewal of external competition produced a slump from which the industry, which was in a condition of heavy indebtedness, has never fully recovered.

Egypt and the Red Sea Route

(FROM OUR ALEXANDRIA CORRESPONDENT)

April 10th

EGYPTIAN exports in 1940 totalled £28,322,000, compared with £34,832,000 in 1939. This decrease, however, is more apparent than real, for the British Government Cotton Buying Commission exports to Great Britain what cotton it can, and the remainder does not appear in the export figures, although its price has actually been paid and increased the country's purchasing power. If the value of the stocks in the hands of the Commission at the end of December were included, exports would have totalled about £40 millions, against imports of £31,378,000. Whereas cotton exports fell off by about one-quarter in value, exports of wheat, rice and sugar increased considerably, thanks to the special conditions created by the war. The whole export picture now presents a much more diversified aspect than in peacetime.

Although the presence of the Italians along the African coast of the Red Sea and the Indian Ocean had never proved a serious obstacle to navigation, even during the occupation of British Somaliland, their departure from this region will be very welcome, as the greater part of Egypt's foreign trade is carried by this route; much time will now be saved by the abolition of convoys, to say nothing of the probable reappearance of neutral shipping and the avoidance of trans-shipment at Mombasa—or even as far away as Bombay.

Belgium To-day

(BY A CORRESPONDENT)

May 20th

In spite of ruthless persecution by the Gestapo, or perhaps as a reaction against it, Belgian resistance is steadily increasing. The Germans recently suspended the 2,672 local councils which, with their centuries-old traditions of administrative and political liberty, were the centre of the opposition. The Gestapo have offered 1,000 marks to people indicating the names of those who commit or organise sabotage. Thirteen persons have been condemned to sentences varying between death and one year's imprisonment for helping British soldiers who hid in the occupied territory. Most cases, however, remain undetected.

News is very strictly censored, and listening to foreign broadcasts is prohibited under penalty of death. The German-controlled *Brüsseler Zeitung* unwittingly reveals various methods which the Belgians are using to irritate and hamper the Nazi invaders. The newspaper warns against persons who spread rumours "spoiling the good relations between the population and the German troops." Nickel coins have virtually disappeared, as people withhold them, fearing the Germans might use them for war material. The same paper protests that these hoarders are as bad as "the young hotheads who cut the German telephone cables or steal petrol." *La Pays Réel*, another paper, complains that teachers spend the greater part of their pupils' time in cramming them with "anglomaniac." "We are compelled to state," says this paper, "that Catholic schools in particular seem to specialise in this work of treason."

Wages have remained unaltered since May, 1940, though food prices have increased enormously. Potato prices, for instance, have risen by 50 per cent, cauliflowers by 150 per cent, carrots by 600 per cent and onions by 1,100 per cent.

The supply position, particularly with regard to potatoes and meat, is very bad. Private reports, dated from the beginning of April, state that the whole food position is deteriorating. In Brussels, there is a slaughter-house for cats and dogs, and every day they kill at least 100 animals. Mutton, if available, is merely dog flesh, but many people have had no meat for a very long time. It is understood that the German families in Belgium receive about three times as much food as the Belgians, and this has already resulted in riots in the Province of Luxemburg and in Antwerp. The situation is at its worst in Luxemburg, where, instead of the official ration of 15 kg. per month, only 3 kg. have been obtainable. The population ask what has become of the meat supplies of this province. For instance one week 9,616 kg. of meat were slaughtered at Arlon, equivalent to a weekly ration of 480 gm. net per head of the town's population; actually, however, only a small proportion of the inhabitants received their ration.

An agreement has, however, been concluded with Moscow, whereby a large quantity of wheat and fats will be delivered to Belgium in exchange for machine tools and heavy steel products during the next twelve months.

Owing to the lack of coal, iron and steel production is restricted, only twenty-five furnaces being in operation compared with forty-four in 1939. The steel syndicate "Sybelac" is authorised to export 3,000 tons per month to Holland, Denmark, Norway and Finland, payment being made through the clearing institute in Berlin. The use of oil and animal or vegetable fats by the paint and varnish industries, and the industrial use of sulphur, have been reduced to 30 per cent of the quantity used in the corresponding period of 1939. The use of oil and fats in the production of oilcloth, linoleum, polish and similar products has been entirely forbidden. The lack of raw material is felt very much in the textile industry, which works about thirty hours per week. Some 70 per cent of the output is taken by the Germans.

German Europe

Textile Rationing.—At the beginning of the war Germany (that is to say, the Old Reich) produced roughly 32 per cent of her total supplies of natural and artificial textile fibres from home sources. In 1940, Germany's total output of artificial fibres was officially estimated at 400,000 tons, of which 300,000 tons were staple fibre; or, home production was some 45 per cent. of her total supplies for the year 1938. A comprehensive system of rationing textiles was necessary to secure the needs of a huge army, and to eke out the meagre remainder among the civilian population. At present, the rationing system is a combination of (a) special permits for household linen, baby clothing, and working clothing, etc.; and (b) a card of coupons which covers all other textile goods, except hats.

Further economies in material and labour can only be effected by standardisation. The first attempt has already been made by the standardisation of working clothes; haberdashery and dress cloths will follow.

Rationing followed on the control of production, which began in 1934, and on the control of prices instituted by the general Price Stop of 1936. Clothing prices, in the index of the cost of living, whose total has remained practically unchanged since the beginning of the war, nevertheless increased by 14.7 per cent between August, 1939, and February, 1941. Increased costs of production because of short time working in textile factories, and the use of more expensive raw materials for artificial fibres, are said to be the causes. Rationing itself also caused an increase in prices. Consumers preferred the higher priced goods, and manufacturers, especially tailors and dressmakers, followed this trend by adorning cheap dresses with fancy haberdashery, solely for the purpose of increasing the price. At present a decree by the Price Commissar is in force, ordering the reduction of the profit margins of wholesale dealers and retailers, and aiming at a reduction of prices by 6 per cent.

The manufacture of textile goods is controlled by a special commissar. The raw material is allocated according to the so-called "index figures," which give priority to army orders; and quotas are allotted for civilian manufacture. Business between retailers, wholesale dealers, and manufacturers is organised on the basis of what are called "coupon clearing offices." At these offices, retailers open "coupon accounts" by sending in the coupons handed over to them by the customers. The procedure of restocking goods starts with the drawing of a "cheque" amounting to the number of coupons deposited. The coupon clearing office endorses the cheque, and sends it back to the retailer, who attaches this cheque to his order for the wholesaler or manufacturer. No goods may be delivered without this cheque.

Restocking is limited to goods which have been regularly ordered by retailers over a longer period; and the system is different for clothing manufacturers and for retailers. The accounts for manufacturers are worked out according to the type of cloth measured in metres; the retailers' account is generally worked out in coupons. The clothiers are thus restricted to specified goods, while the retailers can choose how they use the coupons, though the choice of retailers has recently been restricted also in the case of a number of goods.

European Textiles.—Germany's conquests and the subjugation of other European countries have not eased the textile supply situation. The requisitioning of raw materials in occupied countries was a short-lived advantage. Germany and Italy, the world's leading manufacturers of artificial textile fibres, especially of staple fibre, are thus faced with the need to organise the distribution of textile raw materials between all the different European countries. Most of the elements of the German system of control and rationing have been introduced in Continental countries—including the Neutrals, Sweden, Finland, and Switzerland. Italy and Sweden have confined their measures to standardising textile goods. France, Belgium, Holland, Denmark, Norway, Switzerland and Finland have introduced the coupon system. Rationing systems in the Balkan countries are not complete, and vary according to the general condition of the country.

The magnitude of the problem can be seen from the fact that before the war Continental Europe imported some 40 per cent of total world imports of cotton and some 45 per cent of total world imports of wool. Germany, Italy

and the occupied and dependent countries possessed, before the war, some 60 per cent of Europe's cotton spindles, or some 36 per cent of the cotton spindles of the world. In spite of the prodigious development of the manufacture of artificial textile fibres, a long-drawn-out war must lead to a cotton and wool famine in Continental Europe.

Meanwhile, Germany's war economy pursues a twofold aim; first, the increase of cotton cultivation in Italy and the Balkan countries, as well as a rapid increase in sheep-breeding for wool in Germany and in the Northern countries, and, secondly, the rapid development of the manufacture of artificial textile fibres, mainly staple fibre, in all European countries.

An interesting example is the "collaboration" between the German *Zellwolle Ring* and the newly formed concern *Rayonne Française*, comprising 20 French textile companies. A considerable programme of factory construction has been agreed upon; German patents will be used, and German experts will assist. The co-operative system for financing new factories, first used in Germany, will be employed in France. The shares of the new companies are divided between the whole textile industry, and they entitle each holder to a specified quantity of the annual output.

In Belgium a new federation has been formed to build factories for the manufacture of cellwool. The well-established rayon industry in Holland, represented by *Aku*, is increasing its capacity, and is building new capacities for making cellwool and casein wool; heavy exports to Germany are reported. In Norway, Sweden, and Finland a number of new factories and spinning mills are under construction. Denmark reports no plans for extending its textile industry; but Danish import duties on artificial textile fibres have been reduced for the benefit of German exports. In Hungary a company has been founded for the manufacture of cellwool; and from Roumania, Yugoslavia and Bulgaria the extension of the cultivation of cotton is reported. The set-up of the European textile industry, as contemplated for war purposes by Germany, thus becomes clear. The production of natural and artificial fibre is expanded by German collaboration where it is possible; at the same time, Germany aims at the control and eventually at a supply monopoly of artificial fibres for the whole Continent.

*

Iron and Steel.—After the collapse of France, German Government "trustees" took over the administration and reorganisation of the iron and steel industry in Luxembourg and Lorraine. In April, the "trusteeship" of these concerns was transferred to German firms, which will operate the plants until the question of ownership is definitely settled. The *Hermann Goering Werke*, the *Vereinigte Stahlwerke*, the *Kloekner AG* and a number of other German concerns take over all the Luxembourg and Lorraine iron and steel works. The iron ore mines, however, remain under the direct administration of the commissar for iron ore mining.

The cartels and syndicates in the German iron and steel industry have been prolonged until June 30, 1942. The most important change is the incorporation of the iron and steel works in Luxembourg and Lorraine. The plants in Polish Upper Silesia, in the Sudetenland and in Bohemia and Moravia had been incorporated earlier.

Definite quotas have been allotted to the Luxembourg works, but in Lorraine no quota decision has been made. It is said that the works were neglected under French administration, and the German trustee-concerns have deferred this decision until they know more about the capital expenditure necessary for the modernisation of plants.

*

Wages Rates in Industry.—During 1940 average wage rates in industry remained unchanged at Rm. 0.843 per hour. Wage rates in incorporated territories were adjusted to the German standard; in Bohemia and Moravia rates were increased by 40 per cent; in Luxembourg, and Alsace-Lorraine the increases ranged from 45 per cent to 80 per cent; Polish workers employed in Germany are paid the same rates as German workers, but a deduction of 15 per cent is made because of the lower standard of living in Poland.

THE BUSINESS WORLD

Outlook for Equities

O PINION on the wartime prospects of ordinary shares has boxed almost the entire investment compass in the twenty-one months during which the war has been in progress. At the outset, naturally, it was widely assumed that the Stock Exchange history of the last war would repeat itself with only a few minor modifications. The necessity for issuing large blocks of new Government securities, as part of the process of financing war expenditure, was expected to bring the era of cheap money to an end and produce an appreciable rise in medium and long-term interest rates. Some measure of inflation, also, was considered inevitable, and ordinary shares were expected to have the same "hedging" value as in Great Britain during the last war and in some other countries subsequently. It was taken for granted that the Government would impose a stiff excess profits duty, but that the untaxed margin of war profits would be wide enough to leave ordinary shares with significant "equity" possibilities under a regime of rising prices and earnings. The need for selectivity in choosing individual shares was stressed, but the principle that war tended to emphasise, rather than to detract from, the investment appeal of ordinary shares, as such, was unquestioned.

When Hitler overran Europe in the spring of last year, opinion swung violently to the opposite extreme. The fall in equity share prices in May and June, 1940, was catastrophic, and it reflected, not only the view that ordinary shares were far more vulnerable than had been supposed to "psychological risks" when military matters were going ill, but also the realisation that Government finance was not likely to be on the same pattern in this war as in 1914-19, and in particular that EPT was to be used to frustrate capital appreciation. From the last days of June, 1940, onwards there was a steady recovery in ordinary share values, but it was based on a decidedly moderate amount of buying and suggested the passing of the investors' worst fears about the immediate course of the war rather than any fresh swing of opinion in favour of equity shares generally. From, broadly, the beginning of 1941 to the present time, market sentiment has gradually come to an intermediate position between the two extreme views. There have been periods, lasting usually for a few weeks rather than days at a time, when prices have been slightly rising or equally slowly declining, and rather longer periods when the market has been entirely stagnant. The market still wears a "disillusioned" appearance, and the best proof of the somewhat perfunctory nature of demand is that, although floating supplies of stock are in most cases so moderate that a relatively small amount of buying would set prices moving upwards, that buying is rarely forthcoming.

It can, however, be argued that, provided investors are prepared to abandon all preconceived ideas of the rôle of equities in wartime, sufficient material is now available for a revised estimate of ordinary share prospects, and that that estimate is on the whole rather more favourable than current market conditions would imply. The unknown factor in all contemporary calculations is, inevitably, the course of the war itself. The behaviour of the market in the face of the news of recent British reverses goes some way to suggest that the purely psychological factor counts for less than it did a year ago; the markets have become more shock-hardened.

What is more important, however, in any re-assessment of equity share possibilities is the fact that the domestic environment in which investment of every kind will be carried on for the war's duration can now be seen in clearer focus than at any time since hostilities began. The Government's policy of a closed capital market is firmly established, and, so far as the Stock Exchange goes, it is producing all that the authorities could have expected of it. Interest rates have not risen, and the trend of gilt-edged prices is distinctly firm. There are still, perhaps, one or

two minor loopholes in the control, and one great gap—the absence of a Government wages policy—which, if it were not closed, might ultimately upset the Chancellor's Budget balancing in the widest sense, and threaten gilt-edged values with depreciation as a result of an inflationary situation. That, however, is a risk which the market does not take seriously at present. With this reservation, it may be assumed that investors must reconcile themselves to the prospect of obtaining an income of only a fraction more than 3 per cent on the longest-dated British Government stock, if they are not liable to income tax; with a net yield of little more than 1½ per cent, if they pay tax at the standard rate on the larger part of their income, and of 0.075 per cent on the highest layer of their income, if they are liable to surtax at the maximum rate. It is the Treasury's duty, in the national interest, to ensure that these income figures are not increased, but rather reduced, if possible, during the entire war and post-war period.

To many investors, however, ranging from the large institution, with more or less inelastic contractual liabilities, down to the private individual living, wholly or partly, on investment income, prevailing gilt-edged rates are low enough to involve possible hardship. For such investors, the appeal of equity stocks is not as a hedge against inflation, or as possible source of ultimate capital appreciation, but as a "mixer," to be added to a balanced security portfolio to increase its average yield. Investors now know the worst that EPT can bring. If they are conservative, they will leave the 20 per cent post-war repayment factor entirely out of their calculations, but they may reflect that, if the Government is taking the whole of increased wartime company profits, it cannot take more. Investment in ordinary stocks then becomes a problem in selectivity. If all equities are, in fact, fixed-interest stocks—or, more

correctly, maximum-interest stocks—for the duration, the investor's task is to select those whose yield at market prices is generous enough, compared with the yield on gilt-edged, to make their purchase worth while, and whose prospects of continuing to earn something like current profits are reasonably good.

In practice, that may involve the avoidance of shares in companies operating in industries whose raw material supplies or markets are likely to be circumscribed by rationing or Limitation Orders, particularly trades embraced in any present or future "Lyttelton plan," unless investors have special reason for believing that their profit-earning capacity is, nevertheless, reasonably assured. This, admittedly, means the exclusion of many equities whose peacetime market standing was of the highest. But it leaves an impressively long list of ordinary stocks in companies working either directly for the war effort or producing goods or services deemed indispensable even in wartime. The table in the next column gives a very brief selection of stocks which satisfy these criteria and yield not less than 5 per cent.—which investors may, perhaps, regard as a convenient test of "worth-whileness."

The majority of the companies in this list have published recent reports, covering operations in a period of twelve complete months since the war. A certain reduction in future divisible earnings may result from the fact that EPT

was charged, in the latest period for which results are given, at an average rate of less than 100 per cent. In wartime, nothing is certain—including the duration of the war itself. Barring unforeseen eventualities, however, the prospect that companies like those suggested will continue to remunerate their shareholders at a satisfactory rate seems reasonably good. Generally, the "yield differential" between fixed-interest and equity securities is wider now than what would have been considered normal, in the light of experience over a good many years before the war. Given reasonable stability in market dividends, the gap may well tend to contract rather than expand in future months.

American Banks and Defence

THE American banking system is playing its full and important part in the defence programme which now dominates the economic life of the United States. The sudden acceleration in the activity of the armament industries which followed, first, the Allied purchases of war materials, and then the setting into motion of the United States Government's own huge re-armament programme, reacted directly on the banking situation. In the first place, the industries and trades directly and indirectly affected by the vastly increased expenditure on armaments have increased their borrowing from the banks. This increased utilisation of bank credit by the defence industries was facilitated by the passage of the Assignment of Claims Act last November, a measure which permits borrowing on the assignment of Government contracts. In the second place, the banks have given their full—some might say excessive—support to the financing of the Government deficit by taking up a steadily rising volume of U.S. Treasury paper.

Over the twelve months to the end of last February the loans of the weekly reporting member banks of the Federal Reserve system increased from \$8,520 millions to \$9,408 millions; the increase in this item became particularly pronounced from the end of August. The increase in commercial loans of reporting member banks in 101 leading cities between the end of August and March 26th last amounted to \$950 millions, or about 20 per cent. A recent survey conducted by the American Bankers' Association shows that, at the end of 1940, about one-fourth of the defence loans of 196 large commercial banks in the United States were secured on the assignment of Government contracts, indicating how large a part the Assignment of Claims Act has played in the recent expansion of bank credit in the United States. The increase in the same reporting member banks' holdings of U.S. Government securities over the twelve months to the end of last February was from \$11,281 millions to \$13,138 millions.

The technical reserve position of the banking system was fortunately more than adequately prepared for this expansion in the demand for credit. This may be seen from the fact that over the twelve months in question the excess reserve balances of member banks of the system actually increased from \$5,692 millions to \$6,534 millions. This was, of course, due in the main to the continued influx of gold, which created reserve balances at a faster rate than they were being utilised by the increase in deposits. If a wider retrospective glance is taken at the distribution of assets in the American banking system, it is interesting to note how fundamentally this picture has been changed over the past twelve years. The total of loans and investments of all member banks, which stood at \$35,934 millions at the end of 1929, fell steeply in the depression period, but has been gradually recovering, and at the end of 1940 passed once again the 1929 total, reach-

ing \$37,126 millions. But, over the intervening twelve years, the loans included in this total had fallen from \$26,150 millions to \$15,321 millions, while the investments had risen from \$9,784 millions to \$21,805 millions. Long before British banks were called upon to face the problem of the dominance of investments over loans and advances, the United States banking system had had to adjust itself to this phenomenon.

The existence of huge excess reserves gives corresponding scope for an uncontrolled expansion of banking credit in the United States, and this potential is all the greater for the absence of the traditional corrective of an outflow of gold which can no longer operate under the conditions of to-day. It must not be assumed, however, that the expansion is, in fact, taking place in response to uncontrolled and uncoordinated individual demands for credit. In the first place, the Federal Reserve authorities are fully aware of the danger of uncontrolled expansion of credit for which the technical reserve position of the system gives such immense scope. Those fears were responsible for the message to Congress sent by the Federal Reserve Board in December last, in which formal requests were made for measures to neutralise this inflationary potential. Among suggested remedies were the increase of member bank reserve requirements and a suggestion that the budgetary deficit be covered to a larger extent by raising taxation, or at least by borrowing from the public in preference to direct borrowing from the banking system.

It is evident, however, that the problem of maintaining adequate control over the inevitable expansion of bank credit in the United States cannot be solved by the mechanistic approach of tampering with statutory reserve ratios. The demon of inflation will have to be exorcised in the United States, as in the belligerent countries, by control focused not on the volume of credit, but on its distribution and use, and by supplementing this by direct controls on the production and distribution of goods and on civilian consumption. There are indications that this realistic approach to the problem is, in fact, being made in the United States. It may, for example, be seen in the proposed restrictions that are to be placed by the Federal Reserve authorities, acting with Congressional consent, against the grant of bank credit to finance instalment sales. Another illustration of this more direct technique in the control of bank credit is provided by the mechanism recently set up to maintain contact between the Federal Reserve System and American industry. For some months past, the Board of Governors and the Federal Reserve Banks have been co-operating with the Defence Contract Service, which is a unit of the Office of Production Management, in aiding producers and the Government to make and finance defence contracts. An official of each reserve bank has been designated as Federal Reserve Con-

tract Officer, whose task it is to advise banks, contractors and prospective contractors on the financial problems of the defence programme. In particular, these officers put prospective industrial borrowers in touch with local banks and other lending agencies, and where an industrialist's needs cannot be satisfied by his own bankers, the Defence Contract Officer can place him in touch with the Federal Reserve Bank of his district or with the Reconstruction Finance Corporation.

The service offered by the Contract Officers and their organisation goes well beyond the provision of credit assistance. With each of the Federal Reserve Banks is to be found a District Contract Service, which undertakes some of the work now done in Great Britain by the Ministry of Supply. The service is staffed by men of engineering and industrial experience. Their task is to bring together primary contractors and sub-contractors able and willing to assist in the defence programme and to furnish small and medium-sized local producers with the wide variety of

information needed to fill in Government orders for defence goods. They act as a link between the Government's purchasing agents and local industry. No doubt, as the war progresses and as the calls made on American industry increase, the whole of this contracting organisation will have to be centralised and given more co-ordinated form, and probably greater powers of compulsion over industry, than it commands to-day. But at least an admirable start has been made in fitting the United States banking system into the vast and complicated pattern of the American defence programme. The system has within itself the seeds of all the elasticity which the fulfilment of that programme will demand. What is more important, there is every indication that the United States authorities have fully grasped the principles on which the control of the distribution of credit must be based, and have already established the liaison system between banks and industry which in this country emerged in highly empirical form after some months of actual war.

Finance and Banking

Half-Year End Prospects

There has been nothing in the experience of the money market during the past week to hint at the approach of the turn of June. Short loan conditions have been exceptionally easy, and far from going slow in their purchases of bills in preparation for the June 30 balance sheets, the banks have this week been keen buyers, and unable to satisfy their requirements from the market. The market obtained a 34 per cent. allotment at last week's Treasury bill tender, and has not, therefore, been a ready seller, especially as it is replenishing portfolios which were somewhat depleted by the sales made to official quarters in the recent phase of stringency. Such is the abundance of loanable resources in the market that the prospects for the turn of the half-year can already be envisaged as exceptionally easy. The market appears to have retained a fair amount of end-of-June bills, and in any case calling by the banks is not expected to be on any considerable scale. The accentuation of ease in the short-term credit position has been followed by a greater demand for bonds and other short-term securities. The available volume of these is being further curtailed by the Australian Conversion operation. The recent rise in the prices of "shorts" has led to some expectation that the next series of National War Bonds, of which details should be available before the end of this month, may carry interest at a lower rate than the 2½ per cent. of the present series. The Bank return shows the ease of money to be connected with Government disbursements outrunning revenue, plus the receipts from borrowing, and thus encroaching further on public deposits at the Bank of England. These, already at the low level of £10,929,000 last week, have further fallen by £3,889,000, and last Wednesday stood at the almost unprecedented figure of £7,040,000. Bankers' deposits rose by £802,000 to £122,661,000. The benefit of net Government disbursements to the volume of bank cash would have been greater but for a further expansion of £1,736,000 in the note circulation carrying its total to the new record level of £637,167,000.

India's Sterling Assets

The ease with which the Indian authorities completed the repatriation of the sterling stocks recently vested in this country has led to reports that this operation must be regarded as the prelude to a repatriation of the India 3½s which have been redeemable on 12 months' notice since 1931, and of which some £87,000,000 is outstanding. It is difficult to find justification for this reasoning in the published data on the Indian sterling reserve position. The sterling balances and securities held in the banking and issue departments of the Indian Reserve Bank reached £164,200,000 in the return dated March 21, 1941, the last before the effects of the repatriation impinged on the position of the central bank. By March 28, the total of these sterling reserves had fallen to £108,500,000, the fall of £56,000,000 being the approximate measure of the vested sterling securities held in Great Britain. Since that date, the sterling holdings of the Reserve Bank have been gradually recovering, but the process has been far too slow to

hint at the imminence of another massive repatriation of sterling debt. The return dated May 30 showed the total sterling reserves of the Reserve Bank at £115,700,000, an increase of just over £7,000,000 since the depletion caused by the last vesting order. At this rate of accumulation, some months will have to elapse before another such operation can be attempted. The sterling reserves cannot be denuded below a figure of about £100,000,000, especially as the diplomatic situation in the Far East, together with the shipping position, may between them endanger some of the factors on which the reinforcement of India's sterling reserve position has been built up.

Anglo-International Bank's Capital

The winds of 1940 blew harsh and unkindly for international banking and especially for a bank whose business was by tradition so closely bound with the Continent of Europe as that of the Anglo-International Bank. The report of that institution for last year fully reflects these difficulties. A net loss of £28,630 was incurred, resulting wholly from the realisation of assets. It was added to the debit at profit and loss account, carrying this item to £611,238. The business, which since the beginning of 1941 has been operated by the British Overseas Bank, is being gradually contracted and preparations are being made for a partial return of capital. The chairman's statement which accompanies the report says that, in view of the improvement in the liquid position of the bank and the restriction of its active business, the directors have decided, as soon as certain liabilities can be dealt with, to approach the Court for sanction to a reduction of capital and the return of part of it to shareholders. The latest balance sheet shows this liquefying process already in operation. Balances with bankers in London have risen from £100,000 to £140,000 and British Government securities from £389,405 to £489,941. The main commitments of the Bank are in territories controlled by the enemy. The assets in Germany and countries occupied by Germany at the end of 1940 totalled £518,226, compared with £572,302 a year previously. Assets in Hungary, Yugoslavia and Roumania were £325,015, against £468,167. The value to be attached to these assets is obviously problematical in the extreme.

Argentine Exchange Control

A considerable relaxation in the severity of the Argentine exchange control system has been announced this week. The existing mechanism of that system is apparently to remain intact. The central bank and the Exchange Office will continue to dictate official buying and selling rates while their monopoly of official exchange business remains undisturbed. Trade with the sterling area will continue to be financed through sterling special accounts. The relaxation of the control is to be effected by abolishing the import permit system for a number of goods which normally comprise about 80 per cent of imports into Argentina. These

permits have recently been granted with increasing liberality, but their complete abolition in respect of so great a proportion of Argentine imports will no doubt be followed by both a simplification and expansion in that trade. The decision of the Argentine authorities reflects the considerable improvement which has occurred in the reserve situation. Between the beginning of this year and April 30th, the last date for which a return of the central bank is available, the holding of gold and foreign exchange abroad has risen from 258,000,000 pesos to 302,000,000 pesos, while the holding of gold in Argentina has remained

unchanged at 1,071,000,000 pesos. The strengthening in the reserve position is largely due to an improvement in the balance of trade with the United States, but it is probable that it also reflects some expansion in the amount of sterling held for Argentina in special accounts in London. The disparity in the experience of the South American republics regarding their sterling reserves is so great that it seems unfortunate that it has hitherto proved impossible to merge them all into some composite exchange clearing scheme on the lines of that evolved with the creation of Central American accounts.

Investment

Equities and the Price Level

The stimulus required to release the investment demand, which it was felt must be accumulating despite the savings campaigns, has been provided by the initiative taken in Syria, and Monday of the week now ended saw the most active session for some time. Volume has tended to fall off as the week progressed, but it is still appreciable, and at the time of writing there has been no considerable reverse. The actual movements have been much as expected, namely strength in the Funds and in shares and bonds immediately concerned with the theatre of war, coupled with a selective buying of industrials. It was less clear that miscellaneous foreign bonds would be bought, while the sharp recovery in the developing kaffirs is mainly a reflection of optimism in the Union. The basis is rather wider than might have been expected, but it can all be brought within the terms of a search for yield, which is the main theme of an article on page 795 of this issue. The force of the movement will be determined in large measure by developments in the politico-economic field, and, in particular, by whether a stand is in fact to be made to implement Sir Kingsley Wood's undertaking that prices and wages are to be kept from rising. Every rise in prices will tend to call for additional taxation and also to raise the cost of living, thus providing a double spur to the investor to seek higher yields. Whatever may happen to wages and costs, every effort will be made, by control of retail prices, to minimise the effect on the purchaser, so that the prospects of margins in the consumer trades being maintained, even on the reduced turnover, are none too good, and it is just in these that the EPT cushion is small or non-existent. In the war industries—in the widest definition of that term—the cushion is likely to prevent a fall in earnings, even if the higher rate of tax causes a modest decline in payments, so that, even with EPT 100 per cent and heavy war damage payments to be faced, the present trend favours the war equity. This factor can only be increased in the measure that the stabilisation policy fails of accomplishment.

Canadian Taxation

No final decision appears to have been reached as to the fate of the new 15 per cent tax on dividends and interest on Canadian securities paid to non-residents. The statement of Mr. J. L. Ilsley, Dominion Finance Minister, if correctly reported, suggests strongly that something like the *status quo ante* the Budget announcement is to be restored. The suggestion is that the Federal Government has yielded to pressure from the provinces, of which Alberta and Ontario were suggesting non-co-operation, if exemption of Dominion and guaranteed loan interest from the tax were not extended to them. It is understood that, even if the tax is retained, this concession will be granted. In consequence, the higher impost would apply principally to interest and dividends paid by commercial enterprises. Conversely, it is said that, even if it is decided to go back to the old 5 per cent tax, this will in future be due on payments made in foreign currencies, including, of course, sterling. The matter is one of considerable interest to British holders not only of sterling Canadian securities, but also of non-guaranteed Canadian railway loans and such stocks as International Nickel. The gain to the Dominion Government in taxing British holdings would be a gain in sterling only since, by reducing their payment of Canadian

dollars to British holders, they would diminish *pro tanto* the Government's ability to meet its bills in that currency. The position is, of course, very different for holders in the U.S.A. While no figures are readily available of total holdings outside Canada in various types of stock, it seems open to question whether it would be worth while taxing only holdings in commercial concerns, the more so since discriminatory taxation, usually undesirable, is especially so among those who are attempting to co-operate over a large field.

* * *

Rubber and EPT

It is rather curious that just at the time when rubber plantation companies are protesting against their exclusion from the benefits given to mining companies, with regard to EPT, the shares should be enjoying the first period of activity for a very considerable time. The companies are profiting by steady and heavy demand for rubber at a high price, which makes possible increased dividends in many cases, despite a rather unfavourable base period for EPT. The anxiety of the managements is addressed to the future when, they claim, "all out" tapping will have exhausted their trees, without adding appreciably to their net revenue, while they fear that reserve stocks will last a long time—the longer for the new agreement—so that prices will be depressed. They claim that out of the current increase in revenue, before tax, they should be permitted to retain sufficient to replant exhausted areas. The fear of exhaustion sounds a little odd, if it is intended to refer to existing conditions, for exports are only fixed at 100 per cent of the quotas. That amount is certainly not being shipped, and there is every prospect of a reduction in the percentage. In any case, if the danger is as great as is feared, any additional funds would be better employed in providing for replanting, either with bud-grafts or selected seed, or, perhaps, best of all with part of each, than in increasing distributions. It is, however, relevant to suggest that the industry possesses a reserve for whose use shareholders ought to press, in the radical reorganisation of its management. Ever since the days of the post-1921 movement for "rationalisation" of industry, grouping has been urged upon the plantation industry. It would save in directors' and agents' fees; permit of the better organisation and improve the status of plantation labour forces; economise in matters of finance, and, in general, raise the standing of the industry. It would be regrettable if an industry, which already enjoys Government support for a restriction scheme, were granted further concessions before it had done its utmost to reorganise. But, if a genuine tightening-up were carried out, a part of the resultant benefit should certainly accrue to the companies to the extent necessary to offset any exceptional exhaustion of capital.

Company Notes

Union Castle Earnings

Even on the strictest analysis of Union Castle earnings for the year to December 31, 1940, the resumption of an ordinary dividend, with a 5 per cent payment, is generously covered. Total receipts are shown by the full accounts to have jumped from £347,176 to £831,617, after depreciation and after allocation of £50,000 to tax reserve. The directors

indicate that the rate of depreciation was increased during the past year to the full amount permitted under the war-time scale of the Inland Revenue authorities. Whether or not the total is adequate, £350,000 against £100,000 is transferred to fleet replacement account, bringing the total of this fund, including surplus over book value of tonnage lost and credit on Government tonnage replacements account, to a balance-sheet value of £1,202,511, against £100,000. After estimating as charges against equity earnings the company's fleet replacement provision, the allocation of £50,000 against nil to staff pensions fund and of £52,981 against nil, being the amount written off investments, the 5 per cent dividend is covered by a rate of 8.7 per cent and the carry-forward increased from £188,183 to £238,977. Clearly, the profits position of the company has been revolutionised in the past year. For the current year, as the deputy chairman, Sir Ernest M. Harvey, points out in his speech, circulated with the report, higher taxation and the fact that the company will for the first time feel the full weight of EPT—there were certain non-recurring credits in the 1940 accounts—must trench severely on the surplus available for the ordinary stockholder. The balance sheet shows a decline in fleet, at cost, of more than £2,000,000 to £9,011,705, due in part to the loss of certain vessels. At the outbreak of war, the company had completed an important programme of new construction, re-engining and conversion to oil burning, which contributed to the good result. It is already clear that the replacement cost of these vessels at the close of hostilities will be considerably in excess of normal depreciation standards. The supreme consideration remains that of provision for fleet replacement, and the adequacy of the large provision made cannot be assumed in the absence of full information on the depreciation position. The £1 ordinary stock, at 13s. 3d. ex dividend, offers a yield of £7 10s. 11d. per cent.

* * *

Cable and Wireless Dividend

In view of the strength in recent weeks of the ordinary stock of Cable and Wireless (Holding) it is, perhaps, not surprising that the mere maintenance of the dividend at 4 per cent should have resulted in a fall. No figures are yet available, so that the relation between payment and earnings is a matter of guesswork. It is no exaggeration to say that in well-informed quarters an increased dividend was not expected, and it will hardly be surprising if the full story is rather more encouraging than the dividend. The company's revenue from the investments of the old Cable companies will probably have declined, while that from the Marconi interest should have increased. The payment actually received from the operating company, Cable and Wireless, is unchanged at 4 per cent, of which 2½ per cent is a final. This company will have lost commercial traffic through Government control, but it was commonly assumed that the extension of cheap messages, coupled with a further growth in official business, would mean a larger return before taxation. There is as yet no reason to revise this estimate, and it seems very probable that the clue to the modest size of the payment lies in higher taxation. Indeed, a caveat to that effect was contained in the report of last year. The ordinary stock of the holding company fell two points on the announcement to 64½, at which it gives a return of some £6 8s. 6d. per cent subject to tax.

* * *

Press Profits

Recent results of a varied selection of newspapers indicate that war conditions, in themselves, have had no disastrous effect on profits. The inevitable curtailment in size has, in many cases, enabled economies to be made, while circulations have usually been maintained and advertisement rates increased. The following table analyses earnings and distributions for five groups of newspapers over the past three years. In three cases, those of the *Sunday Pictorial*, *Allied Newspapers* and *Associated Newspapers*, earnings are above the level of two years ago. *Allied Newspapers* record a rise in total profits and, after all expenses, including taxation, equity earnings are up from £144,829 to £174,275. The dividend, which was reduced from 6 to 5 per cent in 1939, is again raised to 6 per cent. The *Daily Mirror* has suffered from the weight of EPT on its own increased earnings and smaller dividends from subsidiaries. Thus profits, after tax, are down from £404,588 for the year to February 28, 1940, to £288,835 last year. The 10 per cent ordinary dividend, reduced from 15 per

cent, is only paid by withdrawing £50,000, previously allocated to contingencies. *Illustrated Newspapers*, issuing luxury products, whose experience has been totally different from that of the general run of daily newspapers, suffered a further decline in profits from £107,341 to £37,724. In general, taxation apart, the following results imply that the war has not made the production of the daily newspaper an unprofitable business.

Company	Total Profits	Earned for Ordinary		Dividend	Present	
		Amount	Rate		Price	Yield

1940	404,588	226,508	16.9	15	0/3	8 0 0
1941	288,835	89,544	6.4	10		

* After depreciation. † After tax, but before £25,000 to tax reserve for *Sunday Pictorial* in 1940 and 1941, and for *Daily Mirror* Newspapers in 1941. ‡ Amount and rate earned on deferred capital. § £1 ordinary shares.

Considerable anxiety must attach to the problem of maintaining supplies of newsprint, but here the balance sheets in question have very encouraging information to convey. *Associated Newspapers*, it is true, show a fall in stocks from £403,000 to £233,000; the *Daily Mirror*, however, secured an increase from £171,567 to £292,939 and *Allied Newspapers* from £102,000 to £211,000. The *Sunday Pictorial* also realised a small improvement on the year. Present yields show a wide range from some 7.27 per cent for *Associated Newspapers* to some 13.33 per cent for the *Sunday Pictorial*.

* * *

Rubber Trust

It is hardly surprising that income from dividends of Rubber Trust declined moderately in 1940 from £193,880 to £189,798. The 10 per cent dividend paid in the three previous years is maintained, but, as in 1939, equity earnings, amounting to 8.2 against 7.7 per cent, do not cover the distribution. A small increase in the carry-forward from £95,601 to £96,011 is achieved through making a draft of £15,000 on dividend equalisation reserve, against £40,000 in 1939, and crediting £10,000 from taxation reserve no longer required. Since last year's draft has reduced the total of the dividend equalisation fund to £5,000, it is clear that ordinary payments can no longer be maintained from this source and that stockholders may face a reduction unless income from dividends shows a definite improvement. The market value of investments at December 31st last stood at £2,812,398 against £3,171,295 in the balance sheet. No important change has taken place in the distribution of holdings, and the depreciation is at

(Chief Office): 1 Cornhill, E.C.5

present fully covered by the total of reserves and carry-forward of some £600,000. The address of the chairman, Mr. H. J. Welch, circulated with the report, provides a detailed account of the vicissitudes of the rubber and tea producing industries in 1940. He points out that, despite loss of markets throughout Europe, the steady absorption of the Allies and the purchase operations of the United States resulted in a continuous rise in the exportable percentage of rubber. The tea position remains more precarious, depending as it does on the possibility of providing shipping facilities. Consumption has been decreased both by rationing and by the loss of the European and other markets, which absorbed some 83 million lbs. annually. Fortunately, Rubber Trust has appreciable holdings outside the plantations industries. The £1 ordinary stock, at 25s. 6d. ex dividend, yields £7 16s. 10d. per cent.

J. Lyons Accounts

The full accounts of J. Lyons for the year to March 31st last, as usual, convey a minimum of information. The decline in profits, struck after all deductions, except directors' fees, from £1,024,623 to £896,710 was already made known by the preliminary statement discussed in *The Economist* of May 31st. After the usual preference allocations, the 20 per cent dividend is covered by 22.4 against 33.0 per cent, leaving the carry forward rather higher at £320,990 against £298,998. The following table analyses the distribution of profits over the past three years:—

	YEARS ENDED MARCH 31		
	1939	1940	1941
Profit	£1,025,690	£1,024,623	£896,710
Directors' fees	13,710	13,171	13,110
Prof. dividends	462,353	462,353	462,353
Prof. ord. div.	28,000	28,000	28,000

Ord., "A" ord., and proportional profit shares:—

Earned.....	521,627	521,099	393,247
Paid.....	417,661	371,255	371,255
Earned %*	30.2	33.0	22.4
Paid %*	22.1	20	20

A.R.P. Provision 100,000
Carry forward 149,154

* On ordinary and "A" ordinary; each proportional profit share ranks for one-fifth of dividend on an ordinary share.

The most encouraging feature of the accounts is the rise in stocks of £418,900 to a balance sheet total of £3,049,375. No doubt an important proportion of the increase in value, and possibly the whole, is to be explained by higher prices, but even stability is highly satisfactory at a time when shortage of the raw materials of catering must be presumed to be the management's most serious handicap. The increase in debtors from £1,098,871 to £1,442,628 appears to reflect

the influence of war damage claims and approximately corresponds to the fall in the balance sheet value of fixed assets, after allowance for depreciation, from £11,504,374 to £10,948,847. General reserve, as before, stands at £2,000,000. Probably the loss through bombing of certain premises will not be an unmixed misfortune at a time when shortage of supplies favours the closing of premises. The £1 ordinary shares, at 79s. 4½d. ex dividend, yield £5 os. 9d. per cent.

ICI Taxation

In an article which appeared in *The Economist* of May 24th an error was made in stating that the accounts of Imperial Chemical Industries did not reveal the full tax provision. This was shown in the Consolidated Income Statement—but not in the tabular form of that statement—as £9,779,867, being income-tax, British and Foreign, EPT and NDC of the parent company and 111 subsidiaries. The two taxes last mentioned absorbed £3,100,000 more than in 1939. We take this opportunity of apologising to the company and to readers for the mis-statement and the resultant error.

VOC Setback

The decline in gross income of VOC from £7,114,798 to £6,623,054 for the year to December 31, 1940, is the first break in the upward trend of receipts since 1935. Net profit, before tax or depreciation, amounts to £2,503,435, against £2,900,459. The setback arises from appreciation of the local currency and reduction in output, sold under contract in terms of the dollar. The tax provision has been reduced from £850,000 to £696,000, but, with depreciation some £15,000 higher at £783,769, equity earnings are reduced, for the fourth year in succession, from £1,281,984 to £1,103,666. Thus, the rate of earnings, at 15.3 against 18.4 per cent, fails to cover the dividend on ordinary and participating preference capital, maintained at 16½ per cent, and the carry forward is substantially reduced from £243,193 to £132,302. No statistics of output or shipments are available, but the directors indicate that capital expenditure, which has declined from £817,551 to £357,034, has been limited to the supply of routine requirements. The balance sheet rise in materials from £1,161,375 to £1,563,623 is stated by the chairman, in his speech circulated with the report, to be represented partly by additional purchases as well as by rising prices. Investments at cost, which have risen from £712,094 to £1,127,235, are slightly below the market value of £1,216,136 at the date of the balance sheet. The rise is accompanied by a drop in cash items from £953,488 to £476,345. On the liabilities side of the account, taxation reserves amount to £1,366,000 out of a total of £2,294,000 for creditors, taxation reserves, bills payable and other liabilities. The 13s. 4d. ordinary shares, at 27s. 6d., offer a yield of £8 3s. 8d. per cent.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

AFTER a poor close before the week-end, due mainly to the unpromising news of the Middle East military situation, sentiment improved strikingly on Monday on news of the British invasion of Syria. Gilt-edged issues, which had been notably depressed on the previous Friday, led the recovery which extended to all sections. The industrial market enjoyed a few good gains and the undertone remained firm. The foreign bond market was on the whole buoyant and more interest in home rails was exhibited than in the previous week.

Before the week-end, losses of ½ in the gilt-edged market were common, being suffered by 2½ and 4 per cent Consols, 3½ per cent War Loan and Local Loans. A number of Indian issues lost ¼ and 3½ per cent Conversion ½. The striking recovery during the current week was most marked among undated issues and

the revival of demand found many jobbers short of stock. At the beginning of the week, the rise was led by 3½ per cent Conversion with a gain of ½, followed the next day by an improvement of ½. Four per cent Funding gained ½ on Tuesday, many other issues rising by ½ and the upward trend was continued in midweek. Both 2½ per cent Consols and 5 per cent Conversion gained ½. In the foreign bond market, Egyptian issues were sold following the bombing of Alexandria, Egyptian Unified losing 1½ at the beginning of the week and Egyptian 3½ per cent 1890 preference 2 points. French railways lost ground as dissatisfaction with the Vichy attitude increased. Both the Midi and Orleans issues were 3 points lower on Tuesday and Seine 4½ per cent bonds dropped 5 points on the same day. Japanese issues consistently improved and there was some support for Chinese 5 per cent stock of 1912. On Tuesday, Austrian 4½ per cent stock jumped 2 points.

A substantial improvement took place in home rails. The ordinary stocks con-

tinued to lose ground in a small way, both before and after the week-end, but on Wednesday Great Western ordinary improved 1½ points and LMS ordinary ½. The senior issues were firmer, although LMS and Great Western debentures were both lower on balance and London Transport issues were also out of favour. Among foreign rails, Canadian Pacific ordinary was in demand and the preference issues on Monday reversed a pre-week-end loss of ½.

Price movements in the industrial market were irregular and, after Monday's improvement, business was not on a large scale. The motors and aircraft section found favour, Dennis, Austin, Morris and Rolls-Royce all gaining moderately. Among breweries, Bass, Barclay Perkins, and Ind Coope were offered and interest was rather slight. Electrical issues remained in favour, W. T. Henleys, Callenders Cable, and GEC all gaining a few pence, but buyers were discouraged by the stability of the Cable and Wireless dividend, and the

(Continued on page 801)

Industry and Trade

The Cement Report

The report of the Committee on Cement Production, set up on January 4th, has now been published (Cmd. 6282). The Committee was asked "to consider and report to the Minister of Works and Buildings whether having in mind the probable demands for cement in meeting current needs and in post-war reconstruction, and taking into consideration economic, strategic and other factors affecting the allocation of cement, new cement works should be established, existing ones extended or old plants modernised, and if so, what general considerations, financial, geographical and economic should apply." Since the quantity of cement used during the war is limited by the labour force available in the building and civil engineering industries, the Committee reached the conclusion that consumption is not likely to exceed 6 million tons per annum, or to attain last year's level of 6,764,049 tons until after the war. And, as the cement industry is in a position to produce at the rate of 7½ million tons per annum with its existing labour force, the Committee is of the view that supplies of cement will be ample to meet all needs, including exports, during the war period; last year's shortage was not general but local, due to the temporary coupon system and to transport difficulties. With an adequate supply of labour,

it is estimated that the industry will be able to produce cement at the rate of 9 to 10 million tons per annum after the war. The Committee therefore concludes that the existing works, together with the projected extensions, should be adequate to meet the greatest demands that might arise during the first two years after the war. But it also suggests that, if a further expansion of capacity should become necessary after the war, the Ministry should take steps "to ensure that no undue pressure is exercised by the established manufacturers to prevent the setting up of new works which are in themselves an economic proposition."

Clothes Ration Concessions

The necessity for secrecy before the announcement of clothes rationing—and though there is alleged to have been some local leakage, Mr Lyttelton's claim that the secret was well kept is certainly justified—prevented previous discussion with the trade. That in the absence of such discussion some anomalies were bound to arise was freely recognised by the Board of Trade, which has shown a sympathetic attitude to the representations made to it. Those who knit garments as personal gifts for members of the Forces are at present unable to obtain wool without coupons, and a

(Continued from page 800)

ordinary shares of the Holding company dropped 2 points on the announcement. Iron and steel shares were moderately in demand and small gains were general, extending to Babcock and Wilcox, Guest Keen, Wm. Cory and Tube Investments as well as other leading issues. Tuesday saw a marked recovery in the demand for textile shares, but here, too, price gains were small. In the tobacco group, BAT and Imps were again in favour and among miscellaneous issues, Associated Portland Cement, Dunlops, ICI and Boots attracted attention. Shipping reacted after the progress of the previous week, but losses were not considerable.

The market in *kaffirs* responded readily to news of the invasion of Syria and gains were general. Among developing mines West Wit. Areas enjoyed a rise of ½ on Monday. Johnnies lost ½ on Tuesday after an initial gain of the same amount, but Sub Nigel and Venterspost were substantially higher. Tin shares suffered from moderate selling, South Tronoh and Mawchi both losing ground. The rubber market was quieter than in the previous week, but a few issues, including Allied Sumatra, Linggi and Bukit Rajah, continued to improve. In the oil market, satisfaction with the improvement in the military situation was responsible for gains in Anglo-Iranian, Burmah and Shell Transport ordinary on Tuesday. Canadian and Mexican Eagles were also higher and, among Trinidad issues, Leaseholds improved ½ on the same day. On Wednesday business was on a smaller scale, but the demand for Anglo-Iranian and Shell Transport ordinary was well maintained.

New York

The critical state of the war in the Middle East and the strike position at home necessarily restricted business on Wall Street both before and after the week-end. In the circumstances, the absence of a definite setback reflects a firm undertone. After news of the British march into Syria and the improvement in the labour position prices tended to improve on Tuesday, but the tone again turned hesitant toward the close. Steel and motor issues generally gained fractionally during the improvement and industrial issues were also favoured. Rails and utilities remained quietly firm. In midweek, after an optimistic opening, dealers reverted to a cautious attitude and business fell away.

The Iron Age estimates steel mill activity at 100.0 per cent of capacity, against 99.5 per cent in the previous week.

"Old Basis" includes public issues and issues to shareholders. "New Basis" is all new capital in which permission to deal has been granted. (c) £2,950,000 deducted for Repayment National Savings Certificates, 5 weeks to May 31, 1941.

similar problem arises in respect of the purchase of garments for prisoners of war and for children evacuated overseas. Concessions in respect of all these are promised. The difficulty of expectant mothers in obtaining material for making baby-clothes is to be met by the issue of extra coupons upon the production of a medical certificate. Special arrangements have been made for fitting out merchant seamen and fishermen without coupons. A particular difficulty arises in respect of nurses, whose regulation outfit requires far more than 66 coupons, and of members of the Services and civilians attached to the Army, holding Service ration cards. For the time being this is to be met by the supply of goods coupon free to members of the Services and to civilians attached to the Army, upon signed statements that the garments are for their essential personal requirements. This also applies to the women's services and to the Army, Navy and Air Force nursing services, but the position of other nurses has not yet been cleared up. The acting profession, both film and stage, and the ballet, are very awkwardly placed. It has already been stated that for the sake of export, a concession will be made to the film industry, and it seems likely that the originally adamant attitude of the Board of Trade in respect of ballet shows will be modified. Owing to the direct incentive given by the system to the purchase of durable goods, the clothing and footwear trades are much concerned for their stocks of light summer footwear and dresses. The Board of Trade has hinted that it may allow these to be released, coupon free, for a limited period. If the problem of definition could be solved it might be better permanently to reduce the number of coupons required for such purchases. This would prevent "hogging," and make for more level-headed buying. It is quite evident that the Board of Trade is out to remove every legitimate grievance as soon as it can find a way. The only complaint to which it is inclined to turn a deaf ear is that of the home dressmaker. This has probably been a good deal exaggerated. A woman of normal size can save coupons by making her own clothes, provided the style is not too lavish in material, which in war-time it should not be encouraged to be. Owing to the lower rate at which children's coupons are calculated, the home manufacture of their clothes will be discouraged. This is extremely unfortunate, but it is difficult to see how it can be remedied without giving loopholes for abuse.

The German Wardrobe

An exact comparison of British and German clothes rationing is made impossible, both by the big differences in quality, and by the wide variations in habits of dress. The following tables show the number of coupons required for each garment in this country, and the percentage which this forms of the total ration. The corresponding percentage is given for Germany, but this is worked out on the basis of the card which expired last March, as the current card, though not altering the total ration, makes allowance for quality. Boys and girls aged 4-14 have separate cards, and children of 2 and 3 have cards with fewer points.

The German cards have a small number of additional coupons for such things as sewing materials. Additional cards with one-third of the total points are issued for boys and girls between 13 and 17. In every single instance the percentage of the total ration which must be used to buy any given garment is higher in Germany than in this country. For example, a suit and two cotton shirts represent a year's ration for a man in Germany. In Great Britain they take 54.6 per cent. of it, leaving enough coupons for two pairs of

† Not provided for; in most cases because not in common use. * Requires special permit. Items in brackets occur in British list, but not in German.

shoes, two sets of underwear, two pairs of socks, and half a dozen handkerchiefs. Moreover, all these are of more durable quality. As time goes on it may be that the British will accept the necessity of a smaller ration. Meanwhile there is something to be said for the present policy of beginning with a fairly generous allowance, or those people who were already exercising the strictest economy would have been heavily penalised.

Essential Work Order for Building

In order to conserve the labour forces of building and civil engineering, and to speed up the construction of aerodromes, factories and other essential buildings, the Essential Work Order has been applied to these industries. By the Order it will be possible to schedule not only individual undertakings, but also individual building sites. Apart from curtailing the right of employers to discharge workers and of workers to leave their jobs, the Order lays down a special procedure to deal with absenteeism, unpunctuality and "behaviour impeding production." In view of the high turnover of labour in the constructional industries, the application of the Essential Work Order to them was unavoidable. With the collaboration of the building operatives, it should now be possible to prevent the delays which have hitherto often impeded speedy production. As in the case of the other industries to which the Essential Work Order has been applied, the Essential Work (Building and Civil Engineering) Order carries with it various concessions to the operatives, including a guaranteed minimum wage. The Order also provides for an increase in the mobile "squad" of building operatives that can be sent to any part of the country at short notice.

Standard Doors

The point has often been made that labour and materials should be economised by standardising, as far as possible, the production of civilian goods and of military equipment. The British Standards Institution has already done good work in assisting this process. The Ministry of Works and Buildings, in close collaboration with the B.S.I., is now actively engaged in exploring the possibilities of standardising the building materials used by the various Government Departments. On June 6th the B.S.I. issued the first of a series of war emergency standards for building materials. The specification concerned relates to doors, and it has been issued to all Government Departments and

contractors supplying them. It is to be hoped that the process of standardisation will be speeded up, not only in the case of building materials, but also in other industries. Wasteful methods of production can no longer be condoned.

Coastal Shipping

Although coastal tramp shipping has not been generally requisitioned, it is subject to licensed voyages and controlled rates of freight which are designed to fulfil the same conditions that govern requisition rates. The rates in the principal trades are determined according to a system of average values, average costs and average times on voyages, and are supposed to cover operating costs and allow the usual balance of 5 per cent on ship values for depreciation and 5 per cent for interest. The trouble is that with conditions varying from day to day and influenced by many factors that do not affect owners of requisitioned ships, such a system cannot work out with complete fairness, particularly as the majority of individual fleets in the coastal trade are too small to be able to spread the effects of bad luck—a series of protracted voyages, for example—in the case of one or two ships. To overcome these difficulties a compensation fund scheme is being worked out by the shipowners, in conjunction with the Ministry of War Transport. This was revealed at the annual meeting on June 10th of the British Motor and Sailing Ship Owners' Association. The plan is to form a fund out of the earnings of un requisitioned vessels on which owners who have suffered hardships will be able to make a claim for compensation on an agreed basis. It has the merit of self-help—among, incidentally, the most individualistic group of shipowners—and is a welcome alternative to a claim for higher rates to cover contingencies.

Farm Wages

The representatives of the farm workers on the Central Agricultural Wages Board have now put in a claim for a national minimum wage of 60s. a week. The Board is still deliberating on this request, and it seems likely that negotiations will be prolonged. It is clear that existing prices for farm products do not justify a further increase in wages of this magnitude, and that a 60s. wage could only be paid if the Government is prepared to raise agricultural prices accordingly. But since a corresponding increase in retail food prices would jeopardise the policy of stabilising the cost-of-living index which was announced so firmly by the Chancellor of the Exchequer last April, a new increase in the national minimum wage can only be provided by an addition to the already large Treasury subsidies to the Ministry of Food. Now, it is true that agricultural wages are still low compared with those in some other trades, but what is more relevant to the present circumstances is that the increase in farm wages since the war has been greater than those in almost any other industry. Last summer, minimum wages were raised by one stroke from an average of about 34s. a week to 48s., an increase of about 40 per cent, and earnings have certainly risen more, owing both to increased overtime and to the shortage of skilled men, who can usually command wages considerably above the minimum. The question before the Central Wages Board is, therefore, not whether farmers can afford to pay higher wages, but whether a small section of the community, which has already obtained a substantial (and probably justified) improvement in its standard of living, shall in wartime still further improve its relative position at the cost of the general taxpayer. And, seen in this perspective, the decision is not one for the Central Wages Board at all; the decision should be made by the Government in accordance with that general policy of stabilising incomes which should be the necessary corollary of its policy of stabilising the cost of living.

COMMODITY AND INDUSTRY NEWS

THE London Metal Exchange held a meeting on June 6th to consider the position involved by a questionnaire which the Ministry of Supply recently sent to certain firms. The questionnaire asks, *inter alia*, for information on tin holdings, location and names of proposed buyers. The Metal Exchange decided,

since not all firms have received the questionnaire, to ask the Ministry its reasons for wanting the information, before giving the answers. Tin prices recovered during the week, cash rising to £268 10s.-£268 15s. per ton on Monday, with the forward quotation at £269-£269 5s. The recovery, however, was

not maintained, and on Wednesday cash closed at £266-£266 5s. compared with £265-£265 5s. a week earlier; three months tin was £267-£267 5s. compared with £265-£265 5s. The rubber market has been quiet of late; spot smoked sheet closed at 13½d. per lb. on Wednesday. (Continued on page 809)

American Rubber Supplies

Details were published in London this week of the third rubber reserve agreement between the United States' Government, acting through the Reconstruction Finance Corporation and the Rubber Reserve Co., on the one hand, and the International Rubber Regulation Committee, on the other hand. By this agreement another 100,000 tons of rubber are to be delivered to the United States Government for its strategical rubber reserve. As in the second agreement, the price for this rubber has been fixed at not less than 17 cents and not more than 18½ cents per lb free on board Asiatic ports, and the additional 100,000 tons are again to be purchased on the open market. The new agreement, however, differs in one important respect from the two previous agreements signed in July and August, 1940. It does not fix the period within which the rubber is to be supplied. In other words, the agreement gives the International Rubber Regulation Committee the opportunity of preventing sudden and serious reductions in the export quotas under the international rubber scheme when the delivery of the 330,000 tons of rubber under the first two agreements with the United States Government has been completed at or around the end of this year. The 100,000 tons under the third agreement will probably be made available in 1942 and will almost certainly be released gradually in order to secure a step by step adjustment of export quotas to actual market requirements. Without the new agreement the quota would have had to be cut very sharply after the end of this year as current world consumption of rubber scarcely exceeds 1,000,000 tons per year, while present supplies under the 100 per cent quota are as high as 1,500,000 to 1,600,000 tons per annum. Apart from the 330,000 tons of rubber covered by the first two reserve agreements—delivery should be completed by, or shortly after, the end of this year—the American Government holds about 90,000 tons of rubber, supplied to its reserve by the British Government under the rubber-cotton barter scheme concluded a few months before the outbreak of war. In addition, consumers in the United States hold substantial reserves of rubber, so that the country's vital requirements seem assured for at least one year, especially as measures have already been prepared to reduce civilian consumption if required.

Although its rubber stocks are thus substantial, the American Government has taken steps to supplement them by synthetic rubber in an emergency. Three weeks ago Mr Jesse Jones, the United States Federal Loan Administrator, announced that the Government, through the Reconstruction Finance Corporation, has made available \$5,000,000 for the construction of four synthetic rubber plants. These plants, which are to be managed for the Government by the U.S. Rubber Corporation, the Goodrich, Goodyear, and Firestone concerns, will have an initial annual capacity of 2,500 tons each, but this is to be extended as soon as practical experience with large-scale production is available. This move followed a close study of synthetic rubber production in Germany and Russia by the United States Department of Commerce and the United States Bureau of Standards. For the time being it must be regarded as an emergency move which may not be extended if the shipping routes between the United States and the Eastern rubber producing countries can be kept open. Like the new reserve agreement, however, it shows that the United States Government is anxious to leave nothing undone to secure its rubber supplies under all conditions. And while the encouragement of the production of synthetic rubber may cause some concern to the plantation industry, the United States can hardly be criticised for preparing for contingencies.

COMPANY MEETINGS

DUNLOP RUBBER COMPANY, LIMITED

NET PROFIT OVER £3,000,000

HEAVY TAXATION CHARGES

HOME TRADING WELL MAINTAINED

SUBSTANTIAL ADVANCE IN EXPORT BUSINESS

SIR J. G. BEHARRELL'S STATEMENT

The forty-second ordinary general meeting of the Dunlop Rubber Company, Limited, was held, on the 10th instant, at the Café Royal, London.

Sir J. George Beharrell, D.S.O., the chairman of the company, presided.

The secretary (Mr Charles Tennyson, C.M.G.) read the notice convening the meeting and the report of the auditors.

The following review of the year's operations by the chairman was taken as read:—

Following what is now becoming a common practice amongst companies with large numbers of shareholders, I am circulating this statement with the directors' report and accounts, and it will take the place of my usual speech at the annual general meeting of the company.

Your board felt that a large proportion of the shareholders would be engaged on work of national importance, which they would not wish to interrupt in order to attend a meeting, and that many might think it contrary to the Government's injunctions against unnecessary travelling if they were to journey to London for the purpose.

For reasons which will occur to all of you, my statement will, of necessity, be much less full than in previous years.

SIR CLIVE BAILLIEU'S APPOINTMENT

First, I would like to refer to the appointment of Sir Clive Baillieu, one of your directors, as Director-General of Munitions Supply in the United States, representing the British Government. His colleagues miss his collaboration and advice in the difficult problems with which present conditions confront them, but you, as well as they, will feel honoured that he has been chosen to take so important a part in the country's war effort. Your board felt sure the granting of the necessary leave of absence to Sir Clive would have your cordial approval.

When I last addressed you the conversion of our national economy from a peace to a war basis was still in a comparatively early stage, but the tendency, as the war went on, for trading conditions to become more and more abnormal was fully foreseen. Since that time the Purchase Tax, the Limitation of Supplies, and Control of Materials have been brought into effect. In all these circumstances it is very satisfactory that, as you will see from the directors' report and accounts, we have been able to more than maintain in 1940 the good trading results of 1939.

FACTORIES FULLY OCCUPIED

Our factories in this country have been fully occupied, many branches of our normal business, in which we expected a heavy decline, including our export trade, having held up remarkably well. Indeed, our export business actually showed a substantial advance in earnings on the preceding year.

The price of rubber and the percentage of quota releases obtaining throughout the year enabled the Dunlop Malayan Estates Company to show a substantial profit, and in spite of the heavy provision which had to be made for United Kingdom Excess Profits Tax, Dunlop Plantations, Limited, which, you will remember, owns all the shares in Dunlop Malayan Estates, Limited, was able to pay a dividend on its preference shares and to repay the Dunlop Rubber Company part of the amount paid by that company under its guarantee in previous years.

ASSOCIATED MANUFACTURING COMPANIES' RESULTS

Our associated manufacturing companies in British overseas territories also showed satisfactory results, though the profits in South Africa were less than in the preceding year. The American

Dunlop Company again made a profit, though this was smaller than in 1939.

The Japanese Dunlop Company was able to remit the dividend in respect of the year 1939. The sales turnover of that year was maintained in 1940 and a dividend at the same rate as last year declared, but we do not yet know whether a permit will be granted to remit this.

It is a melancholy thought that the French Dunlop Company, in which your company hold a large interest and which was so important an outpost of British trade on the Continent, has now to be treated as an enemy company, and, of course, I am unable to give you any information regarding its progress and position.

INDUSTRY'S HUGE CONTRIBUTION TO THE WAR EFFORT

There are certain points in connection with the accounts which I should like to amplify.

The net profit for the year amounted to £3,002,000, compared with £2,853,000 in 1939.

The provision for taxation amounted to £1,742,000, which represents an increase of £715,000 over that for the preceding year. In addition to this, in accordance with the policy decided upon last year, the board has provided £650,000 towards the 1941-42 income-tax liability.

This does not represent the whole burden that the Dunlop Group of companies has had to bear, as the charge for taxation in the accounts of the subsidiary and sub-subsidiary companies amounted to £1,666,000. The total provision for the year under review amounts, therefore, to £4,058,000, compared with £2,388,000 for the previous year, an increase of £1,670,000. The total provision for 1938 was only £820,000. These figures are not given by way of complaint, but industry's huge contribution to the war effort through taxation has to be stated to ensure its proper appreciation.

This great increase has inevitably made a heavy inroad upon the balance of profits available for distribution. After providing for the preference dividends, the board decided to recommend a dividend of 8 per cent. on the ordinary stock and a bonus of 2 per cent., and this dividend and bonus, if approved, will be paid on June 21st.

SUBSTANTIAL RESERVES BUILT UP

For the first time for many years the board has not been able to make any allocation of available profits to increase the reserves of the company, except the special income-tax reserve towards the succeeding year's liability. It is fortunate that the board was able to build up substantial reserves in the past, as during the war there seems little possibility of any large undertaking building up further its financial strength. Upon the termination of the war, however, the company may become entitled to a refund of 20 per cent. of the Excess Profits Tax paid, subject to the deduction of income-tax at the rate then in operation.

For the reason given in the directors' report, the board has transferred to the special reserve against investments in and advances to subsidiary companies the sum of £1,000,000 from the general reserve and £250,000 from the reserve for contingencies. This special reserve now stands at £3,250,000, which sum, in the opinion of the board, is fully sufficient to provide for all contingencies that can now be foreseen.

THE CONSOLIDATED STATEMENT

In view of the full information given in the directors' report and accounts, I do not propose to deal with the accounts in further detail.

THE STRENGTH OF THE ORGANISATION

I would, however, like to call your attention to the consolidated statement of assets and liabilities, which you will find on pages 10 and 11 of the accounts. It was a matter for serious consideration whether or not to continue this during the present abnormal times. Your company was one of the leaders in providing this informative statement, and your board hope to be able to continue its publication. It is, however, important that its limitations under present conditions should be fully understood.

WAR CONDITIONS AND THE COMPANY'S ORGANISATION

I know you will wish to hear something of the way in which the company's organisation is standing up to war conditions.

In the first place, I should like on your behalf to convey a very special message of thanks to the company's employees of all grades who had throughout the year to contend with unexampled difficulties.

The call for ARP workers has been heavy and has met with a magnificent response. The effect of the black-out in factories and offices is very trying.

Much new labour has had to be trained and there has been a large substitution of men by women.

ALL DIFFICULTIES MET WITH LOYALTY AND CHEERFULNESS

Our staff has been seriously depleted by the demands of the fighting forces, and has had to grapple with a great volume of additional work imposed on it by the vast mass of emergency legislation. All these difficulties have been met with loyalty and cheerfulness.

With the company's co-operation the employees at our various factories are providing funds, generally by deductions from wages, for the assistance of those of them who suffer from air attack.

"SPITFIRE" PURCHASED BY FORT DUNLOP EMPLOYEES

The employees at Fort Dunlop organised a collection for the purchase of a "Spitfire," and the money raised, with an additional contribution voted by your board, was used to purchase, through the Motor Industry Fighter Fund, a fighter aircraft, which has been christened "Pericles," after the Prince of Tyre, whose name is familiar to students of Shakespeare.

Results for the War Savings Scheme, of which I told you last year, improved as the year progressed, and we hope to bring about still further improvement this year.

OVER 2,600 EMPLOYEES IN THE FORCES

Over 2,600 employees of the company are now serving in the fighting and whole-time civil-defence forces. A number have been promoted to commissioned rank, some have lost their lives, and I am sure that it will be the wish of members to record a sincere expression of sympathy with the relatives of the fallen.

This is not the place to mention the distinctions which have been awarded to Dunlop employees for gallantry and good service, but an opportunity for doing this will be found later.

I know you will be glad to learn that the board was able to continue the scheme for making financial allowances to employees called up on active service. Although such arrangements must obviously be related to our resources and subject to adjustment when necessary, the board consider this scheme to be in the broadest sense in the best interests of the company.

CONTINUANCE OF RESEARCH AND TECHNICAL DEVELOPMENTS

We have not permitted the war to restrict our research and technical developments; but, on the contrary, our technical staffs have actively co-operated with the Services, and when peace returns we shall secure considerable advantage from the experience gained.

You will realise how exceedingly difficult the processes of distribution have become. Such measures as the Purchase Tax, the Limitation of Supplies, and the Prices of Goods Act have provided many complications, and, in addition, new and strange conditions occur in the distributive field from week to week and sometimes themselves admirably to the unusual circumstances, and I believe that their resource is assisting to increase the company's prestige and goodwill with both trade and public.

Our branches in the field have not been free from disturbance, but no occurrence has been allowed seriously to delay the distribution of our products, and this is a significant tribute to the strength of our organisation. Much excellent and courageous work has been done by our staffs in minimising damage to our property and stocks.

In concentrating upon essential work your company is sometimes unable promptly to meet all the requirements of what may be termed the "civilian market," but from all quarters we have received a ready recognition of the circumstances. Here I should like to express upon your behalf the company's keen appreciation of the co-operation afforded by all branches of the many trades with which we are connected.

Our difficulties in the coming year are not likely to be less than in the year that has passed. There is no doubt that the activities of British industry generally will be more and more determined by the conditions resulting from the war and more and more subjected to Government requirements.

THE BOARD'S PARAMOUNT DUTY

I am sure you will all agree that the board's paramount duty is to preserve the company's assets and liquid position and to keep the organisation at the highest pitch of efficiency. This will not only render possible the utmost service in the national interest during the present emergency, but will also ensure that after the war we shall be able to maintain and advance still further the pre-eminent position of your company in its many fields of activity.

The chairman moved: "That the report and accounts for the year ended December 31, 1940, be approved and adopted, that the dividends already paid on the preference shares be approved, and that the following dividend be declared—namely, a dividend at the rate of 8 per cent., plus a cash bonus at the rate of 2 per cent., on the ordinary stock, such dividend and bonus to be payable on June 21, 1941."

Sir S. Hardman Lever, Bart, K.C.B., seconded the resolution, and, after the chairman had replied to a shareholder's questions, it was carried unanimously.

The chairman next moved the re-election of the retiring director, Sir Alexander Gibb, G.B.E., C.B.

This was seconded by Mr F. Alexander Szarvasy and unanimously approved.

The auditors, Messrs Whinney, Smith and Whinney and Messrs Stokes Brothers and Pim, were reappointed.

VOTE OF THANKS

Colonel F. H. Smith: Ladies and gentlemen,—I hope this meeting will not separate before we, on this side of the table, have expressed our thanks to our worthy chairman and the directors who have brought us through a very anxious year, I think, with conspicuous success. (Hear, hear.) I am sure that it is also the desire of all the shareholders to confirm what you, sir, have stated in your report as to our indebtedness to the staff. In many cases there have been severe calls on the man-power of particular departments, but the others have maintained the *esprit de corps* and also the output, and I think they deserve special thanks from the shareholders. (Hear, hear.) I should therefore like to say that we associate with our thanks to you the hope that you will convey on behalf of the shareholders deep appreciation of the way in which the work of the undertaking has been maintained during a very difficult period. (Applause.)

The vote of thanks was unanimously accorded.

CHAIRMAN'S REPLY

The chairman: Colonel Smith, ladies and gentlemen,—I can assure you that my colleagues and I appreciate very much the warm sentiments which Colonel Smith has so gracefully expressed, and I am very pleased that he associated so wholeheartedly the staff of the company with the vote of thanks. It has indeed been a remarkable year, and it has been very pleasing to see the way in which the difficulties have been tackled and overcome. There has been no holding back by any grade or section of the company, and I know that the words which have been spoken here this morning will be a great encouragement to them all. I will see that they are passed on to the proper quarters. (Applause.)

The proceedings then terminated.

BRITISH ENKA, LIMITED

DIFFICULT TRADING CONDITIONS

The sixteenth ordinary general meeting of British Enka Limited was held on the 12th instant at Winchester House, Old Broad Street, London, E.C., Mr. C. T. Pott presiding.

The chairman said: The working profit after providing for taxation for the year amounted to £84,896, reduced by provision for Depreciation and other items to the net profit of £20,505. The actual trading profit was lower than the previous year, due to difficult trading conditions, particularly during the first half of the year.

You will notice that £31,000 has been charged to Profit and Loss Account in the Balance Sheet as a further provision for 1939 taxation. That is by way of an estimate of E.P.T. liability for that year. Unfortunately our profits standard for Excess Profits Tax is very low, and the hope that the new Budget would give consideration to businesses such as ours which were suffering particularly from depressed trading conditions during the standard years has not materialised.

Our relations with our competitors in the trade have become even closer, and during the year have been extended. This collaboration is proving most useful in ironing out the many difficulties which have arisen owing to the war.

In conjunction with the other viscose rayon spinners a case was presented to the Board of Trade with the result that they have now granted us status as a nucleus firm in the rayon spinning industry.

We have passed more and more of our trade into export channels and although this trade is not as profitable as the home trade, we endeavour in this way to fulfil our national obligations.

Apart from the direct effect of the war upon our ordinary business, we miss the technical advice and assistance of our parent company, the A.K.U., which is, as you know, a Dutch concern. Furthermore, we are deprived of the valuable help of our Dutch directors.

In conclusion, I want you to know that we are all much indebted to Mr. A. D. Carmichael, who has given so much of his invaluable knowledge and time to us. In particular, Mr. Carmichael has achieved outstanding success in bringing about closer co-operation between those producing rayon in this country. It is therefore with much pleasure that I am able to announce that Mr. A. D. Carmichael has undertaken to serve as chairman of the board, a post which I have provisionally filled for many years, and which I vacate more particularly as I am obliged to spend so much time in London and consequently can only visit our works at Aintree at uncertain and infrequent intervals.

The report and accounts were adopted.

ASSOCIATED NEWSPAPERS, LIMITED

STRONG FINANCIAL POSITION

The thirty-sixth annual ordinary general meeting of Associated Newspapers, Limited (proprietors of the *Daily Mail*, the *London Evening News*, and the *Sunday Dispatch*), was held, on the 10th instant, in the Memorial Hall, Farringdon Street, London.

The Viscount Rothermere, the chairman, presided, and in moving the adoption of the annual report and balance-sheet asked the shareholders to take them as read.

A summary of the chairman's speech, which was issued to shareholders with the accounts, is as follows:—

The accounts show the very strong financial position of your company. The net profit of the company for the financial year, after provision is made for taxation and reserve for paper, is £469,542 2s. 2d., compared with £401,018 6s. 7d. for the previous year.

SATISFACTORY RESULTS

On the advertising side the reductions in the controlled sizes of our newspapers could not do otherwise than affect our revenue. I suggest, however, that in these grave and difficult times there is a good reason for satisfaction in the figures as finally presented.

The provision of our raw material—newsprint—is probably the most complicated problem we have had to deal with in running our newspapers under war conditions.

Early in 1940 the Newsprint Supply Company, representing the whole of the Press of the country, was formed with the object of pooling all available supplies of newsprint for the benefit of the newspapers of the country as a whole. No advantage was sought by newspapers like our own who found themselves in a fortunate position either in regard to stocks of newsprint or contracts with Canadian and Newfoundland suppliers. By working together through the Newsprint Supply Company it has been possible to allocate and distribute the available newsprint to all newspapers on a fair and equitable basis, and at the same price.

IMPORTANCE OF A WIDELY DISTRIBUTED FREE PRESS

I would like to record with great satisfaction and appreciation the magnificent way in which the newspapers of the country have worked together during the war. There can be no doubt of the importance of a widely distributed free Press in times of war, and the many letters which we and our contemporaries have received from our readers bear testimony to the fact that the newspapers of the country have done their job—sometimes under appallingly difficult conditions.

The partial liquidation of your company's large stocks of paper largely accounts for the increase in the company's cash position.

Further, you will notice that investments in Government securities stand at £750,217.

The report and accounts were adopted, the retiring directors were re-elected, and the auditors, Messrs. Lever Honeyman and Co., were reappointed.

The proceedings terminated with a vote of thanks to the chairman and directors.

ARGENTINE ESTATES OF BOVRIL, LIMITED

Presiding at the thirty-third ordinary general meeting of Argentine Estates of Bovril, Limited, held on the 9th instant in London, Lord Luke (the chairman) said that some companies nowadays sent their chairman's speech with the reports and paid the dividends after the meeting. They had reversed the order, and sent the dividend cheques with the report but retained their remarks for this meeting—not that there was a great deal now to say about the company's operations, which were, as in the past, divided into two parts. First, the running of the estates, including dealing with cattle stocks of over a quarter-million head, and, secondly, the manufacture in the factory at Santa Elena of corned beef to meet Government orders. There was, more or less, the usual comparatively small profit on the cattle, most of which were nowadays sold to outside freezing works—that was to say, not to their own works at Santa Elena.

As regarded the factory, he thought there might be a slight margin of profit on the corned beef and the by-products, but it certainly was only sufficient to cover a part of the plant depreciation charge, and, of course, nothing towards interest on the capital employed. It was the same with most factories producing corned beef, but they had probably not heard much about this absence of profit, as most of these producers of corned beef had also dealt with frozen beef, which worked in with corned beef manufacture, and, though the latter was admittedly unprofitable, it was carried by the profits usually made out of frozen or chilled beef.

ANOMALOUS POSITION FOR BRITISH FIRMS

As shareholders knew, the company had added an up-to-date frigorifice to their factory five years ago, but because they happened to be a British firm and not on a list of importers accepted by the Board of Trade at the time of the first Anglo-Argentine meat contract in 1933, they were not permitted by the Board of Trade to import into England frozen beef from their own freezing works at Santa Elena, though others who happened to have had some of this long-established entry quota were allowed to use the company's freezing works and ship the beef from it into England. When two or three years ago this anomalous position

for a British firm was mentioned, a Buenos Aires paper, commenting on the position, said:

"It read like 'Alice in Wonderland.'"

At any rate, as an apology for the small profits he must again mention this reason, though he believed even frozen beef profits were not what they were.

In these days, when much overseas industry was closed down, one should perhaps be pleased that the staff and workpeople had been kept in employment.

It had, of course, been a year full of difficulties, not only here, but in the Argentine, and he felt sure shareholders would like to convey their thanks for the past and expression of confidence for the future to Mr Ellison and Mr Baggott and all those who served under them on the estates and in the factories.

As he had mentioned, they sent the preference shareholders a dividend of 3 per cent. with the reports. If towards the end of this year the accounts seemed to warrant it, they hoped to be able to send shareholders 3 per cent. in December, instead of holding it for issue at the time of the annual meeting. Considering the very large sums they had invested in their estates and factories, the accounts were certainly nothing to be elated about, though as companies working in the Argentine went at present they had a showing better than many.

The report and accounts were unanimously adopted.

THE VENEZUELAN OIL CONCESSIONS, LIMITED

CONFIDENCE IN COUNTRY'S SOCIAL AND ECONOMIC PROGRESS

SIR ANDREW AGNEW'S STATEMENT

The annual general meeting of the Venezuelan Oil Concessions, Limited, will be held at Shell-Mex House, London, on June 20th.

The statement of the Chairman (Sir Andrew Agnew, C.B.E.), which has been circulated with the report and accounts, is as follows:—

Ladies and gentlemen,—

Anticipating your approval, I am circulating with the annual report and accounts the remarks which I should otherwise have made at the annual general meeting. This will enable shareholders to obtain all the available information at minimum inconvenience to themselves and will involve minor savings in various directions.

As you will observe, the report is considerably shorter than previously it having been decided to eliminate all information

(Continued from page 803)

day, compared with 13½d. a fortnight ago. The agreement between the American Rubber Reserve Company and the International Rubber Regulation Committee is discussed in a Note on page 803. The first rise in the price of copper sulphate for nearly a year was announced. The export price f.o.b. is raised £1 to £29 10s. per ton.

Export Control.—The control of exports is extended to various articles under new Orders made by the President of the Board of Trade. From June 14th exports of the following goods may be made only under licence: bleaching powder, caustic soda, cement, calcareous, ground and unground, chalk, whether ground or not, including whitening, copper sulphate, salt, sodium bicarbonate, sodium silicate, and sodium sulphate. From June 19th licences will be required to export metal barrels and drums and certain articles manufactured wholly or mainly from tin plate orterne plate. The control over asbestos (raw and fibre) is extended, and minor relaxations have been made in the list of drugs requiring export licences.

A National Egg Company.—A company is being formed, to be the agent of the Minister of Food, to administer the collection and distribution of eggs, somewhat on the lines of the company which deals with bacon. It is believed that it will be ready to begin its work later this month. The company will buy the entire

output of the packing stations, who in their turn receive the whole output of producers, except where producers act as retailers. Producers must obtain 50 registered consumers and be licensed as retailers before being permitted to sell by retail. The retailer will be required to register with a supplier, and he, too, must obtain 50 consumer registrations, except in rare cases.

Licensing Egg Buyers.—All persons who buy eggs direct from producers for the purpose of re-sale, other than licensed packers and wholesalers who are already registered with the Ministry of Food, are required to apply for a licence to trade in eggs as approved buyers. Licences will be granted only to those who were in business as egg buyers for not less than 12 months ended August 31, 1939. A condition of licence will be that the licensee shall only sell eggs to one licensed packing station of his choice, with whom he should register. Applications for licences should be made to the Ministry of Food before June 21st. This licensing is required by the Ministry of Food as part of the scheme for the rationing of eggs.

Cotton.—Traders are occupied in making the necessary adjustments to meet concentration of production schemes. Something approaching finality has been reached in the spinning branch, but developments are still awaited in the weaving section. It is reported that with regard to the recent release of barter

regarding production and field operations. This policy is in line with that being followed by many other companies whose circumstances are similar to our own, and I have no doubt that shareholders will fully appreciate the wisdom of so doing.

In view of this you will not, of course, expect any additional remarks from me other than of a very brief and general nature.

YEAR'S PROFIT

I shall refer briefly to the accounts. You will note that profit for the year is £1,103,666, which is £178,318 lower than last year, but for the reasons already given I do not propose to compare the two years' results in detail.

Turning to the balance-sheet, you will see that capital expenditure has fallen to the low level of £357,000, which comprises mainly routine requirements of well casing, pumping units and machinery. Your board is satisfied that adequate allowance has been made for depreciation.

Stocks of materials have increased from £1,161,000 to £1,564,000, owing partly to higher purchase costs and partly to the necessity, under present conditions, of buying further ahead of requirements than is customary.

Oil in stock, debtors, investments at market value and cash together total £2,156,000, and creditors, including taxation reserves, bills payable and other liabilities, £2,294,000. Of this latter figure £1,366,000 represents taxation reserves.

CHANGE IN VENEZUELAN PRESIDENCY

There is one event to which I should like to refer, namely, the change in the Venezuelan Presidency, which took place in April last. The term of the outgoing President, General Eleazar Lopez Contreras, who took office in 1936, has by common consent represented an outstanding epoch in the development of Venezuela. His successor, General Medina, is a man with similar democratic outlook and ideals, and I feel that we may look forward with confidence to a continuation of the country's political, social and economic progress.

I should not like to omit, even from this short statement, a word of appreciation from the board, and I am sure also from the shareholders, of the valuable services which have again been rendered by our management and staff, both in Venezuela and at home. Numerous members of the staff have, of course, joined the Services, which throws an added strain on those remaining, and the important work which they are doing is much appreciated.

The formal resolutions will be proposed at the meeting in the usual way.

cotton, applications for allotment have been larger than the supply available, and in the circumstances merchants have had to be satisfied with comparatively small lots. Some looms are stopped owing to the limited supplies of yarn. Difficulties are being experienced in any expansion in export trade in piece goods owing to the limited quotas allowed to shippers.

Offals Derationed.—The derationing of offals was announced by the Ministry of Food, with effect from June 9th, and it is promised that this concession will remain in force during the summer months. Consumers are warned that the total quantity of offals amounts to less than five per cent of weekly supply of meat, but butchers are urged to distribute supplies equitably among their customers.

"THE ECONOMIST" SENSITIVE PRICE INDEX (1935 = 100)

SALISBURY MUNICIPAL LOAN

Issue of £100,000 FOUR AND A HALF PER CENT BONDS TO BEARER of £100 EACH

NOTICE IS HEREBY GIVEN that in accordance with the conditions on which the above Loan was issued the following BONDS were on the 5th June, 1941, DRAWN for redemption at par on the 30th June, 1941:—

Bonds numbered 17, 52, 66, 91, 258, 420, 423, 447, 451, 497, 531, 562, 563, 564, 598, 620, 655, 669, 966.

Present, John E. R. Casey, Notary Public, of the firm of Cheeswright, Casey, Duff, Watts and Co., Notaries, 23, Lime Street, London, E.C.3.

The Bonds and all Interest Coupons not then due must be left at the office of the Standard Bank of South Africa, Limited, 10 Clements Lane, E.C.4, three clear days for examination. Payment of principal will be made on and after the 30th June, 1941, from which date the Bonds will cease to bear interest.

In addition to the above, Bonds amounting to £91,300 have previously been purchased and drawn.

For the Standard Bank of South Africa, Limited,

RALPH GIBSON, Manager.

5th June, 1941.

Collective Bargaining

THERE have been signs of exasperation, and sometimes even of bitterness, in a number of recent speeches and articles on war policy, and it is imperative that this peevishness should not be permitted to develop into something deeper and more dangerous. There is no tradition of the Class War in English politics. The problem of the Two Nations has been recognised by all parties for over a century. It has by no means been solved, but no section of the community can claim a monopoly in social betterment; and it would be pitiful and perilous if, at this crucial stage of a deadly struggle, when the outstanding character of the community is the common will to win, sectional antipathies and suspicions were to cloud the single issue. Many more than Mr Bevin and Mr Tanner, of the Amalgamated Engineering Union, have been "nauseated" by the campaign of complaint against "absentee" war workers. All losses of time and output, whether due to an uneven supply of materials, to bad management or to slackness on the part of employees and staff of whatever grade, are equally to be rooted out; and neither politicians, journalists and public men, when they indict the arms workers so smugly, nor Mr Bevin and his friends at Transport House, when they treat every comment on manpower as an attack on trade unionists, contribute anything but backbiting to a solution.

The trouble starts high up. At Derby last week-end, Mr Bevin spoke of himself as "representing" Labour in the Cabinet. Even the Captain-General himself, Mr Churchill, has taken a party headship since the National Government was made. There is no reason for an outsider to doubt that in their Councils the Cabinet are undivided in their work for victory. But it is inherent in the composition of the Government as a "representative"

coalition, and not as an epitome of the nation's talent and leadership, that it should serve as an exchange of interests at least as much as of ideas. Bargains were struck to make it.

It is unfortunately necessary in wartime to surrender the advantages of party politics, which makes it the more regrettable that disadvantages should be preserved. The Prime Minister's party office, though it may render him the symbol of a faction, does not alter his own unbiased concern for the commonwealth. Most Ministers in fact are honest and loyal in their attempts to hold away from party ties. But they are there as party men. They are balanced, numerically, as party men; and the wirepullers and the caucuses are there in the background.

It is hard for Ministers to make sweeping policies by collective bargaining; and it is hard for some observers to overcome the suspicion, no doubt mostly unfounded, that coalition is a cloak for the strongest bargainer. There is a presumption that Mr Churchill may sometimes have to arbitrate when he should be leading, and that contentious social decisions may be skirted to avoid both devil and baker. There are only stray words and deeds to judge from, and Ministers are firm—and no doubt sincere—in their avowals of solidarity. But a balanced coalition is not, in itself, the most national of governments.

There is no usefulness, of course, in mere pipe-dreams. The nation is united in the war effort, but society is still divided. Inevitably, the conduct of the war must be based upon decisions which reach an accord between the conflicting and competing interests of social groups. There is no class war. But there are

classes—shifting and ill-defined maybe, but existing none the less. Their boundaries may be suddenly altered by war conditions without any warning or design; and the differences between them may move and deepen. It is in this conjuncture that war leaders must make their war plans workable. It is easy, for instance, for the economist to advise a general stop on wages, profits and prices; it is right for him to do so, because it is economically desirable for the war effort and, in the long term, socially desirable for both wage-earners and industrialists as well. For the politician it is a hard, uphill task to secure agreement on the restraint of remuneration. He will prefer to seek, with no little success in this instance, the alternative way of restraining expenditure. He will make heavy weather of his economic obligation to reduce the consumption of tobacco and petrol. There is a plain difference, rooted in social fact, between War Economy and War Political Economy.

But this explanation is no excuse for a political attitude which maximises social difficulties that should be minimised. Discussion there must be, but not just bargaining. If the tasks of national unity are deliberately thwarted by haggling, the chances of an agreed and efficient policy are not great. If lip service is paid to the need for a wage and price policy, while nothing can be done because of political obstacles, the menace may heap

up while matters drift—until both the war effort and all the interested groups are losers in the end. The danger of collective bargaining, as a procedure of government, is drift.

Mr Churchill's leadership need not be bounded by party bargains. He is in a position to put a stop to unseemly wrangling in high places by command. He can easily widen the sphere of Ministerial recruitment to all the talents. But new methods are needed as well as new men and a new attitude. Individuals and interests do not haggle solely because of short sight and narrow minds. Often, they bargain because they are struggling to keep their heads above water as the tide of wartime change swirls and rises; and the most potent step to halt their haggling would be to end their struggle.

It is not enough to denounce exasperation. It is no less needful to remove its causes, by ensuring that the risks of wartime economic policy do not fall haphazardly and without discrimination on workers, traders, industrialists, business men, households or families who have no special responsibility or redress. In the right conditions of wartime service—security of work, livelihood and diet for every citizen, whatever changes the exigencies of war may compel—there could be a truce to needless suspicion and to political barter and a mighty release for the willingness and resolution of the British people.

The Conduct of Diplomacy

THE changes in the Diplomatic Service proposed in Sir Malcolm Robertson's report and announced by Mr Eden on June 11th go far to meet a number of the criticisms which have been put forward recently on the subject of Britain's handling of foreign affairs. For some time past, it has become more and more obvious that the conduct of foreign policy in this country was out of touch with the realities of the international situation. However much men may regret the change, it is perhaps true to say that diplomacy has moved from the sphere of art to that of science. The social pattern, the traditional forms, the specialised field of knowledge and action, the leisurely, courteous, mannered exchanges of other and possibly happier periods have given place to the interdependent, activist, tumultuous, and totalitarian world of to-day. In the new "total diplomacy," a diplomatist with only a general appreciation of his country's own vital interests, a certain historical and cultural knowledge of the community in which he is to work and a placid ignorance of its social framework and the economic forces at work in it, is likely to go hopelessly astray. There is no longer a traditional European hierarchy, ruling by self-evident right. It is not only insufficient, it is absolutely mislead-

ing to conduct diplomacy on the basis of contacts confined to the socially insignificant "social élite" of a number of cosmopolitan capitals.

It is therefore welcome news that the Diplomatic and the Consular Services are to be merged. This will help to do away with the illusion that the politics and economics of a community, the social world and the business world, can be considered apart; and from the Consular Service it will probably be possible to pick men at once with the necessary qualifications to give "expert advice on commercial and financial as well as on military matters," and even on "social and labour questions." The list is encouraging. It shows that Mr Eden appreciates the complexity of the forces behind politics in the modern state. It suggests that one of the most vital services of peacetime diplomacy—information—will be far more adequately performed.

These changes clearly call for some modification in the selection and training of diplomatists. Here, too, Sir Malcolm Robertson's report holds out good hopes for the future. The basis of selection is to be widened in order to secure the best talent available in the community, and the disadvantages which questions of finance impose on the present organisation of the Service will be removed, by making it still easier for men without private means to enter the Service and also by providing pensions on retirement for those who have not shown sufficient ability to move on to more responsible posts. Of these reforms, the financial are incomparably more important than the other. A higher education and a liberal background are likely to remain valuable, even essential, qualifications for the career of a professional diplomat. What is needed is that the best of those so endowed should enter the Service and that, once launched, ability not seniority should mark the stages in their career. The early pensioning of the relatively incompetent will thus do even more to improve the efficiency of the Service than the selection of candidates on a wider basis.

The reforms sketched in the Robertson report are not, of course, for immediate application, but it is not only the long-term conduct of diplomacy that is under fire. The Government may be said to have tacitly admitted the truth in the criticisms levelled at the inadequacy of the Service under present conditions by appointing to the three most vital Embassies—the United States, Russia and Spain—Ambassadors chosen from outside the Service; and there is growing uneasiness that in three vital spheres

of policy—in the United States, in Vichy France and, until very recently, in Iraq—British diplomacy is not only not playing its part but is actually impeding the formulation and practice of a vigorous and effective policy, in France or Iraq in the sphere of diplomacy proper, in the United States, in the sphere of news.

Admittedly, the situation in which the Foreign Office finds itself is a peculiar one. The rôle of diplomacy in times of peace is relatively straightforward. Its aim is to watch over its country's vital interests and to settle by compromise and negotiation difficulties which threaten a disturbance of the peace. Very properly, its methods are designed to delay decisions whenever a breach seems imminent, to avoid drastic action and to fend off as long as possible a situation from which a resort to force is the only issue. It follows that, when war has broken out, its functions are at an end between belligerents. There usually remains, of course, a neutral fringe where presumably diplomacy can still be active, but it is questionable whether, under modern conditions of total war, it is either wise or realistic to assume that, because countries are not involved in war, the methods of peace-time diplomacy can continue to be employed in them, or that there even exists a sphere in which normal diplomacy can continue to function at all. Even though Holland was a neutral until May, 1940, clearly the whole question of Britain's relations with Holland was conditioned by the general strategy of the war, including blockade, and the disastrous weakness of Britain's policy *vis-à-vis* and the disastrous weakness of Britain's policy *vis-à-vis* pre-belligerent Italy was partly conditioned by the belief that methods of diplomatic negotiation were still valid in dealing with Hitler's Axis partner.

The same dilemma is apparent to-day in the question of the Anglo-American policy towards Vichy, although here the blame must lie with the American State Department rather than with the Foreign Office, which is not represented at Vichy. It is perhaps true that the diplomats themselves were not personally responsible for weakness and vacillation; but the application to the Vichy situation of the methods of diplomacy proper was inevitably bound to produce weakness and vacillation. All too often decisions appear to have been taken at the Foreign Office or the State Department which properly belonged to the competence of the War Cabinet and the Administration only. It is perhaps true to say that the rôle of diplomacy in war is not to interfere at all with the conduct of the war, and it cannot be said that recent British diplomacy has either understood or played this ideal rôle.

The Foreign Office has, besides this negative part, the positive function of oiling the wheels of the war machine. It has, presumably, unrivalled knowledge of foreign countries and of their likely reactions in given circumstances; it can interpret these reactions both to the Government and to the people at home; and, through its

representatives in foreign countries, it can act as a mouth-piece for the war policy of the British Government. Here however, there is almost as much need of clarification as in the major problem of securing the complete subordination of diplomacy to the purposes of the war or, in more concrete terms, of the Foreign Office to the War Cabinet. The work of keeping public opinion in this country informed has been transferred to the Ministry of Information, whether the Press Section of the Foreign Office has migrated. The change of place, however, seems to be of only geographical significance, for the Ministry of Information has, apparently, no competence to decide what information shall be given out, or in what form. A similar lack of co-ordination or authority is apparent in other spheres, such as broadcasting and, although criticisms cannot be based on the same certainty, in Britain's secret propaganda.

As for the transmission of news abroad, here again the Foreign Office, through its Press attachés, is the normal channel, and there can be no doubt at all that both the quality and the quantity of the news are insufficient. The question has been brought to a head by America. There is constant and universal complaint from the United States that the British news service is inadequate, that it fails to make use of what propaganda value—great or small—the news may have, and that it is generally late. The responsibility lies with the Foreign Office. Its officials can, with justice, reply that nothing in their training fits them to grasp the propaganda value of news and to put it across. In that case, their obvious course is to transfer the responsibility to some body of people who are capable of grappling with the problem. It remains to be seen whether the setting up of a new agency for information in New York under Sir Gerald Campbell will go far enough to meet the present unfortunate situation. The outsider might feel more confident of a happy outcome if the Foreign Office in the past had shown more gracious readiness to divest itself of functions which it was not, in time of war, well fitted to perform. It is obvious that one of the difficulties under which the Ministry of Information labours is the unwillingness of the Service Departments, including naturally the Diplomatic Service, to abandon to it the work of information which, nevertheless, they are not willing or able to perform efficiently.

In the war, then, the rôle of the Foreign Office must be in diplomacy one of absolute subordination to the War Cabinet, and in information one of willing co-operation with the organisations in which the duty of disseminating news is vested. If these two criteria are observed, there is no reason why the Foreign Office should not make an effective and distinguished contribution to the nation's war effort, while Sir Malcolm Robertson's report gives promise of an even more effective and distinguished future.

Bank Credit and Inflation

MONTH by month the publication of the returns of the Bankers' Clearing House reveals how rapidly the volume of bank credit is being expanded, and with what purpose. The May return, for example, shows that the total of bank deposits in the hands of the public has increased by £657 millions, or 30 per cent, over the preceding two years. And, in the same two years, the increase in the volume of credit placed at the disposal of the Treasury by the clearing banks' holdings of gilt-edged securities, Treasury Bills and Treasury deposit receipts has been about £685 millions. The rate of increase in recent months has been considerably faster than over the whole two-year period, though seasonal fluctuations naturally tend to obscure the picture. In the past twelve months, bank credit has been created to the Government extent of £33 millions a month and lent to the Government. The circulation of currency is more than keeping pace. Bank deposits have increased in a year by 17 per cent, notes in circulation by 10 per cent.

Nevertheless, it is the declared opinion of the Chancellor of the Exchequer and of his expert advisers that there has been no monetary inflation, and even those sceptics who dissent agree that the degree of inflation is small. Here, evidently, is a paradox, one that adherents of the old-fashioned Quantity Theory would find it impossible to resolve. Money is being created *ex nihilo* and spent; why is there no inflation? It may help to clarify thought if an attempt is made to explore this conundrum.

Definitions of inflation are proverbially numerous and contradictory. In the framework of war economics, however, the meaning of inflation is fairly clear. The object of every policy of war economics is to reduce civilian consumption in order that production of munitions may expand. Inflation is the technical description of one of the various methods of attaining that object—the method of cutting down consumption by raising prices. The two great objections to it are that it is unjust while it is going on, and that it leaves behind it a fearsome legacy of mal-

INDEX TO VOLUME CXL

Shortage of paper makes it impossible in wartime to follow the normal practice of distributing to every reader a copy of the Index to *The Economist*. Copies of the Index to Volume CXL (January to June, 1941) will be available early in July, and will be sent, free and post free, on application.

As our records have been destroyed will those of our readers who have applied for previous indexes kindly repeat their instructions?

THE ECONOMIST - Brettenham House - London, W.C.2

Will Readers note that from the date of this issue *The Economist's* Telephone No. will be
TEMPLE BAR 3316?

exerted a depressing effect on wage or salary rates. It is certain that all that can be forecast surely is that, with family allowances, children would be better provided for; that large families would not be penalised; and that the hard lot of the working-class mother would be bettered.

Proposals for family allowances have been handicapped from the outset by the perennial and unsensational nature of the problem. The poor indeed are always with

us. But the problem has altered since the outbreak of war, and only a comprehensive system of family allowances can take the sting out of war economic policy—financial, fiscal and distributional. While higher prices, taxation, rationing and shortages are being employed to set an upper limit to consumption, family endowment can secure the minimum, which is demanded by the national interest as well as by the social conscience.

NOTES OF THE WEEK

Outlook in the East

After a week of report and counter-report, there is still nothing definite or final to be said about the state of Russo-German relations. It seems obvious that Germany is on the eve of some great move. Her armies are nowhere in motion, air attacks have been on a small scale in west and east, and contrary to general expectation, no step has been taken to reinforce French resistance in Syria. The unsettled question is where the move will be. Certain facts are, of course, reasonably well established. There are a large number of German divisions on a war footing along the Russo-German frontier, including military and air force units which have been brought north from Greece and the Dodecanese. Preparations have been made by the Finns and the Roumanians—both peoples with a grudge against Russia—which point to war. Finally, Germany is conducting a propaganda campaign designed to convince the world that an attack on Russia is likely. Admittedly, there seem to be almost overwhelmingly powerful reasons why Germany should not invade Russia. Britain is undefeated; the whole of Europe has already to be policed and supervised; the total reorganisation of Russian agriculture and industry is whole-time work even in peace, and Germany is not at peace. Moreover, a campaign now, however quick, might interfere disastrously with a harvest upon which Germany is relying for much of next year's fodder. The only safe assumption for Britain is that the next attack will probably be launched against this island. Nevertheless, the facts must still be explained. Hitler does not indulge in the very heavy expense of large-scale troop movements just to give Stalin a friendly wave over the wall. Rumour has it that the Nazis are demanding the independence of the Ukraine under German management and the demobilisation of the Russian armies in the west. The rumour comes from Berlin, and may be read as part of the usual technique of demanding a ludicrously high price in the hopes of making a merely high price seem moderate. The real terms may well cover a much more modest "business deal"—more deliveries, the reorganisation of transport, the exchange of technicians and the like—and, in the military sphere, joint pressure on Turkey rather than any permission for the transit of troops to the Caucasus. That Stalin will give way on anything but a final provocation is almost certain. The denials of tension contained in the Tass Agency statement—written by Stalin himself?—recall the ostrich policy of other threatened neutrals. The interesting problem is the nature of the final provocation that might precipitate war. But as only Hitler knows how much he will ask and only Stalin how much he will give away, the surrounding world can only wait and see.

The Turks Decide

The Germans have been making good use of the lull in one sphere at least. After weeks of diplomatic pressure and veiled military threats, the Turks have consented to a Pact of Friendship with Germany. The British Government was kept informed of the progress of the negotiations, and the new treaty specifically leaves intact Turkey's obligations to her old ally. The terms—which include a mutual guarantee of the integrity and inviolability of the contracting parties' territory—would perhaps be unexceptionable if the wording of a treaty with Germany ever bore any relation to its real significance and if the ominous condition of further "joint consultation"—further German pressure in other words—was not attached. The Treaty is accompanied by a Note which covers the promotion of economic rela-

tions, and Turkey will, no doubt, shortly return to the vassalage of depending on Germany for some 50 per cent of her foreign trade from which she emerged, with the help of British credits, in 1938. True, the Turks are encircled in the West and Britain has not given a very reassuring military performance in the Eastern Mediterranean. Nevertheless, the Turks have successively failed to fulfil the obligations of the Treaty of Ankara, and it may be questioned whether they would be in their present state of impotence if they had fulfilled the Treaty's terms when Italy entered the war in June, 1940, or invaded Greece in the following October.

Summer Raiding

There has been a break in the enemy's intenser attacks on ports and towns, and the usual questioning has followed. By now, after repeated experience, the thesis that lulls of this sort imply some weakening in the enemy's power to strike does not carry much conviction. It is more likely that these short summer nights are being employed for the periodic reorganisation and tactical adjustment that is now known to be part and parcel of air fighting on both sides. It is a sign of new strength, but not necessarily of any superiority and still less of mastery, that British raids on Western Germany, on enemy-occupied harbours and on the enemy's coastal supply routes—which are vital to his over-pressed transport—have been going on without a break. It is now feasible for British bombers with fighter escorts to range over enemy territory by day, so that, despite the short nights, fairly distant darkness raids are possible, in addition to the "sweeps" over near-by objectives which have become familiar. German raiding has by no means ceased. There has been no real mass attack since the middle of May, but there has been "widespread" activity on many nights, and it appears that, in face of this country's improved defences, the Germans regard it as more profitable and less costly, in their routine operations to make sharp, scattered forays over a wide area against airfields and specific military objectives.

Strength in Defence

Even before this week's announcement about "radio-location," which has made it possible ever since the first Battle of Britain to detect the approach of raiders without permanent fighter patrols, it was plain that the invariable pattern of war, by which offensive weapons soon find an answer, was being repeated. At this stage, the bombers can be promptly found by day or by night, but only in daylight or moonlight can they be shot down in anything approaching deterrent numbers. The chief satisfaction, apart from the promise of still greater successes which the proposed expansion of radio-location equipment and personnel offers—which, it is to be hoped, does not mean that, up to now, there has been any delay or lag in bringing these devices into large-scale production and use—is that the German defences do not yet seem to have found any similarly effective reply to raiding. By day and by night, the balance of losses is comfortably in favour of the RAF, though the current margin is in no way decisive, and it is reasonable to look forward to the second Battle of Britain with some confidence. The points which are being piled up by the RAF in these quieter rounds do not remove the likelihood that the enemy will still try again for a knock-out; it is the chief secret of the Germans' successes that they will court and bear great losses to attain an objective. But this will only be when the *Luftwaffe* can hope for rein-

forcement from invading troops or when the steady pressure of the Atlantic blockade is believed to have enervated this country. If no chance is taken in any defensive detail, if the fate of the Cretan airfields is studied and if Anglo-American co-operation on the Atlantic fulfils its hopes, the attack—which would be the real *Blitzkrieg*—will fail. But easy *a priori* arguments against the practicability of invasion will not make it impossible.

Losses at Sea

Last week Mr Churchill hinted that shipping losses in May would prove to be better than for many months. Once again, however, late news of further losses is altering the picture, and the expected announcement has been delayed. A passage in the Prime Minister's speech comparing Allied with Axis losses in May seemed to suggest that the former might be about 350,000 tons, and it can be anticipated, though with no certainty or inside knowledge, that the latest revisions may possibly bring the total into the over 400,000 tons range where it has remained during the crucial stages since the winter. It is alarmingly high—if it goes on for any length of time. But there is another part of the forest; the Atlantic is only one battlefield. Mr Churchill's reference to Axis losses was a reminder of the counter-offensive by plane and submarine that is being waged against German and Italian supply lanes around the coasts of Europe. The task of nourishing Axis power throughout Europe and the Mediterranean requires many ships, and the rate of loss, with little or no naval protection, is high. It is give and take, for British naval losses in recent operations have also been relatively high, in cruisers and destroyers; and it is an index of the vast scope and arduousness of the struggle that, since the war started, 46 British destroyers have been lost—against 50 transferred from the United States.

After the Robin Moor

The full story of the sinking of the *Robin Moor* on May 21st has now been established. The attack was perfectly deliberate, for the German U-boat commander knew that the ship was American, that its destination was South Africa, and that it carried no war material. Moreover, the choice of the Southern Atlantic, midway between Brazil and West Africa, for the torpedoing was clearly designed to influence South American opinion and to "call the bluff" of the United States. So far, no action has been taken by the Administration, but merchant vessels may now be armed and the negotiations which are going on over a United States air base in Brazil are obviously relevant. The whole incident suggests a radical change of Nazi policy towards America. It has been generally assumed that it was in the interests of Germany to keep the United States out of the war. Can it be that, despairing of preventing American participation, the Germans are now attempting to force the pace in the hopes, on the one hand, of creating a deep national cleavage of sentiment on the question of belligerency and, on the other, of focusing America's war production on her own needs rather than those of Britain? In any case, a change of policy in Berlin has little significance in Washington. The Nazis are as powerless to bring the Americans into the war as they were to prevent them from giving all aid to Britain. The policy of the United States Government will be determined by the President, and there is evidence this week that he has found a number of new methods of continuing a vigorous undeclared war. The freezing of all Axis credits—amounting to perhaps £100 millions after the recent considerable outflow to other neutral countries—is a rational completion of the freezing of the credits of all occupied countries. It is known to have been discussed for some time, but there was a certain opposition to it in the Administration. This step will put an end to a number of Axis transactions; for example, the buying of goods in the United States for delivery to South America or the financing of pro-State propaganda and sabotage in the United States. This latter activity will also decline as a result of the President's decision to close all German consulates, the German Library of Information and all German travel agencies, and to deport the officials working in them. This step does not constitute the breaking off of diplomatic relations, for the action is taken on the grounds of the various organisations' abuse of their position. If the Germans choose to interpret it as a diplo-

matic breach, they are free to do so. It is clear that the President is leaving it to them to force the issue.

Speaking for Europe

One popular explanation put forward to explain the massing of German troops on the Soviet border is that, since Hitler is ready to announce his United States of Europe any day now and is preparing a "peace conference" at which the "new order" will be formally ratified, he is trying to bring pressure to bear on Stalin to join in this consummation and give an air of greater stability, even if not of greater respectability, to the whole procedure. If the conference is really to occur, then it is only fitting that the real spokesman of the nations of Europe should have had the first say. Mr. Winston Churchill, speaking at St. James's Palace to an assembly of all the oppressed nations of Europe, gave a horrifying, yet sober and adequate, account of the "order" which Hitler may call together the "vile race of quislings" to ratify, and the whole gist of his speech was that "it will not be by German hands that the structure of Europe will be rebuilt or the union of the European family achieved." With this there can be no quarrel. But it is pertinent to ask whether the Allied nations are working on the more positive question of determining how and by whom the structure actually will be rebuilt. There are unrivalled opportunities for discussion and clarification in the presence of so many distinguished Europeans on British soil. Are they being fully utilised?

The Syrian Campaign

Impatience is increasing over the slow pace of the Allied advance into Syria, an impatience which has undoubtedly been fed by over-hopeful statements on the imminent fall of Damascus and Beirut which appeared in the first days of the campaign. The British public are accustomed to the speed of German advances, and it is difficult to convince an audience that has witnessed so many brilliant sprints that the slow pace of the British performers is due to policy and not to lack of skill. The tempo of the Syrian campaign is clearly dictated, not only by a somewhat inadequate mechanical equipment—one observer has reported on the inability of his contingent to advance faster than the marching pace of its infantry—but also by a laudable desire on the part of the Allies to advance by persuasion rather than by force. The result has been that towns such as Tyre and Sidon have been taken undamaged and the processes of Syrian life can continue unhampered once the operations have moved on. Since the British will not only have to conquer but also to hold and develop Syria until the Armistice, it is obviously of crucial importance to secure the good will of the inhabitants, and it is to be hoped that food

Total Assets - - £147,000,000

is coming up behind the Allied forces to increase the general harmony. But the disadvantage of this method is the time it has given the Vichy authorities to rally their officers and to concert on a plan of resistance. The fighting has steadily increased in intensity since the action began, and now the French are launching effective counter-attacks which at Kuneitra and Merj Ayoun have carried them behind the Allied line. Reinforcements are on their way, and the situation is described—rather ominously perhaps—as being “in hand.” The effect of this more vigorous defence must be to modify the Allies’ policy with regard to delay and parley. The fall of Beirut, Damascus and Aleppo would probably bring resistance to an end, and although to combine speed and persuasion would undoubtedly be the ideal, the Vichy officers are not open to persuasion and the men, who are half-friendly, half-apathetic, cannot be reached and persuaded until they have surrendered. The call, therefore, must now be for speed and progress.

Back-Yard Hens

In the House on Wednesday, Major Lloyd George, Parliamentary Secretary to the Ministry of Food, announced an adjustment in the Government’s egg control scheme. The aim of the scheme, to relieve the present acute maldistribution of eggs by the introduction of a uniform ration, is highly laudable. The corollary, that the Ministry must control supplies of home produced as well as imported eggs follows. Before the latest amendment, a difficulty threatened to arise from the fact that producers with fewer than twelve hens could retain all their eggs for their own consumption; producers with more than a dozen birds could only retain an unspecified proportion of their eggs after application to the local Food Office. Clearly, there was a very great danger that the owners of a dozen birds or more—and there are a considerable number of them—would prefer to reduce their flocks to 11 and slaughter the surplus. The only result of the new scheme, therefore, was likely to be that even fewer eggs would find their way to the Government packing stations than previously found their way to the market. The difficulties in the way of the control of slaughtering, or control over the withholding of a substantial number of eggs from sale, appear to be insoluble. They have been abundantly demonstrated in Russia and Germany, where the régimes command a powerful secret police. But now an inducement to producers, both domestic and commercial, to sell eggs to the packing stations is to be provided in the form of an increased price, the difference being met by Government subsidy. Apparently, permission for the commercial producer to retain eggs for his own consumption is to be easily obtained. Major Lloyd George is reported to be anxious to avoid the decrease of any more hens. Allocations of feeding stuffs coupons to commercial producers are, however, to be determined by the number of eggs offered for sale, so that there will be an inducement, in addition to the subsidised price, to send the maximum number of eggs to market. In Scotland, special arrangements are to be made where producers are a long way from packing stations. It is highly satisfactory that the authorities have seen their way to defining the domestic producer on a more generous basis, which now includes as many as fifty backyard fowls. All classes of producers have, of course, the right to sell all their surplus produce to the packing stations, and the adjustment might be accompanied by an appeal to sell the maximum number, on the lines of the appeal to sell home-produced fruit to Government jam-making centres. There was little hope that any scheme could be expected to work which placed the interest of the individual in such contrast to his duty to the State—unless it could at least be enforced by effective control.

* * *

The Problems of Housing

The second day’s debate on civil defence produced a detailed description of the working of the regional machinery, an encouraging account by Mr Ernest Brown of the steps being taken to evacuate the under fives from London, and a most interesting and constructive maiden speech by Mr Willink, who since last autumn has been a deputy-Regional Commissioner in charge of London’s homeless.

His speech underlined what has been becoming apparent since the resumption of heavy air raids in the spring and was brought out in the Select Committee’s Report on civil defence—that building casualties have been out of all proportion to human casualties; that, in fact, the destruction of houses is becoming a major problem. The enormous number of people rendered homeless after a raid was, as Mr Willink pointed out, the most surprising feature of air-raids when they began last autumn; since then London has a system of rest centres, billeting and rehousing which, in most boroughs, is working well. But, even in London, the destruction of houses in some districts has been so heavy that even with evacuation the reserve of accommodation is not inexhaustible. In the provinces, and especially in the smaller towns with a military objective employing the greater part of the working population, the position is more acute. It would obviously be theoretically more satisfactory if the unessential population could be encouraged to leave towns such as these in order to diminish the demands on housing; but it would be impracticable because housing accommodation is already congested enough in the reception areas with former evacuees and the Services. There is, however, a lot to be said for the suggestion that an area of 25 miles or so round a target town should be cleared of all evacuees from other parts of the country, so that accommodation in it can be reserved for the target’s workers in case of need. It is too much to expect such workers to be dealt out among a gradually dwindling number of houses in the town itself. The Ministry of Health might well groan at the thought of another large-scale population movement which a scheme like this would involve, especially where it would mean moving happily settled evacuees. But it would perhaps be better to do it now than to be stampeded into it next winter.

* * *

The Empire’s War Effort

A new stage in the British Commonwealth’s industrial effort seems to have been reached. In the first stage, which was hardly begun a year ago when the fall of France awoke the Dominions to the reality of the danger, munition industries were started and expanded alongside the normal peacetime secondary industries, which were themselves allowed to expand as the import of manufactures from overseas became more difficult. Thus, in New Zealand, the Government continued its public works programme—though with the intention of reducing it *pari passu* with an increase in war expenditure. In Australia, an expansionist credit policy was pursued to begin with, because of the large number of unemployed. But no effective steps seem to have been taken to see that the unemployed were absorbed into war industries; and many new consumption goods industries were allowed to spring up. In the other Dominions, the story is the same. All have been trying to run a war economy and a civil economy on the same level and at the same speed. It is true that the latest Budgets of the Dominions show a greater anxiety to meet the greatly increased war expenditure by taxation. The additional new taxation imposed in the Canadian Budget should increase the tax yield by about 40 per cent in a full year; and by Australia’s supplementary Budget of last December £A31 millions of new taxation, equivalent to an increase of 27 per cent on tax revenue for 1939-40, is to be raised in the second half of the current financial year alone. Yet the increase in the national income of the Dominions has been so rapid that it is doubtful whether taxation is anything like high enough to prevent the fear of inflation—it is certain that it is not high enough to bring about the transfer of men and plant from civilian to war industries. The result is that all the Dominions are now experiencing a shortage of machine tools and a shortage of skilled labour—but rationing is virtually unknown.

*

To state these problems does not imply that the Governments concerned are not fully aware of them or that nothing is being done about them. Mr. Stuttaford, Minister of Commerce and Industries, has warned the South African public of the need for economy in non-essential expenditure and has hinted that steps may be taken to discourage imports from America and Japan. But the most heartening sign of the awakening has, not unnaturally, come from Mr Menzies who, in a broadcast this week, announced stern measures to extend Australia’s war effort. Civil production and consumption are to be overhauled, and civil industry

is to be concentrated on a limited number of essentials. Rail and road transport is to be Federally controlled, and coastal shipping is to be requisitioned. The monthly consumption of petrol is to be further cut from 20 million to 12 million gallons. Strikes and lock-outs are to be prohibited, and vigorous action will be taken by the Arbitration Courts against offending unions and employers. These and other measures are as familiar to the people of Great Britain as the problems they are designed to solve, and it is to be hoped that the Australian example will be followed by the other Dominions. It is in no cavilling spirit or lack of gratitude that criticism of their war effort is made. Britain is aware of the internal political difficulties that all the Dominion Premiers have to contend with; it is not certain, from the news so far, to what extent Mr. Menzies is finding it possible to carry the Australian Labour opposition with him in the national effort he has announced. It is only too obvious that Britain herself has set far too slow a pace. But it can legitimately be urged that the Dominions should forget all about their industrial output of 1914-18, comparisons with which seem to blind them to what is needed in this war and what can still be done.

* * *

A Plan for Building

There are indications that the Ministry of Works and Building, under Lord Reith as the Minister and Mr Hugh Beaver as Director-General, is facing its task of making the best of available resources in operatives and materials. The chief difficulty is the shortage of labour rather than the scarcity of bricks and cement. The industry’s labour force has been reduced from 1,350,000 to 750,000 since the outbreak of war, but it is hoped that its present resources will break of war, but it is hoped that its present resources will enable it to carry out a programme involving the expenditure of some £350 millions per annum. As a first step, it has been necessary to relate the building programmes of the various Government Departments to the limits fixed by the industry’s capacity, and, in order to prevent unessential civil building—which is, apparently and rather surprisingly, still possible—the licensing system is to be tightened. Secondly, the Ministry of Works and Building is now taking steps to ensure that the year’s output of the building industry will in fact reach the target figure of £350 millions. The application of the Essential Work Order is designed to prevent a further depletion of the labour force in building and civil engineering, to reduce the heavy turnover of operatives within the industry, and to stimulate the output per man. Thirdly, the Ministry aims at increasing the mobile corps of operatives, available for dispatch to any part of the country at short notice, from some 5,000 to 100,000 men. So far as this side of the Ministry’s activities is concerned, it has shown commendable initiative. But the programme has yet to be carried out, and much remains to be done to adapt the organisation of the building industry to the present emergency by making the methods of contracting more apt and orderly.

* * *

Fighting Round Sollum

Fighting has suddenly flared up on the Egyptian frontier, and it is not the Germans who have taken the offensive. On June 15th the British forces near Sollum attacked the town without success, but the British thrust developed to the south of the town and, fighting their way along the top of the escarpment, some units reached Fort Capuzzo. Then the Germans brought up heavy reinforcements, and after a day’s furious fighting, the British forces withdrew to their original positions, taking some hundreds of German prisoners with them. Both sides claim a victory, and since it is not possible to say what General Wavell had in mind in launching the attack, it is equally impossible to judge whether he obtained the desired results. Presumably it was an attack of the kind that led to the fall of Sidi Barrani. This attack was launched last December in order to disturb Italy’s advance guard and to test the strength of the defences. Its unexpected success led the British Army, by a series of sorties and sieges, to Benghazi. On this occasion, the attack probably succeeded in its original purpose—that of disorganising the enemy and securing information—but there was no unexpected victory to open up vistas of further successful offensive action. The British, therefore, retired with their prisoners, leaving the Germans

to reorganise their advance positions—a costly business, since it has to be completed hundreds of miles from the nearest base.

* * *

The Slippery Slope

The troubles of the Tobacco Controller multiply, and the fact that the present uncontrollable situation might have been prevented, or at least held within limits, by appropriate action on the part of the tobacco companies or the authorities many months ago, is now scarcely relevant. There is a “run” on the shops, and the classic way of dealing with a run, that is, to let the stampede have all they want, in order to restore their confidence in supplies, is not succeeding. Stocks, in fact, are running down with alarming speed. It must almost appear to Mr Maxwell, who has released tobacco in record quantities, that demand is a bottomless pit; and, since something will have to be done about this runaway movement—still greater quantities of tobacco cannot be imported—it is opportune to ask whether the possibility of rationing should not be reconsidered. Because a large part of the population does not smoke, a basic ration for every individual would mean a large trade in coupons; but it would ensure a minimum supply, albeit a small one, for every smoker—which is not guaranteed in the present scramble. The idea of a ration “group,” in which tobacco and cigarettes would be included with chocolate and sweets, has also been suggested. It is difficult to estimate how the demands for these diverse commodities would balance; and chocolate and sweets are foods which, up to a point, should be reserved for children—who do not smoke. At any rate, the problem is plain—to keep consumption back to near its pre-war level and to ensure that some tobacco or cigarettes will be available for every smoker. The present policy of feeding demand—even using precious shipping space to do so—is failing; the suggested prohibition of tobacco for women is absurd and unfair; and the continued presence of tobacco advertising, designed to stimulate demand, is ridiculous.

* * *

Tax-Free Incomes

The full text of the amendments to the Finance Bill affecting tax-free incomes is not yet available, but the explanatory White Paper (Cmd. 6283) and the Chancellor’s statement introducing the necessary resolution make the proposition sufficiently clear. Free-of-tax payments, under pre-war contracts, in respect of alimony, annuities under wills and settlements, salaries, and interest so arranged as to yield a fixed net amount after deduction of tax are to be fully satisfied by provision of the gross amount necessary on the outbreak of war, when income-tax was at 5s. 6d. in the £. So far as these payments are to be made from a fund already taxed, only the net payment has to be made to the beneficiary, who can, however, recover tax to the extent that he is not liable to the full rate. This means, in effect, that the recipient of £1,000 net in pre-war days will now

INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

receive £689 13s., the difference representing tax at 4s. 6d. in the £—the wartime increase—on his pre-war gross income of £1,379 6s. In general, the amendment does not apply to payments which are tax-free only up to a prescribed limit, nor does it apply to any tax-free dividend. Nor are the tax-free payments of building societies brought under control, since other means exist of dealing with them. Payments, other than those out of a taxed fund, are mainly salaries and wages. In this case, the principle is the same, and the employer discharges his bargain when he has met the tax charges which would have been due had the rates of income-tax, and of personal allowances, of 1938-39 and the sur-tax rates of the preceding year still been in force. This appears to mean that a married man with two children, in receipt of £1,000 net pre-war, will now receive some £780, together with the right to a refund after the war of about £55. The reasons for the exclusion of dividend payments from the reform are discussed in a note on page 830.

Shorter Notes

Particulars were given in the Votes of Credit 1941-42 White Paper of the numbers employed by the various war ministries, other than those responsible for the fighting services, on March 1st last. The largest staff is employed by the Ministry of Food, which employs 4,822 persons at headquarters, and 23,097 in divisional and local food offices, at an estimated total cost of £4,568,000 in 1941-42. The Ministry of Supply has a headquarters staff of 9,062, and the Ministry of Aircraft Production one of 5,778. The Ministry of Home Security has a total staff of 4,658, including those in regional offices. The Ministry of Information has 1,357 employees at headquarters, 343 in the regions and 609 abroad. There are 31 Press censors in London, 104 assistant Press censors and 20 deputy assistant Press censors. Under the same Ministry comes the Postal and Telegraph Censorship with a staff of 9,187 at home and abroad. The

total salary bill is estimated at £2,704,000 out of the Ministry's total expenditure of £6,195,000. The balance includes an allocation of £2,700,000 for publicity.

The following table gives the number of civilian casualties in air raids since mass raiding began last September:—

	Killed	Injured, Detained in Hospital	Total Serious Casualties
Total Sept.-Dec., 1940 ...	21,669	30,556	52,225
1941:—			
January ...	1,502	2,012	3,514
February ...	789	1,068	1,857
March ...	4,259	4,794*	9,053
April ...	6,065	6,926	12,991
May ...	5,394	5,181	10,575
Totals to date ...	39,678	50,537	90,215

* Amended.

In May, of those killed 2,512 were men, 1,994 women, 753 children under 16 and 135 unclassified. In addition, 31 men, 25 women and 19 children are missing and believed killed.

In the settlement of the libel action brought by Sir Roger Keyes against the *Daily Mirror*, the full story of King Leopold's surrender was revealed to the public for the first time. It appears that the King did inform the British and French authorities that he was about to ask for an armistice. One message was sent both to London and Paris on the morning of May 27th, and another saying that the King was to ask for an armistice at midnight was sent at 5 p.m. the same day. Unfortunately, as all communications with the British Army were cut, the messages did not reach the Commanders-in-Chief. Thus, Sir Roger Keyes, who was special liaison officer to the King, was completely justified in asking for judgment to be suspended, and though King Leopold's dignified attitude since the occupation had already dispelled most of the feeling against him, wide satisfaction will be felt at this confirmation of his integrity.

THE WORLD OVERSEAS

Difficulties at Ottawa

[FROM OUR OTTAWA CORRESPONDENT]

May 23rd

THE Federal Parliament has been occupied with the committee stage of the Budget, but once the Budget is disposed of, very little business remains. Mr Mackenzie King, however, has intimated that Parliament will not be prorogued but will adjourn; it is presumed that if the Senate of the United States ratifies the American-Canadian treaty about the St. Lawrence Waterway he intends to bring back the Canadian Parliament at once to give the necessary endorsement. The Opposition groups have been criticising details of the Budget. Mr Hanson, the Conservative Leader, has

taken strong objection to the imposition of Federal succession duties in addition to provincial duties of the same kind; there was also a concerted attempt to exempt farmers and fishermen from the 3 per cent per gallon tax on gasoline, but the Minister of Finance has stood firm against any concessions. He has secured the acquiescence of most of the provincial Governments for his proposal that, in return for adequate financial compensation, they should withdraw for the duration of the war from the field of personal and corporation income taxation, but the Ministries of Ontario and Alberta are likely to withhold their consent.

The King Government is discovering that its attempt to maintain friendly relations with the Vichy Government is involving it in increasing embarrassment. Popular pressure in the English-speaking provinces for the dismissal of M. Ristelhueber, the representative of the Vichy Government at Ottawa, has been intensified by the news that a number of Canadians, who are survivors from the torpedoed freighter *Portadoc*, are being detained in French Guinea. About this a strongly worded protest has been sent to Vichy, and reports from Ottawa assert that the staff of the French Legation has made preparations for an early departure.

The Canadian Dairy Products Board announced on May 22nd that all cheese produced in Ontario and Quebec is until further notice to be exported to Britain; as these provinces produce 85 per cent of the cheese made in Canada, this order means that, until large shipments have been made to Britain, no new cheese will be available to domestic consumers. Officials at Ottawa have explained that there is sufficient cheese in store to meet the immediate domestic needs of Canada and that the rationing of cheese for the purpose of reducing home consumption will only be decreed if some difficulty arises in providing the 112 million pounds of cheese promised to Britain.

Given below are data about the weekly economic index

of the Bureau of Statistics and some of its major components:—

Week Ended.	Car-loadings.	Wholesale Prices.	Bank Clearings.	General Index.
May 11-40.....	83.9	82.8	100.5	106.2
April 26-41	98.9	86.4	109.6	111.3
May 3-41	98.1	86.7	110.8	111.4
May 10-41.....	97.9	86.9	101.3	109.8

In April the output of steel ingots reached a new monthly high record of 190,199 tons, which was about 43,000 tons more than the figure for April 1940; for the first four months of 1941, the total output of steel ingots was 725,693 tons, compared with 591,625 tons in the same period of 1940. New industrial plants, built to turn out war materials of various kinds, continue to come into operation at intervals, and the Government has lately announced plans for the construction at Windsor, Ontario, of a large new plant for the manufacture of machine-guns for aircraft, which will cost about \$8 millions and employ some 3,000 workers. There is a tremendous demand for aluminium products for the manufacture of aeroplanes, and, as the result of the new agreement between Canada and the United States for close co-operation in their industrial war programmes, the Aluminium Company of Canada has received from the United States orders for some \$63 millions of aluminium products and will have to enlarge its manufacturing facilities to take care of them.

All the shipyards in the country are working at full capacity, and a demand for raw materials is being created by their activity. The shortage of steel is being met by imports from the United States, but plans are afoot to expand the productive capacity of one of the large steel enterprises of the Dominion Steel Corporation, which has

rolling mills at Sydney, Cape Breton. The forestry industries continue to fare well; in April the output of the newsprint mills amounted to 279,996 tons, compared with 275,769 tons in March and 268,000 tons in April, 1940.

Portugal Restricts Illicit Exports

[FROM OUR LISBON CORRESPONDENT]

June 12th

HEAVY fines on first offenders, with further offences punished by expulsion from Portugal for six years—these are the penalties henceforward exacted for the export of merchandise not covered by official licence. Comprehensive and severe, the new decree affects all who initiate such transactions, and brokers, transporters and merchants. While this decree gives yet more evidence of Portugal's determination to forestall both local scarcity and unneutral transactions, it must be remembered that there is one dangerous leak in the Allied blockade that cannot be checked. This is the sending to Germany of small lots of rare metals, commercial diamonds and the like, conveyed in personal luggage by Clipper passengers from the U.S.A. and re-shipped by German or Spanish air services from Lisbon. It may be only a trickle, but, according to report, it is fairly continuous, and the leak must be sought, and stopped, elsewhere than in Portugal.

American Preparedness

Business and Defence

THE distinction between the full emergency proclaimed by the President on May 28th, and the limited emergency proclaimed when the war began, is not very sharp. The powers of the President deriving from the proclamation of a limited or a full emergency are supplementary to the also not-too-well-defined powers of the President as Commander-in-Chief of the Army and Navy. It is perhaps adequate to say that these powers are "extensive," without trying to define them legalistically. Persons familiar with the late Lord Tweedsmuir's "Augustus" will recall that he laid less stress upon the various specific offices conferred upon Augustus than upon his *auctoritas*—a rather vague but extremely real concept. The American Presidency provides an analogy, as American history has repeatedly illustrated. The declaration of an emergency is itself an executive act, requiring no ratification by Congress, and is in no way comparable with rather similar provisions in various European constitutions, such as proclamation of a "state of siege" or suspension of the Constitution. It is rather an affirmation of the *auctoritas* of the Presidency.

It is in the economic and industrial field that *auctoritas* is most needed. In its fits and starts, the change-over from a peace to a war economy in America reflects the state of neurosis which afflicts every country on the brink of war. Great Britain passed through the same ordeal two years ago. America is sharpening its sword. But progress is uneven; there are huge Government appropriations for expenditure on home defence and on equipment for Great Britain; but current expenditure on defence still represents little more than ten per cent of the growing national income. There has as yet been no reduction in the output of consumption goods, while the unemployed are still counted in millions. The output of motor-cars and lorries, ordinary civilian and commercial vehicles, for instance, during the first three months of this year, was 1,494,000, against 1,260,000 in the corresponding period of 1940, and 1,017,000 in 1939.

The state of business opinion some weeks ago is reflected in the results of a ballot addressed to important "executives," published in the May issue of *Fortune*. Some 40 per cent of these executives hold that the armament programme must go forward with all possible speed, and must take precedence over "business as usual." A further 50 per cent thought that, while the programme must be pressed forward vigorously, it should be carried out with "a minimum of disruption of our ordinary domestic economy." Of the remainder, 9 per cent took the view that there was "an exaggerated emphasis upon building more arms than we are ever likely to need to protect our interests."

The same business executives were asked to state

ALLEGED CAUSES OF DELAYS IN ARMS PRODUCTION	%
1. Methods of placing government orders, red tape, delays ...	43.5
2. Long-standing lack of mutual confidence between government and business ...	41.8

The Bank undertakes general banking business and with its numerous branches offers special facilities in Canada, Newfoundland and the United States.

whether they were critical of the progress of defence preparations, and how they would rate certain factors as contributing to the difficulties. The principal factors enumerated and the proportion of the total number of executives approached listing them as major causes of the difficulties are shown on the previous page.

These figures, which speak for themselves, derive some authority from the fact that the ballot was addressed (a) to the presidents of all the businesses rated AAI by Dun and Bradstreet, (b) to the directors of the 750 largest corporations, owning together some 52 per cent of America's corporate assets, and (c) to business executives whose salaries are at a level that assures that each of them is a person of high responsibility.

Labour and Production

Inclusive of relief workers, the number of unemployed at the end of March last year was 8,500,000. During the twelve months ended March, 1941, the number of employable persons has increased by about 500,000; the fighting services have absorbed 885,000; while employment in civil occupations, other than agriculture, has increased by about 2,365,000. The number of unemployed at the end of last March—the latest figures available—was therefore about 5,750,000. This total includes the 1,767,000 WPA workers, of which 70 per cent are engaged in urgent Government work, such as the construction of aerodromes and roads. In view of the short month worked by WPA, it is estimated that some 750,000 persons, on full time, could carry out their present tasks. On this assumption, the number of unemployed may be put at 5,000,000 rather than at 4,000,000. If allowance is made for seasonal unemployment and for persons "between jobs," the number may perhaps be reduced to 3,500,000.

OXFORD UNIVERSITY PRESS

The unemployed "reserve" is thus still very large. And, in estimating the country's potential, allowance would have to be made for the much greater employed "reserve," that is, the many millions still engaged in occupations that would be unessential in a genuine war effort. In contrast to the country's enormous reserve of labour in general, however, there is a shortage of skilled labour in a number of essential munition industries. Skilled labour is moving steadily to the defence industries, but not quickly enough, and re-training programmes are in general designed to meet immediate needs only.

The strike epidemic continued in May and early June. The bituminous coal strike was scarcely over when the shipbuilders of the Pacific Coast walked out; and this was followed by a strike in one of the largest aeroplane factories. Each of these could be described as a key industry; and it is in the key industries that a strike offers the most positive prospects of success. The output of aircraft is reported to have shown a decline in May and the strike of machinists in the shipyards of San Francisco has been holding up the expansion in shipbuilding in that area.

Last week, however, when the country seemed threatened with the stoppage of work in the greater part of the aircraft industry, the Government took action by sending troops to take over a plant in which an unauthorised strike was in progress. As a result of this step and the growing indignation of the public, most of the disputes in progress have now been settled. Among the more important strikes, only those of the machinists in San Francisco—against the will of the union officials—and of the lumber men in the north-west still continue. The declaration in support of the President's foreign policy, made by nearly 100 officials of the AFL and CIO on June 16th in Washington, may possibly presage an abatement of the strike epidemic.

One of the factors, not necessarily the only or the chief one, behind the unrest that expresses itself in the demand for higher wages is the reports of first quarter corporate earnings. For example, a broad tabulation compiled by the Federal Reserve Bank of New York reported an increase of some 16 per cent over those of the first quarter of 1940. This figure comes under the general heading of pure statistics, since the companies reporting were quite in the dark as to the amount or nature of the taxation to which they will this year be subject; but it was given wide publicity and fed the general impression that business is making enormous profits out of the war. The statistics show that corporate profits in the first quarter of the year were some 10 per cent above the first quarter of 1937. The stock market averages are at present about half the level of the first quarter of 1937, which—for what it is worth—indicates that the investor regards those profits as somewhat academic in character.

The inception of a large munition programme has led to an enormous increase in the demand for machine and other tools. Exports have been reduced, though Great Britain is still an important overseas customer. Despite the rapid increase in production, delivery dates are lengthening and holding up the progress of the defence programme. The following table shows the increase in the number of days required for the delivery of various tools, between September, 1940, and April, 1941, as reported in *Business Week*:

Products	Delivery Time (No. of Days) Sept., 1940, April, 1941	Products	Delivery Time (No. of Days) Sept., 1940, April, 1941
Ball and roller bearings	14 55	Lathe chucks	11 42
Coated abrasives	10 15	Light machine tools	18 90
Drill chucks	12 50	Mechanics' hand tools	12 52
Drop forged wrenches	10 32	Milling cutters	19 60
Electric tools	10 33	Precision tools	60 160
Files	14 44	Taps and dies	13 68
Grinding wheels	14 31	Twist drills	12 60
Hacksaw blades	12 30	Vices	14 38
Hoists, electric	17 44	Welding equipment	14 20
" hand	13 24		

There is a vast store of general purpose machine and other tools in the motor and other industries. Part of these could be transferred to the munition factories. Some of them have been so transferred. But, so long as the output of consumers' goods is maintained, the greater part of this store will not be available for defence work. The motor industry has promised a substantial contribution by its decision not to change its models next year. But the need for speeding up output and the transfer to the munition factories of existing tools remains urgent if the arsenals now under construction are to be equipped in good time.

THE BUSINESS WORLD

Shipping Shares Prospect

WITH the completion of the requisitioning of all ocean-going tonnage, except tankers, early in 1940, the shipping industry entered a new regime. For normal profits, there was substituted a guaranteed rate of earnings, divorced from freight rates, and dependent, in only a very limited degree, on operating costs. The terms allow, normally, a 10 per cent return on the capital value of the ships owned; 5 per cent for depreciation—6 per cent for tankers—the normal rate, and 5 per cent for interest. But a stable guaranteed income is dependent on maintaining fixed assets, and ships are to-day more liable to destruction than any other industrial property. Shipping losses, occurring at a rate between 5 and 6 million tons gross per annum, dominate the present and the future earning power and financial position of the industry; in the absence of information as to the individual ships sunk, they also obscure the outlook for individual shipping companies. Thus, the speculative character of the industry has been increased by the war, as was inevitable. The recent upward swing of Stock Exchange prices reflects the announcement of improved profits and the resumption of ordinary dividends in the case of Cairn Line and the Union-Castle Company. Two swallows do not make a summer, however, and the known facts of the complex situation should be examined carefully before it is concluded that shipping will do well out of wartime Government requisitioning.

The treatment of the "liner" companies under the scheme differs substantially from that accorded to "tramps." Liners are paid so much per ton, to cover running costs borne by shipowners, and a separate sum for interest and depreciation based on the cost price of each ship. The interest and depreciation allowances for a tramp ship are included in the scale of payments for operating costs and are determined according to the average cost price of each vessel of its particular size. The effect is obvious. A liner company, such as Union-Castle, owning a highly efficient fleet of new or newly reconditioned vessels, receives an allowance based on their actual value, whereas a tramp fleet of ships, built at the high prices of the immediate pre-war years, may receive much less per ton and thus be unable to provide full depreciation as well as a return of 5 per cent on the capital represented. The position of these tramp ships may, however, be improved as a result of negotiations recently begun.

As stated, full requisitioning began early in 1940 and, in consequence, reports dated prior to December 31st last are liable to give a misleading picture of the effects of the change. For this reason, and owing to its disproportionate size, the figures of P. & O. are excluded from the total in the table overleaf. The preference capital of the five liner companies amounts to £2,965,000, while the whole capital of the tramp concerns is of one class. Particularly in the case of tramp shipping, 1937 was a boom period—the first year of prosperous trading since the 1929 crash. It is a more reliable standard for comparing shipping earnings under requisition—liner and tramp—than 1939, during which the imminence and outbreak of the war affected different companies in varying degrees. The Chamber of Shipping's index number of shipping freights for 1937 was 131.5, compared with 100 for 1929 and an average of about 78 during the intervening years. The Chamber estimated that in the three years 1936-38, and particularly as a result of improved freights in 1937, tramp earnings were almost sufficient to provide depreciation for those years and to make up the £10½ millions arrears of depreciation accumulated during 3½ years of depression. It may be estimated that the earnings of 1936 and 1938 covered a year and a half of arrears, and those of 1937 the remaining two, besides current depreciation in each case. Thus, the 1937 earnings might be

estimated roughly to represent 15 per cent on the average capital value of the tramp tonnage existing at that period. The four tramp companies given in the table showed a drop in profits compared with 1937 of 10 per cent. Liner company earnings in 1937 were on a smaller scale, as there is always a time-lag between improved trading and increased Conference rates which does not occur in the case of open-market freights. The average dividend distributed in 1938 by twenty-eight liner companies, owning over five million tons gross, was 4.79 per cent on the paid-up capital.

It will be seen that each of the companies covered by the tables has shown greatly improved earnings in 1940 over those of 1939, while the liners have been able to improve on their 1937 profits. The average ordinary dividends paid for 1940 were 5.4 per cent in the case of the liner companies and 9.0 per cent in the case of the tramp; the latter compares with 6.9 per cent for 1938 and 9.1 per cent for 1937. In view of these figures, a certain optimism is, perhaps, only to be expected, but it is as well not to read too much into them. They may prove to be an exceptionally

EXECUTOR AND TRUSTEE BUSINESS CONDUCTED

COMMERCIAL SERVICE

The Bank has over 380 Branches in Africa, and Agents and Correspondents throughout the world. The closest touch with Trade and Industrial conditions is maintained, with special attention to Commercial and Credit Intelligence. This service is available to Exporters, Importers and others wishing to develop trade with South, East and Central Africa.

favourable sample, and it is disclosed that the good results of the largest of the five liner companies, Union-Castle, owes something to the inclusion of taxation allowances from the previous year. As they stand, and with all allowances, the effects of the first year of control would seem to give shipowners no ground to complain of the current return on their capital. Indeed, the result seems a good deal more generous than was expected, although in view of the searching examination of the figures on which the requisition rates are based by the Ministry of Shipping accountants and statisticians, it is unlikely that the earnings of the industry as a whole will exceed the intended 10 per cent.

If the year's revenue has been much in excess of recent earnings, a different picture is presented by the balance-sheet figures. Here, rather than in the profit and loss accounts, is seen the effect of war on the prospects of the industry. In the case of both liner and tramp companies, the changes in the past year have been startling. During the year, the book value of fleets owned fell by £2,753,000 for the liner companies, while free investments, at £1,915,465, were more than trebled. Also, while appropriations from profits to reserves and depreciation were a mere £256,000, total reserves increased by £1,672,000. It is not apparent that these companies have suffered more heavily than most, and it seems only too probable that, as the accounts coming forward cover more and more of the period of intensive sea warfare, the tendency for assets to be transferred from ships to Government securities will be accentuated. The tramp ships do not show so great a change, but the tendency is the same. For both classes, there exists, in addition to the rise in investments shown, the portion of the insurance money which is retained in the Government pool, available only for replacements, while cash holdings have risen on the year.

Finance and Banking

Big Treasury Deposit Payments

The banks have, this week, been called upon to pay the Treasury £40 millions in the form of deposit receipts. Of this total £1,000,000 has been collected from Dominion central banks and the remainder from the usual rota of clearing and Scottish banks. The total exceeds by £25 millions the nominal total of this week's maturities of TDR's, and the excess of payments was probably larger than this as a result of prior recalls of TDR's by the banks for investment of the proceeds in Government issues. These considerable payments have dominated the money market situation this week. That substantial demands would be made on the banks this week was foreshadowed by last

week's Bank return, which showed public deposits at the exceptionally low figure of £7,040,000. As the current payments for Treasury bills exceeded maturities by £10 millions, the receipts from floating debt borrowing have been sufficient to ease this position, and by last Wednesday the total of public deposits at the bank had recovered to £9,810,000—still a sub-normal figure. The banks, faced with heavy TDR payments, have been somewhat diffident buyers of bills, and though there has been enough money to serve all the needs of the market, there has been no real abundance of funds. The semi-official competition for bills at last week's tender was exceptionally keen. Total applications reached £166,490,000, and to ensure the satisfaction of their requirements the semi-official applicants had to tender at

£99 15s. The result was that the average rate of discount fell to just below 1 per cent for the second time since the beginning of the war. The market, which tendered at the usual price of £99 14s. 11d., obtained only 26 per cent of its applications.

Clearing Banks in May

The clearing bank returns covering the month of May are of particular interest in that they reflect almost to the full the effects of London's War Weapons Week, both on the total of deposits and on the distribution of assets. The public's withdrawal from deposits for investment in Government issues, which must have been considerable, has been largely offset by other factors in the credit situation, notably by the continuance of a current deficit which, taking the month as a whole, was greater than the income obtained from public subscriptions to Government issues in the whole of that period. Thus bank deposits are down by a mere £4,564,000 to £2,824,011,000, and even this small mere movement is largely accounted for by the reduction of cheques in course of collection. It may reasonably be assumed that, but for heavy public subscriptions to Govern-

ment issues during the month, the trend of banking deposits would have continued its steep upward course last month. The banks' own direct participation in War Weapons Weeks—particularly in London's effort—is largely shown in the rise of £28,626,000 in investments. The banks' subscriptions in the London week may have been greater than this, for a few of the clearing banks made up their May balance sheets a few days before May 24th, the end of London's week. A sub-drop of £10,708,000 in advances carries the reassuring suggestion that the public's subscriptions to Government issues were not swollen by funds borrowed for that purpose from the banks. It is interesting to note that the clearing banks' Treasury deposits rose over the month by £8,000,000, while the surplus of new money thus issued over maturities during this period ought to have been in the neighbourhood of £40 millions. It follows that an appreciable part of the banks' participations in the Government's longer-term issues during the month was in fact made by the anticipatory recalling of Treasury deposits.

Axis Assets in the United States

The U.S. Treasury order freezing the assets of all European Continental countries is clearly aimed at the Axis powers. It supplements the immobilisation of assets of all invaded countries which was put into effect by the U.S.A. immediately on the invasion of each country concerned. The details of the assets attached by these earlier U.S. Treasury Orders are as follows:—

	In Million U.S. Dollars.			Total
	Bullion. Currency and Bank Deposits	Securities	Other Assets	
Netherlands.....	700	796	123	1,619
France	988	448	157	1,593
Belgium	442	251	67	760
Norway	100	54	21	175
Denmark	55	27	5	92
Roumania	46	2	2	53
Luxembourg	30	16	2	48
Latvia, Lithuania, Esthonia	26	2	1	29
Total	2,387	1,596	386	4,369

The extension of the freezing order to all Continental countries—neutral as well as belligerent—is intended to make the control of Axis assets in the United States more effective than it would be if neutral nominees remained free to dispose of German and Italian assets. The neutral countries, Finland, Portugal, Spain, Sweden, Switzerland and the U.S.S.R., will in principle be granted general licences to deal with their dollar assets. But one may rest assured that these licences will be granted, and operations under them allowed, subject to close scrutiny and supervision. There is already ample evidence at the disposal of the American authorities to show the extent to which Axis funds in the United States have, during the past few months, been clothed with the harmless guise of neutral nominee accounts. Owing to these operations and some transfer of Axis funds to South American countries, it cannot be expected that the net of the freezing order will catch any particularly large fish. Official U.S. statistics show that, at the beginning of this year, short term German assets in the U.S.A. totalled \$6,700,000 and Italian assets \$17,900,000. These totals are, within a few thousand dollars, the same as those outstanding in September, 1939. Over the same period, however, Swiss short-term dollar assets have risen from \$299,900,000 to \$508,400,000. If the freezing order is to attach Axis assets approaching the figure of \$400,000,000 which has been mentioned in the United States, it must in large measure be aimed at direct German and Italian investments in American industry including patent rights such as those held by I.G. Farben Industrie.

Axis Counter-Measures

The German and Italian counter measures have followed as a matter of course, and both countries have now issued orders to freeze American assets. These ripostes are decidedly weak. The nominal figures of assets involved may be impressive, but they are funds which for many years past have in fact been effectively frozen by the exchange control in the two Axis countries and, in particular, by the Standstill Agreement with Germany. For the most part, these assets have been written down to something approaching zero. The loss on them was accepted years ago, and the final act of freezing or even sequestration would leave matters very much where they are already. That would certainly be true of the \$60 millions odd of German Standstill credits owed to U.S. banks. In every case these have been written down to nominal figures. If, however, account is taken of American investments in European countries, now under German control, it must be admitted that the scope for retaliatory action on the part of the Axis powers is considerable. This fact is a token—one of many—of the earnestness behind the United States' help to the Allied cause.

British Help for U.S. Treasury Move

An interesting illustration of growing technical collaboration between the American and British Treasuries was provided on the morrow of the move to freeze Axis assets in America. At the request of the British Treasury, the Bank of England informed banks in this country last Monday that, until further notice, no U.S. dollar balances held on behalf of persons not resident in the sterling area may be drawn on without prior permission of the Bank of England. Banks have also been required to refer to the Bank of England before carrying out any instructions regarding securities held in the U.S.A. on behalf of persons not resident in the sterling area. These instructions dovetail effectively into the Washington freezing order—which, it will be noted, does not affect British assets. They ensure that the freezing order is by-passed by instructions to that the dollar accounts emanating from London. It is highly improbable that this would in fact occur, but the instructions given to British banks make assurance doubly sure in this respect. It may be assumed that the collaboration between the Treasury authorities in the two countries has gone to the lengths of a detailed exchange of information on black lists and other items of economic warfare intelligence.

Sterling Area Dealings Restricted

A further tightening of the sterling exchange control screw occurred this week. From last Monday, all transfers of funds from the United Kingdom to other parts of the sterling area were made subject to the same degree of control

as transfers to countries outside the sterling area. The loopholes which the new measures are intended to close arise from the fact that the system of exchange control is not altogether uniform throughout the sterling area. Thus, such freedom as existed in transferring funds from one part of the sterling area to another might conceivably be the means of an ultimate leakage of sterling through the exchange control into one of the remaining "hard currencies." All transfers of sterling from resident to non-resident accounts—whether the non-resident was in the sterling area or outside it—have of course been subject to the control regulations. But the latitude given to banks in authorising transfers to sterling area countries has been rather greater than in the other cases. This will no longer be the case. In particular,

transfers of sterling from a United Kingdom resident to a sterling area country will only be allowed if the transfer is made to the account of a person resident in that country. For a transfer of sterling to a non-resident account the permission of the authorities in the sterling area concerned will be necessary. The only general exception to this rule will be in respect of transfers from non-resident sterling accounts held in the United Kingdom. The kind of operation at which this tightening of the regulations is aimed is the transfer of sterling to non-resident accounts as an indirect means of making remittances from this country to dependants evacuated to the United States and Canada. A fair-sized trickle of such remittances has been making its way through the meshes of the exchange control.

Investment

The Rate of Interest

The recovery, mentioned in *The Economist* a week ago has continued on a wider basis. To the search for yield, there have been added two new factors, namely the belief that a further Government issue is imminent, and the re-emergence of speculation on a moderate scale. By the latter, it is not intended to infer that gambling on daily movements is in full swing—such a policy is scarcely possible with all business done for cash, nor is the volume really large—but rather that there has been a good deal of buying which is based on faith instead on a reasoned assessment of the outlook. Probably this is best read as a reflection of pressure of savings and a search for means of augmenting gross incomes rather than as bred of a firm conviction that the outlook is greatly improved. As to the prospect of a Government issue it is not unreasonable to suppose that, sooner or later, the existing tap issues will be suspended and new ones substituted which reflect the improvement during the past six months in the long term rate of interest. A circumstance which must be borne in mind is the fact that, while the long term rate has fallen, there is little or no change perceptible in the rate for short dated bonds. Evidently the existing issues cannot rise above the "tap" price, but the old National War Bonds, 1945-47, continue to be quoted at 100 middle. With a closed capital market all things are possible, and no doubt the banks would accept an even less favourable alternative to Deposit Receipts than the existing bonds, while the small difference in yield would, perhaps, make little difference to other investors. Certainly, if such an expedient improved the market for the old bonds, the Treasury would have achieved a very considerable gain. Whether such an issue does in fact come, or whether, as is suggested, there is an operation to fund floating debt, the fall in the long term rate of interest will continue to effect an upward pull on all prices. It is the demand for these stocks rather than the short term rate established which, is of direct importance.

* * *

Tax-Free Dividend Decision

No surprise will be occasioned by the decision of Sir Kingsley Wood not to include tax-free dividends within the scope of his legislation restricting the full application of contracts for payments free of tax. It is rather the exact words he used—as having possibly a wider application—than the mere fact of the exclusion which are important. The object of the new legislation is to reduce inequalities of sacrifice, and it expressly excludes from its purview any contract entered into after the outbreak of war. Actually, the tax-free dividend payments concerned affect only a few preference shares—it is purely a matter of convenience whether an equity payment is made tax free or less tax—and the probability of war was largely discounted in the price of these shares long before hostilities commenced. In any case, there was always a means of escape for the holder in a sale at the market price, and it is definitely reassuring to find the Chancellor of the Exchequer reaffirming the validity of the market's contention that its estimate of worth is normally the best criterion on which to base the value of a security. It would completely undermine the basis of dealings if it were to be conceded that the Treasury—or any other department—had the right to vary terms of contract at will in cases where there exists a ready means of escape if the price appears advantageous. As to the contention of Mr Pethick Lawrence and others that tax-free contracts are

against the public interest, much can be said in its favour, but, unless one is prepared to support the principle of punishing those who obey a law which is found to be against the public interest, their comments are not germane to the discussion.

* * *

An Important Achievement

The reception accorded to the reforms proposed for the stockbroking profession of the country by the London Committee was last mentioned in *The Economist* of May 3rd. In the month to the date of their coming into force, that is June 1st, progress was slow, and the effect of certain clauses concerning country jobbing was deferred until Saturday last, in order to give the Associated Stock Exchanges time for one more meeting and for the necessary communications to the individual committees and to London. This postponement has been used to such good purpose that it is now possible to claim that agreement has been reached with the whole stockbroking profession outside the Provincial Brokers' Stock Exchange. Owing to its character and the course of events, it was difficult, if not impossible, for the representatives of the PBSE to secure anything like unanimity among their extremely scattered membership until the position of the Associated Exchanges was fully defined. Even now, the task is likely to be difficult, if only because the interests of individual members, at least in the short run, differ widely. It is, however, difficult to imagine that the more long-headed among them will, for long, fail to see that the attractions of achieving the same status, as is given by the reforms to all participants, outweigh the inconveniences arising from necessary changes in methods. With the adhesion of all the "Associated" exchanges, there can be little doubt that the aim of the reforms has been achieved. From now on, all members of recognised exchanges will have a common standard of behaviour, which it will be possible to enforce and to improve as occasion demands. This is a step for which the more enlightened members of the profession have been working for many years. It should benefit the investor not less than themselves, and is an achievement on which those responsible merit warm congratulations.

* * *

Courtaulds Compensation

Although it is now fully three months since the disposal of Courtaulds' holdings in the United States was announced, there is still no inkling as to when a settlement with the Treasury is likely to be reached. Holders of the company's ordinary capital have, however, been interested, and a little disturbed, by a lengthy statement from the board setting out their view of the factors which should be borne in mind in fixing the compensation. It is symptomatic that, although the circular gives figures which make the recent market valuation of the shares look ridiculously low—they are very close to those given in *The Economist* of March 29th—the quotation fell a few pence on the news. Leaving on one side the valuation, the statement reveals that both total profits and the amount taken into account of the parent company were larger than had commonly been supposed, and it stresses the fact that, apart from loss of revenue and goodwill, the company's position is weakened, because it will no longer have the same voice in determining world policy in the industry, or the financial strength which

resulted from having well-balanced interests in two continents. In fine, the board made out a strong case for receipts very much above the sum obtained by the Treasury from the sale, and it will be a poor augury for the future of British industry—not to mention the institution of that better order which it is hoped may emerge from the present struggle—if a firm, which was at once powerful, efficient and forthright in setting a good example, were to be sacrificed, while others, perhaps less worthy in one or more of these respects, received more favourable treatment.

Company Notes

Cable and Wireless Accounts

The report of the operating company of Cable & Wireless for 1940 shows a rise in total income from £5,730,929 to £7,494,871. As was suggested in *The Economist* of 14 June in a note on the dividend of the Holding Company, the failure of either company to raise its ordinary payment above 4 per cent is due mainly to the rise in tax liability last year. Thus, British taxation paid by the operating company in 1940 rose from £345,800 to £518,209. At the same time, maintenance expenses and taxation abroad rose from £4,120,560 to £5,119,000, but in view of the absence of any liability for beam rental, surplus earnings at £2,375,771, compare with £1,610,369 in 1939, and the carry forward is consequently raised from £437,836 to £1,613,607.

	Years to December 31.		
	1938	1939	1940

Total income	4,645,830	5,730,929	7,494,871
Maintenance fees, etc.	3,602,958	4,120,560	5,119,100
Beam rental	41,667	Nil	Nil
Earnings for dividend	1,001,205	1,610,369	2,375,771
Dividend	975,000	1,200,000	1,200,000
Dividend, per cent.	4	4	4
Carried forward	27,467	437,836	1,613,607

The whole of the surplus is necessarily used to increase the carry forward since the operating company's liability for EPT, which depends in part on the assessment of the Holding Company, is not yet decided. The striking rise in both total income and equity earnings must be attributed mainly to the great increase in business due to the introduction of cheap rates within the Empire and for those serving in the forces. The increase has much more than offset any decline in revenue from industrial and official use of the services. The balance sheet continues to display great strength. Cash and near cash assets have increased during the year, cash holdings from £1,048,000 to £1,234,000 and holdings of British Government securities from £2,990,000 to £4,922,000 at cost. Creditors, including taxation and contingencies, are nearly £1,500,000 higher at £3,494,976, while traffic and other debtors have jumped by some £870,000 to £2,223,140, both changes which contain ample evidence of the increase in business which the company has carried in the past year. The ordinary stock of the Holding Company, at 61 ex dividend, offers a yield of £6 11s. 1d. per cent.

* * *

Shipbuilding Results

As in the previous year, profits of *John Brown* for the year to March 31, 1941, are shown after tax, EPT and provision for contingencies. Thus, the rise from £566,595 to £592,264, despite the necessity of meeting a higher standard rate of tax, and EPT at little less than 100 per cent, indicates a highly successful year's trading. The depreciation provision is raised from £58,372 to £67,992, leaving a surplus for equity capital of £377,888, representing a rate of 17.5 against 16.8 per cent, tax free, as was indicated in the note on the preliminary statement in *The Economist* of June 7th. The directors are able to make a special allocation of £100,000 to contingencies and war damage reserve and at the same time to raise the carry forward by £8,651 to £211,027, a conservative policy, which has much to recommend it. The absence of a consolidated statement is to be regretted. The profits of the past three years are analysed in the following table:—

	Year to March 31,		
	1939	1940	1941
	£	£	£
Profit after Tax and E.P.T.	687,819	566,595*	592,264*
Depreciation	64,317	58,372	67,992
Fees	5,868	6,653	7,372
Debenture service	91,952	90,232	90,000
Preference dividend	49,010	49,010	49,010
Ordinary shares —			
Earned	476,672	362,327	377,888
Paid	376,931	323,084	269,237
Earned %†	22.4	16.8	17.5
Paid %†	17½	15	12½
Reserve	100,000	—	100,000‡
Carry forward	163,133	202,376	211,027

* After providing for contingencies.

† Free of tax.

‡ Contingencies and War Damage Reserve.

The decision of *Harland and Wolff*, the Belfast shipbuilders, to raise the dividend on "B" ordinary stock from 4 to 6 per cent, less tax, probably reflects a further marked recovery beyond the general experience of marine engineering concerns. After a costly transition to a war production basis, the ability to work to capacity has probably been sufficient to ensure that profits should outstrip rising costs. The dividend on "B" ordinary stock is the second declared on equity capital since the reconstruction undertaken in 1937. The most striking change in the *John Brown* balance-sheet is a jump in stocks from £88,991 to £384,854, financed by a decline in cash, other than cash in the hands of debenture trustees, from £1,862,930 to £1,477,753. Yields are in line with the normal return on heavy industrial issues. The 10s. ordinary shares of *John Brown*, at 27s. 9d., offer £4 10s. 1d., tax free. The £1 "B" ordinary stock of *Harland and Wolff* at 13s. 4½d. yields £9 4s. 7d. per cent, less tax.

* * *

Forestral Land Accounts

The rise in income from trading and dividends earned by Forestal Land in 1940 from £187,757 to £264,487 is highly encouraging. The decline in total receipts from £792,577 to £613,177 is due solely to the fact that only £320,000 against £580,000 is brought in from the depreciation account in respect of investments in the subsidiary, La Forestal Argentina S.A. Deductions from profits include a non-recurring expense of £20,809, being the cost of redemption of the ten-year registered notes. The allocation to tax reserve, however, is down substantially from £80,000 to £15,543. Thus, equity earnings at £385,388, representing a rate of 19.8 against 21.5 per cent, provide a comfortable margin for the total ordinary distribution which is maintained at 9 per cent. After a slightly higher allocation to reserves, the carry-forward is reduced from £179,330 to £139,475. The setback to trading results of the Argentine interests, which followed inevitably from the almost complete severance of the South American continent from overseas markets last year, has been partially compensated by the excellent results achieved by other subsidiaries, in particular Natal Tanning and Calder and Mersey Extract Companies. Stockholders must, however, shortly face a position when it will no longer be possible to write back into profits the depreciation account in respect of La Forestal Argentina. Indeed, this fund now stands in the balance sheet of the holding company at no more than £66,302. Attention was drawn to this development in the Chairman's speech, delivered by Lord Selborne and circulated with the report. The consolidated account shows that stock, other than livestock, has increased from £2,985,840 to £3,194,957. Total reserves, for the group as a whole, stand at £3,760,731 against £3,232,741 in 1939, while fixed assets have moderately declined from £5,080,601 to £4,930,024. It will clearly become increasingly difficult to maintain the current level of income in war conditions, but

substantial surplus earnings stand between stockholders and the necessity of reducing the ordinary dividend. The £1 ordinary shares, at 21s. 6d. ex dividend, offer a yield of £8 7s. 5d. per cent.

"Shell"-Burmah Payments

The announcement that the second interim payment distributed by *Burmah Oil* for 1940 will not be supplemented by the 6 per cent bonus paid in the two previous years leaves the total payment on ordinary stock at 15 against 21 per cent. In view of the political and military developments in 1940 and the spring of the present year, it is hardly surprising that the directors have decided upon a reduction, and, in the circumstances, the cut appears moderate. The 1939 distribution, which required a gross sum of £2,884,668, was covered by an equity surplus of £3,133,915. Total income, however, had declined from £5,178,433 to £4,684,361, and there can be little doubt that it will have suffered a further fall in 1940. The payment of a total ordinary distribution of 5 per cent tax free by "*Shell*" *Transport* is a repetition of the 1939 payment, which compared with 20 per cent tax free paid on the increased ordinary capital in the two preceding years. Since last year's dividend involves a rise in the actual rate less tax, despite further prejudice during the past year, both to the income and to the investment position of the "*Shell*" interests, stockholders have every reason to feel pleased with the announcement. The 1939 dividend was covered by a tax-free rate of earnings of 5.8 per cent, the whole of the surplus being used to raise the carry-forward to £437,231. There is no doubt that the extension of hostilities last year implied, for the present, further serious losses for the "*Shell*" group. While *Burmah Oil* is not directly concerned, it must suffer from its large interest in that company and, to some extent, from its larger holdings in *Anglo-Iranian*. It is doubtful whether present dividend levels can be maintained throughout the current crisis, but the market has retained belief in the companies' prospects. The £1 ordinary stock of "*Shell*" *Transport*, at 43s. 4½d., offers a yield of £2 5s. per cent, tax free. The *Burmah Oil* £1 ordinary stock, now standing at 50s., yields £6, less tax.

Odhams' Record Earnings

The full accounts of Odhams Press for 1940 confirm the impression derived from the review of various newspaper reports in *The Economist* of June 14th that, despite paper rationing, the past year has been distinctly favourable for the Press. Odhams earned a new record income of £606,229 against £428,137, and the ordinary payment is

raised from 6 to 7½ per cent. Tax liability has, of course, risen substantially from £36,672 to £155,094, and, since the company has also initiated a staff pension fund with a first allocation of £75,000, the cover for the ordinary distribution, on a possibly over-strict analysis, is reduced from 21.3 to 17.1 per cent. After placing £40,000 to general reserve, thus raising the total of the fund to £600,000, the carry forward is increased to £86,862. Last year's success is no doubt mainly due to an ability approximately to maintain sales, while the smaller ration of paper brought about a fall in production costs. It is encouraging that the balance-sheet figure of stock and work in progress is up from £136,598 to £649,915, indicating that there is no immediate shortage of newsprint and no disastrous loss through enemy action. Trade creditors are some £124,000 higher at £654,767, while debtors show a decline of some £4,000 to £586,348. The outlook for the current year appears to be promising. The 4s. shares, at 2s. 6d. ex dividend, yield £12 per cent.

Kaffir Dividends

The numerous small reductions in the interim payments of the South African gold-mining companies have left the kaffir market relatively unmoved. To a considerable extent, reductions had been already discounted. It was clear that the 5 per cent rise in the rate of Union taxation on gold mines, introduced in the last South African Budget, came too late to permit an adaptation in the grade of ore mined calculated to offset the new charge against profits. In fact, the reduction in a number of cases, in particular in that of Crown Mines, has been rather less than investors had come to expect. In general, the reductions have been relieved by a number of important rises among mines which have only recently entered the list of dividend payers. Here increased output has more than outweighed the cost of the new tax liability, though, no doubt, the rises are less substantial than they would otherwise have been. Details of the latest interim payments are provided on page 838 of this issue. In the *Anglo-American* group, the sole rise is that of East Daggafontein from 9d. a year ago to 1s. 3d. In the *Gold Fields* group, the increase in the Venterspost payment from 3d. last June to 9d. is due largely to the sinking of the new shaft. Marievale, in the *Union Corporation* group, which paid a maiden dividend of 3d. last December, has now raised its distribution to 6d. In the *Johannes* group, there are no rises, but two companies, Langlaagte and Randfontein Estates, repeated dividends of 6d. and 2s. 3d. respectively. The cuts in the interim payments do not appear to carry any necessary indication of further reductions next December.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

In general, a cheerful sentiment prevailed in all markets this week. Before the week-end, the gilt-edged market closed very firm on rumours of a possible Government issue, and has this week, with investors cheered by news of the United States freezing of German and Italian assets, continued to attract more business. Interest in foreign bonds was rather slight, but, among home rails, last week's improved tone was sustained. Steady buying of heavy industrials, following the issue of various favourable reports, was the chief feature of the industrial market. The kaffir market presented a firm front to the news of general reductions in interim dividends, while the commodity share markets were steady.

In the *gilt-edged* market demand continued to be centred on undated stocks. The strength of the buying movement was due mainly to dealers' estimates of the possibility of the issue of a new loan. Two and a half per cent Consols were strongly in demand, rising ½ before the week-end and ¼ on the first two days of the current week. The majority of stocks enjoyed daily gains in the order of ¼, 4 per cent Consols and Funding and 3½ per cent War Loan leading the market. Local Loans also attracted many buyers and the rumour of a further requisition of Indian stocks raised the price of the 2½ and 3 per cent issues by ½ point on

Tuesday. A further widespread advance in midweek raised old Consols by ¼ to 81½, a new high level since 1937.

The *foreign bond* market enjoyed less business than of late, but prices on the whole were firm. A welcome recovery took place in Egyptian bonds, Egyptian Unified gaining ½ point before the week-end, followed by 1 point on Tuesday on news of the initial success of the British offensive round Sollum. Czech and Austrian bonds also improved. Recent progress in Japanese issues was arrested, both the 4 per cent loan of 1899 and the 5 per cent loan of 1907 losing ½ point on Tuesday.

Ordinary stocks received most attention in the *home rail* market, where last week's improvement was steadily continued. At the beginning of the week, LMS ordinary and Southern deferred put on ¼, while the next day the same issues gained ¼ and Great Western ordinary ½. Among marginal issues, "Berwick" 5 per cent preference, 1955, improved 2 points on Monday, but few other price changes were recorded. On Wednesday, the demand for ordinary stocks reached the highest level for some weeks, Southern deferred rising by 1½.

After a firm close to the previous week, Canadian Pacific ordinary, in the foreign rail market, lost ¼ on each of the first two days of the current week, but the preference issue continued to improve.

The most striking feature of the *industrial* market was the strength of heavy industrial shares, following the issue of various encouraging reports. Harland and Wolff gained 1s. 3d. on Monday on the increase in dividend. John Brown attracted a steady demand and gains of a few pence were realised by such leading issues as Dorman Long, Baldwins, Cammell Laird, Vickers, and Stewarts and Lloyds deferred. The statement on the Viscose deal caused some increase in business in Courtaulds, but after a small initial loss, the price remained firm. Other textile issues showed little change, with the exception of Lancashire Cotton, which realised a number of fractional gains. The improvement in shipping shares continued, led by a strong demand for Union Castle. Furness Withy and Court Line, on the publication of the accounts, shared in the upward movement. Breweries, in general, remained quietly firm, but Mitchells and Butlers put on 2s. at the beginning of the week. Price changes among the tobacco leaders were trendless and irregular. Among miscellaneous industrials, Boots were sold on the bonus decision. Murex and Dunlop continued to attract demand.

At the close of last week the effect of dividend reductions on the *kaffir* market was shown in a large number of irregular price changes. The undertone, however, remained firm and, on Monday, dealers responded strongly to news of the freezing

(Continued on page 835)

Industry and Trade

Motor Car Licences

Last week the Ministry of War Transport issued an appeal to motorists to make early application for the renewal of motor vehicle licences which expire at the end of this month. The appeal has been made in order to avoid congestion in local taxation offices caused by late applications. No suggestion is made that motorists who do not need their cars for essential purposes should refrain from taking out a new licence. There may be revenue or other reasons for this omission, but the end of the quarter would have been a good time for substituting a needs test for the present system of petrol distribution, which is wasteful in that a licence automatically entitles the motorist to a basic ration. Although publication of the figures relating to the number of private car licences current has been suspended, they must still be fairly large; in October, 1940, the number of cars licensed totalled 1,400,000. In view of the urgent need for shipping space, the basic allowance, issued irrespective of need, has become a plain anomaly.

The Coal Problem

A body of expert opinion in the coal mining industry does not regard very hopefully the prospects of increased production under the new arrangements made with the miners. These have considerably improved labour conditions in regard both to wages and to the continuity and security of employment. The guaranteed week under the Essential Work Order removes the two chief war-period causes of short-time working, namely, want of trade in the exporting coalfields and transport difficulties in practically all districts. For a full working week the attendance bonus of 1s. per shift increases the advance in miners' wage since the outbreak of the war to 3s. 4d. per shift—with a probable further increase of between 4d. and 6d. per shift from the beginning of next month—in addition to such gains as may have accrued to individual districts from the normal operation of the machinery providing for the adjustment of wage rates above the minimum fluctuations in the net proceeds of the industry. These concessions have been made primarily in order to enlist the active co-operation of the miners in the effort of the Ministry of Mines to add another 20 million tons "during the next twenty weeks" to the 14 million tons which are already in reserve to meet the contingencies of the next winter. It is hoped that in view of the gravity of the national emergency, the increase in wages will not bring a fall in output per head; and it is thought by some members of the industry that the co-operation of the miners would have been more assured if, as under the terms of the settlement of the national coal strike of the autumn of 1920, the new wage increases had been contingent upon, and proportionate to, an increase in production. The main cause, however, of the prevailing scepticism concerning the capacity of the industry to achieve the weekly target figure of between 4½ and 5 million tons is its reduced man-power. In May, 1940, when the number employed in some of the coalfields was actually greater than at the outbreak of the war, and when the export demand was relatively more intense than that for inland consumption, output fell a little short of 5 million tons per week. Since then between 70,000 and 80,000 underground and surface workers have joined the Forces or migrated to other employments, and the persistent efforts made by the Secretary for Mines to secure the return of at least 50,000 of them have so far met with little success. There appears to be little scope for an immediate expansion in output either by reorganisation or technical re-equipment; the main hopes of the Coal Production Council lie in the activities of the revived pit and district production committees. It is feared, however, that nothing that these bodies may be able to achieve will diminish the urgency of the need for a greatly increased supply of labour, and that the Government and the industry may now have to consider seriously the expediency of temporarily increasing the hours of work and of rationing consumers.

Nazi Europe's Oil

In its May bulletin, Petroleum Press Service has published estimates of the annual oil requirements and supplies

of Nazi Europe in the light of the experience gained since the outbreak of war. Europe's annual pre-war consumption is given in the following table:—

EUROPE'S ANNUAL OIL CONSUMPTION BEFORE THE WAR
(In thousands of metric tons)

	Motor Fuels	Kerosene (a)	Gas & Fuel Oil (b)	Lubricating Oils	Total
1. Germany (c) and Italy.....	3,700	530	3,500	720	8,250
2. Roumania, Hungary, Bulgaria.....	255	280	1,470	55	2,060
3. Occupied territories.....	4,460	770	3,330	500	9,060
4. Sweden, Switzerland, Finland.....	890	205	730	105	1,930
Total.....	9,305	1,585	9,030	1,380	21,300

(a) Including white spirit. (b) Including small quantities used for ships' bunkers. (c) Including Austria.

In the view of Petroleum Press Service consumption (apart from military requirements) could probably be reduced to about 8,700,000 metric tons per annum without crippling the economic life of the countries concerned:—

ESTIMATED MINIMUM NEEDS PER ANNUM (a)
(In thousands of metric tons)

Motor fuels ...	2,800	Gas and fuel oils ...	4,000
Kerosene	800	Lubricating oils ...	1,100
		Total.....	8,700

(a) Excluding military requirements

The potential annual supplies at the Nazis' disposal, including their own production of natural petroleum, coal-oil and substitute fuels, the output of Roumania and anything they may hope to secure from Russia in present conditions, is estimated at 11-12,000,000 metric tons per annum, leaving a substantial margin for military consumption. On the basis of these global estimates Nazi Europe's oil supply position therefore appears to be far from desperate. The calculation, however, does not allow for past or future damage by the RAF to coal-oil plants, refineries and transport facilities. Nor does it follow, as is pointed out in the analysis, that it will be possible to produce the various products in the proportions in which they are required. The supply of lubricating oils, in particular, appears to be causing difficulties.

Labour for Munitions

While the unemployment figures for May 12th show a decrease, the drop is not as large as it was in the previous month. The total number of registered unemployed in Great Britain on May 12th was 368,988, a fall of 28,460 since April 12th, compared with the previous drop from March to April of 47,407. This is the smallest decrease in unemployment recorded this year, but as the total declines, so the decreases become smaller. It is possible, however, that unemployment might rise for short periods, owing to the closing down of firms for lack of business or the concentration of industry. This may be the reason for the fact that there were 1,203 more people unemployed in the North Western Division on May 12th than a month before. The hard core of what might be termed "unavoidable" unemployment—unemployment between jobs, or through bad weather—has now probably been reached, though this might still be reduced by shortening the idle time between jobs. For example, only 4,021 women and girls out of a total of 148,328 unemployed on May 12th were classified as unsuitable for normal full-time employment. Yet an analysis of the duration of unemployment among women on March 24th showed that 40-43 per cent of them had been unemployed from over one month to six months.

The registration of women is showing that very few are completely unoccupied, and if labour is to be found in this class of the population, the Minister of Labour will have to be somewhat harsher than he appears to be in deciding which women shall work in war industries or go into the Services. Many examples might be quoted of exemptions which have been promised, but which should be withdrawn when necessary. Domestic servants, who are at the moment exempt, can in many cases be spared from the households

they serve. To leave young married women in their homes when their husbands are in the Forces is a sentimental gesture which the country will soon be, and possibly is now, ill able to afford. However, as has been so frequently said, labour which is wanted in the munitions factories must be provided by workers released from unessential works and by the paring down of staffs where this can be done. When the concentration of industry has reached the stage of wholesale closing down of firms, a large labour force will be available. The Committee on Retail Trade, too, may possibly recommend measures leading to the release of part of the workers employed in the distributive trades. Preparations must be made for the reception of these workers as they become available, so that not a day's labour is lost.

Canned Meat Control

Under an Order of the Ministry of Food, the manufacture of meat products in airtight tins and glasses will be limited after July 7th to meat and fish pastes, meat and vegetable soups, meat roll or galantine, and ready or preserved meals, packed in prescribed sizes of containers. After that date, no other canned meat product may be sold; wholesale, and retail sales of other products must cease after August 4th. Maximum prices, as follows, become operative on the same dates:—

CONTROLLED PRICES OF CANNED MEAT AND FISH				
	Container Capacity (net weight)	Maximum wholesale price per dozen	Maximum retail price per jar or tin	
		s. d.	s. d.	
Meat or fish pastes in glass jars ...	2½ oz. 2 1½	6 3 5 11	8 6½ 5	
Meat or fish pastes in tins ...	3 1½ 1	2 10½ 1 2	3½ 2½ 1½	
Soups in tins ...	10 16	5 6 7 0	6½ 8½	
Meat Roll or Galantine in tins ...	10 16 2½ lbs. 3	6 6 9 6 20 3 27 0	7½ 11 1 11½ 2 7	
Ready or prepared Meals in tins ...	16 oz.	10 0	11½	

Standards of quality are laid down. Meat and fish pastes must contain between 40 and 60 per cent of meat or fish, and the meat content of meat roll or galantine and ready or prepared meals must be not less than 30 per cent and not more than 45 per cent. Meat extracts are not affected by the Order. The restriction of varieties is a measure of economy which should ensure the most being made of such meat as is available. Price control was needed to curb the activities of speculators, and if Miss Sybil Campbell and her corps of Scotland Yard men are able to prevent the development of a black market, there seems no reason, in this case, why disappearance should follow control.

The Fertiliser Programme

The policy of stabilising the prices of agricultural fertilisers is to be continued for the year ending July 1, 1942. As this involves an increasing subsidy, the special basic slag subsidy, instituted in 1937 under the Land Fertility Scheme, is to be discontinued. This will economise transport, facilitate a reorganisation of distributive arrangements, and make possible some reduction in the price of superphosphate. In the hope of inducing producers of lime to extend their plant, the subsidy on lime is to be continued till the end of July, 1944. Its administration is to be undertaken directly by the Ministry of Agriculture. The distribution of superphosphate, basic slag and potash is to be controlled, in order to ensure the most efficient utilisation of supplies. Supplies are to be held available to County War Agricultural Executive Committees, for use by farmers on their recommendation. The use of potash will be restricted to certain specified crops, such as potatoes and flax. As with most such programmes, its merit will depend largely on the intelligence with which it is carried out. It is not stated whether

there will be any restriction on the use of fertilisers in small quantities by amateur gardeners, or in the supply to the manufacturers of proprietary fertilisers.

Petroleum Control in the United States

Mr. Harold L. Ickes, whose appointment as Petroleum Co-ordinator was discussed on page 774 of *The Economist* of June 7th, has this week taken steps to relieve the "impending shortage of petroleum in the East Coast Area." Following a complaint that a firm engaged on defence work in the district had been unable to obtain oil essential for that work, he has stopped the shipment of a cargo of lubricating oil from Philadelphia to Japan; and he has sent telegrams to the 32 principal East Coast shippers proposing a complete embargo on export sales without prior reference to his office. While it is improbable that East Coast shipments (of which high-grade Pennsylvanian lubricants form a high proportion) will be stopped altogether, Mr. Ickes is clearly anxious that local requirements for defence work shall first be fully satisfied. But why have these measures been necessary? It must be reiterated that there can be no question of a general shortage of oil in the United States—which has a large shut-in production and a substantial export surplus. A tight situation has, however, been developing for some time in the industrialised Eastern States, which are very large oil consumers. The reason is that this area is mainly supplied from Gulf ports by coastwise tankers, and that there has been a growing shortage of tanker tonnage. Fast vessels have been requisitioned by the U. S. Government and a number have been transferred to Great Britain at a time when consumption of oil in the East has been showing a rapid increase. As the record number of tankers now under construction in America comes into use—25 new vessels are expected to be in service this year—the transport position will be eased. It is not unlikely, moreover, that pipelines will shortly be constructed, at the instigation of the Petroleum Co-ordinator, to provide an alternative means of supplying the Eastern States. In the meantime, some restriction of civilian consumption may prove necessary in this area if work of national importance is not to be impeded by a local shortage of essential oil products.

Industrialisation in Latin America

The growing industrialisation of the larger republics of South America will probably be stimulated by the diversion of United States manufacturing capacity to war materials. But such a tendency will, in its turn, be limited by the sources of fuel and power which are available. South America is notoriously short of coal; what coal exists is of poor quality, while supplies from Great Britain are restricted. Argentina's oil does not meet her own demands; the oil-producing countries of the Caribbean are separated by great distances from the ABC States, and as the available tanker tonnage is presumably mobilised for the North Atlantic routes, this obstacle is difficult to overcome. Hydro-electric development has long been recognised as offering great possibilities in Brazil, but it needs heavy and expensive plant, which is not easy to come by just now. Nevertheless, the industrial progress already achieved by certain Republics, notably Brazil, cannot be ignored. Between 1914 and 1935 Argentina increased her industrial production by 79 per cent, but Brazil by 502 per cent. The planned economy of Dr. Vargas began to bear fruit in the industrial field in 1934, and no other country in the world, except the USSR, has proportionately so greatly increased its industrial production. There are to-day nearly a million and a quarter registered workers in Brazilian industries, about 30 per cent being employed in the production of textiles. Rayon is now manufactured; the amount has steadily increased in recent years, and is now at the rate of about 7,000 tons per annum. Sheet iron and steel are produced in Minas Geraes, although the purely Brazilian development of mineral resources has been somewhat retarded for lack of capital. Tariff protection has been an essential weapon in the development of these nascent industries, of which many other examples could be given. When, late in 1940, the country celebrated the tenth anniversary of the New Régime, President Vargas was able to record these developments, at the same time emphasising that they had been facilitated by abundant labour, accompanied by adequate social legislation, and attained through the use of national resources alone.

For Commodity and Industry News see page 840.

COMPANY MEETINGS

EAGLE STAR INSURANCE COMPANY, LIMITED

A SATISFACTORY YEAR

Extracts from statement by the chairman, Sir Edward M. Mountain, Bt., to be presented at the annual general meeting of the company to be held on the 26th instant.

Life Department: New life assurances were completed during 1940 for a net amount of £7,643,793—a substantial increase over the figures for the preceding year. The claims for war losses were slight and other mortality experience was below expectation. The already moderate expenses show a further decrease. Practically the whole of the life business is transacted in Great Britain.

Fire Department: The net premium income was £833,519 and the account showed a profit of £46,375.

Accident and General Insurance Accounts: The premium income is reduced owing to the temporary closing down of certain special contracts during the war and loss of income in enemy-occupied countries. Total premiums were £788,710 (including Employers' Liability), and the account yielded a profit of £98,162.

Motor Department: The premiums for the year amounted to £1,075,757, and an amount of £32,919 was transferred to profit and loss account.

Marine Department: With £481,794 brought forward and net premiums of £691,882, an amount of £50,000 was transferred to profit and loss account; £400,000 of these premiums was for war risks. The marine fund now stands at £638,779.

Profit and Loss Account: Once again, interest earnings plus trustee and other fees more than cover the total dividend payments. The balance brought forward from last year was £493,365, while interest earnings, trustee and other fees and departmental profits amounted to £521,986, giving a total on the credit side of £1,015,351. After making full provision for dividends and other expenses, including such extraneous items as War Damage Insurance, ARP, etc., the balance carried forward is increased to £523,273.

fears of the consequences of the sinking of the *Robin Moor*. Moreover, it is commonly expected that industry will be put on an increasingly war footing to the detriment of the investor. There has been no general setback in prices, but business was dull throughout the week.

LISBON ELECTRIC TRAMWAYS, LIMITED

MR. A. N. RYE'S STATEMENT

The forty-third ordinary general meeting of Lisbon Electric Tramways, Limited, will be held at London Wall Buildings, London, E.C., on the 25th instant.

The following is a summary of the statement by the chairman, Mr. A. N. Rye, which has been circulated with the report and accounts.

The operation of the tramways during the past year again constitutes a record in the number of passengers carried, the number being 142,052,980, against 134,238,698, an increase of 7,814,282. This increase was largely due to a temporary increase of the population from the effects of the war in other parts of Europe and to the Centenary celebrations. The revenue from all sources shows an increase of £109,245 13s. 2d., but this has been more than counterbalanced by an increase in the expenditure of £111,923 3s. 4d.; the profit as shown in the accounts at £159,010 19s. 7d. is £2,677 10s. 2d. less. The increase in the expenditure is caused by the much higher cost of coal and materials of all kinds, and also by the greater mileage run to carry the abnormal traffic.

The board now recommends a final dividend of 4 per cent. net on the ordinary share capital in respect of the year 1940, which, with the interim dividend already paid, will again make 6½ per cent. net for the year. This dividend will absorb £38,041 11s. 2d., leaving a balance of £32,387 13s. 6d. to be carried forward.

Last year I called your attention to the rapidly rising costs due to the war and warned you that we must expect heavy additional expenditure in 1940. That forecast has proved to be correct, but we have been fortunate in obtaining a large increase in traffic, with the result that the appropriation to reserve and the dividends have been maintained at the level of 1939, with only a small decrease of £317 in the carry-forward.

The exceptional traffic of 1940 is not likely to be repeated in 1941, and there is no sign of a halt in the rise in prices of the materials we require; it is therefore unlikely that 1941 will be as good a year for us as 1940.

GOVERNMENT RETURNS

For the week ended June 14, 1941, total ordinary revenue was £19,345,000, against ordinary expenditure of £83,946,000, and issues to sinking funds of £130,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £633,553,000 against £407,178,000 for the corresponding period a year ago.

COMMODITY AND INDUSTRY NEWS

REPORTS were current last Friday that the United States was about to control imports and distribution of metals. This may have been the cause of the selling of tin which took place on the London market, with a consequent fall in prices. Cash tin fell by £3 5s. per ton to £260 15s.-£261, with three months at £262 15s.-£263. There has been some recovery this week, and on Wednesday standard cash was £264 5s.-£264 10s., compared with £267-£267 5s. a week earlier. The forward quotation was £265 10s.-£266, compared with £267-£267 5s. There has been very little movement in rubber prices. Smoked sheet, spot, when quoted, has been 13½d. per lb.

Raw cotton consumption in the United States continues on a record level, the amount used last month being 919,000 bales, against 920,000 bales in April and only 636,000 bales in May of last year.

Wool Textile Price Regulation.—A method of regulating wool textile prices has been voluntarily agreed by the Wool Textile Delegation, in accordance with the principles of the Prices of Goods Act, 1939. The Central Price Regulation Committee announces that the terms of the agreement cover a definition of the factors involved in fixing costs of production and marketing, and that a maximum percentage for profits has been agreed. The Delegation has set up a Central Concentration Committee which is reported to have made good progress in working out the details of the concentration scheme for the wool textile industry.

Copper Deliveries in U.S.A.—The figure of 141,801 tons of copper delivered to American consumers during May is a record one, and compares with 123,580 tons for April. Production figures showed a rise from 88,271 to 90,292 tons of crude copper, while refined copper production was 89,390 tons in May, compared with 88,659 tons in April. Refined stocks at the end of May were 95,568 tons, a fall of 2,193 tons during the month.

Cotton-Weaving Concentration.—The feature of the week has been that the concentration of production in the weaving branch has begun. A number of firms have been instructed to close down early in July, and more concerns have been appointed nucleus firms. Cloth business has been difficult to arrange, but fair orders have been placed for the Government and in essential cloths for the Home Services. Irregular buying has occurred for export, chiefly for Java, South America, West Africa and the Dominions. Much more foreign trade could undoubtedly be done but for the restricted quotas of shippers. A limited trade has been reported in yarns.

Chlorates Controlled.—Purchases and sales of chlorates and all substances containing not less than 10 per cent by weight of free chlorate were controlled by the Minister of Supply from June 14th, under the Control of Chlorates (No. 1) Order. A licence authorising sales must be obtained by the seller unless he sells to a holder of a licence which entitles him to acquire the material.

Food Rationing Changes.—The butter ration is to be reduced from June 30th from 4 ozs. to 2 ozs., but this cut may be made up with margarine, since the total fats ration of 8 ozs. is to remain unchanged. On the same date the cheese ration is to be doubled and will be 2 ozs. a week for ordinary consumers, but the 8 ozs. ration for agricultural workers, underground miners and vegetarians is not to be altered. The minimum preserves ration of 8 ozs. a month has now been changed into a fixed 8 ozs. ration, but in August next it will be raised to 1 lb. a month.

Potato Prices.—Prices of old potatoes were reduced this week to encourage consumption of what is left of the old crop

now that new potatoes should come onto the market. Old potato prices will vary between 5d. to 7½d. per 7 lbs. according to grade and locality. New potatoes are 4d. per lb., but the price will drop to 3½d. per lb. on June 23rd. Further progressive falls in the price of new potatoes will take place.

QUARTERLY TRADE SUPP.

Right About Turn

AT dawn on June 22nd—129 years to the day and almost to the hour after Napoleon crossed the Russian frontier en route for Moscow—Hitler raised the curtain on a new world tragedy; and once again Mr Churchill was proved a true prophet. For months, the Prime Minister had publicly forecast this attack on Soviet Russia; he had warned Stalin; and, in rebuke, he had told the British Communists to expect orders soon to "turn about." Yet many people remained sceptical until the blow was struck. They did not doubt the calculating lust of the Nazis, and they did not expect that the formal accord between Germany and Russia would be any brake upon Nazi aggrandisement. But they underestimated the arrogance of Hitler. They did not believe that the glaring risk of a major war in the East would be taken except under extreme pressure, and they could not agree that, in sober fact, the need of Germany for oil and grain represented such pressure. Mr. Churchill mentioned oil and grain in his speech on Sunday; but (as an article on page 854 suggests) this campaign can hardly bring any quick advantages to the invaders in the economic sphere. On both sides of the battle-line, unless there were an almost immediate collapse of the defenders, the harvests must suffer; the normal supplies from Russia will cease; and the much-publicised stocks of the Ukraine and Caucasus, lying ready to be driven away in army trucks, are a myth. In the very short run, the consequences of a war will probably be economic loss not gain; it closes a gap in the blockade; and the mobilisation of Russian resources to nourish German Europe would be a lengthy process.

The fact is that the economic interpretation of Nazi strategy has been overdone. That Russia could be made the hinterland of Nazi power is undeniable; this is the insurance that the Nazis hope successful invasion now

may give them against failures in other fields later on. But that Russia can straightaway be made the base of the German armies is fanciful. The invasion of Russia is a military adventure; it surprised the sceptics because they did not believe that even Hitler was sufficiently sure of his military power to engage Russia while his fight with the western democracies was growing in violence. It must be the Nazis' hope to put an end to Russian resistance before Britain, with American aid, can strike hard enough to shake them; to remove all military danger in the east before moving west to Britain, south to Africa or south-east to Persia and India; to lock the back door of German Europe; to outflank and outmanoeuvre all possible enemies and to defeat them one by one. It is not a new design, but the present pace is breath-taking. This invasion must not be taken as a sign that Hitler is now turning to the strategy of a long war, but rather as clear evidence that he believes he can end the conflict by a series of killing strokes before America's economic strength can be translated into military power. Triumph in Russia would add immensely to German powers of resistance if the war dragged on. But, by this invasion, the year 1941 is made, not the respite that a few fond people have imagined since Sunday morning, but the period of decision for all the world.

Hitler's reach may exceed his grasp; even if he wins quickly, he may find himself involved in commitments which he can neither limit nor control. Rightly, Mr Churchill made no prophecy when he spoke to the Commonwealth, the Empire and the United States on Sunday evening. He did not say—as some American newspapers are saying, and as the legion of British publicists said when the Germans attacked Norway, the Low Countries, Greece and Crete—that this attack is a desperate gamble. If it fails, it will indeed be a disaster for the attacker; but if

it succeeds, it will be a great victory, and all that can usefully be said now is that the danger to the democracies has been raised to a peak by the strength and confidence of this savage stroke. It is a warning, not a relief. It is a siren sounding through the gathering darkness.

The extent of the danger depends on Russia's resistance and the awareness of the rest of the world. Russia's resistance needs the aid and encouragement of all free states and peoples. This is the crux; and Mr Churchill has never surpassed the statesmanship he showed when he faced this issue in his broadcast. Most of the free world is opposed to Communism. Russia's aid to the Nazis had not increased its friends. Justly, the Poles, the Finns and the Roumanians have bitter memories. Mr. Churchill speaks for multitudes when he says that he has been an enemy of Communism for twenty years—and remains so. Almost without exception, the policy of Stalin at home and abroad has earned the contempt of those who love freedom and straight dealing. But this is no class war or question of ideology. It is an opportunity in the grand strategy of a world conflict, a conflict which is a battle against disaster for all the peoples; and the people of Russia are in the van as they guard their homes. From every Government pledged to bring Hitler down they will earn—and receive—all possible assistance. Like every ruler who stands firm against the common German foe, the governors of the Soviets can be treated as full allies while they fight. It is self-interest to do so. In 1939 it would have been strategic madness to have chosen Russia as an added enemy. It would be equal madness now to spurn Hitler's gift of an eastern ally.

It was an act of swift, strategic wisdom to give this prompt pledge on behalf of Britain. It ended a campaign of whispers which, with the "peace visit" of Hess as its focus, had professed to see a plan to "switch the war" in high places. Hitler's plain aim is to split every country in the world against the Bolsheviks; and the urgent need of the hour is that Mr. Churchill's leadership shall be immediately followed wherever men are free—in the rank and file of this country, among the classes and the masses of the United States, among men of sense and religion in every continent. The whole world will be shaken by the choice. Alliances and declarations will be made. There will be preparations for grimmer battles. But one fact remains unchallenged. It is Hitler who has made every stage of this war. It is Hitler who threatens the earth. And it is Hitler who must be defeated.

"Friendship" and Aggression

To understand the trend of the events which have led up to the attack on Russia, it is necessary to drop ideological considerations as completely as Hitler has done. Ideology in Hitler's armoury is one weapon among many others to secure an increase in power, and it is power in its most naked form that is the ultimate goal of Nazi policy. The question whether a State is Bolshevik or Liberal or Democratic or Catholic is quite immaterial. In Hitler's eyes its significance is only that it exists and that its independent existence is—however cowed and peaceful it may be—an obstacle to total German domination. It is possible to read into the pages of *Mein Kampf* a limited objective—domination of Europe and of Western Russia only, while the seas of the New World are left to Anglo-Saxondom. But *Mein Kampf* is a modest little book, written before Hitler fully realised the possibilities of his world-shattering technique of naked and unlimited aggression. Since those months in the fortress, Hitler's ambition has grown with each evidence of human weakness and human folly. Europe and the Ukraine are no longer enough. As the proclamation which preceded the attack on Russia makes clear, the conquest of Russia is not an end in itself, but a means, an incident in the struggle with Britain and America for the domination of the world. Throughout Hitler's tirade, the enemy is not Russia, but Britain, and, behind Britain, the power of the United States.

Russian diplomacy has probably been alive to the implications of Nazism for longer than have the statesmen of Western Europe. Their immediate fear sprang from

the fact that the riches of the Ukraine figured so prominently in the early *Mein Kampf* programme. It was reinforced by Hitler's use of anti-Bolshevism in the first years of his rise to power. The years from 1933 to 1937 saw one long attempt by Russia to ensure that, if Hitler struck east, France and Britain would enter the war. In this attempt, dogmatic, orthodox Communism was dropped, and the line of anti-Fascism and the Popular Front adopted. Thus Hitler not only represented no ideology himself; he was the cause of its abandonment in others. Nevertheless he was still able, with entire cynicism, to manipulate the anti-Communist tendencies of the West and, in the Anti-Comintern Pact, to forge a weapon which helped to prevent any real *rapprochement* between East and West. It was his weapon against "encirclement"; and before ever he made war, he was already using propaganda to avoid a war on two fronts. Hitler's play on Conservative fears on the one hand and revolutionary tendencies on the other was merely carrying the principle of "divide and rule" from top to bottom of the international and national structure of Europe and the world.

At Munich, Hitler secured the isolation of Russia. The Franco-Russian Pact was dead; Czechoslovakia was divided. There is little doubt that, during the winter of 1938-39, extensive preparations were made for a drive through Poland into Russia to fulfil the *Mein Kampf* programme; but the British guarantee to Poland upset the calculation. Now an attack on Poland would bring in the western countries, and if it were carried through to its logical end in the Ukraine, then Germany would be facing the same hostile coalition which ultimately had caused her downfall in 1918.

The negotiations which led up to the pact of September 1939 had one purpose only, to ensure that when Germany attacked Poland, Russia would remain neutral. Half Poland and a free hand on the "Russian fringe" were freely offered as a bait. In short, Germany was asking Russia to do nothing in return for substantial benefits. Britain's concurrent negotiations had the infinitely harder task of asking Russia to do something—to join in a front against Germany—in return for nothing; and it is significant that one of the reasons for the failure of the negotiations was Britain's refusal to deliver up the Baltic States. The die was almost certainly cast when Britain guaranteed Poland. The Russians realised then that Germany would turn west once the campaign in Poland was over; and they saw their own security assured by the prospect of years of exhausting trench warfare on the other side of Europe. In August, 1939, they signed their Non-Aggression Pact with Germany and a month later assisted in the partition of Poland. Their policy was curiously reminiscent of that of the State they were dismembering. Poland had signed a Pact of Friendship with Germany and had afterwards joined the Nazis in the partition of Czechoslovakia. In June, 1941, the Russians were to learn that the analogy exactly fitted their case.

From the signature of the Nazi-Soviet Pact until the end of the first Battle of Britain, the Russians enjoyed an uneasy security, and they took advantage of Germany's engagement in the west to reinforce their own frontiers. The partition of Poland was followed by the "protection" and finally the absorption of the Baltic States, by the war on Finland from which a new defensive frontier was gained, but at very great cost, and—while French resistance collapsed—by the annexation of Bessarabia. The undoubted strategic benefit of these moves could be seen this week when, after several days of mechanised warfare, the Russians were still fighting almost entirely upon territory annexed during 1939 and 1940.

From Hitler's proclamation, it is plain that the process of Russian expansion was followed with resentment and dislike in Berlin. Nevertheless, with the West undefeated, Hitler was even ready to assist Russia in its policy of expansion. The German Balts were withdrawn; the screw was put on Sweden to prevent the passage of troops to the aid of Finland; and Roumania was advised to submit to the Russian claim on Bessarabia. Nothing could better illustrate the provisional nature of the agreement from the German standpoint than Hitler's readiness to see

Russia expand into these German spheres of influence—the Baltic and the Balkans.

The next phase in German-Soviet relations opened with the failure of the Battle of Britain in October, 1940, and the re-election of President Roosevelt in November. The British defences were still intact, and behind them stood an America growing daily more aware of the implications of the war and better able to reinforce Britain's war effort. The turn of events in the west was almost as bad for Russia as if the Germans had won everything in a single knock-out blow in June. While the war in the west would obviously be long and desperate, it did not for the time being engage any great proportion of the *Reichswehr*. Thus Hitler had the choice of ending the threat in the west by an invasion of Britain, in the hopes that Russia would not profit by his pre-occupation; or he could leave the English Channel and the Atlantic to guard the door and turn to the destruction of Russia as a preliminary to the attack on Britain. It was the old dilemma of the war on two fronts. The question in the autumn of 1940 was whether, as a continued centre of independent military power, Russia or Britain was easier to crush. After the failure of the air battles in September, it became more and more obvious that Russia was the easier prey.

It is not hard to discern, in looking back on the winter of 1940-41, a progressive deterioration in German-Russian relations. Molotov's visit to Berlin, which, if Hitler is to be believed, was a mere attempt at clarification, left all the major problems undecided—Finland, whither Germany was already sending troops; the Balkans, where it was not possible to establish spheres of influence; the Straits, where Germany refused to countenance any Soviet infiltration. Relations grew steadily worse. Soviet diplomacy was undoubtedly trying to stiffen the resistance of Bulgaria to German pressure and rumours circulated of the offer of a military pact, rumours which were to be repeated when Yugoslavia came under fire.

There was, however, no spectacular break. The campaigning season did not open until April and the strategic conditions of a successful campaign against Russia were not yet achieved. Bulgaria and Yugoslavia might still look to Russia as the great Slav protector and the British were already in Greece. This dangerous flank had to be cleared before the major campaign began, and it seems certain now that the drive through Greece and on into Crete was not the first stage of an attack upon Suez, but an act of consolidation and defence—the first phase of the Russian campaign. With the fall of Crete, the Dardanelles and the Black Sea were closed and Turkey was neutralised. The attack on Russia could now be launched without fear of direct Allied intervention. Reinforcements arrived in Finland; units were sent north from Greece; and on June 22nd the offensive began.

The Attitude of the Powers

The first obvious fact in this new phase of the war is that Russia is another neutral Power which has striven to keep out of the conflict, has been deceived by a German Pact of Friendship and Non-aggression and has been plunged into the war at the moment best suited to the military purposes of the Reich. In this sense, and in this sense only, the Russians are in much the same position as the Poles or the Dutch; the difference is that the Russians have themselves been gross aggressors. They must bear responsibility for a neutrality which has left them standing alone when, had they fought in September, 1939, they would still have had the might of the French Army to fight with them—and some of the moral conscience of the world to reinforce them. Now, they are attempting to co-operate with Britain without preliminary staff talks. They have seen potential ally after potential ally struck down, because they still hoped, by non-intervention, to secure their own immunity. It is a sorry tale, but it makes no difference to the fact that, now that they are fighting Germany they will receive all the aid that Britain can give. This is the policy Britain has pursued with all the threatened neutrals. The fact that this neutral is a Great Power with formidable military

equipment only makes the policy more obvious and inevitable.

There is every likelihood that the Dominions will take the same line. Australia has already declared itself. The others will follow suit. In the United States, too, the Administration is likely to follow the policy outlined by Mr Churchill. Both Mr Sumner Welles and President Roosevelt have intimated that since Russia is a country fighting German aggression she will receive all the assistance America is in a position to give. Russian assets in the United States of about £25 million, have been unfrozen and will be available for buying war material.

There is no such clear-cut policy for Japan to follow. The provisions of the Tripartite Pact do not come into force, since not even Nazi propaganda can construe the aggression of June 22nd into an attack by Russia upon Germany. On the other hand, the provisions of the Russo-Japanese Pact of Neutrality obviously do and were doubtless framed at the Kremlin with exactly this situation in mind. Mr. Matsuoka has confined himself to cryptic references to the west wind, the blowing of leaves in the east, and the advisability—or inadvisability—of using a broom. The real problem is whether, with Russia fully engaged in the west, the Japanese will be able to resist the chance of a little "reinsurance" on the frontiers of Outer Mongolia and Manchuria. On the other hand, the menace of a Eurasian land mass completely controlled by Germany is certainly not lost on Tokyo.

Europe's View

Were the Soviet Union merely a neutral Power, wantonly attacked without provocation, its entry into the war would create only military and technical problems. But Russia is also a very recent aggressor in her own right. Russia has seized half Poland, all three Baltic States, part of Finland, Bessarabia and the North Bukovina. Germany will presumably take away this defensive *glacis* in the near future; but Russia's relations with these states create awkward problems. Finland and Roumania are both permitting Germany to make full use of their territory as a base for the attack, but while the Roumanians appear to have joined in the fighting from the first, Finland remained "neutral" until the Russians bombed their towns. Britain has already broken off diplomatic relations with Roumania. What should be the line with regard to Finland? It is natural that the Finns should want to be rid of the Russians. Nevertheless, neutrals which are still able at this late day to see distinctions between Nazi exploitation and Soviet occupation must bear the consequences. Finland has been warned that Britain will fight the Germans wherever they are found, even on Finnish territory. At the same time it should be possible to reaffirm Britain's interest in Finland's ultimate independence, from Germany and Russia alike.

There is a similar problem in the Baltic States. These small countries only achieved independence by being set free from Russia; and governments will undoubtedly be set up under German aegis to represent Baltic "independence." The solution is, perhaps, to be found on the lines of the proposals for Finland. Britain cannot recognise any governments set up by Germany, and does not admit the validity of any "independence" established by the Nazis. Nevertheless, British support of Russia's fight for her own independence does not include a condonation of Russia's actions with regard to the independence of others. In the summer of 1939, Britain stood out for the right of the Baltic States to decide their own future. That right must not be sacrificed now.

Finally, there is Poland. General Sikorski can be congratulated on a statesmanlike move by the Polish Government. Russia's participation in the war is accepted as a fact; the assumption is made that the old frontiers of Poland, according to the Treaty of Riga of 1921, are now restored, and that the Pact of Non-Aggression recovers its validity; to the peace settlement is referred the redrawing of frontiers. The Russians can hardly cavil when they are being rapidly dislodged from East Poland; and it may well be that the enforced entry of Russia into the war will render the settlement of the Polish problem far easier than would have been the case if Germany had been

defeated while Russia retained her neutrality and Poland remained at war with both. Germany's own offer to give Poland its independence establishes a new world record of cynicism and hypocrisy. No Pole will be deceived by it, just as no Pole has been found to participate in a quisling Polish Government.

The Propaganda Trap

There remains the difficult question of Russia's ideology. For Germany, it will be a major military and political weapon. Hitler has already launched his latest aggression as "a crusade for European civilisation against world Bolshevism," and the armies advancing towards the Ukraine are described as bringing religious freedom to peoples oppressed by godless atheism. Wherever German propaganda services function, the whisper will go abroad that Britain is allied with atheistic Bolshevism, and that those who support Britain now are working to make the world safe for Communism. It would be foolish to underestimate the importance of this propaganda. It was over the Right-Left split that the resistance of France was largely undermined, and to men of property and to men of religion everywhere Nazi propaganda will reach out to sow suspicion, destroy unity and to encourage support for a compromise peace.

The results of this propaganda in Europe are probably not very important. Vichy has already declared the new attack a "crusade" and there have been organised Falangist anti-British and anti-Soviet demonstrations in Spain. But it is highly probable that the reasons which will bring Spain and Vichy France into the war—or keep them out—are realistic calculations of the military strength of the belligerents and economic necessities at home. It is in the New World that the Russian conflict gives Nazi propaganda a new opportunity. Fear and dislike of Communism is very strong indeed in South America. It is as well to recall the gusto with which the South American republics turned Russia out of the League after the assault on Finland. In the United States, the Catholic spearhead of American isolationism will be reinforced, and the business world on which the success of rearmament so largely depends may be inclined to

grow hesitant in their support of the President. These fears and suspicions can only be met by vigorous British counter-propaganda, not only on the lines laid down in Mr. Churchill's masterly statement—that the Nazi attack is not a crusade but a prelude to the attack on Britain and America, that Britain does not support Communism and that its worst evils are indistinguishable from those of Nazism—but also in the more positive field of defining what traditions Britain represents and of suggesting the creative response the democracies can yet make to the challenge which called first Communism and then Nazism into being.

It remains to be seen whether a new somersault on the part of the Communists will act as a countervailing factor to the new openings for Nazi propaganda. Stalin has after all a Fifth Column in all the occupied countries in Europe, and, though the week that preceded the attack saw wholesale arrests by the Gestapo of Communists and Communist sympathisers, there is obviously a new and potentially powerful instrument of sabotage in German Europe. In Britain and the United States, the question is whether labour agitation, sponsored by Communists, will cease. The British Communist Party has not apparently returned to the happy uninhibited line of the first week of the war when the chief issue was "Why this war must be won" and is conducting a tactical retreat from the People's Government and the People's Peace by way of a bitter attack upon the Churchill Government and its "fascist" sympathies. In America the Communists appear to have been driven into complete confusion.

The policy of the British Government can afford for the time to be unaffected by diplomatic difficulties and ideological complications. The issue facing this country for the next months is quite simply that of survival. The Russian campaign may give Britain a brief respite. The attack when it comes will be all the more deadly for having behind it the full and undivided might of the German military machine. For every citizen—soldier, worker, business executive, civil servant—the only watchword is vigilance and work. The war will still be won or lost in the west and the issue of victory or defeat hangs on the use that is made of the few weeks that yet remain.

Checks on Production

THERE are some people who argue that there is no shortage of labour in this country, but rather a surplus. They claim that war production is merely a matter of management, of making the best use of the labour already engaged; and they deprecate suggestions that any further large-scale transfer of workers from non-essential employment to war work is necessary. In these contentions, moreover, they are accompanied part of the way by the spokesmen of organised labour who declare that men already in war employment often stand idle for lack of jobs to do.

This is one more instance where a half-truth can be dangerous. It would be impossible to deny that inefficient management—or management unduly hampered by cumbersome controls or transport faults—is an important check on production. One proof of this emerges in the very different rates of output sometimes achieved by similar firms in similar conditions. One firm is comparatively successful in securing a balanced flow of materials and tools; another is not. The absence of a really articulated system of priorities, applying not simply to broad categories of production, but to specific orders—and to the transport and other facilities needed to discharge the most urgent orders—is a deterrent to output. There is a relative lack of precise and expert knowledge in high places about the day-to-day progress and balance of production and supplies—about the current effectiveness of managerial organisation and the extent and character of local bottlenecks. These are arguments for a greater use of production experts in supervision and control, and for the firmer use of Governmental powers to eliminate inefficiency in management and to distribute managers of proved efficiency through vital industries.

They are arguments for the fullest and freest criticism of managements, without any manner of restraint, rebuke or concealment, from every participant in the industrial process, from the humblest worker to the manager himself. It is true that more output could be achieved, with greater speed and a better balance, if purposive reorganisation and control measures of this kind were added to, or substituted for, more negative methods.

But the case for production engineers to remodel the war effort—which is not unnaturally voiced mainly by production engineers who tend to share the fault of the technocrats in their belief that "there is little or no limit" to what can be produced from given resources at a given time—has definite bounds. In the short term, the largest single factor in restraining production is the hindrance to the supply of materials caused by the shortage of shipping space and the Battle of the Atlantic. It is impossible to cut the coat except according to the cloth. And, even where actual shortages of materials do not occur, there may still be a hampering unevenness or irregularity about their arrival. More efficient management would make the least of these material difficulties, but it could not remove them, for there is no magic, either in management or official policy, that can decant a quart out of a pint pot.

Is it correct to say, then, that the need to transfer more workers into the war industries for training and work is removed by the fact that better management could make better use of the workers—and materials—already there, or by the fact that the amount of labour that can be used is limited by the amount of materials that can be imported—or mined or manufactured at home. Clearly not. In the first place, a war-winning pro-

gramme of production must look ahead. It must assume that the Battle of the Atlantic will be won. It must assume that the maximum use for production, fighting or defence will have to be made of every man and woman in these islands. The most cursory examination of the population statistics of Britain, on the one hand, and of German Europe, on the other, shows how heavily the crude balance of manpower is tilted in the enemy's favour. It is true that any attempt to match the German fighting forces in numbers would be an impossible task, but this is the case for a 100 per cent effort in the factories to beat quantity by quality, for production on the largest possible scale as well as in the most efficient way. The argument to the contrary implies that, relying on a mobilisation of resources in the United States that will still take many months to achieve (and on the military resistance of the Russian millions), this country can win the war with one hand tied behind its back—that is, with a large part of its workers making no obvious contribution to the war effort. Both morally and arithmetically, the proposition is singularly poor and unconvincing.

Even with the present limitations of management, control, organisation and materials there are labour shortages—of all degrees. The gap in the supply of skilled men can, admittedly, only be narrowed in the near future by better use of those available, though even here a thorough programme of training and retraining, accompanied by further upgrading and dilution, might make a marked numerical expansion possible. In the last resort, in spite of the wide differences between skilled and unskilled workers, between heavy and light workers, manual and sedentary workers, artisan and professional workers and between men and women, manpower is homogeneous. The worker who could not do a particular job can replace another worker who could. Coalmining

is crying out, in grave need, for the return of 50,000 miners, and 50,000 other workers will be needed to replace them in their present jobs. Women are almost desperately needed to release men in the Services for duties which they themselves could not do.

If the supply of materials were a permanent restraint, the scope for enlisting more war workers, either by transfer and training or *in situ* where they are at present doing less essential work, would, of course, be limited. But even then it would not be negligible. It could be made possible for air and arms factories to work continuously without asking any individual worker to do more than a normal working week—to the advantage both of national production and individual productivity. The needs of the Services and coalmining—and agriculture—could, directly or indirectly, be met. With United States aid at sea the supply of materials will steadily grow, and there is every case for forward planning of labour requirements and forward training of war workers, as well as for the utmost effort to use every existing item of capacity, material and labour in every locality—a policy still impeded by the lack of central direction over sub-contracting.

The truth is that the "efficiency experts" and those who wish to mobilise the entire nation for war work are not sponsors of rival policies but of complementary and inseparable ones. In the last resort, the war effort will depend on the use made of the "marginal" man or woman—the "last" unit of labour; and manpower is very scarce. There will always be exaggerated shortages of labour if recruits are not ready trained and waiting at every stage of expanded production; and there will always be wastage of labour if management and planning are not shrewd and skilful.

Using the Facts

ON Wednesday the Lords debated the Ministry of Information and a number of cogent and reasoned criticisms emerged in the course of the debate. For once, criticism was concentrated upon the real problem—lack of co-ordination and responsibility, with the result that the debate represented not only a remarkable consensus of opinion but also a real contribution to an understanding of the needs of British propaganda. It is unfortunate that the Ministry should have become the butt of so much ill-informed criticism. The changes of its staff have distracted attention from the real need, which is a re-definition of its function. It is probable that the Ministry could fulfil every call made on it without changing, increasing or decreasing its staff, and without very seriously altering its departmental structure. But it will continue to flounder if the real nature of its task is left permanently undefined.

A first difficulty is the lack of a clear division between the Ministry's functions on the home and on the foreign front. The model of the German Ministry of Propaganda was clearly in the minds of the framers of the Ministry of Information, and it was not realised that there is no place for such a model in the life of a free community. For Goebbels, the German people are as much a field for exploitation and manipulation as the outside world. The Government's line has to be put across to them with roughly the same methods and the same deceptions. Thus there is, in the German Ministry, a certain unity of function. Here in Britain, the very idea of an organ of Government empowered to drag on public opinion is the negation of free government. It is true that "keeping up morale" and kindred employments are only a fraction of the Ministry's work, but the outcry—albeit a misguided outcry—raised against "Cooper's Snoopers" and the general attitude of mental resistance to anything coming out of the Ministry, are evidence of a popular temper whose reactions to home propaganda are perhaps sounder than those of the men who first planned the functions of the Ministry.

It is true that the needs and policy of the Government

have to be placed before the people. But in a democratic community, the correct channel is the Press. The Government must be constantly ready with news of its activities and with guidance on the interpretation of policy. It might be possible for the Ministry, in its work on the home front, to concentrate on co-ordinating and rendering more efficient and vital the liaison between the Government and the Press. At present, there are two main criticisms, one of geographical separation—every Ministry has a public relations officer, but there is no one place where the busy journalist can get all the relevant information in a short time—the other of insufficient co-ordination in the handling of news. At present, apparently, no attempt is made to consider the wants or policies of the various Ministries as a whole. The public relations officers of each Ministry, who come in most part from the profession of commercial advertising, are busy boosting their own departments. Yet there are obvious cases in which the interests of two or three or more Ministries are involved, and both the efficiency of the Government and the understanding of the public would be increased by a presentation of the facts as a whole.

One way out of the difficulty would be to group all the Press relations officers of each Ministry together into one place—so far, the Ministry of Information only contains one body of Press officers, the Foreign Office Press section. This process of unification would be completed if the Minister of Information were to institute a regular conference with the Press officers, at which the presentation of the news as a co-ordinated whole was discussed and the relative interests of the various Ministries established. There is even no reason why the competent Minister should be a Minister of Information. It might, for instance, be found preferable to establish a Press section of the Home Office which included the officers of the other Home Ministries. What is essential is that some kind of co-ordination should be achieved.

In the more important sphere of the Ministry of Information's foreign work, the German model has again given rise to misunderstanding. It is assumed that, because

British propaganda was more successful in the last war, it can learn to out-trump Goebbels in this, provided only it is conducted with sufficient force and initiative. But in the last war, the struggle on the propaganda front was between the tradition of Prussia, which was opposed to any propaganda at all, and the nascent commercial advertising of the British Press lords. To-day the Nazis have fused the technique for the high pressure sales talk, with a diabolical flair for the psychological exploitation of human weakness and human vice, to form a propaganda which, in its powers of deception, suggestion and confusion, is a military weapon of enormous effect. British propaganda cannot surpass Goebbels in this field. The line opened by the Press lords of the last war has been followed to a logical conclusion whither British propaganda cannot follow without betraying the cause for which Britain is fighting.

Moreover, on purely practical grounds, an opportunist attitude towards the truth or lack of it in propaganda is not the best policy in the long run. So far, the world has witnessed the German lie backed by the overwhelming military strength of the Reich. The lie will be a crippling disadvantage when once the tide of German victory has turned. In adversity and defeat, the truth provides a modest resting place where the nation can gather strength, in clarity and confidence, for the next phase of the struggle. Goebbels has deprived the German people of this resting place, and it is safe to say that, once the collapse begins, it will be thrice as fast as a result of the monument of lies upon which victory has been insecurely perched.

To say that Britain cannot compete with Germany in the technique of propaganda evolved by the Nazis does not mean that the Ministry of Information has no function to fulfil in the foreign field. There is overwhelming need for effective British propaganda, but it must be a propaganda based on the judicious use of facts. The presentation of a situation—diplomatic, military, political—can make all the difference to its effectiveness abroad. To give only one example: if a major action is planned in, say, Africa, its propaganda importance in various countries, the likelihood of its success, the line to take until success seems certain, the most suitable vehicle of dissemination—all must be discussed in advance; and joint discussion must continue while the action is in progress. Otherwise, as is all too often true in the case of the war in Africa, it may take days of patient work to undo the harm done by some over-optimistic statement made in the early stages of the action—probably by "A spokesman at Cairo." In parenthesis, the disastrous results of this false optimism

in undermining the world's confidence in the objectivity of British news—in itself a great propaganda asset—should be a lesson to all those who wish to see British propagandists exploiting the lie.

The most advantageous use of facts implies reforms of somewhat the same character as those proposed for the home front. The need is for co-ordination and responsibility. At present, there are far too many independent agencies giving out material without knowledge of what is demanded by the situation as a whole. The chief sin laid at the door of the Service Departments is their clumsiness in the release of news. It is true that there are damaging delays and silences. But there is also the less publicised error of releasing too much, quite indiscriminately. It is obviously wrong that the Air Ministry should have a completely separate news service, and there is immediate need for bringing under the control of the Ministry of Information all the agencies for distributing news. This applies not only to the various Service Departments but to such key services as Reuter's, which is responsible for the dissemination of more information than any Government office and whose activities appear to be largely unco-ordinated.

It also applies to the whole system of secret propaganda which seems at present to be suffering under a troublesome and inefficient system of dual control. Nor is it certain that it is conforming to the criterion of adherence to the facts. There is, of course, everything to be gained by giving the most favourable interpretation of Britain to various groups and classes abroad in terms they can grasp, but the interpretation must be of a Britain that exists outside as well as inside the imagination of the propagandists.

Regrouping will be useless, however, unless final responsibility for the choice and use of news rests firmly upon a Minister capable of dealing with the subordinate agencies—departments or otherwise—on the one hand, and in immediate contact with the War Cabinet on the other. The good use of the facts about Britain's war situation depends upon an intimate knowledge of what that situation is, and only a man in the War Cabinet and in constant contact with the formation of policy can possess that knowledge. The chief reforms necessary in the Ministry appear, both on the home and the foreign front, to resolve themselves into the co-ordination of all the existing agencies for disseminating news under one resolute and efficient control in immediate contact with the War Cabinet. It follows that any great structural reorganisation is probably unnecessary. What is indispensable is a Minister with the vision and resolution and responsibility necessary to the proper fulfilling of his office.

NOTES OF THE WEEK

The Progress of the War

It is too early to report on the progress of the war in the east, especially as it is being conducted without any covering force of war correspondents. The German attack appears to be a triple thrust, in the north through the Baltic States to Leningrad, in the centre through Brest-Litovsk and on to Kiev, and in the south through Bessarabia in the direction of Odessa. So far, it is unlikely that the main forces on either side are engaged, and Germany is probably attempting to repeat the tactics which were so successful in Poland, that is, to destroy enemy aerodromes and aircraft before launching the full mechanised drive reinforced by dive bombers—an attack which ground forces unsupported from the air are almost powerless to resist. The Russians admit serious losses of aircraft and, while it is true they have a margin Poland did not possess, their estimated front-line strength of 5,000 planes must include much that could not be put into the air effectively against the *Luftwaffe*. This loss of aircraft is certainly the most disquieting feature of the preliminary phase of the campaign for, if the Russian Air Force is blasted from the skies or destroyed on the ground, then no amount of sturdy land fighting by Russia's 160 divisions can hold up the German advance. There is little in this sphere that Britain can do to give immediate assistance to the Russians. The advance in Syria is so obviously under-equipped in the air that it may

be concluded that there are no reserves in the Middle East to be sent north to reinforce the Russian Air Force. Help in the air must, for the time being, mean intensified bombing raids on German industrial and military targets and again Hitler has chosen his time well. In these short nights, long distance raids are virtually impossible. Mr Eden has given the welcome assurance that Britain will strike even harder against Germany in the next weeks and, if Russia succeeds in holding a line, it may be possible in the course of the autumn to reinforce the Russian Air Force by the Suez route. This presumably will be one of the problems examined by the economic and military missions which are to be sent without delay to Moscow.

Striking Power

The British counter-offensive in the air by day has been methodically gathering strength and direction since the winter; and, now that Hitler has left his western flank exposed while he hurls his forces against Soviet Russia, the familiar "sweeps" by the RAF over the northern part of occupied France have become painful stabs. In the Battle of Britain, the ratio of losses by day was always heavily in favour of the defenders; over France in the past week or so, it has been over three to one in favour of

the attackers. Tactically, the Germans have always been inferior. Now, for a time at least, they have surrendered their strategical advantages over the network of French airfields. The superiority of British over German fighters appears to have survived a year of technical and tactical changes, and the *Luftwaffe* is paying an appreciable price for its preoccupation elsewhere when it loses over 120 fighters—against these "sweeps" alone—in seven days. It may be that the enemy is prepared, in the circumstances, to suffer passively; and recent events probably do not mean that a Battle of France is already in train. The bomber core of the large fighter formations that have been flying as far as 60 miles into German-occupied territory is small; and it would need longer-range fighters than the triumphant Spitfires and Hurricanes to advance the day front to Germany. But these notable successes are a hint of greater ones to come; and they give a plain indication of one of the main ways in which valuable indirect aid can be given to Russia. At night the balance of events has been similar. Every night for a fortnight Western Germany has been bombed—though the nights are too short for the intensest raids—while German night raiding has been very slight. Every advantage, night and day, must be wrung from this situation, so that the Germans may realise that they are fighting on two fronts after all.

The Running Sore

It seems that Hitler is relying on the Battle of the Atlantic to pin down and weaken Anglo-American resistance while he battles with Russia. The tonnage of British ships sunk in May was higher than in any other month of

MONTHLY SHIPPING LOSSES
(In gross tons)

	British	British, Allied and Neutral
Average, Sept., 1939–May, 1940 . . .	91,900	182,400
June, 1940	269,783	533,902
July	284,770	400,353
August	282,432	387,471
September	307,427	435,553
October	299,399	423,616
November	299,816	368,806
December	230,307	313,197
January, 1941	205,473	309,731
February	264,523	339,833
March	338,105	505,750
April	338,186	581,251*
May	355,032	461,328

12 Months to May, 1941 3,475,253 5,060,791

Average, June, 1940–May, 1941 289,600 421,700

* Losses in Greece (unrevised) 187,054.

the war. The tonnage of British, Allied and neutral ships sunk in March has been raised to 505,750 from the 489,229 tons originally announced; the April figure has been revised from 488,124 to 581,251; and it seems not

improbable that the May total of 461,328 tons may also be lifted, as later news of lost vessels comes in, to the neighbourhood of 500,000 tons—though, in this case, the original announcement was itself delayed. There were heavy losses, of course, off Greece and Crete, but the average monthly loss of nearly 520,000 tons in March, April, and May compares ominously with the already high average of 390,000 tons in the previous nine months; and, if British losses alone are counted, nearly a million tons more have been lost in the last nine months than in all the first year of war. It is just a year since the second Battle of the Atlantic started, after the German occupation of the French ports, and the steady improvement in defensive strength and methods since then has not been able to shake off the attack. The recent statement that over a million tons of repaired shipping were sent to sea in a single week, while reflecting credit on the ship repairers, is a reminder that there are considerable losses which are not sinkings. At present, sinkings alone are twice the replacement capacity of British and American yards together; and forecasts for 1942 estimate British output at 1½ million tons and American at 2 million; a total of 3½ million tons against a loss, at the current rate, of 5 million tons a year. Meanwhile, it is the arrival—or non-arrival!—of ships and cargoes that determines the pace and scale of the war effort. The position is serious; and it should be clear on both sides of the Atlantic that no item in the war against Hitler is more imperative than greater successes in this sea battle.

The Coal Crisis

Three months have passed since the Government drew attention to the imperative need for speeding-up the output of coal. Yet, only a few weeks ago, the Secretary to the Mines Department pointed out that, instead of adding to stocks, the industry's output was insufficient to meet current needs. As the Committee on National Expenditure points out in its sixteenth report of the 1940–41 session, little time remains "before next winter's demands will fall upon the industry." The application of the Essential Work Order to coal-mining will prevent the further depletion of the industry's labour force; no more miners are to be called up; and, in an appeal to the miners to do their part, Mr Bevin for once spoke bluntly. "The Government has played straight with the miners and the mining industry," he said, "and the nation is entitled to a square deal from them." Referring to absenteeism, he pointed out that any man that stays away from his job for any but genuine and unavoidable reasons is "acting criminally against his fellow men, the nation and the Forces." He went so far as to remind miners of military age that, if they do not fulfil their obligations and pull their weight, "reservation cannot be continued." The position is grave. It is now widely admitted that the industry's labour force—some 70,000–80,000 underground and surface workers were called up or took up other work during the past year—is inadequate for the task of producing a surplus of some 20 million tons of coal during the next four months. The problem can only be solved, not simply by an immediate expansion in output, but by rigorous rationing as well. In order to secure additional labour, Mr Bevin has appealed to miners who have

left the industry to report to the nearest employment exchange, where each man will be told whether he is needed most in the mines or where he is. But, although there is a "standstill" order on the calling-up of miners, miners already in the armed forces are not to be released. It is far from sure that the appeal will bring forward the additional 50,000 miners that are said to be needed to secure the desired expansion in output and bring them forward in time. In view of the urgency of the problem, a time limit might be set for the registration of former miners; and if the response is found to be inadequate the application of more drastic measures, including a partial recall of miners from the armed forces, should be considered without delay. The country cannot afford a hold-up in the war effort for lack of coal. Steps are required to prevent or curtail the use of coal for any but vital purposes in industry, transport and homes. Factories not contributing to the war effort can hardly have a claim on the scarce supplies of coal. Passenger train services that are not essential should be eliminated; and the strictest economy of coal, gas and electricity must be observed by both industrial and domestic users. Only by prompt and drastic action can the country counter what is a very serious danger indeed.

War Finance

On Tuesday the Commons gave the Chancellor of the Exchequer a supplementary vote of credit of £1,000 millions, making £2,000 millions so far in this financial year. Some £710 millions of the first vote of credit, voted in February, have been spent. Sir Kingsley Wood stated that expenditure was running at the rate of £12 millions a day, and pointed out that savings, at the rate of £5½ millions a day, were not enough to bridge the "true inflationary gap." The rate of expenditure is nearly a third higher than it was a year ago, but it is still below the average of £13.3 millions for January to March, 1941—admittedly the last quarter of the financial year when expenditure always is higher than in the other quarters—and, although the supplies coming forward under Lease-and-Lend will continue to ease the strain on the Budget, the "gap" will widen rather than narrow. At present, consumption is being held down and inflation held off with fair success by rationing and controls on expenditure. But the menace is latent when purchasing power has grown rapidly at the same time as the supply of goods has shrunk. It was welcome, therefore, that the Chancellor reaffirmed his Budget pledge to secure stability in wages and the cost of living, and it would be still more welcome if the pledge were to grow into a policy—and even into a programme.

The President and Public Opinion

Although the German attack on Russia has driven every other item of foreign news from the American headlines, it should be recorded that the President made use of the *Robin Moor* incident to send a special Message to Congress—the first since the Lease and Lend Act—denouncing Germany's piracy as "outrageous and indefensible." The Message described Germany's action as a warning from the Nazis that the United States "may use the high seas of the world only with German consent," and as an attempt to prevent the United States from carrying out its chosen policy of "helping Britain to survive." To this challenge, the President declared, "we are not yielding, and we do not propose to yield." Yet Mr. Roosevelt did not go on to outline any measures he proposed to take nor did his Message meet the simple objection that, so long as "combat zones" exist into which American vessels are not allowed to go, Germany is in fact dictating which part of the oceans of the world the United States shall use. The whole Message illustrated the difficulties with which the President is having to contend in shepherding the American people to an ever greater awareness of their commitments in this struggle. He cannot propose particular and spectacular methods of meeting the Nazi menace, since these would run the risk of endless discussion and concerted filibustering in the United States Congress. But the unspectacular action he can take within his emergency powers is not likely to stir the interest and enthusiasm of the main body of the American people. This apathy reacts in turn on Congress and increases the strength of its isolationists. It is difficult to forecast what, at this moment, can rouse these Americans. A partially successful invasion of Britain

or the fall of Ireland might do so, but the truth is that they have been spoilt in the matter of sensation. Terror raids on London or Odessa make familiar reading. Apart from its confusing ideological implications, even the German invasion of Russia may not be much more than a 24-hour wonder for many citizens of the United States; and, against this background, it is hardly remarkable that the *Robin Moor* incident has made hardly any impression at all.

Efficiency at the Docks

The Select Committee on National Expenditure has lost no time in probing into the effect of the measures taken to increase the efficiency of handling cargoes at the ports. On the whole, their conclusions are not unfavourable. The appointment of Regional Port Directors by the former Minister of Transport has led to an improvement in that these executives can take prompt and final decisions on practically all matters relating to port traffic. The new labour schemes, too, appear to be working satisfactorily. Their introduction, however, coincided with a temporary decline in the pressure of work. The ports have not been crowded, and the schemes have still to be tested by experience. Owing to the reduction of traffic in one port, the system of a guaranteed weekly minimum wage has involved the Ministry of Transport in a higher total wages bill than would have been payable under the previous system of payment for work rendered. In order to improve the efficiency of labour under the new arrangements, the Committee, in the light of the evidence submitted to it, recommend the extension of piece-rates wherever practicable and closer control over labour. It found that, while the majority of workers are fulfilling their obligations, some of them are "deliberately attempting to evade work so long as they do not thereby imperil their right to receive the weekly minimum wage." The Committee also found that there was room at some of the ports for considerable improvements in the number, location, equipment and general amenities of canteens, in the provision of adequate and sustaining food supplies, and in travelling facilities between the places of work and the canteens. These welfare questions are vital. Finally, the Committee urges the provision of inland sorting depots without further loss of time which would assist in speeding up the dispersal of stocks and render them less vulnerable to air attack. It is to be hoped that the Committee's suggestions will not remain unheeded.

Technique of Price Control

There is at length increasing recognition in this country that price control, as one of the main bulwarks against inflation, is an indispensable instrument of economic policy in a country at war. The decision to introduce maximum prices for fish at every stage of production from sea to shop from June 30th is particularly welcome. There is reason to believe that the completeness of the control may prevent the disappearance of fish from the market. The public has hitherto been understandably irritated by the discovery that goods, whose prices are controlled, tend to become unobtainable on the day when the maximum price comes into force. The disappearance during the past week of gooseberries and tomatoes lends fresh point to a grievance which has been impinging on the public consciousness since the vanishing trick performed by the indispensable onion last autumn. It seems probable that either fruit will be retailed at an exorbitant price, or, when in season, it will disappear from the market rather than be offered at the permitted maximum. It is clear that, so far as this policy is deliberately designed to tempt soft fruit into the jam-making factories, it can attract no criticism on the ground of ineptitude. Whether it is good psychology to pursue a policy which carries a promise of fruit for the public at reasonable prices, but is, in fact, designed to divert fruit from the public, is another matter. If, however, the disappearance from the market of foods whose price is controlled is not deliberate policy, the technique of price control is clearly at fault. Goods will be withdrawn from sale at a maximum price lower than that which would be established by the free play of supply and demand, if there is any possibility of disposing of them elsewhere, or at a later date, for a higher net return. That is to say, they will be sold where the cost of transport will be saved, or

at a date when there is prospect of the maximum price being raised. If the Government, in its anxiety to avoid inflation, wishes to avoid a serious curtailment in the supplies of food available for equitable distribution throughout the country, it must control all prices of competing goods, and also prices, including transport costs, at all stages of production. The basic price, that paid to the producer, must be sufficient to induce him to maintain production at the level desired by the Ministry. The scheme for controlling the price of fish shows an appreciation of the position, for the Ministry of Food is to pay transport costs from specified ports to inland centres of distribution. In the case of tomatoes, an attempt has been made to meet the distribution difficulty by dividing the country into seven areas, and permitting retail prices to vary between 1s. 2d. and 1s. 7d. per lb., but unfortunately the process has not been carried sufficiently far to encourage their sale in London.

Unrationed Foods

The appointment of Mr. F. Aldridge to direct the distribution of unrationed foods must be hailed as a development of great promise. It has for long been recognised that the problems of distributing unrationed foods are much more complex than those involved in straightforward rationing. This is true both from the fiscal standpoint, where the choice appears to lie between an uncontrolled rise in the prices of unrationed goods and control of their prices with consequent scarcity, and from the standpoint of nutrition and equity, where the principle of "first come, first served" favours the rich and the leisured at the expense of the needy and the hardworking. Mr. Aldridge's task appears to fall into two parts. Where he considers it necessary and practicable, he may order a commodity to be rationed, and there is little doubt that such an order should be applied in every case where rationing is possible. The crucial difficulty, of course, arises in cases where normal rationing cannot be applied; when supplies are completely inadequate for a minimum per caput distribution, or where the commodity is only very selectively consumed, as in the case of tobacco or vinegar. Here it must be presumed that the principle of group rationing—the global quota—of which the sweet spread ration is the prototype in this country, will be extended. A weekly ration of semolina for every British citizen is perhaps an impracticable ambition, but a weekly ration of cereals grouped together provides a method of tackling the exasperating shortages of sago, seed pearl tapioca, ground rice and the like, with simplicity and fairness.

Damascus and After

After a sharp engagement, the Vichy forces withdrew from Damascus on June 21st and the town was occupied by British, Indian and Free French forces. Resistance is, however, by no means at an end. Although Merz Ayoun has been retaken, the progress up the coast road to Beirut is slow; beyond Damascus, the Vichy forces are consolidating new defensive positions. It may be possible to half-encircle these by an attack from the Iraqi frontier, and it is encouraging news that British columns have surrounded Palmyra on the Mosul-Tripoli pipe line. The stiffest fighting may, however, be expected on a line from Beirut northwards to Aleppo and unless the Allies are able to reinforce their troops, the progress of the campaign so far suggests that the advance may remain too slow. The Syrians themselves appear to be causing no immediate difficulties. The merchants of Tyre and Sidon have already visited Haifa to purchase food and oil and the life of the peasants has been barely disturbed. The Allies had a friendly reception in Damascus, but the question of Syrian independence was raised at once. It is to be hoped that, even while the fighting is still in progress, thought will be given to the problem of an ultimate settlement of the Arab question in the Levant. Otherwise, decisions may be taken now which will prejudice the final solution. Allied with Egypt, Iraq and Turkey, in occupation of Palestine and Syria and in friendly contact with Saudi Arabia, Britain has a unique opportunity—and a unique responsibility.

Negotiations at Djibouti

With the fall of Assab last week and the surrender of some 8,000 Italian troops at Jimma, the final stages of the campaign in Italian East Africa have probably been

reached. It was possibly with the approaching end of hostilities in view that General Wavell decided to regularise the position of French Somaliland by calling on the Governor at Djibouti to declare for the Free French or at least to denounce the pro-Axis policy of Vichy. If the Governor refused, General Wavell was prepared to evacuate women and children from Djibouti and to feed them until evacuation was complete. The question is still under discussion between the British and French authorities, but Vichy is understood to have lodged a protest.

Strengthening Regionalism

In the recent debate on civil defence, the Government turned down the suggestion that the administration of civil defence should be in the control of the regional staffs, working through the local authorities, instead of the present system by which the functions of the Regional Commissioner are mainly restricted to co-ordination and advice. Yet, step by step, regionalism is gaining ground. The Minister of Health admitted, during the debate, that the new fire fighting duties of the Regional Commissioners might necessitate a strengthening of the regional machinery by the appointment of an additional deputy, and last week-end it was announced by Mr. Morrison that, in most regions, the Commissioner will henceforward have a second Deputy-Commissioner. Although the latter's duties may vary according to the circumstances of the region, Mr. Morrison suggested that one of the two deputies should be concerned primarily with fire fighting and the other with the preparation of post-raid measures, that is, reorganisation and reconstruction—roughly, in fact, what Mr. Willink and Sir Warren Fisher have been doing in London since last September. This appointment of additional Deputy-Commissioners does not mean that additional powers are given to the regional staffs over local authorities. Although the Minister of Home Security can delegate to a Regional Commissioner his powers of superseding local authorities in civil defence matters, no such powers have yet been delegated. But, as Mr. Willink pointed out in the debate, a regional officer can do much by setting standards and gingering up the local authorities which fall below it; and if the new deputies are as successful as he has been with the Metropolitan boroughs, their appointment promises a great improvement in provincial civil defence. The other Deputy-Commissioners, who, if Mr. Morrison's suggestion is adopted, will be in charge of fire fighting, will have an equally arduous task. It is interesting to note that the Home Secretary included fire bomb fighters within the co-ordination duties proposed for them, and it is quite certain that though the fire watchers must remain as local forces, there is great need that here, too, a standard should be set. At present little is done to see that each fire watching party is disciplined and efficient.

Ranks and Rates

The incorporation of the ATS into the Army has been made the spearhead of a campaign for the women recruits who are so desperately needed. The rank and file will still be ordered and looked after by their own officers, whose titles have been rather unnecessarily changed (though not, as was expected, to those of the corresponding Army ranks) to mark their receipt of the King's Commission; but it should now be possible for the commanders

THE BRITISH LINEN BANK

of the units with which they are working to direct their operations, without having clumsy recourse to a separate female authority. In part, the new appeal is disingenuous. Much is made of the higher rates of pay, when in fact the basic rates for all ranks remain unchanged—and low. The innovation is special pay for special work, opportunities for which will multiply as the women auxiliaries take over men's jobs; and, presumably, skilled women in specialised work, such as transport and mechanical jobs, will now have the chance of receiving, as well as earning, the proficiency increments which, for no clear reason, have hitherto been denied them. There is no more important national work than to eke out the Army's man-power, at a time when the war factories can ill-afford to spare workers, or potential workers, for fighting; and the position in many branches of the ATS is that every woman recruited now automatically releases a man for more combatant duties. It is perhaps not easy to find recruits for a Service that is as under-paid and over-worked as it is valuable, especially when women in work have official sanction for their disinclination to move. But these changes may be the start of a new phase in which the ATS will be more effectively directed and in which "the rate for the job" may come to have some meaning as women replace men.

* * *

Young Delinquents

One of the harsh necessities of total war is that not even children can escape it. Evacuation, the temporary breakdown of education, the absence of parents, air raids—all these, and many other, circumstances have had a direct effect on child life. It is hardly surprising, therefore, that there has been an alarming increase in the number of children found guilty of indictable offences. The number of offenders under 14 increased by 41 per cent in the first year of the war, compared with the previous twelve months, while the increase in the 14-17 age group was about 22 per cent. These percentage increases are particularly serious because the number of young offenders was already large enough before the war. In 1938, of the 78,463 persons found guilty of indictable offences, over half were under 21 years of age—36 per cent being under 17. Since it is the under 14s who show the biggest rise since the war, it is presumably the breakdown in education which is largely responsible. As a circular from the Home Office and Board of Education points out, full-time education has now been restored in most areas, but school attendance is less satisfactory, and local education authorities are urged to take all possible measures to get the children to school. They are also urged to extend the provision of social and recreative facilities. But what is most in need of reform is the treatment of child offenders when they come before the courts. What is happening is that children are being sent to prison because there are not enough remand homes or approved schools to cope with the great increase in cases. Yet official recognition that prison is the surest way to make a young delinquent into an old offender was shown by the Criminal Justice Bill, which provided that a magistrate could not send anyone under 21 to prison, without first weighing all the circumstances and then stating the cause on the warrant, and proposed the establishment of attendance centres and residential houses. The Bill was killed by the war, but there is no reason why its spirit should not persist, and the Home Office circular does, in fact, point to the need for younger men and women to sit as justices in juvenile courts and reminds justices that corporal punishment is neither suitable nor effective for young offenders. Local authorities were also urged some months ago to increase their remand home accommodation by 50 per cent. Speedy and effective measures must be taken if the work of generations of reformers is not to be undone before the war is over.

* * *

Air Raid Casualties

Although the destruction of property by raiding aircraft appears to have been heavier, month by month, this spring than last autumn, it is a significant fact that the published figures of casualties have been less. The monthly averages were: for September, 1940, 17,569; for the ensuing three months, 11,552; and for the similar period, March to May, 1941, 10,873. It is further to be noted that, while in September 152.6 people were injured—that is admitted to and detained in hospital—for every 100 killed, the figure fell to 135.5 in the next three months, was

only 107.5 for March to May, and for May alone was 96.5. Without much more detail than is available, it is impossible to say with certainty just what these figures mean. There has been no change either in the basis of compilation or in the practice of hospitals with regard to the admission of injured—unless it be to admit rather more easily than in the autumn, when the extent of demands was less clearly foreseen. It may be that in fewer but heavier raids a greater number of people are killed—rather than that fewer, proportionately, are being injured. Or—and it would be a more satisfactory explanation—the change may be due either to better shelters, to better use of shelter or to a different distribution of population. In the absence of adequate information, it seems reasonable to suppose that there are still too many large concentrations of people, but that, for the rest, dispersal is making progress, while, to some extent shelters have been improved. The figures, both of fatal casualties and of wounded—and some of the latter are very minor cases—are still heavy, and suggest that more could and should be done to expedite dispersal and, where that is impracticable, to provide better shelter.

Taxation—Contracting Out

The debate on the new clauses of the Finance Bill, designed to limit freedom from income-tax, revealed a considerable opposition to the clauses as they stand, on the ground that they do not go far enough. It also showed that the desire of the opposition was to prevent anyone from escaping full liability to tax, whereas the object of the Chancellor was at least as much to relieve those who were subjected to an unduly heavy burden, owing to the fact that a tax free payment ranked in front of their claims. A very large part of the debate was devoted to arguments as to whether contracts, arranging for tax-free payments, should not be forbidden as against the public interest. It seems improbable that this claim will meet with any great measure of success, for there will always be minors, the aged, and a number of other people for whom it will be desirable to provide a fixed income for a period of years. For this purpose, the tax-free provision is very convenient, and normally harmless. Tax-free payments to employees, and in particular to directors, are in a different class, and it might well be desirable to place severe limits on the practice, since it tends to breed irresponsibility. At the same time, it is not certain that, over any extended period of time, tax-free wages and salaries result in a larger receipt by the employee than the more usual practice, since he may well be prepared to pay an unduly heavy premium for an assumed certainty of suffering no diminution in cash income. The making of tax-free payments to directors is open to abuse, but it is a relatively rare practice compared with some other means of securing additional emoluments. The cure in this particular case certainly lies in amendments to the Company Acts, so as to make obligatory the publication of total receipts of all the members of a board, a matter in which shareholders might well be more active.

Shorter Notes

Lord Rushcliffe is to retire from the chairmanship of the Assistance Board at the beginning of next month. It was an unusual opportunity for the Minister responsible for the passing of a measure to become responsible for its administration. Lord Rushcliffe has had the additional satisfaction of seeing the Board grow, during his chairmanship, from its beginning as the dispenser of unemployment assistance to its present position as the source of assistance, not only to the unemployed, but to needy pensioners and homeless air-raid victims as well—and the possible nucleus of a Department of Social Security, consolidating and unifying the present scattered and discrepant provision for the poor and unfortunate.

*

From July 1 a system of mailcerts will be introduced to complement the navicert system. It will apply to the United States and will enable senders of parcels from that country to certain neutral countries to ascertain before posting whether facilities can be given for their passage through the British examination stations.

THE WORLD OVERSEAS

The Finances of Vichy France

(By a Correspondent)

THE financial position of Vichy France is illustrated by the failure of the Government to produce a yearly budget or even a rough estimate of its yearly expenditure and revenue. The regime is living from hand to mouth, and all that its Finance Minister has so far been able to do has been to plan expenditure for periods not longer than three months ahead. His quarterly budgets, the first published in January and the second in April this year, consisted of two parts, one giving the figures of ordinary expenditure and the other comprising *les dépenses extraordinaires* to meet the cost of "war liquidation" and of public works designed to lessen unemployment.

Below are given the main items of the two budgets:—

	Jan.—Mar., 1941	April—June, 1941
ORDINARY BUDGET (in millions of francs)		
Public Debt	5,117	4,018
Floating Debt	3,624	3,524
Personnel	5,641	5,726
Materials	3,377	2,947
Public Works	2,012	1,607
Social Services	3,495	3,934
Various	1,145	969
Total	24,411	22,725
EXTRAORDINARY BUDGET:—		
Liquidation of War	12,116	7,790
Public Works and Measures to fight unemployment ...	3,175	2,242
Total	15,291	10,432

Thus the total expenditure amounted to nearly 40 milliard francs for the first and 33 milliards for the second quarter of 1941. The decrease in expenditure was brought about by drastic cuts in the extraordinary budget (liquidation of war and measures against unemployment) and by a reduction in the public debt services. Since the total expenditure for the first half-year is thus about 73 milliards, it is reasonable to expect the budget for the year to be about 140 milliards.

These figures do not include the sums paid out to meet the cost of the German occupation. This contribution (calculated on the combined basis of 400 millions a day up to May and 300 millions for the rest of the year) entails the additional burden of about 125 milliards. Thus State expenditure, plus occupation costs, amount to about 265 milliards, a sum not far below France's War Budget for 1940. Costly as modern warfare may be, the cost of modern slavery to the enslaved proves to be no cheaper even if it is expressed in financial terms alone.

What is the revenue on which Vichy counts? Taxation can yield an insignificant part only; customs duty revenue has fallen off almost entirely. Owing to the general uncertainty of the situation, long or medium term loans are out of the question. There remain only two ways of providing money, both of which have been amply used by the Vichy Government—Treasury bills and advances from the Banque de France.

Since June, 1940, the usual publication of weekly banking returns has been suspended, and not even the yearly balance-sheet for 1940 has been brought to public knowledge. The report of the shareholders' annual meeting (held in March, 1941) is, therefore, the only available source of information concerning the bank's activities.

The advances made to the State come under two separate accounts: advances to meet State expenditure proper; and advances for the payment of occupation costs. Operations in the first category have been based on the pre-war agreement between the Bank and the Treasury.

Their limit had been raised repeatedly during the war until it reached 70 milliards on June 8, 1940. The Armistice was followed by a credit panic, entailing massive withdrawals of bank deposits and a run on the savings banks; subscriptions to Treasury bills ceased almost completely; and for several weeks the Treasury had to rely on Bank advances exclusively. In September, the 70 milliard mark was reached and thus the total of available credits was exhausted. There was, however, no need for further advances, since the banking tension eased during subsequent weeks and Treasury bill subscriptions could be resumed. Towards the end of the year the Government was able to make considerable repayments to the Bank, bringing the figure of advances down to 60 milliards. (These figures include neither the transfer to the State of about 22 milliards gained by the revaluation of the Bank's gold reserve in February, 1940, nor the 30 milliards of gold handed over to the Government against bonds.)

The advances to meet the cost of occupation form a separate account, based on a special agreement concluded on August 25, 1940. The original provisions had fixed their maximum at 50 milliards. On October 29th, the limit was raised to 65 milliards; on December 12th to 73 milliards; on December 31st to 85 milliards; and on March 22, 1941, to 100 milliards.

The Bank's private business is indicated by the following figures: by the time of the Armistice the bill portfolio was between 4 and 5.7 milliards, while during the panic of June-July it went up to 19 milliards. The unusual expansion of facilities by the Bank prevented the credit system from breaking down completely. The subsequent stagnation in business was reflected in a contraction of the bill portfolio to about 3 milliards towards the end of 1940.

The gold reserve of the Bank is given as amounting to 84 milliards, a figure which has not been changed since the revaluation of the gold reserve in February, 1940. Nothing, however, has been officially said as to whether the Bank is really able to dispose freely of its reserve. It now amounts to 30 per cent of the Bank's total liabilities of 288 milliards, against 60 per cent prior to the war. This, however, is of no practical importance for the time being, since no foreign payments in gold have to be effected.

Currency Inflation

The total of bank notes in circulation was 160 milliards by the time of the Armistice, against 123 milliards in May, 1939, and it went up to 218 milliards in December, 1940. No new data are available, but the assumption of a further increase in the circulation of 30-45 milliards seems to be quite conservative. There is no doubt that the doubling of the currency within two years, without business expansion at a corresponding rate, rather in fact with declining business activity, is bound to produce sharp inflationary results. A repetition of the "Schacht miracle," with its rigid and effective control over prices and wages, is most unlikely to take place in a defeated and conquered country. In this sphere—as in many others—the Pétain regime is prevented from a successful imitation of German models by its internal political impotence.

It is true that up to the present the inflation has not become rapid. Paradoxical though it may appear, the position still presents some temporary advantages for the Government. Money, for instance, has become very cheap in Vichy France. The rate of interest on Treasury bills was reduced in January and April, 1941, each time by $\frac{1}{2}$ per cent. The official rate of discount of the Banque de France was lowered from 2 to $1\frac{1}{2}$ per cent in March.

The reasons for this unusual cheapness of money are plain enough. The francs "created" by the Bank to pay the occupation costs are being spent by the Germans on

June 28, 1941

French territory in payment for commodities and requisitioned goods. As there are only very few opportunities for making investments or buying stocks left to the French public, a plethora of money has appeared. Bank deposits and savings are on the increase, and subscriptions to Treasury bills come in smoothly. Cheap money, however, is here not a sign of prosperity but a by-product of growing financial difficulties.

Social Policy in Eire

[FROM OUR DUBLIN CORRESPONDENT]

June 16th

THE social policy of the Government in wartime has formed the subject of an interesting address by the Minister for Supplies. The fundamental basis of that policy is the fixation of a lowest level of means, below which nobody will be allowed to fall, by adapting the provisions of the social services to meet the situation created by difficulties of supply and rising prices. The most important methods of carrying this policy into effect are the increase of benefits provided in schemes of public assistance, the rationing of commodities in short supply, the strict control of prices of essential goods to eliminate avoidable price increases, and the restriction of increases of incomes by income tax and by the pegging down of profits, salaries and wage rates. Rationing will be confined to industrial raw materials and to commodities in general consumption which are, or may become, in short supply.

The Minister explained the distinction between avoidable and unavoidable increases of price. The price of many imported goods has risen because of increased costs of production and transport, and their prices were bound to rise unless they were kept down by a subsidy. The price of the majority of home-produced foodstuffs is practically the same as last year. No change has occurred in the prices of bread, milk and sugar; the prices of oatmeal and lard have been reduced; but the prices of butter, margarine and jam have slightly increased. The articles about which the public complains most are meat and vegetables; in these cases retail trading margins are strictly controlled. Profiteering is kept down to the lowest possible level by the system of price control, and it is the Government's intention to extend the maximum price order to the widest number of commodities in which control is practicable. A necessary corollary of this price policy is the stabilisation of wages, which the Minister defended on the ground that it is better to keep up the volume of employment than to permit wage increases to a favoured minority of sheltered workers.

Work for the Workless

During the debate on the estimate for unemployment relief schemes, the Government spokesman explained some of the difficulties experienced in finding suitable schemes for each locality. The available works in the congested districts in the west were rapidly being exhausted, and it was becoming necessary to transfer men very considerable distances to work. In practice, it had been found that, unless the authorities were prepared to go in for large schemes of temporary transport and erect huts for workers, they were confined to works within a comparatively small radius. While people would temporarily migrate from the west to Scotland, where they could earn large amounts of money in a short space of time, they were not willing to migrate to different districts in their own country, where there had not been the same inducement of high piece-work rates. Now, however, the authorities were in a position to offer piece-work rates even higher than had been earned in Scotland. At the present time, they had on the bogs the biggest unsatisfied demand for rural workers ever known in the history of the country. The turf schemes were being held up by lack of labour. Owing to the difficulties of transport and housing, it had become necessary to put the Construction Corps to work on the bogs. This would help in the provision of fuel, but would do nothing to give employment in the areas where it was most wanted. These should be sobering reflections for those who advocate schemes of public works as the remedy for unemployment.

The Government has dropped certain proposals in the Budget in view of the storm of opposition which they aroused in business circles. The proposed extension of the corporation profits tax was criticised on the ground that it would cripple some of the newer industries which had come into existence as the result of the Government's own industrial policy. It certainly appears inconsistent to nurse indus-

tries into being behind the shelter of strict protection and later to tax them so onerously. The increase in corporation profits tax has now been postponed and the exemption limit raised from £1,000 to £2,500. Other taxes that have been dropped on further consideration are the proposed duties on cider and Irish newspapers. These changes will necessitate borrowing an additional sum of £634,000. The Minister for Finance professed himself unable to consider any substantial reduction of expenditure on the ground that such reduction would inevitably add to the growing volume of unemployment.

Argentina's Trade with the United States

[FROM OUR BUENOS AIRES CORRESPONDENT]

May 17th

THE importance to Argentina of a reciprocal trade treaty with the United States was emphasised a few days ago by the Argentine Foreign Minister, when a simultaneous announcement was made in Washington and Buenos Aires that the trade talks between the two countries, suspended in January, 1940, were to be resumed.

Argentina's import surplus with the United States is not a new feature in the trade between the two countries. From the past fifteen years' mutual trading, an aggregate import surplus of 1,753,000 paper pesos has resulted. But since the loss of its markets in German-occupied Europe, this country has failed to find any alternative outlet in the Western Hemisphere, while war conditions have led it to increase its manufactured imports from the U.S.A. The restriction of these imports had to be faced as a matter of monetary policy.

Since the abandonment of the 1939-40 trade talks, evidence of a real desire on the part of both Governments to foster Argentine-United States trade has not been wanting. Dr Raul Prebisch, manager of the Argentine Central Bank, arranged in Washington for loans from the United States to Argentina totalling U.S.\$110 millions, and Dr Federico Pinedo, former Argentine Finance Minister, is now in the United States in connection with the resumed negotiations, although he is not in an official capacity. Meanwhile, the formation here of an "Export-Import Exchange Corporation" (*Corporación de Promoción del Intercambio*) has just been announced. The 1940 annual report of the Argentine Central Bank pointed out that the United States loan of \$110 millions was a temporary measure to permit Argentine foreign trade to adapt itself to the reorientation caused by increased purchases from the United States and the loss of former export markets (principally Belgium, Holland and Italy), which took between them 155 million paper pesos of Argentine goods between January and May, 1940. It then stated that Argentina was in a position to supply to the United States products formerly obtained by the latter from Europe, and that such exports could be stimulated by the establishment of special bodies here which would include representatives of foreign exporters interested in this market. The newly-formed "Export-Import Exchange Corporation" is obviously an outcome of this policy. Established under the sponsorship of the Central Bank, it includes local representatives of United States commerce and banking, and its function will be to promote exports of dairy produce, wines, dried fruits, etc., for which there has formerly been no regular export market, as a means of creating additional foreign exchange for imports at present restricted (which include American motor cars).

Arms from America

The desire of American exporters to avail themselves of a ready market until now restricted by exchange control regulations will no doubt be a lever for Argentina in the forthcoming talks. The Argentine Government has just passed a Bill providing for the expenditure of 647 million paper pesos on armaments as part of a defence programme calculated to involve 1,000 million paper pesos, and it is expected that the orders for much of the material required under this programme, including a substantial addition to the country's military air force, will find their way to the United States.

On the other hand, the acceleration of the American defence programme has greatly diminished one of the main obstacles to the fruitful conclusion of the 1939-40 trade negotiations—the insistence of the United States on restricted quotas for imports of canned meat and linseed

June 28, 1941

from Argentina. The victualling of U.S. Army and Navy garrisons, particularly in the West Indies, has already led to increased purchases of Latin American foodstuffs by the U.S. Government, and America's raw materials reserve scheme is expected to call for imports of linseed and linseed oil to reinforce her domestic supplies.

The following table compares Argentina's trade with the United States during the first quarters of 1940 and 1941:—

	(In paper pesos)	
	Imports From U.S.A.	Exports To U.S.A.
January-March, 1940	81,437,751	81,895,972
January-March, 1941	38,114,910	119,097,742

During the last few weeks there has been a marked increase in the amount of dollar funds reaching this country. Refugee capital from the United States has been finding its way to this market on an increasing scale for some time, and the recent intensification of this movement is attributed to expectations that the United States will shortly enter the war, and that dollar resources in foreign hands will be blocked. This influx of capital is officially stated to have made possible the latest relaxation of exchange control permits in favour of imports from the United States, which was announced yesterday.

Egyptian Reactions to the Nazi Push

[FROM OUR ALEXANDRIA CORRESPONDENT]

April 30th

THE opening of the Axis spring offensive in the Mediterranean has affected Egyptian economy to a far smaller extent than Italy's entry into the war last summer. The present turn for the worse has not required anything like last year's adaptation. With the practical liquidation of Italian East Africa, Egypt no longer feels herself pressed in on two sides; furthermore, Italian might has been shown in its true light, while the British have proved their ability not only to defend but also to strike. The business world was not the last to realise this, and it accounts for the quiet confidence that recently prevailed within its ranks, even when local political circles were not free from anxiety.

Egypt's sea communications will not suffer much from the reoccupation of Cyrenaica by the enemy and from his establishment along the Greek coastline, nor from the rise in Mediterranean war risk premiums. Since Italy's alignment with Germany, Allied navigation in the Mediterranean had greatly decreased. Subsequently, as Anglo-Greek and Anglo-Turkish ties became closer, the traffic between Egyptian and Aegean ports expanded; but the trade, consisting chiefly of shipments of Egyptian wheat and rice and of Far Eastern produce shipped through the Suez Canal, represented but a small fraction of Egypt's total exports. Of far greater importance is the opening of the Red Sea to American shipping. It is not so much imports that will be facilitated—much of the new tonnage will be earmarked for war material—as exports. Much of the outgoing freight will be made available to local shippers and will help to solve Egypt's major export problem.

The chief reason of the present economic stability is the Anglo-Egyptian cotton deal, which has already put into the hands of the British Government over 70 per cent of the crop. There has, therefore, been no breakdown of the Cotton Futures Exchange as there was on the eve of the French collapse, and the stock market has thus been saved from outside pressure. On the morrow of the Easter recess, during which the German forces had crossed from Benghazi to the Egyptian border and had also entered Salonika, the Stock Exchange opened only moderately lower, and almost immediately after staged a brisk two-day rally to levels well above the previous week's close. Since then, a distinctly easier tone has prevailed, but even after the fall of Athens activity was not lacking. As to local and imported goods, prices fluctuated narrowly, and the volume of transactions remains about normal. On the eve of an intensified Axis drive towards the Suez Canal, the Egyptian economy continues to work smoothly, and rationing—on a liberal scale—is still confined to petroleum.

Sudan's Satisfactory Finances

[FROM OUR ALEXANDRIA CORRESPONDENT]

April 10th

DESPITE the temporary extension of the fighting front to Sudan territory, the 1940-41 financial year was good. Instead of the expected deficit of £E297,100, the final result is expected to be a surplus of £E29,461. In the 1941-42 Budget, revenue is estimated at £E4,066,172 and expenditure at £E4,639,184, against £E4,622,363 and £E4,592,002 respectively in the previous year. The deficit is to be met out of liquid reserves. Among the outstanding features of the new Budget are the final withdrawal of the Egyptian Government subvention, and the extension by the British Government of financial assistance towards meeting the cost of the greatly expanded Sudan Defence Force. The agreement with the British Government to stabilise the Sudan Government's military expenditure provides that the Sudan Government shall pay an annual contribution, fixed at the level of the 1939 estimates, of £E479,080. If, however, financial results prove more favourable than was foreseen at the time of the negotiations, the question of adding 25 per cent or some smaller percentage to the figure will be considered.

Rains have been poor on the whole, and it is unlikely that the total production of maize, the country's staple food crop, will reach the results of recent years when export surpluses were available. As regards cotton, an average crop of 1,096,700 cantars of 99 lb. is expected, against 1,129,351 last year. The acreage under cotton in the Kassala province temporarily occupied by the Italians is 22,158 acres, against 24,400 acres last year.

Foreign trade was affected by the scarcity of shipping and by insurance costs.

	1939 £E000	1940 £E000
Imports	3,777	3,696
Exports	5,368	5,204
Of which cotton	3,400	2,690

The falling off in the volume of cotton exports was greater than suggested by these values owing to the rise in price of about 30 per cent. About one-third of the crop has been carried forward into the new season, but the native growers received payment for their entire production.

Trade with Egypt expanded considerably, and, as happened in the Italo-Ethiopian war, the Sudan will also be able to supply the former Italian East African possessions with a certain amount of foodstuffs.

Portuguese Trade in 1940

[FROM OUR LISBON CORRESPONDENT]

June 18th

GERMAN propaganda for Portugal—Press, wireless and personal—has for long stressed the damage done by Britain to local and colonial trade, thereby causing unemployment and distress. That this was untrue could be gathered by general observation, but, in the absence of statistics, propaganda of this kind could only be met with general assertions. Recently, however, the National Institute of Statistics issued trade figures for 1940. Tabulated below, they speak for themselves, and, in order to forestall any complaint about exaggeration due to higher values, it is pointed out that while prices of imports and exports alike were higher in 1940, there was also much greater production and consumption. The standard of living in Portugal has risen steadily of late and is still rising. This has consequently reacted on local industry, which has expanded in many directions since the war, owing to the fresh initiative supplied by refugee capital and technicians. These are now turning out articles the importation of which has become erratic and costly.

In thousands of contos (units of £10,000)

	Imports	Exports	Total
1939	2,484	1,742	4,226
1940	3,498	2,553	6,051

The totals for the years 1936, 1937 and 1938 were 3,774, 4,617 and 4,279 respectively.

THE BUSINESS WORLD

Russian Resources

THE war between Germany and Russia has only begun. No balance sheet of gain and loss can be drawn up, but it is possible to inquire what economic considerations are involved. The wheat fields of the Ukraine and the oil wells of the Caucasus have been made the symbols of the apparently inexhaustible economic resources of the Soviet Union. Public opinion readily believes that a military conquest of these parts of the Soviet Union would enable Germany to carry off vast surpluses of agricultural and oil products. Yet the German occupation in 1918 yielded only miserably small quantities of wheat and sugar; there was no grain to spare. The Germans learnt then that a country disorganised by war cannot produce surpluses; and to-day the problem is not markedly different. Russia has not yet been ravaged by fighting this time; but the Ukraine, and any other part of the Soviet Union within reach of a conqueror, is of use only if agricultural and industrial production could be continued on the level that has been reached during recent years. There is no doubt that the actual output figures of Soviet Russia are impressive. But at present there are hardly any surpluses over bare consumption; during recent years Russia's total exports amounted variously to only two or three per cent. of total output. In the long run, under German use and exploitation, the position would be very different; but the long run is a matter of years.

When Germany made the first trade agreement with Russia in August, 1939, the parties subsequently agreed to increase their dwindling mutual trade to its former record level, which would have amounted to some 10 per cent. of Germany's total pre-war imports. Then a separate agreement was reached providing for the export of one million tons of feeding stuffs, mainly grain, to Germany. Further agreements concluded in February, 1940, and January, 1941, increased annual deliveries of grain and other feeding stuffs to 2.5 million tons. Germany was to supply Russia with manufactured goods, mainly machinery, and industrial equipment for the oil and synthetic industries; and there were agreements for the transit of goods from the Far and Near East to Germany. Liberal estimates suggest that, during 1939 and 1940, German imports of grain from Russia were 1.5 to 2 million tons, of oilseeds 500,000 tons, of cotton 100,000 tons, and of oil 900,000 tons. Substantial transactions in hides and skins, manganese ore, and other minerals were also reported. After the collapse of France, Russia concluded a number of trade agreements with German occupied or controlled countries, Roumania, Hungary, Norway, and Denmark, stipulating the supply of raw materials, which would benefit Germany's war economy. All this trade with Germany and German Europe ceased with the invasion, and the attack means, at least for the duration of the campaign and perhaps during an appreciable period of reconstruction afterwards, a substantial loss of valuable supplies of raw materials; and the leak in the British blockade is stopped.

The Soviet Union covers a territory far bigger than the United States of America and Canada put together. According to the 1939 census, the population numbered 170 millions. From 1927 to 1939 the population living in towns increased from 26.3 to 55.5 millions, or from 17.9 per cent of the total population to 32.4. These figures indicate the speed of industrialisation. The Soviet Ukraine covers only 2 per cent of the entire territory, but its population, numbering 31 millions, amounts to 18.2 per cent of the total population. The percentage of people living in towns considerably exceeds the average, reflecting that the Ukraine is the most important industrial centre of the Soviet Union. The area under agricultural cultivation amounts to only 17.8 per cent of the total agricultural area of the Soviet Union. The Ukraine is not a "granary." In fact, the "granary" of the Soviet Union has moved more and more to the east ever since large-scale industrialisation began in the Ukraine.

Agriculture in the Soviet Union depends to a very high extent on petrol. In 1939 there were 500,000 tractors, 165,000 combines, and 211,000 heavy farm lorries in use; and mechanisation has reached a point where lack of petrol would be fatal. Hitler could not take both oil and grain. The total harvest of cereals in Soviet Russia in 1937 was 108.3 million metric tons; in 1938, 85.5 millions; in 1939, 106.5 millions; and in 1940, 112.0 millions. These figures were achieved by improved cultivation methods, as well as by extending the area under cultivation. Industrial crops, especially cotton, increased similarly. For several years collectivisation of the peasants almost ruined the livestock industry. Then the government restored the livestock industry to the individual peasant, and the numbers of livestock began to go up at once. During 1940, the cattle population increased by 12 per cent to a total of 67 millions; the number of pigs increased by 9 per cent to more than 32 million, and the number of sheep and goats rose by 23 per cent to 123 millions. But, compared with these

figures, exports of cereals, dairy products, and meat were very small; bread cards were abolished in 1936.

In Central Asiatic Russia, extensive schemes of irrigation are being carried out, and the great variety of climatic zones is favourable to almost every kind of vegetable and fruit. Large-scale experiments are being made with the cultivation of a rubber plant, which may make Russia independent of imports; and the industrial production of synthetic rubber is well advanced. But—and this is the point—the average yield of Russia's agriculture is still below the standard of Central and Western Europe. The implication is still the same; in the short run the Germans have little to gain, because there are no considerable surpluses, and in the very short run, they have something appreciable to lose, because of the dislocation and destruction of war-making. In the long run Russia might be made the economic foundation of Nazi power; but not before next battles in the West have been decided. Further industrialisation could double the total agricultural production—but not in the twinkling even of a German eye.

The feature of Russia's industries is the development of new industrial centres far removed from the western

borders, and Germany's immediate reach. The old-established centres are around Leningrad and Moscow, and in the Ukraine. The most important new centre is in Central Asia, the Kusnetz Basin, which is linked up (over a long distance) with the industrial centre in the Urals, which has become known by the iron ore deposits in Magnitogorsk. This move to the east is important. Some of the intended regional changes in the coal industry are shown in the following table:—

Region	Actual 1938 Output in % of Total Output	Intended 1942 Output according to 3rd Five-Year Plan in % Total Output Planned	
Donbas (Ukraine).....	60.3	48.7	
Moscow	6.1	15.0	
Ural	6.4	11.0	
Far East	3.7	3.9	
Central Asia	0.7	2.0	
Caucasus	0.3	0.9	

In 1913 the Ukraine produced 87.2 per cent. of the total output of coal.

The same shift of industry to eastern centres is seen in the production of iron and steel. Again, the shift is away from the Ukraine to the new centres in Asia. Before the last war the Ukraine produced nearly all the output of iron and steel. The Five Year Plan provides for developments which would leave the Ukraine in 1942 with only 53 per cent of the total output. Actual output of steel increased from 4.2 million tons in 1913 to 17.6 million tons in 1937 and 21.5 million tons in 1940; and output for 1942 is planned at 27.5 million tons. In coal, and iron and steel Russia is self-sufficient; and manganese ore is produced for export in large quantities, the most important sources being in the Ukraine and in the Caucasus at Nikopol and Tshiatury, within German reach.

Russia's consumption of non-ferrous metals (discussed in a Note on page 861) is larger than home production. The latest estimates show the following percentages of home production to total consumption: aluminium, 87 per cent; copper, 58 per cent; zinc, 99 per cent; lead, 77 per cent; and nickel, 20 per cent. There was no home production of tin. The aluminium industry is mainly situated in the Ukraine, based upon the electric power of the plant at Dnepropetrovsk.

Russia is the second largest producer of oil in the world. The oil industry is still centred at Baku in the Caucasus, where much the greater part of the total output is produced (the details are given in a Note on page 861). Besides smaller producing centres in Central Asia and the Far East a second "Baku" is in building between the rivers Volga and Ural, with the centre at Perm; and

total output is now over 30 million tons a year. But Russian exports have steadily fallen from some 5.5 million tons in 1931 to under one million tons. That the oil supply situation has been made difficult because of a slow increase in output, side by side with a rapid rise in consumption, is shown by the fact that last year oil was rationed. The surplus is very small, and without this oil Russian agriculture and industry cannot be developed. In the long run there are oil resources amounting to half the world's to be exploited; but in the short run (for the reasons stated in the Note) Germany can have small hope of great oil gains by conquest—not even of the high-grade Baku petrol which is needed by the *Luftwaffe*.

Russia's economy is characterised by unequal progress in different places. For a long time, communications were neglected until serious transport difficulties threatened industrial output. The actual increase in the length of the railways has been small compared with the increase in freight carried. The present programme, which was in any case to be nourished, if possible, by German supplies and materials, aims at a total length of 60,000 miles, to be reached in 1942, against 56,865 miles in 1938. Motor transport has been developed to a greater extent and higher efficiency; and Russia is the second largest producer of motor lorries. Air transport is also well developed, and in summer months extensive use is made of inland waterways. New canals have been built, and important connections between rivers are under construction; but vast distances remain the first problem of Russian economy—and the Germans have their own urgent transport problems in Europe.

The Ukraine is still the main producing centre of the Soviet Union. The loss of the Ukraine would mean the loss of about half of Russia's heavy industries, and the conquest of the Caucasus would mean the loss of most of the current output of oil, and nearly all the refining capacity. But the new industrial centres in the Ural and in Asia would remain intact even if the whole of European Russia were to be occupied; and it would be a long time before the wealth of European Russia could be harnessed to German needs. There are no enormous stocks and surpluses to be carried away at once, and a policy of simple loot, by very gravely impairing the current working of Russian agriculture and industry, would considerably lengthen the time it would take to press Russian resources into German service. In the end, it is true, Russian resources could make Germany immensely powerful; and the moral to be drawn from the facts is not that the Nazi war machine can make—or expect—quick gains in power from this invasion, but rather that either the invaders must be stopped, or they must be broken by the western Powers before they have time to make use of their booty.

Finance and Banking

Comfortable Half-year End

The imminence of the half-year end has had only the very mildest reflection in credit conditions, such as a modest decline in total applications for Treasury bills and a virtual suspension of clearing bill purchases. Despite the decline of close on £10 millions in bankers' deposits at the Bank of England, the banks have actually remained quite willing lenders of overnight money, and the market has therefore had no difficulty in financing its slightly larger Treasury bill allotment. Ease of credit will be further assisted by the reduction in the Treasury's demands on the banks for fresh accommodation to no more than £20 millions against deposits and tender bills together, as well as by the incidence of the calendar, which will allow the market to concentrate its tenders this Friday on bills to be taken up after the turn of the month. Even apart from these aids, comfortable conditions would be assured by the constant presence in the background of the special buyer, prepared to accept bills at market rates at the first suspicion of stringency. The note circulation shows a further rise of £1,453,000 to the new high record of £638,984,000, making a cumulative rise of £9,469,000 over the past four weeks. Though this is negligible by comparison with the jump of £45,290,000 in the corresponding weeks last year, owing to fears of an imminent invasion following the collapse of France, any expansion at all runs contrary to the normal seasonal movement. The rise is clearly an index of the steadily mounting national wages bill, though it is perhaps reassuring to note that on the year the circulation now shows an increase of only £36,830,000.

Discouraging the use of Drafts

One of the unexpected consequences of war conditions has been the official discouragement of the use of drafts for the purpose of remittances overseas. A circular was

INDEX TO VOLUME CXL

Shortage of paper makes it impossible in war-time to follow the normal practice of distributing to every reader a copy of the Index to *The Economist*. Copies of the Index to Volume CXL (January to June, 1941) will be available early in July, and will be sent, free and post free, on application.

As our records have been destroyed will those of our readers who have applied for previous indexes kindly repeat their instructions?

THE ECONOMIST - Brettenham House - London, W.C.2

recently issued by the British Bankers' Association requesting banks to do their utmost to persuade their clients to use mail transfers or telegraphic transfers instead. The reason is the complications arising from the loss of drafts through the sinking of mail steamers. Very often it is difficult to know for certain whether cheques have become lost through enemy action at sea; in fact, in several known instances cheques which had been presumed lost were presented for payment—not always by their rightful holders. In such circumstances it is risky for the drawers of the cheques to issue a duplicate in replacement of the original, and the clients are usually required to deposit the amount involved. The necessity for providing for dollars or other foreign currencies in case the drafts are payable abroad in such currencies further complicates the matter. At best the loss, or presumed loss, of drafts leads to endless correspondence. The same is true of the loss of letters containing mail transfers, but in that case, at any rate, no risk or legal complications are likely to arise. Needless to say, telegraphic transfers are in existing conditions the ideal means of remitting funds abroad.

★

The loss of pension warrants, dividend warrants, share certificates and so on through the sinking of ships also causes endless trouble to their owners and their bankers. A large number of small amounts are remitted by pension warrants to British Dominions and Colonies, and their loss causes much inconvenience to the pensioners, who can ill afford to wait. Arrangements are being made with the governments concerned to facilitate the replacement of the amounts involved. In the case of dividend warrants, American and other foreign banks are reluctant to collect the amounts on their own responsibility, unless they in turn are covered by corresponding dollar deposits. American banks are precluded by law from accepting a guarantee instead, so that in their case the equivalent of the amounts involved has to be actually deposited with them in dollars. In the case of stock certificates, some American firms insist upon a deposit well in excess of the amounts involved, in order that they should be covered in the event of a rise in the price of the stocks concerned. All these problems require attention, and their solution could be greatly facilitated by closer collaboration between British and American banks and monetary authorities.

★ ★ ★

Large American Loan Expected

According to confident reports from New York, negotiations have reached an advanced stage for an American loan to this country of several hundred million dollars, which is likely to be announced within a few days. The whole of this country's direct investments, as well as marketable securities of companies in which the British interest is a large though not a controlling one, would be deposited with the Reconstruction Finance Corporation as collateral for a loan to be used in payment for war supplies ordered before the passage of the Lease and Lend Act. At the end of 1940 remaining British marketable securities were valued at \$616 millions and direct investments at \$900 millions, though the latter have since been realised to the extent of some \$80 millions by the Viscose sale and the pledging of British American Tobacco's subsidiary, while liquidation of the marketable securities presumably goes on steadily. At about the time the Lease and Lend Act was passed, Mr Harold Smith, the Budget Director, informed Congress that of British orders outstanding to a total of \$2,700 millions, payment had already been made for \$1,682 millions, leaving \$1,018 millions still to be provided for.

★

Whether the latter figure gives any measure of the scale of the projected loan is not clear, since on the one hand Mr Smith stated that part of the \$7,000 millions Lease and Lend appropriation might be used to pay for orders placed before that law was enacted, while on the other hand it is difficult to judge what arrangements have been made about payment for American supplies during the past three months. President Roosevelt has revealed that transfers under the Lease and Lend Act up to the

end of May amounted to the equivalent of only £18,750,000, which can be no more than a fraction of the total supplies arriving from the United States. Presumably, the balance forms part of the \$1,682 millions already paid for, as no payments of any importance can have been made since the passing of the Lease and Lend Act. This is clear from the sudden drop in supply expenditure from an average of close on £90 millions in the January-March quarter to no more than £72 millions during the current financial year. Any arrangement which will obviate the outright sale of Britain's American industrial participations will be the more welcome in view of the disappointing result of the Viscose deal. This was carried out in great haste as a "gesture," before the recent amendment to the Reconstruction Finance Act authorising the RFC to make loans to foreign governments against dollar collateral, which provides the legal basis for the proposed loan.

★ ★ ★

Russian Dollar Assets Unfrozen

In the monetary sphere, the chief consequences of the invasion of Russia have been the prompt unfreezing of Russian assets in the United States, estimated at \$100 millions, and the blocking of Finnish dollar balances. It will be recalled that to secure the more effective blocking of German-Italian dollar operations this was carried out under a general freezing order applying to all Continental countries; there was provision for exemption by general licence for six countries, all at that time neutrals, Finland, Portugal, Sweden, Spain, Switzerland and Russia. Swiss and Swedish assets have already been thawed by the grant of general licences against assurances that these funds would not be used for the benefit of Axis or Axis-occupied countries. Although the earlier reports of Finnish co-operation with Germany in the attack on Russia seem to have been incorrect, the fact that German forces are on Finnish territory clearly makes it impossible for that country to be accorded neutral status. Transfers under the \$35,000,000 Export-Import Bank credit to Finland have accordingly been stopped. In this country, no announcement has yet been made bringing Finland within the area covered by the Trading With the Enemy Act, but the business in Finmarks (hitherto nominally quoted at 200 to the £) has been entirely suspended and a blocking decision is expected. Finnish names have virtually disappeared from the bill market since the severance of trade through the German occupation of Norway. The market holds probably £8,000,000 of Soviet Government 5½ per cent five-year sterling notes issued in connection with the £10,000,000 export credit of 1936, but these are fully guaranteed by the British Government and in effect a British security.

★ ★ ★

Japan Centralises Exchange Operations

The principle of concentrating exchange transactions in Japan in the hands of the Yokohama Specie Bank, acting as agent for the Bank of Japan, is being further extended as from the end of this month. It will from then onward include operations in U.S. dollars and eleven other currencies as widely assorted as Canadian dollars, Reichsmarks and Swiss francs. The declared objective of this concentration is the elimination of the exchange risk for Japanese traders and bankers, the centralised account in each currency being guaranteed by the Japanese authorities, who will meet the losses and pocket the profits accruing on such operations. It must, however, be evident that the concentration serves a somewhat wider purpose—that of tightening the system of exchange control operated in Japan. If we add the latest list of eleven currencies to the group of currencies connected with sterling to which a similar concentration of operations was recently applied, it is evident that the whole body of exchange transactions between the yen group and other currencies will henceforth be centralised and even more amenable to official control than it has been in the past. Incidentally, the Note in *The Economist* of June 7th, page 763, dealing with the first application of this principle of centralisation to currencies linked with sterling numbered the Shanghai dollar among those currencies. Needless to say, this was an error—since the Japanese control would hardly endeavour to provide facilities for dealings in an enemy currency. The Straits dollar should be substituted for this in the list of these currencies.

Investment

Russia and the Investor

The outstanding fact in the reaction of the investing public to the invasion of Russia is that it has not, as have other extensions of hostilities, resulted in stagnation. The volume of business has been appreciably reduced, but there were signs before the Russian situation became acute that activity had reached a temporary maximum. This is not unnatural since British industrial equities, as gauged by the index of *The Financial News*, had been rising for some nine weeks, while fixed interest stocks, according to the same authority, had already suffered a minor reaction. Actually, in the former section, a slight loss on the eve of the invasion has been fully made good, while there is little change in fixed interest securities. Further, outside the sphere of either index, the rather speculative buying of developing mines on the Rand has continued, while there have been signs of a similar spirit in the buying of railway stocks in anticipation of an official statement. With these minor exceptions, demand continues to be highly selective and the spread in yields between the market favourites in any industry and the less well-known, or less uniformly successful, members of that industry, continues to widen. In fact, the reduction of yield margins stops short at the point where neither the size of the concern nor a really excellent record has attracted public interest in the past. Excellent results now are clearly an unreliable guide to the long term outlook, but it will not be surprising if an early development is the acceptance of little known shares with a good record carrying high yields, despite a possible severe limitation on their marketability. Meanwhile, the market has ceased to talk of an impending Government issue, despite the fact that a statement of some sort with regard to National War Bonds appears probable in the near future.

★ ★ ★

Stabilisation by Subsidy

The news that there is to be no general increase in steel prices as from July 1st, to offset the rise in the price of coal and other costs, was received by the stock market with complete equanimity. It is calculated that, as many companies in this industry must be paying heavy amounts under EPT, it is the Exchequer and not the equity holder who will have to foot the bill. This is perhaps the best way of reducing the impact of such increases as have to be granted, but it must be realised that it widens the "gap" and threatens to bring inflation. Unfortunately, steel is not the only industry where costs are rising, and it is only necessary to mention the demands for higher wages, mostly conceded, in whole or in part, by the railway, engineering and road transport workers, to obtain some idea of the importance of this factor in the price structure. It may not in every case prove so easy to prevent the impact of higher costs on the public or on the stockholder, and the recent speculative activity in railway equities and junior preference stocks illustrates the uncertainty in which official silence, both as to the old agreement and concerning adjustment of charges, has plunged stockholders. The truth is that for some nine months the agreement has been a

★ ★ ★

AB Picture Control

According to reports in the Press, there need be no anxiety as to the complete control of Associated British Pictures passing to America. The late Mr John Maxwell owned more than half the ordinary shares of this company, which is engaged in the production, distribution and exhibition of films, and the story had been put about that the whole was to be sold to Warner Brothers. It can now be taken as established that neither the present owner nor the Board of Trade is prepared to sanction such a sale, and that not more than half of the holding, that is some 25 per cent of the total 8,000,000 ordinary shares of 5s., is to be transferred. That being so, there remain two points of interest which should not be overlooked, namely, whether it is desirable that so large a holding should pass into foreign ownership, and, if so, how the payment should be effected. On the former point, there seems little reason for anxiety. As a matter of fact, the cinema circuit controlled by the Associated British Picture group was built up in part on Warner Brothers films. In so far as it remains possible to produce films in this country during wartime, it will perhaps be no bad thing—in view of past experience—if a highly successful American group has an important voice in controlling actual production. The extent to which they control the material produced will doubtless be influenced by Government policy as applied to the film-producing industry. If, however, American interests are to be allowed to acquire British interests it seems only fair that they should pay for them in dollars and not in sterling—of which all American film interests have substantial amounts frozen in this country. This seems to be the necessary corollary of a policy which has required British concerns to sell their foreign interests in order to replenish the shrinking stock of dollars.

Company Notes

Cable and Wireless Holding

It was already known that the receipts of the holding company of the telecommunications group from its own operating company and Marconi's wireless company were

INSURANCE NOTES

London Life.—The accompanying extracts from the life revenue account of the London Life incorporate the figures of the Clergy Mutual and Metropolitan Life, both closed funds which have written no new business for 23 years and 13 years respectively. The most striking feature is the heavy increase in death claims; despite this increase there would have been a profit on mortality had it not been for the inclusion in London Life claims of 31 deaths arising from war causes, costing £122,309. The low cost at which business is handled is, of course, largely due to the absence of commission payments, as well as being partly associated with the high average sum assured—nearly £1,500—per policy.

		Rise or Fall

Surrenders	£340,667	—£53,861
Expenses	£96,063	—£3,557
Expenses—ratio to premiums... ..	5.2%	—

The valuation was made as hitherto on the bonus reserve method, with interest at 3 per cent. The aggregate surplus for the year in the three funds was

£198,730, against £392,376 for the previous year. This surplus has been chiefly employed in writing down the values of properties and strengthening reserves; except in the case of the Clergy Mutual fund, the directors consider that prevailing conditions do not justify a bonus distribution. In the balance-sheet the market value of Stock Exchange securities exceeds the book value; the association has investments of some £7,745,000 in mortgages and house property, and it is the belief of the directors that the reserves and unappropriated funds should be adequate to provide for any losses which have been experienced.

(Continued on page 874.)

unchanged, and the same proves to be true of dividends from the old cable companies, now virtually investment trusts. There is a minor increase in takings from other investments, while the income tax appropriation is slightly lower, so that the net income is £1,207,950 against £1,218,427. After meeting preference dividend and maintaining the ordinary payment, the carry-forward is slightly increased. The figures of the last three years are set out in the following table:—

	Years to December 31.

Apart from a small decline in investments, the balance sheet of the holding company shows little of interest, but the consolidated figures are of some importance. Owing to the accumulation of profits as a provision against the EPT requirements of the group for two years, and to reserve appropriations, there are large additions to cash items and to creditors. The former have been further increased by a modest fall in fixed assets and holdings in subsidiaries. The net effect is a rise of some £1,050,000 in investments and of £1,406,000 in other floating assets, the excess of which over current liabilities is, at £2,615,883, some £633,000 up on the year. Most categories of investments are lower, but gilt-edged are up by £1,545,000. Total holdings are taken in at £13,725,000, and the market value at the end of last year showed a discount of 19 per cent on this figure as against one of 17 per cent a year before. The ordinary stock, at 61 ex dividend, yields £6 11s. 1d. per cent.

Iron and Coal Results

Reports, recently issued, of a number of companies with interests in collieries and in pig-iron production indicate that charges against profits absorbed a larger slice of available earnings last year. Thus, of two leading companies, *Consett Iron* and *Butterley*, the former suffered a setback in profits after all taxation for the year to March 31, 1941, from £633,188 to £531,069, while the latter for the same period experienced a decline from £354,936 to £337,430, before tax. With a reduction of £100,000 to £125,000 in depreciation provision, *Consett Iron* realised a rise in the rate of equity earnings from 9.6 to 10.6 per cent and maintained the ordinary payment at 7½ per cent. After the allocation of £30,000 against £23,000 to be written off investments, the carry forward is slightly higher at £214,448. The *Butterley Company*, which has raised depreciation from £75,755 to £78,529 and provided £112,000 against £102,000 for taxation, has not been able to prevent a fall in the cover for the ordinary dividend—reduced from 10½ to 10 per cent—from 13.1 to 10.2 per cent, even after inclusion of £17,500 no longer required for contingencies reserve. Thus, the carry forward is up only from £59,954 to £60,411. The superiority of the *Consett Iron* results is probably to be explained by the relatively greater importance of this company's pig-iron interests. Both companies were adversely affected last year by the shock to the coal export trade, occasioned by the disappearance of the Continental markets. The chairman of *Consett Iron*, Mr Clive Cookson, in his speech circulated with the report, points out that the concern became a controlled undertaking during the year. The balance sheet of *Butterley* indicates that the shortage of liquid capital, which was apparent at the end of March, 1940, has become more acute. The bank overdraft is up from £44,272 to £145,526 and trade creditors, including taxation, from £287,026 to £478,888. Cash remains at the low level of £2,850. Both companies show a rise in stock, for *Consett Iron* from £898,944 to £1,365,124 and for *Butterley* from £331,763 to £478,476. Otherwise, the *Consett Iron* balance sheet shows

little change of importance. In the current year, in the absence of fresh disturbance to the market for the companies' products, earnings should be well maintained. The £1 ordinary stock of *Butterley*, at 23s. 1½d. ex dividend, offers a yield of £8 13s. per cent. The *Consett Iron* 6s. 8d. ordinary stock, at 6s. 4½d., yields £7 16s. 10d. per cent.

Harland and Wolff Record Profits

The full accounts of Harland and Wolff for 1939 fully justify the optimism induced by the dividend announcement increasing the rate paid on "B" ordinary capital from 4 to 6 per cent. Gross profits are up from £815,151 to £1,142,210, a new record level. The surplus available for "A" and "B" ordinary dividends is actually reduced from £379,784 to £295,825 owing to a substantial rise in tax liability from £22,426 to £431,409, while depreciation is maintained at £400,000. The rate of cover for the "B" ordinary dividend is, however, raised from 16.5 to 17.3 per cent, and after transferring £100,000 to general reserve as in the two previous years, the carry forward is £1,543 higher at £98,434. Considerations of security prevent the management from providing any details of the company's activity last year, other than those contained in the balance-sheet. From this statement it is clear that the concern was employed to capacity. Net additions at cost to fixed assets, at £488,439 against £373,688, bring the total of this item, after depreciation, to £5,835,133, the total of stock and expenditure on work in progress is up from £1,977,256 to the considerable figure of £4,306,376, the greater part of the rise being in the latter item. A rise of some £800,000 in trade debtors provides an increase in liquid assets of £3,025,656, while trade creditors, including tax and contingencies, have risen from £2,185,320 to £5,421,222, of which £1,575,502 is represented by a bank loan. The yield of £8 13s. offered by the £1 "B" ordinary stock at the present price of 13s. 10½d. ex dividend is in line with the current return on iron and steel issues.

"Shell" Earnings Reduced

The accounts of "Shell" Transport and Trading are as uninformative as ever, and with no Royal Dutch statement and the chairman's statement robbed of much of its interest, little light is thrown on the earnings of the group as a whole. The figure of dividends received is slightly lower on the year, and, as is shown in the table below, giving a three-year trend in earnings and allocations, the earned percentage on the equity is again lower at 5.3 against 5.8 per cent.

	Years to December 31.		
	1938. £	1939. £	1940. £
Dividends, etc.	6,680,373	2,527,766	2,382,822
Expenses and Fees	49,783	49,922	52,977
Preference Dividends	800,000	800,000	800,000
Ordinary Stock (tax free):—			
Earned.....	5,830,590	1,677,844	1,529,845
Paid	5,789,126	1,447,281	1,447,281
Earned %	20.1	5.8	5.3
Paid %	20	5	5
Carried Forward	206,668	437,231	519,794

The year has brought fresh misfortunes, Roumania, Bulgaria, Yugoslavia and Greece being added to the countries in which the group has lost physical assets. The chairman, Lord Bearsted, points out that there is no means of assessing damage to these properties, but that it must be considerable, a fact which explains the cautious dividend policy of the operating concerns. All goes well in the U.S.A., where demand is high, and the threat of a surplus has been removed by the decline in the flush production of the Illinois fields. The balance-sheet of the company shows few changes of importance. There is a small transfer, among liabilities, from creditors to carry forward, while fixed assets are down by some £491,000, investments by about £684,000 and dividends accrued by £275,000, against which cash is up by £1,466,000. It was, however, an accident that the company was under-invested at the date of the accounts and there has been a substantial purchase of Government stock since then, probably making good a fall of some £942,000 in this item on the year.

THE ECONOMIST

TRADE SUPPLEMENT

JUNE 28th, 1941

In view of the need to economise paper the Trade Supplement, published monthly until the end of 1940, is now being published quarterly in the last week of March, June, September and December.

The Trend of Business

THE virtual exhaustion of the unemployment "reserve" and heavy shipping losses during the past three months have underlined the need, first for a still better balance in the use of manpower, and, secondly, for a still closer control over the allocation of materials.

Among the measures designed to achieve these ends were the scheme of concentrating the consumption goods industries, announced last March; compulsory registration of men over military age and of women over twenty years old; the application of the Essential Work Order to vital industries; and the reduction in the supplies of personal and household goods, followed, in June, by the rationing of clothing.

The concentration of the consumption goods industries—a measure that was expected to release 500,000 to 700,000 men and women for war work—is still far from complete. A number of firms have been forced to close down for lack of raw materials, while many others have formulated schemes for concentrating production into fewer units. But it will take months before the slimming process can be completed.

Registration of men over military age and of women has begun, but here again progress has been fairly slow. In fact, the speed of the transfer of workers from unessential and over-staffed industries to war work has not been commensurate with the urgent need for greater output.

The Essential Work Order has been applied to the merchant navy, to shipbuilding and ship-repairing, to coal-mining and to building and civil engineering, in order to prevent the exodus of labour from these trades. There are no indications concerning the tonnage of merchant ships launched, but the gravity of the situation was brought home by President Roosevelt when he pointed out that the aggregate output

of British and American shipyards was equal to only about one-half of the losses incurred through enemy action. Mr Grenfell, the Secretary to the Mines Department, pointed out in the House of Commons on May 28th that a dangerous situation existed with regard to coal supplies. The industry's output was below current demand and stocks had been reduced to 14 million tons, equivalent to only about three weeks' production. While the application of the Essential Work Order to coal-mining was imperative, an additional 50,000 miners are said to be needed to provide for the accumulation of stocks for the winter.

The output of consumption goods has been curtailed, though it is questionable whether the reduction has been commensurate to the present emergency. The output of tobacco, for example, is understood to be in excess of the pre-war level. The rationing of clothes *per capita* instead of in bulk has been designed to ensure a measure of equality in distribution. There has been a tendency towards standardisation in the production of consumers' goods, but the possibilities have by no means been exhausted.

The past three months has been a period of expansion in the output of munitions. But the limit of Great Britain's war effort in the factory has not yet been reached. Apart from the need for transferring additional men and materials to vital industries, much remains to be done in bringing about a better utilisation of existing resources. It may be impossible to reach a state of affairs where every man and woman and every machine is fully and continuously employed on essential work. But a determined effort is needed to reduce the waste of resources through lack of foresight, faulty organisation or bad management.

British Industrial Development

COAL

At the end of last March the Government informed the coal-mining industry of the urgent need for an increase in output for the purpose of accumulating stocks during the summer. Two months later, on May 28th, Mr. Grenfell, Secretary to the Mines Department, pointed out in the House of Commons that a dangerous situation existed with regard to coal supplies. The coal-mining industry was not even producing sufficient coal to meet current demands; and stocks amounted to only 14 million tons, equivalent to little more than three weeks' output. Unless at least 20 million tons were added to stocks before the end of October, the position would not be safe. During the same debate Mr. Lyttelton, President of the Board of Trade, stated that the coal problem was no longer one of transport, but one of production. In order to arrest the exodus of labour from the industry, the Government applied the Essential Work Order to the industry early in June and sought to enlist the goodwill of the miners by the introduction of the guaranteed payweek and an increase in wages of 1s. per manshift, conditional upon attendance. And, since the industry's depleted labour force—some 70,000 to 80,000 surface and underground workers have been called up or taken up other employment during the past twelve months—is considered to be inadequate, Mr. Bevin has made an appeal to workers with mining experience to return to their former occupation. It is expected that the production programme could be fulfilled with an additional 50,000 men.

IRON AND STEEL

The output of steel has been fairly well maintained during the past three months. There have been difficulties, owing to the change in the composition of the furnace charges, for example, but, on the whole, the iron and steel industry has achieved a measure of success in adapting its technique to the change. The total supply of ore and scrap has remained fairly satisfactory,

though scrap policy has occasionally been criticised. But while steel supplies have been reasonably adequate, they are only sufficient to meet essential needs. It is understood that the steel distribution scheme is now operating much more smoothly than at its inception.

CHEMICALS

During the past three months the industrial chemicals market has remained steady with a slow volume of enquiry throughout. There has been no evidence of any important price change. Conditions in the pharmaceutical and fine chemicals sections have been rather quiet, although a fair undertone has prevailed throughout, with a steady volume of inquiry. Most items in the coal tar products market have been in active demand and a regular flow of business has been transacted, a considerable interest being shown in cresylic acid. All wood distilled products have been in good demand and prices have been firm.

COTTON

The outstanding event in the industry has been the concentration of production scheme. About 180 spinning mills have been closed out of 415 in the trade, and some 150 weaving firms out of about 1,000 sheds will cease production early in July. Progress in the spinning branch has been slow, but numerous schemes have been put through in the manufacturing section. The authorities have had to give prior consideration to firms that are engaged on Government contracts, and secondly to orders from abroad. Cotton Importers and Distributors, Ltd., has now begun to function and is responsible for the distribution of all cottons. Some revision of prices is expected at the end of July, especially in view of the appreciable advance in prices in the United States during the past three months. Export business in manufactured goods is now restricted according to the quotas allowed, which have been arranged on the basis of a year ago. The bulk of the

trade done has been for Java, Singapore, Rangoon, Argentina and the Dominions. There has been a steady demand from the Government, especially for heavy materials, aircraft fabrics and cloths for proofing, and some fair contracts have been placed. Spinning production is now 55 per cent of capacity as compared with 65 per cent three months ago and 95 per cent this time last year.

WOOL

It is believed that the wool textile industry will receive a rather more generous ration of raw material for civilian purposes during the coming rationing period, July/October, but this, it is said, will be only part compensation for a marked reduction in Government orders. No change is anticipated in the rate of supply of raw material for export in the form of fabrics and garments. There is better news of export of wool yarns and some good enquiries have been received recently from the Far East. The main interest of the wool textile trade to-day, writes a correspondent, is not the raw material supply but the extent to which production is to be concentrated. A number of firms have been listed as protected, but the choice does not appear to have met with general agreement.

JUTE

A considerable advance has taken place in prices for both raw jute and Calcutta goods during the past quarter. The fibre has

risen by £7 10s. per ton to £36 10s. for the full group of Daisee, 2/3, c.i.f. Dundee, August/September, and the new crop has been mentioned at £40. This rise in raw jute prices is reported to be due to the restriction placed upon sowings this season. The Government's intention was to bring the area down to about one-third of last season, when the crop was estimated to be 12,560,000 bales. The raw jute situation in Dundee naturally does not improve: only 400,000 bales of jute have been imported since last August, compared with the usual 900,000 bales in the same period. Only orders for essential purposes are therefore being allowed to be made, and spinners and manufacturers are practically dependent upon Government orders and export business.

FOOTWEAR

Like most other trades, demand for material is high relative to the supply, but civilian trade appears to have its demands met to some extent by the periodic release of Government surplus or reserved stock. Supplies are easily sold. Imports of leather have been greatly reduced and a quota is in operation. The rationing of clothing may have the effect of reducing somewhat the demand for leather in the glove and shoe trades. It is likely, however, that the demand for repairing bends will rise. It was announced on June 24th that a Director of Civilian Footwear had been appointed, under the aegis of the Leather Controller.

Business Developments Overseas

UNITED STATES

Business activity has continued at a high level, and the construction of munition factories, as well as the output of munitions, is proceeding apace. So far, however, there has been hardly any reduction in the output of consumers' goods, such as motor cars. Although there is no general shortage of labour—the unemployed are still numbered in millions—there is a scarcity of skilled labour in certain industries. Moreover, enormous though the country's suppliers of the chief raw materials are, there have been reports of shortages of individual materials. Indeed, the United States has now reached a position where the output of certain types of war equipment can only be increased substantially at the expense of the production of consumption goods. The organisation designed to ensure priority of supplies to the war industries has been strengthened, and, in the case of a number of raw materials, it has already issued directions to this end. Labour disputes have tended to hamper the progress on the munitions front in April and May. But the vigorous action taken by the Government to stop an unauthorised strike earlier this month was followed by the settlement of the majority of outstanding disputes, which has encouraged the hope of an abatement of the strike epidemic.

BRITISH EMPIRE

CANADA.—The seasonal decline in employment which usually occurs during the first quarter of the year was only 2 per cent this year, and in the manufacturing industries employment continued to increase. The total of war contracts by the end of March amounted to \$1,524 millions, of which about 56 per cent was on Canadian and 44 per cent on British account. It is expected that about four-fifths of the \$106 million programme for chemicals and explosives will be completed this summer. Bren guns, shells, bombs and a variety of armament components are now in production, 25-pounder field guns and tanks are to be turned out soon, and anti-aircraft and naval guns before the end of the year. By the agreement with the United States, that country is to enlarge her purchases from Canada by over \$200 million, thus helping to meet the cost of Canadian defence purchases in the United States. Certain components of the munitions which Canada is producing for Great Britain are to be supplied by the United States under the Lease-Lend Act. The agricultural outlook is, for the most part, unusually favourable.

AUSTRALIA.—The June cable from the National Bank of Australasia states that manufacturing and building industries are working to capacity, and the consequent wage increases and full employment are steadily expanding retail trade. A timely rainfall has greatly improved agricultural prospects in all States and there is a good prospect of substantial surpluses of agricultural products.

SOUTH AFRICA.—The engineering shops and the footwear, clothing and blanket factories are well employed, but there is some shortage of raw materials and labour. Gold output in May was 7,791 fine ounces and its value £65,444 in excess of the previous record. Agricultural conditions are fairly favourable and the condition of livestock good. It is hoped to export a fair quantity of grapefruit pulp and raw lemon juice to the United Kingdom.

LATIN AMERICA

Argentina's trade balance for the first quarter of 1941 was favourable to the extent of 102,820,000 pesos. This reversal of the adverse trade balance, however, has been achieved only through a very drastic cut in imports, for exports have been lower. Owing to shipping difficulties, however, import permits for about 80 per cent of total imports—including goods from the sterling area—have been abolished, whilst the remaining 20 per cent will presumably represent luxury goods. Argentina is still faced with the major problem of a very large unsaleable grain surplus, including 12,000,000 tons of maize, as well as large stocks of wheat and

linseed, and the expense of buying these from farmers is a severe strain upon the national finances. Agriculturists are suffering from the effects of low grain prices and the loss of export markets, which find reflection in retail trade. Business in Uruguay is buoyant, sales of wool to the U.S.A. having more than compensated for the loss of European markets. The value of exports of most products—particularly coffee and cotton—from Brazil in the first quarter of 1941 was higher than in the like period of 1940. Coupled with the fall in imports from Britain and Europe, this led to Brazil recording a favourable balance of trade at end-March, 1941, of 213,000 contos, against an adverse balance of 143,000 contos twelve months previously. The agreement for coffee imports into the U.S.A. from Brazil and the other producing countries of South and Central America has been successful in its first year, and coffee prices have advanced sharply, owing to the desire of the U.S.A. to build up coffee stocks as an insurance against possible transport difficulties. This has led to much increased foreign exchange supplies in Brazil, Colombia and elsewhere, and the remittance position with regard to British imports into Colombia, particularly, shows alleviation. The rearmament programme in the United States benefits Chile, through increased shipments of copper and nitrate, for example, and there are hopes of relief to the stringent sterling situation, particularly for the release of at least part of the British goods lying in bonded warehouses. The new cotton crop in Peru is turning out well in quality, and there should be relief in the stringency in sterling because of the reported agreement with Britain to purchase £1,000,000 sterling worth of Peruvian products—particularly cotton.

GERMANY AND GERMAN EUROPE

The disruption of communications and industries in the Balkan countries were compensated by increased activities in Germany and by closer economic collaboration with France and other European countries. The influx of foreign workers into Germany has continued. Some 2.5 to 3 million foreign workers, including prisoners of war, may now be employed in agriculture and industry. Yet a shortage of labour caused a new drive for the concentration of industries; and the calling up of women under the compulsory labour service decree was resumed. State and private concerns co-operated in establishing a number of holding concerns on a Continental basis, such as the "Continental Oil A.G." and the European Re-Insurance Cartel. The extension of German hegemony on the Continent has affected the location of industries. New and in the incorporated Polish territories. The capacities in occupied or dependent countries are being enlarged. There are reports of new iron and steel plants being built in Poland, Holland, Denmark, Sweden, and Hungary. The manufacture of artificial textile fibres is rapidly being expanded in France, Holland, Norway, and Sweden. Germany's manufacturing industry, dependent on increased numbers of unskilled and semi-skilled workers, has continued the process of rationalisation, and the standardisation of civilian consumption goods, such as clothing, and household goods is progressing. Official reports indicate that Germany's foreign trade with Italy, and with the Western and Northern European countries has increased. Foreign trade with the Balkan countries, however, has come temporarily to a standstill. The indices of wholesale prices and of the cost of living remained virtually unchanged during the first four months of 1941. Compared with August, 1939, these indices advanced by 4.5 per cent and 4 per cent respectively. The index of industrial raw materials, however, was 5.5 per cent above the level of August, 1939, and the index of clothing advanced by 14.6 per cent. Price control has been tightened and a general reduction of the retailer's margin decreed. The exceptional liquidity of the capital markets has continued. A temporary slump in share prices was caused by the announcement that a dividend stop would be introduced. The Bourses in occupied countries showed a similar liquidity.

COMPANY MEETINGS

J. LYONS & COMPANY, LIMITED

SATISFACTORY RESULTS IN A DIFFICULT YEAR

DIVIDEND MAINTAINED

SIR ISIDORE SALMON'S STATEMENT

The forty-seventh ordinary general meeting of J. Lyons and Company, Limited, was held on the 23rd instant at the Trocadero Restaurant, London, W.

Sir Isidore Salmon, C.B.E., D.L., J.P., M.P. (one of the managing directors), presided.

REPORT OF THE DIRECTORS

The directors have the pleasure to submit their forty-seventh annual report, with a balance-sheet and profit and loss account, made up to March 31st last, showing the financial position of the company at that date.

The volume of business though not fully maintained may be considered satisfactory in the difficult circumstances.

The balance of trading account after providing reserve for contingencies (including additional taxes and war damage premiums) is

To which is to be added the amount brought forward from last year

Showing available for distribution a total of

From this total the following dividends have been paid or provided:—

On preference and preferred ordinary stock to March 31, 1941

On ordinary, "A" ordinary and proportional profit stock and "B" proportional profit shares—interim paid December 7, 1940

And the directors propose to deal with the balance as under:—

To pay a final dividend of 3s. per £1 unit on the ordinary and "A" ordinary stock, making 4s. for the year

To pay a final dividend of 7.2d. per £1 unit or share respectively on the proportional profit stock and "B" proportional profit shares, making 9.6d. for the year

Leaving to carry forward to next account

The dividends received from subsidiary companies have been included in the company's trading account. In the aggregate the results of the subsidiary companies' trading show a profit. Losses of subsidiary companies so far as they concern this company have been dealt with in this company's accounts.

Messrs S. I. Salmon and A. H. Salmon retire from the office of director and being eligible offer themselves for re-election.

Messrs L. H. Lampitt and J. M. E. Sierra, employé directors, retire and are eligible for re-election.

Messrs Turquand, Youngs, McAuliffe and Company, the auditors, retire and are eligible for re-election.

(Signed) ISIDORE SALMON

Cadby Hall, London, W. 14.

June 10th, 1941.

HARRY SALMON
Managing Directors.

CHAIRMAN'S STATEMENT

The chairman's statement, which had been circulated with the report and accounts, and which was taken as read, was as follows:

I am sending, with the report and balance-sheet, this short statement on the affairs of the company, instead of following the normal practice of addressing shareholders at the meeting. The proceedings, on that occasion, will be confined to the usual resolutions which the Companies Act requires to be submitted. This course will save time, and I am sure shareholders will agree with it.

SATISFACTORY FIGURES

The figures in the accompanying report and accounts, showing the condition of the company's business at the end of the forty-seventh year of trading, you will, no doubt, consider satisfactory in the circumstances under which we have been working, notwithstanding that the balance of trading account is some £130,000 less than last year. This reduction is partly due to the fact that the contingency reserves have had to be increased by provision for war damage contributions and premiums and additional taxes. The amount of war damage contributions, etc., appropriate to the period prior to April 1st, 1940, has been written off against previous contingency reserves.

As we have said in the report, the volume of business has not been fully maintained. In present circumstances the business we can do is primarily controlled by the quantities of raw commodities available; and restriction of such supplies has naturally affected it in the year under review. Loss of staff and difficulties of transport have affected it, too.

SUBSTANTIAL RESOURCES

The year has been a trying one, but its anxieties have been faced with determination by those who serve the company, with the result you see. The dividend has been maintained, and we begin the present year's trading with a balance to the credit of profit and loss account of £320,000, which, together with our reserves, forms a substantial pool from which to meet any extraneous demands the future may make upon us.

As comparative figures are set out in the balance-sheet there does not appear to be any need to refer in detail to the differences. In only three items on the assets side—"Freehold land, buildings, etc.," "Stock-in-Trade," and "Debtors"—are the differences substantial, but these arise from the special circumstances of the time on which I do not think it necessary to comment.

"MUNITIONS FOR THOSE WHO MAKE MUNITIONS"

The Minister of Food has said that "the production of food is as important as the production of munitions" and that "every worker, man or woman, in the food industry can make a vital contribution to victory." We feel we can claim, therefore, that, with our large manufacturing capacity and our highly organised system of distribution, covering all parts of the British Isles, we are rendering a national service. We make munitions for those who make munitions; and the demand for our goods does not lessen day by day, but rather increases. That we cannot fully meet that demand is due to two things to which I have already referred—restriction of supplies and the difficulty of maintaining the necessary labour force—both of them arising, of course, from the exigencies of war conditions.

We have been called upon—and have welcomed the opportunity—to render advice and assistance to various Government Departments and to local and other authorities, in many of the problems

of food production and distribution with which they have been confronted, and in respect of which our experience and knowledge have been, we believe, of value to them.

WAR SERVICES OF STAFF

We have continued to give financial assistance to a large number of our employees serving in the Forces. To them all we convey our good wishes and our hope for their safe and speedy return. Our staff has not only worked with unflinching zeal, but has responded loyally to the calls inevitably made upon them for fire-watching, ARP, and other special duties. On occasions of danger and special difficulty, they have displayed that spirit of fortitude which has been so characteristic of the people of this country at the present time. Our National Savings Group, of which I told you last year, has continued to function with remarkable success.

Obviously, I cannot say anything of the future prospects in these somewhat anxious days; but we look forward with cheerful hope to the time when, having achieved victory (as I am confident we shall), we can return to normal trading, and progress to greater heights of prosperity.

The adoption of the report and accounts and the payment of the recommended dividends was moved by the chairman, seconded by Mr Harry Salmon, J.P. (one of the managing directors), and carried unanimously.

The retiring ordinary directors (Mr S. I. Salmon and Mr A. H. Salmon) and employee directors (Mr L. H. Lampitt and Mr J. M. E. Sierra) were re-elected; and the auditors (Messrs Turquand, Youngs, McAuliffe and Company) were reappointed.

The proceedings terminated with a vote of thanks to the directors and staff.

ODHAMS PRESS LIMITED

PROBLEM OF PAPER SUPPLIES

The twenty-first annual general meeting of Odhams Press, Limited, was held, on the 26th instant, in London.

Lord Southwood of Fernhurst (chairman and managing director), after dealing with the items in the accounts, said that it would be of interest to the shareholders to note that while the copyrights, in the opinion of the directors, stood at a very conservative valuation, the general reserve fund now practically equalled the total of such copyrights.

One of their main problems in the year under review had been the supply of paper. When the Scandinavian countries were overrun in the early part of last year, all supplies of paper and pulp from that source had ceased. Up to that time the company had taken all its supplies from English mills, who, in their turn, depended mainly upon Scandinavian sources for their raw material. That paper problem had been carefully examined by the whole of the newspaper owners in this country, the result being that a company, the Newsprint Supply Company, Limited, had been formed by the newspaper proprietors for the purpose of the co-operative buying of newsprint manufactured in Canada and Newfoundland to supplement that which could still be produced by the home mills. Under that arrangement, those newspapers who had at the time large stocks of newsprint had generously agreed to pool their stocks for the benefit of those who had smaller or no stocks. Allocations were made to each user on a fair basis according to his needs.

Unless anything unforeseen happened, the present arrangements made as to stocks should enable newspapers to carry on for some considerable time.

The other problem was paper supplies for the weekly periodicals and magazines. The drastic reduction by Government Order had resulted in their not only having to reduce the sizes and number of pages but to suspend or amalgamate temporarily some of less important of their publications in order to preserve the good will of their more important properties.

The report was adopted and a dividend of 7½ per cent. as against 6 per cent. last year was approved.

Every year many hundreds of Companies publish Reports of their Annual General Meetings in *The Economist*, thereby reaching thousands of investors in the quiet of their own homes.

In time of war the value of this practice is greatly enhanced because *The Economist* provides valuable information which is not otherwise available to investors, who therefore read it more carefully than ever.

Full particulars of the charges for inserting these reports may be obtained on application to The Reporting Manager, *The Economist*, Brettenham House, Lancaster Place, W.C.2.

FORESTAL LAND, TIMBER AND RAILWAYS COMPANY, LIMITED

DISTRIBUTION OF 9 PER CENT.

The 35th ordinary general meeting of The Forestal Land, Timber and Railways Company, Limited, was held on June 26th in London.

The Rt. Hon. The Earl of Selborne, K.G., G.C.M.G., P.C. (vice-chairman), who presided, said:

The issued capital of the parent company remained unchanged, and the increases shown in the reserves did not call for special comment, except that the general reserve and dividend equalisation reserve had now reached the satisfactory figures of £1,450,000 and £500,000 respectively. The depreciation account in respect of investments in La Forestal Argentina was now down to £66,302, which meant that soon they would no longer be able to make transfers to the credit of profit and loss account from that taxed reserve, as explained in the speech from the chair in May, 1936.

They would observe that the 4½ per cent. ten-year notes had been eliminated from the balance-sheet. They were able to redeem the outstanding balance last December without weakening the financial position of the company. The premium and expenses of this operation, together £20,809, had been charged, of course, to revenue and represent a non-recurring item of expenditure. The increases in creditors and subsidiary companies were due to normal fluctuations.

Among the assets they would notice that La Forestal Argentina's second debenture now stood at £410,000, of which notice of redemption had been received for £320,000, leaving only £90,000 outstanding. That company had now repaid some £2,300,000 of its borrowed capital since its formation in 1931.

Whilst the trading results of La Forestal Argentina were not so good, owing to the closure of the continental markets, this was partly compensated for by the excellent results of the Natal Tanning Extract Company and the Calder and Mersey Extract Company.

RESULT OF YEAR'S WORKING

The liquid assets of the company showed only normal fluctuations, having regard to the circumstances of the time, and he had much pleasure in assuring them that the total of £1,362,962 contained no stagnant pools or backwaters, but was all active in the business or readily realisable. The profit and loss account showed total credits of £613,177 in comparison with £792,577 the previous year. That reduction was mainly due to the additional reserves deemed necessary by their subsidiary companies this year. The balance of profit carried to balance-sheet of £426,669 was available for distribution. The directors had paid the preference dividend and now recommended a final dividend of 3 per cent., less tax, and a cash bonus of 3 per cent., less tax, making a total distribution on the ordinary stock for the year 1940 of 9 per cent., less tax. That would leave the carry-forward £39,855 less than the amount brought in.

The past year had been one of unprecedented difficulty and under the circumstances stockholders had every reason to be satisfied with the results achieved. In South Africa, too, the year had been difficult owing to the many and grievous dislocations of trade caused by the war, but the South African industry was not dependent to the same degree on the custom of European markets and the repercussions of the loss of those markets had been felt there in consequence to a correspondingly lesser degree than in Argentina.

They had steadily continued the policy of endeavouring to be absolutely fair to the consumer by refraining from any increase of price not forced upon them by increases in the cost of production or transport, and that attitude had been appreciated by His Majesty's Government, who had in consequence imposed upon them the least possible degree of restraint and regulation.

He would like to take this opportunity of acknowledging the sympathy and consideration they had met with at the hands of Dr. Snow, the Leather Controller. They would continue in the future, as in the past, to co-operate with His Majesty's Government in every field to the utmost of their power.

During these times members would agree with the board that this company owed a tremendous debt of gratitude to the Services, and more especially to the Merchant Navy. They had accordingly allocated a sum of £5,000 to various war funds and to funds specially benefiting merchant seamen and their dependents, which would be charged in the current year's accounts.

The results they had been able to secure could not have been obtained without exceptional efforts from all, to whom their cordial thanks were due.

The report was unanimously adopted.

diamond drilling is in hand to determine more closely the location of the lodes.

It is unnecessary for me to refer in detail to the increases in British taxation, of which we must all bear our share, but in Australia new taxes have been brought into force of which I think you should have some details. They are as follows:—

(a) Super tax of 1s. in the £ on taxable income in excess of £5,000.

(b) War time company tax, on a sliding scale based on the capital employed in the business from which the profit arose.

(c) Undistributed profits tax at the rate of 2s. in the £.

I must also refer to the provisions of the new Federal Income Tax Act, under which a dividend tax is payable not only by individual non-resident shareholders, but also by non-resident companies, this being in addition to the federal tax payable by Zinc Corporation itself. I do not wish to refer to this in detail, but it appears likely that in the event of the Federal authorities failing to collect the amount of the assessed tax direct from non-resident shareholders, they can call on Zinc Corporation to pay the tax on behalf of the assessed non-resident shareholders.

There are certain abatements to which shareholders other than companies are entitled, and for this reason we have asked nominee companies on our registers, if possible, to supply the details of their clients who have received these dividends from them so that the necessary abatements may be claimed.

The year 1940 marks the first full period of operation of the new equipment, and the record tonnage mined and successful operation of all new plant are sufficient in themselves to prove the care and foresight that has been applied in their design and layout. I would like to congratulate Mr W. S. Robinson on his vision in their planning, and with him our mine manager, Mr A. J. Keast, and his staff, as well as Messrs Bewick, Moreing and Co., our consulting engineers, on their completion and the results that have been attained.

I must also express our appreciation of the work of Mr J. Fitzgerald, the manager, and Mr Hotchin, the secretary, of the Melbourne office, as also that of Mr J. B. R. Challen, our secretary in London.

NEW BROKEN HILL CONSOLIDATED

The 5th ordinary general meeting of New Broken Hill Consolidated, Limited was held on the 25th instant in London.

The following is an extract from the statement by the chairman (Mr J. R. Govett), circulated to the stockholders with the report and accounts:—

Dealing first with the work on the Zinc Corporation property, in the past year sinking of the New Main Shaft was resumed below the No. 16 level, and has been advanced in the current year to a depth of 2,440 ft., where the No. 17 level is now being opened up. Steady progress was made with the advance of the deep southern drives; the main south drive on the No. 14 level was driven to the boundary and connection was made with the boundary winze. Payable ore continued on this level to within 320 ft. of the boundary. On the No. 15 level diamond drilling indicates that the wide ore exposures on the No. 14 level, opposite the New Main Shaft, are fully maintained at this increased depth, whilst preliminary drilling and driving on the No. 16 level give like indications.

On the New Broken Hill property the airshaft (main downcast airway), was extended in country rock a further 538½ ft. to a total depth of 1,648 ft. The exploratory work completed in the year consisted of eight diamond drill holes. In the current year an enlarged programme of exploratory work on both properties is in hand, to determine more closely the location of the narrow and broad lead lodes along the southern extensions in depth. This programme includes drilling in the upper ground for the narrow lead lode, deeper drilling on the broad lead lode and drilling between the White Leads and the Rising Sun shafts some two miles further south. Steady progress is being made with the further sinking of the airshaft, and with the Zinc Corporation New Main Shaft, from which the southern drives to the boundary are being advanced.

I am as yet unable to indicate to you any date when production can be commenced, for, until the present drilling programme has been completed and the resulting information obtained, no forecast is possible.

RUBBER PLANTATIONS INVESTMENT TRUST, LIMITED

DIVIDEND OF 10 PER CENT.

The 32nd ordinary general meeting of the Rubber Plantations Investment Trust, Limited, was held on 25th instant in London, Mr H. J. Welch (the chairman) presiding.

The following are extracts from the chairmans address which was circulated with the annual report:

The net profit balance of £188,446 was slightly less than in 1939. The balance-sheet shows the cost of our investments at December 31st last to have been £3,171,295, which figure exceeded the then valuation by £358,897, against which may be set our reserves and profits to be carried forward, amounting to £601,011. Present-day values of investments in the two industries with which we are mainly concerned have been for some time purely nominal.

Our 234 investments are well spread, both territorially and agriculturally and with little variation from their distribution in 1939, 99 per cent. of the invested capital being held within the Empire or the N.E.I. The directors propose to pay a final dividend of 7 per cent., making 10 per cent. for the year.

The present abnormal situation and the frequent changes which take place emphasize how fortunate the tea industry is in possessing the International Tea Committee, which ensures that adequate supplies are available. It appears reasonable to anticipate a continuance of remunerative prices, but everything will depend upon the course of the war and particularly upon the freight position.

Throughout 1940 war conditions increasingly dominated the rubber-producing industry. The demand for reserve stocks, particularly in the United States, necessitated a continuous increase in the exportable percentage. The permissible exports for the year from the quota countries, excluding Thailand, amounted to 1,245,000 tons. The world absorption during 1940 seems to have been in the neighbourhood of 1,060,000 tons, excluding producing countries. The industry is fortunate in producing, on a remunerative basis, a necessity of the war effort both of ourselves and of our Allies and friends, and that by so doing and by the very large provision of Foreign Exchange and of taxation, it is making a notable contribution to our country's victory.

The report was unanimously adopted.

LONDON ASIATIC RUBBER AND PRODUCE COMPANY, LIMITED

ANNUAL GENERAL MEETING

The Annual General Meeting of the London Asiatic Rubber & Produce Company, Limited, was held in London on 25th instant.

In his address to the members the chairman said:

We have recently sold an outlying block of 266 acres of 33-year-old rubber, the soil of which was unsuitable for replanting. It is proposed to reinvest part or the whole of this money by purchasing shares in good rubber-growing Companies, which will give this Company, we believe, a more valuable interest in planted land than it possessed in the Division which has been sold.

If our recommendations concerning dividend, etc., are adopted, the issued capital will then represent £30 1s. 11d. per planted acre. But it includes net surplus liquid assets of £340,092, so that the net cost is just over £19 per planted acre, the lowest ever recorded.

Though the demand for rubber was sluggish at the beginning of the War period it developed rapidly, chiefly because the Government of the United States followed a policy of building up large reserve supplies of rubber in that country. These demands were readily met by relaxation of the restriction of output and as a result accountable crop for 1940 was 11,855,000 lbs. against 8,231,000 lbs. for 1939 and its average sale price was about 1d. per lb. higher, but no less than £125,000 has been set aside for Excess Profits Tax, reducing our credit balance for the year to £164,618.

The directors recommend transfer of £15,000 to General Reserve and of an equal sum to raise the Dividend Equalisation Reserve from £35,000 to £50,000. The latter Reserve will be used without hesitation when the occasion arises. The final Dividend of 6 per cent. recommended will, if approved, make the total for the year 10 per cent. as in each of the last two years. The sum remaining to be carried forward will then be £83,033.

The forward sales made for 1941 amounted to 1,104 tons, at prices averaging just over 11d. per lb. London equivalent. No sales have been made for 1942 delivery.

The Accounts were adopted unanimously.

THE LUNUVA (CEYLON) TEA AND RUBBER ESTATES, LIMITED

STRONG FINANCIAL POSITION

HELPING THE NATIONAL WAR EFFORT

MR. H. J. WELCH'S STATEMENT

The thirty-fourth ordinary general meeting of the Lunuva (Ceylon) Tea and Rubber Estates, Limited, was held in the Council Chamber of the Rubber Growers' Association (Incorporated), 19 Fenchurch Street, London, E.C., on Wednesday, the 25th instant, Mr H. J. Welch (chairman of the company) presiding.

The representative of the agents and secretaries (Messrs Harrisons and Crosfield, Limited) read the notice convening the meeting and the report of the auditors.

The following is the address of the chairman circulated with the directors' report and accounts, and which was taken as read:

Ladies and gentlemen,—It is advisable for many reasons that meetings of members during the emergency should be as brief as possible. I have therefore decided to circulate with the report for the year this statement to take the place of my usual address at the annual meeting.

BALANCE SHEET

There is no change to report in the issued capital of the company. In the item of sundry creditors there have been included the usual provisions for accruing liabilities and contingencies, such as taxation, furlough and passage expenses. The total cost of the estates now appears at £837,547 and the very valuable buildings, machinery, etc., stand in the balance-sheet at the nominal figure of £1.

SURPLUS ASSETS AND LOW COST PER ACRE

After deducting all liabilities, including the final dividend and the appropriations now proposed, the net surplus liquid assets shown on the balance-sheet amount to £212,977. The issued capital of the company is equal to about £53 13s. per planted acre of tea, rubber and coconuts, and if the net surplus liquid assets are deducted therefrom the net cost of the planted tea, rubber and coconut areas, buildings, machinery and equipment stand at less than £40 per acre. As you are aware, this is very considerably below the cost and replacement value of such planted areas and equipment. In arriving at this net figure no value has been placed upon the 2,570 acres of unplanted reserve lands.

PROFIT AND DIVIDEND

The company made a profit of £120,599 on tea, and £32,850 on rubber. Sundry receipts and interest yielded £7,475. After providing for the London expenses, the amount expended upon buildings, machinery, etc., and the sum set aside for Excess Profits Tax and Ceylon taxation, a credit balance of £111,441 was transferred from the profit and loss account to the balance-sheet.

We recommend an appropriation to taxation reserve of £53,000. It is estimated this sum, together with our other taxation reserves, will cover all our liabilities for home and Ceylon taxation for the current financial year, which are assessable in relation to last year's profits. The board also proposes that, in addition to the company's usual contribution to the staff retirement fund under its rules, a special grant of £2,500 should again be made this year to that fund.

In December last we paid an interim dividend of 4 per cent., and the proposed final dividend of 6 per cent. (both payments being subject to deduction of tax) will make 10 per cent. for the year. The allowance in income-tax deduction makes the dividend equal to 12.83 per cent. for the year. The balance carried forward will be slightly increased to £80,410.

CROPS, COSTS AND PRICES

As compared with 6,309,554 lbs. in the previous year, the restricted tea crop for last year amounted to 6,735,078 lbs.

The f.o.b. cost of production was 9.10d. per lb., or .82d. more than in the previous year, due to increase in cost of upkeep, manufacture and distribution, general charges and Ceylon income-tax. The average net price realised for the exportable crop was 1s. 2.59d. per lb., as compared with 1s. 2.26d. per lb. last year.

The rubber crop amounted to 1,678,484 lbs., an increase of 783,765 lbs. over the previous year.

The f.o.b. cost of production was .56d. per lb. less than for the previous year, and the average price realised for the exportable crop was 9.72d. per lb.

LABOUR, AGENTS AND STAFF

The labour position continues to be satisfactory. Our cordial thanks are again due to our agents, Messrs Harrisons and Crosfield, Limited, our visiting agents, and our very devoted and efficient staff, for the valuable services rendered to the company during the year.

The staff retirement fund operates under a mutual contributory scheme. Although it has only been in force for 13 years, its investments—which are held outside the company's assets in the name and under the control of a trustee company—are valued at over £41,800. In the apportionment among the staff of the special grant of £2,500 to the fund, the directors will again have regard partly to age and years of service and partly to other considerations.

PROSPECTS FOR THE CURRENT YEAR

The company's basic tea assessment for 1940-41 is estimated at 7,469,000 lbs., and for rubber at 2,480,000 lbs. We have budgeted to produce during the current year about 6,111,300 lbs. of tea and 1,700,000 lbs. of rubber.

As mentioned in the report, we have sold the major part of our 1941 exportable tea crop to the Ministry of Food, and 828,800 lbs. of rubber has been sold forward for delivery ex godown during 1941 at just under 9d. per lb. net.

I dealt with the general position and prospects of the tea and rubber producing industries in my address to the members of the Rubber Plantations Investment Trust, and a copy of that address can be obtained on application to the secretaries.

We are fortunate in producing necessities for the national war effort and to be engaged in industries which, by heavy production, taxation and in other ways, are playing a very useful part in winning the war. While we cannot foresee what demands the emergency may yet make upon us, the financial position of the company is a strong one and should enable it to meet successfully any adverse conditions which may ensue from the war.

The chairman then moved the adoption of the report and accounts and the payment of the final dividend as recommended.

Mr H. W. Horner (vice-chairman) seconded the resolution, and it was carried unanimously.

The retiring director, Mr G. N. Thomson, was re-elected; the auditors, Messrs Turquand, Youngs, McAuliffe and Company were reappointed; and the proceedings terminated with a vote of thanks to the chairman and directors and also to the managers, and staff in the East.

TEMPLE BAR 3316

FORSTER'S GLASS COMPANY, LIMITED

DISTRIBUTION INCREASED TO 15 PER CENT.

The following is a summary of the speech to be made at the 22nd annual general meeting of Forster's Glass Company, Limited, to be held on July 3rd next at the May Fair Hotel, London, W., by Colonel C. E. Ponsonby, T.D., M.P., the chairman of the company.

After paying a tribute to the good work of the staff and employees of the company, in which a very heavy burden had been borne by managers and foremen in training the influx of new labour, and pointing out that the loss of any more of the company's man power would mean the loss of production, as there were many jobs in their business which could not be done by women, he said that the profit for the year, after meeting all expenses and providing for taxation, was £47,826 as against £50,714. In view of the many difficulties and rising costs, the directors considered the results to be satisfactory. Of the amount available for distribution—£52,835—there had been transferred to reserve £12,000—£5,000 to reserve account and £7,000 towards meeting deferred repairs. During the war the Board had had to restrict maintenance work on mould upkeep, and consequently when the company was able to resume its normal work in this department they would be faced with considerable expenditure.

The directors had for many years pursued a conservative policy, and, in order to strengthen the financial position of the company, had not only written off large sums for depreciation, but also built up a very substantial reserve. In view of the present satisfactory financial position of the company, the board felt justified this year in distributing a larger amount to the ordinary shareholders, and recommended a distribution of 10 per cent. with a cash bonus of 5 per cent., both less tax, making a total of 15 per cent. for the year as against 11 per cent. last year.

The volume of their sales had been very satisfactory and progress in the export trade of empty bottles was continuing to grow satisfactorily. As to the future, all he could say was that so far production and sales were continuing on a very satisfactory level.

BARRY AND STAINES LINOLEUM, LIMITED

SIR JOHN N. BARRAN'S SPEECH

The meeting of Barry and Staines Linoleum, Ltd., was held on the 24th instant in London.

Sir John N. Barran, Bt. (chairman), who presided, said: In Europe the collapse of France transferred the Rouen factory to enemy hands, and we have earmarked a sum in our reserve funds to cover that asset and all contingent liabilities involved. On the Continent our export trade for the moment is at an end—we have made further large provision for debts in enemy-occupied countries.

At home the full savagery of air raids and burning has been let loose—we have met this by a division of our staff to ensure continuity, and by special steps to give relief to our London workers from the strain under which they have gallantly carried on and helped (happily with success so far) to watch our places of business. You can realise the extent of the expense and operating difficulties which these events have laid upon us.

The progress of recruiting has further reduced our staffs; raw materials have risen in cost and passed under closer control; insurance in all its forms against war risks and damage mounts all the time as a charge upon our workings, while the normal channels of trade are more and more restricted by the drastic reduction of sales quota, purchase tax, and the Government scheme for the concentration of industries.

The results of all these influences are shown in the figures before you, which, after all I have said, call for little further comment or quotation. Our dividend from Canada is much reduced, as our holding company's account shows. Business there has been active but charges heavy. The many forms of expense laid upon us for the maintenance and protection of our manufacturing and proper care for our employees' safety and interest have, of course, had a serious effect on profits, and it is my belief that, taking all into account, you will not be dissatisfied with our dividend proposal.

The report and accounts, with the recommendation of a final dividend, making, with the interim dividend already paid, 10 per cent. for the year, were unanimously adopted.

CABLE AND WIRELESS LIMITED

(The Operating Company)

DIVIDEND OF 4 PER CENT.

The twelfth ordinary general meeting of Cable and Wireless, Limited (the Operating Company), was held on 26th inst. at the registered office, Electra House, Victoria Embankment, London, W.C.

Sir Edward Wilshaw, K.C.M.G. (chairman and managing director) presided.

The secretary (Mr E. K. Jenkins, F.C.I.S.) read the notice convening the meeting and the report of the auditors.

The chairman said: Gentlemen, the accounts for the year ended December 31, 1940, disclose a profit for the year of £2,375,771, after providing £131,021 for cable renewals and £164,000 for amounts written off the cost of terminating a joint purse agreement and other expenditures. Adding the balance brought forward from 1939, £437,836, there was a sum of £2,813,607 available. The interim dividend of 1½ per cent. already paid, together with a final dividend of 2½ per cent., making 4 per cent. for the year, absorbs £1,200,000, leaving £1,613,607 to be carried forward to the next account, and this sum is available for any excess profits tax which may be assessed and for other payments.

It is not yet possible to estimate the company's liability to Excess Profits Tax, the determination of which depends upon the basis of assessment which may finally be applied to Cable and Wireless (Holding), Limited. Until this question is settled no provision can be made for the amount of tax to be apportioned to this company.

It is with deep regret that I have to record the death of the Right Hon. Lord Abertay of Tullybelton, which occurred on December 6, 1940. Lord Abertay, more widely known as Sir Charles Coupar Barric, was one of the first directors of the company, having previously been a director of Marconi's Wireless Telegraph Company, Limited. His experience and judgment were invaluable, and in his passing the directors have suffered the loss of a colleague of great gifts and personality.

It is with profound regret that I have to record that during the past year some members of the staff lost their lives through enemy action. Engaged as they are in a service which maintains the lines of communication of the Empire, some of the staff are necessarily carrying on their duties in perilous conditions at many points, and in expressing our deep sorrow at the loss of these brave men we recall with pride the courage and tenacious devotion to duty with which they and all their colleagues have maintained the highest traditions of the service.

In the light of existing conditions I am prevented from making my usual world-wide review of the company's activities. This meeting is therefore formal and confined to the formal resolutions.

The chairman then moved: "That the printed report of the directors and accounts for the year ended on December 31, 1940, submitted to this meeting, be and they are hereby received and adopted, and that a final dividend of 2½ per cent., less income tax, making with the interim dividend of 1½ per cent., less income tax, already paid a total dividend of 4 per cent., less income tax, for the year ended December 31, 1940, be paid on June 27, 1941, on the shares of the company to all shareholders whose names appear on the company's register on such last-mentioned date."

The Rt. Hon. Lord Pender seconded the resolution and it was carried unanimously.

The auditors, Messrs. Deloitte, Plender, Griffiths and Company, were reappointed and the proceedings then terminated.

THE BRITISH ELECTRIC TRACTION COMPANY, LIMITED

RECORD WORKING PROFIT

The forty-fifth ordinary general meeting of this company was held on the 20th instant in London, Mr. R. J. Howie, C.B.E. (deputy chairman) presiding.

The Deputy Chairman, in the course of his speech, said: The results show a small increase of £2,678 in the gross revenue. The amount of £748,552 is again a new high record for the company. The working profit exceeds that shown for the previous year by £3,075.

As the board considered it advisable to set aside £70,000 (as against £50,000 provided in the accounts last year) as a provision

against excess profits tax, the net profit is £16,925 less than last year.

Our investments stand at £6,894,669, a decrease of £44,345; more than half of this decrease is due to the repayment of a loan by one of our subsidiary companies. On the other hand, our cash resources show an increase of £110,486. It may be of interest to you to know that of our total investments, roughly 70 per cent. of the amount represents businesses which we administer directly or through the British Electrical Federation, and 30 per cent. represents outside investments.

Mr. Austen, in his speech last year, referred to the margin of some £80,000 which remained after the dividends recommended had been provided for. The actual margin this year, you will notice is just over this figure. As regards our inside investments,

I see no reason why there should be any material change in the gross income earned during the current year.

We see from time to time in the Press the view expressed that all public road transport should be nationalised. It would, in my opinion, be a sorry day for the public if this should take place. Under the organisation which we have set up, our various public utility undertakings are operated by separate companies. This has proved efficient, especially under the test of war time, because of the decentralisation of executive control, which allows of quick decisions and the best use of available vehicles.

A dividend at the same rate as for the previous year is recommended to be paid on the Deferred Ordinary stock, which I think in the circumstances of the times must be considered satisfactory.

The report and accounts were unanimously adopted.

COMMODITY AND INDUSTRY NEWS

Pottery Industry Concentration.

Pottery firms applying for nucleus status have hitherto been required to show that they have made arrangements under which, when 30 per cent. of the labour employed on April 1st in the factories concerned has been withdrawn for munitions work, the nucleus factories i.e., the factories remaining in production, will continue to operate at the full capacity of their plant and premises. It has now been decided to admit applications from pottery firms that show that under their concentration arrangements nucleus factories remaining in production will be operating at not less than 75 per cent. of capacity after the release of 30 per cent. of the labour employed on April 1st in all the factories involved under the particular concentration arrangement. Applications will, of course, have to satisfy the other conditions laid down in the White Paper. Applications must be received on or before Monday July 7th.

More Maximum Food Prices.

Canned baked beans, spaghetti, macaroni and vegetable salad prices were controlled on June 23rd under the Canned Vegetable and Vegetable Products (Maximum Prices) Order. Prices have been fixed for first-hand sales, wholesale

and retail sales, varying according to size of container. For example, baked beans vary on a first-hand sale from 3s. per dozen for 8-oz. cans to 10s. for 32-oz. cans; the wholesale price is 3s. 4d. to 10s. 9d. and the retail price 4d. to 1s. 1d. Home-grown tomato prices were controlled from June 22nd; the growers' price is 9d. per lb.; wholesale prices are 10s. 5d. to 13s. 8d. per package of 12 lbs., varying according to the function of the wholesaler; retail prices are from 1s. 2d. to 1s. 7d. according to distance from the producing centres. These prices will remain in force until July 13th, when lower prices are promised. Prices will fall gradually as supplies increase, and will be raised again in the autumn. A new schedule of dried peas and beans adds further varieties to the list of those controlled. Some varieties previously controlled are raised in price.

GOVERNMENT RETURNS

For the week ended June 21, 1941, total ordinary revenue was £25,902,000, against ordinary expenditure of £87,749,000, and issues to sinking funds of £130,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £695,530,000 against £447,512,000 for the corresponding period a year ago.

INSURANCE NOTES

(Continued from page 857)

Provident Association.—The life assurance business of the Provident Association of London is intimately linked with schemes of house purchase finance. Advances on approved properties are made at 5 per cent interest, and where a policy has been in force for four years or more may be for as much as 100 per cent. of the value of the property. The annual report includes four separate revenue accounts. In 1940 new business was naturally much reduced, new policies issued assuring £759,292, compared with £1,460,176 in 1939; new advances aggregated £243,688 against £765,712. Net premiums amounted to £545,796, a reduction of £225,522. The net rate of interest earned was £2 19s. 4d. per cent, against £3 7s. 4d. per cent.

Death claims show a substantial increase from £92,931 to £243,930. In addition to life assurance, the association transacts a fair volume of annuity business, for which the considerations in 1940 were £160,588, a reduction of £145,366, and the payments made £239,394, a reduction of £10,186.

In the profit and loss account credit transfers, including £73,906 in respect of interest not carried to other accounts, amount to £153,043. Dividends at the same rate as before cost £80,000, and after transferring £50,000 to the investment reserve fund and making various other allocations, the balance carried is £33,713, a reduction of £1,616. Liabilities are valued on the stringent basis of 2s. per cent net for life assurance contracts and 5 per cent gross for annuities.

Stock Exchange securities are included at slightly under market prices; the assets in general, of which £8,018,228, more than half of the total, represent mortgages, are certified to be fully of the value stated, less the investment reserve fund of £600,000. Mortgages are geographically well distributed; the average amount outstanding in respect of each advance is £439 and the maximum sum loaned in respect of any one property under £3,000. In addition to the balance of profit and loss account there is a reserve fund of £750,000 and a policyholders' bonus equalisation reserve fund of £250,000. Bonus distributions are on a generous scale; for life policyholders in the ordinary branch the association has declared a reversionary bonus for the year 1940 of 30s. per cent.
